At the same time, it should be emphasized that this simplicity also constitutes one of the main criticisms raised by the critics of such an approach. They are of the opinion that complexity and volatility of organizations are so high that referring to a closed list of issues (topics) (and such one always occurs in case of this type of approach) makes it impossible to take into account the specifics of the given organization (Mettler, 2011, 82).

Analysis of the current robotic process automation maturity models

The subject literature research completed did not unearth any scientific articles in the reviewed magazines published in Polish or English that would present a proprietary, comprehensive robotic process automation maturity models. The starting point for the literature research was an analysis – conducted in August of 2020 – of the publications stored in databases 1) Web of Science (WoS) Core Collection, 2) SCPUS. The focus was on English language publications – articles in the reviewed publications and books. No reports / analyses prepared by consulting companies were taken into account at this stage. The phrases:

- ”Robotic Process Automation” and “Maturity Model”,
- ”RPA” and “Maturity Model”,
- “Software Robots” and “Maturity Model”

were searched for accordingly. The searches were conducted on titles, abstracts and keywords. A similar procedure was applied in case of each database and each phrase: an appropriate keyword was entered into the database search engine to obtain a basic list of documents. Each of these documents was initially analyzed and a classification was made to group the materials into: a) contents totally irrelevant with respect to the issues (topics) discussed in the article, b) generic content, c) documents overlapping the contents found in other databases, d) relevant documents, taken into account in the more detailed analysis. As a result of the completed review of the literature related to robotic process automation and maturity model no items containing references to this topic were identified.

In the final stage, the analysis of books on robotic process automation topics was conducted. Based on the criteria of relevance to the issues (topics) covered in the article, the currency of the content presented and the methodology apparatus used, the decision was taken to include 4 items related to robotic process automation in the literature research. As part of the second stage of the literature research – the items selected as part of the first stage were subjected to a more detailed analysis with regard to maturity model references contained therein. No items containing references to the proprietary take on this topic were identified. In the paper (Willcocks and others, 2017) there is a reference to ”The Enterprise RPA Maturity Model” developed for the company Blue Prism – however it presents robotic process automation stages, and not directly its maturity assessment mechanism. The author is aware of the limitations of the adopted research procedure that in its current form cannot be called a systematic literature review (Uman, 2011).

However, such approaches developed by consulting companies are available. Among them the following ones are worth highlighting:

- HfS Research Maturity Model for RPA,
- Forrester Robotics Quotient Model,
- Mindtree’s Automation Maturity Model,
- Federal RPA Community of Practice Maturity Model

”RPA Maturity Model of Coforce” was excluded from the analysis as, despite the name suggesting that it was applicable to the robotic process automation maturity assessment, after it had been studied, it turned out to be an approach presenting a sequence of activities aimed at deploying RPA tools in an organization. A similar situation occurred in case of ”The Enterprise RPA Maturity Model”, which was prepared for the needs of the company Blue Prism.

Each of the above four models is discussed below.

HfS Research Maturity Model for RPA

HfS Research model was developed in 2014 (Sutherland, 2014). It can be considered to be the market’s first approach to the robotic process automation maturity assessment. Its main specific feature is a focus on the robotic process automation maturity assessment from the perspective of Business Process Outsourcing (BPO) centers. It is visible in the approach to the structure of its building blocks: maturity levels and dimensions of such maturity assessment.

HfS Research model distinguishes three maturity levels (Sutherland, 2014):

- Initialization – a BPO organization at this maturity level is approaching RPA deployment as a kind of an experiment (aiming to grasp some understanding of this technology) that can be implemented within the existing contract with the customers;
- Industrialization – a BPO organization at this maturity level is approaching RPA tools deployment as one of the possible ways to perform some contracts with the customers, however RPA is still not regarded as a key activity;
- Institutionalization – a BPO organization at this maturity level is approaching RPA deployment as a source of building a competitive advantage on the market, which in practice means that it is making sizeable investments in IT processes and tools.

