Specifically, that result in Table 2 is akin to Ben-Jedidia et al. (2014), which reports that domestic loans to the private sector has positive effect on the economic development of Tunisia. The result is tenable because money lent to operators in private sector of Nigeria are seen to be competed for among various applicants and won over by the most lucrative and most prudently managed business proposals. After being awarded such credit facilities, loan officers still monitor the beneficiaries' engagement of such opportunities to avoid the incidences of bad loans. Hence, the productivity of credits lent to the non-public sector is sacrosanct to increased domestic products; and even the GNP. Ben-Jididia et al. surmised that notwithstanding the fragility at the short-run, financial growth positively affects economic development in the long-run.

Generally, results of the study are in tandem with the bulk of empirical literature, which submits that good functioning financial system plays a vital and causal role in augmenting long-run economic development (Demirguc-Kunt, 2012. This is an indication that the Nigeria financial system is fast developing, influencing innovations in the tangible sector of the economy (King and Levine, 1993). It is a fast departure from Ojo (1990) as cited by Falaye (2014), and therefore a good an indicant of improved efficiency in financial contracts enforcement; and strong legal right of foreign investors. Moreover, we acknowledge the finance approved for publishing this article, which Landmark University, Nigeria supplied. It is our hope that tertiary institutions in and around Nigeria will emulate and adopt the laudable gesture.

Abstract

Evidence abound that the levels of Information and Communication Technology (ICT) adoption as well as financial depth differ across Africa's sub-regions is relatively poor. Thus, this study comparatively examines the trend of ICT adoption and financial depth, hence, presenting statistical facts within Africa and Africa's sub regions (Central, East, North, Southern, and West Africa) to develop a positional argument on the state of affairs together with its implications. The data for the analysis is sourced from the World Development Indicators of the World Bank and utilises statistical packages for the collation and characterisation of the data. The outcome of this study will contribute to knowledge information on Africa's financial depth and ICT adoption, hence, spurring the need for the development of both the financial and the ICT sector by different stakeholders.

Introduction

Technology and innovation have been at the very core of human progress thus impacting on the quality of lives of people across the nations of the world through the improvement of educational and health care facilities, accessibility and efficiency (Ejemeyovwi, Osabuohien, Johnson & Bowale, 2019; Ejemeyovwi and Osabuohien, 2020). The rate of adoption of internet and Information and Communication Technologies (ICTs) has proven to be instrumental in driving inclusive growth, connecting people in remote locations to market, improving access to education, enabling access to information, promoting innovation, improving citizens participation in the democratic process and enabling the rise of small and medium scale enterprises (Guerriero, 2015). Financial development is not left out as a result of the fast adoption rate of ICTs.

Well-functioning financial institutions improve overall economic efficiency, create and increase liquidity, mobilise savings, promote capital accumulation, transfer resources across sectors and encourage entrepreneurs (Darrat & Al-Sowaldi, 2010). Okafor, Onwumere and Chijindu (2016) referred to financial deepening as a condition of sufficient liquidity and smooth financial intermediation, hence, the increase in assets and provision of needed financial services to the economy. World Bank (2018) referred to financial deepening (broad money supply to GDP ratio) as the summation of currency outside banks, demand deposits other than those of the central government, the time, savings, and foreign currency deposits of resident sectors other than the central government; bank and travellers checks; and commercial paper. Financial development theoretically

could be achieved through ICT adoption (Ejemeyovwi & Osabuohien, 2018; Karakara & Osabuohien) but however, the question of whether this hypothesis has been the trend in Africa is an unexplored aspect.

The study's objective is to utilise descriptive statistics to explore and argue about the level of ICT adoption and financial depth in Africa through stylised facts. The study commences section one with the introduction about the subject matter; section two itemises the materials and methods which extracts the stylised facts from the data as stated in the objectives using descriptive statistics tools; section three entails the results presentation and discussion section while section four consist of the conclusion on the positional argument.

Materials and Methods

The study utilises descriptive tools to analyse and present the trend of information and communication technology adoption and financial development for Africa as a whole, West Africa, North Africa, East Africa, and Southern Africa. The tools to be utilised include the graphs, tables, charts and descriptions of the trend from 2000 to 2018.

Results and Discussion

In Africa, financial depth has been increasing with few slight downward fluctuations on the average but within the same range. The African average values for the study period range within 27% as at 1999 and 40% as at 2015 and 2016 (Figure 1). Of the countries within the case study, outstanding performances in terms of the most and least financially developed (broad money supply to GDP ratio) African countries include: Morocco and Chad. Morocco is characterised by impressive financial development values among all the countries in Africa which maintained a consistently increasing trend with 66.1% as at 1999, 84.3% as at 2004, 113.3% as at 2013, 118.3% as at 2016, and 120.3% as at 2017. These trend shows that lessons on financial development may be learnt from Morocco by other African countries. Chad, on the other hand, performed poorly at the initial time period but improved overtime in Africa. The statistics further show that Chad had 10.8 as at 1999, 12.36% as at 2004, 13.3% as at 2013, and 15.6% as at 2017. In sum, statistics show that 97% of African countries had values below 50% within the study period.

**Note: AFR = Africa; CA = Central Africa; NA = North Africa; WA = West Africa; SA = Southern Africa; EA = East Africa.*

Figure 1: Average Broad Money Supply to GDP Ratio for Africa and Regions

Source: Authors Computation using data from World Bank (2018)

In West Africa, financial depth has been increasing on the average but the increase has been poor and slow**.** The West African average values for the study period range within 19.49% as at 1999 and 36.35% as at 2014 which was then followed by a certain reduction to 33.5% and 33.03% as at 2016 and 2017, respectively (Figure 1). Of the countries within the case study, Cape Verde impressively had broad money supply to GDP ratio of 59.95% as at 1999 followed by Guinea Bissau with 29.50% while Togo, Senegal and Benin came next with 22%. For the most recent time period of the data set as at 2017, Cape Verde experienced 105.49%, Guinea Bissau (32.71%) while Togo, Senegal and Benin had 56.03%, 49.59% and 39.68%.

Outstanding performances in terms of the most and least financially developed (broad money supply to GDP ratio) West African countries include: Cape Verde and Niger. Cape Verde is characterised by impressive financial development values among all the countries in West Africa which maintained a consistently increasing trend with 59.96% as at 1999, 76.17% as at 2004, 89.44% as at 2013, 104.08% as at 2016, and 105.49% as at 2017. This trend shows that lessons on financial development may be learnt from Cape Verde by other West African countries. Niger, on the other hand, performed poorly at the initial stage but improved overtime in West Africa. Statistics show that Niger has 7.45 as at 1999, 12.36% as at 2004, 22.50% as at 2013, and 27.16% as at 2017. However, as at 2017, the least financially developed economy is Mali having 23.91% as at 2017 as can be seen in Table 1.

Further observation of the broad money supply to GDP ratio show that within 1999 to 2017, (i) West African countries individually performed above their yearly average 99 times (34%) while they performed below the yearly average 127 times (44%) throughout the study period. This implies that most countries individually performed below the yearly average of the broad money supply to GDP ratio. (ii) West African countries individually performed above 50% (average on a scale of 1 - 100) only 28 times (9.7%) while they performed below 50% (average on a scale of 1 - 100) 258 times (90.2%). This further signifies the relatively low financial development in West Africa.

In North Africa, financial depth has been increasing on the average but the rate of increase has been poor and slow**.** The North African average values for the study period range within 50% as at 1999 to about 91.4% as at 2016 which was then followed by a certain reduction to 85.7% as at 2017 (Figure 1). Of the countries within North Africa, outstanding performances in terms of the most and least financially developed (broad money supply to GDP ratio) include: Morocco and Sudan. Morocco is characterised by impressive financial development values among all the countries in North Africa which maintained a consistently increasing trend with 66.1% as at 1999, 84.3% as at 2004, 113.3% as at 2013, 118.3% as at 2016, and 120.3% as at 2017. This trend shows that lessons on financial development may be learnt from Morocco by other North African countries. Niger, on the other hand, performed poorly at the initial stage but improved overtime in North Africa. Statistics reported in Table 2 show that Sudan had 9.4% as at 1999, 17.0% as at 2004, 19.4% as at 2013, and 20.3% as at 2016. In terms performance of North African countries' money supply to GDP ratio, 27.43% of the countries performed below 50% and 73% of their countries performed above 50% which is impressive compared to other regions.

Table 2: The Average of the Broad Money Supply to GDP in North Africa

In Central Africa, financial depth has also been increasing on the average but the rate of increase has been relatively constant than other regions for the same period. The Central African average values for the study period range within 11.5% as at 1999 to about 27% as at 2015 which was then followed by a reduction to 18.0% in 2017 (Figure 1). Of the countries within Central Africa, outstanding performances in terms of the most and least financially developed (broad money supply to GDP ratio) countries include Sao Tome & Principe and Chad. Sao Tome and Principe is characterised by relatively high financial development values among all the countries in Central Africa which maintained a consistently increasing trend with 28.0% as at 2004, 37.7% as at 2013, 34.5% as at 2016 and 34.5% as at 2017. This trend shows that lessons on financial development may be learnt from Sao Tome and Principe by other Central African countries. Chad, on the other hand, performed poorly, improved overtime but the improvement was not significant. Statistics in Table 1.3 show that Chad had 10.8% as at 1999, 8.2% as at 2004, 13.3% as at 2013, and 15% as at 2016. In terms performance of Central African countries' money supply to GDP ratio, 100% of the countries performed below 50% and 0% of their countries performed above 50% which is not impressive compared to other regions within Africa.

In East Africa, financial depth on the average been relatively downward trending. The East African average values for the study period range within 13% as at 2013 to about 42% as at 2005 for which a reduction began in 2002: 45.6% and descended to 42.3% and 39.1% as at 2003 and 2004, respectively which trended downwards till 2017, having a value of 29.8% as highlighted in Figure 1. From Table 4 outstanding performances in terms of the most and least financially developed (in terms of broad money supply to GDP ratio) countries in East Africa, include Eritrea and Malawi (with exception of Somalia and South Sudan having missing records).

Eritrea is characterised by relatively high financial development values among all the countries in East Africa which maintained a consistently increasing trend with 128.9% as at 2004, 123.2% as at 2010 while the 2012 – 2017 records were not reported. Statistics further show that Malawi had 16.2% as at (1999, 12.3% as at 2004, 26.0% as at 2013, and 23% as at 2016. In terms performance of East African countries' money supply to GDP ratio, 73.57% of the countries performed below 50% and 26.5% of their countries performed above 50% which is not that impressive but is better compared to the central African region.

In Southern Africa, financial depth on the average was upward trending till 2010 which was then followed by a relatively downward trend. The South African average values for the study period range within 13% as at 2013 to about 32.5% as at 2000, had an increase resulting to 50% by 2010 for which a reduction began in 2011: 47.7% and descended to 42.3% and 39.1% as at 2003 and 2004, respectively which trended downwards till 2017, having a value of 40% (Figure 1). Of the countries within Southern Africa, outstanding performances in terms of the most and least financially developed (in terms of broad money supply to GDP ratio) include South Africa and Swaziland.

South Africa is characterised by relatively high financial development values among all the countries in South Africa which maintained a consistently increasing trend with 61.6% as at 2004, 75.8% as at 2010, and 72.2% as at 2017. Statistics in Table 5 show that Swaziland had 23.5% as at 1999, 17.4% as at 2004, 25.4% as at 2013, and 30.5% as at 2016. In terms performance of Southern African countries' money supply to GDP ratio, 68.08% of the countries performed below 50% and 32% of their countries performed above 50%.

Internet Adoption Trend in Africa

In Africa, internet adoption rate maintained a consistently increasing trend with a temporary change on the constantly increasing growth path as at 2009. The African average values of internet adoption rate for the study period ranged within 0.5% of the total population as at 1999 to about 23% of the total population as at 2016. The slight alterations to the steady increasing state occurred in 2008 and 2009 with the internet adoption rate maintaining the same value of 6% for the two tome periods (Figure 2). This implies that something significant happened that caused the non-increase or non-decrease in the level of internet adoption. Outstanding performances in terms of the most and least countries with regards to the internet adoption rate are Morocco, Mauritius, Sierra Leone and Somalia. Mauritius had the most impressive figures at the beginning of the time period 4.7 – 15.2% of the total population (1999 - 2005) while Morocco had the most impressive figures from 19.8% to 58.3% of the total population (1999 and 2016 respectively). On the other hand, Sierra Leone and Somalia performed poorly, but Sierra Leone performed better from 1999 – 2003 but Somalia improved slowly overtime, leaving Sierra Leone as the least performing country between 2003 - 2016.

*Note: AFR = Africa; CA = Central Africa; NA = North Africa; WA = West Africa; SA = Southern Africa; EA = East Africa.

Figure 2: Internet Adoption Average in Africa and Regions

Source: Authors Computation using data from World Bank (2018)

For West Africa average, the level of internet adoption has been increasing overtime with notable temporary alterations to the steady increase but however, has ranged within 0.3% of the population (2000) and 17.1% of the population (2016). Further observation indicates that the slight alterations to the initial steady growth path for West Africa average values of internet adoption rate occurred between 5.6% of the population (2010) and 9.5% of the population (2013). The average internet adoption rate in West Africa as shown in Table 6 report 0.5% as at 2001), 2.2% as at 2006, 6.4% as at 2011, 14.7% as at 2015 and 17.1% as at 2016. Exceptional individual performances were attained by Gambia, Liberia, and Niger at the initial study time period - 2000 while Guinea Bissau and Cape Verde were exceptional towards the end of the study period - 2016. Liberia and Niger attained the countries with the least internet adoption rate having about 0.0% as at 2000 while Gambia attained country with the highest internet adoption rate having about 0.9% of the population as at 2000. In terms of other outstanding performances, Cape Verde attained the country with the highest internet adoption rate having about 50.3% of total population as at 2016 while Guinea-Bissau attained country with the poorest internet adoption rate having about 3.8% of the total population as at 2016 which was amazingly the highest percentage all-through its country's history

.

In North Africa, internet adoption average steadily increased overtime with slight and temporary alterations (2004, 2010 and 2012) but however, has ranged within 0.4% as at 1999 to 40.1% as at 2016. The North African average values of the rate of internet adoption within the study period range within 0.4% as at 2003 and 40.1% as at 2016. Also, the slight alterations occurred in 2004, 2010 and 2012. (Figure 2). Of the countries within North Africa, outstanding performances in terms of the most and least internet adopting countries include: Tunisia and Sudan. Tunisia exhibited values among all the countries in North Africa which had the highest values and maintained a consistently increasing trend with 1.6% as at 1999, 6.5% as at 2003, 8.5% as at 2004, 43.8% as at 2013, and 49.6% as at 2016. Sudan on the other hand, performed poorly at the initial study time period having 0.6% as at 1999, 0.5% as at 2003, 0.8% as at 2004, but from 2010, Libya became the country with the smallest internet adoption rate having 14.0% as at 2010, 16.5% as at 2013 and 20.3% as at 2016. The statistics is shown in Table 7.

In Central Africa, internet adoption began in 1999 and has experienced an exponential increase overtime which significantly kicked off in 2009 and remained consistent till the end of the study period. The Central African internet adoption rate per 100 persons within the study period range within 0.1% as at 1999 to about 17.9% as at 2016. The average pattern picked up a significant upward trend at 2009 with 4.7% (Figure 2). Of the countries within Central Africa shown in Table 8, outstanding performances in terms of the most and least internet adopting countries include: Sao

Tome and Principe, Democratic Republic of Congo and Chad. Sao Tome and Principe exhibited the highest values among all the countries in Central Africa by maintaining a consistently increasing trend with 0.4% as at 1999, 10.2% as at 2003, 13.3% as at 2004, 23.0% as at 2013, and 28.0% as at 2016. Chad on the other hand, performed poorly at the initial study time period having 0.0% as at 1999, 0.0% as at 2001, but from 2002, Democratic Republic of Congo became the country with the smallest internet adoption rate having 0.1% as at 2003, 0.4% as at 2007 and 5.0% as at 2016.

In East Africa, internet adoption rate on the average has maintained a consistently increasing trend with slight alteration to the steady increase at 2009. The average values of the rate of internet adoption within the study period range within 0.7% as at 2003 and 17.9% as at 2016. Also, the slight alteration occurred in 2009. (Figure 2). Of the countries within East Africa shown in Table 9, outstanding performances in terms of the most and least internet adopting countries include: Seychelles and Somalia. Tunisia exhibited values among all the countries in East Africa which were the highest values and maintained a consistently increasing trend with 6.2% as at 1999, 14.6% as at 2003, 24.3% as at 2004, 50.4% as at 2013, and 56.5% as at 2016. Sudan on the other hand, performed poorly at the initial study time period having 0.0% as at 1999, 0.4% as at 2003, 1.1% as at 2004, 1.3% as at 2011, 1.5% as at 2013 and 1.9% as at 2016.

In Southern African region, internet adoption began in 1999 and also experienced an exponential increase overtime which significantly kicked off in 2010 and remained consistent till the end of the study period. The trend is similar to that of Central Africa. Southern African internet adoption within the study period range within 1.2% as at 1999 to about 36.1% as at 2016. The average pattern picked up a significant upward trend at 2010 with 11.3% (Figure 2). Of the countries within Southern Africa shown in Table 10, outstanding performances in terms of the most and least internet adopting countries include: South Africa and Lesotho. South Africa exhibited the highest values among all the countries in Southern Africa region by maintaining a consistently increasing trend with 4.1% as at 1999, 7.0% as at 2003, 8.4% as at 2004, 46.5% as at 2013, and 54.0% as at 2016. Lesotho on the other hand, performed poorly as the country with the smallest internet adoption rate within the study time period having 0.1% as at 1999, 0.3% as at 2001, 1.5% as at 2003, 3.4% as at 2007 and 27.4% as at 2016.

Conclusion

Judging from the review of statistics on information and communication technology adoption, the average amount of individuals using the internet in Africa ranged from 0% to 23% of the total population, which seemed to be relatively low. With regards to the regions shown in figure 2, North

Africa seemed to be the highest (ranging from 0.4% – 40.1%) which was followed by Southern Africa (ranging from 1.2% – 50.5%) then followed by East Africa (ranging from 0.7% – 17.9%). Central Africa followed ranging within 0.1% – 17.9% and then lastly West Africa (ranging from 0.02% – 1.3%). Internet technology's importance was emphasised by studies (Ejemeyovwi, Osabuohien, & Osabuohien, 2018) for which the technology serves as a platform for new technology adoption such as Bigdata technology (Alalade, Ejemeyovwi, Ekong & Adeyemo. 2019; Ekong, Adiat, Ejemeyovwi, & Alalade, Harnessing 2019) inclusive economic development (Ejemeyovwi, Adiat, & Ekong, 2019;. Ejemeyovwi, Osabuohien, Bowale,. Abuh, & Adedoyin.2019).

Africa's performance on the broad money supply to GDP ratio (financial deepening), has also been relatively poor. The African region was seen to be below 45% at all the time periods (specifically ranging between 28% and 40.9%) and only few countries have few time periods above the average values of Africa, which is relatively poor. With regards to the regions, North Africa seemed to be the highest (ranging from 49% – 98.5%) which was followed by Southern Africa (ranging from 32% – 50.5%) then followed by East Africa (ranging from 29.8% – 39.1%). West Africa followed ranging within 19.5% – 36.4% and then lastly Central Africa (ranging from 11.1% – 27.8%). This is shown in figure 3.1. Also, in terms of the percentage of countries that performed below 50% (benchmark for this study), 97% of countries within Africa performed below 50%: 90.2% of countries within West Africa performed below 50%; 27.43% of countries within North Africa performed below 50%; 100% of countries within Central Africa performed below 50%; 73.5% of countries within East Africa performed below 50%; 68.08% of countries within Southern Africa performed below 50%. This reinforces the fact that financial development is relatively low in Africa

The implications of this poor performance of financial development in Africa include: the reduced capital availability, reduced attractiveness for investors, reduced production possibilities, inefficient financial intermediation and the tendency for a slow pace and possibly non-achievement of the sustainable development (Anh, 2017; Sanogo & Mousaa, 2017). This suggests that improving financial development will lead to increase in investment thereby leading to increase in liquidity, solvency and profitability; stimulation of capital reserves, improvement of investment opportunities, and achievement of Sustainable Development Goal (SDG) nine (9) of industry, innovation and infrastructure development in 2030.

Abstract

Job performance is one of the most critical topics in literature. Additionally, both managers and researchers paid more attention to this topic due to a crucial role in the success of organizations. There is a limited study conducted in developing countries. Likewise, most of the previous studies focused on organizations and limited studies conducted in the education field. This paper develops a conceptual model for organizational Justice and job performance to fill this gap. The potential participants of this study were academic staff at Iraqi public universities selected depending on stratified sample technic from 9 universities located in Baghdad. Based on the finding of previous studies, the results suggest that organizational justice dimensions are one of the most important factors that influence organizational performance.

Keywords: Job performance, organizational Justice, academic staff, university Rank, Higher education.

Introduction

Job performance (JP) consider one of the most crucial topics in the literature. It is primary interest to both managers and researchers, Due to its vital role in the success of organizations. Therefore, necessary to understand the mechanisms that affect job performance, particularly among academic staff. Besides, university performance is primarily determined by academic staff activities such as publications, conferences, patents and community service. This study attempts to add to the literature by offering a more detailed understanding of how organizational justice (OJ) influences job performance. Many factors affecting the performance of an employee are studied, while limited studies have examined the effect of OJ on JP among academic staff. Meanwhile, organizational Justice, a neglecting topic in higher education institutions. Most of the previous studies paid more attention to find the impact on performance appraisal (Byrne *et al.*, 2012; Tinuke, 2015; Onuselogu and Adaobi P., 2017) and limited studies have been conducted to find the impact of OJ on JP in the educational field (Arab and Atan, 2018). Meanwhile, the procedural Justice has been selected as the primary indicator of job performance in most of the studies (J. A.Colquitt, 2001; Zapata-Phelan *et al.*, 2009; Chien, Lawler and Uen, 2010; Suliman and Kathairi, 2013), While there are other two dimensions of OJ which neglected by the most of previous studies, particularly in the higher education context.

Iraqi universities suffering from low ranking among regional universities (Webometric, 2020) Furthermore, university ranking highly depend on academic staff performance in term of Research productivity (Mousa, Jameel and Ahmad, 2019; Jameel and Ahmad, 2020). The number of publications

for Iraqi universities in a reliable database is only 28091 (SJR, 2020) this number placed the Iraqi universities in low rank.

Purpose of this study is to propose the conceptual framework that may examine in higher education institutes, particularly in Iraqi universities in future studies.

Literature Review

Academic Performance

The term of academic is usually used about the school, university, or any higher-learning institution. This involves human academic activities in a structured educational environment. While, Performance is an activity, implementation and production. Performance refers to as what is accomplished under current circumstances which subsume the mechanism of obtaining and using knowledge skills structure and a host of successful, motivational and stylistic factors influencing the ultimate responses (Karem *et al.*, 2019; Jameel and Ahmad, 2020). (Armstrong 2010) Defined Performance as achievement, implementation, success, the efficiency of anything done, and contributing to outputs/outcomes (accomplishment). (Jameel and Ahmad, 2019a) and (Karem *et al.*, 2019) Indicate that performance is the execution of specific tasks calculated against specified reliability, completeness, cost and requirements. (Jameel and Ahmad, 2020) and (Jameel and Ahmad, 2020) emphasize were that education, research/publication and community service positions were essential for the growth of any nation internationally since these roles specifically promote social welfare, financial literacy, safety and reduced crime in communities. Research is one of the reasons why universities were founded, leading to new information development, the production of technology, enhanced service quality and increased educational prestige and economic value. The performance of universities mostly measures by the efforts of academic and non-academic staff. Academic staff at university comprise people who carry out educational work at the university, including teaching, research, and, in some instances, administrations. However, Educational achievements are the primary criteria used to assess university academic performance (Jameel and Ahmad, 2019a, 2019b). According to Tinuke (2015); Abba and Mugizi (2018) the criteria which could measure the academic performance such as staff skills, material resources, teaching, publication, research and community service.

Organizational Justice

Throughout recent years, social justice study has attracted significant interest. Studying Justice in psychology began with Adams ' monograph on equity theory (Adams, 1963) stressing assumed fairness in performance. Nevertheless, considering the importance researchers assign to justice existence, reproducing and expanding this research area was unavoidable. Organizational Justice may clarify a wide range of workplace attitudes, highlighting the importance of equality and equity values as a prerequisite for organizations to function effectively. However, (Greenberg, 2004) believe that OJ can decrease job stress. However, According to Lee *et al.*, (2015); Karem, Jameel and Ahmad (2019) Justice is a vital element in the development and maintenance of a sustainable labour environment defined as a Member's sense of the moral property of the way they are treated. OJ is the understanding of the equity with which an entity handles workers (Greenberg, 2004). OJ can be defined as a quality of mutual interest, affecting both interactions with others and consequences that influence the physical, psychological and social health of others (Cropanzano *et al.*, 2001; Jameel, Mahmood and Jwmaa, 2020). OJ often has three components: Distributive Justice (DJ), Procedural Justice (PJ) and Interactional Justice (IJ) (Leventhal, 1980; Bies and Moag, 1986).

Distributive Justice

DJ includes the allocation of incentives for work related to outputs. It is based on the theory of equity, in which expectations of unequal distribution of job incentives compared to work contributions could create tension among the employees. Likewise, Distributive fairness is the degree to which the

institutions' individuals view the distribution of resources (Greenberg, 1990; Jameel, Mahmood and Jwmaa, 2020). DJ relates to the Justice of particular results relative to that obtained by others (Farndale, Hope-Hailey and Kelliher, 2011; Karem, Jameel and Ahmad, 2019). DJ primarily applies to the organization's performance.

Procedural Justice

The degree to which uniformity occurs in the decision-making process of an institutions' and to what extent the views of representatives are expressed in the decision-making process is known as PJ (Greenberg, 1990). PJ applies to whether decision-making procedures maintain continuity and whether beneficiaries of these judgments can affect the system (Byrne *et al.*, 2012). The procedural Justice refers to facets of corporate transition processes. Furthermore, PJ represents the formal expectations and performance of the communication partnerships in the decision-making process; PJ is distinct from IJ as it illustrates the informal connections between the decision-making unit and the approving institution (Karem, Jameel and Ahmad, 2019; Yu *et al.*, 2019).

Interactional Justice

IJ characterized as the degree of treatment obtained by institution participants like provide details to them, especially when the making decision (Yu *et al.*, 2019) and (Karem, Jameel and Ahmad, 2019). Interactional Justice addresses the association between workers and the institution and the treatment of individuals (Jameel, Mahmood and Jwmaa, 2020). However, Interactional Justice, often perceived an element of PJ, refers to how one is handled during the execution of a system or policy (e.g. with respect and dignity) and stresses the interaction and social process dimensions (Bies and Moag, 1986).

Proposed Model and Propositions

Based on the literature, this study proposes that organizational Justice will affect positively on job performance among academic staff. Figure 1 illustrates the conceptual framework

Figure 1 : conceptual framework

Hypotheses development

Organizational Justice and Job Performance

The universities are the only organizations centred on dual-core functions of information development and dissemination through research, teaching and community engagement processes (Jameel and Ahmad, 2020). Although university academic staff do intricate work in an increasingly tricky setting, both in the area of teaching and research. Several researchers indicated that performance and engagement at work were two significant findings related to the sense of Justice (J. A.Colquitt, 2001; Cropanzano, Bowen and Gilliland, 2007; Zapata-Phelan *et al.*, 2009).

When individuals agree social and mental requirements such as speech, respect and dignity (dimensions of PJ and IJ) are fairly treated, they will generally Respond to higher performance and feel stronger. If organizations develop high-quality communication agreements with their workers by handling them equally and allowing them to make decisions about their results (fair processes), employees are more fulfilled and more likely to work to achieve a better standard of JP. Individuals are expected to show enough work performance and feel dissatisfied if they assume, they are low exchange relation. Empirical studies have demonstrated usually that DJ significantly predicted to Job performance (J. A.Colquitt, 2001; Shan, Ishaq and Shaheen, 2006; Cropanzano, Bowen and Gilliland, 2007). However, many findings have shown that PJ leads actively and substantially impact on JP (J. A.Colquitt, 2001; Shan, Ishaq and Shaheen, 2006; Zapata-Phelan *et al.*, 2009; Chien, Lawler and Uen, 2010; Suliman and Kathairi, 2013). However, IJ relation to JP remains unclear, and correlation experiments between these two factors produced mixed results, Some studies reported the IJ was not related and does not impact on job performance (Colquitt *et al.*, 2006; Zapata-Phelan *et al.*, 2009). While some other studies found a significant positive relationship (Shan, Ishaq and Shaheen, 2006; Suliman and Kathairi, 2013). According to the above mentioned, the study proposes the following hypotheses.

Proposition 1: Distributive Justice has a significant and positive effect on Job Performance among academic staff. Proposition 2: Procedural Justice has a significant and positive effect on Job Performance among academic staff. Proposition 3: Interactional Justice has a significant and positive effect on Job Performance among academic staff.

Research Methodology

In general, several conceptual frameworks on organizational Justice and job quality are available.

Measurement

This describes the four variables briefly to be used in the models. First, the distributive justice measures were drawn from a previous study that assessed the employee's perception of equality and equity, Items propose to adapted from (Leventhal, 1980) to assess academics staff perceiving distributive Justice. Second Procedural Justice shall be specified as necessary in the assignment process, such as coherence, lack of bias, reliability, equality of the applicants, correction and ethics of the organizational procedures Items propose to adapted from (Leventhal, 1980). The third factor incorporates the Items propose to adapted from (Bies and Moag, 1986), which analyzed the appropriateness of care workers to interactional Justice obtained from an individual of authority. Fourth Job performance Items propose to adapted from (Shan, Ishaq and Shaheen, 2006; Musah *et al.*, 2016; Abba and Mugizi, 2018) to measure the academic staff performance in term of publications, Teaching and university services.

Unit of Analysis

The potential participants were academic staff at Iraqi public universities selected depending on stratified sample technic from 9 universities located in Baghdad.

Statistical Data Analysis

To achieve the study aims, the Structural Equation Model (SEM), particularly, an analysis of a moment structures (AMOS) appropriate because the techniques allow multiple equations to be simultaneously calculated and conduct a variable analysis, including path analysis in one stage (Hair *et al.*, 2014). The study should be carried out in two phases. First, based on the confirmatory factor analysis, the measurement framework is estimated. Second, researchers examine the conceptual model and measure the path coefficients (Hair *et al.*, 2014).

Expected Findings

The researchers expect to find there is a strong impact of Organizational Justice dimensions on Job performance among the academic staff. It is also likely that the study will reveal that a favourable situation with regards to the Organizational Justice dimensions mentioned will also lead to a more positive Job performance. These findings are in accordance with other studies completed in the past, such as that of (J. A.Colquitt, 2001; Shan, Ishaq and Shaheen, 2006; Cropanzano, Bowen and Gilliland, 2007), which have all found the positive prediction of organizational Justice on job performance.

Conclusion

This paper proposed that Organizational Justice could be the most critical factor to predict job performance. Furthermore, academic staff performance plays a vital role in enhancing the universities ranking, community services and teaching quality. In this context, we proposed in this study the conceptual framework to determinants organizational justice and academic performance. Research in developing countries are still behind the developed countries, and the grading and quality of education in the universities of developing countries need to be improved. This study was designed specifically for testing in a developing country. The authors will, in future empirically examine the proposed model by deploying an academic population at both private and\or public universities. Stratified samples or random sample data may be collected through a questionnaire.

Causes of Contemporary Migrations

Abstract

Migrations, permanently inscribed in the history of human development, have been and are determined by a number of factors. This paper, the aim of which is to demonstrate current causes of migrations, sets out to settle the formulated research questions concerning the main contemporary factors of movement of people and to point to conditions which may affect these processes occurring in the future. It analyses social and economic factors (including the issues of development disproportions between countries, food problems, debt issues), technological, demographic, political as well as those associated with the occurring changes in man's natural environment. A hypothesis has been formulated in accordance with which we are increasingly dealing with the fact that individual factors determining the movement of people permeate, which affects the impossibility of clear indication of its specific cause. The hypothesis was verified positively.

Keywords: migrations, international migrations, causes of migrations, determinants of migrations, climate migrants, SARS-CoV-2 pandemic.

Migrations, falling under multidimensional phenomena of various character (demographic, economic, social, political, cultural) and as such a subject of research of many scholarly disciplines (e.g. demography, sociology, legal studies, economy) have existed for thousands of years and are permanently associated with human history [Keeley writes about migration processes in the past (Keeley, 2019, p. 21ff)]. They have been and are determined by numerous factors, though as pointed out by A. Maryański "migrations are by nature a vigorous element dependent of many incalculable factors" (Maryański, 1984, p. 10). One can conclude that they are a resultant of numerous social and economic circumstances (Szajnowska-Wysocka 2000, p. 28). In the historical development migrations have changed their character and intensity multiple times.

This paper, the aim of which is to demonstrate current causes of migrations, sets out to settle the formulated research questions concerning main contemporary factors of movement of people and to point to conditions which may affect these processes occurring in the future. This analysis is done with the assumption that this study addresses international migrations with their broad understanding, thus undertaken as movement of people from one country to another for a temporary or permanent stay, freely or under coercion (Cziomer, 1999, p. 77). The causes of the described phenomenon which we dealt with in distant past will stay outside the scope of this study. It seems obvious that since the dawn of time people have moved in response to a demographic growth, climatic changes or expansion of production and trade (Castles, Miller, 2011, p. 107). Contemporary migrations and their causes are a certain consequence of various factors which occurred in the 20th century, a century called "the age of migrations" by S. Castles and M. J. Miller (Castles, Miller, 1998). It needs to be borne in mind that intensification of processes associated with movement of people in the 20th century entailed unprecedented development of infrastructure, means of transport and media as well as an economic upturn. It was also associated with the result of activity of two totalitarian regimes and two world wars which caused mass flights or displacement and deportation of people of unparalleled volumes. The migration waves in the second half of the 20th century did not weaken and in certain periods even intensified. It was caused by new international circumstances which contributed to the migration wave, i.e. decolonization, post-war economic development, demand for cheap labour, armed conflicts, political and religious persecutions. It was noted that more often than before migrations gained a multiple character - migrants change their countries of residence multiple times during their lifetime (Wójcik-Żołądek, 2014, p. 10).

Social and economic factors are undoubtedly essential causes of contemporary migrations. Particular attention needs to be paid in this regard to the severe disproportions between the level of economic development of individual countries and their groups. It is pointed out that the consequence of the development asymmetries involves great differences in standards and quality of life between different countries and regions (Sulmicka, 2001). To illustrate the "development gap" with regard to economic and social and civilisation development in the West-South relations, one needs to point out that in 1990 the West, which accounts for 15.7% of the population, produced 71.7% of the gross world product, post-communist countries which accounted for 7% of the population - 12.3% of the GWP, and the South, representing 77.3% of the world population produced only 16.1% of the gross world product. One needs to point out that this "development gap" has not narrowed significantly despite world scale efforts (since the 1960s the so-called UN development decades have been undertaken in this scope). The 1999 United Nations Development Programme – UNDP entitled "Human Development Report 1999" pointed out that differences in incomes between the 20% of the population who live in developed countries and the 20% living in the least developed countries were 30:1 in 1960, 60:1 in 1990 and in 1997 it reached 74:1. 86% of the gross world product fell for those 20% of the richest populations, while a mere 1% for the poorest. The Report demonstrated that the OECD countries with 19% of the global population had 71% of global trade in goods and services, 58% of global foreign direct investment and 91% of all Internet users (UNDP, 1999).

The UNDP created (as is highlighted) a more comprehensive though subjective so-called human development index – HDI, with the scale from 0 to 1, which takes into account, apart from the economic aspect (real purchasing power of the obtained income per capita), also certain social and civilisation aspects of this development (such as life expectancy, literacy index) (Tabor, 2000, p. 276). Based on this index, the UNDP published in 1990 the first ranking of 130 countries with the population at least 1 million, in which the top places were occupied by the so-called countries of the West (Japan in the first place - 0.996), whereas the last positions were taken by African countries (last place - Niger 0.116) (Tabor, 2000, p. 276). In the last ranking published by the UNDP, enumerating 189 countries, the first twenty places are taken by: Norway (0.954), Switzerland (0.946), Ireland (0.942), Germany (0.939), Hong Kong [China] (0.939), Australia (0.938), Iceland (0.938), Sweden (0.937), Singapore (0.935), Netherlands (0.933), Denmark (0.930), Finland (0.925), Canada (0.922), New Zealand (0.921), United Kingdom (0.920), United States (0.920), Belgium (0.919), Liechtenstein (0.917), Japan (0.915) and Austria (0.914). Whereas the following countries are at the bottom of the list (starting from the end): Niger (0.377), Central African Republic (0.381), Chad (0.401), South Sudan (0.413), Burundi (0.423), Mali (0.427), Eritrea (0.434), Burkina Faso (0.434), Sierra Leone (0.438), Mozambique (0.446), Congo (Democratic Republic of the) (0.459), Guinea-Bissau (0.461), Yemen (0.463), Liberia (0.465), Guinea (0.466), Gambia (0.466), Ethiopia (0.470), Malawi (0.485), Djibouti (0.495) and Afghanistan (0.496) (UNDP, 2019). This data shows that the situation stays unchanged, the so-called Western countries still occupy the top spots and African countries take the lasts places.

The subject matter of development disproportions also covers raw materials-energy questions, food problems and international debt issues (Tabor, 1994, p. 144). There is no doubt that raw materials and energy determine economic development, which is why the possibilities of using raw materials which are key to the economic and civilisation development and the energy derived from them are treated as a key factor of long-term growth. The existing disproportion between "resources" and "needs" is also the reason for interdependence of countries and sometimes may lead to crises and disputes, or even international conflicts (Stadtmüller, 2000, pp. 21 4-219).

Food problems are also marked with a great imbalance between individual countries and regions. Some countries have a problem to manage food surpluses, while others do not have enough food to cover basic social needs. Food production is mainly determined by resources and natural functions, by the area of arable land, adequate resources of fresh water and well-functioning ecosystems. The 2019 report "The State of Food Security and Nutrition in the World (Safeguarding Against Economic Slowdowns and Downturns)" shows that more than 820 million people in the world suffer starvation. It was also pointed out that after many years of a decline, the number of undernourished people began to rise again in 2015 and compared with this in 2017 the number of people suffering from starvation

rose by over 11 million. It seems that the goal specified in the 2030 UN Agenda for Sustainable Development (United Nations General Assembly, 2015, p. 14) involving total elimination of severe poverty in any form throughout the world seems too ambitious and difficult to implement.

It needs to be borne in mind that in the areas where there is a food deficit social distress often occurs, and when this problem increases it may pose a risk of armed conflicts for access to fertile soils and water (Stadtmüller, 2000, p. 213).

Examining debt issues, one may agree with the view that it is not a problem until debtors, for various reasons, are not able to settle obligations towards their creditors on time. However, the problem grows the more countries-debtors stray away from the so-called safety boundary, that is when the annual service of foreign debt exceeds 25% of the value of annual export and the amount of payment of annual interest exceeds 10% of this export (Tabor, 1994, p. 154). This has been pointed out since the beginning of the 1970s. The level of foreign debt of developing countries has been constantly on the rise (Górniewicz, 2010, p. 69ff). It needs to be noted that the growth of debt in the world may lead to a financial crisis or even chaos. Despite the various actions taken in order to lower debt in the world the chances of eliminating all related threats are limited (Tabor, 1994, pp. 153-156).

Taking into consideration social and economic contexts one cannot leave out the psychological factor in perceiving objective differences in the level of development of societies. The perception of the economic situation and of the perspectives of the development of one's country, the assessment of capabilities and opportunities for individual progression and professional career, hope for personal success or the sense of security, faith (or its lack) in stabilisation and a "better tomorrow" are also essential (Kozanecka, 1997, p. 201). It is pointed out that in a situation where pessimism prevails, migration pressure rises for obvious reasons (Anioł, 1992, p. 23).

Technological factors also play a crucial role among determinants of contemporary migrations. Modern means of transport and developed communications network allow easy, quick and relatively inexpensive movement of vast masses of people from one country or continent to another. It is one of the key factors of the observed migrations accelerations. One may agree with the view that without modern means of transport and well-developed communications network the great "migration of peoples" observed in recent decades would have been practically impossible (Anioł, 1992, p. 23).

Demographic factors are now an important group of determinants which affect mass migrations. The speed of population growth in each country causes various consequences, both when it is low and when it is high. When analysing demographic data, a number of worrying phenomena was observed, that is a population growth observable since 1950s, where the pace of growth of the population of under-developed countries is much higher than that of developed countries. It was assumed that should current trends be maintained, in 2050 world population will exceed 10 billion, where 95% of this growth will fall for today's countries of the South (Tabor, 2000, p. 265 and Cesarz, 2000, pp.163-167). One needs to take into account that the changes in the distribution of the world population are also associated with a vigorous influx to cities (Cesarz, 2000, p. 167-168). A rapid growth in populations of large cities such as Mexico City, Shanghai or Mumbai is also concerning (Mojsiewicz, 1997, p. 211).

It is also worth noting that demographers point to an unfavourable structure of the age of the population (Mojsiewicz, 1997, p. 211). The average age at the moment is as follows: in Europe – 42.4; in North America – 39.7; in Oceania – 35.8; in Asia – 33,8; in South America – 33. 2, and in Africa – 24,1 (World Population, 2020). This data clearly shows that developed countries located in Europe or North America belong to "the aging societies" compared to under-developed countries in Africa, Asia or South America. One may agree with the belief that geography of demographic asymmetries overlaps with the geography of developmental disproportions (Tabor, 2000, p. 265). The ageing societies of developed countries and often a low or negative birth rate also cause demand for labour. Thus, these countries often conduct a well-thought out migration policy in his regard the aim of which is to manage migration processes and use them in the development of a given country. In

these countries the supply of labour often depends on the inflow of immigrants (Matkowska, 2013, p. 77).

At the moment it is not known either what impact the pandemic caused by the SARS-CoV-2 virus will have on demography. It may significantly affect the demographic situation of many countries, but without a doubt it will influence the economic situation in the world.

Political factors still take a significant place among the factors of contemporary migrations - political upheavals, political instability of certain countries established after WWII, armed conflicts. Causes of emigration also include discrimination and persecution of national minorities, for political and religious reasons and due to sexual orientation and others. The causes for a decision to change one's place of residence also include reasons associated with limitation of fundamental human rights.

The data from the United Nations High Commissioner for Refugees demonstrates that in 2018 more than 70 million people were forced to leave their place of residence and in 2009 this number was over 43 million (UNHCR, 2018, p. 4).

It also needs to be noted that the choice of a place of residence may be done after personal experience with the migrant's lack of acceptance of the political system.

When presenting determinants of contemporary migrations one cannot omit the factor associated with negative changes in the natural environment. Vast numbers of people leave their places of residence due to degradation of the natural environment and a change in its conditions or climate. Many world regions due to i.a. lack of water, water pollution, desert terrains or degradation of farmlands due to excessive exploitation or deforestation are not fit for human habitation. It is assumed that if a given country has less than 1,000 cubic meters of water per person throughout the year it suffers water shortages, which severely hampers economic development and negatively affects human health (Przyszłość, 1999, p. 53). In 1990 20 countries were is such a position, whereas in 2025 they are to reach 30 (Przyszłość, 1999, p. 53).

It is worth noting that the concept of "climate migrants" was first used in the 1980s in reference to people forced to leave their natural place of residence due to such changes to the natural environment which led to a threat to their life and health (Groszkowska, 2019, p. 241-242).

The issues concerning the impact of climate changes on the phenomenon of migrations were subject of interest of the Intergovernmental Panel on Climate Change (IPCC) under the United Nations, which in 2007 published a report (IPCC, 2007) where it was pointed out that climate changes will proceed ever more quickly and in consequence the number of people exposed to extreme weather phenomena, rising sea and ocean levels and other climatic threats will rise, which in turn will bring about a growth in migration (Groszkowska, 2019, p. 242).

In the 2004 IPCC report (IPCC, 2014) a distinction was made between two types migrations associated with climate change, namely: 1. caused by extreme weather events (their frequency will increase with the occurring climate changes) and 2. caused by long-term changes in the natural environment, such as rising sea levels which will flood little island states and will force residents to resettle. The report from the UN High Commissioner for Human Rights (HRC, 2018) also refers to this division, where it classifies events into sudden onset events (hurricanes, storms, and flooding) and slow onset events (sea level rise, increasing temperatures, ocean acidification, glacial retreat, salinization, land and forest degradation, loss of biodiversity, and desertification). This division was also upheld in a 2019 document adopted by way of intergovernmental negotiations drawn up under the auspices of the UN entitled Global Compact for Safe, Orderly and Regular Migration (United Nations General Assembly, 2019).

These events were explained in the document Slow onset events – Technical paper (FCCC, 2012). The first ones ("rapid onset events") include single, discrete events that occur in a matter of days or

even hours. Whereas the other ones ("slow onset events") evolve gradually from incremental changes occurring over many years or from an increased frequency or intensity of recurring events.

One also needs to take into consideration that the impact of environmental factors on people's mobility is undoubtedly a complex phenomenon and often occurs in relation to social, economic or political factors (Groszkowska, 2019, p. 242).

To sum up, one can conclude that contemporary migrations are determined by numerous political, cultural, social, economic factors and those associated with the degradation of man's natural environment. Individual reasons for migrations permeate increasingly, especially that they are strictly interrelated, which is why it is often difficult to classify unequivocally a specific reason for a given movement of people. Without a doubt, the most severe effects causing migrations will still be brought about by the rising disproportion in the social and economic development of the world's countries and emerging conflicts in the world or by the factors of man's natural environment, which in the long run may lead to the disappearance from the world map of some island states. At the moment it is impossible to fully understand the conditions and changes occurring in individual countries and regions without reference to the global context. The existing interrelations of the impact of participants of the global system of international relations are a consequence of the common occurrence of processes of internationalization of various spheres of social life. Today it is also impossible to predict the impact of the pandemic caused by the SARS-CoV-2 virus. It will gravely influence the social and economic situation of countries and may bring about an increased demand of developed countries for highly-qualified labour force, which in turn may contribute to the ample one-way migration flow of highly-qualified staff and to the "draining" of poorer countries of the most valuable factor of development that is human resources, especially highly-qualified staff.

In the course of research, the assumed hypothesis was verified positively concluding that we are increasingly dealing with the fact that individual factors determining the movement of people permeate, which affects the impossibility of clear indication of its specific cause.

Abstract

Amid radical changes in the management systems of industrial corporate entities over the past 15 to 20 years, personnel management has undergone significant modernization. Human resources management is being transformed into human resources management. This transformation of personnel management has found expression in the following main trends: over the past few years, there has been a relative and absolute increase in the number of personnel management personnel (in the departments: personnel, development, training and certification of personnel, labor and wages, social development) and advanced training of others categories of employees. In this regard, in order to increase the effectiveness of the personnel management system, a classification of labor management strategies for industrial enterprises in relation to their production program is proposed, the implementation of which, taking into account the influence of external and internal factors, can significantly reduce the cost of implementing the production program due to its balance with labor resources enterprises. A game model has been developed to determine the optimal number of personnel aimed at continuing education, in which the minimization of losses associated with the fact that the level of qualification of specialists does not increase and the cost of training specialists with appropriate restrictions is the objective function. The problem in the proposed formulation is the problem of resource allocation and can be solved by applying game models. The practical significance of this model from the point of view of improving the level of quality of planning for improving the qualifications of industrial enterprises employees is confirmed by the results of its implementation at the St. Petersburg enterprise of the fuel and energy complex of the Russian Federation. In this regard, the article devoted to the improvement of professional development of industrial corporate education personnel, as applied to the strategy of structural and factor support of the company through the use of game models to determine the number of personnel allocated for further training, is relevant and timely.

Keywords: Industrial Corporation; Personnel Management; Game Model; Strategy.

Introduction

Personnel management is considered as interrelated organizationally-economic and social measures system on conditions creation for normal functioning, developing and effective using firm personnel potential. Most important personnel management system elements are personnel policy and personnel strategies. Personnel policy Personnel policy is the system of aims, principles and determined by them forms and methods, rules, norms and criteria of work with personnel, set in firm and corresponding to business strategy. Personnel policy aim is providing optimal needed personnel quantify & qualify content renewal, keep and development processes balance according to business needs. Personnel strategy is the set of basic principles, rules and aims of work with personnel taking into account business strategy, organizational structure, personnel potential and personnel policy. Personnel strategy or personnel management strategy is based on personnel policy and firm development strategy and is long-term.

Personnel management strategy elaboration consists in determining basic acts destinations, resources, time parameters, measures complex on chosen firm aim realization. In set assumption, effective firm HRM in its base must be executed on some principles, elaborated by science and tested with practice, main of which are: setting link of current and perspective planning for making future labor potential condition the result of aimed development, coordinated with changes in technic production basis; achieving maximal fitting labor force characteristics to requirements of production and market.

Rising corporative activity effectiveness requires personnel management strategies classification, interlinked with its production program (Figure 1).

Figure 1: Labor resources strategies classification, interlinked with production program

The article considers improving planning industrial corporation personnel qualification improvement for basic strategy – structure-factor providing with game models for determining optimal personnel number for qualification improvement.

Literature Review

In modern economic conditions, the selection and implementation of an organizational strategy for structural changes in corporate entities, on which the development of a strategy for managing personnel in corporate education is based, involves assessing the existing type of organizational structure. There are various types of organizational structures. In modern management theory, there are two types of organization management - bureaucratic and organic.

Currently, in conditions of ever-increasing dynamism of the external environment, fierce competition, customer orientation, the transition to flexible organic structures, the method of which is reengineering of business processes, is relevant (Morgunov (2000); Ivanov (2000); Dobrokhotova and Kukushkin. (2000)). The issues of business process reengineering are the subject of works (Ilin et al (2017), Ilin and Shirokova (2018)). These works examine in detail not only new terms of the process management of the holding, but also developed various technologies for reengineering business processes, evaluating the effectiveness of process management. A large area of research is the development of business process management reengineering software, which makes it easier to apply the mechanism of business process reengineering (Ilin et al (2017); Ilin and Shirokova (2018); Ilin et al (2019); Ilin et al (2019); Sokolitsyn et al (2017)).

According to O. Cheremnykh, the transition to a process management structure, in which the organizational structure of the company consists of a set of business processes and sub-processes that "produce" clearly defined "internal products" for specific internal and external consumers, is accompanied by optimization (reengineering) of key business processes, is the most important component of a qualitative increase in the efficiency of business management (Cheremnykh (2019)).

The structure of business processes at different enterprises may vary. It is advisable to create an enlarged diagram of business processes for enterprises of one industry, however, an accurate list of business processes, and especially subprocesses, can be formulated only at a particular enterprise. The list of business processes should be approved and documented in each organization (Ilin et al (2017); Ilin and Shirokova (2018); Ilin et al (2019); Ilin et al (2019); Sokolitsyn et al (2017), Klochkova et al (2017), Trostinskaia et al (2017), Shirokova and Naidenysheva (2017), Zemlinskaya and Fersman (2017).

In domestic and foreign literature, the approach to personnel management as a business process is extremely rare, the consideration ends with the wording of this process. So, Orlova et al (2019) by staff reengineering refers to the restructuring of management. In a number of articles on business process reengineering, human resources management is reflected in some business processes (Oksana et al (2019); Ilin et al (2019)).

Process-oriented personnel management is fuller considered only in a few works. So, the International Benchmarking Chamber has proposed a list of 13 business processes of the organization, one of which is "Human Resource Management".

The consultants of the Tengry Group consulting group (The Tengry group (2019)) identify the business process of preparing, training and certification of personnel as auxiliary, but exclude it for organizations of less than 300-400 people. However, there are personnel management at such enterprises, even if the personnel processes are not carried out by personnel management personnel, but by direct managers.

D. Khlebnikov identifies the business process "Reproduction of competencies" - all types of activities related to providing the business system with the necessary competencies (knowledge, experience, skills) and their carriers (personnel). The main result of the process is personnel with the necessary level of competencies (Khlebnikov (2017)). In our opinion, the result of the personnel management business process is correctly defined, but clients, the input of the business process are not considered, and the content is considered very superficially.

The content (subprocesses and functions) of the business process "Staffing" offers (Velieva and Dudyashova (2014)) as one of the subprocesses of the business process "Development of production capabilities", namely:

- development and management of strategies in the field of human resources (determination of costs, determination of personnel requirements, analysis and development of functions, determination of results and indicators, determination of areas of responsibility);

- management of staff reception (planning and forecasting staff requirements, career planning, search, selection and hiring, team building, reorganization, reduction, dismissal of staff);

-development and training (qualification management, development of training programs, career guidance, development of areas of responsibility of management teams);

- productivity management, moral and material incentives (determination of performance indicators, development of a constant and variable part of wages, management of material and moral incentive programs);

- ensuring the health and satisfaction of staff (development of support systems for work and family, ensuring staff satisfaction).

But, despite the full list of functions for working with personnel, the activities of the personnel service are considered solely from the point of view of the full transition of the organization to process management.

The concept of personnel processes is most accurately given in (Anisimova et al (2014). It groups all personnel management functions into 4 main subprocesses: 1. personnel selection; 2. staff career management; 3. monetary staff career management; 4. personal career management of staff In our opinion, this author has further advanced in building a personnel management system based on a process approach, the design feature of which is "... the allocation of a single management function is previously fragmented manpower flows and management processes, integration of individual units Personnel Management Service and functional subdivisions of businesses into a single enterprise management system''. Further, in this paper we propose specific methodologies for the implementation of HR processes.

However, in our opinion, this approach should be finalized in terms of focusing the HR process on the client (or clients), as well as more clearly reflect the relationship of the HR strategy, on the basis of which HR processes are carried out, with the organization's business strategy. The list of personnel processes should also be supplemented by adding processes aimed at transforming the organization itself (working conditions). Thanks to this, they optimize personnel management activities (personnel management services or the process team for staffing), since emphasis is placed on the relevance at the moment for the current organization of personnel processes. Molchanov (2016) considers personnel procedures as a mandatory process element of personnel management and breaks down personnel management into several groups of business processes: 1. business processes for hiring personnel (selection and hiring processes, actually hiring, information support for hiring, that is, relevant checks and professional tests); 2. business processes of adaptation and consolidation of personnel (including processes of personnel motivation, conflict management); 3. business processes of internal movement of personnel (including advanced training); 4. business processes for the release of personnel.

A literature sources range considers effective personnel preparation as one of leading factors of successful contract system functioning. Thus they forms integral model of teaching purchase personnel (contract managers) taking into account such characteristics as professional experience and others. These articles analyze contract managers preparation methodic system specialties. This theme articles study results can be used as base for organizing personnel professional teaching and re-preparation, existing professional development programs optimization and innovative projects retaliation in these spheres. (Averina et al (2018)).

An articles range presents Russian education system potential researches results and ways to improve it for raising personnel preparation quality for digital economy. These researches authors answer such questions, as: 1) what qualification requirements are usable for labor resources; 2) which is Russian education system potential in personnel preparation for digital economy; 3) what are risks in Russian education system in learning digital economics. These articles conclusions backgrounds actuality of personnel preparation for digital economy (Mitrofanova et al (2018); Peshkova and Samarina (2018), Necheukhina et al (2017), Vinogradova et al (2017)), Iliashenko et al (2017)).

A researches range is devoted to need in teaching high schools employees to digital technologies for universities academic programs transfer on distant teaching. Authors use method of modeling for providing regional economic digitalization of Russian and foreign universities high education programs (Bolgova et al (2020), Rao et al (2018)), Goncharova and Bezdenezhnykh (2018), Andreyeva et al (2018), Konnikov et al (2018), Kuladzhi et al (2017)).

Some literary sources deal with continuing education courses for studying accounting information systems. So, the articles (Kogut et al (2020), Diaz-Fernandez et al (2017), Vinogradova et al (2017)) address the issues of accounting for human capital in the digital economy. In the accounting community, company personnel are recognized as an object of personnel records, but are not recognized as an object of accounting, cost accounting. In these works, it was concluded that the main areas of transformation, from the point of view of improving the theory of accounting and reporting in the digital economy, are the following areas of the economy: manufacturing, financial services, education, healthcare and the media.

In many cases, the application of analytical methods to solve the task of managing labor resources is impossible due to the need to take into account the complex interactions of many variables that affect the final result. In such situations, it seems appropriate to use mathematical modeling models. So, for example, considerable attention was paid to the study of the problems of the distribution of work among performers in the scientific literature, and especially in the framework of the economically-mathematical field. There are various approaches to the implementation of these tasks, we will combine them in three areas: transport-type models; game theory models, sequential models, and simulation models (Sokolitsyn et al (2016); Sokolitsyn et al (2017); Sokolitsyn et al (2016), Ilin et al (2018), Valebnikova et al (2018), Glukhov and Vasetskaya (2017)).

Research Methodology

A recent study of the personnel experience of a number of industrial corporate entities in St. Petersburg has shown that one of the unresolved issues of improving the training and professional development of specialists and managers is planning the number of employees to be trained at corporate entities.

Currently, staff development planning is carried out as follows. Industrial corporate entities conduct research to determine the number of specialists and managers to be trained. The following main types of continuing education courses are carried out in them: training of managers, advanced training of specialists and managers. The number of students for each year is determined on the basis of the need for each employee to undergo advanced training in accordance with the requirements established by the leadership of the corporate company and the influence of the external environment, that is, an approximate percentage of the total number of middle and senior level employees.

With the current planning procedure, there are a number of disadvantages. Firstly, there is a situation where the implementation of the plan is often ensured by training employees who has no especial value for the corporate firm, while others do not upgrade their skills at all.

Secondly, the requirement to undergo advanced training by an appropriate employee, as practice shows, is not always feasible, for several reasons. So, for example, it is inappropriate to send specialists who retire after 1 - 2 years. In addition, employees subject to training in the planning period may quit or become ill by the time they receive training. All this leads to emergency situations when a candidate is urgently selected for referral to the appropriate training center.

The elimination of these shortcomings can be facilitated by the introduction of a coefficient when planning advanced training for employees at a company, which provides for the establishment of a certain percentage of employees in the total number of corporate education personnel.

To determine such a coefficient, it is necessary to calculate the optimal number of specialists and managers to be trained, based on the criterion of economic feasibility in conditions of uncertainty. Uncertainty means the possibility or impossibility (due to the above reasons) of sending an employee to training.

The indicated problem for a specific corporate structure boils down to solving the problem of determining the optimal number of workers in certain categories sent for training from corporate education units.

It is proposed to build an economic and mathematical model for solving the problem as a result of the existing strategic uncertainty as a model game for the designer against "nature", where "nature" is understood as a certain time fund (person × h) intended for advanced training.

As a criterion for the optimality of the solution of the problem, the minimum cost sum S, rub.

$$S = S_1 + S_2, \tag{1}$$

where S_1 - losses associated with the fact that the level of qualification of specialists does not increase, rub .; S_2 - the cost of training specialists, rub.

$$S_1 = \sum_{j=1}^{m}\sum_{k=1}^{n} C_k \max(y_{jk} - x_{jk} a_k ; 0), \tag{2}$$

where m is the number of units whose specialists are sent for training (j = 1, 2 ... m); n is the number of types of training (k = 1.2 ... n); a_k - the duration of the k-th type of training, h; C_k – average losses caused by the employee's refusal to train, rub.

The strategy of the second player (designer) is the choice of x_{jk} - the number of personnel from the j-th unit sent to the k-th type of training, determined under the restrictions:

$$x_{jk} \quad - \quad \text{whole numbers;} \tag{3}$$

$$\sum_{k=1}^{n} x_{jk} \le \mathrm{P_j}\,\mathrm{N_j} \qquad (\mathrm{j}=1,2,...,\mathrm{m}), \tag{4}$$

where Nj is the number of people in the j - th unit, P_j is the maximum possible value of the coefficient for determining the number of employees requiring advanced training, from the number of personnel in the j th unit of corporate structure.

The strategies of "nature" (I player) is the choice of the possible number of man-hours for training specialists from the j-th unit on the k-th type of training with restrictions

$$d_k \le \sum_{j=1}^{m} y_{jk} \le \mathrm{r_k}, \tag{5}$$

$$\sum_{j=1}^{m}\sum_{k=1}^{n} C_k \le \mathrm{T}, \tag{6}$$

here T is the time fund intended for training specialists, person / h; d_k - the minimum necessary time, person / h, provided for the training of specialists in the k-th form; r_k - the maximum allowable time provided for training specialists in the k- th form

$$S_2 = \sum_{j=1}^{m}\sum_{k=1}^{n} C'_k \, x_{jk} \, . \, a_k \, , \tag{7}$$

where C'_k – average costs associated with training of the k-th form, rub./h

Formula (1) can be rewritten in this form

$$S = \sum_{j=1}^{m}\sum_{k=1}^{n} C_k \max(y_{jk} - x_{jk} a_k \, ; 0) + C'_k x_{jk} a_k \, , \tag{8}$$

The task of determining the optimal number of workers in certain categories sent to training from specific departments is the task of allocating resources and can be solved by the method of distributing resources of several types between several sections, that is, by applying game models.

Practical Results

The calculated optimal number of personnel aimed at continuing education through the use of game models to increase the effectiveness of the implementation of the structural factor factor strategy for a number of St. Petersburg enterprises that are part of industrial corporate entities. So, for example, a calculation was made for a medium-sized enterprise LLC Gazstroymashina, which is currently one of the leaders in the development and manufacture of various equipment for enterprises of the fuel and energy complex of the Russian Federation. Its main partners are such well-known enterprises as Gazprom, Mosenergo, Stroytrangaz and others.

Unfortunately, all the calculation results for the proposed model for this enterprise cannot be presented. Therefore, the article presents only the basic calculations.

So in 2018, according to the results of calculations based on the developed model, nine employees were sent instead of the previously planned twelve employees from various departments of the enterprise. In addition, training costs decreased by 38 thousand rubles this year, and according to expert estimates of employees of the enterprise as a result of advanced training of these nine employees, revenue growth in 2019 will be approximately 1.2%.

In addition, the presented model for personnel development can be applied in the practice of personnel management of firms in various sectors of the national economy.

Limitation

Currently, in conditions of a high level of uncertainty in the development of the Russian economy, it is quite difficult for firms based on demand for their products to form a portfolio of orders on a long-term and medium-term basis, which makes it difficult to determine the needs of personnel capable of ensuring the implementation of the production program, balanced with minimal losses.

In addition, a certain deficit for some categories of personnel leads to an increase in the cost of its use with a rather low solvency of many firms.

Significance of research

Ensuring a balanced production program and labor resources has at least two goals. The first is to achieve structural balance.

It involves optimizing the number and structure of the main production staff (categories of professions and their qualifications) in relation to a given (fixed), annual production program.

The second goal is to ensure factor balance. It involves the optimization of the production program for a given (fixed) number of key production personnel.

Thus, as a recommendation, it is necessary to more detally and thoroughly refine the set of strategies that form the strategy of structural-factor balance of the development of the company, the implementation of which will reduce the cost of the production program and will increase the competitiveness and financial stability of industrial corporate entities.

Results

The article presents a classification of basic strategies to ensure the balance of the production program and labor resources. A game model is proposed for determining the optimal number of personnel aimed at continuing education, the implementation of which can significantly improve the quality of staff development planning at an industrial enterprise by improving the balance of enterprise personnel with the implementation of its development strategy, which is confirmed by the results of the implementation of this model at St. Petersburg an enterprise of the fuel and energy complex of the Russian Federation.

Abstract

Industry development on integration concept base is closely concerned with enterprises dissatisfactory condition and low activity resultatives in modern Russian economy. Such condition causes include two basic ones: misbalance of the majority of internal enterprises structures and disharmony of their relations with external counteragents. But sufficient specific of functioning industrial corporations in their integration development concept framework and with need in continuous adaptation to market environment conjuncture is coordinating principally several on destination and affect power market subject's interests. Particularly, government institutions are interested in sustainable functioning and developing big industrial enterprises, which ensures high economic growth, employment, regular inflows to budget. Sociologic services interests are in sphere of public progress from industrial enterprises activity, which must take into account each public member interests, while ecologists suggest entrepreneurs save resources and minimize damage to environment. The article inquires base corporation sustainable development strategy components taking into account specific Russian market relations conditions and suggests methodic aspects on their sustainable development level climb. The inquiry practice sufficiency consists in possibility to use considered methodic aspects on Russian corporation development sustainability rise not only in industry, but also in other national economy spheres. Thus, article on problems of forming and developing industrial corporations' strategic sustainability considers methodic aspects, concerned with efforts concentration on basic strategic sustainability components, which realization will allow rising their strategic sustainability level with more effective presenting resources usage in market economy uncertainty.

Keywords: Strategic Sustainability; Components; Industrial Corporation; Development; Inquiry; Management.

Introduction

Industry is developed countries economy base; its effective functioning makes key impact on their socially-economic development. Hardly predictable Russian economy market conditions and enough hard world economy condition more and more sharpen industrial enterprises strategic development issues. In order to ensure and keep sustainability of functioning, contradict crisis situations, get more adaptively and maneuverability, industrial enterprises use integration and cooperation instruments. CEOs more and more prefer collaboration in market segments entry and control, joint cumulated knowledges and resources usage, forming corporations, which, concentrating sufficient gross national product part in their assets can economically control not only singular industries and sectors, but also all national economy, which makes them economic power centers. In Russia industrial corporations, with aimed governmental support, also can become most effective form of organizing production, which will ensure organic financial and industrial capital relationship, helping progressive changes in Russian economy and oriented on export growth.

Such wide problems ring, concerned with industrial economy sector enterprises corporatization, ensuring and supporting their sustainability in strategic perspective, determines this inquiry actuality.

Problems actuality and not enough study in inquired sphere their high sufficiency for Russian industrial enterprises determine this inquiry theme choice.

Literature Review

In modern household conditions sustainability problems are first for many real economy sector household subjects. Big industrial enterprises and their integrated unions have sufficiently more opportunities to adopt unfavorable environment changes with both internal resources and borrowing loan sources.

Let's consider several "sustainability" economic category traction variants. Enterprise sustainability, according to Diaz-Fernandez et al (2017); Ilin et al (2017); Ilin et al (2018); Ilin et al (2019); . there is enterprise financial condition, when household activity ensure in normal conditions executing all liabilities to employees, other organizations, government, due to enough incomes and their fit to outcomes. According to Kogut et al. (2020); Orlova et al. (2018); Peshkova et al. (2018); economic sustainability is complex household subject characteristic for some time period, reflecting ability to support key financial, marketing, production and personnel figures with high probability at normatively set level with external and internal affects.

There are three sustainability kinds (Rao et al. (2018); Sokolitsyn et al. (2013); Sokolitsyn et al. (2016)) external (achieved with external management, i. e. governance and objective environment factors (market, geographic etc.) impact); internal – determined with in-time and economic reacting environment affects and adaptation to new conditions; heritage – based on forming, keeping and developing internal enterprise opportunities and resources, which usage allows keeping sustainable condition. "Sustainability is whole system characteristic, not reduced to its single elements. Some systems can form stable super-system with one link kind and unstable with another, despite stable or unstable behavior of its particular parts" (Sokolitsyn et al. (2016); Sokolitsyn et al. (2017)); Glukhov et al. (2018); Ilyinsky et al. (2019); Orlova et al. (2018); Kozlov et al. (2018); Borremans et al. (2017); Zaychenko et al. (2017); Lisitsa et al. (2019)).

However in some cases sustainability is unfavorable sequence of system inert and sufficiently restricts its management possibilities (Sokolitsyn et al. (2017); Rudskaia and Rodionov (2019); Turan et al. (2020); Zhilenkova et al. (2019)). Because, from one hand, sustainable system condition is base for its parameters and processes prediction on perspective, which is favorable factor for development strategy elaboration, from other hand – for manageability, sustainability (constancy) makes some processes and phenomena low manageable (Camocho et al (2019); Borkovskaya et al (2020), Ilin et al (2019); Bagaeva et al (2019); Ilin et al (2018)).

Thus, sustainability, and especially strategic in economic literature is perceived ambivalently, because issues of sustainable functioning and developing household subjects are interdisciplinary, i. e. considered by a range of sciences.

Research Methodology

Industrial corporations, compare to middle and small business, have advantage of sufficiently higher production-household activity effectiveness because of production scales and activity diversification. It impacts sale market, making complex R&D, entering innovations, high-qualified personnel invitation. Thus, big integrated industrial unions have sufficiently more opportunities to adopt unfavorable environment changes with both internal resources (for example, goods, works, services diversification; widening market links; assets structure optimization) and borrowing loan sources. But such system development prediction, especially in long-term perspective, becomes harder. Also more sufficient task for integrated industrial firms is achieving and keeping all system sustainability. It is caused by that corporative forms development as stochastic process can depend on each external environment factor that called "butterfly effect", which result can be both positive and negative. And

big industrial corporations sufficiently harder do strategic changes. But with effective their internal resources adaptation and functional links transfer, industrial corporations can develop ability to continuous auto-renewal and keep sustainable position. And in modern market conditions for these organizations problem of achieving and keeping strategic sustainability gets especial sufficiency, because complexing their organizing, interlinks and interdependence causes actuality of ensuring all integrated system sustainability.

Industrial organizations strategic sustainability and development requires keeping organization and its interlinks with internal conditions of functioning and factors, determining external environment changes. Corporative industrial firm strategic sustainability support requires continuous monitoring and analyzing internal and external impacts on all production-household system effectiveness, and also in-time reacting affects, including with adaptation to household conditions.

Industrial corporations' strategic sustainability term in long-term aspect includes strategic dynamic organization development, achieved in strategic management process for the following sustainable development components:

- financial-investment sustainability;
- product competitiveness;
- organization activity diversification;
- development complexity;
- organizationally-production flexibility;
- innovation activity.

In managerial decisions elaboration and realization in forming strategic sustainability one of main tasks is creating strategic competitive advantages, i. e. new opportunities, and also risks distribution between particular business-units for strengthening positions in competitive fight both these business-units and whole integrated organization.

The article inquires base corporation sustainable development strategy components taking into account specific Russian market relations conditions and suggests methodic aspects on their sustainable development level climb.

Thus effective managerial decisions elaboration in forming industrial corporation strategic sustainability and its level rise (figure 1) requires efforts concentration on the following three basic strategic sustainability components:

- ensuring at set branch-average level or at rivals level basic figures, assessing organization strategic sustainability level, i. e. economic sustainability level rise;
- social and ecologic responsibility level rise;
- rising relationship level and effectiveness of governmental and municipal bodies with business.

The considered main types of corporate education activities are interconnected and interdependent, the level of development of each type of activity has its effect on the overall economic sustainability of education, especially in the long term.

The increase in the level of sustainability of the financial and investment type of corporate education activity and its efficiency is characterized by an improvement in the state of financial resources so that education, through their effective use, can provide the specified process for production and sales of products, as well as effectively invest them in projects aimed at diversifying the activities of education.

An increase in the level of sustainability of commercial activity and its effectiveness is characterized by an improvement in the state of business activity, the reliability of economic relations and market share for its products.

Improving the sustainability of marketing and its effectiveness is characterized by an improvement in the market for manufactured products and the use of the market potential of corporate education.
The increase in the level of sustainability of production activities and its effectiveness is characterized by the stability of the production cycle, the smoothness of its resource and technological support.

Figure 1: Basic components of forming and developing industrial corporation strategic sustainability

Improving the sustainability of organizational design and its effectiveness is characterized by an improvement in the management structure, a higher degree of coordination and adaptability of relations between different departments of corporate education, taking into account the impact of the external environment.

An increase in the level of sustainability of personnel management and its effectiveness is characterized by an improvement in the provision of production by qualified personnel and its involvement in social processes.

Improving the sustainability of investment activity and its effectiveness is characterized by a greater ability of corporate education to introduce new technologies and methods of organizing production and management.

Thus, the formation and development of strategic sustainability of industrial corporate education occurs by managing the main activities taking into account the interests of society and the state. Their

optimal, balanced combination, in turn, is converted into economic potential, that is, the ability to ensure their long-term functioning through the achievement of strategic goals and the implementation of the strategy, which is the key to the strategic sustainability of industrial corporate education with dynamic development.

Practical Results

The main scientific and practical provisions relating to the formation and development of strategic sustainability of industrial corporate education can be used in the production and economic activities of both enterprises included in corporate education, and for it as a whole, as well as further research in this area.

The inquiry practice sufficiency consists in possibility to use considered methodic aspects on Russian corporation development sustainability rise not only in industry, but also in other national economy spheres.

Limitation

Despite numerous publications on the topic of sustainable development and the development of socio-economic systems, there is still no consensus on what a “sustainable corporation” should be.

One reason for this situation is the comprehensiveness of the concept. Most scientists look at sustainability issues from various perspectives: economists emphasize maintaining high economic growth and employment; sociologists focus on social progress, which would take into account the needs of each member of society, while ecologists are trying to reduce the damage to the environment of the planet.

Thus, one of the biggest difficulties in the formation and development of strategic sustainability of industrial corporate education is its comprehensiveness.

Significance of Research

As a result of the study, it was shown that the implementation of the strategic sustainability of an industrial corporation allows balancing the state of material and financial resources of the corporation, the optimal combination and rational use of which ensures its ability to develop, maintain and maintain the necessary conditions for development, combined with the interests of society and state institutions, strategic goals and long-term competitive advantage.

Conclusions and Recommendation

As a result of the research carried out in the article, it was found that the adaptation of industrial corporate enterprises to modern business conditions is the basis of its strategic stability and consists in preventing and eliminating the destabilizing effects of environmental and internal factors, which makes it impossible to achieve a given level of system economic efficiency. It is also important to note that for an industrial enterprise of a corporate form, when forming a set of factors of strategic sustainability, the influence of such global factors as social responsibility and environmental safety of activities increases. Therefore, when developing scenarios for the development of the external environment, it is mandatory to take into account environmental and social risks, which have become part of the system of managerial risks along with commercial and investment ones.

Configuration of Selected Competencies of International Managers in Knowledge Transfer

Aurelia DOMARADZKA

Wroclaw University of Economics and Business, Poland
aurelia.domaradzka@ue.wroc.pl

Abstract

The purpose of the article is to identify the configuration of competencies and acquisition of HRM qualifications by the management / HR managers and a way to transfer knowledge in the field of HR management between the headquarters and the local unit. This purpose was achieved by means of empirical research through correlation analysis. Verification of hypotheses led to the conclusion that the method of acquiring competences of the managerial staff and the method of acquiring qualifications is conducive to the level of knowledge transfer in the field of HRM between the headquarters and the local unit

Keywords: Competencies, Human Resource Management, Knowledge Transfer

Introduction

The subject of the article are the competencies of the managerial staff and the method of acquiring qualifications in the field of human resources management (HRM). The research studies their impact on the method of knowledge transfer in international organizations[1]. This problem seems extremely interesting in the light of the growing interest in knowledge transfer, knowledge sharing or knowledge exchange, but it is not considered in the area of human resource management and in relation to international companies. Knowledge transfer in international companies is more complicated due to the location of units in different countries (see Stor, 2018). In this context, the primary purpose of the article is to identify the configurations of key competencies and acquisition of HR qualifications by the management / HR managers and a method of transferring knowledge in the field of human resource management between the headquarters and the local unit. Therefore, at the beginning of this article the author explains the subject of interest and the purpose of the work. Then, the main theoretical and terminological assumptions are presented. Further on, the methodology used in these studies and the results of research are discussed. Finally, summary and conclusions are formulated.

Competencies of the managerial staff in the area of HR Management

The constantly evolving role of the human factor in organization management requires continuous development and strict assignment of functions to managerial positions (Quinn, Faerman and Thompson, 2007). The HR function is also the most dynamic function of the company, which has been evident in recent decades (Wiernek, 2006). Recognizing the role and importance of managerial staff in human resource management, which is supposed to support organizations in achieving goals, strategies and tasks, and thus, in achieving success and competitive market position (Stor and Suchodoslki, 2016), allows to assume that an effective supervisor anticipates problems and manages risk properly (Juchnowicz and Kinowska, 2018). The biggest challenge for companies is to recruit people with great potential who have the chance to become valuable employees with high level of performance(Sulich, 2015). Therefore, top management representatives, as well as other key people

[1] For stylistic reasons, the term international company is used interchangeably with the concepts of corporation and international organization, and is understood as an entity that owns and controls assets in at least two countries. It consists of the headquarters of the parent corporation / corporate headquarters and foreign subsidiaries [Stor M. 2011, p. 42; Schroeder 2000, p. 13; Purgal-Popiela J. 2017, p. 47]

for the organization, have a decisive influence on the formation of dominant adaptive behaviors throughout the organization (Barabasz and Bełz, 2017). This role is certainly more difficult in the case of international companies, in which, in addition to knowledge of various HR tools and processes, one must also demonstrate knowledge of the country's culture, market environment and employee mindset (Raczek, 2016). As numerous studies show, the elements that compose managerial qualifications can be strongly influenced by national culture and, therefore, their assessment may be different in each country (Stor, 2008). Therefore, a modern employee of the HR department should have extensive knowledge and competencies, enabling them to perform an advisory and supportive role for management boards in making strategic decisions affecting the global functioning of the company (Raczek, 2016). Managerial staff in order to support key processes of creating, sharing and disseminating knowledge should have appropriate managerial competencies. M. Stor points out that the success of modern international managers depends on their own qualifications[2], which must be constantly developed, and the competences that they get in recognition of these qualifications (Stor, 2010). Therefore, the competency structure consists of psychological features, knowledge and skills (Stor, 2008). The article adopts the definition proposed by M. Stor, who believes that competencies are: skill, knowledge, personal characteristics and behaviors needed to effectively play the role/perform work in a given organization, and support the enterprise in achieving its strategic goals (Kupczyk and Stor, 2017)

The importance of knowledge transfer in international companies

Today, knowledge is shared between geographically dispersed individuals and organizations, and across cultural and national borders. Therefore, understanding how knowledge can be transferred from one entity to another is extremely important. Effective completion of knowledge transfer, which is one of the most important stages of knowledge management, is considered laborious and time-consuming (Duan, Nie and Coakes, 2010). The concept of knowledge transfer has not been clearly defined, without going into deeper discussion the article adopts the definition of knowledge transfer proposed by J. Purgał-Popiela. According to this definition, knowledge transfer concerns dynamic processes in which there is a flow of knowledge between parties involved in the transfer (transmission) and acceptance (absorption) of knowledge and which lead to changes in the original state of knowledge of the participants of these interactions (Purgal-Popiela, 2017). Managers must adapt traditional human resource management practices to accelerate and create knowledge within the company (Kianto, Sáenz and Arambura, 2017). Human resource management (HRM) contributes to innovation by increasing the organization's knowledge base and stimulating knowledge creation(Duan, Nie and Coakes, 2010). The transfer of knowledge in international companies is associated with using existing resources and capabilities in the new location or with the intention to acquire valuable knowledge available there, which in both cases depends on their successful transfer (Purgal-Popiela, 2017). M. Kuzel, based on the results of the conducted research, expressed the fear that especially systems of reverse transfer of knowledge and skills may be ineffective (Kuzel, 2013), there is no knowledge about the way in which organizations learn from their environment (Sharma and Lenka, 2019). While the transfer of knowledge encounters certain obstacles, international organizations face additional challenges due to cultural, political, economic and geographical differences (language, climate) (see, among others, Schlegelmilch and Chini, 2002; Duan, Nie and Coakes, 2010). A foreign subsidiary must comply with local laws, local culture and other environmental conditions that affect people and organization management, which becomes a challenge for multinational corporations that for their part would like to manage a subsidiary in the host country based on human resource management policies and practices in the country of origin (Oppong, 2018).

---

[2] In the literature, the terms competencies and qualifications are often used interchangeably (see, among others, T. Oleksy, 2006; Jabłoński M., 2011). To clarify: *competency is a potential ability to function in a given situation or under certain conditions and is associated rather with formal documentation of knowledge, skills, experience or certain psychological features (Stor M, Kupczyk T p. 21).*

Table 1 Correlation between the key competencies of the managerial staff and the method of acquiring qualifications in HRM, and the method of knowledge transfer in the field of HRM between the headquarters and the local unit

Source: results of own empirical research

Methodology of conducted empirical research and obtained results of empirical research.

This article presents the results of surveys carried out in 2019. 50 international companies with at least one unit in Poland constituted the population of the examined organizations. As a result of the study, the country of origin / seat of the parent corporation (Corporate Headquarters) was determined: Austria - 2, Belgium - 1, Czech Republic - 1, Finland - 1, France - 5, Spain - 2, India - 1, South Korea - 2, Germany - 15, Switzerland - 1, Sweden - 3, USA - 11, Great Britain - 4, Italy - 1. The research tool was a survey questionnaire. The questionnaire was addressed to the managerial staff / HR managers of the organizations surveyed. The main goal of the study was to determine the relationship between the key competencies of the managerial staff and the method of acquiring qualifications in the field of human resource management (HRM), and the method of knowledge transfer in the field of HRM between the headquarters and the local unit.

The article tries to to determine whether there is correlation between the key competencies of the managerial staff and the method of acquiring qualifications in HRM, and the method of knowledge transfer in the field of HRM between the headquarters and the local unit. Thus presented research goal allowed to formulate two research hypotheses:

H1: key competencies of HR managers influence the method of knowledge transfer in the field of HRM between the headquarters and the local unit

H2: the method of acquiring qualifications in the field of HR Management affects the method of knowledge transfer in the field of HRM between the headquarters and the local unit.

A nonparametric Spearman rank-order correlation was used for the analysis. The study of Spearman rank-order correlation was justified by the use of ranks (1-4) which are features of the Likert scale in the questions.

The results are collected in Table 1. and the commentary is narrowed to statistically significant correlations. Assuming that the relationship between variables is statistically significant at $p < 0.05$, it can be said that the greater the weight of knowledge transfer in the field of HRM:

- from the local unit (branch) to the Corporate Headquarters (parent unit), the greater the assessment of such a way of acquiring knowledge as informal learning in the HR department at the Corporate Headquarters ($r = 0.69$) and participation in HRM qualification programs organized by the Headquarters Corporations ($r = 0.68$), but the lower informal learning in the HR department of the examined local unit ($r = -0.04$);
- from the headquarters to the local unit, the greater the assessment of such a way of acquiring knowledge as informal learning in the HR department at the Corporate Headquarters ($r = 0.57$);
- inside the HR Department of the local unit, the greater the assessment of such a way of acquiring knowledge as informal learning in the HR department at the Corporate Headquarters ($r = 0.48$); and of competencies: using SIP ($r = 0.47$);
- between HR Department and the local unit, the greater the assessment of skills in the field of HRM ($r = 0.29$).

Conclusion

In the light of the research findings, it should be considered that the purpose of the article has been achieved. It was possible to determine the configuration of competencies of the managerial staff / HR managers due to the method of transferring knowledge in the field of HRM between the headquarters and the local unit. It was also possible to determine how important the method of acquiring qualifications in the field of HRM is due to the method of transferring knowledge in the field of HRM. The analysis of the results partly allows to determine that:

H1: key competencies of HR managers influence the method of knowledge transfer in the field of HRM between the headquarters and the local unit = hypothesis is rejected (no influence evidenced)

H2: the method of acquiring qualifications in the field of HR Management affects the way of knowledge transfer in the field of HRM between the headquarters and the local unit = hypothesis is confirmed (positive influence evidenced).

The verification of research hypotheses made it possible to formulate a general conclusion that the method of acquiring qualifications of managerial staff in the field of HRM in various ways can affect the method of transferring knowledge in the field of HRM.

However, the weak point of the research is the selection of a research sample. It is unknown what the results would be if the sample included, e.g. more Asian countries, so the research cannot be generalized to the entire population. Therefore, it is unknown whether the patterns sought would be ultimately extended by additional applications. Despite these limitations, the conducted research has a cognitive value and allows filling a certain research gap, especially in connection with the relations that appeared between the competencies of HR managers and the method of acquiring qualifications in the area of HRM and the transfer of knowledge in the field of HRM between the headquarters and the local unit

Managerial Competencies Management - A Practical Approach

Aleksandra MIKŁA

Wroclaw University of Economics and Business, Wrocław, Poland
aleksandra.mikla@ue.wroc.pl

Abstract

Employees are a key component of modern enterprises and the level of tasks performed depends on the state of their competence, which is measurably reflected in achieving the objectives set by the organization. The main goal of this article was to find an answer to the question concerning the possibility of achieving the company's objectives by means of effective and efficient management of employees' competencies. The result of theoretical research work is to adopt the following thesis: identification of employee competencies, and consequently reaching the competence gaps of the organization, causes that activities related to competence management may, in a measurable way, be reflected in the results and success of the company.
The thesis formulated in this way, in turn, contributed to the clarification of the empirical problem, namely: *What is the state of the managerial staff's competencies, crucial for the organization in terms of achieving the objectives?* The empirical research made use of the analysis of the available organizational documentation and questionnaires filled in by the management staff. This article focuses on the results of the empirical studies carried out, as well as an analytical review of the collected research data and conclusions and recommendations for the surveyed organization.

Keywords: competencies, competencies management

Introduction

The strategic links between competences and human resources management and business management are the foundation of competence management in an organization. The importance of competencies is evidenced by the fact that they shape the profile of the employee and enable him/her to perform the entrusted work effectively.

The interest in issues related to the competence of employees comes from the continuous growth of the importance of human resources in organizations. Employees are a key component of modern enterprises and the level of tasks performed depends on the state of their competence, which is measurably reflected in achieving the objectives set by the organization.

The main **goal** of the author of this article was to find an answer to the question concerning the possibility of **achieving the company's objectives** by means of **effective and efficient management of employees' competencies**.

The result of theoretical research work is to adopt the following **thesis**: identification of employee competencies, and consequently reaching the competence gaps of the organization, causes that activities related to competence management may, in a measurable way, be reflected in the results and success of the company.

The thesis formulated in this way, in turn, contributed to the clarification of the empirical problem, namely: *What is the state of the managerial staff's competencies, crucial for the organization in terms of achieving the objectives?*

In order to answer this question, it was necessary to take appropriate methodological actions related to empirical research. First of all, it was established that **the subject of the research** would be the diagnosis of the competence status of the management staff, in terms of key competencies. Next,

efforts were made to find an appropriate **research object**. As a result of the search, a local leader from the passenger transport industry was selected, who recently undertook actions aimed at improving the effectiveness and efficiency of the human resources management system.

The empirical research made use of the **analysis** of the available **organizational documentation** and **questionnaires** filled in by the management staff. This article focuses on the results of the empirical studies carried out, as well as an analytical review of the collected research data and conclusions and recommendations for the surveyed organization.

The terminological and conceptual assumptions adopted for competence management.

When conducting theoretical considerations on the employees' competencies management, it is difficult to find commonly accepted definitions of competence and competence management in the literature. A review of the literature on human resources management shows the vastness of definitions of competences, their diversity results from the scientific perspective adopted by a given researcher. Therefore, due to the practical orientation of this article, the terminological assumptions adopted will be presented below.

For the purpose of this work, it is understood that competencies are the skills, knowledge, personal qualities and behaviors required for the effective performance of the work assigned, inextricably linked to acting in a specific situation. Qualifications, on the other hand, are the potential ability to function under given conditions. Thus, qualifications make the employee capable of performing the tasks entrusted to him or her, and competencies determine that these tasks have been performed as expected. This means that before an employee has the expected competencies at the required level, he or she must first have a certain type and level of qualifications. Definition by M. Stor (2014).

Another theoretical issue to be addressed is the key competencies, meaning those which, due to the defined reasons, are most important for the organization, the job position or the employee himself. P. Drucker defines the key competencies of an organization in a precise and concise way as what a given company can do best. In relation to an employee, the term refers to the most important and distinctive personal qualities. It is also worth noting, that a very high level of key competencies and a lower level of other competencies of secondary importance is more beneficial for the organization than the average level of all expected competencies.

T. Oleksyn (2010) mentioned, that due to the importance of employees competencies for the organization, this issue will be further discussed in the next section. Employees are undoubtedly one of the key components of the organization and their competencies can be invaluable, this is also expressed in his statement by K. Obłój (2000), who claims that each company is ultimately the accumulated knowledge of past and present employees.

In both the literature and business practice of companies, competencies are discussed in connection with management. Bearing in mind, that competence in an organization is used for a specific purpose, it is important to understand what we mean when we compare the concepts of competences and management. T. Oleksyn (2010) reduces competence management to the basic functions of management, i.e. planning, organizing, directing (leadership) and controlling. However, he emphasizes, that management always has a practical dimension and should be goal-oriented, respecting the principles of rationality, economy, effort and ethics.

This short discussion about competencies, their importance and management, leads to the conclusion, that, depending on the specific needs of a company, its personnel management system and people themselves, competence management has many different applications. Objectives can be general or specific, they can be more business- or human capital-oriented, and they can be organizational or individual in nature. However, the main objective of competence management is to support and enable the company to succeed, achieve and maintain a competitive advantage and prepare the organization for changes and functioning in a turbulent environment.

Practice of Managing the Competences of Management Staff - Empirical Research

The literature studies carried out led to the general conclusion, that issues of employees' competencies relate to the strategy and functioning of the company as a whole. As a result, it was assumed, that the use of the term 'competencies management' is considered appropriate. Based on the theoretical research **a thesis** was also put forward, that the identification of employees' competencies, and consequently reaching the organization's competence gaps, causes that activities related to competence management may, in a measurable way, be reflected in the results and success of an enterprise.

Previous theoretical research has contributed to the formulation of the following **empirical problem**: *What is the state of the managerial staff's key competencies for the organization in terms of achieving the objectives.* **The subject of the empirical research** is a diagnosis of the current state of competence of the management staff in the area of key competences.

A Polish company, which is a leader among commercial carriers in the Lower Silesian Province, was selected as the **research object**. The audited company is a company that has been on the market for over 60 years, providing regular bus services throughout the country, as well as providing coach rental services in the country and abroad. The company declares that it transports around 3 million passengers during a year, covering over 9 million kilometers. It has 130 buses, coaches and tourist coaches in its rolling stock. The company declares its overall strategy as follows: strengthening its competitive position on the market and increasing its development potential. The cited policy shows that the company strives to improve its capabilities; this is also reflected in the company's activities.

The selection of the organization was intentional, because the activities of the new management board of the company, aimed at improving the effectiveness and efficiency of the human resources management system, made it possible to conduct empirical research in the organization. The following **research techniques** were used: analysis of available organizational documentation and questionnaires filled in by the management. The analysis of the documentation was used for the general characterization of the company together with the competence management system functioning within it, and allowed to identify the key competencies that the management staff should have. The questionnaire asked for self-assessment of particular competences. From the methodological point of view for a person performing self-assessment the level of his or her own competences is compared with that of other people. Such cross-referencing was to help in formulating final conclusions. The point is to determine, in the most adequate way possible, the current competence status of the employees of the surveyed company.

Based on the documentation and the analysis carried out, a list of key competencies was identified for the managerial staff. Then each of the listed competencies was defined in accordance with the needs articulated by the organization and taking into account activities of a strategic nature. In this way, **10 key competencies** were identified: 1) communicativeness, 2) leadership, 3) decision making, 4) identification with the company and loyalty, 5) ability to predict, 6) delegation of tasks, 7) flexibility of behavior, 8) organizing own work, 9) building organizational culture, 10) resistance to stress.

For the assessment of competencies, a four-stage measuring scale was used, in which the following markings were used: 1 - I lack a given competence, 2 - I rather have a given competence, 3 - I have such a competence, but it needs to be improved, 4 - I fully have such competence.

The return of the questionnaire was very high, as it was completed by 7 out of 9 managers (return level 77%).In case where the respondents did not indicate answers for certain competencies, it was decided to calculate average values for missing choices. The averages were calculated based on the values marked by the respondents for the remaining competencies. Statistica 12 was used to supplement the missing data. Statistical analyses were carried out on the basis of choices made by the respondents in terms of self-assessment of their competencies. Table 1 presents the average

values obtained by each of the surveyed competencies.

Table 1: Average values obtained in the self-assessment of competencies among management staff

MANAGEMENT STAFF											
COMPETENCE	Communicativeness	Leadership	Decision making	Identity with the company and loyalty	Ability to predict	Delegation of tasks	Behavioural flexibility	Organization of work	Building an organizational culture	Stress resistance	**TOTAL**
MEAN	3.43	3.29	3.43	3.43	3.43	2.86	3.43	3.57	3.43	3.14	**3.34**

Source: empirical studies

Bearing in mind, that the highest possible value on the measuring scale is 4, it is worth noting that the competence of 'organizing own work' reached the highest mean. It obtained a score of 3.57, thus indicating only a slight need for improvement. The second place was taken by a set of 6 competencies with a slightly lower average than the one discussed above, i.e. 3.43, which includes: building an organizational culture, flexibility of behaviour, ability to predict, identification with the company and loyalty, decision making and communication skills. The next place is taken by the competence defined as leadership, whose average score was 3.29, so the need to improve this competence is clearer. Another competence, resistance to stress, is ranked fourth with a score of 3.14. The last, fifth, place is occupied by a competence that has an average score of 2.86, and therefore the identifying persons directly express the need to improve it. This competence is the delegation of tasks.

Conclusions of the study

The diagnosis of the state of competence of the management staff allows to identify competence gaps. The surveyed company indicated, that the desired value of each of the key competencies is value 4, i.e. a fully possessed competence. Therefore, the competence gap was determined from this value.

The competence gap in the organization is the difference between the structure and level of competencies held by the employees and the desired competencies. This gap is a deficiency or lack of specific knowledge, features, skills and attitudes of employees that prevent or reduce the level of performing the work on a given position in the expected manner. The reference point for identifying the competence gap are job descriptions and expected behaviors of the employees, which should include qualification requirements for employees and managers (making them capable of performing their duties at a given position), as well as competences (stating that work at a given position is performed expectedly), contributing to achieve strategic objectives of the company.

As a result of surveys conducted among the management staff, it was determined in which area of competencies and how big the competence gap between the desired and current level is. The largest competence gap resulting from the self-assessment of managers concerned the delegation of tasks. Chart 1 presents a graphical list of competencies required and diagnosed as a result of the survey.

Chart 1: Competences required and diagnosed in the managerial staff profile

Source: empirical studies

The competence mismatch of managers concerns, to a large extent, the ability to manage teams of employees, and particular competence gaps have been shown in a delegation of tasks and leadership. These competencies are among skills that are achievable, capable of being shaped and acquired through increased professional experience in the management position. Diagnostic tools (questionnaires) used in this article made it possible to collect data based on which various analyses were carried out to identify the development needs of the **management staff**.

Preliminary analyses indicated, that there are gaps in each competence area, which means that the level of knowledge, skills, attitudes, behaviours and personality traits of the surveyed managers does not correspond to the level expected in the created competence profiles.

Recommendations for organizations

As a result of the empirical research carried out and with reference to the company's strategy (which is: Strengthening the competitive position on the market and development potential), the following recommendations for actions aimed at the development of human resources management in the context of competence management can be formulated.

Competence management, as a subfunction of human resources management, has been defined as a set of activities performed in the organization and aimed at identifying, acquiring, developing and retaining in the organization such employees' competencies that enable the realization of strategic objectives of the company. In view of the research carried out it can be said, that such competencies have been identified in the company, and therefore further actions should be directed at acquiring, developing and retaining in the organization employees who demonstrate such competences. In this respect, the proposed solutions and actions of human resources management should enable the achievement of objectives related to the competence management.

Therefore, it is reasonable to develop and implement a system solution in which competencies are treated as a common base for all activities aimed at people in the organization, i.e. those that make up human resources management.

With regard to the analysis of the survey results among employees in managerial positions, priority should be given to the development of the following competencies: delegation of tasks, leadership and resistance to stress.

To sum up, the development of management staff competence should take place in two ways. On the one hand, appropriate actions and programs should be implemented in the scope of various sub-functions of human resources management, such as selection of personnel (including, in particular, job descriptions and introduction to work), improvement and control of relations with internal and external customers, evaluation of employees, their remuneration, intangible motivation, integration, communication, shaping the organizational culture, employees leaving the organization and competence management. On the other hand, it is also necessary to develop and carry out appropriate training courses and trainings dedicated especially to management staff.

Summary

The subject of consideration and research in this master's degree dissertation was the competence management. The main objective was focused on finding an answer to the question of how to achieve the company's objectives by means of effective and efficient management of employees competencies.

In the theoretical part, based on the literature review, the concept, essence and objectives of competence management are presented and the key role of the managerial staff is demonstrated. Attention is also paid to the methodology of activities involving competence management. The considerations undertaken probably did not exhaust a broad set of views expressed about employees competencies, however, in the author's opinion, the issues of competence management have been discussed in a manner allowing to continue the practical considerations described in the following parts.

To achieve the goal, research techniques were used, including the analysis of available organizational documentation and questionnaires filled in by the management staff. On the basis of the conducted research, competence gaps were defined for the management staff of the surveyed company. Based on the performed analyses, it became possible to determine recommendations and directions for further actions.

The author of this study indicates, that the development of competencies that should be followed by the surveyed organization should take place in two ways. On the one hand, actions and programs should be taken to improve the subfunctions of human resources management, focused on competences, especially on the selection, evaluation and improvement of employees. On the other hand, training courses and trainings should be prepared and conducted to strengthen the competences of the management for which the largest gaps have been identified.

In conclusion, it can be stated, that in the context of the findings made, the purpose of the article can be considered to have been achieved. The research carried out in the course of the study made it possible to determine actions aimed at competence management and, as a consequence, at improving the effectiveness and efficiency of the objectives and strategies implemented by the organization.

Democratic Schools in Poland As Educational Innovation: A Qualitative Study

Katarzyna GAWLICZ
University of Lower Silesia, Wroclaw, Poland, email: katarzyna.gawlicz@dsw.edu.pl

Marcin STARNAWSKI
University of Lower Silesia, Wroclaw, Poland, email: marcin.starnawski@dsw.edu.pl

Abstract

The paper explores educational ideas and practical issues within democratic schools in Poland. A recent development that started in 2013, democratic schools are set up by parents dissatisfied with the country's mainstream education system, as an alternative learning environment free from the perceived shortcomings of public schooling. The major question addressed is: How are these schools innovative? The notion of educational innovation is analyzed in terms of educational ideology and of practice, including organization and pedagogy. The authors argue that while the founders and the staff of democratic schools are driven by and preoccupied with the fundamental problems of learning, upbringing, and child development, they are more dedicated to rethinking or redefining them and less engrossed by devising pedagogical solutions or didactic techniques. Central aspects of democratic schools' ideology of education are identified, such as taking children's interests as the starting point in designing educational processes and prioritizing children's well-being and the development of their social competences over academic skills. Practical innovations include approaching education as a matter of debate and experimentation, organizational modifications of everyday practice, in particular involving children in decision-making processes on school matters, and respectful, equality-based child-adult relationships. The article concludes with an account of controversies around the sustainability and the potential impact of democratic schools.

Keywords: alternative education, democratic schools, educational innovation, ideology of education

This place is different. I will stand up for it, despite its shortcomings. I will defend it with all means possible, because it is something exceptional that has to be created and nurtured, and developed.
(A democratic school educator)

Introduction

This paper explores educational ideas and practical issues within democratic schools in Poland. Representing a recent educational development, democratic schools are set up by parents who are dissatisfied with the country's mainstream education system and seek to provide their children with an alternative learning environment free from the perceived shortcomings of "systemic education," in particular of public schooling. Educational philosophies underpinning democratic schools revolve around a comprehensive transformation of the school as a community, rather than focusing on efficiency-oriented improvements in instruction methods or tools. The major question addressed below is: How are Polish

democratic schools innovative, and what makes their founders innovators and their ideas and practices the vehicles of innovation? The first section outlines the contemporary democratic school movement in Poland and the position of democratic schools vis-à-vis the national schooling system. Subsequently, the notion of educational innovation is introduced against the background of modern efforts aimed at providing alternative schooling. We argue that while the founders and the staff of democratic schools are driven by and preoccupied with the fundamental problems of learning, upbringing, and child development, they are more dedicated to rethinking or redefining them and less engrossed by devising pedagogical solutions or didactic techniques. We use Meighan and Harber's (2007) notion of the ideology of education as a set of "theories" concerning respective dimensions of schooling. As the main part of our argument, we offer a qualitative analysis of interviews and the observational material collected in several democratic schools in Poland. In conclusion, we return to the question of the democratic schools' potential for initiating change in Poland's culture of schooling and in the understanding of the purposes of education.

Democratic schools in Poland: Development and selected characteristics

The democratic school movement is a small, yet dynamically growing, educational phenomenon in Poland. First four democratic schools opened in Poland in 2013, and, as of 2020, there are approximately thirty of them across the country. They considerably differ from typical educational facilities of Poland's schooling system, where schools are state-managed institutions working within a framework determined by the Ministry of Education and accountable to it for the implementation of the standardized curriculum and the fulfillment of centrally mandated objectives. Typically not accredited as schools[1] (unlike their counterparts in the U.K. [Garry et al., 2018] and Israel [Hecht, 2012]) and operated by non-governmental organizations or small companies offering educational and care services, democratic schools can be said to be positioned on the fringes of the education system. Their students are formally registered as receiving out-of-school education, which is recognized as a viable form of compulsory education (called "the school duty" in Poland). They have to be enrolled at a regular school and take annual examinations to prove they have achieved the learning outcomes stipulated by the national curriculum. At the same time, democratic schools do not receive any state funding and, not being subject to legal regulations for educational institutions, they enjoy the liberty to determine their priorities the way they see fit.

Rarely encountered in mainstream schooling, the pivots of the educational ideology embraced by democratic schools include the unschooling tradition (Holt, 2004; Stern, 2013), radical free schooling in Western Europe and the U.S., such as Summerhill or Sudbury Valley schools (Hope, 2019), and modern parenting approaches (Kohn, 2006). They are inspired by child-centered approaches to education and the understanding of child-adult relationships as based on respect and nonviolent communication (Juul, 2011; Rosenberg, 2003). Some of these schools belong to the European Democratic Education Community, and endorse its central values and principles of equality, shared responsibility, respect, self-directed learning, and collective decision making.[2] However, partly due to the legal context, and partly in response to the confusing nature of the term, schools of this kind may refrain from labeling themselves as "democratic." Instead, they rely on a range of telltale monikers, e.g., flexible, friendly, or free, with the latter also indicating their deliberate dissociation from the formal education system. Nevertheless, since the term "democratic schools" tends to serve as a common identifier, we use it throughout this paper.

Democratic schools and the progressive educational tradition

From an anthropological perspective, innovation is an initial stage in cultural change (the introduction and adoption of an idea or a practice), and, as such, it requires widespread learning and collective acceptance of the new element to be integrated with the shared patterns. Murdock (1960) distinguishes four variants of innovation: variation, invention, tentation, and cultural borrowing. What defines innovation is therefore not an absolute but a contextual, or relative, novelty of an element at a given place

(or society) and time. Also, innovation does not necessarily entail a break with the past, as it may either draw on an existing tradition and/or institution or reintroduce an idea and/or practice to be retested under new circumstances.

In contemporary educational contexts, innovations tend to be understood as novel didactic techniques, services, and/or technological tools, and the very term has become somewhat of a fetish in the marketized educational realities (Crosscombe, 2018). However, what passes as innovation may actually fail to further real problem-solving (Yordanova, 2019), to integrate pedagogy and technology for more effective learning (Pisanu, 2014), and to effect a more complex change in the educational culture(s) of schools and beyond. The comprehensive view, however, seems relevant when educational innovation is not equated with improvements within the entrenched systems of standardized rules and roles, but denotes efforts at seeking alternatives, therein redefining central concepts and practices. In the modern context, such comprehensively innovative approaches were promoted and tested across the world throughout the 20th century by experimental or laboratory schools and other establishments based on progressivist philosophies, the "new education" principles, and critical pedagogies. Such practices were encouraged and implemented by a long list of visionaries, reformers, and proponents of "active school," "experiential learning," "child-centered pedagogy," collective upbringing and peer cooperation, etc. (Bowers, 1967; Darling and Nordenbo, 2003; Gribble, 1998). Intrinsic to them all, their variety notwithstanding, was a criticism of the traditional pedagogies prevalent in mass schooling. As the principle of free and universal access was widely accepted, the notion of quality education based on the child's dignity and agency was increasingly highlighted (Piaget, 1974; UNICEF, 2007). Democratic schools in Poland are embedded in this tradition, dating back to the interwar period (Gawlicz and Starnawski, 2018) and revived through experiments inspired by Alexander Neill's Summerhill school in the 1990s (Neill, 1995; Brzezińska and Brzeziński, 2012).

The Methodological Framework

This paper draws on the material collected in a project exploring the origins, rise, and current daily life of democratic schools in Poland. The fieldwork spanned four years and took place in eight schools, selected with regard to their geographical location, size, the declared pedagogical approach, and willingness to participate in the project. The objective was to capture both the variety of approaches to the organization of democratic schools and their development in time. The research methods used in each research site included interviews, observations conducted during a total of approximately 200 visits, and the analysis of school documents, websites, and social media accounts. In order to obtain a multifaceted perspective on the schools, the interviews were carried out with different stakeholders: parents, staff members, and students, and addressed issues related to the genesis of the school, the process of joining it, everyday school routines, and the understanding of democratic schooling and its role in the broader education system. A total of ninety interviews were administered. This research design resulted in the collection of abundant data which helped us both to produce a detailed description of the observed settings and practices, and to identify meanings ascribed to them by school members (Flick, 2007). However, the results neither reflect the multiplicity of ways in which democratic education is practiced beyond the studied schools nor provide substantial insights into the effectiveness of this model of schooling.

Addressing the question of innovation, our analysis below focuses on the passages in the interview transcripts[3] in which the respondents pointed to the features that rendered their schools novel and distinct from mainstream educational institutions. Based on these passages, we developed analytical categories, and then identified corresponding excerpts in our fieldnotes with a view to grasping the discourse-practice interplay and thus demonstrating the complexities of the approach adopted the schools. The analysis is divided into a depiction of the selected components of the typical ideology of education explicitly or implicitly shared by leaders, educators, and parents, and a discussion of the major dimensions of practice, that is, the organization of school life and the implemented pedagogies. We draw on the definition of the ideology of education as an ensemble of theories concerning various dimensions of schooling, where

"theories" are colloquially conceived as "ideas and beliefs held by a group of people about the formal arrangements for education, specifically schooling, and often, by extension or by implication, also about informal aspects of education, e.g. learning at home" (Meighan and Harber, 2007, p. 218). In our view, the practice dimension is only analytically distinguishable from the ideology dimension, as the two actually make up one whole that comprehensively determines the experience and a collective identity of democratic school-based communities.

Ideology of Education

In this section, we identify and depict the ideology espoused by parents and staff members in democratic schools. This ideology initially arises in opposition to what they perceived as typical of mainstream schooling (or, to use their parlance, *the system*). When describing their approach to education, democratic-school parents and educators highlight the aspects that make it distinct from what they view as the dominant schooling model.

Children's interests as the starting point

In terms of *learning and teaching*, the democratic-school parents and staff follow constructivist approaches and emphasize that education should be individualized and based on a child's interests, rather than on an external, standardized, and ready-made curriculum. In this understanding, they draw (without necessarily acknowledging it) on progressivism with its central tenets of readiness, choice, needs, play, and discovery (Burman, 2017, p. 252), and envision the child as competent, naturally developing, trustworthy, and inherently capable of learning (Pomianowska and Stańczyk, 2017). Efficient learning, in their view, cannot be forced on children, as it is triggered by learners' intrinsic motivation: their sense of necessity ("I believe that if she needs something, she will learn it" [S5_P6]) and/or passion ("Children develop faster when they are happy and learn what they want to and what they are interested in" [S7_E5]). This is linked to the idea of the teacher as a companion in the learning process, rather than as a transmitter of predetermined knowledge.

Such a notion of learning and teaching makes some proponents of democratic schooling endorse unschooling, even though it is formally impossible in Poland, given the compulsory national core curriculum and mandatory exams for children in out-of-school education (Pomianowska and Stańczyk, 2017, p. 327). Democratic schools downplay the significance of the curriculum, framing it as a requirement that has to be dealt with instrumentally, rather than as a valid ground rule for educational activity. It has to be covered in conformity with the law, but it is not where the essence of learning lies. This ties in with other components of the educational ideology upheld by democratic schools, i.e., their *theories of assessment, of resources and locations appropriate for learning* (Meighan and Harber, 2007). First, democratic schools reject the idea of external assessment expressed in grades as causing stress and leading to the categorization of students into good, average, and poor. Instead, they favor self-assessment or formative feedback. In their argumentation, they draw on the theories of motivation that underscore the detrimental effects of grading on children's interest in learning, their responses to failure, their willingness to challenge themselves, and the quality of their learning (Kohn, 2000). Second, democratic schools perceive learning as happening continuously, in any situation, and through any means, whereby precedence is granted to free play (Gray, 2013), experimentation, hands-on activities, and participation in natural situations, e.g., tending to animals, "trampolining, going out for French fries […], rolling in the mud, or running around the forest all day, or lying in the hammock" (S1_P2).

Well-being and socio-emotional competence over academic skills

In terms of *theories of knowledge* and *of aims, objectives, and outcomes* (Meighan and Harber, 2007), democratic schools share an understanding that preeminence should be given to personal and social

competences, rather than to academic knowledge. While this does not mean that they belittle the latter (parents' and educators' interviews abound in passages where they marvel at the pace and efficiency with which children acquire academic knowledge, and at the depth and quality thereof, frequently extending far beyond the curriculum), it is not treated as centrally important ("Knowledge is something one can always gain," as one educator said [S5_E6]). Such a hierarchy of priorities stems from an often emphasized belief that the future is unpredictable, and, thus, that it is impossible to determine what specific content knowledge children may need. Given this, well-developed personal and social competences are potentially more desirable.

In the discourse of democratic schools, the development of socio-emotional skills is predicated on attentiveness to the well-being of children, who are considered "human beings with the same rights as those an adult has" (S5_E8). Respecting children, listening to them, and treating them seriously contribute to creating settings that "do children good" (S3_P2) and where they "are simply happy" (S4_E4). This in itself sets these spaces apart from typical schools, which are rarely deemed enjoyable, and fosters conditions for children to achieve self-insight and self-knowledge: how they feel, what they like and dislike, what they want, and what interests them – also academically – which is deemed a prerequisite for effective learning (Hecht, 2012). Supported in their choices, children develop self-esteem, confidence, and resourcefulness: "She listens to herself and reacts in line with her needs. […] When she has an idea, she just shares it" (S4_P3). Eventually, they become capable of taking control of their own lives. This is associated with developing social skills, such as the capacity to appreciate a variety of opinions, to argue for one's views, to collaborate with others, and to solve conflicts respectfully, which is seen as instrumental in preparing children for active social involvement and participation. Such a perception of the aims and outcomes of education causes the advocates of democratic schools to consider them, quite against the prevailing view, a "school of life" rather than a "bubble." Accordingly, they think of regular schools as an adult-managed "artificial world" (S1_P2), and insist that in democratic settings children directly experience that "real life doesn't look the way they'd want it to look, and that they have to come to terms with others and find a solution" (S7_E5/P).

Educational ideology in practice: Organization and pedagogy

Education as a matter of debate and experimentation

Two aspects are often emphasized by individuals involved with democratic schools: that it is expedient to forge a school vision through debating and experimenting, and that it is urgent to take an active stance and create a new educational setting if the current one harms children and a viable alternative cannot be found. Debate is integral in/to the development of democratic schools, from meetings before the opening of a facility, to constant discussions in different fora (of children, parents, and the staff) once it becomes operational. Resources used to generate the school vision and procedures include the literature on democratic education in other countries, study visits at schools in Poland and abroad, and the exchange of ideas at conferences or summer camps. In the spirit of experimentation, various solutions are put to the test.

While the attitude of openness to new ideas enables democratic schools to constantly develop in response to the changing needs and circumstances, some problematic aspects arise, beginning with the ownership of the vision. The schools stress the equality of voices, but some voices may and do sound louder than others. Most typically, school founders and leaders play a dominant role in defining the school's educational philosophy. Among parents, visions promoted by the strongest-minded individuals gain prominence. Children are usually not included at the early stages of the school formation, and while there are mechanisms in place to involve them in decision-making processes, their position is visibly weaker compared with adults'. Besides, to operate on the educational market, the schools need to attract a sufficient number of fee-paying families, which poses a challenge of retaining the coherence of their vision while accommodating parental expectations. Finally, since education is a political and ethical

endeavor involving "different understandings, values, and interests" (Moss and Urban, 2010, p. 31), reaching a shared vision of a democratic school proves challenging. While the dynamic that results from a variety of perspectives contributes to a school's vitality, it may threaten its stability. Differences in vision are known to have led some start-up groups and schools to split and form separate facilities, a process which helps create a place where members feel at home, but also aggravates the financial strain. The observation that "the only constant here is that everything changes" (S5_L5) reveals a feature of democratic schools that is simultaneously highly valuable and troublesome.

Organizational aspects of day-to-day practice

Resulting from value-laden choices, such as freedom vs. structure and individual vs. community, the organization of everyday life in democratic schools needs to be considered as linked to their pedagogies. They distinguish democratic schools both from mainstream educational institutions, and – due to the adoption of different values – from each other. These pedagogies also change in time as a result of reinterpreting the principles of educational ideologies and the core values championed by the schools. Below, we will discuss two dimensions of organization: time management and housekeeping duties.

The schools in our sample took various approaches to planning and time management, from developing fairly stable schedules to prioritizing spontaneity. Educational activities themselves were organized differently, ranging from day schedules with lessons planned at fixed hours and participation required or optional, to the adults inviting children to join them for an activity, to no activities on offer unless the children asked for them. If offered, activities were either divided into subjects or arranged as integrated project work. Typically, a range of extracurricular activities would be offered, including yoga, knitting, and astronomy. School schedules also included school meetings, which served as collective decision-making fora. Most of the settings did not divide the children into age groups, and promoted learning in varied locations outside the school building, such as museums, workshop venues, and outdoor spaces (e.g., forests) (see Kłosińska, 2019). Given the value put on children's free play (Gray, 2013) and dedication to fostering responsibility through decision-making, ample time was left at the children's disposal. Since educational ideologies of the schools foregrounded autonomous learning based on intrinsic motivation, the dominant model was to transfer the responsibility for education on the students, while providing them with abundant resources and forms of support.

Involving the children in school maintenance tied in with approaches to the freedom-responsibility balance and perceptions of children and adults. The settings that drew on, for example, Korczak's (Wolins, 1967) vision of "children's homes"[4] touted school as a shared responsibility or a home-like space and, accordingly, tended to systematically engage the children in cleaning or helping with meals. The establishments that focused more on individual rights tended to leave it up to the children to decide whether they would tidy up or not. This would open up pedagogical discussions on responsibility for taking care of the shared space, appropriate responses to the children's refusal to do so, and child-adult relations.

The ways of balancing freedom and structure give rise to several concerns. Ensuring children's involvement in decision making represents a much desired departure from practices of limiting students' participation, which are typical of Polish educational institutions (Napiontek, 2013). Additionally, research has shown that learning is efficient and rewarding if students take control of their learning (Gray and Chanoff, 1986; Gray, 2013; Hecht, 2012). Yet, some interviewees observed that excessive freedom could be detrimental to children as it deprived them of the sense of security and failed to teach them to take responsibility for their actions. In particular, younger children were said to be "not ready yet" for "too much choice" (S4_P4) and "incapable of imagining that if they don't study, they will fail [an exam]" (S4_P2). The chaos resulting from loose schedules and frequent changes was considered harmful to children with special educational needs, which led some schools to restrict access for such students, especially if their funding was insufficient to provide professional assistance. Finally, the principle of

autonomous learning as the organizational cornerstone of a school is not without its problems. Specifically, autonomous learning hinges on the competences that are vastly dependent on a child's social and cultural capital and on support from a stimulating environment. While it can be successfully carried out in schools attended by students from families with considerable cultural and economic capital, and enjoying access to high-quality resources, it proves challenging in settings where those are missing or insufficient. Moreover, as some staff members observed, the enhanced focus on intrinsic motivation and students' readiness to learn may lead to overlooking children's developmental problems that obstruct their engagement in learning. As these observations suggest, launching novel, otherwise beneficial, educational approaches requires careful attention to their complex consequences and to the circumstances in which they are implemented.

Child-Adult Relationships

As their distinctive feature, democratic schools promote child-adult relationships embedded in the democratic type of discipline, wherein power is shared and order is derived from collectively deliberated and agreed-on rules (Meighan and Harber, 2007, p. 226). Close, trusting, and acceptance-based relationships between children and adults are considered prerequisite to learning, as expressed in an often-repeated phrase "There is no education without relations." Such relationships are underpinned by the perception of the child "as a human being with the same rights as an adult has" (S5_E8), the cultivation of equality and respect as fundamental values, and the rejection of a typical image of the teacher. Democratic schools are not bound by regulations on staff qualifications, and they frequently employ educators without teaching diplomas, prioritizing personal qualities and passions instead. The label "teacher" is replaced with an array of terms, such as "tutor," "mentor," or simply "adult." Against the cultural norm, children are on first-name terms with adults, and engage in close bodily contact with them. Children are also involved in various decision-making processes wherein conditions are created for them to discuss and disagree with adults.

However, such respectful, equality-based relationships are neither easy nor unproblematic to establish. Socialized in a culture where hierarchical relations are a norm, adults need to learn new positions, which entails confronting their own preconceptions and habits. This includes issues ranging from simple everyday routines, such as queuing for lunch, to complex mindsets and attitudes, such as overcoming the feeling of incompetence when children refuse to attend a lesson, or refraining from using one's legal responsibility for children to exert power over them. This process is of utmost importance since, to quote a staff member, "nobody can give children more freedom than they have themselves," and adults create school space depending on "who [they] are, how they deal with their different experiences, with conflicts, with resistance, anger" (S3_L2). Another risk involved is swinging to the other extreme. A parent shared her concern with "adults [becoming] a lower caste ... [having to] serve," worrying "what [this situation] teaches the children" (S5_P7). Striking a balance can be challenging, and the adults who find themselves unable to do so are expected to engage in a personal development process that would help them recognize their needs and set their own boundaries, while still respecting children. Otherwise, they are bound to leave the school sooner or later.

Conclusion

Democratic schools in Poland not only exemplify planned and implemented local educational innovation, but since that they form a network of mutually inspiring communities and other agents, they can also be regarded as an educational ecosystem (Abdul-Jabbar and Kurshan, 2015) with a potential to set an example of changes in the country's educational culture, at least in an experimental mode and on a micro scale. Democratic schools embody not only the borrowing pattern (from the earlier generations of progressivists and contemporary educational "radicals" elsewhere) but also other variants of innovation conceptualized anthropologically by Murdock (1960): *variance*, that is, modification of certain aspects of schooling; *invention*, i.e., using concepts developed primarily in other fields (such as nonviolent

communication); and *tentation*, or "trial-and-error learning" of how to develop and maintain the new learning environment. By stressing respect for children as agents of their own learning and full-fledged "citizens" of their school, by building their pedagogies around students' curiosity, interests, and creativity, and by attempting to structure adult-child relations in a relatively non-hierarchical way, democratic schools demonstrate that "another education is possible" if only there is a will to experiment with it.

A number of critical and potentially contentious points must be acknowledged. Whether and how the effectiveness of this innovation can be measured and verified is one question to ponder for practitioners and further researchers. Another problematic aspect is the precarious status of democratic schools (fringe positioning in relation to the schooling system and the lack of steady – public – funding for an adequate infrastructure and stable employment contracts for professional staff), which threatens their long-term sustainability. Even though the parent-paid fees are sometimes differentiated according to families' financial capacity, tuition-based financing is certainly part of the problem, rather than part of the solution, as these schools certainly do not aspire to provide education exclusively to the wealthy. Further, given the recent conservative turn in Poland, fears have been voiced over possible curbs on out-of-school education, including democratic schooling. The latest regulations[5] introduced by the Ministry of Education have been interpreted as a warning sign thereof. Last but not least, while democratic schools may indeed bring about change at a micro level by creating emancipatory experience for the students and adults involved, they do not seem at this point to be a feasible systemic solution. Even though democratic schools avoid educational elitism, they largely rely on families' economic resources and, importantly, tend to cater to parents with higher cultural capital (knowledge and appreciation of alternative education) who are well-networked socially and have time to engage in school community-building. This is not the case for the majority of parents in public schools. Therefore, if the proponents of democratic schools want to see their innovations as harbingers of a wider transformation in educational culture, one of the major challenges in the upcoming years may be policy development to ensure that the democratic education ideals translate into what Fielding and Moss (2011) advocate when they describe the democratic common school as "a public institution and a public space, a forum or place of encounter and connection, interaction and dialogue open to all citizens, young and old" (p. 108).

Endnotes

1. Given this, some researchers label them as quasi-schools (Uryga and Wiatr, 2015).
2. https://eudec.org/democratic-education/what-is-democratic-education (retrieved July 9, 2020).
3. All participants are quoted anonymously. Symbols attached to quotations indicate leaders (L), educators (E), and parents (P), with interview numbers within a given school community. "S" with a number indicates a school.
4. However, unlike Korczak's orphanages and boarding schools such as Summerhill, contemporary democratic schools in Poland mostly operate as day settings, or organize away-activities periodically.
5. The regulations included reducing the governmental subsidies for out-of-school students, setting stricter conditions of enrollment at the base school (now it must be a school situated in the student's zoning district), and restricting the acceptability of assessments issued by Psychological and Counseling Centers (while assessments provided by public centers are recognized, those issued by private facilities are not).

Acknowledgment

The research was funded by the National Science Centre, Poland (project no. 2014/13/D/HS6/01896).

Abstract

Leading people is not an easy task. This is perfectly captured by Plato's remark: "The most important thing is that nobody is ever left without leadership, a man or a woman, that they don't get used to serious matters or games and act in their own way." Designing an activity and convincing others to do it is a real art. Many military commanders, politicians and managers have found this quite painfully. To encourage others to follow you, you need both the right knowledge and many skills, which, however ... can be learned! The authors of this article in the years 2007 - 2018 cooperated jointly in building and implementing command and leadership programs at the General Tadeusz Kościuszko Military Academy of Land Forces in Wroclaw. These were the first courses in this dimension in the Polish Armed Forces. Military leadership seems to be something natural and "traditionally" constantly present in the armies of the whole world. The educational practice encountered by the authors at a military university was quite complex. Authors of presented project (work in progress) willing to analyze and discuss the role of leadership and its' meaning in the organization . The main thesis of the project is that leadership in the military sector is not just a process that involves influencing other people, without having to use coercion, to shape goals and motivate others to achieve them. Leadership in an army is also a property or a set of attributes of a leader, i.e. an individual whose role has been accepted by others.

Keywords: The Leadership, The Military Academy, Improvement.

Introduction

Many people are "born" to become leaders and often become them. But what do those who do not feel the mission to lead people and do not even try to encourage others to work together in a new direction? Nothing lost. In the light of the latest research, and this is also demonstrated by business practice, we have many types of leadership and under certain conditions everyone can become a leader. The only problem here is ... being ready to play this role. The first step in this direction is to know yourself, your weaknesses and the best sides of character. It gives you confidence and allows you to feel internally consistent. It also becomes a premise for opening up to the world and others, as well as being free to undertake new experiences without fear and prejudice.

Leading people is not an easy task. This is perfectly captured by Plato's remark in the book by Popper K (1993): "The most important thing is that nobody is ever left without leadership, a man or a woman, that they don't get used to serious matters or games and act in their own way." Designing an activity

and convincing others to do it is a real art. Many military commanders, politicians and managers have found this quite painfully. To encourage others to follow you, you need both the right knowledge and many skills, which, however ... can be learned! Improvement also requires personal predisposition to lead and lead others. Even Leonidas and Aristotle, teachers of the Alexander the Great (356–323 B.C.), were convinced of this.

In this context, attention is usually paid to charisma, as a special, even unique gift that has only a few and makes it easier to influence others, as well as to build the authority. Referring to military service -cadets were aware of the "need" to be a leader, but they are often unable to put it into practice in military service. The traditional autocratic command of a non-tolerant opposition and the use of the order for "immediate execution" are not methods of building the authority of an effective commander. The cadets were often surprised that in order to become a leader, they had to be "named" as leaders by followers (Kaluzny R., Pietrakowski P.,2020). This was emphasized already in the first issue of The Practice of Management in the fifties of 20th century by P.F. Drucker (1954), who claimed that "The only proper definition of a leader is that which says that it is a person who has followers (...) without followers, not subordinates, there is no question of leaders". The difference between the commander and the leader was then determined for the first time (Kacała J., Michaluk A., 2014).

Contemporary organizations often have problems maintaining the desired pace of development, stagnation and even regression. Among the many reasons for this, there is usually a visible leadership deficit. So there is no leader here who would show a new direction - the goal that the organization should follow. It is also important that through various actions and exerting influence, this person would be able to arouse enthusiasm, "breathe new spirit" into the organization's community in order to effectively achieve these new goals.

The authors of this article in the years 2007 - 2018 cooperated jointly in building and implementing command and leadership programs at the General Tadeusz Kościuszko Military Academy of Land Forces in Wroclaw. These were the first courses in this dimension in the Polish Armed Forces. Military leadership seems to be something natural and "traditionally" constantly present in the armies of the whole world. The educational practice encountered by the authors at a military university was quite complex.

Authors of presented project (work in progress) willing to analyze and discuss the role of leadership and its' meaning in the organization . The main thesis of the project is that leadership in the military sector is not just a process that involves influencing other people, without having to use coercion, to shape goals and motivate others to achieve them. Leadership in an army is also a property or a set of attributes of a leader, i.e. an individual whose role has been accepted by others.

Literature Review

Leadership is a kind of power where one person has the ability to influence or change the values, beliefs, behavior and attitudes of another person.

Ganta, V. C. and Manukonda, J. K. (2014) mentioned the leaders must be skilled at the process of creating a shared vision and to do so in such a way that other can visualize it. "A vision is something that you can see." In Peter Senge's (1990), classic book, *The Fifth Discipline*, he discusses the importance of creating a vision that is *shared* by others and provides useful perspectives on how this can be accomplished. In a research study by Baker, Edward L. MD (2014)Leaders must also lead the process for identifying and communicating the broader strategies ("the how" and "the why") needed to bring the vision ("the what") into reality.

Visionary leaders who create a culture of engagement maintain employee trust, drive optimal levels of productivity, increase overall satisfaction and retention, and are able to position the company for success. A critical element in building confidence, motivating performance, and increasing employee

engagement is having people at the top who inspire belief in the organization's future. When done effectively, organizations experience better business success and stronger bottom-line business performance (Wiley J.W. 2010)

It is important that organizations embark on leadership development programs that will enhance leadership effectiveness. Leadership development should be comprehensive and systematically integrated into the organizational culture in order to produce leaders who can deal adequately with organizational challenges. Organizations and leadership developers should use a systemic approach in order to address the current leadership crisis (Amagoh, F., 2009).

When times are good, honest communication from those at the helm creates loyalty and organizational pride, ensuring companies retain top performers. Wiley, J. W. (2010)mentioned the leadership effectiveness can be defined by five characteristics: (1) the ability to give employees a clear picture of the direction the company is headed; (2) the ability to handle the organization's challenges; (3) a genuine commitment to providing high-quality products and services; (4) a demonstrated belief that employees are important to company success; and (5) the ability to inspire confidence in employees.

Even though considerable attention is often given to formal team leaders, it is important to recognize that the functional view of team leadership is deliberately inclusive when it comes to who satisfies these team needs. Because multiple individuals are often capable of satisfying team needs, it has been suggested that we "devote attention to the study of leadership rather than leaders," in part because of the "observation that many every-day groups have different leaders in different situations". The leadership is therefore conceptualized as the process of team need satisfaction in the service of enhancing team effectiveness (Baron I.S., Agustina H., 2017). Leadership management training should be supported by the abilities and skills of participant in following the training with various techniques used by trainers and facilitators.

Intelligent leaders also have the responsibility to use their skills and knowledge to effectively and efficiently guide their business forward in the face of an uncertain future and also to decrease the feelings of insecurity in their employees caused by that uncertainty. In the paper by Hao M. J., Yazdanifard R. (2015) a leader has the power to influence the success of the organization, due to his full power to control the direction of the organization, as well as through the influence they exert on their employees that motivates them to bring the company to greater heights.

Leaders are able to inculcate an environment of teamwork and to delegate the job to the qualified team members. Leaders do not create followers, rather they create more leaders. An effective leader acknowledges the team members for a job well done, regardless of whether the team was able to completely reach the set goals, or not. A leader is capable of developing the best out of his team members; leadership is regarding "we" and not "me" (Khoshhal K. I., Guraya S. Y., 2016).

Project research problem and research method

Building curricula for officer cadets of the Polish Army, the authors took extensive experience from J. Adair's [1] publications, which in this regard began to be gradually published in Poland after 1990. In the content and structure of the curriculum in the Management field of study, devoted a lot of attention to including courses that build the profile of the future commander through the superposition of content and exercises of "military" and "civilian" nature. The officer cadets simultaneously studied content in the field of command for a specific type of the army (infantry, reconnaissance, artillery, etc.) as well as content in the field of organization management similarly to the students of the Wroclaw University

[1] J. Adair was a senior lecturer at the Royal Military Academy, Sandhurst from 1961 to 1967 who carried out some observation work on young officer cadets handling leadership tasks

of Economics and Business, where many civilian academic teachers came from(Kopertyńska M.W., Pietrakowski P. 2019, MichalukA., Kacała J., 2014, Martusewicz J., 2019)

Advanced leadership studies and scientific research undertaken by the authors of this publication at the military university meant that these experiments would be gradually adopted in the civilian sector, where various leadership courses and workshops were increasingly carried out. Interestingly, they all primarily referred to examples of outstanding military commanders. In the military academy; the 5-year Master's Degree in Management was just a cooperation of military and civil content useful in modern command. Command is of course a basic trend of military studies and in this respect the improvement of leadership competences has become a real challenge.

The observation of young officers of Management graduates in the years 2008-2018 provided a lot of evidence that the new concept of "civil-military" education is starting to work in a fairly traditional and resistant to change military environment. These experiences prompted the authors to extend their research and implementation in a managerial environment.

In the military academic programme the majority of classes are carried out in the form of exercises and trainings preparing to fulfill the role of a leader in an organizational environment. Subjects implemented in the form of lectures are only used to present the latest knowledge in the field of leadership and human capital management of an organization. They constitute the theoretical basis for exercises and practical trainings. They mainly serve to improve the leadership competences of course participants. The classes put great emphasis on the individual learning of their competences by the participants. This is knowledge that serves to further improve the desired leadership competences. During classes, participants solve many tasks and tests both individually and in small teams. Active teaching methods and techniques are used that prepare for the role of a leader in a modern organization. Practical forms fill a minimum of 60% of study time during studies. Practical scenarios envisage playing roles in stressful situations, time deficit and threats, aimed at familiarizing participants with the presence of various threats and limitations typical of managerial work. Therefore, we decided that the group of students of the military academy (Management specialization) will be our study group.

Based on the literature review and authors' observation the research questions have been formulated:

- Does the personal characteristic of the cadet changes during the course?
- Does the cade discover his/hers natural leadership predispositions and ways to improve them during the study?
- Does the cadet apply principles and techniques to effectively motivate other members of the group during the study?
- Does the study made the cadet (after graduate) to more effectively assess the competences of subordinates and shape their professional development ?
- Does the study made the cadet (after graduate) able to design changes in the organization more flexibly and effectively?
- Does the cadet (after graduate) communicate with members of the organization in a way that enables better understanding, empathy and acceptance of the organization's adopted goals?
- design tasks for teams, appoint them and ensure their effective functioning,
- Does the cadet (after graduate) recognizes and resolve conflicts in the organization, including those that result from the impact of the environment and internal and external threats?
- Does the cadet (after graduate) deals with stress and danger situations, showing support to his/hers subordinates?
- Does the cadet (after graduate) builds an organizational culture in which job satisfaction and awareness of the community are the primary directive for the development of the organization?.

The goal of the project (work in progress) is to carry out, based on the systematic review of the literature, qualitative and quantitative research. In the first period we plan to execute Individual In-depth Interviews (IDI), with representatives of the course (twice- during the course, and 1 year after graduating, N=25). The qualitative study will help to formulate the hypothesis and the model of the effective leadership in the military organization. Next step of the project will be the quantitative research carried out with representatives of the military force (management officers) (N = 300). The collected data will be subjected to computer processing and quantitative analysis using descriptive statistics and the use of the SEM / PLS (structural modeling).

Abstract

Many of organization implement code of conduct as an explicit guidance to help employees knowing the standard of ethics from management's viewpoints, with the aim to gain productivity achieving organization's goal. The purpose of this paper is to examine the influence of ethics institutionalization on organizational citizenship behavior and to analyze the role of organizational commitment in mediating the impact of ethics institutionalization on organizational citizenship behavior with psychological empowerment as a moderator in one of Social Security Agency in Indonesia. This research employed a quantitative approach with online survey method to 784 respondents which were determined by purposive sampling method. Respondents come from employees of the social security institution who already work at the institution for minimum three years. The results show that both explicit and implisit ethic institutionalization has a positive effect on organizational citizenship behavior, whereas organizational commitment act as a mediator, and psychological empowerment may moderate their positive linkages.

Keyword: Ethics Institutionalization, Organizational Commitment, Psychological Empowerment, Organizational Citizenship Behavior

Introduction

The social security institution, as one of public institutions engaged in the sector of social security, has prepared various arrangements to regulate its organization in supporting the fulfillment of services provided to the public. One of the guidelines produced is the institution's code of ethics which provides guidance for all employees and management to be professional and responsible of their tasks. On implementation, explicit codes of ethics clearly understood by institution members and can drive ethical behaviour implicitly by each individual. This was considered with reduction of violations rate during 2014-2017. Data of public complaints against institutions has also increased along with technological developments that can facilitate the delivery of information. Therefore, to improve excellent service to the community, management needs to direct its employees to be involved in organizational citizenship behavior.

Moreover, organizational citizenship behavior reflects those actions performed by employees that surpass the minimum role requirements expected by the organisation and that promote the welfare of co-workers, work groups, and/or the greater organisation (Jehad, Quoquad, Farzana, and Mohmad, 2011). Although there is no direct relationship between institutionalizational of ethics and organizational citizenship behavior, but with the increase in ethics behaviour as shown on the reduced rate of violation, can support the enhancement of organizational citizenship behavior through organizational commitment as mediator variable and accelerated by psychological empowerment as a moderator variable.

Literature Review

Organizational Citizenship Behavior

Term Organizational Citizenship Behavior (OCB) was first created by Bateman and Organ (1983), came from from Katz's research (1964), that studies innovative and spontaneous extra-role behaviors and distinguishes high or low performance of employees. According to Katz and Kahn (1978), OCB is an extra-role behavior concept which states that an effective organization must evoke innovative behavior. Podsakoff and MacKenzie (1994) explain that OCB is discretionary work-related behavior, it is not related to formal organizational reward systems, and promotes the effective function of organizations. Therefore OCB refers to individual behavior that benefits the organization but is not formally determined or valued by the organization. (Organ, Podsakoff, and MacKenzie, 2006). Bateman and Organ (1983) explains OCB has several dimensions, that is: Sportmanship means the desire of employees to tolerate discomfort in the work environment without complaining; Civic Virtue is the behavior of employees who have the responsibility to participate in the activity of surviving the company; and Helping is a combination of several other types of OCB such as Altruism, Courtesy, Peacekeeping, and Cheerleading which is the behavior of helping a coworker to solve a problem or to avoid a problem.

Institutionalization of Ethics

Organizational practice in engaging ethics in decision making process is called "institutionalization of ethics" (Singhapakdi and Vitell 2007). Organizations can increase the formalization of ethics in the form of a company code of ethics and ethical guidelines as a guidelines for employees, and can also make changes to the organizational structure by creating special positions for ethical management (Vitell and Singhapakdi 2008). Furthermore, Singhapakdi (2010) explains that Explicit Ethics Institutionalization (EE) refers to the codification of ethical behavior in terms of ethical codes, policy guidelines, orientation programs, and ethics committees. Whereas Implicit Ethics Institutionalization (IE) refers to a work climate in which ethical behavior is understood by employees as important in the formation and function of the company (Lee, Yu, Sirgy, Singhapakdi, and Lucianetti, 2018). According to previous research, EE has a significant effect on IE and not in reverse. There are several reasons, that is EE can provide clear understanding for employees about what is ethical and not in organizational environment and EE can also increase ethical sensitivity among employees to create an ethical climate as a form of IE (Lee, Yu, Sirgy, Singhapakdi, and Lucianetti, 2018).

Organizational Commitment

Jaworski and Kohli (1993) define Organizational Commitment (OC) as the behavior to know bounding of employee and organization also willingness to make personal sacrifices for the organization. According to Robbins (2003), an employee with OC will identify the goals of the organization, and wishes to maintain membership in the organization. OC is seen as employee loyalty to their organization (Muchinsky, 2007). Meyer and Allen (1991) state that OC is formed when employees and organizations foster greater interest in maintaining their work relationships. Commitment can be increased and utilized to support organizational goals if employees are allowed to participate in decision making (Salancik, 1977). Luthans (1995) explains that OC is defined as a strong desire for someone to become a member of an organization; the willingness to exert every effort for the organization; and trust and acceptance of the organization's values and goals. In other words, OC is an attitude that shows the "loyalty" of employees and the ongoing process of how members of the organization express their sympathy for organizational failure and success.

Psychological Empowerment

Psychological empowerment (PE) increases motivation of work that are manifested in four cognitions that reflect an individual's orientation to his work role, that is: Meaning, Competence, Self Determination, and Impact (Spreitzer, 1995). The concept of PE is rooted in theory Rappaport (1987)

which explains the mechanism for promoting employee contributions in an organization in order to meet their needs and defend their rights (Lee, 2001). The first dimension of PE, meaningfulness, refers to the value of an objective in relation to the standards of individuals who are intrinsically concerned about the tasks given (Thomas and Velthouse, 1990). Competence (or self-efficacy) is the extent to which a person can complete a task skillfully (Thomas and Velthouse, 1990). Self Determination connotes individual independence in initiating and continuing tasks (Spreitzer, 1995). The fourth dimension, Impact, refers to the influence individuals feel over important strategic, administrative, or operational outcomes (Liao, Toya, Lepaj, and Hong, 2009).

Research Model and Hypothesis Development

Effect of Explicit Ethics Institutionalization on Implicit Ethics Institutionalization

Institutionalization of ethics is considered capable of resolving ethical issues in an organizational environment (Gellerman, 1986; Murphy, 1989; Stevens, 1994) both explicitly and implicitly to assist management in decision making. Based on research conducted by Singhapakdi, Sirgy, Lee and Vitell, (2010) Explicit Ethics Institutionalization has a significant positive effect on Implicit Ethics Institutionalization, not the other way around.

H1: Explicit Ethics Institutionalization (EE) has a positive effect on Implicit Ethics Institutionalization (IE)

Effect of Explicit and Implicit Ethics Institutionalization on Organizational Commitment

Ethical elements such as fairness in the workplace, attention and concern for employees, trust in employees, and organizational reputation are factors in work that have the greatest influence on employee commitment to the organization (Ferrell, Fraedrich and L. Ferrel, 2002). Furthermore, according to Valentine and Barnett (2003) shows that someone in an organization who has strong ethical values can improve Organizational Commitment. Based on previous research conducted by Vitell and Singhapakdi (2008) and Lee, Yu, Sirgy, Singhapakdi, and Lucianetti (2018) stated that Explicit and Implicit Ethics Institutionalization had a positive relationship with Organizational Commitment.

H2: Explicit Ethics Institutionalization (EE) has a positive influence on Organizational Commitment (OC)

H3: Implicit Ethics Institutionalization (IE) has a positive influence on Organizational Commitment (OC)

Organizational Commitment on Organizational Citizenship Behavior

Organizational Commitment is related to employee motivation. Evidence reveals that employee involvement is observed by their extraordinary actions or behavior in the organization, such as their agreement to work after working hours (Caldwell, Chatman, and O'Reilly, 1990). Haigh and Pfau (2006) in their research found a significant positive relationship between Organizational Commitment and Organizational Citizenship. Consequently, the positive relationship between affective Organizational Commitment and Organizational Citizenship Behavior is a sensible relationship (Moorman, Niehoff and Organ, 1993; Organ and Ryan, 1995).

H4: Organizational Commitment (OC) has a positive influence on Organizational Citizenship Behavior (OCB)

Mediation of Organizational Commitment

There is no direct effect between institutionalization of ethics on organizational citizenship behavior. However, Maignan, Ferrel, and Hult (1999) found that proactive citizenship behavior where ethics for their responsibilities as part of an organization can increase the level of employee commitment to the company. And found a positive relationship between explicit ethics institutionalization and implicit ethics institutionalization with Organizational Commitment (Lee, Yu, Sirgy, Singhapakdi, and Lucianetti, 2018) and a positive relationship between Organizational Commitment and organizational citizenship behavior in Obedgiu and Bagire research (2017).