HfS Research listed the following model maturity assessment dimensions (Sutherland, 2014):

1. Main goal of RPA deployment – a BPO organization indicates the goal of RPA deployment. On the initialization level the goal is to replace actions performed by a human-operator with a software robot, on the industrialization level – to enhance cognitive capabilities of an employee-specialist, and on the institutionalization level – to introduce cognitive tools.
2. RPA program business owner – a BPO organization indicates a person responsible on the strategic level for works carried out in the RPA area. On the initialization level it is usually a customer service team manager, on the industrialization level – a global process owner, and on the institutionalization level – BPO's Vice President for operations.
3. RPA deployment vision – a BPO organization indicates what the robot implementation model is. On the initialization level these are usually robots that are not coordinated with one another, on the industrialization level – robots accessible from a central location, and on the institutionalization level – robots operating under a service model.
4. RPA technology vision – a BPO organization indicates what the technology context of using RPA tools is. On the initialization level it is usually remote access, via terminals, on the industrialization level – robot integration with customer applications, and on the institutionalization level – an integrated robot platform.
5. RPA competence ownership – a BPO organization indicates who the subject matter owner of RPA deployment works is. On the initialization level these are usually independent business analysts, on the industrialization level – process experts team, and on the institutionalization level – RPA Center of Excellence.
6. Source of financing – a BPO organization indicates what the RPA deployment works' source of financing is. On the initialization level these are usually customers' funds, on the industrialization level – customers' and BPO's funds, and on the institutionalization level – BPO's own funds.
7. Approach to robotic process automation – a BPO organization indicates what its approach to robotic process automation is. On the initialization level robotic process automation is not preceded by the alteration of the processes, on the industrialization level robotically automated processes are analyzed and, based on that, improvement measures are undertaken, and on the institutionalization level robotically automated processes are comprehensively altered.
8. Customer context during robotic process automation – a BPO organization outlines rules of cooperation with customers during robotic process automation. On the initialization level robotic process automation is visible from the customer's perspective, on the industrialization level a BPO organization starts a discussion on robotic process automation, and on the institutionalization level a BPO organization, jointly with the customer, agrees on the robotic process automation roadmap.
9. Analysis of the data collected owing to the RPA tools – a BPO organization indicates how it is using the data available thanks to the use of the RPA tools (in particular all kinds of logs). On the initialization level data is used to generate ad-hoc reports, on the industrialization level a BPO organization uses the data collected to systematically generate reports, and on the institutionalization level a BPO organization develops, based on such data, a dashboard that is continuously updated.
10. Long term RPA development vision – a BPO organization indicates how it perceives robotic process automation. On the initialization level robotic process automation is perceived as an ad-hoc solution that can be replaced with a different approach, on the industrialization level a BPO organization perceives robotic process automation as a tool that provides business flexibility, and

on the institutionalization level a BPO organization wants, thanks to robotic process automation, to achieve the ability to dynamically adapt to technology and business changes.

The proposed model should be regarded as a comprehensive approach, although narrowed down to BPO type organizations. It should be noted, however, that this model is not equipped with assessment questions, which leaves a lot of room for interpretation by the unit employing such a solution.

Forrester Robotics Quotient Model

Forrester developed ”Forrester RQ (Robotics Quotient) Model” in 2018, and offered its updated version, named 2.0, in 2019 (Gownder, 2019).

The core part of the model is the RQ (Robotics Quotient) concept, which is defined as a measure of: ”ability of individuals and organizations to adapt to, collaborate with, trust, and generate business results from automated entities, including software like RPA, AI, physical robotics, and related systems” (Gownder, 2019).

This model does not introduce maturity levels (as is the case with other models). Forrester model assumes that the higher the RQ value, the more mature the organization is in terms of robotic automation of its operations.

The authors of the model assume that assessment will take the form of a self-assessment and take into account the thus-far achievements of the organization with respect to automation/robotic automation. This model proposes that leaders coming from the following areas should take part in the assessment: IT, operations, business and HR. Additionally, it is recommended that assessment is periodically repeated – usually every 6-12 months.

The current version of the Forrester model includes three assessment areas (people, leadership, organization), to which 15 high level assessment topics (items) are assigned. Having completed the organization’s assessment using such topics the result obtained should be referenced to the fourth area – trust (Gownder, 2019).

”People” area includes the following assessment topics (items) (Gownder, 2019):

- “Nontechnical employees can easily adapt to new tools, processes, and/or values at work”.
- “Nontechnical employees communicate well with each other about technologies we use at work”.
- “Nontechnical employees know when to question the results of an automated technology”.
- “Nontechnical employees can easily work with machines to jointly solve problems”.

“Leadership” area includes the following assessment topics (items) (Gownder, 2019):

- “Leader can easily apply technological implementations from one unit of the business to another”.
- “Company has clearly articulated how different automation technologies can help us reengineer our current business processes”.
- “Leaders have proven to be effective at process and operational realignment when needed”.
- “Leaders communicate honestly and empathetically with employees”.