H5: Organizational Commitment (OC) mediates the positive influence of Explicit Ethics Institutionalization (EE) on Organizational Citizenship Behavior (OCB)

H6: Organizational Commitment (OC) mediates the positive influence of Implicit Ethics Institutionalization (IE) on Organizational Citizenship Behavior (OCB)

Moderation of Psychological Empowerment

Employees who are committed to the company will have organizational values that have been internalized in themselves, a sense of belonging, and are willing to invest their personal efforts for the organization, while Psychological Empowerment facilitates the realization of this willingness (Farzaneh, Farashah, and Kazemi, 2014). Empowered people are aware of the factors that affect the welfare of individuals and their organizations (interactional components), perceive a higher capacity of self, and are willing to exercise control over organizational problems. Psychological Empowerment strengthens employees who are committed to the organization to help others overcome their problems (behavioral component) (Zimmerman, 2000). Therefore, Psychological Empowerment is able to be the right construction to increase employee motivation in showing organizational citizenship behavior. Also, an individual with a greater level of Psychological Empowerment will be better suited to show a higher Organizational Commitment and will eventually be involved in organizational citizenship behavior (Farzaneh, Farashah, and Kazemi, 2014).

H7: Psychological Empowerment (PE) moderates the relationship between Organizational Commitment (OC) and Organizational Citizenship Behavior (OCB), where the higher the PE the relationship will be stronger and conversely the lower the PE the relationship will be weaker

Based on seven hypotheses above, the research model can be depicted as follows (see figure 1).

Figure 1: Research Model

Research Methodology

Procedure and Sample

The research sample come from employees of a Social Security Agency, who have already worked at the institution for a minimum three years tenure. Respondents were then given a questionnaire containing items about general information (gender, marital status, age groups, educational level, years of service, and job position) and observed variables.

Total of 784 questionnaire was successfully collected. This number has met Krejcie & Morgan requirements (1970), minimum samples 357 for Structural Equation Modeling (SEM). Related to SEM, data then analyzed using Confirmatory Factor Analysis (CFA) from Lisrel 8.7 program.

Measurement and Scales

This study uses a measuring instrument from previous literature that has been translated into Indonesian. All items in the questionnaire use 1-7 Likert scale (1 = strongly disagree; 7 = strongly agree). OCB was measured by three dimension (Helping, Civic Virtue, and Sportmanship) with 14 questions from Podsakoff and Mackenzie (1994). EE as an independent variable was measured by seven questions from Singhapakdi dan Vitell (2007). IE was measured by nine questions from Singhapakdi dan Vitell (2007). OC as a mediating variables was measured using seven questions from Jaworski dan Kohli (1993), while PE as a moderating variables was measured by four dimension (Meaning, Competence, Self Determination, and Impact) with 12 questions from Spreitzer (1995). In this study, the reliability test of each variable was measured using Cronbach's alpha. The minimum value of Cronbach Alpha (α) for each variable must be minimal 0.6 (Hair, Black, Babin and Anderson, 2014). Every variable has reached it, OCB (Helping dimension $\alpha = 0.936$; Civic Virtue dimension $\alpha = 0.830$; Sportsmanship dimension $\alpha = 0.818$), EE ($\alpha = 0.847$), IE ($\alpha = 0.856$), OC ($\alpha = 0.894$), and PE (Meaning dimension $\alpha = 0.873$; Competence dimension $\alpha = 0.971$; Self Determination dimension $\alpha = 0.881$; Impact dimension $\alpha = 0.763$).

Result and Discussion

Table 1 shows the demographic data of respondents in this study. Majority of employee return were male (59,1%), while the others were female (40,9%). Based on the marital status, most of them are married (76,8%) , 76,8% are single, and ever been married 2,0. Most of these employee returns were at age range 21-30 years (48,7%), while 22,8% were 31-40 years old, 21,0% were 41 to 50 years old, 7,3% were above 50 years old, and only 0,1% of them are 20 years and under. Based on the level of education, most of them are college graduates (77,9%) , 13,3% are magister graduates, 7,3% of them only diploma graduates and the senior high school graduates just 1,5%. Most of these employee returns were at years of service range 3-5 years (44,6%), then above 15 years of service (26,8%), while 20,8% were at range 6-10 years, and 7,8% were 11 tot 15 years. Based on the job position, most of them are staff (77.8%) , 13.3% are middle manager, 8.4% of them as a first manager and top manager just 0,5%.

Table 1: Demographic Data

Demography	Category	Summary	Percentage (%)
Gender	Men	463	59,1%
	Women	321	40,9%
Marital Status	Single	166	76,8%
	Married	602	76,8%
	Ever Been Married	16	2,0%
Age Groups	≤ 20	1	0,1%
	21-30	382	48,7%
	31-40	179	22,8%
	41-50	165	21,0%
	≥ 51	57	7,3%
Educational Level	Senior High School	12	1,5%
	Diploma	57	7,3%
	College	611	77,9%
	Magister	104	13,3%
Years of Service	3-5 years	350	44,6%
	6-10 years	163	20,8%
	11-15 years	61	7,8%
	≥ 16 years	210	26,8%
Job Position	Staff	610	77.8%
	First Manager	104	13.3%
	Middle Manager	66	8.4%
	Top Manager	4	0.5%

The research model should be analyzed by its Goodness of Fit Index (GOFI) to see a match between selected variables and data (Schermelleh-Engel, Moosburger, and Muller, 2008). We can see the criteria at table 2. Most of the criteria indicate that the research model is good fit, particularly for the RMSEA, which happens to meet the criteria. Therefore, the research model is assumed to be valid.

Table 2: Goodness of Fit Index

Criteria	Provision	Actual Value	Conclusion
RMSEA	≤ 0.08	0,069	Good Fit
GFI	≥ 0.90	0,89	Marginal Fit
NFI	≥ 0.90	0,97	Good Fit
NNFI	≥ 0.90	0,97	Good Fit
CFI	≥ 0.90	0,97	Good Fit
IFI	≥ 0.90	0,97	Good Fit

The following step was to check results of regression analysis, to examine the relation and significance between variables. Figure 2 shows the regression coefficient (β) and t-value between variables.

Figure 2: Regression Estimates of Model (with t-value)

The results of the analysis show that EE has a positive and significant effect on IE (β = 0.5, t-value = 13.15). So the first hypothesis (H1) is supported. This research also show that Institutionalization of Ethics both EE (β = 0.8, t-value = 2.74) and IE (β = 0.81, t-value = 17.71) has a positive and significant effect on OC. So the second hypothesis (H2) and third hypothesis (H3) are supported. Then OC has a positive and significant effect on OCB (β = 0.4, t-value = 6.7), accordingly fourth hypothesis (H4) is supported. Look at the mediating effects of OC between EE and OCB, direct effect (β = 0.08, t-value = 2.74) and indirect effect (β = 0.19, t-value = 5.86), so OC mediates the positive influence between variables, and H5 is accepted. Therefore, mediating effects of OC between IE and OCB, direct effect (β = 0.81, t-value = 17.71) and indirect effect (β = 0.32, t-value = 6.60), so OC mediates the positive influence between variables, and H6 is also accepted. And for the last hypothesis show that PE can moderates positive effect OC on OCB (β = 0.13, t-value = 4.07). So the seventh hypothesis (H7) is supported.

From the results of the statistical tests above, several things could be figured out. It can be concluded that the greater the ethical behavior formally expressed by the company will increase employee perceptions of ethical behavior that is implied and understood as very important. This is in accordance with Singhapakdi's research (2010) that explicit ethics institutionalization has a significant effect on implicit ethics institutionalization and not vice versa. In addition, the greater the ethical behavior formally expressed by the company will increase employees' perceptions of their attachment to the company and are willing to make personal sacrifices for the company. These results are in accordance with the research of Vitell and Singhapakdi (2008) where explicit ethics institutionalization has a positive effect on organizational commitment. Also the greater the ethical behavior that is implied and understood as very important by employees, will also increase the perception of employees' ties with the company so that employees are willing to make personal sacrifices for the company.

Likewise with the research of Lee, Yu, Sirgy, Singhapakdi, and Lucianetti (2018) who explained that implicit ethics institutionalization has a positive relationship with organizational commitment of employees in the company. The greater the ties of employees with companies where employees are willing to make personal sacrifices for the company will increase employee perceptions of relationships with discretionary work, that is not related to rewards given by the organization but do it voluntarily.

These results are in accordance with the study of Farzaneh, Farashah, and Kazemi (2014) who explained that organizational commitment positively influences organizational citizenship behavior. The magnitude of the influence of ethical behavior formally expressed by the company will increase employees' perceptions of their engagement with the company which then triggers employees to engage in discretionary behaviors. Likewise with the magnitude of the influence of ethical behavior that is implied and understood as very important by employees will increase employee perceptions of engagement with the company which then triggers employees to engage in discretionary behaviors.

Then the greater the increase in motivation for his work will increase employee perceptions of engagement with the company while triggering employees to engage in discretionary behaviors.

Conclusion and Recommendation

This study continues previous research on the institutionalization of ethics both explicitly and implicitly which has a positive effect on organizational commitment. But differently in this study is examining the effect of ethical institutionalization indirectly on organizational citizenship behavior. Issue of excellent service in organization is being intensified by business practitioners as well as at state institutions, for this reason development of organizational citizenship behavior is needed. This is caused the role of organizational citizenship behavior that is able to encourage employee productivity to be focus on increasing effectiveness and efficiency of the company. In this study, organizational commitment is proven to mediate the relationship between institutionalization of ethics and organizational citizenship behavior. Psychological empowerment has also been proven to accelerate the relationship between organizational commitment and citizenship behavior. This shows that employees of a state institution that has higher motivation for their work have stronger organizational citizenship behavior than those who are not motivated enough.

This study also has limitations that need to be developed in future studies. The first limitation is found several indicators on invalid variables. For this reason, a wider sample is needed to believe indicators for the variables used in previous studies are valid and reliable. Second, this research has been carried out in state-owned institutions with the results of all the hypotheses being fulfilled. So future research may conduct similar model of this research but in other sectors to find out whether the same hypothesis is also acceptable. Third, refer to the second point, cultural and organizational characteristics of the sample in the state institution can influence the study's findings. Future research should formally incorporate these variables as variables to control their effects. Finally, it is hoped that more research will be conducted in the future to replicate and build on this program of research.

Abstract

Indonesian Migrant Worker has created significant economic contributions to the country. They have potential role in creating entrepreneurship. This study would explore about how the entrepreneurial intention of the Indonesian Return Migrant were formed when they build a business. Moreover, the study wants to find how the entrepreneurial purpose and usage of remittance can influence the entrepreneurship behavior of Indonesian Return Migrant. Based on interview and focus group The study involved 34 Indonesian Return Migrants from three provinces that become the main sources of Indonesian Migrant Worker, namely East Java, Central Java, and West Java. We have found some relevant entrepreneurial intention factors, namely attitudes, subjective norms, perceived behavioral control, and educational factors. The remittance benefits earned by the Indonesian Return Migrant were used for investment, asset, saving, helping families, and making business. Moreover, it was found that entrepreneurship intention and remittance beneficial have a contribution in supporting entrepreneurship behavior of the Indonesian Return Migrant.

Keywords: entrepreneurship, entrepreneurial intention, remittance, return migrant

Introduction

The number of Indonesia's workforce (economically active) with an age range of more than 15 years and already employed, totaling 131,005,641 inhabitants (Badan Pusat Statistik, 2019). The population included in the Indonesian workforce is not only in the Republic of Indonesia territory but also in other countries. Those who work in other countries are called Indonesian Migrant Worker. According to data from The World Bank (2017), the total population of Indonesia abroad is around 4,247,814 people. The National Agency for the Protection and Placement of Indonesian Migrant Worker (BNP2TKI, 2019a), it is mentioned that Malaysia, Hong Kong, and Taiwan are the most popular destinations for sending Indonesian workers. The Indonesian Migrant Worker generally came from provinces on the island of Java, namely East Java, West Java, and Central Java.

The Indonesian Return Migrants are those who have returned from working abroad and settled in their home country. BNP2TKI stated that Indonesian Return Migrant has entrepreneurial potential. Therefore, BNP2TKI provided a development program for entrepreneurial development. BNP2TKI also encourages the Indonesian Return Migrant to improve the welfare of their families when they return to their home regions by doing creative business. Creative business results are also supported to be exported so that they can penetrate foreign markets with the provision of a network owned by return migrant workers. The export proceeds indirectly help the national economy (BNP2TKI, 2019b).

Entrepreneurship behavior is the process of creating value or adding value to something. This process involves a variety of unique resources that exist by bringing together various resources that are owned to be utilized. Utilization can be used in various business opportunities (Omisakin, Nakhid, Littrell, &

Verbitsky, 2016). Most Indonesian Return Migrants returned to their countries do not want to become workers again after returning. The returning also becomes the driving force for them to be entrepreneurs.

Indonesian Return Migrant has the experience, networking, and provision of abilities (skills). Marchetta (2012) stated that those who have worked as migrants have more experience to be able to open their jobs (become entrepreneurs). In theory, entrepreneurial intentions can influence a person in deciding whether to carry out an entrepreneurial activity or not. The entrepreneurial intention is defined as a conscious thought before taking action to start a new business. The role of entrepreneurial intentions is significant in encouraging someone to start a business (Moriano, Gorgievski, Laguna, Stephan, & Zarafshani, 2011). Stephens & Partridge (2011) stated that entrepreneurship and economic growth in disadvantaged areas carried out by residents of an area have positive implications for employment growth.

The amount of remittance beneficial between countries originating from Indonesian Return Migrant reaches hundreds of trillions every year. Bank Indonesia noted, during 2018, the number of remittance funds originating from Indonesian Return Migrant was around US$10.8 billion or around Rp151 trillion (CNN Indonesia, 2019). Almost 75% of the average use of Indonesian Migrant Worker's salaries is to be sent to their hometowns in Indonesia. Furthermore, as much as 15% of the average total of Indonesian Migrant Worker expenditure allocated to accommodate their daily needs while working. Meanwhile, only 10% of the total salary is used for personal savings (BNP2TKI, 2016).

Yuniarto (2018) mentioned that Indonesian Return Migrants tend to actively carry out entrepreneurial activities when they return to their hometown. Return migrants tended to become entrepreneurs after returning home than those who do not work as immigrants. The causal factor is that immigrants usually work in developed countries whose economic level is higher than the origin country (Démurger & Xu, 2011). Murphy (2000) added that the return migrant's role is very dynamic when they return because they bring new information to the local community and the enthusiasm to build new entrepreneurs. Furthermore, they also encourage broader development for their regions, not only in terms of the environment and infrastructure but also in building rural and urban industries for their regions.

The study attempts to analyze the use of remittance generated by Indonesian Return Migrants. Besides, the authors also explored related to the factors forming the entrepreneurial intentions of Indonesian Return Migrants when they were doing business in the home country. Furthermore, this study also wants to find out how entrepreneurial intentions and the use of remittance can encourage the growth of Indonesian Return Migrant entrepreneurial behavior. Indonesian Return Migrant respondents who were involved as data sources come from three provinces on Java; East Java, Central Java, and West Java. Based on data collected by BNP2TKI (2019c), the following provinces are the three provinces that send the most Indonesia migrant in the period of 2014 to 2018.

Literature Review

Return Migrant

The phenomenon of migrant workers is now something interesting to discuss. The state government considered these migrant workers to be potential investors. The investment was because the amount of remittance received by the state comes from migrant workers. The remittance was believed to be a more effective instrument for income redistribution, poverty reduction, and economic growth of the country compared to regional development programs carried out by the government (De Haas, 2010).

Indonesian Return Migrants are considered to have a positive influence on the development of the home country. Recent literature shows that migrant workers returning to their origin have a high preference for becoming entrepreneurs. Equipped with work experiences abroad, migrant workers returned to their home country with a series of results in the form of experienced human capital and financial capital for them to open a business. In China, return migrants had invested twice as much in

productive agriculture as those who are not migrants. The potential of return migrants also directed work mobility towards non-agriculture with an increase in post-migration skills and abilities. Those who return have a higher human social capacity to mobilize capital that leads to the opening of entrepreneurs (Démurger & Xu, 2011).

The return migrant workers had created many positive aspects of the economy. They have the role of promoting local economic growth. They also became one of the sources of business preservation in the home country. However, the return migrant workers also had a negative impact, including fostering an environment of fierce economic competition that led to social distrust, a high level of exclusivity of post-employment networks, and socio-economic inequality (Anwar & Chan, 2016).

Entrepreneurship

Entrepreneurship is the process of creating value by having together a variety of owned unique resources to take advantage of various business opportunities. In several studies, it had been proven that entrepreneurial strategies contribute significantly to entrepreneurial performance. Entrepreneurship is an essential factor for the company's strategic interests (Omisakin, Nakhid, Littrell, & Verbitsky, 2016). Entrepreneurship is the work of an organization. Entrepreneurs had the opportunity to organize something. Entrepreneurship encompasses the nature of an entrepreneur with a particular set of characteristics and traits (Gartner, 1988). Entrepreneurship is a positive term related to the company's business success. For example, entrepreneurship is related to innovation, proactive action, and risk-taking (Wiklund, 1999).

Entrepreneurial intentions are known as conscious thoughts that precede action and direct all attention in starting a new business. The process of forming intentions in creating a business is the first step that must be done. One model that is very influential in the process of building intentions is the theory of planned behavior (TPB) model. The TPB approach is a model that offers a coherent and generally applicable theoretical framework. This model predicts entrepreneurial intentions by calculating social factors, not just personal factors (Moriano, Gorgievski, Laguna, Stephan, dan Zarafshani, 2011). Intention can be derived from aspects of attitudes towards behavior, subjective norms, and perceived behavioral control. Attitudes toward behavior refer to the extent to which a person has an evaluation or assessment, which states that the behavior is good (beneficial) or not good (unprofitable) when implemented. Furthermore, subjective norms, which are considered as social factors, are related to perceived social pressure when doing or not doing a behavior. Then perceived behavioral control is associated with the ease or difficulty felt by someone in carrying out an action whose assumption reflects the past-experience and the obstacles that need to be anticipated when implemented (Ajzen, 1991). Besides, the role of education is an effective means of promoting and developing entrepreneurial intentions and entrepreneurial activities (Liñán, Rodríguez-Cohard, & Rueda-Cantuche, 2010). Another statement about entrepreneurship said that culture is closely related to entrepreneurial intentions. The culture here is linked with gender as a moderation between subjective norms and entrepreneurial intentions (Díaz-García dan Jiménez-Moreno, 2009).

Entrepreneurship has an essential role in job creation and economic development. Entrepreneurship education is correctly regarded as one of the principal instruments for fostering entrepreneurial behavior (Liñán, Rodríguez-Cohard, & Rueda-Cantuche, 2010). Entrepreneurship, in some literature, has an essential role in community development. The contribution of entrepreneurship to the community has an impact on the development of the economic sector (Omisakin, Nakhid, Littrell, & Verbitsky, 2016). Besides, another positive effect of increasing new entrepreneurs is the emergence of economic growth. Entrepreneurs are considered able to provide new jobs so that indirectly helps reduce the number of unemployed (Stephens & Partridge, 2011).

Remittances

Remittance has a role in the development of the home country. Leon-Ledesma & Piracha (2004) found that the short-term migration of residents of Eastern European countries to Western European countries affected the significance of the establishment of business ventures in the origin country. These funds, along with the funds brought by migrants after returning to their home countries, positively increase

the average production in the home country. Also, remittances have a substantial effect on increasing investment in the origin country. The use of remittance can be one source that can reduce poverty, equitable consumption, and household expenditure. Remittance can also reduce spending on education funds and health services. Remittance is commonly used for savings and investment (Naudé, Siegel, & Marchand, 2017). Remittance may be needed to build (or buy) a house in the origin country. Besides, remittance is also allocated to maintain assets (Carling, 2008). Some forms of remittance beneficial and investments made are to buy greenhouses, rototiller machines, walnut gardens, etc. (Piras, Vittuari, Möllers, and Herzfeld, 2018). In China, per capita income increases with remittances sent to the country by migrant workers. The use of funds specifically for entrepreneurial activities which primarily can increase income in the village (Démurger & Xu, 2011). The remittances are a source of opportunities for entrepreneurs with small and medium enterprises (Anwar & Chan, 2016).

Remittance is a significant source of opening a micro business in the home country. Remittances have a positive effect on the emergence of a business in the household sector. International remittances have significantly and positively contributed and been associated with business ownership. The flow of remittance to the origin country is one of the emergences of new companies, such as start-up firms (Naudé, Siegel, & Marchand, 2017). There is a significant effect on entrepreneurship opportunities for migrant workers returning to their home countries. This effect arises from overseas savings sent to the home country (remittance), which avoids liquidity funds and the length of service abroad. The existence of funds sent to the origin country by migrants was also found to be a factor influencing the high capital to open a business or new venture (McCormick & Wahba, 2001). In line with those statements, Ma (2002) found the positive impact of remittance on investment savings, which was one of the reasons for the economic empowerment of the home country. Remittances also flow to the level of entrepreneurship in the origin country. Entrepreneurial behaviors are becoming wide open with an increasingly significant flow of remittance to their home countries. Remittances also have an impact on capital mobilization, which is an essential aspect of regional entrepreneurial potential.

Methodology

The research design used in this study is qualitative. The research begins with assumptions, general views, and the use of a conceptual framework. This research also studies problems related to individuals or groups that are considered as social problems. This research method is also commonly used because researchers want to find something complicated, detailed understanding, and require exploration of a problem or issue deeply (Creswell, 2007).

This research chooses to use a case study approach in answering the problems. Case studies are empirical research that looks at complex contemporary phenomena in-depth and in real-life contexts (Yin, 2009). Stake (1995) said that there were several stages of analytical methods commonly used in case study research. First, categorical aggregation, namely the stages of grouping various data into categories and classes to find an understanding. In the second stage, direct interpretation is when researchers see data and directly provide an explanation from one perspective, without seeing other data. The interpretation is used to sort the data one by one, and later it will be put back together. The third stage is establishing a pattern and examining relationships between data in several categories. The purpose is to help researchers to see the differences and similarities of the cases studied. The last stage, researchers make a naturalistic generalization of the analyzed data, so that the case studies conducted can be concluded in the application of other cases (Creswell, 2007).

In this research, the respondents are the Indonesian Return Migrant, who has returned to their home country. These respondents came from 3 districts located in 3 provinces, namely Karawang district of West Java province, Kendal district of Central Java province, and Blitar district of East Java province. In each area, FGDs were carried out in each group of respondents with the composition of Karawang regency 12 respondents, Kendal regency nine respondents, and Blitar district 13 respondents. The total number of respondents involved in this study were 34 people, consist of 9 males and 25 females of Indonesian Return Migrant.

Most of the Indonesian Return Migrant respondents have already run their businesses. Before returning to Indonesia, all of the respondents used to work in different countries abroad. The origin countries abroad of respondents were South Korea, Saudi Arabia, Taiwan, Singapore, Hong Kong, Malaysia, Qatar, and Oman. The professions carried out by the Indonesian Return Migrant also varied. Most of them worked as domestic workers. Some worked as caretakers for children and the elderly, whereas the others are factory workers, ship and fisheries laborers, farming workers, and stone factories.

FGD data collection was conducted from March 26 to September 14, 2019. The guiding questions in conducting interviews and the FGD process in this study used the form of semi-standardized interview questions or what is called semi-structured interviews. Tod (2006) explained that the semi-structured interview process still uses guiding the discussion with predetermined topics. However, it is still possible to provide responses and unexpected problems by giving open questions to the interviewees (Ryan, Coughlan, & Cronin, 2009).

Several questions were asked in the FGD guidelines and interviews. The guiding points are accompanied by a description of what needs to be deepened at each point. In the FGD question, there are eight guideline points, including the reasons, activities, and experience of becoming an Indonesian Return Migrant; the use of remittance funds; entrepreneurial support; individual quality, and suggestion for return migrants. In the interview questions, there are six points raised, namely the reasons for becoming Indonesian Return Migrant, the use of remittance funds, goals, experience support and obstacles in starting a business, and suggestion for Indonesian Return Migrant.

Results and Discussion

The use of remittances beneficial

From the analysis conducted, the purpose of remittance at the Indonesian Return Migrant is very diverse. In general, the use of remittance is used to purchase assets, invest, be saved, help families, and support entrepreneurial activities. First, Indonesian Return Migrant uses remittance to buy assets. Assets become one of the priorities for Return migrant workers in using remittance. Land and houses are the options from most Return migrant workers to buy. For those who previously owned land, the remittance is used to repair the home. Other than that, for Return migrant workers who already had a house before they leave, the funds they got are used to improve the house. Furthermore, other assets that are targeted to be purchased by Return migrant workers are vehicles such as motorbikes and pick-up cars. These assets purchased is aimed to keep the remittance did not just run out. Carling (2008) explained that the house is the most common asset owned by migrant workers in their home country. Remittance may be needed to build (or buy) a house at their origin, and it is also used for further maintenance. Parinduri & Thangavelu (2008) showed that shipping money allows for an increasing income and value of assets. Assets purchased by migrant workers tend to be in the form of houses and jewelry.

> *I also buy a land and a house only, just a house and land. I buy a land first ... after the land, next, build a house.* (A12, Karawang, Female, 16 June 2019)
>
> *Yes, built a house* (B8, Blitar, Female, 20 July 2019)
>
> *Yes, I save the money right away, send it, use it to repair the house, and buy a vehicle* (B Together, Blitar, Male and Female, 20 July 2019)

The second use of remittance owned by the Indonesian Return Migrant is to invest. The investment made by Indonesian Return Migrant is based on the results of the previous analysis, which is to buy rice-fields to work on. Besides, when they do not have enough costs to buy, they tend to rent rice fields. In investment, the rice fields, Indonesian Return Migrant, also usually chose investments in livestock. Investment in cattle is the easiest and most common method of investment by Return migrant workers in the origin area. In line with Piras, Vittuari, Möllers, and Herzfeld's research (2018), which stated that

there are several choices for migrant workers to invest in the agricultural sector. Some options that become a trend are buying dairy cows, agricultural machinery, and agricultural land.

> *But I'm afraid if I lend it, the money will not return. Later, after the debt increases, he moved to another shop to borrow again. Nah, I'm afraid it will be like that, so the capital is useless. I better buy a rice field. If I buy a rice field, my enemy is only 'planthopper,' rat, but my rice-field is still there. Only the rice field income is reduced.* (B8, Blitar, Female, 20 July 2019)

> *Yes, if I have a job, then I'll do it. If I don't have it, I just have a goat in cattle so that my money will be growing, hehehe. If the goat has a lamb and it's already big, it can be sold so that it will make income for me* (A8, Karawang, Female, 16 June 2019)

Furthermore, some Return migrant workers use remittance to keep and saved. Some store it conventionally, but some of them keep it in the bank. The funds deposited are related to the long-term needs that will be used by Return migrant workers when they return to their home countries. Naudé, Siegel, & Marchand (2017) explained that remittance could be used for savings and investment. In many developing countries, the existence of remittance can be a solution to the shortage of venture capital and is invested through small and medium businesses. When the development of the financial sector is weak, the existence of remittance can be mean to strengthen a region's economic growth.

> *Some of it, I use to help my parents, the other I save myself. I have savings. Here at the bank, sir. The money was sent here sir..* (C4, Kendal, Male, 14 September 2019)

> *Yes, I have money saved. Yes of course* (A2, Karawang, Female, 16 June 2019)

The Indonesian Return Migrant also used the remittance to help families in their home countries. This factor is a motivation for them to send remittances. For them who are single when they work abroad, the funds tend to be used to help their extended families; including parents, siblings, and others. Démurger & Xu (2011) explained that remittance helps reduce the problem of rural poverty. People's income in the area increased because of remittance sent by one of the family members. Next, Naudé, Siegel, & Marchand (2017) explained that the remittance could be the source in reducing poverty, equaling the distribution of consumption and household expenditure in the origin area.

> *It is to help my parents because our economy is not as good as others, Sir. So I use it to help my parents. And others to fix the house. For the house, ya, and then helping my parents. After that, the main one is helping my sister in school.* (C2, Kendal, Female, 14 September 2019)

> *Sometimes I like to lend my money to others first* (A2, Karawang, Female, 16 June 2019)

> *For my son. Nothing for others. The money is mostly for children* (C5, Kendal, Female, 14 September 2019)

Finally, the remittances have contributed to support entrepreneurial behavior. Many Return migrant workers returned abroad and decided to open their businesses. The typical business to make is opening a shop or store. The other efforts they do after returning relate to the skills they got. Some Return migrant workers who have expertise on farms, tend to open businesses in the field. The other is creating a cake shop or mini restaurant relating to cooking skills. Ma (2002) found that remittances have an impact on capital mobilization, which is vital to strengthen regional entrepreneurial potential. Naudé, Siegel, & Marchand (2017) also explained that the flow of remittance to the origin country became one of the supports for the emergence of new companies and businesses. They mentioned that the international remittance has significantly and positively contributed and is associated with new business owners.

> *Sell vegetables.., sell vegetables..., selling vegetables from house to house. Well, instead of going to the rice fields, it's good to go to the market. Every day, walking around before dawn,*

> *I already departed. then I arrived home at nine in the morning.* (B8, Blitar, Female, 20 July 2019)

> *I am selling cakes, from house to house. I trade cakes from house to house.* (A2, Karawang, Female, 16 June 2019)

> *No, when I go home, I find out what business opportunities from my friends. There are many opportunities to raise quail. I finally joined, raising quails. Then I only sell the eggs. Just sell the eggs*. (B7, Blitar, Male, 20 July 2019)

> *That's all. after I am home, I got the idea. No, it's not an idea from my parents but mine. I buy a tool to climb the mountain. I rented these tools to my friends.* (C10, Kendal, Male, 14 September 2019)

The Establishment of the Entrepreneurial Intention

Based on the results, it is mentioned that Attitude, Subjective Norms, Perceived Behavioral Control, and Education played a role in the formation of Entrepreneurial Intention to the Indonesian Return Migrant. The findings of Attitude, Subjective Norms, and Perceived Behavioral Control in building entrepreneurial intentions have been discussed in many kinds of literature. Ajzen (1991) provided a general explanation related to the theory of planned behavior (TPB). He said that entrepreneurial intention influenced by Attitude, Subjective Norms, and Perceived Behavioral Control. Besides, Moriano, Gorgievski, Laguna, Stephan, and Zarafshani (2011) in their research stated that the formation of entrepreneurial intentions could be predicted by referring to the theory of planned behavior (TPB). Díaz-García and Jiménez-Moreno (2009) also mentioned in their research that attitudes towards entrepreneurship, subjective norms, and self-affirmation in entrepreneurship (entrepreneurial self-efficacy / perceived behavioral control) have a significant relationship to entrepreneurial intentions.

> *Yes, if I have a job, then I do it, if I don't have it, I just have a goat in cattle so that my money will be growing, hehehe... If the goat has a lamb and if it's already big, it can be sold, so it's income for me ...* (A8, Karawang, Female, 16 June 2019)

> *When I was there, I had work. So, if I'm home and there's no work, it doesn't feel right, I'm used to working. If I work, there will be income. If I am just at home, there will be no income, so I'm confused. *laugh*. If there is no income, it makes me feel hard.* (B8, Blitar, Female, 20 July 2019)

> *My neighbor. He said that I have good sales talent. It means, my neighbor gave me support to become an entrepreneur* (C2, Kendal, Female, 14 September 2019)

> *Because my deceased sister has a shop.* (A2, Karawang, Female, 16 June 2019)

> *I followed my husband. Then, it turns out that being in business is fun. Now I enjoy my work.* (C2, Kendal, Female, 14 September 2019)

> *Well, instead of going to the rice fields, it's better for the market*. (B8, Blitar, Female, 20 July 2019)

Education plays a role in the formation of entrepreneurial intentions. The intended education is in the form of specific skills training for Return migrant workers. From the analysis, when return migrant workers trained themselves with particular skills, they will build self-desire to do business (entrepreneurial intentions). The training can be accessed during migrants abroad or the skills they train when returning to Indonesia. Rodríguez-Cohard and Rueda-Cantuche (in Liñán's, 2010) have explained the factors that influence the level of entrepreneurial intentions, and one of the elements is

entrepreneurship education. This study showed that the role of education is an effective means of promoting and developing entrepreneurial intentions and entrepreneurial behavior.

> *From friends. I learned from friends, and then I continued to study in Indonesia. I am not yet skilled, but I am desperate ... Yes ... until finally there is a friend who invites. Let's learn to make kebabs ..* (C3, Kendal, Male, 14 September 2019)

> *There is a business idea. Catering business. When I was in Taiwan, there was often cooking training* (C11, Kendal, Female, 14 September 2019)

Entrepreneurial Intention and Remittance Beneficial that Supports the Entrepreneurship Behavior

In this discussion, it can be concluded that the entrepreneurial intentions of Indonesian Return Migrant and the use of remittance contribute to support entrepreneurial behavior after returning. It was explained that entrepreneurial intentions were a strong predictor of the entrepreneurial behavior of Indonesian Return Migrant. Moreover, the use of remittance also promotes entrepreneurship behavior carried out by Return migrant workers in the origin area.

Entrepreneurial intentions play a role in supporting the formation of entrepreneurial behavior of Return migrant workers. Entrepreneurial intention possessed by Indonesian Return Migrant can be seen from the business planning, entrepreneurial commitment, and the enthusiasm before starting a business. This entrepreneurial intention has an essential part in shaping the entrepreneurial behavior of Return migrant workers. These findings are supported by Moriano, Gorgievski, Laguna, Stephan, and Zarafshani (2011), who declared that entrepreneurial intentions are conscious thoughts that occur before a behavior and these thoughts direct someone to start a new business. The process of forming intentions (entrepreneurial intentions) in making an entrepreneurial activity is the first step that must be done. Referring to the theory of planned behavior (TPB), Ajzen (1991) stated that an intention is the only best predictor of behavior. The statement is in line with the entrepreneurial intention, which is considered as one of the most appropriate indicators in predicting entrepreneurial behavior. Krueger and Carsrud (1993), in their research, tried to apply the theory of planned behavior (TPB) in entrepreneurship. One of the findings in the study conducted is that entrepreneurial intentions can be used in measuring and predicting entrepreneurial behavior.

> *Yes, I thought about it. I have planned it before. I am already planning by myself. There is no influence from friends. I just want to have a business. I want to be an entrepreneur .. If it doesn't exist ..., initially his wife didn't want to. Finally, I have done it myself. I do my own business.* (C1, Kendal, Male, 14 September 2019)

> *Yes, before I left, there was a sewing job. The intention was to go abroad, opening convection, and it arrived there. I don't know. I already have money, why do you want to open a shop. Gitu. then I am not skilled in sewing. *laugh*. Heeh, Before going to work abroad, I already thought of finding capital for business. Well, so my parents used to be a trading company. I went along with parents, maybe it fits there. If I sew, it's just one or two jobs.* (B8, Blitar, Female, 20 July 2019)

> *I have do want to do business, but I don't know what kind of business ... It's like this ... yes, but one house sells kebabs. I learned from friends, and then I continued to study in Indonesia. I am not yet very skilled, but I am desperate. That's not it ... No, no. I study by myself. But there is no idea yet .. yes there is an intention ..* (C3, Kendal, Male, 14 September 2019)

The next results used to answer the research questions about the remittance of Return migrant workers in contributing the entrepreneurial behavior. Ma (2002) settled that remittance will have an impact on capital mobilization as an essential aspect of regional entrepreneurial potential. Démurger and Xu (2011) said that income per capita in China increased with remittances sent to the country by migrant workers. The usage of funds significantly escalates the entrepreneurial activities that cause income in the origin village. Leon-Ledesma & Piracha (2004) found that the short-term planning of Eastern European countries to Western European countries affected the establishment of business ventures in the origin country.

> *Because of my husband. My husband has five years of experience working at a cellphone counter. Yes, I used to work at a cellphone counter ... if my husband has the soul of a businessman. So, if he has some capital want to open a business, it will suit him. So, I ... Hehehe. So, I followed my husband. Oh, I just found out that entrepreneur people are fun.* (C2, Kendal, Female, 14 September 2019)

> *I use the funds to sell fried meals ... yeah ...* (A3, Karawang, Female, 16 June 2019)

> *Here it is. This is a big shop. Selling mobile credit too, I bought it there. He also opens a mini shop.* (B8, Blitar, Female, 20 July 2019)

Conclusion

The Indonesian Migrant Worker had economic potential with remittance while working abroad. With the remittance, Indonesian Return Migrant has the potential to open new businesses. The creation of new businesses was also a factor that encouraged the growth of the Indonesian economy.

In this study, Indonesian Return Migrants received remittance when they work abroad. The remittance was used for various needs by migrant workers. First, remittances are used to buy their assets in their hometowns, such as land, houses, and vehicles. Then, the remittances are used for investment by migrant workers. Forms of investment carried out, such as buying rice fields and livestock. This investment is typical for community investment in rural areas. Next, the remittance obtained is also used to help families in their hometowns. The family can be parents, siblings, spouses, and even children who are left behind when they work. Furthermore, the remittance is partly deposited by Indonesian Migrant Workers in the form of savings. These savings are used for their future needs. The remittance is also used by Indonesian Migrant Worker when they return to their hometown to open a new business.

This study also discusses the formation of entrepreneurial intentions in Indonesian Migrant Worker. The intention is formed from several factors, which are in line with the Theory of Planned Behavior by Ajzen (1991). The elements of entrepreneurial intentions that fit the theory are attitudes towards behavior, subjective norms, and perceived behavioral control. The other findings from this study are the education or training that found to be a factor building entrepreneurial intentions in Indonesian Return Migrant.

The final result of this study is that remittance and entrepreneurial intentions contribute to the formation of entrepreneurial behavior. The remittances gained by Indonesian Return Migrants are utilized as venture capital to open a business when returning to their origin country. The factor of entrepreneurial intentions is also a factor driving the formation of entrepreneurial behavior. In choosing a business, there are various businesses built by Indonesian Return Migrants, such as opening a shop, opening a food stall, opening a farming business, and selling food.

Based on the results of the study, it can be seen that there are several recommendations for BNP2TKI, who are responsible as Indonesian Migrant Worker processors. First, many factors can be the reason for the use of remittance funds among Indonesian Migrant Workers, either to improve their welfare, to

help families in general, or to seek capital (financial or experience) in building a business. Therefore, it is essential for Indonesian Return Migrant, Indonesian Migrant Worker, or prospective migrant workers who will go abroad to be equipped with financial management skills for them. BNP2TKI has a role in providing these provisions and abilities before the Indonesian Migrant Worker departs for overseas migration.

Furthermore, it is known that one of the factors forming entrepreneurial intentions is training related to specific skills acquired by Indonesian Return Migrant. In developing entrepreneurship, the Indonesian Return Migrant, the government, specifically BNP2TKI, needs to make a severe effort of providing skills training for Indonesian Migrant Workers and Indonesian Return Migrants. The training provided is not only for Indonesian Return Migrant but also for Indonesian Migrant Worker families who will go abroad. It is related to the remittance funds that will be received by Indonesian Migrant Worker families in the origin country so that the funds received can be used as business capital later. A series of training for both Indonesian Return Migrant and Indonesian Migrant Worker families also aims to enable entrepreneurial intentions to emerge, which in turn will encourage entrepreneurial behavior.

The final impact of the results of this study is that there are contributions from remittance funds in the formation of entrepreneurial behavior. In this context, financial capital owned by Indonesian Return Migrants can be a driver for forming new businesses when they are home. The government, in this case, BNP2TKI, can provide a variety of tangible support for entrepreneurial activities carried out by Indonesian Return Migrant. The support provided can be in the form of convenience in providing entrepreneurship training, the creation of business groups for Indonesian Return Migrant, explaining the potential for business development in the origin country of Indonesian Return Migrant, and also assistance in terms of additional business capital. These supports are very influential for Indonesian Return Migrants, whose purpose is to develop the business they have built.

Abstract

Indonesian return migrant workers are expected to have a great potential to be developed as entrepreneur. Their social remittance can be leveraged in entrepreneurship activities when returning home to stimulate economic growth. The purpose of this study is to examine how the Indonesian return migrant workers use the social remittances gained during migrating abroad to develop their entrepreneurship activities after returning to their hometown. The study was conducted using a qualitative approach and applying interviews and focus group discussion (FGD) methods for the Indonesian return migrant workers in Blitar (East Java), Kendal (Central Java), and Karawang (West Java) regions, which were major sources of the Indonesian migrant workers. The results show that the social remittances brought by migrant workers to their home region have played a role in encouraging the entrepreneurship of Indonesian return migrant workers. The results of the study can be used as alternative consideration to policy makers in making development policy and programs for Indonesian migrant workers, especially those who have returned to Indonesia.

Keywords: Entrepreneurship, Social Remittance, Return Migrant Worker

Introduction

The sending of workers abroad is one of the strategies undertaken by the Indonesian government to overcome the problem of unemployment and limited domestic job opportunities. The number of Indonesian migrant workers and the amount of remittances always show a trend of rising incomes every year (BNP2TKI, 2019). The large number also shows how significant the role of Indonesian migration workers as a substantial contributor to increasing foreign exchange for the country. In addition to the large number of Indonesians who migrate abroad to work; on the other hand, many Indonesian migrant workers have completed their work contracts abroad and returned to their home regions. Researches explain that remittances from abroad are one of the important factors that help economic growth and have a significant effect on poverty alleviation in a country (Azam, Haseeb and Samsudin, 2016). The combination of financial and social remittance of migrant workers is a valuable asset for economic reintegration of the return migrants (Yuniarto, 2018). Indonesian migrant workers mostly come from rural areas which concentrated in several regions. Based on data from BNP2TKI (2019), the majority of Indonesian migrant workers come from the provinces of East Java, Central Java, and West Java.

Return migrant workers have great potential to be developed (Adams, Richard H. and Cuecuecha, 2010; World Bank, 2017; Pauli and Osowska, 2018). Migrant workers provide financial remittances which can be invested in economic activities when returning to their home regions to stimulate economic growth through their entrepreneurial activities (Spitzer, 2016). In addition to financial remittances, return migrant workers also bring home additional knowledge, skills, experiences, norms and values, and social capital gained while working abroad (Grabowska, Garaphic, Jazwinska, & Radziwinowiczowna, 2017; Levitt & Lamba-nieves, 2011; Peth & Sakdapolrak, 2019). These non-

financial transfers were defined by Levitt (1998) as social remittances or the diffusion of ideas, norms, values, practices, and social capital to the origin country. Benefitting from the financial remittances and social remittance while they work abroad, return migrant workers are expected to be self-employed or to enter the field of entrepreneurship after returned to their home region.

Researches on the entrepreneurial potential of migrant workers still evolve. Most studies for Indonesian migrant workers relating to entrepreneurship discuss about the allocation and management of remittances and the role of financial remittances in the economic perspective(Adams, Richard H. and Cuecuecha, 2010; Anwar, 2013; Primawati, 2017; Mas'udah, 2019). While there are still little discussions on how social remittances affect the entrepreneurship of migrant workers or about experiences gained by migrant workers that are useful to be applied in Indonesia. Therefore, we conduct this research to answer this gap. In addition, the results of previous studies are still inconclusive, so further research is needed to explore how the forms of social remittances obtained by migrant workers and their effects on entrepreneurship. This research will present descriptive data on how social remittance (such as ideas, values, skills, knowledge, or experience) can support the entrepreneurship of Indonesian migrant workers.

Literature Review

Entrepreneurship

Entrepreneurship is firstly mentioned in the early 18th century by a French theorist. Richard Cantillon (1755, in Bjuggren, Johansson and Stenkula, 2012) defined entrepreneurship as self-employment of any sort, referring to a risk-taking person who bought goods for a certain price and sold them for an uncertain price in the future for an expected profit. Since Cantillon, several economists tried to develop a theory about entrepreneurship. The most popular view of the entrepreneur in economics has been developed by Joseph A. Schumpeter in the 20th century. According to Schumpeter, an entrepreneur does not always mean a trader or manager but also a unique person who has the courage to take risks and introduce innovative products and new technology into the economy (Suryana, 2013). For Schumpeter, the entrepreneur is the individual carrying out new combinations, introducing new products or processes, identifying new export markets or sources of supply, even creating new types of organization (Olim, Mota and Silva, 2015). In accordance with its development, the concept of entrepreneurship has special characteristics, such as having the ability to create something new and different (creativity and innovation), organizing, taking risks, results-oriented, always creating opportunities, personal satisfaction, and independent.

Another definition by Hisrich, Peters and Shepherd (2017), entrepreneurship is the dynamic process of creating additional wealth by individuals who dare to take major risks with the conditions of reasonableness, time, and career commitment or the provision of added value for goods and services. These products and services do not have to be new or unique, but they must, however, be established by entrepreneurs by accepting and putting skills and resource needs (Hisrich, Peters and Shepherd, 2017).

In empirical research the rate of entrepreneurship is commonly estimated using the self-employment rate or other measures of small business activity (Henrekson and Sanandaji, 2013). However, many of the self-employed are not entrepreneurial in the Schumpeterian sense, especially when they do not bring a new innovation to the market and do not plan to grow their business. Piracha & Vadean (2010) try to distinguished self-employment as either own account workers and entrepreneurs and compare their differences in Albanian migrant workers. This difference is important because self-account workers tend to have a weaker direct effect on employment (and hence growth) compared to entrepreneurship. If this also applies to migrant workers returning to their home regions, then their economic impact on the household economy will be weaker than expected (Piracha & Vadean, 2010). Despite decades of academic research, Schumpeterian entrepreneurship remains a subtle concept, difficult to define exactly and harder yet to measure (Henrekson and Sanandaji, 2013).

Migrant Workers Entrepreneurship

Some previous studies related to the relationship between migrant workers returning to their countries of origin and entrepreneurship gave several results that tended to be the opposite. An argument that supports migrant worker entrepreneurship is the opinion of Neville, Orser, Riding, and Jung (2014) who believe that a migrant worker will tend to be less risk-averse, or not refuse to take risks, this is illustrated by the actions of those who dare to go abroad alone to try their luck as migrant workers. Migrants are also seen to be able to see business opportunities as they have previously been able to see opportunities to work abroad (Hart and Acs, 2011)

Pauli and Osowska (2018) point to the important role of migration in the decision to start a business because almost half of the respondents surveyed formulated business ideas during migration. Capital gains that influence the development of entrepreneurial potential are mostly observed in terms of financial and human capital, with relational capital only applied to business ideas. Human capital is important because it is the assets that individuals acquired through their investment in schooling, on the job, and in other kinds of experiences (Rauch and Rijsdijk 2013). Migrant workers learn new things while abroad, in addition to collecting savings and building foreign relations, which can also make it easier to start a new business after returning to their home country (Marchetta, 2012).

On the other hand, other studies explain that a migrant worker should not be seen as a super-entrepreneur because not all migrants tend to be more entrepreneurial than non-migrants (Naudé, Siegel, & Marchand, 2017). When leaving abroad, most of migrant workers are low-skilled, low-educated, and they generally departed to become a migrant worker only to meet the needs of domestic workers or other work in the destination country (Busro, 2017). Return migration leads to self-employment not because of financial and human capital acquired abroad but because of barriers in the local labor market, which might limit return migrants' access to salaried employment (Levy, 2008). This can explain why migrant workers are not interested in entrepreneurship after returned. There are two conditions needed to maximize entrepreneurship and resource opportunities of migrant workers returning to their home countries to be successful, including: (1) conditions relating to how a former migrant worker can obtain and apply the knowledge that they gained during the migration process and learn to apply it when returning to their country of origin, (2) a return migrant worker needs to develop capabilities and adaptation strategies to maintain his economy after returning to their village or region of origin (Yuniarto, 2018).

Recent entrepreneurial research on Indonesian migrant workers discusses the relationship between return migrant worker and their economic reintegrating strategy. Most recent research discusses how the financial remittances sent by migrant workers significantly affect the lifestyle of their families in the area (Mas'udah, 2019). Yuniarto (2018), in his research, concluded that the combination of financial support and knowledge into entrepreneurship is a valuable asset in the economic reintegration efforts of return migrant workers in their home villages.

Social Remittance

Levitt (2001) introduced the concept of social remittances, which is defined as the ideas, behaviors, identities and social capital that flow from receiving to sending-country communities. Previous research also explained social remittances as a term for non-financial assets that obtained as a result of overseas migration and then transferred back to others in the area of origin (Levitt, 1998). This because migrant workers can interact more with the people in the destination country and learn more quickly and effectively and are better able to reflect on their application than those who merely observe. Within the scope of migration theory, de Haas (2010) explains that social remittance is a feedback process in migration system theory. In the same study, it mentions that social remittances are contextual and commonly referred to as forms of cultural change that are driven by migration. Migration through confrontation with other norms and habits can influence the formation of identities, norms, values, and behavior in the area of origin of migrant workers, mainly when migration is associated with social and material success (de Haas, 2010).

Levitt & Lamba-nieves (2011) emphasize how migrant workers' experience before going abroad, and the ideas and practices they bring will affect the type of remittance they send back. Social remittance is cultural and social, which circulates continuously and repeatedly, rather than moving in one direction. Besides, the study also shows how social remittances from previously influential in the household sphere, but it can also extend to regional and national and impact on other habits. Levitt (1998) categorised them into three domains: (1) normative structures (ideas, values, beliefs that include norms of behaviour, the notion of family responsibility, principles of neighbourliness, community participation, aspiration for social mobility); (2) systems of practices (actions shaped by normative structures such as organisational practices: recruiting and socialising new members, goal setting and strategising, establishing leadership roles, and forming interagency ties; including how individuals delegate household tasks and how much they participate in political, religious and civic groups (acts, actions, rituals); (3) social capital based on values and norms which form the resource for collective actions and facilitates the circulations of norms and values.

The mechanism for transmitting social remittances differs from the type of spread of global culture in several ways (Levitt, 1998). Grabowska, Garaphic, Jazwinska, & Radziwinowiczowna (2017) once tried to explain the concept of stages and models of the social remittance transfer process by identifying the main stages of the social remittance transfer process (i.e., acquisition, transfer, and impact) and other related modalities (such as resistance, imitation, and innovation). Furthermore, Peth & Sakdapolrak (2019) try to improve by distinguishing social remittances into intangible social remittances and integrated social remittances (incorporated social remittances). First, intangible social remittances which include information, the reflection of norms and values, differences in perspective, ways of doing things, and generally new ideas. Second, there are more tangible and incorporated social remittances, such as new skills and knowledge to be transferred and used when migrants return to their home regions or migrate again to a place where they can practice their skills and knowledge. The process of acquisition and transfer of social remittances is closely related to migration activities Peth & Sakdapolrak (2019). In the process of transferring social remittances, there are particular prerequisites or conditions (for example, social closeness during migration) that apply and obstacles to overcome.

In the context of Indonesian migrant workers and entrepreneurship, several studies have discussed entrepreneurship among Indonesian migrant workers who have returned to their home regions. However, most studies are focused more on the management side of migrant workers' financial remittances and the role of these remittances from the perspective of economic development (Mas'udah, 2019; Spitzer, 2016). Another study found that workers from Java who migrated to South Korea had several positive effects on their attitudes, such as discipline, diligent, and hardworking. These social remittances are useful for various purposes, including production, consumption, and economic investment (Anwar, 2013). Other studies use the term knowledge remittance as a more specific form of Levitt's (1998) approach to social remittance, and try to see its effect on self-employment career choices in migrant workers in Indonesia (Supriyanto, 2017).

Methodology

Qualitative approach is conducted to give a better understanding of how social remittances play a role in supporting Indonesian return migrant workers' entrepreneurship. Qualitative research is designed to tell researchers how (process) and why (meaning) things can occur (Cooper and Schindler, 2014). The qualitative method in this study was to obtain an overview and information of data in more depth with a thematic approach. A thematic approach is a method for identifying, analyzing, and reporting themes that are patterned in a phenomenon (Boyatzis, 1998). This method can provide a detailed description of the research theme. The thematic approach is one of the methods used in processing qualitative information.

Data collection methods used were group discussion forums (FGD) and interviews. FGD respondents in this study were migrant workers who had returned to their home regions, namely Karawang, Kendal, and Blitar. The three regions are located in top three provinces in Indonesia (East Java, Central Java,

and West Java) which contribute highest number of Indonesian migrant workers. In the process of selecting respondents, we used a purposive sampling technique. Purposive sampling is one of the most common sampling strategies for selecting groups of participants according to previously selected criteria that are relevant to particular research questions (Wahyuni, 2015). Respondents' backgrounds are return migrant workers who both have a business and who do not have a business. In each FGD group, there were 9 to 13 respondent participants who were female and male. The respondents have worked in different countries for at least two years. Moreover, to gain a deeper understanding related to the entrepreneurship of migrant workers, this study conducted interviews with three expert respondents in the field of entrepreneurship. The three respondents comprised Head of the Center of Small and Medium Enterprises (SME) of the University of Indonesia, a lecturer of the Faculty of Economics and Business (FEB UI) who teaches entrepreneur class, and a marketing expert who earned a doctorate degree in marketing.

This research uses one software program to assist in sorting and organizing data. QDAS (Qualitative Data Analysis Software) is a software or computer program to help the process of qualitative research analysis. The software can enable researchers to work efficiently with complex coding schemes and large amounts of text, facilitating depth and sophistication of analysis (King, 2004). According to Creswell & Poth (2018), computer programs are most helpful in research with extensive data - such as more than 500 pages - although it can also provide more value with less data. The data in this study were in the form of transcripts from 3 FGD groups, with a total of 154 pages and seven interview transcripts with a total of 192 pages. Although it does not reach 500 pages, the use of a computer program is sufficient to be used and can provide additional findings which not found through manual analysis. Data processing techniques in this research used NVIVO 10 software. The analysis technique in this study is based on the results of the reduction (coding) and data presentation, which is carried out both manually and the results of data processing using NVIVO 10 software. NVIVO 10 provides a unique advantage for creating a data category indexing system called a "node." We use NVIVO 10 software to make it easy to analyze the results of interviews, FGDs, and literature studies in sections or sub-sections related to analyse the entrepreneurial potential of migrant workers.

Validity and Reliability

Several studies have tried to establish methods for the validity and reliability of qualitative studies. Researchers can choose a validation technique that is preferred but uses several, or at least two validation strategies (Creswell & Poth, 2018). Validity in qualitative is an attempt to examine the accuracy of research results by applying particular procedures (Creswell, 2016). In this study, there are several strategies to validate the research process. The first is triangulation, which is a process that involves corroborating evidence from various sources to explain a theme or perspective (Creswell & Poth, 2018). This research involved several researchers in the process of data collection and FGD (researcher triangulation) collected from three different districts namely Blitar, Kendal, and Karawang (location triangulation), as well as two data collection methods, namely Focus Group Discussion and interviews with return migrant workers (triangulation method). The researchers have also interviewed four respondents from return migrant workers as a form of triangulation of methods. We interviewed respondents with some open questions to produce in-depth answers interspersed with closed questions to get specific and precise information. Another strategy to support the validity of qualitative research results is to make detailed and concise descriptions (Cresswell, 2016).

Reliability refers to how far the results of this study can be replicated (Merriam and Tisdell, 2016), in terms of how the results of the study will be consistent based on data collected in the study. According to Merriam and Tisdell (2016), to ensure reliability, researchers must describe in detail how the research was conducted and how the data was analyzed. In this study, the authors describe in detail systematic research and data analysis methods in the research methodology chapter. Creswell (2014) states that qualitative researchers need to document case study procedures and as many steps as possible in those procedures. Therefore, Wahyuni (2015) advises researchers to make study protocols, or guidelines, as a tool to ensure that there is consistent treatment throughout data collection and analysis. This study developed an FGD protocol to guide the research team. The researchers has also compiled a simple codebook that contained explanations of the categories in the study to help coding in this thematic

analysis remain consistent throughout the analysis process. Codebooks are useful for maximizing coherence between codes or categorization in research (Cresswell, 2016).

Results and Discussion

Based on interview with three expert respondents in the field of entrepreneurship, data analysis was carried out, including the use of NVivo 10 for coding. The process has created several nodes classified into internal factors and external factors that support entrepreneurship. The internal factors consist of effectiveness, risk profile, cognitive adaptability, affordable loss, risk profile, proactive personality, learning from failure, self-efficacy, innovative and creative, structural thinking, opportunity oriented, capital, growth-minded, and complacent nature. As external factors comprised access to information and communication and crisis effect (see figure 1).

Fig. 1 : Node Mapping Determinant Factors of Entrepreneurship

Of the three respondents interviewed, all of them have provided similar opinions that risk profile and opportunity orientation have a role in supporting entrepreneurship. Entrepreneurial activity involves, by definition, taking risks of some type (Fernandes *et al.*, 2018). According to Kuratko (2016), a successful entrepreneurs are a very calculated risk taking. Opportunity orientation is the nature of someone who is always observant in seeing opportunities that exist. This also supports the opinion of Stoner (1997, in Rusdiana, 2018), which states that an entrepreneur is aware of opportunities that are not seen or ignored by other business executives. Opportunity orientation is a constant awareness of the opportunities that exist in everyday life, where a successful entrepreneur starts from an opportunity and lets their understanding lead to other important issues (Kuratko, 2016).

Neville, Orser, Riding, and Jung (2014) argue that a migrant worker may be less risk-averse, as is evident in their decision to migrate which is also a risky activity. Also, Hart and Acs (2011) argue that migrants can see business opportunities as they have previously been able to see opportunities for migration. However, based on the results of the FGD, it shows that not all return migrant workers have

a preference or a tendency to take risks and be keen to see opportunities. Some migrant workers have succeeded in developing their business by borrowing money, or they have succeeded in seeing opportunities in their area. However, there were return migrant workers who were hesitant to open a business and decide to become a farmer, as it has lower risk.

From FGD we found that one of the reasons for return migrant workers to set up a business is economic pressure (crisis effect). This is also in accordance with the findings of the interview by one expert that the crisis effect is also one of the drivers for entrepreneurship. However, the results of the interview also found that the criteria for entrepreneurial success can be seen from how their business developed and how they funded the business, whether from investment or own capital. We found that most return migrant entails the creation of microenterprise and are closer to self-employment with necessity entrepreneurship (individuals who choose to pursue entrepreneurial careers given lack of other employment opportunities) instead of based entrepreneurship (defined as entrepreneurial activities involving a pursuit of a perceived business opportunity even when other employment options are present) (Zheng and Musteen, 2018). Respondents have lower affordable lost and hesitate to take the risk of borrowing money from bank or saving and loan cooperatives to develop their businesses. In addition, the crisis effect prevented the respondents to develop because they feel satisfied as long as their business survives.

> *I am afraid of being in debt. Uh huh (in debt). Yes, I prefer to start a small business as long as it is from my own money. If we take it in the saving and loan cooperative, we will be at risk. We should leave guarantees. Also we are still new to this business. It's good if we are optimist that we can. If not, then I don't know how we should pay the saving and loan cooperative later.* (Respondent E, Return migrant worker, FGD in Kendal, September 14, 2019)

> *As long as we can finance our daily needs, that's enough. The important thing is to eat for every day. Although it is difficult to collect a lot of money, but thank God we can still survive. That is it.* (Respondent K, Return migrant worker, FGD in Kendal, September 14, 2019)

Nevertheless, there are also return migrant workers who have successfully expanded their businesses. This return migrant workers were also previously had several other businesses before developing his current business, but was unsuccessful because the product was less attractive to consumers. These return migrant worker learned from previous failures and sees other opportunities by utilizing existing resources.

> *Previously I tried selling seaweed crackers, that time I got coached by the government, the office of fisheries and marine, which was in Depok. But in the past the demand was limited and it is not successful.... So I now have changed to sell lemon syrup. Thanks God, it worked. From the first time selling seaweed, I've borrowed money from a financial institution. For seaweed crackers I have borrowed 5 million rupiahs. The second time, I have borrowed 15 million rupiahs. Just yesterday I borrowed 100 million rupiahs for lemon syrup business ... because I'm considering its developments too.* (Respondent S, Return migrant worker, Interview, Jakarta, May 24, 2019)

Some reasons for respondents to open a business are because of crisis effect, influenced by the surrounding environment, and seeing opportunities in the home region. The influence of the surrounding environment is in the form of influence because of seeing the example of a neighbor who has successfully opened a business, or because of growing from a family environment that is also an entrepreneur. This crisis effect arises because of their economic pressures to survive. This characteristic of entrepreneurial activities are also called as necessity entrepreneurs where individuals tend to start new business because of lack of other employment opportunities and as "last resort" of individuals to make a living (Zheng and Musteen, 2018).

> *Because I don't know what else to do. The money was used to build a house but then it turned out that I was cheated by my husband and everything just disappeared. I ran out of money,*

> *finally my house was sold to be used as capital to open a business.* (Respondent G, Return migrant worker, FGD in Blitar, July 20, 2019*)*

> *I was interested in selling groceries.. In my village it was very rare, there were only three groceries stores in one village.* (Respondent G, Return migrant worker, FGD in Kendal, September 14, 2019)

Besides, some migrant workers choose to become own-account workers or ordinary housewives instead of opening a business. The types of own-account workers (Piracha and Vadean, 2010) found here are farming or freelance. From FGD, we also found several reasons why the return migrant worker was reluctant to open a business. Also, some migrant workers have previously tried to open a business but were unsuccessful. The lack of capital is one of the factors that makes migrant workers not willing to open businesses. In spite of relatively big amount of salary when working abroad, usually the money is used up to finance the daily needs of the family, repair the house, or buy land, rather than to buy productive assets. Besides, the problem of competition is also the reason why respondents do not open businesses. Respondents assured that before leaving for migrant workers abroad, they saw the possibility to open a business in their area, but when they returned home, the area was entirely developed, so they did not know what business they wanted. This can happen because they cannot see other opportunities to open a business, so they doubt if they can succeed in setting up a business.

In addition to financial capital problems and fear of competition, the inability to manage finances is also an obstacle faced by respondents. The inability of migrant workers to manage their finances after arriving in Indonesia also causes the money to run out quickly. This is influenced by the bad habits in their home regions (usually people in rural area) to defer the payment. Some have even tried to open a business but eventually went bankrupt because they were unable to manage finances because many neighbors set back the payment. Then this story becomes an example for other return migrant workers, so there is a fear and anxiety of not being able to manage finances when opening a business.

Social remittances brought back to home countries can take the form of ideas, behavior, identity, or social capital, such as skills, knowledge, experience, and innovation (Levitt, 1998; Peth & Sakdapolrak, 2019). Some forms of social remittances found in respondents of Indonesian return migrant workers is explained (see figure 2).

Fig. 2: Tree Map of Respondents' Social Remittance

Based on the data obtained, the return migrant workers gain the ability to interact with others while working abroad. Migrant workers learn how to communicate in place with new cultural settings. At

least from working abroad, migrant workers acquire language skills by learning a new language. Some of these migrant workers have also been provided with language courses before migration, although some have not. However, when working in other countries, even though they do not yet master the language in the country, migrant workers are forced to learn and understand the language used in that country so that they can interact and communicate in doing their work.

> *I can speak Mandarin ... because I worked there I think I can automatically speak the language ... I came back from abroad last 2014, right. But because I think it's been quite a long time there so I'm used to Mandarin or Cantonese now. Sometimes during Eid and there are family gatherings, I unconsciously speak in Mandarin with my sister who was a migrant worker also.* (Respondent Y, Return migrant worker, Interview, Banyumas, June 4, 2019)

In addition, the experience of migrating can also help migrant workers to be more flexible in adapting to environmental changes. New skills can be obtained by changing employers, because it can familiarize someone with changes in style and way of work desired by the employer. Job changes during migration abroad can also introduce migrant workers to a new and different management style or work culture.

> *I think I tried everything. Five years working abroad. I have worked in building construction, then three years in a factory, then one year and a half in fishing.* (Respondent L, Return migrant worker, Interview, Kendal, September 14, 2019)

At the time of data collection, we asked respondents of return migrant workers to explain their experience or things that they think valuable in building business. Then return migrant workers discuss about some of the values or attributes that are most remembered. They considered that honesty, discipline, and hard-work are most useful to be re-applied after returning to Indonesia. Even though these characteristics are common and can be found everywhere, return migrant workers practice these attributes in their daily lives while working abroad because they are valued more and become a high value in their workplace environment.

> *I think it is honesty. Because in the country where I used to work, honesty is very important. Looks like honesty is a priority there. In my experience, when I first started working there, the employer tested me. For example. When washing clothes, in his pocket I found some money. Starting from a few coins, then the next day I found more money slipped in his pocket. I thought he has put it deliberately to asses my honesty. Besides that, how hard-working we are at work was also highly considered by my employer.* (Respondent I, FGD in Blitar, July 20, 2019)

In addition, migrant workers consider the nature of discipline and hard work in building a business. According to them, this trait they learned from the destination country, namely Korea and useful to be applied when they returned. These attributes that they brought and applied in home region are what they think they learned the most while working abroad. This values are transferred by migrant workers to their home region by implementing this values in daily lives and showing it as example in the neighborhood. According to Grabowska, Garaphic, Jazwinska, and Radziwinowiczowna (2017), social transfers also happen by sharing observations and opinions, by discussing issues, by encouraging others to do something “in this or that way”, by persuading (soft per- suasion is most effective), by doing things together with a migrant, and when a migrant acts as a “social example” for people to imitate his/her practices(Grabowska *et al.*, 2017).

> *Maybe after returning from Korea, the most useful thing was not the financial capital, but it was the discipline. The hard work. From the first time I worked there, I had to be disciplined every time. That's why people in the village here consider me the most rigid person. That's what I learned. So even now, if I teach, before students arrive, I already stand by here. It's always like that. If anything happens, I will still come to work.* (Respondent L, Return migrant worker, Interview, Kendal, September 14, 2019)

> *What I learned while working abroad is about hard work. In Korea, you can say, we live only for work. What I learned from the Korean, you could say you are lazy if you only work 8 hours. If you are mediocre, you will work 12 hours. If you are diligent, you will work above 16 hours. So I learned that, the hard work.* (Respondent D, Return migrant worker, FGD in Kendal, September 14, 2019)

Furthermore, according to Peth and Sakdapolrak (2019) there are more tangible and incorporated social remittances, such as new skills and knowledge to be transferred and used when migrant workers return to their home regions, or migrate again to a place where they can practice skills and their knowledge. The change of occupation has a greater potential for social remittances, as new skills and knowledge can be generated and transferred during and after the migration process (Peth and Sakdapolrak, 2019). While migrating abroad, migrant workers have the opportunity to gain new skills, both from job scopes that are still new to them and from outside activities organized by the government or migrant worker communities in their respective countries.

> *At my workplace (a nursing home for elderly), the equipment or everything is complete. When we should inject the medicine, even all directions in the form of images are available so that we can understand easily. We just need to follow a predetermined schedule which describe when we should do it,, to whom, and where. As caretakers, we are also trained to inject. Because I worked as a caretaker of a decrepit grandmother, when the grandmother was sick and hospitalized, the nurse also gave me training. When I worked, the new thing I learned was all that. When the grandmother is sick and has to get through a surgery, sometimes we also have to be good at regulating her blood sugar, we were also trained for that. (*Respondent C, Return migrant worker, FGD in Blitar, July 20, 2019*)*

> *When I was in Taiwan, I took part in training to make Taiwanese special drinks. Here we call it bubble tea drink ... Training is given from the Taiwanese government for Indonesian migrant workers there. I used to make it right when I was there. At home, at least I can teach others to make it.* (Respondent G, Return migrant worker, Interview, Kendal, September 14, 2019)

> *In the host country, there were many other activities for fellow Indonesian migrant workers besides working, there were Moslem forum (Quran recitation) and courses, such as sewing courses, bag crafting courses, and many more… There were also equivalence education programs such as junior secondary (package B) and upper secondary education (package C). These all are specifically for Indonesian migrant workers. And that was officially from the Consulate General of the Republic of Indonesia.* (Respondent E, Return migrant worker, FGD in Kendal, September 14, 2019)

In addition they also have the opportunity to acquire skills or skills in organization because there is also an organization or community forum for migrant workers to jointly organize an activity. In Taiwan, there are also migrant workers active in an organization for Indonesian citizens.

> *I joined an organization while in Taiwan. I became one of the branch administrators of Nahdlatul Ulama. Yes, it is the branch of Nahdlatul Ulama in Indonesia ... They also held a regular meeting.* (Respondent N, Return migrant worker, FGD in Kendal, September 14, 2019)

Migration experience can be an advantage for migrant workers when they learn and eventually master a new skills, knowledges, and ideas to be used in the future. Nonetheless, there are several conditions where these social remittances are not fully obtained by migrant workers. A person is unable to learn new things (non-learning) because he feels there is no change or disjuncture (Jarvis, 2007). This could have happened because they did not find a significant difference between new work conditions and working conditions in the country of origin. From the findings, some respondents who worked in the Middle East did not have the tendency to open a business even though the duration of working abroad exceeded five years. Respondents are more likely to choose to become own account workers such as farmer, animals breeder, or freelancer. This can be explained because the type of work they take there on average is domestic work, so it does not add skills or new knowledge for migrant workers. In

addition, there are strict restrictions for migrant workers to leave the house or make direct contact with outsiders while working in the Middle East.

> *I am a helper when I worked in Arab. There was rarely other activity besides working for me because my employer wouldn't let me go out. He said it's haram (forbidden). However, the communication with family via telephone or mobile phone is allowed, I'm just not allowed to go out, I must always at the house for 24 hours.* (Respondent A2, Return migrant worker, FGD in Karawang, June 16, 2019)

While migrating abroad, migrant workers has also gained new skills and knowledge from their work environment or from other activities they do during work breaks. For some respondents in countries such as Taiwan and Korea, there were other activities besides work carried out either by the local government or the community of fellow migrant workers in the destination country. Some of the new skills gained were through training, such as thin sewing and making bags. There were also study activities or organizational activities for migrant workers. Also, the change in social identity in the community as a migrant worker after returning to Indonesia after return migrant workers had the opportunity to be able to develop their potential for entrepreneurship further. Some of the efforts and training and training programs carried out by the service, local government, and the ministry can also be an additional accumulation of human capital and social capital owned by migrant workers. Not only coaching or training but sometimes there is also a production machine assistance program for the development of productive businesses for return migrant workers that can be utilized.

Conclusion

During migration, Indonesian migrant workers learned some new skills, knowledge, values, and social skill. These forms of social remittances are expected to become a social capital that can be leveraged to open a business when they return to Indonesia. Some values or attributes that are considered beneficial to be re-applied after returning to Indonesia are honesty, diligence, self-discipline, and hard work. Rusdiana (2018) explains that one of the ethical principles in business or entrepreneurship is honesty, trustfulness, earnestness, and integrity. A similar study also found that Javanese workers who migrated to South Korea gained some positive effects from working abroad that influenced their attitudes in their communities of origin, such as discipline, diligence, and hard work (Anwar and Chan, 2016). Although these characteristics are common and can be found anywhere, migrant workers practice these attributes in their daily lives while working abroad because they are valued more in their work environment. Migration provides opportunities and context to form, validate, and develop social skills both explicitly and implicitly, which help practice reflexivity both to others and to migrant worker by gaining social awareness from the world around and by mastering new social instructions on how to apply in a unfamiliar environment (Grabowska, 2018).

Grabowska (2018) shows that the social skills of migrant workers can be part of social remittances (Levitt, 1998) obtained and transferred in the work environment. This was also evident in this study that return migrant workers also had the opportunity to gain more skills and experience while working abroad. In addition, their identity as Indonesian migrant workers also allows them to have more entrepreneurship education or training provided by the government when abroad or after returning to their home regions.

Despite the potential gain from financial and social remittances that return migrants have from being a migrant workers, it was found that not all respondents have an intention to set up a new business after returned. Some respondents also claimed to go abroad when still young, so they did not really think of doing business after their return. The gain of human capital and social capital formed through migration are usually not directly transferred to the country of origin but are collected and stored from time to time to be used when required (Grabowska, 2018). Peth and Sakdapolrak (2019) shows that social remittances also require that migrants have the structural and personal ability to make use of them.

The finding shows that most of the businesses run by return migrant workers tend to be micro or small businesses. Most respondents who open a business use small capital from remaining of personal saving instead of borrowing from banks or saving & loan cooperatives. This can be explained because the migrant workers tend to spend their financial remittances on raising their status and status of the family rather than investing in productive assets (Mas'udah, 2019). A similar study by Anwar (2013) also showed financial remittance utilization within return migrant workers in Indonesia are for savings to buy a house or to renovate house, to pay off debts, and also to buy a vehicle, farmland, or livestock. Our suggestions for policy makers to provide alternative funding solutions in addition to remittances to help develop the business of Indonesian return migrant workers. If the government also wants to increase opportunity-based entrepreneurial activities (Zheng and Musteen, 2018) among of Indonesian return migrant workers employees, it is important to be able to identify which individuals have an entrepreneurial interest and spirit to further develop and provide education that is not only about entrepreneurial strategies but also about access to institutions that can help provide financial loans to fund their businesses.

For further research regarding the role of social remittance, a quantitative approaches can be conducted to compare whether the findings of the results of this study had also applied to wider respondents. Further research can also try to utilize variables such as the period of migration, education, or the employment sector when working abroad to see its role in the quality of social remittances brought to the home region to be utilized in entrepreneurship. In addition, further research can also use a larger sample to involve migrant workers in addition to Java with a more balanced sample composition so that the results of the study can better represent the population of migrant workers in Indonesia.

The Relationships of Workplace Fun, Inspirational Leadership, and Participative Decision Making towards Employees Happiness at Work: Case of IT Workers in Jabodetabek Area

Rizka Amalia RYOKO
Department of Management, Universitas Indonesia, Depok, Indonesia, rizkaryoko@gmail.com

Aryana SATRYA
Department of Management, Universitas Indonesia, Depok, Indonesia, aryana@ui.ac.id

Abstract

This research aims to examine the relationship between workplace fun and inspirational leadership towards employees' happiness at work when its mediated by the variable of participative decision making. The sample of this research is programmers as the knowledge intensive workers in 24 – 40 years old in Jabodetabek area. The method to process the data was with the Structural Equation Modeling (SEM). The result of this research shows that workplace fun and inspirational leadership directly have positive relationship towards employees' happiness at work. As for the mediating effect of participative decision making was not proved to had an effect towards those relationships.

Keywords: happiness at work, workplace fun, inspirational leadership, participative decision making

Introduction

Indonesia has notable growth in information, communication, and technology industry indicated by the exponential growth in several digital services such as e-commerce, fin-tech market and digital content (Frost and Sullivan, 2018). The growth was indicated by the contribution of the IT industry in Indonesia GDP which accounted for 7.2% in 2016 and the industry grew 9.5% per year between 2014 and 2017, the fastest growth compares to other industries in Indonesia (ILO, 2019). As the industry and production process becoming more complex and specialized, the more communicative effort from the higher-level manager is required to manage the creation process within the organization. Thus, the demand for well-informed or knowledge labour with high-level of educational background and specialized skills are expected to be capable in handling, synthesizing, and creating new knowledge to address new problems in this continuous emerging market and industry environment (Pyoria, 2005).

Along with the development of digitalization in every industry, programmers or software/IT developers as one of the examples of knowledge workers that are becoming one of the most wanted workers (World Economic Forum, 2018). Another emerging roles and expertise that are predicted to have a significant increase in demand up to 2022 are individuals who able to do data analysis, digital sales and marketing, computer and mathematical experts.

Knowledge workers have constant needs to familiarize themselves with new and updated findings and information in their related fields of work, in order to stay up-to-date on the recent problems which required innovative problem solving, therefore knowledge sharing among knowledge workers is one of the ways to make knowledge workers stay engage and feel fulfilled with their jobs (Erren, 2010).

Happiness at work (HAW) is a construct that proposed by Fisher (2010). For many years and after tons of research done by the scholars, numbers of constructs might have an overlapping concept one to another that could lead to one main idea as employees' happiness at work. These constructs more or less have some the similarities that reflect the happiness and positive attitudes towards the job. Fisher also grouping these happiness-related constructs in the workplace into the transient level, person level,

and unit level. In this research, we will focus on the person level happiness-related construct which includes job satisfaction, engagement, and affective organizational commitment because the transient level tends to represent short-lived emotion and mood meanwhile unit level happiness which focused on teams and organization which the aggregate of individuals.

According to a survey of employees' job happiness index conducted by Seek Asia (2017), among ASEAN countries, employees in Indonesia and Vietnam are the happiest employee in the region. There are three main kinds of drivers of happiness that have been taken into account in this survey which are workstyle, rewards, and leadership style from supervisor. Focusing in Indonesia's case, the survey revealed that even though Indonesian employees are the happiest employee in ASEAN, the unhappiest employees in Indonesia are generally coming from the younger and less experienced workers, and are represented by the worker who work in IT, general trading, and media industries (Seek Asia, 2017).

Unfortunately, the amount of potential and professional IT workers available in Indonesia is not as much as the demand needed by the companies. High cost of capital and the lack of skilled workers in the technology sector are still the two main factors that hinder the companies in Indonesia to improve their technological development (ILO, 2017). It indicates that skilled IT-related workers are scarce and become the most wanted human resource among competitor companies within the same industry who also desire to hire skilled IT workers. Therefore, it is one of basic necessity for the organization to maintain IT workers happiness as their role is very crucial to brings the digitalization to the organization so organization can always keep up with the recent technological development.

Literature Review

Happiness at Work

Fisher (2010) divided "happiness"-related construct in organizational perspective into three levels which are transient level, person level, and unit level. The majority of organizational behaviour research concern about the second level which is the person level as the most happiness construct in organizational perspective is conceptualized based on the variance that occurs at an individual level (employee). Example research constructs that are categorized as person level, for instance, job satisfaction, engagement, and affective organizational commitment which will be discussed further in this research. Another construct that categorized in this level is such as job involvement, dispositional affect and affective well-being at work. Salas-Vallina and Fernandez (2017) were concerned on the person level as the person level perceived to be have the more stable attributes that could differentiate each person rather that the transient level and unit level.

Fisher also indicates that group-level constructs are sometimes can be fluctuate and usually studied in a shorter time frame. Thus, Fisher suggest that person-level construct provide more stable and minimum variation throughout the time. Furthermore, Fisher suggested the measurement of happiness at work construct to be targeting these three targets: (1) the work itself; (2) the job's context and features; and (3) the organizational as a whole. These three foci or targets are represent by engagement which represent employees' involvement and enjoyment towards the work itself, job satisfaction which represent the cognitive judgment about the work including work environment (e.g. pay, co-worker's behavior, supervisor, work environment), and affective organizational commitment which represent the employees' feeling about organization such as sense of belonging and attachment.

Job satisfaction can be defined as a pleasurable or positive emotional state of employee that resulting from an appraisal of one task (Locke, 1976). Job satisfaction and job dissatisfaction can be influenced by several factors such as manager's concern for employee, job design, working conditions, social relationships with colleagues, and level of aspiration (Rue and Byars, 2003). Employee engagement described as emotional bonds to the organization or the amount of the employee feel belongs, attached, and willing to invest and put extra effort into their job and organization (Kahn, 1990). Allen and Meyer (1990) described affective organizational commitment as an affective or personal emotional bond between the employees to the organization in a form of strong emotional commitment as the employee feels involved, and enjoys their membership in the organization.

According to Salas-Vallina (2017), engagement, job satisfaction, and affective organizational commitment are shared common core as these three dimensions capture a broad and accurate attitude of happiness while considering different sides and scope of happiness. Therefore, happiness at work can be determined as the higher construct of these three dimensions.

Workplace Fun

Fun in the workplace has been an interest of several scholars in recent decades as nowadays there is more and more modern workplace that has promotes a more fun work environment through more play and humor. For instance, big companies such as Google and IBM have implemented the fun elements into their organizational culture and this implementation has followed by great success (Karl, Peluchette, Hall, and Harland, 2005). According to Tews, Michel, and Allen (2014), there is three dimensions of workplace fun which are fun activities, coworker socializing, and manager support for fun. Fun activities can be in a form of social interaction and group activities which encourage the implementation of fun element in the workplace. Coworking socializing emphasize on the friendly communication among peers in the workplace (Tews, Michel, and Allen, 2014). Meanwhile, manager support for fun refer to the what extent manager or supervisor encourage the existence of fun element in the workplace and support the subordinates to having fun while they're working (Tews, Michel, and Allen, 2014). Furthermore, Tews also described how these three dimensions are related one to another.

As positive emotions as joy and interest could be some of the trigger of creativity and the urge to exploring new ideas, creating a fun environment in the workplace could be a good method for the managers to provide and facilitate sharing knowledge between the workers. Meanwhile, a positive emotion such having a close and warm relationship with colleagues and co-workers could be one of the sources of happiness for the workers. In the history of organizational behaviour studies, it can be assumed that the dominant causes of the employees' happiness or unhappiness were to be found in the attributes related to the organization, the job itself, the supervisor or manager, and other aspect related to the work environment (Fisher, 2010).

Inspirational Leadership

According to Stogdill (1950), leadership can be defined as an act of one individual who influencing the action of a group of people that have certain shared-objectives and goals. Etzioni (1965) suggests that the core of the leadership is how the leader could influence the sub-ordinates including change the preferences or even perspectives. Leaders with a strong people-oriented would like to listen to employee ideas, suggestions, and perspectives, do personal favors for employees, support their interests, and treat employees as equals (McShane and Glinow, 2009). This research will focus on people-oriented or perspective which focus on employees' happiness and well-being.

In the organizational context, inspiration is the extent to the leader stimulates enthusiasm among subordinates for the group-based work through continuously says some motivation words to boost their confidence in order to successfully achieve their goals (Yukl and Van Fleet, 1982). Moreover, Yukl and Van Fleet (1982) also provide some examples of leader's behaviour that considered as inspirational for the subordinates such as instills pride in individuals, giving personal encouragement and compliment to build their morale and boost confidence, set his own behaviour as an example. However, the distinction between transformational leadership and inspirational leadership might be ambiguous and it was unclear how to distinguish these two approaches. Lee (2014), pointed out the differences between transformational and inspirational leadership based on several characteristics such as impression, philosophy, social distance, power distance, process, openness, and when this type of leadership is appropriate to be applied.

Inspirational leaders give impression to the followers that they are an imperfect leaders which might be doing wrong things, has a relatively close but not very close social distance to their followers, egalitarian power distance, how they perform the change in the organization is in the stressful process but in attentive, interesting, and provocative way to boost the change within the followers, in terms of degree of openness inspirational leader tend to reveal the weakness selectively, and inspirational

leadership is appropriate to be applied at a matured institution which requires gradual transition and tends to maintain their status quo (Mei Lee, 2014; Bass, 1999; Goffee & Jones, 2006).

Participative Decision Making

According to Morrison (2011), employees' voice is an employee's way to communicate the concerns, ideas, or opinions regarding work-related issues that they faced in the workplace with the good intention to improve the organization or the work units. While employees voicing their voice is the expected and favourable condition in order to maintain good communication within the organization, employee silence is the contradictive condition where employee consciously holding and keep their ideas, questions, opinions, suggestions, and all the information they know and choose to not express it to who might be had the responsibilities to take an action to address the problem (Brinsfield, Edwards, and Greenberg, 2009). The typical cause of employee chooses to not share any kind of valuable information they have is because of fear or concerns about the negative effect for their career when they choose to speak up (Milliken, Morrison, and Hewlin, 2003). Thus, the exact cause of why employees choose to share or to not share information becomes a significant issue to be discussed.

Morrison (2011), based on his literature study, proposed three main predictors of voice which are organizational contextual factors, supervisor behavior, and employees' attitudes and dispositions. An organization that is less bureaucratic with supportive conditions is giving cues to the employee that they are actually able to express their opinion and suggestion and those inputs could actually make a difference and will not harm their career (Morrison and Milliken, 2000). Meanwhile, when the organization had full of fear and intimidation environment, those kind environments will discourage individuals from breaking the silence (Pinder and Harlos, 2001). The supervisor's behavior that reflecting high-trust relationship between subordinate and the leader, approachability, and possessed openness could also drive the decision whether they would or would not voice (Ashford, Sutcliffe, and Christianson, 2009).

Reinhardt et al. (2011) concluded that knowledge workers are considered as the investor of knowledge which this knowledge become the energy and potential resource for the organization. Hence, knowledge workers by its nature are willing to engage and participate if they have the right motivation to do so. Therefore, managers as the part of the organization which directly interact with the employees could take the role as the catalyst to induce and establish a proper working conditions that stimulate employees to actively engage and participate in the knowledge sharing process and also able to state their opinions and determine their attitude towards managerial decision (Kelloway and Barling, 2000).

Research Method

Structural Equation Modeling (SEM) method will be used because the researcher wants to test whether the model in this study, which is a modification of the previous research (Salas-Vallina and Fernandez, 2017) model is fit or not. Researcher used LISREL to processed the model fit in SEM, meanwhile the reliability and validity test of the questionnaire items were processed using SPSS. Non-probability sampling is used in this research. Before conducting the main test, the pretest will be conducted to 40 respondents in order to test the reliability and validity of each item of the questionnaire. Later on, the main test conducted to test the model fit and the hypotheses of the relationships between variables.

In this study, the relationship between two independent variables which are Workplace Fun and Inspirational Leadership towards the Happiness at Work as the dependent variable will be examined. The mediating effect of the Participative Decision Making as the mediating variables towards to both independent and dependent variables will also examine in this research. This study will discuss about what are the underlying factors of IT workers' happiness at work in Indonesia.

Figure 1 : Research Model

Research Hypothesis:

There are four hypotheses examined in this research:

H1: Workplace fun positively affects employees' happiness at work
H2: Inspirational leadership positively affects employees' happiness at work
H3: Participative decision making mediates the relationship between workplace fun towards employees' happiness at work
H4: Participative decision making mediates the relationship between inspirational leadership towards employees' happiness at work

Measurement

This study uses questionnaire to measure the data in order to assess the hypothesis. The questionnaire are measured using 5 items of workplace fun from Karl and Peluchette (2006), 3 items of inspirational leadership from Rafferty and Griffin (2004), 5 items of participative decision making from Steel and Mento (1987), 3 items of engagement from Schaufeli et al. (2002) as the dimension of employees' happiness at work, 3 items of job satisfaction from Schriesheim and Tsui (1980) as the dimension of employees' happiness at work, 3 items of affective organizational commitment from Rhoades, Eisenberger and Armeli (2001) as the dimension of employees' happiness at work.

Research Result

Table 1 shows the demographic data of respondents in this research. Majority of the respondents were males, who made up more than half of the sample (66.67%). Approximately 70% respondent has bachelor degree, 13.58% were high school graduates, and 11.11% of respondents were diploma. 21-30 years old age group is very dominant with 88.27% while the rest is 31-40 years old (6.17%), less than 20 years old (4.94%), and 41-50 years old (0.62%).

Table 1: Respondent's Demographic

Demography	Category	Percentage (%)
Gender	Men	66.67
	Women	33.33
Educational Background	High School	13.58
	Diploma	11.11
	Bachelor Degree	70.37
	Master Degree	4.94
	Doctor/PhD	0
Age Groups	<20 years old	4.94
	21-30 years old	88.27
	31-40 years old	6.17
	41-50 years old	0.62
	> 50 years old	0

Before testing the relationship between variables, all items included and overall model fit should be examined their validities and reliabilities. It was found that item WPF5 and JS2 were invalid items. Therefore, these two items were deleted from the model. The model's goodness-of-fit was examined and it was found that the value of RMSEA is 0.099 which indicated the model has marginal fit. In order to achieve the good fit, researcher then modified the error covariance of the items.

After the modification of error covariances, the absolute fit measures show that the research model has relatively good fit indicated by RMSEA value which below 0.08 (0.072) and in incremental fit measures NFI showed model has good. Meanwhile AIC from the parsimonious measures also showed the model's good fit. The summarize of the goodness-of-fit result of structural model can be found on Table 2.

Table 2: The Result of Goodness-of-fit Structural Model Analysis

GOF Measurement	Result	Interpretation
RMSEA	0.072	*Good Fit*
NFI	0.91	*Good Fit*
AIC • *Model* • *Saturated* • *Independent*	 226.62 240.00 1730.08	*Good Fit*

There are four proposed hypotheses in this research. All hypothesis in this research are processed and tested in LISREL 8.51 in accordance to structural model t-values. Meanwhile for examining the mediation effect of the participative decision-making variable as the mediation variable, the researcher multiplies the SLF of independent variables towards the mediation variable and the SLF of mediation variable towards the dependent variable. Hence, to calculate the total effect between these variables, the sum of direct effect and indirect effect are needed (Wijanto, 2008). Table 3 below summarizes the hypothesis testing in this study:

Table 3: Research Hypothesis Testing

Hypothesis	T-Value	Interpretation
H1: Workplace fun positively affects happiness at work	3.48	Hypothesis was accepted, the data supporting the hypothesis
H2: Inspirational leadership positively affects happiness at work	6.26	Hypothesis was accepted, the data supporting the hypothesis

H3: Participative decision making mediates the relationship between workplace fun towards happiness at work	0.87 → 1.52	Hypothesis was rejected, the data not supporting the hypothesis
H4: Participative decision making mediates the relationship between inspirational leadership towards happiness at work	6.28 → 1.52	Hypothesis was rejected, the data not supporting the hypothesis

Based on the result of T-values, Hypothesis 3 and 4 was rejected since the T-values shows insignificant relationship between the variables. Therefore, participative decision making cannot mediate the relationship between workplace fun towards happiness at work and not mediates the relationship between inspirational leadership and happiness at work.

Hypothesis 1 and 2 which are the direct effect between the variables are supported in this research, in line with previous study which stated that experiencing fun ambiance at the workplace (Bolton and Houlihan, 2009) and leadership style could improve employees happiness as it could positively affect employees engagement, job satisfaction, and organizational commitment (Salas-Vallina and Fernandez, 2017)). It implies that having a pleasant working ambiance that allow employees to having fun and release their stress are needed in order to make IT workers feel happy and contented about their work (Tews, Michelle, and Allen, 2014), as it creates a positive emotion that becomes the fuels for the employee to tackle stress and reduce the tension or pressure in the work condition which likely to happen to the IT workers that always working in a fast-changing and high pressure working condition in order to have a better well-being (Frederickson, 2000). Moreover, this pleasant working condition also should be imposed or implemented by the manager or supervisor as the leader of the working unit as leadership style could affect to the employees' positive attitudes towards their work (Joshi, Lazarova and Liao, 2009) through set a proper example for the workers and building trust to the employee.

This research found that items WPF1 ("this is a fun place to work") and WPF3 ("managers encourage employees to having fun at work") have the highest loading factor which implies that these items highly represent the workplace fun variable. Therefore, employees can feel the excitement and fun environment in the working place if the workplace itself give them pleasant circumstances. This kind of pleasant circumstance can be supported by a flexible workplace that enables employees working in a place that is comfortable for them and creating fun and playful activities once in a while with the team and colleagues to reduce boredom. Moreover, encouragement from managers also has an important role in terms of reminding employees to not forget to take rest and have fun so they can enjoy their task. Manager's encouragement can be in a form of an invitation to eat or getting out together with the team after work hours as the refreshment. In this research, workplace fun has no relationships towards employees' participation in decision-making process. Employees might have a different perspective about fun and different acceptance towards having fun and playful environment in the workplace (Clouse and Spurgeon, 1995). One person might totally enjoy it and performed better in a playful circumstance meanwhile the other person might perceive it as disturbing their concentration which reducing their creative thinking process and impact on they cannot come up with new ideas and suggestions. These might be the reason why workplace fun had insignificant relationships with employee participation in decision making.

For example, in a real case of the implementation of workplace fun in PT. T is focused on how they build a pleasant and comfortable atmosphere in the workplace through creating a homey workplace, set the lighting not too bright but not too dim, set the layout of the room so employees can move easily, and provide some snack or refreshment on the workplace (Karl and Peluchette, 2006). Another example was done by PT. S which emphasize that they have a regular (most likely monthly) occasion like seminar or sharing session which designed and organized by the younger workers so the younger workers can have more time to interact with the same-age colleagues. Celebrating a special moment together such as celebrating someone's birthday or promotion also could give employee' pleasant feelings towards their colleagues. These kinds of occasion could reduce employees' boredom and give them positive moods (Karl and Peluchette, 2006).

Furthermore, this research also found that items IL1 ("managers says things that make employees proud to be a part of this organization") and IL2 ("managers says positive things about work unit") have the highest loading factor. Inspirational motivation performed by the managers could affects employees' happiness and well-being. When managers say good things about how well the organization is or appreciate the work units, it will make the employees proud and satisfied with themselves and happy to become a part of the organization. Inspirational leadership also provides greater opportunities for employees to express their opinions as its stimulates employees creativity and build employee trust, so they able to express their opinions or suggestion freely as the leader sets the example of being outspoken about their thoughts even though they might make some error, which error can be considered as source of employees learning process (Barile, Saviano, and Simone, 2014).

The findings in this research were not supported the hypothesis regarding the role of participative decision making as the mediator of workplace fun and inspirational leadership towards happiness at work even though there is a positive relationship between inspirational leadership and participative decision making. This finding indicates that in order to employees are able to feel happy and contented about their work, it was not enough to have the feelings of they are allowed to express their opinion and suggestion or contributes to decision-making process. From theoretical perspective, both workplace fun and inspirational leadership are variables that we could see the impact directly and immediately towards the employees' well-being and do not really need the role of mediator variable to enhance these relationships. Participative decision-making variable itself still needs any other factor to support its implementation. For instance, according to Vroom (1964) the employee will be considered to take action to speak up when they feel that there is a high probability of the voice to be heard effectively. Otherwise, they feel that speaking up and give opinions and suggestions as a pointless action.

According to Morrison (2011), organizational support in a form of supervisor and top-level management provide cues to the employee that their opinions was heard, will be accepted and make a difference to the company. This kind of organizational support is likely to happen in an organization that has a good suggestion system, grievance procedures to the top-level management and has a low bureaucracy. Based on that concept, it was not enough for the supervisor to allow the workers to give their suggestion, the supervisor also needs to show that the worker's suggestion would actually be implemented in the company so the employee feels assured that their voice was actually heard by the higher-level management.

Conclusion and Recommendation

When workers experiencing fun at their workplace, it will positively affect the improvement of employees' happiness and well-being. Creating a fun environment could reduce employees stress' factor especially in IT workers which always work in high-pressure working conditions since they are enforced to always innovate. Fun at work was perceived as the generator of positive emotion within the workplace that gives the employee a sense of contentment about their work and improve their well beings.

Leaders that implementing inspirational motivation and supportive working condition would enhance employees' happiness as a whole. Inspirational leadership also could improve employees' satisfaction and commitment through implementing a sense of pride and belonging to the companies through inspirational motivation as the leader could visualize and communicate organization's vision clearly to the followers.

While the direct relationship between workplace fun and employees' happiness at work could be defined as a positive relationship, mediating variable participative decision making still needs the role of other variables to support employees' well-being. In general, IT workers' have been contented and happy only by having a fun working environment and supportive leadership who uses inspirational motivation and IT workers happiness does not heavily rely on the amount of opportunity given to them to participate in decision-making process.

Even though that in this research participative decision making could not mediate the relationship between leadership style to the employees happiness at work just like the previous research by Salas-Vallina and Fernandez (2017) did, still there is positive relationship between inspirational leadership and participative decision making as it could build employee trust that their supervisor is willing to listen to their opinion and suggestion regarding their work and encourage them to speak up and voice their opinion about problems that could occur in completing task. Although, participative decision making was proved that has no relationship towards the employees' well-being , in this case, as IT workers are working on the innovative climate that is expected the workers continuously innovate and create new ways of thinking and learning, sharing knowledge is important thus, this research proved that inspirational leadership style already facilitate employees to speak up and proposed their opinion.

In conducting this research, there are several limitations. The mediation effect was not found in this research because of involving employees in the decision-making process does not directly make the employee feel satisfied and happy but requires the actual realization of the employees' ideas and suggestion in order to achieve employees' satisfaction and happiness as a whole. Future research might consider to involve different dimensions or measures to examine these relationships.

While maintaining fun at the workplace to improve employee's happiness, the manager should also focus on how to create a conducive atmosphere in the workplace which allows employees to effectively share their knowledge and exchange constructive ideas. Some employee could perceive fun at the workplace as "too much fun" which could reduce their concentration and impede their creative thinking process which hinders them to actively participate in proposing new ideas and contributes in decision-making process.

Some fun elements that already implemented in respondent's workplace is such as have a regular event like seminar or sharing session which designed and organized by the younger workers and celebrating a special moment together such as celebrating someone's birthday or promotion also could improve employees' feelings. A tidy and comfortable layout which facilitate employee positive interaction can also help to create a fun atmosphere in the workplace. Managers have to show that they willing to listen to the employees' suggestion and discuss it together with the team in the regular group meeting so employee feel that their suggestion is an important matter to be discussed together and their voices are actually heard by the board. Shorten the flow of employee suggestions through having regular meetings in the working units where employees can sit together with the higher-level management could improve employees' satisfaction as they would feel as soon as they proposing new ideas, the ideas will be heard and taking into higher manager's considerations. Decision-making process that requires less formal and low bureaucracy also could improve employees' participation in decision-making process because it makes the process shorter and faster which supporting IT workers working conditions.

Abstract

The purpose of this research is to analyze the impact of turnover intention phenomenon in a metal manufacturing company. It examines the interrelation of job satisfaction, work-life enrichment and trust to management toward employee turnover intention. A survey involving 293 operators was conducted to test the proposed conceptual model in this study. By employing Structural Equation Modelling (SEM) the finding of this study shows that the job satisfaction, supported by the work-life enrichment and the employee trust toward management affect the employee's turnover intention. The investigation on turnover intention is relevant with the company's condition at that time. All analyzed factors are generated based on discussion with human resource department. Last but not least, the managerial implication for improvement, and suggestions for further study are also discussed.

Keywords: Automotive, Manufacturing, Job Satisfaction, Work-Life Enrichment, Trust, Turnover Intention, Production, Casting, Machining, Finishing

Introduction

Manufacturing sectors have become a significant concern for the Indonesian government as they grow slowly to Indonesia's Growth Domestic Product (GDP) in the last two decades (Hartomo, 2019). One of the reasons is due to the trade war between United States (US) and China since 2018, which weakens the global economy supply chain (Adharsyah, 2019) and affects workforce lay-off in automotive manufacturing sectors globally (Aninda, 2019). Regarding this phenomenon, it must be noted that one of the most significant contributing sectors to manufacturing GDP's growth in Indonesia is the automotive industry ("Industri Manufaktur", 2017). Most of these automotive manufacturers apply assembly-system in their production process. Each of the corresponding suppliers supports the materials needed by them. These materials needed may vary across the component; it depends on the production plan and the requirement of automotive manufacturers. Therefore, establishing a proper supply chain strategy may be required. On the other hand, the fact that these "trade war problems" will affect Indonesia in the future, the government may need to think about the strategy to support and develop manufacturing industries, especially automotive sectors.

Moreover, both government and company's owners should also put more concern in potential lay-off threat as the number of unemployment or jobless labor in Indonesia is around 7.05 million as per data in August 2019 (Indonesia, 2019). However, it would not be easy to implement the development as it would require a very complicated process and would take quite a long time to finish. Thereby, specifically for the company, enhancing workforce quality and retain potential talent will play a significant role. Upon this fact, however, it is an unavoidable challenge for this manufacturing sector to retain the potential workforces, especially on skilled labor. Economic and Social expert has also identified the negative impacts of turnover. The cost which is associated with turnover is included but not limited to the recruitment process, replacement fit in the right candidate, and personnel training for adaptation (Hom, Lee, Shaw, and Hausknecht, 2017). Besides, the cost associated with production costs & volumes, as well as administrative costs, will also be included. Based on the reference example data of Dessler (2013), in educational service, around 12% occurs voluntary turnover.

It is common for such companies, especially the manufacturing industry, to face problems in managing temporary workers. It has become a permanent challenge in the human resource management field (Feldman, Doerpinghaus, and Turnley, 1994). In Indonesia, approximately around 40 % to 50 % of employees in the manufacturing industry have less than 36 months of job tenure in February and August period according to BPS Sakernas Jakarta data in 2015. As maintaining workforce turnover is very important, there is one manufacturing company in Indonesia that face the current situation challenge. The company's name is called as PT Excel Metal Industry. They just recently try to implement the concept of lean manufacture to promote effectiveness and efficiency. By that means, it includes maintaining the rate of defective products and enhancing number workforce of efficiency.

There are a variety of reasons to analyze the cause and indication of employee's turnover. However, at PT Excel Metal Industry, the research focused on finding the effect of three contributing factors toward turnover intentions of the employee. These factors are job satisfaction, work-life enrichment, and trust. These factors have a significant influence on turnover intentions. Likewise, they also have a substantial impact from one variable to another. One point that must be noted is that this research emphasizes on the turnover by the decision of employees themselves. Over the decades, many scholars have been trying to figure out how to examine and investigate the outcome regarding this workforce turnover. One of the research examples is the effect of workplace violence and job satisfaction on turnover intentions (Li, Zhang, Xiao, Chen, and Lu, 2019). According to their study, it was found that job satisfaction plays a mediator role between workplace violence and turnover intention among nurses. It was suggested that among nurses who suffer workplace violence should be encouraged to resort to problem-focused.

Meanwhile, work-life enrichment's concept is derived from Greenhaus and Powell (2006). They describe as the extent to which experiences in one role improve the quality of life in the other role. It is aimed to enhance the quality of life through experiencing work activity. Consider the example such as communication skill training provided to the employee may also benefit them for their real-life activity. According to Carlson's, Kacmar's, Wayne's, and Grzywacz's (2006) research in public relations, work-life enrichment is taken into three dimensions in which are development, affect, and capital. The development stands for instrumental resources that can benefit an employee's personal life (capabilities, skills, and knowledge).

On the other hand, the final factor that will be the main focus of this research is trust between the employer (management) and employee of PT Excel Metal Industry. Several existing studies relate trust to a particular variable in their analysis. One example is, according to Fungá˘cová, Hasan, and Weill (2019), the analysis of trust relative in banks. Their finding concludes that trust at a bank based on a factor such as sociodemographic, religious, political, and economic value form trust at the individual level. Their study was conducted in a world survey covering up to 52 countries from 2010 until 2014. Furthermore, their study also finds that women trust banks more than men. In general, the scope of this research is limited only to the three main factors (job satisfaction, work-life Enrichment, and trust), especially in terms of its impact on voluntary employee turnover. Therefore, the main context that differentiate this study between other similar research is in the variable of work-life enrichment. As the variable is unique, the number of research on this variable is still limited, especially in manufacturing sectors.

Literature Review

Turnover Intention

Turnover, as the main topic of this research, has become an interesting issue in the corporation. Many scholars have analyzed turnover in many forms of definition. According to Cascio (1995), turnover is defined as any permanent departure or leave beyond organizational boundaries. In a simple word, turnover means a condition when the employee leaves the company permanently for any reason (Aksu, 1996). There are two different types of turnover, according to Dessler (2013). The first one is voluntary Turnover. It is an intentional leave decision caused by motivation from the employee. It can be

reflected by their behavior, such as when an employee starts to look for a new job (Ito & Brotheridge, 2005). Meanwhile, the second is involuntary Turnover. It is defined as a type of turnover that is caused by reasons out of employee decision (unintentional). A proper management strategy is needed to control these turnover condition as it matters when recruiting, selecting, hiring, and training is costly and expensive (Cho & Lewis, 2012).In comparison, it can be concluded that the definition context between turnover intention and actual turnover is different. Actual Turnover discuss about actual activity, the occurrence of permanent departure, while turnover intention describes reason why a person want to leave his/her job.

Job Satisfaction

Job satisfaction is defined as a person's effective, emotional response, the general attitude toward various jobs, or work (Kreitner and Kinicki, 2010). This definition implies that job satisfaction is relatively different among each individual. It may be considered that it is not uniformed. The stimulant of job satisfaction occurrence may also vary from one company compared to other as several universities in the world have conducted and developed the study of this job satisfaction. Similarly, Spector (1997) defines the theory as to how people feel about their jobs that is include any kinds of aspects of their jobs. Spector (1997) divide his job satisfaction concept into nine different dimensions. On the other hand, Kreitner and Kinicki (2010), describe job satisfaction into five dimensions models. Interestingly, Dugguh & Ayaga (2014) also have different theory regarding to job satisfaction. They in fact divide job satisfaction into three dimensions. According to these finding, most study related to job satisfaction discuss its definition different type of dimension factors. The measurement of satisfaction is rather complex and differ from one person to another. Therefore, it is suggested for researcher to identify the cause of job satisfaction based on a proper dimension used.

Work-life Enrichment

The concept of work-life enrichment is derived from the concept of work-family enrichment in theory. Firstly, it must be understood that the meaning of work-family enrichment, according to Greenhaus and Powell (2006) is the one that experiences a role or function improves the quality of other role or function. The role itself refers to the variable of work (1st role) and life (2nd role). Enrichment is applied when both roles attain certain aspects, which include but not limited to psychological, flexibility, physical, materials, social capital, perspectives, and skills, improving performance in the other role (Vargas, Gómez, and Ortíza, 2015). It must be noted that between work and life, both are having separate meanings in terms of its conceptualization. According to Jiang & Men (2017), as cited in Kossek & Lambert (2004), work is conceptualized as a condition when the employer pays the employee, while everything or every context outside of work is called life. Employee's best interests can be fulfilled through a healthy and balanced lifestyle, which refreshes their life and enhances their morale (Haar, 2013). As described in the previous chapter, the concept of work-family enrichment is later adapted by Carlson, Kacmar, Wayne, and Grzywacz (2006). Having parallel meaning with work-life balance, work-life enrichment's research is still limited in most academic journal. Therefore, this research help to expand the knowledge of this variable.

Trust

Many basic concepts define the basis of trust as a theory. Trust can be conceptualized as existing when one party has confidence in an exchange partner's reliability and integrity (Morgan & Hunt 1994). Meanwhile, according to Grunig & Hon (1999), trust is defined as the degree of confidence and willingness of one party to be open to other parties. Thereby, it would be clear based on the three definitions that the concept of trust itself can be stated as the confidence in exchange from one to another. In most research, this variable is used following to different kinds of subject's prespective. Similar to job satisfaction concept, one definition of trust may not fit with all research subject since it must follow the proper dimension explanation.

Research Model and Hypothesis Development

Effect of Job Satisfaction

Job satisfaction is negatively correlated to turnover intention according to Carmeli's & Weisberg's (2006). Their research prove that the more the employee experience higher satisfaction on job, the lower their intention to leave the company permanently. On the other hand, job satisfaction may seem to show positive effect on both work-life enrichment & trust toward management's decision. According to Jaga's & Bagraim's (2011) study in national retail-chain, job satisfaction was a significant output of work-family enrichment compared to career satisfaction. Meanwhile, according to Rich's (1997) study in ten different U.S. companies, job satisfaction has a reliable connection in enhancing the trust of sales-manager. Therefore, the hypothesis can be developed as follow:

H1: Job satisfaction negatively affects the employee voluntary turnover intention.
H4: Job satisfaction positively affects the employee's trust toward management
H6: Job satisfaction positively affects the work-life enrichment

Effect of Work-life Enrichment

Wayne, Randel, and Stevens (2006), in their research, have found that work-life enrichment is negatively affect the turnover intentions. It means, if workers are able to experience the positive impact of work to their life, their intention to leave woul surely be reduced. Furthermore, work-life enrichment not only reduces turnover intention, but also enhances a person's trust (Jiang's & Shen's, 2018). Based on these finding, these are the hypothesis that can be derived:

H2: Work-life enrichment negatively affects the employee voluntary turnover intention.
H5: Work-life enrichment positively affects the employee's trust toward management.

Effect of Trust

According to Cho's & Song's (2017) study on 242 social workers in South Korea, they found that trust in an organization is more impactful to affect turnover intention rather than surface acting or emotional labor. In other words, the higher trust would reduce the intention to quit on the social worker. Applying the similar concept of Cho's & Song's (2017) finding in manufacturing industry, the suggested hypothesis for this research would be as given below:

H3: Trust toward management negatively affects the employee voluntary turnover intention.

Research Methodology

Procedure and Sample

The data collection method is purposive sampling, non-probability distribution method. It took around three months for the author to collect all respondent's data. The questionnaire was distributed to production department (casting, machining, and finishing) at operator-level, in coordination with human resource department as the informant. The data was collected at a sequential period, without any manipulation and interference on occurred settings such as environment and respondent activities. Following to Slovin's formula (Tejada & Punzalan, 2012), the assumption on margin of error in this research would be five percent, while the total population that is considered to be involved is 778 employees. Therfore, the calculated sample size (n) would be at the very minimum is 264 respondents.

Measurement and Scales

This study uses a measuring instrument from previous literature that has been translated into Indonesian. The design of the questionnaire applies a quantitative methodology using Likert-Scale. All of the scale option is formulated from the range level of 1 (strongly disagree) to level 6 (Strongly agree) (Cooper, Schindler, & Sun, 2014), since the Likert scale of 6-point provides higher reliability value, and it is fit for research that has only several variables (Chomeya, 2010). In addition to it, Chang's (1994) finding also suggests that the scale of 6-point Likert would increase the opportunity for response sets the value to raise, which affects internal consistency reliability compare to lesser value 4-point In this study, the reliability test of each variable was measured using Cronbach's alpha. Finally, the reliability test of each variable was measured using Cronbach's alpha. The minimum value of Cronbach Alpha (α) for each variable must be minimal 0.6 (Hair, Black, Babin, and Anderson, 2013).

Result and Discussion

In order to fully construct the complete analysis, validity and reliability test in the complete model must be calculated. In order to define the result, Table 1 shows calculation on Construct Reliability (CR) Value, and Variance Extracted (VE) Value. Most of dimensions shows Job Satisfaction dimension, Turnover Intentions, Job Satisfaction, and Work-Life Enrichment fulfill the requirement to be considered as valid and reliable.

However, only the QTR1 in the variable of trust was found to be invalid. Since QTR1 value does not seem to fulfill validity and reliability criteria, it is then removed from the analysis (Rothwell & Arnold, 2007). Since QTR1 value does not seem to fulfill validity and reliability criteria, it is then removed from the analysis (Rothwell & Arnold, 2007). Continuing the new modification result, Table 3. shows the value of CR and VE, which shows the remark to be valid & reliable.

Table 1: Calculation on Construct Reliability (CR) and Variance Extracted (VE)

Through the analysis of Structural Equation Modeling (SEM), the Goodness of Fit (GOF) test overall is required to be conducted (Wijanto, 2008). The aim of this test is to whether the collected samples can represent the population. Figure 1. shows the initial model of GOF analysis. It can be seen that the RMSEA is considerably very high, with the value of RMSEA equals to 0.273. It indicates that the model is not a good fit since RMSEA should have a value of at least ≤ 0.08 or < 0.05 for a close fit.

Table 3: Demographic profile

Variable	Category	Frequency	(%)
Marital Status	Single	140	0.478
	Married	151	0.515
	Formerly Married	2	0.007
Age	18 - 25	128	0.437
	26 – 33	115	0.392
	34 – 41	41	0.140
	42 - 49	6	0.020
	≥ 50	3	0.010
Education	SMK	290	0.990
	D3	3	0.010
Working Contract	< 1 Years	72	0.246
	1 – 2 Years	107	0.365
	3 – 5 Years	35	0.119
	6 – 10 Years	48	0.164
	11 – 15 Years	24	0.082
	≥ 15 Years	7	0.024
Working Status	Temporary	226	0.771
	Permanent	67	0.229
Department	Casting	135	0.461
	Machining	87	0.297
	Finishing	71	0.242

The respondents taken are 100% male-operator as the scope of the industry is automotive manufacturing. As can be seen in table 3., the total size, according to the complete questionnaire distribution, was in total 293. All worker position level is considered to be hard-skill labor. They are all mostly come from a nearby area of Cibitung recruitment, and they have a lower education level under a bachelor's degree. Most of their working contract is less than 1 – 2 year, and their working statuses are temporary in dominant. Meanwhile, respective department are at most taken in Casting division since according to past record, casting was shown as the highest turnover rate

Figure 1:Model Fit Test

In light of this, the author of this research conducts re-specification on the syntax to create a model that Goodness fit. The result of the GOF test can be seen in Table 4. shows that each goodness fit indices show that the model overall is fulfilling a good fit requirement.

Table 4: Goodness of Fit Index

Goodness fit Indices	Fit Measures	Standard Required	Results	Remarks
Absolute fit Indices	RMSEA	≤ 0.05 or 0.05 ≤ RMSEA ≤ 0.08	0.000	Close Fit
	Chi Square (P -Value)	≥ 0.05 & Chi-square lower is better	1.000 & 0.00	Good Fit
	NCP	The lower the better	0.000	Good fit
	GFI	≥ 0.90 or 0.8 ≤ GFI ≤ 0.9	0.92	Good fit
Incremental Fit Indices	NFI	≥ 0.90	1.00	Good fit
	NNFI	≥ 0.90	1.05	Good fit
	IFI	≥ 0.90	1.05	Good fit
	RFI	≥ 0.90	1.00	Good fit
	CFI	≥ 0.90	1.00	Good fit

Figure 2 shows the regression coefficient (β) and t-value between variables to examine the relation and significance between variables.

Figure 2:Research Model Testing (with t-value)

In the first hypothesis, the effect of job satisfaction toward employee turnover intentions shows a significant result. The T-value is -11.76, which the value is less than -1.96. Therefore, the first hypothesis can be accepted as job satisfaction affect negatively to turnover intentions. This finding is actually linear and consistent with Carmeli's & Weisberg's (2006) research, as they found in their study that job satisfaction is inversely correlated to turnover intention.

The test of the second hypothesis shows that the T-values between work-life enrichment and employee voluntary turnover intention is -3.30. It is considered to be significant since it is less than -1.96. The T-value clearly shows that the relationship is inverse or in negative pattern/form. When work-life enrichment is high to have an impact on the employee, intention for the worker to leave their job will be low. The hypothesis tested upon this research follows the same result in McNall, Masuda, & Nicklin (2010) and Jiang & Shen (2018) research.

Trust in management and employee voluntary turnover intentions, according to figure 2 shows the T-value of -2.81, which was significant as it is less than -1.96. Similar to the previous hypothesis, the effect of trust in turnover intention is in the form of an inverse or negative direction. It means that a higher level of trust of the employee toward management, the lower employee intention to leave their current job. program itself may encourage the employee to trust their management. Thus, the hypothesis derived from this research is linear and consistent with Ertürk (2014), Cho &´Song (2017), and Jiang & Shen (2018) research.

Table 5: Direct effect of each hypothesis

Hypotheses	Path	T-values	SLF	Results
H_1	Job Satisfaction → Turnover intention	-11.76	-0.45	Supported
H_2	Work-life Enrichment → Turnover Intention	-2.81	-0.12	Supported
H_3	Trust → Turnover Intention	-3.30	-0.33	Supported
H_4	Job Satisfaction → Trust	7.64	0.17	Supported
H_5	Work-life enrichment → Trust	8.22	0.41	Supported
H_6	Job Satisfaction → Work-life enrichment	29.15	0.45	Supported

According to the result of path analysis at Table 5, the T-value between job satisfaction and trust is 7.64, which indicates the variable effect is significant, and the fourth hypothesis is drawn in a positive

direction. In light of this, it can be stated that the higher job satisfaction the employee feels, the higher also employee trust toward management. Therefore, it can be concluded that increasing employee satisfaction in the dimension of increasing amount pay, deliver good supervision, and enhance the proper nature of work may encourage employee trust in management decisions, especially those that affect employee immediately in the personal context. The hypothesis testing in this research supports the previous research result to prove the positive effect of job satisfaction to trust (Rich, 1997; Khany and´Tazik, 2017).

The T-values of the fifth between work-life enrichment and trust are 8.22, in which the value is considered to be very significant (> 1.96), and the direct effect is positive. In other words, the more impact of work-life enrichment to the employee, the higher their trust toward management would be. In work-life enrichment, Currently, the supporting journal available that relates work-life enrichment to trust is still limited. The closest concept that can be derived is from Jiang & Shen´(2018) research, which their model is used as the primary reference in this research.

Finally, the last hypothesis analyzed the correlation between job satisfaction and work-life enrichment. The T-values for both variables is 29.15, which becomes the highest significance value compare to all other hypotheses. As the value is significant, the hypothesis for the corresponding variable is accepted. In other words, job satisfaction affects work-life enrichment positively. As job satisfaction increased, work-life enrichment impact on the employee will be increased as well. The hypothesis is synergy with the conceptual theory of satisfaction derived by Carlson, Hunter, Ferguson, and Whitten (2014).

Based on the analysis result, the effort for PT Excel Metal Industry to control turnover rate should be supported by top management decisions. Thus, other variables such as job satisfaction, work-life enrichment, and trust must be included to develop strategic planning. As can be seen in figure 2, this research constructed a model that shows the overall results that each variable has a significant effect from one to another. To simplify, when operators of PT Excel Metal Industry is satisfied with the job they are currently doing, especially with the job nature they can enjoy, their intention to leave the company permanently will be reduced. By enhancing the opportunity for operators to spend more time with family and encourage trust in management decision that affects personal preference would also support reducing employee intention to leave.

Conclusion and Recommendation

Based on this research related to analyzing the effect of job satisfaction, work-life enrichment, trust as factors toward employee voluntary turnover intentions, it can be concluded into several issues. First, job Satisfaction negatively and significantly affects employee voluntary turnover intentions. The greater value of job satisfaction perceived by the employee will reduce the employee turnover intentions in PT Excel Metal Industry.

Second, work-Life Enrichment negatively and significantly affects employee voluntary turnover intentions. When work-life enrichment perceived by the employee is high, employee intentions to leave PT Excel Metal Industry permanently will be reduced. Third, trust in management negatively and significantly affect employee voluntary turnover intentions. The higher employee trust toward management's decision, the lower employee intentions to leave PT Excel Metal Industry permanently.

Fourth, job satisfaction positively and significantly affects employee trust toward management's decision. Job satisfaction perceived by the employee will increase their trust in management's decision of PT Excel Metal Industry. Fifth, work-life enrichment positively and significantly affects employee trust toward management's decision. When aspects of work can enrich family life of PT Excel Metal Industry employee, it will increase employee sense of trust toward management's decision. Sixth, job satisfaction positively and significantly affects work-life enrichment. A condition when job satisfaction is fulfilled, work-life enrichment will also be perceived. In PT Excel Metal Industry, the employee tends to value their job more if it can enrich their family life.

Based statistical finding, there are several recommendation for the practical implication in PT Excel Metal Industry. This research divide the implications into three categories. First for job satisfaction, the company needs to conduct workload analysis (WLA) & measure Employee Stress Index first to verify and review the working field conditions. The purpose of workload analysis is to measure the difficulties of one job position to be performed, analyze the potential risk of safety, and create an atmosphere that the worker may be able to enjoy, especially in the Casting area where the condition is very hot & the task performed is difficult.

Second, for work-life enrichment, the company is to provide information related to overtime weekly schedule in the information board so that the employee may know when they should plan to spend quality time with family, especially on the weekend. The company may need to consider in developing a better plan of PPIC in order to reduce the sudden change in production schedule (which includes overtime).

Third, for variable of trust, management should encourage transparency on what decision they want to take during management speech. Things such as potential risk and any adverse condition that may occur in the company must be socialized. If possible, it would be better for the company to state clearly about the bonus regulation, which includes calculation formula in PKB

Due to the limitation of time, this study may not be able to continue further to analyze the implemented action for reducing the actual turnover. However, the finding of this study can be used as suggestion for the company to create several programs for employee in deciding the action taken to reduce the actual turnover. In terms of the academic benefit, this study provides interesting information for other researcher that can be used as reference in analyzing turnover intention cause. Moreover, this study opens the opportunity for the next research topic.

To continue the further research, there are several suggestions that can be offered. First, turnover intentions in this research only measure the operator-level (hard skills). Therefore, the next research may continue to staff and upper level. Second, Other factors may affect the turnover intentions; the author suggests to analyze job search behavior and work environment in the future as proposed by Phillips (2003). Third, further study should analyze the effect of turnover intentions directly to organizational performance. Finally, Further study might also consider in comparing the gap between actual turnover occurred with turnover intentions. Therefore, a longitudinal study is strongly recommended.

Abstract

Innovative work behavior is a critical factor that determines successful work performance in organizations, particularly in digital creative industries as application and game developers. According to early research, innovative work behavior can be influenced by several factors. The primary objective of this study is to investigate the mediating effect of work-life balance and psychological flow on the relationship between work autonomy and innovation work behavior. The research adopts a quantitative approach to address the research objectives. The participants in this study were employees (n=263) at the application and *game* development sectors of creative industry in Indonesia. LISREL 8.8 was used to analyze the quantitave data. The findings revealed that work autonomy provides significant impact to the innovative work behavior of the workers in application and game development sector, particularly if they perceive that they experienced work life balance and psychological flow. Both work-life balanced and psychological flow have mediated the relationship between work autonomy and innovative work behavior. The results of this study highlight the requirement for the application and game developer companies to give and improve a policy for employees to control their own work because innovative work behavior is strongly influenced by work autonomy, especially by criteria autonomy. This study provides contribution in examining the mediation mechanism, particularly the psychological flow, which is a key variable but has little research.

Keywords: Innovative Work Behavior, Psychological Flow, Work Autonomy, Work-Life Balance

Introduction

Creative economy is a newly formed economy that relies on the creativity of Human Resource as its main factor of production in the economic activity, and is regulated by the Ministry of Tourism and Creative Economy, also known as *Kemenparekraf* (Thomas, 2019). The creative industry is considered as the future of industry of Indonesia (Hamdani, 2019). The significance of this contribution given by creative economy has made Indonesia to have prospects to become the country with the fifth highest income in the world by 2030 (Harefa & Nuky, 2018). This immense contribution in the sub-sector is also brought about by the substantial growth of businesses in the field of application and game development. Based on data in the year 2016, there are 12.441 businesses in this sub-sector within the period of two years (Sabdarini, 2018). There are a lot of start-up companies in this sector today. The immense growth of this sub-sector has made competitions to be more intense, therefore entailing the workers in the application and game development industry to improve their product quality to be able to compete, both domestically and internationally.

The abundance of creativity, ideas, and concepts are required to improve product quality. Innovation too is required for companies in this sector. Innovative work behavior is important in allowing creativity of employees to contribute in product innovation and therefore in the company. Innovative

work behavior is defined as every action oriented to bring about changes within the organization, both as form of products or processes (Krause, 2004). Several divisions are naturally in charge of continually creating new formations and innovations, thus this work behavior to be able to bring about creativity and innovation is incredibly needed. These divisions may involve software or IT development, designer, product producers, product development, and so forth. The need to innovate is also seen in the area of marketing as it is thought to be a dynamic area, where the job has to go along with the trends and growing information to market products that are acceptable to the consumers.

As for the employees of application development, their responsibilities are based on projects with unexpected work load, requiring consistent project delivery within the agreed timeline without any critical bugs (Mathew, 2007). Based on the employees of game development companies spread out in several countries, 51% of them mentioned that they work overtime due to the presence of critical time to finish products within the deadline (crunch time). During this crunch time, 37% work 50-59 hours per week, 29% work 60-69 hours per week, and the rest 14% work more than 70% per week (International Game Developers Association, 2018). The application and game developer sub-sector in Indonesia have excessive work time. The application and game developer sector was once the highest sub-sector in the creative industry which had excess working hours with a percentage of 86.40% (Sabdarini, 2016). Time pressure is considered as the destructive factor and negatively impact the innovative work behavior. When this negative factor arises, other factors are then required to support the innovative work behavior. These factors may both be external or internal. Common ways that applied by several companies in the creative industry, especially in the application sector and game developers is giving work flexibility to their employees.

According to a research earlier, one of the external factors affecting the innovative work behavior is work autonomy, or the freedom to control work. Spiegelaere, Gyes, Witte, Niesen, Hootegem (2014) explained that the freedom in working, whether of methods, schedules, and work evaluation criteria, influences the innovative work behavior of employees. Nielsen & Cleal (2010) revealed that employee autonomy can increase motivation in the workplace. Although motivation is a broader domain, psychological flow itself is seen by involving aspects of intrinsic motivation (Bakker, Golub, & Majdarijavec, 2017). Demerouti (2006) who researched on the job characteristics one of which being work autonomy, found that this is related to the psychological flow in working, or also the experience requiring absorption, enjoyment, and intrinsic motivation. Psychological flow drives positive results to individuals such as productivity, satisfaction with life, positive mood and emotions and others (Mihelič & Aleksić, 2017). Psychological flow affects individuals who need creativity task in carrying out their daily work so that the optimal experienced has an important role in stimulating innovative behavior.

Research done on work-life balance in gaming industry in Finland concluded that the employees feel the work-life balance between their job and personal lives (Nahkamäki, 2015). James (2013) has found that work-life balance improves the learning capabilities of employees, allowing them to concentrate, innovate, be involved in their job, have the capability to lay new ideas, therefore initiating the innovative work behavior amongst IT developers. This is brought about by participating in many activities, and interacting socially will give various points of view that will expand into new ideas (Mihelič & Aleksić, 2017). If individuals can manage and carry out their personal lives without conflict with work, the quality of an individual's private life will be positive, and provide satisfaction.

This satisfaction in personal lives outside their job can increase their positive feeling towards their jobs and also increase the individual’s ability in creating new things (Tang, Huang & Wang, 2017). Mihelič & Aleksić (2017) stated that individual’s satisfaction on work-life balance can reduce fatigue so that the individual may have several roles and do not have any difficulties in overcoming various requests needed. This satisfaction triggers positive affection as the individual is involved in meaningful life events to the individual, which leads to high probabilities for the individual to experience psychological flow during activities. Psychological flow is defined as an action experienced by the individual in which the individual takes control and is in harmony in carrying out activities, resulting in a condition of complete and optimum involvement within the activity (Maeran & Cangiano, 2013). This optimum condition is the condition where the individual is highly concentrated and focused on the job, so much so that he gets carried away by time.

Innovative work behavior had been researched by many countries in diverse company. A research study in Malaysia by Hilmi, Pawanchik, Mustapha and Mahmud (2012) shows that Malaysian employees does have a high level of innovative work behavior. Saether (2019) mentions that R&D employees in high-tech companies in Norwegia expected to have high levels of innovative work behavior as contribution to their firms' innovations. Innovative work behavior had been conducted in diverse industries in Indonesia but with small number of studies for examples, study in hospitality industry (Noerchoidah, Eliyana & Christiananta, 2020). Owing to explanation above, researches about innovative work behavior that focus on creative industry is still rare in developed countries.

Based on the earliest research, the researchers wanted to analyse the factors that may influence the innovative work behavior by investigating the effects of policy in giving the freedom at work (work autonomy), positive feeling based on balanced work and personal life (work-life balance), optimum condition, and the individual involvement on one's work (psychological flow). For this reason, the researchers are interested in deepen their knowledge of the impact of work autonomy towards innovative work behavior at work, mediated by work-life balance and psychological flow of employees in application and game development sector in Indonesia.

Literature Review

Innovative Work Behavior

Krause (2004) defined innovative work behavior as every action oriented to bring about changes within the organization, both as form of products or processes. This concept emphasizes on a situation requiring problem solving or requiring change. An individual who tries to find solutions by giving a new idea and tries to implement it is said to have behaved innovatively. Innovative work behavior has two dimensions in its implementation, exploring ideas and solutions, and then implementation of those ideas (Krause, 2004).

Generation ideas is every process involving the behavior of analysing and formulating problems, finding new ideas, whether developed anew or combination of existing ideas, in order to propose an idea. Generation idea process is related to implementation. The second dimension is implementation: the process at which the new idea is being used and distributed. Implementation of this innovation gives new knowledge, making this stage of the process a repeating one. This concept emphasizes on the fact that implementation and generation ideas are inter-related to each other (Krause, 2004).

Work Autonomy

The theory of work autonomy by Breaugh (1985) is oriented to Hackman & Oldham (1975), however executing the work independence aspect, therefore work autonomy is then categorized into three. First is work method autonomy, explaining the level of freedom and choices owned by an individual regarding to procedures and methods they are to use in going about their work. Second is work scheduling autonomy. The definition of this is the level of sense of belonging owned by an individual in controlling their own schedules to carry out their job. Third is work criteria autonomy, explaining the level of ability of an individual in modifying or developing the criteria to be used in evaluating work performance.

Work-Life Balance

In his research, Fisher (2001) emphasizes on work-life balance being a perception of each individual whether they have the resources (time, behavior/achievement of goal, energy and effort) both in personal life and at work, thus showing the presence of balance of both roles. Fisher, Bulger, & Smith (2009) stated that someone has work-life balance when there is time, behavior (achievement of goal), energy and effort in both areas of life. Work-life balance can be seen from four aspects (2009), first is Work Interference with Personal Life (WIPL), that views whether work life intervenes the personal life

of an individual, for instance, the high work load and working hours interrupts oneself to take care of personal life.

Second aspect is Personal Life Interference with Work (PLIW), viewing how far the personal life of an individual intervenes work life, so as to interrupting the performance of work. Third aspect is Personal Life Enhancement of Work (PLEW). This aspect views the positive impact in the work-life relationship. The positive impact of personal life of an individual to the work life can be seen from this aspect. How the personal life impacts positively the work performance of an individual is also shown, for instance the improvement of work performance due to the content psychology of an individual. The last aspect is Work Enhancement of Personal Life (WEPL). In contrast to PLEW, WEPL views how far the work life of an individual positively impacts the personal life, for instance the ability obtained from work has helped an individual in behaving adaptively in one's personal life.

Psychological Flow

Psychological flow is also known as Optimal Experience, which is achieved by optimum work performance followed by positive mental condition and positive thoughts (Csikszentmihalyi, 1990). Bakker (2008) defined psychological flow from three aspects, absorption, enjoyment and intrinsic motivation. Bakker (2008) defined absorption as the level of complete concentration that occurs in an individual when one is completely deep in the work. Second aspect is work enjoyment, defined as a form of cognitive and affective evaluation of psychological flow experience, making an individual feel the sense of contentment and enjoyment during work. Third aspect, intrinsic motivation, is defined as the push in an individual to do the related work for the purpose of achieving the contentment and satisfaction that are adhered to the activity or work (Bakker, 2008).

Research Model and Hypothesis Development

The factors affecting innovative work behavior have been greatly found before through several researches. External factors that may build innovative work behavior at work is by implementing work autonomy policy. Giving high control to employees in doing their job, especially the freedom in using methods to complete their tasks, has effectively encourage them to develop new and innovative ideas (Spiegelaere, Gyes, Hootegem, 2016).

The research done by Sia & Appu (2015) explained that by giving autonomy, the minds of employees will be more relaxed hence they are capable of creating new ideas, initiating the emergence of innovative work behavior. The research done by Kono, Sekiguchi, Suzuki and Takaishi (2018) on interaction of method autonomy, schedule autonomy and criteria autonomy towards innovative work behavior proved that these three kinds of autonomy impact the innovative work behavior.

In the scope of this research, employees working in application and game developer experience higher pressure and work demand as seen from the average working hours exceeding 48 hours a week. Work autonomy is one of the many ways given by the management to the employees to let them have control over their own responsibilities of giving qualified productivity, seen from their abilities in creating ideas and in implementing the existing innovation. The effectivity of work autonomy towards innovative work behavior has been proven by earlier researches. Based on this, the first hypothesis of this research is therefore:

H1. There is a positive relationship between work autonomy and innovative work behavior

Moving over to a more intrinsic factor, the internal factors, it is known that positive evaluation towards the quality of personal life and its impact to positive evaluation of work also significantly influence the initial aspect in innovative work behavior (Tang, Huang & Wang, 2017). When personal life and work life experiences bring about positive qualities, the individual will have positive value of oneself, therefore pushing the emergence of innovative behavior at work (Mishra, Bhatnagar, Gupta, Wadsworth, 2017).

Reviewed from the other researches, work autonomy also impacts aspects other than innovative work behavior. According to Russel (2009), an individual who has the freedom to control his job has better balance between work and personal. Chung (2017) stated that work autonomy impacts both personal life and job, as work autonomy reduces conflicts that might occur between work and personal life. Wheatley (2012) also acknowledged that with the freedom of control and flexibility at work, the individual can reduce conflicts within work life and personal life, decrease work stress, and avoid pressing situation. These discoveries and statements led to the hypothesis as follows:

H2. There is a positive relationship between work autonomy and work life balance

Maeran and Cangiano (2013) had done a research that analysed the relationship between job characteristic and psychological flow where autonomy was one aspect of the job characteristic. The results implied that autonomy impacted significantly and positively the psychological flow. Likewise, Bakker (2005) did a research on the relationship of social support, supervisory coaching, autonomy and feedback towards psychological flow. The result also indicated that there was an impact created by autonomy to psychological flow. The research done by Demerouti (2006) was also consistent with the previous research, stating that impact of autonomy was one of motivational potential score to see the relationship of psychological flow at the workplace. Looking at the earlier researches, autonomy increases the occurrences of psychological flow or work optimization in employees. If employees often experience psychological flow or optimum working experience, then it is expected that they would give quality result. Thus, based on this, the researcher came up with the hypothesis as follows:

H3. There is a positive relationship between work autonomy and psychological flow

The research done by Mishra, Bhatnagar, Gupta, Wadsworth, (2017) proved that when personal and work life mutually give positive qualities, the individual will value themselves positively, this therefore enforces the emergence of innovative behavior at work. James (2013) also stated that positive values to work-life balance contributes to innovative behavior. Other supportive researches revealed that mutual relationship between work life and family has the potential to improve innovative behavior (Fletcher & Bailyn, 2005). Mihelič & Aleksić (2017) explained that work-life balance can increase the individual's ability in creating new ideas, which is one of the aspects of innovative behavior. This is because the interaction with surroundings will enrich the individual's ideas and knowledge. Participating and being involved in various activities, together with interacting socially, will give wide perspectives that will enhance the individual's ability in creating and innovating. Jaussi, Randel & Dionne (2007) mentioned that the experience obtained outside of work will give positive impact to the individual's ability in developing new ideas while at work, and this is one part of innovative behavior.

H4. There is a positive relationship between work-life balance and innovative work behavior

According to the research done by Tang, Huang & Wang (2017), when an individual is content with their personal life outside of work, the individual is able to channel positive feelings towards their job. Positive feeling makes the individual works optimally. This can also increase the ability in innovating new ideas, which is one aspect of innovative work behavior at workplace. Mihelič and Aleksić (2017) explained the underlying process of this is because work-life balance can decrease individual's fatigue, enabling them to overcome the demands of different needs and roles.
Positive value to work-life balance triggers positive affection situation as the individual involved in life considered to them as meaningful. The research done by Kuhnle (2012) aligned with the other researches stating that there was positive correlation between work-life balance and psychological flow.

H5: There is a positive relationship between work-life balance and psychological flow

One factors that can encourage the formation of innovative work behavior is psychological flow (Maqbool, Černe, and Bortoluzzi, 2019). Psychological flow give rise to an individual fully involving oneself with his work. This full involvement includes cognitive, affective, and motivation, brings positive impacts to organizational activities, such as problem solving, strategy formulations, making approaches which are also a form of creative organization behavior (Zubair and Kamal, 2015).

H6. There is a positive relationship between psychological flow and innovative work behavior

The research done by Abstein and Spieth (2014) that saw the role of work-life conflict as an antithesis of work-life balance in mediating human resource management policies, one of them being autonomy, towards innovative work behavior concluded that work-life conflict had negative correlation to innovative behavior, and autonomy as an approach in giving freedom to the employee too had negative correlation with work-life conflict, therefore increasing innovative work behavior. This also explained that there was a mediating role of work-life conflict. The previous explanations on various researches concluded that work-life balance impacts innovative work behavior positively (Mishra, Bhatnagar, Gupta, Wadsworth, 2017; Mihelič & Aleksić, 2017) and work autonomy impacts work-life balance positively (Russel, 2009; Chung, 2017; Wheatley, 2012). All of the three constructs have preceding interconnected researches and are supported by research, therefore to that reason, the researcher constructed the following hypothesis:

H7: work life balance has a mediating effect on the relationship between work autonomy and innovative work behavior

The research done by Zhou (1998) stated that autonomy improved one construct of psychological flow, intrinsic motivation that in turn encouraged the emergence of new ideas, which is part of innovative behavior (Zhou, 1998). Other research also stated that work autonomy can affect innovative work behavior through the role of work engagement, where the construct is related to psychological flow, absorption (Spiegelaere, Gyes & Nielsen 2014; Spiegelaere, Gyes & Hootegem, 2016). Based on this, psychological flow is then expected to have its role in mediating the impacts between work autonomy and innovative work behavior. Therefore the researcher constructed the following hypothesis:

H8: Psychological flow has a mediating effect on the relationship between work autonomy and innovative work behavior

Based on the conceptual model, the following hypotheses were developed for testing:

Figure 1: Research Model

Research Methodology

Procedure and Sample

The approach used in this research was quantitative approach based on the research that was to be done. Respondents in this research comprising 263 respondents from several companies in Indonesia that develop applications or games. Respondents gave several answers about their job sectors, because of this, researchers divide into five type sectors of application and game developer sectors (game developer, e-commerce, financial technology, information technology developer, and internet of things). Majority of respondents work at e-commerce sector with a total 90 respondents. In addition, there are 70 respondents which work at game developer sector, 60 respondents work at information technology developer, and the rest with a total 24 respondents work at internet of things sector.

Snowball sampling was used in this study by asking for help from existing population members. Questionnaires were distributed using social media. Participation was entirely voluntary. Respondents were assured that their responses to the online survey are confidential. The research data was collected from the end of August to December 2019. The research process from the preparation stage to the data processing was carried out from January to December 2019. In processing the data, the researchers used LISREL 8.8 as the software that can process Structural Equation Modeling (SEM) to analyze the data obtained, and SPSS was used to analyze the statistical description.

Measurement and Scales

Researchers took primary data using questionnaires about perceptions of work autonomy, (Breaugh, 1985) work-life balance (Fisher, 2001), psychological flow (Bakker, 2008) and innovative work behavior (Krause, 2004). The questionnaires were self-reported, reflecting assessments of environment and personal life. The primary data obtained were composed of: respondent demographic data in the form of gender, age, marital status, company of work, and department of work. Likert scale was used as the measurement scale in this research, with the range of 1 (fully disagree) to 5 (fully agree). The questionnaires were adapted by translation from English to Bahasa Indonesia to accommodate the understanding of the respondents.

The results of pre-tests done on 36 respondents resulted to reliability values of each of the four variables with Cronbach's alpha of ≥ 0.7, therefore concluded that the measurement tools of work autonomy, work-life balance, psychological flow and innovative work behavior were reliable (Maholtra, 2010). Of validity of pre-test results, it was known that the value of component matrix in work-life balance variable WIPL1 item was $0.141 < 0.5$, which according to Malhotra (2010), a measurement tool is stated valid if the value of component matrix is greater than or equal to 0.5, therefore the item was demoted by the researchers and was not used in the real test. In the validity test using the overall data of 263 respondents, based on the analysis process using LISREL 8.8, it was known that three items have factor loading values of < 0.05. The researchers decided to reduce those three items in the data process in order to improve the reliability and validity of the measurement tools.

Results and Analysis

Before analysing the model, goodness of fit test was conducted. The goodness of fit test can be decided by comparing the calculated Goodness of Fit (GOF) value to the predetermined standard value. The result of GOF is shown in Table 1. The result showed that the overall value of Goodness of Fit was said to be highly suitable with the model.

Table 1. Goodness of Fit Index

Criteria	Provision	Actual Value	Conclusion
RMSEA	≤ 0.08	0.065	Good fit
GFI	≥ 0.90	0.95	Good fit
NNFI	≥ 0.90	0.97	Good fit
CFI	≥ 0.90	0.98	Good fit
RFI	≥ 0.90	0.95	Good fit

Proceeding to the hypothetical analysis, it was known that the research hypothesis was acceptable if the t-value was greater than or equal to 1.65 in one-tailed hypothesis. Figure 2 shows that there was only one correlation t-value under 1.65. This showed that there was one objected hypothesis. Thus, concluded that H1-H4 as well as H6 were accepted, showing that there are significant positive impacts between the research variables. On the other hand, H5 was objected, showing that there is no significant impact between work-life balance and innovative work behavior.

Figure 2: Hypothetical Test Result Model

From the result of mediation calculation on Table 3, it is shown that work-life balance as a mediator did not fulfil the third requirement of Baron and Kenny (1986) because it does not have direct impact (direct-only-non-mediation) to innovative work behavior. On H8 hypothesis, it was known that psychological flow mediates the relationship between work autonomy to innovative work behavior by *partial mediation* according to Baron and Kenny (1986).

Table 3: Mediation Impact Test Result

Construct	Model 1	Model 2
work-life balance as mediator	4.68	3.43
psychological flow as mediator	4.42	3.43

Based on the result of the research done, it is found that the high work autonomy, especially in giving enough control in deciding the goal of work to application and game development employees is in fact pushing them to behave innovatively. This is shown from the values on work autonomy variable ((β = 0.35, t-value = 3.43). When there is high level of delegation in the work autonomy, there is improvement in innovative work behavior. This high control shows that the employees have the freedom in choosing or changing methods, procedures, schedules, and working criteria. Spiegelaere, Witte, Gyes, Niesen (2014) states that work autonomy, be it in methods, scheduling, or work evaluation criteria, has significant impact in improving innovative work behavior. Sia & Appu (2013) explains that work autonomy influences individuals, therefore encouraging them to develop new ideas, which is also included in the generation ideas aspect of innovative work behavior.