”Organization” area includes the following assessment topics (items) (Gownder, 2019):

- “Someone at my company could complete analysis for the automation process”.
- “We have the right technology experts needed for the automation technologies that we’re interested in”.
- “My company encourages alignment and collaboration between different parts of the business”.
- “My career path in the world of automation is clear to me”.
- “We have established a structured training curriculum for working with automation technologies”.
- “We are measuring how automation technologies improve the experience of our customers”.

- "We have identified and implemented KPIs related to automation technologies".

Having responded to the above assessment topics (items) the organization must assess how the results obtained are impacting the choice of automation technology – in the context of trust to such technology. The authors of the Forrester model are noting such aspects of the technology choice as the level of the organization's acceptance versus the degree of non-deterministic / non-transparent character of its operations (this is of particular importance with respect to technologies that utilize artificial intelligence mechanisms – a solution that includes elements thereof can be very efficient, but the results obtained can be hard to explain / audit) (Gownder, 2019).

The model presented features an interesting approach that goes beyond robotic process automation (in particular it can be applied to assess the maturity of the manufacturing process robotic automation implemented using industrial (physical) robots). Unfortunately, this model is the most restricted one (in terms of licensing) among all the models presented in this article. Forrester charges interested companies licensing fees for the use of the detailed list of assessment questions and IT tools that support the assessment process.

Mindtree's Automation Maturity Model

The model developed by Mindtree utilizes the concept of an organization's five maturity levels – from "Ad hoc" level to "Adaptive" level (Kumar, 2016). The structure of such levels is very precisely defined. It is composed of:

- a general description of the level,
- benefits for the organization that are achievable once the organization has reached the given maturity level,
- roles that initiate actions related to the organization's transition to the given maturity level,
- consequences of the organization finding itself on the given maturity level from the human resources management perspective.

Each maturity level is described in general below (Kumar, 2016).

Level 1 (Ad hoc) – the level on which automation related activities are undertaken within the organization, but they are not planned or coordinated in any way. Such activities are conducted by various teams – depending on the needs and there is no formal budget allocated thereto. Automation is usually implemented using scripts, tools that a team has already had or solutions available under the open source license. On this level of maturity automation is initiated by persons that are motivated to improve their work efficiency. On this level of maturity an increase of the organization's / department's work efficiency by not more than 5% can be expected. On this level of maturity automation does not have any impact on the level or structure of employment.

Level 2 (Opportunistic) – the level on which the goal of automation related activities is to solve a specific business problem – i.e. they are reactive. Automation is usually implemented using RPA class tools. The organization starts discussions on selecting a tool and allocating budget to automation related works. On this level of maturity automation is initiated by the leader of the area in which a problem occurs. On this level of maturity an increase of the organization's / department's work efficiency (productivity) by 5 to 10% can be expected. On this level of maturity transfers (reassignments) of personnel between departments may take place as a result of automation.

Level 3 (Systematic) – the level on which automation related activities are managed within the organization in a comprehensive manner, through a portfolio of initiatives and they are actively pursued (places where automation can be implemented are sought out). Automation is implemented using RPA class tools and based on the agile approach (Scrum/DevOps). Automation is initiated by dedicated experts who understand the specifics of the process based approach and are familiar with automation technologies. On this level of maturity an increase of the organization's / department's work efficiency by 10 to 20% can be expected. On this level of maturity transfers (reassignments) of personnel between departments take place or layoffs are made as a result of automation.

Level 4 (Institutionalized) – the level on which automation related activities are becoming a part of every initiative undertaken by the organization. The organization has a formulated automation strategy in place. Automation is implemented with the use of classic RPA tools, cognitive automation tools (using machine learning and natural language processing), chatbots and voicebots. Automation is initiated at the enterprise's strategic objectives levels. On this level of maturity an increase of the organization's work efficiency by 20 to 30% can be expected. On this level of maturity material transfers (reassignments) of personnel between departments take place or significant layoffs are made as a result of automation.

Level 5 Adaptive) – the level on which robotic process automation solutions adapt to changing business needs (it is possible thanks to a broad combination of automation tools with machine learning techniques and natural language processing). In particular, the solutions built are self-healing and self-scaling. Automation is the foundation of the company's operations – becoming a major part of the business strategy. On this level of maturity an increase of the organization's work efficiency by more than 30% can be expected. A comprehensive alteration of the company's organizational structure and employment take place as a result of automation.

The model presented features an interesting approach that goes beyond robotic process automation, as it refers, on one hand, to simple automation using scripts and macros, and on the other hand – to cognitive automation. Unfortunately, this model does not take a structured form and is not equipped with assessment questions, which leaves a lot of room for interpretation by the unit employing such a solution.

Based on the above analysis of the existing maturity models it can be stated that there is a research gap that involves a lack of the commonly available, open (accessible without fees) and developed with methodological diligence approach that would allow for conducting a robotic process automation maturity assessment in a systematic manner.

Federal RPA Community of Practice Maturity Model

Federal Community of Practice dealing with robotic process automation is a collaborative body designed to rapidly accelerate the adoption of RPA technology across the US federal government agencies. The community consists of representatives from more than 50 federal agencies, with more than 750 members. The community pursues a bifurcated mission. First, the organization is charged with discussing and designing solutions to help individual agencies overcome the technical, management, and operational challenges that arise in deploying robotic process automation. This portion of the group's mission includes such initiatives as designing common federal solutions for credentialing, privacy, and security with respect to robotic process automation, and designing common management metrics to gauge federal government wide impact of robotic process automation. The second element of the community's mission is to provide knowledge sharing and mentoring to organizations looking to launch an RPA tools implementation program or to evolve their current approach to RPA.

The Federal RPA Community of Practice Maturity Model introduces four maturity levels described below (Federal RPA Community of Practice, 2020).

Level 1. Organizations at this level are at the start-up stage of implementing an RPA program. Pilot bots development process is usually underway or less than 5 bots are used in the production environment. The annualized bot capacity created is less than 5k hours. The organization has established a formal process related to the RPA tools deployment.

Level 2. Organizations at this level are developing an RPA tools implementation program. Between 5 and 20 bots are used in the production environment at such organizations. Their annualized capacity is estimated to stand at 5-50k hours. The organization has formally defined security, privacy, as well as RPA tools deployment program policies. The organization's program management, reporting, and robotically automated process improvement capabilities are being developed.

Level 3. Organizations at this level are already experiencing visible impacts of the RPA tools implementation program. More than 20 bots are used in the production environment at such

organizations. Their annualized capacity is estimated to stand at 50-100k hours. The organization has developed formal IT security and privacy policies with respect to robotically automated processes. The organization has strong RPA program management and process improvement capabilities. RPA tools have been deployed across multiple functional areas of the organization. The foundations for further scaling up have been built.

Level 4. An organization is experiencing significant impacts of the RPA tools implementation program. 5-10 bots are deployed every month. Their annualized capacity is estimated to stand at more than 100k hours. RPA Center of Excellence, that coordinates work for various business units, has been established. The organizations are expanding their RPA tools by adding intelligent automation capabilities. Dedicated personnel (FTEs) responsible for the RPA tools deployment program management and business process reengineering is in place. Workforce redeployment, capacity planning, and reskilling are required due to the robotic process automation achieved.

The model presented is characterized by a highly comprehensive approach to assessing the robotic process automation maturity of an organization. The weakness of the model is the fact that it is targeted to the specifics of the US government's federal agencies. As a result, any attempts to use it in relation to enterprises require a number of adjustments to be made.

Based on the analysis of the existing maturity models carried out in this section, it can be concluded that there is a research gap involving the lack of a commonly available, open (available free of charge), and developed with a methodological regime, approach that would allow for a systematic assessment of the robotic process automation maturity. Therefore, undertaking research work in this area is justified.

Developing the design assumptions of the proprietary robotic process automation maturity model of an enterprise

In order to maintain the methodological regime the author, planning to work on developing the proprietary robotic process automation maturity model of an enterprise (Robotic Process Automation Maturity Model), decided to use the procedure presented in (Becker and others, 2009, 218). It is composed of a series of the following steps: 1) Initiation, 2) Problem definition, 3) Comparison of existing maturity models, 4) Determination of development strategy, 5) Iterative model development, 6) Conception of transfer and evaluation, 7) Implementation of transfer media, 8) Evaluation, 9) Introduction of amendments to the model. Items 1-3 of that procedure are presented in the earlier sections of the article, while developing of the model's design assumptions is a part of implementing item 4 of the procedure.

When defining the set of the design assumptions of the proprietary robotic process automation maturity model of an enterprise, the author completed an analysis of the existing maturity models with respect to process management, software development and robotic process automation.