The balance of personal and work-life felt by the employees also enhances the birth of innovative behavior by influencing psychological flow (β = 0.87, t-value = 4.78). This shows when the interaction between personal and work life is more positive, the more often they will feel optimum experience in carrying out their job. Also, the innovative behavior is enhanced by psychological flow (β = 0.52, t-value = 4.32). Psychological flow promotes the birth of new ideas and innovative behavior such as experimentations, taking risks, and innovating (Mihelič & Aleksić, 2017).

Work autonomy is also known to influence psychological flow that impacts on the improvement of innovative work behavior (β = 0.45, t-value = 4.78). When employees are given freedom and flexibility to adjust when and how the work should be done according to the wants from within oneself, they will work positively and will be absorbed into their work. The freedom in choosing which method and order the task are to be done, will activate the intrinsic motivation to carry out the work. (Theurer, Tumasjan, Welpe, 2016).

Table 4. Standard Loading Factor of work autonomy indicators

Construct	SLF
Method autonomy	0.69
Schedule autonomy	0.75
Criteria autonomy	0.76

The results from table 4 shown that the highest SLF value on autonomy work dimension is criteria autonomy with 0.76. Schedule autonomy has an SLF value of 0.75 where this value nearly close with the criteria autonomy value, and method autonomy has an SLF value of 0.69. This shows that the criteria autonomy has the biggest role in the work autonomy at this study.

Discussion

Based on the results, the work autonomy given to the application and game developer employees would lead to the improvement to their innovative work behavior, particularly if they perceived that they experienced work life balance and psychological flow. The work autonomy is in fact plays a major role in improving innovative work behavior, especially the control over determining objectives. These objectives are related to tasks needed to be done in a certain period of time. Companies in application and game development sector applies Objectives and Key Results (OKR). OKR is determined from the scope of organization to the individual himself. When given autonomy in the form of enough control, employees are then able to negotiate and propose alternative options of work targets. When given enough control to determine and evaluate objectives, employees will then become more critical. This will train them to solve problems and form plans to innovate new ideas as one form of effective and efficient solutions. As a developer, these abilities are very much needed to develop better application updates, and they need to be done quickly. Aside from that, giving enough freedom in determining objectives enables employees evaluate themselves and their results. Once they were aware of what needs to be reviewed and improved based on their own results, they will strive to improve their work quality by cultivating new and innovative ideas that can be implemented at work.

The presence of psychological flow experience, particularly contentment of work, is able to strengthen innovative work behavior of employees working as application and game developers. Freedom at work relieves the burden and pressure of work targets to employees that in turn enables them to be focused and to enjoy working. This also gives them positive values when working. They will then not slumber and are spirited at work even when they get tired.

Giving work autonomy is one policy among others that can create positive feeling at work. The policy that enables employees to maintain their work-life balance that they can value their life positively is in fact affecting their optimum work, which in turn improves innovative behavior. This is because work autonomy gives room for employees to improve their balance between personal life and work life. Positive affect brought about personal life impacts workers in such a way that they will become more relaxed and are able to focus on their job. This shows that they are enabled to work optimally or experience psychological flow.

Conclusion

Based on the explanation on the result of research analysis, the conclusion that can be made is that work autonomy gives positive and significant impact to the innovative work behavior of the workers in application and game development sector. This means, the higher the work autonomy owned by the workers, the higher the innovative behavior. Other factors influencing innovative work behavior is psychological flow that has been found to give positive and significant impact towards innovative work behavior. This means that the more often the workers are absorbed and optimally work, the more they behave innovatively. Work-life balance is known to have no significant impact towards innovative work behavior. Other than direct impact, work autonomy has indirect positive and significant impact towards innovative work behavior through psychological flow, while work-life balance does not have

any role in mediating the effect of work autonomy towards innovative work behavior. Stating that the higher the work autonomy, the higher the chance of occurrence of psychological flow, thus the higher the innovative work behavior.

Managerial implication, limitation and future research

Other than the results obtained, researchers also give suggestions for managerial implication. Suggestions that can be given to the company managements in the field of application and game development sector to improve innovative work behavior among employees are, first, to implement a policy for them to control their own work criteria and goals because criteria autonomy has not been implemented equally in companies. This can be supported by applying suitable goal setting framework, such as Objectives and Key results, therefore providing an open discussion and meeting space to discuss together of the goals to be achieved. Another method that can be done to give rise of innovative work behavior is by improving the abilities of employees to work optimally (psychological flow).

Another solution that can be implied in establishing innovative behavior is by expanding their abilities to work optimally (psychological flow). Based on this, the company needs to focus on developing intrinsic motivation, one aspect of psychological flow, and on continuously improving positive affect of employees at work. One way that can be done to improve this motivation is using the role of manager to give explanation about the meaning of the job they do, so they are aware that their roles have significant contribution within the organization or company, and enabling them to use their time efficiently to work even when they have spare time.

Despite its contributions, several shortcomings of this study should be noted. The first limitation is about self-reported nature of the gathered data and it could impact the result because of the possibility of bias. To reduce this concern, future research can use different methodological approaches, including expert ratings from supervisor for innovative work behavior questioner. Another limitation of this research is the unavailability of data on the population, as only 263 participants were involved in the present study, the sample size may have caused the not significant results. So, one of the recommendations is to increase the sample size of participants, including employees from diverse sub-sectors in creative digital industries. This would enhance the generalization of research findings to the entire population. Suggestion for future studies if done with similar research design with similar contexts, the researchers recommend the following to be noted down. The next research should use other methods such as longitudinal method. This recommendation may encourage more future researches to do sustainable researches over long period of time, hence the analysis of cause-consequences of innovative behavior may be explained more profoundly. Other suggestion for future research is to enrich the research field by adding new antecedents, whether as independent variable, moderator, or mediator because there is still little research that addresses about innovative work behavior and the factors which could influence it.

Abstract

Quality audits have a crucial role in the effectiveness of government administration. Previous studies showed that audit quality can be altered by several variables, therefore the purpose of this study is to be able to find out whether time budget pressure, self-efficacy, resilience, and burnout affect the reduced audit quality practices (RAQP) resulting in lowering the audit quality, on auditors in the public sector. Data were collected by distributing on-line questionnaires to 385 public auditors and Structural Equation Modeling was used for data processing. The results showed that time budget pressure had a significant positive effect on burnout and RAQP, whereas self-efficacy and resilience had a significant negative effect on burnout and RAQP while burnout showed a significantly positive value on RAPQ

Keywords: Time Budget Pressure, Self-Efficacy, Resilience, Burnout, Reduced Audit Quality Practices, Public Auditor

Introduction

Based on the data quoted from Trading-Economic (2019), the Indonesia's Corruption Perception Index (CPI) was 38 from 100 in 2018. Corruption Perception Index ranks the countries based on the corruption perception done by its public sector. Zero-point mean very corrupt and 100 points mean very clean. Thus Indonesia's CPI can be considered very low.

The government audit report on the country's potential loss from the year 2017 until 2019 is shown in figure 1. Lee, Su, Tsai, Lu, and Dong (2016) stated that ensure the audit quality was an important approach to increase the resource also to stimulate economic growth. Audit quality holds a crucial role in government administration's effectiveness.

Figure 1: Total Government Loss (in million Rupiahs)

Source: (BPK-RI, 2017a, 2017b); BPK-RI (2018a); (BPK-RI, 2018b, 2019)

From the earlier study, it is known that audit quality can be influenced by several variables. Time budget pressure (TBP) aroused when allocated time for audit is less than the actual time needed to finish the audit, therefore the auditors using their personal time to be able to finish the audit on time (Sayed Hussin, Iskandar, Saleh, and Jaffar, 2017). Ettredge, Sun, Lee, and Anandarajan (2008) states that from the conclusions of the results of several studies show that time budget pressure (TBP) does exist in the audit sector, and the auditor must constantly trade-off between the time dedicated to carrying out the financial statement audit work and the quality of the results of his work with the cost to do his work. Gundry, and Liyanarachchi (2007) stated that audit quality (AQ) was negatively affected by higher TBP compared to optimal TBP. Therefore auditors feel the pressure because they have to carry out the tasks within the specified timeframe to complete the audit.

On the other hand, the ability and technical knowledge related to auditing and the ability to solve problems become important determinants of judgment task performance. Traits possessed by an auditor such as self-efficacy and goal orientation may be able to distinguish the level of audit judgment. The effect of self-efficacy on social and cognitive aspects of the judgment in various work conditions has been recognized, but the research examining the effect of auditor self-efficacy on audit performance judgment is still very limited (Sanusi, Iskandar, Monroe, and Saleh, 2018). If it said that AQ is easily affected by the auditor's ability, effort, and persistence than if there is an effort to upgrade the level of self-efficacy (by changing belief, information, and knowledge), it can lead to improvement of auditor's work result. (Lee, Su, Tsai, Lu, and Dong, 2016).

Smith, and Emerson (2017) found that the higher the auditor's level of resilience in dealing with stressful situations, the less likely that the auditor would take action to reduce AQ. The auditor plays an important role as the front line institution that maintains the process of preparing financial statements, as well as plays an important role in the effectiveness of capital market turnover. As a result, everything that has the potential to reduce AQ is an important concern for management, investors, regulators, and all stakeholders who may be affected by the financial statements.

Burnout is a common occurrence among auditors. Audit offices are well known for their busy work patterns and this industry has historically been associated with high turnover rates (Cannon and Herda, 2016). Previous studies found that high workload contributed to burnout, increased turnover and decreased performance. Over time, audit offices are increasingly aware of this problem and are increasing efforts to monitor and manage workloads. Despite the efforts made, there are still concerns that the high workload could negatively impact AQ (Persellin, Schmidt, and Wilkins, 2018).

Literature Review

Reduced Audit Quality Practice (RAP)

Audit Quality (QA) is a crucial concept in auditing. Colbert, and Murray (1999) suggested that it is hard for the management to be able to measure AQ because AQ cannot be observed. It has to be assessed from planning and the audit scope and the auditors have to be assessed periodically. Audit quality also often discussed as reduced AQ, which is lower audit quality and much more specific which behavior that caused the reduced AQ. Broberg, Tagesson, Argento, Gyllengahm, and Mårtensson (2016) defined reduced AQ as an action that intentionally and not supposed to reduce the efforts to collect the audit data. Behaviors that associated with reduced AQ are a concern for the audit profession because it tends to be a systemic action. Previous research indicates that more than half of auditors admit to doing at least one deviant behavior. Apart from reduced AQ actions carried out both individually and collectively, it does not always result in an impaired audit opinion, but such behavior has the potential to lowering the validity of the audit (Smith, Emerson, and Boster, 2018).

Time budget pressure (TBP)

Time budget pressure (TBP) is a time constraint that arises or may arise due to limited resources (time) allocated to carry out audit tasks (DeZoort and Lord, 1997). Andreas (2016) states that TBP is a condition in which auditors have to face limited time allocation to implement the audit program. A tight time budget is perceived as a time pressure in carrying out audit procedures that trigger an imbalance between the time available and needed to complete the audit task, furthermore, this can trigger the dysfunctional behavior of the auditor. Several studies have been conducted to determine the relationship between TBP and AQ and underreporting time. Umar, Sitorus, Surya, Shauki, and Diyanti (2017) refer to Utary (2014) argued that if the time budget is difficult to be met, then dysfunctional audit behavior will increase. However, if the auditor shows dysfunctional behavior, then it will have an impact on the declining quality of the audit, both directly and indirectly (McNamara and Liyanarachchi, 2008). Examples of dysfunctional behavior performed by auditors are reducing or replacing some procedures and collecting ineffective audit evidence (López and Peters, 2012).

Self-efficacy (GES)

Self-efficacy is a construct that represents one of the key aspects of social-cognitive theory (Bandura, 1994). In his theory of behavior change, Bandura stated that self-efficacy determines whether the behavioral action will be initiated, how much effort will be made, and how long it can last for obstacles and failures. According to several theories and research, self-efficacy makes a difference in how an individual thinks, feels and reacts. In terms of feelings, low levels of self-efficacy are associated with depression, anxiety, and feelings of hopelessness. Someone with a low level of self-efficacy will also have a low level of self-esteem and will have a pessimistic feeling about their achievements and development. In terms of cognitive, the feeling of having certain strong competencies can facilitate cognitive processes and performance in a variety of circumstances, including in terms of producing decisions that determine the quality (Schwarzer and Hallum, 2008). Refer to (Chen, Gully, and Eden, 2001), Zhang (2018) states that self-efficacy is generally defined by certain tasks that one thinks of, but can also refer to various achievement situations.

One consequence of high self-efficacy levels on auditors is tending to make it difficult for the auditor to make soft decisions on material audit issues compared to auditors who have lower self-efficacy levels (Svanberg, Öhman, and Neidermeyer, 2019). Sanusi, Iskandar, Monroe, and Saleh (2018) also stated, in the context of the audit, the auditor's confidence in their ability to carry out the task requires the belief that they have cognitive abilities to carry out their duties. This trust in cognitive abilities is known as self-efficacy. Self-efficacy is a motivational construct that influences individual activity choices, levels of achievement, persistence, and performance in certain contexts. Self-efficacy represents an individual factor that, according to social cognitive theory, affects judgment performance (Stajkovic and Luthans, 1998).

Resilience (RES)

Resilience is not easy to define, in general, the approach to defining resilience is grouped into three things: some researchers think that resilience is in a person (trait), other researchers argue that resilience is a result of behavior, and several other researchers consider resilience to emerge as a process (Gras, Font-Mayolas, Baltasar, Patiño, Sullman, dan Planes, 2019). Connor, dan Davidson (2003) define resilience as a personal quality that enables a person to develop in dealing with various problems.

Burnout (BOT)

Burnout is conceptualized as a negative psychological response to work demands and / or interpersonal stressor (Almer and Kaplan, 2002); (Cordes and Dougherty, 1993) and is thought to manifest through repeated or extended exposure to stressors. Smith, Emerson, and Boster (2018) states that burnout is a negative psychological response that arises as a result of work pressure and/or interpersonal conflict and arises as a result of repeated stresses over a long period. Cordes dan Dougherty (1993) defines emotional exhaustion as a feeling of lack of energy and decreased emotional resources of a person, and

depersonalization as a tendency to treat others separately, and do not care. Reduced personal accomplishment is characterized by a feeling of low self-esteem, low motivation, and an inability to work satisfactorily, for example, a tendency to evaluate someone negatively.

Research Model and Hypothesis Development

Effect of Time Budget Pressure, Self-Efficacy, Resilience and Burnout on Reduced Audit Quality Practices

Auditors are routinely preoccupied with a variety of audit clients, must follow strict task scheduling, conduct mentoring, must meet job demands, as well as participate in various types of training in one work year. During busy periods, the auditor can work extra for more or less 5 hours than usual working hours (Persellin, Schmidt, and Wilkins, 2018). The high demands of the auditor's work will be increasingly challenging and consuming time during the auditor's busy period. The auditor will be burdened with high time pressure and overtime hours and risky decision making (Lopez dan Peters, 2012). Smith, and Emerson (2017) suggested that the higher the level of auditor's resilience can reduce the level of burnout and also minimized the RAQP.

H1a: Time Budget Pressure has a positive effect on Reduced Audit Quality Practices
H2a: Self-efficacy has a negative effect on Reduced Audit Quality Practices
H3a: Resilience has a negative effect on Reduced Audit Quality Practices
H4: Burnout has a positive effect on Reduced Audit Quality Practices

Effect of Time Budget Pressure, Self-Efficacy, and Resilience on Burnout

The research conducted by Treglown, Palaiou, Zarola, and Furnham (2016); Kutluturkan, Sozeri, Uysal, and Bay (2016) dan Hao, Hong, Xu, Zhou, and Xie (2015) suggested that the higher the level of auditor's resilience it can reduce the level of burnout. Earlier studies also found that burnout associated with absenteeism, poor job performance, reduced citizenship behavior, and increasing turnover intention. Smith dan Emerson (2017) states that, if stress is an immediate response to an environmental stressor, burnout represents the consequences arising from prolonged and repeated exposure to the same stressor. The duration of exposure to this stressor can defeat a person's coping abilities. Smith dan Emerson (2017) also found evidence of a relationship between stress and the individual components of burnout as well as the relationship between the dimensions of burnout with the emergence of job satisfaction, turnover intentions, and job performance. Burnout can lead to decreased effectiveness and productivity, reduced commitment to work, has a negative effect on domestic life and has a negative effect on health. (Guenette and Smith, 2018). :

H1b: Time Budget Pressure has a positive effect on Burnout
H2b: Self-efficacy has a negative effect on Burnout
H3b: Resilience has a negative effect on Burnout.

Based on the hypotheses above, the research model can be depicted as figure 2.

Figure 2. Research Model

Research Methodology

Procedure and Sample

The population in this research is the public auditors in Indonesia. A total of 385 questionnaires was successfully collected from August until September 2019. This number already met the minimum criteria for using the Structural Equation Modeling (SEM) as suggested by Leohlin (2004) that the minimum sample used for SEM are 200 or as suggested by Wolf, Harrington, Clark, and Miller (2013) that the minimum criteria for using SEM are (1) 100-200 minimum sample; (2) 5-10 observation for each parameter; (3) 10 samples for each variable. The data collected then will be analyzed for its Confirmatory Factor Analysis (CFA) using Lisrel 8.8 program.

Measurement and Scales

This study uses primary data obtained through questionnaires given to respondents. The question used in this questionnaire is: (a) six-item for time budget pressure adopted from Sayed Hussin, Iskandar, Saleh, and Jaffar (2017), (b). ten-item for self-efficacy adopted from General Self-Efficacy Scales (GSE) by Schwarzer, and Jerusalem (1995); (c) ten-item for resilience adopted from The Connor-Davidson Resilience Scale (CD-RISC) by Campbell-Sills, and Stein (2007); (d) nine-item for burnout adopted from Smith, Emerson, and Boster (2018); (e) five-item for reduced audit quality practices adopted from Smith, and Emerson (2017).

This research questionnaire using a Likert scale with a range of 1 to 7 because it can increase the value of reliability and validity, and the use of a wider range of scales provides a wider range of answer choices for respondents so able to improve the distribution (Dawes, 2007). Emerson (2017) states that many researchers use a 7 or 9 Likert scale because the scale can work more robustly. Leung (2011) also suggested in his research that the presence of neutral points in the Likert scale used, did not show differences in the normality of the data, his research showed that the wider the scale used, the better normality of the data would result.

The research hypothesis testing was carried out after it was confirmed that the SEM model had met the good fit requirements and the indicator variables were valid and reliable in reflecting latent variables. Testing is done by looking at the path coefficient and t-value and then compared with t-table. The results of the test show how the direction and significance of the influence or relationship between variables. With a significance level of 0.05, the hypothesis is accepted if t-value ≥ 1.65 (Hair, Black, Babin, and Anderson, 2014). The mediation measurement will be referring to mediation measurement by Leohlin (2004).

Result and Discussion

The demographic data from the respondent are described in table 1. Therefore, the majority characteristics of the respondents were male, married, age of 31-40 years old, had a background education as undergraduate degree, and had possessed quite extensive working experiences of 6-15 years at the positions of young auditor.

Table 1. Respondent Demographic Data

Demographic Data	Respondent Count	Percentage
Sex		
Male	244	63.38%
Female	141	36.62%
Marital Status		
Married	323	83.90%
Single	56	14.55%
Widow/widower	6	1.55%
Age		
21-30 years old	45	11.69%
31-40 years old	268	69.61%
41-50 years old	65	16.88%
Up to 50 years old	7	1.82%
Education		
Bachelor	258	67.01%
Master	125	32.47%
Doctor	2	0.52%
Years of services		
1-2 years	16	4.42%
3-5 years	24	6.23%
6-10 years	148	38.44%
11-15 years	143	37.14%
Up to 15 years	53	13.77%
Working Position		
Junior Auditor	131	34.03%
Young Auditor	220	57.14%
Senior Auditor	34	8.83%

The variables reliability measures by Construct Reliability (CR) and Average Variance Extracted (AVE) and the result is each variable fulfills the reliability criteria. The complete measurement for AVE and CR from each variables are shown in the table 2.

Table 2. AVE and CR for each variables

Variables	Average Variance Extracted (AVE)	Composite Reliability (CR)
TBP	0.55	0.71
GES	0.52	0.88
RES	0.52	0.92
BOT	0.52	0.70
RAP	0.50	0.80

The measurement for goodness of fit of the research model is shown in table 3. The goodness of fit test can be decided by comparing the calculated Goodness of Fit (GOF) value to the predetermined standard value. The result showed that the overall value of Goodness of Fit was said to be highly suitable with

the model, since at least one measure for each type of fit measures indicated good fit (Hair, Black, Babin, & Anderson, 2014).

The results of hypothesis testing show that all hypotheses are acceptable because they show a significance value of t-value ≥ 1.65, as shown in figure 3, which describes the regression coefficient (β) and t-value between variables. The mediation measurement result shows that burnout mediates time budget pressure, self-efficacy, and resilience on reduced audit quality practices by complementary (partial) mediation.

Table 3. The Research Model Goodness of Fit

Fit Measures	Good Fit Criteria	Data Measurement	Notes
Absolute-Fit Measures			
Chi-square (X^2)		1767.61	Poor fit
ρ Value	≥ 0.05	1.00	
GFI	≥ 0.90 or 0.8 ≤ GFI ≤ 0.9	0.73	Marginal fit
RMR	≤ 0.05	0.20	Marginal fit
RMSEA	≤ 0.05 or 0.05 ≤ RMSEA ≤ 0.08	0.000	Good fit
SRMR	≤ 0.05 or 0.05 ≤ SRMR ≤ 0.1	0.23	Marginal fit
Incremental-Fit Measures			
AGFI	≥ 0.90 or 0.8 ≤ AGFI ≤ 0.9	0.69	Marginal fit
NNFI	≥ 0.90 or 0.8≤NNFI≤0.9	1.02	Good fit
NFI	≥ 0.90 or 0.8≤NFI≤0.9	1.00	Good fit
RFI	≥ 0.90 or 0.8≤NFI≤0.9	1.00	Good fit
IFI	≥ 0.90 or 0.8≤NFI≤0.9	1.02	Good fit
CFI	≥ 0.90 or 0.8≤NFI≤0.9	1.00	Good fit

The path diagram at figure 3 displays that the relationship between the time budget pressure and the practices of reduced audit quality variables shows a t-value of 8.28. Therefore, the hypothesis 1a can be accepted. This implies that the higher the time budget variable pressure felt by the examining staff at BPK-RI, then practices of reduced audit quality too will more and more increased. This is in line with research conducted by Gundry, and Liyanarachchi (2007); Otley, and Pierce (1996); Coram, Ng, and Woodliff (2004); and Broberg, Tagesson, Argento, Gyllengahm, and Mårtensson (2016), who stated that there is a positive significant relationship between time budget pressure with reduced audit quality practices. This is because with time pressure in completing audit tasks enlarge the possibility for auditors to take the appropriate actions reduce audit quality.

Figure 3. Regression Estimates of Model (with t-value)

The path diagram for the relationship between the time budget pressure variable with the burnout variable shows a t-value of 6.15. Therefore, the hypothesis 1b was accepted. This shows that the higher the time budget pressure felt by the BPK auditors, the higher the burnout they feel. Shbail, Salleh, and Nor (2018); Darawad, Nawafleh, Maharmeh, Hamdan Mansour, and Azzeghaiby (2015); (King'ori, 2016); Teng, Shyu, Chiou, Fan, and Lam (2010), found that there was pressure caused by time constraints show a significant and positive relationship to burnout. This is caused by the pressure caused by the limited time of inspection will trigger the emergence of burnout.

The relationship between the self-efficacy variable with the reduced audit quality practices shows a t-value of -2.42. Therefore, the hypothesis 2a was accepted. This shows that the resilience has an influence and negative effect on the reduced audit quality practices. As with research on self-efficacy and burnout, research conducted to find the relationship between resilience and reduced audit quality practices is also still very limited. In his research, Smith, and Emerson (2017) stated that one of the internal factors of individuals that can be used to overcome stressors arising from organizations is resilience so that the higher the level of resilience that is owned by individuals, it can reduce the negative impact caused by various stressors. One of them is to reduce reduced audit quality practices.

The path diagram for the relationship between the self-efficacy variable with the burnout variable shows a t-value of -2.13. Therefore, the hypothesis 2b was accepted. This shows that the the greater the level of resilience at the BPK RI agencies, the burnout level experienced by the inspector staff will decrease. Smith, and Emerson (2017) stated in their research that resilience has a significant and negative influence on burnout, so that steps to increase resilience levels such as providing related training can improve the ability of auditors to overcome the pressure arising from burnout. This is in line with the research of Smith, and Emerson (2017), research conducted by Treglown, Palaiou, Zarola, and Furnham (2016); Sozeri, Uysal, and Bay (2016) and Hao, Hong, Xu, Zhou, and Xie (2015) quoted that by increasing the level of resilience that an individual has, it can reduce the level of burnout felt by that individual.

The path diagram for the relationship between the resilience with the reduced audit quality practices variable shows a t-value of -2.28. Therefore, the hypothesis 3a was accepted. This means that the resilience variable has a negative effect on the reduced audit quality practices variable. In his research, Smith, and Emerson (2017) stated that one of the internal factors of individuals that can be used to overcome stressors arising from organizations is resilience so that the higher the level of resilience that is owned by individuals, it can reduce the negative impact caused by various stressors, such as the reduced audit quality practices.

The hypothesis 3b was accepted since the path diagram for the relationship between the resilience with the burnout variable shows a t-value of -3.40. Therefore, the higher the resilience shown by the auditors can reduce the level of burnout felt by that individual. Smith, and Emerson (2017) stated in their research that resilience has a significant and negative effect on burnout, so steps to increase resilience levels such as providing related training can improve the auditor's ability to cope with pressure or overcome the negative impacts arising from burnout. This result is in accordance with the research conducted by Treglown, Palaiou, Zarola, and Furnham (2016); I quote, Sozeri, Uysal, and Bay (2016) and Hao, Hong, Xu, Zhou, and Xie (2015).

The t-value calculation of the H4 hypothesis shows a significance value of 8.28, which means that the burnout variable has a positive influence on the reduced audit quality practices variable. The acceptance of this hypothesis shows that the higher the level of burnout felt by the auditor, the higher the possibility of reducing audit quality practices. Some studies that support this hypothesis are research conducted by Smith, and Emerson (2017), Smith, Emerson, and Boster (2018), and Fogarty, Singh, Rhoads, and Moore (2000) who find that with an increased level of burnout that is felt by the auditor has a positive influence on the emergence of reduced audit quality practices.

Overall, the results of this study indicate that if the auditor has confidence in conducting audits (self-efficacy) and able to improve their self when facing difficulties (resilience), therefore, when the auditor faces limited time of work (time budget pressure), the auditor can overcome the emergence of fatigue due to work pressure (burnout), which in turn can reduce the occurrence of actions that can reduce audit quality (reduced audit quality practices). Self-efficacy is shown by the ability to think of various alternative solutions when faced with a problem and resilience is shown by the ability to achieve its goals even though faced with various obstacles, it will be able to reduce the pressure arising from the tight time allocation of audit (time budget pressure) so that feelings burnout that arises in the auditor, that is the feeling of not caring (depersonalization) with the main form of feeling hard-hearted to the supervisor can be reduced to moderate levels.

As a result of the high self-efficacy through the ability of auditors to think of various alternative solutions when faced with a problem and a high level of resilience that is shown by the ability to be able to achieve its goals even though faced with various obstacles, can reduce the occurrence of reduced audit quality practices with the main components reducing the audit work below the standard.

Conclusion and Recommendation

From this study, it can be concluded that time budget pressure can significantly and positively influence burnout and reduced audit quality practices. Where the higher level of time budget pressure felt by the auditor will be able to trigger the emergence of burnout and increase reduced audit quality practices that can affect the decline in audit quality. Self-efficacy and resilience are proven to have a significant and negative effect on burnout and reduced audit quality practices. This means that the higher level of self-efficacy and resilience possessed by the auditor, can reduce the perceived burnout and reduce the occurrence of reduced audit quality practices that can have a positive impact on improving audit quality. Burnout is known to have a significant and positive effect on reduced audit quality practices.

This research faced with several limitations where researchers have not been able to research things that can affect the level of self-efficacy such as problem-solving skills, perceived ability, and confidence, or even on other variables that can also affect reduced audit quality practices such as professional development, auditor experience, professional skepticism, auditor independence, and auditor integrity, so it is expected that in the future these variables can be used as further research material.

Another limitation is the reduction of three out of a total of six indicators of time budget pressure variable, which can affect the construct of time budget pressure variable. It is expected that future research can be carried out with more adequate data collection times and sample sizes, therefore, the

data obtained can be a better represent indicators of time budget pressure variable and other variables in this study.

Abstract

Organization must rethink the relationship with its employees in order to compete in this rapidly changing business world. As market demands for innovation, this rapid change require employees to be involved in various ways with their work and company, communication is needed between the management and employees. Internal communication is one of the channel to influence employee engagement, improve employer branding and increase employee retention as attracting and retaining highly talented employees. The purpose of this study was to understand the effect of internal communication on employer branding and employee retention through employee engagement. Structural equation modeling (SEM) was served to analyze collected questionnaires at building industry. The results showed that the internal communication and engagement would be effective to retain the employees only if the employees felt safe in working for reputable companies. The results were expected to consider internal communication as strategic management tools.

Keywords: internal communication; employer branding; employee retention; employee engagement

Introduction

In order to compete in this rapidly changing business world, an organization must rethink the relationship with its employees. As market demands for innovation, this rapid change requires employees to be involved in various ways with their work and company. As organizations develop, the role of public relations includes the internal scope to establish harmonious relationship between the organization and employees as internal audiences in it. Harmonious internal relationship leads to a sense of mutual understanding and trust, a comfortable work atmosphere, encourage good cooperation and avoid conflict. Internal communication is one of the discussions that often arises in strategic management and plays an important role related to employee engagement in the industrial nowadays as it offers two-way communication between employees and management.

Internal communication is defined by Men and Bowen (2017) as “a process co-created by the organization and its employees”. Welch and Jackson (2007) further explained that strategic interactions and relationships between parties within organizations include “internal line manager communication, internal team peer communication, internal project peer communication, and internal corporate communication”. Effective internal communication can increase employee awareness of opportunities and threats, and develop employee understanding of changes in organizational priorities (Bakker, Albrecht, and Leiter, 2011; Bindl and Parker, 2010). In measuring internal communication satisfaction, communication satisfaction is important to determine the level of employee satisfaction with the communication process within the company thus involves all areas of social interactions, keeps people together, and helps to perfect organizational communication. Communication satisfaction is the level of individual satisfaction with various types of communication in an organizational environment (Jalalkamali, Iranmanesh, Nikbin, and Hyun, 2018). Karanges, Johnston, Beatson, and Lings (2015)

revealed that there is a significant positive relationship between internal communication and employee engagement. Results suggest that internal communication facilitates the interaction between the organizations, supervisors and employees which create workplace relationships, and through this optimizes employee engagement. Verčič and Vokić (2017) study also confirmed that internal communication satisfaction has a significant role in high employee engagement.

Schaufeli, Shimazu, Hakanen, Salanova and De Witte (2019) defined employee engagement as a positive and satisfying state of well-being, which is characterized by high pleasure and arousal that will increase productivity. Although it is important to understand the relationship between internal communication and employee engagement, there is still few empirical researchs address the association of these two (Welch, 2011). Employee engagement is very important towards the company's branding strategy. It is best to build strong brands internally by increasing engagement. Burawat (2015) found that there was a positive relationship between company brand and employee engagement. Hashim and Nor (2018) also revealed that employees most likely felt safe working at well-known companies, especially international brands. In addition, Neill (2016) provided new insights on how internal communicators promote ethics and values among new and existing employees under the umbrella of corporate branding.

Employer branding covers development benefits, as well as economic benefits, and psychological benefits (Berthon, Ewing, and Hah, 2005). Employer branding is a contemporary approach that is continuously expanding and it can keep up the firms' reputation in attracting and retaining employees (Ahmad and Daud, 2016). Organizations are concerned with what their employees think about them as an employer. According to Sokro (2012), an organization makes use of its employer branding strategy to attract employees in their business that can stay with the company and influence the choice of employees to stay or leave the organization. Hadi and Ahmed (2018) also stated that employer branding enabled the employer to build an image in people's mind that the firm is a great place to work. Eemployer branding has the ability to retain the best people by providing an environment that allows employees to live the brand through various aspects (Fernon, 2008). This increases their satisfaction and is likely to remain within the organization (Jain and Bhatt, 2015).

Gaddam (2008) identified that commitment, retention, performance, satisfaction, interests, interests and loyalty can all be positively linked. Allen, Bryant and Vardaman (2010) also recognized that brand increased employee morale and satisfaction, which in turn increased retention. Singh and Rokade (2014) suggested that brand are important for employees to stay in the organization and that it developed a strong appeal to get the opportunity to work with good brand. In addition, Ashfaq, Ur Rehman, Safwan, Afzal and Humayoun (2012) examined how effective communication played an important role in retention and motivation stated that overall work atmosphere, rewards and skills acquired by employees are important but are not useful if supervision and communication are not comfortable enough which means that communication is very important for employees.

Increasing engagement by improving non-financial drivers such as communication, recognition, supervisor support, work engagement, teamwork, and role clarity could increase retention (Balakhrisnan, 2015). It is a positive message that even without financial expenditure, the engagement of employees and retention can be increased. Biswas and Suar (2016) argue that costs associated with employee replacement today are high and employer branding can be used to improve employee relations and ultimately reduce turnover (Berthon, Ewing, and Hah, 2005). Bussin and Mouton (2019) found that employees with high overall employer branding scores were more satisfied, less likely to actively seek to move and less likely to consider to leave.

Employee retention is the company's efforts to retain its employees in the organization that aims to help achieve maximum organizational targets. The term retention is related to turnover, which means the process of employees leaving the company (Mathis and Jackson, 2006). Turnover intentions are used to measure employee retention rates. Turnover intention according to Babalola, Stouten and Euwema (2016) is the tendency or intention of employees to stop working from work voluntarily or move from one work place to another according to their own choice.

In Indonesia, all industries need to attract talent and retain potential employees, include the brick-and-mortar industries. One of the company is BuidingCo. In 2019, the company conducted employee surveys. The company was also registered as the Top Employer Certification for 2020 where the company would complete a detailed assessment of its human resource management practices through the HR Best Practices Survey. The expectation of the certification was that company could become employer of choice, in which company succeeded in maintain its certification for two consecutive years. However, feedback from both surveys related to the points of the extent to which the new recruitment impressions of the company's brand are fulfilled by their experience after joining, how to measure engagement in the organization each year by using a comprehensive engagement study, whether the survey results are communicated quickly and how to systematically measure the company's reputation as an employer. Based on these feedback points, a lot of attention was paid to employee engagement and employer branding in the company which it prioritized internal communication. This research was expected to be able to contribute to the concept of internal communication in the management sphere as a management strategy related to employee engagement, employer branding and employee retention. The paper proceeded then by the literature review, followed by the research methodology and the results explained finished by conclusion.

Literature Review

Internal Communication

Internal communication is defined in many different ways and interchangeably referred to as internal public relations, employee communications, business communications, employee relations, internal relations, internal marketing, intra-organizational communication, and staff communication (Men and Bowen, 2017; Verčič, Verčič, and Sriramesh, 2012; Welch and Jackson, 2007). Men and Bowen (2017) specifically defined internal communication as “a process co-created by the organization and its employees,” and defined internal relations as “the strategic management of internal communication in managing interdependence and building mutually beneficial relationships between the organization and its employees.” In comparison, Welch and Jackson (2007) took a stakeholder perspective focusing on internal stakeholder segmentation. They defined internal communication as “the strategic management of interactions and relationships between stakeholders within organizations across numerous interrelated dimensions, including internal line manager communication, internal team peer communication, internal project peer communication, and internal corporate communication”.

In measuring internal communication, communication satisfaction is the most suitable construct. Communication satisfaction is the level of individual satisfaction with various aspects of communication in organizations (Downs and Hazen, 1977). This understanding put forward about communication satisfaction defining as individual satisfaction with various kinds of communication in the organizational environment. Communication satisfaction is defined as satisfaction with communication related to the position of employees in the organization (Mount and Back 1999). Downs and Hazen (1977) developed the Communication Satisfaction Questionnaire (CSQ) to discuss the relationship between communication satisfaction and job satisfaction. CSQ is the most widely used business communication satisfaction questionnaire, which provides leaders with the knowledge and tools to build positive attitudes and performance (Mount and Back, 1999). According to the Downs and Hazen study (1977), it was revealed that CSQ construction includes organizational and management communication from requesting corporate communications. In short, basically, both CSQ construction and internal communication are agreed on at the same time in corporate communications. Downs and Hazen (1977) identified eight dimensions of communication satisfaction in organizations consisted of communication climate, supervisory communications, organizational integration, media quality, horizontal informal communication, general organizational perspective, subordinate communication, and personal feedback.

Employee Engagement

Conceptualizations of engagement build from Kahn's (1990) influential work about three constructs help explain how engagement develops: meaningfulness, safety, and availability. According to Kahn (1990), engagement implies physiological as well as physical presence in performing an organizational role. Another important definition of engagement comes from Schaufeli, Shimazu, Hakanen, Salanova, and De Witte (2019) as they defined it as a positive, work related state of mind that is characterized by vigor, dedication and absorption. The dimensions or aspects of the employee engagement are vigor aspect characterized by high levels of strength and mental resilience in work and persistent in facing difficulties. The second dimension is the aspect of dedication characterized by a feeling that is full of meaning, enthusiasm, inspiration, pride and challenging at work. The third dimension is the aspect of absorption which is marked by concentration and deep interest, immersed in work, time seems to pass so quickly and individuals find it difficult to break away from work so that and forget everything around them. (Schaufeli and Bakker, 2004). Saks (2006) stipulated that employee engagement includes two important aspects, job engagement and organization engagement.

Employer Branding

Ambler and Barrow (1996) describe the employer brand as the package of functional, economic and psychological benefits provided by employment, and identified with the employing company. Backhaus and Tikoo (2004) additionally stated that the employment brand highlights the unique aspects of the firm and how they differentiate from its competitors by attracting, motivating, and retaining the firm's current and potential employees. The added value of favorable employee response to employer knowledge is generally expressed as employer brand equity. An outcome of employer brand equity is 'organizational attractiveness' (Lievens and Highhouse, 2003) which it was used to measure employer branding as company need to know their degree of attractiveness. Employer attractiveness is the profit that is coveted by employees when they work in an organization (Berthon, Ewing, and Hah, 2005). Employer branding measurement tool called Employer Attractiveness Scale was developed by Berthon, Ewing, and Hah (2005) consisting of five dimensions with 25 questions to infer how the level of interest in each dimension of employer branding. The values including the value of interest related to innovation and interest in products and services generated by the company, social values related to the conditions of the work environment and relationships between other employees, economic values related to the benefits derived by employees from the economic side, the value of development related to the possibility of employment opportunities and promotion in the future, and the value of the application related to the possible application of something that has been learned and an indication of how far the organization is oriented towards consumers.

Employee Retention

Employee retention is an effort of the company to keep its employees in the organization that aims to help achieve the maximum organizational targets. The purpose is to retain potential employees who are valuable assets. It also defined as "a technique adopted by businesses to maintain an effective workforce and meet operational requirements" (Mehta et al. 2014). Das and Baruah (2013) explained the concept as "a process in which the employees are encouraged to remain with the organization for the maximum period or until the completion of the project". The term retention is related to the term turnover, which means the process of employees leaving the company (Mathis and Jackson, 2006). Turnover intention was used to measure employee retention rate. According to Porter and Steers (1973), turnover intention is a withdrawal behavior when employees feel dissatisfied. Mobley also defined that the turnover intention is the psychological tendency of employees who are dissatisfied with certain aspects of the organization and want to leave the organization after comparing external work opportunities with current work. Moreover, Mobley, Horner and Hollingsworth (1978) further suggested that turnover intention is a combination of job dissatisfaction, plans to quit, and the tendency and likelihood of finding other jobs at their own choice.

Methodology

Hypothesis Development

Effect of Internal Communication on Employer Branding

Neill (2016) had provided new insights that how internal communicators promote ethics and values among new employees and those that already exist under the umbrella of corporate branding. However, this research focused more on public relations.

H1: There is a positive influence of Internal Communication (IC) and Employer Branding (EB)

Effect of Internal Communication on Employee Retention

Ashfaq, Ur Rehman, Safwan, Afzal Humayoun (2012) found how effective communication played an important role in employee retention and motivation. It showed that employee morale was relatively high, which it illustrated that relationships in their work are important for job satisfaction. This reflects that the overall working atmosphere, rewards and skills acquired by employees are important but are not useful if supervision and communication are not comfortable enough to work. This research concluded and gave recommendation that communication is very important for employees.

H2: There is a positive influence of Internal Communication (IC) and Employee Retention (ER)

Effect of Internal Communication on Employee Engagement

Karanges, Johnston, Beatson and Lings (2015) stated that internal communication is important in the organization as it facilitated interaction between organizations, supervisors, and employees which create relationships at work based on meaning and value. Verčič & Vokić (2017) study also confirmed that internal communication satisfaction had an important role in high engagement.

H3: There is a positive influence of Internal Communication (IC) and Employee Engagement (EE)

Effect of Employee Engagement on Employer Branding

Burawat (2015) reported that there was a positive relationship between company brands and employee engagement and further reported that development and application were the most important dimensions. Hashim and Nor (2018) also revealed that employees most likely feel safe in working for well-known companies, especially if they carry international brands. Therefore, for employees to survive, they believe that they must be more engaged with their work.

H4: There is a positive influence of Employee Engagement (EE) and Employer Branding (EB)

Effect of Employee Engagement on Employer Retention

Balakrishnan, Masthan, and Chandra (2013) stated that retention can be increased by increasing the level of employee engagement by overcoming non-financial drivers of engagement such as communication, recognition, supervisor support (work), work engagement, teamwork, and role clarity. Therefore it has given a very positive message that even without financial expenditure, the engagement of employees and retention can be increased.

H5: There is a positive influence of Employee Engagement (EE) and Employee Retention (ER)

Effect of Employer Branding on Employee Retention

Gaddam (2008) stated that commitment, retention, performance, satisfaction, interests, interests and loyalty identifies can all be positively linked. Allen, Bryant and Vardaman (2010) also recognized that brand increased employee's morale and satisfaction, which in turn increased retention. Hadi and Ahmed (2018) also stated that branding created possibility in building image "a great place to work". If done properly, it had the ability to retain the best people by providing an environment that allows employees to live in the brands through various aspects (Fernon, 2008). This increased their satisfaction and would likely to remain in the organization (Jain & Bhatt, 2015).

H6: There is a positive influence of Employer Branding (EB) and Employee Retention (ER)

Based on the hypotheses above, the research model can be depicted at figure 1.

Figure 1: Research Model

Research Method

Procedure and Sample

This study was a cross-sectional study, where data was collected only at one time (Cooper and Schindler, 2014). This research was conducted through quantitative method by collecting primary data. To quantify the relationships between internal communication, employer branding, employee retention and employee engagement, data were collected via an online survey to involve employees at BuildingCo using convenience sampling. The respondents we also asked about general information such as gender, age, work location, service year, and educational level. Hypothesis testing was done using structural equation modeling with PLS-SEM.

Measurement and Scales

All items within the online survey were measured using 7-point Likert-scales (strongly disagree to strongly agree). One stage of pre-testing were implemented to resolve any fundamental problems in the online survey and to test for content validity. The questionnaires were modified from Downs and Hazen (1977) of Communication Satisfaction Questionnaire (CSQ), Berthon (2005) of Employer Attractiveness Scale, Mobley (1978) of Turnover Intention Questionnaire, and Schaufeli and Bakker (2004) of Utrecht Work Engagement Scale (UWES) with a total of 52 questions. In this study, the reliability test of each variable was measured using Cronbach's alpha. The minimum value of Cronbach Alpha (α) for each variable must be minimal 0.6 (Malhotra, 2010). Every variable were reliable as it resulted IC (α = 0.878), EE (α = 0.91), EB (α = 0.925), as well as ER (α = 0.847).

Results and Discussion

In this study, demographic data was collected from 100 workers. Majority of respondents were male with total 66% due to the nature of the industry in building material manufacturing. The majority of the respondents (66%) possessed bachelor degree, whereas 44% of respondents worked at Jakarta, and the rests were scattered in several plants and sites. Most of them (21%) have had service year between 1 to 3 years in the company.

The measurement model was evaluated through convergent validity consists of reliability items (validity of each indicator) and average variance extracted (AVE) (see table 1). Testing of item reliability (indicator validity) can be seen from the value of the loading factor (standardized loading). A re-estimation was made on the model after being reduced to produce a valid indicator. The results of the second structural model have indicated that the values of the Standardized loading factor for each

indicator are greater than 0.7. This means that the indicators in the model are valid as a measurement tool for latent variables so that they can be used for modeling. The reliability test was performed using Average Variance Extracted (AVE) and Composite Reliability (CR). This study has shown that the AVE values of all variables were greater than 0.5. This means that the latent variable already has a good convergent validity where the latent variable can explain an average of more than half the variance of the indicators. The CR values of all latent variables are more than 0.7, mentioning that all latent variables are reliable, or all the indicators have consistency in measuring their respective latent variables.

Table 1: AVE and CR for each variables

Dimension	Variables	Average Variance Extracted (AVE)	Composite Reliability (CR)
Employer Branding	Application	0.876	0.701
	Development	0.873	0.633
	Economy	0.826	0.704
	Interest	0.854	0.661
	Social	0.903	0.652
Employee Engagement	Absorption	0.882	0.714
	Dedication	0.910	0.771
	Vigor	0.919	0.792
Employee Retention	ER	0.909	0.770
Internal Communication	Communication Climate	0.919	0.695
	Personal Feedback	0.857	0.601
	Supervisory Communication	0.887	0.613

Figure 2 showed the results of the hypothesis testing. Based on direct effect coefficient structural model, it can be concluded that internal communication had significant effect on employer branding at 0,624. Therefore, H1 was supported and this support Neill (2016) research that internal communicator could promote employer branding to employees. In contrary, H2 was not supported since internal communication did not significantly affect employee retention at 0.055 even though Ashfaq, Ur Rehman, Safwan, Afzal Humayoun (2012) research mentioned that effective communication might have important role in retention.

Figure 2: Hypothesis Testing

*Note: **: Significant at 5%*

In regards to employee engagement, the internal communication had a significant effect to employee engagement at 0,624, whereas in turn, employee engagement also had a significant effect to employer

branding at 0,292 (see table 2). Thus H3 and H4 were supported. These findings was in line with Karanges, Johnston, Beatson and Lings (2015) research that internal communication had significant role in organization to facilitate interaction between organization and employees thus increased employee engagement also Verčič & Vokić (2017) study that internal communication satisfaction had an important role in high engagement. It also supported Burawat (2015) and Hashim and Nor (2018) that engagement and employer branding had positive relationship that employee preferably feel safe if they worked at well-known company. This research has proven again that internal communication significantly and positively influenced engagement and employer branding which implied that the better the process of internal communication in the company, the more employees feel involved and engaged thus make the company a great place to work. This also support Hadi and Ahmed (2018) research that branding created possibility in building image "a great place to work". This research mentioned that employees agreed that they received information about how they are valued, receive recognition of their efforts, receive information about how problems at work can be overcome, interesting company publications, and how communication in the company motivates and encourages their enthusiasm to achieve company goals and make them identify themselves or feel an important part of the company.

However in contrary, H5 was not supported since employee engagement did not significantly affect employee retention at 0.079 even though Balakhrisnan, Masthan and Chandra (2013) research mentioned that retention could be increased through increasing engagement. In the end, employer branding, however, had a significant effect on employee retention at 0,367. Thus H6 was supported and this supported Gaddam (2008) also Allen, Bryant, and Vardaman (2010) research mentioned that given employer brand could increase moral and satisfaction of employees thus increased retention. If done properly, it had the ability to retain the best people by providing an environment that allows employees to live in the brands through various aspects (Fernon, 2008). This increased their satisfaction and would likely to remain in the organization (Jain & Bhatt, 2015). Moreover, to win the "war of talent", Gilani and Cunningham (2017) indicates that employer branding is integrated into the organization and holds value for employees and contributes to them staying employed.

Table 2: Direct Effects of the Structural Model Pathway Coefficients

Hypo-theses	Path	Path Coeff.	t-value	p-value	VIF	Results
H1	Internal Communication → Employer Branding	0.624	8.893	0.000**	1.636	Supported
H2	Internal Communication → Employee Retention	0.055	0.369	0.356	2.937	Not Supported
H3	Internal Communication → Employee Engagement	0.624	8.729	0.000**	1	Supported
H4	Employee Engagement → Employer Branding	0.292	3.872	0.000**	1.636	Supported
H5	Employee Engagement → Employee Retention	0.079	0.678	0.249	1.921	Not Supported
H6	Employer Branding → Employee Retention	0.367	2.362	0.009**	3.344	Supported

*Note: **: Significant at 5%, *: Significant at 10%*

The research showed that employee engagement is also considered to significantly affect employer branding, which in turn employer branding significantly affects employee retention. This means that the more employees are involved with their work, the more attractive the company will be, which then increases employee retention. This is supported by data showing that employees feel they have the opportunity to be able to teach others about what they know, feel themselves accepted and have a sense of ownership of the company, feel the company is a good company so that it can be used as a stepping stone for future work. This result is also supported by employees feeling that the company is innovative because of work practices, and produces quality products. This certainly increases the company's reputation as well as increasing the attractiveness of the company, which in turn affects retention.

As this study also measure the role of employee engagement as mediator, based on indirect effect coefficient structural model, it also can be concluded that employee engagement significantly mediates internal communication with employer branding with estimated coefficient 0.182, but employee engagement did not significantly mediates internal communication and employee retention at estimated coefficient 0.049 (see table 3). Since there were few researchs about employee engagement mediating between internal communication to employer branding and employee retention, this research could provide insight into how engagement played the mediator role which mostly engagement played as mediator linked to job characteristics, organizational commitment, job satisfaction, psychological capital and role of perceived organizational support.

Table 3: Results of the Indirect Effect of Structural Model Pathways Coefficients

Variables	Path Coefficient	t-value	p-value
Employee Engagement mediates the relationship between Internal Communication and Employer Branding	0.182	3.325	0.000**
Employee Engagement mediates the relationship between Internal Communication and Employee Retention	0.049	0.640	0.261

*Note: **: Significant at 5% level, *: Significant at 10% level*

Table 2 shows that all VIF values were close to 3 and lower, mentioning that no indicative of probable collinearity issues among the predictor constructs to prevent bias the regression results. Therefore, we may examine the structural model of PLS SEM results (see table 4), including coefficient of determination (R^2) assessing explanatory power of the endogenous variables and Q^2 values that indicates predictive accuracy (Hair, Risher, Sarstedt, and Ringle, 2019). Table 4 explains that the model could explain substantial variance of employer branding, as for the other two constructs, namely employee engagement and employee retention, the model provided limited limited explanation of their variances. The results also in line with the Q^2 values, which the model have provided medium predictive accuracy for employer branding and employee engagement, and small predictive accuracy for the employee retention.

Table 3: Results of the Indirect Effect of Structural Model Pathways Coefficients

Variables	R^2	Q^2
Employer Branding	0.701	0.325
Employee Engagement	0.389	0.222
Employee Retention	0.221	0.156

The comprehensive findings show that at BuildingCo, the synergy between internal communication and engagement was not enough to improve the employee retention. This result is in line with findings of Alias, Noor, & Hassan (2014) in Malaysian companies. The benefits of internal communication and engagement would be effective in influencing the decision of employees to stay at the organization only if the employees felt safe in working for reputable companies. The evidence that BuildingCo itself was certified as the Top Employer in 2020 has explained why the employees considered to stay remain at the company. However, companies need to rethink on how take internal communication activities and tactics seriously, or otherwise, they would easily move to the other competitors in the building industry.

Conclusion

This study had open new insights on how internal communication mostly discussed on public relation topics can be used in management topics as strategic management tools related to employee engagement, employer branding, and employee retention. The importance on how company need to attract talent and retain employees remains top priority for them to maintain their competitive advantages. This study had proven again that the implication of internal communication was boosted if the company could keep its prestige as one of the leader in the industry. Most results related to the insignificant effect of employee retention may be because turnover intention was used to measure the employee retention. Also, since the study relies on employees' self-reports, which raises concern about self-serving bias when employees report their own behavior (Gruman and Saks, 2011) and concern about common method bias. However, all constructs were measured with established scales, which mitigate measurement error and decrease common method bias (Spector, 1987).

Based on the research results, the company needs to pay attention to aspects that employees feel are still lacking. Among other things related to the receipt of information about the comparison of work with others. This can be overcome by clarity in the job description for each position. Then another point of concern is that employees feel that top management does not know and understand employees' problems, as well as listen to and pay attention to employees. This can be overcome by employee dialogue to intensify meetings between management and employees. On the other hand, employees feel the company should be more often involved in social activities. As for other findings related to relationships between coworkers, support and enthusiasm from coworkers, and gaining direct experience from other departments that were felt to be lacking which in the end felt the work environment did not make them happy. Advice can be given related to relationships with colleagues, this is a task for managers to pay more attention to the relationship between team members with other members both from the same division or different divisions. This can occur due to the possibility of miscommunication or other divisions' work performance that is uncomfortable.

Finally, this research does have sampling limitations that reduce the generalizability of our findings to the wider population – the sample is small in absolute numbers and self-selected, and the study is limited to a single organization source. The first limitation was that this research had only been carried out on 100 employees of staff and lower level of management in a company. In the future, self-selection and one-organization issues could be diminished and a broader scope of research was expected to obtain broader and comprehensive overview of internal communication from employees working at brick-and-mortar industries in Indonesia or broader in various organizational and industrial settings. Moreover, there were still a need for exploration of other factors and testing some models that involve different variables. Balakrishnan, Masthan, and Chandra (2013) suggested the use of details of drivers of employee engagement that influenced the employee retention. Since internal communication was a new construct discussed in management scope, it might have different perspective than discussed in public relations scope.

The Growing Role of Marketing Communication and Visual Identification in The Company's Development

Pawel NOWODZINSKI

Czestochowa University of Technology, Czestochowa, Poland, pawel.nowodzinski@wz.pcz.pl

Abstract

The main purpose of the paper is an attempt to present the role that visual identification should play in the process of preparing a marketing strategy for a modern enterprise. The offer of the company is addressed to a specific segment of recipients (target group). The case study of the Tiens Corporation is presented.

Keywords: Marketing Communication, Visual Identification

Introduction

The purpose of the paper is to indicate the marketing communication as an important element in the process of building a strategy to reach a selected target group. Marketing communication in the context of this work is defined as a set of information (signals) that the company emanates from various sources towards not only to its clients but also to other entities of the marketing environment. Marketing communication is also defined as the information that reaches decision-makers in the form of megatrends, identified needs, buyer preferences, and macro-developmental tendencies [Mruk, 2004; Schultz, Schultz, 1998; Finne, Grönroos, 2009; Stuart, Kerr, 1999; Naeem, Bilal, et al. 2013; Finne, Grönroos, 2017].

The article presents one of the elements of marketing communication - visual identification on the example of the concept of the TIENS Group Co. Ltd.

Success of the strategy in today's competitive reality is conditioned by the proper identification of the target group, which implies the appropriate development of graphic elements related to marketing communication, which affects the functioning of the company. The visual context is of great importance, especially since more than eighty percent of the reading devices have a visual form, the eye is a well-developed sensory sensor, better supported by the brain than all other senses [Sydenham, Dudziewicz, 1990; Feenstra, Borgstein, 2019; Ramos, Sampaio, et al. 2020; Rathee, Rajain, 2017].

In today's market reality, appropriated by the dominant customer - the creator of the organization's market attitudes - Searching for the main determinant of the strategy of business organizations has no obvious solution. Intuitively, it seems that it should be a customer, but in management practice, the basic criterion by which the company's management is accounted for is economic profit. Nevertheless, it is the customer, or rather the degree of satisfaction of his needs, that predominantly determines the amount of profit achieved. Over the past thirty years in management and strategic management, the place and role of the client has often changed. In this historical context of the analysis, we find periods of disregard for this stakeholder, but also periods when the client becomes the sole determinant of business strategy [Niemczyk, Stańczyk-Hugiet, 2012; Barutcu, Yaldir, et al. 2017; Rubera, Kirca, 2017].

Turning to the universal model, it becomes important to create a positive image of the organization that will be an emanation of its internal strength. Every company consciously or unconsciously creates a certain image - more or less favorable. Understanding its strengths and weaknesses allows

you to take action to maintain positive characteristics, eliminate negative or completely change the image. A positive image allows, among others on: diversifying products, brands and enterprises, creating relationships with clients, building trust in the company [Tkaczyk, Rachwalska, 2016; Vid 2016; Goetschalckx, Moors, et al., 2019].

Visual Identity System

Visual identification should be one of the elements of the organization's identity. The study of corporate identities includes directions related to corporate identity, organizational identity and visual identity [Balmer, 2001; Skaggs, 2019; Bravo, Matute, et al. 2017]. Visual identification is the basic tool that is used to create (positive) brand image of a company on the market. It defines all symbols and behaviors used in the company to obtain clear and consistent market identification and distinguish it from competing brands. A consistent visual system is the most important element of overall identification [Eriksson, Fundin, 2018]. For example: [...] the visual identification of scientific institutions on their websites is based on the consistent use of colors, company symbols and lettering. As in the real world, child units should be included in the parent institution's visual identity system by visually linking to its website's design while maintaining individual visual identity [Jaskowska, 2007]. The only area of company identity that can be fully controlled by the company is visual identity (visual identity system). The visual identification system is part of the company's communication, which through specific symbolism tries to send an appropriate message about its identity, making it known and recognizable. Symbols used by enterprises as part of the visual identity system can be divided into five main categories: organization name, slogan, its symbol (sign and logo), colors and typography [Lis, 2013, Trynchuk, 2017; Raposo, Neves, et al. 2017]. One of the key concepts for building an organization's identity is the visual identity system. It is a set of rules and consistently designed patterns, which in total are to build positive perceptions about the organization or product and consolidate the desired opinions among employees, partners and clients, creating a consistently visual identity. Visual identification - this is the whole symbolism used by the company, that is, all that you can recognize from the outside that it is our company; it is the color, logo, logotype etc. These are other elements through which relationships with the environment are built [Gawroński, 2009; Su, Swanson, et al. 2016]. A properly constructed visual identification system should consist primarily of such elements as: [Budzyński, 2002; Dejnaka, 2006; Melewar, Jenkins, 2002; Riel, Balmer, 1997; Abratt, Mingione, 2017; Wiedmann, 2004] graphic sign (logo), company colors, company prints (business cards, letterhead, envelopes, commercial documents), advertising materials (information boards, guidebooks, brochures, leaflets), vehicle marking, external and internal decoration of buildings, company flags and banners, unit and collective packaging of products.

The visual identification system enables the organization (enterprise, institution) or product (service) to be distinguished from competing market participants who try to present offers more attractive than competitors. Visual and non-visual identification does not only apply to consumer goods producers, it is also effectively implemented in non-commercial marketing concepts (political marketing [Nieć, 2013; Wring, 1997; Henneberg, 2002; Lees-Marshment, 2001; Lees-Marshment, 2019], religious marketing [Partycki, 2007, Stolz, Usunier, 2019; Pinelli, Einstein, 2019; Wiesenberg, 2019], marketing of public local government units, territorial marketing [Szromnik, 2006; Eidelman, Fakhrutdinova, et al. 2016; Frolov, Sarkisyan, et al. 2017; Kuttubaeva, Ishchuk, et al. 2017]. A good example are city coats of arms and hymns, already developed in the Middle Ages [Dacka, 2004; Shaw, 2016; Fox, 2019], document and correspondence markings were the prototype of modern professional identification systems [Macalik, 2013; Veldman, Willmott, 2017]. In modern understanding, the visual identity system is the whole symbolism used by the organization, means of communication with the environment, an element of broadly understood identity. It is thanks to the visual identification system - the organization is recognizable and gains credibility. A logo, i.e. a graphic representation of a brand representation, forming a trademark - combines symbols, shapes and colors into a specific whole. It performs important marketing and information functions: it distinguishes the brand from the competition and also shapes the relationship with the consumer [Gawroński, 2009; Reyes, Nieto, et al. 2018; Barnes, 2017; Jiang, Gorn, et al. 2016; Van Grinsven, Das 2016].

We can distinguish a number of fundamental determinants that are important in creating the image of the product and having significant marketing significance. Nowadays, an increasing role is being paid to the considerable role of human senses [Pabian, 2011; Dąbrowska-Leszczyńska, 2014; Krishna, Lee, et al. 2017; Krishna, Cian, et al. 2016; Géci, Nagyová, et al. 2017]. Early marketing achievements did not pay much attention to the fact that human senses can play a very important role in the selection of goods - often greater than other values (utility features, price / quality relations, etc.). Sensory features of the product received through the senses can also prove to be an important factor in building competitive advantage [Śmiechowska, Dmowski, 2014; Yoganathan, Osburg, et al. 2019; Farhadi, Slambolchi, et al. 2017; Wiedmann, Haase, et al. 2018].

As already mentioned, a company logo and corporate identity is now a basic tool for building a company's image, brand and prestige, but also the basis for positioning a company on a competitive market. [...] A well-designed logo should contain a maximum of content, while maintaining a minimum form. [...] You can specify the basic criteria that a good logo should meet, the American designer J.S.B. Morse formulated them in the form of four principles: it must meet the basic principles of design, it must be functional, it must represent the company well, it must be unique [Włoszczyński, 2015; Van Grinsven, Das, 2016; Séraphin, Ambaye, et al. 2016; Wang, Duff, et al. 2018]. The characteristic and individual graphic trademark is another seemingly banal element of marketing. Its primary purpose is to help the customer differentiate your brand from the market. Large global corporations consciously use this tool, for which immediate visual identification in visual contact with the product is a priority [Dutko, 2013, Chen, Nguyen, et al. 2017].

The company's corporate identity (visual identity, visualization, corporate identity, CI) is a collection of various elements (graphic, musical, typographic and other) with directives regarding their use, which are included in the book of identity. Thanks to the above system, all marketing messages sent by the company are consistent, interact with each other, strengthening each other, which gives a synergy effect - the sum of joint action is greater than the sum of actions of each individual. Corporate identity, apart from the attitude of the organization, behavior and communication with the environment, is one of the important pillars of the institution's identity [Mruk, 2004; Naumovska, Blazeska, 2016; Sharif, Butt, 2017]. Based on this, together with the other elements, the company's image is created. Often, when the message relates to the intangible sphere - visual identity is a kind of packaging eg for services. The visual identification system is designed to manage graphical marketing messages to eliminate: inconsistent messages, disturbances in brand communication processes, disinformation, loss of trust among customer groups. Due to the fact that the modern environment is extremely saturated visually, it is important that each solution stands out and be original - it should be simple, bold, memorable and reflect the essence of the company's personality, and be able to operate on many platforms media and perform well in various applications. Visual identity is an important tool supporting brand awareness by evoking emotions and associations associated with it. Thanks to repeated duplication, and thus exposure, symbols are remembered and recognized. Designers use knowledge about the sequentiality of human visual perception to create the most relevant solutions. The human brain, as the first always recognizes the shape - the image is received and remembered directly, the second is the color that liberates emotions, while the word itself must first be subjected to the process of decoding to read them - this processing process takes the mind the most time. Due to the consistency of the visual message, the system based on clearly defined standards raises trust in the recipient, which carries the feeling that the client is dealing with a company with a high degree of credibility, guaranteeing the safety and quality of services offered [Wrona, 2015; Dixon, Perry, 2017; Zhao, Calantone, et al. 2018; Bolhuis, de Jong, et al. 2018].

Logotype concept. TIENS case study

Each enterprise using its products or services aims to appear on a competitive market, and then build a lasting advantage over other entities. The brand is one of the most important marketing instruments allowing for effective competition and successive acquisition of the market. The strong position of the brand plays a significant role in product shaping, price, distribution and promotion, and appropriate activities within the brand management process have a significant impact on the brand's

existence in the minds of customers. The brand, being the result of a thoughtful management process, should affect the clients' awareness, encourage them to buy, and as a result increase the level of sales and contribute to building the company's competitive advantage [Szymankowska, 2013; Kim, Jeon, et al., 2011; Yu, Cable, 2012; Vukasovič, 2012; Reyes, Nieto, et al. 2018].

Therefore, the corporate identity of the company must be adequately adapted to the target group, which according to analyzes will be the recipient of the marketing activities of the loyalty program creator. Communication activities, including a properly tailored visual identification system, should be directed to a predetermined target group. The visual identification system must result from an appropriate marketing strategy built for a target group. The target segment of consumers can be described, for example, by the segmentation tool Censydiam and by technical conditions (disposing of tools that can be carriers of program elements) and demographic variables [Maison, Poraj-Weder, 2015; Callebaut, Hendrickx, et al. 2002; Garant, Korycka, 2015]. Marketing activities include the end users of the company's products. It is a group that requires the greatest communication effort and is the basis for building relationships with other groups. The Censydiam model helps to develop positioning of products and brands in such a way as to create an emotional relationship with the target group (helps to design effective marketing activities based on the feelings and desires of consumers, not just their declared beliefs and opinions). The fundamental foundation of the model is the assumption that all consumer behavior is controlled by the desire to meet basic needs that have their source in the subconscious. To meet these basic needs, consumers use different strategies (called incentive strategies) and, as a result, choose different products and brands (to meet their needs). This model enables deep exploration of motivation - thus it is the optimal solution in the case of analyzing motivation, feelings and desires to determine the optimal product / service portfolio or positioning for each product / brand so as to design a coherent and effective communication strategy for the entire portfolio, such as and individual products and brands. Defining the target segment thus determines future visual identification.

TIENS Group Co. Ltd. (TIENS Group) was founded in 1995 by Li Jinyuan in Tianjin (Tianjin) in China. Is an international, multinational corporation, operating in various industries, such as the food industry, education, tourism, finance, international trade, and e-business. The TIENS Group (TIANSHI) entered the international market in 1998. Currently, with operations in over 190 countries, the TIENS Group has branches in 110 countries.

TIENS is derived from the Chinese word Tianshi , which is a cluster of the word Tian which means sky, which is associated with the will of the heavens, favorable geographical location and universal support, and Shi meaning lion.

Fig. 1: The original TIENS logotype

Source: http://witajwtiens.blogspot.com/p/filozofia-tiens.html

For centuries, the city of Cangzhou was famous for its antique lion sculpture, made of iron, which became the symbol of the city, called the Lion City . The founder of Li Jinyuan, and now its president wanted to commemorate the iron lion of his hometown and chose the word lion . In 1993, Li Jinyuan came to Tianjin to found a company there. That is why the company was named Tianshi (Heavenly Lion). The lion is a commemoration of the memories of the founder associated with his hometown, while the wings are to symbolize the growing aspirations and dynamics of the company. The logotype design is based on a dynamic arc that symbolizes advanced technology, carries a message of unlimited possibilities thanks to its interactive structure and symbolizes inexhaustible energy and continuous development [see Fig. 1].

Fig. 2. The current TIENS logotype

Source: http://witajwtiens.blogspot.com/p/filozofia-tiens.html

In turn, the three-leaf branch resembling an unfolded map of the world reflects the strategy of international development of TIENS. Individual leaves are the image of a product that is characterized by 'naturalness and health', yellow color symbolizes 'sunshine' and 'wealth', while green is the natural color of 'green Earth' [see Fig. 2].

Fig. 3. Genesis of the TIENS logotype

Source: http://witajwtiens.blogspot.com/p/filozofia-tiens.html

A pattern of three human silhouettes joined by hands surrounds the leaves in a natural way, indicating that the TIENS concept is people-oriented and TIENS participants around the world are closely connected. As a whole, the logo is intended to illustrate the continuous development of the brand. The new logo was developed based on the original colors. It embodies the brand's priority values. The whole symbol is an illustration of the key features of the brand under study - it is the concept of A shared world. One family, connects to the long-term brand strategy, expressed by the slogan "Together We Share". According to the managers, the new project is the beginning of the new TIENS road, which begins the development of the global brand.

Conclusions

The growing number of available marketing communication channels due to the development of technology should give companies the opportunity to have a flexible approach to the communication process related to the choice that ensures effective and efficient communication results. The criterion of effectiveness and efficiency should be the basis for planning the communication process with the market, because these measures influence the assessment of the final market effect obtained by companies. In the process of managing a modern enterprise (especially in the era of marketing management), you can use rich marketing instruments, however, the strongest and most positioned brand in the consumer's consciousness is considered to be the most important and strongest. The use of brands is one of the most effective ways to gain and consolidate a company's competitive advantage. A well-perceived brand is not a product, but a set of associations thanks to which a product or service bearing a trademark is bought more often and can be offered at a higher price than competing products. This is, among other things, because the brand allows you to identify and distinguish it from other products offered on the market. However, before you can take advantage of all the opportunities and privileges it brings, you must undergo a difficult process of creation and then brand management.

Abstract

Motivation. Offer profiling for customers is one of the most effective methods of achieving customer satisfaction. The realization of the offer profiling process requires an individual approach, which isn't always possible especially for large scale activities.
Purpose. The aim of the article is to propose a model for the selection of web technology solutions depending on the specificity of the business as well as the way of individual customer service.
Design. The goal will be achieved by answering the following questions: a) are there web solutions that enable automation of the selection of offer parameters? b) is it possible to create tools supporting automation in order to achieve intelligent personalization?
Methodology. The research methods used to answer the research questions were critical analysis of literature and IT solutions. In research were used: questionnaire interviews, participatory observations, analysis of IT solutions implemented in research entities and direct participation in processes.
Findings. 1) Web solutions have evolved from passive solutions - of informational nature, through actively enabling two-way communication between the client and the enterprise, to solutions using full automation enabling the implementation of intelligent personalization; 2) Enterprises conducting service activities have a very individualized customer service process as well as the process of creating offers; 3) automation enables intelligent personalisation of offers, which is also possible in enterprises providing knowledge services.
Implications. Recognition of the possibilities of implementing solutions enabling automation of the offering process as well as provision of basic knowledge services can significantly increase the competitiveness of these enterprises.

Keywords: intelligent personalization, web solutions, social networks, semantic networks, sensory networks

Introduction

The development of technologies supporting remote communication and the collection and transmission of large collections of information has significantly changed the conditions and ways of functioning of the organization (Wallis 2015, p. 102-110; Olszak 2016, p. 84-85; Andoh-Baidoo 2016, p. 193-204; Bernat, Cieśliński 2016, p. 31-32). Subsequent stages of evolution of technologies enabling remote communication and data transmission between entities entering into business relations revolutionized the ways of doing business and, above all, the ways of communicating with the environment. In the literature very often the problems of implementation of web solutions as the main determinant of the organization's development are discussed. Nevertheless, issues related to the impact of the development of intelligent technologies on the processes of personalization of value creation for the customer are rarely discussed. Subsequent versions of web solutions, defined 1.0 to 5.0 respectively, evolved from solutions enabling remote communication with unlimited groups of recipients in a passive way, through solutions enabling increasingly interactive ways of communication, to solutions using artificial intelligence.

The transition from passive communication to solutions which, using Artificial Intelligence tools, are able to customize messages according to the value of the characteristics of the information recipient is becoming increasingly sought after by entrepreneurs. Such a spectacular progress in the development of technology makes them not only a tool used to support business, but they have become a determinant of creating completely new solutions in the area of customer service processes. The result of this direction of ICT development has been personalization, which is in complete contrast to the economies of scale that were possible as a result of the development of social networks that describe solutions from the Web 2.0 stage (Stanton 2001, p. 199-201).

The aim of the article is to indicate how the developing web technologies influence the creation of mechanisms of personalization of offers constructed for customers. The key attribute of the personalization process is the intelligent adjustment of offer parameters to current customer needs.

Therefore, the first part of the article will present a short analysis of theoretical considerations of approaches to the concept of "personalization" in order to define and place the considerations contained in the article in the development of management and quality sciences.

Against the background of considerations about the directions and mechanisms of personalization, the next phases of Web 1.0 to 5.0 solutions development will be discussed and their relation to the adoption of trends in the personalization of activities, especially in the area of marketing and communication will be indicated.

The last part of the article contains a presentation of a synthetic analysis of the results of research carried out in a group of several knowledge organizations[1]. The aim of the research was to identify and assess the scope of application and impact of web technologies on the development of personalization processes.

Technological conditions for smart personalization solutions

The development of technologies using the Internet has changed not only the channels of communication between enterprises and their environment, but the whole philosophy of conducting business activity. The depreciation of geographical barriers, the possibility of reaching unlimited groups of customers with a product offer, allowed for the evolution of the organization's activity and shifted the focus from material value chains to intangibles (Benito-Osorio, Peris-Ortiz, Armengot, Colino 2013).

The literature most often indicates that the dynamic development of remote communication was initiated by Tim Berners-Lee's (1999) research on improving the exchange of information between researchers, which resulted in 1993 in CERN making its World Wide Web software available in the public domain (Król 2019).

This event triggered a spectacular development of communication technologies (Chomiak-Orsa 2020). In the literature we can find classifications or characteristics of the next more and more advanced versions of technological solutions defined as solutions and web applications (Khanzode, Sarde 2016; Kambil 2008). And so it is most often said about:

- Web 0.0 - Desktop-Era - was dominated by desktops, a small group of users, had the ability to transfer information between them. This stage of technology development contributed primarily to the opening of communication channels enabling access for users on a previously unknown scale.

[1] Knowledge organizations that have been audited are tax advisory offices and accountancy offices. The survey had a qualitative character, so 17 respondents were subjected to the survey - each respondent was a representative of a different business entity. The research was conducted in November 2019.

- Web 1.0 - the early Web (The Basic Publishing and Transaction Medium) - there has been a significant development of technologies enabling the transfer of mainly text files between computers on the network, such as e-mail, GaduGadu instant messaging, Irc. There was a slow dissemination of access to the network through fixed telecommunication links. This laid the foundations for the creation of an information society, which was characterized by the free flow of information. At this stage of network development, communication on a large scale was of the greatest importance, with personalization processes not yet of great importance, and it was important to reach large groups of customers.
- Web 2.0 - The Social and Co-created Web - is a spectacular development of the Web as a result of "co-creation" mechanisms. The Web is developed as a result of the development of Open Source software. Users drawing information from the web can simultaneously shape its content. At this stage, we can talk about the first significant manifestations of personalization, because the creators of Open Source solutions shaped the IT solutions, adapting them primarily to their identified needs. In addition, the analysis of content and expectations published in social networks significantly raised awareness of the needs and interests reported by users. During this period of development of web solutions, there was a slow focus on solutions personalization.
- Web 3.0 - The Semantic and Intelligent Web - content availability is increased by combining multiple information sources. The use of neural networks and genetic algorithms contributes to increase the computing and analytical capabilities for large data sets collected, among others, in social media. This spectacular increase in analytical capabilities contributes to the launch of activities aimed at a more accurate analysis of customer segments and identification of their common features or significant differences indicating the need for more precise definition of the proposed values.
- Web 4.0 - The Mobile, Machine and Object Web - as a result of the development of artificial intelligence methods and machine learning, the Web becomes not only interactive but also seeks symbiosis with users by personalizing the information made available to users. The web "alone" seeks to select "right" information for specific users as a result of artificial intelligence solutions. This stage of evolution of web solutions was a spectacular turn in the perception of the possibility of personalizing messages, information, offers that were created and directed in a dedicated way (Choudhury 2014, p 8096-8100).
- Web 5.0 - The Sensory-Emotive Web - seeks to implement sensory solutions in the field of neurotechnologies that will be able to record and analyze user emotions. This stage of web development assumes that not only historical information can contribute to the personalization of business processes, but also takes into account current, identified in real time customer preferences.

Each of the above mentioned generation of web solutions is a tool used in business practice (Chomiak-Orsa, Hauke 2020). On the other hand, individual stages of technology development have contributed to an ever "deeper" application of these solutions in organizations. Therefore, Table 1 presents the relations between individual generations of web solutions, the functionalities they make available and the possibilities in the area of personalization.

Tab. 1. Correlation between the Web evolution and the scope of personalization of selected areas of the organization's functioning

Web version	Functionality available	Scope of personalization
The Basic Publishing and Transaction Medium	Static passive websites (Bernes-Lee, Cailliau, Luotonen, Nielsen 1994) allowing only a small number of authors to publish content for a narrow audience with access to the Internet (Król 2019).	Creating passive communication solutions of informational nature. First attempts to personalize but only in the area of graphic design of a passive Internet site
The Social	A platform that integrates all	Creating solutions enabling

and Co-created Web	devices connected to it (O'Reilly 2005). All users can not only read but also publish information, which gives the possibility of mutual communication. Web 2.0 platform gives the possibility to use information resources from different sources (mushup) (Cormode, Krishnamurthy 2008). There is a significant development of websites and social networks.	two-way communication. Creating mutual communication processes. The content of the message was the responsibility of the person who also constructed the message being sent.
The Semantic and Intelligent Web	The transformation of the network into a database which, by collecting large data sets, enables the use of artificial intelligence (Fuchs, Hofkirchner, Schafranek, Raffl, Sandoval, Bichler 2010) in semantic analysis (Morzy 2009, p. 31; Berners-Lee 2014; Berners-Lee, Hendler, Lassila 2001, p. 34-43) of user-generated data.	The tools enable characterization of customer segments, analysis of business partners, creation of business solutions resulting from possessed IT resources as well as employees' knowledge. This contributes to the creation of algorithms facilitating the selection of an appropriate offer for the customer
The Mobile, Machine and Object Web	Mobile solutions integrating all elements of the network in real time, enabling geo-location, user identification and personalization of the transmitted information in real time, systems for managing data collected from thousands of sensors (Sarowski 2017, p. 32-39; Brachman 2013) and processing these sets in real time. Creation of chatbots automating simple operational activities with a high level of duplication. Using multimedia systems combined with virtual reality solutions for remote training or distance learning (Burdea, Coiffet 2005).	Value proposition for customers in a completely new innovative dimension, introducing co-creation into manufacturing processes, more accurate and detailed analysis of customer segments, application of personalization mechanisms and customer experience in value creation processes, automation of communication processes, characterization of customer segments, analysis of business partners, creation of business solutions resulting from possessed IT resources as well as employees' knowledge, improvement of relational capital through building bonds resulting from the use of virtual reality technology
The Sensory-Emotive Web	Attempts to use neurotechnology to interpret selected user biometric indicators by web applications (Patel 2013, p. 410-417) will adapt the scope and type of messages not only to the user's historical interpretations but to his current mood. The use of	IT solutions enable immediate identification of stimuli, analysis of changes in the environment and automatic adaptation to the diagnosed needs of the analysed fragment of reality.

	advanced analysis and inference mechanisms to process large datasets of data to simulate inference and identify relationships between variables (Fleerackers, Meyvis 2018) .

(2017); Morzy M., (2009); Berners-Lee T. (2014); Cormode, G., Krishnamurthy, B. (2008); Król, K. (2019).; O'Reilly, T. (2005).

Intelligent personalization - the customer is the central element of the process

Personalization and co-creation processes are currently the main directions in the improvement of marketing activities. Using artificial intelligence in these processes is one of the main trends in e-commerce development (www.wiadomoscihandlowe.pl; www.payu.pl 2018; www.payu.pl 2019; www.praktycznymarketing.pl; https://achmielewska.com). The notion of "personalization" appears in reference and is most often defined in the area of marketing activity (Szymanski 2010, p. 119-128) as innovative communication processes allowing for skillful adaptation of the company's activities to the needs, likes and behaviors of the customer during contact (Porębska-Miąc 2006, p. 200-215; Firgolska 2017, p. 130-139; Shen, Ball 2009, p. 79-91). Personalization is a trend that is the result of the development of technologies such as artificial intelligence, which is why more and more often there is talk about personalization, which concerns both product solutions in the field of IT (Jelonek 2014, p. 267-278; Yijuan, Nicu, Ross, Oi 2011, p. 247-277) and the possibilities offered by its implementation (Iskierka, Wężgowiec 2018, p. 32-39; Wójcik 2013, p. 112-121). In relation to ICT solutions that should support business processes enabling personalization is defined in correlation with such terms as product customization (Nordin, Kindström, Kowalkowski, Rehme 2011, p. 390-408), presumption (Radziszewska 2010, p. 249-256) or co-creation (Janiszewski, Szmal 2018).

Despite the multitude of definitions as well as indications concerning the directions of implementation of personalization processes it can be noticed that each of the above mentioned considerations indicates the same key attributes and objectives of personalization (Manczak, Sanak-Kosmowska 2018, p. 29-35; Stępniak 2018, p. 190-194; Pukas 2012, p. 83-86; Jabłońska 2018; Jelonek 2014, p. 267-278).

The most important goal is to place the customer as the central point of the sales process. Special emphasis is placed on individual approach in sales processes. This means that it is necessary to collect information about the customer or groups of customers so that profiling is possible - in other words, personalization.

In personalization processes it is also important that the practical implementation of personalization should be beneficial not only for customers but also for the organization.

From a customer's perspective, personalisation should enable customers to achieve greater satisfaction and to meet their reported consumer needs more fully. What is more, it allows the customer to get an impression of its "uniqueness" for the company. This is relatively easy to achieve when dealing with services traditionally provided to individual customers. However, entering digital markets and selling goods and services on a mass scale becomes difficult to "beautify" and "individualise" the customer.

On the other hand, personalisation using mechanisms of co-creation and prosumption can and should contribute to the product development of an enterprise. Personalisation occurring as a result of better identification of customers' expectations or even resulting from their indications and expectations as to improved versions of products and services minimises the risk of producing products that will not enjoy interest on the market. As a result of more precise processes of identifying customer needs,

the company can better define target customer groups, build a customer knowledge base, create personalized relationship policies, increase the effectiveness of building customer loyalty to the competition (Drab-Kurowska 2011, p. 674-681).

With the development of information technologies and the globalisation of market processes, access to large groups of customers was multiplied, while the appropriate adaptation of the offer for selected customers was a growing problem. Both the globalization mechanisms and the resulting generalization and the tendency to personalize offers became possible thanks to successive stages of web technology development.

The above mentioned aspects of personalization and application of ICT solutions are beginning to play a significant role in the area of creating relations with customers. This is of particular importance in relation to:

- defining customer segments through groups of recipients functioning and communicating primarily on the Internet. Personalisation is possible through the use of ICT tools, which not only enable the collection of large information collections but also provide unlimited analytical possibilities.
- creating a value proposition dedicated to properly identified and segmented customers, where as a result of virtual chains, as well as analysis of customer preferences, it will be possible to personalize a value proposition correlated with needs. In the case of virtual customers, it is also important that the customer often treats the possibility of remote contact as the primary value and is primarily interested in intangible value chains or remote implementation of material value chains. Therefore, the use of web tools and personalization mechanisms will enable the realization of these needs remotely.
- creating a relationship policy that, through personalisation and the use of co-creation and prospective mechanisms, can better influence the feeling of customers that they are contributing to the development of an enterprise that responds to their needs.

Adopting the perspective of defining the functioning of an organization that uses personalization in the processes of creating offers and customer service may significantly contribute to the development of the organization, which at the same time will respond in a more flexible way to the evolving needs of customers and environment.

The approach discussed above, which aims at constructing organizational solutions, is focused on personalization thanks to a wide and spectacular development of Internet technologies.

Motivation and presentation of the test method

A critical analysis of the literature made it possible to indicate the directions as well as the available IT solutions supporting intelligent personalization. In order to verify the literature considerations, qualitative research was conducted in 17 organizations. The research methods included questionnaire interviews, participatory observations, analysis of IT solutions implemented in research entities and direct participation in processes.

Fig. 1: Research procedure

Source: own study

Knowledge organisations have been studied. The group of entities was homogeneous in terms of industry, as the surveyed entities included only tax advisory offices and accounting offices. As the survey was a qualitative one, the questionnaire interviews were conducted with 17 respondents - each respondent was a representative of a different business entity. The research was conducted in November 2019 during seminars and industry conferences for tax advisors.

The summary presented in the article is synthetic in nature. This means that the responses of the respondents were assigned to categories reflecting successive generations of Web solutions, respectively

Use of Web technology in personalization – a synthetic of case studies

The researcher defined the range of technological solutions for each web generation and as a result of the answers given for the applied solutions, assigned the respondent to a specific generation of solutions (Chomiak-Orsa, Hauke 2020).

Synthetic compilation of respondents' answers is presented in Table 2.

Tab. 2: Examples of smart personalization solutions

Mechanism to be applied	Number of respondents
Intelligent searching	3
Smart sheets	7
Intelligent message initiating contact	6
Personalised starter offer	2
Predictive customer analysis	5
Intelligent range of services	5
Intelligent communication process	3
Personalised offer	5
Intelligent handling process	4
Use of blockchain solutions	1
Intelligent liability calculation process	10

Source: own study

A summary of the size of the indications of individual respondents is presented in Table 2 and shown in Figure 2

Fig. 2: List of applied intelligent solutions in the surveyed entities

Source: own study

Analyzing the respondents' indications, it is clear that each of the surveyed companies uses modern web technologies that enable the creation of intelligent, personalized processes of acquisition as well as customer service. Nevertheless, the use of such advanced technologies as semantic networks or predictive algorithms is not yet widely used. It can be concluded that companies providing individualised services by carrying out face-to-face processes with customers have very high barriers for introducing automatic solutions. On the other hand, high costs of making investments in the implementation of advanced technologies are a barrier.

Despite the high technological awareness of the respondents, the implementation of this type of technology is still a big novelty for organisations such as tax consulting offices.

Conclusions

The aim of the article was to discuss the possibility of using Web tools in creating intelligent personalization solutions. The analysis of the literature as well as an in-depth analysis of the functional capabilities of modern ICT solutions indicates a very wide spectrum of possibilities to create intelligent personalized offers as well as customer service processes.

The author also sought an answer to the question: are the solutions enabling smart personalization of offers and customer service also possible to implement knowledge in organizations such as tax consulting offices. As a result of the research, the degree of use of web technologies by organizations was identified and diagnosed in order to personalize selected business processes. The article presents pilot studies carried out on a group of 17 entities which are knowledge organisations from one industry, i.e. providing services in the field of tax consulting and management accounting. As the research has shown - all entities are evolving towards personalization using more and more advanced IT tools for this purpose. This means that even running such an individualized and personalized business requires the implementation of web-based solutions. However, as the research shows, a small group of these entities currently uses such solutions.

The results of the research indicate that the implementation of such solutions will most probably constitute the next stage of development of a tax consultancy firm.

Abstract

Global society is a type of society with certain characteristic and repetitive forms of social life that occur one after the other, e.g. in specific states or nations. A characteristic feature of the global economy is the emergence of international corporations and economic integration occurring between countries around the world. The purpose of the article is a detailed analysis of social globalization in the world. The social globalization dimension includes personal contact, information flows and cultural globalization. The aim of the study is to classify states belonging to the European continent into clusters, including countries characterized by similar development of social globalization. As part of the study, three separate groups of clusters will be constructed, differentiated due to oscillations around the 2-year, 4-year and 8-year trend. Trend analysis and long-term non-linear ordering. A discrete wavelet was used for wavelet analysis of the time series studied. In the process of discrete wavelet transformation, the approximation is called in approximation and detail.

Keywords: Globalization, Global Citizenship, Global Society, Integration, Social Globalization, Wavelets.

Introduction

Globalization is such a qualitative change that transforms current development conditions so much that it fundamentally changes the basic factors affecting the well-being of people, enterprises and countries. The term globalization is commonly used as a term, very complex, ambiguous and multifaceted. Goes beyond the sphere of economics and finance, it covers the area of politics, demography, technology, information, ecology, health, internal and international security, as well as culture and religion. Most often, however, thinking about globalization comes to mind quite advanced form of economic activity, which is carried out on the international level and on the level of markets, sectors and enterprises, which is also characterized by the growth of various kinds of connections between various entities of international life. The definitions of globalization that can be found in the literature draw attention to various aspects of this process and depending on the field in which the author specializes, emphasize other areas of globalization. As every process, globalization is developing (see fig. 1).

Fig 1: Index of globalisation.

As for globalization, there are different variations of this process. One of the varieties is social globalization, which will be devoted to the rest of this article. Social globalization, expressed as the spread of ideas, information, images and people. Social globalization is subdivided into interpersonal, information and cultural globalization. Social globalization consists of interpersonal, informational and cultural globalization, each of them contributing the third to the social globalization index.

Globalization has its pros and cons in all spheres it affects. However, it is impossible to stop this process, so it is necessary to control its course in such a way that as many countries as possible benefit from participation in it. Therefore, globalization cannot be a spontaneous process, countries must learn to shape it properly. One should get to know the mechanisms of globalization well and consciously use them. Active participation in this process is conducive to rapid reduction of areas of poverty, rapid development of education, and above all, rapid growth and economic development.

Global Citizenship

Globalization is a process that has already affected almost all spheres of life - political, social, economic, culture, communication and private life. So social ideas and movements are also globalizing, which make up what we might call a global society.

The creator of the concept and concept of "global society" was Herbert Marshall McLuhan (Canadian sociologist). McLuhan coined the expression "the medium is the message" and the term global village, and predicted the World Wide Web almost 30 years before it was invented. He regarded the printed book as an institution fated to disappear.

Global society means the existence of the same structures around the world ("global village"), a high degree of civilization development, blurring borders between countries, the activities of large corporations worldwide.

In general usage, the term “global citizenship” may have much the same meaning as "world citizen" or cosmopolitan, but it also has additional, specialized meanings in differing contexts. Various organizations, such as the World Service Authority, have advocated global citizenship.

However, the question arises as to what the definition of global society really is. Paul van Seters, who brings the Charles Taylor distinction between three different definitions of global civil society to a global level, believes that (see Haratyk, 2011):

- According to the minimum definition, global civil society exists when there are independent international non-governmental organizations (GSOIs).
- According to a stronger definition, global civil society exists when society creates an internal structure and coordinates its activities through international non-governmental organizations (GSOII).
- According to the third definition, global civil society exists when international NGOs exert significant influence on global or international policy (GSOIII).

The process of creating a global society is called globalization. The origins of this type of society should be sought at a very fast rate of information flow, mass media access and telecommunications development. Obviously there are different approaches in this context, e.g. according to Clark: "The fall of the Berlin Wall ended the rivalry of superpowers, which defined politics for most of the 20th century, but a different system of three superpowers emerged in its place. The first is the US government and military complex and its allies. The second is the power of a global corporation. The third is the power of public opinion and civil society " (Clark, 2008). According to Roland Robertson, in reference to Ferdinand Tönnies's division of human communities into communities (Gemeinschaft) and associations, organized communities (Gesellschaft) the following typology of global communities is possible (Robertson, 1919):

- "Global Community I" - the world is a mosaic of closed, mutually separated communities, or unique and egalitarian, higher and lower in cultural development, but mutually isolated and

not aspiring to subordination different from each other. Compliant with the ideology of anti-globalization and fundamentalist religious orientations.

- "Global Community II" - a universal consensus around certain common values and ideals. A world consistent with the Christian idea of God's kingdom on earth, the concept of the universal Church and ecumenical tendencies. These are also aspirations of the peace movement or the environmental movement and the human rights movement.
- "Global community I" - a mosaic of sovereign, independent nation-states connected by strong, mutual cooperative bonds in the field of economics, politics and culture.
- "Global community II" - predicts the disappearance of nation states and regional unification, followed by global unification under the aegis of a joint political organization or supranational world government.

Social Globalization - Detailed Empirical Analysis

Globalization measures can be divided into those of an economic nature and those that estimate social progress. The impact of the globalization process on the social sphere is enormous. This is evident at every step of human life, both in the spiritual sphere (values, ideas, culture, religion), the sphere related to personal and family life, as well as everyday life - education, work. This impact is bi-directional, both positive and negative. Therefore, one should strive for the positive effects of the globalization process to affect the social sphere over negative ones.

Globalization has its pros and cons in all spheres it affects. However, it is impossible to stop this process, so it is necessary to control its course in such a way that as many countries as possible benefit from participation in it. Therefore, globalization cannot be a spontaneous process, countries must learn to shape it properly. One should get to know the mechanisms of globalization well and consciously use them. Active participation in this process is conducive to the rapid reduction of areas of poverty, the rapid development of education, and above all, rapid growth and economic development.

Fig 2. Social globalization index in World

Source: Own calculations based on data from Swiss Economic Institute.

The social globalisation dimension includes personal contact, information flows and cultural globalisation. "For each of these in turn a distinction is made between de facto (KOFSoGIdf) and de jure globalisation (KOFSoGIdj).

De facto personal contact is measured in terms of international telephone connections, tourism flows and migration, while de jure personal contact is quantified on the basis on telephone line rentals, international airports and visa restrictions. De facto information flows are determined based on

international patent applications, international students and trade in high-tech goods. De jure information flows consist of access to television and the internet, press freedom and international internet connections.

De facto cultural globalisation comprises trade in cultural goods, international trademark registrations and the number of McDonald's restaurants and IKEA stores. De jure cultural globalisation is measured in terms of civil rights, gender equality and educational standards" (Swiss Economic Institute, 2020).

Social globalisation has hardly advanced at all in recent years either. The figures below show the evolution of the social globalization index since 1970.

Fig 3. Social globalization index in World

Source: Own calculations based on data from Swiss Economic Institute.

The analyzes show that the index of social globalization in the period 1970-2018 grew the fastest on average in Low Income annually, while in the years 1990-2018 and 2000-2018 in South Asia. In the period 1970-2018, the poorest social globalization index grew in North America, in 1990-2018 the slower pace of change was High income, and in 2000-2018 in North America (see Table 1).

Table 1: Average annual rate of changes in the social globalization index.

	Period		
	1970-2018	**1990-2018**	**2000-2018**
World	0,50%	0,73%	0,71%
East Asia and Pacific	0,56%	0,76%	0,64%
Europe and Central Asia	0,24%	0,32%	0,50%
Latin America and Caribbean	0,51%	0,65%	0,55%
Middle East and North Africa	0,56%	0,80%	0,82%
North America	**0,18%**	0,22%	**0,18%**
South Asia	0,87%	**1,67%**	**1,76%**
Sub-Saharan Africa	0,74%	1,13%	1,32%
High income	0,30%	**0,41%**	0,34%
Low income	**0,90%**	1,39%	1,64%
Lower middle income	0,83%	1,23%	1,22%
Upper middle income	0,56%	0,79%	0,75%

Source: Own calculations.

Analyzing the changes in the development of social globalization in the world, according to the above division, it should be noted that the largest change in this index compared to the previous year took place in Low income countries. In 2008, the index represented 106.7% of the 2007 index. In other regions, the maximum increases were:

- World - maximum increase by 3.11% compared to the previous year.
- East Asia and Pacific- maximum increase by 3,49% compared to the previous year.
- Europe and Central Asia - maximum increase by 2,99% compared to the previous year.
- Latin America and Caribbean - maximum increase by 3,13% compared to the previous year.
- Middle East and North Africa - maximum increase by 5,72% compared to the previous year.
- North America - maximum increase by 2,06% compared to the previous year.
- South Asia - maximum increase by 8,03% compared to the previous year.
- Sub-Saharan Africa- maximum increase by 5,36% compared to the previous year.
- High income- maximum increase by 2,09% compared to the previous year.
- Low income- maximum increase by 6,67% compared to the previous year.
- Lower middle income - maximum increase by 6,05% compared to the previous year.
- Upper middle income- maximum increase by 3,80% compared to the previous year.

Details are shown in the figure below.

Analyzing the data, it can be seen that the largest decrease compared to the previous year was Europe and Central Asia. The decrease was by as much as 10.35% (a decrease from 1990 to 1991). In other regions of the world, the maximum decreases were as follows:

- World- 1,06%
- East Asia and Pacific-1,31%
- Europe and Central Asia - 10,35%
- Latin America and Caribbean - 0,84%
- Middle East and North Africa - 1,56%
- North America-2,24%
- South Asia-4,06%
- Sub-Saharan Africa-1,47%
- High income-0,71%
- Low income-1,07%
- Lower middle income-1,27%
- Upper middle income-0,92%.

Fig 4. Dynamics of changes in the social globalization index. Change in the index of social globalization compared to the previous year.

Source: Own calculations.

Analyzing the dynamics of the social globalization index compared to 2000, we obtain that the largest increases compared to 2000 were as follows:

- World- increast by 27,33% (the value of the index in 2016 constituted 127.33% of the index from 2000);
- East Asia and Pacific- increast by 24,32%;
- Europe and Central Asia - increast by 18,55%;
- Latin America and Caribbean - increast by 20,63%;
- Middle East and North Africa - increast by 32,86%;
- North America - increast by 6,59%;
- South Asia- increast by 81,19%;
- Sub-Saharan Africa - increast by 55,93%;
- High income- increast by 12,37%;
- Low income- increast by 74,08%;
- Lower middle income- increast by 50,90%;

- Upper middle income- increast by 29,06%.

Empirical Analysis European Continent

The aim of the study is to classify states belonging to the European continent into clusters, including countries characterized by similar development of social globalization. As part of the study, three separate groups of clusters will be constructed, differentiated due to oscillations around the 2-year, 4-year and 8-year trend. The study was based on 36 countries belonging to Europe. Due to the lack of relevant data, countries such as Kosovo, Macedonia, Slovakia and Vatican are not included. Data from the 1970s.

The research analysis based on a wavelet analysis with a discrete wavelet (see, among others, Hadaś-Dyduch 2015a, 2015b, 2016a, 2016b, 2016c, 2017, 2019, 2019a) and non-linear ordering (Dezin, 2017; Jajuga, 1993). Wavelet analysis and nonlinear ordering were used for the study. The key steps of the algorithm used in the study are summarized below.

Introduction of time series to the model
Extension of individual series.
Calculation of wavelet coefficient
Discrete wavelet transform aplication
Determination of centers of gravity of individual classes
Determination of the value of the function used as a criterion for the quality of the classification.
Designation for one of the objects to change the value of the function of the classification quality criterion resulting from the object being moved to each of the currently occurring classes.

The Research Results

The algorithm application described in chapter 3 allows for the construction of clusters containing groups of similar countries in a given time trend and also for the following conclusions.

The index of social globalization in the world since 1970, increases on average by 0.97% annually. However, since 2008, the global social globalization index has been increasing on average by 0.61% annually.

Currently, the highest value of the social globalization index is in the following countries: Albania 64.33; Ukraine 65.40; Belarus 65.70; Russia 65.81; Andorra 66.88; Moldavia 68.06; Bosnia and Hercegovina 68.25; Liechtenstein, 68.47; Romania 70.05; Serbia 72.08 (see figure 4, 5). The lowest value of the social globalization index is in Sweden 85.68; Cyprus 85.81; Finland 85.85; Belgium 86.29; Austria 86.75; United Kingdom 88.05; Italy 88,12; Denmark 88.30; Luxembourg 89.89; Norway 90.43.

Fig 6. Index of social globalization in Albania and Ukraine, Luxembourg and Norway
Source: Own elaboration

Fig 7. Dynamics of changes in the social globalization index. in Albania and Ukraine, Luxembourg and Norway

Source: Own elaboration

The top ten countries with the highest growth rate of the social globalization index are: Estonia 1.43%, Russia 1.57%, Belarus 1.68%, Ukraine 1.77%, Moldavia 1.90%, Bulgaria 2.03%, Albania 2.09%, Lithuania 2.18%, Romania 2.20%, Bosnia and Hercegovina 2.41%. However, the countries with the lowest growth rate of the social globalization index are: Liechtenstein -0.10%, Andorra 0.04%, Sweden 0.29%, Denmark 0.41%, Ireland 0.44%, Austria 0.46%, Norway 0.49%, Iceland 0.49%, Portugal 0.55%, Finland 0.57%.

Fig. 1 Index of social globalization in Luxembourg and Norway

Source: Own

Fig 9. Dynamics of changes in the social globalization index in Albania and Ukraine, Luxembourg and Norway

Source: Own elaboration

The calculations and simulations carried out show that by analyzing the social globalization index in the 2-year tendency, 11 clusters can be created. Countries with a similar development trend of social globalization in the two-year trend are (see Figure 9): klaster1: Bosnia and Hercegovina, Czech Republic; cluster 2: Denmark, Iceland, Ireland, Latvia, Ukraine; cluster 3: Germany, Luxembourg, United Kingdom. Cluster 4: Belgium, Finland, Portugal; cluster 5: Malta, Netherlands, Sweden; cluster 6: Andorra, Croatia, Liechtenstein, Montenegro, Serbia, Slovenia; cluster 7: Belarus, Bulgaria,

Lithuania; cluster 8: Austria, Cyprus, Italy, Spain; cluster 9: Estonia, Greece, Hungary, Romania; cluster 10: Albania, Norway, Poland; cluster 11: France. The following countries were not included in the study: Kosovo, Macedonia, Moldavia, Russia, Slovakia, Switzerland, Vatican.

The development of the social globalization index in France in the two-year trend is not similar to the development trend of any of the countries of the European continent (countries such as Kosovo, Macedonia, Moldavia, Russia, Slovakia, Switzerland, Vatican were not taken into account. However, already in the 4-year tendency it is the closest to the trend in Austria and in the 8-year tendency to Finland and Spain.

Fig 10. Index of social globalization in Poland and Albania

Source: Own

The volatility of the social globalization index in the 4-year tendency allowed the division of countries belonging to the European continent into 12 clusters. By grouping, the following countries are not included: Kosovo, Macedonia, Moldavia, Russia, Slovakia, Switzerland, Vatican. Cluster 1: Croatia, Iceland, Slovenia, United Kingdom, Estonia; cluster 2: Latvia, Romania, Ukraine; cluster 3: Germany, Spain; cluster 4: Bulgaria, Lithuania; cluster 5: Ireland; cluster 6: Belarus; cluster 7: Belgium, Cyprus, Finland, Malta, Norway, Sweden; cluster 8: Austria, France; cluster 9: Liechtenstein, Luxembourg; cluster 10: Denmark, Netherlands, cluster 11: Andorra, Montenegro, Serbia; cluster 12: Greece, Hungary, Bosnia and Hercegovina, Italy, Poland, Albania; cluster 13: Czech Republic, Portugal.

Conclusion

Globalization has its pros and cons in all spheres it affects. However, it is impossible to stop this process, so it is necessary to control its course in such a way that as many countries as possible benefit from participation in it. Therefore, globalization cannot be a spontaneous process, countries must learn to shape it properly. One should get to know the mechanisms of globalization well and consciously use them. Active participation in this process is conducive to rapid reduction of areas of poverty, rapid development of education, and above all rapid growth and economic development. According to (Zdanowski, 2000) when globalization is said to be a phenomenon of crossing borders, economic activity and labor flow are most often meant. Meanwhile, globalization means a global flow of primarily intangible assets - social norms and behavior, cultural and political norms, and its result is the continuous formation of new and as yet unknown cultural ties that differ from those previously formed by nations and ethnic groups. Interesting multifaceted analyzes of Europe are also described in (Czech & Krakowiak-Drzewiecka, 2019; Pietrzak, 2020; Grybaitė & Stankevičienė 2018; Staníčková, 2020).

aryana@ui.ac.id

Abstract

Terrorism activity need funding supports in its survival. The practices of conventional methods, such as physical robberies, sending cash via couriers, and charitable donations have now moved towards the use of technology, particularly the use of internet-supported technology. This paper aims to describe the methods of financing terrorism implemented in Indonesia, covering both the use of traditional methods and internet based technology methods, and the recommendation to countering the financing of terrorism by the misuse of the internet. This research was conducted using qualitative method, combining discussions with experts from various government agencies, as well as journal literature reviews and reports. This paper shows that the existence of the internet indirectly expands the financing of terrorism with a wider, faster, anonymous, and greater amount.

Keywords: Internet, Terrorism Financing, Indonesia

Introduction

Like most organizations, terrorists need funds to meet their needs (Reda, 2014). According to some experts, funds are seen as a 'source of life' and a driving force of a terrorist organization. Without funding, terrorists will not be able to carry out their operation, attack, or even exist as an organization (Freeman, 2011). The funds, both in the form of income and assets, are the most important part in the survival of terror organizations. Without funds, terrorism will not occur.

Santoso and Laksmi (2016) explained some examples. Al Qaeda in 2000 needed funds of around USD 9,000 to USD 500,000. In the attack on the London Underground on July 7, 2005, Al Qaeda was estimated to cost around USD 9,700. While the terrorist attack on the Madrid Railway on March 11, 2004, funds were needed around USD 110,000. For terrorist attacks in Southeast Asia, such as the bombing at the Marriott Hotel, the al-Jama'ah al-Islamiyah terrorist group costs around USD 30,000 and for the 2002 Bali bombings it requires USD 50,000. The terrorist attack said to be the deadliest so far, the attack on the Twin Towers of New York on September 11, costs around USD 400,000 to USD 500,000. Therefore, funds are very crucial in the act of terrorism.

The terrorism funding methods have developed throughout the time. In early 2000, the majority of their funding sources came from the infaq and zakat of members and sympathizers, whereas cash were smuggled in from abroad, charities, aid from Al Qaeda, bank robberies, narcotics trafficking, and through *hawala*, which is an informal money transfer based on trust between brokers at the sending and receiving locations. (Abuza, 2003).

However, the method of financing terrorism has undergone various changes. Purwawidada (2014) explains that the use of the conventional methods, such as physical robberies, sending cash via couriers, charitable donations and alms, to foreign aid, terrorists have now moved where the 'robberies' are carried out digitally through illegal financial technology (FinTech) as done by Rizky Gunawan. During 2010 to 2012, Marwan and Rizky Gunawan managed to obtain accumulated funds of Rp 6

billion from the illegal hacking of a financial technology company, which offered by an investment company named Speedline.com. The funds were partly used for training in Poso area in South Sulawesi, amounting to Rp 500 million, and bombing in the Kepunton church in Solo in 2011.

The illegal use of FinTech to obtain funds shows that terrorists are always following technological developments. Terrorists do this to adapt to government regulations, especially in the financial sector and to avoid surveillance and tracking by the authorities. This method has several advantages such as fast, effective, efficient transfer of funds, without the need for physical face-to-face. These advantages were then used by terrorists as a loophole to become a medium for terrorism funding. (PPATK, 2015). In addition, the use of technology in terrorist operations is also in line with the will given by Imam Samudera in 2004 before being executed, where his successor jihadists were encouraged to study and practice hacking in terror (Purwawidada, 2014).

This paper aims to examine various methods that have been used in Indonesia throughout the time. It is divided into three sections: section one provides a brief historical review of terrorism financing; section two considers the nature and operation of technology in terrorism financing; and section three discusses the method of the financing of terrorism in Indonesia.

Conceptual Frameworks and Methods

The funding sources used by the terrorist groups vary, from legal sources to illegal, directly or indirectly, such as using intermediaries, and from local to global. However, funding for terrorism is not only limited to money. Those who encourage, plan, and get involved in the process of their action can also be categorized as terrorism funding. Because terrorism financing activities are becoming increasingly visible in the formal financial sector and law enforcement agencies, terrorists must find an alternative method to sustain their activities, one of which is through the internet.

The first part of the paper will discuss the evolution of terrorism funding according to Vittori (2011), followed by the use of technology in terrorism financing, and the dynamics of terrorism financing in Indonesia. The discussion of internet-based methods for the financing by terrorist follows the typologies offered by the United Nations Office on Drugs and Crime (UNODC) (Conway, 2005).

The paper will use results of discussions with institutions related to various agencies relating to terrorist countering in Indonesia, such as Detachment 88 (Densus 88) of the Indonesia Police Agency, Indonesian Financial Transaction Reports and Analysis Center (PPATK), and digital forensic experts. Whereas, the secondary data was obtained through Financial Action Task Force (FATF) and PPATK reports, as well as literature studies that discuss funding of terrorism.

Periods of Terrorism and Financing Methods

Vittori (2011) analyzed the evolution of financing of terrorism based on the thoughts of David Rapoport, namely four waves of terrorism consisting of 1) Anarchist Waves; 2) Anti-Colonial Waves; 3) New Left Movements; and 4) Waves of Religion. In his analysis, Vittori (2011) states that each wave of terrorism has a certain funding method. Therefore, the method of financing terrorism has evolved from time to time, where the methods used have become increasingly complex, varied, and adapted to the current conditions.

First wave: Anarchists (Ages 19-1914)

It was explained that the Anarchist wave arose because of the technology that began to advance in the century. Communication and transportation patterns such as telegraphs, daily newspapers, railway lines, have eliminated time and space restrictions. This is the era of the first global war on terrorism. Countries in Europe and North America fight what is considered a global anarchist conspiracy. Initially, these revolutionary groups operated with only limited funds. They rely on confiscation or takeover actions, which were usually in the form of a bank robbery.

In this period, lone wolf activities also appeared. At that time, there were no organizations with clear commands. All individuals are anarchist and free to protest in various forms when they feel there is a compatibility of thought. They become individuals who act as ideologists who act individually or in small groups, to issue propaganda that aims to inflame the spirit of radical change in society.

Second Wave: Anti-Colonialism (Early Twentieth Century - 1960s)

The second wave emerged at the end of the 19th century, and reached its peak at the end of World War I when the empire was destroyed and the idea of determining the fate of each country began to emerge. At this time, what is called state sponsored terrorism or the state as a supporter of terrorism emerged. In this wave, robberies still occur even though not as common as the first wave. On the contrary, diaspora funding emerged. For example, the Irish Republican Army (IRA), and its splinter, the Provisional Irish Republican Army (PIRA) received a lot of money, weapons, and volunteers from people of Irish descents living in the United States. They have not only provided money, but also lent a bank account for PIRA funds, even stole weapons to be sent to PIRA cells.

Third Wave: New Left Movements (1968-1989)

This third wave began with protests against the involvement of the United States in the Vietnam War, especially the mass demonstrations in 1968. At this time, there was a tendency to combine left radicalism with nationalism, because self-determination always had a greater constituency. In addition, this period is the beginning of modern international terrorism, where extremists can easily attack in unrelated places, because of modern communication such as television coverage.

In terms of funding, bank robbery is still the choice for these leftist radical groups to fulfill their resources. In addition, kidnappings to request ransom are also widely carried out, and perfected into more professional practices. During this time, a nexus began between terrorists and transnational crime groups. One example of the first collaboration undertaken to overthrow the government is Camorra and the Red Brigades. In addition, they also commit narcoterrorism which is seen as far more profitable than bank robberies. Another source of funding is state sponsorship, which is one of the proxy war strategies. The peak of the state sponsorship was in 1978, when the Arab League promised to support the Palestinian Liberation Organization (PLO) with $ 250 million annually.

However, the most important innovation in this era is the creation of business-oriented organizations. The PLO Fatah faction under Yasser Arafat was the first group to realize that a strong financial base is essential for the organization to continue to grow, so that the accumulation of capital and wealth becomes an organizational priority. They must make Palestinians recognize the PLO as a humanitarian organization and must maintain personal control over military aspects.

Fourth Wave: Religion Related Activism (1989-now)

When the third wave began to recede in the early 1980s, waves of religion began to emerge and by 1990, most terrorist attacks were motivated by religion. In the religious tide, terrorists try to take control of the government to impose a religious order on the state. In this fourth wave, many state sponsors supported terrorists, especially to encourage religious agendas.

One innovation that characterizes this wave is the widespread use of charities to fund and facilitate terrorist groups. Support through charity, whether intentional or not, has become the main vehicle for channeling diaspora funds to terrorist organizations in various countries. In addition to charity, various criminal acts remain the choice of terror groups. Medicines are used as the primary and most common means of fulfilling resources, not only for groups in Latin America but also for religious groups, such as the Islamic Movement for Uzbekistan in connection with the Beka'a Valley Agriculture that produces heroin. Criminal acts committed in this era are also increasingly sophisticated. They commit forgery, credit card fraud, to identity theft.

Another progress on this wave is the emergence of franchise groups (Vittori, 2011). Hezbollah and Hamas are said to be one of the franchises, with most of their resources coming from Iran and Syria. However, they also maintain a substantial source of internal funding, so that they are still able to maintain substantial autonomy from their sponsoring countries. In this regard, Al Qaeda is the first terrorist organization capable of sponsoring other terrorist organizations. They are known specifically for giving "seed money" to promising terrorist cells, to carry out operations on behalf of the larger Al Qaeda movement. Not only to smaller terrorist cells, Al Qaeda is also able to sponsor a terrorist state. It is known that they have funded Sudan. As a reward, they received a place of protection for operations, a training base, and conducted research on weapons of mass destruction.

Technology and Terrorism Funding

Cyber Terrorism

Ballard (2002) divides the relationship between technology with terrorists into four types, namely: information attacks and infrastructure attacks, where technology is targeted, and technology-based facilities and fundraising and promotion, where technology is used to prepare for terrorist acts. The whole attack and use is then called a cyber incident.

According to Ballard (2002), the most commonly known form of cyber terrorism is information attacks, which are defined as attacks aimed at destroying or changing the contents of electronic documents, computer systems, and various other materials. Many researchers and counter-terrorism experts have focused on this attack, because this attack was the most occurred and reported. Other forms of this attack include online harassment, identity theft, threats, the use of computer viruses, and so on. The second form of cyber terrorism is attacks aimed at destroying or damaging physical infrastructure. This includes attacks on hardware, operating platforms, or programs in a computer system. The effect here is the destruction of data, computerized systems and controls.

The third category of cyber terrorism is not in the form of attacks, but rather the use of technology to facilitate terrorist attacks, both traditional and cyber attacks. These uses include message encryption technology, the use of steganography to conceal plans to carry out attacks, disseminate information, and use internet sites to find ways of making bombs and so on. The final category in cyber incident typologies is the use of technology to raise funds as well as to promote their ideology or propaganda. Although this activity does not directly represent cyber terrorism, it does represent the planning and gathering stages of their support (Ballard, 2002).

Financial Technology and Terrorism Funding

The term "FinTech" is an abbreviation of the word "financial technology". The Financial Stability Board (FSB), an international institution whose job is to maintain global financial stability, defines FinTech as a technology that enables financial innovation and produce new services, including business models, applications, processes, or products, that can have an impact on the market, financial institutions, and financial service providers (Lukonga, 2018).

At first, FinTech was part of Citicorp's research in the early 1990s, which aimed to bring their reach closer to the market. However, the term FinTech is increasingly developing and becoming an 'umbrella' for terms that include innovative financial solutions through the application of information technology (Puschmann, 2017).

The use of technology in financial services is actually not new. Over the years, banks have experienced a revolution in their services using technologies such as e-banking, international transfers, credit cards, and cash machines (Auto Teller Machines / ATMs) that are designed to support banking operations. Lukonga (2018) considers that the existence of FinTech has caused a paradigm shift in the financial system. FinTech sometimes replaces the role of conventional financial institutions, such as banks, insurance firms, and asset management companies, with the process that is still traditional, giving rise to a new business model.

The existence of FinTech is driven by changes in consumer demand, especially from millennials who have grown and developed in a digitally connected world. For other consumers who tend to be more conservative and continue to use banks, they put pressure on banks to adopt similar technology to enable banks to improve their services. Financial services that are the focus of FinTech include payment systems, deposits, capital and loan, insurance, to financial management

As said by Choo (2009), the advances in information and communication technology have and will continue to influence the financial and banking systems in operation. With these advancements, making payment, investment and money transfer activities easier because it can be done online which is now popular in the community. However, people's dependence on electronic payment systems and facilities to move large sums of money quickly and across different jurisdictions presents its own risks such as the threat of money laundering, fraud, and financing of terrorism.

Another FinTech method that has a high risk of being used as a means of financing terrorism is virtual currency. Whyte (2018) says that the technology offers a relatively safe and reliable method for sending money, has the opportunity to be a source of income, and is not too difficult to understand and use. Virtual currency also offers opportunities for money laundering by avoiding regulations in the formal financial system.

Methods of Financing Terrorism in Indonesia

Conventional Methods

Abdullah Sonata, through the Committee's Organization Crisis Response Measures (KOMPAK) has raised funds under the guise of humanitarian assistance for natural disaster victims and the poor, both from domestic and abroad, such as Saudi Arabia, Kuwait, Australia, Britain, Spain and funds from international organizations. An amount of eight billion rupiah was obtained between 1998 and 2001. KOMPAK was involved in purchasing illegal firearms from Philippines to be supplied to conflict areas in Poso, Sulawesi (Celebes) and Ambon, Maluku (Molucca) (Golose, 2015).

The Ambon and Poso conflicts were categorized into acts of terrorism because, in this conflict, there were some parties who took advantage of the situation for the interests and existence of their terror groups in Indonesia. For example, the the al-Jamaah al-Islamiyah (JI) group entered Ambon in 1999, followed by JI from countries such as Malaysia and the Southern Philippines to join the Ambon and Poso conflicts under the command of Hambali and Mustofa alias Abu Tholut (Karnavian, 2008).

In early 2000, Hambali succeeded in raising funds of US $ 200,000 or around two billion rupiah, which is acquired from contributions, such as infaq and sadaqah, of Muslims in Malaysia. The amount of funds donated by the JI members could be such a big amount, since some JI members worked as professionals. The funds were used to buy weapons, military training, recruit and finance the activities of perpetrators violence in Poso and Ambon (BNPT, 2013).

In the 2002 Bali Bombing case, sources of funds originated from Al-Qaeda that were brought in cash by Wan Min Wan Mat and sent to Ali Gufron (Mukhlas), Noordin M. Top, and Azmi Rahim to prepare the attack (Golose, 2015). Similar to the Bali Bombing I, in the 2003 Marriott Hotel bomb case, funds were also distributed in cash. The original funds were obtained by Gun Gun Rusman Gunawan, then sent to Hambali through several of their couriers (Tempo.co, 2014).

JI considers that carrying cash as the most effective method for channeling funding. According to Safrudin (2018), JI prefers to take informal routes through underground when going across the border area to enter Indonesian territory. In addition, the length of the border line between Indonesia and neighboring countries makes the border region vulnerable to being used as a path for smuggling goods and money to support acts of terror in Indonesia.

Indonesian terror groups also often do bank robberies and jewelry stores or what they usually call fa'i to meet their funding needs. JI group has robbed 2.5 kilograms of gold at *Elita Indah* gold shop in Serang on August 22, 2002, and the robbery of 3 kilograms of gold at *Gunung Agung* gold shop in Palu, February 2006. The robbery in Serang was related to the Bali Bombing I in 2002, whereas the robbery in Palu was related to terrorism in Poso (Safrudin, 2018). In 2003, Fadli Sadama along with his members conducted bank robbery of the Lippo Bank in Medan and managed to get IDR 113 million. Other groups that frequently conducted robberies were the Abu Roban group, who had robbed the BRI Batang office in 2013 and gained IDR 790 million, BRI Grobokan in 2013 and gained IDR 630 million, and *Terus Jaya* gold shop in Jakarta in 2013 and brought 1.5 kg of gold. worth IDR 500 million (Purwawidada, 2014).

Financial Technology Use for Terrorism Financing

As mentioned previously by Choo (2009) and Whyte (2018), the electronic payment system, new paymet methods, and payment via the internet offer several advantages such as fast, effective, efficient transfer of funds, without the need for physical face-to-face and money. These advantages are then used by terrorists as a loophole, causing the risk of using them to become a medium for terrorism funding. (PPATK, 2015). Not only that, the internet seems to provide a 'virtual bridge' that can cross the national borders, so it enables terrorists to get a wider scope with a greater profit potential (Carroll & Windle, 2018)

Conway (2005) explains the framework offered by the United Nations Office on Drugs and Crime (UNODC) on classifying terrorism funding on the internet into four methods, namely direct solicitations, new payment methods and e-commerce, exploitations of online payment tools, and charitable organization.the use of the internet for the financing by terrorist, which are: a) direct solicitiation via terrorist website; b) exploitation of e-commerce tools and entities; c) exploitations of online payment tools and new payment methods, such as virtual currencies and hacking at FinTech; and d) exploitation of charities and fronts, which is used as a front to promote the ideology of their organization or to provide for their material needs.

Direct Solicitation

Direct solicitation refers to the use of sites, chat rooms, emails, and others to solicit and collect donations directly from their supporters. Since the September 11 tragedy, terrorists have increasingly used social media in terms of funding their actions. Through social media, terrorists can reach a greater number of audience through peer-to-peer communication, which is done through chats and forums, social networks like Facebook, Twitter and Instagram, mobile applications for personal communication, such as Whatsapp and Telegram, or safer communication networks like Surespot and VoIP (FATF, 2015). In Indonesia, requests for donation and fund can be in the form of explicit statements, such as those made by Mujahideen of East Indonesia (MIT) on social media. However, urgent requests are usually done by asking for donations directly to their supporters as in the case of Rio Adiputra (Conway, 2005).

Although the MIT fundraising process was carried out directly, MIT still used an intermediary account, the Abu Ahmad Foundation (AAF), a fundraising foundation from Indonesia that collected money to buy food, weapons, clothing and other materials for jihadists, as well as to open a new Telegram channel (memri.org). Whereas in Rio Adiputra case, ordered by Imron, he requested funds directly from the 'brothers' in Bima to be given to the 'Umahat' or the terrorists wife left by their husband because their husbands were shot by the police, imprisoned, or escaped, or the 'ikhwan' which incorporated in the Santoso group. He then received funds of IDR 1.5 million from Hafid, Fadli, Lahmudin, to buy tickets to Poso, buy explosives in the form of fertilizers, and rent vehicles (District Court of East Jakarta verdict No. 776/Pid/Sus/2015/PN.Jkt.Team).

The vulnerability to social media abuse is compounded by the fact that Indonesia does not have a data center for social media, so it needs to do mirroring to neighboring countries. This will certainly hinder

the investigation process if there is any misuse done by the terrorists or other crimes that have the potential to cause many victims.

E-Commerce

E-commerce sites provide customer-to-customer buying and selling service are now very popular. The increase in e-commerce users is because the customers can easily access the sites anywhere, the sites are open to the public, the registration is very easy and fast, there is no face-to-face transaction, there is no procedure to verify and identify the customers, the customers can use anonymous email addresses, it has a fast transaction process, it enables users to register more than one user, and it facilitates various transactions across national borders. With all of these advantages, online trading sites or e-commerce are prone to be misused by criminals and terrorists (FATF, 2008).

In Indonesia, the case of terrorism involving the use of e-commerce is the Surabaya bombing happened on May 2018. Dita Oeprianto, along with his three children and his wife, blew themselves up in three different churches. The bomb he assembled was a Triacetone Triperoxide (TATP) type or often called 'the mother of satan' by terrorists. According to the National Police Public Relations Head Setwo Wasisto, this type of bomb is a bomb that is easy to assemble, but has a high explosive power (Nathaniel, 2018). Based on the information from PPATK, Densus 88, and the National Police Forensic Laboratory Center (Puslabfor Polri), the explosive materials were purchased several times through e-commerce, such as fertilizer, acetone, ball bearings, lighters, and so on, which are basically known as daily necessities, but were vulnerable to misuse. The easiness of getting these materials shows the lack of the monitoring processes and the awareness of the seller.

Internet Based Payments

Internet-based payment method is part of the New Payment Methods (NPMs) that has developed in response to the market needs as an alternative to traditional payment. In some cases, this development has been driven by a demand for a safer and more convenient way to pay online. Whereas in other cases, the development is based on the desire to provide any access to financial services for those who are 'excluded' from the traditional financial services, such as individuals with poor credit records, minors, and residents from distant areas to access the bank (FATF, 2010).

One of the internet-based payment service providers that has been abused by terrorists is PayPal. Wahyudi (2019) explained that PayPal is used to transfer funds of USD 1,000 to Indonesia from Bahrun Naim who is located in Syria. The funds were sent to Munir Kartono, which then channeled to Dwi Atmoko as the bomb maker, Nur Rohman as a suicide bomb martyr in Mapolresta Surakarta in 2016, and his wife for living expenses and compensation for the death of her husband. Densus 88 mentioned that Munir Kartono, Nur Rohman, and Dwi Atmoko did not know each other. They only received orders directly from Bahrun Naim. When Dwi Atmoko handed the bomb to Nur Rohman, it was only marked by the code that Bahrun Naim had prepared beforehand. This makes it difficult for the authorities to track them. Not only that, that the amount of money sent is insignificant, so it will not cause the redflag for the financial service providers.

Virtual Currency

Virtual currencies are digital objects that have economic value, and function the same as fiat currencies (government-issued). This technology allows people to transfer their funds internationally and anonymously. If previously, currency purchases can be easily seen, identified, and traced through a formal banking system, all virtual currency transfers are very difficult to detect. Moreover, virtual currency has characteristics that give two advantages for terrorists, namely: can be exchanged for fiat money, and high anonymity in its application.

In Indonesia, terrorism funding through virtual currency is used by Bahrun Naim network. According to Gunaratna (2018), Bahrun Naim was a terrorist from Southeast Asia who first used the virtual currency Bitcoin. In December 2016, Bahrun Naim ordered Dian Yulia Novi to carry out a suicide bombing that was planned to be carried out at the State Palace as the main target, the Guards for DKI Jakarta Governor Basuki Tjahjapurnama, and the Brimob Mosque in Kelapa Dua. According to Densus 88 members, the funding of this project was sent by Bahrun Naim in Syria to Indonesia using Bitcoin. However, during the investigation, Dian admitted that she did not know the sender and the source of the incoming money and who the bomb maker is. She was only explained by her husband, Solikin, that the funds were sent by Bahrun Naim (Densus 88). Until now, the Police and PPATK are still trying to trace the flow of funds from Bahrun Naim (Sohuturon, 2018).

Charitable Organization

Terrorist organizations often exploit charities as the intermediaries to raise funds in disguise. This method is very popular, especially among Islamic terrorist groups because they feel they have an obligation as Muslims to donate charity and zakat regularly. Tasnima Salsabila, a Hong Kong migrant worker who was affiliated with Bahrun Naim network, used her personal money to “donate charity” in the way of Allah because she believed that everyone who used part of their wealth to help the warring Mujahideen would receive the same rewards as the mujahidin who carried out amaliyah (Putusan PT Jakarta 189/PID.SUS/2018/PT.DKI). Thus, charity becomes a fertile field for the terrorists to exploit because people think funding the terrorist acts is part of their worship. In some cases, terrorist organizations even set up a charity with humanitarian purposes, such as helping victims of disaster, illness, poverty, etc., despite the fact that their funds can be used to fund the acts of terrorism or help the terrorist families (FATF, 2015).

In Indonesia, Azzam Dakwah Center (ADC) was a charity based on social institution, charities, and da’wah formed by Jamaah Ansharut Daulah (JAD) and used as a front for the supporters of the Daulah Islamiyah. The da'wah center was run under the leadership of Azzam who was affiliated with ISIS. The funds were collected through the infusions of six Qoriyah (regions), namely Karanganyar, Klaten, North Solo, East Solo, Sukoharjo and Solo Raya.

ADC was also often used to prepare for several acts of terrorism, such as making Molotov cocktails and canned bombs. The bomb was made by Suyanto to attack the Alfamart Surakarta shophouse conducted by Wahyudi, Candi Resto by Wawan Prasetiawan, and the private house of Candi Resto by Suyanto in November 2016. The three attacks were carried out based on the instruction from Nor Solikin, inspired by the chaos that occurred in Jakarta during Aksi Bela Islam, and a retaliation for the action of tearing the Quran that was allegedly committed by the owner of the Candi Resto restaurant (High Court of Jakarta verdict No. 189/PID.SUS/2018/PT.DKI).

Conclusion

Criminals and terrorists have shown their adaptability and opportunistic nature in finding a chance to launder illegal money and fund the acts of terrorism. It is undeniable that the information technology development, such as the internet are increasingly expanding the access, opportunities, and reach of terrorist activities, including funding. When the internet has become a global phenomenon, where everyone is easy to access, and commercial websites and payment systems via the internet have become more advanced, the potential and risk of abuse by criminal and terrorist organizations is also increasing.

Terrorists are no longer dependent on the conventional method of funding, such as cash couriers, robberies, and through formal financial institutions. They take advantage of the development of technology and the internet, which they are able to collect large, fast, and anonymous funds through social media, e-commerce, internet-based payment services, and charities. All these conveniences, on the one hand, actually become the vulnerabilities and weaknesses to the system and application on the

Internet. Therefore, it is necessary to strengthen the security system on the internet and increase public awareness as the internet service users.

The security system can be improved from the initial stage of service on the internet, such as an adequate verification process to prevent the use of fake identities. According to Laksmi (2017), a strong regulation related to the internet-based payment services need to be established in Indonesia. This regulation must cover customer identification and verification process, and include a control and reporting system to be useful to identify suspicious transactions and report them to the Financial Intelligence Unit, and developing the centralized services to enable companies to monitor cross border transactions and assist the monitoring and evaluation process of the regulator.

In addition, an initiative are needed for the service providers to actively monitor and report the content that are deviated and suspected. The service providers on the internet, such as social media, online payment systems, e-commerce, and online charity should store all user data and transactions – including the information on parties involved, addresses, public keys, and date of transactions – to facilitate the process of investigation and monitoring if there is an abuse (Salami, 2018).

In the wake of increasing number of online-based charitable institutions, such as Aksi Cepat Tanggap, Kita Bisa, and so on, which can raise funds quickly and reach the wider community, the government needs to educate the public through campaigns in proactive media in order to increase the awareness and caution about the danger of terrorism financing and money laundering through charitable institutions. It is also necessary to conduct an audit by the authorities as well as transparency regarding the structures, beneficiary owners, place the charities into high-risk institutions, and make detailed financial reports.

Abstract

This paper tests the endogenous theory that in open economies, domestic interest rate may elude the capacity of developing economies to fathom. The study applies the fully modified ordinary least square technique to examine the rational expectation theorem on Nigeria's long-term interest rate sensitivity to the Fed fund rate, while trade openness, exchange rate, inflation expectation, public debt ratio, and bank competitiveness are introduced as control variables, from 1970 to 2017. The result reveals that domestic interest rate has negative short-run and long-run sensitivity to the US Fed fund rate and trade openness, while it is significantly sensitive to inflation, exchange rate and public debt ratio. Policy recommendations are provided.

Keywords: Financial system, Interest rate macrostructure, Sub-Sahara economies

JEL Code: G20, F41, O55

Introduction

In the modern financial market, the interest rate mechanism serves as risk ingredient for credit availability. The mechanism connects the economic system and the financial system for functional savings, investments and productivity. Should the financial system be ineffectual, interest rate may be maladapted to function as architect of scarce resource mobilization, allocation and utilization (Ojo, 2010). In contemporary times, developing economies have huge finance gap challenge due largely to maladapted financial system, with high rate of financial mis-match, and financial stress that exacerbates credit defaults (World Bank, 2001). Prevalence of credit defaults often result in financial instability. On instability, literature argues that bank-based financial structure, of which sub-Sahara countries are examples, by nature are less structured for stability (Knoop, 2013), which may be worse in a maladapted financial environment. The yield curve, where it exists may be directionless; often not meaningful or tie with the economic cycle.

In Nigeria, despite ranking as one of top largest economies in sub-Sahara Africa (SSA), its financial system has unfortunately been biased against the real sector, with very low inclusivity (Ojo, 2010). The financial system is bank-based, with very low bank branch per capita (World Bank, 2018). The bank intermediated financing system consequently does not largely support the agriculture and small

scale industries, the main source of employment and GDP. The mechanism to obtaining required long-tenured capital funds is usually quite problematic (WEF, 2015; Ojo, 2010). In general, Knoop (2013) opines that the financial system in the SSA region is perceived as failing. A failed financial system is characterized by very high interest rate, high interest spread, high credit default rate, and low financial inclusivity; an environment where willing entrepreneur are being alienated from the formal finance system into the informal arrangement, like the pervasive rotatory savings and credit associations (ROSCAS), where credit assistance is often inadequate. Dahou *et al.* (2009) highlights failings of African financial markets, characterized by highly concentrated banking sector, poor banking intermediation, poor remuneration of deposits; high interest rate spread; illiquid and narrow capital market; and lack of innovative financial instruments.

Keynes argues that interest rate mechanism sets the limit to the level of employment in the economy, such that, the interest rate sets the standard upon which the marginal efficiency of a capital could be newly productive (Williams, 1999). Low financial inclusiveness and high interest rate regimes in sub-Sahara Africa may have contributed significantly to her poverty dilemma, as cost of funds that could aid micro, small and medium enterprises (MSME)'s productivity and entrepreneurial capacities in general are usually within the second to third degree (Eke, Adetiloye, Adegbite, and Okoye, 2017). Contemporaneously, real savings-deposit rate is abysmally low, with adverse consequences on the financial development process.

Being capital scarce developing countries, sub-Sahara Africa have often relied on the external fund sources for much needed development capital, through capital purchase by borrowing and through foreign direct and portfolio investments. Indirectly too, the increasing global economic integration and openness to trade constitute fundamental source of capital sourcing. Hechscher-Ohlin theorem encourages, that mutual benefits exist from trade (Leamer, 1995). Given the relative weak levels of market efficiency, foreign borrowing and other capital flows are however, often determined by world interest rates *(wir)* dynamics, which may transmit more risks to the domestic financial system, (Grossman and Stiglitz, 1980; World Bank, 2001). In modern economies, interest rate determination has microeconomic foundation, but broad macroeconomic impact (Lucas and Sargent, 1978). It is conceptually a macrostructure; a price with far-reaching impacts (Eke, 2018). For instance, in line with rational expectation, and due to economic distortions from abroad, the US may raise her domestic interest rates, commonly known as normalization.

Interest rate determination is potent to the much needed international capital inflow in capital scarce developing countries, as it is to domestic capital mobilization and efficient resource allocation. Indeed, due to increasing global embrace of capital liberalization for international capital flows, interest rate misalignment may produce severe economic shock, leading to significant contractions in productive capacity and per capita income. Intense information flow is a global prerequisite for efficient financial system; notably in financial risk sharing, which many capital scarce developing countries may be guilty of (Ojo, 2010). Secondly, in the event of unintended risks, increased reliance on foreign capital flow may expose the sub-Sahara countries to risk of major financial disturbances, just as the experiences of Asian and Latin American economies in the 1990s (Daniels and VanHoose, 2011).

The extent of openness to factor flows and global trade have been noted in the literature to have conflicting impacts on growth paths, as debates still rage as to whether more open developing economies indeed experience faster growth and development than otherwise (Daniels and VanHoose, 2011). Nevertheless, irrespective of the balance of the argument on economic openness and protectionism, the cost of capital determination, and hence the financial system stability, may be more influenced by the extent of developing countries openness to trade and factor flows. This is the crux of this study, that is, whether, the cost of capital, that occupies huge role in domestic capital resources allocation is more open to external determination than domestic monetary authority can fathom. Stiglitz and Greenwald (2003) posits that interest rate compares conventionally with commodity prices, given the quality of its information content, its impact on borrowers' behavior, and its local and structural effects on the global economy.

Conceptual Framework

Trade and finance are the link of an economy to the global economy (Dornbusch, Fisher, and Startz, 2011). The open finance mechanism operates through the international credit channel of monetary policy rate *(MPR)*, (Morais, Jose-Luis and Claudia, 2015). The authors suggest that increasing 'risk taking channels of monetary policy' may reveal to a large extent how external monetary policy rate *(MPR)* and quantitative easing (*QE*) decisions could influence credit risk taking behavior of domestic banks in developing economies, with broader impact on economic variables, as depicted below:

$$wir \downarrow \Rightarrow capital \inf low \uparrow \Rightarrow ir \downarrow \Rightarrow I \uparrow \Rightarrow Y \uparrow$$

(1)

Where: *Wir* is world interest rate, *ir* is domestic interest rate, *I* is investment, *Y* is output.

From the context of investment multiplier, domestic deposit money banks may benefit from relatively low foreign interest rate (wir) could improve their borrowing from abroad, hence capital inflows, and thus expand domestic economic activities, leading to income growth. The reverse order holds when wir rises, as was it occurred following the 2008 global crises in less advanced economies.

These transmissions and thoughts may have been justified in the literature. Although, both the International monetary fund (IMF) and the World Bank were established to lend money to poor countries that would face economic crises and assist to attain development convergence respectively (Pressman, 2006), however, these global bodies' market ideologies and policy prescriptions often push for high interest rate to borrowing developing countries. The experience has usually exacerbate domestic interest rates, leading to financial and economic crises, as noted in many economies crises such as the Asian currency crises of the late 1990s, Argentina financial crises of late 1990s to early 2000s, the sub-Saharan African economies from late 1980s to mid-2000s (Stiglitz, 2002; Pressman, 2006). These unwholesome relations may have caused what the IMF regards as enormous reputational risk (IMF, 2003), of which the institution was expected to obtain 'learning culture' thereof (IMF, 2004). Furthermore, the literature is replete with risks of original sin and currency mix-match (Eichengreen, Hausmann, and Panizza, 2007), which may be linked to behavior of the wir .

Facts on Nigeria's interest rate

A major characteristic of Nigeria financial system is high interest rate (such that, on average lending cost is between 30-35%), paucity of long-tenured savings and high interest rate spread (Ojo, 2010), perhaps due to prevalence of high inflation rates, and hence negative real savings rate (Table 1). Other major features of the financial system are very low bank branch per capita, and poor financial intermediation ratio (Ojo, 2010). The structure of Nigeria's interest rate relative to peers in the World Bank rated lower middle income (LMI) group reveals that while interest spread (difference between commercial banks' average lending rate and deposit rate) in LMI countries consistently declined from 9.583% in 2000 to 6.083 in 2017, the Nigeria's spread rose from 2.25% in 1985, through 16.26% in 2000, dropped marginally to 15.66% in 2005 and rose steadily to 26.55% in 2017. The huge gap may further unveil the huge profit take and hence the limited financial depth and uncompetitive bank-based financial system in Nigeria. On the other hand, high inflation rate regime in Nigeria is fueled by inflationary pressure (Okoye, Olokoyo, Ezeji, Okoh and Evbuomwan, 2019) which has also lowered the quality of life of citizens, retarded economic and fiscal performance (Okoye, Omankhanlen, Okorie, Okoh and Ahmed, 2019).

Table 1: Nigeria's interest rates macrostructure relative to peers (selected years)

Interest rates	1980	1985	1990	1995	2000	2005	2010	2014	2015	2016	2017
MPR %	6.0	10.0	18.5	13.5	13.5	13.0	6.08	12.15	13.0	14.0	14.0
T. Bill %	5.0	8.5	17.5	12.5	12.0	7.0	3.84	10.5	9.40	10.11	15.72
Savings rate	6.0	9.5	18.8	12.61	5.29	10.82	5.67	9.16	8.68	6.22	10.88
MLR	10.0	11.75	27.70	20.79	21.55	19.49	22.62	25.74	26.71	27.29	30.68
IRS	4.0	2.25	8.90	8.18	16.26	15.55	20.41	22.36	23.13	23.15	26.55

Sources: *Central Bank of Nigeria statistical bulletins (2007-2017). MPR is monetary policy rate. T. Bill is Treasury bill rate; MLR is maximum lending rate; Interest rate spread (IRS) is computed as difference between maximum lending and deposit rates. LMIE interest spread is for Lower-middle income economies, obtained from the World Bank, the World Development Indicator: data.worldbank.org. RDR is real deposit rate.*

Destroches and Francis (2007) argue that in an increasingly integrated global capital market, the real interest rates on savings and investment is somewhat determined by global forces in the global market. Potently, this research work reasons that, the financial system that facilitates the platform for saving and lending, borrowing and investing, are all tied together significantly by the rate of interest (Rose, 2003). Thus, relying on the above foundation and conceptual framework, this paper deduces from the rational expectation theorem by arguing the following research questions. First, why would the world interest rate *(wir)* be related to domestic interest rate structure? Secondly, to what extent does the world interest rate *(wir)* impact the domestic financial system? The study therefore makes the proposition, in the Nigerian case that, there is no significant relationship between the domestic interest rate and the world interest rate in Nigeria; secondly, the world interest rate does not significantly impact the Nigerian financial system in the long term.

Literature Review

Financial literature on developing economies has considerable theoretical backing of the impact of capital accumulation and allocation on financial system development, and that it facilitates the finance and economic growth nexus. However, despite the capital liberalization revolution initiated by McKinnon (1973) and Shaw (1973), which has gained substantial global currency (Destroches and Francis, 2007) finance in sub-Sahara Africa has underperformed of its expected role (Dahou *et al*, 2009; Ojo, 2010). The World Bank opines that finance in the channel of investment to growth. In many developing economies however, the linkage is relatively weak, as the financial sector may require pressing reforms (Ojo, 2010; World Bank, 1989). In Nigeria's case, perhaps due to its imperfections, the financial system have developed and functioned in a maladapted form in terms of aiding fund mobilization, poor liquidity of financial instruments and investment options (Ojo, 2010).

Structurally, interest rate through its future value mechanism has the potency to influence the economy's future pricing system. The same follows in the global perspective at the international financial system, as *wir* avails borrowers, lenders, savers, and investors with sensitive price signals and hence a requisite risk control measures. Studies at the global level claim that nominal interest rate is made of world interest rate, real exchange rate and local inflation; and that dynamics in international business cycle indicates trend in *wir*, a proxy for international required rate of return (Dillen, 1995).