Additionally, the author conducted semi-structured expert interviews with persons dealing professionally with robotic process automation. In 2018-2019 the author conducted an analysis of 18 projects completed in Poland, related to the implementation of RPA tools in medium and large companies representing diverse industries (banking, insurance, telecommunications, financial services, BPO (Business Process Outsourcing) and SSC (Shared Service Center), e-commerce, traditional retail). However, the author is aware of the fact that an 18-interview sample is limited in size. The reason for such a limited size was still a low penetration of robotic process automation. The analysis was based on semi-structured interviews conducted with persons in charge of robotic process automation deployments (middle level management personnel) or supervising such implementations (higher level management personnel). The criterion for selecting respondents was having completed at least one pilot RPA tool implementation. The information obtained during such interviews was also used as a contribution to developing the proprietary model's assumptions.

The design assumptions of the proprietary model of assessing robotic process automation maturity of an enterprise developed by the author are provided below:

1. Model must allow for objectively assessing the actual robotic process automation maturity level for an organization which implies the need to precisely define assessment questions and have them cover the broadest possible scope of issues (topics) related to robotic automation;
2. Model can be used at a company of any size that finds itself on any robotic process automation maturity level. This leads to the preparation of a set of questions that is as content rich as possible;
3. Model can be used at a company of any size and any industry at which robotic process automation is taking place. This implies developing a model in such a way that it does not reference company size or industry specifics (e.g. in terms of terminology used);
4. Model must be as simple as possible and inexpensive to use, which implies that assessment will be performed by an organization's in-house team, with potential methodological support from an external consultant;
5. Model is not connected to any specific robotic process automation vendor/tool, which implies that the model does not reference any detailed technology issues (topics).
6. While viewing robotic process automation as a specific type of an organizational change, the model must take into account not only technical aspects, but the strategic, organizational, cultural and competency related ones as well.
7. Due to the diverse range of issues that need to be taken into account, the model must have a multidimensional and hierarchical structure.
8. Each issue presented in the model must be mapped in the form of a control question with a specific number of possible answers.
9. The use of the model should enable the determination of a) overall robotic process automation maturity of the enterprise; b) maturity of the enterprise with respect to the particular dimensions of the model - e.g. in terms of the strategic or organizational aspects of robotic process automation.
10. The maturity model should be adaptable to the specifics of the given enterprise, while it is assumed that there will be a certain fixed (invariable) part of the model and a part that the enterprise will be able to modify on its own.

Summary and directions of further research

Trend analyses indicate that in the overwhelming majority of industries there is no turning back – advanced robotic process automation is inevitable. This is why it is so important to make managers and decision makers realize how profound the changes brought about by robotic process automation at their organizations will be.

Activities related to increasing an organization's maturity with respect to robotic process automation entail the need to incur specific expenditures – both financial outlays, as well as organizational measures. This is why it is so important to be able to precisely point out areas where such activities are justified. This is possible thanks to completing an assessment of the current maturity of the organization's robotic process automation.

In the first part of the article the author lays out three objectives of this paper. In the third part of the article an attempt is made to accomplish the first objective: key concepts of maturity models are discussed. In the fourth part of the paper the current approaches to assessing robotic process automation maturity are discussed, thus achieving the second objective of the article. The set of the design assumptions of the proprietary robotic process automation maturity model is discussed in the subsequent part of the article. This way the third objective of the article is accomplished.

Therefore, the author is planning to continue his research in this area. In particular, the author is planning to undertake the task of developing the proprietary robotic process automation maturity model based on the design assumptions developed and presented in the article. The model, to be developed by the author, will be made available free of charge – including the detailed description (along with the complete list of assessment questions) and the IT tool supporting its application. Any organization will be able to apply the model for its internal needs, and also adapt it to the extent required thereby.

Acknowledgment

This research was funded by the support of the Fundation Centre for Studies on Digital Government project "Advanced aspects of business process automation".

Abstract

The purpose of the study is to analyze the processes of digitalization at the regional level and determine the level of readiness of Russian regions for intensive digital development. The authors conducted a comparative analysis of Russian regions in terms of access of households and organizations to digital infrastructure, their use of digital technologies for personal and professional purposes, digital literacy, as well as investment in ICT development and R&D. The authors used the Portulance Institute methodology to determine the network readiness index of Russian regions. The available data from the Russian statistical database were grouped into subgroups - technology, people, governance, and impact. Calculations of the network readiness index for 80 regions of Russia were made by authors. The results allowed to conclude that 32 regions of Russian Federation have high network readiness indicators. The proposed tools for assessing the network readiness of regions can be used as a criterion for differentiating digital development policies at both the state and regional levels.