Moreover, for developing economies, the increasing financial globalization may impact more on domestic interest rate dynamics, as real interest rate responds to huge debt servicing challenges (Eke,

2018). Interest rate functionalities have macroeconomic management influences, an instrument that restores equilibrium, as a countercyclical policy instrument for regulatory authorities.

Following expanding capital market integration, Bosworth (2014) exposed the link between real interest rate and external systematic risks, and submits that fiscal policy may serve as antidote to the adverse impacts. Spratt (2009) suggests that lack of effective use of fiscal policy may be have aggravated the rising interest rate spread overtime, as the CBN (2010) reveals that nominal interest rate transmits multiple impulses and directional pathway

In summary, aside internal variables, domestic financial system is potentially linked to elements of global openness such as trade, capital flows, remittances, official and non-official transfers.

Empirical Literature

Iacoviello and Navarro (2018) employed heterogeneous Panel in 50 developed and emerging economies from 1965 to 2016 to examine new empirical evidence on foreign spillover effects of higher US interest rates. Gross domestic product (GDP) in both advanced and emerging markets were found to respond to US monetary shocks; with emerging economies having higher impact. The study however did not consider Nigeria's case. Bahadir and Lastrapes (2015) applied dynamic factor model using yields of emerging and industrialized countries beyond US Treasury bill rate to examine whether in integrated capital market, domestic interest rate in emerging markets account for world interest rate impact. The outcome is consistent with capital market integration in emerging market, particularly for long-term US dollar denominated bonds. Desroches and Francis (2007) studied the relative importance of determinants of long-term world interest rates. Key variables studied affect the behavior of world interest rate overtime: the variables are labour force growth; age structure of global economy; state of financial development. The study however ignored sub-Sahara Africa from the sample. Pigka-Balanika (2013) examined the impact of openness on growth among 71 different economies from different regional blocks using panel fixed and two-way fixed effect regression from 1990 to 2005. Trade liberalization has positive and significant impact on growth, except for sub-Sahara region.

Negro, Giannone, Giannoni, and Tambalotti (2018) applied vector auto-regression with common trend from 1870 to 2016 to examine the role of global factors in relative low real interest rates in seven industrialized economies. The outcome reveals the following: no more specific country trend since the 1970s; lower rate is driven by increased premium demand from international investors; and lower global economic growth is driving the decline.

A striking observation from the reviews above notes gap in the scope and methods employed, this study therefore employs different method, that is, autoregressive distributed lag (ARDL) method for Nigeria.

Theoretical Framework and Methodology

Theoretical framework

The interest rate framework adopted is the international Fisher's theory. In the open interest rate framework (Omolehinwa, 1998), Fisher reveals that difference in identical bond instrument may be the linked to differences in market forecast of expected exchange rates, an indication that the law of one-price operates through the real interest rate *(rir)* system. The microeconomic foundation of market interest rate is linked with the consumer's utility mechanism, as the consumer decision to postpone present consumption earns savings time preference, otherwise referred to as the consumer's opportunity cost (Jones, 2010). On average the instrument may stand for the economy's real risk-free rate (*Rrr)* of interest. Algebraically, the treasury rate (Rf) then consists of real risk-free rate (Rrr), adjustment for expected inflation $E(\pi)$ as follows:

$$Rf = Rrr + E(\pi) \quad (2)$$

Equation 2 is the domestic Fisher model. It reveals that the nominal short-term interest rate rises along with expected inflation, to maintain real interest rate constant. The framework is as follows:

$$(1+i) = (1+\rho)(1+E(\pi)) \quad (3)$$

i is the nominal short-term rate, ρ is expected real interest rate, and $E(\pi)$ is expected inflation. Dornbush *et al.* (2011) posit that transaction cost increase, on account of inflation, may generate differing economic influences on account of whether inflation is anticipated or not. Where it is anticipated, the economics of rational expectation mechanism would prevail on business contracts, such that inflation generates no real costs. In the first instance, currency holding cost rises with inflation rate, and hence hurts if not substituted for interest bearing assets. Moreover, individuals and households have to allocate more resources, for possible increased price. Under unexpected situation, a higher risk level may be assumed depending on whether the economic unit is a creditor or a debtor (Dornbush *et al.,* 2011).

Data

The data sources and descriptions of variables employed are presented in the table below. The theoretical literature justification and *a priori* are stated. The Nigerian interest rate is the maximum interest rate as published by the Central Bank statistical bulletin. The fed fund rate is proxy for the world interest rate, as evidenced is studies such as Bahadir and Lastrapes (2015), Iacoviello and Navarro (2018). It is sourced from Federal Reserve Bank of St. Louis (Table 2).

Table 2: Data: description, sources, measurement and justification

Variable description	Source/Measurement/Proxies	Literature justification
Irt= interest rate	Central Bank of Nigeria	Bosworth (2014)
Wir= world interest rate	The US Fed fund rate**	Iacoviello and Navarro (2018). Bahadir and Lastrapes (2015).
Inf= inflation rate	National Bureau of Statistics	Soludo (2005)
Bc= bank competitiveness	World Bank*/ Bank branch per 100,000 adults/proxy for financial depth	Ojo (2010)
Open= trade openness	World Bank*/ Trade % of GDP	Pigka-Balanika (2013)
Exr= exchange rate	Central Bank of Nigeria/ Naira direct quote to US dollar	Ojo (2010)
Pdr=public debt ratio	World Bank	Bhatia (2008)

*Source: compiled by the authors; *World Bank data base, data.worldbank.org; **https://fred.stlouisfed.org/series/FEDFUNDS*

The study adopted the fully-modified ordinary least square in an autoregressive distributive lag system. The short-run dynamics adjustment term was established, along with the FMOLS co-integrating analysis

Model Specification

The functional model that may link nominal interest rate to suggested explanatory variables of world interest rate, trade openness, inflation expectation, exchange rate, bank competition and public debt ratio is implicitly presented as follows:

IRT= f(Wir, Open, Inf, Exr, Bc, Pdr)
(4)

+ − + + − +

Stated underneath are the expected regression signs. The explicitly structured log form of the autoregressive distributive lag (ARDL) model is as follows:

$$InIRT = \alpha_i + \beta_1 \sum_{i=1}^{p} Inirt_{t-i} + \beta_2 \sum_{i=1}^{p} Inwir_{t-i} + \beta_3 \sum_{i=1}^{p} Inopen_{t-i} + \beta_4 \sum_{i=1}^{p} In\inf_{t-i} + \beta_5 \sum_{i=1}^{p} Inexr_{t-i} + \beta_6 \sum_{i=1}^{p} Inbc_{t-i} + \beta_7 \sum_{i=1}^{p} Inpdr_{t-i} + \varepsilon_t$$

(5) where: *p* stand for the optimal lag

Results and Findings

Unit root analysis

The study applied Augmented Dickey-Fuller (ADF) and Phillips-Perron (PP) techniques to carry out the unit root test statistics. One variable, the inflation rate *(Linf)* appear to be stationary at level, while the rest six variables namely interest rate (*Lrt),* Fed rate *(Lfed),* exchange rate *(Lexrt),* bank competitiveness *(Lbc),* openness *(Lopen),* and public debt ratio *(Pdr)* are first differenced stationary. The non-uniform stationary properties suggest the use of ARDL methodology for co-integration analysis, as use of ordinary least square may produce spurious outcome (Granger and Newbold, 1984).

Table 3: Unit root tests

Summary statistics

A significant item in the summary statistics presented in Table 4 is the Jarque-Bera test which reveals that the study fails to reject the null hypotheses that five **(5)** variables- interest rate *(Inr)*, Fed rate *(Fed),* trade openness *(Open)*, Public debt ratio *(Pdr)*, and Bank competitiveness *(Bc)* are normally distributed, while it rejects normality for two variables series- inflation rate *(Infr)* and exchange rate *(Exrt)*. The result agrees with the model's Jarque-Bera diagnostic test result in Table 10**.**

Table 4: Summary statistics

Correlation Matrix

The correlation statistics produce negative association between Nigeria's interest rate and the Fed rate which suggest that the Nigeria interest rate regime may not be sensitive to global forces as represented by the US Fed rate; while in line with *a priori* reasoning it is positively sensitive to endogenous forces such as inflation rate, public debt ratio and exchange rate. Furthermore, against *a priori* thoughts, trade openness and bank competitiveness share positive association with domestic interest rate. On trade openness, the positive link may suggest the pressure of high imports and the nature of imported goods relative to primary commodity exports which Nigeria has been noted (UNCTAD, 2014; UNCTAD, 2016; Eke, 2018; Eke and Alege, forthcoming). On bank competitiveness, it suggests that policy on increased bank branching may not be an antidote to managing cost of funds downwards since the measure may not increase the limited depth of financial markets, level of inflation, risks and uncertainty (Soludo, 2005), rather technology, such digital finance model may serve the purpose.

Table 5: Correlation matrix

	LINR	LINF	LFED	LOPEN	LPDR	LBC	LEXR

Lag length order

The optimal lag length of the variables is established to moderate the time dynamics that was fitted for the model. While three techniques- All information criterion (AIC), Final prediction error (FPE), and the LR criterion limits the lag length to two (2), Schwarz information criterion (SIC) and Hannan-Quinn information criterion (HQ) chose lag one (1) as lag length as optimal. The study therefore adopts lag length two (2) as optimum, as presented in Table 6 below:

Table 6: Optimal lag length

Lag	LogL	LR	FPE	AIC	SC	HQ
0	-221.47	NA	4.86e-05	9.9335	10.2118	10.0378

Granger causality result

The Granger-causality statistics is presented in table 7 below. Established in the vector autoregressive (VAR) framework, it provides preliminary investigation on the short-run relationships among the variables, and could assist to establish basis for variables' inclusion in the model. By *a priori*, inflation rate, the fed rate, bank competitiveness and exchange rate significantly granger-causes interest rate in Nigeria. Bi-directional causal relations exist among exchange rate and interest rate. Similarly, in line with expectation, while public debt ratio is sensitive to exchange rate, bank competitiveness also granger-causes exchange rate.

Diagnostic Tests

Model serial correlation LM Test

The serial independence LM test presented below in Table 8 provide evidence which indicates that the study fails to reject the hypothesis that there is no serial correlation among the series, as the F-stat. value of 0.1060 produces a probability value of 74%. The result thus concludes that the residuals do not contain serial correlation.

Table 8: Breusch-Godfrey serial correlation LM test

.	*LM test*	*DF*	*Probability*

Co-integration Test

The tau-statistic and z-statistic results in both Phillips-Ouliaris and Engle-Granger methods are presented in Tables 11 and 12 below. The results suggest existence of long-run co-integration, as their probability values are below 5%. The study therefore rejects the hypothesis that the series are not co-integrated.

Table 11: Co-integration test: Phillips-Ouliaris test

Short-run adjustment results

The short–run dynamic adjustment result is presented in Table 13. The error correction (adjustment) mechanism of 56 per cent is significant at 5 percent, and of the right negative sign, which suggest that the interest rate model's disequilibrium is adjusted to equilibrium annually.

Table 13: Short-run results

Long-run results and analysis

Given the significance of the diagnostic results above, it suggests that the inferences and the significant coefficients of the long-run regression results presented in table 14 below may be valid. The R^2 of 83.7% suggests that the model is fitted, as the joint influence statistics is significant. The moderate fitted-test score suggests that the coefficients might be free of multicollinearity bias. Moreover the all-variables Wald's F-stat. and X^2 tests are significant, which suggests that the model may be reliable. On specifics, the fed rate has negative long-run relationship with interest rate, same as the short-run result and correlation statistics earlier analysed. It reveals that one per cent rise in the fed fund rate may result in 0.63 per cent reduction in Nigeria interest rate. Against the conceptual thought presented above (see equation **1**), it suggests, *ceteris paribus,* that the Nigeria's interest rate regime may not be positively sensitive to the US monetary rate changes, such as normalization policies suggests.

The result suggests that contrary to *a priori* of normalization policy, an increase in the US fed rate, may not lead to capital outflow from Nigeria, that may result in interest rate surge. On the other hand, a decrease in the fed rate, may not lead to capital flight to Nigeria, given the workings of international interest rate parity, which may then decrease interest rates in Nigeria; perhaps for reasons of other macroeconomic risk factors. In other-words the fund transfer mechanism is not automatic, such that reduction in fed rate, would lead to capital outflow or attract much needed global capital, necessary to reduce domestic interest rate. It may imply that the interest rate policy rule in Nigeria would largely be determined by workings of endogenous production forces, or the workings of the domestic economy. The adverse effect of US normalization that has been of primary concern in monetary policy rate determination of developing economies does not seem to arise. Rather this paper's

outcome suggests that such fears should be directed at high debt service burden, political risks, and corruption issues, as affecting interest rate.

Other results reveal that, in line with domestic Fisher hypothesis, inflation rate positively drives interest cost, while in line with the international Fisher effect, exchange rate is technically linked with interest rate rise, as it seems to drive it in Nigeria. The result also suggests that the interest rate parity may hold, as the spot and forward exchange rates are positively linked with interest rate.

Moreover, public debt ratio positively drives interest rate. A one per cent increase in public debt could result in corresponding 19 percent increase in interest rate in the long term. In the short-term regression, the coefficient is 3.8 per cent. It indicates that the high rate of public debt consumption, that is now common in developing economies may be producing high price in interest rate for the Nigerian financial system than what policy makers envisage.

Overall, bearing the state of information asymmetry, the results of positive elasticity of interest rate subject to a per cent increases in inflation, exchange rate, and public debt ratio may affirm the rational expectation hypothesis for interest rate determination in Nigeria. This outcome may require effectiveness in policy articulation and formulation, and may not be of random-walked nature, as attributed to Robert Lucas (Pressman, 2006; Grossman, 1981).

In line with *a priori,* trade-openness has negative long run effects on interest rate, which suggest that a one percent increase in trade ratio *ceteris paribus* results in 0.2 percent reduction in interest rate. It indicates that, perhaps, given commitment to trade liberalization interest rate reduction could be effectively achieved in Nigeria.

Policy implication of findings

The policy implications of the findings suggest as follows: first, domestic interest rate negative and significant sensitivity to world interest rate (wir) in both the short and long-term suggests that, against the rational expectations doctrine, Nigeria's monetary policy mechanism and its functional interest rates is not exogenously link to the US fed fund rate system. It may appear that there is no monetary policy spillover effect on Nigeria monetary system, as advocated by global financial regulator, the Bank for International Settlement (BIS). This may suggest the workings of the rule-based Central Banking System that had been promoted in the 1980s and early 1990s (Volker, 2014; Taylor, 2014; Obsfeld and Rogoff, 2002). The result suggests that recent US fed rate normalization programmes couldn't have impacted the Nigerian monetary and credit system adversely.

Taylor (2014) observes that the rule-based monetary system by global Central Banks could advance international finance stability. The paper reveals that under economic openness, developing economies could obtain spill-over benefits, in low long-run price and output stability, from rule-based system of monetary policies in advanced economies. To this effect, accelerated global financial liberalization may have encouraged leading international banks in sub-Sahara Africa (SSA) to obtaining cheap credits from significantly advanced credit market environments, which *a priori* should result in low interest rates for high investments and output (Taylor, 2014). This result supports the empirical findings that sub-Sahara Africa is characterized by weak transmission of monetary policy mechanism (Mistra, Montiel and Spilimbergo, 2011; Berg and Rafael, 2018).

However, financial institutions in emerging markets often leverage on advanced economies' low interest-rate regimes, even at zero per cent in climes such as Japan, Germany. The negative result suggests that local banks in financial institutions in Nigeria may not explicitly be transmitting arbitraged spread yields, hence do not impact the country's interest rate, nor drive investments. This may also be unrelated to the relative smallness of Nigeria's financial system and the limited openness to the global economic order. Unique feature of small financial systems economies is low competition, due to few financial institutions, and higher finance operating costs (Bossone, Honohan and Long, 2002). Iacoviello and Navarro (2018) found in a multi-regional study that GDP in emerging markets declined in response to the US normalization policy as it did to the US economy.

It suffices to reveal that the unstructured nature of the interest rate to global interest rate, may explain why the economy is dominated by large informal sector, as formal finance-system have eluded genuine entrepreneurial venture. High interest rate continues to emasculate real sector firm, such that they are closing shop, and relocating to neighboring countries. Today, only oil extraction and firms in the service industry are well placed to attract finance from the credit market, as private credit to GDP keep falling year on year, on account of interest related cost of finance.

Secondly, in line with extant growth literatures, other controls in the model: inflation rate, exchange rate and public debt positively drives interest cost. The plausible implication is that in high interest rate environment, the financial intermediation industry may find it difficult to flourish, giving way for high risk taking attitude for any interested entrepreneur (Knoop, 2013; Eke, 2018). The implications of high lending cost on investment and growth may just be unimaginable. The economy is largely dominated by the informal sector, which has relied on rotating savings and credit associations (ROSCAs) for their micro and small-scale entrepreneurial capital at cheaper cost than the formal bank finance (Knoop, 2013).

It may also imply that appropriate policies may not have been adopted at structural reforms to manage inflation, encourage industrialization and boost productivity. Critical sectors that low interest rate could moderate for greater investments needs are agriculture, road and rail infrastructure, and small and medium scale enterprises (SMEs), home mortgage sector where currently the housing deficit is in excess of seventeen million (CBN, 2013). Inflation driven high interest cost could exacerbate the financially excluded population, and hence deepen poverty. For instance report from the National Bureau of Statistics claim that despite the importance of agriculture to the GDP, in excess of 40%, agricultural loan is less than 3 per cent of total credit in 2017 and 4 per cent in 2018 financial years (CBN, 2018). The structure of Nigerian economy does not help matter, as it is import

dependent, hinged largely on mono-product primary commodity export, which is subject to global price vagaries, and weak manufacturing sector. Moreover, rising public debt, over the 2005 Paris club debt forgiveness, may be crowding-out the credit system, hence high interest cost, particularly when the debt are not infrastructure-linked borrowing. Made worse is the very low per capita income, hence low consumption power, that may be discouraging industrial investments.

Trade openness has negative long-run impact on interest rate. This result sheds light on immense benefit from trade openness on Nigeria's financial system, as current restrictive trade policy and openness to trade has revealed to the contrary. It suggests that the economy needs to be more open to trade, as perhaps the governments was yet to appraise among other from trade competitiveness, the financial system implication of her opposition to greater trade openness, provided appropriate remedies are instituted against unfair trade practices on the economy.

Conclusion and Recommendations

This paper tests the basic rational expectation hypothesis that in open economies, domestic interest rate may be sensitive to global information, such as the fed fund rate. This study relied on the fully modified ordinary least square, in an autoregressive distribution system to conclude that Nigeria's interest rates structure is not sensitive to world interest rate, proxied by the US fed fund rate. Therefore, the rational expectation theorem of monetary policy rate determination on global information does not seem to hold in the Nigerian case.

From the findings above the study recommends as follows. First, since the study suggest that Nigeria interest rate regimes does not seem to be sensitive to global interest rate risk, Nigeria policy rates should be set independent of the Fed rate; but be guided by the dynamics of endogenous macroeconomic variables. Central Banks globally usually pursue two goals for its policies: to keep interest rates low and to increase the amount of money available for lending, so as to maintain employment on the rise. Nigeria shouldn't be an exemption.

Secondly, a relatively lower US fed rate regime should *ceteris paribus* attract capital to capital-scarce safe heavens. This exercise may deepen the financial market and lower interest costs. Nigeria can attract foreign capital by ensuring low-risk macroeconomic environment, such as growth-inspired inflation rate, freer exchange rate regime, provision of basic physical infrastructure, like constant electricity, that would enable lower cost production cost. Government has the responsibility to inspire business friendly environment that could moderate unemployment and inflation. Institutions that influence economic, social and political outcomes should be efficient and effective, as their actions or inactions affects business conducts, to make Nigeria a safe haven for investments.

Thirdly, the regression outcome of positive and significant impact of inflation rate, exchange rate and debt ratio on domestic interest rate reveals the high risk macroeconomic environment. Hence high interest rate reflects appropriate level of risk that could attract requisite foreign capital. Governments need to improve production infrastructure to reduce cost push inflation such as modern transport and energy facilities. It suffices to stress that Nigeria still suffer from poor energy supply for her bourgeoning micro, small and medium enterprises (MSME) often relied on towards easing unemployment challenges. Furthermore, the foreign exchange market need to be completely liberalized and the dual exchange structure removed for foreign exchange market competitiveness. Public debt policy as instrument of public budget may need to be handled with caution. Debt contract in form of revenue bonds should to be tied to specific income generating infrastructural investments.

Fourthly, the combined adverse long-run effects of inflation risk, exchange rate risk, and public debt risk on interest rate can be addressed by improving the level of productivity of the people in all sectors. Government should ensure systems of quality institutions that promote competitiveness and productivity. The adverse effect of fed rates may have contributed to the relatively high interest rate and hence, unhelpfulness of the financial system in general, since the informal finance services the credit system more. Government should encourage the informal finance by human capital training and organization to enhance their services

Finally, greater trade openness reduces interest rate, which requires government policies to encourage openness to trade. Government should put up institutional and legal safeguards on fairness to trade to maximize broad range of returns, such as reduction in interest rate. Governments should encourage technology transformation in agriculture and manufacturing exports to reduce the level of extroversion.

Abstract

The article is devoted to the study of one of the issues of ensuring the quality and safety of food products in Russia - the need to provide complete and reliable information about the product delivered to the consumer. The authors consider this legal obligation of the food producer as one of the most important guarantees for the realization of the right of Russian citizens to purchase high-quality and safe products.

The need for compulsory labeling or information provided by law or state standard is indicated. The authors insist on expanding the list of mandatory information on certain groups of goods that should be established by state bodies. In their opinion, this will contribute to stricter compliance with the requirements for the quality and safety of food products in the Russian Federation, which, in turn, will ensure the national security interests of the Russian state in the food sector.

Keywords: quality and safety of food products, product information, quality of food products, law, national security, consumers, consumer market.

Introduction

High-quality and safe food is a prerequisite for the full existence and development of any society. The state of public health and other indicators affecting the quality of the human potential of a nation depend on the qualitative characteristics of food products (Vorontsov A.L., Vorontsova E.V., 2016). Because of this, the factor of quality and safety of food products acquires the value of the factor of national security of the state, ignoring which deprives society of the prospects for normal reproduction, and, accordingly, in general any prospects.

Awareness of the above circumstance has forced many states to pay increased attention to the problem of quality and safety of food products, which has found expression in the development and institutionalization of mechanisms to ensure their quality and safety. The Russian Federation is one of such states, especially since the qualitative characteristics of the products consumed by the population did not always meet the demands of consumers and the requirements of authorized state bodies. Moreover, the low quality of food products has long been a traditional problem of the Russian consumer market, which could not but cause an aggravated reaction of society (Vorontsona E.V., Vorontsov A.L., 2018).

Changes in the socio-economic situation in the country made it possible to create the necessary conditions for improving the quality of food products entering the market. However, the increase in the volume and assortment of manufactured and supplied products, as well as the increase in the purchasing power of Russian citizens, did not, and could not; solve the problems of quality and safety of food products. A significant role in this case was played by an insufficiently perfect legal mechanism designed to fulfill the role of a regulator of quality and safety issues at all stages of the food product life cycle - from its production to receipt by the consumer. And if at the stages of

production, storage and transportation of food products, the current legal mechanism laid the main burden of responsibility for compliance with the requirements for its quality and safety on the producer, seller and, in part, on the state regulatory authorities (as an official guarantor), then at the stage of product acquisition the consumer was guided by his own opinion based on the information available to him, firstly with information contained on the product.

Results and Discussion

The consumption of food products with low consumer properties, as noted in the Strategy for improving the quality of food products in the Russian Federation until 2030, is the reason for reducing the quality of life and the development of a number of diseases of the population, including due to unreasonably high calorie content of food products, reduced nutritional value, excess consumption of saturated fats, micronutrient deficiencies and dietary fiber, in connection with which they are of particular relevance, the issues of ensuring consumers' right to reliable product information (Order of the Government of the Russian Federation of 29.06.2016).

For many years, the problem of the Russian consumer market was the poor quality of goods coming from the countries of the near and far abroad. There were objective reasons for this: the need to saturate food shelves in combination with the low purchasing power of the Russians was facilitated by the import of relatively cheap goods in the purchase, the quality of which. As a rule, it could not be high.

The measures taken by the state, and most importantly - the increase in the purchasing power of our citizens and the development of consumer culture, led to the fact that the quality of goods imported from abroad significantly improved (in proportion to the increase in prices for them). And if not all citizens due to their financial situation could afford to buy really high-quality goods (products), then, in any case, there was a situation in which the buyer had the opportunity to choose.

The situation has changed dramatically with the introduction of economic sanctions against our country. Previously functioning channels for the receipt of marketable products were blocked. This caused the need for import substitution and, from an economic point of view, created the prerequisites for the development of domestic production (especially in the field of food production. It seems that this can only rejoice. Poor-quality goods ceased to come to us from abroad, the Russian manufacturer began to actively enter the consumer market, which, it seems, is much easier to control at all technological stages of production. However, the quality problem has not gone away. Moreover, the lack of foreign competitors creates a temptation for the Russian manufacturer to neglect the quality requirements and mislead the buyer regarding the latter. Thus, there is a very real threat of violation of the right of consumers to receive goods of good quality.

We remind the reader that the quality of a product is a combination of its useful properties that can satisfy certain human needs under normal conditions of use. It should be noted that the Law of the Russian Federation “On the Protection of Consumer Rights” does not provide a legal definition of the quality of goods; it only defines the safety of goods. The Federal Law "On Quality and Food Safety" enshrines the concept of quality and safety. So, according to Article 1 of the Federal Law “On the Quality and Safety of Food Products”, the quality of food products is the totality of the characteristics of safe food products that meet the requirements established in accordance with the legislation of the Russian Federation, the terms of the contract, sample, standardization documents, and technical documentation that determine consumer properties, nutritional value, authenticity, grading (caliber, category and others), and satisfying the physiological needs of a person (Federal law dated 02.01.2000). In the Strategy for improving the quality of food products in the Russian Federation until 2030, the quality of food products is understood as the totality of the characteristics of food products that meet the stated requirements and include its safety, consumer properties, energy and nutritional value, authenticity, the ability to satisfy human needs for food under ordinary conditions use to ensure the preservation of human health.

The consumer often evaluates the quality of the goods by their appearance, taste, smell, color and other external characteristics. As a rule, the consumer does not have special knowledge in the field of quality assessment of goods purchased by him. An important role is played by the information about him received from the seller.

Speaking about the quality of goods, we mean their compliance with standards, specifications, samples, etc. And we don't think about the fact that a product that meets the requirements of standards, specifications, samples can still be recognized as poor quality.

Yes, this is possible if there is no mandatory labeling or information on this product, provided for by law or state standard.

Product information must meet the requirements of Art. 9 - 10 of the Law on the Protection of Consumer Rights.

The Law "On Protection of Consumer Rights" enshrines the right of consumers to information about the manufacturer, seller and goods. But he does not disclose the content of the concept of "necessary information". The manufacturer, seller himself determines the necessary amount of this information, realizing his responsibility for its incompleteness. For certain types of goods, the list of information and methods for communicating it to the consumer are established by decisions of the Government of the Russian Federation, which are binding on the entire territory of the Russian Federation. Since the Law contains a list of mandatory information about the product, the information established by the Government of the Russian Federation, as well as the manufacturer, seller, is additional or reflects the specifics of the product. Such information must be complete and accurate.

Information on goods must contain:

- the name of the technical regulation or other established by the legislation of the Russian Federation on technical regulation and indicating the mandatory confirmation of conformity of the goods designation;

- information on the basic consumer properties of the goods, in relation to food products, information on the composition (including the name of food additives, biologically active additives used in the manufacturing process of food products, information on the presence in the food products of components obtained using genetically modified organisms, if the content of these organisms in such a component is more than nine tenths of a percent), nutritional value, purpose, conditions of use and storage of products such as are for food, about how to make ready meals, weight (volume), the date and place of manufacture and packaging (packaging) of food products, as well as information on contraindications to their use in certain diseases. The list of goods, the information on which should contain contraindications for their use in certain diseases, is approved by the Government of the Russian Federation [5];

- the price in rubles and the conditions for the acquisition of goods, including when paying for goods after a certain time after their transfer to the consumer, the full amount payable by the consumer, and a schedule for paying off this amount;

- warranty period, if installed;

- terms and conditions for the efficient and safe use of goods;

- information on the energy efficiency of goods in respect of which the requirement for such information is determined in accordance with legislation on energy conservation and on improving energy efficiency;

- the service life or shelf life of the goods, established in accordance with this Law, as well as information on the necessary actions of the consumer after the specified periods and possible

consequences if such actions are not performed, if the goods after the specified periods pose a danger to the life, health and property of the consumer or become unsuitable for intended use;

- address (location), company name (name) of the manufacturer (contractor, seller), authorized organization or authorized individual entrepreneur, importer;

- information on the mandatory confirmation of the conformity of the goods referred to in paragraph 4 of Article 7 of the Law of the Russian Federation "On the Protection of Consumer Rights" (that is, if mandatory requirements are established for goods by law or in the manner prescribed by them that ensure their safety for life, health of the consumer, and the environment and the prevention of harm to consumer property, the conformity of goods to the specified requirements is subject to mandatory confirmation in the manner prescribed by law and other legal acts. The number of imported goods, without information on the mandatory confirmation of their compliance with the requirements specified in paragraph 1 of Article 7 of the Law of the Russian Federation "On Protection of Consumer Rights" (the consumer has the right to have the goods under normal conditions of use, storage, transportation and disposal was safe for life, health of the consumer, the environment, and also did not harm the property of the consumer. prevention of damage to consumer property is mandatory and is established by law or in the manner prescribed by it));

- information on the rules for the sale of goods.

If the product purchased by the consumer was in use or the deficiency(s) was eliminated in it, the consumer should be provided with information about this (The law of the Russian Federation of 07.02.1992).

The technical regulation of the Customs Union "Food products in terms of their labeling" in Art.4, establishes labeling requirements for food products. In particular, the marking of packaged food products provided for by this document and inscribed in the form of inscriptions shall be applied in Russian and in the state(s) language(s) of the state - a member of the Customs Union, subject to the relevant requirements in the legislation(s) of the state(s)-member(s) of the Customs Union, with the exception of the cases specified in this document, or rather information about the name and location of the manufacturer of food products supplied from third countries, it is allowed to indicate the letters latin alphabet and Arabic numerals or in the state(s) language(s) of the country of location of the food manufacturer on condition that the name of the country in Russian (Decision of the Commission of the Customs Union dated 09.12.2011).

Information on imported goods should contain the following information in Russian: name of the country of manufacture, manufacturer, their legal address; purpose, basic properties and characteristics; terms and conditions of use; other information on goods provided for in accordance with the legislation of the Russian Federation. It should be placed on the packaging or label of the product, on the insert sheet or in the form of an annotation to be displayed together with the samples.

This situation enables consumers to protect their rights regarding the quality of foreign-made goods. However, there are no real levers of consumer influence on manufacturers located outside the Russian Federation. The reference to the application in international situations of the norms of international treaties (Article 2 of the Law on the Protection of Consumer Rights) also does not solve the problem.

GOST R 51074-2003 “National Standard of the Russian Federation.Food Products.Information for the consumer. General requirements” establishes not only general requirements for the content of information for the consumer, but a list of information on food groups (GOST R 51074-2003). Information for the consumer in accordance with GOST R 51074-2003 must be unambiguously understood, complete and reliable, so that the consumer cannot be deceived or misled about the composition, properties, nutritional value, nature, origin, method of manufacture and use, as well as other information, characterizing directly or indirectly the quality and safety of a food product, and

could not mistake this product for another one that is close to it in appearance or other organoleptic characteristics.

The information is brought to the attention of consumers in the technical documentation attached to the goods, on the labels, markings or in any other way accepted for certain types of goods. Information on the mandatory confirmation of the conformity of goods to established requirements is presented in the form of marking of goods in the prescribed manner with a conformity mark and (or) in another way established by laws, other legal acts or usually presented requirements, and includes information on the number of the document confirming compliance with the term his actions and the organization that issued him. The consumer can additionally receive information on products of interest to him also on Internet sites, in commercials and catalogs.

Thus, product information is an effective means of ensuring its quality. Both Russian producers and Russian consumers should always remember this. The absence of certain types of foreign goods and, accordingly, the availability of their analogues produced in Russia (in connection with the sanctions imposed on our country), does not at all preclude the possibility of non-compliance with the quality requirements of these goods. Widespread in Russia the slogan “we will support the domestic producer”, addressed to consumers should correlate with the obligation of the manufacturer of the products to strictly observe the requirements for its quality, and reliable information about the product should become an axiom of relations in the consumer market. It seems that the development of the situation in this direction will contribute to a more complete realization of the right of Russian citizens to purchase safe food of good quality.

Conclusion

Our brief study allowed us to draw a number of conclusions:

- in the system of legal measures ensuring the realization of the rights of Russian citizens to high-quality and safe food products, the right to reliable information about a product occupies an important place, since it is it that allows the consumer to make his own choice of a food product, guided by his preferences regarding it nutritional value and taste;
- the obligation of the manufacturer, established by Russian law, to indicate the necessary and reliable information about the product, as well as sanctions for not providing or distorting it, serve as an instrument of legal support for the quality and safety of food products, forcing the manufacturer to bring their goods in accordance with the specified characteristics (usually high in view of marketing needs and maintaining the image of the manufacturer);
- further refinement of the lists of information on certain groups of goods established by the state, as well as improving the consumer culture of citizens will, but in our opinion, contribute to a more complete and strict observance of the requirements for the quality and safety of food products in the Russian Federation, which, in turn, will ensure the interests of national security of the Russian state in the food sector.

Abstract

The article is devoted to the analysis of the practice of legislative regulation of issues of quality and safety of food products in the Russian Federation. The authors note that the problem of ensuring the quality and safety of food products is an urgent task of any state, given the enormous importance of the qualitative characteristics of the food consumed by the population in order to maintain the national gene pool and the stable development of society. Only healthy nation is able to withstand internal and external challenges, ensuring its progress and prosperity. Therefore, the problem of ensuring the quality and safety of food products should be considered as an important part of the problem of ensuring national security. This approach will allow us to concentrate organizational and legal efforts on solving the problem of creating a mechanism for ensuring the quality and safety of food products. The authors analyze the legislation of the Russian Federation aimed at regulating the issues of quality and safety of products, including program strategic documents designed to improve the existing legal mechanism in this area. Noting the positive trends in the legal regulation of issues of quality and safety of food products, the authors of the article draw attention to the fact that the Russian state has not yet been able to equalize the legislative "bias" existing in this area: the norms of Russian law are still mainly aimed at ensuring food safety requirements, not quality. All this creates potential threats to the health of Russian citizens, and therefore - threats to the national security of the country.

Keywords: quality and safety of food products, food, legal support of quality and safety, ensuring quality and safety, legislative regulation, legal mechanism, national security, food security, technical regulations, mandatory requirements, health protection, public health.

Introduction

The problem of ensuring the quality and safety of food products is an urgent task for any state, given the enormous importance of the qualitative characteristics of the food consumed by the population to maintain the national gene pool and the stable development of society. For states whose consumer market, for one reason or another, is experiencing a shortage of food products of its own production and (or) is excessively dependent on food supplies from abroad, this task is especially acute, since in this situation conditions arise to fill their food market with poor quality and counterfeit products that can cause significant harm to public health. It is obvious that in this case the interests of the national security of the country will be jeopardized, since only a healthy nation is able to withstand internal and external challenges, ensuring its progress and prosperity.

For Russia, the problem of food quality and safety was especially acute in the 90's XX century, when in conditions of total food shortages, the flow of food products with low consumer properties and unsafe for health poured into the Russian market. The collapse of the national food industry, the

inconsistency of the previous legal framework with new market relations - all this was an ideal environment for ignoring the requirements for the quality and safety of food products. As a result, the Russian consumer purchased food products whose expiration date had long expired (most often this happened when delivering products from abroad), or products whose consumer properties did not meet the standards of the country of origin.

Inside Russia, counterfeit (usually artisanal) production flourished that did not meet elementary technological requirements. For the population, this turned into massive food poisoning and outbreaks of salmonella, botulism and other diseases.

Quite a lot of time has passed since then, and the measures taken by the Russian state - toughening regulatory requirements for food safety, increasing domestic food production - played a role. The quality and safety of food products in circulation has increased. At the same time, the Russian food market is still subject to threats associated with low consumer properties and the safety of food products and raw materials for their production. To a large extent, this is a consequence of the imperfection of the existing legal mechanisms for ensuring the quality and safety of food products, which in turn was caused by a wrong look at the problem itself - for a long time the issues of quality and safety of food products were considered, as a rule, in the context of the implementation of civil law claims of citizens. This narrowed the essence of the indicated problem and downplayed its significance for society as a whole. At the same time, the understanding of the quality and safety of food products as one of the most important aspects of ensuring national security has significantly intensified the organizational and legal activities of the state in this area.

The aim of our study is to analyze the legislative regulation of the quality and safety of food products in the context of ensuring the national security of the Russian Federation. The study of the problem of legal ensuring the quality and safety of food in this context is, in our opinion, a promising area of scientific activity, and in addition it allows bringing the legislative regulation of this sphere to a higher legal level (taking into account the (huge) importance that is attached in the Russian Federation national security.

Materials and Methods

The empirical material for the study undertaken by the authors was the legal acts of the Russian Federation aimed at regulating relations in the field of ensuring the quality and safety of food products, as well as ensuring the national security of the country. Basically, these were program strategic documents that made it possible to determine the principled position of the Russian state with respect to the main directions and ways of ensuring the quality and safety of food products, achieving food security, the role and place of these tasks in an integrated system of ensuring national security of the Russian Federation.

The study was built on the basis of the general principles of scientificness, objectivity, and the adequacy of the methods used for research tasks. The direct research methods were: the method of formal logic, scientific assumptions (hypotheses), the formal legal method, the method of generalization.

Results and Discussion

The national security of the state depends on many factors, each of which can be crucial for the life support of society. In this case, it all depends on the situation in which the state finds itself under the influence of certain circumstances: social instability, military threat, economic crisis, natural disasters, etc.

Among all the factors that are essential for ensuring national security, the factor of public health should be highlighted. This is explained by the fundamental role of public health for the functioning

of all spheres of public life, without exception. The coronavirus pandemic resulted in global changes in the system of public relations both within countries and internationally, is a clear example of this. Thus, the "cross-cutting" nature of the factor of public health and its importance for the normal functioning of society is becoming increasingly apparent.

For the national security of the Russian Federation, the state of public health is of particular relevance due to the low reproduction of the population, a decrease in the age limit for the occurrence of chronic diseases, and the prevalence of diseases caused by lifestyle. These circumstances may call into question the possibility of realizing the ambitious tasks that Russia has set for itself to ensure its sustainable development. The intensification of modern production, its transfer to hard-to-reach areas with an unfavorable climate and other features of modern labor activity require a healthy workforce. The needs of the Armed Forces of the Russian Federation also require good health, the importance of which has grown significantly in the face of geopolitical pressure exerted on us. All this makes us pay close attention to the state of public health, as well as to factors that directly affect it.

The food consumed by the population is perhaps the main factor determining the state of health of the population. This is due to the fact that the bulk of the substances necessary for a person get to him from food. At the same time, it is with food and water that the human body gets more than 85% of all toxic substances. Food products in the scientific community have long been considered only as the "fundamental prerequisites" of health (Tobes B., 2001). They appear in the same quality in a number of international acts.

The Russian legislator did not stand aside from this trend. The Federal Law (2011) "On the Basics of Protecting the Health of Citizens in the Russian Federation" provides that health protection is ensured, including by the production and sale of food products of appropriate quality (Article 18). In turn, the adoption of such legislative acts as the Law of the Russian Federation (dated 07.02.1992) №2300-1 “On Protection of Consumer Rights”, Federal Law (of 05.07.1996) №86-FZ “On State Regulation” was aimed at ensuring the quality and safety of food products. in the field of genetic engineering”, Federal Law (of 02.01.2000) №29-FZ“On Quality and Food Safety”, Federal Law (27.12.2002) №184-FZ“ On Technical Regulation”, Federal Law (of 29.06.2015) №162-FZ “On Standardization in the Russian Federation” and others. Particular attention was paid to improving control and supervisory mechanisms and limiting the turnover of products obtained using genetically modified organisms. In this regard, the adoption of Federal Law (dated 03.07.2016) №358-FZ “On Amending Certain Legislative Acts of the Russian Federation with Regard to Improving State Regulation in the Field of Genetic Engineering”, which banned the production and import into the Russian Federation of products containing genetically modified organisms. Despite this, the Russian food market is not at all insured against the receipt of low-quality and dangerous samples, which is confirmed by experts of the Federal Service for Supervision of Consumer Rights Protection and Human Welfare, who note that the consumed food products, as well as water, are one of the main causes of most diseases (State report, 2012). This calls into question the provision of public health, and, accordingly, national security in the food sector.

It should be noted that in the Russian Federation the problem of ensuring the quality and safety of food products has long been perceived very one-sidedly. It was believed that only food safety indicators in the indicated context are less important for ensuring national security interests in the food sector, and therefore do not need detailed legal regulation. At the legislative level, this has found expression in the loss of the quality of its mandatory value and the reorientation of the legislator to regulate issues related exclusively to ensuring the safety of food products. At present, it is safety indicators that have the nature of mandatory requirements according to the Federal Law (of 27.12.2002) №184-FZ “On Technical Regulation”.

At the same time, objective reality shows us that many public health problems are caused precisely by the qualitative characteristics of the food consumed. We are talking about the excess in food products of reasonable (acceptable from the point of view of medicine) indicators of fat content, calorie content, sugar, carbohydrates and other things, and, conversely, about the lack of

micronutrients, coarse fibers, etc. necessary for the body in these products. The constant use of these products (despite their safety) can lead to delayed negative health effects (obesity, diabetes, etc.), creating a threat of a national scale. Thus, the task of ensuring the quality of food products also falls into the category of tasks related to ensuring the national security of the Russian state. Apparently, it was the recognition of this circumstance that prompted the leadership of our country to reconsider its approaches to legislative regulation of issues of ensuring the quality and safety of food products and to pay attention to the need to create legal mechanisms to guarantee proper quality indicators of food products. In 2016, an Order of the Government of the Russian Federation (date of 29.06.2016) was issued, which approved the Strategy for improving the quality of food products in the Russian Federation until 2030 (hereinafter referred to as the Strategy), contains program provisions that reflect the conceptual approach of the Russian state to solving the problem of providing its population with a full-fledged (that is, relevant WHO recommendations and other international organizations), which allows to prevent certain diseases, contributing to the improvement of quality and increase the duration of human life) nutrition through improving the quality characteristics of food products.

The Strategy (2016) indicated to us was the basis for the formation in the Russian Federation of a national system for managing the quality of food supplied to the consumer market. The goals of the Strategy were to ensure the quality of food products, stimulate increasing demand and supply for increasingly high-quality food products, and ensure that consumers have the right to adequate food quality.

The Strategy (2016) contains a detailed list of tasks, the implementation of which, according to the creators of this document, will achieve the above goals. Among them: ensuring the monitoring of the quality of food products; improving state regulation in the field of food product quality, including in terms of ensuring state control (supervision) and applying administrative responsibility for non-compliance by the manufacturer (contractor, seller, person acting as a foreign manufacturer) of food product quality requirements; creation of a unified food product traceability information system; development and implementation of a food product quality management system.

It is easy to notice that these tasks involve the creation of new organizational, legal and managerial institutions that have not previously been used in the mechanism for ensuring the quality and safety of food products. Their implementation will require tremendous work of all interested departments, as well as the legislator, which does not allow us to hope for a quick resolution of these problems. Nevertheless, the fundamental position of the Russian state is obvious, consisting in the harmonization of legislative approaches regarding the consolidation of mandatory product requirements. Initially, this is manifested already in the very definitions of the fundamental concepts used in the Strategy. Thus, the concept of food product quality is defined as a set of characteristics of food products that meet the stated requirements and include its safety, consumer properties, energy and nutritional value, authenticity, and the ability to satisfy human food needs under normal conditions of use in order to ensure the preservation of human health. As you can see, in this definition, food safety is an integral characteristic (component) of its quality, i.e. actually presumed. At the same time, according to the logic of the legislator, the presence of a food safety condition is not enough to recognize its quality. In this case, the legislator returns to the practice of regulating the issues of quality and safety of food products (in terms of their relationship to each other) used in the Soviet period and, as we think, there is nothing wrong with such a return, since it is such a combination of quality and food safety that meets the interests of preserving the health of citizens, and accordingly the interests of the national security of the country.

At the same time, it should be noted that at present, the real legal mechanism for ensuring the quality of food products is in its infancy: the quality indicators of food products have not yet been included in technical regulations, and they are absent in most current standards and technical conditions. In general, the establishment of mandatory requirements for food quality by the Russian legislator is only planned. Their early establishment is hampered by the lack of a modern methodology for assessing potential risks to the health of citizens of certain food contaminants, the lack of the necessary scientific justification for the maximum permissible content of these contaminants in food, etc.

Thus, it can be stated that the legal mechanism currently in force in Russia to ensure the quality and safety of food products is still focused mainly on ensuring product safety requirements, ignoring the regulation of its quality. At the same time, the perception of this mechanism as one of the tools for ensuring national security allows us to hope that what we noted the imbalance of legal regulation of issues of food quality and safety will nevertheless be eliminated.

In the Russian Federation, the formation of a holistic mechanism for ensuring the quality and safety of food products occurs within the framework of ensuring the food security of the country, which in turn is one of the main directions of ensuring Russia's national security for the long term (Vorontsov, A.L., Vorontsova, E.V.,2019; Vorontsova E.V., Vorontsov A.L, 2019). It is in this capacity that the Food Security Doctrine of the Russian Federation (dated of 21.01.2020) considers food security - a strategic planning document that develops the provisions of the National Security Strategy of the Russian Federation (Decree of the President of the Russian Federation of 31.12.2015) related to food security. In the Doctrine (dated of 21.01.2020), providing the population with high-quality and safe food products is declared the national interest of the Russian Federation in the field of food security, which puts the solution of this problem to the list of the priorities of the Russian state.

The fact that the problem of ensuring the quality and safety of food products is considered in Russia in the context of ensuring its national security is also evidenced by the fact that a number of program provisions of the Doctrine actually duplicate the provisions of the National Security Strategy. This applies to requirements for improving technical regulation, sanitary and epidemiological, veterinary and phytosanitary surveillance, monitoring food safety for human health, and preventing the uncontrolled import and circulation of food products obtained using genetically modified organisms (moreover, the Doctrine contains the task of preventing the import into the territory of the Russian Federation of genetically modified organisms for the purpose of sowing, growing and breeding them, as well as a ban on breeding animals whose genetic program has been changed using transgenic technologies) and some others.

The enormous importance attached to the Russian Federation by the task of improving the quality indicators of food products, as well as indicators of its safety, is also evidenced by the fact that providing the population with safe and high-quality agricultural products is proclaimed a strategic goal of ensuring the country's food security. The Food Security Doctrine of the Russian Federation indicated by us contains a list of areas of state activity, the implementation of which will ensure the quality and safety of food products. Among them: monitoring the compliance of these products with the mandatory requirements of technical regulations of the Eurasian Economic Union; creation of a modern technical and methodological base, allowing to improve control over the quality and safety of food; harmonization of international requirements and their quality and safety parameters; encouraging manufacturers to produce environmentally friendly food products that comply with sanitary-epidemiological, veterinary and other requirements; strengthening the legal liability of manufacturers for violation of mandatory requirements for food products, etc.

It should be noted that in the programmatic strategic documents of the Russian state, ensuring the quality and safety of food products, as well as food safety in general, is linked to the formation of a healthy type of food, which indicates a comprehensive perception of this problem and an understanding of the fact that its solution does not lie only in the field of normative regulation of indicators of food quality and safety, but also in the field of the structure of food consumption, as well as the food traditions of the population.

Conclusion

The study allowed us to draw a number of conclusions:

- taking into account the decisive importance of the qualitative characteristics of food products for public health, the factor of quality and food safety plays an important role in ensuring the national security of the state;

- for the Russian Federation, the need to take effective measures aimed at ensuring the quality and safety of food products is exacerbated by the presence of negative trends in public health, the reason for which is the quality of food consumed by the population;

- the existing legal mechanisms to ensure the quality and safety of food products do not guarantee the citizens of the Russian Federation the exercise of their right to purchase food of the proper quality necessary for an active and healthy lifestyle. The legal regulation of this sphere is still focused mainly on ensuring the safety requirements of food products, while the issues of its quality remain outside the zone of legal regulation. At the same time, it is the qualitative characteristics of food products on the Russian food market that raise concerns in terms of potential threats to the health of Russians.

The problem identified by us significantly affects the national security of the Russian Federation. Due to this, the Russian government outlined drastic measures, which are reflected in the program strategic documents;

- the state's reaction to the need to ensure quality indicators of food products was the adoption of the Strategy for improving the quality of food products in the Russian Federation until 2030, which was the basis for the formation of a national food quality management system. In general, the Strategy is focused on providing good nutrition and disease prevention andincreasing the length and quality of life of the inhabitants of Russia. It seems to us that the implementation of the program provisions of this document in terms of legislative regulation of product quality issues will make the general mechanism for ensuring the quality and safety of food products more harmonious, since it will allow introducing into the regulatory framework not only requirements related to food safety, but also requirements related to its quality;

- taking into account the great importance of high-quality and safe food products to ensure the national security of the country, the solution of this problem is carried out in the framework of ensuring food security. The food safety doctrine of the Russian Federation contains a specific list of areas of state activity, the implementation of which is designed to ensure the quality and safety of food products.

Abstract

Study aims at finding out if the stock mart in Nigeria already advanced to the extent of being able to impact positively on the country's economic evolution sustainably. Observed studies on the rapport that exists amid financial advance and economic development in emerging economies mostly underscore the importance of the banking sub-sector. Those studies ignore the strategic role of the stock mart in these countries relative to evolution of the economies. Few others that consider the influence of the bourse did using mart capitalization generally to proxy stock mart development. The study becomes so imperative given the spate of globalization and foreign investments via the bourse. Moreover, this study concentrates on the impact of the stock exchange proxied by mart capitalization (debt). Johansen co-integration and Augumented-Dikey Fuller stationarity tests are used to assess the influence that the stock mart development in Nigeria has on sustainable evolution. It is done to see if mart capitalization, as a measure of mart development, could impact on sustainable evolution of the nation. Empirically, we find that the stock exchange in Nigeria enacts positive but no significant influence on sustainable increase of the economy.

Keywords: Sustainable Evolution, Gross Domestic Products, Market Capitalization, Financial Growth
JEL classification: G12

Introduction

One could define the stock exchange as the totality of buyers and sellers of equity and loan stocks, their instruments of trade and the enabling frameworks. According to Familoni (2001), the bourse is established an apex financial mart for the sales as well as purchase of financial securities and all allied activities that go along with the trading. It is purely a forum for financial dealings that is made up of stocks of equity and debt instruments. The equity mart is for already existing shares and the debt mart is for fixed-income securities. In the words of Olowe (2011) as Azubike (2017) quotes it, the apparatus of stock mart came exist to facilitate investments, which hitherto were intrinsically illiquid to be made liquid. This occurs via divestments, given the discretion of the investors devoid of disrupting the operation of the borrower. In the words of Petros (2007), very vibrant stock marts could ease investing in better returns yielding projects; thereby enhancing efficient redistribution of capital and engendering the projections for evolution, even in the long run.

Undoubtedly, the stock exchange as a long term borrowing sustenance platform enhances corporate evolution. It implies then that the more the stock mart develops in enabling the exchange of stocks, the more the economy grows. Indeed, evolution is a good measure of success. The longer the term of evolution, the merrier the success story is told of any economy. To grow means to naturally increase by addition either through assimilation or accretion (Herman, 1993). Thus, evolution is quantitative; and therefore measurable. In the words of Chandra et al (2017), evolution is still one crucial factor in while considering valuation, accessing credt, attracting top skilled professionals, as well as in increasing shareholders' returns. In the words of Adebanjo (2014), evolution becomes sustainable when resources used and the extent of such evolution does not become hazardous to future generations. Hence, sustainable economic evolution could define as such progressive increases induced by concerted actions that enhance standards of living in a given region. In other words, sustainable evolution could be defined as sequential increases of material wealth of which production components are not detrimental to the wellbeing of the concerned economy.

Evolution becomes sustainable when its rate can be continued with, without causing economic problems. Toni (2016) perceives sustainable evolution as having to do with corporate efficiency and long term stability. It is about maximizing resources. In her words, it entails the ability to continually earn more than the outlay at a good margin, militating unprecedented risks, while continuing to invest. It requires immense agility and dynamism. Agility here implies being able to optimize sourcing of funds that are adding value, while putting an eye on the look for better and more efficient ways of accomplishing tasks. Toni (2016)

concludes that being agile equally helps to mitigate risks by being able to shift, change and pivot ahead of, or in response to, mart forces.

At the corporate level, sustainable evolution could be defined as such increment that could be maintained without having to jeopardise ownership. Hence, Pandey (2010: 637) defines sustainable evolution in term of yearly financial developments that are in conformity with organisation's financial policies; assuming no issue of new shares. That is, sustainable evolution of a single product firm is such evolution that the firm attains while maintaining its annual operational efficiency; without raising external equity. It implies that new issues could contributory jeopardise firm control of organisations; hence, sustainable evolution if not well managed. Howitt (2006) submits that sustained economic evolution should be a continuing process that should never end.

Meanwhile, the gap that ignited this research is well captured in Brown and Nyeche (2016). Brown and Nyeche (2016) state that observations on the rapports that exist amid finance developments and evolution of emerging economies focus more on prominence of banking. Those studies ignore the strategic role of the stock marts in these countries, relative to economic evolution. Brown and Nyeche (2016) identify the roles of the marts among others to include savings mobilization and creation of credits. Other roles identified by them include diversification of risks, enhanced corporate control, and efficient allocation of funds. They conclude that efficient and effective delivery of these functions could foster economic evolution rate. Nigeria is one of such emerging economies. The extent to which the Nigerian stock exchange impacts its level of efficiency to grow the nation's economy sustainably is the subject of concern to this study.

Moreover, study set to examine if connection exists amid the stock-exchange and sustainable evolution. In addition to this are the set sub objectives of study, which include finding out if the Exchange has any influence on sustainable evolution in Nigeria. The second goal is to establish the nature of impact, if there is, that the stock exchange has on sustainable evolution in Nigeria. Therefore, the two null hypotheses of study are that stock exchange has no impact on sustainable evolution in Nigeria; and that there exists no causal connexion amid the stock exchange and evolution in Nigeria.

Theoretical framework

The pecking order theory base on the assertion that managers have richer knowledge of firms than investors. Hence, managers will issue out debt instruments when optimistic about firms' future prospects. This implies that equities are issued by prudent managers when they are sceptical about firms' prospects. In other words, the issuance of debt instruments is an indicant that the firm is sure of steady cash inflows that would repay the sum borrowed and its attached costs. This means that informed finance managers would only favour the issuance of equities whenever the ruling price of shares is over-valued. Summarily, the pecking order theory asserts that the issuance of new equities is often the last resort of managers. Hence, the managers prefer financing projects with retained earnings when available and adequate. When not adequate, managers prefer to borrow, using the retained earnings as leverage. One could therefore state that debt is considered cheaper than the cost of equity capital. Payable interests on debt are deductible before tax.

Moreover, internal equity is cheaper than external equity capital. This is so because there are no costs of issuance attached. Therefore, managers avoid issuing new equities so that wrong signals would not be relayed to the investing public about their firms. Hence, they mostly avoid raising capital via the stock exchange publicly. This explains why some finance managers would choose to raise funds privately; but with some of the structures of the stock exchange. In the words of Pandey (2010), managers always prefer to use internal finance. In the absence of internal finance, managers would issue secured debt instruments. If not sufficient, managers would issue unsecured debt or better still a hybrid of debt instruments. Thus, informed managers only issue new equities as a last resort to finance projects.

Meanwhile, there is the endogenous evolution theory, which sought to explain the need to focus inward in a bid to advance evolution. The endogenous evolution theory is of the view that long-run evolution rate in any nation could be influenced by concrete measures. Good policies aid savings and optimal allocation of resources. This suggests that policies which embrace change, competition, openness, and innovations should enhance evolution. On the other hand, policies that restrict change by protecting some particular firms are likely to retard evolution. In clear terms, endogenous evolution theory states that evolution is a fundamental function of endogenous factors.

Efficient Mart Hypothesis

This mart premise posits that when stockholders are faced with novel info they could over react while some others could under react. This means that shareholders' responses are at random. Their reactions chart normal distribution. In the words of Jensen (1978), mart is 'efficient' relative to information. In an efficient mart, it is impossible to generate excess returns base on mere available information. This is due to the fact that prices automatically adjust instantly unbiased to new information; thereby leaving no chance for investors to reap excessive gains. This, in addition, means that all current information about a stock and its expected future cash-flows is included in its mart price.

The hypothesis therefore posits that it is simply not possible for any stockholder to outwit the mart. This is due to the fact that share prices already integrated and reveal all relevant information. It is however assumed that all stockholders adequately perceive available info in the same way. Efficient capital mart implies a well-informed mart. In the words of Pandey (2010; pp.: 46), efficiency of any stock exchange could translate to mean the propensity of the quoted financial securities to reflect and integrate in their prices every pertinent information; with speed.

Therefore, the proficiency of quoted securities' prices depends on the promptness with which the prices adjust to all relevant accessible info. The faster the adjustments speed, the more reflective the securities' prices. Moreover, Fama (1970:383) categorised the sub-capital mart's efficiency into strong, semi-strong and weak forms. The weak-form is the lowest status, which defines the mart when current prices of a shares completely mirror all past prices. Thus, this status implies that past prices cannot be solely used to predict future prices for abnormal gains.

The semi-strong status of efficiency posits that the present stock prices reflect all publicly accessible info. These include information on the quantity of money in circulation, rates of exchange, rates of interest, and stock splits among others. Thus, if the available information incorporates private info, it is therefore not likely that a stockholder earns abnormal gains. In this wise, the mart is said to be strong form efficient. Under the strong form status, mart prices reflect all pertinent information, including public and private info. The strong form status implies that private info reflects in the stocks' prices. Private information may be tough to obtain even though it could prove useful in making abnormal profits.

Empirical Evidence

Over the years, the involvement of the stock exchange in economic evolution and development is increasingly being a key subject of discourse in literature. Many authors argue in favour of its contributions to increasing productivity and economic development, while others argue against its being a causal factor. Still, some others do argue that the relevance of stock exchanges to economic development depends more on some additional factors. For instance, Boubakari and Jin (2010) claims that there exists a prosperous link between the stock marts and economic evolution in some countries whose stock marts are liquid and pro-active. However, this is not so in countries where the stock marts are small and less liquid. In their own words, arguing in favour of stock exchange led evolution, stock mart development has a significant and positive long-run impact on economic evolution. Azubike (2017) puts it that the stock mart is a pivot upon

which economies revolve because it creates, mobilizes and rations long-term funds tailored toward increasing productivity of concerned economies.

Today, the stock marts remain in focus due to their perceived benefits by policy makers. They are often cited as haven emerged indicators of business direction (Petros, 2007). Notably, in the list economic benefits of stock marts are mupping up of savings and provision of liquid capital, with which firms are established and grown. Petros (2007) asserts that efficient delivery of these functions can augment the rate at which economies grow. The stock marts provide the avenue for corporations to raise finance at comparatively low costs. Hence, corporations in nations with already developed markets are less reliant on banks' credit. According to Petros (2007), the stock marts are expected to inspire savings by being innovative in creating novel financial instruments that could better meet investors' risk preferences and credit needs. However, the slow rate at which the Nigerian market develops could be partially due to the unwillingness of the local firms to go public as explained by Meyrs' pecking order theory. Petros (2007) concludes that developed stock marts are able to positively influence savings among individuals and provide avenues for firms' finance. This explains the positive connexion that many authors report, which exists amid developed stock marts and the real economy of host countries. Hence, the efficiency of the stock exchange is often perceived as a barometer for gauging the level of host countries' economic evolution. It further explains the reason why most of the existing literature emphasize the need for government policy framework in enhancing the stock marts' development as Brown and Nyeche (2016) observe. Moreover, Ngare et al (2014) reports that nations with stock marts are more productive when compared to countries without stock mart; and concludes that market's availability and development has positive effect on domestic productivity.

Singh, as seen in Petros (2007), posits that stock marts are expected to enhance gross domestic productivity by boosting savings and at the same time increasing investments. In actual fact, the stock marts provide the much needed avenue for growing corporations to raise credits at comparatively lower costs. In line with this, Petros (2007) is of the opinion that stock marts are truly able to engender productivity by encouraging savings and providing same to finance the industries. To corroborate this view, Chris (2012), quoting Azubike (2017), posits that these stock marts constitute a catalyst to grow and develop economies. Petros (2007) applies autoregressive distributed lag model to find if there is any long-run connexion amid stock mart performance and domestic productivity in Zimbabwe. The study concludes that productivity is positively and significantly related to the performance of stock marts in Zimbabwe. One should note that earlier in the study Petros highlights the works of Levine and Zervos (1998) as well as Nyong (1997) on the co-integration amid stock marts and productivity. As perceived by Petros. Nyong collated an aggregate index of capital mart performance; and used it to examine its connexion with long run productivity in Nigeria. The study use time series data collated from 1970 through 1994, and includes a measure of financial depth as control. Nyong (1997) finds that capital mart performance negatively and significantly correlates with long run productivity in Nigeria.

Levine and Zervos (1998), as Petros (2007) reports, examine if strong connexion exists amid market performance and long-run productivity. The study use pooled cross-country time-series regression of 41 countries from 1976 through 1993; to assess the connexion. The study conglomerates the bourse sizes, liquidity, and integration with world markets into stock mart development index. The productivity rate per capita is then regressed on a variety of variables that are designed to control for initial conditions, and then include the index of stock mart development. The study finds a strong correlation amid overall stock mart performance and long run economic productivity.

Moreover, in a similar study, Owusu (2016) use the ARDL and Unrestricted Error Correction Model (UECM). He uses combined stock mart development index. Study finds stock mart performance has negative effect on sustainable domestic productivity in Nigeria. In the words of Owusu, this might have been due to the not so liquid nature of the Nigerian bourse, as well as its size relative to the magnitude of the nation's economy. This view is partially corroborated by Ovat (2012); as cited by Owusu (2016). Ovat

examines the impact of the markets in driving economic productivity, with evidence from the Nigeria. Ovat (2012) disintegrates market performance into market size and liquidity. The study tests for data stationary, co-integration, and causality. It finds two-way causation between markets liquidity and domestic productivity. The forte of the causation emanates from market liquidity, while the size of the mart proves to have zero or near zero effect on increasing local productivity. Further in the empirical evidence of Owusu (2016) is a similar study that Owusu and Odhiambo (2014) reports on the Ghanaian stock mart's development vis-a-vis economic productivity. The study finds that stock mart performance has no positive influence on domestic productivity, whatsoever. Werema and Nikupala (2016) reports that Biyan (2012) finds both market capitalization and value of shares traded slightly contribute to domestic production. This is in their literature review studying the impact of the stock exchange on the ddomestic productivity of Tanzania. Same is the report of a similar study conducted on Kenyan Stock mart by Ikikii and Nzomi (2013). The same results are found in Mauritius (Nowbutsing, 2009) and in South Africa (Odhiambo, 2009), as Werema and Nikupala (2016) reports.

In their own study, Werema and Nikupala (2016) reports that the stock mart capitalization has a weak significance and a negative effect on economic productivity in Tanzania. The volume of shares traded is reported to have yield positive result on the economy's productivity. These effects are contrary to priory expectation that the stock mart capitalization and volumes traded should weigh positively on economies' productivity. In the words of Werema and Nikupala (2016), these results could be because of the small nature of the stock market capitalized in the country. This infers that the Tanzanian market is in its nursling stage and has not spurred the nation's productivity (Werema and Nikupala, 2016). In consonance with this view is the literature review of Azubuike (2017) on studies conducted on the Nigerian and German stock marts' impact on economic productivity of these countries. Azubike reviews Adamu and Sanni (2005), Obamiro (2005), Abu (2009), Ewah et al (2009) and Autonios (2010). These studies all find positive correlation amid stock marts development and economic productivity. Not only that, some authors argue that its even economic productivity that exerts influences on stock marts. For instance, Vazakidis and Adamopoulos (2009) submits that domestic productivity improves stock markets' performance in France. Vazakidis and Adamopoulos investigate the causal relationship between market performance and domestic productivity in France for the period 1965-2007, using Vector Error Correction Model (VECM). Study examines the causal connexion amid the variables, using Granger causality test; base on VECM. To achieve this goal, stationary (unit root) tests are carried out for all-time series data in their levels at first difference. Johansen co-integration analysis is applied, to observe if the variables are co-integrated of the same order; taking into account the maximum eigen values and trace statistics tests. VECM is selected to examine the long-run connexion amid stock mart development and economic productivity. Finally, Granger causality test is used to find the causality direction amid the examined variables of the estimated model. Study unveils that a shock increase in economic productivity of 1% leads to an increase of stock mart index of 0.24%, while interest rate increase of 1% leads to a decrease of stock mart index of 0.64% in France.

Research Design

Study focus on effectively capturing the impact of that aspect of the Nigerian Stock Exchange that mostly pertains to sustainable productivity. Ordinary least square method with Augmented Dickey Fuller test are adopted for stationarity. Study uses a framework that emphasises the debt aspect of mart capitalisation (MpD). This has never been used in any empirical study prior to this. It is novel.

$$GDP_r = f(M_s, V_t, M_pD, M_pE, C_rP, i, v, ecm)$$

Where:

GDPR	=	log of GDP
Ms	=	Broad money supply
M_pD	=	Mart capitalization (Debt)
M_pE	=	Mart capitalization (Equity)

C_rP	=	Credit to private sector
V_t	=	Volume of stock traded
i	=	Prime interest rate
ecm	=	error correction term

Economic A Priori Expectation

In line with empirical reasoning, financial deepening, mart capitalization, credit to private sector, and money supply have positive relation with GDP; while interest rate has inverse relation with GDP. If the estimates negate what is stated in the model, then there ought to be some strong reasons to enable the acceptance of the stated estimates.

Data Analysis

The used secondary data are sourced from various issues of CBN's Annual Reports and Statistical Bulletins, and the Nigerian market's fact sheets. The unit root tests conducted for all the variables, as shown in Annexure-1, except for the value of stock traded (V_t) and the interest rates (i) are stationary at first difference. This implies that only the value of stock traded (V_t) and the interest rates (i) are stationary at 1% level of significance.

Unit Root and Co-integration Test

It has been established from literature that most time series' variables usually have unit toot. Since this study adopts time series data for its empirical analysis, the test for the presence of unit root or otherwise in the variables becomes imperative. The Augumented-Dikey Fuller (ADF) test is used to achieve this. The result shows that; only prime interest rate variable is found to be stationary at level. Other variables in the study are stationary at first difference.

Table 1: Result of Unit Root Tests

(Kindly see annexure 1 for the results of unit root tests)

Source: Authors' computation, 2018

There is the need to conduct co-integration test among variables. This is necessary because the presence of unit root in almost all the variables reveals that there is short run disequilibrium among them. Johansen co-integration test is therefore adopted which reveals that there is long run connexion among the variables.

Since almost all the variables in the model are not stationary at level, adopting ordinary least square method (OLS) would not be suitable. Thus, Error Correction Model (ECM) is adopted instead of ordinary least square estimator. The variable, prime interest rate (*i*), is eliminated from the Error Correction Model because it is found to be stationary at level. The formulation of Error Correction Model requires that all variables under consideration must be stationary at level. The Error Correction Model is given as below.

$\Delta LRGDP_t = \beta 0 + \beta 1 LC_rP_t + \beta 2 LM_PD_t + \beta 3 LRM_{St} + \beta 4 M_PE_t + \beta 5 LV_{tt} + \beta 6 \Delta LRGP_{t-1} + \beta 7 LC_rP_{t-1} + \beta 8 LRM_{St-1} + \beta 9 M_PE_{t-1} + \beta 10 LV_{tt-1} + \beta 11 ECT_{t-1} + \mu$

Regression result of the error correction model (ECM)

Variable	Coefficient	t-Statistics	Prob. Value

Prob(F-statistic)	0.000081		

Interpretation of Results

The co-efficient of the error correction term (ectt-1) is -0.860222 and it is statistically significant at 10 percent level of significance. The negativity and statistical significance of the variable satisfies the condition of reliability of the error correction model. It implies that about 86 percent of the error is corrected annually. Hence, the speed of adjustment amid short run disequilibrium and long run equilibrium among the variables is very high. Given the R2 of 0.987619, it indicates that about 98 percent of the variable factors causing the change in log of real gross domestic product are captured in the model. The overall model is statistically significant as the value of F-statistics reveals.

The result of analysis shows that out of all the variables analysed, LMPD, LRMS, LCrPt-1, and LRMSt-1 are statistically significant. From the result, although the lag impact of broad money supply on economic productivity is negative. However, the impact of real broad money supply of the current period on the economic productivity is positive and very high. In the same vein, it has also been established from the result that there is huge impact of the volume of credit to private sector in the previous year on the economic productivity of the current year when other variables are held constant. Most important is the fact that the magnitude of mart capitalization (debt), which has direct and concomitant impact on economic productivity of Nigeria. This is an empirical proof that the Nigerian stock exchange has impacted on sustainable productivity of the nation's economy. It is in line with the theoretical postulations of Pandey (2010: 637).

Conclusion

The stationarity of the variables at 1st difference, given 1% level of significance implies the reliability of data. Equally from the normalized co-integration equation, the focal sustainable productivity debt aspect of mart capitalization (MpD) has no positive long-run connexion with economic productivity (GDPR). It is however mind bulging that the causality tests unveil that neither mart capitalization (debt), mart capitalization (equity) nor volume of stocks traded on the Nigeria stock exchange has any Granger causal effect on the productivity of the economy. This implies an under-developed state of the nation's bourse. It calls for the need to further develop the nation's stock mart.

Recommendations

The authorities of the Nigeria Security and Exchange Commission should be commended if one considers the feat attained by the Nigerian Stock Exchange, relative to its contemporaries on African continent. However, one feels obliged to admonish them to sustain the tempo; given the global expectation of Nigeria to emerge more pronounced in the committee of advanced nations. In line with this, additional impetus should be accorded the creation of more assorted plush debt instruments on the stock exchange. Quants could be directly employed by the SEC to increasingly execute the task. In institutions of higher learning, SEC could encourage studying stock-trading as a professional course of study like Accounting, Banking, Finance, Marting and so on, in a bid to produce more quants.

Besides, more branches of stock broking and commodity exchange platforms could be created in all the states of the federation; linked up by electronic trading and telecommunication systems. In addition, more awareness campaign could be engendered towards facilitating increased listing of firms; towards boosting activities on the Stock Exchange. In addition, the local government councils could be more liberalized to enable their ability to raise infrastructural development funds via the Stock Exchange.

Acknowledgement

Glory be to God for his mercies that endures. We hereby acknowledge the financial supports of the managements of Landmark University, Nigeria and of the Nigeria Security and Exchange Commission. May the God in his mercies continue to prosper you in all your endeavours. Thanks and God bless.

Abstract

Fraud in the field of digital technologies is becoming more sophisticated and widespread. Monitoring of fraudulent schemes for cybercrime allowed identifying criminal acts based on these types of fraud and preventing them at an early stage.

Keywords: Digital Technologies, Financial Services, Digital Fraudsters, Phishing, Skimming, Sniffering.

Introduction

The term "digital economy" was first used in 1995 by the American computer scientist Nicholas Negro-Ponte. Since then, it has been used all over the world. There are quite a few definitions of this concept, but they all boil down to the fact that the digital economy is an economy based on the use of digital technologies in production [1].

The Fintech revolution continues to unfold, with digital financial services significantly expanding the ways in which people make transactions that go beyond traditional banking. They are also changing the way existing banks conduct banking, as they themselves are increasingly digitizing traditional channels.

Digital financial services make everyday life easier, help families and businesses plan for everything from long-term goals to unexpected emergencies, and contribute to their prosperity and sustainability.

Financial security is the protection of financial interests at all levels of financial relations [4, p. 19]. Authors such as A. S. Linnikov and O. V. Maslennikov identify the following financial security risks associated with the use of modern electronic technologies and affecting the financial system: cyber attacks; risks of fraud in the IT sphere; risks of software errors; strategic risks associated with the rapid development of information technologies and changes in financial business conditions; risks of state regulation of financial innovations; the risk of increasing the scale of the shadow economy due to the growth of economic activity in cyberspace; the risk of disrupting the functioning of complex

information systems; the risk of reducing employment as a result of automation of business processes; the risk of forming alternative decentralized currency systems, and others [13, p. 12].

The huge amount of advertising placed on the Internet is a fertile ground for criminals who play a game with numbers, waiting for unsuspecting victims.

There are the following forms of fraud in the digital environment.

Prepaid fraud is the most common fraud on the Internet. As the name suggests, this scheme works by requesting a prepayment.

The fraudster sends some goods and services that he sells or offers, usually at an attractive price. Then it requires payment of a small advance, i.e. this money is intended for processing the order. To avoid becoming a victim, you should never deal with an unfamiliar online company without some form of insurance. In this case, the best type of insurance is the escrow service. Thus, the seller will receive money only if he fulfills his transaction.

Phishing is the most dangerous form of cyber attacks faced by customers and corporations in the modern world, because it is aimed at using human factors, not systems. Phishing is the fraudulent use of electronic means to deceive and exploit users. Phishing attacks attempt to get sensitive information – usernames, passwords, credit card details, network credentials, and more. By posing as a legitimate representative of an organization over the phone or email, cyber attackers use social engineering to manipulate victims by performing certain actions, such as clicking on a malicious link or attachment - or deliberately divulging confidential information.

Almost any kind of personal or organizational data can be valuable. In addition, some phishing scams may target organizational data to support espionage or espionage against state-backed opposition groups.

Email phishing consists of sending fake emails in which fraudsters fraudulently try to force the recipient to disclose information. This information may include: passwords; credit card numbers; login credentials; and corporate secrets.

The form that the message takes can help identify phishing: attackers disguise themselves as a trusted person (company), often real or plausible, with which the victim can deal. This is one of the oldest types of cyber attacks, Dating back to the 1990s, and still one of the most common and harmful, which is becoming more sophisticated.

Phishing attempts most often start with an email trying to get sensitive information through some kind of interaction with the user, for example, by clicking on a malicious link or attachment.

Using hidden redirection, attackers redirect users to a phishing website that is a copy of a legitimate website. Phishing scams can use a fake website by using JavaScript commands to make the website URL legitimate.

By manipulating links, an email may contain minor typos or use of subdomains. The presence of phishing kits allows cybercriminals, even with minimal technical skills, to launch phishing campaigns. The phishing Suite combines the resources and tools of a phishing site that need to be installed on the server. After installation, the attacker only needs to send emails to potential victims.

Analysis of phishing tools allows security services to track who is using them. By tracking email addresses, you can associate participants with specific campaigns. You can not only track where credentials are sent, but also see where they are approved from.

Phishing scams can also use phone calls, text messages, and social media tools to trick victims into providing sensitive information.

Some specific types of phishing attacks use more targeted methods to attack individuals or organizations.

In phishing with deception, the hacker sends out an email designed to deceive the recipient, based on trust. These types of phishing attacks are widespread and are sent to tens of thousands of people at once. They rely on volume rather than specifically targeting their recipients.

In "harpoon" phishing, email messages do not look as random as in General phishing with deception. Attackers collect information about their targets to fill emails with a more authentic context. Some attackers even intercept business email and create messages with individual settings.

"Whaling" phishing is specifically designed for high-level and senior managers in the organization. Fraudsters spend a lot of time to study the target victim, choose the time and means to steal data.

Harpoon and whaling attacks are extremely complex. As employees become more aware of threats and fraud, cheating becomes more difficult for the hacker. But this has not slowed the growth of corporate data breaches year after year. On the contrary, this trend continues to grow. From 2016 to 2017, data loss increased by 6%, along with a whopping 21% increase in hacked accounts and malware. Registered increases occur only from phishing attacks. When combined with other forms of vulnerability, it becomes clear that organizations are subject to a well-planned and well-thought-out attack.

Organizations should train employees to prevent phishing attacks by recognizing suspicious emails, links, and attachments. Cyber attackers always improve their methods, so continuing education is a prerequisite.

The main signs of phishing are: poor spelling and grammar; suspicious sender; threats to close the account; links, especially if the target URL is different from the ONE displayed in the email content; unexpected attachments, especially files with an extension .exe.

Additional technical security measures may include:

- two-factor authentication (includes two methods of identity verification);
- email filters that use machine learning;
- extended password logins using images, identification hints, etc.

Also, you should not publish personal data on social networks (for example, date of birth, vacation plans, address or phone number).

Skimming is an uncontrolled fraud because the theft of cash occurs before it is entered into the accounting system, so it is never reported in the company's accounting reports. Individuals are also vulnerable and may encounter the use of ATMs, debit and credit cards.

Among other types of crime, skimming is the simplest form of fraud. However, skimming is the most difficult to detect because it does not have control logs that can reveal the source of the theft. Often skimming is detected by accident. However, in some cases, businesses may suspect potential fraud by detecting revenue below expected.

Skimming in the business area can take several forms:

- Direct theft. A fraudster hides money from an employer, business partner, or shareholders.
- Tax evasion. Skimming is a popular tax evasion scheme. A business owner can get cash without recording it in the accounting system. In this case, funds are transferred from the client directly to the business owner. Thus, the owner can avoid paying income tax or personal income tax.

– Bribery and other crimes. Sometimes skimming involves other crimes, such as bribery or protection racketeering. The business owner can use skimming to allocate funds for bribes or as payment to racketeers.

Skimming for individuals can take different forms:

– ATM. Using ATM skimming, fraudsters can get a person's debit card number by installing an illegal card reader on the ATM. In addition to this, thieves use a camera to record a person's personal PIN code.

– Credit card. The intensive development of modern information technologies in the field of electronic payment systems eliminates the need for citizens to carry cash. However, along with the convenience of non-cash payments, the risk of becoming a victim of fraud using payment cards increases. Thus, according to the Ministry of internal Affairs of Russia for the period from 2017 to 2018, fraud, including under article 159.3 of the criminal code "Fraud using payment cards" increased by 4.7% (in 2017, 24916 were detected, and in 2018 - 25738) [15]. When using a credit card, thieves charge a small fee that may go unnoticed by the cardholder.

Credit card skimming is a type of credit card theft where fraudsters use a small device to steal information in another legitimate credit or debit card transaction. When the card passes through the skimmer, the device captures and stores all data stored on the card's magnetic stripe. The bar contains the credit card number and expiration date, as well as the full name of the owner. Thieves use the stolen data to make fraudulent payments online, or using a fake credit card.

Credit card collection devices are designed to be easily combined with the machine on which they are installed. There are several ways to detect a credit card withdrawal device:

– A credit card reader that "sticks out" far beyond the panel. Skimmers are designed to match an existing credit card reader.

– Parts of the credit card reader are loosened or move when swaying. The credit card reader must be securely attached. Moving parts are an indication that the reader has been tampered with or that a skimming device is attached to an existing reader.

– A Pinpad that is thicker than usual. In addition to a skimming device, scammers can place a fake keyboard on top of a real one to capture keystrokes. This way they can get a pin or zip code in addition to their credit or debit card details. If the keys are difficult to press, you should remove the card and use another ATM.

Once the victim's credit card information is stolen, scammers create a cloned credit card to make purchases in the store, use the account to make purchases online, or sell the information online. Victims of credit card skimming are often unaware of the theft until they notice unauthorized withdrawals from their account.

Many banks and credit card issuers are getting better at detecting fraudulent transactions and may not process suspicious payments until the customer confirms that they initiated the transaction.

To catch fraudulent payments related to a skimming incident, you must periodically review your accounts, monitor checks and credit card accounts online, and immediately report any suspicious activity to your Bank or credit card Issuer.

To avoid credit card skimming, you must check ATMs before using them. In ATMs, skimmers often place the camera in the keyboard's field of view to steal the PIN code. These cameras are often very small in size, so they are difficult to detect.

If you suspect the presence of skimmers, you should contact your Bank or credit card Issuer, even if no fraudulent payments have been detected. The earlier the suspicion is reported, the faster the protection from liability for unauthorized use will be provided. You must provide as much information as possible about the possible location of the skimmer, which can help the Bank prevent future losses.

Sniffering (data interception) - fraudsters practice data interception in crowded places (in restaurants, cafes, train stations, etc.) using a network traffic analyzer (sniffer, from the English word tosniff - "sniff") - a special computer program for intercepting packet data, decoding and analyzing it. A free and public Wi-Fi network is just the place where you can become a victim of an attacker. Fraudsters can intercept any data, including passwords from payment accounts and payment details of the card, if, for example, the owner pays using it in an online store, and the connection was not properly protected [17].

A sniffer (or packet analyzer) is a type of computer software or hardware used to intercept and register traffic passing through a computer network. It can be described as a "listening" device that allows you to intercept network traffic. Packet analyzers are used for network management and network security, but can be used by unauthorized users to steal information from the network.

Packet sniffers are used for both legal and illegal activities. A legal packet analyzer is a commercial device used to help manage and maintain a network, as well as to ensure network security. It is used as a diagnostic tool for network backup systems and for checking the network system for security violations.

An illegal packet interceptor is used by a hacker to gain unauthorized access to confidential information and data on the network. Criminals use sniffing to steal Bank card data, customer data, passwords, and codes. Credit card information is collected as payments are transferred over the network during authorization, and then retrieved. An illegal packet analyzer is installed without the knowledge of the it administrator and is hidden in different areas of the network for the purpose of spying and stealing information packets that pass through the network. The use of sniffers is fairly easy because they are very difficult to detect and can be installed in virtually any location in the network.

There are the following ways to ensure security from sniffing:

- periodically updating passwords.
- do not disclose your credit card number to third parties;
- save receipts and receipts;
- report any suspicious expenses to the card Issuer;
- use a credit card instead of a debit card. Credit cards offer better protection against fraud and identity theft;
- use data encryption;
- use special programs to scan the network for possible spies.

Online quiz and Scam games - this form of online fraud is quite simple. The hacker sends a message containing a link to a quiz or game. This game or quiz may be harmless in itself. The problem starts when they require some verification before being allowed to play. Sometimes a website may require you to enter sensitive data when registering.

Internet fraud, including surveys, works as a fraud e-mail attachments. The victim receives a link asking them to participate in the survey. Some of these surveys promise some form of reward after completion. As soon as the victim clicks on the link, dangerous malware is installed on the PC, which steals and sends its information to the fraudster.

Another type of fraud is so-called asset recovery firms that target people who have lost money as a result of another type of fraud - often a fictitious work-from-home scheme. After cheating, the victim's name is likely to be included in the list that will be passed from one Scam to another. Victims can even be contacted by the same scammers who took the money the first time, now presenting themselves as the company that will return it. It should be borne in mind that the phone requests from companies on asset recovery are almost always the work of Scam artists. If someone calls and offers a refund service for a fee, you should never pay for it.

Since the beginning of 2018, OLX, an online ad platform that connects people to buy, sell, or exchange goods and services, has removed more than 250,000 "suspicious users" from its platform. A total of 1.3 million ads were removed. This is primarily due to the combination of human and automatic detection. Most of these ads are flagged using automatic detection.

OLX uses contextual messaging, where it notifies users in chat messages in certain situations when suspicious behavior is detected. In addition, OLX uses online user device identification to monitor their presence on the Internet for suspicious patterns, as well as registration captchas to authenticate users logging in from unidentified devices.

Abstract

The digital economy contributes to fundamental transformations of all spheres of human activity, defining a new quality of human capital of the territories. One of the key factors of this kind of transformation is the level of digital literacy of the population, formed by knowledge, skills in the field of digital consumption, digital competencies and digital security. The study of the distribution of ranks, "Index digital literacy" is considered the rating of Federal districts of the Russian Federation and the main trends of territorial differentiation of the integrated administrative-territorial units of the country. Along with the change in the quality of human capital in terms of the development of digital competencies, the demand for it from the labor market is changing. The article considers the key digital competencies, which are an integral part of the professional competencies of modern workforce. Examples of necessary digital skills of certain professions are given.

It is established that robotics has a special influence on the formation and development of human capital. This fact is confirmed, including the emergence of new opportunities to overcome the existing biological limitations. However, the active introduction of robots is associated with significant risks. As examples of such risks, the article identifies threats of violation of human rights and freedoms due to hacker attacks, risks of potential unemployment, rising inequality and exclusion of certain categories of citizens from the economy.

In the article the perspective directions of the solution of problems of transformation of human potential and social adaptation of the population to challenges of digitalization and robotization of economy among which the active policy in the labor market, support of the income, continuous training and more flexible educational systems are formulated.

Keywords: Human Capital, Digital Economy, Digital Competence, Digital Literacy, Robotics

Introduction

The digitalization of the economy and the fourth industrial revolution are accompanied by the blurring of the boundaries between physical, digital, and biological technologies. Proposed in 2011 at the Hanover fair, the term industry 4.0 characterizes the process of radical transformation of global value chains. The ultimate goal of this process is a flexible interaction of virtual and physical

production systems that ensure full adaptation of products and the formation of new operating models. In this context, one of the key tasks is to create fundamentally new jobs and develop human capital as a key competitive advantage of countries undergoing such economic transformations.

The requirements for qualification in production also vary significantly depending on the degree of digitalization and the level of technology. The introduction of any new technology means that employees, one way or another, will face certain challenges that form additional requirements for their skills and competencies.

At the same time, the digital transformation of socio-economic systems not only acts as a driver for the development of new industries, but also contributes to fundamental transformations in all spheres of human life. With its help, a fundamentally new approach is possible in ensuring the achievement of sustainable development goals and solving key problems of modern society of a social and climatic nature [16]. Under the influence of advanced science and technology, regional health systems, education, and the labor market are being transformed, and as a result, the quality of the human capital of the territories is changing [7].

Digital literacy of the population as one of the key factors in changing the quality of the region's human capital

Traditionally, human capital is considered in three aspects: health, education, and culture [2]. In turn, each of these structural elements includes a set of functional parameters. In the period of digital transformations of economic systems at different levels, the competence approach to determining the quality of human capital is particularly relevant, according to which the level of education should be determined by the ability and readiness of a person to perform effective and productive activities in various socially significant situations based on the use of key competencies. Therefore, the main result of the educational process is not just increasing the volume of knowledge, but the acquisition of diverse experience [13]. In the digital economy, digital competencies are the most important ones, which are a system of knowledge, skills and attitudes necessary for living in a digital society. Such a system generates digital literacy of the population, including knowledge, skills and abilities in the field of digital consumption, digital competencies and digital security (figure 1).

Digital consumption	Digital competencies	Digital security
• Fixed Internet • mobile Internet • Digital device • Internet media • News • Social network • Public services • Telemedicine • Cloud technologies	• Retrieval • The use of digital devices • The use of social network functionality. • Financial operation • Online purchases • Critical perception of information • Production of multimedia content • Syncing devices	• Personal data protection • A strong password • Legal content • Culture of behaviour • Reputation • Ethics • Information storage • Creating backups

Fig. 1 Parameters of digital literacy of the population

Since 2015, the non-profit organization ROCIT, with the support of the HSE, has been implementing the research project "digital literacy Index". Its calculation is based on the measurement of key parameters of digital literacy, which are quantified by a system of three sub-indices. According to the value of the resulting indicator, each Federal district is assigned a rank (table 1).

Table 1: Distribution of ranks "digital literacy Index" by Federal districts of the Russian Federation, 2018

Region	Digital consumption	Digital competence	Digital security
Northwestern Federal District	1	1	2
Far Eastern Federal District	3	2	1
Central Federal District	2	3	4
Ural Federal District	4	6	3
Siberian Federal District	5	5	5
Southern Federal District	7	4	7
Volga Federal District	6	7	8
North Caucasian Federal District	8	8	6
Crimean Federal District	9	9	9

The highest index value was recorded in the North-Western Federal district. In the second position is the Central Federal district, which is due to the resulting indicators of Moscow and the Moscow region, where the level of digital literacy is quite high compared to other regions of the Russian Federation. In third place is the far Eastern Federal district, the most remote from the European part of the country, which determines the special importance of digital communications for its residents. The Ural Federal district is in the fourth position. The fifth position belongs to the southern Federal district. The North Caucasus Federal district is in sixth place, and the Siberian Federal district is in seventh place. The Volga Federal district occupies the penultimate, eighth place in terms of the integral value of the PPI and for each of the three sub-indices separately. The Crimean Federal district completes the list [1].

Main trends in demand for human capital from the labor market

Along with changes in the competencies of human capital, the demand from the labor market also changes. The digitalization of the economy and the robotization of production have a mixed effect on it, generating on the one hand job cuts, stagnant wages and growing wage inequality, and on the other creating fundamentally new popular and highly paid professions.

According to forecast calculations, new production technologies and widespread robotics will deprive 5.1 million people of work. The most significant reductions will affect office and administrative employees, as well as production personnel in certain industries. At the same time, it is expected to compensate for these losses due to the two-million growth in engineering, financial and computer specialties.

It should be emphasized that the reduction in the share of human labor against the background of the introduction of widespread robotics will be most evident in developing countries that lack breakthrough technologies, compensated by the available labor force. Eventually, many large-scale production will be returned to the US and the EU, and developing countries will lose an important industrial resource.

In this regard, digital skills are becoming an integral part of professional skills in both education and science and industry [15]. The implementation of breakthrough technological projects in the digital

economy creates a demand for specialists who possess a set of rigid, flexible and special digital competencies (figure 2).

Fig. 2 Key digital competencies

In the context of the digital transformation of the economy, the possession of key digital competencies becomes relevant for the vast majority of professions. In particular, in order to optimize ad management and predict the emotional response to it, digital competencies are necessary for marketers. In law, digital skills will allow you to automate the analysis of materials, as well as simplify the preparation for the trial. For modern engineers, professional digital competencies are already an integral part of the employer's required skill set. In addition, the demand for data specialists is expected to grow rapidly in most industries, which will facilitate the acquisition of this profession of an intersectoral nature.

Changes in the number and structure of jobs are not the only significant consequences of the digital transformation of the economy. The development of technology will trigger a gap between income from labor and capital, which will lead to an increase in inequality among workers. Owners of intellectual and physical capital (developers, shareholders, and investors) will get the maximum benefit from the upcoming changes. Workers with a low level of education and skills will eventually become ineligible, due to the replacement of this kind of work with robotic resources.
In this context, it is obvious that the state authorities already need to take actions to restructure the education system and train specialists, modernize the infrastructure, and create new jobs. Changes are also needed in the legal framework for the development and implementation of new progressive tax legislation [12].

The impact of robotics on the formation and development of human capital

In the foreseeable future, new technologies will help overcome the current biological limitations:

– devices on the human body that are part of the Internet of things will transmit context-sensitive information that relates directly to our emotions, increasing their manageability;
- exoskeletons and prosthetics, coupled with the brain, will increase the physical strength and endurance of a person, as well as return mobility to the elderly and people with disabilities;

- sensors and computers embedded in contact lenses and permanent implants will allow you to hear whispers behind walls, give you natural night vision and allow you to immerse yourself in virtual and augmented reality;
- nootropic drugs will expand a person's cognitive abilities and transform work and education [15].

Robotics, which is getting deeper and deeper into human life, will expand the horizons of its application in the near future and will be integrated into new industries and activities. Robots will be involved in the organization of patient care, delivery of purchases, harvesting, maintaining the infrastructure of society and providing a host of other services, which will be facilitated by the spread of the Internet of things with the connection of third-generation robotic systems with artificial intelligence. Using terabytes of information received from the network, such robots can be responsible for automating business processes, education, service and service delivery.

The problem for society is the difficulty of increasing a person's competitiveness in an augmented economy, as well as preserving their rights and freedoms. Given the high cost of augmented technologies, not everyone can afford such a transformation, while losing their competitive advantages in particular in the labor market. It is also likely that network add-ons can be a target for hacker attacks aimed at controlling a person's mind and body.

To date, we can identify the following main areas in which the strengthening of the role of robotics is less likely:

- creativity, research and new creation, entrepreneurship;
- development of robots and software;
- social interaction, which implies personal contact, the ability to feel, empathize (social workers, teachers);
- work in adaptive conditions (doctors, emergency services);
- responsibility and management related to the need to bear financial, legal or other responsibility (top management and relatives by profession);
- mentoring-the transfer of implicit knowledge and the ability to persuade (academic leaders, clergy, sports coaches) [17].

The risks of actively introducing robots are obvious. They are related to potential unemployment, rising inequality, and the exclusion of certain categories of citizens from the economy. Another negative consequence is the increased polarization of the regional population in terms of education, competence, age, and gender. Older people of working age do not react so flexibly to changes in the external environment and are less likely to learn new technologies. As for the gender polarization of society, this trend is explained by the excess of the share of men over the share of women employed in potentially less robotic industries. Differences in the degree of adaptation to the robotic circular reproduction of regions will contribute to the formation of zones of social tension, increase in interregional migration flows, and reduce the stability of the budget system of individual territories [7].

Conclusions and Recommendations

Thus, the development of the digital economy will solve a number of socio-economic problems:

- create new opportunities for entrepreneurship and employment;
- improve the quality of social services provided;
- improve the system of education and professional competencies;
- create new opportunities for socially significant scientific research;
- strengthen communication between the state, business and society;
- encourage the participation of business and civil society in the formation of the country's economic well-being and a favorable environmental background [15].

On the other hand, the problems of transformation of human potential and social adaptation of the population to the challenges of digitalization and robotization of the economy, related to the need to improve the level of skills and development of digital competence, remain unresolved. In this regard, active labour market policies, income support, continuing education and more flexible educational systems are essential. The identified features should be taken into account and subjected to additional scientific research in order to overcome possible threats and minimize the risks associated with digitalization and robotization of key sectors of the economy.

Assessing the Citizens' Adoption of e-Government Platforms in the North-West Province Local Governments, South Africa

Frans M. MOSETJA; Nehemiah MAVETERA; Ernest MNKANDLA

North West University; University of South Africa, South Africa
Frans.Mosetja@nwu.ac.za; Nehemiah. Mavetera@nwu.ac.za; mnkane@unisa.ac.za

Abstract

Local governments in South Africa are responsible for the provision of basic services. There are countless benefits that come with e-Government platforms if they are properly implemented to help local governments deliver these basic services to citizens. This study investigates factors influencing the adoption and use of e-Government platforms by citizens in the North-West Province, South. The study is set against a background of significant change in South Africa where government services are electronically delivered. The outcome of the study revealed that: 1) local governments are starting to benefit from higher levels of adoption of e-Government platforms by citizens; 2) user-friendliness, access to information and 24-hour availability of e-Government platforms are some of the factors that motivates citizens to use and adopt e-Government platforms; 3) the municipalities have room on their e-Government platforms for dialogue on how best to improve service delivery; 4) the use of only English as the preferred language, lack of adequate ICT infrastructure and training have an impact on the use and adoption of e-Government platforms; 5) e-Government platforms are seen by many citizens as convenient means to promote access to information and public participation in local government.

Keywords: e-Government, e-Government platforms, user acceptance, local government.

Introduction

The use of websites by the public sector has gained significant attention in recent years among practitioners and academics in the fields of public policy, public affairs, and communication. Websites have become one of the most important tools for citizens to get information about municipalities (Murray & Klobby, 2013). South Africa has one of the most progressive constitutions in the world and public participation is one of the fundamental principles cherished in virtually all aspects of it (Naidu, 2008). It would be a tragedy for our democracy if this principle were to remain nothing more than words on paper and does not translate into concrete and tangible participation that affects policy at all levels, starting in the communities where people live and what is at stake is their everyday lives and livelihoods (Naidu, 2008).

Government agencies do not, as a rule, engage citizens in the development of their e-Government services and resources, many applications are internally driven to meet cost savings and other government mandates regarding efficiency (Bertot, Jaeger, & McClure, 2008). The objects of local government were clearly entrenched in Section 152 of the Constitution (Thornhill, 2008). These include, inter alia, that the involvement of communities and community organizations be encouraged in all matters concerning local government (Thornhill, 2008). Lack of inclusion of citizens in an ongoing and regular basis can lead to a range of barriers for users of e-Government services – and that users are seeking help from alternate sources such as public libraries (Bertot, Jaeger, & McClure, 2008).

As governments break new ground with social networking tools, there is a dual challenge of not only harnessing this new technology to deliver the benefits of better citizen interaction, but also accurately evaluating the effectiveness of government websites (Murray D. , 2010). Effective matching of virtual representation to citizen and stakeholder preferences should be grounded in feasibility assessments along with several dimensions (Baker, Fairchild, Pater, & Seavey, 2010). There has been a growing need for research on factors influencing the adoption and diffusion of e-Government services (Abdel-Kader Abdel-Fattah, 2014).

Literature Review

A.*e-Government overview*

South Africa has three vertical governance levels that are at national, provincial and municipal (local) level. At each level people, have just realized the benefits that can be gained by using e-Governance systems (Mavetera & Lemme, 2006). Local government is accepted as a sphere of government in its own right. Thus, local government is no longer viewed as subordinate to provincial and national government (Malherbe, 2008). Mahole, Moroke, & Mavetera (2014) defines local government as a branch of government and administration that is most intimately concerned with the lives of ordinary people and with those matters that are closest to them in their daily experience and basic needs.

B.Factors that contribute to technology adoption and use of e-Government platforms by citizens

e-Government has been identified and adopted as one of the most efficient vehicles for appropriate, transparent and inclusive / participatory decision making (Bwalya, 2009). In the past decade, most countries have embraced new technologies to improve the way they offer public services to citizens (Shareef, 2013). The rapid rate at which internet adoption is growing in Africa has revolutionized not only the way people communicate with each other but has also resulted in rapid growth in number of businesses using the internet to connect with their customers (Mpinganjira, 2012). There seems to be an almost universal adoption of Information and Communications Technologies by governments at all levels, local and national (Keefe & Crowther, 2015).

C.*Implementation of e-Government platforms*

The vital initiatives for implementing e-Government should be followed and given due attention to enhance the delivery and use of e-Government services. One of these initiatives is the active launch of official government websites as the main portals for delivering online services to all the different categories of e-Government, including G2C, G2B, and G2G (Alfarraj, Drew, & AlGhamdi, 2011). Jayashree and Marthandan (2010) articulate that e-Government cannot be thought of as a one-step process or implemented as a single project. It is evolutionary in nature, involving multiple stages or phases of development. Alhomod and Shafi (2012) point out that there are four stages of e-Government which in most cases follow each other. e-Governments all around the world have different objectives and follow different models for e-Government development. The advantage of having a phased approach is that the success of each e government initiative can be calculated and the possible errors and pitfalls of the initiative can be rectified. Generally speaking, there are four stages of e government which in most cases follow each other:

Fig. 1 : Stages of e-Governance

D. Information and Communications Technology (ICT)

Information and Communications Technology (ICT) is an overarching term that includes all technologies for the manipulation and communication of information (Liem, Swierenga, & Gheerawo, 2010). "The term IT, or Information Technology began to be used to describe computers and these various peripheral devices. Then the internet arrived together with computer networks, the World Wide Web, email and search engines. A new term entered the language ICT. ICT embraces the many technologies that enable us to receive information and communicate or exchange information with others" (Orinda, 2015). ICT provides communication i.e. faster and accurate, and further provides adequate storage with the use of computer, electronics devices and software application (Dhindsa, Narang, & Choudhary, 2013).

E. ICT Accessibility and Usability

Accessibility and usability are closely related; their goals, approaches, and guidelines overlap significantly. It is most effective to address them together in many situations, such as when developing websites Accessibility is about ensuring an equivalent user experience for people with disabilities, including people with age-related impairments. For the Web, accessibility means that people with disabilities can perceive, understand, navigate, and interact with websites and tools, and that they can contribute equally without barriers. Usability is about designing products to be effective, efficient, and satisfying (Abou-Zahra & Henry, 2012).

F. Community participation

South Africa: Currently, one of the main concerns in environmental governance is to be able to build real partnerships between public authorities, private industry and citizens. From this perspective, citizens' involvement is becoming increasingly important (Reiter, Gronier, & Valoggia, 2014). Recent literature has emphasised Gov 2.0 as a possibility for greater communication, participation, and collaboration with citizens (Aladalah, Cheung, & Lee, 2015). e-Government and electronic participation have received increased attention as tools that 21st Century governments utilize to interface with citizens in the conduct of the public's business (Smith, 2015). However, citizens' participation levels in Gov 2.0 have not met to the hype (Aladalah, Cheung, & Lee, 2015).

The government of the Republic of South Africa (RSA) consists of a central government, nine regional governments (provinces) and a total of 262 local governments (municipalities). (Mahole, Moroke, & Mavetera, 2014). Since 1994, there has been a widely-observed commitment in South Africa to participatory governance within both government and civil society (Smith T. , 2008). The involvement of citizens and communities in local government is a statutory requirement of the legislative framework in South Africa (Ngamlana & Poswayo, 2013). Apathy towards political participation is of concern for many countries throughout the world, and for many people political participation means no more than voting in an election (Van Belle & Cupido, 2012). The South African Constitution makes several provisions for public participation. Empowered participatory governance approaches have worked elsewhere in the world under less favorable conditions than we have here in South Africa (Narsiah, 2010)

Global trends: In keeping pace with the rapid developments in information and communication technology, the Saudi government has invested heavily, in recent years, in the development of e-participation services in e-Government websites with the aim of enhancing citizens' interaction with the government and thereby making the latter more responsive and accountable to citizens' needs. However, despite its significant efforts, a low level of use of the online opportunities by the citizens for interacting with the government is an endemic problem faced by the Saudi government (Alharbi & Kang, 2014).

Italian e-Government projects since 2000 have been functional to implementing at the national level

the objectives set out in the Lisbon Agenda, eEurope 2002, eEurope 2004, i2010, and the European Digital Agenda. Innovation in the Italian public sector is not merely the sum of all smart technological factors but is rather achieved by integrating organizational processes and traditional best practices. Several municipalities (such as Ravenna) are pursuing the objective of computerizing and automating their services with a view to implementing e-Government services, and in a scenario where not all the administrative government agencies are at the same level of innovation, traditional and paper services need to be managed in combination with paperless e-services (Martoni & Palmirani, 2013).

Methodology

Based on literature review there is evidence that e-Government initiatives are depended on both the government support and citizens' adoption of e-Government platforms. To gain a deeper understanding of what motivates citizens to visit government websites and actively participate in decision-making, a more detailed study was conducted using a self-administered structured questionnaire as a tool for data collection. The study was undertaken in the North-West Province municipalities in South African. Quantitative research was used. A survey strategy was the chosen strategy for this research.

The population for this study comprised of students and the working class because the two groups are amongst the adult population for whom the Internet has become part of their daily lives. There are 19 municipalities in the North-West Province, 15 municipalities have functional websites and 4 municipalities don't have websites. Random sampling method was used targeting 20 respondents from each municipality to make up 300 respondents from 15 municipalities with functional e-Government platforms Out of the questionnaires sent to 300 potential participants 169 responded, giving us 56% response rate. The sample size for this study was therefore 169.

There are important ethical issues that must be carefully thought through when undertaking research (Young & Barrett, 2010). The protection of individuals who volunteer to participate in research is essential to the ethical conduct of human research (Federman, Hanna, & Rodriguez, 2003).

The questionnaire for this study was designed such that it respected the participants' rights to confidentiality, anonymity and privacy and to withdraw from the study at any time. Anonymity was assured because participants were not asked to disclose their names. The participants will be informed of the research results if they so wish. The survey had two paragraphs that explained what the research was about and participants' rights to confidentiality, anonymity, privacy and the right to withdraw from the survey.

How to collect appropriate data is a crucial issue in pragmatic research because the data collection instrument will determine whether the data gathered are reliable and fairly accurate to represent the authentic performance of linguistic action (Nurani, 2009).

For this study, online self-administered questionnaire was used to collect primary data from students and the working class. The questionnaire was upload onto an online system with specific instructions as to how the questionnaire should be filled. The respondents were first asked for their consent and informed about the purpose of the study, which was for academic purpose only. A degree of anonymity was achieved by not asking the respondents to identify themselves.

The overall data collection was to acquire better idea of students' and workers' opinions towards the use and the adoption of municipal e-Government platforms. The data collection was conducted in three phases. Data from the three phases were collapsed and analyzed as single unit. This was done to avoid repetition.

A. *Phase 1 Pilot study – Staff (North West University and Students*

During the pilot phase, questionnaires were distributed to randomly chosen staff members and students from different faculties of the University of the North West. The researcher explained to

individual staff members and students the objectives of the study. The respondents were asked to identify questions they felt were difficult to answer or understand. They were also asked to identify any leading questions. All the staff members approached completed the survey. The same applies to the students approached, all of them completed the survey. Most respondents felt that one of the questions was vague. The question was rephrased.

B. *Phase 2 – Student*

The proposed study was conducted with students from the North-West University – Mafikeng Campus, North Province, South Africa. The researcher had no difficulty obtaining permission to conduct the study using students. Permission was obtained from the lecturers. The researcher visited two classes from two different faculties after receiving approval to do a five minutes' presentation from individual lecturers. The five minutes' presentation was used to explain what the survey was all about and to gain informed and voluntary consent from the students. Only students from the North-West Province, South Africa were encouraged to participate in the survey. Thereafter the lecturer of the particular class was sent the URL to the survey to post on the online learning system for students to access.

C. *Phase 3 - Working class*

The researcher contacted municipalities, clarified the purpose of the survey and requested a list of citizens' email addresses. Some municipalities did not have the list. The research access was not easy with this group. For instance, 15 municipalities were approached, but only the nine municipalities responded positively. The rest of the municipalities did not have a list of citizens' contact details. From a list of approximately 300 emails a sample of 100 was selected. The URL to the survey together with ethical clearance was emailed to the potential participants.

Data analysis

Data analysis can be thought of as the process of collecting, transforming, summarizing, and modelling data, usually with the goal of producing useful information that facilitates drawing logical conclusions or making decisions. Virtually any field that conducts experiments or makes observations is involved in data analysis (Greenwald & Thomley, 2015).

There are many mathematical data analysis methods, including statistics, data mining, data presentation architecture, fuzzy logic, genetic algorithms, and Fourier analysis, named for mathematician Joseph Fourier (Greenwald & Thomley, 2015).

In this research study, the extent of adoption of e-Government platforms by citizens was examined. Data collected by the questionnaire was coded by the researcher. Firstly, the data was recorded in an MS Excel program and later transferred to Statistical Package for the Social Sciences (SPSS). Descriptive and inferential statistical analyses such as mean, standard deviation, frequency, percent, and correlation were implemented using SPSS. Frequency tables were drawn and from these tables the data was presented in pie diagrams and bar graphs.

Descriptive statistics (frequency, graphical presentation and tables) and chi-square test for independence of association was computed using SPSS. Wegner (2016) postulated that descriptive

statistics summarises large sums of data into smaller measures while chi-square test measures the difference between the observed frequencies and the expected frequencies.

Findings

A.*To measure the level of user friendliness of the e-Government platforms*

The majority of the respondents agreed that the municipality has conducted workshops to make them aware of the available technology to use to access its online services; the respondents indicated that the website can be accessed on the mobile devices like cell phones & tablets; the respondents agreed that they can report any damage on the municipality infrastructure anytime using the website /e-Government platforms; the respondents agreed that the website /e-Government platform is easy to learn and maneuver; the respondents agreed that the use of website /e-Government platform saves them time in requesting services from the municipality; the respondents agreed that the municipality updates their website /e-Government platform regularly; the respondents agreed that to access the website /e-Government platform requires some skills in ICT; and lastly the respondents agreed the website /e-Government platform requires no special software to be able to use it. e-Government platforms are perceived by citizens as being friendly to the users. The users found all the statements relating to the level of friendliness to e-Government platforms as positive

B. To identify factors that motivates citizens to participate actively in government decision-making

Majority of respondents are in favor and supportive to all the six statements under this objective. The following are the statements that the majority of the respondents were in favor of: the municipality is accessible to them all the time; the municipality is open to constructive criticism on their online platform; the municipality has room for dialogue on how best to improve service delivery; decisions on the development of e-Government platforms are made based on a series of consultative forums; the municipality is making means and ways to empower them to be part of the collective and lastly e-Government provides room for online discussion.

Citizen participation is considered as one of the core elements of transparency of Governments with regard to their citizens. (Boudjelida, Mellouli, & Lee, 2016). Citizens have new expectations based on involvement, collaboration and participation in urban governments' life and administration: therefore, the improvement of citizens' empowerment should be one of the main objective of any structured web presence of municipalities. (Buccoliero & Bellio, 2016).

Agbabiaka (2016) states that the primary goal of eGovernment is to create public value. Against this backdrop, governments all over the world continue to invest huge capital on eGovernment with a view to improving internal efficiency and providing better and quality services to the citizenry (Agbabiaka, 2016).

C. To determine the effectiveness of the e-Government platforms

Majority of respondents are in favor and supportive to all the eight statements. The following are the statements that the majority of the respondents were in favor: they can report corruption activities using the E-Government platform; e-Government empowers citizens to perform transactions online; e-Government platforms provide easy access to municipal services; e-Government platform promotes the use of ICT; e-Government platform increases transparencies for decision making; the e-Government system will enable them to accomplish tasks more quickly; learning to operate the e-Government system is easy for them and lastly there is faster access to documents and forms through e-Government platforms.

There is ample opportunity for government agencies to build greater trust with citizens through increased social-media based "collaboration" and "participatory" decision, policy making and service delivery (Chouikh, Ojo, & Driss, 2016). Noticeable government efforts are ongoing for utilizing social media platforms in both pushing information to citizens (one-way interaction) and obtaining timely citizen feedbacks and opinions on government actions (Rezk & El Khayat, 2016). While social media platforms have been largely used by government entities for communicating with and obtaining feedbacks on programs and services from citizens; traditional websites remain the primary interaction channel (Chouikh, Ojo, & Driss, 2016). However, the success of eGovernment is best measured by the perceptions of citizens who use the services (Agbabiaka, 2016).

D. To determine the major challenges of using e-Government platforms

Majority of respondents are in favor and supportive to seven statements and are opposed to two.

The following are the statements that the majority of the respondents were in favor: they use the internet on regular basis; they are not familiar with e-Government platform; they do not have access to ICT facilities/Internet; the language used in e-Government platforms is understandable; they have access to a computer; they find it difficult to use the e-Government platform due to lack of information and lastly they find it difficult to use the e-Government platform due to lack of awareness campaigns.

The following are the statements that the majority of the respondents were not in favor: uncertain about safe use of e-Government platforms; and uncertain about safety of using e-Government to transfer personal information and sharing information with public agencies online or electronically.

The utilization of new technologies by the public sector differs from the one by private companies and individuals (Parycek, Schöllhammer, & Schossböck, 2016). It is widely acknowledge that many of e-Participation initiatives often attract wider audience and face serious limited citizens' involvement (Alabariyat & Sá Soares, 2016). The use of social media has been seen as a hope to remedy such limitation, however, despite the recently adoption of social media the lack of citizens' involvement in e-Participation initiatives still remains (Alabariyat & Sá Soares, 2016).

Conclusion

Citizens have begun to envisage the importance of e-Government platforms usage in relation to access to information and public participation in local government decision making. Local governments on the other hand, are starting to benefit from higher levels of adoption of e-Government platforms by citizens. It is clear that local governments need to invest more on making sure that e-Government platforms are user-friendly and accessible by citizens.

User-friendliness, access to information and 24-hour availability of e-Government platforms are some of the factors that motivates citizens to use and adopt e-Government platforms. Being able to engage with local government officials and getting feedback encourages citizens to visit and use e-Government platforms again.

e-Government platforms are seen by many citizens as convenient means to promote access to information and public participation in local government. Citizens are happy that they can perform some transaction through e-Government platforms. There is also an effort by local government through e-Government platforms to improve service delivery which is well received by citizens and seen as the right direction taken by local government to deliver better services to citizens.

The implementation of e-Government platforms has changed the way governments interact with citizens. This study revealed that lack of adequate ICT infrastructure and training contribute to the low use and adoption of e-government platforms. The use of only English also has an impact on the use and adoption of e-Government platforms.

Recommendations

The following recommendations, based upon the results of the study are:

Strengthen awareness and ensure accessibility of the internet and usage of the e-Government platforms by local governments. The awareness of the existence, benefits and user-friendliness of e-Government platforms is not enough hence the low usage and adoption of the platforms. Evidence have shown that citizens are willing to use and adopt e-Government platforms. Therefore, there is a need for more workshops and roadshows to make citizens aware of the existence, benefits and user-friendliness of e-Government platforms.

Some of the statements are dependent on some of the demographic factors such as age, gender and current qualifiction. It is a clear demonstration that technology use is most depended on age factor. The growing younger citizens demands of online services indicates that e-Government platforms will most likely be supported by the younger age groups. There is a need for a campaign by the local governments that conveys the benefits of using e-Government platforms across all ages. Challenges that can affect and prevent the usage of e-Government platforms should be investigated and removed to allow and encourage all citizens irrespective of age and qualifications to use and adopt the e-Government platforms.

The uncertainty and the perceived safety of the usage of e-Governance must be investigated further and the myths around the usage be nullified/confirmed with research. There is a need to explore public awareness of, attitudes towards, beliefs about and safety of the e-Government platforms. It is important that citizens trust local governments with their personal information when using e-Government platforms.

A follow-up study to test the actual effectiveness of the e-Governance in the municipalities is recommended. The potential for e-Government platforms to positively contribute to good governance and citizen participation has been known for a long time, but very little concrete empirical evidence of the effects of e-Government platforms on governance, and how these effects should be evaluated, exist.

Abstract

Globally, organisations in developed countries are faced with a highly competitive labour market. Therefore, leading to the emergent of locating enthusiastic employees who will be creative and innovative enough to differentiate and drive an organisation to achieve new feats. The rise for innovation in organisations has demanded the need for creative work-force. Organizations with employees that exhibit innovative work behaviour as they get things done can achieve cutting edge growth and performance. For employees to effectively generate ideas, promote an idea and implement it, an organization must have had a value proposition in place. This value proposition is a flexible benefits policy that encourages organisations to fabricate employees reward to their needs and priorities. The purpose of this study was to conceptually; (a) find a match between innovative work behaviour and organisational growth; (b) evaluate the mediating effects of employee value proposition on both innovative work behaviour and organisational growth. Various articles were reviewed from the areas of marketing, organisational behaviour and business management on the subject matter. This study was premised on three major theories namely: Penrose theory, Interactionist Theory and Porter's Generic Value Chain Model. The study discovered that employee value proposition can induce innovative or disruptive work behaviour, with myriads of effects on organisational growth. It is therefore suggested that Human Resource Professionals and Managers must evaluate, manage and monitor Employee Value Proposition (EVP) in a goal-oriented manner to stimulate innovative work behaviour to achieve growth and competitive positioning. Empirical enquiries can be made to further this study.

Keywords: Employee value proposition, innovative work behaviour, recruitment, retention and growth.

Introduction

The rise in technological applications and borderless trade zone of products and services, organisations must innovate to gain a competitive positioning. Messmann (2012) posited that innovation is an effect of societal and economic developments, technological developments, revolutions of organisational structures and tasks, and as well become a major feature of today's world of work. Therefore, the search for a talented workforce has become imperative. Presently, within the Nigeria manufacturing industries, Orga and Ogbo (2012) recognized that organisations are confronted with employees' related challenges. These challenges include poor job fit, poor customer service, poor employment engagement, poor values of the workforce and the complexity of the organisation and its technology to mention but a few. Beyond recruitment, selection and retention of a talented workforce there arise a need to manage employees' creative ability. These abilities include; being able to identify work-related problems, generate ideas to resolve them and intentionally striving to realize such ideas as matching organisational goals. Aligning and mapping innovative work behaviour towards achieving growth is a challenging and difficult process to handle. This is due to the several discrepancies and fragmented nature of innovative work behaviour to translate into organisational growth. However, the role of innovative work behaviour to drive profitability, employee performance and market expansion is yet to be explored.

According to Al-Azzam (2015) companies have been forced to find their employee's needs and wants by understanding the valuable work behaviour that makes them attracted to a prospective employer. Managements clue to employees' needs and value will help induce innovative work behaviour, earn more revenue and make organisation survive in highly competitive situations. Studies recognized both employee value proposition (EVP) and Innovative Work Behaviour (IWB) as needed factors in human resource (HR) strategic practices to achieve competitive advantages. The employee value proposition is a flexible benefits policy that encourages organisations to fabricate employees reward to their needs and priorities. This value proposition becomes a stimulus to which employees react which could be productive or destructive. Innovative work behaviour is one of the productive outcomes which could be linked to organisational growth.

Innovative work behaviour (IWB) on the other hand can be referred to as attitude that "encompasses all work activities that are required from employees to accomplish the prerequisite innovation tasks (Messmann, 2012). Behind each of the expected innovations by an organisation, innovative work behaviour is stimulated by HR strategic practices. Yuan and Woodman (2010) recognized that such work behaviour is edge-to-edge processes to reach organisational aim goals effectively. Scholars such as Åkesson, Skålén, Edvardsson & Stålhammar (2016); Bos-Nehles & Veenendaal (2017); Veenendaal & Bondarouk, (2015) have been able to identify that employee value proposition systems are ways of initiating new behaviour in employees. The need for a logical view to ensuring that when employee's physiological and emotional needs or nature are taken care of, problem identification, innovative idea generation, and idea realization could be prompted using value propositions to employees. This is with the aim that such propositions are expected to facilitate employees' performance, profitability and market expansion which indicates 'organisational growth. The crucial business perception of exploring employee's value proposition and promises with the reality of fulfilling it has called for a new inquiry. This study is, therefore, aimed at finding how value proposition motivates employees to put up innovative work behaviour that will enhance significant growth.

Literature Review

Conceptual Clarifications of Innovative Work Behaviour and Employees' Value Proposition

As employers in present-day seek a bigger market share, they as well, needed to be equipped and have what it takes to ensure a quality workforce that can keep the organisation relevant. Laszlo and Zhexembayeva (2017)stipulated that every organisation has to strategize to embed sustainability, business value and achieve competitive positioning.

Work behaviour is anticipated to be innovative to attain set objectives. Studies (Scott & Bruce (1994); Newman, Herman, Schwarz & Nielsen, (2018) posited that innovative work behaviour is employees' ability to create and implement new and valuable ideas at work. Innovations play a vital role in firm long-term sustainability, growth and survival and have been long embraced by firms that want to be visible, viable, effective and competitive in the dynamic business world (Akhigbe and Bibiebi, 2017). Meanwhile, Afsar, Badir and Khan (2015) posited that intense rivalry and unceasing threat to earn worthy market share has pushed organisations to differentiate and continuously allow innovation from inspiring employees who can achieve organisational objectives. Extant literature in psychology established the fact that behaviour takes place as a response to a stimulus, hence for employees to be innovative in their work behaviour value proposition has to be strong. Randel, Galvin, Shore, Ehrhart, Chung, Dean and Kedharnath (2018) recognized inclusive leadership, belongingness (social interactions) and value proposition for uniqueness as a factor that induces creative work behaviour.

Scholars (Salau, Osibanjo, Adeniji, Ojebola, Oludayo, Falola and Atolagbe 2018) reported that employees' value proposition as a motivational strategy and flexible benefits allowed for rewarding unique skill, abilities and talented employees. It is one of the human resources (HR) strategic practices. It is an employer brand strategy that is unique, relevant, compelling, designed to attract, engage and retain a talented workforce (Minchington, 2006). EVP is an established link and exchange of value between employee's expertise, competencies and experiences and organisational provisions for meeting employee's expectations. The study revealed that it is more gainful for organisations to put in place suitable strategies such as good organisation's image or reputation, regular salary package, and humane treatment of employees as strategies for growth and performance (Gberevbie, 2010).EVP is a total reward strategy that is highly diversified. It brings five different areas which include social management, work-life balance, organisational brand, opportunity development and compensation management under a single umbrella. It can be used as employees resourcing and retention strategy.

Career development is an encouraging phase of any effective EVP and it is ideal on helping employees to get their work done easily. Bhattacharyya (2011) reflected on the importance of using career development as a form of the value proposition which includes: offering promotional avenues, enhances the morale of employees, internally manage promotional vacancies and guarantees better use of employees' abilities. Mouzelis, (2017) identified that organisational growth life cycle is akin to the biological life cycle. According to Demir, Wennberg and McKelvie (2017), the issue with growth is so fragmented that it will take five drivers to achieve high growth: human capital, strategy, human resource management, innovation, and capabilities. To have growth in any organisation there must be a unique offer with peculiarities. Such peculiarities must have such feat that can consistently resolve management challenges that are not seen with other growing firms(Delmar, Davidsson and Gartner, 2003).

Theoretical Framework

Based on the literature review on the employee value proposition, innovative work behaviour and organizational growth three grounded theories were found relevant. The theories are Penrose theory; Interactionist theory; and Porter's Generic Value Chain Model.

(i) Penrose Theory

Edith Penrose (1914-1966) was one of the most celebrated women economist, who wrote the momentous book- Theory of the growth of the firm in 1959, and which led to the birth of Resource-Based View a central paradigm in current strategic management research. The trio field of management, human resource and strategy borrowed from her insight of organisational growth. Penrose in her study identified two resources which are physical and human resources. They are potential bundles of achieving both growth and competitive advantage in an organisation. This theory posited that these two resources can be induced to expand the limit and growth rate of an organisation by an enterprising manager. The theory recognized the facilitation of knowledge within, interrelatedness, and encouragement of productive opportunities as seen by the manager. The theory discovered that growth gets limited if intuition, imaginations and idea does not precede economic decisions. By implication, the need to meet with uncertainty and organizational complexities is to encourage knowledge and changes. Ensuring the ability to use the knowledge which is dependent on interactions, career development and competency is well facilitated and imperative to sustain an organization.

(ii) Interactionist Theory

Interactionist theory is a perspective of organisational creativity developed by Woodman, Sawyer and Griffin (1993). It was focused on how individuals shape and organisation and are shaped by the organisation through meaning that arises through interactions. The interactions induce contextual influence that can facilitate innovative work behaviour. Such contextual influences are social reward, motivation, social influences, physical environment, self-esteem, knowledge, style and preferences. It also stresses that creativity is a complex interaction between the individual and their work situation at different levels (individual, group and organisation) of the organisation.

At the group level, innovation is a result of individual creative behaviour, the interaction between the group members (e.g., team composition), team features (e.g., norms, size), team practices, and contextual impacts (e.g., organisational culture, remuneration systems). Innovation is an outcome of individual and group resourcefulness at the organizational level (Woodman, Sawyer and Griffin, 1993). Several studies revealed a major conceptual framework most commonly used to accentuate the connection between contextual and individual variables that could improve or inhibit workplace innovation (González-Sánchez, Suárez-González &Gonzalez-Benito (2018); Yuan & Woodman (2010); Zhang & Bartol (2010).

(iii) Porter's Generic Value Chain Model

Michael Porter (1985) identified two organisational activities; primary and support activities that can drive organisational competitive advantage. From Porter's postulation, González-Sánchez, Suárez-González, and Gonzalez-Benito (2018) asserted that HR functions stand as the core of a value chain in any organisation. The latest variant of value chain concept proposed by KramerandPorter (2011) namely creating shared value. It is a generic value chain thinking located in the entire value chain as strategic analysis, based on consideration of the competitive advantage (Simatupang, Piboonrungroj and Williams, 2017). Innovative work behaviour is a form of shared value. Holloway (2017) recognized that shared values are built on relationships that required, support decision-making and action. These influencing the value system and can be a 'grand plan', in a dynamic competitive environment. The implication of this theory is that; HR functions with employee value proposition inclusive can contribute to a firm's relative cost and create a basis for differentiation both to attract and retain a talented workforce. Growth, competitive advantage, firm's value chain and the way it performs are reflections of Individual's behaviour and the organized effort.

Research Methodology

This research study adopted the qualitative research approach to examine the mediating effect of employee value propositions on innovative work behaviour and organizational growth. To conceptually enrich this research, secondary data was retrieved from the internet. About 60 articles with a focus on keyword variables from Google, Jstor, EBSCO, Science direct, Sage, Elsevier and Scopus journal outlets were reviewed. Most of the articles were from the area of marketing, organisational behaviour (OB) and business management.

Result and Discussion

The Match between Innovative Work Behaviour and Organisational Growth

Scholars' knowledge of the factors behind organisational growth remains fragmented. Therefore, the potential to generate high impact ideas that would ascertain long-term economic returns to shareholders dwindles (Senderovitz, Klyver and Steffens, 2016). However, studying growth factors is fraught with challenges as they are difficult to sample and follow (Daunfeldt, Elert and Johansson, 2014).Scholars (Nicholls-Nixon, (2005); Powell & Sandholtz, (2012) posited that rapidly evolving organisational structures is also making organisational growth difficult to study. Quinn (2018)posited that organisational growth and expansion are always definitive and iterative and discovered it is always frustrated by barriers and government policies. Several studies argued that manager's ability to issues in the organisation should be from micro perspective especially when attention is drawn to crucial employee's attitudinal and behavioural reactions(Baluch, Salge & Piening, 2013; Katou & Budhwar, 2012).

The obvious mismatch between innovative work behaviour and organisational growth after a considerable time is shocking. The time frame to identify employees' needs and intentions when time is scarce (Wisniewska & Wisniewski, 2018). It also includes the loss of the valuable idea that could have emerged as innovative to enhance organisational growth when there is a breach in a business life cycle that exists due to the company's failure. Innovative, novel and creative work behaviour is what keeps organisations evolve and revolve at each stage of the spin of a business lifecycle. Dodgson, (2018) and Cefis and Marsili (2018) shared a similar view that there comes a need for a certain measure of innovative work behaviour especially; when the expected goal is to stimulate product rebrand, increase sale, increase market share and ensure organisational economic revival. Anderson, Faulk and Stewart (2014) posited that the capacity needed in the early idea and start-up stages is different from the capacities needed by the organisation at the mature stages. Work processes are iteratively linked by feedback loops which include the advancement of an idea that may promote the exploration of further opportunities or ideas. The nature of successful strategies and the mixed feeling of frustrations and achievement that arise while driving organisational growth is inevitable (Baluch, Salge & Piening, 2013). Having this understanding innovative work behaviour became a base on which organisational innovation and competitive advantage are sustained (Montani, Courcy and Vandenberghe, (2017); Ramamoorthy, Flood, Slattery and Sardessai, (2005).

The Role of Innovative Work Behaviour in Achieving Organisational growth

Innovative work behaviour has both an employer and an employee perspective. As the employer thinks of branding its organisation to attract a talented workforce, increase market share and make a profit; the employee is thinking of need satisfaction, image, reputation and equity. Innovative work behaviour (IWB) is not a competency that works with one aspect of the organisation than another. They are initiated abilities, knowledge and skills that rebrands the value of the products, services, practices and processes of an organisation. Renders (2015) recognized that employees with innovative work behaviours have special ability to be dedicated, work and increasingly perform in both current and future task. In most cases, innovative work behaviour is ignited when employees are avail with work-related opportunity, training and career development. Aslam, Aslam, Ismail and Cheema (2017) posited that when training and development are in place innovative work behaviour

of employee will be enhanced, shapes the culture and improve product/services patronage of the organisation. The result of effective innovative work behaviour is innovation.

Employee Value Proposition as a Mediator between Innovative Work Behaviour and Organisational Growth

According to Nijenhuis (2015) building on Scott and Bruce (1994) model posited that factors like communication, supervisor's role, workgroup, perceived image gain, personal characteristics, role clarity, training and development are all stimulants to innovative work behaviour. Three innovative behaviour were identified in this study which are idea generation, idea promotion and idea realization. Innovative work behaviour is all-inclusive, so it entails social interactions from the stage of problem identification, idea generation to the stage of realization. According to Anderson, Potočnik and Zhou, (2014), innovative behaviour in organisations is a state-of-the-science and can be facilitated at three different levels; individual, group or organisational depending on the value communicated to the labour stakeholders.

Social interaction is an information-sharing moment among employees. It is a strong platform for generating veritable ideas. It is an opportunity for individual employees to express their feelings, identify and discuss issues, recognized an impending problem and create an alternative solution. Social interaction among employees has both functional and social value. Such values have to be promoted to have a competitive advantage". Value propositions which include information sharing and supportive supervision to employees prove positively related (Bos-Nehles & Veenendaal, 2017). Nonetheless, Ramamoorthy, Flood, Slattery and Sardessai (2005) argued that remuneration has direct effects on innovative work behaviour. Yuan and Woodman (2010) examined employees' innovative behaviour and job performance and discovered that there are apparent supports for innovation. These supports are myriads of value propositions that were made to employees to stimulate their innovative work behaviour and enhance growth.

Awasthi and Sharma (2016) recognized a significant relationship between employee career development and organisational growth. An employee value proposition is a resourcing and retention strategy that is useful both in the early idea start-up and mature stage of any organisation. These forms of strategies are fundamental to the survival and sustainable development of any organisation in the face of an increasingly competitive business (Falola, 2017). The proposition to encourage employee's career growth and development is useful in problem identification and exhibited in solving problems. This reality could help boost employee's performance on the job and increase market shares. Intentional realization of goals becomes possible, especially when the manager's discretionary skill makes value proposed to employees serves as a tool that will drive organisational growth.

Apart from employees' career development is reward flexibility. Though reward flexibility is flawed in Nigeria as a country it is still useful in retaining a talented workforce and ensures organisational span of life. Reward flexibility is an extension and sustainability strategy organisations use to achieve their goals(Connell, Agarwal & Dhir, 2018). Reward flexibility is a way of presenting sustainable ingenuities without any challenge to entrench employees who operate within company practice and maintain client relationships.

Thus, the mediating effect of employee value proposition on innovative work behaviour and organisational growth is therefore proposed by the researcher as depicted in Fig. 1. Below

Fig. 1 Researcher's proposed model

Conclusion

Matching available core competencies with opportunities is a smart move any manager would use to attain a competitive edge. The need to value chain activities, identify and understand the gap between innovative work behaviour and organisational growth becomes imperative. EVP is model around people, work situations, organisational culture, opportunities and reward package. Therefore, managers with transactional and inclusive leadership style should craft organisational growth around it.

EVP promotes value chain activities and a strong strategy to initiate innovative work behaviour in employees. Manager's skill and ability to attend to; employees attitudinal and behavioural needs, recognize the right EVP to initiate innovative work behaviour and understand EVP strategic mix that is important to drive organisational growth. When an organisation create an opportunity for interpersonal relationships and social interactions idea are easily generate. Members of the same organisation seek common goals to achieve better values, life quality and fairness as they strive to achieve organisational goal. It is discovered that when innovative work behaviour is encouraged and well monitored the organisation's economic reward will be robust, and the entire business stakeholder will be assured of having a profit on their various investment.

Manager's skill and entrepreneurial ability to initiate professional or task-related training and development programs and encourage career development path for employees is a tool to have new insight into contemporary workplace issues. This becomes a way of providing employees' psychological instrument to identify job-related issues easily and resolve it before it sabotages planned goals. Ability to also carve flexible and equitable reward system can facilitate the intentional realization of innovative idea that would bring about a rare branded product and facilitate quality services to customers. Knowledge and idea shared through creative thinking during social interactions will help employee's smooth job performance and boost ethical and professional practices. The reflection of employees' cutting edge services to clients and customers of the organisation will create a branded image that is worth of patronage thereby leading to gaining market share and improved profitability. To ensure a value system and embed sustainability in a business life-cycle, HR managers should draw employee value proposition grand plan, to operate in a dynamic competitive environment.

Abstract

The purpose of this work was to conceptually; (a) validate the relationship between physical wellbeing initiatives and presenteeism situations, (b) establish the significant role of psychological wellbeing initiative on employees' turnover intention among others. This conceptual paper is an archival review of the Nigeria Pharmaceutical firms. Secondary data was retrieved from online journals using the keywords of the subject matter. About 60 articles with both local and global view from Google, Jstor, EBSCO, Science direct, Sage, Elsevier and Scopus journal outlets were reviewed. These are articles from the area of human resources management, organisational behaviour (OB) and business management. The underlying theories adopted for this study are Six-factor Theory and Subjective Wellbeing Homeostasis Theory. This study was able to draw policy and managerial implications, that wellbeing initiative as workplace policies; can help achieve workplace diversity, work/life balance and sustainability goals in the pharmacology field. It is therefore suggested that; (a) Organizations can draw policies such as dietary awareness and physical exercise to curb behavioural outcomes especially the issue of presenteeism. (b)Homeostasis buffer, in the form of work-life balance policies that will help stabilize employees' emotional and mental wellbeing, should be targeted towards reducing employees' intention to leave the organisation. (c)HR professional in both Pharmaceutical and non- pharmaceutical companies should develop healthy policies concerning employees' job type (physical work) and enhance work climate that can foster employees' loyalty to encourage sustainable organization. Empirical enquiries can be made to further this study.

Keywords: Well-being initiative, behavioural outcomes, presenteeism, performance.

Introduction

Efforts by organizations in taking advantage of globalization, policies, trends and high efficiency of technology, require managers to pay vital attention to employees' intrinsic motives and behavioural responses. These Intrinsic motives are physiological and psychological drivers that contribute to employees' health, happiness and focus on functioning well. Employees have been recognised as both valuable assets and key success factor to any organisation. Employees' wellbeing has become a management mantra in recent times. Scholars such as(Ajayi & Olatunji, 2019; Balogun &Olowodunoye, 2012)have shown that employees' reactions to an organizational situation affect many sectors in Nigeria including companies within the pharmaceutical industry.

According to Obukohwo Olele and Buzugbe (2018), the Nigerian pharmaceutical sector has the potential to be a leader in the production and distribution of pharmaceuticals within sub-Saharan Africa. But the sector was poorly rated (World Health Organisation, 2018). In the manufacturing sector, pharmaceutical scientists are involved in the processes of converting chemical and biological materials into pharmaceutical products and therapies. These professionals use the latest equipment, processes, and software solutions to ensure the products produced are profitable, safe, and regulatory compliant. Although Nigeria has a large human population (having approximately 200 million people) and vast natural resources, the country has few skilled personnel within the pharmaceutical industry causing reliant on high importation of foreign drugs. Such few available employees' may be susceptible to occupational stress-causing mistakes in product outcomes due to intense daily activity(Faremi, Olatubi, Adeniyi & Salau, 2019).

Having this understanding, that human factor is a core consideration in work processes minor mistake or variation without safe and regulatory compliance can be a disaster to the health of products final consumers (Cox, Kate, James Black, Grand-Clement & Hall. 2016). As such, only a few of the pharmaceutical firms in Nigeria can participate in the supply of anti-malaria, anti-TB medicines, anti-retroviral and other pharmaceuticals in international tenders (Lead Capital Ltd., October (2008).Organisations to achieve sustainable performance are expected to be creative, innovative and smart by taking into considerations employees' behavioural responses. Afidegnon (2019) opined that achieving sustainable goals seems unreachable except employees' behavioural outcomes are well tackled focusing on their state of well-being (such as employees' emotional and mental health, social connectivity, financial education and sense of fulfilment).

Literature Review

Wellbeing: A Conceptual Clarification

Wellbeing is not just a state of being without illness or diseases. It is "typically changes through time, depending on employees' ability in handling physiological, psychological and social being (Lohaus & Habermann, 2019). The state of employees' wellbeing is a persistent concern that needs to be dealt with urgently to resolve employees' behaviours (Al Mamun and Hasan, 2017). Driving a business to achieve competitive advantage and sustainable performance does not only rely on the manager's ability to make provisions for adequate resources but also to ensure that the workforce is in good health. The CIPD's UK Working Lives survey report (2016) recognises health and well-being as a distinct and vital aspect of work quality considering significant outcomes, emphasizing that 'being well is working well'.Bapna, Langer, Mehra, Gopal and Gupta (2013) posited that a gratified and encouraged employee has a greater chance of making important contributions to the organization.

Halleröd and Seldén (2013) identify the complexity involved in defining well-being. The authors specified that; it exists when employees know that their potential is powerful in coping with the normal strains of life.It is a fluid way of being and needs nurturing throughout life. Wellbeing is a word that has been interpreted as health, achievement and happiness. The research of Dodge, Daly, Huyton and Sanders (2012) affirm the multi-dimensional and intangible nature of this word "well-being". The authors were able to identify two approaches that emerged in the process of defining wellbeing. The approaches are: (i) Hedonic approach (ii) Eudaimonic approach

The hedonic approach is the standard and level of living of an employee. Hanc, McAndrew and Ucci (2019)recognized it as a subjective state of wellbeing that reflects happiness, pain, anger and standard of living. Psychologists described it as a state of seeking pleasure and avoidance of pain (Lengieza, Hunt & Swim, 2019). According to The World Health Organisation (WHO, 2018) standard of living is the worth of occupation and working conditions, the standard of housing, sanitation, nutrition, level of provision of health, educational achievement, social security, access to recreational and other services that can be used to measure individual socioeconomic status.

The eudaimonic approach highlights positive psychological functioning and human development. It can be defined "as the orientation, behaviour, experience, or functioning that allow human flourishing and fulfillment of basic, intrinsic motives (Huta & Waterman, 2014). It reflects the objective nature of a total well-being of employees' quality of life as perceived by such employees.Wellbeing wholly is abalance point between an individual's resource pool and the challenges face (Dodge, Daly, Huyton & Sanders, 2012). While hedonic wellbeing emphasizes feeling good, eudaimonic wellbeingfocuses on functioning well or doing good (Oades, 2019). The goal of measuring workplace well-being is to complement Occupational Safety and Health measures to make sure employees are safe, healthy, fulfilled and engaged at work.

Wellbeing initiatives and Employee Behavioural Outcome

Well-being initiatives are referred to as intervention which describes policy, process or structure designed by employers' targets to improve health and wellbeing of employees' at work (Fenton, PinillaRoncancio, Sing, Sadhra & Carmichael, 2014). Well-being initiatives are the thoughtful and determined programs put together by insightful managers for attaining desirable employee behaviour towards the achievement of both current and future organisational objectives. Promoting employees' wellbeing is seeking employees' satisfaction, fulfilment and health.

According to Osibanjo, Abiodun, Salau, Adeniji, Falola and Alimi (2018) to manage human resources strategically employees' behavioural outcomes has to be in focus. The authors described behavioural outcomes as employees' reaction to job situations especially the way a job is designed. Stephen (2014)identified employees' behavioural outcomes is referred to as manifestations of employees' physical, psychological or behavioural responses (which include turnover intention, loyalty, unfriendliness, absenteeism, low engagement) to occupational situations. It is described as employees' perception and attitudinal changes concern with the support top management give to them (Oludayo, Falola, Obianuju & Demilade, 2018).

It is challenging to comprehend with assurance what impact workplace wellbeing initiatives are making. Several studies have explored the different types of wellbeing initiatives. Carmichael, Fenton, Pinilla, Roncancio, Sadhra, and Sing (2016) identified initiatives such as mental health initiatives, health promotion initiatives, muscular-skeletal disorder initiatives and safety at work initiatives either in seclusion or in combination and their impact on both employees and employers. Spence (2015) also recognized other programs such as career wellbeing, financial wellbeing, social wellbeing and environmental wellbeing as initiatives that contribute to employees' wellness and behavioural outcome that directly or indirectly affect organizational stake.

Studies (Faremi, Olatubi, Adeniyi and Salau 2019; Al Mamun and Hassan 2017)identified that factors affecting employee turnover, sound retention strategies and other behavioural outcomes in a business organization are as a result of wellbeing issues. Such issues include job stress, emotional labour and emotional intelligence which are related to employees' state of well-being(Ogungbamila, Balogun, Ogungbamila & Oladele, 2014).In this context, the study explores workplace wellbeing initiatives in four different areas. They are; (i) Physical wellbeing initiatives (ii) Psychological wellbeing initiatives (iii) work climate initiatives; and (iv)Social wellbeing initiatives. Each initiative dependent on each other is chosen as the main foci of this research activity.

Theoretical Review

(i) The Six-factor Theory

The Six-factor Model of Psychological Well-being was the work of Carol Ryff, 1989. It described six factors that promote employees' psychological well-being, contentment, and happiness. The theory

assumes that organisational success depends on six psychological well-being elements. The elements are (a) positive relationships with others (b) personal mastery (c) autonomy, (d) a feeling of purpose and meaning in life, (e) personal growth, and (f) personal development. The implication of this theory is that attaining a state of balance between affected challenging and fulfilling life events is very crucial, and to do so should aid the attainment of psychological well-being. Employer's creative intuition and leadership style to take into consideration these six factors will help regulate employees' behavioural outcomes enhance prompt achievements and encourage organizational sustainability. With different viable initiatives around these six factors, detrimental employees' behavioural outcomes can be curbed.

(ii) Subjective Wellbeing Homeostasis (SWB) Theory

The theory was proposed by Cummins in the year 2010, in a comparable sense to the maintenance of body temperature. The main crux of this theory is that, automatic neurological processes to maintain personal well-being that is mildly positive and initiated control of the level of SWB. Barrington-Leigh (2018) recognized that achieving stability in well-being is due to different factors which include economic and political stability of a country. Nonetheless, Cummins, Lau and Davern (2012) proposed that the real cause for stability was genetic. Therefore, they proposed what is called 'Homeostasis buffers' which are defence mechanisms in three levels namely; (i) defensive behaviour (ii) external resources and (iii) internal resources

Defensive behaviour: employees are skilful at avoiding unpleasant emotional encounters through established life routines, these make daily experiences foreseeable and convenient. However, tough and unexpected issues will cause SWB to be out of place and ranges from time to time. Elevated SWB is connected with features like pleasure, open-handedness and enhanced friendliness while the downside includes pain, sadness and illness.

External Resource: it is discovered money and intimate relationships are the two most powerful second-level defence mechanisms. The role of both as a flexible resource contributes to the quality of life an employee has.

Internal resources: These are both conscious and unconscious devices help to minimize threat against balanced subjective wellbeing.

This theory implies that basic control and positive reappraisal can be provided by basic organizational programs and policies. Abell (2019) states that policies focused around work climate can deflect core negative views which help employees achieve a homeostasis state of wellbeing. It is important to note that employees' wellbeing initiatives such as getting along with colleagues, self-esteem, fairness, personal healthy watch, and taking safety precautions while handling machines can help balance contributes to employees state of wellbeing.

Methodology

This research adopted the qualitative research approach to conceptualize and examine the effect of well-being initiatives and employees' behavioural outcomes. It is an archival review of the Nigeria Pharmaceutical firms using secondary data retrieved from online journals. The reason for focusing this study in the pharmaceutical industry is because of the; (a)global poor ratings of the industry, (b) likely hidden and untraceable detrimental effect of human error in that field can be harmful to the Nigerian populace. About 60 articles with are both local and global view from Google, Jstor, EBSCO, Science direct, Sage, Elsevier and Scopus journal outlets were reviewed. These are articles from the area of human resources management, organizational behaviour (OB) and business management on the subject matter.

Findings and Discussion

Background review on Well-being Initiatives and Employees Behavioural Outcomes

The focus of most studies was more on employees work activities with little or no mentioning of specific wellbeing initiatives that can drive positive employees' behavioural outcomes. Gilbreath and Karimi (2012)posited that behavioural outcomes (including presenteeism, turnover intention, employees' loyalty and engagement) to organisational situations could frustrate the effort of achieving competitive positioning. Studies affirm that employees' state of wellbeing contributes to improved performance(Bogetic, Đorđevic, Ćockalo & Vorkapic, 2018). The need to explore the effect of wellbeing initiatives becomes a concern that surrounds Nigeria's pharmaceutical companies' limitation of not being a main player in the global terrain. This study, therefore, is bringing the wellbeing initiative construct and employees behavioural outcomes together under a single focus.

Physical wellbeing initiatives and Presenteeism

Scholars such as (Ganster, Rosen and Fisher, 2018; Kim, Kim, Newman, Ferris and Perrewe, 2019) identified that employees behavioural issues that are related to physical wellbeing include absenteeism, presenteeism, and commitment. Presenteeism ensues when employees are physically present, but mentally absent (Hemp, 2004). It is when employees attend work even if they are not feeling healthy. Employees' target to reduce and prevent organizational punitive measures related to absenteeism has metamorphosize into presenteeism. Studies revealed that type of work (physical), low social support from family and friends can lead to job dissatisfaction and low engagement (Spanos & Strigas, 2018). Therefore, the state of employees' physical wellbeing will justify the rate of presenteeism in an organization. According to the American Association of Nurse Anesthetists (2019), physical wellbeing is lifestyle behaviour and choices to ensure health to avoid preventable diseases and conditions. Physical initiatives are organizational policies which include health promotion through physical activity, nutritional awareness, safety and health talks, and programs aimed at reducing exposure to or intake of dangerous substances and smoking prevalence. Aldana, Barlow, Smith, Yanowitz, Adams, Loveday and Merrill (2006) recognized that physical activities, dietary changes and group support programs can be used to reverse or prevent life-threatening diseases such as metabolic syndrome, cardiovascular diseases, cancers, overweight and obesity. Faremi et al., (2019); Vuorio, Suominen, Kautiainen and Korhonen 2019; Zerbeș, Cioca and Neamu (2019) stated that when employees are strained, stress and make to work for longer hours than necessary organizations will be at risk of presenteeism. *Based on the above arguments, the second proposition is that;*

P1: ***Physical wellbeing initiatives help to curb presenteeism situations.***

Significant Role of Psychological Wellbeing (initiatives) on Employees Turnover Intention

Turnover intention can be referred to as employees' wilfulness to separate from his or her current job. It is a ˝conscious and thoughtful wilfulness to leave the organization (Emiroğlu, Akova & Tanrıverdi, 2015). Studies affirm employees' intention to leave an organization is as a result of certain factors such as job stress, emotional labour and emotional intelligence which are core aspects psychological wellbeing (Ogungbamila, Balogun, Ogungbamila & Oladele, 2014). Psychological well-being is an engagement with existential challenges of life (Keyes, Shmotkin Ryff, (2002). It denotes the extent to which employees experience enthusiasm and moods of happiness. This feature of psychological wellbeing is also recognised as subjective wellbeing (Ng, W. and Diener, 2019). Scholars such as Skevington and Böhnke 2019; Corazon, Nyed, Sidenius, Poulsenand Stigsdotter 2018; and Gawke, Gorgievski and Bakker 2018)discovered that psychological initiative could be formal or informal to both individual and organisation. Psychological wellbeing initiatives are interventions and programs that tackle issues of employees' emotional and mental health. According to Robertson and Cooper 2011; Coetzee and Van Dyk, (2018)employees who maintain psychological balance and mental

wellbeing, function properly in an organization. Friedman, Ruini, Foy, Jaros, Love and Ryff (2019) posited that when employees do not enjoy autonomy, environmental mastery, achieve a positive relationship with others and a stable lifestyle it may spur employees' intention to leave the organization. *Based on the above arguments, the second proposition is that;*

> *P2: Psychological wellbeing (initiatives) play a significant role in employees' turnover intention.*

Work Climate (Initiatives) and Employees' Loyalty

Scholars such as(Viitala, Tanskanen and Santti, 2015; Wu and Li, 2018 and Willis, Reynolds and Lee 2019) state work climate as an organizational initiative to promote employees state of wellbeing. Work climate initiatives are programs organization can put in place to achieve employees' loyalty. Employees' loyalty is mostly induced when the work climate in the organization is tolerable. Work climates are a set of shared opinions concerning the processes, practices and policies that an organization supports, expects and rewards(Thakre & Shroff, 2016). According to Chung, Liao, Jackson, Subramony, Colakoglu and Jiang (2015), a supportive work climate in an organization is an aspect of wellbeing that can make employees' loyalty strong. Work climate encourages community spirit in employees, a shared vision and a positive outlook which can improve organizational business lifespan. The literature revealed that work climate initiatives aid and regulate job stress, performance, recruitment, morale, organizational learning, teamwork, turnover and employees' well-being.Employee's innovativeness and risk-taking behaviour contributes to employees' spirit of loyalty and organisational intrapreneurial engagement. *Based on the above argument, the third proposition is that;*

> ***P3:*** *Work climate does have an impact on employees' loyalty.*

Effects of Social Wellbeing (Initiatives) on Employee Engagement

Social wellbeing is one of the dimensions of wellbeing. Teghe, Daniel and Rendell (2005) viewed wellbeing as a social thing. Social wellbeing can be referred to as the degree to which employees feel a sense of belonging and social inclusion. Social wellbeing initiatives are the programs put in place for employees to enjoy social support both within and outside work schedules. Some of the initiatives may include incentive-based team trips, team-based incentives, creating opportunities for cultural inclusions and encouraging interpersonal relationships for idea cross-fertilizations.Pfeffer (2018) in his book 'Dying for a Payback' identified two critical contributors to employee engagement one of which is social support. Literature (MacLeod, D. and Clarke, 2014)affirm positive employee engagement is linked to factors such as employees' capability to contribute to workplace decisions and a sense of achievement. When employees are connected in the organization, they feel supported. *Based on the above argument, the fourth proposition is that;*

> ***P4:*** *Employee social wellbeing (initiatives) do have effect on employees' engagement*

Based on these findings from the literature the researcher hereby proposed the following model in fig.1 below

Proposed Schematic Model of the Study

Fig. 1 Researcher's proposed model

Conclusion

This research paper aims to conceptualize the concept of well-being initiatives and employees' behavioural outcomes in Nigeria's pharmaceutical companies. Literature was reviewed to examine the concept of well-being initiatives and employees' behavioural outcomes. Different authors were able to identify the relationship between well-being initiatives and employee behavioural outcomes (i.e. presenteeism, turnover intention, employees' loyalty and engagement) which affect the sustainable performance of a business. Wellbeing initiative can help achieve workplace diversity, work/life balance and goals are more easily reached. Considering the intuitive ability of employers, HR professionals, managers and legislative body to initiate programs such as dietary awareness, organisational support and physical exercise will enhance a stable state of employees' wellbeing. Work-life balance policies, training and development programs will help stabilize employees' emotional and mental wellbeing thereby reducing employees' intention to leave the organisation.

HR professional in both Pharmaceutical and non- pharmaceutical companies could develop healthy policies concerning job type (physical) and work climate, that can foster employees' loyalty in the organization. Management should draw policies to encourage employees' engagement by creating opportunities for teamwork and social support from family and friends. Further empirical studies can be carried out to test the relationship between the variables of well-being initiatives and employees' behavioural performance. However, this study is limited, other areas of interest to researchers may be explored Comparative studies could also be carried out on wellbeing initiatives between developed and developing economy.

Abstract

The objective of this study is to explore the crucial business perception of Casualisation and its implications on organisational growth. Casualisation in Nigeria has witnessed a lot of criticism. It has been viewed as a degrading form of engaging workers in labour engagement. Major decline in the labour market, especially within the public sector, where employment has been exchanged with massive privatisation of government agencies which heightened the misuse of Casualisation as a working arrangement. A model and a theory are the two underpinning focus for this work which includes: Atkinson model on the flexible firm and equity theory. Two hundred fifty questionnaires were used as a survey instrument to collect quantitative data, while 15 interviews were carried out involving four managers' and 11 supervisors. Proportionate stratified sampling method was used for the study representativeness. In presenting a frequency distribution of the data, descriptive statistics were implored using simple linear and regression analysis tool of Statistical Package for Social Sciences (SPSS) version 24 software in testing the formulated hypotheses. The study revealed that Casualisation of a job as a form of sub-standard job, without any curb, can grow fast into modern-day' slavery'. The study recommends that Casualisation can be used as a form of recruitment pool and help manage the rate of employability within an organisation. Manager's ability to recognise referent leader among casual workers could serve as a mechanism to establish a social relationship and sound organisational culture. To further this study, more enquiries can be focused on the agricultural sector or in a different geographical part of the country.

Keywords: Business perception, Casualisation, inequity, Atkinson Model and growth.

Introduction

Man being an 'Economic man' seek better condition to earn his livelihood and balance it with other activities that make him fulfilling; therefore, rationally opting for a flexible working system 'casualising'. Studies (Anyim, Ufodiama&Ideh, 2017) posited that the centric desire of employers to

exploit employees and myopically exclude the work-life-balance benefit. Casualization in Nigeria has witnessed a lot of criticism. Fapounda (2012) viewed it as a degrading form of engaging workers in labour engagement. Major decline in the labour market especially the public sector employment has been exchanged with massive privatisation of Government agencies and heightened the misuse of Casualisation as a working arrangement by not applying decent terms and conditions of employment (International Labour Organization, 2014).

According to Danesi (2011), casual work has always existed for particular jobs; but it is the structure that it has taken in the last two decades that is diverse and challenging. Meanwhile, exploring the employers and employees business perception is the general objective of this study; the fast-changing nature, trends in employment and innovative services has given rise to Casualisation as the modern strategy in today's workplace. According to Salau, Falola, Ibidunni& Igbinoba, (2016) strategies have to be in place to ensure employees role in organisational success, one of which Casualisation can be considered.

Perception of Casualization and Organizational Growth

Scholars now infiltrate elements like workers with no respectable job and wage, a secure future, social protection, and access to rights into defining Casualisation (ILO, 2017). The term casualisation does not indicate an indecent work arrangement but a work arrangement that is temporal without an arrangement for tenor benefits. The USA Bureau of Labour Statistics (2019) posits casual work as "any job in which employees do not clearly understand contract for long-term employment or one in which the minimum working hour can fluctuate(Connelly & Gallagher, 2004). It can be described as "the process whereby employees in an organisation are casual or part-time employees with no lawful provisions (Solaja, 2015). The tradition of engaging casual workers in Nigeria for provisional positions comes in casualisation form(Kalejaiye, 2014).

Generally, 'casual employment is not permanent; requires formal or informal critical skill for job performance and provide for payment hourly, daily or at the end of the contract period. Although recent scholars (Walker, 2011) identified Casualisation as the process of engaging workers on contract recognised has non-standard of labour arrangement which has disadvantages to workers. Casual work has awkwardly empowered employers to misuse employees' knowledge, skills and abilities and as well as to abridge the working conditions that are to be of standard relating to opportunities. Employees are now being subjected to sub-standard or informal forms of work arrangement which are bore by nepotism, favouritism, God-fatherism and tribalism, especially in an economy that is sectioned to different tribes like Nigeria. This is because it not only the employers' that like to engage employees on a casual basis only but also the employee who desire job engagement opportunities on a casual basis.

Business is an activity, which provides people with needed goods and services at a profit (Timms, 2011). Every business has its participants who are; the employers, and the customers who they both depend on to achieve their goals (Galotti, 2017). Perception could be defined as the process by which individuals select, organise and interpret situations around them using their five senses to reason. Business perception is the awareness of both employer and employee about the possible profit they will make from engaging together in a working relationship. This awareness could be informed by the goals of the business or the need of each participant in the job contract. Growth means 'increase'. Senarath-Jayasinghe and Fernado (2017) recognised the going concern and growth of the organisation becomes the first and the major concern of every business owners as they start to engage in business activity. Achieving key organisational growth indicators (profitability, growing customer base, customer satisfaction employees' satisfaction and employers' satisfaction) is made robust by the consistent availability of needed employees that could achieve sustainable growth. There will always remain a huge difference between organisation growth and organisation, providing the platform for an employee to consistently drive change to enrich proper achievement of growth.

The Inequity of Casualization in Nigeria Work Place

Scholars such as (Rasak, Oye, Oyeyipo&Ganiyu, 2019) argued Casualisation had presented a discrepancy connecting the fluctuating nature of work arrangements, compared to the existing legislation and policy framework built around the philosophy of standard employment. The total differences in the benefits of an employee with full-time employment and employee with part-time job engagement are so astounding in the Nigeria workplace. According to Bamidele (2010)report by the Campaign for Democratic and Workers Rights in Nigeria, showed 45 per cent, casual workers, in Nigeria. This can only indicate the vast utilisation of Casualisation in major sectors of the country. The unfair and different ways of using Casualisation by different organisations of even the same sector has called for standard with which employees be engaged. Okafor (2011) emphasised that Casualisation surges inequality within and among organisations, and as well threatens employment and living standards. Nonetheless, the more the usage of Casualisation to engage employee is not just determined by the employers only but also the decision of the employees themselves to achieve certain goals.

Employers'Perception of Casualization

Exploring the business perception of Casualisation is more of viewing the possible positive aspects of this mode of employing workers. According to Horwitz, Allan, Brosnan and Walsh, (2000), organisations have to embrace employment flexibility to achieve high productivity, lower costs and competitive agility. Unaligned leadership with an initiative to manage talent can induce the sensibility to employ people casually to make the job position transitional.

Small business owners demand the local labour market to enrich, measure success factor and engage in labour activities that are not costly. Bamidele (2010) identifies the following as causes and reasons casualisation thrive in organisations especially manufacturing industries which include;

a. Recruitment strategies; which is acquiring and retaining high-quality talent' becomes critical to an organisation's success (Richardson, 2013). Casualization, therefore, becomes a viable means of recruiting, selecting and retaining needed employees into the organisation.
b. Labour regulation; due to active union activities and sensitive labour market regulation, it becomes challenging for employers to operate businesses considering labour cost, therefore, resulting in engaging in more flexible recruitment practice.
c. Labour cost; there is a glaring discrepancy in the direct cost incurred considering the compensation and benefits of a permanent worker to that of a casual. But few studies are yet to evaluate the extent to which indirect cost is incurred to maintain a regular workforce in the process of achieving organisational goals.
d. Labour flexibility; Casualisation has added flexibility on both the demand and supply sides of the market (Richardson, 2013). Both the employer and employee enjoy the proportional value of money and time involve in the bargaining conclusion of Casualisation as a means of labour engagement in the face of variability, diversity and contingency situations.
e. Labour control; employment practices have been structured due to rising differences between the labour market and the employers of Labour. With Casualisation, employers become more in-charge to determine conditions with which employees are engaged in the organisation while employee considers labour dynamics making Casualisation become a routine filtering device to monitor employers' exploitation and encourage a quality life.
f. Labour market restructuring; the quality of Labour in the local labour market would endear the heart of employers towards Casualisation, especially when the work process involves creativity, innovation and sustainable economy local, un-schooled but talented individuals are therefore engaged to get the job done. The aspect of engaging female folks in almost every sphere of careers has held in high esteem a fair consideration for casual working arrangement.

Employees'Perception of Casualisation

The world becoming a global village is turning every aspect of labour engagement into competitions with this in mind offering employment casually becomes a key to

i. Personal satisfaction and achievement: students who are self - sponsored would prefer casual work to meet up with their other academic responsibilities. Women who play different roles as a wife, mother and student would also desire casual working opportunity with the probability that such job engagement will be modified as soon as they are ready to fulfil the conditions of a full-term work
ii. Career path development: studies show that artisans who are interested to work in a formal environment can decide to work in a company of a related field to develop more interest to build a career in their area of competency. Employees' career growth opportunity is an adequate retention strategy to help gain insights and experience from the organisation practically and as well overcome the alarming rate of employees' turnover (Ohunakin, Adeniji & Oludayo, 2018).
iii. Employees with core competencies that want to explore the large market can also decide to be on contract terms without being tied down by conditions to a single or few employers. This would also mean economic progress and having access to different clients or customers.
iv. Skilled and age of the employee: certain abilities come with experience; therefore retired individual may opt for casual work arrangement to support the organisations with their experience.
v. There are also several other reasons like health issues, succour to unemployment that could inform the decision of employees who prefer to work base on casual terms.

Rasak, Ake, Asamu and Ganiyu, (2019) proposed some decent "guidelines or principles that form the bedrock of business ethics concerning human resource management in Nigeria. The principles include; the principle of respect, the principle of beneficence, the principle of justice and principle of social responsibility

Theoretical Underpinnings

(i) Atkinson Model (1984) on Flexible Firm

Senarath-Jayasinghe and Fernado (2017) recognised Atkinson, 1984 found major situations underpinning employment practice which he identified has followed; market stagnation, uncertainty, and technological change. Therefore, it is opined that organisations being under pressure should fix adaptive ways to take account of consistent market realities. He suggested flexibility can be of three kinds which are, functional, numerical and financial flexibility. Functional flexibility is required within the work process and progress along with the terms of achievable goals of the organisation. Employees can be reassigned swiftly and easily between activities and tasks. An organisation may obtain functional flexibility through processes such as job- rotation, widely designed jobs, and cross-functional teams (Pantic-Dragisic&Söderlund, 2020)

Numerical flexibility seeks that the number of labour demand by employers is closely in a match with the available number of employees need. This is the reason most organisations create a pool of employees to make ready a good number of them that have basic and rare skills, knowledge and abilities which can promote the innovative competency of the organisation. Financial flexibility: Employees with core competencies are sometimes casualised because retaining them on full employment could be expensive for employers. Having to meet up with market competitions and expansions, a reasonable manager would want to have such employees engaged with less compensation and benefit attached just within the period of the employment relationship. Pay flexibility is of greater importance in any organisation. It is a shift to new pay and remuneration system that facilitate either numerical or functional flexibility, such as assessment-based pay systems in place of rate-for- the-job systems.

(ii) Equity Theory

Equity theory is based on the idea that individuals are motivated by fairness, and if they identify inequities in the input or output ratios of themselves and their referent group, they will seek to adjust their input to reach their perceived equity. If employees perception does not agree with the goals of the organisation, such employee may reduce his performance, hoard his idea (either about new marketing strategy or new market horizon,) thus impeding growth in the organisation.

Methodology

This research adopts a combination of both quantitative and qualitative research design (mixed method) to acquire comprehensive information to help the research to validate a business case on Casualisation and explore its implications on organisational growth. Retrieving information from the internet, use of journals and textbook relevant to the research topic forms the basis for the development of the various concepts, construct and variables of this study. 250 questionnaires is used as a survey instrument to collect quantitative data, while 4 managers' and 11 supervisors responses to the interview questions were used to gather qualitative data. Proportionate stratified sampling method was used for the study because representativeness concerning variables used as the basis of classifying categories increased chances of being able to make comparisons between strata which include the managers (who represent the employer), the tenor staff and the casual staff. The analysis was made to present the data collected for this study, descriptive statistics were also used in presenting a frequency distribution of the data and simple linear regression analysis using Statistical Package for Social Sciences (SPSS) Amos.16 software was used in testing the formulated hypotheses. To confirm the reliability of the research instrument Cronbach's alpha, Likert scale on the questionnaire, and responses generated from the interview to corroborate the responses from the questionnaire method were use in this study. The alpha value for the construct indicated that the items formed had reasonable internal consistency reliability of 0.772.

Findings and Discussion

Background information of respondents

The gender of respondents shows 14.6 % male, most of who work at snack and drink stand, as drivers and ticketers, while 75.4% were female. The age of the respondents reveals that respondents between 21-25 years represent 21.2%, respondents between 26-30 were 28%, 31-40 years representing 43.6% and 41-45 years represents 7.2% of the total sample. It can be deduced from this table that majority of the respondents were relatively adults. The marital status of respondents who are single represents 34.8%, married representing 56% while divorced represents 9,2% of the total sample. This indicates that majority of the respondents were married. The academic qualification of respondents reveals that 33.2% were OND/NCE holders, 44.8% were BSc/HND holders while 22% were PGD/MSc/MBA holders. This indicates that majority of the respondents were BSc/HND holders. Findings also revealed that 27.6% had been working from 0-2 years, 39.2% of respondents have served between 3-5 years, and 33.2% have served for 5 years and above. The distributions of respondents' status in the organisation 8.9% of respondents were tenor staff who hold strategic positions of the cafeteria unit. It includes the managers, accountant and some supervisor who monitors the order of each cafeteria from the central kitchen. 91.1% of respondents were the casual staff. This indicates that majority of the respondents were casual staff including the drivers, cooks, ticketer, delivery boys and girls.

Analysis of Data on Employees' perception of Casualisation

The analysis shows 75.6 % of the respondents agreed and strongly agreed that they need casual work to sponsor themselves in school. 65.2% takes on casual work to balance up their dual role as a mother and wife, 9.2% of which are widows. 78. 0% of the respondents agreed and strongly agreed that casualisations contribute to their work experience and 20.4% of the respondents agreed and strongly agreed that they need income from a casual job to support their business. Managers' responses to the interviewed questions revealed that casual work arrangements form a major part of the recruitment

pool for the organisation. Most cases, information about vacant positions in the unit is first disseminated to both casual and tenor workers in the organisation.

Analysis of Data on Employee's career growth

Analysis indicates that 86.4% of the respondents agreed and strongly agreed that workers gained a lot of experiences while working. 97.6% of the respondents agreed and strongly agreed that workers are trained on the specification of food crafted and sold to avoid waste and 14.9% of the respondents agreed and strongly agreed that workers are paired especially in the technical aspect of the catering job to avoid unnecessary accidents. Respondents' responses from the analysis also show that 8.9% of the respondents agreed and strongly agreed that they paired supervisors with managers to acquit them with managerial issues before they were made supervisors. The interviewed carried out amidst the casual workers revealed that the unit transit casual staff to tenor staff, if the staff is seen as been hard working. With the aid of observation, one could easily identify the whole sense of belonging that the workers' display and the workers also revealed that the unit allows for creativity especially when it comes to pastries and snack making.

Percentage distribution of responses to Employees Performance and Labour cost

Analysis indicates that 86.4% of the respondents agreed and strongly agreed that workers prefer casual work to unemployment. 97.6% of the respondents agreed and strongly agreed that they seek casual work arrangement as an opportunity for economic empowerment and 73.9% of the respondents agreed and strongly agreed that if time is well structured, they will be glad to do overtime. Respondents' responses from the analysis also show that 98.4% of the respondents agreed and strongly agreed that good pay will keep their performance high. Responses from the managers and supervisors interviewed indicate that casual work arrangements save the unit from labour cost, especially since the catering services has been operating a central kitchen from which all the connected cafeteria access and order food.

Percentage distribution of responses to the reward system and organisational market expansion

Analysis indicates that 87.6% of the respondents agreed and strongly agreed that their wages commensurate with their effort. 96.2% of the respondents agreed and strongly agreed that organisation does not give casual workers bonus for extra performance and 96.8% of the respondents agreed and strongly agreed that familiarity is the basis for the hiring of casual workers. 91.6% of the respondents agreed and strongly agreed that co-workers left working because they were not well remunerated especially having to do overtime when there is a special order. These findings indicate that sampled respondents believe that organisational reward system influences market expansion.

Hypotheses Testing

Four hypotheses were raised in a null form and tested in the course of this study. The significant level of 0.05 or 95% confidence level was set to determine if the findings were significant or not. The findings were presented below:

Hypothesis One

H_{01}: There is no significant relationship between employees' business perception of Casualisation and recruitment pool.

Table 4.4.1: Correlations			
		Casual employees' perception	Recruitment pool
Employee's Perception	Pearson Correlation	1	.530**
	Sig. (2-tailed)		.000
	N	250	250
Recruitment Pool	Pearson Correlation	.530**	1
	Sig. (2-tailed)	.000	
	N	250	250
**. Correlation is significant at the 0.01 level (2-tailed). Source: Researchers Survey Compilation (2020)			

From the table above, correlation analysis was conducted to determine the relationship between casual employees' perception and recruitment pool. There is a strong positive correlation between casual employees' perception and recruitment pool (r= .530**, N= 250, p value= .000). The result is statistically significant with a p-value of .000 which is less than the level of significance of 0.01. Therefore, improved casual employees' perception will enhance employee involvement

Decision: Reject the null hypothesis and accept the alternate hypothesis. Hence, there is a relationship between casual employees' perception and recruitment pool.

Hypothesis Two

H_{02}: Employees' career growth does not elicit job transition

Table 4.4.2a: Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.530a	.280	.278	.456
a. Predictors: (Constant), Employees' career growth				

Table 4.4.2b: ANOVA						
Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	20.084	1	20.084	96.682	.000a
	Residual	51.516	248	.208		
	Total	71.600	249			
a. Predictors: (Constant), Employees' career growth						
b. Dependent Variable: Innovation						

Table 4.4.2c: Coefficients						
		Unstandardized Coefficients		Standardised Coefficients	T	Sig.
Model		B	Std. Error	Beta		
1	(Constant)	2.090	.253		8.268	.000
	Employees' career growth	.536	.055	.530	9.833	.000

Table 4.4.2c: Coefficients						
Model		Unstandardized Coefficients		Standardised Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.090	.253		8.268	.000
	Employees' career growth	.536	.055	.530	9.833	.000
a. Dependent Variable: Innovation Source: Researchers Survey Compilation (2020)						

From the tables above, simple linear regression was conducted to determine whether employees' career growth brings about job transit in an organisation. The model summary shows a variation of 28% in job transit can be explained by an influence of employees' career growth. The result is statistically significant at a p-value of .000 which is less than the level of significance of 0.05. This indicates that employees' career growth positively predicts job transit in organisations. Besides, a beta coefficient of 0.530 indicates that employees' career growth is a significant predictor of innovation.
Decision: Reject the null hypothesis as p-value is less than 0.05. Therefore, employees' career growth brings about job transit in an organisation.

Hypothesis Three

H_{03}: Labour cost does not influence employees' performance to a significant extent

Table 4.4.3a: Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.370a	.137	.133	.757
a. Predictors: (Constant), Labour cost				

Table 4.4.3b: ANOVA						
Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	22.500	1	22.500	39.296	.000a
	Residual	142.000	248	.573		
	Total	164.500	249			
a. Predictors: (Constant), Labour cost						
b. Dependent Variable: Employee's performance						

Table 4.4.3c: Co-efficients						
Model		Unstandardized Coefficients		Standardised Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.476	.263		9.400	.000
	Labour cost	.397	.063	.370	6.269	.000
a. Dependent Variable: Employee's performance Source: Researchers Survey Compilation (2020)						

From the tables above, simple linear regression was conducted to determine whether Labour cost influence employee's performance. The variation of 13.7% in employee's performance implies the

labour cost of the organisation. The result is statistically significant at a p-value of .000 which is less than level of significance of 0.05. This indicates that Labour cost positively predict employee's performance. Also, a beta coefficient of 0.370 indicates that performance norm is a significant predictor of employee's performance.

Decision: Reject the null hypothesis as p-value is less than 0.05. Therefore, Labour cost influence employee's performance.

Hypothesis Four

H_{04}: Organisational reward system of casual workers does not have a significant impact on market expansion

Table 4.4.3a: Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.573a	.328	.325	.505
a. Predictors: (Constant) Organisational reward system				

Table 4.4.3b: ANOVA						
Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	30.827	1	30.827	121.018	.000a
	Residual	63.173	248	.255		
	Total	94.000	249			
a. Predictors: (Constant), Organisational reward system						
b. Dependent Variable: Market expansion						

Table 4.4.3c: Coefficients						
		Unstandardized Coefficients		Standardised Coefficients	T	Sig.
Model		B	Std. Error	Beta		
1	(Constant)	1.650	.270		6.112	.000
	Organizational reward system	.640	.058	.573	11.001	.000
a. Dependent Variable: Market expansion						

Source: Researchers Survey Compilation (2020)

From the tables above, simple linear regression was conducted to determine whether Organisational reward system has a significant impact on the market expansion. From the model summary, a variation of 32.8% in market expansion can be explained as an influence of organisational reward system. The result is statistically significant at a p-value of .000 which is less than the level of significance of 0.05. This indicates that Organisational reward system positively predicts market expansion. Also, a beta coefficient of 0.573 indicates that financial reward system is a significant predictor of market expansion.

Decision: Reject the null hypothesis as p-value is less than 0.05. Therefore, Organisational reward system has a significant impact on the market expansion.

Conclusion and Recommendations

The perception of both the employers and the employees, as well as, the intervention of the government body hereby becomes imperative to manage Casualisation in this era of globalisation. In this study, the following recommendations are made.

i. Human resources managers should identify and ensures that casual employees' activities are in line with standard achievements of goals.

ii. Employees' training, research and development on useful ideas discovered can foster career growth and bring about job transit. Therefore employees should be given the freedom to open discussions with supervisors and top managers during tea and lunch breaks to promote work initiatives.

iii. Identifying referent leader among casual workers who could serve as a mechanism of to better management of organisations can be used to establish a sound organisational culture, manage and resolve conflicts arising from diversity, work process, interpersonal and social relationship.

iv. To reduce the inhumane way of exploiting employees and justify the perception with which the employer engages his workers. The mediating factors of change in institutional and external attributes of a growing organisation have called for a well define legislated business policies for any form of work engagement.

v. Every employer should aim at facilitating a transitions compensation system that would harmonise the fair treatment of both the employees on Casualisation or full-time employment.

Abstract

The paper is investigated reindustrialization capacity of Arctic regions of Russia. The international experience of the implementation of the reindustrialization strategy was analysed; the methodological foundations for assessing the readiness of regions for reindustrialization were studied. New assessment approach for reindustrialization capacity was suggested using the fuzzy-logic.
The developed approach was used out for assessing the level of readiness of the Arctic regions of the Russian Federation for reindustrialization and recommendations for improving the reindustrialization strategy were formed for each Arctic region.

Keywords: Fuzzy logic; Reindustrialization, Arctic region, Russia

Introduction

Today, the strategic views of not only Russia, but also other states have turned to the Arctic. Despite strong interest, the development of the Arctic poses many challenges due to high logistics costs, poor infrastructure, difficult climate conditions, advanced technology needs, low population density and not developed reference points for further development.

In the previous period of historical development, the economic structure and labor market of the Arctic regions of the Russian Federation were oriented towards the single investor - the State (Skhvediani & Kudryavtseva, 2018).

A sectoral and regional economy, a system of material incentives, transport and energy infrastructure have been developed to meet its needs.

From this period, the Arctic inherited:

- Irrational structure and poor diversification of the mono- or oligo-genic resource economy;
- Insufficient communication and broadcasting systems;
- High moral and physical depreciation of fixed assets, infrastructure and life support systems;
- Inadequate demographic structure and resettlement system;
- Lack of a flexible mechanism for state regulation of environmental management;
- The imbalance between federal, regional, local and corporate interests;
- The high dependence of the traditional indigenous economy on direct State participation.

After the break-up of the USSR, in the 1990s of the 20th century, economic activity in the Arctic was carried out under conditions of savings in practically all positions.

Savings were realized by:

- wages, which deprived the population of a resource of economic stability and mobility due to accumulations;
- development of the housing and communal environment and the social security sector, which in the context of the reforms led to the rapid degradation of the housing resources and crisis of public utilities systems;
- improvement and updating of technologies, which brought a significant part of production assets and transport systems to the point of complete wear and tear;
- environmental safety of economic and defense activities, which led to the pollution of large territories and water areas in the Russian Arctic (Shestopalov, 2008).

These factors had an inertial negative impact on the socio-economic sphere of the Arctic zone of the Russian Federation and formed a region-specific set of constraining factors:

- increasing disparities between regions of the Arctic and other regions of the Russian Federation in terms of their level of social and economic development;
- high and ultra-high production costs associated with remoteness of sales markets, limited transport accessibility and extreme climatic conditions;
- progressive pollution and degradation of environmental components under the conditions of increasing anthropogenic pressure, accumulation of wastes and contaminants from transboundary transport;
- the need to use special technologies, equipment and materials;
- the need for significant capital investment in the capital-intensive basic commodity sectors of the Arctic;
- high depreciation of fixed assets;
- the sub-optimal demographic structure and settlement system;
- lack of human resources of specialists with experience and high cost of attracting labor resources.

The industrialization of the Arctic zone of the Russian Federation began in the mid-thirties of the twentieth century and peaked in the sixties - seventies. In the 1980s, the process of industrial development in the Arctic (still ongoing) entered an inertial phase. The 1990s were dominated by a decline in inertia and an increase in the processes of degradation of technological potential, depreciation and retirement of production assets, and elements of infrastructure.

The long stagnation of the process of industrialization of all spheres of life and economic activity of the Arctic zone of the Russian Federation, which led to a general decline in the competitiveness of the economy of the Arctic regions and a deep crisis in the social sphere, determined the insufficient resources of the economies of the Arctic regions to carry out the necessary technological breakthrough. The Arctic regions are unable to flexibly respond to new emerging economic and technical problems. The Arctic zone of the Russian Federation needs reindustrialization based on the latest technological advances.

If the Arctic regions do not carry out reindustrialization, this will lead to their complete degradation due to the deterioration of the production and infrastructure base, as well as systemic macroeconomic problems (Melamed & Pavlenko, 2014)

The first industrialization of the Arctic has been largely detached from the task of improving living standards. As a result, a considerable amount of «deferred» social obligations has been formed. The second industrialization of the Arctic should be based on the need to realistically form social commitments and achieve an economically determined high social standard in enterprises, industrial complexes and the public sector. At the same time, there is an undesirable imbalance in the way the State and the private sector redirect their efforts mainly towards solving social problems. While the

social aspects of development are important, concentration in these directions should not lead to «devouring» of the economic potential of the second industrialization of the Russian Arctic. At the same time, it is clear that the implementation of reindustrialization projects will obviously make it possible to significantly improve the standard of living of the people of the region.

The first industrialization of the Arctic did not take sufficiently into account the environmental impact and destruction of the traditional habitat and economic activities of the indigenous peoples of the North. This has led to the fact that today, the potential for economic development of the Arctic through investment by private Russian companies is being constrained by the need to undertake a considerable amount of obligations to eliminate the consequences of ecologically ill-conceived economic activities, from the 1950s to the 1980s.

The new industrialization of the Arctic must take into account the interests of environmental conservation carried out on the basis of energy-saving and environmentally friendly technologies (Dmitrieva & Burii, 2019). Projects for the reindustrialization of the Arctic should be based on appropriate institutional changes that will improve the investment climate and give a green light to capital inflows into important infrastructure and production projects. The following approaches are under active discussion:

- application of direct or indirect investment incentives for significant projects in the Arctic zone. The characteristic of the Arctic economy is that large projects implemented in an integrated manner are more likely to be commercially successful. However, the payback period for such projects will be long enough to require a preferential tax regime;
- tax incentives for small and medium-sized businesses, e.g. created by vertical diversification of large companies. The creation by large companies of additional jobs in the service and ancillary industries, even if they are not part of the core business, requires the encouragement of direct tax incentives. Only the direct encouragement by the State of the outflow of labour into small and medium-sized businesses will help large companies operating in socialist enterprises to increase productivity by ensuring their global competitiveness;
- changing the principle of the contribution for environmental damage to increase the business opportunities to use the funds for the introduction of environmentally friendly technologies in production. Companies should be able to reduce environmental taxes through corporate environmental programs. Otherwise, while maintaining the existing system of compensation for environmental damage, there will be hidden double taxation of the business, in which he will be forced to spend money both on improving the environmental parameters of production and on current compensation for environmental damage;
- creation, on the basis of tax revenues from enterprises registered in the region, of a special fund for contributions to the development of the Arctic zone (on the principle of «funds of future generations») with the formation of special financial instruments. For this, however, it will be necessary to create specialized financial instruments and infrastructure, in particular, such as the «Arctic Bank for Reconstruction and Development», which could receive part of the fiscal fees from enterprises in the region;
- creating a stimulating tax and investment environment for the development of traditional nature management, which would stimulate large businesses to make targeted investments in the development of small traditional forms of management. However, such productions should not be charitable, but commercially oriented.

Literature Review

The problems of industrial policy are more relevant today than ever, because today is a new industrial revolution period. At the moment we are at the stage of transition to the sixth technological order, the creation of our own new Russian production. It is important to understand that this transition is not possible without solving several basic problems; therefore, it is important to determine the current level of readiness of the regions for reindustrialization.

In Russian and international practice and science, there is currently no holistic, generally accepted, universal methodology for assessing the level of preparedness of regions for re-industrialization of the economy (Miller et al, 1984; Heymann & Vetter, 2013; Euler Hermes Economic Outlook, Special Report, 2013; Prisecaru, 2014; Amitai, 1983; Samuel, Peter & William, 2009; Pasholikov & Dudakov, 2019; Kulagina, Mikheenko & Rodionov, 2019; Kotynkova, 2017; Skripnuk, 2019).

Since the manufacturing sector plays a leading role in reindustrialization, the majority of authors assess the readiness of the regions by determining the production potential (Tarasov, 2018; Buzmakova, 2017; Bodrunov, 2015; Barashkova, 2015; Granberg, 2006; Greenberg, 2017).

An analysis of the literature and practical recommendations was carried out by the author, which identified a number of basic methods for the assessment of productive capacities: (Erokhina, 2015; Korsuntseva, 2013; Andriychuk, 1981; Karsuntseva, 2014; Tarasov &Vahromov, 2009; Aglyamov, 2015; Rudskaya & Rodionov, 2018; Chernogorskiy, Shvetsov & Parkhomenko, 2018; Zdolnikova & Babkin, 2018).

1) By resource assessment. The author of this method states that the analysis and assessment of the region's productive capacity should be carried out through a system of indicators. The main one is a general indicator, which helps to compare the actual output of enterprises with the potentially possible output that enterprises are able to provide with the most efficient use of production capacities, intellectual, labor, material, energy, natural and other resources play a central role in this system (Erokhina, 2015). In this case, it is necessary to pay attention to the presence of subjectivity in the choice of resources.

2) Index analysis. An index analysis of the assessment of production potential is often used by enterprises, but can also be used on a regional scale. The essence of the method is that each element of productive capacity is compared with the average value of the same element, but over the total number of enterprises (regions) studied. The result (index) describes the relative efficiency of productive capacity. This method is based on the use of a multifactor correlation model, but its difference from the similar ones lies in the way of estimating and applying the parameters of the statistical model (Korsuntseva, 2013) It should be noted that there are some limitations in the indices used to measure the impact of individual inputs on the output of an enterprise's productive capacity.

3) Method of linear optimization models. In the practice of assessing production potential, the method of linear optimization models has also found application, based on determining the value of the potential volume of production for all types of products, taking into account the optimal mode of resource supply. The production potential, in this case, is expressed in terms of value and is found by simple arithmetic summation of the found production volumes (Andriychuk, 1981). Using linear forms of modeling can lead to a significant error of the method, due to the fact that most potential-forming factors in the dynamics have tendencies of nonlinear development. Therefore, while the linear optimization method is attractive, it needs to be refined for the non-linearity of some connections, as well as the addition of validation criteria for the linear forms used (Karsuntseva, 2014).

4) Correlation and regression methods. Multi-factor correlation and regression analysis allows the identification of the most important factors determining the efficiency of production and the quantification of their impact on the result, both individually and collectively. This method examines the relative capabilities of territories (regions) by comparing the normative output of products corresponding to a given resource supply with an average level of resource use. This method was used to assess the production potential of the Kamyzyaksky district of the Astrakhan region. (Tarasov & Vahromov, 2009; Aglyamov, 2015; Rudskaya & Rodionov, 2018)

5) Basic production functions. The simplest type of production function is static production functions, which reflect the dependence of output on the expended resources (capital and labor). The main disadvantage of the model reflecting this dependence lies in its static nature: it does not take into

account the time factor as a dynamic variable. While the enterprise's production process is influenced by many factors of the internal and external environment, such as the level of employee qualifications, the degree of development of the enterprise's infrastructure and information technology, competition, relationships with suppliers and consumers, relationships with competitors and investors, with authorities and etc. The addition of the variable t allows us to take into account the impact on the production process not only of capital and labor, but also of other factors of production (Chernogorskiy, Shvetsov & Parkhomenko, 2018; Zdolnikova & Babkin, 2018)

An analysis of approaches to assessing production potential based on the above methods allows us to conclude that it is impossible to obtain on their basis the complete information necessary for an accurate assessment of the region's readiness for reindustrialization, and requires their refinement in the direction of eliminating the shortcomings presented.

6) During the study, the author discovered a fuzzy logic method developed by S.A. Poltavsky to determine the level of economic development of the regions of the Russian Federation. In contrast to the previously described approaches, with this method, variables can take on linguistic meaning. In this method, there is a low degree of subjectivity, minimal intervention of experts in the study (only at the initial stage when selecting a set of features), and possibility of operations with large amounts of data. Moreover, on the basis of fuzzy classification of regions, a clear classification can be obtained, while obtaining a fuzzy classification from a clear one is impossible (Poltava, 2008).

This method will provide a reasonable classification of regions according to the level of readiness for re-industrialization of the regional economy, which was not possible using the methods 1-5 described earlier.

Methodology

Thus, the authors develop a method for assessing the readiness of regions for reindustrialization using the fuzzy logic method.

To implement the approach, it is necessary to build the equation (Formula 1):

$Y=\{x, T, D\}$, (1)

Y - is the level of readiness of the region for reindustrialization;
X - actors, which determine variable Y value;
T – X-range: "low level of the region's readiness for reindustrialization," "the region's readiness for reindustrialization is below average", "average region's readiness for reindustrialization," "region's readiness for reindustrialization is above average," "high level of region's readiness for reindustrialization";
D - domain of definition in interval [0;1].
The following is a scale of fuzzy variable Y (Table 1).

Table 1: Recommended fuzzy-scale for Y-variable

Set of values	Title	Description
0-0,333	«low level of readiness of the region for re-industrialization»	The region is poorly prepared for reindustrialization of the economy, with a large number of problems, such as the scientific and technological backwardness, lack of resources, poor productive capacity and poor environmental situation
0,167-0,5	«level of readiness of the region for re-industrialization below average»	The region has its own conditions for re-industrialization, but there are lag in a number of significant factors

0,333-0,667	«average level of readiness of the region for re-industrialization»	Regions where factors are at an acceptable level to attempt re-industrialization, but additional investments are needed to increase the chances of success
0,5-0,833	«level of readiness of the region for re-industrialization above average»	A region with good characteristics, lagging behind in insignificant components and not requiring large resources to change the situation in the region
0,667-1	«high level of readiness of the region for re-industrialization»	Regions with better conditions for transition to re-industrialization compared to other regions

The next step is to identify the factors for the modelling (Djamilia, Kuzaeva & Glushkova, 2019). The assessment of the level of readiness of the regions for reindustrialization of the economy will include five main areas: 1) Industrial capacity; 2) Innovative capacity; 3) Investment capacity; 4) Human capacity; 5) Environmental capacity (Table 2).

Table 2 - Factors of re-industrialization of the economy [32]

Area	**№**	**Title**
Industrial capacity	X1	Gross Regional Product (GRP)
	X2	Industrial Production Index (IPI)
	X3	Labor Productivity Index (LPI)
	X4	Consumption of fixed capital (CFC)
	X10	GRP energy intensity
Innovative capacity	X5	Volume of innovative goods, works, technology services
	X6	Technology Innovation Costs
	X13	Innovative activity of organizations
	X14	Internal research and development costs
Investment capacity	X9	Investments in fixed assets
	X12	Solid public road density
Human capacity	X7	Number of higher education institutions and scientific organizations
	X8	Per capita income
	X15	Annual average number of employees
	X16	Number of researchers with an academic degree
Environmental capacity	X11	Environmental rating (composite index)

The next step is to collect statistics. The initial statistics for the calculation were taken from Rosstat. (Official website of Rosstat, 2019) The linguistic scale for each of the input variables is encoded by conversion to a metric on the interval [-1; +1] according to Formula 2:

$$x = \frac{X_i - X}{\overline{X}} \quad (2).$$

Each factor X_i can be given a level of significance for the analysis of (r_i).

If all indicators have equal value (equally preferred or no preference system), then use Formula 3.

$$r_i = \frac{1}{N} \quad (3)$$

The next step is to present matrixes of factor values for each region based on the classification table (Table 3).

Table 3 - Classification of the level of factors

Range of values, X		Membership function
-1≤x≤ -0,667	X1 (Low)	1
-0,667<x<-0,333	X1	$\gamma_1 = \frac{-0,333 - x}{0,667}$
	X2 (Below the average)	$1 - \gamma_1 = \gamma_2$
-0,333≤x<0	X2	$\gamma_2 = \frac{0 - x}{0,667}$
	X3 (Average)	$1 - \gamma_2 = \gamma_3$
0≤x<0,333	X3	$\gamma_3 = \frac{0,333 - x}{0,667}$
	X4 (Above average)	$1 - \gamma_3 = \gamma_4$
0,333≤x<0,667	X4	$\gamma_4 = \frac{0,667 - x}{0,667}$
	X5 (High)	$1 - \gamma_4 - \gamma_5$
0,667≤x≤1	X5	1

The last step is to determine the value of the final factor according to Formula 4:

$$y = \sum_{j=1}^{5} y_l \sum_{i=1}^{N} r_i \lambda_{ij} \quad (4)$$

$$y_j = 0,833 - 0,167 * (j - 1)$$

y_j – nodal points of triangular numbers,

r_i – weight of i-th factor,

λ_{ij} – the value of the membership function of the j-th quality level relative to the current value of the i-th factor,

5 – the number of classifier levels.

Findings and Results

Following this analysis, the Arctic regions of the Russian Federation were rated according to their level of readiness for reindustrialization (Table 4).

Table 4 - Rating of the Arctic regions of the Russian Federation in terms of readiness for reindustrialization

Position	Region	The level of readiness to re-industrialization	
15	Krasnoyarsk krai	0,65981	Above average
38	The Republic of Sakha (Yakutia)	0,557452	Average
47	Yamal-Nenets Autonomous Okrug	0,507706	Average
48	Arhangelsk region	0,507206	Average

53	Murmansk region	0,488998	Below the average
58	Komi Republic	0,471167	Below the average
66	Nenets Autonomous Okrug	0,43259	Below the average
78	Chukotka Autonomous Okrug	0,408385	Below the average
82	Republic of Karelia	0,38654	Below the average

The following conclusions emerged from the analysis:

1. Krasnoyarsk krai

According to the analysis, the Krasnoyarsk krai takes a high position - 15th place, but if we look at the value of 0.659, then we can see that it is only slightly above the average level in Russia and it has something to work on. To illustrate this, diagram have been constructed on the selected factors (Figure 1), which illustrate where the region has succeeded and where it needs to strengthen its activities in order to make a successful transition to re-industrialization.

The potential of Krasnoyarsk Krai is generally assessed positively, with the exception of the environmental sector. The most positive level region has in investment capacity, but the human capacity demonstrates a poor situation. Environmental capacity is negative.

In a detailed examination of the influencing factors in Figure 1, it is noticeable that the region needs to increase such indicators as the number of educational institutions of higher education and scientific organizations (X7), income per capita (X8), the place in the ecological rating of regions (X11), as well as the innovative activity of organizations (X13) and the number of researchers with academic degrees (X16).

Fig. 1 : Factors forming the Krasnoyarsk Krai reindustrialization capacity

2. The Republic of Sakha (Yakutia)

The Republic of Sakha (Yakutia) takes 38th place out of 85 regions with an average level of readiness for reindustrialization. The leading area of the region is an industry, and the weakest is the innovation sphere. There are three areas with negative level: innovative, human and environmental.

Figure 2 shows that the region should pay attention to the volume of innovative goods, works, technology services (X5), the costs of technological innovations (X6), internal research and development costs (X14), the annual average number of employees (X15) and number of researchers with academic degrees (X16).

Fig. 2 : Factors forming the Republic of Sakha (Yakutia) reindustrialization capacity

3. Yamal-Nenets Autonomous Okrug

The Yamalo-Nenets Autonomous Okrug takes 47th place in terms of readiness for reindustrialization, its leading area is the investment sphere. The weakest area of the region is innovation, but human capacity and environmental capacity are also poor. The highest capacity region has in investment field.

The region's lowest indicators are observed for such factors as the volume of innovative goods, works, technology services (X5), the costs of technological innovations (X6), internal research and development costs (X14), annual average number of employees (X15), and the number of researchers with academic degrees (X16) (Figure 3).

Fig 3 : Factors forming the Yamal-Nenets Autonomous Okrug reindustrialization capacity

4. Arkhangelsk region

Arkhangelsk region takes 48th place in terms of readiness for reindustrialization. The most developed areas of the region are environmental and industrial capacity, and the weakest are investment capacity.

The region has low technological innovation costs (X6), small investments in fixed assets (X9), low solid public road density (X12) and a small number of researchers with academic degrees (X16) (Figure 4).

Fig. 8 : Factors forming the Arkhangelsk region reindustrialization capacity

5. Murmansk region

Murmansk region is 53rd in terms of readiness for reindustrialization. The leading areas of the region are ecology and industry, while innovation and investment are very poorly developed.

Analyzing Figure 5, it can be noted that the lowest factors are the volume of innovative goods, works, technology services (X5), the costs of technological innovations (X6), the density of public roads with hard surface (X12), the internal costs of research and development (X14).

Fig. 5 : Factors forming the Murmansk region reindustrialization capacity

6. The Republic of Komi

The Komi Republic is 58th in terms of readiness for reindustrialization. The leading areas of the region are ecology and industry, and the weakest are innovations.

The region lags behind on the following factors: internal costs of research and development (X14), the volume of innovative goods, works, technology services (X5), the cost of technological innovation (X6), the density of public roads with hard surface (X12) (Figure 12)

Fig. 6 : Factors forming the Komi Republic reindustrialization capacity

7. Nenets Autonomous Okrug

The Nenets Autonomous Okrug ranks 66th in terms of readiness for reindustrialization. The leading directions of the region are ecology and industry and lagging – innovation.

Figure 7 shows a significant lag in internal spending on research and development (X14), the annual average number of employees (X15), and the number of researchers with academic degrees (X16).

Fig. 7 : Factors forming the Nenets Autonomous Okrug reindustrialization capacity

8. Chukotka Autonomous Okrug

In terms of readiness for reindustrialization, the Chukotka Autonomous Okrug takes 78th place. The leading areas are ecology and industry, and the weakest are investments.

It is important for the region to focus on the following factors: investment in fixed assets (X9), the density of public roads with hard surface (X12), internal research and development costs (X14).

Fig. 8 : Factors forming the Chukotka Autonomous Okrug reindustrialization capacity

9. Republic of Karelia

The Republic of Karelia is 82nd in terms of readiness for reindustrialization. The leading areas are ecology and industry, and the weakest are investments.

Fig. 9: Factors forming the Republic of Karelireindustrialization capacity

The region lags behind on the following factors: the volume of innovative goods, works, technology services (the X5), the cost of technological innovation (the X6), internal spending on research and development (X14) (Figure 9).

Limitation

The possibilities of fuzzy sets for the valuing of aggregated economic indicators are limited by the lack of expert and statistical database (information necessary for conducting) the research.

Conclusion

After analyzing all regions of the Arctic region, the authors found a trend in the weak innovative activity. The basis of reindustrialization is innovation based on the development, production, and mass distribution of basic innovations in all sectors of the region's economy, so it is very important to develop this area in the regions.

In order to stabilize and revitalize the innovations of regions, it is important to:

- to intensify innovative activities in order to create new competitive products and improve the quality of products to world-class level and expand due to this external and internal market for industrial enterprises of the region, etc.;

- maximize the use of scientific advances in the restructuring of the economic sectors of the region;
- form regional science, technology and innovation programs and projects;
- open an innovation center for consulting enterprises when creating new investment projects or promoting existing ones;
- introduce a regional contract system in the field of scientific and technological development;
- increasing the focus of the regional order on scientific, technical and innovative products to solve important regional problems;
- attracting investments from the federal budget and extrabudgetary sources for the implementation of scientific, technical and innovative programs and projects of regional significance;
- stimulation of inventive activity, increasing the level of patent protection of products and technologies; protecting the patent market of the region from the influx of foreign patents;
- assistance in protecting national priority on the results of scientific research carried out at the expense of budgets of all levels and protecting the interests of authors and patent holders of industrial property;
- development of business-innovation planning;
- organization of technology parks, grants, subsidies (Shestak, Shcheka & Klochkov, 2019).

A cluster approach to the implementation of innovation policies can be considered as one way of activating and improving the innovation environment in the region. Clusters create optimal conditions for innovative development (Gromova, 2018).

Partner enterprises gain rapid access to the latest developments of each other and are in a state of organizational, financial and technological interaction. Thus, the cluster organization of production creates a synergistic effect and ensures continuous progressive development. The process of creating innovative clusters should take into account the specifics of the regions: levels of regional innovative potentials, financial security of regional budgets, innovative activity of enterprises in the region, levels of their industrial development.

sstanciu@ugal.ro.

Abstract

Insuring the quality of the agri-food products represents a primary concern at an international, regional and national level. Governmental policies in Republic of Moldova to ensure the food safety is based of the modern principle "from the pitchfork to the fork", that includes monitoring the quality at all the stages of the food chain. The study proposes an analysis of the main regulations and public institutions with attributions in the area of the quality at national level. The sources of documentations were represented mainly by the national legislation in this area, completed with scientific articles and publications from specialized magazines. The research highlighted the attempts of modernization of the national system of quality, with an eye to harmonize it with regulations in the European system. There is a developed legislative framework that it's permanently adapted to the international norms. The National Agency for Food Safety is the main public institution with attributions in the area of the food quality, supported in their actions by the ministries responsible for health, agriculture, economy, financial and intern fields. Although the HACCP system is obligatory, to apply for it isn't generalized at national level. The national standardization system is harmonized to the international norms. Ensuring the quality of grocery products in Republic of Moldova is an extensive process that requires efforts from public institutions, but also from the consumers. Even though there are certain progressed registered the last few years, lack of the staff, insufficient funds or difficulties in applying the legislation specific for food products there are problems the quality system faces in Republic of Moldova. The done research is preliminary and sets the basis to certain complex analysis that are going to be developed during the doctoral training program.

Keywords: Quality, Security, Food/Groceries, Control

Introduction

The transition to the market economy - process started in the '90s in Republic of Moldova, applying reform measures in agriculture, the appearance of the private propriety on the farm land fund and also on animals and products of animal origin and coming considerably closer of the economic relations with the European Community led to the necessity of harmonizing national legislation in the area of norms of organizing formal controls specific concerning the food for human consumption. Ensuring the food quality involves an ensemble of measures applied on the whole food chain, starting with the agricultural production, continuing with the processing and placing it on the market for the final consumer and it represents a prerogative of the national policies in the area of the food security and population health. Reorientation of the food export, traditionally destined for the Commonwealth of Independent States until 1992 for the European Union market or for the countries of the Middle East or South-East Asia, with a request of increasing, led to the necessity of modernizing the ways of production and applying certain efficient systems of the quality management, including the control performed by official institutions.

Literature Review

According to writers Enciu and Meleșco (2012), consumers have the right for the consumed food to be without any dangers for health and the personal consumption. In order to align to European norms, Republic of Moldova has developed and recently approved a series of normative acts in the governmental official control in the agri-food industry. Munteanu Pila and Stanciu (2019), proposed a comparative presentation and analysis of Romania and the Republic of Moldova from food security perspective. Although there are important differences between the two countries in providing food for the population, there are also common issues specific to food security. both countries are confronted with the dependence of the import national food market, and the lack of coherent strategies dedicated to food agriculture and food security, the rapid changes in the agricultural sector, as well as in globalization and trade liberalization, lead to rapid changes in the consumers' needs and demands on the food's quality and safety, food security, nutrition, legislation and control.

The first stage in adapting the system of official control to European regulations the Law 590/1995 was adopted, concerning the standardization to national level, followed by regulations concerning the plant area (1996-2016), the consumer's security (Law 105/2003), aspects concerning the food (Law 78/2004), ecological production (Law 115/2005) or the animal production sector (Law 231/2006) (National Agency for Food Security ANSA, 2020). The activity of the sanitary-veterinary sector is regulated by Law 221/2007. The normative act above-mentioned has put the foundation for official controls in the sanitary-veterinary sector and also regulating the authorization in the sanitary-veterinary of the activity of the units of economical profile. The initial legislation was completed with a series of legislative regulations, so that at the moment on the agency's web site are present about 25 laws specific to the area (ANSA, 2020).

To ensure the food security it's necessary to consider all the aspects connected to the chain of growth, production and even placing the food on the market as a whole continuous process, due to the fact that these elements separately among themselves can influence the quality of the food production (Brădățan and Enciu, 2007. In the actual conditions the legal and methodical support, of the institutional structures, of the human potential and the necessary material, general evaluation of the food security in the food chain proves that the weak links are the final ones: companies of public and trade food enterprises (Opopol, 2014). The recent increase in fraud in the food sector, but also a better organized activity of official controls in the field was presented by Munteanu Pila and Stanciu (2018). Proper management of natural resources can allow the sustainable use of agri-food products in Moldova, being required a number of monitoring and control measures at the national level.

Materials and Methods

In the conducted research were used statistic information from the reports of the National Agency for Food Security from Republic of Moldova concerning the multi-annual national plans of control between 2016-2018. For the bibliographic research were used specialized publications selected from the data basis Google Academic, Clarivate Analytics or Scopus. The statistical data were analysed and the obtained results were interpreted based on the national legislation to highlight the efficiency of the authority of control and appreciation of the degree of conformity from the food area of Republic of Moldova with legislative regulations in force.

The Food Quality System in Republic of Moldova

Ensuring the quality of the agri-food products has become a necessity in Republic of Moldova, in the technological conditions (that allows producing certain products with superior physicochemical and sensory properties), of the globalization and dynamic properties of the quality (Agrobisznes, 2020).
According to the National Strategy in the area of the food security, the responsibility for regulating the policy concerning the food security lays on the Agriculture, Regional Development and Environment Ministry, being partially shared with the Health, Labor and Social Protection Ministry or other institutions (Government of Republic of Moldova, 2019).

The consolidation of the quality infrastructure in Republic of Moldova was started in 2006, at the same time with the Quality Infrastructure Conception that rationalizes the modernization of the legal framework, is based on the standardization norms, on the evaluation of the product conformity and on a national program to elaborate technical regulations, the already existent legislation, but without consistency support within a clear conception of development of the quality infrastructure at national level.

Subsequently, the institutional aspect of the food security being approved in 2011, the National Strategy in the food security area in the period between 2011-2015, a document that was going to stabilize, based on certain reference models of certain European States, a personal approach of organizing the food security and of execution of the institutional structure responsible for this area.

The main directions concerning the modernization of the quality system in Republic of Moldova included:

- **National Standardization System**

The standardization of products and services in Republic of Moldova is based of Law 590/1995. Executing the national policies is the attribution of the Standardization Institute of Moldova (ISM), public institution subordinated to the Ministry of Economy that carries its activity in accordance with the provisions of the Law 20/2016 concerning the national standardization. SIM (ISM) organizing and functioning are regulated through the government's decision No. 996/2012. The standardization of the food in Republic of Moldova is voluntary, being marked with the "SM" logo. The standardization becomes mandatory, if adopting a certain technical regulation makes reference to a specific standard. At the moment about 27,000 standards (of them about 6,000 related to the European ones) are adopted in Republic of Moldova. The Standardization Institute of Moldova is responsible for the adoption of the European standards (EN) and international (ISO) in the food area, for e.g.: test methods, national sampling methods etc. For the agri-food export, necessity of national standards is established in the delivery contract (Source ISM, 2020).

- **Technical regulations in the agri-food area**

Technical regulations represent the basis determining the minimal requests for quality and security that the agri-food products must have. The system is founded by the Government's Decision 873/2004 "Concerning the approval of the National Program for the elaboration of technical regulations", completed by Law 420/2006. National technical regulations usually are elaborated based on international standards, but if there are national standards elaborated according to the international ones of relevant regional ones, then they'll become the basis of those technical regulations. In Moldova there are over 100 technical regulations adopted at the moment and the level of the agri-food chain (where about 40% regulations are concentrated), governmental decisions include technical regulations for each product category placed on the market (Source Agrobisznes, 2015).

- **Assessing the compliance of products with legal requirements**

The agri-food conformity evaluation is correlated to the National Standardization System and the ensemble of technical regulations in the agri-food area. The evaluation activity of the conformity if regulated by the Law 235/2011. When commercializing the food products, the trader has to have a certificate of conformity (issued by the certified organ), a tests report (issued by an accredited laboratory) or a hygienic notification, as it is established in regulations. For products intended for export, the existence of the conformity certificate isn't mandatory, if in the export contracts it isn't indicated the obligation of this certificate or if this conformity certificate isn't a necessity for the importing country (Agrobisznes, 2015).

- **Quality Systems Management (ISO, HACCP)**

In Republic of Moldova, the norms of the Hazard Analysis and Critical Control Point System HACCP become mandatory starting with 2010, according to the Government's Decisions 412/2010 and 435/2010 concerning the hygiene rules and food products. The HACCP system started being implemented in our country starting with 1998 in the units of producing preserves, due to the external partner's requests. The HACCP didn't get a generalized spread at the national level, although it is mandatory for processor categories. According to Agrobisznes, in 2015 the exact number of factories that implemented the HACCP system in Republic of Moldova isn't known (Agrobisznes, 2015).

National Institutions with attributions in food quality assurance in Republic of Moldova.

The strategy of Republic of Moldova of agricultural and rural development for 2014-2020 (approved by the Government's Decision No. 409/2014), and the Strategy concerning the food security for 2018-2022 (approved through the Government's Decision No. 1150/2017) have the main objective of ensuring a fair living standard for farmers, stable supply with food secure for consumption for affordable prices for consumers.

According to official regulations, the competent authorities with responsibilities in the food security area are:

- Ministry of Agriculture, Regional and Environment Development,
- Ministry of Health, Labour and Social Protection via The National Agency for Public Health,
- Ministry of Intern Affairs,
- Ministry of Defence,
- Ministry of Finances, via the Customs Service
- National Agency for Food Security, that is supposed to coordinate the authorities in the food security area.

National Agency for Food Security ANSA

ANSA is the administrative authority with national activity responsible for implementing the government's policies in the area of regulating and controlling the security of the food and in the sanitary veterinary area, zootechnical, of plant protection and the phytosanitary quarantine, seed control for food security, quality of primary products, food products and food for animals. Having in its structure the Direction for the control of quality and quality systems, ANSA has become the main factor in ensuring the agri-food quality during the whole production chain, according to the concept "from pitchfork to fork".

The Agency was created in 2013 by the Government Decision Nr. 51/2013, by reorganizing some central national institutions with control functions and surveillance in the sanitary-veterinary area, phytosanitary surveillance, public health surveillance (Sanitary-Veterinary Agency and for the Food Security of Animal Origin - responsible for implementing and monitoring the policies and strategies in the sanitary-veterinary area and the security of the Food of Animal Origin; The General Inspectorate for Phytosanitary Surveillance and Seed Control - responsible for implementing the government's policies in the phytosanitary quarantine area, protections of plants, seed control, and also cereals' quality and the derived products, producing and trading tobacco and tobacco products). (ANSA, 2016). ANSA activates based on Law Nr. 113/2012 concerning the principles of stability and general requests of the law regarding the food security No. 221-XVI/2007 regarding the sanitary-veterinary activity, on Law 228/2010 regarding the protection of plants and the phytosanitary quarantine, and also a Government's Decision No. 600/2018 regarding the organization and functioning of National Agency for Food Security.

The procedure and the method of performing official controls in the sanitary-veterinary and phytosanitary areas are regulated at national level via specific legislation, available on the agency's web site (ANSA, 2020). A specific element, that differentiates the agency's activity compared to other authorities of control in Republic of Moldova, is that the planned controls aren't announced beforehand, as with other official institutions. This element increases the degree of objectivity in evaluating the unit submitted to verification, ensuring an identification of the potential risk factors in that exploitation.

The Multi-Annual National Plan of Control in Republic of Moldova in supervising the food products, of animals' health and plants' health is a strategic document that stipulates the governmental functions delegated to the National Agency for Food Security. The document provides the measures that are going to be taken in the period between 2016-2020 during the official control in the mentioned areas and offers oriented, including for the stipulations of the plans for yearly controls (ANSA, 2016). Organizational structure of the agency includes 23 territorial entities and 7 inspection posts at the border. The agency's selected staff comprises 1330 jobs, and 223 of them are in the central structure, 150 inspection posts at the border and 957 in the territorial subdivisions. Actually, in the ANSA, in 2019 there were 1,144 employees and their distribution if represented in Figure 1.

Figure 1: Distribution of the ANSA employees on divisions (2018)
Source, The Author, based on ANSA (2019).

The biggest staff deficit in 2019 is seen at the central level, there were 88 jobs aren't covered (Figure 2). Because of the staff shortage, the agency registered a decrease of the number of official controls done in the area of animals well-being and protection, doing activities of official control reported to the number of objectives that must be verified being effected (ANSA, 2019).

Figure 2: Covering the necessary staff for ANSA (2018)
Source. Author, based on ANSA (2019).

ANSA exerts the quality of founder in certain public institutions that have administrative and technical control on these institutions.

- The Republican Centre for Veterinary Diagnosis is a national reference laboratory in the veterinary area, food security and food for animals, areas of competence of the centre being the following ones (Government of Republic of Moldova, 2018):

- Laboratory investigations concerning the animal's health;
- Laboratory investigations in the area of security and quality food of animal origin and food for animals;
- Laboratory investigations in the area of verifying the quality and the harmlessness of medications of veterinary use;
- Evaluating the risk and scientific research in the area of activity;

- The public institution "Central laboratory of testing the alcoholic and non-alcoholic beverages and preserved products" IP "LCTBANPC", the Center's areas of competence being the following ones (IP "LCTBANPC", 2018):

  - Providing analysis services regarding the security and quality of the food, of the raw materials and alcoholic products;
  - Organizing the lab and sensory analysis for alcoholic products and food products;
  - Providing evaluation services of alcoholic products conformity and food products;
  - In other areas, through legislation, including the founder's documents, in the laboratory's competence;
  - Testing the quality and harmlessness of the alcoholic products, collected by the organs performing control and surveillance of the alcohol products;
  - Doing the arbitration tests regarding the quality and harmlessness of the alcoholic products;
  - Providing the methodological help regarding the done control on the quality and implementing new methods of testing the quality and harmlessness of alcoholic products;
  - Elaboration, revision and execution the technical-normative documents;
  - Implementing methods of control of the quality and harmlessness of alcoholic products according to European and international practices;
- The Central Phytosanitary Laboratory performs their functions of control, supervising and monitoring of the National Governmental Programs in the phytosanitary area, as it follows (Ministry of Justice, 2020):

  - Verification and identification of the phytosanitary situation, plants protection and nutrition, soil fertility;
  - Verification of the quality of products of phytosanitary utility, pesticides residues in plants and vegetal products;
  - Verification of the seed and seedling material quality, the agri-food products quality and of the products involved in the ecological agriculture;
  - Providing testing services regarding the harmlessness of products of phytosanitary utilization.

Control points at the border are responsible for the sanitary-veterinary and phytosanitary at the border of living animals, food and plants, animal feeds, medications, pesticides in order to protect the animals and plants health, public health, preventing the introduction of epizootic diseases on our country's territory. The rehabilitation the Check Points at the Border, done with the financial support of the World Bank Group is integrated in the concept of implementation of the unitary system of official control. During this activity, the reconstruction and re-utilization of five check point at the borders with the European Union and Ukraine: PCF (Check Point at the Border - CPB) Leușeni, PCF (CPB) Giurgiulești, PCF (CPB) Palanca, PCF (CPB) Criva and PCF (CPB) Tudora.

The way of performing official controls and supervising the products of animal and non-animal origin, of units of retail and public food, of pharmaceutical products for veterinary use, of animal food are provided in the National Multi-Annual Plan of Control of ANSA. The yearly plans for monitoring residues concerning red meat, products of meat, eggs, natural honey and fish are also elaborated.

Execution of governmental official controls takes place in two situations:

- Control actions performed according to the yearly plan, done according to the planned control

- Unforeseen official control, if there is a complaint made by a consumer, another third person or when possessing truthful and probative information that in that controlled unit there are risks related to food security (Figure 3).
-

Source: Authors, by using Law No. 131/2012.

The unforeseen control is compulsorily accompanied by the control delegation and by the informative argumentative note, respectively of motivation regarding the initial unforeseen control from the office. Harmonizing the legislation in the sanitary-veterinary area under the control and accomplishing it by the veterinary doctors of free practice.

Ministry of Agriculture, Regional and Environmental Development

According to the Government's Decision 695/2017, the Ministry of Agriculture, Regional and Environmental Development elaborates documents of policies, of projects of legislation in the food security area and executes the function of founder of the National Centre of Verification and Certification of the Vegetal Products and of the Soil, and also of the Agricultural Informational Centre, responsible for implementing the e-Agriculture strategy, of informational automatized systems of administration and of management of business processes in the agro-industrial area, including the functional improvement of the Agency's activities.

Ministry of Health, Labour and Social Protection

Via the National Agency for Public Health ensuring the identification, evaluation of the management and communication of risks in the area of the harmlessness of food products for public health, of the population's health and nutrition; preventing disease caused by food products; epidemiological research and registration of disease outbursts caused by food; supervising the health situation and the level of knowledge of the staff regarding the hygiene norms in the units that produce, store, transport and trade food products or provide services of public catering; authorizing and supervising on the market of the new food, of the food supplements, fortified food products, mineral waters, drinking water from the system, of the nutrition and health mentions inscribed on the food products, of the materials that come in contact with food products, food additives, food for infants and toddlers, of the food for special nutritional destination; warning and supervising the nutritional labels of the food.

The Ministries of Internal Affairs and of Defence have attributions in the area of the food quality established, especially in situations in crisis.

Ministry of Internal Affairs MIA

The attributions of the Ministry of Internal Affairs in the food area mainly refer to supporting ANSA's actions, if needed and if there are specific crisis situations / food crisis. In emergency situations, MIA ensures via the Material Reserve Agency, from the State Reserve, the products and the goods strictly necessary for operational interventions for the protection of the population, economy and national security, according to the established procedures.

Ministry of Defence

In crisis situations, the Ministry of Defence coordinates and organizes the activity of sanitary-veterinary inspection and for the food security in the structures of the Ministry of Defence, they coordinate the elaboration of regulations specific for the inspection sanitary-veterinary and for the food security in the military units, it controls and monitors the operators from the food business who carry their activity in the spaces that belong to military institutions; they find and report the contraventions from the sanitary-veterinary legislation and for food security; they elaborate periodical reports regarding the activity of public and sanitary-veterinary health in the area of food security.

Ministry of Finances (MF), via the Customs Services collaborates with the staff with control attributions within the Agency to eliminate the risk of introduction in Republic of Moldova of goods that don't meet the sanitary-veterinary requirements established in the legislation in this field. Furthermore, the MF exercises the function of point of contact within the SRAAF and they take part to information exchange within the system, accordingly to their competences.

The National Agency for the Consumer Protection

The agency in an administrative authority subordinated to the Ministry of Economy and Infrastructure, responsible for implementing policies in the consumer protection area and for executing the governmental control regarding the product compliance and/or of services placed on the market to the requirements required or declared and respecting the provisions of the normative acts in the area of the legal metrology, of norms and rules for carrying out trade activities (Ministry of Economy and Infrastructure, 2020).

The National Agency for Public Health

The supervision of the public health, occupational safety, circulation of medications and para-pharmaceutical products, controls of medical devices, including their radiology and nuclear safety, of the provided medical services, the pharmaceutical activity, the activity regarding the transplant area. Consumer protection in the medical, pharmaceutical and para-pharmaceutical products area, of the provided services by the pharmaceutical and medical institutions, and also in the area of other products and services made available for the consumer by the pharmaceutical and medical enterprises and institutions (Ministry of Economy and Infrastructure, 2019). According to the last legislative harmonization, ANSA took other the competence of control on the entire production chain and food circuit. Starting with 2018, after legislative modifications, the agency holds the whole control without interrupting or initiating the delegation of certain decisions by other control authorities regarding the applying sanctions or restrictions about food or managing certain crisis situations, as it was until 2018 when the authority had to delegate certain situations to the National Agency for the Consumer Protection or the National Agency for Public Health.

Conclusions

Confronted with many internal and external challenges, the infrastructure of the agri-food quality in Republic of Moldova enforces the modernization measures in the legislative framework and of the agri-food succession flow. Founding the National Agency for Food Security - ANSA, simplified in a certain measure the activity of the profile public institutions, that were concentrated in one single authority.

Reforming the national system of regulations in the area of quality and its harmonizing to the European requirements represents a lengthy process imposing efforts from the side of both national and local authorities and also traders with food profile.

Abstract

The advancement and diffusion of Web technology forced the availability of information with quality and easily accessible. Such requirements have actively engaged Human-Computer Interaction (HCI) research community to ensure that IT interfaces can be used on an equal basis by users with disabilities and older users. It is therefore essential that the interface is easy to use and that it meets the expectations and needs of all users.

The advancement and diffusion of technology, particularly the Internet, requires providing quality and easily accessible information. These requirements confirm the relevance of the role of the interface as the main element of user interaction with information systems.

The development of interfaces that satisfy users with different needs, use their motor and perceptual, cultural and social skills is not a simple task. According to several experts and pioneers in HCI, interfaces must be built respecting the principles of user-centric design, using a high level of use and in compliance with the guidelines of basic accessibility so that all the aspects of a user's experience (UX) in such environments are considered and covered.
We realize that interfaces are still an important research, worth exploring for its potential to create accessible personalized interfaces. That's the aim of this work when proposing a methodology for assessing dynamic websites accessibility which can be applied throughout or in the end of the development phase. This evaluation is based on an open document made available by the World Wide Web Consortium (W3C) regarding accessibility guidelines, a standard to ensure the long-term growth of the Web through the Web Accessibility Initiative (WAI).

Keywords: Universal Web Access; Web Accessibility Assessment; Human-Computer Interaction; Interfaces.

Introduction

Accessibility and Universal Access are not new concepts. However, in view of the population that is aging and of the constantly increasing technological complexity, they become not only timely, but also pivotal for the prosperity of future societies (Stephanidis, C. et al., 2019). In this sense, accessibility standards were established in national legislation. In September of 1999, Portugal regulated the adoption of rules for accessibility to information made available on the Internet by the Public Administration.

Afterwards in June 2000 the European Commission's – eEurope 2002 An Information Society for All – action plan[1] was approved, which included among other measures, the commitment to adopt guidelines on accessibility, Web Content Guidelines Accessibility (WCGA), from the World Wide

Web Consortium (W3C), made available by Web Accessibility Initiative (WAI), on public Websites until the end of 2001.

The accessibility standards defined by the accessibility guidelines for Web content, WCGA2.1 (latest version), allows to meet the needs of different groups and situations through three levels of compliances, namely: A, AA or AAA. Level A is the minimum required for a Website to be accessible by a group of users with a low degree of disability (WAI, 2018).

It is also to be employed by international standardization organizations, which signifies that on a political level it is not only of importance for people with disabilities, but anyone can also benefit from universal access approaches, as it is now clear that one's abilities are constantly changing (Persson et al., 2015).

In Portugal we had to put hands-on work after the publication of a resolution of the Council of Ministers (no. 155/2007) made with the purpose to establish guidelines regarding the accessibility of Government Websites and services and public institutions of the Central Administration on the Internet to citizens with special needs. This resolution recognizes that the 97/99 resolution had no practical effects. With this new legislation, it has been defined that only informative Websites must comply with WCAG 1.0 level A, within three months from the date of its publication, while Websites with transactional services must comply with level AA, within six months.

A task-force has been established with advisory functions, consisting of representatives of the Administrative Modernization Agency, responsible for its coordination, of UMIC - Knowledge Society Agency of the National Rehabilitation Institute - and the Government Network Management Centre – which shall work in articulation with the General-Secretariat of the Presidency of the Council of Ministers, and shall contribute towards the proper identification of technical requirements for accessibility, namely those related to conformance level "A" and "double-A", and provide further cooperation as far as technical advice is concerned. This time we could see the results and real effects mainly on public administration Websites accessibility.

The WCGA guidelines, not being mandatory for non-public Websites, have come to guide and encourage Webmasters to reach a certain level of accessibility in the Websites they manage, certified by posting one of the W3C logos in the homepage.

Brief Literature Review

When the accessibility issues arise, several authors, such as Sloan, D. et al. (2000), Nielsen, J. (2000), Brajnik, G. et al. (2006,2008), Rutter, R. et al. (2007), Foley, A. (2011), Stephanidis, C. (2011,2014), within many others, started to systematize and study the assessment of accessibility (and usability), establishing different methods and variables for practical application. Several studies and methodologies have recently appeared, combining objective and subjective measures, using manual or automated tools. We have selected a few representative publications between 2015 and 2020; it is well known, within the IT community that five years is a long time due to its rapid transformation and evolution.

Aizpurua (Aizpurua, A., et al., 2015) published an article in *the Computers in Human Behavior* journal about what extent the expectations and confidence influence experienced accessibility on the Web. Coming to the conclusion that the evidence suggests that compliance with accessibility standards does not always guarantee a satisfying user experience on the Web. So, to fill this gap and in order to meet the literature indications, its decisive address the expectations users have about online content and functionalities. To do so, 11 blind participants were involved and enquired through interviews and questionnaires about 12 tasks they completed in four Websites. They found that "Identifying the nature of expectations is key (i) to formalize more exhaustive user testing protocols and (ii) to complement and complete existing accessibility guidelines."

Crespo et al. (2016) developed an automated tool to analyse Websites to detect accessibility problems automatically; after this, a guided assistant is used to offer adequate solutions to each detected problem. This approach can be useful to improve the level of accessibility of many Websites for people, besides experts.

Later, Schmutz, S., et al. (2016) questioned if the Implementation of the recommendations from Web Accessibility Guidelines would also provide benefits to nondisabled users, assured that contrary to some concerns in the literature and among practitioners, high conformance with Web accessibility guidelines may provide benefits to users without disabilities. Recognizing that the user's evolvement became fundamental at some stage of the Website development.

A year later, we found an interesting investigation from Aline Silva (Silva, A. B. P. D, 2017) about the ccontinuous assessment of accessibility to support the evolution of Websites. A study was carried out, supported by an automatic accessibility assessment a tool and a questionnaire adapted to support developers on finding and fixing the accessibility faults. A direct contact was used too, to alert the Website managers about the faults founded. Due to the lower adhesion and realizing that if these faults, if not validated again by experts or with the support of the tools, will cause a regression in the quality of the Website. This work had as main objective "to test the hypothesis that the adoption of a continuous process of validation of accessibility of Websites allows to keep them accessible, despite maintenance and modifications made throughout its existence" (Silva, A. B. P. D, 2017).

Still in 2017, Abduganiev, S. G. (2017) made a comparative study towards automated Web accessibility evaluation published in The International Journal of Information Technology and Computer Science. The purpose of this empirical research was to assess and compare eight popular and free online automated Web accessibility evaluation tools (AWAETs).

The main motivation was the necessity to "emphasize that one should not forget that the disabled are also human beings and they are in large numbers" once they consider the average accessibility level of sites to be very low.

The conclusions were compiled on a final report where they reported nineteen pros and fourteen cons of AWAEMs, fifteen recommendations for the AWAEM's quality improvements. Since then, it was possible to fix the cons founded and choose the AWAET more appropriate to each case and "consequently contribute to rational use of AWAEMs in evaluating and enhancing Web accessibility".

Few months later, Abascal, et al. (2018) published a study *in the Web Accessibility. Human–Computer Interaction Series*, about the same subject: Tools for Web accessibility evaluation. More tools came up to perform diverse types of automatic accessibility evaluations and on-site and remote evaluations with users can also be supported by specific tools. Even manual evaluations may be supported by crowdsourcing-based tools. It was necessary to investigate the importance of these innovations in the advancement of Web accessibility. This study concluded about the need for tools-based Web accessibility field and made a review about the main characteristics of those tools used in this area, providing insights about their effectiveness.
Acosta-Vargas, P., et al. (2018) presented a paper, in the *International Conference on Information Theoretic Security,* where they propose a combined method for evaluation of Web accessibility grounded in several studies that recommend combining some methods with each other to achieve better results. In this study they applied the Web Site Accessibility Assessment Methodology (WCAG-EM) considered in the Web Content Accessibility Guidelines 2.0 (WCAG 2.0). From the results, we conclude that most tested Websites can achieve an acceptable level of compliance and as future work they will focus on optimizing this combined approach originating a guide to help develop more inclusive Websites.

A very recent study published in *Interacting with Computers* journal, from the seniors researchers, Brajnik & Vigo (2019) took a step forward as they realize "the fact that several Web accessibility metrics exist may be evidence of a lack of a comparison framework that highlights how well they work and for what purposes they are appropriate." So, it wasn't a matter of guidelines compliance, yet criteria

that can be used to assess the quality of existing metrics and to analyse some of the automatic ones. The they propose and demonstrate a feasible framework that comprises validity, reliability, sensitivity, adequacy and complexity of metrics in the context of four scenarios where the metrics can be used. The insights obtained lead to "focus more on quality aspects of accessibility metrics with the long--range goal of improving the effectiveness of accessibility engineering practices."

Most part of the studies presented referred that the results obtained, after applying WCGA or any metrics (automated or not), were very accurate, but only useful to confirm the formal aspects of the Website. In other words, it wasn't possible to conclude whether it is, in fact, fully usable by users with disabilities. The accessibility of the Website cannot be summarized using a single, quantitative accessibility score, only observing real users interacting with the interface, can be conclusive about the real degree of accessibility of the Website.

Pereira, L. S., et al., (2015), "in order to ensure the access of the visually impaired to all information provided online it is necessary to remove existing barriers on the Websites through several existent approaches, from recommendations to Web development to validations of existing Websites" developed a methodology for a preliminary Web accessibility evaluation method through the identification of critical items with the participation of visually impaired users. Only during the user's navigation through the Website would be possible to detect interaction issues. So, "in this scenery, this study uses previous researches on the subject and Web accessibility rates in order to identify those barriers commonly founded by these users with total visual impairment, as well as to come up with a list of recommendations in order to optimize the evaluation process." This research contributed with a methodology to conduct evaluations with insights from the real users and the visually impaired users.

With regard to user's participation, Borsci, S., et al. (2015) presented a paper, on a scale of satisfaction assessment involving disabled users in the usability testing of Websites, in the International Conference on Human-Computer Interaction. They implemented a usability test with blind and sighted users to observe the differences between the two evaluation. As they say, "the insight of disabled users could be a key factor to improve the usability of those interfaces which aim to serve a large population, such as Websites of public administration and services. If the Website is usable it must be accessible, once usability encompasses accessibility Yesilada, Y., et al. (2015)

To sum up this brief review, although the few studies with real users, the recommendations from the literature indicate that not to stick with assessing compliance with WCGA or other standards for Web accessibility but, complement the study, whenever possible, with real users.

Now and in what regards to the assessment methodology itself, we could observe a wide range of automated tools mentioned above. While doing this, an obvious question arises: should we use only automation tools, manual tools or a combination of both?

As the literature says, trough the more influential authors in the last 30 year like Nielsen, J., Loranger, H. (2006), Rutter, R., et al. 2007), Brajnik, G. (2008), Foley, A. (2011). Stephanidis, C., & Antona, M., 2014), Shawar, B. A. (2015), (Crespo, R. G., et al., (2016), Silva, A. B. P. D. (2017), Gonçalves, et. Al. (2018), (Abascal, et al., 2018), (Acosta-Vargas, P., et al., 2018), Stephanidis, C., et al., 2019), the automated tools are very useful, providing significant insights to the evaluator, specifically in what regards to formal Website's structure. On the other hand, manual tools can become impractical in medium or large Websites.

Recently, Mucha, J. M. (2018) conducted a study with a combination of automatic and manual testing for Web accessibility where his "research confirmed the hypothesis that outcomes from manual and automated Web accessibility evaluation can be combined on the grounds of implemented guidelines. The study has shown that there is no need to choose either manual or automated method of accessibility testing. Both methods can be deployed in a synergistic way and complement each other." The integration of manual and automated evaluation (WTKollen testing tools), can cover up to 57.9% of the criteria of WCAG 2.0 on Level AA. Previously, the maximal coverage for testing, using only one method (either automatic or manual) was equal to 42.1% and 28.9%, respectively.

An integrated methodology to assess Web accessibility, combined with manual and automated methods, can become a very useful tool to uncover different type of inconsistencies. In the next section a proposal is depicted, which can be used, simultaneously by the experts as well as the non-experts.

Methodology: Methods, techniques, and tools

This section is proposed as a methodology grounded on the review of the literature and on the information analysis provided by the WAI form the W3C to assess the level of compliance of a dynamic Website along the standards defined by the accessibility guidelines for Web content, WCGA 2.1 [5]. The main guidelines are grouped into four principles: Perceptible, Operable, Navigable and Robust.

We believe that the first step in assessing the accessibility of a Website is to conduct a preliminary study, to detect the most evident accessibility problems with the Easy Checks – A First Review of Web Accessibility, a document provided by WAI (Easy Checks – A First Review of Web Accessibility). This can be performed by free automated Tools (WebDev Toolbar, which is an extension added to the browser).

This first review covers just basic accessibility issues; we can confront this result with a more robust assessment to evaluate accessibility widely in order to fix the main issues.

According to the specifications found in the WAI, also supported by the literature, one of the most effective strategies to test the accessibility of a dynamic Website would be:

1. **Define the scope of the evaluation**
2. **Use tools for automatic assessment of accessibility on the Web**
3. **Manually evaluate examples of representative pages**
4. **Summarize and present the results**

The action plan must consider specifically the compliance with the requirements displayed on table 1.

Table 1. Action Plan

ACTIONS	REQUIREMENTS
Action 1. Define the scope of the assessment. the scope must be stated in order to define boundaries of the study.	A1.1. Specify the level of compliance (A, AA or AAA) with WCGA 2.1; A1.2. Select a sample of representative pages of the Website for manual evaluation according to certain criteria and; A1.3. Select a URL (uniform resource locator) for the Website or an expanded selection, for automatic and semi-automatic evaluation.
Action 2. ***Use tools for automatic assessment of Web accessibility.*** It is recommended the use of at least two tools as it helps to eliminate potential errors in the identification of accessibility problems.	A 2.1. It is advisable to use at least two tools in the sample of selected pages, e.g. Wave [12], Taw [13], and to run at least one tool throughout the site (or in the selection of expanded pages); A 2.1. In this way, the validation of mark-ups is obtained, including the syntax and style of the pages;
Action 3. Manually evaluate examples of representative pages.	A 3.1. Examine the pages using at least three graphic browsers, in different versions and platforms.

Manual assessment is somewhat less objective than automatic, with the exception of the directives defined by the WCGA, which are carried out directly, with little room for subjectivity. But it will not be entirely preventable due to the high number of situations that are not likely to be integrated into automatic tools.	A3.2. Examine the pages using specialized text browsers, e.g. Lynx [14], Opera [15] and specialized voice browsers, e.g. the Home Page Reader [16], Jaws [17]. A 3.3. Read and evaluate the content of the pages, checking that the text is clear and simple in its entire length, in a manner appropriate to the purpose of the Website.
Action 4. Summarize & present the results. Refer to the problems and best practices identified on each type of page; the representative URL, as well as the method by which it was identified. Recommend particular attention to the aspects described below.	A 4.1. Correct the accessibility barriers identified through the conformity assessment process; A 4.2. Expand the positive aspects of the Website; A 4.3. Ensure continuous maintenance, as well as Website monitoring.

This preview review, in addition to enabling the identification of significant accessibility barriers, to be eliminated before carrying out the evaluation with users, also helps to define the key points to be tested posteriorly with users.

User's Involvement in Assessing Accessibility

Although checking compliance with accessibility standards remains mandatory, the participation of the users, as we mentioned earlier, helps to understand how the Website really works. The test using disabled users or elderly users permits identify problems that will not be detected using only conformity guidelines assessment.

One of the first studies carried out in the United Kingdom in the early 2004, it's an evaluation report of the commission on the rights of people with disabilities, in which presents great differences between the results obtained in the evaluation according to the standards or according to the users. Means that standards compliance and users tests are not mutually exclusive; on contrary: should be used simultaneously, combined in a proper way naturally.

User involvement bring many advantages, but it is not enough to determine whether a Website is accessible or not, and must be jointed with the assessment of compliance, with the rules to ensure the accessibility of the Website to users with different degrees of disability.

Years later, Aizpurua, et al., (2016) explored the relationship between Web accessibility and user experience (Norman, D. Nielsen, J., 2016) and concluded that understanding the interplay between the user experience (UX) and Web accessibility is key to design Web sites that beyond access, could provide a better UX for people with disabilities.

According to the WAI (2020) disabled or elderly users can be included in a wide variety of assessment activities, from brief consultations to large-scale usability studies, specifically:

> **1.** ***Informal assessment*** of a specific issue, e.g., someone using a screen reader (speech synthesizer) or a special browser that allows you to use only the keyboard and not the mouse.
>
> **2.** ***Testing the formal usability*** of a Website according to a specific protocol to obtain quantitative and qualitative data from specific tasks performed by users. These usability tests can be optimized and address specific accessibility issues.

Last but not the least, according to a WAI document, (*involving users in Web Accessibility Evaluation,* 2020), conducting informal assessments throughout development is more effective than usability testing at the end of the project. The inclusion of users at the beginning of the project helps to understand accessibility issues in the real world, such as people with disabilities or the elderly who use

the Web with adaptive strategies, (e.g., increasing the font size in a common browser) and assisted technologies (e.g. screen readers, screen magnifiers, speech recognition software, selection buttons instead of the mouse and keyboard). Resulting in better end products for users and ensuring a more efficient Website development.

Conclusion and Future Work

Trough out this work was described a methodology, grounded by the literature, for assessing the accessibility of a Website, combining automatic, semi-automatic and manual tests. Compliance with the WCGA 2.1 guidelines was the starting point of the assessment, and once verified, guarantees the accessibility of the Website to a group of users with certain physical disabilities.

As near future work we foresee to apply this methodology to a Website of a digital secretariat of a higher education institution, in order to obtain compliance with accessibility level A: the minimum necessary to guarantee access to the Website by a group of users with low disabilities, such low or lack of vision, or deafness, which allows them to attend or work in an institution not directed to cases of serious disabilities. The evaluation will focus primarily on technical aspects. Thereafter will carry on usability tests with users with physical disabilities, once their experience (UX) helps to ensure the effective application of the technical solutions found WAI (2020).

Results will be published into a user-friendly report format, with recommendations, and made available to the webmaster of the institution, in order to certificate the website as accessible and in compliance with level A WCGA 2.1. Hopefully, soon a logo from W3C will be posted in the homepage.

Silvius STANCIU

"Dunărea de Jos" University of Galați, România,
sstanciu@ugal.ro.

Abstract

In the current global context, the need for safe food is growing and food security is taking on new dimensions**.** This paper has a double objective. First, it provides a review of food safety system legislation in Moldova. Secondly, an analysis is made of the controls performed in the field of food safety. Moldova has exceptional natural resources, favourable to agricultural production and consistent exports. The Moldovan food safety system has registered some gaps compared to the European food regulations, due to the orientation of exports to the Russian market, until a few years ago. Currently, Moldova has signed partnership agreements with the European Union, allowing food exports to the EU market. The paper assessed the food quality control and monitoring system in Moldova, according to the Annual Reports of the National Agency for Food Safety. In the period 2016-2018, official controls focused mainly on food of animal origin. Planned inspections have steadily increased, while unannounced inspections peaked in 2017. After the checks, specific measures were recommendations, but about 200 food production units were closed for critical non-compliance. The study is an initial stage of doctoral research, which proposes a complex analysis of the agrifood system in the Republic of Moldova and of the measures necessary for compliance with Community regulations,

Key-words: quality, security, food, official control.

Introduction

Moldova has exceptional natural resources, favourable for agricultural production. Fertile soil is ideal for growing corn, fruits and vegetables. Due to its geographical location, the country enjoys a moderately continental climate with short and relatively warm winters and long warm amounts, so that early crops can be grown, giving producers a strong competitive advantage.

The strategic purpose of the internal and external policies of Republic of Moldova is integration in the European Union EU. The association agreement with EU was initialled in 2013 and came into force in 2014. Through this agreement, Moldova made a series of commitments. The document contains 395 instructions and regulations, once applied, will make national legislation to be correlated with the EU acquis. The Free Trade Agreement between Republic of Moldova and EU proposes to ensures the economic integration of Republic of Moldova in the community's market and the gradual liberalization of the good and services trade, reduction of customs duties, of technical and non-tariff barriers. Within the policies of the community states according to the basic principle regarding the food security consists in an integrated approach "from farm to consumer", concerning all the section of the food chain, but it also defines the authority's attributions and functions to remove any superposition of the competence areas. The development of commercial relations outlined between Republic of Moldova and the community states has imposed the application of European principles and practices of official control in the European food security area at national level. Harmonization with food safety control practices in the European market opens up new opportunities for local food producers to access the demands of European countries and creates a competitive environment for Moldovan food producers.

Literature Review

In the context of EU integration, national food security policies have proposed a series of actions to harmonize internal regulations with European ones: Law no. 131/2012 on government control over entrepreneurial activity, Law no. 221/2007 for the sanitary-veterinary activity, Law no. 228/2010 on plant protection and Law no. 306/2018 on food security. Last period, the governmental policies were especially focused on the official control system, methodical and logistics support being ensured and harmonized to the European partnership. Food security policy is based on the efforts of those involved in the food chain: producers, processors, carriers and consumers. Food security must become a common responsibility for those involved in the food market. According to the National Food Safety Agency ANSA, procedures and control mechanisms are needed to ensure food safety for consumers (ANSA, 2016). To ensure food safety, legal regulations must be considered as a continuous process, because if they are considered as separate, the quality of food production could be severely affected (Brădățan and Enciu, 2007).

Materials and Methods

The research used statistical information provided by the Multiannual National Control Plan for the period 2016-2018, presented in the ANSA Reports. For documentation were used specialized publications selected from the Google Academic, Clarivate Analytics data base. The statistical information was analysed, and the results were interpreted according to the national legislation, to identify the efficiency of the official controls and to appreciate the non-conformity degree tracked by the control authority in the agri-food area.

Food safety control system in Moldova

In Moldova, the national authority empowered to conduct official control of foodstuffs is the National Agency for Food Security (ANSA). Moldova's food safety agency was established in 2013 as a single food safety control authority for the entire food chain. Along with the Ministry of Agriculture, the main policy maker, this young institution was the FAO project's main beneficiary (FAO, 2018). A national food safety emergency response plan, and regulations to strengthen the food recall system, were drawn up as part of the FAO project. Risk analysis and risk-based inspections, foresight and intelligence in the food chain, and early reaction to food safety threats are essential capacities for a national food safety system. Food safety risk is reduced by applying good practices and the principles of HACCP (Hazard Analysis and Critical Control Points) all along the food chain – from farm to consumer.

ANSA has responsibilities in terms of ensuring veterinary control and animal welfare: seed control; plant protection and health; phytosanitary quarantine; security of biological, chemical, physical food of animal and non-animal origin; animal health; control of contagious diseases in animals, zoonoses and epizootic agents; supervises and monitors the production, import, marketing, use and storage of plant protection products; veterinary medicines and fertilizers; the supervision and control of residues of pesticides, fertilizers, other contaminants or the supervision of the quality of raw materials, food and feed, as well as other areas related to food safety, animal and plant health. ANSA controls on food safety are based on national legislation, harmonized with European regulations. The research made by Munteanu Pila and Stanciu (2019), showed common issues on food security for Romania and Republic of Moldova: dependence on food import, lack of coherent strategies dedicated to food agriculture and food security, rapid changes in food chain, changes in the consumers' behaviour and high requirements on the food's safety, nutrition and control.

In the action plan for the implementation of the Association Agreement between the Republic of Moldova - European Union EU (2017-2019) the list of sanitary and phytosanitary measures included approximately 241 regulations on the agri-food sector, necessary to be harmonized. Law 306/2018 on food security mentions the basic principles on food security: risk analysis, precaution, protection of consumer, transparency of normative acts and specific procedures for the food field. Parts of the current food safety assurance system are in the early stages of transition to Hazard Analysis Critical Control

Point (HACCP) programs. An important element of Law 306/2018 on food safety is the application of the principles of the HACCP in official controls of the food chain. The application of the HACCP principles in the food sector is not a substitute for official controls by competent authorities (Vieru,2017). Food chain operators must cooperate with authorities in accordance with Community or national legislation.

The food safety system includes producers, processors, shippers, retailers, food preparers, and, ultimately, consumers.

Despite the hardships the food security system encounters, the consumers have the right to get food without any dangers for their health and the personal consumption (Enciu and Melești, 2012).

In Republic of Moldova the official controls in the food security area are performed according to the Multi-Annual Control Plan PNMAC 2016-2020 elaborated and approved, considering the principles and requirements, the law regarding the governmental control on the entrepreneurial activity 131/2012, Law No. 221/2007 regarding the sanitary-veterinary activity, Law No. 228/2010 regarding the plants protection, the Regulation of the European Parliament (CE) No. 882/2004 regarding the guidelines for assisting the member states in elaborating the unique national multi-annual integrated plan of control and of the Commission's Decision 2007/363/EC concerning the guidelines to elaborate PNMAC.

Basic principles of the official control must be: prevention; control based on the evaluation of risks; presumption of innocence; legality and respect the competence; the proportionality of the control and it opportunity, legality and respect the competence. The control will be applied only when absolutely necessary and only when other methods of verifying compliance with the law have been exhausted. The proportionality and timeliness of the control implies the exercise of control as soon as possible, in accordance with the stated reason; proof of control actions and acts; non-compliance with the patrimonial interest of the control by removing the direct breakdown in the budget of the control body, respectively of the financial resources coming from the pecuniary sanctions (ANSA, 2016).

Proportionality and opportunity concerning the length of the control - exercising the control as soon as possible, according to the reason stated by the organ of control; the evidence of all the actions and acts of control; not allowing the patrimonial interest of the control by removing the direct breakdown in the budget of the organ of control respectively of the financial resources coming from the pecuniary sanctions. (ANSA, 2016).

Based on an analysis by Vieru (2017), it can be deduced that the main aspects of compliance with food safety rules include actions to verify the requirements of the national veterinary authority, general hygiene issues and compliance with the production process, monitoring programs and quality documents.

The main objective of the controls executed by ANSA is the inspection of the territorial centres, the analysis of the roads of access, complementary spaces, hygiene maintenance. The inspection of production units requires the evaluation of the hygiene of spaces, equipment and tools, sanitary filters, analysis of technological flow, reception and manage of raw materials. During the inspection, ANSA officials verify the standards of food processing, implementation of Food Safety Management Systems, respectively Good Manufacturing Practice (GMP), Good Hygiene Practice (GHP) and others quality requirements (ANSA, 2018).

Munteanu Pila and Stanciu (2018) analysed food fraud in Moldovan fishery sector, and official controls made by ANSA on fisheries products. The judicious management of natural resources allows the sustainable use of agri-food products, requiring monitoring and control measures at national level.

Official controls performed by ANSA between 2016 -2018

Although the Regulation's provisions (CE) No. 882/2004 doesn't apply to controls concerning the health of plants, official controls of the products of protection of plants for marketing and use. The

Regulation and the Commission's Decision 2007/363/EC concerning the guidelines in elaborating the PNMAC requires to be included in the national plan of control measures referring to these subjects. So the multi-annual plan and the reports concerning the implementation of the Multi-Annual Plan of Control for 2016-2020 reflects the activity on all the components of ANSA's activity. Analysing the data represented in Figure 1 it can see a considerable growth of official controls in 2017 compared to 2016. The planned controls registered a growth of 119,06%, but for spot controls the relative growth (143,13% in 2017 compared to 2016). In 2018 the planned controls registered a growth of 15,52%, and spot controls have decreased of 32,92% compared to 2016.

Figure 1: Governmental official controls (2016-2018)
Source: Elaborated by the author based on ANSA Reports (2016-2018)

In order to establish the degree of the risk of the non-conformities tracked after the official controls, the results of the official controls were analysed. The data is systematized in table 1.

Table 1. ANSA actions within the official controls

	Measures ordered	2016	2017	2018

2	Contravention fines	571	1634	2,752
3	Suspension of activity	-	76	146
Total		**3,755**	**12,538**	**14,305**

Source: Elaborated by the author based on the yearly ANSA Reports (2016-2018).

Applying the Law 231/2012 regarding the governmental control on food production, three forms of nonconformities established by the national legislation can be identified. So, the actions of the organ of control and the applied measures during the control are reported at three levels of violation of the legislation: minor, major and critical:

- Minor nonconformities - characterized through the possibility of the removal that can take place so that the current activity of the person isn't affected and doesn't create an imminent danger for the environment, life, health and people's property.
- Major nonconformities are characterized through the impossibility of removal during the control being necessary and the possible allocating a time for actions of removal and that creates an imminent, but not immediate, danger for environment, life, health and the property of the controlled person or their employees or it creates an imminent danger, but not immediate, for the society, that isn't removed in the indicated term, it's going to become immediate.
- Critical nonconformities - the removal isn't possible during the control, but these kind of actions have to be undertaken immediately, and it creates an imminent danger and immediate for the environment, life, health and the control of the person's property and /or their employees or it creates an imminent danger and immediate for the society.

For the minor nonconformities, it's recommended ways of removing it. For major, beside the recommendations of removal and offering the term of remedy, sanctions can be applied, but restrictive measures can't be applied. In case of critical situations, removal is indicated, and sanctions and restrictive measures are applied, respectively, suspending the activity of the economic entity. Analysing ANSA data, in 2016 were 15,659 minor nonconformities on food security, and 3,755 major. In 2017 there were 32,190 minor nonconformities, 12,462 major and 76 critical. In 2018 there were registered 30,254 minor; 11,159 major and 146 critical unconformities. Considering global ANSA controls on the food sector, starting from raw material, continuing to food industry and market, it could be considering 3 categories of control *(table 2).*

Table 2. Type of controls made by ANSA

Stage of food chain	Controls (on areas)
Producing the raw material	animal: health; identification and și traceability; well-being; zootechnical supervision; products medicinal veterinary; animal feeds; vegetal: plants health, phytosanitary and fertilizers
Processing	Processing the products of animal origin; processing the products of vegetal origin;
Marketing	Food market, public alimentation and restaurants

Source: Elaborated by the author based on ANSA Reports, (2016-2018)

According to Figure 2, official controls performed in the food sector are focussed on raw materials (57%), followed by processing sector (34%), food trade, consumer protection and public alimentation and public catering occupying the last position (9%).

Figure 2: Categories of control, on stages of circulating the product
Source: Elaborated by the author based on the yearly ANSA report (2016-2018)

In table 3, the abbreviation P represents planned controls, and I unexpected (checks) controls, in %.

Table 3: Official controls weight, in the area of producing the raw materials (%).

Official control on agriculture, by the fields:	**2016**		**2017**		**2018**	
	P	**I**	**P**	**I**	**P**	**I**
Animals health	6	49	13	53	23	50
Animals identifying and traceability	2	24	1	5	-	-
Animals well-being	7	25	4	16	-	-
Zootechnical supervision	40	-	67	11	61	20
Medical veterinary produces	3	-	5	1	3	-
Animal feed and nutrition	2	-	3	-	3	-
Plants health, phytosanitary, and fertilizers	40	2	7	14	10	30
Total	100%	100%	100%	100%	100%	100%

Source: Authors, based on ANSA Reports (2016-2018)

According to figure 2, in 2016 the majority of planned controls were made in the zoo technical sector, at it could mention that the areas of animals' health, well-being, intensification and traceability constitutes 15% in total controls made by ANSA. Check controls on the segment of animal's health represents 49%, of total control on the raw materials sector.

In conclusion, it can notice that the official controls in sanitary-veterinary areas regarding the living animals aren't planned applying an incorporated system that would include doubling the planned controls from the same institution of control in one year of economic administration, and also in this system of control prevail a small weight of planned controls compared to the unforeseen ones so as to we can say that the authority mostly applies the form of the unforeseen control, in the absence of conclusions from the previous evaluations on the checked objects that would allow identifying the risk and justifying the beginning of official controls. Figure 3 showed that controls in the food marketing, consumer protection and public catering for 2017 increased with 68,14% compared to 2016 and 6% in 2018. The controls on areas of processing the products of vegetal origin registered a growth of 55,2% in 2017, compared to 2016, and an increasing with 27,3% in 2018.

Official controls in products of animal origin registered a growth of 0,16 % in 2017, compared to the previous year and decrease of -3,7% in 2018, being the segment within the control registered a decrease in 2018, being influenced by a smaller number of performing check official controls.

Figure 3: Official controls performed in the process and marketing area.

Source: Elaborated by the author based on the ANSA's reports concerning the official controls (2016-2018)

Analysing the information presented in Table 4 it can notice that in the sector of food products of animal origin, the minor nonconformities registered an increase of 21% in 2017 compared to 2016, but the major registered a decrease of 22%. 53 critical nonconformities were registered in 2017, representing about 3% of the total controls made in 2017 in food processing sector. In 2018 it's registered a decrease of major nonconformities in sector of food products of animal origin compared to 2017 (-13%). On food commerce sector major nonconformities registered an increase of 77% in 2017 compared to 2016, but in 2018 the major nonconformities registered an increase of 24% compared to 2017. In table 1 the nonconformities found were classified as minor (m), major (M) or critical (C).

Table 4: Categories of registered nonconformities

Nonconformities / Controls in food processing	2016		2017			2018		
	m	Ms	m	M	C	m	M	C
Food of animal origin	805	1,164	1,026	904	53	1,110	781	33
Food of vegetal origin	594		967	359		1163	661	75
Food Market	3,612	1158	9,762	5210		9,000	6,907	32

Source: Elaborated by the author based on the ANSA reports regarding the official controls (2016- 2018).

According to Opopol (2014), food control represents a complex system. The purpose of the control is to apply food regulations, in order to protect the consumer from contaminated and fraudulent food consumption. The planning of the annual control plan must take into account the proportionality of the control and the possibility to carry out the control only when absolutely necessary (ANSA, 2016). Based on table 4, it can be observed a significant increase in the number of checks. The national

authority must justify the reasons and the planning of the controls, based on the risk criteria, of the analysis of the results of the previous controls.

Conclusions

Legislation and control are the two components of risk management. The national legislation on food safety transfer the regulatory powers to The National Food Safety Agency ANSA. ANSA must meet the fundamental principles of independence, excellence and transparency to be successful in its mission. The research showed that the planning and performance of controls on food quality was not correlated with the level of risk of the sectors. Authority controls were directed mainly to the marketing of products where fraud can be easily performed. This aspect can also be explained by the dependence of the national food market on imports, mostly from Ukraine. The sector of animal food product, more susceptible to risks and non-conformities, had several controls. The study represents a preparing stage in the doctoral research that sets the basis of extensive evaluations of the food quality system in Republic of Moldova of the necessary measures to align it to the community's regulations. The research has highlighted the national measures for modernizing the food sector through monitoring and control activities, harmonizing the national legislation to the European requirements, the results and progresses made by national authorities.

Abstract

The problems of financial support of agricultural enterprises in the context of current conditions are considered. The necessity of the development of the mechanism of state support of agrarian industry in the conditions of economic instability has been substantiated. The main sources of financial support of agricultural enterprises have been investigated and the main ways of their activation have been determined. Specific measures to improve financial and credit support of agricultural enterprises, both at the micro and macro levels, have been proposed.
Keywords*:* investments, financial support, credit relations, state support, mortgage mechanism, credit management systems.

Introduction

Systematic economic transformations of the agrarian sector of the economy in conditions of instability and uncertainty necessitate the adaptation of agricultural enterprises to the market environment. The problem of resourcing enterprises, especially financial, is one of the most acute ones. Unfavorable external financing conditions, reduced budget allocations, and lack of own resources encourage economic entities to improve the use of financial resources. The development of an effective economic mechanism for financial support of agricultural enterprises implies the priority of their own financial resources (attraction, growth, effective distribution, etc.) and creation of necessary conditions for selective state support.

Effective management of the processes of formation, distribution and use of financial resources provides an opportunity for timely financing of operational activities of enterprises, compliance with the terms of their obligations, capital insurance, economic and social development and growth of their business activity.

Analysis of recent research and publications

Important contribution to the development of the theory and methodology of formation and use of financial resources was made by Ukrainian scientists O. Hudz, M. Demianenko, V. Zinovchuk, V. Oparin, P. Stetsiuk, O. Tereshchenko, S. Yurii, Yu. Tsal-Tsalko and others. Scientific studies of V. Aleksiichuk, V. Andriichuk, P. Haidutskyi, P. Kaninskyi, P. Laiko, M. Malik, L. Maslovska, V. Mesel-Veseliak, H. Pidlisetskyi, P. Sabluk, A. Chupis and others are dedicated to issues of development of financial relations of resource-forming and resource-consuming nature in the globalized market environment.

Objectives statement

Within the conditions of economic instability, the range of problems in financing, crediting and government support of agricultural enterprises has increased significantly. This necessitates their assessment, identification of the causes of underfunding and further research aimed at finding the best ways to solve the above problems.

Presentation of basic material of the research

Agriculture, regardless of the level of development of forms of ownership, methods of its organization, has its specific, peculiar to it features that significantly differentiate it from all other sectors of the economy. These peculiarities manifest themselves in the conditions of a market economy under the domination of free competition, where the state does not objectively interfere with the activities of agrarian sector, without being able to effectively participate in inter-industry competition. In most countries of the world, one of the priority areas of economic policy is state regulation of agriculture, within which specific legislative acts are adopted, on the basis of which effective programs are developed that ensure the sustainable development not only of agriculture, but also of all spheres of agriculture as well as the development of rural areas.

The world's realities and extensive historical experience make it possible to conclude that state intervention (balanced, complex and purposeful) is more an objective necessity than a temporary anti-crisis measure. Adam Smith also supported participation of the state in the fate of low-profit and strategically important for the welfare of the society spheres. In the conditions of competitive market relations, banks cannot be "forced" to lend to agro-industrial complex, but it is quite acceptable, with the assistance of the state, to make necessary adjustments to their credit policy, in particular, by developing a motivational component – at the level accepted at the same time for the farmer and his investor. The national priority in the sphere of agro-industrial complex is largely intended to serve as the corrective factor that determines the business and investment climate of the industry in the future.

In today's context, there is a wide range of tools to influence agricultural situation. The range of priorities, as well as the mechanisms of influence, is heterogeneous and conditional, which sometimes causes difficulties in the correct choice and assessment of economic course.

At the same time, we emphasize that stimulating investments in the agricultural sector is an important part of the state's agricultural policy, a central element in the national forecasting system. At least, this does not contradict the realization of the concept of effective demand by J. M. Keynes, the "father" of a scientifically grounded system of state regulation of economy. Increasing food capacity, improving social sphere of rural territories, protecting domestic agricultural producers in domestic and foreign markets are closely and almost directly dependent on the investment block of priorities in the system of state regulation. Only by providing methodological and financial incentives for the implementation and conditions for expanded reproduction in business – activity of objects of agricultural policy (agricultural producers), the government have the right to raise the issue of the effectiveness of political decisions initiated today. The credit should be returnable, but affordable, the system of state leasing should fill the needs of farms adequately and expediently (in terms of minimizing the natural factors for the reproduction of the purchased livestock), and the customs tariff

system sufficiently to protect the producer, as is the case in most countries of Central and Eastern Europe.

In addition, for a system of mechanisms to enhance the investment attractiveness of the agricultural sector to function effectively, potential investors need effective legal protection. Creation of a positive investment climate, development and structuring of its economic and socio-legal content in the form of a complex of the state law on agricultural development, an adequate financial target program of support to the village for the medium term, resolutions of the Government of Ukraine which give the right, while maintaining competitive principles, to take advantage of privileges, subsidies, tax breaks, trade preferences.

The main factors that cause decline in agricultural production, decrease in its efficiency, deterioration of social development of the village and the need to improve financial support of agricultural sector in modern conditions are:

1. Misguided agricultural policy in setting priorities – reforming property relations was preceded by the development of new models and forms of management.
2. The agrarian sector of the economy performs the state's inherent social function of providing population with cheap food and acts as a creditor for other sectors as a whole.
3. Significant discrepancy between prices for agricultural products and material and technical resources (technical means, fuel – lubricants, electricity, mineral fertilizers, plant protection products, cost of services, etc.).
4. The imperfection and almost complete absence of an effective system of financial and credit support of agro-industrial complex.
5. Low level of credit market development for agricultural sector.
6. Agrarian credit subsystem is not formed.
7. A long-term strategy for the development of agricultural sector, taking into account the current conditions, and its social significance has not been worked out.

Overcoming these deficiencies is an important nation-wide problem, the solution of which must be united by agrarian, banking capital – providing active state stimulation.

Research on financial support of agricultural enterprises indicates that these enterprises operate at the expense of their own resources, which today are significant in persentage but not sufficient for self-financing. This leads to the development of both banking and partner forms of lending. Bank lending does not play a significant role in the development of agricultural sector, although there are currently positive trends in the growth of lending by domestic commercial banks, including in terms of preferential lending (Table 1).

Table 1: Amounts of budget allocations and crediting of agricultural enterprises in 2008-2018, billions of UAH. [1]

Year	Budget allocations	Credits granted, total	Including preferential
2008	9,7	10,4	7,6
2009	8,3	12,8	7,0
2010	11,6	14,6	7,8
2011	5,8	20,1	15,1
2012	3,3	5,8	2,6
2013	4,6	9,7	6,2

2014	4,3	12,5	6,5
2015	7,0	13,5	1,4
2016	7,5	21,4	0
2017	9,2	14,6	0
2018	2,7	11,8	3,2

The current state of development of credit relations is characterized by the process of finding new forms of credit support of agrarian vector of the economy in relation to new economic conditions. Changing the conditions of economic environment causes a change in credit relations in agricultural sector of economy (Fig. 1).

Fig. 1: Potential creditors of agricultural producers*

** Summarized by the authors*

The data in Table 1 show that crediting of agricultural enterprises does not have a stable dynamic, which confirms the absence of a long-term credit support program for the industry.

Economic history of different countries shows that significant credit growth can increase the risks to the economic stability of a country's development. That is why it is believed that the so-called Asian financial crisis of 1997-1998 pp. was triggered by non-repayment of loans by large national corporations. Today, some experts believe that a similar crisis could happen in Ukraine, in particular, the director of European department of International Monetary Fund Michael Doppler. It is believed that a significant economic growth observed in the United States during the 1990s was caused by speculative fever, conditioned by a significant expansion of bank loans among other things [2].
Considering the theory of everyday problem, it should be noted that it has a long history. One of the

first to pay attention to it was J. Mill. "... For almost half a century, there has been no commercial crisis against which the Bank would not be gravely accused of having caused it or strengthened" [3].

Many borrowers and farmers in order to implement their business plans and production schedules are forced to attract up to 2 - 3 loans from different banks within a year. Often, plans are at odds with reality. This alone is a significant factor for the lender of the increased risk of the transaction. In addition, the risk of livestock disease, non-productive crop losses and almost the norm in unstable meteorological conditions, with even a single short-term delay means the extension of more stringent conditions for future credit agreements.

Some concerns among economists, including representatives of agribusiness, cause Ukraine's accession to the WTO on US financial terms. Acceptance of these conditions promises aggravation of competition for the insurer and systemic risk of being financially disadvantaged (in terms of portfolio structure), which will indirectly affect the advantages of the domestic clientele. Expanding the insurance space is not likely to reduce the tariff burden. Insurance premiums will be raised by domestic insurers in order to hold existing programs with Western products accountable (this is primarily about property insurance).

Summarizing the difficulties on the way of agrarian sector, we note that these are essentially the manifestation of the following risks, which can be divided into two groups:

1. Socio-political and structural-economic – incompleteness of the legal framework, cautious anti-inflationary agrarian policy, relatively small amounts of state investments in the sphere of agro-industrial complex; imperfection of the mechanism of state regulation of the industry; low payment discipline in relations between business entities; undercapitalization of banking system and insufficient level of protection of creditors' rights, for example, in the part of "blurring" in the legislation of the terms of the recovery of the debtor's property.
2. Risks of a sectoral nature – weak justification and low budgetary and - economic efficiency of the majority of investment projects in the field of agro-industrial complex, shortage of energy raw materials and skilled labor, high level of competition from foreign producers, significant (more than 60%) degree of "dependence" sector from the opportunities and resources of personal farms.
3. Risks of financial and credit nature – low level of development of the financial market, imperfect infrastructure of the credit system serving agrarian industry, no defined strategy for the development of credit security of production entities.

These negative factors are virtually interrelated. It is believed that strategic planning for the development of agro-industrial sector, implemented by the vector "state - banking sector - agricultural producers" is in conjunction with risk and motivational components of the policy / business of each participant in the agribusiness support system.

The main provisions and measures to stabilize agricultural sector in the current economy and change the motivational component of investment activity of banks in this market segment require the following activities:

- to ensure the quality of economic growth of all strategic sectors (and agriculture refers to them) on the income side of basic economic parameters. To continue positive innovation in determining national priorities in the development of the State Budget of the country;
- to develop and ensure support of the profitability of agricultural sector at the appropriate level. Proceeding from this, the development and implementation of a weighted system of insurance of incomes of agricultural producers are believed to be promising;
- to determine in tax legislation the rules that give the right to receive benefits to economic entities that invest a certain amount of their profits in agricultural sector of the economy;
- to strengthen customs control on the import of foreign raw materials.
- to assess the probability of benefits from the reduction (minimization or differentiation of rates) of the income tax of banks – from the income directed to lending of the enterprises of agricultural sector of the economy;
- to provide practical opportunity to set so-called "usury limits" (widely used in the United

States of America) at the Government level to prevent undue overestimation of bids by commercial banks;

- to develop the structure of a specialized agricultural bank on the basis of the universal credit institute (in the mould of widespread in Western practice) development bank;

a) crediting the purchase of mineral fertilizers; feed, the purchase of fuel, veterinary drugs, to cover the costs of insurance for future harvests - up to 12-15 months in the form of overdraft, single issue or within the credit line;

b) medium-term lending (for up to 5 years) of the needs of agricultural machinery, freight transport, production equipment, with the aim of modernization of fixed assets, creation of production facilities for processing agricultural products;

c) credits for the purchase of breeding young animals on his pledge, for carrying out works of new construction, for creation of production capacities of agricultural enterprises (in particular, for the construction of livestock complexes) on terms of long-term financing (up to 8 years).

The development of mortgage relations in agriculture in modern conditions is of great importance due to the need to attract additional investments in agro-industrial complex in order to revive agricultural enterprises of different forms of ownership. Poor mortgage quality limits agricultural businesses' access to credit and increases banks' credit risks. In this regard, the formation of the land market is, in our view, a high-priority task, the solution of which will allow to launch a mechanism of mortgage lending in agriculture, where agricultural lands will be as a mortgage, which will help to attract investment loans.

The use of mortgage mechanisms allows business entities to:

- get a loan for the purchase of land and start your own business using it;
- expand the existing economy by purchasing new real estate, including new land, buildings and structures;
- renew working capital.

The current state credit relations development is characterized by the process of finding new forms of credit support for agricultural sector of the economy in relation to new economic conditions. Changing conditions of economic environment causes a change in credit relations in agricultural sector of the economy.

The crediting process for agricultural producers in Ukraine has not gained stability and is cyclical. Credit institutions of the country need to work out a single criterion for determining the volume of lending to agricultural industry. In most of the world, 70% of agricultural credit goes to bank loans. Under these conditions, the volume of bank credit support for agrarian sector of Ukraine should be in the range of UAH 10-12 billion [4].

However, there is no consensus as to the optimum amount of credit resources to the gross agricultural output.

To do this, it is necessary to define a minimum (though not significant enough) and a maximum credit limit, which directly affects the creditworthiness of enterprises. In our opinion, the amount of credits attracted by agricultural enterprises should not exceed 40% of the volume of gross agricultural production. Exceeding this limit may disrupt the playback cycle [5].

The insufficient level of development of the credit market and the imperfect mechanism of state support of agrarian industry are evidenced by data at the regional level (Table 2).

Table 2: Indicators of economic activity of agricultural enterprises of Cherkasy region

Indicators	2014	2015	2016	2017	2018	2018 to 2014, %
Gross output of agricultural enterprises at constant prices in 2010, mln	10577,1	11335,6	11102,8	10985,5	11372,8	107,5

** Calculated according to the data of the Main Statistics Department of Cherkasy region*

Data of Table 2 shows that most agricultural enterprises in Cherkasy region are not fully covered by their own working capital (55.88% on average). This indicates that it would be advisable to attract loans from banking institutions, but the provision of credit resources tends to decrease. This situation causes agricultural enterprises to seek their own reserves to finance current assets (profitability is confirmed by the effectiveness of these searches).

However, most agricultural enterprises in the region are working under the conditions of a crisis of

payments. Thus, the accounts payable of agricultural enterprises in the structure of sources of circulating assets for 2017 amounted to 39.6% or 30.3% of the gross output. The payment crisis has a direct impact on the financial situation of the enterprises of the industry and makes it necessary to work out a strategy of financial development of the region taking into account the starting economic opportunities of each entity. This is in the context of reduced state support programs for agricultural enterprises in modern conditions (compared to 2014 in 2018, the amount of state support was only 30%).

In today's context, the issue of efficient use of land resources and preservation of soil fertility is particularly acute. Today, Ukraine's farmland is losing about 600 million tons of soil and 16 billion m^3 of surface water annually, which would be enough to form 16 million tons of grain. The area of degraded soils increases by 80 thousand hectares every year. Almost every third hectare (30.7%) is eroded. Lands that have been destroyed by water and wind in Luhansk, Donetsk, Kirovohrad and Chernivtsi regions make up 50-65% of arable land. In the steppe zone, two thirds of the land have reduced fertility. One in four hectares is acidic, and almost every second of the Forest-Steppe and Polissia zones (49.7 - 47.4%). Particularly large areas (52.1 - 65.0%) of acid soils are in Vinnytsia, Cherkasy, Ternopil and Khmelnitskyi regions.

In recent years, Ukrainian land has been used with complete disregard for physical law of the return of nutrients, which has led to instability in agriculture, reduced agricultural efficiency, especially in years when natural disasters are increasingly occurring. The yield loss on poorly washed-off soils is 20%, averagely washed-off – 40%, heavily washed-off – 60%. The annual total losses of the state amount to UAH 12.76 billion, and loss of net profit – UAH 7.4 billion. [6].

The state regulatory documents should provide for the provision of credit privileges for the rational use of land. Improving the effectiveness of the use of land resources of the country is the basis of its food security and the basis of a favorable competitive environment after Ukraine's accession to the WTO. However, the legislation does not provide for economic incentives for the rational use and protection of land with credit privileges.

By reducing the fertility of land resources, its value as capital and as value of collateral is reduced, which reduces the effectiveness of credit mechanism of agricultural sector as a whole.

Thus, there are no real influential mechanisms for using economic incentive procedures through granting credit privileges in Ukraine, while in other countries of the world these incentives are the main and most effective ones.

The production of organic and environmentally friendly agricultural products is still relevant.

The production of organic and environmentally friendly agricultural products also remains relevant.

According to the Ministry of Agriculture, in the last five years the land occupied by organic production has increased by 54% and today makes up 421 500 hectares. Of these, organic cereals are grown at 48.1% of cornfields (7th place among the countries producing the relevant products), over 16% - oilseeds (5th place), and 4.6% - legumes (7th place), vegetables - 2% (10th place), fruits - 0,6%. In addition, according to the 2018 report of commercial service of the US Embassy in Ukraine, the average return on investment in domestic organic farming can reach 300%, making it one of the most attractive destinations for foreign investors. Skillful management guarantees considerable profits, because products grown without "chemistry" are now gaining more popularity and cost more than "ordinary".

Measures for soil protection and production of organic products require improvement of the mechanism of crediting of agricultural enterprises as part of the strategy of agricultural sector development.

The main elements of the system of state support measures and state regulation should be:

• maintaining the profitability of agricultural sector of economics at the level of the average rate of return on the Ukrainian economy through the implementation of an effective antimonopoly policy of regulating prices for natural monopolies goods and regulating the proportions of internal and inter-branch exchange;

• active stimulation of integration processes, pooling and cooperation of capital, preferential attraction of funds for investment of the basic industry;

• introduction of mechanisms of minimum guaranteed prices, government interventions and mortgage transactions, price grants and compensations;

• co-operation of capitals, preferential attraction of funds for investment of the basic industry;

• increasing purchasing power of agricultural producers on the basis of development and improvement of equipment leasing and commodity credit;

• increasing the effective demand of the population, especially the disadvantaged, by providing assistance;

• assisting manufacturers in adapting to market conditions and facilitating market infrastructure development;

• sound protectionist policies to protect domestic producers from unequal competition for imported goods in the domestic market;

• providing the village with affordable loans, taking into account its specific features.

Under such conditions, the profit in agriculture will reach about UAH 7.5-10 billion on average per year which will become the main source of financial resources and real investments in the industry.

In order to develop credit relations in agrarian sector of the economy, to solve financial, economic, environmental and social problems of the region, it is necessary to develop an appropriate policy of solving problems regarding ensuring the creditworthiness of borrowers and transition to new forms of management and development of financial and credit mechanisms by intensifying the interaction of state and regional authorities and economic entities [7, p. 107].

Thus, the system of credit management of agricultural sector of the economy is a set of financial and credit relations and should implement the basic management functions arising from the creation of certain conditions for finding, attracting and efficient use of financial resources of economic entities in agricultural sector of the country's economy and its individual regions.

The main components of credit management system of agricultural sector of the economy are shown in Fig. 2.

Fig. 2: Three-level system of credit management of agricultural sector of the economy

Presented in Fig. 2, the credit management system of agricultural sector of the economy is considered as a set of bodies of state, regional administration and agrarian enterprises that interact with each other, where each element of the system (state, region, enterprise) is guided by its own goals during the formation and decision making and voluntarily interacts with other participants only in case of obvious benefit to itself.

Thus, state, region and agrarian enterprises can be considered as elements of a three-level system of management: agrarian enterprises – the object of management, regional bodies – the subject of management of the first level, state – the subject of management of the highest level of members of the system [8, p. 135].

Thus, the improvement of crediting in agricultural sector in Ukraine implies performing the following tasks:

- stimulating the development of various forms of economic management, increasing the role of internal (own) accumulations of enterprises for financing projects;
- improvement of legal framework and forms of state support for priority projects and programs for the development of agricultural sector of the economy;
- creation of a favorable investment climate for expanding extra-budgetary sources of financing capital investments and attraction of domestic and foreign private investments;
- expanding the practice of joint public-commercial financing;
- management of bank credit risk by setting limits and diversifying the terms of loans, introducing a reliable system for diagnosing the financial condition of the borrower;
- expanding the practice of insurance and guaranteeing state support for agrarian programs.

Therefore, economic effect of improving credit management and support system for agricultural sector is reflected in the growth of both resource potential and performance of agro-industrial complex.

Fig. 3: Impact of crediting on performance of activities of agro-industrial complex [9, p. 50]

Conclusions

Thus, the proposed ways of improving crediting of economic entities in the agrarian sector of the economy, which combine interaction between the three levels of the hierarchy of management - macro-, meso- and microlevels (state – region – agrarian enterprises), aimed at improving financial and credit system of supporting agrarian sector and determining management scenarios according to the priority directions of development of agricultural sector of the economy taking into account targeting and consistency of the results of overall efficiency.

Abstract

The paper discusses how the level of assembly line automation affects the production cost function. The paper introduces to the issue of Industry 4.0 that is associated with topic of automation. Afterwards three levels of automation are described (that the paper is concentrated on) - manual (no automation), semi-automated (partial automation) and complete automation. In the main part, the paper analyses the components of production cost function and for each component identifies the factors that need to be taken into account and which can influence the calculation of the production cost function, this is the original part of research. Not only the factors but also their influence to the components of production cost function is described in the paper. The target of the paper is to show that evaluating of the investment in automation by calculating the production costs is more accurate and convenient than simple conventional ROI calculation. By simplified ROI calculation a lot of important factors and influences can be overlooked.

Keywords: Costs, Automation, Assembly line, Industry 4.0

Introduction

In this paper we will discuss the factors that influence the cost function for different levels of automation in a assembly process in order to determine, what level of automation is optimal solution for a company. It is important to realize, that deciding upon the level of automation can´t be based on simple ROI calculation, which considers only 4 or 5 factors, because many more factors need to be considered.

This could help companies to choose the “right” level of automation due to their production, requirements and demands. This gives great benefits when it comes to time and cost savings in the planning and implementation phase.

Industry 4.0

Industry 4.0 (the fourth industrial revolution) is a designation for the current trend of digitization, its associated automation of production and the labour market changes it will bring. The four industrial revolutions are briefly described by Basl (2017) in the figure 1.

Fig 1. Four industrial revolutions – Basl (2017)

Poor et al (2019) mentioned that the basic visions of the so-called Fourth Industrial Revolution emerged in 2011. According to this idea, “smart factories” will emerge using cyber-physical systems. They will assume the repetitive and simple activities that have been performed by humans until then.

This will be accompanied by a change in the labour market, which could jeopardize the employment of people on which computers with new control / decision-making systems or robotic systems controlled by these systems could replace human power (for example diagnostic medical systems, will replace workers with lower qualifications). New jobs should be created which, however, will require higher qualifications of staff. It was mentioned by Poor and Basl (2018).

Raska and Ulrych (2017) mentioned that Industry 4.0 will be implemented using methods of machine perception, self-configuration and self-diagnostics and with computer connection of machines and parts.

Poor et al (2019) mentioned that both products and machines receive chips to control and operate over the Internet. In addition, cloud storage, 3D printing, data centres, automated problem reporting, and "smart warehouses" will be used to keep track of low supplies.

Industry 4.0 methods and tools should save time and money and increase business flexibility. The main risks include hacker attacks and data abuse. It was mentioned by Horanek and Basl (2018).

Industry 4.0 brings hope to improve the quality of human life by increasing labour productivity and the disappearance of monotonous and physically demanding professions. Automation, system integration and greater efficiency through more sophisticated logistics are also hope for reducing industry-related negative human impacts and for implementing sustainable development. Bures et al (2019) mentioned it.

As it was mentioned Industry 4.0 (the fourth industrial revolution) is associated automation of production. The next part of the article is concentrated on description of automation, mechanization and manual work.

Levels of Automation

Levels of Automation can be defined as splitting tasks between people and technology from completely manual to fully automatic. Therefore, automation can be understood as providing support to a worker, for example in the form of tools, to fulfil his task . Such support can be considered as a certain step of automation leading to full automation. It was mentioned by Simon and Broum (2018). As an illustration, we’re supposed to attach a nut. The nut can be attached manually, but if support is provided in the form of a pneumatic tightener, it is a certain level of automation. If we replace this support with a machine or robot, the level of automation is higher to achieve complete. Otherwise, manual work can be understood as actions performed by human employees with the help of tools. Here, other levels of automation are understood as an admission of an automated solution in which an act is performed without human assistance. Frohm et al (2008) and Srajer et at (2011) mentioned it.

Manual

Bures and Cadkova (2020) mentioned that manual work can be understood in different ways. One way is to understand the concept of manual work as an operation performed by a worker using basic hand tools. A second way is a person performing the work without any support in the form of tools. This way looks at manual work so that it is completely performed only by a person based on his abilities, and no human function is replaced.

Semi-automated

Bures and Cadkova (2020) also mentioned that most production combines human work and automation. Therefore, tasks are divided between manual work and automatic work. Semi-automatic production can, therefore, be considered as a production where at least one of the functions of the person performing the work is replaced by another source. In essence, mechanized or computer tasks are considered to be a higher level of automation. When implementing automation, it is necessary to find the optimal part of the value flow that should be automated. Also, it is necessary to determine the amount of automation and consider human resources, information, and technology.

Automated

Fully automated production is where the work of man is completely replaced. A typical example is remote-controlled machines and robotics (collaborative robot, industrial robot etc.). It was mentioned by Granell et al (2006). In this case, the machine completely and itself solves all the problems that occur. With full automation, the machine is tasked with refinement, accelerating and facilitating human work. Such production reduces the need for a person in the workplace to carry out a particular activity. It was mentioned by Broum and Simon (2019).

Calculation

We use the minimization principle to calculate a certain volume of production at minimal cost. The volume will be constant.

Benes (2014) mentioned when doing business, the basic goal is to keep costs below the selling price of the product. This can be achieved primarily by reducing production costs, from the pre-production stages that determine future production costs. In this paper we will focus on reducing specific costs incurred in production.

Own production costs can be considered as a decisive criterion for assessing the economy of production and one of the most important factors for ensuring economically optimal production. The essence of management lies in the analysis of processes, whether in terms of quality, cost or time. It is the suitability of the production process to ensure the corresponding output is reflected in the cost of production. Poor et al (2016) mentioned it.

The optimum production process for a given performance can be considered to have the lowest production costs for a given product, while maintaining the required quality and delivery deadlines. Broum et al (2012) and also Cechura et al (2012) mentioned it.

Own production costs can be defined as the targeted consumption of production factors to generate a certain output in production

Production costs function

To determine our own costs of production, we will use the calculation based on full costs, because we need to capture all the costs incurred in production. Production costs are calculated on the basis of the

calculation of the direct material, direct wages and production overhead, which is then divided into individual components. The production costs are related either to a certain period of time or to a precisely defined calculation unit. It was mentioned by Ehrlenspiel (2007) and also by Broum and Kleinova (2018). Expression of own costs of production and its individual components (costs of technological operations and costs of non-technological operations) are based on the relation by Olfert (2006):

$$PC = DMa + DWa + IMa + MC + TC + C\ ntech \quad (1)$$

PC Production costs [EUR]
DMa Direct material [EUR]
DWa Direct wages [EUR]
IMa Indirect material costs [EUR]
MC Machinery costs [EUR]
TC Tool costs [EUR]
$Cntech$ Non- technological costs [EUR]

Precisely defined performance is then called a calculation unit in terms of costing. In production, the calculation unit is considered to be a product, batch or order. Let's take a look at the individual components of the costing formula and what factors can affect them in automation. The definition of the factors is original part of research. In this work we will consider that the default state to be manual work.

Costs components

Direct material costs

Direct material represents the consumption of material (basic material, raw materials, semi-finished products, subcontracts, etc.) for the production of a given calculation unit (part, product, batch, order, etc.) expressed in monetary units. It is determined on the basis of material consumption standards. It was mentioned by Zahalka and Raz (2019).

For a component or simple product of one type of material, the following shall be determined:

$$DMa = \text{MCS} * \text{MUP} \quad (2)$$

DMa Direct material [EUR]
MCS Material consumption standard [unit (Kg/m/...)]
MUP Material unite price [EUR/unit (Kg/m/...)]

These costs are directly related to production, they are given by production processes, production technology, used production machines and their parameters.

Factors that may affect direct material are mentioned in table 1.

Table 1: Factors that may affect direct material

Factor	Manual	Semi automated	Automated
Level of accurancy	x	Machine works more accuratly, it saves material (↓ MCS)	Machine works more accuratly, it saves material (↓ MCS)

Direct wages

Direct wages represent labor consumption per unit of calculation, ie. basic wages of production workers. They are determined on the basis of the production process and time standards.

$$DWa = \sum_{i=1}^{n}(WTSO * WaT) \quad (3)$$

DWa Direct Wages [EUR]
WTSO Work time standard of operation [Hour]
WaT Wage tariff [EUR/hour]
n Number of operations

Factors that may affect direct wages are mentioned in table 2.

Table 2: Factors that may affect direct wages

Factor	Manual	Semi automated	Automated
Number of workers	x	Partial reduction of workers at the assembly line (↓n)	Partial or total reduction of workers at the assembly line (↓n)
Qualification	x	Decrease of necessary knowledge of the manual worker for the operation, thus decrease of wage tariff. (-WaT)	Decrease of necessary knowledge of the manual worker for the operation, thus decrease of wage tariff. (-WaT)
Speed of robots and its influence on operations	x	Decrease/Increase of Work time standard of operations (↓/↑ WTSO) due to speed of robot	Decrease/Increase of Work time standard of operations (↓/↑ WTSO) due to speed of robot
Range of operations done by the robot	x	Decrease/Increase of Work time standard of operations (↓/↑ n) due to the range of operations that the robot can do	Decrease/Increase of Work time standard of operations (↓/↑ n) due to the range of operations that the robot can do

Cost of overhead material

The cost of overhead material, which includes e.g. lubricating and cutting fluids, manufacturing aids, auxiliary material, office supplies, etc., is usually determined on a costing unit using a surcharge calculation with a percentage overhead, where the schedule base is made up of direct material. It was mentioned by Kurkin et al (2011).

$$IM = OMS*Dma \quad (4)$$

IM Indirect material [EUR]
OMS Overhead surcharge,(estimated from the previous period consumption) [%]
Dma Direct material (according to the above defined calculation) [EUR]

Factors that can affect the overhead material are mentioned in table 3.

Table 3: Factors that may affect overhead material

Factor	Manual	Semi automated	Automated
Level of accuracy	x	Machine works more accurately, it saves direct material (↓-DMa) It also may save auxiliary material (↓OMS)	Machine works more accurately, it saves direct material (↓-DMa) It also may save auxiliary material (↓OMS)
Type, number and suitability of the machine	x	Decrease of number of the production aids (↓OMS) Saves auxiliary material (↓OMS)	Decrease of number of the production aids (↓OMS) Saves auxiliary material (↓OMS)
Maintenance material	x	Increase of lubricating and cutting fluids (↑OMS)	Increase of lubricating and cutting fluids (↑OMS)

Machine costs

Machine costs represent costs relating to individual machines and equipment in a production unit for a given period of time. The cost of production per calculation unit is calculated using machine hourly rates mentioned by Kral (2002).

$$MC = \sum_{i=1}^{n}(WTSO * MHC) \quad (5)$$

MC Machinery costs [EUR]
WTSO Work time standard of operation [Hour]
MHC Machinery hour cost [EUR]
n Number of operations

Factors that can affect the machinery costs are mentioned in table 4.

Table 4: Factors that may affect machinery costs

Factor	Manual	Semi automated	Automated
Type, number, size, and suitability of the machinery	x	Cost of the machine + depreciation + interest + space (premises) costs + energy costs + maintenance costs + maintenance stuff increase + deployment costs + programming/ setting/ adjusting costs (↑MHC)	Significant increase of the machine cost + depreciation + interest + space (premises) costs + energy costs + maintenance costs + maintenance stuff increase + deployment costs + programming/ setting/ adjusting costs (↑MHC)
Speed of the machinery	x	Increase/decrease of the machinery operation standard due to different	Increase/decrease of the machinery operation standard due to different

		speed (↓/↑ WTSO)	speed (↓/↑ WTSO)
Range of operations done by the robot	x	Increase or decrease of number of operations (↓/↑ n)	Increase or decrease of number of operations (↓/↑ n)

Tool costs

Tool costs represents the cost of tool consumption on individual machines in a production unit for a given period of time. The cost of production is calculated using hourly cost rates.

$$\mathrm{TC} = \sum_{i=1}^{n}(WTSO * THC) \quad (6)$$

TC Tool costs [EUR]
WTSO Work time standard of operation [Hour]
THC Tool hour cost [EUR]
n Number of operations

Factors that can affect the tool costs are mentioned in table 5.