Keywords: Digital Economy, Region, Russia, Digital Readiness, Network Readiness Index, Digital Infrastructure

Introduction

The process of formation of the digital economy is significantly differentiated in terms of countries and regions of the world. The reason for differentiation is the different level of digital infrastructure formation and access to the use of ICTs.

Today, the availability of the Internet, as well as the possibility of using digital technologies to solve personal and professional problems, determine the level and quality of the population life (Molchan et al., 2019). Regions that are remote from digital infrastructure are deprived of opportunities for progressive development, and their populations cannot be included in the processes of global communications.

Cite this Article as: Naira P. BYCHKOVA, Zulay K.TAVBULATOVA, Natalya V. RUZHANSKAYA, Ruslan M. TAMOV and Evgeniya K. KARPUNINA "Digital Readiness of Russian Regions" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

This, in turn, constrains economic and social activity, limits the human potential realization for the benefit of social progress, provokes imbalances in the regional economy of Russia, violating its integrity, as well as causes problems of socio-economic lagging at the international level.

The Russian Federation is currently lagging far behind the world's leading countries in terms of digital development. The share of the digital economy in Russia's GDP is about 4%, which is 1.5-3 times lower than in the United States, China, and the European Union (Ushakova and Uskov, 2019). If we look at international comparisons, we can see that in the international ranking of countries in terms of ICT development, Russia ranks only 45th in the world (Tadvisor, 2020), according to the E-Government Development Index in 2018, Russia ranked 32nd (United Nations, 2020), in the Digital Competitiveness Index, the country is ranked only 40th out of 63 countries (IMD, 2019).

It is likely that this lag in Russia is determined by the scale of its territory, significant regional development differentiation, as well as gaps in state policy in terms of digitalization, which define the digital unpreparedness of certain territories for the penetration of digital technologies and inclusion in the digital space (Portulance Institute, 2019).

Thus, there is a need to analyze the processes of digitalization at the regional level and determine the readiness of Russian regions for intensive digital development.

Methodology

The starting point of the study is the network readiness assessment methodology developed by the Portulance Institute (2019). In accordance with this methodology, the network readiness index is calculated based on four groups of indicators: Technology (access, content, and future technologies), People (individuals, businesses, and governments and their readiness for digital transformation), Governance (credibility, regulation and inclusion), and Impact (impact of digitalization on the economy, quality of life, and contribution to the achievement of sustainable development goals). Indicators of international statistics allow to calculate and compare countries in terms of this index. However, the lack of initial statistical information about Russian regions does not allow using the indicators included in the index. In this regard, the authors made adjustments to the methodology taking into account the Russian specifics.

The system of indicators reflecting the network readiness of regions, adapted to the Russian specifics, is presented in table 1.

Table 1: A system of indicators for assessing the network readiness of regions

Group of indicators	Network readiness Index indicator	Similar indicator for Russian regions
Technology		
Access	1.1.1 Mobile tariffs	-
	1.1.2 Handset prices	-
	1.1.3 Internet access	-
	1.1.4 4G mobile network coverage	-
	1.1.5 Fixed-broadband subscriptions	Percentage of households with broadband Internet access, % (Gks, 2019a)
		Organizations with broadband Internet access, % of the total number (Gks, 2019a)

	1.1.6 International Internet bandwidth	-
	1.1.7 Internet access in schools	-
Content	1.2.1 Digital participation and content creation	-
	1.2.2 Mobile app development	-
	1.2.3 Intellectual property receipts	-
Future Technologies	1.3.1 Availability of latest technologies	Advanced manufacturing technologies used (Gks, 2019b)
	1.3.2 Company investment in emerging technology	-
	1.3.3 Government procurement of advanced technology products	-
	1.3.4 ICT PCT patent applications	-
	1.3.5 Computer software spending	Capital expenditures on information, computer and telecommunications equipment (weighted relative to the population of the region) (Gks, 2019b)
	1.3.6 Robot density	-
People		
Individuals	2.1.1 Internet users	Users of the Internet among households, % of total households (Gks, 2019a)
	2.1.2 Active mobile-broadband subscriptions	-
	2.1.3 Use of virtual social networks	The percentage of households making purchases online, % of total households (Gks, 2019c)
	2.1.4 Tertiary enrollment	Education index (Analytical center under the government of the Russian Federation, 2019)
	2.1.5 Adult literacy rate	Literacy, % (Analytical center under the government of the Russian Federation, 2019)
	2.1.6 ICT skills 2nd sub-pillar: Businesses	-
Businesses	2.2.1 Firms with websites	Organizations with a website, % of the total number of organizations Sabelnikova et al., 2018)
	2.2.2 Internet shopping	-
	2.2.3 Professionals	Online staff training, % of the total number of organizations (Sabelnikova et al., 2018)
	2.2.4 Technicians and associate professionals	Using special software tools in organizations (Gks, 2019d)
	2.2.5 Extent of staff training	-