Table 5: Factors that may affect tool costs

Factor	**Manual**	**Semi automated**	**Automated**
New tools for the machines might be needed	x	Cost of the machine + depreciation + interest + maintenance costs + maintenance stuff increase + deployment costs (↑MHC)	Cost of the machine + depreciation + interest + maintenance costs + maintenance stuff increase + deployment costs (↑MHC)
Speed of the machinery	x	Increase/decrease of the machinery operation standard due to different speed (↓/↑ WTSO)	Increase/decrease of the machinery operation standard due to different speed (↓/↑ WTSO)
Tools usage	x	Due to optimal programs to tools last for longer (↓/↑ THC)	Due to optimal programs to tools last for longer (↓/↑ THC)
Range of operations done by a new tool	x	Increase or decrease of number of operations (↓/↑ n)	Increase or decrease of number of operations (↓/↑ n)

Non-technological costs

Non-technological costs are costs related to non-technological operations, such as handling, manufacturing and inspection costs. This division of non-technological costs was mentioned by Gorner and Simon (2015) The calculation is then performed by adding the following costs.

$$C\ ntech = Cman + Cprem + C\mathrm{inc} \quad (7)$$

$Cman$ Manipulation costs [EUR]
$Cprem$ Premises costs [EUR]
Cinc Inspection costs [EUR]

We can also take these costs into account when deciding on partial or complete mechanization, but only if they affect us the space(premise) occupied by the workplace, the related handling or the product inspection process. Polasek and Simon (2018) mentioned that. Alternatively, instead of non-technical costs, change-induced undesirable costs could be chosen, which would include other, poorly classifiable costs.

Table 6: Factors that may affect non-technological costs

Factor	Manual	Semi automated	Automated
Premise	x	Increase/decrease of space needed (↓/↑ Cprem)	Increase/decrease of space needed (↓/↑ Cprem)
Manipulation	x	Increase/decrease of manipulation needed (↓/↑ Cman)	Increase/decrease of manipulation needed (↓/↑ Cman)
Inspection	x	Way of quality check may decrease control costs (↓/↑Cinc)	Way of quality check may decrease control costs (↓/↑Cinc)

Criterial function

The criterion function (K) was derived from the calculation of production costs. Novikov and Kleinova (2018) were mentioning that while maintaining the functionality and quality of the product and keeping the deadline for delivery under given production conditions, it should apply to the most economical form of mechanization.

$$Min(K) = Min(PC) \tag{8}$$

$$Min(K) = Min(DMa + DWa + IMa + MC + TC + Cman + Cprem + Cinc) \tag{9}$$

DMa Direct material [EUR]
DWa Direct wages [EUR]
IMa Indirect material [EUR]
MC Machinery costs [EUR]
TC Tool costs [EUR]
$Cman$ Manipulation costs [EUR]
$Cprem$ Premises costs [EUR]
$Cinc$ Inspection costs [EUR]

Conclusion

The paper was concentrated on analyses the individual components of production cost function. Each component was analysed separately and the relevant factors were analysed. Factors that need to be taken into account and which can influence the calculation of the production cost function.

The paper managed to influence altogether 18 factors that need to be considered when thinking about automation. As shows in the figure 2 bellow, 5 of these actors will most likely decrease the outcome of the criterial function of production cost, 3 were identified as factors that could increase the calculation result and finally 10 factors that can either increase or decrease the outcome.

Fig 2. Influence of factors on production cost

The main purpose of the paper is to show that evaluating the investment in automation by calculating the production costs is more accurate and convenient than commonly offered methods of calculation, which are based on ROI calculation with only few factors, such as number of shifts, number of operators removed and annual labor cost per operator. The fewer factors we consider, the lesser the calculation will be accurate.

The next step is to analysed the individual factors in detail with specification of values (and their range) linked to each of the factor. Then the comparison of calculations by simplified ROI and product cost functions will be created.

Analysis of The Importance of Factors Describing the Mission of Enterprises According to Toyota And the BOST Method

Stanislaw BORKOWSKI

Kielce University of Technology, Kielce, Poland
borkstanislaw@gmail.com

Abstract

The article reviews the concept of the mission of enterprises, the structure of research surveys, including the BOST survey. The place and factors describing the mission at the Toyota House and in the mentioned survey were determined. Surveys, involving respondents determining the importance of factors: quality, costs, work safety, implementation time, crew morale (they describe the mission in the TPS system). The BOST survey was carried out in two companies: a manufacturer of bread and pastry, a manufacturer of lighting equipment. It was shown that regardless of the type of production, the first three places were occupied by factors: quality, costs, and work safety. Analysis of the relationship between factor importance assessments using preferences revealed details of built series. An assessment of the significance of diversity of average scores for the obtained sets of scores was also carried out. The aim of the analysis is to present which factors are the most important by building the significance sequences of obtained results. The information obtained confirmed previous relationships between the factors. The content of the mission for the surveyed enterprises was formulated. The results obtained for the type of small and medium-sized enterprises overlap with the results of tests verified in other enterprises.

Keywords: mission, toyotarity, BOST method, preference, similarity.

Introduction

Mission is a precise word Stochowski (1994) expressed in a language understandable to employees and the organizational environment outlining its far-reaching goals and aspirations. Mission is the statement of vision employed by organization for strategic purposes. Vision Stabryła (2000), Porter and Kramer (2011) on the other hand, is the image of the future that organizations want to create. The word "vision" comes from the Latin word *videre,* meaning "vision". Obłój (2014) mentioned that according to the most natural definition vision is the concept of the company's future, the most fundamental aspiration that in order to be effective should be shared by both the management and other employees Campbell and Nash (1992), Dwojnicki (1995).

Company mission acquires strategic significance when it satisfies three requirements:

1. Defines the direction and concerns the future Mackiewicz H. (2009),
2. Expresses dreams and challenges in which employees participate Lisiecki (2001), Cardona and Ray (2009), Cady, Wheeler, DeWolf and Brodke M (2011),
3. Its implementation process is credible Campbell and Nash (1992), Canals (2010).

1. If the mission of the company is to clearly communicate the direction, it must refer to a time that has not even started, that is, to the future. To deal with the present, it is based on short-term goals, while mission is forward-looking. The future can be defined precisely, as was the mission formulated in 1961 by the American President J. F. Kennedy: "This nation should commit itself to achieving the goal, before the decade is out, of landing a man on the moon and returning him safely to the earth ". It is also possible to formulate a timeless company mission, as Yashinari Kawai, the president of the Japanese company producing poor quality bulldozers and Komatsu excavators did expressing the company's mission in two words: "Muru-Cat" ("beat Caterpillar"). In those days Caterpillar was the world's leading manufacturer of heavy equipment, and the entire sector consisted of strong companies (Ford,

International Harvester, Case, Fiat). Indeed, dreaming about beating the world leader by a weak Japanese company meant looking far into the future. In the research study by Obłój (2014), Komatsu has almost fulfilled its vision, and the way it has been done is a wonderful illustration of the importance of mission for an effective organization.

2. In Komatsu, subsequent successes boosted motivation and gave hope that an "impossible mission" is achievable, even if the victory is far away. Good mission triggers employees' zeal and enthusiasm, and allows them to treat the vision of the company as their own. Peter Senge writes: "Visions are liberating. They create a spark of excitement, which puts an organization above everyday life. In a normal organization, the mission that employees accept will change into their relationship with the company. It ceases to be "their company" and becomes "our company". The very word "dreams" causes anxiety in some managers. They claim that "dreams" are childish, and managing a business should be realistic. The majority of employees do not dare to dream but struggle with the realities of everyday life. If they are professional and competent their actions are effective and they manage to solve the problems of yesterday on the current basis. Dreams remain only a fantasy if the entrepreneur or manager is not able or does not want to infect others with his/her enthusiasm and convince employees of his vision of the future of the company. In a typical company there are three groups of employees: mercenaries, loyalists and guards. Mercenaries are obedient and indifferent. In return for fair pay and working conditions, they "sell" the company a certain amount of their time and skills. If someone offers them better working conditions they will move to a new company without much hesitation. Loyalists are committed to the company for various reasons: they may have been working in the company for years, they like what they do, they are proud of their workplace, or they believe that the balance of contributions and benefits is positive. For loyalists to change the job means high psychological costs and uncertainty which they do not tolerate. Loyalty to a company can, therefore, be mainly instrumental ("it pays") or evaluative resulting from the acceptance of the mission, that is, company's future. Guards are involved in the company for good; most often because they are its founders, have emotional ties with the company leader, or simply identify themselves fully with company's mission and values. It seems clear that there are just few guards in the company. The loyalists are a minority, and the mercenaries (and malcontents) dominate. It is a true art to convince some mercenaries and loyalists that a given mission is important, makes sense and can also become their dream and aspiration. The prerequisite for achieving this is the credibility of the management and the company as a whole in the context of the company's mission.

3. It is amazing how many companies after taking a lot of trouble and spending so much time and money to state their missions, in the face of tough businesses realities almost immediately have shown their employees that it is just an empty phrase not worth the paper on which it was written by Cardana and Ray (2009). In 1988 General Motors executives launched a huge campaign under the slogan "GM employees are the most important for us." Three years later, GM announced the intention of closing 21 factories and dismissing 8% of the staff. The results of research into the usefulness of missions are not particularly optimistic. Extensive British studies show that answering the question whether the statements of company mission and goodwill are just slogans, 6% of respondents said "absolutely yes", and 53% "partly". If there were a conflict between company values and short-term gains, only 23% thought that values would have priority. And this constitutes the major problem for the management. Once formulated the company's mission, can become either extremely helpful or harmful.

Mission in the structure of Toyotarity

TOYOTARITY is a concept invented by the author of the chapter and is a proprietary name Borkowski (2012).

Toyotarity is defined as a scientific study of human-machine and human-human interactions with regard to process-based approach and Japanese culture, especially that of Toyota, aimed at continuous improvement with the use of knowledge.

The basic model of TOYOTARITY is shown in Figure 1.

The choice of flat figures is intentional:

• The circle as a symbol of human being in the dipole human-machine emphasizes the importance of people both in the organizational structure and operation of manufacturing and service companies, etc. This element of TOYOTARITY must treat all components of the organization equally and know exactly what is going on around the organization (how the market and competitors behave). The concept "human" is a mental shortcut used by initiators of business activities, investors, top executives, tactical managers and company owners. It includes the elements of COMPANY MISSION STATEMENT.

Fig. 1. The basic model of TOYOTARITY

Borkowski (2012) mentioned in the BOST method Toyota management principles are described by specific factors. The number of factors depends upon the scope of principle and fluctuates between 4 and 10. The set of factors is called areas. Some principles are divided into two or three areas. Toyota's management principles are divided into four sections, while the BOST survey has two versions: one for an employee and the other for a supervisor. The version for an employee contains a set of factors describing principles: 1; 2; 3; 4; 6; 7; 14 and the elements of the roof of Toyota house (quality, costs lead time, occupational safety, staff morale). The version for supervisor contains a set of factors that describe all Toyota's management principles and the elements of the roof of Toyota house. The survey rating scale is a rank scale. Respondents evaluate the validity of the factor inserting one of the numbers within the scale into an appropriate box.

The BOST method defines relations between material resources and human resources and between human resources and human resources and is named Toyotarity. The BOST method describes Toyota's management principles with its characteristic factors. The set of factors is called an area. Each of these principles is described with an appropriate set of factors. Apart from Toyota's principles described with applied factors and respondents' features the set of research problems also contains elements of the roof of Toyota's house, which describe the mission of enterprises.

The Toyota Production System is based on the assumption that all individual elements work for the cause of a whole. In the research study by Liker (2005), Ohno (2008). Its goal is also to support and encourage employees to continually strive for improvement in every sphere of company's activity. In literature, several models of Toyota production system are described.

Mission in the BOST questionnaire

Borkowski (2012, 2016a) mentioned that the survey is universal and can be used both in manufacturing and service-providing enterprises (e.g., banks, hospitals, schools and shops). The survey for manufacturing enterprises (one version for employees and the other for supervisors) consists of 12 sets of factors (areas). The version for the employees includes a set of factors describing the elements of

the Toyota house roof and principles 1; 2; 3; 4; 6; 7 and 14, whereas the version for the supervisors includes a set of factors describing all the principles of management in Toyota and the elements of the Toyota house roof. The survey contains a rank scale and the respondents use it to evaluate the importance of each factor. Respondents may assess the significance of a given factor by placing one of the numbers within the range of scale in an appropriate box.

In the author's publications (2016b) the elements of mission, the roof of Toyota House, are presented as follows:

Area E1. What is most important in your enterprise? Arrange the factors in the priority order inserting 1; 2; 3; 4; or 5 (5 is the most important factor) into the box:

JA		Quality
KO		Costs
CR		Lead time
BP		Occupational safety
MZ		Staff morale

The owners of the following enterprises agreed to have a survey conducted:

The manufacturer of bread and cakes (T). During production, traditional bread and cake making technologies are used. As for the cakes, the enterprise takes orders from individual customers to provide sweet delights to all kinds of occasions including; weddings, anniversaries, eighteen birthdays, religious ceremonies and post funeral receptions. The enterprise has a network of shops within 50 km of its headquarters.

The manufacturer of lighting equipment (T1). He manufactures chandeliers, lighting fixtures and wall lamps basing upon its own designs. In the production process semi-finished steel, non-ferrous metal alloys, wood, marble, plastics, leather and textiles are used. The enterprise purchases semi-finished products in bulk. Then they are divided into smaller parts and profiled according to the design. The enterprise owns two shops. Most of its products are sold in supermarkets.
A preliminary condition for classification of the companies to BOST study was confirmed information about implementation of Toyota management principles in the workstations in analyzed company. In selected enterprises the population of respondents was chosen, which consisted from production workers of the examined enterprise, having a contact with manufacturing process in the workplace. The BOST questionnaire form was filled out in both companies by 30 respondents i.e. nearly half of production workers. Such a large research group of directly production workers will allow to precisely identify the most important factors in the surveyed enterprises. This article presents an analysis of the answers given to the question contained in the BOST questionnaire, referring to the roof of Toyota's house.

The use of Thrustone scale and the scale of range to analyze the series of factors arranged by the degree of importance

Thurstone's *comparative judgement method* introduced in Sagan (2009) and (2012) is used (Fig. 2) to develop a one-dimensional metric scale of factor preferences that allows us to compare the rating of each factor with those of all other factors. The results of comparisons provide the basis for the development of the scale of preferences are introduced in the research study by Borkowski and Knop (2014).

Fig. 2. Characteristics of comparative evaluations' scale for importance factors in E1 area: a) distribution of factors on the scale, b) scale structure (%). Example

The scale of preferences is based on the ratings assigned by respondents to each factor. The ratings are used to compare pairs of factors. The result of Thurstone method is the distribution of the factors along one-dimensional scale which provides information on similarities and differences between the factors and allows us to indicate the groups of factors with a similar rating (on the basis of the distance between factors on one-dimensional rating scale).

The distribution of factors on the scale includes four groups:

- *costs* factor (KO) is unlike other factors most preferred,
- *quality* factor (JA) and *work safety* factor (BP) are similar to each other, and highly preferred,
- *lead time* factor (CR) is unlike other factors, its preference being mid-level,
- *staff morale* factor (MZ) is unlike other factors least preferred.

The inspiration for the search for a different scale that would allow to obtain the information on the degree of similarity or difference between the factors and to identify the group of factors with similar ratings was the fact that *Thurstone comparative judgment method* requires the same number of responses, which poses a problem for the BOST method.

The results are obtained by the questionnaire method; the respondents are employees of the operational level of enterprises. Their number is limited and the number of questionnaires accepted varies widely (usually from 15 to 60). We can either select companies which have obtained the same number of questionnaires or reduce the number of questionnaires to the smallest number obtained in the selected group. The second method involves the loss of hard-earned data. Thus it is reasonable to present a replacement for a comparative scale. While analyzing the stages of the comparative scale development, we note that in the final phase, the smallest number must be subtracted from the existing numbers, so that the scale can start with zero.

To develop series of ratings, the average ratings of individual factors are used. We determine a range and subtract the lowest average rating from each rating. Then we order the results from the smallest to the highest value. This procedure is not provided by the Thurstone method, but it is necessary to calculate both the distance between factors and scale structure. The length of comparative scale is replaced by the scale of range. Further steps are the same as in the Thurstone method. The distribution of factors on the scale of range is presented is described as follows:

- c*osts* factor (KO) is unlike other factors most preferred,
- *quality* factor (JA) and *work safety* factor (BP) are similar to each other and highly preferred,
- *lead time* factor (CR) is unlike other factors, its preference being mid-level,
- *staff morale* factor (MZ) is unlike other factors least preferred.

It represents the largest share of the pairs of factors on the analyzed scales. This induced the author to conclude that:

There exists a research tool equivalent to one-dimensional Thrustone comparative scale and this is a range scale.

In the Borkowski (2016a) publication the lack of the criterion for the division of the comparative scale is pointed out. Hence the following division of the comparative scale is presented: 0% least preferred, 0 - 20% weakly preferred, 20 - 40% moderately preferred, 40 - 60% rather preferred, 60 - 80% strongly preferred, 60 - 100% very strongly preferred, 100% most strongly preferred.

The structure of ratings assigned to factors

During the presentation and preliminary analysis of the significance of the aforesaid factors a positional measure of distribution (Fig. 3) Pułaska-Turyna (2008). From Figure 3, presenting T company, it appears that a clearly marked mode occurs for the following sets of factors: costs (KO) - the maximum rating "5", lead time (CR) - rating "4", staff morale (MZ) - the lowest rating "1". For the quality factor (JA) the number of "4" and "5" ratings is the same and differs only by 1 from the next number that received "2" rating. A set of ratings with a similar feature exists for the occupational safety factor (BP), where "4" has the maximum number of occurrences.

Fig. 3: Roof of the Toyota house. Distribution analysis of evaluations E1 area factors. It concerns T

The evaluation of the significance of factors in the company manufacturing lightning equipment (T1) can be summarized as follows (Fig. 4): the sets of ratings for *quality* (JA) and *staff morale* (MZ) do not contain the lowest and the highest score, respectively. The set of ratings of *costs* factor (KO) contains only two numbers: 5 refer to extreme ratings of ”1” and ”5”, 4 refer to three other ratings. *Lead time* factor (CR) has two modes: for the lowest rating ”1” and for ”4”.

Fig. 4: Roof of the Toyota house. Distribution analysis of evaluations E1 area factors. It concerns T1

Development of the series of factors arranged by the degree of importance (The Roof of Toyota House)

One of the aims of the BOST survey is to examine the relationships between ratings obtained for the factors. For that purpose, the series of factors (describing the Toyota mission) arranged by the degree of importance, the preferences for each factor and the differentiation of average ratings are presented. To develop the series of factors by the degree of importance, the rating scale is used. It is calculated on the basis of the average rating. For a five-point scale it is five. The extent to which the scale is used is expressed as the average rating divided by the maximum rating (resulting from the scale) multiplied by a hundred (expressed as a percentage). Fig. 5 shows the application of the ranking scale in two enterprises.Based on the data the following series of factors (describing the Roof of Toyota House) arranged by the degree of importance were obtained:

Enterprise T
KO > JA > BP > CR > MZ **(1)**

Enterprise T1
BP > JA > KO > CR > MZ **(2)**

Fig. 5: The usage of measurement scale for evaluations the importance of factors which describe the mission in companies: a) T, b) T1

In general, the series can be described as follows:

- *quality* factor (JA) takes the first place three times, *costs* (KO) and o*ccupational safety* (BP) take it once,
- the second place is taken twice by *quality* factor (JA) and *costs f*actor (KO); it is taken once by *lead time* factor (CR),
- two factors take the third place: *occupational safety* (BP) which appears three times and *lead time* (CR) which appears twice,
- *lead time* factor (CR) takes the fourth place four times and *occupational safety* just once,
- *staff morale* factor (MZ) takes the fifth place in all series of importance

According to the employees of bakery and pastry enterprise (T), the most important factor in the mission is *costs* (KO) while *quality* (JA) takes the second place. The enterprise T has implemented a HACCP system which guarantees food safety, in other words, quality. The bakery is a family run enterprise with a long tradition. However, it is not enough to become a leader on the competitive market. The respondents consider costs to be the most important. They are 100% right. Low costs of bread production influence its price. The shops practically do not send unsold bread back to the bakery. So, the costs determine the mission of food business.

The analysis of the series of factors (2) describing the Toyota mission in the enterprise producing lightning systems (T1) indicates that o*ccupational safety* (BP) is the most important factor. Chandeliers, night lamps, standing lamps are everyday products that we use in our apartments, so it seems natural to look at them and think what their production looks like. We will certainly notice that a large part of the production involves manual work, mainly related to electrical installation. The employees use screwdrivers, and ticks for eight hours that may cause smaller or bigger cuts even though protective gloves are worn. Every injury means the exclusion of the employee from the production process so, to put it simply, it is a loss for the company. *Quality* factor (JA) takes the second place. Since electrical goods have safety label their quality is guaranteed by the regulations in force.

Interpretation of series of importance

The interpretation of series of importance describing Toyota mission will be conducted on the basis of preferences expressed by the respondents while ranking the significance of factors. Two scales will be used to compare preferences: Thurstone scale and the scale of range developed by the author. The purpose of using two scales is to demonstrate their equivalence. The figures include: the comparative scale and the scale of range: (a) showing the factors studied, (b) illustrating the distance between adjacent factors, (c) showing the distance (%) between adjacent pairs of factors on a selected scale.

Fig. 6 and Fig. 7 present the sets of the preferences for the factors describing Toyota mission in bakery and pastry enterprise (T). The diagrams refer to the series of importance defined by the relationship.

Fig. 6. Characteristics of comparative evaluations' scale for importance factors in E1 area: a) distribution of factors on the scale, b) distance between pairs of factors, c) scale structure (%). It concerns T

Fig. 7. Characteristics of range' scale for average importance evaluations' for the factors in E1 area: a) distribution of factors on the scale, b) distances between pairs of factors, c) structure (%) of scale. It concerns T1

It should be noted that the factors in series are arranged by decreasing values while on the scales they are arranged by rising values. Therefore, we will start the analysis of diagrams from the factor located at the end of the relevant scale. We will begin the interpretation of the series of importance checking if the order of factors on the scale is the same as their position in a series. Analyzing the distribution of factors on the comparative scale (Fig. 6a) we notice the following order: KO, JA, BP, CR, MZ. In Figure 7a (the scale of range) the order is as follows: KO, JA, BP, CR, MZ. We can conclude that the order of factors on a comparative scale and on the scale of range is the same and corresponds to their positions in the series of importance (1; 2). This implies that the series of importance can be represented graphically using either comparative scale or the scale of range.

Differentiation of average ratings of factors describing the enterprise mission

This part presents the interpretation of series of factors arranged by the degree of importance. In this section a statistical analysis of the significance of differentiation of average ratings for three α levels (0.05, 0.1, 0.2) is conducted. Table 1 presents the results concerning the significance of differentiating the average ratings that contributed to the construction of relation.

Table 1. Roof of the Toyota house. The results of importance difference analysis average evaluations factors for E1 area

Indications		KO	CR	BP	MZ
JA	test	*0,78*	*3,16*	*1,73*	*5,27*
	α = 0,05	*no*	*yes*	*no*	*yes*
	α = 0,1	*no*	*yes*	*yes*	*yes*
	α = 0,2	*no*	*yes*	*yes*	*yes*
KO	test	*E1*	*3,73*	*2,34*	*5,68*
	α = 0,05	*2,0129*	*yes*	*yes*	*yes*

	α = 0,1	*1,6787*	*yes*	*yes*	*yes*
	α = 0,2	*1,3002*	*yes*	*yes*	*yes*
CR	test	*yes - significant diversification*		*1,01*	*2,25*
	α = 0,05			*no*	*yes*
	α = 0,1			*no*	*yes*
	α = 0,2			*no*	*yes*
BP	test	*no - insignificant diversification*			*2,90*
	α = 0,05				*yes*
	α = 0,1				*yes*
	α = 0,2				*yes*

Since there are five factors in the E1 area, we will analyze four pairs of relationships. As given in the research methodology, the analysis starts with the first top row and then we go to the first column and make an appropriate change from vertical to horizontal orientation. There is no significant difference between the average ratings of the pairs of factors JA: KO at any of the assumed α levels. This can be written as (0; 0; 0), which means that, in a given case, the average rating does not show difference at the α level of 0,05 (the first digit in brackets), 0,1 (the second digit in brackets) and 0,2 (the third digit in brackets). If the differentiation exists, the digit 1 appears. The differentiation of average ratings of pairs of factors JA: CR is written as (1; 1: 1), which means that a statistically significant differentiation between the average ratings of the two factors exists. Applying the proposed notation to a pair of average ratings of JA: BP we obtain (0; 1; 1). The average ratings of *quality* (JA) and *occupational safety* (BP) are statistically significant at α = 0.1 and α = 0.2 (the second and third digit in the notation). There is no differentiation between the average ratings at α = 0.05 (the first digit in brackets). The average ratings of pairs of factors KO: JA are (0; 0; 0) and they equal those for JA:KO. The implication is that there is no significant differentiation between average ratings. KO column does not contain any more interesting data. The orientation of KO is horizontal and there are three missing factors there. The average ratings of pairs of factors: KO: CR, KO: BP, KO:MZ are written as (1; 1; 1). They show a significant differentiation at all three α levels. For the data in CR column the *lead time* factor (CR) forms the pairs: CR: JA and CR: KO. Their average ratings are written as (1; 1; 1) but for the CR row and the pairs CR: PB and CR: MZ the ratings for the first pair of factors are (0; 0; 0) and (1; 1: 1) for the second. The average ratings for the pairs of factors in which *lead time* (CR) is present do not differ if they appear in a pair with *occupational safety* (BP) factor. However, the average ratings are differentiated at all α levels for *lead time* (CR) in pairs with *quality* (JA), *costs* (KO) and *staff morale* (MZ) factors. *Occupational safety* factor (BP) is present in the following pairs: BP:JA, BP:KO, BP:CR, BP:MZ. The average ratings for these factors are written as (0; 1; 1), (1; 1; 1), (0; 0; 0), (1; 1; 1), respectively. The average ratings of BP: KO and BP: MZ are significantly differentiated at all three α levels. The average ratings of BP: JA are different at α = 0.1 and α = 0.2, but there is no difference at α = 0.05 (zero is the first item in the notation). The average ratings of BP:CR are not differentiated at the assumed α levels as expressed by (0; 0; 0). The average ratings of MZ: JA, MZ:KO, MZ:CR, MZ:BP are differentiated in all cases and for all α levels which is expressed by (1; 1; 1). The adjacent factors presented in (1) form the following pairs: KO: JA, JA: BP, BP: CR, CR: MZ.

It was revealed that in a number of factors important for the first of these companies, the factors: quality and safety at work showed similarity to each other (criterion of similarity of 10% of the scale). The distance between these factors is 3.3% of the scale, the distance between factors: cost and quality 13.2% of the scale, while the total length is 0.93 units. In the case of the second of the mentioned companies, there was no case of similarity of factors in terms of preferences. Respondents in a company manufacturing lighting equipment believe that their enterprise is important to safety at work, followed by quality and costs in the third place.

In the researched company a quality of products, as well as safety in the workplace are important in production process and in the entire enterprise. Significance sequences of factors describing roof of

the Toyota's house is an interesting element. They contain a logical order conditioned by organization of production in the company. The practical use of BOST surveys gives the opportunity to benefit from the practical knowledge of employees at the company's production level. This may contribute to the identification of key areas for the functioning of the enterprise.

Conclusion

The publication highlights the existence of many definitions of the term mission of enterprises in specialist literature. Attention was paid to the significance of this term in the Eastern approach to management, especially management in the Toyota production system (TPS). Elements of this management are presented in the form of Toyota Houses, which have different: constructions. "The common part of these houses is the roof, the elements which define the mission of TPS are: quality, costs, work safety, time of implementation, crew morale". Toyota management principles are the basis for the term TOYOTARITY, whose research tool is the BOST survey and also the method of analyzing the results of copyright surveys under the same name. The BOST method is one of the qualitatively quantitative research methods, because respondents are asked to rank the factors: describing the roof of the Toyota House and the rules of Toyota management, the set of factors is called the area. The methodology uses the results of a survey carried out at the manufacturer of hubcaps and metal decorations for cars as well as the manufacturer of bread and cakes. Using the results of the survey, a series of importance of factors describing the mission were built (arithmetic means were used), similarity or lack of it was determined in terms of preferences of the analyzed factors (Thrustone and author scale - range was used), significance of differentiation of average marks was assessed. Based on these three elements, information was obtained authorizing the definition of the mission of the surveyed enterprises:

- producer of hubcaps and metal decorations for cars. The mission of our company is to produce hubcaps and metal decorations for cars of a quality higher than required by applicable legal regulations and standards, treat employees' safety at work as well as quality. The management puts a special attention to minimizing production costs, thanks to which our products are also competitively priced,
- producer of bread and cakes: The mission of our company is to produce, at the lowest possible cost, high quality and healthy food for everyday consumption, especially bread and cakes and pastries for various celebrations, which exceeds the requirements of the HACCP system. Employees have appropriate safety conditions at work,
- manufacturer of lighting equipment: The mission of our company is to manufacture lighting equipment with the CE mark in conditions safe for employees of quality exceeding legal provisions and standards requirements, paying great attention to production costs.

Application of The Kanban Methodology In Research Projects Management

Ewa MARCHWICKA

Wroclaw University of Science and Technology, Wroclaw, Poland, ewa.marchwicka@pwr.edu.pl
Katarzyna WIEJA
k.wieja1804@gmail.com

Abstract

The goal of the paper is to analyze if Kanban methodology can be used in managing research projects. Researches were conducted based on the data collected during realization of research projects implemented at Wroclaw University of Science and Technology. Thanks to interviews with project teams and project managers the most important elements of the Kanban methodology were identified which should be implemented in the management of research projects. The most important result of the analyzes was the design of the Kanban electronic board project and its verification for the selected research project. The board was programmed in VBA (Visual Basic for Applications) implemented in MS Excel.

Keywords: Project Management, Kanban, Research Projects.

Introduction

In the 1950s, a production management system called Kanban was developed in Japan. The word was created from a combination of two Japanese words: Kan - visible and Ban - a piece of paper. Kanban is the Japanese term for "sign" or "signboard" (Sugimori et al. (1977) and Anderson (2016)). Initially, Kanban was used to manage production in industries such as automotive (Liker (2004)), aeronautics (Venables (2005)), healthcare (Rocha et al. (2018)), education (Fitriawati and Lestari (2019)), retail clothing (Tokatli (2008)). Over time, it gained popularity in software development as one of agile approaches in project management (e.g. Al-Baik and Miller (2015), Lei et al. (2017) or Kirovska and Koceski (2015)). A review of the literature on the use of the Kanban methodology in IT project management can be found in Ahmad et al. (2017). Brechner (2015) states that the adoption rate of Kanban methodology is increasing. In this paper, we would like to consider whether it is possible and reasonable to apply selected Kanban methodology practices in research project management.

The Kanban methodology can be described as "start with what you know". The application of this methodology reduces resistance to changes in the organization, because it is a catalyst for a fast and focused change in line with the company's goals. As part of the Kanban methodology, the project team works together to create a typically immaterial work product. Even if the product is physical, its value is not in itself, but in its informational content. The basic activities of managers who manage in accordance with the Kanban methodology can be defined by six general practices (Anderson (2016)):

1. Visualize. The project workflow should be displayed on a Kanban board (this board is described in more detail in Chapter 2.5). This makes it possible to limit work in progress at each stage of project work. It is also important to specify commitment and delivery points. These steps distinguish the Kanban methodology from the usual flow system. There are various improvements in the use of the Kanban board, for example color-coded task labels and visualizing the owner of each task (Nakazawa and Tanaka, (2016)). The popular visualization technique used in Kanban methodology is also known as cumulative flow diagram (Alaidaros et al. (2018)). The cumulative flow diagram presents the cumulative distribution of tasks over time (Karunanithi (2016)).

2. Limit work in progress. According to this practice, imperceptible knowledge must be made visible and the service must be guaranteed to work with the right amount of work. This quantity should not be

too large or too small. For this, work in progress limits, called WiP (Work in Progress) limits, are set. By setting WiP limits and then following them, the "push" system (work is "pushed" into the system) changes into the "pull" system (work is "pulled" into the system at the right time). In the new system, work is "pulled in" only after the current work completion (after the current tasks are completed). It is not "pushed" into the system immediately when it appears. Therefore, the goal of setting work in progress limits is to prevent too little or too much work in the system. Thanks to this practice, the members of the project team do not feel overloaded with work. In addition, this action improves the flow of value to the customer.

3. Manage flow. Care should be taken to maximize the value delivered, while the realization time should be minimized. The flow of work itself should be as smooth as possible.

4. Make the rules public. The basic practice in Kanban is to clearly define the rules, as well as the mechanism for questioning them when these rules do not work.

5. Implement feedback loops. Loops are an essential part of controlled processes. They are very important for changes resulting from the evolution of the organization.

6. Improve cooperation. Kanban methodology is often referred to as improvement / adjustment methodology. Improvements never end because in this case the concept of "perfection" is not achievable. To improve communication within the project team, it is recommended to organize daily Kanban meetings. These are short meetings of the project team (usually up to 15 minutes) in which team members describe their work progress. The purpose of these types of meetings is to improve daily coordination and work organization. Shamshurin and Saltz (2019) propose a method to improve team performance for teams that use Kanban.

Methods

The goal of the paper is to analyze if Kanban methodology can be used in managing research projects. To achieve the goal of the article, the following research methods were used: interviews with members of project teams in research projects (including research project managers) implemented at Wroclaw University of Science and Technology, analysis of project documentation and own observations collected during the implementation of such projects.

Results

Based on Kanban definitions presented in Kniberg and Skarinm (2010) where Kanban methodology is considered in three aspects: visualize the workflow, limit WiP (Work In Progress) and measure the lead time, we analyzed the use of these practices in managing research projects.

Visualize the workflow

One of the basic practices in Kanaban methodology is workflow visualization. One of the tools recommended here is a Kanban board. Primarly, the Kanban board is used to visualize work in progress and improve flow. Thanks to it, members of the project team can clearly see how many tasks they started, which allows them to avoid work overload because they do not undertake to realize too many tasks in a given time range. The use of Kanban boards reduces the amount of work in progress and enables more efficient management of project tasks realization (Anderson (2016)). Boards can be constructed in physical (e.g. paper board, wearing board) or electronic form. Most often, physical Kanban boards are created on large sheets of white paper. Colored sticky notes with the name of the task, its description and date are placed on them. The color of the sticky note depends on the criteria established by the team. Colors can symbolize the type of task, its urgency or importance. In addition, task sticky notes are marked with the avatar of the person who is responsible for the task. An avatar can be a person's initials, name or signature.

The authors of this work designed a table to be implemented in research projects. Since research projects usually lack funds for the implementation of additional tasks (in addition to the research tasks anticipated in the research plan), it seems necessary for this type of board to be available free of charge.

Therefore, the authors of this work decided to choose the MS Excel tool due to the very good knowledge of this program by all members of the project team and free access to the software by every university employee. An important advantage of this software is also the ability to create calculations of necessary measures and metrics, as well as their graphic presentation without having to import data to another program. If someone is interested in the application, she/he should contact the authors of this paper.

The developed Kanban board is organized in five MS Excel sheets: *Tasks*, *Board, Measures*, *Throughput Chart, Cumulative Flow Diagram* which will be described in the following subsections. The *Tasks* sheet stores information about the tasks performed during the realization of the research project. Each task has a unique ID number assigned, which is used to identify the task on the board. This number appears automatically when the user enters the task description. This option has been implemented using the *IF()* function, which can be used to check whether a given string in the cell assigned to the *Description* column contains a string. If the string is entered, the function takes the numerical value from the row above and adds one to it. The first ID number is already entered because it can be assumed that the project will have at least one task. Another attribute of each task is its status, selected from the drop-down list of five options: *ordered task* - task that appears in the project and awaits project manager approval, *pending task* - task approved and pending implementation, *realization* - task in progress, *internal review* - task being verified and *completed* - task completed and accepted by the project team. Each of the tasks is also described with an attribute such as its execution mode, selected from four options: *expedite*, *fixed date of implementation*, *standard*, *tangible*. Usually, tasks are carried out in the *standard* mode, which means no specific requirements are foreseen. However, they can also be performed in other modes, such as: *expedite* (this mode is selected when the task should be completed as soon as possible), *fixed date* (with a specific date of execution), *tangible* (tasks are carried out in this mode when they need to be performed up to specific date). It is also important for the team to have a commitment point, which is the boundary between the ordered status of the task (*ordered*) and the status of waiting for the task to be completed (*requested*). This point is important because after reaching it, the task must be carried out by one of the researchers within a specified period. In addition, the project tasks are grouped into categories that can also be selected from a drop-down list from four possible options: *research area*, *publication*, *lecture*, *others*. Each category is assigned the appropriate color that represents the group on the board. The *research area* is marked in green, the *publication* - pink, lecture - *blue*, and others - *yellow*. The next attribute of each task is a description in which the user can save any information relevant to him. After completing the described attributes of tasks implemented in the project, the user completes the dates of appearance of each task in individual areas of the board. For each of the five areas, a column has been assigned in which the relevant date should be given. On this basis, the number of days the task has spent in a given area is calculated. To perform these operations, the function *DATEDIF()* was used. An interesting fact is that this function is somewhat hidden in a spreadsheet and the user will not find it in the function browser or in MS Excel help. Thus, the only possibility to use this function is when the user is already aware of its existence and enters it manually. The *DATEDIF()* function has been combined with the *IF()* function, so that if the appropriate cells are not filled with the date (this happens when work on the task is not yet advanced), the error message about missing data will not appear. The last attribute of the task is its duration in the analyzed project, expressed in weeks. To calculate this value, the *DATEDIF()* function was used, which is used to calculate the number of days between the appearance of a task on the board and its completion. In the next step the result is divided by seven to express the number of days in weeks unit. A function *ROUNDUP()* was also used to round the calculated number of weeks to whole weeks. This rounding is intentional, because at a later stage this value will be used to illustrate the number of tasks completed in a given week. These functions are combined with the *IF()* function so that if the task is not completed the error message does not appear. The task attributes listed above are the table column headers, while the rows contain individual tasks. The tasks table can contain information on up to fifty tasks. The tasks table has been constructed so that when scrolling tasks down, the column titles are always visible. Above the tasks table, in the upper right corner, there are buttons redirecting the user to the Kanban board, calculated measures or charts. The button referring to the board also automatically updates the board. Any changes made to the tasks table (such as adding or removing a task, changing the status of a task, changing the mode or category) will be updated in the board. To ensure greater transparency of the worksheet, grid lines, formula bar and headers have been disabled.

The *Board* sheet contains a developed Kanban board. An example of such a board is shown in Figure 1. Above the board, in the upper right corner, there are buttons that redirect the user to other sheets.

	Ordered tasks				Pending tasks				Realization				Internal Review				Completed			
Expedite																				
Fixed date of implementation																				
Standard										2	3	9						1	4	5
									10								6	7	8	11
																	12			
Tangible																				

Fig. 1. Sample Kanban board

Figure 1 shows a Kanban board filled in with tasks. Based on the board, one can immediately determine to which category the task belongs and at what stage of work it is. To get more detailed information about a task, the user must go to the *Tasks* sheet and search for a specific task based on the ID number.

The basic sequence of actions that had to be automated thanks to VBA was the process of moving subsequent tasks to the right places on the Kanban board. For this purpose, the Tasks procedure was written. This procedure first limits the tasks table area, then checks the status of the task and the mode of its execution, and places it in the right place. The task ID appears in the selected cell. The next step is to fill the cell to which the task was assigned with the correct color. Project tasks can appear in any of the twenty areas, starting from the second cell. Subsequent tasks appear on the right. The described procedure handles a situation in which there will be more tasks than anticipated places in each area. In this situation, an appropriate message is displayed and if accepted, the tasks are overwritten with the previous ones.

Measure the Lead Time

The *Measures* sheet has four navigation buttons. Under the buttons there is a table containing the task ID and the measures calculated for the given task. To ensure greater transparency of the worksheet, grid lines, formula bar and headers have been disabled. The head of the analyzed research project monitors two basic measures: *Lead Time* and *Cycle Time*. *Cycle Time* is the time that elapses from the beginning of the task realization to its completion. This time can be expressed in days, weeks, months or any other unit of time selected according to the size of the project. In turn, the *Delivery Time* is the total time that elapses from the moment the task appears on the board in the order area until the task is completed. This time can also be expressed in any time units. However, one must ensure that the unit is identical to the cycle time unit in the project. Table 1 presents sample calculations of measures for individual tasks.

Table 1: Sample calculation of measures for individual tasks in the selected project

ID	LEAD TIME	CYCLE TIME
1	60	59
2	-	-
3	-	-
4	43	42
5	50	41
6	41	38
7	74	62
8	49	45
9	-	-
10	-	-
11	41	35
12	33	29

In order to calculate the cycle time, the time spent on the task in the work phase and the internal review phase time were added up. In case the task has not been finished yet, thanks to the *IF()* function, no error message is displayed. What is more, to calculate the delivery time, the times that the task spends in each phase - from the moment it appears on the board as the ordered task until its completion are added.

The second option to monitor the velocity of delivering tasks is the ability to create a throughput chart in the developed tool. Throughput is a quantitative measure that shows how many tasks have been completed in a given unit of time. This time can be expressed in any unit of time, which should be chosen according to the size of the project. This measure is easiest to be visualized on a bar chart. The *Throughput Chart* sheet has four navigation buttons. To make the spreadsheet more transparent, it has disabled gridlines, the formula bar and headers. In addition, the spreadsheet includes a table used to calculate the throughput chart. The table shows the project weeks and the number of tasks completed in a given week. Based on the data in this pivot table, a throughput graph is automatically created that shows the number of tasks completed in a given week. An example of the capacity graph is shown in Figure 2.

Fig. 2. Sample throughput graph in the sample project being analyzed

Limit Work in Progress

Limit Work in Progress is also an important practice of the Kanban methodology to be used for research projects, because scientists tend to start research tasks without completing them and start realizing more interesting tasks. Therefore, the developed tool offers the possibility of generating a cumulative flow diagram, which facilitates monitoring Work in Progress (WiP) and allows to set a WiP limits. The *Cumulative Flow Diagram* sheet also has navigation buttons at the very top. A table was built under the buttons, which shows how many tasks in a given week are in each of the implementation phases. Based on this table, a layered chart called a cumulative flow diagram is generated. Figure 3 shows an example of a cumulative flow diagram.

The cumulative flow diagram indicates what work looks like each week. The delivery time, cycle times and total work in progress can be determined from the chart. Information from the chart can be the basis for suggesting process improvements.

Fig. 3. Sample Cumulative Flow Diagram in the selected research project

Discussion

The conducted research shows that the Kanban methodology, developed for production processes and successfully applied for IT projects, can also be used in research projects (at least some of their parts). To our knowledge, based on the existing literature studies, such an application has not been researched or measured so far and this article proves that Kanban usage is fully justified also for research projects. In the article we presented analysis of using the main practices of Kanban methodology in research projects. The main result of the work was the design of the Kanban board for the research project in the MS Excel environment and its verification based on the projects implemented at the Wroclaw University of Technology. Thanks to the electronic version of the Kanban board, the research project manager can easily and quickly access basic measures of project progress. The motivation of the project team members to carry out tasks in a timely manner, as well as the motivation to update the percentage of tasks realization in the table on a regular basis, have increased. The project manager is most satisfied with the ability to track the measures and metrics he is interested in, because on their basis he can make necessary changes in the deadlines for tasks and in the project plan. The electronic board is intuitive to use. Any user, even the one who is not advanced in MS Excel, will be able to use it. The implementation of the board in the selected research projects went smoothly and effectively. In addition, the benefit of implementing the designed board expected by the project manager (as shown by the interview) is to increase the motivation of the project team members to perform their tasks. The manager hopes that the project tasks will be carried out within deadlines and there will be no delays in implementation. Because in the designed Kanban board it is possible to monitor the time of task delivery and cycle time

by the project manager and the research team. Project team members accepted the new method of monitoring work progress and committed to regularly updating the board.

The proposed research and methods used have their limitations. Primarily, the suggested elements of the Kanban methodology have been implemented in only one research project. This methodology has been rated positively, but the effects of implementation need to be analyzed also on other research projects. As a future work we see a need to develop a quantitative method for measuring how much the implementation of the Kanban methodology helps project teams and managers in implementing research projects and to identify the crucial areas of improvements.

Abstract

The article presents the problem of dependency between perceived of organizational justice and organizational commitment. In this article, factors supporting organizational commitment related to criteria of organizational justice proposed by J. Colquitt and R. Moorman where analyzed.

Authors have reviewed literature in the field of employees' organizational commitment and perceived organizational justice especially concerning on relations between particular aspects of both organizational phenomena. Based on this research authors find that there is no published research of testing R. Moorman and J. Colquitt scales in area of relation between particular aspects of organizational justice proposed by these authors and organizational commitment. In this case the aim of presented article was to examine the relation between organizational commitment (and its dimensions) and perceived organizational justice (and its dimensions).

The findings of this study show which measurement reflects more conveniently the level of perceived justice.

The research was held at Wrocław University of Business and Economics in Poland on the group of 170 working students of full-time and part-time studies.

Keywords: organizational justice, organizational commitment, Moorman's scale, Colquitt's scale.

Introduction

Organizational commitment is a state reflecting employees' identification with their firm's goals, values and norms (Mowday, Steers, Porter, 1979). The aspect of organizational commitment has been widely discussed in the source literature for many years. Many authors have deeply discussed both the drivers as well as the consequences of organizational commitment. R. Mowday *et al.* (1982) claimed organizational commitment to be characterized by at least three crucial conditions: *a) a strong belief in and acceptance of the organization's goals and values; b) a willingness to exert considerable effort on behalf of the organization; and c) a strong desire to maintain membership in the organization*. J. Meyer and N. Allen (1991; 1996) also discussed a multifold nature of organizational commitment as a psychological state and separated three natures of organizational commitment. They differentiated a

desire (affective commitment), a need (continuance commitment), and an obligation (normative commitment).

There are only few negative consequences of organizational commitment listed in the literature. Special engagement in one's company issues may lead to their career stagnation or even decrease in one's innovativeness and creativity (Mathieu, Zajac, 1990). It may also strain one's self-development (Randall, 1987). Organizational commitment constitutes a remarkable aspect in many companies. It may be especially significant in health services or educational services. In service sector, lack of alternatives is driven by continuance commitment. Such a state of matter may cause a dilemma (Raju, 2017).

Indeed, organizational commitment generates many advantages for an organization. High employee commitment is supposed to be a driver of a lower employee turnover and attrition rate, as well as the lateness and absence. Workers committed to their organization usually tend to be decently motivated and to maintain high morale (Fako, Nkhukhu-Orlando, Wilson, 2018). They also use more eagerly their potential and capabilities at work. Organizational commitment constitutes a source of organizational performance and employees' spontaneous contributions towards one's organization or an individual (Dixit, Bhati, 2012). Moreover, it is crucial in encouraging the employees to engage in organizational citizenship behaviors (OCB). Organizational commitment enhances extra role performance, accountability, job satisfaction and work motivation (Fornes, Rocco, 2004; Mathieu, Zajac, 1990).

Employees do not need to look for a job if they are satisfied. The organizational climate should be convenient for its workers, providing them stable conditions to participate actively in their firm's daily life. Organizational commitment is perceived to be a useful feature, because it is a driver of firms' success (Mathieu and Zajac, 1990). That's why it is necessary to determine how this feature is shaped and enhanced.

The literature review showed that employees' commitment is strictly related to the reciprocal relationships between employees and supervisors. This statement is clearly supported by social exchange theory (Blau, 1964; Wayne, Shore, Bommer, Tetrick, 2002).

Pursuant to A. Bandura's social learning theory (1977), people learn by observing the behavior and analyzing its consequences (Mushtaq, Ellahi, Bashir Khan, 2020). No wonder people reciprocate a favorable demeanor when they are treated decently. J.S. Adams' equity theory (1965) suggests that an entity calculates the possible output that might be obtained, providing given input. Obviously, the input/output ratio must be clearly profitable for an employee to act such a behavior. *Quid pro quo* agreement reflects significance of organizational fairness. When the considered dependence is not equal beneficially for both parties, the relationship may be hampered or inhibited (Deutsch, 1975).

The problem of justice is important in social, political and economic areas of our lives. J. Rawls (2004) escribed fairness as the first virtue of social institutions. The issue has been broadly raised in many critical materials (Greenberg, 1990; Colquitt, Wesson, *et al.*, 2001; Tyler, 2010). At the beginning, researchers named two divergent terms of justice: distributive one and procedural one. The most common type of justice –distributive justice – refers to outcomes allocation (Deutsch, 1975; Hart and Deutsch, 1986). It was the first type of justice, that was recognized. *The concept of distributive justice is concerned with the distribution of the conditions and goods which affect individual well-being* (the distribution concerns both benefits and costs). According to Deutsch (1975), equity, equality and human needs touch the aspect of distributive justice. Then, researchers started to scrutinize the principles of outcomes' distribution.

In turn, procedural justice is strictly associated with the decision-making processes, i.e. process control (Colquitt, Noe, Jackson, 2002; Leventhal, 1980). Although several authors previously concentrated only on two dimensions of organizational justice, R. Bies and J. Moag (1986) introduced the *human* approach of fairness perception. Such a dimension was named interactional justice (Colquitt, Wesson, *et al.*, 2001).

Further, it was categorized into: interpersonal and informational justice (Colquitt, Wesson, *et al.*, 2001). Interpersonal justice may be perceived by how employees are treated by their supervisors (Ambrose and Schminke, 2009) in the context of outcomes distribution (Greenberg, 1993a). Meanwhile, informational justice focuses on informing employees about the procedures and regulations applied in decision-making processes (Bakhshi, Kumar and Rani, 2009) and refers to the way how fairly the distribution procedures are explained and communicated by decision makers (Greenberg, 1993b; Li and Cropanzano, 2009).

Many researchers have discussed the issue of organizational justice in the context of organizational commitment and other factors (Organ, Moorman and Niehoff, 1993; Tyler, 2010). In order to point out the significance of organizational justice, the authors systematized the relations between organizational justice and organizational commitment in a table below.

Table 1: Relations between organizational justice and the organizational commitment – literature review

References	Respondents	Examined factors	Main findings	Scales used
(Organ, Moorman and Niehoff, 1993)	870 employees of public TV, United States	effects of job satisfaction (JS), organizational commitment (OC), and procedural justice (PJ), organizational citizenship behavior (OCB)	-PJ is significantly related to OC, -PJ is related to OCB	(Organ, Moorman and Niehoff, 1993)(Lind, 1988)(Organ, Moorman and Niehoff, 1993)
(Masterson *et al.*, 2000)	651 university employees, United States	PJ, interactional justice, OC, leader-member exchange (LMX), JS, OCB, perceived organizational support (POS)	-LMX fully mediated the relationships between interactional justice perceptions and both JS and supervisor-directed OCB, -POS fully mediated the relationships between PJ and both JS and intentions to quit and partially mediated PJ's relationships with both OC and organization-directed OCB.	(Folger and Bies, 1989; Tyler, 1989)(Folger and Bies, 1989)

(Bakhshi, Kumar and Rani, 2009)	128 employees working in medical college in North India	Organizational justice (OJ), job satisfaction, organizational commitment	PJ and DJ are significantly and positively related to organizational commitment	(Aldrich, Price and Mueller, 1988; Organ, Moorman and Niehoff, 1993)(Porter *et al.*, 1974)
(Ravangard, Ansarizade and Sajjadnia, 2013)	120 employees, public university in Persia	OC, OJ, affective (AC) and normative commitment (NC), continuance commitment (CC)	-AC, NC and total OC have significant positive correlations with total OJ and its three components: PJ, DJ and interactional justice; -CC had only a significant positive correlation with PJ and interactional justice	(Organ, Moorman and Niehoff, 1993)(Meyer and Allen, 1991)
(Suliman and Kathairi, 2013)	500 full-time government employees in UAE	OJ, OC, job performance (JP) in state-owned organizations	-significant relationship between OJ and all forms of OC; -OJ (procedural, interactional) is positively and significantly correlated with AC, CC and JP; -moderating effect of AC and CC of high JP.	Based on (Colquitt, 2001)(Moorman, 1991)
(Jiang, Gollan and Brooks, 2017)	706 university employees across China, South Korea and Australia	Distributive (DJ) and PJ, OC, organizational trust, OT	-PJ and AC are significantly related, -OT fully mediates the PJ and AC relationship. -in China and South Korea, both DJ and PJ were significantly related to AC	(Colquitt, 2001)
(Ari and Çağlayan, 2017)	524 academicians from the school of physical education (professors, assistants, researchers etc.) in Turkey	OC, AC, NC, OJ	-the highest perception regarding OC was in the AC dimension, it was followed by NC dimensions, -there are moderate and low-level positive relationships between the OJ dimensions and OC dimensions	(Moorman, 1991)(Meyer and Allen, 1991)

Source: own elaboration

As signalized in the table above, the researchers used many various scales to examine the level of perceived organizational justice. A number of studies have examined the relation between organizational justice and employees' commitment. In many papers, there was found a significant positive relation between these aspects (Organ, Moorman and Niehoff, 1993; Colquitt, Wesson, *et al.*, 2001; Mushtaq, Ellahi and Bashir Khan, 2020). According to the table 1, the most often are used: four-dimensional J. Colquitt's scale (2001) and three-dimensional R. Moorman's scale (1991).

R. Moorman's (1991) scale reflects three various aspects of organizational justice: procedural, distributive and interactional. Conversely, J. Colquitt's (2001) split interactional justice into two different sections: informational and interpersonal. The most common type of justice – distributive justice – refers to outcomes allocation (Deutsch, 1975; Hart and Deutsch, 1986). It was the first type of justice, that was considered. Then, researchers started to scrutinize the principles of outcomes' distribution. Procedural justice, introduced by Thibaut and Walker (1975, 1978), analyzes the processes that lead to those outcomes' allocation. R. Bies and J. Moag (1986) noticed the significance of personal interactions that assists goods' and rewards' distribution. Their analyzes introduced the concept of interactional justice. As social interactions importance was signalized in research area, the exploration in the field of interactional justice enhanced. Interactional justice split into interpersonal and informational. Interpersonal justice refers to how people are treated by their supervisors in the context of outcomes distribution (Greenberg, 1993a). Conversely, informational justice refers to the way how fairly the distribution procedures are explained and communicated by decision makers (Greenberg, 1993b; Li and Cropanzano, 2009).

Taken together, the findings from table 1 would seem to suggest the remarkable relation between perceived organizational justice and organizational commitment. The findings demonstrate the importance of each specific dimension of organizational justice and their influence on each kind of organizational commitment. The literature review shed light on the aspect of organizational commitment among the employees of university, medical services, government institutions, public and private enterprises. Analyzed papers (Organ, Moorman and Niehoff, 1993; Masterson *et al.*, 2000; Bakhshi, Kumar and Rani, 2009; Ravangard, Ansarizade and Sajjadnia, 2013; Suliman and Kathairi, 2013; Ari and Çağlayan, 2017; Jiang, Gollan and Brooks, 2017; Osei, Osei-Kwame and Osei Amaniampong, 2017; Mushtaq, Ellahi and Bashir Khan, 2020) indicate the interdependence between perceived organizational justice and employees' attitude towards organization (i.e. organizational commitment, organizational citizenship behavior, job performance).

The aim of this paper is to examine the relation between organizational commitment (and its dimensions) and perceived organizational justice (and its dimensions). The authors measured the level of perceived organizational justice applying two popular scales: J. Colquitt's (2001) and R. Moorman's (1991), commonly used in literature (as well as in analyzed papers). In turn, organizational commitment was measured using the scale developed by N. Allen and J. Meyer (1991).

Methods

The empirical studies were conducted on a group of 170 working students (bachelor, master and postgraduate studies). The aim of the research was to determine how perceived organizational justice dimensions proposed by J. Colquitt and R. Moorman affect the organizational commitment (both as a whole and as its individual components). The results of our pilot study have shown some trends and complement existing literature findings. Our pilot study will be continued by the authors in order to reduce the statistical error.

The survey consisted of 87 questions and was based on the original J. Colquitt's (2001) and R. Moorman's (1991) scales (in case of organizational justice). To examine the relations between organizational justice and organizational commitment, the authors used scale proposed by J. Meyer and N. Allen (1991). In all cases the original research scales proposed by listed authors were used.

Secondly, an appropriate statistical analysis was performed. The authors used methods such as: regression analysis, multiple regression analysis and structural equation modelling.

First multiple regression analysis was performed, where the dimensions of organizational justice were taken into account as independent variables (in two cases, i.e. both models according to R. Moorman (1991) and J. Colquitt (2001)). An organizational commitment was adopted as the dependent variable (as the average of results in each dimension proposed by N. Allen (1991)).

Multiple regressions analysis using this method did not give results at a statistically satisfactory level. For this reason, series of single analyse were conducted, using the regression analysis of each independent variable (which are particular dimensions of organizational justice). In each case organizational commitment according to N. Allen was adopted as the dependent variable.

A regression analysis was also conducted in relation to the variable which is the average value of organizational commitment calculated as the average of the results from individual dimensions (affective, continuance, normative). The results obtained are summarized in Table 2.

Additionally, in order to determine the relationship between organizational justice according to R. Moorman's (1991) and J. Colquitt's (2001) approach and an organizational commitment, a path model was proposed and analysis using structural equation modelling was performed.

These analyses were conducted for a simplified model in which the impact of variables such as distributive and procedural justice (both in R. Moorman (1991) and J. Colquitt's (2001) proposal) on the organizational commitment was assumed. In this model, the variables related to interactional, interpersonal and information justice were tested as mediating variables (see Fig. 1). In case of J. Colquitt's (2001) proposals, the average value of variables which was interpersonal justice and information justice was also tested as a mediating variable.

Results

An important problem addressed in this article is to demonstrate the relationship between a sense of organizational justice and commitment to work. The results obtained for the models of justice developed by R. Moorman and J. Colquitt were compared in the context of their organizational commitment - according to the scale developed by J. Meyer and N. Allen. The research results presented below indicate a moderate or weak impact of the sense of organizational reliability (by type) in relation to commitment to work (by type). They also show that R. Moorman's scale is better suited to study the impact of a sense of justice on employee commitment in this specific research sample. The results are presented in Table 2.

Table 2. Linear regression between a sense of organizational justice and organizational commitment (N = 170)

Organization justice		Commitment		
		Affective	Continuance	Normative
Total	Moorman	**0.443****	0.121	**0.264****
	Colquitt	**0.401****	0.115	**0.260****
Distributive	Moorman	**0.334****	0.070	**0.183***
	Colquitt	**0.287****	0.117	0.090
Procedural	Moorman	**0.417****	0.045	**0.252****
	Colquitt	**0.308****	0.091	**0.193***
Interactional interpersonal /	Moorman	**0.325****	**0.162***	**0.204****
	Colquitt	**0.301****	0.149	**0.190***

** p<0,05, ** p<0,01 Bold values indicate the statistical significance of the parameter.*

Source: own elaboration

The table above shows that the use of the R. Moorman's scale is a better suited model to examine the correlation between sense of organizational justice and commitment. The value of the sense of justice in general in R. Moorman was higher and equal to 0.443, while in J. Colquitt it is 0.401, In particular types of justice the R. Moorman model also has higher values than J. Colquitt (i.e. in procedural justice this value is 0.417 compared to 0.308). The most susceptible to the impact of a sense of organizational justice is affective commitment - the values of the sense of each justice were statistically significant, i.e. showed a significant impact. Studies have shown that the sense of organizational justice does not significantly affect continuance commitment. In this case, none of the types of organizational justice was statistically significant (except for R. Moorman's interactional justice - the value of the statistics was 0.162 for p <0.05). In contrast, normative attachment was significantly affected by most types of organizational justice (except for distributive J. Colquitt - 0.09 for p> 0.05). Values describing the correlation of attachment to the company in the context of the sense of individual types of organizational justice gave average values and ranged from 0.287 to 0.443 for affective commitment,

statistically insignificant values for continuance commitment and 0.183 to 0.295 for normative commitment.

For the purpose of achieving the set goal, the method of data path analysis was also used to show the directional impact of the analysed variables and their interrelationships. Path analysis is a technique that uses multivariate regression analysis. The starting model for this method is proposed in Fig. 1.1. relationship diagram.

Fig. 1: Path diagram for the research model

Source: own elaboration.

For the purposes of the analysis, the authors assumed the existence of a direct correlation between the interactional / interpersonal / informational type of organizational justice and organizational commitment. The analysis confirmed the validity of the hypothesis about the proposed shape of the diagram.

The diagram has been tested for the R. Moorman and J. Colquitt scales. For the analysis, the basic parameters used in the path analyses that reflect its results (p, RMS, GFI and AGFI by Joreskog) were used. In table 3. presents values that were obtained on individual path diagrams.

Table 3: Basic statistics values for path analysis

Path diagram	p	RMS	GFI	AGFI
R. Moorman's path diagram (direct variable is interactional justice)	0,933	0,005	1	0,998
J. Colquitt's path diagram - I (direct variable is the average value of interpersonal and informational justice)	0,117	0,052	0,987	0,935
J. Colquitt's path diagram - II (direct variable is interpersonal justice)	0,031	0,069	0,979	0,896
J. Colquitt's path diagram - III (direct variable is informational justice)	0,043	0,065	0,981	0,905

Source: own elaboration

The results obtained indicate a high fit of the model to real data. GFI indicators oscillate between 0.979 and 1.00, while AGFI 0.896 - 0.998. The desired value also includes RMS values (all below 0.1). The best fit of the model can be seen in the case of Moorman - the parameters indicate the best fit (path diagram shown in Fig. 2.).

Fig. 2: Path diagram - model based on the analysis of R. Moorman's organizational justice scale with marked path coefficients and residual

Source: own elaboration

The obtained parameter values allowed the interpretation of direct and indirect causal effects. interactional justice moderately strongly affects organizational commitment, while its value is strongly influenced by procedural justice 0.64.

In the figures below there are 3 different paths based on the J. Colquitt model. Three versions of the model were presented with different variables, which directly affect organizational commitment. In Fig. 2. direct value refers to the average value of information and interpersonal types of justice, along the path presented in Fig. 4. direct variable is interpersonal type justice, while in Fig. 5. informational type. On each diagram of paths taking into account the concept of J. Colquitt's organizational justice scale one can observe a much stronger impact of procedural justice on information / interpersonal - in two diagrams the values are not statistically significant (variant with the mean value from informational/interpersonal and interactional values as directly affecting organizational attachment). Distributive justice affects organizational affiliation with a strength of 0.15 (0.37 x 0.41) through the mediating variable 'interactional justice', while procedural justice with a strength of 0.26 (0.64 x 0.41).

Fig. 3. Path diagram - a model based on an analysis of Colquitt's organizational justice scale with marked path coefficients and residual.

Source: own elaboration

In the first version of the path analysis of the model based on the J. Colquitt organizational justice scale, the mean value of informational and interpersonal variables was used as a counterpart of R. Moorman's interactional justice. Similar to the analysis of the model based on the Moorman scale, procedural justice has a stronger impact on informational / interpersonal justice (0.42), while distributive justice is not statistically significant. When examining the impact of distributive justice on organizational commitment through the mediating variable (average value of informational and interpersonal justice), one statistically significant result was obtained - procedural justice affecting with a strength of 0.15.

Fig. 4. Path diagram - a model based on an analysis of J. Colquitt's organizational justice scale with marked path coefficients and residual.

Source: own elaboration

In the second variant of path analysis of the created model based on the J. Colquitt scale, interpersonal justice was adopted as the mediating value. Distributive justice and procedural justice are both statistically significant. The mediating variable is more strongly influenced by procedural justice (0.32), whereas distributive by 0.17. In examining the impact of direct distributive and procedural justice on organizational commitment, we obtained the results 0.05 (0.17 x 0.31) and 0.1 (0.32 x 0.31) as follows. Alike to previous analyses, it should be stated that procedural justice strongly influences organizational commitment.

Fig. 5. Path diagram - a model based on an analysis of J. Colquitt's organizational justice scale with marked path coefficients and residual.

Source: own elaboration

As in option II of the path analysis of the value of the impact of individual types of organizational justice on the informational justice (mediating variable) and their indirect impact on organizational commitment were the same. Summing up the analysis of paths for the model based on the scale of organizational justice according to J. Colquitt, one can conclude that variant I, which takes the mediation average value from informational and interpersonal justice gives higher values than when analysing the interpersonal and informational mediation variables separately.

Discussion

The analysis of models based on the scale of justice according to R. Moorman and J. Colquitt leads to the formulation of several important conclusions. First of all, it should be noted that the use of the R. Moorman organizational justice scale in path analysis for the developed model shows stronger links with organizational justice than J. Colquitt's scale, which can be described as a better fit to the empirical

data model. In addition, the strongest organizational justice affects affective commitment, but it does not affect continuance commitment. Distributive justice affects mediation variables and organizational attachment much less than procedural justice. The results obtained in the study are consistent with the results obtained in the 90s by R. Moorman or D. Organ. The results of the research open the possibility of conducting further analyses, which take into account the significant cause-effect relationships occurring in organizations, at which the scales of R. Moorman and J. Colquitt can be used. The research emphasised the significance of organizational commitment in the context of organizational justice.

Abstract

Types of innovations in the construction industry are discussed in this article. Particular attention is paid to nanotechnology and nanomaterials which are currently being actively developed at the level of basic research but are not widely used in real production. This is the main problem of the development and spread of innovation. The model for assessing the diffusion of innovations in an economic setting is proposed in this article. This allows assessing the possibility of using innovative technologies in the production process. The model is built on the basis of the physical task of determining the diffusion flow. The model is adapted to solve economic problems. The concept of innovative risks is defined as an anti-environmental effect.

Keywords: Diffusion of Innovation, Nanotechnology, Risks of Innovation, Model of Diffusion of Innovations

Introduction

We have been using the terms "nanotechnology" and "nanomaterials" for a long time in our lives. These are the chemical industry, mechanical engineering and instrument making, the defense industry, aeronautics and space technologies, nuclear energy, electronics and microelectronics, robotics, computer technology, medicine, the pharmaceutical industry, biotechnology, cosmetics and many other areas of the modern industry. And, of course, we must not forget about one of the most important sectors of activity - construction.

The use of these unique materials and technologies is widely distributed in all of these areas of human activity. The construction industry lags behind other industrial fields in the industry-wide conception.

The nanotechnology industry in Russia is only at the beginning of a fundamental process of its development. Despite the lack of approbation and operational experience, many industries accept these unique developments quite actively. Thus, the nanotechnology industry is most actively developing in the energy sector, defense and space industries, medicine and pharmaceuticals, the textile industry, which has applied nanotechnology and nanomaterials among the first.

Problem Statement

Despite the fact that the construction industry is provided with unique developments by the nanotechnology industry, so many nanocoatings, nanofilms, nanostructures and nanomaterials have

been developed by the nanotechnology industry. At the same time, the construction industry is at an easy pace to introduce it into large-scale production.

First of all, we will consider those technologies and materials that have already been provided to Russian builders. These are nanomaterials and nanoconstructions:

- nanostructured concrete;
- glass fiber-reinforced composite;
- high strength steel;
- nanocomposite pipes;
- nanocoatings and nanofilms;
- nanostructured ceramics;
- innovative film;
- structural composites;
- self-cleaning coatings, etc.

These categories of materials include many different types. The variety of which is difficult to fit into the framework of one research. It has to be said that each individual type is a completely new material that carries certain functions and has its own unique characteristics adapted to solve specific problems in the field of construction operations and construction technologies.

Besides the nanotechnology in the construction industry, there are many unique developments that are innovative and creative. These developments can bring the industry to a whole new level.

3D printing is one of the unique technologies. The first development of 3D printing has started in the eighties of the last century. Today 3D printers are actively used in construction, especially for non-standard architectural forms. Typical objects are also suitable for construction based on this technology. The construction time of the building is significantly reduced relative to a similar object constructed using standard methods.

At the same time, this new technology has its disadvantages:

- the unavailability of using vibro concrete because the concrete with a high setting speed should be used;
- there is no specific methodology for structural reinforcement;
- the 3D printer works only in conditions of positive temperatures and dry weather;
- possible formation of voids because the vibrocompression is not used with this technology.

Especially, the builders did not like the last point. It is known that voids and cracks in concrete can lead to very negative consequences during building operations.

But this problem can be completely resolved. There is another unique technology that should be considered - self-healing concrete. It is hard to imagine that a collapsing wall is being rebuilt independently without any external influences. However, this is already a reality. Microbiologists have helped to solve the problem of concrete restoration. It is known that over time, concrete gains strength and the liquid fills the appeared microcracks. As a result, we get a set of negative effects: corrosion of reinforcing elements, violation of the structural characteristics of concrete, structural continuity, etc.

Microbiology has given builders a very creative solution: to use the ability of some microorganisms to produce limestone using a nutrient medium in the course of its vital functions. There is not enough nutrient medium in concrete. So, the calcium lactate which is consumed by microorganisms is using to create it. The limestone which fills the cracks in concrete structures is formed as a result of a chemical reaction.

Literature Review

For the first time, the concept of diffusion of innovations was described in the works of E. Rogers. E. Rogers has applied the concept which justifies the mechanism for introducing innovations into the real sector of the economy by political and economic factors. The provisions which have been developed by E. Rogers give an explanation of the diffusion of innovation in the economic and political aspects of the country's development. He identifies exogenous environmental factors and defines it as catalysts for the spread of innovation or as resistance factors.

The terms "innovation transfer" and "innovation spillover" can be found in some foreign literary sources. Both terms are related to innovation distribution channels. The first category includes leasing (buying and selling licenses) and franchising.

The term “innovations spillover” is more complicated in its interpretation. This term came from chemistry, and initially, it sounded like “spillover effect”. In an economic interpretation, this term defines the diffusion of innovation from the point of view of the spread and transfer of intellectual property through the “flow” of intellectual human capital.

T.F. Gareev gives more economic concept in his works. He defines the commercial and non-commercial nature of technology transfer. Economists think that such concepts are more acceptable but marketing specialists have been argued that such concepts are not entirely successful.

In our opinion, the diffusion of innovations as a conceptual apparatus includes a larger complex of aspects and represents a systemic concept that covers all stages of the development of the innovation process from the idea of creation to its implementation.

Perhaps it makes sense to give a more detailed idea of the phenomenon of diffusion of innovations as an economic and, therefore, commercial process. But in this work, we have tried to find the answer to the question of how to accelerate the process of diffusion of innovations and determine the catalyst for this process. First of all, we have to define the innovations as a complex process of transforming the idea into a final innovative product which includes at least four stages: the idea of creation with the consideration of motivation - development (creation) - testing - implementation.

Based on the definition of diffusion as a physical process (diffusion, dispersion), the process of diffusion of innovations can be represented in the form of the stepwise model of diffusion. It means that distribution can occur at each of the stages considered starting from the innovative ideas and ending with final products which are ready for use in a real production process.

Findings

The question arises: why does the construction industry implement high performance technologies and materials so slowly? For example, the pace of innovative development in China is higher than the pace in Russia and also in United States of America. What is the problem of the innovative development of Russian industries and construction?

The main problem of the active spread of innovative solutions in large-scale building production is the lack of a wide range of investors who allow the use of new technologies and materials due to its lack of testing in the market. In other words, due to the high risks of innovative projects. Not every investor is ready to invest in new technologies. If we talk about construction products, the new technologies can be very costly.

A risk assessment tool must be developed to create an active environment for the diffusion of innovations. According to this tool, it will be possible to assess the potential negative exogenous impacts. It is also necessary to create a model of diffusion of innovations to assess the rate of the introduction of innovations in the production process.

The term "diffusion" is mainly used in the natural sciences. It has come to the economy relatively recently. Today, the term “diffusion of innovations” sounds more and more often. This term means the rate of distribution of innovative solutions and its use in the production process.

In the physical process, the less the resistance of the medium, the more the diffusion activity. For example, the diffusion will be more active with the increased temperature.

The problem in the economic statement is presented as follows. Let's consider the risks as environmental resistance. The risks are presented as negative factors that impede the spread of innovations and reduce the effectiveness of implementation in the economic space.

Economic diffusion will be more active if the temperature is “increased” in the diffusion medium. Such a “warm-up” from an economic point of view can be interpreted, such as increasing the activity of marketing initiatives, risk analysis and measures to reduce it, etc.

According to Fick's first law of diffusion, the flux density of the substance will be equal to:

$$J = -D\frac{\partial c}{\partial x}, \quad (1)$$

where D - diffusion coefficient.

Diffusion coefficient is a quantitative characteristic of the diffusion rate equal to the amount of substance (in mass units) passing per unit time through a unit area (for example, 1 m²) with a concentration gradient equal to one (corresponding to a change of 1 mol / l → 0 mol / l per unit of length). The diffusion coefficient is determined by the properties of the medium and the type of diffusing particles.

The diffusion D is numerically equal to the mass flux density with a density gradient equal to one, i.e.

$$D = \frac{1}{3}\overline{V} \cdot \overline{l}, \quad (2)$$

where $\overline{V}$ — average velocity of thermal motion of molecules, $\overline{l}$ — mean free path

Thus, the risk of introducing innovations is reflected precisely in the diffusion coefficient if we draw an analogy between the physical task of determining the diffusion flow and its economic interpretation.

Since the diffusion coefficient is determined by the "properties of the medium", therefore, the more active the resistance of the medium, the lower will be the density of the diffusion flux, i.e. diffusion coefficient will also be less.

In the economic model, the diffusion of innovations is presented:

$$J_d = -R\left(\frac{\partial g}{\partial q} + \frac{\partial g}{\partial r} + \frac{\partial g}{\partial s}\right), \quad (3)$$

where R - diffusion coefficient of innovation.

The task is to calculate the resistance of the medium or its anti-action. The anti-action of the medium can be defined as the “pressure” of risks.

Expression (2) in the economic interpretation will sound like this: the diffusion coefficient is 1/3 of the product of the number of innovations introduced per unit time N (for example, a year) by the size of the economic sector S.

To predict the economic diffusion process, it is necessary to know what the expected dynamics of the diffusion coefficient of innovation is. For this, it is necessary to adjust the diffusion coefficient by the value of the external resistance, i.e. the magnitude of the risks with the consideration of its occurrence and the range of variation.

Thus, the diffusion coefficient of innovations will take the final form:

$$R = \frac{1}{3} N \cdot S \cdot (1 - P), \quad (4)$$

where N – speed of adoption of innovation; S – the sectoral distribution which can be expressed as the ratio of the number of enterprises using certain innovations to the total number of industry enterprises in a given region; P – probability of occurrence of risks, i.e. those adverse factors of the external economic environment that impede the introduction of innovations in real production.

Based on empirical data (information on the implementation of various innovations in the industry over the past period), the diffusion coefficient of innovations can be calculated.

Risks are defined as incompatible events. The sum of several events is an event consisting in the occurrence of at least one of these events. If A and B are incompatible events, then its sum A + B means the occurrence of event A or event B. The probability of occurrence of one of two incompatible events is equal to the sum of the probabilities of these events. Therefore, the sum of the probabilities of incompatible events A_1 - A_n which are forming the complete group, is equal to one.

All that is left to do is to determine the risks of innovation and the likelihood of its occurrence. This can be done based on expert assessments or using various risk assessment models.

Conclusion

The obtained model allows assessing the rate of innovation spread at various stages of creating innovative products and identifying the environmental anti-action which is defined as innovation risks in the generally accepted economic concept. The stages of development of the innovation process make it possible to determine the so-called reference point. In consideration of the foregoing, the need to assess the level of diffusion of innovations with the consideration of the risks arising at each individual stage. The model can be adapted to solve various industry problems.

Abstract

The article analyzes processes of formation of green economy within the framework of sustainable development between the countries of the Black Sea region. The role of green economy aimed at reducing the negative impact on the environment is revealed. The subject of the study is the main directions of green economy emerging in the Organization of the Black Sea Economic Cooperation (BSEC). The BSEC member States play an important role in the sustainable development of the black sea region. The article presents an analysis of CO2 emissions by sectors of the economy in the BSEC, which indicates the relevance of the transition to green economy in the region. In the process of studying the normative documents of the organization, the author's vision of the key directions of green economy is proposed. The research conducted in the article on the use of renewable energy sources in the world and in the BSEC countries is aimed at identifying the stage of formation of one of the directions of green economy in the BSEC countries on the way to sustainable development. A forecast is made of the use of renewable energy sources (RES) sources and conventional energy sources in five countries of the BSEC, which revealed the largest amount of installed capacity of renewable energy sources. The existing problems in the BSEC require special attention, as well as analysis, which will show the main solutions and opportunities to reduce environmental costs.

Keywords: BSEC, sustainable development, green economy, RES.

Introduction

The last decade has seen the largest increase in energy consumption in history. And at the same time, the world community began to worry about climate change, environmental problems and energy security problems. Also, existing and projected climate problems increase with population growth, urbanization and migration. Thus, many countries have set a course for a low-carbon economy, sustainable development and a green economy. Renewable energy has regained an important role, especially in the area of electricity generation.

The Organization of the Black Sea Economic Cooperation (BSEC) is a unique platform that was established as a unified regional economic organization in June 1992. The key priorities concerning the BSEC activities in the field of sustainable development are defined by Goals of the “BSEC Economic Agenda: towards an Enhanced BSEC Partnership”, adopted in 2012 (BSEC, 2012). Sustainable development is way of conceiving the global interaction between economy, society and environment.

Research is devoted to Sustainable development of the BSEC Member States for the effective integration into the green economy. Green economy is the economy that provides social welfare and justice, but at the same time environmental risks and ecological deficit is minimized (Babenko et al, 2018, p. 36). This economy is inclusive with efficient use of resources and minimal use of

hydrocarbons. Green energy strategy, environmental protection in the Member States, produce green products and services and others are important elements of the green economy in the Black Sea region (BSEC, 2012). A range of environmental and economic possibilities are available for realization green economy.

The main objective of the article is the implementation of the concept of green economy in the BSEC Member States. The main goals are to identify the main directions of green economy in the BSEC region and to highlight the main role of RES. This paper contributes to existing studies focusing on how countries can develop the directions of green economy in the long term.

The paper consists of the following parts. First, the theoretical review disclosures the features of green economy and the importance of this study for the BSEC region. Second, the paper identifies peculiarities of development of RES applied by BSEC. Third, this study aims at determining the overall ecological and economic tools associated with global sustainable development trends in the Black Sea region.

In that way, perspective the development of the BSEC within green economy will help to better understand future policy decisions by addressing complex environmental impacts as the new baseline to design sustainable development.

Theoretical base and features of green economy

The term “green economy” was firstly mentioned in 1989 in the title of Blueprint of Green Economy. Later in June of 1992 this term was underpinned by the Conference on Environment and Development in Rio de Janeiro. However, green economy did not get wide dissemination before the world crisis of 2007-2008, which helped push it swiftly to the top of political discussion. The financial crisis drove many countries into recession and into higher level of debt while also causing high numbers of job losses and widespread business failure. At the same time it entailed food and goods lacks in developing countries because of high prices on fuel and products. These events coincided with increasing concern about the potential impact of climate change caused by human activities. The green economy’s conceptual foundation recognizes that the separation of economic development and environmental policies is artificial (Georgeson et al., 2017). It was a critical moment for scholars and politicians to revise people’s production and consumption behavior and change it accordingly green economy concepts. Current situation and further steps to “green” future were discussed during Rio + 20 Global Summit (Rio de Janeiro, Brasil). Summit resulted into setting 17 Sustainable Development Goals (SDG), where 7 of them is devoted to ecological improvement.

Green economy belongs to sustainability sciences, which is defined as is “…an emerging field of research dealing with the interactions between natural and social systems, and with how those interactions affect the challenge of sustainability: meeting the needs of present and future generations while substantially reducing poverty and conserving the planet's life support systems” by Proceedings of the National Academy of Science of the United States of America (National Academy of Scienc, 2011). As the a part of this group, green economy possess the sustainability science characteristics (Kates, 2010):

- it is use-inspired; in other words, it is defined by the problems that is addresses rather than by approach employed. In this, it contrasts with curiosity driven or “blue skies” research. It is applied in nature, designed to meet human need;
- it focuses on coupled human-environmental system. Integration is therefore a core theme. It is also strongly interdisciplinary, including both social and environmental sciences as well as other fields;
- sustainability science is rooted in values. Many proposed solutions relating to the development of the green economy depend on the values of different people. The subject therefore includes the science of identifying and analyzing values and attitudes as well as action.

Green economy aims at improving a human well-being and committed to social equality, thus, contributing to reducing environmental risks and ecological deficit-reduction resources (Canfin and

Lambertini, 2018). The findings of the literature review highlight the fact that there is no agreed definition of green economy. Examples of interpretation follow:

- UNEP has defined the green economy as «one that results in improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities. It is low carbon, resource efficient, and socially inclusive» (UNEP, 2011). This definition has been cited in a number of more recent reports, including by the UNEMG and the OECD.
- Another definition for green economy offered by the Green Economy Coalition (a group of NGOs, trade union groups and others doing grassroots work on a green economy) succinctly defines green economy as «a resilient economy that provides a better quality of life for all within the ecological limits of the planet» (Georgeson, 2017).
- The International Chamber of Commerce defines the green economy from business perspective as "an economy in which economic growth and environmental responsibility work together in a mutual reinforcing fashion while supporting progress in social development".
- Lund University explains green economy as "…one that generates increasing prosperity while at the same time reducing our environmental impact."

The mutual meaning that all of four definitions shares is interconnection of economic, social and ecological aspects of economies development. They all agree that we countries can succeed only if all of three spheres will work together.

More broadly the green economy meaning explained by International Human Dimensions Programme on Global Environmental Change (International Human Dimensions, 2012). In its opinion green economy is "One that focuses on enabling people around the world to pursue and achieve lives that are meaningful to them, while minimizing humanity's negative impact on the environment. It is an economy that is measured against the yardsticks of human well-being and its productive base. It is the economy that is anchored by a passion for equity and celebration of ingenuity."

Professor of city and regional planning in Berkley (Chapple, 2008) defines the green economy as: "the clean energy economy, consisting primarily of four sectors: renewable energy (eg. solar, wind, geothermal); green building and energy efficiency technology; energy-efficient infrastructure and transportation; and recycling and waste-to-energy. The green economy is not just about the ability to produce clean energies, but also technologies that allow cleaner production process, as well as growing market for products which consume less energy. Thus, it might include products, processes and services that reduce environmental impact or improve natural resources use".

The Danish 92 Group defines the green economy as: "…not a state but a process of transformation and constant dynamic progression. The green economy does away with a systemic distortion and dysfinctionalities of the current mainstream economy and results in human well-being and equitable access to opportunity for all people while safeguarding environmental and economic integrity in order to remain within the planet's finite carrying capacity" (Danish 92 Group, 2012).

Green economy indicators written by Andrea M. Bassi et al and UNEP staff in 2014 (Andrea and Bassi, 2014). According to this guidance green economy indicators have 4 successive purpose (Fig. 1):

- Issue Identification: instruments that help decision makers identify and priorities problems that might undermine the path towards sustainable development.
- Policy Formulation: help to design solutions.
- Policy Assessment: expected economic, social and environmental effects of different policy options need to be measured with the help of impact indicators.
- Policy monitoring and evaluation: support the assessment of the performance of the intervention implemented, and allow decision makers to design timely corrective measures, when needed.

Fig. 1: Green Figure economy policy circle

Source: authors' calculations

Traditional industries are gradually being replaced by more environmentally friendly ones, thereby replacing the raw material economy based on the extraction of natural resources. Green economy is manifested in the growth of investments, new jobs, improvement of the environment, prevention of reduction of biological diversity in the Black Sea region and etc.

The historic Paris Agreement, the 2030 Agenda for Sustainable Development and 17 Sustainable Development Goals provides a chance for countries to improve and to support climate action to reduce emissions and build resilience to climate change. The SDGs can promote global changes by providing a growing vision of sustainable society. Extensive efforts are needed to raise public awareness about the essential need for economic and political reform. Today, sustainability specialists must make the cases for the concept sustainable development to encourage companies to reduce negative impacts. So, businesses must begin to apply the same responsibility standards that individuals currently apply (Dixon, 2019).

Currently, renewable energy sources compete with traditional resources (oil, gas and coal) in the energy sector, which is evidenced by the refusal of many countries from polluting technologies in favor of green innovation in order to achieve 100% of renewable energy production. The renewables, with its huge volume of investment and amount of state initiatives, are an opportunity to move the world into a green future and help countries transition to low-carbon, clean energy with new green infrastructure.

This trend is gaining momentum as the topic of climate change becomes a promising direction for business in the coming years. The number of companies that implement the principles of sustainable development in their business models is constantly growing.

In the context of limited resources and the concept of circular economy has been developed, which is applied in various industries with environmental, economic and social benefits. Circular economy increases resource efficiency and renewable resources and reduces the amount of waste in the environment (Pakhomova and Richter, 2017). Circular economy practices can help achieve of the

SDGs' targets, such as SDG 6 (Clean Water and Sanitation), SDG 7 (Affordable and Clean Energy), SDG 8 (Decent Work and Economic Growth), SDG 12 (Responsible Consumption and Production), and SDG 15 (Life on Land) (Schroeder et al., 2019).

Every year the number of supporters of greening and climate risk reduction represented by international organizations and intergovernmental associations increases. Climate risks and their impact on all spheres (environment, economy and society) are assessed. Despite the fact that the consequences of risks may be noticeable only in the long term, we need to act now.

Overall, green economy has been researched and defined in different research reports with various terms rather well known today. However, this concept being in some sense a more complex, as well as a more day-to-day subject, is not clear, the amount of research on it is insufficient.

Methodology

Econometric models are made to reveal causal relationships between variables (GDP, renewable energy sources (RES) and primary energy (PE)). The aim of the researcher in solving this problem is not only to find the correlation dependence between two variables, but also to obtain a predictive estimate of the effect of one property on another.

Logic of mathematics instrument:

- to calculate of a correlation coefficient;
- to build a multiple linear regression;
- to make a forecast of renewables, primary energy, GDP;
- to make explanations.

Correlation analysis is a method of statistical data processing, which consists in studying the relationship between variables. Correlation analysis allows to answer whether in general there is any connection between variables and in case there is some how close it is.

The sample correlation coefficient:

$$r = \frac{SS_{XY}}{\sqrt{\mathrm{SS_X}\,\mathrm{SS}_Y}} \quad (1)$$

Where

$\mathrm{SS_X}, \mathrm{SS_Y}, SS_{XY}$ – *sums of squares and cross products.*

The plus sign before the coefficient indicates that the relationship between the phenomena or the indicators is direct. The more one indicator, the greater the other. Such a correlation is called direct, or positive. If the coefficient is greater than 0.70, the relationship between the indicators is strong; from 0.30 to 0.70 - communication is moderate; less than 0.30 - weak communication.

If the coefficient has a minus sign, then the correlation is inverse, or negative. In this case, the higher one indicator, the lower the other.

Regression refers to the statistical technique of modeling the relationship between X and Y. The simple linear regression is the model of the relationship between two variables: a dependent variable and an independent variable.

When we model the relationship between the dependent variable and a set of several independent variables, we use a technique called multiple regression.

$$Y = b_0 + b_1X_1 + b_2X_2 + \varepsilon \qquad (2)$$

Where

Y – is the dependent variable;
X – is the independent variable;
ε – is the error term;
b0 – is the intercept of the systematic component of the regression relationship;
b1,2 – is the slope of the systematic component.

The process of finding the least-squares prediction equation, testing the adequacy of the model and estimating the values of model parameters is called a multiple regression analysis.

Renewable energy forecasting results provide information about the expected changes in the energy to be generated in the near future in the world and the BSEC Member States.

Environmental risks in Black Sea region

One of the main causes of climate change is greenhouse gas emissions from industry, transport, agriculture and other important sectors of the economy. Traditional fuels are the largest source of carbon dioxide.

The global CO2 emissions trend has increased since the beginning of the 21st century. The dataset shows that global anthropogenic fossil CO2 emissions increased by 1.2% in 2017 compared to 2016 reaching 37.1 Gt CO2 (Muntean et al., 2018, p.5).

In 2017 BSEC's fossil CO2 emissions increased by 2% to about 2 Gt compared to 2016 (Fig. 2).

Fig. 2: Fossil CO2 emissions for the BSEC by sector, 2009-2017 (Mt CO2/yr, t CO2 /capita /year; t CO2 /1000USD GDP /year)
Source: authors' calculations based on the data from (Muntean et al., 2018).

BSEC per capita emissions of 58 tonnes CO2/cap/yr are higher than in 2016. Russia is the fifth largest emitter of global CO2 emissions (1.8 Gt CO2), due to an increase in the consumption of coal, natural gas and oil consumption. Also the largest fossil CO2 emissions were in Turkey and Ukraine in 2017. The largest increases of fossil CO2 emissions were in power industry (power and heat generation plants) and transport (road & rail & ship & aviation).

Pollution of the environment, and especially of the marine environment, has become so widespread that urgent action is required by the BSEC governments. The marine ecosystems are under threat, due to of the heavy load on the ecology of the sea coast (Tsiaras, 2010, p.15).

All the declarations of the BSEC summit confirm the priority of environmental issues for the organization. For example, the Declaration of the Black sea Economic Cooperation Summit (Istanbul, 1992) requires States to take part in new regional initiatives through "appropriate steps to protect the environment, especially to preserve and improve the ecology of the Black sea, as well as to conserve, exploit and develop its potential». After the transformation of the international structure in 1999, environmental protection became one of the priority areas of cooperation within the organization, which was presented in the Charter of the BSEC.

The climate changes will be influenced the natural resources, the economic activities and will be had an aftermath of societal of the region. It is likely that vulnerable components of ecosystems of Black Sea region will be impacted the most.

Cooperation among the member states to adopt green economy

The main activities, concerning the promotion of cooperation in the field of green economy, are carried out by the BSEC Working Groups on different areas, such as environmental protection and energy. The Working Group developed the “BSEC Climate Change Adaptation Strategy for the Black Sea” on 15 December 2017, which is contained a tasks to Goal 5 of the “BSEC Economic Agenda” for mitigation measures to address the impact of environmental risks (BSEC Climate Change, 2017).

When exploring the potential implications of green economy perspectives for sustainable development, it is important to stress the incredible diversity of the countries encompassed in Black Sea region.

BSEC is supported activities in the BSEC region in the field of environmental protection taking into account the provisions of the BSEC Charter and the other BSEC documents. After the signing of the Bucharest Convention, which provided an international legal framework, environmental programmes were developed in the BSEC Working Group on environmental protection in cooperation with the European Commission, UN Agencies (UN development Programme and UN Environmental programme), the World Bank and etc. (Dogru, 2013, p.17). The BSEC working group on environmental protection aims at cooperation of the member States in the field of environmental protection and seeks to strengthen cooperation in key areas: control of air, water and land pollution, elimination of environmental consequences, nature protection; development of ecological tourism in the black sea region.

The author's visions of the main directions of the green economy of the BSEC are presented in figure 3. Thus, all priority directions of green economy are discussed and monitored to ensure energy and food security, the implementation of waste management, health care and etc.

Fig. 3: The main directions of the concept of green economy in the BSEC
Source: authors' calculations

Governments should pay special attention to climate change as an issue of security and sustainable development and address it together. Solutions to climate change must involve a wide range of actors and stakeholders, including local governments, civil society organizations, academia and the business community.

Renewable energy in the Black Sea energy market

Cooperation among the Member States is strategically task with the view to promoting renewable energy sources and energy efficiency. So, the countries are trying to promote renewable energy through energy efficiency and economic growth. In 2018 BSEC's renewable energy installed capacity increased by 4% to about 139 Gt compared to 2017 (Fig. 4).

Fig. 4: Total renewable energy installed capacity in the world and in the BSEC by sector, 2009-2018 (MW)

Source: authors' calculations based on the data from (IRENA, 2019).

The renewables are expected to have an increase of their use, but the use of it is expected to account for the smallest percentage. The share of Russian renewable energy installed capacity in the BSEC was equal to 38% in 2018 (fig. 5). Thus, Russia, Turkey, Romania, Greece and Ukraine play dominant role in renewable energy installed capacity in the BSEC.

Fig. 5: Renewable energy installed capacity in the BSEC countries in 2018 (%)

Source: authors' calculations based on the data from (IRENA, 2019).

For the BSEC countries it's important to develop the innovative, environmentally friendly and resource saving technologies.

The BSEC is facilitating its members' integration into the global green economy and advancing sustainable cooperation capacities within the region.

The dependency relationship between RES and GDP growth has been less studied in different scientific works because the issue of production and renewable energy consumption has been researched only recently as a fundamental objective for sustainable development. In this field, the authors, who has studied the relationship between renewable energy and GDP, estimated for G7

economies, the Organization for Economic Co-operation Development (OECD) economies and the EU member states, there was statistically significant and insignificant relationship between GDP and renewable energy (Marinaș et al., 2018).

We try to find an answer to the question of what is the relationship between renewable energy consumption and GDP, and, accordingly, to understand how the development of renewable energy will affect the economy in the world and the top-5 BSEC countries. Figure 6 shows the correlation field and the empirical regression line of the relationship between RES and GDP.

The world: the higher RES, the higher GDP. The relationship between the indicators is strong (r = 0,9).

Greece: a strong negative association (r = -0,9) implies a relatively positive linear relationship between RES and GDP. But the relationship between the indicators is negative.
Romania: a correlation of r = 0,6 implies a relatively strong positive relationship between GDP and population
Russia: in the example of RES and GDP, we got r = -0,4, which means that the more RES, the lower level of GDP.

Turkey: a correlation of r = 0,1 implies a weaker association between RES and GDP.
Ukraine: a correlation of r = -0,3 suggest a weak, negative association. A correlation close to zero suggests no linear association between two variables.

The results obtained for the world and the top-5 BSEC countries, are, for the world and countries, such as Greece, Romania and Russia, consistent with the conclusions revealed in other researches, given the empirical estimation of the relationship between the consumption of renewable energy and GDP. The ecological trends had led to a significant increase in renewable energy consumption in the BSEC Member States, which validate the directional relationship from GDP to renewable energy consumption. The absence of the causality relation in Turkey and Ukraine may be suggested to the difficulties of identifying and insignificances these variables in managing the policies of renewable energy sources.

Fig. 6: Correlation field based on renewables from GDP (billion tones oil equivalent, billion of U.S. dollars)

Source: authors' calculations based on the data from (BP, 2019).

The search for answers to the following questions becomes more and more meaningful: what will be the share of RES in the world and the top-5 BSEC countries' energy consumption over time; what is the economic and non-economic expediency of its increase.

The global demand for RES is constantly growing (see Fig. 7). According to the forecast, RES will grow slowly against the background of growing energy consumption; despite this traditional sources will be in demand for a long time.

Fig. 7: Forecast consumption of RES and PE in the world and the top-5 BSEC countries by 2021(billion tones oil equivalent/ billion)

Source: authors' calculations based on the data from (BP, 2019).

In the foreseeable future, the trajectory of RES and PE consumption curves in the world do not intersect, indicating the development of these two sources of energy in parallel within its technological stage.

It is assumed that structural changes in the traditional energy sector will not be carried out in the analysis of this forecast in Russia and Turkey. RES will not have a significant impact on the economy. However, the volume of renewable energy will slowly increase every year in energy consumption. Renewable energy use in Greece, Romania and Ukraine is still increasing, although a slowdown in overall development has continued. Also, the forecast show a decline for consumption of traditional resources between 2015 and 2018, and this decline will continue.

As this analysis makes clear, current and planned policies offer a comparatively slow trajectory whereby the world would exhaust its energy-related “carbon budget” in under 20 years. As a result, the energy system requires rapid, immediate and sustained change. The deployment of renewables must increase at least ten-fold.

In contrast to fossil and nuclear fuels, which have finite reserves expected to last for tens to hundreds of years, RES will be available from year to year for a very long time. Furthermore, RES have lower greenhouse gas emissions than fossil fuels, and are therefore expected to play an important role in achieving global climate goals.

The results and implementation of tools related to green economy

The strategies for BSEC to support climate change adaptation in the Black Sea region recognize the problems of climate change and the need for common solutions for seeking common sustainable initiatives. The BSEC need to facilitate the exchange of information related to the environmental situation in the Black Sea region and to use of economic and ecological tools in the field of the environmental protection in order to develop for mutual projects.

The main aim of green economy is to design of better, demand-driven and output-oriented green programmes and projects in the region, targeting more effective use of existing funds.The politics of many countries focused on reducing energy consumption and on enhancing the deployment of renewable energy within the energy sector.

"Green Black Sea" is perspective direction that includes the ecological culture, also economic and social prosperity of population. It makes the concept of sustainable development driving force, because the environmental dimension runs through all of actions and aims of the BSEC.

National governments in the BSEC have already moved towards identification of key possibilities for building sustainable development in the future. In many BSEC countries, taking into account the green objectives of economic indicators, there is a wide application of economic levers (fines for pollution and others). Particularly interesting the "Polluter pays principle" is applied where the manufacturer must at its own expense to cover any costs representing the opportunity to lead the adverse environmental impact and restore damage to the environment.

Productive cooperation in order to preserve and protect the natural resources of the region and to maintain stable environmental conditions is the duty of each the BSEC member state.

Thus, the next goals to need achieved as part of green economy in the BSEC:

1. Improve global safety, combating climate change and environmental degradation.
2. Increase the competitiveness and job potential of green industries by boosting investments in the green economy.
3. Strengthen the BSEC’s international position and work towards its strategic independence by setting and implementing ambitious sustainable goals.
4. Improve governance in the BSEC to support the sustainable transition to a safer and more competitive economy.

Today, the countries have a responsibility to coordinate their work and boost their cooperation to decrease ecological risks in the Black Sea region. It is necessary to predict long-term environmental

consequences as a result of economic decisions. Furthermore, regional and international organizations need to involve civil society in regional dialogue and cooperation in fields of green economy.

Conclusion

The Black Sea region is special place, where countries of this region are positioned strategically at the crossroads of East and West and they have a high potential of growth with their unique and complementary markets. Unfortunately, there are many issues that the Black Sea is facing, for example: differences of the size of economy of the BSEC countries, lack of communications between countries, difference in legal systems and best practices and est.

As a global actor, BSEC need to play a crucial role in ensuring conditions for peace, stability and sustainable development throughout the whole region, including its immediate neighborhood with other countries and promoting of the regional cooperation initiatives and programs in the field of environment.

The concept of green economy is defined as one that is low-carbon, efficient and clean in production, based on sharing, circularity, collaboration, solidarity, resilience, opportunity and interdependence in Black Sea region. The scientific research aims to offer a comprehensive framework for analyzing green economy issues. The green economy contributes to the accelerated transition to a low-carbon economic model through which new directions/ industries are emerging in the BSEC countries. According to the flows, the share of the green economy in the market is steadily growing, and the fossil fuel sector is in a state of decline.

In accordance with the goal set by the author, the following tasks were formulated and solved: the author's approach to the interpretation of the main directions of the green economy in BSEC was proposed; the analysis of the dependence of GDP and RES in the five countries of the organization was carried out, the forecast of RES development was determined; the key tools and results in ensuring the transition to a green economy in the black sea region were shown.

Although this paper provided an overview on the relationship between RES and GDP, additional research will be required to further explore and analyze in depth the correlation and opportunities between RES practices for SDG targets in the BSEC member states.

Assessment of Project Maturity Using the OPM3 Model

Agata KLAUS-ROSINSKA

Wroclaw University of Science and Technology, Faculty of Computer Science and Management, ul. Ignacego Lukasiewicza 5, 50-371 Wroclaw, Poland, e-mail: agata.klaus-rosinska@pwr.edu.pl

Cezary LUBINA

Wroclaw University of Science and Technology, Faculty of Computer Science and Management, ul. Ignacego Lukasiewicza 5, 50-371 Wroclaw, Poland, e-mail: cezarylubina@gmail.com

Abstract

The aim of the paper is to present the way of using OPM3 to asses project maturity in organizations. To achieve the goal, a review of the literature in the field of project maturity models was carried out and qualitative research -"single holistic case study" connected with project maturity assessment of a selected company from manufacturing industry was presented.

Keywords: Project Maturity, OPM3, Qualitative research, Case study, Manufacturing industry.

Introduction

The project maturity is considered to be one of the key factors determining the effectiveness of projects and project portfolios management in enterprises. The most important elements defining maturity in this aspect include: processes, structure, people and systems [Weidemann 2017]. There are many definitions of the organization's project maturity, including "*the ability, readiness of the organization to effectively select a project portfolio supporting the strategy and goals of the organization as well as the use of professional techniques and tools, project management methodologies that are leading to the successful completion of the project and translate this success into further projects*" [Juchniewicz 2013]. Another definition of the organization's project maturity is "*the ability of the organization or/and its processes to improve and thus to bringing better results*" [De Bruin and Rosemann 2005]. According to the first definition, the organization's project maturity refers to the strategic management and emphasizes the importance of choosing the right projects to implement. Both of them accent the fact that the higher the maturity in project management, the greater the chance of project success.

Many models assessing project maturity can be found. According to [Spalek 2013] several dozen models are used worldwide, [Steyn et al 2012] source counts there are about thirty of them. Almost every reputable organization that sets project management standards has created its own project maturity model. The most known models were shown in Table 1.

Table 1: Selected models of the organization's project maturity

Model short name	Full name of the model	An organization that creates standards in project management
OPM3	Organizational Project Management Maturity Model	Project Management Institute (PMI)
CMM/CMMI	Capability Maturity Model Integrated	Software Engineering Institute of Carnegie Mellon University
K-PMMM	Kerzner Project Management Maturity Model	Harold Kerzner
P3M3	Program and Project Management Maturity Model	Office of Government Commerce (OGC), department within the UK Government

Each model distinguishes about five levels of maturity, which requires certain conditions to be met by the organization or the project. The first level is characterized by some chaos, lack of stability, which is then gradually mastered by acquiring experience and learning about processes, structures, people and systems. Thanks to this it is possible to move to higher and higher level. At the highest - fifth level, continuous improvement is possible to achieve ever better results.

Conducted literature review (chapter 2 of the paper) shows that there are not many publications describing in real cases how a given project maturity model can be used. In manufacturing industry few case studies about how to assess the organization's project maturity were found (OPM3 – [Silva et al 2019] and purposely developed model – [Guimaraes et al 2018]). There was even found one case study directly connected with automotive industry – [Kerzner 2019], but it was focused more to specify questions related to project maturity in the company rather than show how the project maturity model (K-PMMM) can be used in it. Therefore, authors decided to choose one - well known model (OPM3) and after describing the basic assumptions of it (chapter 3), present its use for selected organization from the manufacturing industry (chapter 5).

The contribution of this article to the current state of knowledge is to illustrate how qualitative research can be used in assessing the maturity of organization and supplementing information about the level of project maturity in companies from the manufacturing (to be more specific - automotive) industry.

Literature Review – Project Maturity Models

Type of literature review used in the article is *scoping review,* which aim to provide an assessment of the size of available literature, defining the scope of conducted research [Orlowska et al 2017] on [Booth et al 2012]. The characteristics of this type of literature review are presented in the Table 2.

Table 2 : The characteristics of *scoping review*

Search	Appraisal	Synthesis	Analysis
'As far as time allows', it may also include unpublished works and research	None	Narrative, tables	Quantity and quality assessment of available literature

The main criterion of the literature review was the qualitative research used to measure the organization's project maturity. Because empirical research was planned to be carried out in the form of a case study, the literature review was conducted for such a research strategy. The process of literature review began with the selection of keywords that are related to the research subject. Two axes were used, the first one with the keyword regarding the project maturity models, and the second one with qualitative research in type "case study". The selected keywords with the combinations are shown in Table 3.

These words were used to search for articles in selected scientific databases – *Science Direct* and in *Primo* search engine (available to employees and students of Wroclaw University of Science and Technology in Poland). The *Primo* search engine searches many scientific databases, including those valued by scientists, for example: Taylor & Francis Online – Journals, Directory of Open Access Journals (DOAJ), Emerald Insight, Wiley Online Library, Wiley (CrossRef), Elsevier (CrossRef), SpringerLink Books, Knovel E-Books, ProQuest Research Library, ProQuest Dissertations and Theses Full Text. Thanks to this, it became possible to analyze the texts articles (including main PM journals), conference materials, e-books, as well as doctoral dissertations.

Table 3: Combinations of selected keywords for literature review

Keywords			***Science Direct* Results**	***Primo* Results**
I	II	III	IV	V
Axis 1	Boolean Operator	Axis 2		
project maturity model	-	-	57 121	150
project maturity model	and	case study	6	5

The search results are shown in columns IV and V. For the combination of "project maturity model" and "case study" axes in *Science Direct* only 6 papers were found, which is a huge variation between using only one ax - "project maturity model" (57 121). Besides, after analyzing the content of the articles, only 3 out of 6 actually relate to project maturity models. Whereas in *Primo* – only 5 papers were found (considering two axes). The titles of papers and project maturity models used for assessing real organizations are given in the Table 4.

Table 4: Case studies - use of project maturity models

No.	Title	Project maturity model

5	Utilizing a capability maturity model to optimize project based learning – case study [Al Mughrabi and Jaeger 2017]	Project Based Learning Capability Maturity Model (PBLCMM)

6	Project Management Maturity: Case study analysis using OPM3® model in manufacturing industry [Silva et al 2019]	OPM3
7	Using the Project Management Maturity Model, Chapter 14: Case Studies [Kerzner 2019]	K-PMMM
8	Organizational Project Management Maturity Model (OPM3®) – Third Edition, Appendix X4: Case Studies [PMI 2013]	OPM3

After making the decision to use the OPM3 model, prestigious journal related to project management was additionally examined - *International Journal of Project Management* - for finding research using this model, especially in the context of manufacturing industry. No articles were found directly dealing with the use of the OPM3 model in measuring project maturity or articles regarding project maturity in the manufacturing industry. There were cross-sectional articles related to maturity models [Milosevic and Patanakul 2005], [Kwak et al 2015], [Williams 2004], [Ahlemann et al 2009], [Gorog 2016] and articles about project maturity assessment in other sectors [Jia et al 2011], [Cooke-Davies and Arzymanow 2003].

OPM3 – Model for Assessing Project Maturity

Model OPM3 (Organizational Project Management Maturity Model) was developed by the PMI (Project Management Institute). The main purpose of this model is to evaluate project management according to the PMI concept in terms of its maturity, based on experiences of other companies and good practices. OPM3 is built from components include: Domains, Process Improvement Stages, Best Practices, Capabilities and Outcomes [PMI 2013] (see in Figure 1). The basis for assigning an organization to one of the levels of maturity is the percentage of Best Practices implemented in three main domains: project, program and portfolio.

Fig. 1. OPM3 Standard – Components

The OPM3 model cataloged and described 586 Best Practices. Best Practices refer to the methods, currently recognized within a given industry or discipline, to achieve a stated goal or objective [PMI 2013]. Best Practice can be understood as "*the optimal way of achieving the assumed goal*" [Trocki and Buklaha 2016]. The application of the described practices results in an increase of the organization efficiency and effectiveness. To be able to state that a given good practice is being applied in an organization, the organization must have specific Capabilities.

At least two Capabilities are assigned to each Best Practice. Capability is part of Best Practice, it is a competence that an organization must possess in order to apply Best Practice. 2109 Capabilities were

defined in the described model. Capabilities can be interrelated. This imposes on the organization the need for continuous long-term process improvement.

Best Practices and Capabilities have been grouped into individual domains: project management, program management and portfolio management (Project, Program, Portfolio - PPP).

The OPM3 model details the Process Improvement Stages: Standardize, Measure, Control, Improvement - SMCI. In Table 5 is an example of assigning Best Practices to these stages [PMI 2013].

Table 5: Assignment of exemplary Best Practices to each of the Process Improvement Stages

Best Practice ID	Best Practice Name
1005	Standardize Develop Project Charter Process
1700	Measure Develop Project Charter Process
2240	Control Develop Project Charter Process
2630	Improve Develop Project Charter Process

Best Practices and Capabilities relate to the environmental and cultural aspects of the organization in accordance with the Enablers which are [PMI 2013]: Benchmarking, Competency Management, Governance, Individual Performance Appraisals, Knowledge Management and PMIS, Management Systems, Organizational Project Management Communities, Organizational Project Management Methodology, Organizational Project Management Policy And Vision, Organizational Project Management Practices, Organizational Project Management Techniques, Organizational Structures, Project Management Metrics, Project Management Training, Project Success Criteria, Resource Allocation, Sponsorship, Strategic Alignment .

The assessment according to the OPM3 model is carried out on the basis of three elements: Acquire Knowledge, Perform Assessment and Manage Improvement. In their scope can be specified 5 activities forming a cycle: Prepare for Assessment, Perform Assessment, Plan for Improvements, Implement Improvements, Repeat a Process.

The assessment is made on the basis of a specific score: 1) binary scoring - 1 for a fully existing Outcome and 0 for an Outcome that does not fully exist, or 2) assessment of a variable measures - based on how often the Outcome exists. See in the Table 6.

Table 6: Variable Measures Scoring

3	Fully implemented, consistently for Outcomes of Best Practice
2	Fully implemented, not consistently for Outcomes of Best Practice
1	Partially implemented for Outcomes of Best Practice
0	Not implemented for Outcomes of Best Practice

Qualitative research in type single case study

Qualitative research was based on a wave of criticism of quantitative research, which intensified in the 1960s and 1970s. Qualitative research is becoming not only alternative or complementary research for quantitative research, but also equal research [Juszczyk 2013]. Qualitative research is used when a researcher is interested in deepened knowledge about a topic, understanding the essence of a given phenomenon, and quantitative research when it is necessary to verify a research hypothesis. According to U. Flick, qualitative research aims to look at the outside world, as well as to describe, interpret and explain phenomena from an internal perspective [Flick 2010]. As part of qualitative research, frequently used strategies are [Creswell 2013], [Czakon et al 2011]: ethnography, grounded theory, case studies, phenomenological research and narrative research.

For the aim of the paper, a qualitative research strategy was applied - case study. W. Czakon points to three purposes of using case studies: the theorygenic goal (cases are examined to develop the existing

theory, provide explanations of unrecognized phenomena and to help understand the course of processes), the purpose of testing the theory (the case is to prove the genuineness of the theory) and the application purpose (when a case study has a clear practical orientation) [Czakon et al 2011]. In this context, the adopted research strategy is of the formative and partly application nature, taking into account the possibility of using research results by people managing projects.

In [Yin 2015] four models of case study can be found: single holistic case study, single embedded case study, multiply holistic case study, multiple embedded case study. A single case study is a case study organized around one case. In a single case study units of analysis do not have to be on one analysis level. When, within the limits of a single case study (e.g. organization), we separate sub-unit or sub-units of analysis (e.g. projects implemented in the organization), we deal with the embedded case study. When the case study deals only with the global character (e.g. organization), we deal with a holistic case study. When a case study involves more than one case, we are dealing with a multiple case study. For the multiple case study, two types can also be distinguished: "holistic" and "embedded", in other words, multiple case studies can include many single holistic cases or many single embedded cases [Yin 2015].

For the purposes of this article, a single holistic case study model was chosen. “Holistic”, because case study it is related to assessment of whole organization (regarding to its project maturity). According to R.K Yin, the use of a single case study is the right solution when the case is decisive (meaning it will be decisive for the theory or theoretical assumptions), unusual (i.e. illustrating deviation from theoretical norms), common (meaning to grasp the circumstances of some everyday situation, in order to give information about processes related to the theoretical interests of the researcher), revealing (when the researcher has the opportunity to observe and analyze a phenomenon previously inaccessible to social sciences) or requiring research in the long-term, so-called longitudinal (when the theory assigned to it should show how the conditions change and the processes relevant to them over time) [Yin 2005]. In this article the justification for undertaking a single case study is a common case. On the basis of single case study, an opportunity was created to learn how the assessment of the project maturity of a selected organization can be carried out using a specific OPM3 model and how the results of this type of assessment can be used.

Assessing project maturity in chosen company from manufacturing industry

Selected company - basic information

The company that will be assessed is a production company specializing in mass production of a wide range of elements made of sheet metal, strips in the field of extrusion, punching and bending on presses. In addition to the production of metal parts for the automotive and household appliances industry, the company has CNC tool shops and specializes in building new and overhauling currently used for the production of press tool components for its customers. Two production plants located in Poland employ approximately 350 employees. The main goal of the company is to achieve the highest quality of production, ensuring effective customer service. The company has a Quality Management System confirmed by the ISO/TS 16949 - certificate required for all automotive industry suppliers. Projects implemented are: primarily the launch of new products for mass production and related investments, such as: production of a new tool, purchase of a tool, purchase of new machines or transfer/modernization of existing production lines. During one year about 40 new projects/launches are carried out.

The organization's plans for the coming years assume major development in automotive services (currently around 30% of the company's revenues are from automotive industry, plan for 2020/2021 is reach 50%) and expanding the range of the product (new production hall put into use in 2020). The achievement of these objectives of the organization is therefore directly related to the implementation of a large number of new projects in a relatively short period of time. And thus the key factor will be the way in which projects are implemented in the organization. It was important for the company to check what level of project maturity it is in, so that it can check what to improve in the context of achieving its objectives.

The company is representative for the automotive and household appliances sectors in terms of the size and resource base. It was chosen mainly because of its size, and thus certainty as to the implementation of projects in it. The methods of data collection were mainly in-depth interviews (semi-structured through the use of OPM3 Self-Assessment Method) and documentation analysis (documentation such as internal regulations, statutes, procedures). In large enterprises there is a greater possibility of conducting a significant number of interviews, moreover, one of the authors of the article is employed in the company (he is the head of the project management department), thus the participant observation was used. Interviews were conducted with employees who are responsible for managing, executing projects - representatives of project management, quality, sales, purchasing, industrialization, production, tooling, maintenance and HR departments. When answering, respondents took into account all types of projects implemented in the enterprise (small, large, along and with cooperation, rather short-term which results from the specifics of the industry).

Assessing project maturity with use of OPM3

The assessment of the current state of the project's project maturity in the company was carried out on the basis of questions which are included in OPM3 Self-Assessment Method (SAM) Questions in Appendix X3 and a list of Best Practices in Annex X1 from [PMI 2013]. Due to the extensiveness and level of detail of the topic, in this paper only issues related to project domain will be addressed, and those related to the portfolio and program will be omitted.
The rest of the text presents the results of the project maturity analysis of the current state of a selected company. The results were divided according to indicated in chapter 3 stages of processes improvement: Standardize, Measure, Control, Improvement – SMCI.

Standardize

Standardization means the harmonization of certain services, objects, tools in such a way that regardless of the place of their performance/use, the quality and quantity is the same or as close as possible to each user. Schemes for their performance should be created, which in subsequent processes translates into their control and evaluation. The assessment of the process must be documented and communicated.

In the studied company, the number of points gained in this domain is 88 out of 135 possible. The lowest rated questions were about the WBS (*Work Breakdown Structure*) document and the standardized communication plan in the project - Best Practices: 1075, 1115, 1160, 1260, 1300, 1380, 1195, 7530, 2035, 7540.

Measure

This stage is related to a set of activities performed to determine a measure of a given physical or contractual quantity. Measure is about determining what to measure, as well as collecting the measures that measure it. It aims to help understand if the process is operating within acceptable limits. In the studied company, the number of points gained in this domain is 87 out of 135 possible.

The biggest problems noted during the assessment of “Measure” are: no standardized communication plan in the project, no document regarding changes in the project, no WBS document – Best Practices: 2000, 1085, 1940, 1850, 1650, 1990, 2070, 2005, 7580, 2045, 7590.

Control

Control is the activity of checking the status of the actual condition and comparison with the required (designated) state. It is: comparison of actual performance with planned performance, deviation analysis, evaluation of trends to improve the process, evaluation of possible alternatives and recommending appropriate corrective actions. In the studied company, the number of points gained in this domain is 81 out of 135 possible.

The worst rated questions are about the WBS document, a document regarding project changes and cost control – Best Practices: 2540, 1095, 2330, 2580, 2380, 2390, 2490, 2530, 2610, 2015, 7630, 2055, 7640.

Improve

All elements that make up the organization should be improved. System operation, procedures, process design, and employee qualifications must be monitored to find opportunities for more efficient operation. Continuous improvement is the process of creating something better, developing new qualities and skills. In the studied company, the number of points gained in this domain is 55 out of 135 possible.

The biggest problems related to continuous improvement are related to Best Practices: 2850, 1065, 2930, 1105, 2770, 2880, 2920, 3000, 2025, 7680, 2065, 7690.

In order to confirm the organization's good practices connected with four Process Improvement Stages - SMCI in Table 7 were listed documents used in the assessed company when projects are conducting.

Table 7: List of documents supporting project management in the assessed company

No.	Document in PM in the assessed company
1	Kick off document_project_diam257
2	Standard project plan (MS Project)
3	Weekly works status (MS Excel)
4	Standardized project folder template
5	Tool requirement project approval_ tool approval_rev.1
6	Hi plan machine resources
7	Hi plan die shop new project timing
8	Project plan - status control MS Project
9	Kick-off presentation
10	Budget Control after closure of the project - calculated automatically by the ERP system
11	KPI (quarterly controlled)
12	Trial report Process approval
13	Training plan
14	New projects status review
15	Analysis of potential defects and effects of FMEA

Summary of results and improvement actions

The organization received 311 points out of 540 - which gives 58%, it shows that some project management areas need improvement. Most points awarded in the field of standardization, which proves that the company has standardized project management methods, which is partly due to the fact that the organization operates in the automotive industry. Requirements for launching new components for mass production and therefore also project management in this industry set standards such as:

• APQP (*Advanced Product Quality Planning*) is a set of guidelines created jointly by the Big Three of the automotive industry Chrysler, General Motors and Ford. These guidelines were addressed to their suppliers and sub-suppliers. The main goal of creating APQP was to show how to develop products so that their quality was satisfactory for the organization. Therefore, APQP can be defined as a

description of the communication methods and processes that occur between a company and its subcontractor during product development.

• PPAP (*Production Part Approval Process*), is the process of approving parts for production. This process confirms the compliance of each individual component with customer requirements. PPAP is made on the basis of 18 strictly defined documents, which include DFMEA, PFMEA, Control plan, Process Flow Diagram, R&R (MSA) or analysis of measurement results compared to documentation.

• VDA (*Verband Der Automobilindustrie*), MLA (*Maturity Level Assurance*), this standard is mandatory processes for suppliers of car parts to German production vehicles, such as Volkswagen or BMW.

• ISO/TS 16949 specifies the requirements for the quality system for products in the field of design or development, production, installation and servicing in the automotive industry.

The lack of some of the documents or Best Practices described in the PMI may be due to the fact that they were not included in the above-mentioned standards. The most important differences, in stages of "Measure" and "Control", include the lack of a WBS document, a communication plan and a document tracking changes in the project. Cost control in the project also needs to be improved. The lowest rated range covering "Improve" stage, which is confirmed in practice. Some of the processes in the organization are not measured and controlled (real time spent on the project/ task, number/ time of delayed tasks, component costs in budgets, quality of communication in the projects, project scope) and only individual actions are analyzed, not project management in general. This does not allow drawing appropriate conclusions and introducing corrective actions into subsequent projects (*lessons learned*). Projects are tracked and monitored to some extent, but they are not completely analyzed.

The most important actions that should be taken are the introduction of the WBS document, communication plan, document tracking changes in the project and creating a document that will allow the analysis of the project and drawing conclusions that will be used in subsequent projects.

Conclusions

Assessment of project maturity allows the organization to diagnose the state of project management, recognize project management processes, define the good and weak points of the organization, and clearly define its level of maturity in relation to the competition and its partners. In project maturity models in addition to the diagnostic ability, a large part is to support the development of the organization. The OPM3 model presented in the paper precisely defined the state of project management of organizations and make easier to do specification of actions that should be taken to achieve a higher level of maturity. An examination of an organization's project maturity can also lead to an improvement in the competitive position and prestige of an organization - a high level of maturity is a confirmation that the organization uses a unified, professional language, professionally uses techniques, tools and methodologies for project management.

Although in the literature on the subject there are voices that models in project management are 'useful fictions', in the assesed company people who 'commissioned' examining project maturity were of the opinion that it is necessary to objectively indicate where the organization in term of project maturity is, what are its strengths and weaknesses, what can be improved. This is due to the fact that the company is expanding and restricting, because of the higher and higher needs and expectations of the automotive industry market.

The OPM3 model is to serve improvement activities for the company that will use it. The creators of the model emphasize that there is practically no such possibility for the company to achieve all best practices at all stages and in all domains. However, it should systematically improves its results/ achievements. The results should therefore be compared in the context of subsequent maturity assessments. There is also a justification for comparing (on a benchmarking basis) to other enterprises, but companies rarely publish the results of their evaluation. What can be read from the literature however is that different industries implement projects at different levels of maturity [Cooke-Davies and Arzymanow 2003], degree of maturity depends on many factors [Gorog 2016] and for manufacturing industry are proposed various project maturity models [Schumacher et al 2016]. The evaluated company meets more than 50% of best practices in the domain of project management, but in general it is

hard to deduce, whether it is good or bad. Authors did not identify in the scientific literature the positions in which the project maturity of manufacturing companies is determined.

According to the purpose of the article - it was shown in a real example - how to use the OPM3 model to assess the project maturity in an organization. The description of the case study completes the list of publications in Table 3 that may be useful for project management practitioners. The presented works meet the legitimacy of using a single case study as a research method.

Abstract

At the moment, active research in the field of integrated reporting is being conducted in Russia and internationally. However, until now many issues in this area remain poorly researched and are of a debatable nature.
In particular, Russian scientists practically do not raise the question of how and by what means the necessary degree of information connectivity and mutual consistency of the elements of integrated reporting is achieved, in what ratio should information be presented in it, or how, these elements unite and form a single information field .
The article justifies the conclusion that there are three different approaches to defining the boundaries or perimeter of integrated reporting, within which the perimeter of integration is defined, the main elements of the integrated are structured and linked: the «weak» union, the «strong» connection and, finally, the connection in the «narrow» sense.
On the basis of the conducted research on 10 major Russian organizations, the degree of coherence of the presented integrated financial statements for 2016 was evaluated. Specifics of ensuring transparency and coherence of the integrated reporting of Rosatom State Corporation were studied in detail. The conclusion is substantiated that the «weak» connection used in it is directed more toward revealing common strategic guidelines for the near future. However, it does not provide a proper clear understanding of all the key components of creating economic added value. A possible solution to this problem may be a revision of the approach to the formation of the perimeter of integration towards the «strong» connection.
Keywords: integrated reports, users, information, connection.

Introduction

Complex, diverse, multidirectional institutional processes that take place around the world led to a fundamental change of ideas about the ways, the amounts and methodological platforms for information disclosure concerning some reporting entity activities for its stakeholders. In many respects, this is determined by the fact that nowadays the traditional concept of capital has undergone a serious transformation. The capital involved in added value creation, considered by investors as the main guarantee of a positive return and return on investment, has acquired a comprehensive and integrated character and cannot be reduced only to financial or material flows.

Accordingly, the return on investment, the growth of business value and development prospects are estimated not so much through financing scale and the real availability of material values, but also by the consideration of intangible components, such as business connections, network interactions, the

use of modern communication technologies, market segmentation, an active use intellectual property, green business solutions, etc.

Under these conditions, accounting (financial) statements, remaining the most important basis for investment and financial decisions, cease to be the only information source about a business property and financial position and are not able to satisfy the increased diversity of information requests from various users. Therefore, other forms and types of corporate reporting, such as, for example, social, environmental one, the reporting in the field of sustainable development, etc. are demanded more and more often.

The theoretical basis of the study. The issues of financial and non-financial reporting theory and practice in Russia and abroad were studied by the following Russian and foreign scholars: D. Berstein, D.Ya. Solomatin, A.N. Kochetkov, T.Ya. Prokudin, Ya.V. Sokolov, L.A. Tchaikovskaya, M.I. Kuter, N.A. Kamordzhanova, M.M. Gurskoy, S.N. Polenova, V.I. Petrova, L.B. Trofimova, N.N. Khakhanova, E.V. Sevastyanova, S.A. Stukov, M.R. Matthews, M.Kh. Perer, A.N. Sushkevich, Chan Ngok Chang, J. Richard, and V.V. Pankova.

The studies on the issue of corporate social responsibility, environmental orientation and sustainable business development, including the issue of non-financial information disclosure, were conducted by the following researchers: Yu.P. Anisimova, Yu.M. Belyaeva, T.L. Bezrukova, I.P. Bogomolova, S.V. Ivchenko, G.A. Lobanova, I.P. Soboleva, K. Carter, S. Matos, D. Rogers and J. Hall.

The issues of business relationship effectiveness enhancement with various stakeholder groups for sustainable development and necessary information provision are reflected in the works by R. Freeman, K. Fussler, T. Holmes and D. Ecklington.

Due to the fact that the problems of non-financial reporting in general, and integrated reporting, in particular, are of high practical importance, an important role is played by international research and developments conducted under the auspices of various international organizations, such as the Association of Certified Chartered Accountants (ACCA), World Business Council for Sustainable Development (WBCSD), International Federation of Accountants (IFAC), International Integrated Reporting Committee (IIRC), International Institute on Sustainable Development (IISD), etc.

Study: Main Part

One of the most widely and actively promoted solutions aimed at financial statement information content expansion is the formation of the so-called integrated reporting, the main purpose of which is to provide a comprehensive presentation of all types and forms of resources (capital) used by the business. The high importance of non-financial reporting in the current economic environment is recognized in the concept of public non-financial reporting development and the plan of measures for its implementation in May 2017. Such reporting ensures that various "organizations provide meaningful, complete, timely, accurate, balanced, comparable reliable and objective information about their activities on economic, environmental, social aspects and management systems to meet the information requirements and interested party demands" (The concept of public non-financial reporting development and the plan of measures for its implementation, approved by the Order of Russian Federation Government No. 876-p).

The International Integrated Reporting Council presents it as a "comprehensive compact message to all interested parties about the ways an organization strategy, its management, its activities, and future plans, taking into account the external environment, lead to short-term, medium-term and long-term additional value creation" (International Integrated Reporting Council ("the IIRC"), 2013). It is considered as a modern, actively used channel of information interaction, implemented for the widest range of interested parties, including employers, customers, suppliers, business partners, local communities, regulatory bodies, and authorities.

Research Methodology

One of the key elements of the integrated reporting concept is the active use of the "integration" category in relation to business goals and objectives, considered in the context of the so-called integrative thinking. The main essential characteristic of this methodical approach is to combine separate elements (individual reports) into a single whole, which ensures the appearance of an additional and a very important feature - emergence - which enhances and supplements the existing information and communication characteristics of the reporting elements.

The roots of this approach in Western business and political culture can be traced back to G. Hegel's philosophy, who, considering the process of human cognition, drew attention to its internal dialectical nature and complex cultural dynamics. At that, the dialectical process of ascent from the abstract to the specific one is characterized by internal integrity, manifested primarily through the union of the constituent parts.

In the modern business environment, integration is considered in a more down-to-earth style, primarily as the element of organizational effectiveness and identity. The usefulness and the importance of integration are directly indicated, for example, in the documents by the Institute of Chartered Accountants of England and Wales (ICAEW) (The Institute of Chartered Accountants in England and Wales, 2009) and the Organization for Economic Cooperation and Development (OECD) (Organization for Economic Co-operation and Development, 2015). "Integrity stimulates trust and is vital for the reputation of individuals and organizations, the economic development of nations and information and reporting reliability" (The Institute of Chartered Accountants in England and Wales, 2009).

However, this is a complex and ambiguous concept. The diversity and the ambiguity of its application areas show that one can talk about such concepts as political, social, industrial, economic, financial, cultural, scientific and educational integration, etc. (Sorokina, 2008). Each of these concepts reflects some of the elements, some properties of the surrounding reality. And it is possible that this ambiguity, even multiplicity, largely determines the wide distribution of integrated reporting throughout the world. This is also true for Russia.

Study Procedure

Recently, in Western academic and applied research more and more attention is paid to the combination ways of various information types, accounting and non-accounting one, into a single whole, forming a single document - integrated reporting.

The need for an effective and broad combination of heterogeneous information elements is indicated in the works of the famous Western scholar, one of the main ideologists of integrated reporting, R.J. Eccles, who was among the first ones noting the importance of financial data proper combination and integration with a wide range of non-financial indicators that contain the information about intangible assets, key performance indicators, corporate management, etc. (Eccles, Krzus, 2010).

The informational diversity of data provided in integrated reporting can be clearly seen from the p. 3.10 and 3.11 of the conceptual framework for corporate integrated reporting, which include the following items:

- substantive elements: organization activity and external environment overview, top management, opportunities and risks, strategy and resource allocation, business model, operation results and future prospects;
- time: past, present, and future;
- capital: financial, industrial, intellectual, social, relational, human and natural;
- financial and non-financial information;

- qualitative and quantitative information;
- internal management information, the information for the boards of directors, the information for external reports;
- other internal information, additional external information.

However, such information diversity does not create a single whole, well understood by interested users. Therefore, one of the most important principles for the preparation of integrated reporting is the internal connectivity requirement, which allows you to implement fully the previously considered integration principle. They assume that the practical implementation of such a requirement is able to provide the necessary complex semantic and meaningful combination of various types of information on a single methodological basis, which determines the general format of their internal representation and external perception integrity.

Therefore, the unity of integrated reporting image should be considered, among other things, not only as of the way of information disclosure about the internal integration achieved by some organization, which includes five key aspects (The Institute of Chartered Accountants in England and Wales, 2009):

- the moral values that the organization supports;
- the driving motives of organizational activity;
- the obligations assumed by the organization and public responsibility for their implementation;
- the qualities demonstrated and encouraged by the organization;
- the organization high achievements, including role models.

For the purposes of this article, a separate element of integrated reporting with a relatively independent value and a certain semantic load will be called an internal element (a part) of integrated reporting. In essence, such an element should disclose the information on the use of one or another type of capital, or be an autonomously perceived component of a general report (a final report), which reflects information on an internally homogeneous range of issues.

In the documents dedicated to integrated corporate reporting, such an element with a certain autonomy is a private or a separate report. If they consider an integrated report as a document that reveals comprehensive information about the process of added value created by an organization, then each such element (a part) of it can be viewed as the description of activity key areas in which this process is implemented, as the methods for its implementation.

The conceptual framework for integrated reporting preparation determines that any significant business components associated with a particular capital can be distinguished in order to disclose necessary information. Such components can be considered both independently, acting as original information sources, and in combination, when their presentation occurs from the standpoint of a holistic and integrated view of the business.

Organizations generate a wide variety of information during their activities, including those presented in various reports, either as required by law (for example, accounting (financial) or tax reporting), or formed voluntarily, in order to communicate better with interested parties to meet the information needs of the latter (e.g. a sustainable development report). If such additional reporting is generated in parallel with integrated corporate reporting, it is advisable to include the references to relevant reporting forms in the latter (International Integrated Reporting Council ("the IIRC"), 2013).

In practice, it can be seen that integrated reporting and individual reports perform various functions. Initially, the most objective informing of interested parties about the organization ability to create

value was considered as the main goal of integrated reporting preparation. However, nowadays this goal is viewed more broadly - like the need to demonstrate the "value creation story"[10] consistently and clearly and disclose specific information about individual types of capital.

In this regard, the task of high-quality, reliable and correctly composed integrated reporting development acquires a fundamentally important methodological significance. An effective solution of this task is largely determined by the correct choice of a central reporting unit and, accordingly, the integration perimeter, within which the final report configuration will be determined. Therefore, the completeness, the clarity and the depth of disclosure in the final accounts will be determined by connection degree between various parts of the final report.

The degree of information coherence and mutual consistency of integrated reporting is largely determined by the methodological basis, which determines the way of a final report structuring, the proportion of information presentation, and the combination way of its various elements. But this aspect of integrated reporting remains unstudied by domestic scholars.

According to the developers of the integrated reporting concept, the boundaries of the integrated report, as well as the elements included in it, should be configured according to standard financial statements (International Integrated Reporting Council ("the IIRC"), 2013). The limitations of the latter are obvious. While integrated reporting should also cover so-called external impact zones, reflecting certain economic, environmental, and social outcomes of its activities and their consequences, the information about them does not stay often within the limits of standard financial reporting (International Integrated Reporting Council ("the IIRC"), 2011). This is due to stricter requirements for capital, asset, and liability element recognition in the latter. Since the zones of influence are not clearly defined often, and the information about them is poorly structured, they are difficult to identify in standard financial statements.

Besides, integrated reporting should allow the tracking of all links of the economic added value chain in the short, medium and long term. And this is also impossible within the financial statements.

The study of domestic and foreign materials shows that you can use at least three different approaches to determine integrated reporting boundaries or perimeter. Each of them defines specifically the way of boundary development, the integration framework structuring and the grounds final reporting drawing up.

According to the performed analysis, the following approaches can be distinguished: "weak" association, "strong" connection, and finally, the connection in a "narrow" sense. The presence of three approaches is determined by the fact that a different type of element connection into a whole allows us to reflect and reveal the peculiarities of the existing business practice in different ways, taking into account industrial and national specifics.

Let's describe the main characteristics of each of them.

A "weak" connection assumes that integrated reporting is based on the most significant, key part, which is considered to be "essential", while the remaining parts only reinforce the information contained in it. The latter are considered as secondary and are auxiliary ones in general reporting structure.

There are two possibilities here. The first is that the leading part is the accounting (financial) component, the information content of which is increased through the inclusion of social or environmental components.

In the second case, integrated reporting is designed as a clear alternative to accounting (financial) statements. Accordingly, social or environmental reports play a leading role, and financial data is attached to them as a supplement only.

In fact, a final report arising on the basis of such a connection, cannot be considered as full-fledged integrated reporting for various reasons, primarily due to the incompleteness and insufficient

coherence of the parts included in it. The main focus of such reporting is biased towards the information presented in the main part. There is only a mechanical connection of the constituent elements in it, without a sufficient internal and logical interconnection, while there is no real integration, leading to the value increase of the disclosed data.

When a financial component is taken as the main part, such a report is generally reduced to extended accounting (financial) statements. This approach also occurs in Russian practice, where integrated reporting is the way of additional self-representation, rather than a full-fledged communication channel for relationship development with interested parties.

A "strong" connection implies that the parts of the integrated reporting are located in it "proportionally", and each of them is considered as a full-fledged report of independent value. The details of different parts complement each other. Unlike the previous approach, the main, "leading" part, to which additional information is attached, is not highlighted here. Instead, a relatively complete presentation is formed across all lines of accountability. Accordingly, each of the parts of the integrated report characterizes a specific area and has an independent value now.

At the same time, the aggregation takes place mechanically, mainly due to the fact that the information contained in certain parts is repeatedly intersected within a final report or is actively used in other parts. This implies the development of close reciprocal informational links, which in some cases turn out to be redundant. The final integrated corporate reporting, in this case, turns out to be quite informative, but it does not provide a comprehensive synthesis. Each of the parts characterizes a specific area without the loss of independent value. It is included in the general report through internal links and cross-references, due to which it can be considered as a single report element. But these parts are not so much lined up in some coherent unity, due to which a holistic picture emerges, as they are located side by side, complementing each other. A final report, in this case, is a document containing a vast array of information without the necessary connectivity. And therefore, it does not provide adequate disclosure about the ways the various elements involved in business capital generate the process of added value creation.

A final report turns out to be more aggregated than in the previous case, but its main disadvantage is its lack of information. Collected from separate parts, it does not add additional information besides the data which they contain.

The connection in the "narrow" sense is the approach that provides the best of all the interconnectedness of the information presented in an integrated report. The individual parts of the report act here as related to other parts of the information element. Taken together, they can be interpreted in a wider context than separately.

Accordingly, in this case, the elements of corporate integrated reporting are not included in it as independent reports and therefore cannot initially contain all the information included in a final report. An overall report is based on the balance principle between detailing and analyticity. It contains only the necessary, relevant information selected according to the principle of materiality and significance and describing the way the process of business added value creation takes place. At that, it is advisable to avoid the overloading with details and the inclusion of information not related to added value creation in a final report. In other words, a report must meet the criterion of brevity (International Integrated Reporting Council ("the IIRC"), 2013).

Summarizing the above mentioned, several comments should be made regarding the correlation of corporate integrated reporting and other types of reporting.

There is always a certain information area overlap between the different types of reports. So, you can see the connection between social and intellectual capital reports, between the Board of Directors and the Management Reports, etc. Many elements of non-financial information are used more and more in accounting (financial) statements. This overlay contributes to the appearance of excessive, redundant information that makes corporate integrated reporting overloaded with details, background information, and repetitive data. The brevity criterion assumes that the information contained in

separate reports that are prepared separately and have independent significance should be included in the corporate integrated reporting selectively, without a direct link to an original source (International Integrated Reporting Council ("the IIRC"), 2013). In this case, integrated corporate reporting and other types of reporting can be generated autonomously based on organization goals. Accordingly, their functions will be different, the information will be added without intersection, and thus their information value will be increased.

From the foregoing, it is clear that a separate presentation integrated due to other types of reporting has different objectives. While corporate integrated reporting provides a generalized, holistic assessment of the value creation process by business, the rest of the reporting reflects detailed information on the various activities and used capital types. The information contained in them turns out to be more specific and is aimed at the "narrowed" informing of interested users about various business areas.

It should be recognized that nowadays the relationship issue between the information field of integrated reporting and other types of reporting remains controversial. They started the studies in this field relatively recently.

In 2016, they conducted the studies on non-financial reporting of 10 large domestic organizations, which in terms of their composition and disclosure nature met the requirements of the International Rules for integrated reporting preparation. Despite the fact that the study was limited, the conclusions made in it allowed, among other things, to assess the degree of coherence between the presented integrated reports.

In particular, they performed a detailed analysis of reporting transparency and coherence degree in relation to the State Corporation "Rosatom". Since 2009, Rosatom has been actively developing the area of corporate reporting related to the presentation of non-financial information. At that, the developments aimed at integrated reporting, "Rosatom openness and transparency increase, image, business reputation, and competitiveness strengthening, information support for the promotion of products and services in Russian Federation and abroad" were initially adopted as the basis (State Atomic Energy Corporation "Rosatom").

Based on leading international developments, taking into account the advanced domestic and foreign experience, "Rosatom" developed its own system document "Rosatom Policy in the field of public reporting" and prepared the corresponding "Standard on public reporting", applied by "Rosatom" and its related structures.16

The reporting for 2016 prepared by "Rosatom" includes the following elements (see Table 1):

Table 1. “ROSATOM” INTEGRATED REPORTING CONTENT

Disclosure area	Main content
Chapter 1. Rosatom today	About Corporation Key results of 2016 Main events of 2016 Appeal by the Chairman of the Supervisory Board Director's appeal Appeal from the representative of interested parties Financial and economic results

Disclosure area	Main content
Chapter 2. Business Strategy	2.1. Activity Strategy until 2030 2.2. Value creation and business model
Chapter 3. Contribution to strategy implementation: international activity results	3.1. Presence Markets 3.2. International Business 3.3. International cooperation
Chapter 4. Contribution to strategy implementation: the results of division and complex activities	4.1. Mining Division 4.2. Fuel Division 4.3. Machine engineering division 4.4. Engineering Division 4.5. Electricity Division 4.6. Nuclear weapons complex 4.7. Nuclear icebreaker fleet
Chapter 5. Contribution to strategy implementation: innovations and new products	5.1. Science and Innovation 5.2. Business diversification
Chapter 6. Contribution to strategy implementation: corporate process effective management	6.1 Corporate management 6.2. Risk management 6.3. Performance of state functions 6.4. Financial and Investment Management 6.5. Optimization of production and business processes and cost reduction 6.6. Procurement Management 6.7. Internal control system 6.8. Study Results

Logical and textual analysis of "Rosatom" integrated reporting for 2016 allows us to conclude that it uses a "weak" connection aimed at common strategic guideline disclosure for the near future. The dominant, "center" idea of the reporting is a general picture development about business, the description of the management structure and strategic goals outlined without proper balance in respect of the main structural element description. Despite the fact that the latter are presented as required by the relevant international and internal documents, a clear and precise idea about the creation of added economic value has been not formed still.

Result Analysis

A possible solution to this problem may be the revision of the approach to the integration perimeter development in the direction of a "strong" combination of reporting elements.

Conclusion. The preparation of integrated reporting is an important step towards major changes, both in the reporting organizations and in their business environment. These are the changes that affect significant issues strategically, in particular, to the issue of an effective and efficient way of corporate goal implementation and the way of added economic value chain development. And one of the most important factors that allow for more complete, deep and correct disclosure of information on each element of non-financial reporting is the correct choice of integration perimeter.

Abstract

The right to good administration is one of the aspects of the civil right to good governance. Its practical dimension is manifested in the continuously improved protection of civil rights and liberties in relations with the national administrative entities and the institutions and bodies of the European Union. This paper is composed of three main parts. Part one is devoted to the general issues of the individual's right to good governance. Therein, the Authors analyse the formation of the individual's right to a fair and equitable administrative procedure in contacts with state authorities. Part two presents the major issues related to the standards of the European Union in respect of the operation of public administration bodies. Part three discusses the selected matters connected with good administrative practice, as illustrated by the example of Poland. In concluding remarks, the Authors present their conclusions, also indicating the need for further activities to raise the social awareness of the civil right to good administrative practice.

Keywords: European Union law, human rights law, fundamental rights, civil rights and liberties

Introduction

In modern states, administration forms part of the structure of public authorities, which is responsible for the practical implementation of the functions of the state. The manner in which the administration bodies are organised influences the quality of the tasks they perform, promotes or inhibits civilizational and cultural progress, and also translates into the image of the state as perceived by the citizens. Nowadays, the administration carries out many highly diversified tasks aimed at satisfying the growing social needs. This approach to administration is compatible with a concept proposed by

Jacques Ferrier, for whom public administration forms an essential link between design and implementation, between politics and technology (Ferrier, 1974, p. 35).

Administration is not a self-contained entity. It is rather a collection of instruments through which the state fulfils its obligations towards society (citizens) and performs its tasks resulting from its functioning in the transnational and global structures of power. This means that administration, understood as an implementation mechanism for the tasks of the state, must be subject to modernisation and change. The direction of those changes was described by B. Guy Peters, pointing in his research to the four main models of administration transformation: the market, participatory, flexible, and deregulatory models (Peters, 1999, p. 404-405). The aim of the reforms was, and still is, to eliminate those solutions which hinder or make it impossible for administration to solve the fundamental social problems and needs. In accordance with the Latin *administrare*, administration bodies should be helpful and effective when solving problems and should serve society (Lipska-Sondecka , 2019, p. 10). In a world of megachange, the issue of the place and role of administration in modern states is of exceptional importance. Individuals, social groups, and large communities expect public authorities to ensure security, stability of living and development conditions, a sense of respect for human dignity, and respect for their fundamental rights and liberties. Good administration practices are invaluable in making these expectations reality.

The selected problems of the right to good governance

The end of the 20th century and the first half of the 21st century were characterised by profound, intensive, and complex changes taking place at all levels of social structures. Exogenous factors such as globalisation, regional integration, economic and financial crises, and armed conflicts in different parts of the world have contributed to a new view on the problems of good governance in a changing world. The number and diversity of entities involved in this process resulted in the need for redesigning the functions to be performed by administration under new conditions referred to as a "network" (Lipska-Sondecka, 2019, p. 257). At the national and trans-national levels there appeared a greater need for organisational, administrative and protective activities when it came to solving problems and issues affecting the public and individual people (Oniszczuk, 2008, p. 59). The right to good governance and the right to good administration, which falls within the framework of the former, have set the course for changes in all subjects of social relations. In Human Rights Resolution 2005/68 of 20 April 2005 entitled 'The role of good governance in the promotion and protection of human rights' the UN Commission on Human Rights states that: 'transparent, responsible, accountable and participatory government, responsive to the needs and aspirations of the people, including members of vulnerable and marginalized groups, is the foundation on which good governance rests and that such a foundation is a sine qua non condition for the full realization of human rights, including the right to development' (Izdebski, 2012, p. 378). Therefore, one can conclude that the fundamental rights of the individual include the right to good administration, which means the prevention of the use of violence by the administration (Oniszczuk, 2008, p. 59). There appeared a space for the formation of administrative law understood as an ordered collection of legal standards, whose objective is the direct realization of values distinguished by virtue of the common good by administrative bodies (Oniszczuk, 2008, p. 59). The contemporary catalogue of values referred to as *bonum communis* (the common good) also includes the right of the individual to good administration. This right derives from the concept of protecting the individual against the omnipotence of the state and the arbitrariness of decisions taken by state authorities. It is rooted in the European Convention for the Protection of Human Rights and Fundamental Freedoms, where the sections related to the right to a fair trial, the right to property, and the right to information affect the shape and nature of the administrative systems of many modern European countries (Jackiewicz, 2008, p. 103). In Finland, the right to good administration is reflected in the Constitution and normal legislation. In Sweden, it constitutes a fundamental principle of the operation of all administrative bodies. In Denmark, the provisions of the Code of Administrative Procedure are developed based on the practice of the Parliamentary Ombudsman. There is more to the right to good administration than just the legal standards determining the behaviour of public entities. It also covers actions conducive to the maintenance and enhancement of those freedoms and human rights which condition the standard of living of individuals (Oniszczuk, 2008, p. 63). Good administration operates under law and within its boundaries for the common good, and safeguards order and security for individuals,

social groups, and large communities. The right to good administration in the context of respect for human rights was noted at the international level by the Council of Europe in the 1970s. The Council took action to define the general principles of relations between individuals and administrative bodies which would be consistent with respect for civil rights and freedoms[1]. The Convention for the Protection of Human Rights and Fundamental Freedoms of 4 November 1950 played an important part in determining the standards of the right to good administration by the Council of Europe. This document specifies the fundamental rights and freedoms of a human being and requires states to guarantee those rights and freedoms to any person under their jurisdiction. The Convention also establishes an international system for their protection. The most important rights and freedoms guaranteed to each and every individual by the Convention include: the right to life, the right to protection against torture and inhuman treatment, the right to liberty and security, the right to respect for private and family life, home and correspondence, freedom of expression, freedom of thought, conscience and religion, the right to freedom of peaceful assembly and to freedom of association, and the right to a fair trial. The Council of Europe draws particular attention to the protection of ideals and principles constituting the common heritage of a free and democratic Europe. Human rights, regarded as inalienable, universal, and vested in every individual since birth, occupy a special place among the values promoted by this organisation. The concept of human rights as fundamental rights is reflected in many constitutional provisions of modern states, thereby influencing the determination of obligations of public authorities towards individuals. It should be understood as the right of every individual to sound and effective operation of public institutions (Izdebski, 2012, p. 377).

The main objective of the activities carried out by the Council of Europe as regards good administrative practice is to introduce uniform standards of administrative procedures, which should guarantee every individual the fair implementation of the specific provisions of substantive law. According to Jerzy Łętowski, the 'European nature of the state and its bodies is proven first and foremost by the standard of regulation of procedures binding on administrative authorities' (Łętowski, 1992). Good administration is a collection of well-thought-out and well-designed instruments enabling all entitles involved in the government process to operate effectively and to safeguard freedom, liberties and human rights. It still, however, is a vague term, since it appears impossible to list all the elements comprising the concept of good administration. The structure of public administration in modern European states is formed based on the political system traditions in the given state, the history of administrative thought, and administrative culture. The models of administration differ from one another. It is, therefore, extremely difficult to devise a universal definition of the right to good administration. Despite the differences resulting from states' acting within national models, a certain common denominator can be indicated, indisputably referring to the concept of good administration. It is the rule of a democratic state governed by the rule of law, which takes into consideration and respects in its political system such values as: freedom, sovereignty, pluralism, equality before the law, constitutionalism, the separation and balance of powers, the authorities acting within the limits of the law and, finally, respect for the rights of the individual. The problems of good administration and the right to it have been recognised not only by the Council of Europe but also by the European Union.

The right to good administration as a fundamental right of the European Union

Already in the 1960s, the case-law of the Court of Justice of the European Communities included the issues of fundamental rights understood as the general Community law principles protected by the judicial authorities of the European Communities. As European integration improved, the role and significance of fundamental rights, including human rights, grew to such an extent that the assurance of upholding those rights was included in the preamble to the Single European Act of 1986. The commitment of the member states to respect human rights and fundamental freedoms was also included in the provisions of the Maastricht Treaty of 1992. Nevertheless, the right too good administration could be regarded as a fundamental right in European Union only after the Treaty of Lisbon and Charter of Fundamental Rights, an integral part of this Treaty, were signed in December 2007. The right to good administration (Article 41) systematises and streamlines the system for the protection of fundamental rights in the European Union and guarantees respect for and protection of human and citizen rights in the European Community. The provisions of Article 41 of the Charter not only provide for the lawful activities of administration, but also impartial and objective behaviour of

officials. The right to good administration includes the following: the right of every person to present his or her case in person before any measure which would affect him or her adversely is taken, the right of every person to have access to his or her file, while taking into account the rules of confidentiality and of professional and business secrecy, the obligation of administrative authorities to present reasons for their decisions, the right to seek compensation from the Community for any damage caused by the EU institutions and their officials, and the right to write to the institutions of the European Union in one of the languages of the Treaties and obtain an answer in that language (Ura, 2007, p. 231-232). In the light of Article 41 of the Charter of Fundamental Rights, the right to good administration is first and foremost the obligation for the entities and bodies of administration to observe procedures for fair administrative procedure. Administrative procedures are a recognised part of administrative law in most Member States of the European Union, including Poland. Good administrative practice also includes the right to be compensated for damage caused by EU institutions and their officials connected with the performance of their duties. This aspect of the right to good administration has its roots in mediaeval Europe, where the construction of the rule of law was adopted quite commonly, for example in England and Sweden (Izdebski, 2012, p. 383). Here, one should underline that the subjective scope of the Charter is limited in terms of the right to good administration. Grzegorz Krawiec explicitly stated that: 'its provisions are addressed to the institutions, bodies, offices and agencies of the Union with due regard for the principle of subsidiarity and to the Member States only when they are implementing Union law. ... This provision indicates that the Charter of Fundamental Rights (and thereby the right to good administration under Article 41) should apply to EU officials, institutions, offices and agencies only when the authorities of those states deal in matters with Community elements' (Krawiec, 2009, p. 21). Despite their limited character, the provisions of Article 41 of the Charter clearly highlight the role of administration and its officials to serve citizens, in accordance with Latin *administrare* (to serve, to be of use).

The right to good administration included in Article 41 of the Charter is confirmed in the European Code of Good Administrative Behaviour. This document was compiled by the first European Ombudsman, Jacob Söderman, and adopted in the form of a resolution by the European Parliament on 6 September 2001. In spite of the non-binding nature of the Code, its adoption indicates that the European Union and its bodies strive to systematically bring into effect the concept of the right to good administration. This document forms part of the legal acts of the Union regarded as *soft law*, i.e. non-binding secondary legislation. Despite its "soft" nature, the Code is regarded by virtually all EU institutions as instructions on how their staff should act in relations with the public. In the light of the Code, the officials shall act according to law, shall be impartial and independent, and shall fairly and reasonably resolve difficult matters. Jerzy Świątkiewicz highlights that 'the Code of Good Administrative Behaviour can be treated as a selection of standards which are useful also outside the Union to assess the functioning of the administration. There are no grounds which would speak against regarding the standards of the Code as useful in determining the obligations of Polish administration and in interpreting substantive law and procedural law. This is of significance for the adjustment of everyday relations between the public and the authorities to the requirements imposed within the European Union' (Świątkiewicz, 2007, p. 22). The administration of good practices goes beyond the legal standards determining the correct procedures for public authorities and their staff. It is also a model for modernisation efforts made by modern states in terms of implementing the civil right to good governance.

The implementation of the right to good administrative practice, as illustrated by the example of Poland

The preamble to the Constitution of the Republic of Poland of 2 April 1997 states that Poland has the duty to 'guarantee the rights of the citizens for all time, and to ensure diligence and efficiency in the work of public bodies'[2]. Poland's membership in the Council of Europe (1991) and later in the European Union (2004) obliged the state to apply models covered by transnational and international standards in the national legal system. This means that a given model being reflected in a state's legal system influences not only the legislator but also the bodies applying the law, implying the necessity to reference its content on a case-by-case basis (Jackiewicz, 2008, p. 166). In the light of the provisions of the Constitution of Poland, the right to good administration is referenced as early as in

Article 2 which states: 'The Republic of Poland shall be a democratic state ruled by law and implementing the principles of social justice', while Article 7 provides for the obligation of authorities to act on the basis and within the limits of law. In Article 9 the Polish legislator provides for the will for Poland to respect binding international law. These articles clearly indicate that the legal system of Poland is structured based on the rule of law, and, as a democratic state, the Republic of Poland shall observe all obligations resulting from its membership in transnational and international structures. The right to good administration is also reflected in Article 153 of the Constitution, stating that 'A corps of civil servants shall operate in the organs of government administration in order to ensure a professional, diligent, impartial and politically neutral discharge of the State's obligations'. Therefore, the corps of civil servants are under a constitutional duty to substantively, expertly, reliably, and trustworthily fulfil their professional obligations, which, undeniably, constitutes a fundamental part of good practice in the activities of public administration. In terms of normal legislation, the right to good administration translates into the regulations covered by the Code of Administrative Procedure[3]. Although the provisions were adopted in the 1960s, owing to a number of amendments, they take into account the principles of good administrative practice, which is in line with the democratic character of the rule of law, as well as those stemming from Article 41 of the Charter of Fundamental Rights of the European Union. Jerzy Łętowski underlines that most rights of the individual included in the Code, resulting from the right to good administration, form, at the same time, part of the equitable administrative procedure, i.e. allowing citizens to participate in the resolution of their cases, openness of proceedings and access to file, impartiality of the determining authority, fair nature of the proceedings, obligation to justify its decisions, the right to appeal against decisions, ensuring judicial review of the legality of decisions (Łętowski, 1995, p. 172). The principle of equitable administrative is complemented by the principle of effectiveness of procedure. Lawyers who deal in administrative law also pay attention to another principle related to the right of the individual to good administration. This is the right to a fair trial, which as a rule – in a substantive sense – characterises any democratic state (Adamiak, Borkowski, 2002, pp. 87-89). The provisions of the Code rather exhaustively determine the actions of the target parties to the procedure. Rule of law, legality, efficiency, objectivity, transparency, openness, professionalism, and loyalty are the main characteristics stemming from the document in question. Administrative courts, which supervise the activities of public authorities, guarantee that the provisions of the Code of Administrative Procedure, based on the principles referenced above, are observed. Jan Zimmermann indicates that administrative courts pursue two objectives: the first (direct) one concerns controlling the activities of public administration and determining whether those activities are in line with the adopted and acceptable models; the other (indirect) is related to protecting the adopted catalogue of values (Zimmermann, 2018, p. 476). Administrative courts in Poland can exercise two types of control, i.e. direct control by challenging activities of an administrative authority in court or indirect control by bringing action against a decision (Warzecha, 2006, p. 231). Hence, administrative law is a system of specific standards of conduct for administrative bodies which are obliged to act in accordance with the rules in force. Those principles should not be regarded as merely legal standards but should be considered as ethical standards (Woodhouse, 1997). In order to makes this possible, educational activities are necessary to raise awareness of the civil right to professional, reliable, fair and friendly administration. Already in 1993 the Supreme Court, in its judgment stated that: 'The individual has the right for their claims and applications to be examined within a procedure provided for by law and forms defined by law. ... It is against constitutional principles for administrative bodies to act in a way where citizens' applications are handled outside the procedure and in forms not provided for – this generates legal uncertainty and restricts citizens' rights to protect their rights before public authorities and courts'[4]. The wording of this judgment confirms that knowledge of good administrative practice can contribute to better and more effective enforcement of one's constitutional, fundamental rights. This can also translate into the improved activity of administrative authorities, including enhanced protection of civil rights and freedoms which are regarded as an integral part of human rights.

Final remarks

Good administration is a well-thought-out and well-designed executive mechanism for the tasks of the state. The structure of such an apparatus requires that the actual conditions of the constantly changing reality be taken into consideration. The administrative system has the duty to realise public

expectations towards authorities, and the extent to which they are met indicates the level of modernity of the state's and its authorities. On the one hand, good administrative practice means specific legal solutions while, on the other hand, it is a system of values grounded in civil rights and freedoms. These form a fundamental part of human rights and freedoms. The law and its standards determine only certain desirable *patterns* of organisational behaviour, principles, and scope of action for public entities (Lipska-Sondecka, 2014, p. 113). They form a basis for the executive mechanism allowing the state to fulfil its functions, carry out tasks, and meet the needs and expectations of the citizens. Nowadays, in a world of megachange, good administrative practice gains exceptional importance. The right to good administration is an integral part of the right to good governance as 'the condition for the full realisation of human rights' ((Izdebski, 2012, p. 378).

The administrative apparatus of the state must serve the society, and its activities should be characterised by sensitivity to, understanding of, and kindness towards human problems and concerns. Those principles not only stem from transnational and international standards but also comprise the rules of social coexistence. The most important responsibility of all moderators of public life not only in Poland but also in Europe, is to raise public awareness of the right to good administrative practice. Meeting these expectations is crucial if we want modern countries to be able to bring about change appropriate for the 21st century.

Introduction

By Russian and international experience, a multi-level stability assessment system should be taken into account in order to assess the socio-economic stability and development prospects of coastal territorial objects. And for totality of such objects in the form of coastal ecosystems and coastal infrastructure, in which a person is present in all kinds of their life activity (residence, work, rest, etc.), as applied to the tasks of territorial planning, it's needed to use the system approach [1, 4, 5, 7, 9, 14].

Using the methodology for assessment and analyzing the components of the sustainability and socio-economic development of the coastal eco-socio-economic system for different spatial levels it can allow [1, 2, 6, 7, 11, 12, 13, 14]:

- to obtain reliable data on the state of the coastal eco-socio-economic system at various spatial levels;
- to provide information for decision-makers, which necessary to assess the development and variability in the living conditions of the population and the effectiveness of the maritime economic enterpriser activities;
- to develop plans for territorial development for the coastal eco-socio-economic system;

– to develop forecasts of the interaction of society and nature, reducing anthropogenic and natural risks and the vulnerability of coastal objects and in general, the forecast of the state of the coastal eco-socio-economic system, depending on the development scenario.

Applicability of the indicator method of analyzing of the socio-economic stability of territories for coastal local municipalities

The level of regional municipalities considered in [3, 10-12, 13, 15] and gives a picture of the coastal eco-socio-economic system on a large scale, which is insufficient for assessing the operational development of the local territories. So the more detailed consideration of the territorial object is required.

The use of indicator method of a comprehensive assessment of stability of local coastal municipalities as complex systems allows to assess their condition, giving the ability to show hierarchy and to predict the trends of vulnerability and variability [1-5, 8, 10-12, 13, 15]. In this case, the indicator approach can also be used to evaluate each of the stability factors separately.

Applying this method to the local spatial level, it will include the coastal local municipalities within their administrative borders. This is due to the fact that these territorial entities have open official data on direct and indirect impact factors, such as anthropogenic and economic activity, population density, areas of protected areas, and other data.

For developing the system and methods of indicator calculation the following assumptions were made for all indicators [3, 11, 12, 13]:

– the indicator value must be dimensionless and take values in the range from -1 to +1;
– it is necessary to avoid using weight functions in calculation of integral indicators, as this will lead to ambiguity and contradictions in the assessment of the importance of each indicator and described element.

Based on this, each factor of sustainability as a set of indicators and comprehensive integrated indicator of stability are estimated as the average value of a set of indicators and their values also ranges from -1 (extremely negative influence of factor or sustainability assessment) to +1 (extremely positive impact of factor or sustainability assessment).

For the local spatial level, unlike the spatial level of regional municipalities, only a medium-term nature of changes is present, and the political and strategic components are absented. So only two sustainability factors must be considered as components in order to account.

– economic;
– social.

The economic factor of sustainability and development is determined based on such parameters as:

– indicator of the value of the local budget;
– indicator of investment in basic capital;
– indicator of regional transport infrastructure development;
– indicator of tourist potential, based on the number of places to accommodate visitors;
– indicator of the amount of subsidy of the local municipality budget from the budgets of the Subject of the Russian Federation.

The social factor of sustainability and development is determined based on such parameters as:

– indicator of the population growth, with separate accounting for the values of birth rate and mortality;
– indicator of the population's availability of housing and living conditions;
– indicator of the population's provision with social infrastructure facilities, based on the number of schools and medical organizations;
– indicator of the migration balance of the population;

- indicator of the square environmental protected areas located on the territory of the local municipality;
- indicator of volume of removed solid municipal waste from the territory of the local municipality.

A comprehensive integrated indicator for assessing the sustainability of a coastal local municipality is calculated separately for each local municipality, and shows the situation and condition for this territorial object. At the same time, taking into account parameters and factors listed above makes it possible to obtain a current comprehensive assessment of the stability of the coastal local municipality as a coastal eco-socio-economic system, which includes not only an integral indicator, but also complex multifactorial assessment of stability.

Assessment of socio-economic sustainability of coastal local municipalities of the Murmansk district of the Russian Federation

The above system was probated for coastal local municipalities of the Murmansk region. Total of 11 coastal local municipalities were analyzed:

- City of Murmansk;
- Kandalaksha urban settlement;
- Lovozero rural settlement;
- Mezhdurechye rural settlement;
- Pechenga urban settlement;
- Teriberka rural settlement;
- Tuloma rural settlement;
- Umba urban settlement;
- Ura-Guba rural settlement;
- Varzuga rural settlement;
- Zelenoborsky urban settlement.

Statistical information from the Federal state statistics service of the Russian Federation and its territorial authority for the Murmansk region for 2013 and 2017 was used as input data. This allowed to assess not only the current situation, but the trends of variability and development of coastal local municipalities as coastal eco-socio-economic systems.

Economic factor of sustainability

Analysis of the economic sustainability of the coastal local municipalities of the Murmansk district for 2017 showed that in general all municipalities have a low level of economic development and mainly negative values of the integrated indicator of economic sustainability. Exceptions are the City of Murmansk, the Kandalaksha urban settlement and Varzuga rural settlement (Fig. 1), whose values of integrated indicator of economic sustainability are 0.42; 0.27 and 0.03, respectively. The limits of negative values of one range from -0.80 (for the Ura-Guba rural settlement) to -0.03 (for the Mezhdurechye rural settlement).

Fig. 1: Values of integrated indicator of economic sustainability for coastal local municipalities of the Murmansk district, 2017

(CATF – closed administrative-territorial formations)

The main negative features of the level of economic development (by the decrease of negative impact on the economic factor of sustainability) are:

– indicator of regional transport infrastructure development. A positive value equal to 1 was recorded for the City of Murmansk only. For other coastal local municipalities of the Murmansk district, the indicator values vary from -1 (Lovozero rural settlement) to -0.60 (Kandalaksha urban settlement).

– indicator of investment in basic capital. Three local municipalities have a positive value: the City of Murmansk and the Mezhdurechye rural settlement with indicator values equal to 1, as well as the Varzuga rural settlement with an indicator value of 0.15. Other coastal local municipalities of the Murmansk district have negative values of this indicator, from -0.97 (Pechenga urban settlement) to -0.40 (Tuloma rural settlement).

– indicator of the value of the local budget. By consider of this indicator, it is necessary to note the presence of 5 positive values. For the Lovozero and Varzuga rural settlements, as well as the Umba and Kandalaksha urban settlements, the indicator values are close to 1, and for the Zelenoborsky urban settlement the indicator value is 0.29. Other coastal local municipalities of the Murmansk district have negative indicator values that range from -0.89 (Teriberka rural settlement) to -0.08 (Mezhdurechye rural settlement).

The indicator of tourist potential for the most territories has positive values ranging from 0.05 (Zelenoborsky urban settlement) to 1 (Teriberka, Tuloma, Lovozero, Varzuga and Umba settlements). Accordingly, this one has less impact on the integral economic factor of sustainability. Negative values of this indicator range from -1 (Ura-Guba and Mezhdurechye rural settlements) to -0.37 (the City of Murmansk). The indicator of the amount of subsidy of the coastal local municipalities of the Murmansk district also has more positive values, except for the Ura-Guba, Lovozero, Varzuga settlements (the indicator value is -1) and the Umba urban settlement (the indicator value is -0.91). For other territories the indicator values varies from 0.52 for the Tuloma rural settlement to 1 for the City of Murmansk.

In comparison with 2013, there was a relative improvement in the economic situation for the Mezhdurechye rural settlement and the Zelenoborsky urban settlement, the values of the integral indicator of the economic factor of sustainability increased by 0.26 and 0.25 units, respectively (Fig. 2). For Mezhdurechye rural settlement it is associated with a significant increase in investment, and for the Zelenoborskiy urban settlements – with the growth of tourism attractiveness of the municipality and some reduction in subsidy. For other municipalities the situation is reversed compared to 2013. For the Teriberka rural settlement the integral indicator of the economic factor of sustainability decreased from 0.44 to -0.17, which is the maximum in comparison with other local municipalities. This is mainly due to a significant decrease in the amount of investment basic capital and a decrease of value of the local budget.

Fig. 2: Difference in assessment of the values of integral indicator of the economic factor of sustainability for the coastal local municipalities of the Murmansk district, 2013 and 2017
(CATF – closed administrative-territorial formations)

Social Factor of Sustainability

The social sustainability factor is positive in half of the coastal local municipalities of the Murmansk district (Fig. 3). The lowest value of the integral indicator of the social sustainability factor is -0.35, and it was registered for the Zelenoborsky urban settlement, and the maximum value 0.4 - for the Pechenga urban settlement and the Lovozero rural settlement.

Fig. 3: Values of integrated indicator of social sustainability for coastal local municipalities of the Murmansk district, 2017

(CATF – closed administrative-territorial formations)

The most positive contribution to this condition is made:

– indicator of the population's provision with social infrastructure facilities, whose values for the coastal local municipalities range from 0.15 (Zelenoborsky urban settlement) to 1 (Ura-Guba, Mezhdurechye, Varzuga rural settlements and Umba and Kandalaksha urban settlements). The exception is the Teriberka rural settlement with a negative indicator value of -0.44.

– indicator of the population's availability of housing and living conditions, whose values are less than 1 only for the Zelenoborsky urban settlement (-1) and the Varzuga, Tuloma and Mezhdurechye rural settlements (-0.83; -0.49 and -0.11, respectively). For other local municipalities the positive indicator values prevail, which range from 0.02 (The City of Murmansk) to 1 (Kandalaksha urban settlement).

– indicator of volume of removed solid municipal waste, which has a less positive impact on the situation due to half of the negative values of the indicator for municipalities, with range from -1 in the Varzuga rural settlement to 0.71 in the Lovozero rural settlement.

Indicators of the square environmental protected areas, migration balance and population growth are mostly negative, which does not have the best effect on the social stability of coastal local municipalities. However, the presence of positive indicators indicates the beginning of solving the existing problem with the outflow of the population, decrease in the birth rate and the creation of new protected areas. Indicators of the square environmental protected areas are above zero for the Pechenga urban settlement (the indicator value is 1) and Umba urban settlement (the indicator value here is 0.14), as well as for the Lovozero rural settlement (the indicator value is 0.24). Negative values of this indicator for other territories vary from -1 to -0.09. Indicator of migration balance in the following coastal local municipalities have positive values: 0.90 for the Varzuga rural settlement, 0.83 for the Pechenga urban settlement, and 0.02 for the Tuloma rural settlement. Values less than zero for other territorial entities range from -1 to -0.18. The indicator of population growth varies widely from -0.97 (Umba urban settlement) to 0.72 (Pechenga urban settlement). This indicator has only two positive values: in addition to Pechenga urban settlement, in the Tuloma rural settlement, the indicator value is 0.15.

The integral indicator of the social factor of sustainability for the coastal local municipalities of the Murmansk district showed significant dynamics of variability over the period from 2013 to 2017 (Fig. 4).

Fig. 4: Difference in assessment of the values of integral indicator of the social factor of sustainability for the coastal local municipalities of the Murmansk district, 2013 and 2017
(CATF – closed administrative-territorial formations)

It is worth noting that, despite the presence of negative values of the integrated indicator of social factor of sustainability in half of the coastal local municipalities, the overall change shows a trend towards improving the situation. In comparison with 2013, the picture has changed for the better, and the differences in the values of this integrated indicators in the majority have positive values from 0.06 (Zelenoborsky urban settlement) to 0.46 (Pechenga urban settlement). This was due to an increase in the population's provision with social infrastructure facilities, improved housing and living conditions and the development of a positive policy in the waste removal sphere. However, for the Varzuga, Ura-Guba, Mezhdurechye and Teriberka rural settlements, the situation worsens by about 0.1 units, which is associated with the deterioration of housing and living conditions and the outflow of population from the territories.

Comprehensive integrated indicator of sustainability

According to the values of the comprehensive integrated indicator of sustainability for assessing the stability of coastal eco-socio-economic systems, it is possible to recognise the Kandalaksha urban settlement as the most stable coastal local municipality of the Murmansk district, with a value of the comprehensive integrated indicator more than 0.1 (Fig. 5). The least stable coastal eco-socio-economic systems are the Zelenoborsky urban settlement, the Teriberka and Ura-Guba rural settlements, with values of the indicator of sustainability less than -0.2.

Fig. 5: Values of the comprehensive integrated indicator of sustainability for the coastal local municipalities of the Murmansk district, 2017

(CATF – closed administrative-territorial formations)

In comparison with 2013, the Pechenga urban settlement shows relatively significant positive dynamics, the values of the comprehensive integrated indicator of sustainability for which have changed from -0.23 to 0.05 (Fig. 6).

The decrease in stability is observed for the Teriberka and Ura-Guba rural settlements. For the first of the coastal eco-socio-economic system this is due to a serious deterioration of the population's provision with social infrastructure facilities and a sharp decline in investment in basic capital. And for the second one this connects with a decrease of the local budget and outflow of population.

In general it should be noted that the overall comprehensive integrated situation in the Murmansk district is relatively stable, with a sufficient degree of homogeneity in the coastal local municipalities.

Fig. 6: Difference in assessment of the values of comprehensive integrated indicator of sustainability for the coastal local municipalities of the Murmansk district, 2013 and 2017
(CATF – closed administrative-territorial formations)

Conclusions

Thus, the result of the analysis and assessment possibilities of the accounting of medium-term socio-economic changes in the coastal local municipalities as coastal eco-socio-economic systems, was developed a conceptual model for integrated assessment of sustainability of coastal eco-socio-economic systems and development planning for local municipalities.

Testing the model on the coastal local municipalities of the Murmansk district has shown its applicability both for assessing the current condition of coastal eco-socio-economic systems, and for tracking the dynamics and forecasting the variability of their stability: by the comprehensive integrated indicator and by separate factors of sustainability. Also, due to the local level of consideration of coastal eco-socio-economic systems, it is possible to determine the point of negative and positive impact on the system and further adjustment in the positive direction. This will improve the state of the coastal eco-socio-economic system at a higher spatial level: the coastal regional municipalities and the Murmansk district as a coastal Subject of the Russian Federation.

Abstract

The incidence of unclaimed dividends has been one of the major issues in the Nigerian economy till date this research examined the impact of registrar's span of control services by the active nineteen (19) registrar companies in the Nigerian stock market and the effect on the growth of unclaimed dividends in Nigeria. Regression model and stochastic dominance were used to examine the relationship between the span of control of company registrars and the incidence of companies' default and registrars` defaults in the determination of the growth of unclaimed dividends. The study revealed that there is a positive and significant relationship between the span of control of company registrars and aggregate amount of unclaimed dividends with the quoted firms in Nigeria. The study revealed that there is first and second order stochastic dominance of unclaimed dividends with the companies over the unclaimed dividend with the registrars. The study also revealed that there is skewness in the distribution of the number of the companies each registrar serviced in the Nigerian stock market. The study therefore concludes that the increasing amount of unclaimed dividends with the companies that pay dividends than the registrars that are expected to manage the process of dividend payment for fifteen months beginning from the date of dividend payments in Nigeria. The study therefore recommends that the Federal Government and supervisory authorities should intensify the enforcement of the policy on the maximum number of companies each registrar companies should service. And to check the possible collusion between the registrars and the quoted companies that pay dividends in Nigeria. This will ensure that there is equity and even distribution of services among the registrars, and also to reduce the rising trends of unclaimed dividends in Nigeria. A situation where some registrars serviced up to forty and some serviced only one or two, in the face of poor staffing by the registrars calls for urgent review.

Keywords: Shareholders, Unclaimed Dividends, Company Registrars, Nigerian Stock Exchange, Span of Control

Introduction

The incidence of unclaimed dividend in Nigeria remains one of the major issues that have continued till date. The major concern is that many shareholders especially the small investors are not getting their dividends as and when due from their investments. This is happening despite the fact that the Securities and Exchange Commission (SEC) had introduced the Electronic-Dividend Mandate Management System (E-DMMS) in collaboration with the Central Bank of Nigeria (CBN), Nigerian Interbank Settlement System (NIBSS), with other stakeholders. Olowokeere (2018) sated that shareholders Association of Nigeria has argued that both quoted companies and the Registrars have deliberately slowed down the process of the e-dividend system. According to the shareholders, Registrars employ tactics of selective payments and distribution of electronic dividend (e -dividend) while exploring loopholes in the rules and enforcement by SEC. They argued that among other requirements, the Registrars ask for a bank account, official identity card, signatures, and utility bills, in filling the Know Your Customer (KYC) form. They further explained that the argument was the differing ways Registrars and shareholders embraced e-dividend initiative which is a major concern to investors. The information demanded by Registrars are already contained in investors Bank Verification Number (BVN) which are already with the stockbrokers, where they bought their shares and who are custodians of the information. They wondered why an investor is tossed from one end to another when it comes to dividend payment (Olowokeere, 2018).

One of the requirements for smooth running of the stock market is that shareholders must receive their dividends when declared according to their shareholdings and so the possibility of unclaimed dividends would be minimal. However, this has not been the case in Nigeria. From 1986 to 1996, the figure of unclaimed dividends stood at N4 billion, from 1996 to 2006 it increased to N40 billion (Owolabi & Obida, 2013). From 2006 to 2016 it rose to about N80 billion, and as at December, 2018, it stood at N130 billion (Olowokeere, 2018). This, in the past, led to a proposal by the National Assembly to set up a committee to manage the unclaimed dividends but the move was rejected by the Shareholders` Association of Nigeria.

The few researches that have been done in this area identified reasons for the rising unclaimed dividends. They adduced that the rising pattern of unclaimed dividends in Nigeria was, among others, due to ineffectiveness of the postal services in Nigeria, issues of multiple applications for shares, and uninformed investors. Other reasons adduced are the lack of postal services in some communities, investors changing their addresses without notifying the Registrars, and the Indigenization decree of 1972, when some investors used fictitious names to buy shares which later could not claim their dividends.

Many analysts have adduced many reasons responsible for unclaimed dividends in Nigeria. Kighir (2006) analyzed dividend payout and unclaimed dividends in Nigeria and attributed unclaimed dividends to some factors which include: the shareholders, the quoted companies, companies Registrars, and the regulatory authorities themselves. The Companies and Allied Matters Act (CAMA, 2004), Section 382 subsection (1), and Corporate governance code (2018) states that the decision to pay dividend rests on the board of directors of companies, and the legal position of unclaimed dividend is that after 15 months, dividends not paid are expected to be returned to the company from which investors or beneficiaries will make claim not later than twelve years afterward. It would appear that this clause is being exploited by the companies and the registrars themselves. It is against this background that the paper examined the span of control of registrar's services in Nigeria.

The registrar's span of control services refers to the number of companies each registrar serviced or have control to pay its declared dividends. The actions of the Securities and Exchange Commission in tackling the rising unclaimed dividends is that there can be lapses in part of Registrars operational activities that could contribute to or trigger increase in unclaimed dividends in Nigeria. Registrars are institutions responsible for keeping the records of shareholders of quoted companies in the first instance.. The size or number of firms each registrar controls, or the span of control of companies the

registrars are servicing could be a source of the rising unclaimed dividends in Nigeria. In addition, some companies in Nigeria vary in sizes and structure, so also are the registrars.. Some Registrars service some large number of blue chip quoted companies, in addition to other middle sized companies. Some registrar's service up to about forty companies, while some service few companies, as low as two or one. However, this research adds to the existing knowledge by examining the span of control of company registrars and the incidence of unclaimed dividend in Nigeria. The rest of the paper has been divided into literature review, methodology, data analysis, discussion of findings and conclusion.

Considering the effect of unclaimed dividend in Nigeria, Studies like Opara and Emenike(2014) investigated on the implication of unclaimed dividend on the economic development of Nigeria. The study employed the use of desk research method. The study revealed that the problem of unclaimed dividend can be attributed to shareholder and the trends has a negative impact on investors' confidence. The study concluded that the adoption of the electronic dividend payment must be inclusive and Nigerians should adopt a model where there a dematerialization of share certificates in other to resolve the problems of unclaimed dividend permanently. Jalloh (2017) also examined the impact of dividend policy on shareholders in the agricultural industry in Nigeria. The study used ex-post facto research design and the multiple regression analysis. The result revealed a positive relationship between the variables on dividend payout and the market price share (mps). The changes on the independent variables (mps) are as a result of the changes with the independent variables. The study recommends that firms especially in industries should have a robust dividend payout in other to attract investors. Ezeudu and orikara (2017) examined unclaimed dividend and the implication on the economic growth of Nigeria from 2005 to 2015. The study employed the ordinary least square multiple regression model to investigate the relationship among the variables. The study revealed that there is appositive and significant relationship between earnings per share (uses as control variable) and the real gross domestic product in Nigeria. The study recommends a mobilization of all unclaimed dividend by firms in Nigeria and the creation of a pool of those funds to channel infrastructural development in other to enhance economic growth.

Literature Review and Hypotheses Development

Concept of unclaimed dividend

According to Olowe (1997) dividend is a taxable income of payment declared by the board of directors to shareholders, and the payment could be quarterly or yearly, depending on the type of company. Payment of dividend maximizes shareholders wealth, and dividend not claimed by shareholders or investors give rise to the issue of unclaimed dividends. Dividend declarations are made by companies and dividends are paid by the Registrars of the respective companies to the respective shareholders.

Osaze & Anao, (1999) stated that the issue of unclaimed dividend cannot be over emphasised and so, improper payment of dividend by company registrars to lack of transparency by the company registrars, can result to the issue of unclaimed dividends. The financial statement of a company is the reflection of the company's shares. When there is improvement or update on a company's bank account, it can help in adjusting unclaimed dividend, because it will also reflect in the financial position of the company concerned (Unegbue, 2002). This does not only benefit the stockbrokers but also the people in the environment because the number of shares a company owes is the reflection of the company's own worth or value.

The issue of unclaimed dividends is not peculiar to Nigeria alone. Some countries have made adequate provisions for the appropriation of unclaimed dividends. An example of such a country is Kenya. Where unclaimed dividend assets amounted to 9.2 billion Kenya Shillings, and 573 billion Shillings, between 2009 and 2011 respectively.. A parliament was established by the government of Kenya to set up an Appropriation Bill which was called unclaimed financial assets set up Authority Board to carry out unclaimed financial assets. The bill was passed and sent to the president but the parliament that deals with this bill abandoned the property.

According to Ekanem (2002), the issue of unclaimed dividend has been prevalent in the Nigerian stock market. The investors, shareholders are interested with the issue despite the effort made by regulatory agencies. He concluded that integrity seems to be the prevailing question in the management of unclaimed dividend in Nigeria in the midst of consistent increase in s the unclaimed dividends.

Review of prior studies on unclaimed dividends

In this section, literature which relate to the subject matter is briefly reviewed in order to portray the gap in knowledge. Few authors have conducted researches of company registrars as it relates to unclaimed dividends in Nigeria. The rising unclaimed dividends have been a major concern to shareholders, investors, and the potential investors alike.

Suleyman (2005) examined the phenomenon of unclaimed dividends in Nigeria. With the use of secondary data and trends and chi-square statistical analysis, it was observed that the increase in the number of Registrars does not benefit the registrars. As more Registrars are set up, the more disadvantaged existing ones would be. The study concluded that companies and registrars do not manage the unclaimed dividends. The study found that there was insincerity on the payment and declaration of unclaimed dividends on the part of the companies. The study recommends that a trust fund be set up in order to take up the management of unclaimed dividends, and that all companies should adopt the e-dividend policies. Despite this recommendations, the unclaimed dividends amount was still on the increase.

Ogbodo. (2017) analysed the effect of unclaimed dividends on the financial statement of some commercial banks in Nigeria. The study addressed dividend policy on corporate performance of some banks.. It employed the use of primary and secondary data, and the annual reports of two commercial banks were used from 2008-2012. The z test statistical tool was used to test the results. The study showed that unclaimed dividend affects the financial position of the firm and in such firms, investors are more concerned. The study, therefore, recommends that cash and short-term funds should be made available by companies in case a fund is being transferred to a separate account as it will help management in presenting a true and fair financial statement. This did not however address the increasing unclaimed dividends which was not restricted to the banking sectors alone.

Owolabi and Obida (2013) examined rising issues of unclaimed dividends. The authors analysed the value of dividend unclaimed over the years giving various reasons attributable to the increase. A descriptive statistic was used to analyse the data of First Bank Nigeria (FBN) for a period of ten (10) years. The study suggests that there should be a readjustment in section 382 of CAMA 1990 and interest should be given when beneficiaries come for dividend due to the death of their benefactor, and the use of electronic dividend payments. He also suggested that the lost and expired dividends must be replaced. The study only used one bank to make conclusion and recommendation.

Recent issues surrounding unclaimed dividends are the impact of operational mechanism of the registrars in areas of span of control, and the fact that there are unclaimed dividends with companies within the six months and less than fifteen months that dividends were to stay with the registrars. This paper has focussed on the examination of this area.

A notable gap in the literature is that prior studies failed to examine the operational mechanisms of registrars especially the size of control of registrars in respect of the number of companies each registrar serviced in the Nigerian stock market. They failed to examine companies default and registrar's defaults in terms of the amount of unclaimed dividends in the custody of the two institutions.

Development of hypotheses

Based on the gap in literature, this study attempts to provide answers to the hypotheses stated below in the null form.

$H0_1$ There is no significant relationship between the span of control of registrars and the increasing amount of unclaimed dividends in Nigeria

$H0_2$: There is no significant difference between Registrars default and companies default in the determination of unclaimed dividends in Nigeria.

Research Method

The study used the cross-sectional research design. The cross-sectional design involves the use of cross-sectional data to gain knowledge about some phenomenon among variables over a short period of time, not less than five years, from 2012- 2018. Causal research design was also used, where data are collected to quantitatively identify the causal relationship between the dependent variable and independent variable(s), using statistical inferences or diagnostic tests to arrive at the conclusion of the study. In addition, the population of the study consist of 364 companies listed as at December, 2018. However, the sample size consist of 264 out of the 364 companies quoted. The sample size consists of only public limited companies that have ordinary shares or in which the 19 active company registrars serviced.

Model specification

Model 1.

The study used analytical model of the ordinary least square regression. The Regression model is stated below...

. The model can be expressed explicitly in the equation below.

$$TUCD = \alpha + \beta SOC + \beta 3COD + \beta 4RED + e \qquad \ldots(1)$$

Where,
TUCD = Total unclaimed dividends
SOC = span of control of firms by the registrars (the number of companies each registrars services) in the determination of unclaimed dividends in the Nigerian Stock Market
COD = companies` default (the total amount of unclaimed dividends with companies in the determination of unclaimed dividends management in the Nigerian Stock Market.
RED = registrars` default (total amount of unclaimed dividends with registrars in the determination of unclaimed dividends management in the Nigerian Stock Market.
e = error term.

Stochastic Dominance

Model 2.

This model is to test the cumulative distribution functions of unclaimed dividends with the registrars and the quoted companies by using the Vose Dominance functions to run and test hypothesis two stated in this paper. We assume that distribution A represents the distribution of unclaimed dividends with the registrars, and B is the distribution of unclaimed dividends with the quoted companies. If B is to the right of the two, then, B is said to dominate A, and is first order dominance over A.

First Order Stochastic Dominance

Consider options A, B, that have the cumulative distribution functions $F_A(x)$ and $F_B(x)$,

Where it is desirable to maximize the value of x.

If:

$$F_A(x) \leq F_B(x) \text{ for all } x \qquad (2)$$

Then option A dominates option B. That amounts to saying that the cumulative density function (cdf) of option A is to the right of that of option B in an ascending plot.in an ascending plot as in fig 1.

Fig. 1: Options A and B cumulative density functions.

From table 1, the total number of companies serviced by each of the active 19 company registrars are presented. This includes funds, state government trust funds and many other securities. But this study is concerned with equities only. From table 1, Africa Prudential, serviced 48 securities out of which 38 are equity firms. We considered only the equities or ordinary shares this study. However, some registrars serviced only equity firms, like ALL CROWN registrars that serviced only two equity firms. Out of the 364 securities, 246 were equities, making 68 percent of the population.

UDUSM =	UNCLAIMED DIVIDENDS UNDER SIX MONTHS
UDWREG =	UNCLAIMED DIVIDENDS WITH REGISTRARS

Table 2, presents all the data used for the study, and this include the actual sample of span of control used, the total unclaimed dividends amount, unclaimed dividends that are less than fifteen months, unclaimed dividends with companies, unclaimed dividends under six months, and unclaimed dividends with registrars.

Table 3: CORRELATION MATRIX

		CORRELATION MATRIX				
	SPANC	SPANC1	UDLFM	UDUSM	UDVDCO	UDWREG
SPANC	1	0.967678611	-0.07501	0.649324	-0.05609132	-0.60192769
SPANC1	0.967679	1	0.018746	0.7355463	-0.14438458	-0.60778189
UDLFM	-0.07501	0.018745875	1	0.265208798	-0.89444974	0.498278975
UDUSM	0.649324	0.7355463	0.265209	1	-0.27685345	-0.59459643
UDVDCO	-0.05609	-0.144384585	-0.89445	-0.276853445	1	-0.51454085

Table 3 is the correlation matrix of all the variables used in the study. It can be observed that there is a high correlation between unclaimed dividends with companies (UDVDCO) and unclaimed dividends less than fifteen months (UDLFM). Companies are expected to hand over their dividend payments to registrars to administer within this period. The purpose of correlation is to identify variables that correlate so as to avoid autocorrelation in our regression analysis. The study is more concerned with the span of control and the unclaimed dividends with companies. We present the regression results in table 4 below.

Table 4. TOTAL UNCLAIMED DIVIDENDS WITH UDLFM, UDUSM, USVDCO, and UDWREG.					
	Dependent Variable: UDTOT				
	Method: Least Squares				
	Date: 11/04/19 Time: 06:50				
	Sample (adjusted): 1 19				
	Included observations: 19 after adjustments				
	Variable	Coefficient	Std. Error	t-Statistic	Prob.
	SPANC1	-1.86E+08	1.67E+08	-1.115678	0.2848

	UDUSM	0.36072	0.126711	2.846794	0.0137
	UDVDCO	0.538367	0.116565	4.618612	0.0005
	UDWREG	0.291197	0.132254	2.201803	0.0463
	C	5.51E+10	1.41E+10	3.901877	0.0018
	R-squared	0.910375	n dependent var		9.24E+10
	Adjusted R-squared	0.875903	. dependent var		1.68E+10
	S.E. of regression	5.93E+09	ike info criterion		48.09626
	Sum squared resid	4.57E+20	hwarz criterion		48.3945
	Log likelihood	-450.9144	han-Quinn criter.		48.14673
	F-statistic	26.40964	bin-Watson stat		2.302272
	Prob(F-statistic)	0.000002			

From table 4, total unclaimed dividends are positively related to other variables, except Span of control (SPANC1) and unclaimed dividends less than fifteen months (UDLFM). These two variables are not statistically significant considering their t -statistic values. However, unclaimed dividends with the companies (ADVDCO) has a t – statistic value of 4.6186, and therefore significant at the 5

percent level. The results shows that the unclaimed dividends with the companies drives or is a major determinant of total unclaimed dividends (UDTOT.) Unclaimed dividends with the registrars is significant at 5 percent level, with a t-statistic value of 2.2018, and the unclaimed dividends under six months also is significant in determining total unclaimed dividends with a t-statistical value of 2.8468 at 5 level of significance. The study revealed that total unclaimed dividends is negatively related to span of control and that span of control is not significantly related to total unclaimed dividends. We therefore cannot reject the null hypothesis that there is no significant relationship.

The R-squared value is 91 percent, showing that all the independent variables are able to explain 91 percent of what determines total unclaimed dividends during this period. The adjusted R-squared which is a diagnostic control of R-squared is 87.6 percent and not too far away from the value of R-squared. The Durbin Watson statistic value is 2.302 which shows that there is no autocorrelation in the result. The F-statistic which indicates whether our equation and the variables are right in determining total unclaimed dividend has a value of 26.40964 and this passes the 5 percent level of significance.

Since the unclaimed dividends with both companies and registrars are significant, there is need to probe the relationship between the two and span of control. Table 5 provides the results.

Table 5: REGRESSION OF UNCLAIMED DIVIDENDS WITH COMPANIES AND SPAN OF CONTROL SAMPLE

Dependent Variable: UDVDCO				
Method: Least Squares				
Date: 10/29/19 Time: 23:20				
Sample: 1 19				
Included observations: 19				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
SPANC1	-7.13E+08	3.32E+08	-2.146535	0.0498
UDLFM	-0.655362	0.222958	-2.939396	0.0108
UDUSM	-0.395732	0.27059	-1.462479	0.1657
UDWREG	-0.70483	0.237625	-2.96614	0.0102
C	1.18E+11	7.19E+09	16.40698	0
R-squared	0.891675	Mean dependent var		5.47E+10
Adjusted R-squared	0.860725	S.D. dependent var		3.64E+10
S.E. of regression	1.36E+10	Akaike info criterion		49.72466
Sum squared resid	2.59E+21	Schwarz criterion		49.9732
Log likelihood	-467.3843	Hannan-Quinn criter.		49.76672
F-statistic	28.81006	Durbin-Watson stat		0.929743
Prob(F-statistic)	0.000001			

From table 5, using the coefficients, there is a negative relationship between unclaimed dividends with companies (UDVDCO), which is the dependent variable, with all the independent variables: the span of control (SPANC1), unclaimed dividends less than fifteen months (UDULFM), unclaimed dividends under six months (UDUSM) and unclaimed significant in determining the unclaimed dividend with companies. And unclaimed dividends less than fifteen months is also significant. The R-squared value is 89 percent. That means that span of control, unclaimed dividends less than fifteen and six months, and unclaimed dividends with registrars are determinants of unclaimed dividends with the companies. And of these variables, span of control is a driver of the unclaimed dividends with companies. Thus, the null hypothesis that states that there is no significant relationship between the span of control of registrars and the increasing amount of unclaimed dividends in Nigeria is rejected. The alternative hypothesis is accepted. The F-statistic value is 28.8 and this is significant at five percent level of significant.

Table 6: REGRESSION OF UNCLAIMED DIVIDENDS WITH REGISTRARS AND SPAN OF CONTROL

	Dependent Variable: UDWREG			
	Method: Least Squares			
	Date: 10/29/19 Time: 23:22			
	Sample: 1 19			
	Included observations: 19			
	Variable	Coefficient	Std. Error	t-Statistic	Prob.
	UDVDCO	-0.547523	0.184591	-2.96614	0.0102
	SPANC1	-5.32E+08	3.06E+08	-1.736738	0.1044
	UDLFM	0.12107	0.247791	0.488597	0.6327
	UDUSM	-0.720052	0.168917	-4.262761	0.0008
	C	7.30E+10	2.08E+10	3.514309	0.0034
	R-squared	0.890307	Mean dependent var		2.60E+10
	Adjusted R-squared	0.858967	S.D. dependent var		3.19E+10
	S.E. of regression	1.20E+10	Akaike info criterion		49.47211
	Sum squared resid	2.01E+21	Schwarz criterion		49.72065
	Log likelihood	-464.985	Hannan-Quinn criter.		49.51417
	F-statistic	28.40734	Durbin-Watson stat		2.212939
	Prob(F-statistic)	0.000001			

From table 6, the R-squared value is 0.890397, showing that 89 percent of the unclaimed dividends with registrars have been explained by the independent variables. Unclaimed dividends under six months is a driver of the amount with the registrars, followed by those with the companies. However, at 10 percent level, span of control is important a value of 1.7367. Durbin Watson statistic(DW), and the F-statistic pass the 5 percent level of significance.

TABLE 8					
RESULT OF THE STOCHASTIC DOMINANCE OF CUMMULATIVE UNCLAIMED DIVIDENDS WITH COMPANIES AND REGISTRARS.					
CUMDVCO is 1d over CUMREG	CUMDVCO is 1d over CUMREG	CUMDVCO is 1d over CUMREG			
CUMDVCO is 1d over CUMREG	CUMDVCO is 1d over CUMREG	CUMDVCO is 1d over CUMREG			
CUMDVCO is 1d over CUMREG	CUMDVCO is 1d over CUMREG	CUMDVCO is 1d over CUMREG			

From tables 7 and 8, the unclaimed dividends with the companies is first order dominance over the unclaimed dividends with the registrars. The study reveals that companies have more control of unclaimed dividends in Nigeria than the registrars. Thus we reject the null hypothesis that states that there is no significant difference between companies defaults and registrars defaults.

FIG 1. CHART OF UNCLAIMED DIVIDENDS WITH COMPANIES AND REGISTRARS

Fig 1, shows the graph of dividends with registrars and the unclaimed dividends with companies. Unclaimed. Arising from the graph, it could be seen that the UDVDCO is to the right of the UDWREG. This indicates that UDVDCO is far away from the Y-axis than UDWREG. The distance between the two is large towards the right. That suggests that UDVDCO is first and second order determinant over UDWREG. The study revealed that the companies have more unclaimed dividends than the registrars that are responsible for paying dividends declared by companies. This reinforces the results of the stochastic Dominance run above. Thus confirming the rejection of the second null hypothesis that there is no significant difference between Registrars default and companies default in the determination of unclaimed dividends in Nigeria. The study revealed that there is a significant difference between companies` default and registrars` default.

Recommendations

From the above analysis, the study recommends that an enforcement policy of fixing a maximum number of quoted companies a registrar should service should be introduced by the supervising authorities. The study implicates both the companies and the registrars in terms of handling the dividend payment processes in Nigeria. There should therefore be a close documented process and monitoring of the process of dividend payment channels between the quoted companies and the registrars to ensure transparency in the process of dividend pay-out in Nigeria.

Conclusion

The study examined the relationship between the span of control of company registrars and the incidence of unclaimed dividend in Nigeria. The study employed a cross sectional research design with a population that comprises 364 of all listed equity and non-equity companies. A sample size of 264 made up of only equities were selected from the population, and all the active 19 company registrars were used from 2012-2018. The study as part of its findings observed that the span of control by company registrars has a significant but positive relationship with unclaimed dividend with companies there is a significant difference between the unclaimed dividends with companies and with registrars.

Limitation/ Future Research

The study is limited to that fact that it only examines the span of control of company registrars and the incidence of unclaimed dividend in Nigeria. However, future researcher could focus on other aspects or mechanisms of company registrars. More so, based on the number of years required in the study, future research in this area could extend the number of years required in this study.

Abstract

Every business can evaluate its performance through many indicators. Every indicator has its advantages, but also disadvantages. Traditional financial analysis uses information from the past. Because of it they are not often sufficient to business performance measurement. One of modern tools of business performance evaluation, which has been in very interesting during period of recent year, is the economic value added – EVA. The reported profits of each business have a very strong impact on a variety of business activities and decisions that the company management has to do. The aim of earnings management is to report profit at the amount required by corporate management. Earnings management uses some techniques of creative accounting. The main aim of the article is to examine theoretical background of EVA and some motives of earnings management. Based on this information there could be find some relationship between earnings management and the economic value added indicator. There is also mentioned the effect of earnings management and EVA on the company and individual investors of the company. The contribution of the article is to summarize of knowledge about economic value added and earnings management, their assessment and determination of their impact on the company.

Keywords: Earnings Management, Economic Value Added, Earnings, Business Performance

Introduction

The term Economic Value Added (EVA) has been used in recent years, it has been increasingly promoted in economic theory and economic practice of companies in countries with developed market economy, for example the USA, the UK, Germany, countries of the Visegrad Group (Marik, Marikova 2005).

Indicator EVA was created at the turn of the 1980s and 1990s in the US as a concept of a management tool valuation of Stern Stewart & Co. It was defined as operating profit without the cost of capital which are used to generate that profit. Authors of model EVA are representatives of Stern Stewart & Co. - G. Bennett Stewart III and Joel M. Stern. According to Stewart, EVA is a financial indicator of performance of the company, which captures the economic profit of the company that the company achieves. This profit company achieves also when current costs and capital costs are paid (Horvathova, Mokrisova, Vravec 2015).

EVA is one of the modern methods of financial analysis that is based on economic evaluation on the financial statements of the company (Holeckova, 2008).

Development of economic value added indicates whether the enterprise creates value for the owner or not. If the net profit do not cover the cost of capital that the owner has invested in the business, then despite the fact that the company as a whole shows a profit, it is a loss for owner (Zavarska 2012). The cost of capital determines the amount of funds that a company can acquire through the issuance of shares, loans or a combination thereof (Rebetak, Karpac, Bartosova, 2019).

Economic value added is a method that has been increasingly common in recent time. It is a way of managing the business based on the value created for the owner, respectively business owners. The central idea of economic added value is that investments create value for investors when the return on investment is expected higher than its capital cost. This means that the EVA indicator measures how the company contributed to the increase or decrease by its own activities during the period values for their owners (Zavarska, 2012).

The basic principle of economic added value is that it measures economic profit. And therefore, if the enterprise shows positive accounting profit, it also shows economic profit when its accounting profit is higher than the cost of invested equity (Kiselakova, Jencova, Čverhova 2012).

Earnings management is not directly a creative accounting technique, but is a concept that is inextricably linked to it. Earnings management is practice that business use, and in some cases may even contribute to a more realistic picture because it includes risks (Mulford, 2002). Earnings management is goal-intervention in external financial reposting with intent to obtain some gain (Bagnoli, Watts, 2000). Earnings management is acceleration or deferral of expenses with the objective to produce consistent growth in earnings. These earnings may not reflect the economy of the enterprise during the time period (McGregor, 2011).

Earnings management combines the requirements of top management in the area of profit and it manipulates financial statements and accounting processes themselves to make them requirements satisfied. Earnings management is an integral part of creative accounting. In a company where earnings management is practiced, accountants usually automatically expect to use creative techniques bookkeeping. Earnings management can use all the techniques which are involved with adjusting the economic result. Some author divide two perspectives of earnings management: earnings smoothing and management of earnings to achieve positive target of this possibility to influence profit of company (Hoang, Joseph, 2019).

The most common methods of adjusting profits are income smoothing and big bath. The income smoothing method holds the same level of the profit so that it does not fall, ideally profit has slightly growing trend. Revenue from successful years is used during worse business era and it eliminates losses. The big bath method is mainly used when the enterprise shows a loss now but it expects profit in the future. In this case, the company does not want to reduce its loss, but on the contrary it tries to deep loss and then artificially increases its profit in the next period (Mulford, Comickey, 2002).

Methodology

The aim of the article is to evaluate profit management and EVA as two ways of measuring corporate profitability and efficiency. The article also evaluates the positives and negatives of the EVA indicator and the motives that lead to the application of earnings management. The method of analysis was used in the writing, we started from a general evaluation of the problem to reach concrete results. Based on theoretical knowledge we reach the conclusion. Scientific information from the Web of Science Core Collection, conference articles, articles from economic journals of the Slovak Republic, books of domestic and foreign literature were used. The reason for choosing the topic is the authors' interest in the issue. The authors are interested in investment, profit and earnings management. The contribution of the article is based on a summary of knowledge about selected EVA and earnings management and evaluation of their interaction.

Results

As already mentioned, the EVA indicator prefers economic profit, ie. profit formed by the difference between capital returns and economic costs. It included in addition to accounting costs also so-called opportunity (alternative) costs. They represent the return that the owner (investor) would receive if he invested his resources in others shares (activities). Indicator EVA can be calculated:

$$\mathbf{EVA=NOPA-WACC \times Capital}$$

NOPAT - profit / loss from operating activities after taxation,
WACC - weighted average cost of capital,

Capital - total invested capital,
NOA - net operating assets.

There is some practical example how to calculate EVA. Earnings before interest and taxes amounted to $5,130 million. Applicable tax rate is 35%. 60% of the company's assets are financed by debt which has an after tax cost of 3.8%, while 40% is financed by equity with a cost of 9.8%. Average total capital employed over the period amounted to $50,420 million.

NOPAT = EBIT × (1 − Tax Rate) = $5,130 million × (1 − 35%) = $3,334 million

WACC = 0.6 × 3.8% + 0.4 × 9.8% = 6.2%

Economic Value Added = $3,334 million − 6.2% × $50,420 = $208 million

This tells us that company added a total of $208 million to its value.

The EVA value obtained may have the following values:
EVA ≥ 0 - return on invested capital in the business is higher than costs investment in this capital, which means that business is more profitable than all less risky ways of capital appreciation and therefore the company creates value for the owner.
EVA <0 - the cost of invested capital is higher than the return on that capital, implying that business is disadvantageous because wealth is lost business owners, i.e. j. the enterprise does not create value for the owner (Horvathova, Mokrisova, Vravec, 2015).

Advantages and disadvantages of the EVA indicator

Benefits of EVA include:

- EVA is close to the net present value category,
- It fits the theory that increasing the value of a business is possible if the managers adopt projects with a positive net present value,
- Indicator is a simpler performance indicator than other value-added ones indicators and is understandable.
- Eliminates the effects of the application of different accounting rules and therefore it is an important complement to traditional performance indicators in financial analysis for managers.
- EVA can use one methodology in several areas of business actions and it focuses only on the core business of the enterprise. Profits of individual companies in the countries are strongly influenced by the economic development of the country, as they have an impact on unemployment, remuneration of employees (Behun, Gavurova, Tkacova, Kotaskova, 2018).
- EVA is the simplest value indicator (Pavelkova, Knapkova, 2005).

The disadvantages of EVA include:

- It is based on information of financial statement, quantification of input profit data and invested capital.
- The calculation of the cost of equity is complicated and does not provide unambiguous the result.
- If the growth of the EVA is accompanied by an increase in the cost of capital, it may decrease the value of the company even with a simultaneous increase in EVA.
- EVA takes into account the revenues and costs achieved in the given period, does not include expected benefits in future periods, not even in the form of estimates future flows.
- It is not adjusted for the effect of inflation.
- The problem is the calculation of costs, in particular equity and this indicator does not include expected revenue in the future
- EVA cannot be used as a basis for assessing strategic development company (Pavelkova, Knapkova, 2005).

In our opinion, the EVA indicator is very important for companies. The basic principle of EVA is that it measures economic profit. Economic profit is achieved when not only current costs but also capital costs are paid. For businesses, EVA is an important tool for measuring performance. The

indicator is also an important for measuring the company's valuation, which is important to shareholders. EVA also serves as an important tool of motivation for employees. Regular calculation of the indicator is therefore important for companies.

Motives of Earnings Management

Earnings management is not a technique, but it is often associated with creative accounting. There are a lot of different models and processes how to measure and predict earnings management. Models of identifying and predicting earnings management in companies are usually based on the dependence between total assets of companies and various profit measures (Svabova, Valaskova, Durana, Kliestik, 2020). Earnings management is one of the forms of creative accounting. It can be positively or negatively influenced by tax aggressiveness, leverage or institutional ownership (Susanto, Pirzada, Adrianne, 2019). Between leverage and earnings management there is very positive relationship. Also companies with high leverage prefer real earnings management more than accrual-based earnings management (Khanh, Thu, 2019). It is a deliberate intervention of management to the process of determining profit when they want to achieve their own goals. In addition to earnings management, an important part of each company's internal process is risk management, which affects the company's future development (Olah, Kovacs, Virglerova, Lakner, Kovacova, Popp, 2019). It is significant for every business to investigate risk and risk management (Valaskova, Kramarova, Kollar, 2015). Earnings management tries to prepare financial statements by usage information about the amount of profit demanded by investors and other creditors. Reputation is very important for every company because it can influence earnings and quality of financial performance. These are than important for investors (Huynh, 2019). We know some motives of earnings management:

- It avoids a significant fall in share prices due to market expectations

Because of the negative market reaction to unexpected changes in profits, managers are motivated to hedge investors' expectations by taking certain measures affecting the amount of profit. Companies often exert pressure to meet market expectations. In practice, businesses try to provide investors and analysts with information about the expected development of profit. Nowadays, companies in the field of artificial intelligence for enterprise applications reach a very high level of revenues (Tuffnell, Kral, Durana, Krulicky, 2019). Several companies such as Coca-Cola, Intel Corp. and Gillette Co., use the opposite approach and they do not provide analysts with quarterly and annual estimates. The reason is to focus on meeting long-term strategies.

- Smoothing fluctuations in profit against the long-term sustainable trend

This way of reporting profit (smoothing) is also related to the effort to meet investors' expectations in future periods. Investments in artificial intelligence and Internet technologies are expected to increase in the future, bringing many benefits in terms of revenue growth (Whittle, Gregova, Podhorska, Rowland, 2019). Management of company may be concerned about the fact that increasing margins in current period raises increased market expectations in the coming periods. When business managers do not believe that this level of profit would be sustainable in the long term, they are motivated to manage profit in the direction down at present. For this reason, the smoothing of profits is sometimes seen as an effort of managers to bring analysts internal information connected with future development of the company's profit (Ortega, Grant, 2002).

- Maximizing the proceeds of the public offering (IPO) and secondary issues (SPO)

In general, the management of a stock issuing company aims to increase profits, share prices and investor interest. Practical experience shows that the earnings management becomes particularly popular during the period of the first public offer of shares (IPOs) when companies try to show themselves in the best light. In fact, earnings management in the IPO occurs so often that investors are aware of this practice and because of it they know the possibility in their assessments earnings management. Earnings management is also used to raise the issue price when company want go public and sold shares (Sosnowski, 2018). Some studies show that the market does not know if shares are overstated due to earnings management.

- Usage of earnings management avoids breaching credit agreement conditions and minimizing transaction costs.

The loan agreement represents an agreement between the enterprise and its creditor in which the company undertakes to maintain selected financial indicators set by the lender at the required level. Between these indicators usually include profit´s criteria such as return on assets, profitability of equity, coefficient of interest coverage, etc. It is considered very risky when a company is unable to meet a given conditions and in this case the lender can either apply for immediate repayment of the loan or interest rate increase.

Relationship between Economic value added and Earnings Management

Economic Value Added is an indicator that allows evaluate the performance of an enterprise and the economic efficiency of its business. It helps to top management, controllers and owners to evaluate the performance of the company and the trend of its development, to find out how the business activity influences the shareholder's business investment, evaluate the effectiveness of investment projects, and increase the material involvement of workers to the results of business activities. Earnings management is a process of changing the financial statement. It tries to conceal real economic conditions. Every business can be characterized by a large amount of financial and nonfinancial numbers. Financial statement, balance sheet, profit and loss account make image of companies processes and operations (Siekelova, Kovalova, Ciurlau, 2019). On the other hand earnings management tries to attain private gains out of contractual outcomes. Through earnings management the company can increase the reported profit or reduce the reported loss, manipulate indicators of financial analysis. Company uses this technique to eliminate financial risk, delaying shareholder control requirements, strengthen the position of management, and increase the enterprise's ability to raise funds. Profit is important for every investor. Investors are also focused on information about a possibility and risk of bankruptcy in every business and country (Kovacova, Kliestik, Valaskova, Durana and Juhaszova, 2019).

Earnings management and Economic value added can be used by the company to determine its economic efficiency and profit. Through this indicator and method, companies are able to influence shareholders, investors and the total investment of the company.

Fig. 1 : Interaction between earnings management and EVA
Source: Jahani, A. M., Zalghadr-Nasab, M. R. and Soofi, F. (2013)

Authors Jahani, Zalghadr-Nasab and Soofi (2013) have made an research of the relationship between economic value added and earnings management. Between earnings management and EVA is important relationship. Increasing of earnings management in a company is probable connected with increasing of EVA and also decreasing ot method is connected with decreasing of indicator.

Conclusion

Economic value added is a term that currently marks a very important value measure of a company's performance. The basic idea of the indicator is that invested capital must have a greater benefit than the cost of that capital. The EVA indicator is based on the microeconomic concept of the company's goal - maximizing profit, where profit is understood here as economic. It expresses the interest of owners and investors. Earnings management is technique which is used to produce financial statements that present an overly positive view of a company's business activities and financial position. Earnings management applies rules and creates financial statements that inflate or "smooth" earnings. It is used by company to create higher profit and then to influence investor.

The main aim of the article is to summarize the basic theory of economic value added, describes the basic definitions, calculation procedures and the main advantages and disadvantages of this indicator. Companies use this indicator to determine the performance of the company, assesses the profits of the company for the period. The article further describes the basic motives that lead companies to use creative accounting, respectively. One of the techniques of creative accounting - earnings management. It is again used by businesses to misrepresent their financial statements and thereby seek to build a positive image, increase the value of their securities and positively influence the investors themselves.

The contribution of the article lies in the assessment of economic value added and earnings management. It describes the basic selected theoretical procedures and characteristics of both indicators. The article shows the interconnection of indicators. Finally, the relationship of indicators is also supported by a graphical representation. The reason for choosing the topic is its timeliness and interest of authors in the given area. The reason for choosing these two indicators is that they are indicators evaluating the performance and profitability of the company. In the future, we would like to focus more closely on the interaction between economic value added and earnings management, but also among other selected performance indicators and earnings management.

Abstract

The importance of price to the company is undeniable, while for the buyer price is the most important factor in buying a product or service. For the seller is important price, which should bring to the company funds for further activities and also bring profit for the effort. This implies that pricing is an essential part of the functioning of businesses in addition to marketing strategies or business planning. The main objective of this work is to analyze cost-based pricing in a manufacturing company. The aim was to describe the possibilities of cost-based pricing through examples. The thesis used the methodology of deduction and analysis of pricing based on costs in the manufacturing company. After the analysis, we have proposed specific cases where companies based on certain assumptions choose one of the pricing options. We have also outlined the procedures for calculating the sales price of a product in a manufacturing company for each cost-based pricing method. Based on these procedures, different production companies can, under non-identical conditions, determine the selling price of the product to be introduced.

Keywords: cost-based pricing, cost-based pricing methods, manufacturing company, pricing

Introduction

The prices of goods and services are paid by the seller and the buyer and therefore pricing is an essential part of businesses. This process is constantly changing and influenced by various factors. It is influenced by competition, the nature of demand and the market, inflation, the company's goal, costs, product life-cycle, marketing mix strategy and many other factors. On this basis, we can argue that pricing is a constantly changing and dynamic process that needs to be adjusted and monitored very carefully.

We agree with the claims made by Kufelova (2017) that the prices of products and services are subject to a correlation between the required amount of profit, the size of production and costs. According to the author, in the current market economy, most businesses are founded with the aim of making a profit that largely testifies to the company's success and prosperity. The amount of profit is influenced mainly by factors such as volume of production and realization, price and also costs. There is a clear relationship between costs and production volumes. As sales volume increases, total costs and price decrease, what is caused by fixed costs.

In general, we can characterize a manufacturing company as a company that produces something. Its activity is focused on production of tangible goods of industrial or consumer character. Through the production activity, the production inputs are transformed into production outputs. From this, there is a clear relationship between the volume of production and the cost of this production volume. The purpose of each manufacturing company is not only the production of products, but also the sale of manufactured products. By selling, these enterprises raise funds to cover the costs of production and also raise funds for further development and investment. The sale also ensures that a reasonable profit is generated for the company. Manufacturing companies can often be family firms. According to

Suprianto, Rahmawati, Setiawan and Aryani (2019), manufacturing companies as family firms can be considered a traditional market sample where different influences influence family earnings management. Family businesses have a stable market position, but their failure as a result of management by generations is a common phenomenon.

According to Gajanova, Nadanyiova and Moravcikova (2019), for the existence and profitability of the production company are important customers and above all they are loyal customers. Acquiring new customers is very important for manufacturing businesses, but loyal customers are often the key to market success in the face of increasing competition. Manufacturing companies must therefore monitor all factors and meet all the needs of loyal customers and constantly communicate with them. (Chetthamrongchai, Saengchai, 2019) However, it should be added that marketing communications must be direct, bilateral and clear. (Nadanyiova, Gajanova, 2019) In order to communicate with customers, manufacturing companies should also be adequately informed through the authorities, with the State itself drawing information not only from within the country, but also from surrounding countries and an overview of the whole market. (Valaskova, Kramarova 2015)

A manufacturing company can be considered to be competitive if it fulfills all customer requirements in terms of quality, price and communication, while customers are satisfied and trusted. According to Podhorska, Gajanova, Kliestikova and Popescu (2019) in this way, a manufacturing company builds a reputation in the customer community, and this is often the decisive factor for competition. The goodwill thus acquired and built can be considered as the key to market leadership.

For a manufacturing company, its products and assortment are at the heart of its existence and must adapt them to customer requirements. It must focus on the assortment demanded by all customer groups. It should avoid that the appropriate assortment consists exclusively of goods that are designed for one sex. Therefore, the choice of assortment should also be made by a group of people to avoid gender bias. Every age and gender group should be satisfied with the assortment. (Mihaila, Kovacova, Kliestikova, Kliestik, Kubala, 2018) The choice of product range of the manufacturing company is also crucial for its customers, who often prefer the private brands of products. (Valaskova, Kliestikova, Krizanova, 2018) However, manufacturing companies must focus not only on products, but also on the services they provide and integrated solutions. The introduction of 'intelligent services' as an integrated system would allow for the exchange of information between customers and manufacturing companies, thereby ensuring that higher customer requirements are met. (Kanovska, 2018)

Manufacturing companies, especially nowadays, have to focus on an environmentally minded customer. Therefore, manufacturing companies must also take environmental risk and associated costs into account and constantly reduce the negative impact on the environment. (Eriandani, Narsa, Irwanto, 2019) Intelligent technologies could help both production enterprises and environmental sustainability. (Zhuravleva, Nica, Durana, 2019) According to Fielden, Michalkova, Vrbka and Lyakina (2019), sustainable manufacturing is currently very important, covering areas such as marketing or customer relations.

Rajnak et al. (2007) argue that pricing is the essence of pricing and is a complicated process. A properly designed price is the quickest way for a business to maximize its profits. An appropriately priced price can even increase profits faster than increasing turnover. Of all management decisions, price decisions are the most visible and have a significant impact on the overall profitability of the business.

Literature Review

Pricing is a constantly evolving process that adapts to the current situation and market requirements. There has always been a way or a pricing method in the world, and historically it is not possible to determine exactly when the first pricing methods were introduced. However, the understanding of pricing once and for now is very different, so only literature from the late 20th and 21st centuries can be used for today's pricing in businesses.

One of the first authors to deal with pricing in the form we know it today was Olah and Janicek (1978), who laid the foundations of pricing based on cost calculations in their publications. They considered cost calculations as the basis of price formation, consisting of the cost of production and the associated profit component included in the price. A similar pioneer in this field of modern pricing was the author Zeelenberg (1986), who in his publication Industrial Price Formation dealt with pricing in industry.

The importance of the pricing strategy and the difficulty of pricing levels have been described by Janok (1996), where he considers pricing to be essential in introducing new products, changing market conditions, changing costs and competing. The cost and costing of pricing has been discussed in the publications of Kupkovic (1996, 1999, 2002), Chromajakova, Skoda (2005), Kostkova and Lajos (2011) and many others.

Pricing is also known for price flexibility, which is essential in adapting prices to different market conditions. Flexibility and pricing principles were addressed by Hanna and Dodge (1997), who also discussed pricing practices. Price decision-making and pricing methods were dealt with by Rajňák (1999, 2007), who also dealt in detail with cost-based pricing and its methods and calculation procedures.

The prize and pricing was given by the author Lipianska (2002), while later she collaborated on other publications and created a price-oriented authorial team of Lipianska, Hasprova (2007, 2009, 2011, 2016). The authors focus on a wide range of prices, pricing and pricing, also in terms of marketing and marketing strategy. Kufelova (2015, 2017), who deals with pricing in various market conditions for various entities, whether profitable or non-profit, also has a significant contribution to pricing.

Methodology

Not only manufacturing companies can choose one of the general pricing methods for pricing. The main components of pricing include cost, competition and demand. These three elements are very important in determining the appropriate price level to be targeted by the producer, since the most appropriate price is between the competitive price of the product and the price created at cost level. Based on competition, price and demand, we distinguish the following approaches:

- cost-oriented pricing,
- demand-oriented pricing,
- competitive pricing. (Lipianska, Hasprova, 2011)

Kupkovic (2002) argues that **cost-oriented pricing** is one of easy and quick pricing. The price is created by the means spent on a unit of output, that is, a product or service, plus an individual amount of profit, which depends on the type of calculation, whether it is absorbing or variable. This pricing is a success in companies producing a large number of product ranges. In this approach, the price should cover the costs of production and sales and also take care of the profit.

Demand-based pricing reverses the process because the company determines the target end price based on the customer's perception of the value of the product. Pricing thus begins with an analysis of the customer's needs and perceived value, and the company determines the price of the product accordingly. This approach is based on the customer's preferences and opinions and therefore companies try to adjust prices as much as possible to their customers. They obtain this information from various sources such as polls, questionnaires and the like. (Kotler, Armstrong, 2004)

According to Lipianska and Hasprova (2011), in **competitive oriented pricing**, demand and costs are not an essential element, but competitors' prices. In this approach, the company does not develop its pricing strategies, but sets the price from the price of similar products of competing producers. Companies using this strategy can choose a price that is either below the competitive price, above the competitive price, or at the same level as the competitive price.

In pricing, effective pricing control is required for all methods based on relevant standards and regulations. On the basis of this inspection, it is possible to identify certain deficiencies or errors in the pricing process and to contribute immediately to their correction. (Svadlenka, Chlan, 2009)

Cost-Based Pricing

Cost-based pricing is mainly used because it requires little information and is relatively easy to do. It is a pricing method that companies use to maximize their profits but does not take demand into account, and demand information is not often available and expensive, so this method is often considered the most rational approach to maximize profits. Minimizing costs and maximizing profits are, according to Brabenec (2010), the main objectives of manufacturing companies, while the costs produced by affiliates are often used for tax optimization.

Given that this pricing method does not take into account demand, competition or the market environment, it can be seen that the individual who is willing and able to pay for the product is not related to the cost of production. Rational customers do not have to choose a higher price, especially if they have cheaper substitutes, they can choose a higher price based on a higher quality or luxury brand. This implies that the characteristics of a product and the level of customer satisfaction are a determinant of its market value, but consumers themselves do not know and are not interested in the cost of production.

For cost-based pricing, cost calculations may be made on the basis of total own or incomplete direct or variable costs, with profit being recorded as a profit margins, a price margin or the required return on investment. This means we know the following cost-based pricing options that we classify as cost-oriented pricing:

- using profit margin,
- using a price margin,
- using return on investment. (Rajnak, 2007)

Cost pricing using a **profit margin** generally involves the calculation of the cost of the product, followed by the addition of a percentage mark-up for pricing. The procedure for calculating the selling price is such that the enterprise first calculates the cost of manufacturing this product, the necessary net profit and gross profit for that product, then determining the profit for that product and finally calculating the price of that product. In doing so, the price of the product is determined as the sum of the costs and the profit margin per product or as a multiple of the product price and the profit margin coefficient plus one unit.

There are three types of profit margin known: maximum, average and minimum. The maximum profit margin can only be used if it is a monopoly or if the requirements for return on capital are too high, and this profit margin is only used by companies whose main objective is profit maximization. The average profit margin is capable of generating sufficient funds for the company's basic development needs, loan repayments and easy reproduction, and also generates profits sufficient for the venturers or business owners. The minimum profit margin ensures an economic survival of the company by means of a minimum profit, which usually represents the amount of all outstanding loans. This profit margin only allows companies to make a basic recovery. (Kufelova, 2017)

Rajnak (2007) calls cost-based pricing using a **price margin** as well as pricing at the desired return on sales. Generally, it is a uniform pricing or price deviation, ie return prices, through which an enterprise achieves its target return. With this method, during the price reduction process, there is a risk that the owner miscalculated the price margin and then the profitability coefficient of sales needs to be changed. The method requires much more practical experience and knowledge, especially when it comes to a product where sales and demand are changing rapidly. Therefore, this method of pricing is not recommended for start-ups as they do not have information on past years' sales and also have insufficient experience in estimating all the necessary quantities.

The return on sales factor can also be characterized as the amount of profit per unit of sales. The overall nature of the calculation must therefore be based on the required return on sales by establishing a price margin. Several steps are known to calculate a price by using a price margin. Based on the financial goals of the company it is necessary to calculate gross profit, then it is necessary to calculate the price margin as a ratio of gross profit and sales and finally it is necessary to calculate the price of the product using the price margin. (Sedlak et al., 2007)

According to Kufelova (2017), cost-oriented pricing using **return on investment** is generally valued on the basis of target return on capital. A correct estimate of the total costs and sales volume of the whole production is needed. This approach is based on the idea of translating the target role of the company as a whole into the prices of individual products. The target role of the company is measured through the ROI indicator, which can be calculated as the ratio of profit to used capital.

The return on investment variable is linked to the investment of capital in various technologies or projects. Projects are often about optimizing project management, ie investing in a project portfolio. (Kral, Valjaskova, Janoskova, 2019) The size and nature of the investment of the production manufacturing depends on various factors. Often, account is taken of the size, method of management or performance of the organization in which part or project the manufacturing undertaking wishes to invest. (Nguyen Luu, 2019) When investing in complex technology systems, according to Ciszewski and Nowakowski (2018), it should be taken into account that the cost of ownership of such systems is often much higher than the cost of acquiring such systems.

Results

Based on a theoretical definition of cost-based pricing, different situations may arise in a manufacturing undertaking where one of the cost pricing methods is better than the other two methods. In this part of the paper we will define certain pricing cases with the choice of a specific method and also with a description of the procedure for manufacturing companies X, Y and Z.

Manufacturing company X is a legal entity which pays income tax. The company also pays a certain percentage to the reserve fund from net profit. To put the products into production, the company must take out a loan with a certain annual repayment of principal. The company must know the amount of its fixed costs related to the realization of production and also knows the variable costs per product. Likewise, the company must be able to estimate the production volume of the product as well as the standard calculation items that are reflected in the product, such as direct material, direct wages and production overheads. The basic financial objective of the company is to repay the loan, so it is clear that it **will use the profit margin for pricing.** The business process can be divided into several steps:

- the enterprise must determine the allocation base for fixed costs, which is usually direct wages. Direct wages per piece are multiplied by the number of products and the amount is divided by fixed costs and thus gets a fixed cost coefficient. An enterprise achieves fixed cost per product by multiplying direct wages per product by a fixed cost coefficient.
- the next step is to determine the net profit containing the levy on the reserve fund by a simple formula where the net profit is divided by the difference (1 - reserve coefficient). As the enterprise is a taxable person, gross profit is calculated by the enterprise as a proportion of the net profit including the levy on the reserve fund and the difference (1 - income tax coefficient).
- it is necessary to quantify the total costs of the enterprise by adding together the variable costs of the total production volume and the fixed costs of the total production volume.
- the profit margin is calculated by the enterprise as a ratio of gross profit to total costs.
- gross profit per product is earned by the company as a multiple of total costs and profit margin.
- the last step is to calculate the selling price by adding the total cost of the product and the gross profit of that product.

Manufacturing company Y has invested a certain amount of money in new technologies and expects to return this invested capital over a period of time, ie a return on the invested capital will be a percentage. The company knows the volume of product sales and also estimates its own costs per product. On the basis that the company expects to return the invested capital, **pricing using return on investment** will be used to determine the selling price. The business should take the following steps:

- the percentage of return on investment must be multiplied by the amount of the investment.
- the next step is to divide this multiple by the planned sales volume and, to obtain the selling price of the product, the company adds the estimated total cost of the product. The requirement of return will be met if an undertaking sells products at the desired sales volume for this sale price.

Manufacturing company Z achieved a certain amount of sales and total production costs last year. The company wants to produce a new product, while applying production overhead and administrative overhead at a certain amount. Direct costs such as material, wages and other per product are known to the enterprise. To determine the selling price of a new product that must meet the return on sales criteria, an enterprise uses **pricing using a price margin** as follows:

- the enterprise first calculates the total cost of the product by adding the direct costs, production overhead and administrative overhead. Subsequently, the company calculated gross profit as the difference between total sales and total costs.
- the company will calculate the price margin as a ratio of gross profit to revenues.
- finally, the enterprise calculates the selling price of the product at which the product should be sold in order to meet the return on sales criteria, as a proportion of total costs and difference (1 - price margin).

From these cases, the procedure and the criteria which must be known to the undertaking for determining the market price of the product are evident. In practice, a large number of other cases may arise, but the essence of choosing the appropriate cost-based pricing method remains the same.

Conclusion

Price decision-making, pricing strategy and pricing processes are time-consuming, costly, and labor-intensive and require some experience in this area. The constantly changing market environment and the pressure of competition are factors that constantly increase the importance and substance of pricing. Also, the fact that price is mostly a decisive factor, whether for the buyer or the seller in the exchange process, is an important incentive for businesses to pay enough attention to pricing.

Several general pricing methods are known, and one of them is cost-based. Costs are an integral part of all manufacturing companies and their minimization is a matter of course for them. Cost-based pricing in the manufacturing company can be done using a profit margin, a price margin or a return on investment. Based on the results of this work, it can be argued that a manufacturing company must be well informed about its objectives, market conditions and often its previous output so that it can be sure of the right choice of pricing method.

The results of this work show that the manufacturing company will use cost-based pricing using a profit margin if it knows the full amount of its costs, can estimate the future production volume of the product being introduced and has the financial objective of covering new product into production. Cost-based pricing using a price margin will be used by the manufacturing company when it knows the costs and revenues of the previous period and can determine variable costs and overheads per unit of production of the new product. A manufacturing company will use cost pricing using a return on investment if it wants to return its invested capital over time and knows the total cost of the previous period and can determine the variable cost per unit of production of the product being introduced.

Abstract

Successful digital business transformation requires the right approach to building business architecture. The article describes an approach in which, based on the identification of the main stakeholders and drivers of the digital transformation of Russian business, a model of motivational expansion is built. This, in turn, allows developing a methodology for the formation of digital architecture from the level of enterprises to the state level. As a methodological basis of the research, a combination of an architectural and service-oriented approach at various levels is applied. The article provides examples of digital architecture at the enterprise level and its distribution to the level of industries and regions as an architecture of the digital business space.

Keywords: Digital Transformation, Enterprise Architecture, Digital Space Architecture, Motivational Expansion

Introduction

Digital transformation is a process that businesses around the world need to adapt to the new conditions and preferences of the digital economy society. The main driver of changes is the consumer. Digital transformation is a process of business change that provides a set of transformations through the introduction of an innovative culture in the company, adaptation of business models, widespread use of data, customer-centricity and value management (Gimpel and Röglinger, 2015). Customer-centricity, partnership, data use, search and implementation of innovations can be considered as the key directions of digital transformation (De la Boutetière et al., 2018). Business needs all the tools and the ability to adapt to the rapidly changing culture of consumption and communications. The product now is a complete process of interaction with the client, in connection with which it is necessary to study, analyze and manage customer experience in order to use it as a platform for the growth and creation of new products and services. Digital transformation is based on the principle of developing infrastructure as a platform or an entire ecosystem of a company. An important component in this concept is the principle of an open API and flexible integration. Digital partnership is becoming one of the important factors of scaling. The key to successful business transformation is the correct formation of the company's structure, the selection of personnel with the necessary qualifications and motivation, the selection of the right

approach to conducting business and management methodology. Accordingly, it is required to build a digital architecture relevant to the tasks.

A set of social and socio-technical arrangements, activities for the organization and management of digital processes, technological environment (including digital infrastructure, digital platforms), digital processes, digital data, etc. forms a digital space (De Smet et al., 2018). The pace of change in different spheres of life directly depends on the quality of digital transformation, including the degree of use of data flows (digital processes). The density of connections and relationships in the social world has significantly increased due to the use of technology and information and communication technologies, and will continue to grow to new structural changes that are being shaped in socio-technical systems: digital infrastructures, digital platforms, data warehouses (information or digital data), virtual worlds, etc. The formation of digital space must begin at the enterprise level and extend further to the level of the industry, region, etc. for inclusion in large-scale global digital transformation processes. At the same time, regional and industry strategies should be consistent with transformation strategies in the breakthrough sphere.

One of the main principles of digital modernization is the use of an architectural approach to the description of processes, the introduction of a digital architecture management system from strategic planning and risk planning to project planning, maintenance of project management at all levels with personalization of responsibility in all areas (Bharadwaj et al., 2013).

In order to develop the architecture of the digital space of Russian business, a study was conducted, during which the main drivers of the digital transformation of Russian business were identified. On this basis, the model of motivational expansion is constructed (Fig.1).

Fig.1: A model of motivational expansion of the Russian business system in the transition to a digital economy.

Further research is devoted to the development of a methodology for the formation of digital architecture from the level of enterprises to the level of industries and regions.

Methodology

The methodological base of research includes:

1. Enterprise architecture as an integrated approach to integrating heterogeneous elements (business processes, functional structure, organizational structure, information systems and technologies, digital technologies, manufacturing technologies, assets) into an effective business system (Ilin et al., 2017; Lankhorst, 2004).
2. Service-oriented approach as a means of harmonizing (aligning) the requirements and capabilities of business and IT elements of a single system (Papazoglou and Van Den Heuvel, 2007).

The research methodology for the purpose of constructing a digital transformation methodology should be considered by levels:

1. Level of enterprise
   1.1 Formation of business process models and architecture of IT support for enterprises.
   1.2 Identification of digital technology capabilities and the formation of digital services architecture.
   1.3 Formation of approaches to the implementation of digital technologies (based on the concept of ERP3).
   1.4 The introduction of digital technology in enterprises.
2. Industry level
   2.1. Development of reference (replicated) industry models of digital architecture.
   2.2. Identify end-to-end digital technologies for industries.
   2.3. The formation of the architecture of the industrial digital environment.
3. Region level
   3.1. Integration of regional and corporate technologies.
   3.2. The formation of the architecture of the regional digital environment.

Principles of the formation of digital space architecture:

1. interaction of subjects at the selected levels;
2. a single information space.

Results

The study showed that the main stakeholders of digital transformation in Russia are the state, the market as an institutional environment, sectors of the economy, legal entities and private entrepreneurs. These stakeholders are interested in the stable growth of the national economy, in the general improvement of the quality of services and manufactured products, in the competitiveness of national products and services in the global market, in the formation of a single information space accessible to all participants in the business environment (Ilin and Grigoreva, 2017, Lukyanov et al., 2019). The main drivers for using digitalization technologies are economic changes, cost reduction while increasing profits, and establishing a stable business.

On this basis, a methodology for the formation of digital architecture from the level of enterprises to the level of industries and regions (up to the state level) has been developed. At each level, the key interests of key participants are taken into account.

For instance, for the health care organization, the organization's management, line ministry, suppliers of medical equipment and medicines, insurance companies are identified as the main stakeholders of digitalization. The main drivers of digitalization for healthcare organizations are an aging population and changes in the nature of morbidity (with a tendency for chronic diseases to prevail), the increasing cost of providing medical services, and the use of new technologies. This analysis shows that a change in the architecture of the medical organization is required to increase the efficiency of

its work with a constant increase in the quality of medical care. The solution is the Smart Hospital model, implemented on the basis of the Health 4.0 concept combined with the medical principles of P4 (Hood, 2013).

This model enables predictive, preventive, personalized and participatory delivery of health services. Also, the implementation of the model requires the expansion of the competencies of medical and administrative personnel. Implementation of Smart Hospital architecture allows to automate activities, move to client-centric criteria for effectiveness, and strengthen the organization's market position. Thus, at the enterprise level, models of architecture and IT architecture of a medical organization that implements the concept of Smart Hospital were developed and the procedure for transforming the architecture of a medical organization during the transition to the concept of Smart Health was determined. Based on this, a reference model of the business processes of a medical organization has been developed at the industry level. At the regional level:

- a reference model of the business processes of a geographically distributed medical organization has been developed;
- requirements for digital technology services to support the management of geographically distributed medical organizations have been defined;
- an architecture for telemedicine services based on the Internet of Things technology has been developed.

For the field of maritime logistics at the enterprise level:

- a business model of the global shipping container line in the context of digital transformation has been developed;
- a method for analyzing the impact of digital transformation on key resources and key capabilities of the global shipping container line has been adapted;
- a strategic architectural alignment method has been adapted to harmonize business and IT architecture global shipping container line;
- a method of forming a balanced scorecard to evaluate the effectiveness of the digital transformation of the global shipping container line, taking into account the specifics of the industry, was developed.

Important in this business model are the use of paperless electronic document management, Internet of things technology (Golosovskaya et al., 2019, Maydanova and Ilin, 2018, Popova et al., 2019). Based on this, a reference model of the digital architecture of the global shipping container line has been developed at the industry level.

For the housing and communal sector and urban infrastructure at the enterprise level:

- the requirements of resource-supplying organizations and consumers of resource-supplying organizations for a monitoring, control and management system for the distribution and consumption of energy resources were analyzed,
- software and hardware complexes for monitoring and managing housing and communal services objects were introduced and integrated.

For example, for the purposes of managing the urban transport system, the city authorities, the population, the business community, emergency services, and law enforcement agencies are defined as stakeholders. The main objectives of the management are information, efficient and safe use of road infrastructure, fast and high-quality feedback. Data collection is carried out from cameras, detectors, GPS / GLONASS devices. Data transfer to the intelligent system is also carried out using mobile phones, TV/radio, information screens. Intelligent transport system processes the data and transfers the results to the control center of the urban transport system. In this architecture, the Internet of things technology, service-oriented architecture (SOA) is widely used. Business models in the housing and communal sector are focused on the use of energy efficiency principles. For example, a business model was developed using piezoelectric materials to illuminate urban spaces.

The stakeholders in this business model are municipal authorities, transport companies, population, and production enterprises (Kalyazina and Lepekhin, 2018). Similar business models can be used for other alternative renewable energy sources. There are projects of an automated resource accounting system in homes; on the development of infrastructure for electric vehicles; on the implementation of a hardware-software complex for monitoring and managing resource supply, which allows for weather regulation of the supply of thermal energy, monitoring of overflows / underflows, prompt reporting of operational failures in resource supply networks; on equipping streetlights with radio-controlled relays to save energy when street lighting (Kalyazina et al., 2018). In general, such solutions are focused on the application of the Smart City concept, the main stakeholders of which are the population, government, and business. Based on this, at the industry level:

- a business model for the interaction of housing and communal services market participants has been developed;
- the possibilities of development and implementation of housing and communal services solutions using digital technologies (the Internet of things, machine learning and predictive analytics, big data processing, cloud computing) were identified;
- the architecture of digital services in the field of monitoring, control, and management of distribution and consumption of energy resources using the concept of the Digital Twin has been developed and approaches to its implementation in enterprises have been identified;
- a typical industry solution (software and hardware complex) for monitoring and management of housing and communal services has been developed;
- a promotion plan and an approach to integrating the developed solution into the existing IT architecture of enterprises has been developed.

Conclusion

Identification of stakeholder expectations from digital transformation and the main drivers of the development of Russian business enterprises allows formulating an approach to the formation of digital architecture of enterprises, which allows extending the digital architecture to the level of the industry, region, up to the state level. Such a single directed approach allows shaping the architecture of the digital space of Russian business according to predefined principles, methodology, taking into account the interests of all stakeholders. As a result, an effective digital transformation will provide a timely and adequate response to the challenges of the economy and consumers.

Abstract

The article considers the methodology of developing a top-level business processes reference model for the construction of architectural solutions in hospitality industry. In this paper, the authors identify basic stages in the development of business architecture for hospitality enterprises and define the main differences between business functions and business processes. Classification of basic, managing and supporting business processes is also given. As a result of the research, the reference business processes model of top level digitalization is developed. Development of a top-level business processes reference model allows to construct an optimal architectural solution that will create new opportunities for hospitality industry enterprises in the era of digitalization, when the increase of manageability, monitoring of performance indicators and security control will allow to move to predictive models and proactive (program-target) management of accommodation facilities.

Keywords: Top-Level Business Processes, Basic Business Processes, Supporting Business Processes, Managing Business Processes, Reference Model, Business Architecture, Architectural Solution, Business Process Modeling, Accommodation, Hospitality Industry, Hotel Business, Hotel Chains.

Introduction

Currently, the process of digital transformation has a significant impact on almost all sectors of the economy, but the hospitality industry in the Russian Federation has been undergoing dramatic changes since 2014. The main catalyst for the support of hotel business in Russia remains the placement of rooms in the cross-country areas. According to official data, almost 70 percent of industry is taken over by hotels in two Federal cities - Moscow and St. Petersburg.

Enterprises of the hospitality industry in the Russian Federation continue to be in a rather difficult situation. According to official data, Russia continues to lag behind its European partners in terms of overall number of rooms per capita. However, most managers of the hospitality industry also noted the low level of customer demand. The result of low consumption is a sharp reduction in costs for hotels and, as a consequence, the deterioration of the services quality.

Competition in the hospitality market remains very high. External growth reserves are almost exhausted, special attention is paid to the optimization of companies own resources. In addition, the cost of hotel product continues to be an important factor for end users.

In these conditions, successful companies are the most effective in their business processes, in accordance with which, the main emphasis of the companies development is digitalization and even greater focus on consumers.

Methodology

Effective management of business processes is impossible without the construction of process architecture, which is associated with construction of business architecture for the company as a whole. The main stages of business architecture development within hospitality industry are shown in figure 1.

Figure 1: Main stages of business architecture development within hospitality industry enterprises

The consumer value chain of each major hospitality company is implemented through the performance of its functions by individual structural units. Building a function-oriented model of the organizational structure is a fundamental element for designing the business architecture of the company . At the same time, according to figure 1, the next important step in the business architecture development is to build a model of business processes.

At the initial stage of building a reference model, it is necessary to present the definition of business processes. Since the construction of a business process model is the stage following the development of a functional model, it is advisable to focus on identifying the differences between business functions and business processes.

Figure 2: Main differences between business functions and business processes

Business process is the cumulative sequence of actions to convert the resources received at the input into the final product that has value for the consumer at the output.

The consumer can be both external and internal in relation to the company. At the same time, external consumer is not part of the network company, and the internal consumer is inside the company [6]. In addition, it is important to know the consumer of the business process because it is he, who explicitly or implicitly sets the requirements for the process and, therefore, can have an impact even on the very existence of a particular process.

When considering business processes, it is necessary to take into account the levels of detalization. Thus, at the initial construction stage it is essential to select top-level business processes.

Top-level business processes should be understood as key or most important business processes for the organization, which perform the target functions of the company and determine their structure [4].

Building a top-level model is a tool for analyzing the company's activities used to form a system of processes. The top level business processes model is necessary, first of all, for reasonable formation of structure of process categories and groups in system of processes at the hospitality enterprises.

There are different classifications of business processes. Classification of business processes helps to determine how to distinguish a particular process from their total mass.

As a rule, the basic processes are based on the result that is valuable for the consumers. Supporting processes are allocated by the resource that they supply to the company, and control processes - by the object over which the control action is carried out.

While studying business processes of hospitality enterprises, the authors define a key feature that determines the belonging of specific business processes to a certain type, as which the directed action of each business process in creating consumer value is taken. At the same time, the flow of consumer value creation should be understood as a set of all actions to transform resources and information into an end product for the consumer. It should be noted that the value stream is better represented graphically — in the form of business processes map.

According to this, basic business processes are the processes that directly create customer value, constitute the core business of the company and create the main revenue stream.

Managing business processes include processes that increase customer value, which cover the entire range of management functions at the level of each business process and the business system as a whole.

Supporting business processes are designed to provide basic and managing business processes and are focused on supporting their universal features.

Let us consider each separate type of business processes of the top-level hospitality enterprises in more detail.

The basic top-level processes of the hospitality enterprises are presented in figure 3.

Figure 3: Basic top-level processes of hospitality industry enterprises

The processes presented in figure 3 are referred to as the basicones, since they create the consumer value of the hospitality industry enterprises. Let us consider them in more detail.

Reception and accommodation. The technological cycle of service implies a process that covers the period of time from the moment when a potential consumer contacts the hotel by phone or otherwise, to the payment bill and the checkout. The process of guest service in hotels of all categories has the following stages:

- Preliminary hotel booking (reservation);
- Reception, check-in and accommodation;
- Providing accommodation and food services;
- Providing additional services to residents;
- Final payment and check-out.

One of the most important services in the hotel is to book a room, as it allows you to guarantee the accomodation in advance and stay in a particular hotel. When booking a room, the first impression of staff and the hotel as a whole is shaped. As an example, let us consider the "Booking" business process in more detail.

Elements of "Booking" include:

- "input" - booking request, customer data, date of arrival, length of stay, availability, additional data, means of payment;

- "output" - mark in the booking log, booked room, confirmation letter to the client, booking report, payment for the room or a refusal to book;
- "control" - journal of booking, booking manual;
- "mechanism" - staff, office equipment (computer, telephone, MFP), software and Internet.

Business processes modeling of hotel reservation allows to:

- determine what enters the service at the "input", which is important for a detailed understanding of the process;
- what functions and in what order one's are performed within the department responsible for this process or sub-process;
- what is the executor guided by when performing each process;
- identify the resources that are required to implement certain operations and analyze their availability and quantity;
- what is the result of the service (output).

In accordance with the established rules of hotel services, hotels must provide round-the-clock check-ins and check-outs. To make the stay comfortable for a client, hotels, in addition to offering rooms, must provide a certain amount of additional services according to its category, specialization, size, etc. Regardless of the functional characteristics, any hotel should set a main goal which is to bring the living conditions of the client to home ones during the entire stay of guests, to create conditions for effective work, recreation, entertainment. High level hotels require a business center, service bureau, spa-center, car hire, etc. Additional services are also important in ensuring the income of hotels. The share of income from the offer of additional services can reach 30%.

Logistics. Logistics or the organization of supply of the enterprise with products and expendables for production of dishes, goods for resale (alcohol, drinks, etc.), expendables for rendering services to guests and ensuring economic activity is the most important business process. This is explained by its costly nature. Therefore, the strictest formalization and control are extremely necessary in the process of managing this unit. When purchasing food, the hotels follow the laws of the country regulating this sphere of activity, internal rules and methods (for example, contracts concluded with suppliers, production technology used in this enterprise, service methods, etc.), norms of ethics, aesthetics and psychology, which are of particular importance in the subsequent stages, current orders and orders of the management (hotels and catering services).

Studies show that a 3% reduction in logistics costs results in a 1-2% increase in return on sales. This is achieved by a clear organization of a single process of raw materials movement from the supplier to the end user (guest), the purpose of which is to minimize costs for the purchase, transportation, storage of products and accelerate the turnover of capital by minimizing stored reserves. This solves the following problems:

- development and implementation of a common procurement policy and strategy;
- development and implementation of search methods, selection methods and evaluation methods of supplier, methods of contractual work;
- creation and strict observance of the uniform cycle of the organization of deliveries and movement of production in the enterprise on points of production and sales;
- formation of reports on logistics processes, including the balanced scorecard;
- control of movement, safety and correct consumption of products within the enterprise at the points of production and sales.

Since the specifics of hospitality enterprises is that suppliers usually deliver products by their own vehicles, it is not advisable to consider the transport part of logistics in the main business processes. In any case, the management company performs delivery for individual restaurants in a chain, so it would be more correct to consider only two areas of logistics. The first is purchasing, the second is storage and movement of the purchased goods within the enterprise.

Marketing. Marketing in the hotel business is often identified with the sale and advertising of hotel services. In fact, sales and advertising are the only components of "marketing mix", and often are not

the most important. Advertising and sales are part of the policy of promoting goods and services to the market. There are other elements of marketing — the product itself, its price and distribution. Marketing also includes comprehensive research, information systems, planning and strategies. Development involves designing innovations that can provide new opportunities for sales. Such innovations should meet the needs and preferences of potential customers.

Monitoring involves the analysis of the results of activities to promote services to the market and checking whether these results reflect a truly full and successful use of existing opportunities in the tourism sector.

However, marketing expands its functions, placing special emphasis on relationships with consumers. Long-term relationships with customers are much cheaper than the marketing costs required to increase the interest of the new consumer to the hotel services.

Production and sales of products and services. Food service in hotels is an important structural subdivision in the formation of the main product of hospitality - the provision of food services and a number of additional services, which are determined by the functional type of catering establishments. The enterprises of restaurant economy in structure of hotel complexes public, however are obliged to serve first of all clients of hotel. In specialized accommodation facilities - boarding houses, hotels, clubs, hotels with treatment and other - services are provided only to guests of the institution. In the structure of hotel complexes the functional organization of food services is solved taking into account the category of accommodation.

In modern conditions, the management of the hotel company must be simple and flexible to be competitive. It should have the following characteristics:

- a small number of control levels;
- small units staffed by qualified personnel;
- production and organization of work based on the principles of effective communication.

Strategic management of the hospitality industry includes the following:

- development of a strategy consistent with marketing strategies and analysis of the tourism market;
- identification of economic factors affecting the efficiency and completeness of the hotel management implementation;
- preparation of the budget plan and pricing policy; long-term and short-term planning of the structural units of the hotel;
- assessment of risks associated with the hotel business;
- planning of loading the number of rooms, seats at catering establishments, animation and health centers and vehicles.

Top-level management processes of the hospitality industry are shown in figure 4.

Figure 4: Top-level management processes of hospitality enterprises

Supporting technological processes provide the conditions necessary for the implementation of the main processes: staffing, financial and accounting, security, control of technological and aesthetic condition of equipment and premises, their maintenance and repair. Supporting processes of top-level enterprises of the hospitality industry are shown in figure 5.

Figure 5: Supporting top-level processes of hospitality industry enterprises

Supporting processes are associated with the operation of equipment and premises (cleaning, cleaning), storage and movement of raw materials, semi-finished products, finished products. They are held in the hotel warehouse, transport, engineering and technical services. Service processes also include social services provided to employees in the enterprise.

Supporting and servicing technological processes can be performed by other specialized enterprises, for which these processes are the main ones. Specialization leads to better service. The organization of such technology is beneficial for small businesses. However, the hotel supporting and servicing processes are provided by their own services (own Laundry, maid service, catering service, tourist information Agency, etc.).

Results

Consistent consideration of basic, managing and supporting business processes, as well as the identification of their relationships, allowed to build a reference model of top-level business processes, presented in figure 6, which is a necessary condition for the development of architectural solutions for the hospitality industry.

Figure 6: Reference model of top-level business processes of the hospitality enterprises

The developed reference model of top-level business processes will allow to develop an optimal architectural solution that will create new opportunities for the hospitality industry enterprises in the era of digitalization, when the increase of manageability, monitoring of performance indicators and safety control will allow to move to predictive models and proactive (program-target) management of accommodation facilities.

Conclusion

Further modeling of basic, managing, and supporting business processes of enterprises of the hospitality industry on the basis of a reference business model, the upper level will allow optimizing the information with respect to the data describing the current or future (forecast) state of business processes and analysis and presentation of data in the form required to solve strategic and tactical challenges facing the hospitality industry. Underestimating business processes, hotels lose not only

the opportunity to improve the quality of service, but also the ability to respond to customer criticisms. By noticing only individual "details" indicated by the guests and focusing on them, it is not possible to see the full picture until the entire business process associated with this detail has been carefully worked out and modeled.

The described processes are examined for the presence of empty points (when the staff does not know how to act with guests), critical points (when conflicts with guests occur most often) and points of inactivity (when the process begins to move in a vicious circle). After these points are identified, the processes are improved and put into practice (internal trainings, work standards).

The conducted research will provide an opportunity to gain a competitive advantage, reduce financial and commercial risks of business activity, to determine the attitude of customers to the provided service, to assess strategic and tactical activities of the hotel, improve the effectiveness of communication markets, to determine the optimal segment positioning processes and the nature of their life cycle.

Abstract

This article considers the methodology for development of data architecture of the interface for interaction with suppliers on the basis of DMS modeling at chain trading companies. The study identifies basic business processes of chain retailing companies, examines the typical structure of business processes within the interface of interaction with suppliers at chain trading companies, and classifies the main documents. Based on the analysis of sub-processes, the authors consider the main stages of data architecture development, classification of the main documents used in the "Purchase" business process, as well as entities and tools for data architecture formation. The conducted research allowed the authors to model the top-level document management system that reflects an external, internal, and supporting document flow at chain companies, and also serves as a basis for development of data architecture of interface for interaction between chain trading companies and suppliers.

Keywords: Document Management, Electronic Data Interchange, Data Architecture, Data Modeling, Entity-Relationship, Business Process, Model Of Document Management, Document Management System, Purchase, Retail, FMCG Segment, Retailing Trade.

Introduction

In the present day conditions with the intensive development of chain retailing trade, the retailers who keep on working effectively are those, whose assortment relies on maximum demand satisfaction through complementary products and partner services. Nevertheless, even in the conditions of relative economic stability in the retail market, external reserves for growth of chain companies within FMCG segment are gradually working themselves out. In this situation, the management of chain companies begins to pay special attention to the search of internal growth reserves. In the conditions of retailing trade digitalization, document management optimization at chain companies within FMCG-segment should be observed as one of those reserves [1].

Particularly important is the improvement of document management system in terms of business processes optimization, since even minor changes in business processes (basic, managing and/or supporting) entail an inevitable change in the company's document flow. In its turn, this creates new requirements for data architecture of a chain company in FMCG segment. Thus, it is advisable to carry out the development of data architecture based on the modeling of basic business processes.

Methodology

As a rule, there are four basic business processes identified in FMCG chain retailing companies [3]:

- A1 Purchase;
- A2 Logistics;
- A3 Marketing;
- A4 Sales.

The interface for interaction with suppliers of chain trading companies includes the "Purchase" business process.

The typical structure of the "Purchase" business process at chain FMCG companies is shown in figure 1.

Figure 1: Typical structure of the "Purchase" business process in the interface of interaction between chain companies and suppliers

Document flow between suppliers and chain companies is one of the areas of external document flow. Cooperation between the parties concerned begins with the conclusion of a contract. At this stage, in the transition from paper to electronic form of interaction, there is a significant reduction in time, and as a consequence, financial costs of network companies [2]. It is worth mentioning that the introduction of electronic document management solves such typical problems of chain trading companies, as technical errors in multiple data entry, time spent on approval, loss of documents when signing the paper version of the document, etc.

At the first stage of the "Purchase" business process price forecasts for the period are prepared. In order to be efficient, it is necessary to analyze prices at all channels of distribution - direct producers, distributors, competitors, etc., due to the fact that only after understanding the producer's pricing, it is possible to estimate objectivity of prices and to define strategy of negotiations with potential suppliers [5].

In order to organize the purchase process effectively, it is necessary to develop and agree on a delivery schedule with regular suppliers. Delivery schedules require compliance with the supply discipline, allow to minimize inventory and, as a result, reduce the cost of procurement logistics.

At the second stage of the "Purchase" business process, the selection of potential FMCG suppliers is carried out. The right choice of supplier is vitally important not only for the price, but also for the stability of supply, provision of guarantees of delivery in accordance with the order, service, promotion and other aspects. Interaction with suppliers normally begins on the portals of chain companies [7]. In order to participate in the selection, the manufacturer must register in the information system of the chain on the website, get a link to one's personal account, enter the data concerning all manufactured goods and, then place a commercial offer. The commercial offer is verified, the goods get into the tender table and are ranked by the system. The top lines of the table go for those goods that have the best indicators for sales forecast, marginality, compliance with quality criteria (based on data provided by Roskachestvo), etc. The tender table is constantly updated [4]. In case of successful participation of potential suppliers in the competitive selection, the conclusion of the contract becomes a next stage of the "Purchase" business process.

Conditions of cooperation, assortment and promotion programs are thoroughly worked out with each supplier and/or manufacturer during the negotiation campaign. One of the most important contract sections is the terms of payment, including prepayment, partial prepayment, deferred payment, and goods delivery for sale. Together with suppliers, a balanced assortment structure is built. The data on sales in different regions of a chain company are taken as a basis, and consequently the assortment is fine-tuned for each network depending on the region, format, positioning and consumer needs.

The next important stage of the "Purchase" business process is the operational management of supplies, which are carried out, as a rule, in the distribution centers of a chain, directly supplying goods to retail outlets. At the same stage, claim settlement and return of goods are carried out [8]. Contract is a matter of great importance because the company will be able to recover claims for non-performance of the contract only if it is officially recognized as a legally competent one.

In the digital transformation context, implementation of the "Purchase" business process becomes impossible without modern information technologies. Electronic data interchange is wide spread in terms of interaction between network companies and suppliers of goods. Currently, most of the FMCG chain retailing companies are already actively operating with the electronic data interchange system (EDI), and in the recent years the number of their partners connected to this system is steadily increasing. Connection of partners, systems integration, transformation and transmission of messages between partners is carried out by specialized companies - EDI providers.

The final stage of the "Purchase" business process is the evaluation of suppliers, including the analysis of supply regularity, quality assessment, and, as a result, clarification of the criteria for the selection of FMCG suppliers [9]. In order to expand the base of potential suppliers and increase

competition between them, it is necessary to conduct regular market research of manufacturers and distributors.

It is worth mentioning that these studies are based on the analysis of big data, omnichannel characteristics, digitalization of internal processes and building a supply chain in order to meet customer needs as quickly as possible.

Classification of basic documents used in the "Purchase" business process is shown in figure 2.

Figure 2 - Classification of basic documents used within the interface for interaction between chain trading companies and suppliers

It should be noted that the DMS of network trading companies within the "Purchase" business process depends on the location of distribution centers that handle incoming goods and their redistribution for shipment to individual retail outlets in the structure of chain trading companies [6].

At present day the following options are available for distribution centers:

- Distribution center may be the part of the organizational structure of a chain trading company along with the retail outlets.
- Distribution center can be the part of a holding company or a large retailing chain that unites several legal entities. That is, on the one hand, it serves only participants of one holding, but on

the other - the center and the retail points of sales served by it (supermarkets and stores, etc.) are interconnected, but separate legal entities. Therefore, the movement of goods between them actually implies not an internal movement, but the transfer of ownership from one organization to another.

- Distribution center may be owned by a third-party company, most often a logistics company. In this case, we can talk about 3PL (Third Party Logistics) services, that is, the provision of a specialized logistics company to various trade organizations of a certain set of logistics services: order management, delivery of goods from a supplier to a distribution center of the logistics company, cargo handling, storage and shipment to customers.

Depending on the affiliation of the chain company's distribution centers, the list of documents and the direction of their flow in the general document management system can vary significantly.

Thus, the combined influence of all external and internal factors that have a significant impact on the document management system, leads to the need for the formation of data architecture of the chain FMCG company [10].

Let us consider the main stages of data architecture development for the interface of interaction with suppliers. Based on the analysis of the sub-processes of the "Purchase" process, it is possible to create data architecture that reflects the model of information interchange in accordance with the implemented business processes.

Before proceeding to the formation of data architecture, it is necessary to find out what requirements and limitations are imposed on the data that provides information support for the business process in question, ans what is the source of data that supports this process. To identify the requirements, it is necessary to conduct structured interviews with the owners of the process and with the employees directly involved in the process implementation [3].

A detailed analysis of sub-processes showed that data accompanying the process can be divided into three categories:

- data obtained from transactional system (e.g. supplier data, product data, etc.);
- data generated on the basis of transaction, for example, data on the purchase - the volume of purchase, the price at which the purchase of goods was carried out, etc.
- data obtained from external sources: from social networks or from external databases, for example, supplier data for supplier market analysis.

The first and second types of selected data are formed as a result of the transactional system operation. On the basis of these data, the functionality of transactional system allows to generate the required reporting, which is the documents support of sub-processes. Table 1 shows an example of the interconnection between reporting documents and data types.

Table 1: Interconnection between reporting documents and data types.

Reporting	Type of data		
	Suppliers data	Product data	Purchase data
Report on the results of suppliers market analysis	+		
Product card		+	
Consignment note	+	+	+
Commercial invoice	+	+	+
Contract between organization and supplier	+	+	+
Goods delivery schedule for period	+	+	+
Plan of obligations to suppliers for period	+	+	+

In the presented list there are stages of almost all subprocesses of the "Purchase" process: planning of purchases; choice of suppliers; conclusion of a contract with supplier; operational management of goods deliveries.

The second and third types of data are used for loading into BI app in order to form various analytics, including: calculation of goods requirement for period; scheduling deliveries of goods to the company; market analysis of suppliers; analysis of supply regularity by a supplier [4].

Therefore, the data supporting all subprocesses must be accumulated in a single transactional system. In case of using different transactional systems, data integration between these systems is required. Another important aspect is the ability to load data from transactional systems and external sources into a BI app.

Based on the information above, we can formulate the following general requirements for data architecture:

- possibility of automatic information processing accompanying all subprocesses;
- the need to take into account situations where one purchase from the supplier is followed by another purchases of goods in accordance with a certain nomenclature, i.e., more than one type of goods
- a single data format used to implement all subprocesses;
- data integrity, data consistency;
- ability to generate reports, for example, delivery schedule for period, contract with supplier of goods, etc.
- possibility of integration with BI app that allows to carry out analytics on various aspects (analysis of the suppliers market, analysis of deliveries regularity by the supplier, ability to download data from external sources).

Figure 3 shows the top level FMCG data architecture of the "Purchase" business process.

Figure 3- Data architecture of the interface for interaction with suppliers (information systems).

Let us consider in more detail data architecture of the transactional accounting system for purchases/returns of goods. Detailing the architecture at the next level involves creating a data model for the transactional system.

To design data models of a transactional system, the most commonly used method is entity-relationship modeling (ER-modeling) with such concepts as: entities, their relationships and attributes to describe the properties of entities and their interconnections [6].

During the analysis of the subject area, as well as the formulated requirements and limitations, the following entities were identified: product; supplier; manager; business region.

The following connection is defined between the entities:

- Chain company initiates a trade operation (purchase or return of goods). The Company can make many purchases or returns, but each purchase/return can only be initiated by the Company. The Company has many suppliers who provide it with goods in accordance with the contract. "One-to-many" connection.
- The fact of trade operation (purchase/return) contains the item. One item can be reflected in multiple trade transactions, and a single trade transaction that is reflected in a transaction system can contain many items. "Many-to-many" connection.
- Purchase or return is carried out from the warehouse or to the warehouse. One warehouse can ship goods for many trade operations, but each trade operation accounts for one warehouse in the system. "Many-to-one" connection.
- Supplier operates in a specific business region, but a single business region can be the place for many suppliers. "Many-to-one" connection.
- The supplier is serviced only by the manager who is attached to one. At the same time, one manager may work with more than one Supplier. "Many-to-one" connection.
- The Manager works only in one department of the Company, while many managers work in one Department of the Company. "Many-to-one" connection.

  As an example, table 2 provides a list of primary entities and their attributes.

Table 2: Entities and attributes of the interface for interaction with suppliers

Entity	Description	Attribute	Attribute name in the model
Goods	Item that is ordered from the Supplier or returned to the Supplier's warehouse	Product_ID	Product_ID
		NameDepartment	NameProduct
		VendorCode	VendorCode
		NameClass	NameClass
		NameCountry	NameCountry
Supplier	Partner of the organization supplying the goods	ID_SP	ID_SP
		NameDepartment	NameSP
		NameSP	NameSP
		Address	Address
		Phone	Phone
		MobilePhone	MobilePhone
		INN	INN
		BankAccount	BankAccount
		SupplierReliability	SupplierReliability
		AdditionalInformation	AdditionalInformation
NameSP	Business region in which the supplier operates	Business region_ID (PK)	Region_ID (PK)
		Name of region	Name_Region
Manager	Manager of the company that serves the partner and works in the organization	Code of manager_ID (PK)	Manager_ID (PK)
		Surname of manager	SurnameManager
		First name of manager	FirstnameManager
		Last name of manager	LastnameManager
		Department (FK)	Department_ID
Department_ID	Department in which the purchase is carried out and managers work	Department_ID	Department_ID
		Name of department	NameDepartment
Trading operation	The fact of purchase (return) of goods,	ID_Fact	ID_Fact
		Product code	Product_ID

Entity	Description	Attribute	Attribute name in the model
	characterized by quantitative indicators of trading activity of a chain company	ID_SP	ID_SP
		Arrival	Arrival
		Date of first contract	DateContractFirst
		Contract life completion date	DateContractEnd
		Manager_ID	Manager_ID
		Quantity of contract	QuantityContract
		Price	Price
		Quantity	Quantity
		Date of fact	DateFact

If you include the trade entity as shown in table 2 in the logical data model, one of the data integrity rules is violated: there will be problems with adding, deleting, and editing data. This is explained by the fact that the entity "Trading operation" (purchase/return) is not reduced to the second standard form. In this situation, you want to decompose the entity into two entities, for example "Purchases" and "Fact".

The "Product" entity is characterized by such attributes as "Classifier" and "Country". In order to avoid problems with adding and deleting data, it is proposed to allocate two additional entities (guides) in the logical data model - "Classifier" and "Country" guides.

Results

Currently, large FMCG chain retailing companies are actively implementing new information technology solutions and automating business processes in order to reduce costs and increase sales. In these conditions, the transition to electronic document management can be considered as one of the stages of digitization in chain trade.

Document management system in retail is extremely extensive, due to the large size of trading companies. Thus, its optimization is an extremely important component of the cost reduction process [11]. The system of general document flow at FMCG chain retailing companies can be represented in the form of three subsystems - external, internal and supporting document management [7].

The top-level document management model of FMCG chain retailing companies is shown in the figure.

Figure 4 - Top-level document management model of FMCG chain retailing companies.

In terms of the analysis of problems concerning construction of complex electronic DMS, the aspect of creation and functioning of data architecture is especially interesting.

The figure shows a conceptual model of data architecture for FMCG retail. The model is made in UML notation, which allows to reflect the key classes and relationships, as well as to analyze the presence of connections that require simplification ("many-to-many").

Figure 5 - Conceptual model of data architecture at FMCG chain retailing companies

As a result of the model formation, top-level data architecture can be supplemented by including a layer of IT-infrastructure. This will help to form a comprehensive model of data architecture, starting with the database that is the basis of the transaction system and up to completing the IC top-level – level of corporate portal of the company represented in the figure.

Figure 6 - Data architecture of the interface for interaction between chain trading companies and suppliers.

Data warehouse architecture should be flexible enough to grow and change together with the needs of business, as the requirements of the FMCG chain retailing segment change quite quickly under the influence of the market. Today, random efforts to normalize the architecture of corporate data warehouses are not enough. Furthermore, inconsistency of modeling methods inevitably leads to rather tense implementation of solutions.

Conclusion

For FMCG-retail companies, the task of determining data architecture based on DMS is a matter of the highest priority.

The generated DMS model allowed to identify the following key entities in the data model of FMCG retail:

- purchase of goods – fast moving consumer goods sold at points-of-sale;
- turnover – goods sold;
- points of sale – retailing points of sale;
- warehouses – distribution centers;
- workers – staff;
- consumers – customers who purchase goods of the company.
- counterparties – a person or company that assumes an obligation under the contract;
- contracts – agreements with partners on mutual obligations;
- payments – settlement.

The study identifies basic business processes of chain retailing companies. The typical structure of the "Purchase" business process is considered. The classification of basic documents within the analyzed business process is presented. On the basis of the analysis of sub-processes included in the "Purchase" process, the main stages of data architecture development, interrelation of reporting documents and data types, architecture of data (a layer of information systems) are considered in the paper.

As a result of the study, a top-level data architecture was formed, reflecting the model of information interchange in accordance with the basic business processes of FMCG chain retailing companies. The resulting data model can be considered universal for FMCG-retail companies, as it allows to organize data management in such a way as to ensure further development and effective functioning of the chain companies architecture.

Abstract

A modern manufacturing enterprise is hardly imaginable without process automation – both core and management processes. The efficiency of an enterprise largely depends on the high-quality data processing within the single information space of the enterprise. The introduction of an integrated automated system for an industrial enterprise, coordinated with the business model, will create an effective enterprise management system and reduce future costs for the modernization and development. Actual trends in the digital transformation of industry reinforce the requirements for a complex model of a business management system, including the integrated information management system model as an integral part of it. The paper is aimed to create a model of the manufacturing enterprises architecture, including a comprehensive vision of business and technological processes, their IT support, information and production infrastructure of manufacturing enterprises. The model was developed based on the analysis of experience and the current practice of automating large industrial enterprises in Russia in such sectors as construction, mining, and engineering.

Keywords: enterprise architecture, IT architecture, technological architecture, technological processes

Introduction

Digital transformation is a major challenge for today's businesses. Opportunities of modern digital technologies, such as the Internet of Things, big data, predictive analytics, blockchain, machine learning, inter-machine interaction, cyber-physical systems, etc., are able to meet the requirements of the business on a qualitatively new level, allow to significantly increase the efficiency of enterprises and make the processes that were impossible before possible for enterprises to implement. The well-known concept of Industry 4.0, which declares the transition to a new format of industrial enterprises, at the same time opens up new opportunities for industry, but at the same

time poses challenges to industrial enterprises to effectively transition to a digital model of activity. [1-3] It is obvious that the successful implementation of digital transformation projects requires a systematic approach to the formation of the target business model and the development of a transition plan to it.

Today, industrial enterprises should take into account the following actual trends when designing a business management system:

•Active growth of IoT practices and marketplace [4,5]. Thanks to the ability to transmit data using 5G networks and advances in sensor technology, in the coming years, the industry will be able to make even greater use of devices within the framework of the Industrial Internet of Things (IIoT) concept to increase productivity, product quality and reduce costs;

•As IIoT and intelligent systems become more widely used, there will be a dramatic increase in the amount of data generated by production processes - the ability to analyse this data must be ensured;

•As information technology evolves, so do the skills of cybercriminals. Recognition of the urgency of the problem of information security for certain industries in the modern world was the adoption of a number of legislative acts in 2017-2018, tightening the requirements in this area [6-8].

The need to consider the enterprise management system as a single complex of implemented business and technological processes, information flows and data flows, information systems and technologies determines the role of the architectural approach in the formation and reform of management systems to improve the efficiency of business due to its internal structure. As a similar complex approach to the formation of a balanced and effective management system in the professional community of business analysts and implementers of IT solutions is a concept of enterprise architecture, which offers to consider the model of the enterprise as a unity of heterogeneous elements (business processes, organizational structure, functional structure, information systems and applications, data, document management, business and IT services, etc.) in their interconnection and interdependence. Nowadays, when management and realization of business are impossible without IT-support, the model of enterprise architecture gives the necessary complex vision of all aspects of management system and allows to connect business and IT-components of management into a single system. [9] However, the existing approaches and models of enterprise architecture do not pay due attention to production technologies, which determine the special structure of technological processes and technological infrastructure.

The purpose of this work is to form an extended model of the enterprise architecture, which includes as an integral element of the core technology and related technological infrastructure. Development of such an extended model is especially relevant in the context of the ongoing digital transformation of business, because the introduction of digital technologies in industrial enterprises will affect both the elements of business and IT-architecture, and elements related to production technologies. This section should follow keywords. This section should provide background of the study and highlight research motivation.

Methodology

The methodological foundations of the work are: business analysis, an architectural approach (including the concept of a service-oriented architecture) and a technological approach. The paper introduces the concept of infrastructure-intensive enterprises, proposes an extended model of the

architecture of such enterprises and a method of its development that takes into account the specific features of the architecture of such enterprises and, in particular, the peculiarities of the IT architecture design. As a result of adapting existing approaches to modeling and developing the manufacturing enterprises architecture, the extended model and approach to the development of enterprise architecture were supplemented with aspects related to production technologies, the joint influence of business and technological processes on the formation of enterprise IT architecture was described, the example of the IT-architecture functional structure of the mining business was described.

Results

Features of IT-architecture design of infrastructure-intensive enterprises.

The object of consideration of the present article are the enterprises, the technologies of realization of the main activity of which determine the specific infrastructure, structure of assets, resources used and require significant investments in the physical infrastructure. This category of enterprises primarily includes industrial enterprises, but also enterprises of other industries - construction, transport, medical, etc. - i.e. all those branches of industry where the technologies for the implementation of core activities require specialized and capital-intensive infrastructure. With regard to such enterprises, the term "infrastructure-intensive enterprises" is introduced [10] (a broader term - infrastructure-intensive industries - can be introduced).

In the traditionally adopted, established by various international standards (TOGAF, FEAF, DODAF, Zahman model) [13,14] and deservedly recognized by the international scientific and professional community interpretation of the architecture of the enterprise, the business management system as a system includes such groups of elements (so-called layers) as [15]: business architecture, architecture of information systems and applications (IT-architecture) and technological architecture (Fig.1). Business architecture includes such elements as functional structure, business process system, organizational structure; in the architecture of information systems and applications - information systems and applications that support the implementation of business processes, as well as data architecture; technological architecture - infrastructure that provides the capacity for deployment and operation of information systems and applications (servers, networks, databases, etc.). [6] Layers of enterprise architecture interact with each other through services - units of functionality provided by elements of different layers to each other. Thus, business architecture in response to customers' requirements provides them with business services. In turn, the architecture of information systems and applications in response to the requirements of business architecture provide IT services to support business processes. Similarly, the technological architecture provides the possibility of functioning of information systems and applications by providing services in strict accordance with the requirements of IT-architecture. Such service orientation allows to form a balanced management system where all requirements of architecture elements to each other are realized and there is a possibility of flexible and operative introduction of new functionality of the system due to transparent model of interaction of elements.

Fig 1. The traditional model of service-oriented enterprise architecture

Currently, automation of industrial enterprises is moving to a new level: it is not only the introduction of production control systems (class MES) and process control systems (class APCS), but also the introduction of digital technologies in the technological process, as well as in the architecture of information systems and applications. Thus, a number of technologies within the framework of the concept of Industry 4.0 is aimed at the introduction of production technologies or their information services into the sphere of implementation [17]. For example, cyber-physical systems (Cyber-Physical Systems, CPS) are designed to replace human labor in the performance of routine operations of technological processes or operations that are difficult to perform by humans (in harsh climatic conditions, etc.); technology of industrial Internet of Things (Industrial Internet of Things, IIoT) [2,3,11] allows you to collect in real time the indicators of the implementation of technological processes, while partially replacing the existing systems of instrumentation and automation (instrumentation and automation) by functionality; Big data processing technologies allow to process large amounts of data on the progress of technological processes collected in real time, and to carry out the analysis of such data; technologies of inter-

machine interaction (machine-to-machine, M2M) allow to transfer the control of the next stage of the technological process between the components of technological equipment without human intervention, etc.

The introduction of such technologies requires a clear understanding:

•The place of such technologies in the enterprise management system;

•Requirements to digital technologies from business and technological processes and possible requirements to change the processes themselves;

•Mutual requirements of digital technologies and elements of IT and technological architecture;

•A way of integrating digital technologies with other elements of the management system. [4]

At the initiative of public and private institutions in Germany, a reference model of RAMI4.0 architecture was developed to provide a unique vocabulary and structure that everyone can understand when describing the components of intelligent production or Industry 4.0, which was officially adopted in March 2017 as a publicly available specification for intelligent production. 18] Undoubtedly, the future is beyond such models of production enterprises, however, the time horizon for the widespread introduction of such architectures seems quite distant. At the moment, the development of the architecture of infrastructure-intensive enterprises on the basis of universally recognized models (e.g. TOGAF), with the introduction of missing elements into it, seems relevant.

It is expedient to include in the contour of consideration of the enterprise architecture a separate layer, which includes technological processes and related infrastructure and resources: buildings, structures, technological equipment, transport, material and material resources, etc. Thus, the layer of architecture, including as a key element of the technological process and related infrastructure in the proposed concept is called "technological architecture", while the infrastructure that provides the deployment and implementation of functions of information systems and applications (technological architecture in the adopted TOGAF terminology) - "IT infrastructure" (Fig. 2).

Fig 2. Extended model of service-oriented enterprise architecture

Allocation within the framework of the enterprise architecture of the layer of elements connected with production technologies, will allow to identify and take into account the impact on the architecture of information systems and applications of the enterprise as a system of business processes, and technological processes. Among IT-specialists the model of hierarchy of information systems is known for a long time and is used [19, 20], actual first of all for the industrial enterprises (Fig.3). The following levels of information systems corresponding to management levels are singled out: Automated Process Control System (APCS) - management of technological processes, MES - production management, ERP - enterprise management, BI - analytics and support of making strategic decisions. Systems of class BI sometimes carry out beyond the limits of a pyramid of information systems, but the hierarchy of interaction of the presented classes of systems from it does not change - it is in many respects a question of representation.

Fig 3. Hierarchy of enterprise information system

The MES concept is being actively developed and implemented, and nowadays it attracts great interest from practitioners as a link in the pyramid of information systems of the enterprise with its own functionality. The layer of information systems of MES class is a characteristic feature of industrial enterprises, as it focuses on the so-called production processes.

Landscape design of functional systems of IT-architecture of mining enterprise. The proposed approach to the design of the IT-architecture of the enterprise, taking into account the requirements of both business and technological processes and production processes, was applied in the project of development of IT-architecture of the mining enterprise. Digital technologies are changing the mining industry, changing the operating models of mining companies and allowing them to remotely manage more and more processes. The key requirement for an effective digital transformation of any enterprise is comprehensive business automation, which implies the integration of information systems and data within a single information space. To ensure such complex automation of business it is important to design a complex information space based on the analysis of all business, production and technological processes.

On the basis of the analysis of business, industrial and technological processes of the concrete enterprises of a mining industry of Russia (on the basis of interview with experts and the analysis of the data of Internet sites of the organisations designing the mining enterprises and their automated systems [12-17, 25]), and also on the basis of studying of reference models [26-27], the following list of functions of the mining enterprise has been developed (Table 1). It should be noted that Table 1 lists the functions not only of the production mining enterprise, but the functions of the mining business as a whole. Thus, the functions № 1-6 may not be implemented directly at the operating mining plant, and are carried out by various design organizations and other participants in a single process.

Table 1: The functional structure of the mining enterprise

№	Mining function	Information system management layer supporting function
1.	Object Definition	-
2.	Intelligence service	MES (incl. BIM, GIS)
3.	Rights management	ERP
4.	Scientific research work	MES (incl. BIM)
5.	Design of a mine (mine) (PIR - design and survey work)	MES (incl. BIM)
6.	Engineering	MES
7.	Production planning	MES
8.	Streamline Operations	MES
9.	Ore mining	MES - operational production management Automated process control systems - real-time control of technological processes
10.	Ore transportation of ore	MES - operational production management Automated process control systems - real-time control of technological processes
11.	Ore sorting and mixing	MES - operational production management Automated process control systems - real-time control of technological processes
12.	Ore processing (beneficiation)	MES - operational production management Automated process control systems - real-time control of technological processes
13.	Melting	MES - operational production management Automated process control systems - real-time control of technological processes
14.	Refining	MES - operational production management Automated process control systems - real-time control of technological processes
15.	Product processing	MES - operational production management Automated process control systems - real-time control of technological processes
16.	Waste management	MES - operational production management Automated process control systems - real-time control of technological processes
17.	Infrastructure production support	MES - operational production management Automated process control systems - real-time control of technological processes
18.	Asset Management	ERP MES
19.	Production Management	MES - operational production management Automated process control systems - real-time control of technological processes
20.	Logistics (transport and storage)	MES - operational production management Automated process control systems - real-time control of technological processes
21.	Accounting and reconciliation	ERP – strategic planning and management MES - operational production management Automated process control systems - real-time control of technological processes

22.	Customer relationship management	ERP
23.	Marketing and sales	ERP
24.	Financial management	ERP
25.	Personnel Management	ERP
26.	IT Management	ERP
27.	Product Lifecycle Management	ERP MES
28.	Land management	ERP
29.	Strategic management	BI ERP

Comparison of the key functions of mining companies and the levels of information systems, the tasks of which include IT support for these functions, is given in Table 1:

- forms the requirements of business and technological architecture to the functional structure of the IT-architecture of the enterprise;
- forms a landscape of functional structure of IT-architecture of the enterprise at all levels of management;
- is the basis for further design of individual subsystems of IT-architecture of the mining enterprise;
- is the basis for the formation of requirements for horizontal and vertical integration of information systems;
- creates prerequisites for the effective implementation of digital technologies.

Such a representation can serve as a kind of reference model of requirements to the functional composition of information systems. Each functional block is not necessarily realized by separate information system, rather on the contrary: suppliers both ERP, and branch MES-decisions group a number of functional blocks within the limits of the uniform decision. Use of similar reference models at a stage of designing of IT-architecture is the important precondition of complex automation.

Conclusion

The paper proposes an extended model of enterprise architecture that meets the needs of enterprises, the various aspects of which (structure of assets, infrastructure, location, etc.) are largely determined by the peculiarities of technologies for the implementation of core activities - primarily industrial enterprises. Such a model of the enterprise architecture links into a single complex such elements of business as: functional structure, business processes, organizational structure, cash flows, document flow, information systems, applications and data, technological processes and related infrastructure, IT infrastructure. The account of interrelation and interdependence of the listed elements at a stage of designing of business will allow to create transparent control system of the enterprise, and also will provide a basis for operative introduction and effective introduction of organizational changes of the enterprise according to requirements of a business environment. In the work the example of application of the offered approach to landscape designing of functional subsystems of IT-architecture of the mining enterprise is described. With a certain adaptation the proposed extended model and method of development of architecture of the infrastructure-intensive enterprises can be used as universal and applied not only for industrial, but also for the enterprises of other branches, the technologies of implementation of which have a significant winding on the infrastructure and IT-architecture of the enterprise (for example, medicine, transport, construction, etc.).

Abstract

Nowadays, thanks to the advent and development of such modern information technologies as IoT, Big Data, Blockchain and many others, digitalization affects more and more areas of Russian business. Such changes are inevitably reflected in enterprise architecture. This research discusses the need to adapt the standard enterprise architecture framework, TOGAF, to present the latest technologies in it. Moreover, a list of digital architecture's requirements of the Russian business for the technologies ensuring its implementation has been compiled.

Keywords: Digital Architecture, Enterprise Architecture, IT Requirements, Enterprise Architecture Framework

Introduction

Digitalization is a business transformation. This is the use of information technologies (IT) for the implementation of business processes and the digitization of all types of information that can benefit the business (Legner et al., 2017). Digitalization is changing not only business, but the whole society, creating electronic services, products, changing the usual approach to production, work, training. For example, the creation of a single digital infrastructure for public services, advanced online banking, electronic medical records, online universities and the robotics of some professions, all this is just an incomplete list of innovations that came with the advent of digitalization (Dubgorn, Zaychenko, & Grashhenko, 2018).

This change in business became possible only thanks to the active development and popularization of the latest technologies. According to the «Hype Cycle for Emerging Technologies» popularity chart, technologies such as Blockchain, Digital Twins, Virtual Assistants, the Internet of Things and Deep Learning are now at the peak of high expectations, which means that they are in the active phase of implementation and use in various fields (Figure 1)(Panetta, 2018).

Fig 1. Hype Cycle for Emerging Technologies, 2018

Consider examples of the implementation of these technologies in Russian business. For example, Blockchain technology has become the basis of a project for registering participatory construction contracts. This project will allow to have more transparent transactions, both for equity holders and for the state (Kolobov, Filatova, Borshcheniuk, Semerianova, & Bayanov, 2019). Moreover, the project of the first information system in Russia for antitumor clinical research based on the Blockchain implemented by one of the oncology research center can be highlighted. Such a system will make it possible not only to register research volunteers, but also to secure their personal information (I. Ilin, Levina, Lepekhin, & Kalyazina, 2018). Digital twin technologies are actively used in one of gas and oil companies to create unified control centers for oil refineries and oil producers. This allows to diagnose objects, manage them, predict and optimize their work remotely (Zaychenko, Smirnova, & Kriukova, 2018). Speaking about virtual assistants, it is worth mentioning first of all voice assistant from Russian IT company, whose monthly audience is 35 million unique users. This assistant can not only answer questions and order a taxi, but also be the basis of a Smart Home system, coordinating all Internet things on the network. Speaking about the Internet of Things, which is the basis of many modern technologies, should be mentioned that production and transport are leaders in investing in the Internet of things in Russia. Moreover, the Internet of Things is actively used in the field of housing and communal services, this is ensured by smart meters that transmit and analyze data (Zaychenko, Borremans, & Gutman, 2018). Deep Learning, in turn, is a field of machine learning research and an area of artificial intelligence (AI) research. According to studies, virtual assistants, machine learning and predictive analysis are the most used AI technologies in Russian business (Figure 2) (Wright & Schultz, 2018).

Fig 2. AI technologies in Russian companies, %

Since many of these technologies have recently begun to be applied on real projects, it is now too early to judge the success and effectiveness of these technologies in the long term, but nevertheless, active business changes are already noticeable. Moreover, a changing business dictates requirements for changing the architecture of the enterprise.

Today, the most famous and used enterprise architecture description framework is TOGAF. It is based on the ADM method, which step by step describes the development of architecture. Three TOGAF enterprise architecture domains, which can be called three layers of architecture, are distinguished: a Business layer, an Application layer, and a Technology layer (Figure 3) (Levina, Borremans, & Burmistrov, 2018).

Fig 3. TOGAF domains

TOGAF itself is a comprehensive framework that can be adapted to the development of a specific corporate architecture. However, from the point of view of modern IT, this framework cannot be considered universal.

Despite the fact that TOGAF mentions and describes business services on the Business layer, application services on the Applications layer, platform services on the Technology layer, and there is also a special notation "Mobile IT Category" and the API is mentioned in the Applications layer and the Technology layer, there are no cloud elements in this framework (Masuda, Shirasaka, Yamamoto, & Hardjono, 2018).

The purpose of this article is to formulate a list of requirements for information technology for the subsequent description of the new digital business architecture framework for Russian business.

Literature Review

Information technology requirements imply a description of the properties and qualities of information systems, software and hardware. Speaking about IT requirements in general, there are two types of requirements: functional and non-functional in nature. The first type describes the requirements for the behavior of the system, the second - shows the requirements for the nature of the behavior of the system (Becker, Tebes, Peppino, & Olsina, 2019). The subtypes of requirements and their case examples in more details are presented in the Table 1. The examples are made on the basis of Russian transport industry (I. V. Ilin, Iliashenko, Klimin, & Makov, 2018).

Table 1: IT requirements

Type of requirements nature	Subtype of requirements	Characteristic and example of requirements
1. Functional	1.1 Business requirements	Description of the high-level goals of the enterprise that will be achieved by implementing IT. Example: Intelligent Transport Infrastructure, within the framework of the Smart City concept, should automatically inform the traffic participants with up-to-date information using digital information boards (DIB) (Bolobonov, Ilin, Korolev, & Frolov, 2019).
	1.2 User requirements	Description of how the product is used by the end user. Example: User Stories describing the driver, who changed the route, having learned the latest information from the DIB.
	1.3 Functional requirements	Description of the functionality that can be implemented in this system. Example: The digital information boards should display the optimal speed, calculated taking into account weather conditions and congestion routes.
2. Non-functional	2.1 Business rules	A characteristic defining or restricting certain aspects of a business. Example: Placement of the DIB should be in accordance with the standard.
	2.2 System requirements	Description of a specific method for implementing product functionality. Example: a system for analyzing the current situation on the road should be located on a cloud platform where unstructured big data will be processed.
	2.3 Documentation Requirements	Description of the content of documents required for implementation. Example: documentation for the development of an information system must comply with an international standard IEEE Std 1016-1998 «IEEE Recommended Practice for Software Design Descriptions».

	2.4 Design and usability requirements	Description of graphic, visual and navigational aspects of the developed IT. Example: The font used in the DIB should be read when visibility is poor.
	2.5 Security and Reliability Requirements	Description of the created security levels, access levels, identification process and information flows. Example: Only leading programmers can access changes to the system algorithm.
	2.6 Function metric requirements	Description of performance indicators, fault tolerance, etc. Example: a system can be updated only at night.
	2.7 Operation and Personnel Requirements	Description of the required level of staff skills and requirements for working with IT. Example: After each major update of the information system, staff training is required.
	2.8 Other requirements and restrictions	Description of the possibility of integration, mobility, autonomy. Example: a system must be integrated with all Smart City systems (Chourabi et al., 2012).

It can be noted that all the requirements listed above relate to different layers of the enterprise architecture: from the goals and initiatives of the business (1.1, 2.1, 2.3, 2.7, 2.8) and specific applications (1.2, 1.3, 2.4,), ending with the requirements for networks and IT infrastructure (2.2, 2.5, 2.6).

Results

The enterprise architecture represents a comprehensive vision of the organization. That is why the framework on which it is built should reflect all aspects of the business, including new information technologies. To create this new framework for building a digital architecture, it is necessary to take into account not only existing standards and contain not only the basic requirements for IT, but also include a number of additional organizational requirements (Masuda & Viswanathan, 2019). The list of such requirements includes:

1. Standardization of the main business processes of the selected industry.

One of these requirements is the standardization of the main business processes of a particular industry and the creation of flexible data management platforms. Such standardization will allow the development of more “box version” IT solutions, which will accelerate the pace of digitalization of area. Moreover, this will allow the creation of adapted versions of reference models of enterprise architecture for specific industries.

2. Creation and incorporation of an Architecture Board into organization.

The next requirement is the mandatory inclusion of Architecture Board in the organization, which would allow to create high-quality and flexible models, as well as understand the necessary level of IT implementation in a particular case.

3. Analysis of demand for IT.

This analysis and subsequent management in a specific area should also become the basis for building the architecture of a digital enterprise. This will not only reduce the cost of introducing new IT in the industry, but also make it possible to predict the risks associated with their implementation.

4. Assessment of the enterprise maturity regarding the application of IT.

Another important aspect may be the level of the enterprise maturity for the implementation of modern technologies. The created assessment model will allow building models for implementing various IT for specific cases.

The requirements described above should be the core of the enterprises development along with functional and non-functional requirements. It is a combination of organizational, functional and non-functional requirements that will allow to build an ecosystem of enterprise architecture for the subsequent creation of reference models and a new framework.

Conclusions and Discussions

The digitalization and development of modern enterprises is inextricably linked with a change in the enterprise architecture. The new digital architecture puts new demands on information technology. Now these requirements should be not only functional in nature, for example, a description of the strategy and technical means of its implementation based on user requirements. Also, requirements of a non-functional nature should be taken into account, for instance, requirements for documentation, interface, standardization, personnel, etc. Moreover, the organizational requirements describing the approach to IT implementation become the most important requirement of the digital space architecture.

In the further studies, the issue of forming a reference model of the digital Russian business based on the described IT requirements can be considered. Moreover, the question of formalizing organizational requirements, for example, by creating a model for assessing the enterprise maturity and their readiness to implement modern IT, can be raised.

Abstract

In the article, we elaborated the issue concerning the marketing strategy of a successful brand, which should lead to the effective application of the overall corporate strategy with regard to the global environment. The global Starbucks brand, which is of irreplaceable importance on the current market, is subject to analysis. In order to properly define the company's marketing strategy, the analytical part of the article describes the basic 4P marketing mix of the brand, and the defined segmentation structure of the Starbucks brand with regard to current perceived global trends. In addition to marketing, these areas also fulfill the company's brand strategy. Based on the data obtained on all the mentioned areas, the discussion part of the article approaches the definition of the company's goals and a description of the resulting marketing strategy, which also includes the company's brand strategy. Both strategies can significantly affect the overall competitive performance of the company in the global environment in question. The discussion part also includes the direction of the company to the future, based on a defined marketing and brand strategy, which are generalized in the final part. Achieving the goals of the resulting marketing strategy should lead to strengthening the competitive position, brand promotion and better marketing performance of the company in the global environment. The resulting strategy is defined depending on international marketing trends, and the development of an environment to which the company must respond quickly and adapt effectively, depending on the changes that the time horizon brings. The final part of the article defines recommendations with regard to current global developments based on the analyzes that were part of the analytical part of the article.

Keywords: Marketing strategy, Brand, Starbucks, Marketing, Customers

Introduction

As already mentioned in the abstract page, the subject of the definition of marketing strategy will be the Starbucks brand. In order for a brand to be successful in the current market environment, it must constantly adapt to the development of the environment and the trends that are dominant in the given period. When creating a marketing strategy, it is necessary to take into account the overall strategy of the company and the defined marketing philosophy. Gavurova et. al (2018, pp. 72 - 84) argues that part of effectively achieving the goals of the company's marketing strategy should be a brand strategy, which is irreplaceable in building the overall image of the company and customer loyalty. Krizanova et. Agrees with this opinion. al (2013, pp. 105 - 112). Building relationships with customers, building their loyalty and properly satisfying all needs and requirements is the first step to achieving brand success in an international environment. The authors Hallowel et. al (2019, pp. 13 - 18). Valaskova et. al (2018)also agrees with this statement. al, who further argue that in building loyalty and the right brand strategy of the company, other factors that can influence purchasing behavior must be taken into account. Basic factors include, for example, demographic, behavioral or geographical. (2018, pp. 149 - 163). Kliestikova et. al. (2019) Is also attached to the important importance of behavioral factors. al, who argue that transposition into subjectively perceived sources of brand value is important in perceiving consumer loyalty. (2019, p. 190 - 203) This can subsequently be reflected in the overall marketing performance of the company in connection with the limited achievement of the objectives

of the defined marketing strategy of the company. Based on the individual statements of the authors, it is necessary to take into account the fact that the marketing strategy is influenced by a number of factors that must be taken into account by all brands operating not only in the national but especially in the global market environment. These factors must also be taken into account by the Starbucks brand, which operates intensively in this environment.

Starbucks

As mentioned in the introduction to the article, various factors such as customer loyalty, satisfaction of needs, behavioral aspects, environmental impact, trends or brand image are of irreplaceable importance in creating and achieving the goals of a marketing strategy. The individual factors need to be taken into account and taken into account as they can significantly affect the market performance of the company. The author Zeman and Bognad (2019, pp. 1 - 9) also agree with this opinion. According to the authors Tuan et. al, it is important to perceive the brand image as it can influence the competitive position in the market environment (2018, pp. 270 - 281). Starbucks must also take this into account.

Starbucks Corporation was founded on March 30, 1971 in Seattle, Washington. The company's mission is to constantly advance and become a world leader among suppliers of first-class coffee and to maintain the growth of uncompromising principles. The following six principles help assess the adequacy of decisions:

- ensure an excellent working environment and treat others with seriousness and respect,
- understand diversity as a necessary part of the way society does business,
- comply with the highest quality standards when purchasing, and delivering fresh coffee,
- constantly strive to ensure customer satisfaction,
- make a positive contribution to the life of the community and its surroundings,
- realize that the basis of future success is profitability.

Based on these principles, it can be argued that Starbucsk is determined to play a leading role in protecting the environment in all aspects of its business. Krizanova, Gajanova and Nadanyiova also agree with this opinion (2019, p. 17) The business of the company is based on the ownership of the parent company. Heniman and Wanikawa state that between 2000 and 2007, Starbusk had up to 64% of its licensed subsidiaries. Of the total number, only 36% of them were directly owned. They came from the USA. (2008, p. 25) Currently, Starbucks is following a similar trend, showing a higher percentage of licensed affiliates. Starbucks currently has four operating segments in various market environments in the United States, Canada, Latin America, Europe, China and developing countries. Unreported operating segments include Teavana, Seattle's Best Coffee, Evolution Fresh and Digital Ventures' own ventures, which are combined and presented as other segments.[1]

Revenues from reported segments and other segments as a percentage of total net income for 2014 were as follows: US (74%) EMEA (8%), Emerging (7%), Development Channel (9%) and others (3%). The segments include our own but also licensed cafe operations. The US market segment is most important for Starbucks. It is an important measure of a company's business. The EMEA and CAP markets are still in the early stages of development and require extensive support from the organization, given their current level of revenue and operating income compared to the US market. In some EMEA and CAP markets, acquisition and operating costs are higher than in the US market, due to higher rents for significant historic premises or country-specific regulatory cost requirements.[2]

Emerging market segments include roasted ground and wholemeal coffee, premium Tazo ® teas, Starbucks and Tazo brand products, various beverages such as Frappuccino ® Starbucks Doubleshot ® espresso beverages, Starbucks Refreshers ® beverages and other branded products sold worldwide through channels, such as grocery stores, club warehouses, specialist shops, supermarkets and also fast food outlets.

Operations owned and managed by the company accounted for 79% of total net income. Starbucks' retail goal is to be the leading retailer of branded coffee and tea in each of its target markets by selling the highest quality coffee, tea and related products, as well as through the customer experience. Licensed operations accounted for 10% of total revenues Licensed operations generally have a higher operating margin than company-owned and managed operations. Under the licensed model, Starbucks receives a reduced share of total revenue, but this is more than offset by a reduction in its share of costs because these are primarily generated by the license.

The licensed stores use the expertise of local Starbucks partners who share the operation and delivery of the experience. Licensee is sometimes the only way to gain access to the desired premises. These are mostly retailers with market knowledge. Starbucks obtains royalties and license fees from the sale of coffee, tea and related products. The company also sells certain equipment, such as coffee machines and things needed to prepare products. Employees who work in licensed stores are required to follow operating, work procedures, training and courses. Traditional franchising is used for Teavana ® and Seattle Best Coffee ®, as well as for Starbucks ® stores in some markets.

Marketing processes

In applying the tools of the basic marketing mix, Starbucks makes intensive use of all the frameworks in which it strives to fulfill the basic marketing strategy and satisfy the needs and wishes of the targeted segment. As part of the analysis of the marketing mix, we will discuss the product, pricing, distribution and communication policy of Starbucks. Based on the data obtained from individual tools, we will proceed in the discussion part to define the marketing and brand strategy of the company.

Product policy

The company's product range is very wide. The company is primarily committed to selling coffee beverages and the best coffee beans. In order to properly ensure compliance with strict standards, employees constantly check the purchase of coffee, roasting, packaging, global distribution and the like. The company offers more than 30 blends of coffee in its portfolio, including original premium coffees. The company even produces its hand drinks in the form of freshly brewed coffee, hot and iced espresso drinks, Frappuccino coffee and decaffeinated drinks, Starbucks fresheners and many more. The consumer goods category includes coffee and tea products such as Starbucks coffee, Ready Brew, K-Cup, Teavanna, Verisimo, Tazo and others. In addition to coffee and tea, the consumer goods category also includes Ready-to-Drink (RTD), which includes: bottled ice juice, tea, bottled Frappuccino, chilled cup of coffee, Starbucks Iced Coffee, Starbucks Refreshers, energy coffee drink and more.3

An interesting feature of the company is how it adjusts its product portfolio. A typical example is the Chinese market, which is known mainly for drinking tea and tea drinks. Based on this factor, the company decided to offer a wide range of teas in this market in addition to coffee. In this regard, the company also cooperates intensively with local partners. Based on the above, it can be argued that in strengthening the brand and marketing strategy, the company intensively takes into account the factory of cultural differences. [4]

http://usatoday30.usatoday.com/money/industries/food/2009-01-28-starbucks_N.htm

Price policy

The best-selling commodity on the market is Arabica coffee. Its price depends on various factors such as the supply of demand at the time of purchase. Supplies and prices can be influenced by many factors in its countries of production, including weather, natural disasters, crop diseases, generally rising agricultural costs, stock levels, as well as political and economic conditions. The price is also affected by trading activities in the Arabica coffee market, including hedge funds and index commodity funds. In addition, green coffee prices have been affected in the past and may be affected in the future by actions by some organizations and associations that have in the past tried to influence green coffee prices through export quota agreements or restrictions on coffee supply.

Starbucks purchases coffee at a "fixed-price" and "price-to-be-fixed purchase commitement", depending on market conditions and factors, to ensure a sufficient supply of quality green coffee.[5]

Despite the fact that coffee drinks and their various variations represent a global product, the company implements local adjustment mainly in the area of pricing strategy. It can also significantly affect the overall marketing strategy of the company and its operation in the industry. To operate in the industry according to Hollowell et. al are influenced by various factories that the company should take into account when carrying out its business. (2019, p. 9 - 15) A typical example can be the product "Grand Latte", the price of which varies considerably in selected economies. According to The Wall Street Journal, Grand Latte is the most expensive in Oslo, where the price of the drink is $ 9.82, in Moscow $ 7.40, in Paris $ 5.18, in Toronto $ 4.08 and in Hong Kong 3.87 $. As can be seen in different global economies, the price of this product varies.[6] This is influenced by a number of factors. The factor that most intensively affects the price of the marketed product is the monetary policy in individual regions. This means that in countries where there is a strong currency, Grand Latte coffee is higher than in countries with a currency that has less purchasing power, which is a typical example of India. This policy also has a strong impact on the overall marketing strategy, which must be tailored to individual regions within the global market environment.

Communication Policy

The most intensive tool by which complaints can be associated with the possible risk of the customer is his marketing communication, it may happen that it is not possible to satisfy the needs and wishes of customers. It also tries to intensively strengthen brands that use methods of communication.

Unlike other businesses in the food industry, Starbucks has invested only $ 10 million in 2009 since 1996. The company advocated low investment for the following reasons: Starbucks presented itself with its highly acclaimed logo, its ubiquitous presence and corporate image. He focused on customer loyalty based on a sense of connection. Satisfied customers did the company's largest advertising, for which they did not have to pay, and therefore the company focused primarily on the customer. Marketing communication of a company is related to its development. This means that as the brand has developed in individual years, so has their marketing communication focused on satisfying customer needs.

As part of its communication policy, Starbucks uses the most intensive sales support. It uses the My Starbucks Rewards loyalty program, which the company evaluates as an effective tool for connecting with customers. Registered customers can collect stars and earn rewards each time they visit the point of sale. The most common rewards include a free drink, a free piece of cake in customers' birthday with any other handmade drink, free customization of the drink, and the like. The company has been using this tool extensively in the US and Canadian markets since 2016. Another sales support tool that Starbucks uses extensively is free gifts. It uses "Buy One Get One Free" for it, which is for customers every Friday. In addition, free gifts are provided for specific occasions, such as the Spice Latte

[5] UNITED STATES SECURITIES AND EXCHANGE COMMISSION: http://secfilings.nasdaq.com/edgar_conv_html%2f2014%2f11%2f14%2f0000829224-14-000041.html#FIS_BUSINESS

[6] Oslo: The town with the most expensive coffee: http://www.news.com.au/travel/world-travel/oslo-the-town-with-the-most-expensive-coffee/story-e6frfqai-1226584690823

pumpkin's thirteenth birthday celebration in October 2016. During this period, Starbucks supplied free coffee to the first 1,300 customers.[7]

In addition to sales support, the company also makes intensive use of offline advertising tools such as television advertising, advertising in newspapers, magazines, posters and the like. However, it also focuses intensively on seasonal sales, especially during the Christmas holidays or Star Holiday, Red Holiday Cup and the like. The mentioned tools, which the company uses for the purpose of its promotion, intensively contribute to the effectiveness of the implementation of the marketing strategy. At the same time, it can be argued that promotion contributes to strengthening the brand in a global market environment.

Distribution Policy

In the case of Starbucks' marketing analysis, the distribution policy is crucial. As there is a presumption that most coffee customers buy in stores and drink at home, the company tries to take advantage of such demand in the form of penetration into supermarkets. The company's distribution strategy consists of direct delivery to retail networks. However, despite this strategy, the company entered into a new brand agreement with the global corporation Kraft. Based on it, the company roasts and packs its coffee, and Kraft will ensure the marketing and distribution of this coffee, in which we can see the elements of cooperation management. We have shown the fact that the Starbucks distribution strategy is crucial for the company's marketing strategy, as the company not only secures the distribution itself, but also strives to create cooperative partnerships. The advantage of this partnership is that in a single night, 25,000 supermarkets can reach Starbucks products and receive 3,500 Kraft dealers. Kraft thus competes with its range and, through the most popular brand, gains immediate entry into the fast-growing segment of exclusive coffee.

In addition to supermarkets, Starbucks uses other ways to get its brand to market. As an example, Marriott provides Starbucks at more than 60 airports and also serves this coffee to its airline passengers. The Westin and Sheration offer packages of such coffee in the hotel rooms. Starbucks has also contracted cafes at Watersones Libraries.

Segmentation structure

In addition to the tools of the marketing mix, the segmentation structure is also important for Starbucks. Starbucks decided to modify this in 2008. As the price of the product range increased this year, the company decided to provide its products to customers who have more money and are willing to pay more for Starbucks products. Among other things, the company began to focus on image, as many young people visit stores only because of prestige, even though their financial situation is not favorable. The author Purgat claims that image is one of the main factors that influence shopping behavior. (2018, pp. 123 - 142) Such customers are satisfied with the feeling that they are seen by others when they enter and leave the store. In this way, the company also tried to influence the behavioral aspects of the primary segment. In connection with current trends, we can define the basic characteristics of customers as follows:

- people who like to drink coffee, whether alone or in society,
- they like the different types of coffee that Starbucks makes,
- aged 18-60,
- live in or around cities,
- work as professional, managerial and managerial positions,
- socially - responsible people who care about the environment,

[7] Starbucks marketing communication mix: https://research-methodology.net/starbucks-marketing-communication-mix/

- expect the company's service to be at a good level.[8]

Based on the defined characteristics, we can define the primary and secondary segment. The primary segment for the company are men and women aged 25 to 40, who represent up to 49% of the company's total sales. Starbucks strives to reach this group of customers through modern design that is consistent with advertising and decoration, striving to make Starbucks products a symbol of social status. The customers of this group are mostly residents of cities with relatively high incomes, opportunities for professional career growth and focus on society as a whole. The growth of this target group is 3% per year. The secondary segment is young people aged 18 - 24, who account for 40% of the company's total sales. This group can include university students who use cafes as a space where they can study and socialize with other friends. Based on this factor, Starbucks in the US began to adapt the interior of the stores.[9]

Discussion

Based on the data and information from the previous chapter, we will proceed to the definition of marketing and brand strategy of the company. Prior to 2008, the company's strategy was primarily to expand into new markets. This strategy was primary because the company wanted to expand its business into the global environment and want to reach "every household". The implementation of the strategy was characterized by elements of quantity rather than quality. After 2010, the company's strategy changed again and began to focus on the quality of products and individual stores.

Later, the company's strategy focused on an active promotional policy on social networks such as Facebook, Instagram, Twitter. Through social networks, the company spread its good name in an undemanding way among fans who intensively shared their photos with green and white cups and happy smiles. A key element of the strategy of this period was also a change in business. Starbucks was interested in making customers feel comfortable, so he adapted the cafes individually. There were not the same two cafes, all tried to adapt to local customs and traditions. Light wood dominated, the emphasis was on lighting and a place with storage space. It was challenging, but the success did not take long. In 2020, Starbucks had nearly 36 million fans on the social network Facebook and 11.2 million fans on Twitter. 18.4 million followers on the Instagram.[10]

At present, the company's marketing strategy is focused on providing first-class products, maintaining the brand image and the ideal of social responsibility. It follows from the above that the strategy is also focused on customer loyalty. According to Gajanová, Nadanyiová and Moravciková, this is an important aspect for building a brand strategy (2019, pp. 65 - 84). Properly implemented, it can lead to a good reputation for business. Podhorska et al. (2019, pp. 271 - 285).

Starbucks is a global company with a diverse customer base and ever-changing workforce. Diversity and inclusion is not only a business priority but also a necessity. A key element of Starbucks' long-term growth strategy is to create a workforce that reflects the company's community that operates globally. To achieve this goal, Starbucks seeks to create opportunities, attract, develop, retain and engage the future workforce. It focuses on how to continue the strategy of diversity and inclusion in tackling the challenges of increasingly global business. Starbucks needs partners who will be actively involved in Starbucks' efforts. Starbucks sees its greatest potential for working with farmers, partners, customers and like-minded organizations to move the industry forward. Looking to the future, where Starbucks wants to move in five years, it can continue to change the baseline model towards greater sustainability, find new ways to minimize the environmental footprint and create opportunities for young people, thus creating a new workforce for the future.[11]

Based on the above information, it can be argued that the overall strategy of the company consists of various factors. These may include a cooperation partnership with a global company, satisfying the needs and wishes of customers, modification of the segmentation structure, monetary stability and the like. All of these factors, according to Olah et. al important for the financial management of the company and can in a positive and negative sense affect the total revenues of the company (2019 pp. 20 - 39). All these factors help to properly fulfill and satisfy the marketing and brand strategy of the Starbucks brand. Based on the findings, it can be argued that Starbucks' brand strategy is currently strong. Which also reflects the fact that customers go to the company only to spend some time there and not to buy the product. Flisikowski and Kucharska claim that brands are considered the company's most valuable asset. (2018, p. 251 - 264) Unlike the authors, Krawczyk adds that the brand is an important competitive advantage in a market environment. (2019, pp. 181 - 191) Nwachukwu and Olatunji argue that taking a competitive advantage can also strengthen the overall optimization of the company. (2018, pp. 15 - 25). But that's a priority for Starbucks. This proves that Starbucks has a strong strategy in place that it can pursue in a global market environment. Mihăilă et al. Shares this view. al (2018, pp. 158 - 164)

Conclusion

Today, the global market is very diverse and companies must adapt to it by applying various forms of communication tools. Starbucks strives to develop a comprehensive approach that contributes to the areas in which it operates while supporting young people who represent future employees for the business. An essential factor on which the entire strategy of the company is based is the focus on the quality of products and customer satisfaction. By meeting the needs and desires of customers, Starbucks believes it will be a leader in the coffee business.

Abstract

The main aim of this paper is to approach the theoretical background of earnings management in connection with the detection of accruals. Earnings management is legal management of profit within the legal framework, but it should be noted that earnings management involves creative accounting techniques, the use of which may call into question the true and fair view of the financial performance of the business. In practice, there may be opportunities to influence accounting information through the use of different methods and techniques, as a result of which the financial statements lose their function and thus misrepresent the accounting data. Because accruals are used as a key indicator that shows the performance of a business, it can be used to make the business performance look different from the actual position of managers. If there is a discrepancy between the timing of cash flows and accounting recognition of the transaction, accruals are increased. In this paper we specify the theoretical background of earnings management in connection with the detection of accruals, where we use the method of description and classification of scientific terms. We illustrate the accruals in connection with earnings management through an example focused on revenues recognition and total accurate balance.

Keywords: Earnings Management, Earnings, Accruals, Revenues, Total Accrued Balance.

Introduction

When it comes to rapid changes in the global business environment, more and more companies are realizing the impact of revenue management on global business (Hudakova et al., 2018). Every company has economic and moral responsibility to external entities for good financial results (Durica et al., 2019). Relevant information is essential for effective and efficient corporate governance (Rybicka and Rybicki, 2018). Due to the manipulation of financial information, the actual financial situation and operating results of companies cannot be reflected in users of financial information (Certin and Ugur, 2015). A disadvantage that the manipulation of accounting information can cause is the division of financial resources into areas that are not able to allocate them efficiently, which results in additional costs in the economy (Küçükkocaoğlu and Küçüksözen, 2005). In general, global leaders and accountants should carefully consider their decision-making process when analyzing earnings performance (Kovacova et al., 2019a) and also consider the vicious link between revenue management and financial performance and with reference to the reputation of the organization (Huynh, 2019). According to the concept of profit manipulation, most entities imagine how companies are trying to influence revenues and expenditures due to lower tax payments. Many businesses manipulate profits to maximize business value. And revenue management is one of the methods companies use to manage profits on an accrual basis. It is this that reflects the motive for writing this article on accruals related to earnings management, which is used as a key indicator of the company's performance and which can be used to make the company's performance look different from the company's actual performance. In this paper, we specify the theoretical basis of earnings

management in connection with the determination of accruals, where we use the method of description and classification of scientific terms. We illustrate the accruals in connection with revenue management with an example focused on revenue reporting and the overall exact balance.

Theoretical Background

Earnings

Earnings are the most important item in the financial statements (Svabova et al., 2020) which plays an important role in attracting investors and therefore the management of the company strives to maximize the results of the financial statements (Susanto et al., 2019). For this reason, managers constantly monitor earnings for each period (Valaskova et al., 2015) and subject it to different calculations or future forecasts. Managers and corporate analysts use a wide range of tools, algorithms, and methods, while the goal of these entities is the same: to predict the future development of corporate financial health (Kovacova et al., 2019b). The reported profit values are then compared with analysts' forecasts, which also affects stock prices. Any investor wishing to buy shares must be adequately informed and have an overview of the financial situation of the individual companies operating on the market since investing in the purchase of securities presents a high risk from the investor's perspective. Therefore, individual investors invest their funds in companies that show potential profitability. If the reported profit coincides with the analysts 'estimates, then the market share price will rise, and conversely, if the reported profit values differ from the analysts' estimates, then the market share prices will fall. In addition to stock prices, profit also affects the remuneration of the managers of the business. Managers strive to keep their profits between their minimum and maximum levels, resulting in their ability to increase their bonuses by overestimating their reported profits. If the reported profit reaches the maximum possible bonus value, managers' motivation will consist of accumulating reported profit for further use by taking specific steps to reduce the reported profit (Healy, 1985).

Earnings management in connection with the detection of accruals

According to McKee (2005), earnings management is purposeful and legal management of decision-making and reporting to achieve stable and predictable financial results. It is legal management of profit within the legal framework, but it should be noted that earnings management involves creative accounting techniques, the use of which may call into question the true and fair view of the financial performance of the business. In practice, there may be opportunities to influence accounting information through the use of different methods and techniques, as a result of which the financial statements lose their function and thus misrepresent the accounting data. Earnings management reduces transparency in financial reporting and that is why managerial restriction induced by a lack of privacy can damage the interest of external subjects (Arya et al., 2013). One author explains that reducing financial limitations of enterprise can be the goal of the earnings management, because of obtaining higher external capital (Sosnowski, 2018). Earnings management measures are derived from an accrual approach (Suprianto et al., 2019). The essence of accruals is to present the true performance of a particular business by recording revenue and expenses in the period in which they were incurred. Accruals in the accounting language can be understood as the timely recording of a financial event on the account, taking into account the principle of periodicity, without taking account of cash inflows or outflows. Accrued charges are recorded to the relevant account the effect of transactions and other events when the transactions and events are carried out and reported in the financial reports for the period and not when they are withdrawn or paid with cash or cash equivalents (Örten et al., 2011). In other words, it can be pointed out that, on an accrual basis, the resulting financial transactions and events in the enterprise are reflected in the financial statements without having to wait for the transactions to be converted into cash. Richardson, Sloan, Soliman and Tuna (2005) state that the cash account will be the only asset or liability item to be presented in the balance sheet because of the more comprehensive description of accruals, in the absence of accruals-based accounting. The reason why this is so is that other assets and liabilities are the result of accrual-based accounting. In other words, all assets except cash are included in the decision-making process

using accruals. Accruals are therefore a means of assessing and measuring performance by accounting revenue (Balsari et al., 2010). Because accruals are used as a key indicator that shows the performance of a business, it can be used to make the business performance look different from the actual position of managers. Subramanyam (1996) asked the question: Why do managers decide to use manipulation concerning accounting accruals. There are at least two aspects from which this issue is important. The first consideration is the interest of users of financial statements in how to interpret discretionary accruals and how to increase these numbers and how to reduce the reported earnings. The second aspect is the tendency of standards makers to take measures to limit the ability of managers to exercise discretion in the reporting process. This decision is based on the assumption that the exercise of their accounting discretion is carried out by managers for their benefit. The total accrual is divided into discretionary and non-discretionary accruals. Discretionary accruals are the accruals that emerge depending on the discretional power or unexpectedly, and they are also called abnormal accruals or unexpected accruals. Nondiscretionary accrual is also named as normal accruals, and they are the accruals that are related to routine operations of the enterprise. Discretionary accrual is generally used as a measure and an indicator of accounting policy choices of managers, and the degree of discretionary accruals is estimated (Certin and Ugur, 2005). The overall increment is the starting point that is important in measuring and estimating discretionary accrual. Several studies report that models that can measure accounting quality and thus earnings management divide the total accrual into a discretionary and non-discretionary accrual (Teoh et al., 1998). In some studies, as a result of this distinction, the discretionary accrual amounts are indexed to the total assets or the sales revenue amount, and the tendency that comes into view in this index by years is accepted to be the indicator of financial information manipulation devoted to various purposes. The discretionary accrual is indexed according to the total assets or the sales revenue amount, and the tendency that occurs in view in this index by given years is accepted to be the indicator of earnings manipulation (Tekin and Kabadayı, 2011).

Accrual Studies

There is a large extent of research examining the effects of characteristics of enterprises on earnings management practice, in which accrual plays a significant role (Khanh and Thu, 2019).

Table 1: The accrual-based earnings management models

Models	Year
The Ronen and Sadan model	1981
The Healy model	1985
The DeAngelo model	1986
The Jones model	1991
The Modified Jones model	1995
The Jeter and Shivakumar model	1996
The Beneish model	1997
The Teoh, Welch and Wong model	1998
The Margin model	2000
The McNichols model	2002
The Hribar and Collins model	2002
The Dechow and Dichev model	2002
The Larcker and Richardson model	2004
The Kothari model	2005
The Pae model	2005
The Stubben model	2010

The present review of the scientific literature in this area points to diversity (Novak Sedlackova et al., 2019) because each of the models uses the different intensity of measurement of earnings management (Hollowell et al., 2019). Ronen and Sadan (1981) created a model that first stimulated

the accrual modeling stimulus. It is based on the modeling of costs classified according to the profit and loss statement and also the analysis of long-term trends in the area of earnings development through a two-level regression model. The purpose of this model is to reduce earnings variability by generating a balanced figure that is close to the long-term average earnings, the so-called trend of income. In the following figure, we can see the process of balancing earnings showing two situations. The first situation is an overestimation of reported earnings when true earnings are below the trend line, which means that the enterprise does not get above the long-term trend. The second situation is the opposite, and therefore, true earnings above the trend line represent an underestimation of earnings for the enterprise.

Fig. 1: Smoothing around Trend Income

As part of the process of smoothing earnings, the individual items in the profit and loss account are timed as the enterprise is required to report total actual earnings. When estimating trend earnings, the reported earnings may also deviate from the trend. The deviation can move in both positive and negative directions. In case of a positive deviation of the reported earnings from the trend, the company can manage the earnings downwards and in case of a negative deviation again up (Ronnen and Yaari, 2008). The essence of the Healy model (1985) is the total accrual consisting of a non-discretionary accrual where the author assumes that its value is not always zero and a discretionary accrual different from the long-term average of the total accrual. The average overall accrual is perceived by the author as a differential variable, based on which it classifies the sample of the enterprises into three groups. The first group contains companies with the assumption of legal manipulation of earnings by increasing it. The other two groups of companies are focused on manipulating earnings by reducing them. The author concludes that the total average accrual in the first group of enterprises is evaluated using a pairwise comparison of the average total accrual in the two remaining groups of enterprises. When we subtract the non-discretionary accrual from the total average accrual, we get discretionary accrual. An increase or decrease in the accrual is accompanied by an increase or decrease in the enterprise's revenue, resulting in a deviation in the non-discretionary accruals estimate (Hoglund, 2012). A prerequisite for the DeAngelo model (1986) is the equality of the non-discretionary accruals and the overall accrual of the immediately preceding period, which results from the 'random walk' process to which the accrual meets. This model is a special case of the Healy model, where the non-discretionary accrual estimation period is limited concerning the immediately preceding period. For both models, the total accrual is used to estimate the expected non-discretionary accrual. The DeAngelo model and the Healy model can measure non-discretionary accrual flawlessly if the non-sparking accrual is steady and the mean discretionary accrual is zero. Which model is more appropriate to use is determined by the nature of the time series exhibiting the non-sparking accrual. Rather, the DeAngelo model is used to estimate a non-discretionary accrual that is consistent with the “random walk” process, while the Healy model estimation refers to the “white noise around average” process. The Industry Model relaxes the assumption that nondiscretionary accruals are constant over time. Instead of attempting to model the determinants of nondiscretionary accruals directly, the Industry Model assumes that the variation in the determinants of nondiscretionary accruals is common across enterprises in the same industry The power of this model to decrease the measuring error in discretionary accruals depends on two factors. The first factor is the fact that the Industry model meets only the change in the nondiscretionary accruals that

are common for the enterprises in the equal sector. If the changes in nondiscretionary accruals to a great extent reflect the changes special to the conditions of the enterprise then this model will not be able to exclude the discretionary accrual indicators from nondiscretionary accruals. The second factor is the fact that this model presents the discretionary accruals that are interrelated among enterprises in the equal sector. This situation can cause a problem with the existence of earnings management. The greatness of this problem depends on how related is the motive of earnings management among the enterprises in the equal sector (Yurt and Ergun, 2015). The Jones model (1991) takes into account the impact of changes in the economic situation in a business relative to the non-discretionary accrual, using independent variables, which are tangible fixed assets and sales, expressing their linear regression. According to this model, the profit series of individual enterprises are divided into two subperiods. The estimation period represents the first stage when the discretionary accrual value is zero. Jones's model expresses the relationship between the short-term accrual, the so-called. working capital accrual and change in sales, or the relationship between depreciation and long-term assets. With the help of regression, it is possible to estimate the necessary coefficients α0´, α1´, α2´. Consequently, estimates of these factors can be implemented in the second stage formula, which is the "event period" when the discretionary accrual value is not zero, which implies the existence of earnings management. Jones points out several assumptions of the model. The first assumption is that within the “estimation period” individual enterprises do not implement earnings management because this assumption points to its biased measurement. The second assumption considers that the coefficients do not change over time, which may have an impact on the selection of the set of individual enterprises (Hoglund, 2012). The third assumption is based on non-discretionary revenue and says that in the case of discretionary revenue management, some of the earnings may be removed from the discretionary accrual estimate. Jones's model contains the error I and II. type. A type of I error assumes the detection of earnings management, although it does not occur, by a type of II error is not revealing earnings management in case of its occurrence (Bernard and Skinner, 1996). Dechow, Sloan and Sweeney (1995), to improve the specification of the original Jones model, suggested adjusting the change in sales by a change in receivables. The modification aimed to reduce the error in the measurement of discretionary accrual if it was created using revenue. In the case of time series analysis, the first stage of non-discretionary accrual estimation is taken from the original model. The modified model assumes that any changes in sales revenue from the provided credit are the result of earnings management. It is questionable whether the proposed modification improves the original model. Another of the authors, Jeter and Shivakumar (1999), modified the original Jones model in which they defined cash flow from operating activities as a non-discretionary part of earnings management, trying to improve Jones's model to measure earnings management in companies with extremely reported cash flow. McNichols (2002) continued to modify the original Jones model by adding CF of the previous, present, and future periods. Teoh, Welch, and Wong (1998) adjusted the Jones model using the short-term accrual, which they expressed as the difference between the change in non-cash short-term assets and the change in short-term operating liabilities, thus identifying the non-discretionary part of the short-term accrual through business growth. Kothari et al. (2005) presented a modification of the original Jones model, also known as "performance matching", offering two approaches. The first is the matching of similar businesses, which alleviates the need to estimate the discretionary accrual by the least-squares method. The second, linear approach, involves taking into account the return on assets to regulate the performance of the organization. Author Beneish (2001) created a model focused on identifying earnings management from organizations dealing with significant financial performance, and examines actual earnings management occurrences, comparing the performance of the model to that of the aggregate accrual approaches, particularly the modified Jones by Dechow et al. (1995). The method establishes a distinction between GAAP violators and aggressive accruals. Peasnell et al. (2000) introduced an alternative model for accrual estimation, known as the so-called "Margin model". They used cross-sectional data to mitigate the weaknesses of the Jones model. They took a two-step approach from the original Jones model but used the working capital accrual as an estimate for the overall accrual and different explanatory variables - sales and customer cash. The authors argue that the Margin model generates relatively better specific accrual estimates when cash flow levels are extreme. They consider the original Jones model to be stronger in the case of manipulation through sales and bad debts. They consider the Margin model stronger in the case of cost manipulation detection. Hribar and Collins (2002) point out that calculating the accrual using balance sheet data can cause different

errors and that is why they detect earnings management using the total accrual (discretionary and non-discretionary accrual) calculated using the net operating cash flow reported in the cash flow statement. Dechow and Dichev's model (2002) focuses on working capital accrual and operating cash flow. The authors consider working capital and operating cash flow as short-term characteristics and therefore expect their changes during the year. Lacker and Richardson (2004) have added an accounting market ratio and cash flow from economic activity to the Modified Jones model to mitigate measurement errors associated with the discretionary accrual. The discretionary accrual represents the difference between the total accrual and the estimated non-discretionary accrual. The Pae model (2005) was created to estimate the discretionary accrual. Its goal is to increase the predictive power of the Jones model and the modified Jones model in the form of an expansion containing variables that capture operating cash flow. The Stubben model (2010) focuses on discretionary revenue, with the use of revenue to estimate discretion eliminates error measurements, thereby reducing data distortion. This model is more specific compared to other accrual models for three reasons. First, it assumes that discretionary revenue reflects the accrual of claims and that accrual of claims is more directly related to revenue than the working capital accrual. Second, the model takes account of reported revenue rather than cash receipts. Third, it examines the accrual of claims separately in the fourth quarter, as they are less likely to be recorded before the end of the year. The result of this model is to avoid excessive discretion when revenue for the fourth quarter is relatively high or to understand discretion when revenue is relatively low.

Revenues recognition and total accrued balances

Empirical research contributions have explained earnings management in connection with the detection of accruals. If there is a discrepancy between the timing of cash flows and accounting recognition of the transaction, accruals are increased. A substantial example of this is revenue recognition. The following table shows the accrual process by the medium of recognition of revenues after customer advance cash and before total collection.

Table 2: The accruals process and revenues recognition

Period	Event	Cash flow	Accounting recognition of revenues	Accrual
1	Advance from a customer	Inflow of advance	-	Increase in unearned revenues
2	Shipment of merchandise to the customer	-	Recording of revenues	Increase in accounts receivable
3	Customer settles his account	Inflow of the final payment	-	The decrease in accounts receivable

From the table, we can see that advance from customer causes a liability called unearned revenues. In the next period, the goods are delivered to the customer, which results in a decrease in unearned revenues, and at the same time, there is an increase in accounts receivable. The final payment from the customer decreases the assets called accounts receivables. Revenues reported by an enterprise must equal total cash inflows and total accrual must equal zero. The result of this equality is the accrued balance of assets and liabilities reverse and thus in our case after the customer receives the delivery of goods the unearned revenues liability is reduced to zero and after the customer settles his account the accounts receivable assets are reduced to zero.

Total accrued balances of an enterprise in a given period can be expressed by the equation:

$$EBTA_{it} = DA_{it} + NA_{it} + Reversal_{it} + EBTA_{i,t-1} \quad (1)$$

where:

$EBTA_{it}$ ending accrued balances of an enterprise in period t

DA_{it} discretionary accrual of enterprise resulting from transaction and events occurring in period t

NA_{it} non-discretionary accruals of enterprise resulting from transaction and events occurring in period t

$Reversal_{it}$ The reversal in period t of balances accrued by the enterprise in the previous period t-1

$EBTA_{i,t-1}$ accrued balances of an enterprise in period t-1

Based on the above equation for calculating total accrued balances, we suppose that an enterprise makes 800€ sale and a normal credit period is 30 days. Sale can not be made without deallocation of credit policy and that is why an enterprise boosts its earnings by agreeing to 50% in 30 days and the remaining 50% payment in 60 days. The following table shows the decomposition of account balances and accruals.

Table 3: The Total accrued balances of an enterprise

Indicator	Period in months			
	1	2	3	Total
EBTAi,t-1	0			
EBTAit	+800	400	0	
DAit	+400			+400
NAit	+400			+400
Reversal		-400	-400	-800
Total				0

Based on this table we can see that in the first month both non-discretionary accrued balance and discretionary accrued balance increase by 400€. In the following month, the non-discretionary accrued balance is reduced by 400€. In the third month, discretionary accrued balance is reduced by 400€. The payments of 400€ in the second and third months represent reversals which make safe that changes in accrued balances are equal to zero.

The ability to manage earnings is narrowed by the reversals of accrued balances. We focus on revenues in the current period, which is increased by delivering unsolicited goods to the customer. Based on the unsolicited delivery of goods, the claim and return of goods from the customer are expected in the following accounting period. This is the so-called channel stuffing whose goal is restructuring of transactions when customers are offered excessive discounts to make early purchases to support sales. The revenues in the following accounting year are thus reduced by sales returns and accounts receivable accrued balance thus reverses. We suppose that in the following period unmanaged earnings and expected reported earnings will be equal. That is why the enterprise has to redouble managed earnings for compensation of the negative impact of the reversal of earnings management from the previous period. Reversals are important but the most empirical research ignores them because they are undetectable. The most empirical research contributions compare total accrual with a divergence between ending and beginning accrued balance. It can cause an error in the measurement of accruals. The following figure gives an example.

CASH			ACCOUNTS RECEIVABLE			SALES	
BB	50		BB	80			
	1800		NDA	200			2000
			DA	50			50
	80				80 (Reversal)		
EB	**1930**		**EB**	**250**			**2050 EB**

Fig 2. The Difference between the beginning and ending accrued balances

The beginning balance (BB) of cash is 50€ and the beginning balance of accounts receivable is 80€. Beginning accrued balance of accounts receivable is paid in the current year. Enterprise realizes two sale transactions. The first transaction represents the normal sale of 2000€. This sale causes an increase in non-discretionary accruals (NDA) by 200€. The second sale represents channel stuffing that causes an increase in sales and discretionary accruals (DA) by 50€. The change that occurred in balances of accruals is 170€ which was calculated as 250€ minus 80€. It is equally as differences between earnings and cash flow which was calculated as 2050€ minus 1880€ but we can see that total accrual consisting from non-discretionary accrual and discretionary accrual is 250€ which was calculated as 200€ + 50€. A reversed beginning balance of 80€ caused this difference. If the beginning balance was not paid in the current year, the difference between beginning balance and ending balance reflects total accrual consisting of non-discretionary and discretionary accruals as would difference between revenue and cash flow. Based on the example we can see that many empiricists ignore reversals and they implicit correct for the omission by relating their measured accruals to the difference in sales rather than to sales. Measurement of accruals which is done by ignoring reversals is defeated in all that managers purposefully accrue during the current year.

Conclusion

As noted above, most of researched studies has identified earnings management with the detection of accruals. Accruals arise when there is a discrepancy between the timing of cash flows and the accounting recognition of the transaction what we illustrated through an example focused on revenues recognition and total accurate balance. We found that advance from customer causes a liability called unearned revenues. The final payment from the customer decreased the assets called accounts receivables. Revenues reported by an enterprise had to be equal total cash inflows and total accrual had to be equal zero. The result of this equality was the accrued balance of assets and liabilities reverse and thus in our case after the customer received the delivery of goods the unearned revenues liability was reduced to zero and after the customer settled his account the accounts receivable assets was reduced to zero. Then we explained example relation to reversals where we pointed out the difference between the beginning and ending accrued balances and we found that if the beginning balance was not paid in the current year, the difference between beginning balance and ending balance reflects total accrual consisting from non-discretionary and discretionary accruals as would difference between revenue and cash flow. Based on the example we could see that many empiricists ignore reversals and they implicit correct for the omission by relating their measured accruals to the difference in sales rather than to sales. Accrual measurement, which is done by ignoring reversals, is defeated in everything that managers intentionally gain during the current year, which can lead to the use of earnings management.

Abstract

Strategic management in the environment of non-profit organizations is a frequently discussed topic. Strategic management in the conditions of non-profit organizations is based on the concepts that are applied in the conditions of companies. The comparison of strategic management in the commercial and non-profit sector brings some differences. The most important difference is that the non-profit organization bases its management on its mission, which is superior to all partial processes, decisions and tasks that take place in the non-profit organization. The article focuses on strategic management in the conditions of these organizations and its aim is to identify a suitable method that would be universal and could be applied to the management of non-profit organizations, regardless of the subject of activity. As there are no specific management concepts that would be created exclusively for the non-profit sector, we decided to deal with two selected concepts - the classical and BSC method. We used the comparison methods that were used to assess the suitability of the classical control concept and the BSC control method, and based on the comparison, we chose the appropriate method, which we subsequently modified. The hypothesis was chosen on the basis of specific elements of non-profit organizations, namely that it will be necessary to modify the selected concept of management in non-profit organizations so that strategic management corresponds as much as possible to the needs of non-profit organizations.

Keywords: Non-Profit Organization, Strategy, Strategic Management, BSC Model

Introduction

Compared to the business sector, the non-profit sector is specific with certain features. When we look at the non-profit sector as a separate area of the national economy, the primary difference that distinguishes it from the commercial sphere is that its primary goal is not to make a profit. It consists of non-profit organizations whose goal is to provide public services (Drucker, 2016). These services are provided in various areas of the country's economy - e.g. in the fields of health, education, science and research, culture, child and youth work, protection of human rights, etc. Anheier and Salamon specified 5 basic aspects that are characteristic of non-profit organizations:

1. non-profit organizations have a formal structure; that means they are to a certain extent formalized, respectively. institutionalized,
2. are of a private nature, which means that they are to a certain extent separate from the government;
3. they do not make a profit, so they are unprofitable. Thus, they do not have a primary goal of making a profit. Although non-profit organizations can make a profit, it is never distributed to the owners, but is

returned to the non-profit organization's budget and is used to cover the activities of the non-profit organization.
4. they are self-governing, which means they are not dependent on being run by the state.
5. they are voluntary, so their activity, as mentioned above, is based on the work of volunteer workers (Anheier and Salamon, 2000).

In the current economic environment, great emphasis is placed on the management system in non-profit organizations (Borisova, et al., 2019). As there is no separate concept governing the management system for non-profit organizations, we must rely on the concepts used in the business environment. Any management of organizations, companies or people is currently based mainly on business area (Crotty and Ljubownikow, 2020). The comparison of a non-profit organization and a business entity brings several differences, even in the field of management.

Unlike commercially oriented companies, non-profit organizations work with a more complex system of organizational goals (Drucker, 2016).

Another difference is that personnel management is more complex for non-profit organizations than for companies, because many people with volunteer status can work within a non-profit organization. In the case of non-profit organizations, great emphasis is placed on the financial aspect, because the main source of funding is contributions from donors, which are obtained mainly from the external environment. In some cases, a non-profit organization may make a profit and it automatically becomes part of the funding source and cannot be distributed among the owners of the organization. Even in the case of non-profit organizations, the monitoring of financial results allows the prediction of financial stability in future periods (Bartosova and Kral, 2017).

Financial management undoubtedly belongs not only to the business sector, but also to non-profit organizations. These organizations must constantly seek sources of funding and
and decide how to combine them so that they can fund all their activities. Valaskova et al. considers financial behavioral aspects of decision-making itself to be key in financial decision-making, as they can be used to explain why some market areas appear ineffective for organizations (Valaskova, et al., 2019). In financial management, the author Brabenec recommends to use modern methods of financial management in the conditions of current markets (Brabenec, 2010).

It is important that the non-profit has a developed area of management, on which the success of the non-profit organization in the target market depends. According to Blazek, the term management means the process within which the control object, ie. the individual or group sets goals and, depending on the behavior of the managed entity, then selects appropriate tools, techniques or procedures, through which the effective achievement of the set goals will be ensured (Blazek, 2014). Another definition looks at management as a process of coordinating the activities of a group of workers, which is carried out by an individual or a group of people in order to achieve given results that cannot be achieved by individual work alone (Donelly, et al., 1997).

The concept of strategy is also closely connected with the management system. We can understand the strategy as a direction that must be followed in order to achieve the set goals. Even in the conditions of non-profit organizations should be determine strategies that will enable them to achieve and also maintain a competitive advantage (Chijioke, et al., 2019). This is the overall process of steps that we need to take to meet the objectives set. As part of strategic management, non-profit organizations try to reconcile the internal environment of the organization with the external environment, which takes place at a professional level (Bryce, 2017). The result of this process is a strategy that determines the development and direction of the non-profit organization, specifying the way in which the set goal will be realized. Author Drucker considers strategy to be an essential tool through which an organization can translate intent into the end result (Drucker, 2016). By Nica, et al. considers it advantageous to use artificial

intelligence to evaluate the success of strategic decisions that have been made in the organization. (Nica, et al., 2019).

Authors Donnelly, Gibson and Ivancevich define strategic management as a process that consists of examining market conditions, customer needs and expectations, a process that specifies strengths and weaknesses, as well as a summary of the effects of the internal and external environment. These aspects can bring interesting market opportunities for non-profit organizations, but on the other hand, the organization learns about possible threats in the market. (Donelly, et al., 1997). It is very important to deal with market risks, because they are an important factor in influencing the competitiveness of organizations operating in the market (Hudakova, et al., 2018). The author of Cera is of the opinion that younger non-profit organizations may be more vulnerable in terms of their strategic management compared to organizations that operate on the market for longer (Cera, et al., 2019). The strategic levels that are part of strategic management are shown in Figure 1.

Figure 1: The parts of strategic management

Source: own processing

Alani, et al. states in its publication that strategic orientation is considered a principle through which organizations are able to innovate (Alani, et al., 2019).

Author Hagoort, in turn, distinguishes three dimensions of strategic management, among which he included: context, content and process. The first dimension is the context, which includes internal and external aspects. The subject of the internal context is the internal organization of the organization, organizational structure and also strategic performance. The content of the external aspect of the context is represented by competitiveness and other factors that have an immediate influence on strategic decision-making (Hagoort, 2001). By Olah, et al. considers trust in organizations to be a crucial element in building an organization's competitiveness (Olah, et al., 2017). Strategic decision-making belongs to another, second, dimension, namely content. The content focuses on the emergence of the mission and value systems. The last dimension, the process, already brings concrete solutions, which consists in the selection of a specific strategy that can best achieve the set goal and also determines how the organization will implement it in practice (Hagoort, 2001).

Methods

In this part of the article we deal with the comparison of two models of concepts that can be used in the environment of non-profit organizations in connection with their strategic management.

The first model is based on the classical approach to strategic management and the second model is based on the BSC method, which can also be applied not only in the commercial sector but also in non-profit organizations.

Classic concept of strategic management

The basic premise of an effective strategy is the creation of a certain structure or framework. The strategic framework of the basic concept is applicable in the for-profit, commercial sector as well as in the non-profit sector in the conditions of non-profit organizations. The output of strategic management is the compilation of a strategic plan. In the context of non-profit organizations, the strategic framework would include the following aspects: the most important is the mission, which is superior to the management in the organization. Another important aspect is to perform the analysis, both in the context of the company's internal environment as well as in the external environment. Based on this analysis, the non-profit organization is able to specify the opportunities in the market, or market gaps that it can use to its advantage and, on the other hand, can identify threats that may pose a disadvantage for its market operations. The strategic framework within the classical concept is shown in Figure 2.

Figure 2: Strategic planning framework in non-profit organization

Source: own processing

Mission

The starting point of any strategic planning is the mission itself, which gives us information about what are the intentions and reasons for the existence of the organization and also its goals. The mission describes the direction of the organization in the long run. Its essence is therefore the setting of long-term goals and the related determination of an appropriate strategy, thanks to which these goals will be achieved. The mission of a non-profit organization should meet the following conditions: it should be clear, concise, concretely formulated so that the mission is understood by all members of the organization and they do everything possible to ensure that the mission is fulfilled.

Environmental Analysis

This analysis is aimed at examining the environment in which the organization operates. For a non-profit organization, the external environment represents a set of factors of a wide environment, which create a certain framework, certain conditions within which it carries out its activities. We could mention factors such as political, cultural, environmental, social, technological, political and legislative conditions in their specific form over the time horizon under consideration in terms of strategy-making. The immediate surroundings of a non-profit organization are persons to whom public benefit services are intended, this also includes other non-profit organizations that pursue the same or similar purpose as the considered non-profit organization and also donors, the public, financial institutions, etc. The analysis of the environment provides the non-profit organization with information about possible threats and opportunities in the market.

Internal Analysis

The internal analysis focuses on identifying the strengths and weaknesses of the organization itself. The most effective way to examine the internal environment is to conduct an audit of the organization, through which it is possible to identify key problems of the organization. The data obtained then help to identify priority problems and their solutions. The basic issues that should be addressed in the internal analysis are the following:

• What is the nature of the programs that the organization provides?
• Who are these programs for?
• What is the level of success of each program?
• How does society perceive the programs?
• What score do we achieve compared to a similarly focused non-profit organization?
• How can we improve individual programs?
• What are the costs of each program?
• Who runs a non-profit organization?
• At what level is the remuneration of the organization's employees?

In strategic management, we must therefore take into account the following elements: At the top of the entire management is the mission of the organization. Based on the mission of the organization, we can perform an analysis of the external environment and an analysis of the internal environment. After performing the analyzes, the strategy itself comes into play. The strategy needs to be planned and must also include a financial framework, ie. a budget must also be planned for the strategy, when the organization must set aside a certain amount of money that it will invest in implementing the strategy in practice.

S*trategic Management According to the BSC Method*

The BSC method is used to measure the performance of organization or enterprise. This method connects the individual goals of the organization and serves as a means to sustain the goals and strategies of the non-profit organization. It presents four perspectives that allow to achieve an optimal, balanced state between short-term and long-term goals, as well as between outputs and processes, while the basic intention is to achieve the so-called. integrated strategy. In the basic context, the objectives of the strategies are divided into four areas, which are as follows:

A) Financial perspective: this is an essential area, as it points to improvement, resp. deterioration the financial performance of an organization when we implement a specific strategy. For non-profit

organizations, it is necessary to consider the relationship to public administration and whether certain financial success can be achieved.

B) Customer Perspective: This focuses primarily on the customer, respectively user of the service provided and evaluates the level of satisfaction of the needs of the target subject.

C) Internal Processes: these are all processes that take place within an organization and must be effectively applied to meet customer needs. Any non-profit organization should endeavour to ensure that, in an area in which it excelled and to meet the expectations of donors who have provided it with the funding to ensure its mission and activities.

D) Learning and Growth: This aspect is directed towards the inside of the organization and pursues the improvement of abilities of the staff working for the non-profit organization. In this case, the question is whether we can improve services even further and whether we are able to make changes.

The basic principles of the BSC method are as follows:

• clarification and updating of the strategy, through which we can focus on future periods;
• the strategy is analysed within the organization and thoroughly discussed;
• the sub-objectives of the individual departments are linked to the overall strategy;
• obtaining feedback on the performance of individual processes;
• we can specify the threats and risks that exist in the market.

The prerequisite for any strategy is the specification of long-term goals and related sub-goals. The BSC method is used to measure the performance of a given organization. This method connects the individual goals of the organization and serves as a means to sustain the goals and strategies of the non-profit organization. It presents four perspectives that allow to achieve an optimal, balanced state between short-term and long-term goals, as well as between outputs and processes, while the basic intention is to achieve the so-called. integrated strategy. In the basic context, the objectives of the strategies are divided into four areas, which are as follows:

The aim of the article is to compare selected concepts for strategic management in the environment of non-profit organizations and to select a suitable variant that would be more effective in terms of management of these organizations. Part of the goal is also to determine whether the selected concept can be applicable to non-profit organizations without modification, inasmuch as the strategic management is based on concepts that are primarily intended for enterprises. We work with the hypothesis that a concept that is applicable in the business environment will require some modifications for use in non-profit organizations.

Results

Based on the analysis, in which we assessed selected conceptual approaches to strategic management in non-profit organizations, we would recommend the use of the BSC method. We consider the BSC method to be a more suitable method precisely because it is possible to link the set goals of the organization to the final context of the overall strategy. The essence in this case is to maintain a balance within the organization and its organizational structure, with great emphasis on internal communication. Although the BCS method is applied in practice mainly in the conditions of enterprises and measuring their performance, in our opinion, it would bring beneficial effects in the environment of non-profit organizations. We have created a universal framework for solving strategic management in non-profit organizations to streamline the results of their activities in the future.

In the basic sense, the BSC strategy is implemented on the basis of four key areas, which include the area of customers, finance, growth and internal processes. In the conditions of non-profit organizations, we would recommend modifying these areas into the following units: the financial area, the public, the internal processes of the organization and cultivation. According to the modified areas, the strategic framework of the BSC method would look like this:

Figure 3: Modified framework according to the BSC concept for use in the environment of non-profit organizations

Source: own processing

As for the area of finance, it is very specific in the case of non-profit organizations. Since non-profit organizations are not created for profit, we cannot count on profit as a source of funding. In the conditions of non-profit organizations, funding is dependent on contributions from donors, from which they cover their activities. It is from this point of view that we propose that non-profit organizations address the following issues when applying strategic management within the modified form of the MSC method:

• How do we ensure the financial stability of a non-profit organization?
• How correctly will we present our position to potential donors?
• How do we want to maintain stable relationships with our existing partners?
• How do we intend to establish new relationships?
• How will we allocate resources with respect to the organization's mission?
• At what level are we able to transform the mission into a fundraising system?

The second area after the modification of the BSC method is presented by the public as another key area for non-profit organizations. In this case, we recommend non-profit organizations to place great emphasis on communication with the public, based on which the non-profit organization can assess at what level the services are provided to target entities, or which service would be welcome for specific target entities, etc. The basic issues that should be addressed in relation to the public are the following:

• What services do we include in our program?
• What is the interest in the provided program?
• What is our target segment?
• What can we do to increase the target group's interest in our services?
• What communication channels do we choose?
• What resources are we able to allocate for communication and marketing purposes?

Internal processes should be understood as the arrangement and structure of goals within the organization. We would highlight this area the most, mainly due to the fact that the balance in the fulfillment and balancing of goals at the next levels of the strategy depends to a large extent on internal processes. The initial definition of internal processes and the subsequent formulation and control of partial goals can achieve a balance within the non-profit organization, and it is thanks to this that goals that are outward-facing, towards people, can be effectively fulfilled. In this area, we emphasize the following questions that every non-profit organization should ask itself:

- What is the formal structure of our organization?
- What are the informal relationships in the internal environment of the organization?
- Who has the specific tasks and why?
- Is our work structure sufficient within the current needs of the organization?
- Can we respond flexibly to change?
- Does our non-profit organization enable the provision of retraining and training for its employees?
- What is our remuneration system and how is it set up? Should changes be considered?

As for cultivation, it should proceed through all levels of the strategy, because cultivation is directly linked to the mission of the non-profit organization. Through it, there are partial penetrations with the area, which focuses on the target market segment and undoubtedly also with the area of internal processes. To some extent, the area of cultivation should focus on linking and then balancing the mission and internal processes. In this case, we are talking about inward cultivation of a non-profit organization, ie. applies to members, volunteers and all staff. In the case of outward cultivation, we would be talking about cultivating a specific segment of the market, that is, the people we are targeting. Within this section, non-profit organizations should address their own revitalization program, training of employees in specific key activities, e.g. this could be capacity building for executives related to the leadership and management of a non-profit organization.

Regarding the individual proposed areas of strategic management applied through the BSC method and the connection with the objectives for the given area, we propose the following matrix, which it can be understood as a universal matrix of strategic management. This matrix would serve as a model for strategic management solutions for non-profit organizations, and each organization could tailor specific goals to its subjective needs. The figure 4 shows the proposed matrix for application in the conditions of non-profit organizations.

	Program	Realization	Public Administration	Private sector
Finance	Sufficient amount of resources for a quality program, redistribution of funding sources.	Search of donors, sustainability of existing relationships with donors, partial self-sufficiency.	Financing through multiple sources, balanced budget.	Financing through multiple sources, balanced budget.
Public	Knowledge of the target group, knowledge of quality requirements and an overview of the interest in the service provided.	Appropriate marketing strategy targeted at a selected segment.	Communication, awareness, support.	Support of public events, public interests and support of communities.
Internal Processes	Openness, creative environment, perfect knowledge of the internal environment and relationships in the organization.	Professionalism, organizational structure, formal relations, quality of processes.	Financial management, management plan, compliance with the established plan, marketing strategy connected with fundraising.	Financial management, management plan, compliance with the established plan, marketing strategy connected with fundraising.
Cultivation	Education, enlightenment, personal development, communication.	Education, training, employee innovation, personal development, growth.	Public impact, awareness.	Public impact, awareness.

Figure 4: The matrix of universal solution for strategic management in the environment of non-profit organizations according to the BSC method

Source: own processing

In order to balance all levels of the strategy, it is necessary to understand the following matrix from both a horizontal and a vertical point of view. The vertical axis is represented by four modified areas of the BSC method, and the horizontal axis shows four key areas that are part of the existence of each non-profit organization: its own program, method of implementation, public and private sector. The areas of the horizontal axis form the internal and external environment of the organization. The internal environment includes the program and method of implementation, and the external environment is represented by the private and public sectors. The inside of the matrix consists of basic goals that correspond to the intersection of the individual elements of the horizontal and vertical axis of the matrix and to which non-profit organizations should pay attention.

Discussion

Regarding strategic management in the conditions of non-profit organizations, we recommend non-profit organizations to deal intensively with this aspect, because the external environment is constantly changing and needs to adapt to it. Certainly, even in cases where organizations feel the need for change, they should not be afraid of change, and we would recommend them not to be afraid to start a possible restructuring. They can use the concept of strategic management and our proposed modified model on this issue, based on which it is possible to achieve better performance of the organization. (Dobrovic, et al., 2019) The models of strategic management in the environment of non-profit organizations are also recommended to be used by the author Dobrovic, et al.

In particular, the condition in the market is that the ever-changing environment places ever-increasing demands on these organizations and, if they are to survive and continue to function in the market, they must withstand all threats in the market. We see as a possible solution the constant evaluation of the market, market conditions and finally the approach to restructuring through the concept of strategic management. By Caryl, et al. considers process monitoring in today's economic environment to be necessary (Caryl, et al., 2019). Carvalho, in turn, considers it important that non-profit organizations place increasing emphasis on their responsibility within their mission (Carvalho, et al., 2019). In the concept of strategic management in the conditions of non-profit organizations, it is important to address the question of whether organizations are interested in strategic management and also how they perceive the need for strategic management. It is important to specify the reason why the non-profit organization wants to implement the selected strategy in practice. According to Kral et al. In creating a strategic framework, the criteria that managers of non-profit organizations consider to be the most important should be carefully identified (Kral, et al., 2019).

The hypothesis we worked with - the concepts for strategic management applied in the conditions of commercial enterprises will require certain modifications has been verified. The chosen BSC model as a more suitable variant for strategic management in the environment of non-profit organizations was changed for use in these organizations.

Conclusion

Strategic management is an important element in the environment of non-profit organizations and it is through the quality of strategic management that the organization can gain a competitive advantage. It is very difficult to assess at what level non-profit organizations have strategic management, but we consider it important that they deal with this issue carefully. Strategic management is reflected in the quality of market research, on the basis of which a non-profit organization can identify the market environment in which it operates and adapt the concept of strategic management to it.

In this paper, we recommended the use of a modified BSC method for strategic management, in which a matrix was designed with the basic elements and corresponding objectives that every non-profit organization should address with an emphasis on improving its competitiveness and performance. Only if the non-profit organization cares about the quality of strategic management and has perfectly answered questions in terms of its existence, then it can be assumed that there will be a positive effect in the form of increasing its competitiveness.

Acknowledgements

The paper is an output of the science project VEGA 1/0544/19 Formation of the methodological platform to measure and assess the effectiveness and financial status of non-profit organizations in the Slovak Republic.

Abstract

The purpose of the paper is to analyze and evaluate health and safety at Primary Health Care (POZ) facilities. In the paper, the results of research conducted among medical and support staff have been presented. In the research, the behavioral safety improvement methods dedicated to the medical industry and a questionnaire, which is a tool assessing the effectiveness of the methods have been used. The obtained results confirmed the need to implement the behavioral-based safety concept (BBS) based on behavioral observation, thematic training and supporting materials in Primary Health Care facilities. It has been noticed, that knowledge about safe behavior and awareness of occupational hazards as well as their effects are not in the same level among all POZ employees. In practice, work safety is not treated by all employees as the supreme value. Therefore, there is a great need to shape safe and accident-free behavior of Primary Health Care facilities employees using selected methods of the BBS concept.

Keywords: behavioral-based safety, occupational hazards, Occupational Health and Safety, OHS, safety management, healthcare institution.

Introduction

This section should follow keywords. This section should provide background of the study and highlight research motivation. Medicine and management are scientific disciplines that operate on very different theoretical levels and use various activities in practice (Bukowska-Piestrzyńska, 2011). At a time when medical service providers are very prosperous enterprises, more and more attention is paid not only to the type and amount of services provided, but also to aspects related to the management of such a specific organization. The specificity of facilities providing medical services includes, next to the basic elements (employee, customer, service, product), there are factors of high occupational risk. This high risk for loss of health (and even life) results from exposure to factors occurring in the work environment. Both employees of institutions who are so-called internal clients are exposed to them, as well as external clients, i.e. patients. These threats are related to hazardous (accident) factors, but also onerous or harmful factors, which in turn include physical, biological, chemical and psychophysical factors (Ulewicz i inni, 2015). In the light of the data, the European Agency for Safety and Health at Work (EU-OSHA), over 10% of European Union employees is employed in the health and social care sector. This sector belongs to the largest employing sector in Europe and includes a large group of various professions, including doctors, nurses and so-called auxiliary medical staff (support staff). This is a feminized sector, with 77% of the workforce being women. In addition, in the health sector the incidence of accidents at work is 34% higher than the average for the entire European Union, and the sector itself is in second place, right after construction, in terms of the incidence of work-related

musculoskeletal disorders (European Agency for Safety and Health at Work, 2019). The main risk factors in the health sector of the European Union and related health problems are primarily the abovementioned musculoskeletal loads resulting from faulty body postures while performing work and incorrect lifting and carrying of weights (Niciejewska & Klimecka-Tatar, 2016). In addition, the European Agency for Safety and Health at Work (EU-OSHA) draws attention to biological factors - microorganisms, contaminated blood, viruses, e.g. HIV or hepatitis B, as well as accidents at work, which are in the form of micro-injuries, cuts, punctures, etc. Also chemical agents present in the work environment of health care are a group of risk factors indicated as the main ones. These include especially disinfectants, anesthetic gases, and antibiotics. These compounds may be harmful to the skin or respiratory system, and may also be carcinogenic. More important risk factors in health care also include shift work hazards, especially at night, which are associated with many undesirable phenomena and behaviors - fatigue, a decrease in the level of physical and mental fitness, mistakes resulting from reduced attention and concentration, etc. Increasingly, in the European Union countries, attention is being drawn to threats that are difficult to identify. These are threats belonging to the psychosocial group, including aggression of patients and their family members, which is not rarely in the form of physical and psychological violence against a healthcare professional (European Foundation for the Improvement of Living and Working Conditions, 2016). Research on working conditions as well as occupational hazards in healthcare, conducted by EU-OSHA, is reliable and well documented. In Poland, there is still a lack of reliable research on working conditions and the identification of hazards in health care, especially when it comes to the professional group of primary care physicians who work in Primary Health Care Facilities (POZ). This is a professional group that is on the so-called "First line" of patient relationships. Therefore, it is most exposed to threats, which in literature are called "new and emerging", often difficult to identify, analyze and evaluate. It is also the most numerous among all others group of medical specialists (general practitioner or internal diseases). According to the Supreme Medical Chamber, as at 31 December 2018, the number of doctors specializing in "internal diseases" (professionally active) is almost 29,000. The given number of all practitioners (professionally active) and belonging to the regional medical chamber (hold a professional title) as at 31 December 2018 was almost 138,000, the aforementioned group of doctors constitutes almost 21% of the total Supreme Medical Chamber - based on on the Numerical Statement by field and level of specialization, (www.nil.org.pl of February 5, 2019).

The medical profession treated for years as a special calling, today it is subjected to a test determined primarily by social phenomena, i.e. a decrease in respect for the medical profession, claiming patients, aggressive family members of patients, media campaigns, numerous processes related to errors made by doctors. The medical profession has a very long educational path. It is estimated that a doctor achieves professional capacity at the age of 27, and full professional development at the age of 34-35. Due to the economic situation, this period is not rarely extended to 39-44 years of age. The upper age limit for the exercise of the medical profession is not restricted by age. The limitations are psychophysical fitness and the possibility of medical practice (Irzyniec & Konodyba-Szymański, 2010). Therefore, the professional career of a doctor can be divided into two main periods - the period of acquiring knowledge and full activity and professional fitness (on average up to 42 years of age), and the period of subsequent work, which sometimes lasts over 30 years (Lewandowski, Niciejewska & Marjański, 2019). The work of a doctor is associated with a number of occupational hazards with which their have contact almost every day. Exposure to these factors is also significant. Despite the legal basis on medical activity, which specifies the working time of doctors employed in a medical entity not exceeding 7 hours and 35 minutes a day and an average of 37 hours and 55 minutes a week in an average five-day working week, there are cases of non-compliance with these guidelines (Polish Act of 15 April 2011 on medical activities, Journal of Laws of 2018 0.2190). It can only be assumed that the consequence of non-compliance with the rules of occupational hygiene, i.e. breaks and rest after work, may couse medical errors, accident occurrences, illness and even death. Literature and

available scientific papers on the subject discussed also indicate a failure to comply with the doctor's working time as a threat which in turn carries a high risk of health loss and even life, both for the doctors themselves and their patients (Irzyniec, Konodyba-Szymański & Szczerba, 2010).

Previous studies on occupational health and safety in the environment of healthcare professionals, including doctors, clearly indicate the occurrence of many and very diverse threats. The available literature indicates above all biological hazards that result from the specifics of the work. It includes many activities that can lead to, among others for blood-borne infections (Gołofit-Szymczak & Górny, 2019). According to the World Health Organization (WHO), out of 35 million medical workers globally, up to 8-10% are exposed to pathogens and the possibility of infection. It is estimated that as many as 2 million can be infected with HBV, less than 1 million with HCV, and about 170 thousand with HIV. In Poland, HCV infection is a significant clinical, epidemiological, economic and social problem. It is a serious health threat for medical workers employed in health care entities, including doctors (Sierpińska, 2017). Microorganisms that are transferred in the bioaerosol fraction are another threat in the doctor's work. The transmission of viruses that cause SARS and influenza (e.g. avian influenza viruses, also known as ”bird flu”, swine influenza virus (SIV) known as ”swine flu”) is also very dangerous. Among the "new" biological threats should be mentioned those that did not exist until the 70s of the last century. These are allergic hazards caused by latex that creates medical gloves. The problem of "dangerous gloves" mainly concerns surgical specialties. Chemicals, in turn, that may pose a threat to doctors are disinfectant drugs and preparations. Chemical compounds used in oncological and antiviral treatment are among the most dangerous. Anesthesia gases are also a group of dangerous compounds for the health and even life of doctors (Żółtańska & Bujnowska, 2010). In turn, the so-called "old-classic" physical factors of occupational risk for physicians include, first of all, noise, vibrations, microclimate, lighting, dustiness etc. Ionizing radiation from X-ray machines or electromagnetic radiation of physical therapy apparatus is particularly serious. There are still old devices in Polish branches that are still in operation and pose a threat to the health and life of employees who operate them (Makowiec-Dąbrowska i inni, 2010). Some of the more recent physical hazards include those associated with laser techniques. Emission of harmful fumes and dust originating, among others from damaged tissues are chemical (toxic compounds) and biological (bioaerosols and viruses) (Dutkiewicz & Górny, 2002).

In the literature on the subject relatively little space is devoted to psychophysical threats, especially psychosocial ones. These threats are difficult to identify and thoroughly analyze and evaluate. For many years, this type of occupational hazard was neglected and even underestimated. Recently, the topic of psychosocial risks occurring in the work of doctors is more often addressed by specialists and scientists. And all this as a result of special programs and campaigns promoting health and safety in healthcare facilities. The European Agency for Safety and Health at Work conducts research on the risks of 'new and emerging', also in the work of medical doctors (European Agency for Safety and Health at Work, 2019). When considering the topic of conditions of medicals work, it should not be ignored the topic related to work-life balance. Shift work, especially at night, causes a large psychophysical burden on work, especially doctors, who often practice their profession in several facilities, stretching the day to the maximum. Thus, they do not maintain the principle of balance between work and leisure. Health effects in the form of initial symptoms - musculoskeletal disorders, food disorders, circulatory disorders - are the beginning of many diseases, occupational diseases and even accidents at work (Zużewicz, 2017).

Generally, one may be tempted to state that there is a lack of reliable identification of threats in the group of doctors (medicals), especially in the largest group due to the type of specialization - "first contact" doctors working in POZ facilities. There is a lack of effective methods for shaping safe

and accident-free behavior among medical staff and support medical staff. In many organizations, including health care facilities, building awareness in the field of occupational health and safety (OHS) is limited to compulsory training. In everyday work, shaping this awareness often takes the form of superiors' orders and prohibitions. This approach to broadly understood work safety does not give measurable effects in the form of even a reduction in the number of accidents at work. There are still a large number of accidents in Poland (although in 2018 there was a 4.6% decrease in incidents compared to 2017) at work, the main reason for which is the human factor, especially the inappropriate behavior of employees when performing tasks on position (GUS 2018, PIP 2019). In addition, the fatal accident rate places Poland in fourth place from the end in Europe (Eurostat 2019), and expenditure on benefits from the accident fund in Poland is rising (PIP 2019). There are many methods and tools by which employers try to shape the awareness of safe work among their employees. Increasingly, medium and large enterprises observe, for example, employee involvement in matters related to the safety of employee tasks - identification of occupational hazards, assessment of occupational risk and all preventive measures as well as promoting safe behavior at work (Niciejewska & Klimecka-Tatar 2017, Niciejewska & Klimecka-Tatar 2018, Ulewicz et al. 2015; Wolniak, 2019). One of the concepts that affects the elimination of undesirable behaviors in the work process is Behavioral-Based Safety (BBS). This is safety based on behavioral observation. It was developed by behaviorists who assumed that people learn from the effects of their behavior, with a tendency to repeat behaviors that brought them pleasure, and to refrain from those that brought harm (Niciejewska & Obrecht, 2020; Skowron-Grabowska & Sobociński, 2018). According to Geller's principle: "a change in behavior leads to a change in mindset and attitude" (Taylor, Alvero 2012).

According to this concept, the use of behavioral methods for a long time in relation to employees should shape a safe attitude, which will result in safe behaviors (Szczygielska, 2014, Boczkowska, Zawodiecka-Sikora 2014). At the very beginning, the concept of BBS in the enterprise should be carried out by the supervisor. Similarly to the concept of improvement (kaizen or Lean), all actions improving behavior begin at the top in the organization hierarchy. But when the tools used are firmly inscribed in the company's safety culture that it is worth extending the BBS concept program by introducing behavioral linear observations - "an employee observes an employee" (Jasiulewicz-Kaczmarek et al. 2015).

The results of numerous studies carried out in Europe and around the world confirm the effectiveness of the BBS concept. The use of behavioral methods to reduce dangerous behaviors effectively eliminates such behaviors, reducing, among others the number of accidents at work. Dangerous behavior modification programs have been promoted in the United States and Canada for many years (McAfee, Winn 1989). The results of various experiments carried out by foreign companies regarding the impact of BBS on the modification of hazardous behavior have shown a positive impact on employees' awareness of occupational health and safety (Snyder 2012, Tuncel et al. 2006). Dangerous behavior modification programs have proven to be an effective accident prevention tool. Hazardous behavior modification programs based on BBS work well in many industries - construction, cement production, urban road construction projects, transport, etc. (Li,Xie i inni 2018, Fang i inni 2020, Nunu i inni 2018, Zhang i inni 2019, Guo i inni 2018, Wang i inni 2018). The BBS concept is a big challenge for business entities with a service profile. In such enterprises it should be taken into account that the participants of the process are, apart from employees, also customers. Changing the behavior of processess participants is not possible without the commitment of management in the field of health and safety department. Willingness to invest in safe and ergonomic working conditions and the flexibility of employers in making positive changes in organizational factors is the basis in shaping pro-safe behavior among employees (Zawodiecka-Sikora et al. 2010).

Polish enterprises also implement programs to modify dangerous behavior based on BBS. Despite the fact that the approach to the issue of safety based on safe behavior is nothing new (the approach to the issue of safety based on safe behavior appeared already in the 40s of the last century), in Poland there is an increase in the number of consulting companies that provide services in the field of behavioral audits. Based on the work of H. W. Heinrich, it could be stated that only 10% of accidents at work and occupational diseases are the result of improper working conditions, and more than 88% - dangerous behavior of employees. Polish enterprises that underwent an experiment on the modification of dangerous behavior based on BBS, noted in the first phase (i.e. immediately after the implementation of the program) a sharp decline in the number of registered dangerous behaviors, and in the next phase (after a long time since the implementation of the program) stabilization and gradual reduction of the number registered risk behavior (Pęcilło 2010, Pęcilło 2011). Hazardous behavior modification programs based on BBS are effective and bring measurable results (Szczygielska, 2015).

It is obvious that the effectiveness of actions according to the BBS concept is closely related to the size of employment (number of employees) as well as the type of business (service / production or industry branch). The medical industry is probably such a specific industry. Medical industry is characterized primarily by exposure to biological factors, but also psychophysical and psychosocial factors, as hazardous and accident factors. Aggression of patients, their families, work overload, stress related to fear of infectious diseases - all this can lead to dangerous, potentially accidental behaviors. This paper is an attempt to answer the question whether behavioral safety methods work and effectively improve safety in a Primary Health Care Institution (POZ).

Methodology

The research results presented in the paper based on the principles of the BBS (Behavioral-Based Safety) concept. The research consisted of two stages.

- Stage 1: selection of behavioral methods aimed at improving the level of occupational health and safety in chosen Primary Health Care (POZ) facilities.
- Stage 2: assesment the effectiveness of behavioral safety methods used.

In the first stage, selected behavioral methods have been planned. All methods have been discussed according to the level of occupational health and safety improvement - method selection taking into account the POZ facilities work organization (Table 1).

Table 1: A set of behavioral safety methods used in selected Primary Health Care Facilities to increase the level of occupational health and safety

Activity type	Name and activity characteristics	A group of employees to whom the activity was dedicated
Behavior observations	Reward system - promoting safe behavior in the workplace - activities to support positive attitudes of employees in the field of health and safety - observation by the management	Doctors, nurses
	Penalty system - suppressing negative, dangerous behaviors threatening the health and life of employees in the workplace - observation by the management	Doctors, nurses
	"Here and now" - mutual ("I watch you - You watch me") active response in real mode to dangerous behavior of employees	All POZ employees

	Calls postponed - mutual ("I you - you me") later reaction to the employee's dangerous behavior	All POZ employees
	Anonymous mailbox (policy of safe behavior without blaming) - a place to inform about dangerous or undesirable behavior of other employees (anonymity)	All POZ employees
	Non-anonymous mailbox - a place to inform about dangerous, accidental behavior of other employees (given name and surname of the reporting person as well as the reporting one)	All POZ employees
	Self-observation - controlling, observing your own behavior - writing down dangerous behavior and reporting to management	All POZ employees
Training	Collective training on identifying and analyzing employees' hazardous behaviors (their own and others behaviors)	All POZ employees
Supporting materials	An information board regarding accident occurrences, threats and preventive actions	All POZ employees
	Brochures and leaflets on preventive measures	All POZ employees

The second stage of the research was based on surveys. The total number of respondents was 48 employees. Among them were 32 medical employees (general practitioners, nurses) and 16 auxiliary staff (receptionists, assistants, administrative and office employees). The survey by means of a questionnaire was conducted on a voluntary and anonymous basis. All employees participating in the survey answered a number of questions. The questions contained in the form were developed based on the content of behavioral safety methods implemented in the first stage of research (BBS concept). Respondents rated the effectiveness of individual behavioral safety methods used in their workplace on a scale of 0 to 4, where 0 meant that the method "has no effect" on safety improvement, 1 - "has a little impact", 2 - "has a medium impact", 3 - "has a high impact", 4 - "has a very high impact".
The survey has been conducted after a period of implementation of the proposed behavioral safety methods (table 1) and all employees of designated POZ entities took part in the study.

Results and discussion

The study consisting of two stages was conducted in four Primary Health Care Facilities (POZ). The BBS concept implementation process took three months. After this time, the second stage (assesment) of the study took place - a questionnaire survey has been conducted among POZ employees to assess the effectiveness of the behavioral safety methods used. Table 2 presents the results of research carried out at POZ facilities, a summary of respondents' opinions on the BBS concept tools used.

Table 2. Survey questionnaire regarding the assessment of the effectiveness of implemented behavioral safety methods in the examined Primary Health Care Facilities

No.	Type of behavioral safety method (actions)	Impact of the method (action) on work safety in the opinion of employees				
		0 – "has no effect"	1 – "has a little impact"	2 – "has a medium impact"	3 – "has a high impact"	4 – "has a very high impact".
1.	Reward system - promoting safe behavior in the workplace - activities to support positive attitudes of employees in the field of health and safety - observation by the management				19 medical staff 10 support staff	13 medical staff 6 support staff
2..	Penalty system - suppressing negative, dangerous behaviors threatening the health and life of employees in the workplace - observation by the management			30 medical staff 5 support staff	2 medical staff 11 support staff	
3.	"Here and now" - mutual ("I watch you - You watch me") active response in real mode to dangerous behavior of employees			7 medical staff 10 support staff	25 medical staff 6 support staff	
4.	Calls postponed - mutual ("I you - you me") later reaction to the employee's dangerous behavior		17 medical staff 12 support staff	15 medical staff 4 support staff		
5.	Anonymous mailbox (policy of safe behavior without blaming) - a place to inform about dangerous or undesirable behavior of other employees				30 medical staff 14 support staff	2 medical staff 2 support staff

	(anonymity)					
6.	Non-anonymous mailbox - a place to inform about dangerous, accidental behavior of other employees (given name and surname of the reporting person as well as the reporting one)		6 support staff	10 medical staff 10 support staff	22 medical staff	
7.	Self-observation - controlling, observing your own behavior - writing down dangerous behavior and reporting to management		32 medical staff 12 support staff	4 support staff		
8.	Collective training on identifying and analyzing employees' hazardous behaviors (their own and others behaviors)				32 medical staff 16 support staff	
9.	An information board regarding accident occurrences, threats and preventive actions				32 medical staff 16 support staff	
10.	Brochures and leaflets on preventive measures				32 medical staff 16 support staff	

In the light of the obtained results, it can be stated that among the respondents, the most effective action under the BBS concept is "reward system - promoting safe behavior in the workplace", i.e. actions supporting positive attitudes of employees in the field of health and safety by the management who is the observer. According to medical workers, this type of activity has a "high impact" (59% of medical staff) and a "very high impact" (41% of medical staff). Support staff have assessed in the same way. Almost 63% of support staff indicated this activity as having a "high impact" and 37% of support staff as having a "very high impact" on safe behavior in the

workplace. Less enthusiastically, but equally positively, the respondents assessed activities related to the penalty system, i.e. the suppression of negative, dangerous behaviors threatening the health and life of employees in the workplace - observations by the management. Almost all medical staff (94%) considered such activities to have a "medium impact" on safety, while most support staff (69%) assessed this type of activity under the BBS concept as „high impact". Similarly, "Here and now" - mutual ("I watch you - You watch me") active response in real mode to dangerous behavior of employees, were assessed.

The respondents very positively assessed activities related to the "anonymous mailbox", which is based on a policy of safe behavior without blaming. All respondents rated its impact as "high" (94% of medical staff and 88% of support staff) and "very high" (6% of medical staff and 12% of support staff). As activities having a "very high" impact on safety in the workplace, shaping safe behavior, all respondents indicated:

- collective training on identifying and analyzing employees' hazardous behaviors (their own and others behaviors),
- an information board regarding accident occurrences, threats and preventive actions,
- brochures and leaflets on preventive measures.

In turn, for the least important activities - having a "medium impact" or "a little impact" on shaping safe behavior among employees, the respondents indicated:

- Non-anonymous mailbox - a place to inform about dangerous, accidental behavior of other employees (given name and surname of the reporting person as well as the reporting one)
- Self-observation - controlling, observing your own behavior - writing down dangerous behavior and reporting to management

Analyzing the above results, it can be stated that the concept of BBS in examined Primary Health Care Facilities is not yet fully understood and the majority of respondents do not identify with its premises. Respondents do not trust the BBS concept, especially in the aspect of line audit, consisting in mutual attention to mistakes or potentially accidental behavior. There is a conviction in the respondents that every attention, especially not anonymous, can be perceived as something unethical, denunciation. Still, the most "safe", because they have no signs of denunciation or complaints, are considered activities that do not carry the need for direct interference with the individual and confrontation with it. These are collective trainings, leaflets, information boards. Employees have identified those activities that have the greatest impact on shaping safe behavior. However, one may be tempted to state that the indication of these activities as the best was chosen only because of the lack of an alternative to which the respondents would be 100% convinced. There is therefore a great need to change employees' attitudes to the BBS concept. Employees do not trust actions that interfere so much in mutual relations. Paying attention, pointing out erroneous behaviors, they still consider to be unethical acts of denunciation.

Conclusions

Employees at Primary Health Care Facilities are exposed to many factors that threaten their health and even life. The specificity of their work imposes many restrictions on safe behavior. Unfortunately, man as the most unpredictable link in the work process chain, through their dangerous behavior can put other people at risk - internal clients of the organization (i.e. other employees) as well as external clients, i.e. patients. There are many methods that can be used to shape safe behavior in the workplace. Among them are behavioral methods that are widely recognized by employees - the BBS concept. It is recognized as a very effective method that increases the safety in the enterprise if it is properly understood. The BBS concept, through its activities, shapes awareness of safe behavior among employees, which is paramount. The results of the activities BBS concept evaluation have showen that respondents feel some concerns and do

not trust some of the BBS concept activities. The biggest problem for them are actions that involve interference in the behavior of another employee, especially not anonymous. In Poland, this concept - although not new - is not popular among employees. In the mentality of many employees, activities under this concept constitute a significant barrier. This concept will have no effect if employees perceive its actions as unethical, with the signs of denunciation or complaint.

Abstract

The article presents an overview of business models for the area of additive manufacturing in Industry 4.0. The authors present the additive manufacturing business model. The classification of business models is presented in three categories: startup direction companies, mass production, value proposition delivered by the business model. Value proposition delivery business model is a proposal classification prepared by authors to show connection between Industry 4.0 technology, proposal of value and Scalability 4.0 concepts. Authors present example of use value proposition delivery business model on the example of additive manufacturing.

Keywords: Business Model, Additive Manufacturing, Industry 4.0, Scalability 4.0

Introduction

The fourth industrial revolution, also called Industry 4.0, is – like the previous ones – characterized by the ability to transform economies, jobs and societies through the introduction of new technologies and processes. Digitization, automatisation, artificial intelligence, IoT and machine learning are increasingly infiltrating the world and business.[1] Additive manufacturing (AM) technologies are among the dynamically developing fields of Industry 4.0. They are no longer a fledgling technology – 3D printing has matured and is entering a new era, which has serious implications for the business models that companies can use. Over the past few years, the growing possibilities of AM, together with the expansion of available materials and the ecosystem of suppliers, have enabled cheap manufacturing of a much wider range of products, from simple models of game figurines to parts of cars or aircraft. AM provides an unprecedented opportunity to customize products and respond quickly to changes in market demand. As a result, it is moving from limited applications, such as prototyping and manufacturing of conventional tools, to a central role in production for an increasing number of industries. Examples of areas related to the use of AM and possible business models will be discussed below.

Definition of additive manufacturing (AM) and business model (BM)

In the changing world of Industry 4.0, what should be considered is the developmental potential of business models taking into consideration prototyping with the participation of additive manufacturing. The concept allows us to think about changing enterprise activity, building prototypes of technological

[1] Przemysł 4.0 w Polsce – rewolucja czy ewolucja? Pierwsza edycja badania Deloitte o skali i poziomie Przemysłu 4.0 w Polsce, access on: 27.04.2020 https://www2.deloitte.com/pl/pl/pages/technology/articles/raport-przemysl-4-0-rewolucja-czy-ewolucja.html

solutions and implementing digital business models, resulting in the emergence of the Industry 4.0 business model.

A business model describes the rationale of how an organization creates, delivers, and captures value[2]. Moreover, a business model is an abstraction of how a business functions. (…) What the business model will do is provide a simplified view of the business structure that will act as the basis for communication, improvements or innovations, and define requirements for the information system necessary to support the business. It is not necessary for a business model to capture an absolute picture of the business or to describe every business detail. (…) The evolving models also help the developers structure and focus their thinking. Working with the models increases their understanding of the business and, hopefully, their awareness of new opportunities for improving business[3]. It is also worth adding that the digital business model is "a transaction handled using digital technologies. It can be described based on six core elements: a transaction, an offering digital system, a demanding digital system, a (digital) performance, an appropriate counter performance (monetary or non-monetary) and the repeatability of this transaction".[4] This formulation of a business model may be particularly important in the application field of such new technologies as additive manufacturing.

The first additive process was invented in the 1980s. Since that time, additive manufacturing technologies have been established in several industry branches and still show a significant market growth.[5] Additive manufacturing, according to the ISO/ASTM standard, is defined as the "process of joining materials to make parts from 3D model data, usually layer upon layer, as opposed to subtractive manufacturing and formative manufacturing methodologies".[6] It is also known as rapid manufacturing or rapid prototyping.[7] It allows to build three-dimensional structures from digital data (3D model) by adding material in a layer-by-layer manner. This technological process is also called three-dimensional (3D) printing.[8] In order to produce physical 3D objects in AM technology, it is necessary to use CAD 3D software or scanner – e.g. computerized tomography (CT), micro-CT, magnetic resonance imaging (MRI) – and then create a digital design file in the CAD file.[9] Using additive manufacturing, a design in the form of a computerized 3D solid model can be directly transformed to a finished product without the use of additional fixtures or cutting tools.[10]

In contrast to conventional manufacturing technologies, the advantages of additive manufacturing are easy to acknowledge. Technological progress in this area has allowed to eliminate several limitations in manufacturing and enabled to obtain products more precisely, with controlled dimensions and more complex geometry, without using traditional tools, with low manufacturing costs, in a shorter time and

with minimum human intervention.[11] The application of additive technologies allows a full control over the target geometry of a structure and guarantees high repeat accuracy of the manufacturing process.[12] Recent technologies in additive manufacturing have the potential to eliminate traditional manufacturing limitations and to impact, among other things, the sustainability of the production processes.[13] That is why over the last thirty years these technologies have been widely used for the manufacture of very different and unusual parts.[14] It has been increasingly applied in the aeronautical and aerospace industries, automotive, biomedical and other fields, e.g. architecture. The use of AM in such a variety of manufacturing fields is possible mainly thanks to the processing of various materials, ranging from metals, ceramics and polymers to composites. Whereas the first applications were only for prototyping purposes based on polymer processes, today high-quality metal-based products can also be made additively, mostly using the Laser-based Powder Bed Fusion process (LPBF).[15]

It should be pointed out here that over a dozen approaches to additive manufacturing may be listed in the group of advanced technologies. In the ISO/ASTM 52900 norm, seven groups are distinguished, as presented in Fig. 1 together with examples of technologies.

Fig. 1. Additive Manufacturing processes

Sources: Own, prepared according to ISO/ASTM 52900 Additive manufacturing — General principles — Terminology.

Nowadays, additive manufacturing is commonly referred to as 3D printing, however it must be noted that it is a "term often used in a non-technical context synonymously with additive manufacturing; until present times this term has in particular been associated with machines that are low-end in price and/or overall capability."[16]

Example of additive manufacturing business models

Specialist literature extensively describes and proposes various business models containing detailed accounts of elements of the model as well as descriptions of the influence of additive technologies on

[16] ISO/ASTM 52900

elements of the business model[17]. Other broadly discussed issues include those of additive printing technologies and a new paradigm resulting from the use of those technologies in business[18].

In the analysis of changing technologies and expansion of AM, three development directions of business models may be distinguished. The first, startup direction comprises a group of models based on prototyping, close co-operation with the client or preparing dedicated customer solutions, as well as models based on core competencies. The models are characterized by focusing on co-operation with the client and meeting customer expectations. The second direction — is a group of models based on mass manufacturing or activities aiming to deliver technological solutions, products or projects on a large scale.

Fig. 2: Components of business model Scalability 4.0

Sources: Own.

The third direction is based on the value proposition delivered by the business model – it is a proposition of a solution allowing to establish what the business model offers from the perspective of its scalability. The authors of the concept suggest combining the Industry 4.0 technology of additive manufacturing, elements of business models and value proposition, and elements bringing the Scalability 4.0 effect, in order to build the most effective business model for an enterprise (Fig. 2).

Startup additive manufacturing business models

In Poland, many companies using 3D printing have been established in the last ten years. It should be noted, however, that these are mostly units that do not have advanced devices in their resources, working mainly with the FDM technology.[19] Their models are often of low quality, with poor mechanical strength. Due to the aforementioned restrictions, such products cannot be used e.g. as spare parts for cars or orthopedic prostheses. Therefore, microenterprises often focus on offering custom-made services. Their business model is based on the possibility of making simple accessories or spare parts for which there is a unit demand (e.g. replacement of an exhausted part with a specific geometry).[20] To implement this business model, very often all you need is an online store, basic spatial design skills and a simple 3D printer on which you can quickly, easily and relatively cheaply make such an element. The development of the company in this business model is not easy due to considerable competition and low-level innovation. These companies often expand their activities by selling consumables or spare parts only for this type of equipment.

Another area of business activity is the production and/or sale of consumables for low-budget 3D printers, i.e. the well-known filaments. An interesting business model is establishing close co-operation with a company specializing in the production or processing of plastics, from which you can order a finished product. Then pack it in your own boxes and sell it under your own brand. Such a company focuses only on developing the right mix (which can also be outsourced), sales, order processing and marketing. There are also numerous websites of sales representatives offering sales of 3D printers.

When analyzing the market in terms of the use of AM in various industries, one should also consider very advanced 3D printers. They allow manufacturing products with very complex geometry or even designed mechanical properties.[21] These are machines that process materials such as e.g. metal, polymer and ceramic powders (e.g. SLS, SLM, EBM, 3DP) or liquid materials, e.g. resins (e.g. SLA). These types of printers are successfully used in the automotive, aviation and medicine industries.[22]

An important issue to consider in the context of this technology is the skill of advanced design for AM (DfAM).[23] In this area, two directions of building business models can be identified: offering design services and conducting training for engineers who will be educated as specialists in this field. In the first case, the Printelize platform can be a good example. Printelize Marketplace is a trading platform that allows you to automate and optimize the search of 3D printing suppliers, the valuation of the printing service and its sale.[24] It is a place where commissioners of 3D printing meet with order takers. This tool simplifies the processes of offering, sales and communication, making access to 3D printing even easier. Designing for 3D printing is currently the most desirable skill on the service market. It is not about simple modeling of details, but the ability to create spatial models, taking into account engineering knowledge in the field of material processing. Specialists are needed who are able, for example, to design a detail taking into account material shrinkage during the 3D printing process,

optimize the geometry in terms of printing, or prepare it in a way to eliminate problems associated with postprocessing.[25]

Understanding the idea of Industry 4.0, which AM is part of, will allow to introduce changes in business models that increase the share of these technologies in mass production. The continuous development of the industry is associated with changes on production lines, where conventional production methods are replaced by AM. Their flexibility gives producers the certainty of optimal return on costs incurred and the possibility of personalizing the product. Small batches improve quality, simplify planning and encourage continuous improvement. In addition, 3D printing allows you to combine materials with different properties during one printing process and embedding structural elements inside the project structure.[26] This allows manufacturers to limit the number of parts produced, which reduces assembly time, for example.[27] Attention should also be paid to the need to have smaller storage resources (e.g. damaged items can be produced immediately without having to store them). In addition, factories can use optimization software to customize production and/or improve their products at a low cost, without the need for interruptions during the expansion of assembly lines or the change of tooling and tools used in the conventional production model.

Changing the business model is also possible in the medical or pharmaceutical industry. An example is the FabRx machine[28], which allows the additive manufacturing of tablets with a personalized dose of a drug substance (called printlets). In addition, this 3D printing system allows the inclusion of several medicinal substances in a single tablet, with a view to creating drugs for patients who must take several pills at once (children or the elderly).[29] This type of system can be used where mass production is unprofitable, e.g. due to low demand or high storage costs. Hospitals, pharmacies and also pharmaceutical companies can take advantage of this.

Thanks to personalization, product optimization and production efficiency (also production tools) and new business models, AM enables unbelievably fast innovations – the two-year period from the idea to launching the product on the market is shortened to a maximum of two months.[30]

Mass additive manufacturing business models

New production technologies are reasons for the generation of new business models. They are very often modifications of existing business models or inspire the emergence of new models. The chart below lists suggested business models compatible with additive manufacturing solutions, as well as models resulting from the appearance of the idea of additive manufacturing.

Type of business model	Advantages	Type of industry	Example of product
Mass customization	- it takes product variation to the extreme, - it entails creating one-off products that are precisely adjusted to the needs or whims of individual buyers - thanks to the efficiency and precision of digital technology - cost less than conventionally manufactured items and fit individuals' specifications more exactly.	- medical, - automotive, - home decoration, - architecture - personal accessories	- hearing aids, - orthodontic braces, - prostheses, - sunglasses, - car and motor-cycle accessories, - Christmas tree decorations.
Mass variety	- it targets customers who have strong and varying preferences, - customers do not need products adjusted to their personal specifications, - manufacturers can skip the process of collecting personal information, - manufacturers can offer a wide variety of options at affordable prices, - units are one-offs.	- jewelry - architecture - fashion	- jewellery - home accessories - shoes
Mass segmentation	- it greatly limits variety, offering only a few dozen versions of a product, - it works well for highly segmented markets, such as components designed specifically for popular B2B products, - each version serves a single segment and differs from the others enough that conventional manufacturers would need costly new machine tools to make all of them, - thus additive companies can make them at a lower cost, - production is in batches rather than one-off, - it is also suitable for seasonal, cyclical, or short-term fad markets.	- automotive, - cyclist, - architecture - personal accessories	- spare parts, - accessories for cyclists (handlebar mounts, durable, lightweight part)
Mass modularization	- rather than offering customers different versions of a product, this model involves selling a 3D-printed body with interchangeable modules for insertion, - manufacturers design the base units, - reduces assembly costs, increases opportunities for miniaturization, and creates space for additional electronic components to be integrated into the product in ways that conventional modular	- automotive, - telecommunica-tions, - personal accessories	- smartphones

Type of business model	Advantages	Type of industry	Example of product
	production methods cannot manage.		
Mass complexity	- exploits the ability to make products with intricate designs that conventional manufacturing cannot achieve and to produce unusual shapes and embed sensors and other elements, - that ability reduces production costs while improving the product's reliability, - with new design software emerging, AM can now restructure materials at the micro level to improve properties such as porosity, strength, durability, elasticity, and rigidity	- automotive, - aerospace, - personal accessories - fashion	- honeycomb-shaped supports for airplane fuselages, - nozzles for commercial mixers - strong, supple, lightweight lattice structures for the midsoles of running shoes
Mass standardization	- as 3D printers grow ever more efficient, they may become competitive for making standardized products even when they do not save on direct costs, - AM reduces: an extended and risky supply chain, expensive capital equipment, the elaborate assembly of parts, and high inventory or transportation costs, - proves that high-volume standard products can be churned out at a low cost in certain circumstances.	- high-tech products, - automotive, - aerospace - electrochemical energy systems[31]	- video screens - spare parts - membrane electrode assemblies

Business model based on the theory of value proposition

One of the main objectives of a good business model is supplying the customer with a value proposition. Value is defined in a number of ways in business model theory. Osterwalder and Pigneur propose a description of fields of building value in a business model on the basis of five areas of value: Value Proposition, Value Creation, Value Delivery, Value Capture, Value Communication. Value Proposition is a key element in every business model. It would be also interesting to consider how to connect the particular areas of building value with Industry 4.0 technologies, including AM and others. The Scalability 4.0 concept might be an element combining in the long term the classic business model and Industry 4.0 technology. The Scalability concept will be able to generate the effects of mass production, mass trade and the mass provision of customised services. What was impossible in the past due to limitations in production technologies, transport technologies and sales technologies due to, among others, the costs of technology change, transport costs, and the cost of customising individual

[31] Hashemi, MH., Babic, U., Hadikhani, P. and Psaltis, D. (2020), 'The potentials of additive manufacturing for mass production of electrochemical energy systems', *Current Opinion in Electrochemistry*, Volume 20, April, pp. 54-59.

offers, is now possible. According to the authors, Scalability 4.0 takes the following form: the economies of scale and experience curve, network effect obtained within the network of suppliers, producers and customers, long-tail effect, Big Data effect (advantage in data processing and analysis)[32]. After combining the three elements:

- Industry 4.0 technologies – Autonomous Robots, Simulation, System Integration, IoT, Cybersecurity, Cloud Computing, Additive Manufacturing, Augmented Reality, Big Data, Other;
- Classic value proposition offered by the business model – Value Proposition, Value Creation, Value Delivery, Value Capture, Value Communication, Other;
- and the Scalability 4.0 concept – effects of mass production, mass trade and the mass provision of customised services;

new opportunities for building value in Industry 4.0 conditions may be observed. New technologies allow the development of elements of the business model. Thanks to that, there is a possibility of strengthening the selected area of building value. In the next step, it may influence business scalability and bring benefits. Fig. 3 presents a combination of the concepts. Generating added value should begin from selecting the Industry 4.0 technology. This influences the given elements of the business model, and consequently the area of building value. The Scalability 4.0 concept is the final result.

Fig. 3. Concept of combining technology, value proposition and Scalability 4.0
Sources: Own prepared by Rafał Trzaska using Osterwalder model, Scalability 4.0 concept and Industry 4.0.

In order to understand the relationships, let us use additive manufacturing technology. We assume that the analysed enterprise uses 3D printers and has performed a strategic analysis of key competencies of the organization. The analysis results in a certainty that the enterprise has the key competencies necessary in AM and in implementing solutions connected with this technology. According to the business model, key competencies are defined as ways of offering value to the client. It may therefore be stated that the enterprise in question has the key competencies, on the basis of which it may create competitive advantage. Moreover, it may consider how to multiply the competencies in other areas of development. Competencies are rare resources which are difficult to copy, so the choice of a path of their multiplication may be arduous, capital-intensive and time-consuming, as well as difficult to scale.

[32] Niemczyk, J., Trzaska, R., Borowski, K. and Karolczak, P. (2019), 'Scalability 4.0 as economic rent in Industry 4.0', *Transformations in Business & Economics*, 18(2B (47B)), pp. 824–838.

However, thanks to the use of appropriate technology, it may turn out that the competencies we have are sufficient to ensure the development of the organization without any additional expenditures. The crucial activities here include the network effect and long-tail effect, capable of bringing a strategic advantage.

Fig. 4: Example of a business model based on the value proposition of an enterprise using AM
Sources: Own prepared by Rafał Trzaska using Osterwalder model, Scalability 4.0 concept and Industry 4.0.

The example of an AM-technology business model based on the value proposition is one possibility. In another, the cause-and-effect chain may also be reversed. Ways of generating value may be considered then, as well as types of technologies used in order to gain an advantage. These constructions may lead to generating new business models and strategies of operation.

Conclusion

The current global digitization progress causes changes in the field known as Industry 4.0. The term comprises a number of advanced digital technologies, including additive manufacturing. According to a report prepared by Wohlers Associates[33], one of the largest consulting companies in the field of additive manufacturing, the value of the AM industry will increase from $15.8bn in 2020 to $23.9bn in 2022 and $35.6bn in 2024. It proves that the AM market is intensively and continually growing. It also refers to the implementation of advanced manufacturing technologies. The changes also result in adjustments in human resources and organisational management[34], which in turn means changes in business models.

This paper is a review of business models implemented in sectors based on additive manufacturing. The authors have distinguished three approaches to business models: the startup approach (company offering to market), mass production (market needs to company) and value proposition (company and market co-operation). The three approaches show that there are many ways of creating business models when an enterprise applies new technologies. New sales opportunities follow in such cases, as well as possibilities to offer various kinds of services. Each of the approaches is characterized by both common and distinguishing features.

[33] Wohlers Report 2019, ISBN 978-0-9913332-5-7.
[34] Krot, K., Mazgajczyk E., Rusińska, M. and Woźna, A. (2019), 'Strategy of improving skills of innovation managers in the area of advanced manufacturing technologies'=, Intelligent systems in production engineering and maintenance', *Advances in Intelligent Systems and Computing*, Springer, vol. 835, pp. 296-305, ISSN 2194-5357.

The common elements of the business models include:

- responding to market needs, and particularly – customer needs
- possibilities of applying Industry 4.0 technologies in various business areas of the enterprise
- seeking a competitive advantage of the enterprise on the market
  The differentiating elements include:
- business models other than the ones used so far: the start-up approach (company offering to market), mass production (market needs to company) and value proposition (company and market cooperation).

It must also be stressed that these considerations are only a fragment of a larger study that can be continued and elaborated, for instance concentrating on extending the range of materials used, thus broadening the offer. Another interesting direction might be an analysis of the evolution of business models in various sectors from the perspective of additive manufacturing.

Abstract

A non-profit organization is a legal entity that provides services of general interest under pre-determined conditions and for all users on equal terms, and whose profits may not be used for the benefit of founders, members of bodies or its employees, but must be used in full to provide services of general interest. The effective functioning of non-profit organizations is primarily driven by the organizational skills of managers. The basis of self-government is the ability to organize and manage your own time. The management of an individual's time generally depends on his ability to respond adequately to stressors and disturbances that have a negative impact on his work performance. In work activities, self-government is closely linked to the systematic nature of work. The manager who maintains the system and the sequence of tasks prevents them from accumulating. The principle of optimal organization of time in managerial practice also lies in managerial skills. Throughout the working day, managers are confronted with situations that are time consuming. They are surrounded by people, situations and consequences that cause a waste of time. These "time thieves" of managers focus on efficiency, focus and performance. They can get rid of them only by self-discipline. Time is alienated by factors that put them in a stressful situation, stressors and factors that we call work breaks. The task of self-government and time management is the time manager to categorize as effectively as possible the individual management functions and tasks of time thieves who are in their workplace. These thieves can be eliminated by early detection, implementation of effective methods and control of the effectiveness of established measures to ensure productivity and time spent effectively not only for managers but also for individual employees of non-profit organizations.

Keywords: Non-profit organizations, Efficiency, Stressors, Disturbance.

JEL Classification: L30, L31

Introduction

Creative managerial thinking in a market economy becomes a guarantee of survival and a condition for entrepreneurial success. The management of the manager, inspired by such thinking, is then highly creative and at the same time proportionate to the business environment. It accepts risks and uncertainties, helps to heal an inefficient corporate and extra-corporate economy. One of the core tasks of the manager is the task of performing their work efficiently and arrange everything to do what is necessary for the job to be successful. The basic prerequisites for doing this work are the good results of the work achieved by performing effective activities using their intelligence, imagination and knowledge. Its action will only become effective once certain conditions have been met. The main condition is determined by the needs of the process and can be expressed by the imperative of "mind".

The manager is supposed to produce ideas, ideas, information, and turn them into useful values through his subordinates or associates. The work of managers is classified by management activities, which we also call core management functions. These managerial functions are different from the perspective of many authors. Each manager holds a certain managerial position and therefore shows that he is required to perform the main functions of managers with regard to the overall efficiency of the business. Effective manager is expected to plan, organize, manage human resources, manage, communicate, control, and make decisions. To what extent is this work effective, depends on the external and internal conditions of its work.

Stressors

Internal factors concern the manager's own relationship to work and the circumstances that arise from the content of his work and put him in a stressful situation. We call these factors stressors. Stress at work has become a major health and safety issue. One of the things that creates stress in managers is the failure to discharge obligations, which in most cases is caused by their postponement to later. Procrastination is not only a thief of time but also of life. By postponing things they can avoid being prepared thoroughly, working on smaller parts and gathering all the necessary materials so that they do not risk having to break the work by getting up from the desk (Kushlev, et al. 2016).

The second stressor, who lurks at the managers and takes time for them, is "fire extinguishment", that is, unexpected events "that can take them away from the current work up to several hours. In situations where the crisis occurs first or second, it is very difficult to find the right solution, it requires a high level of intelligence and a lot of experience. However, if the occurrence is much higher and we can not find a suitable way to prevent it, the best solution is to create a set of measures that it can use (Morlock, et al. 2017).

Denial is a feature that keeps managers at work and exposes them to stress. The longer they decide, the less time they have left to work. Through long thinking, they are offered more and more opportunities, but this may not be good. Managers often take care of projects that carry a lot of responsibility. Responsibility is another thing that causes them a sense of stress, because only one error can negatively affect their career or, cooperation with the client the project may relate to (Smith, et al. 2018).

Managers often have too much work and are unable to do anything right. They find themselves in a stressful situation that causes overloading with a lot of work. Then they are in the gap between many broken work activities. This confuses them and gradually loses sight of them. Finally, stress is coming, and they are no longer able to concentrate on one project because they are immediately thinking about waiting for another. Managers should be able to guess where their borders are. If they do not know, they can help them learn from previous experiences. Sometimes it is good to try out the extreme burden to discover the difference between meaningful extraction and congestion (Tziner, et al. 2015).

Lack of time is another factor of stress. At present, increasingly frequent prolonged and irregular working hours are due to lack of time. Its reason may be various interruptions and their own working style. The stress caused by this is that managers can not accurately determine priorities and divide the working day. Managers come into contact with other people every day, whether within or outside of the organization. Human relationships can also be considered a source of stress if these relationships do not move in the right direction. It can be very stressful for the manager to work with the feeling that he does not have good relationships with some people or has unresolved conflicts with them (Valera, et al. 2016).

Unclear powers also cause stress because managers have no clear definition of their duties and job assignments. Because of this, they get into a slump because it can happen that they know the information is too late and it is difficult to get them into a project or other task. The manager should always make sure that he has all the necessary information to prevent the time losses that arise from the lack of clarification (Alani, et al. 2019).

Every manager needs to concentrate on his work. Therefore, if they have limited work space, he can stress it and is unable to concentrate. The managers should have their own space adapted to their duties and requirements so that they does not feel confined Graessley, et al. (2019). Resolving crisis situations and problems can bring them to a state of long-term tension that can negatively affect their sleep. Permanent inadequate sleep is associated with adverse outcomes in working life. In order to effectively manage the organization and achieve positive work outcomes, managers should try to avoid stressful situations and respond to persistent stress (Janoskova, & Kral, 2019)

Disturbance

Another factor influencing the quality of work not only managers but also subordinates are disturbances. Often, managers are faced with situations that they can not resolve important tasks because they are constantly interfering with them Nagy, et al. (2018). It is therefore important to be aware of these interruptions properly and not allow them to be an obstacle to fulfilling their job responsibilities. This section contains various types of interruptions with recommendations to prevent them (Kmecova, 2018).

The most common interruptions include phone, SMS, and email interference. At present, technology is increasingly penetrating everyday life, causing more and more interruptions with various warnings. In the end, these warnings cause inattention (Musova, et al. 2018).

Managers' time also misses unexpected visits. They stop at the office, often talk about insignificant issues, and keep managers away from work. Chat conversations - whether live or through social networking managers, take time. It's a big waste of time. It is estimated that it is up to 75% of working time. For social activities, managers should reserve time for coffee breaks, lunch breaks, and after work. The greatest value is the time they spend talking about the problems and obstacles their business faces (Carvalho, et al. 2019).

Another thing that is wasting time for managers and subordinates is meeting. These can be planned or unplanned. They take away the participants up to 40% to 50% of the working time. Unless they are carefully planned, they are just a waste of time. They are, however, an indispensable part of every business and should therefore be carried out as efficiently as possible. Remembering a thief of time disturbs the managers' work day, and often because of them they do not have enough time to do business (Pisar, & Bilkova, 2019).

Methodology

The purpose of the article is to identify disruptions in the work of managers in non-profit organizations. The survey contains a total of 42 questions about managers' time management. 4 questions are devoted to stress and distractions. The sample of the survey consists of 210 managers from non-profit organizations from the Slovak Republic. The survey involved 80 women and 130 men.

Results

The first question in the monitoring of factors influencing the quality of work performance, we found out whether the managers of individual non-profit organizations work under stress, which was answered positively by up to 78 managers. However, occasional stress at work is perceived by up to 116 managers. Thus, we can say that up to 194 managers face stress in the workplace and only 16 managers stated that they do not work under stress at all, so we can say that internal manifestations in the form of stressors affect managers as we see in Chart 1. In the second question we asked whether managers can complete their work without interruption. Graph 1 shows that disturbances are not as significant a factor as stressors, which is definitely a consequence of the organization of work and good conditions in the workplace. In this case, only 15 managers stated that they would not complete the activity without interruption, 84 managers said that sometimes they were disturbed at work and as many as 111 managers stated that they completed the work without interruption.

Table 1: Monitoring the presence of stressors and disturbances

Source: Authors

In the third question, we asked about the most common stressors that affect managers in the performance of their work. Most respondents cite centralization as a transition to a new system. Most of the respondents came from small non-profit organizations, where the transition to centralization is ruled out. The second biggest stressor was seen by managers in their superiors. Respondents considered lack of time, social problems, multitasking, inadequate information, a sense of responsibility, failure of technical equipment, unclear goals at all levels or poor planning as other factors in table 2.

Table 2 : The most common stressors

Source: Authors

In the last question devoted to the influence of external and internal factors, we focused on naming the most common stressors. Although most managers have indicated that they will complete their work without interruption, all managers report the most common interruptions see in table 3.

Table 3 : The most common interuptions

Source: Authors

The most common interruptions are considered by managers to be the following colleagues, phone calls, mailbox congestion, noise, handling of private affairs and family.

Discussion

Efficiency means doing the right thing. Managers must have the necessary knowledge, experience and ability to distinguish what is right for the business. Efficiency is the most economical use of resources. An efficient manager therefore knows how to use the resources he has at his disposal. The efficiency of the managers' work depends on their time management, and the ability to implement defined plans by managing available resources. Participation in work-related stress reduces its effectiveness, it can lead to negative emotions, and in the worst case also leads to illness (Meyers, et al. 2019).

The sources of stressors at work are situations with demands that managers perceive over their strengths and abilities. A major problem in the inappropriate organization of time lies in the present strategy of organizations, which is directly related to the aforementioned time compression, i. pressure to manage multiple activities in a shorter time horizon. For this reason, long-term planning is lost in organizations, retreats to short-term goals, but they put higher demands on human potential. The human potential associated with organizational goals is primarily the capabilities and skills of the manager. Negative consequences of inappropriate time organization, or time burglars, represent a misconduct that manages time. These consequences result in the inability to determine the priorities for solving the problems, the inability to distinguish the importance and the urgency, the effort to handle everything that is coming or the implementation of the wrong things (Andjarwati, et al. 2019).

Another mistake is the preference of short-term goals over the medium or long term, the loss of a review of priorities and goals, the absence of a real time planning system, intuitive action, and the inability to reject a new role, or delegate tasks, an effort to do it all alone. The lack of self-discipline, disorder in the papers and failure to respect the physiological curve of performance and distraction together with neglect of rest even leads to a deterioration of the state of health (Salaga, et al. 2015).

Disturbances are stimuli that arise from the activity of an enterprise, employees or business surroundings. Efficient policies for emails or telephones are also effective for telecommunication devices. Managers should only provide the necessary phone calls and emails. When dealing with important tasks, they should disable all interference devices and should have regular time when they will handle all phone calls and emails and get to know other colleagues or the public. In the event that an unwelcome visitor is approaching, managers should quickly get up as if they were leaving and get to know that they have a lot of work to do (Trettin, et al. 2019).

If the meeting lasts, do not hesitate to close the discussion, for example, by saying: "Before you go, one more thing." Managers should give unexpected visitors the idea that you do not always have time for them by specifying the date when you are available. Even meetings can be made more effective. The meeting is to be organized if it is really necessary and it is important to ensure that only those people who are needed are involved Valaskova, et al. (2018). It is necessary to draw up a clear agenda and establish the meaning of the meeting. However, there are many other stressors and disturbances for which a clear elimination procedure needs to be developed. These stressors and disturbances may also vary in relation to the type of management and managerial tasks that managers encounter in individual work projects.

An Overview of Non-Profit Financing in Slovakia

Filip REBETAK

University of Zilina, Faculty of operation and economics of transport and communication, Department of economics, Univerzitna 1/8215 Zilina, Slovak Republic, filip.rebetak@fpedas.uniza.sk

Abstract

Non-profit organizations fulfil a major role in an economy and society – they provide services in domains where these are not provided by neither government, nor market, i.e. the profit focused businesses. The core principle of their working is them being non-profit. It means the operations they conduct don't bring financial benefits to their founders or owners, but all revenue proceeds must be reinvested in the pursuit of the mission of the organization for which it was founded. And for these operations, all non-profit organizations need some source of financing, whether internal or external. Financing of non-profit organizations is a complex issue, maybe even a more complex one than the financing of for-profit businesses, because they have to usually rely on generosity of its donors to get the funding needed for their calls. Their financing is an important part of their life and usually decides whether they can fulfil their stated mission or not. Therefore, in this article, we aim to provide an overview of the current aspects of non-profit financing in Slovakia with focus on the different sources of funding available for non-profit organizations.

Keywords: non-profit organizations, financing of non-profit organizations, non-profit funding sources

Introduction

Non-profit organizations fulfil a major role in an economy – they provide services in domains where these are not provided by neither government, nor market – i.e. the profit focused businesses. The core principle of their working is them being non-profit. It means the operations they conduct don't bring financial benefits to their founders or owners, but all revenue proceeds must be reinvested in the pursuit of the mission of the organization for which it was founded. And for these operations, all non-profit organizations need some source of financing, whether internal or external. Financing of non-profit organizations is a complex issue, maybe even a more complex one than the financing of for-profit businesses, because they have to usually rely on generosity of its donors to get the funding needed for their calls.

Non-profit organizations are getting more and more important in the current socio-economic context. (Carvalho et al., 2019) Their financing is an important part of their life and usually decides whether they can fulfil their stated mission or not. Therefore, in this article, we aim to provide an overview of the current aspects of non-profit financing in Slovakia with focus on the different sources of funding available for non-profit organizations

The article is divided into three parts. In the first part, we deal with the current state of research into non-profit organizations and their financing. In the second part, we focus on non-profit financing in Slovakia in general, in its theoretical aspects and with an emphasis on possible diverse funding sources for non-profit organizations in Slovakia. In the third part, we conclude with some overview on the current state of non-profit financing in Slovakia.

Current research on non-profit organizations and their financing

Non-profit organizations have been studied by many authors. One of the most used definitions of non-profit sector is the one by Salamon and Anheier (1992) in which they formulated 5 criteria that characterize as organizations possessing formal structure, having private (non-state) character, having non-profit goal, being independent and self-governed and being voluntary. Usually these 5 criteria are joined by another two which are being non-religious and non-political.

As for the financing of non-profits, this topic is also researched extensively. Eppich and Grinda (2019) looked into financial management of cultural heritage sites who lack resources and identified a need for identification of more funding resources. Kisileva and Dubrova (2019) studied Russian corporate non-profit organizations. Rudnik and Kushtanina (2016) studied normative financing of non-profit performing arts organizations in Russia. Margarian (2017) studied financing strategies for non-profit organizations with aim to establish how the effectiveness of public support systems depends on recipients general financing strategies. Doyle et al. (2016) looked at resource dependence and survival of a hospital through different stages on its history depending on changes to its funding. Mikolajczak (2018) studied the impact of revenue diversification of a non-profit organization on the probability of its commercialization – i.e. organizations begin self-financing through sale of a product or service. Leshanych et al. (2018) focused on financing of higher education institutions in different countries.

Moreno et al. (2017) studied crowdfunding as possible new funding source for non-profit organizations. Yang et al. (2016) and Pitschner et al. (2014) also studied crowdfunding and found that non-profit projects are significatntly more likely to get funding trough crowdfunding. Social media is also important. (Ashander et al., 2019)

Hladka and Hyanek (2018) studied non-profit financing in Czech Republic, more precisely the crowding-out effect of public money. They found that indeed, public money has a crowding-out effect on private donations, however not for other types of financing sources, such as self-financing. Dvorakova and Mackova (2016) studied non-profit financing in terms of management of the non-governmental non-profit organization. Radic and Barbaca (2018) focused on financing of non-profit organizations in Croatia through European funding sources. Vasicek et al. (2017) also focused on Croatian non-profit organizations to assess their financing needs. On the other hand, Ceptereanu et al. (2017) studied Romanian non-profit organizations and their financial sustainability.

Financial stability of non-profit organization is also very important and is closely linked with availability and diversification of sources of financing. Many models for prediction of financial vulnerability of non-profit organizations (i.e. how vulnerable are they to financial shocks) use concentration of revenues as one of predicting variables. (Tuckman, Chang, 1991); (Trussel, 2002); Greenlee and Trussel (2000) Mazanec and Bartosova (2019) also proposed a model to assess financial vulnerability of non-profit organizations particularly for Slovakia, however, they did not use the revenue diversification as a variable due to the unavailability of data. Some authors are using cart-based models for prediction of financial distress. (Durica et al., 2019) The existence of a large number of models is caused by the fact that there is no universal application in various sectors and economic conditions. (Kral et al., 2018) Various financial indicators, mostly financial ratios, are usually used to predict the financial distress. (Svabova, Durica, 2019), (Valaskova et al., 2015). Financial analysis results cannot be taken as useful and acceptable without their objectification on the basis of chosen reference rates, values. (Bartosova, Kral, 2016)

Trust is also important in obtaining finances from different sources. Olah et al. (2019a) studied relationship between trust and financial performance. Other researchers study decision-making in selecting and managing employees. (Meyers et al., 2019) Valaskova et al. (2019) looked at financial

decision-making and its behavioral aspects. Olah et al. (2019b) also researched financial risks, so did Hudakova et al. (2018). Brabanec (2010) studied cost contributions.

Moniz (2017) researched the use of tax assignation for financing churches and religious organizations. Hladka and Hyanek (2016) studied the usefulness of tax assignation in Czech Republic as it is the only country of the Visegrad group that does not have a tax assignation scheme. This topic was also previousle researched by Otavova et al. (2014). Marianna (2017) also researched tax assignation systems in central European region.

Non-profit financing in Slovakia – theoretical aspects

Principles of Financing in Non-Profit Organizations

Marcek (2004) defined following basic principles of NGO financing: multi-source financing, co-financing, self-financing, fundraising, management of external resources, efficiency, demonstrable use of funds, reimbursement of costs related to fulfilling the mission of the organization, focus on projects, budgeting, earmarking of funds. The principal preconditions for effective financing are, above all, the credibility and good name of the organization and the transparency of its operation.

Kuvikova et al. (2014) redefined the principles and came with 4 principles: non-profit nature of the organization, multiple sources of financing, self-financing and fundraising, tax exemption.

Non-profit nature of the organization is the basic principle in the financial management of a non-profit organization. All money (in any form – revenues, grant, donation) obtained must be used in the organization to fulfill its stated goals and objectives and cannot be redistributed or taken out of the organization.

Principle of multiple sources of financing means getting financial resources from different sources. With multiple sources of funding, organizations can diminish their reliance on one source of money. Moreover, another good reason to seek multiple sources of financing is that some donors are not willing or not able to cover all costs of the organization or costs of a given project realized by the non-profit organization.

Self-financing and fundraising is another basic principle of non-profit financing. It is a way of acquiring or obtaining financial or non-financial resources for the activities of an organization. If a non-profit organization is able to generate income from its own activities, we speak of self-financing. Self-financing is important for achieving the stability of the organization and its independence in terms of financing. In most cases, however, the organization is dependent on financial resources from the external environment. In that case, we can talk about fundraising, i.e. an activity that can be characterized as an active activity of non-profit organizations aimed at obtaining external financial and non-financial resources. (Kuvikova, 2004)

Tax exemption is a generally accepted principle in developed countries. With the tax exemption, we can talk about three basic tax regimes for the flow of funds to and from a non-profit organization:

1. tax exemption - it is an exemption of income from the main activity of a non-profit organization from corporate income tax, but the exemption can also be from value added tax, customs duties and various other property taxes;

2. tax relief for non-profit organizations, the so-called tax credit - the organization pays taxes without exemption, but has the opportunity to claim various reliefs from the calculated tax liability;

3. tax relief for contributors, the so-called tax benefit - this is the support of private persons who provide funds to non-profit organizations, these contributors have the opportunity to claim the gift as a non-taxable part of the tax base or deduct the amount of the gift from the tax base

Sources of financing for non-profit organizations

There exist many classifications of sources and forms of non-profit financing. Following are some of the most used classifications and sources of financing we identified after a research on this topic. For a better understanding they are listed in the following table and are elaborated upon in more detail below the table.

Table 1: Sources of financing for non-profits

Internal	Self-financing		• Equity introduced by the founders • Membership charges • Sales of products or services • Advertising, sale or renting of property
External	Domestic or foreign	Public sector direct financing	• Grants and subsidies from government, local governments, cities, foreign countries, EU funds or other bilateral and multilateral funds • Payments for services provided by non-profits
		Public sector indirect financing	• Customs and tax exemptions • Assignation of the percentage share of income taxes of legal entities and individuals
		Private	• Individual and corporate gifts, donations and sponsorships, • Assignation of the percentage share of taxes of legal entities • Grants from foundations

Source: author's compilation

Internal sources of financing represent an important piece in the puzzle of non-profit financing sources. It is called self-financing. Self-financing is a process in which a non-profit organization uses its capacities (human, material, financial, know-how, etc.) to create and obtain resources (especially, but not exclusively, financial) while fulfilling its mission. At the same time, the fulfillment of a public or mutually beneficial mission of the organization is a key element that distinguishes it from a business entity. Although making a profit may seem inappropriate to a non-profit at first glance, the opposite is true. Even a non-profit, as well as a business entity, can generate a positive economic result from its activities. The difference, however, is that in the first case, this profit is intended for the fulfillment of non-profit goals within the mission of the organization and not for the enrichment of owners, as in the case of entrepreneurs. (Marcek,2004) There are different sources of self-financing. It can either come from its founders in form of the initial or ongoing funding, its members in the form of a membership fee or it can be from its commercial activity, like sales of products and

services or using its assets – sale or renting of property, advertising income, etc. If a non-profit organization is doing business activities, it has to divide their revenues and costs between the main and the business activity and the revenue from these activities is taxable and has to be used to fund the primary goals for which the non-profit organization was founded. (Rebetak et al., 2019) In some cases, it can even be investment income on its asset, however it is rare in Slovak conditions. Self-financing presents an important pillar of stability for non-profit organizations, because it decreases their dependence on external funding.

External sources of financing represent all the money that comes to the organization from the outside. External financing comes from some of the other economic entities from all the sectors of the economy, whether public or private. When it comes to external sources of financing for non-profit organizations, one of classification is judged important by many authors and it is the location of the source. The sources of funding can be either domestic or foreign, i.e. based in a different country or from an international organization.

Public sector direct financing sources of non-profit financing are the many grants and subsidies that the public sector entities give to the non-profit sector or payments for services that the non-profit organizations provide for the public sector. These financing sources can come from any part of the public sector. The government usually operates its grant schemes from its ministries and agencies, each ministry and agency giving grants for organizations working in its dedicated area, like Slovak Aid for the humanitarian aid. Local governments and municipalities also have their own grant schemes and provide a source of financing for local non-profit organizations. These grants usually come usually earmarked for a specific use in some beneficial activity for the public – art, sports, education, healthcare, social care or humanitarian aid, etc. Non-profit organizations also provide services for the public entities and receive payments for them. Among the public sector direct financing sources, a special mention goes to the EU structural funds and other bilateral and multilateral foreign funds like Norway grants, that provide great source of financing albeit with a greater deal of bureaucracy and administrative difficulty. (Gregorova-Brozmanova et al., 2009)

Public indirect financing is through two means: customs and tax exemptions and tax assignation. Customs and tax exemptions are another source of funding, or more precisely of an advantage given to non-profit organization by the government or municipalities. State forgoes a part of its revenues it may get on taxes to support non-profit organizations. They are exempt from the income tax on their activities tied to the main goals of the organization and can be also exempt from some other taxes and custom duties, like for example property tax. Tax assignation is a support mechanism for the non-profit organizations that lets taxpayers assign a fixed percentage share of their paid income taxes is another source of financing which is largely specific to central Europe. (Hladka, Hyanek,2016) In Slovakia, uniquely in the world, not only individuals but also corporations can divert a portion of their income tax to non-profit organizations. Individuals who paid taxes can direct 2% or 3% of the tax to the non-profit sector. 3% can be assigned by persons who have volunteered for at least 40 hours per year. Legal entities may assign a tax of 2% or 1%. An entity that donated funds of at least 0.5% of the tax paid may assign 2% share of their income tax. (Rebetak et al., 2019) Creation of this tax assignation for corporate income taxpayers led to a rise in the number of a special type of foundations in Slovakia - corporate foundations. Since 2004, the year of the change, many larger corporations have established foundations that bear the name of the founding company and its logo and work on publicly beneficial causes. Most of them then funnel their corporate income tax assignation to their foundations and fund their charitable donations with these funds. In 2011 there were 85 corporate foundations in Slovakia. (Strecansky, 2012). Tax assignation is on one hand a way for the government to support non-profit organizations, but it also provides a possibility for private individuals or businesses to fund their preferred non-profit organizations.

This leads us to private sources of funding for non-profit organizations. The tax assignation is one of the ways that private individuals or businesses can donate to their non-profit organization of choice. Non-profit organizations have to be eligible however the bar to pass is low, so most non-profit

organizations strive to benefit from this possibility and ask individuals or companies for their tax assignation. Gifts, donations, sponsorships, grants, loans and public collections are other private sources of financing that non-profit organizations strive to obtain. Gifts can be also of non-financial nature, such as physical objects, volunteering or sharing of information or know-how. Gifts and donations from individuals and companies usually mean a big number of small donors who support the financial stability of the organization. However, attaining a sufficient number of such small individual donors can be challenging for a non-profit organization. Activity of soliciting such gifts and donations is called fundraising and is an important part of life for a non-profit organization. Grants from private entities such as corporations or foundations present an opportunity to cover costs associated with specified projects for which the grants have been given. Private sources of non-profit financing wouldn't be complete without a mention of foreign private funding, either directly from individuals and corporations or through foundations. Many foreign foundations create their own branches in Slovakia or choose a Slovak partner – some well-respected foundation. Some of these foundations function as grant-givers, i.e. not having their own operations focused on some publicly beneficial purpose but redistributing or giving grants to other non-profit organizations for diverse projects.

Non-Profit Financing in Slovakia In Numbers

As for the current state of financing of non-profit organizations, on the following figure, we can see the amounts of money received by non-profit organizations in Slovakia in the period 2008-2018, with 2018 being the last year of available data at the time of writing this article. These are donations to all non-profit organizations in their general sense, not only private non-governmental entities, they however represent most of the organizations and also in share of donations. We can see an overall growing trend in donations to these entities with a strong growth from 2012 till 2015 and a bit of a slump in the following period, however, we can see an uptick in 2018.

The increase in period 2012-2015 was mainly due to individual donations starting in 2012 with a biggest increase of 75% in 2013 when comparing to 2012 for an amount of almost 96 million € and further growing in following years to a high of 136 million € in individual donations in 2015. Individual donors from Slovakia are the biggest donors for non-profit organizations.

Corporate donations have been mainly consistent throughout the years without big variations except for year 2014 where they jumped 37% y-o-y. Their share as a percentage of all donations has been around 30% since 2013. Foreign donations also grew in 2012-2015 period with a peak of almost 99 million € in 2015.

Figure 1: Amount of received donation and grants to Slovak non-profit organizations per origin of the donation for 2008-2018 in €

Source: Slovak Statistics Bureau.
http://datacube.statistics.sk/#!/view/sk/VBD_SLOVSTAT/ns2002rs/v_ns2002rs_00_00_00_sk

Another source of funding that we mentioned in the previous chapter is the tax assignation – i.e. assignation of a percentage of the paid income tax by individuals and corporation to be redistributed to their chosen non-profit organization. The figure 2. presents an evolution of the amount given through tax assignation to non-profit organizations by companies and individuals. We can this source of financing as growing and the trend is projected to continue in following years. In 2019, tax assignation represented 73 million € in funding for non-profit organizations.

Figure 2: Amount of tax assignation in Slovakia per year in mil. €

Source: Institute of Financial Policy at the Ministry of Finance of Slovak Republic
https://finance.gov.sk/sk/financie/institut-financnej-politiky/ekonomicke-statistiky/asignacia-dane/

As for the research done in Slovakia on non-profit financing, usually it was done through a method of a structured questionnaire. Kuvikova and Vacekova (2009) studied sources of financing for governmental and non-governmental non-profit organizations. They found for non-governmental non-profit organizations to following diversification of sources of financing:

- 39,69 % coming from individual and private sources,
- 21,29 % comes from self-financing activities,
- 20,19 % comes from government,
- 16,79 % comes from foreign donors,
- 2,04 % comes from other sources

Svidronova and Vacekova (2012) also studied the financing of non-profit organizations and that 85% of organizations have more than one source of financing. i.e. they diversify their funding sources. She also found the tax assignation to be the most used funding source (91,6% of non-profit organizations used it) followed by private individual or corporate funding (60%), grants (45%), public sources such as subsidies from state or municipality (42%).

Conclusion

This article aimed at providing an overview of different financing opportunities for non-profit organizations in Slovakia. Non-profit organizations are an important part of Slovak society society and they play an important role in providing generally beneficial services that neither market nor state provides. They need funding for their operations as any other organizations for-profit or government organization, however they are usually reliant on generosity of their donors to fund their financing needs. We focused on many different sources of financing available for non-profit organizations in Slovakia. In conclusion, we can state that there are many sources of financing available for non-profit organizations and the amount of money given to non-profit organizations has a growing tendency. However, we can observe a lack of current research into this topic based on sound data. The unavailability of more data pertaining to the use of different sources of financing non-profit organizations, with current studies done on a small number of non-profit organizations, might therefore limit their applicability. The theoretical research lacks behind the well-established practitioners in the non-profit sector and the unavailability of ample statistic data is limiting the researchers. Nevertheless, we can observe some interesting findings for financing non-profits in Slovakia. Tax assignation is a big source of funding and its projected to get even bigger and was already observed to present an important source of funding. This might be inapplicable to other countries where the institute of tax assignation is not established. Other sources of non-profit financing enumerated in this article are also applicable elsewhere around the world, obviously with some adjustment to the local condition but the framework is sound.

Abstract

Nowadays, it is increasingly difficult for companies to stay in the market, compete with organizations with similar services or products, and thus continue to move forward and become more successful. One of the basic goals of every business is to achieve success and prosperity. From this goal, the overall corporate policy, decisions and specific activities of the company are derived. The development and success of the company are among the basic goals of business. Due to the constantly changing and advancing market conditions, it is not easy to clearly identify the factors that affect the development of the company. Already in the past, the model of the marketing mix, which consists of tactical marketing tools of product, price, distribution and communication policy, was decisive for the success of the company. The paper focuses on marketing communication, which is an integral part of the activities and the overall activity and position of the company. Communication is one of the tools of the marketing mix, which has an important position in increasing competitiveness and achieving success in selling products as well as the success of the company. It is also an important tool for building corporate identity and corporate image. The aim of the article is to point out the importance of marketing communication in connection with the successful sale of the product as well as to achieve success and increase the competitiveness of the company as a whole and to clarify the individual tools of marketing communication.

Keywords: communication, marketing, product, sale

Introduction

At a time when there is competition between customers, it is very important for a company to differentiate itself from the competition, create a certain position in the market and become known to potential customers. A competitive environment creates an environment for companies that need new innovative products and services to succeed in the market (Durana et al, 2020). Not only the company is undergoing changes, but also the people themselves, which include both employees and customers. We see these changes mainly in higher expectations, demands or changing needs. People are becoming more demanding, which must be considered by entrepreneurs who decide to enter the market or who are already at the centre of events. Companies must continually strive to improve or at least maintain its market performance (Parobek, 2016). As there is currently a lot of competition in the market and we can say that supply has long exceeded demand in many sectors, a competitive advantage becomes relevant for the company, as a result of which it can gain a large number of customers and thus strengthen its market position. Vafaei et al. (2019) perceives customer satisfaction with the company's products or services as a key factor in the company's success and long-term competitiveness. The success of the company is helped by the correct determination of

specific marketing goals that the company wants to achieve, defining the target group of customers and adapting the individual tools of the marketing mix. All these activities related to the purchase and sale of the product to the final consumer can be called a collective name - marketing. Today's successful company provides 4P as a matter of course. However, they must be accompanied by other factors that determine the future performance and competitiveness of a modern enterprise. Mainly factors such as product innovation and the quality of service provision. These must be innovations of this type that generate new demand. As Rosalie et al. (2019) state innovation is an integral part of business. According to Janoskova and Kral (2019) for the successful innovative development of the economy in each country, it is necessary to set certain preconditions that should ensure positive results. Mira et al. (2018) state that in new economies driven by creativity, knowledge and technological development, innovation is the success key to achieve competitiveness. Businesses must also monitor market factors such as changes in demand and competitive behaviour (Buc et al. 2013). Related to this is the ability to respond quickly to changing customer requirements. Some customers consider the speed of response and the quality of service to be the most important features in which they choose their suppliers. A company that wants to be successful must carefully and constantly monitor the indicators characterizing the satisfaction of each customer. For example, according to Bartosik-Purgat (2018) the country of origin and the brand image are among the main factors influencing consumers' purchasing decisions. The success of companies is influenced by a set of factors of tangible and intangible nature, the so-called development potential. These include factors such as the level of innovation, the level of customer satisfaction, the level of employee motivation and the protection of the environment. These factors also include, for example, sustainable production (Terry, 2019). Olah et al. (2017) point out the relationship between the key success factors and the company's performance. The success of the company in making products or services offered by companies in some way different from the competition. In the context of this, it is important to state the findings of Mikolas (2005), who emphasizes that competitiveness is created by other attributes, in addition to the basic four attributes, human, technological, financial and business potential of the company. Kadar and Kadarova (2010) point out that if companies want to be able to compete or to compete in the market, they need to constantly improve individual business processes as well as adapt to customer requirements. However, business also brings risks. Poliak et al. (2014) point out to systematic risk, such as political, international and economic risks and unsystematic risk that is directly linked to society, for example managerial skills. Business risk is also pointed out by Valaskova, et al. (2019). In connection with corporate communication, Dedina and Odchazel (2007) emphasize that they clearly and directly affect the performance of the entire organization and it is essential that the company pays enough attention to them, because managing them can give the company a competitive advantage. To the importance of effective communication in building and maintaining performance success also point out Nwabueze and Mileski (2018).

Theoretical Background