	2.2.6 R&D expenditure by businesses	-
Governments	2.3.1 Government online services	Percentage of households receiving public services online, % of the total number of households (Sabelnikova et al., 2018)
	2.3.2 Publication and use of open data	-
	2.3.3 ICT use and government efficiency	-
	2.3.4 R&D expenditure by governments and higher education	Internal R&D costs (weighted relative to the region's population) (Gks, 2019b)
Governance		
Trust	3.1.1 Rule of law	-
	3.1.2 Software piracy rate	-
	3.1.3 Secure Internet servers	
	3.1.4 Cybersecurity	Percentage of the population who used information security tools, % of the total population of the region (Gks, 2019d)
	3.1.5 Online trust and safety	-
Regulation	3.2.1 Regulatory quality	-
	3.2.2 Ease of doing business	-
	3.2.3 Legal framework's adaptability to digital business models	-
	3.2.4 E-commerce legislation	-
	3.2.5 Social safety net protection	-
	3.2.6 ICT regulatory environment	-
Inclusion	3.3.1 E-participation	-
	3.3.2 Socioeconomic gap in use of digital payments	-
	3.3.3 Availability of local online content	-
	3.3.4 Gender gap in Internet use	-
	3.3.5 Rural gap in use of digital payments	-
Impact		
Economy	4.1.1 Medium and high-tech industry	Share of high-tech and knowledge-intensive industries in the gross regional product (Gks, 2020)
	4.1.2 High-tech exports	-
	4.1.3 PCT patent applications	-

	4.1.4 Labor productivity per employee	The index of labor productivity (Gks, 2020)
Quality of Life	4.2.1 Happiness	-
	4.2.2 Freedom to make life choices	-
	4.2.3 Income inequality	-
	4.2.4 Healthy life expectancy at birth	Healthy life expectancy at birth (Analytical center under the government of the Russian Federation, 2019)
SDG Contribution	4.3.1 Access to basic services	-
	4.3.2 Pollution	Organizations that have implemented innovations that improve environmental safety in the production of goods, works, and services (Gks, 2019d)
	4.3.3 Road safety	-
	4.3.4 Reading proficiency in schools	-
	4.3.5 Math proficiency in schools	-
	4.3.6 Use of clean fuels and technology	-

After the selection of indicators are examined to excessive deviations that may interfere with the objectivity of ratings. Deviations with an absolute asymmetry value greater than 2 and exceeding 3.5 are excluded from calculations (Groeneveld and Meeden, 1984).

The authors use the normalization method to achieve comparability of indicators:

$$x_i = \frac{xi}{xmax} \quad (1)$$

The authors perform a sequential aggregation of points based on the calculation of the arithmetic mean for each indicator that makes up the overall network readiness index. The ideal value of the network readiness index is 1.0.

The information base of the research consists of statistical data of Federal service of state statistics of Russia, Analytical center under the Government of the Russian Federation, Higher school of Economics, Organizations for economic cooperation and development (OECD), McKinsey Global Institute.

Literature Review

The versatility of the process of digital economy formation in their research showed Atkinson et al. (2009), Varian et al. (2002), Gillett et al. (2006), who based on empirical data studied the impact of digital technologies and the Internet on socio-economic processes in the United States, United Kingdom, France, and Germany. Frey and Osborne (2013), Brynjolfsson and McAfee (2014) paid attention to the study of the processes of labor market transformation under the influence of automation, as well as pointed to the trend of reducing the average and low-skilled labor force as a result of capital substitution.

Katz (2012, 2017) identified three waves of digitalization, as well as the corresponding types of technologies being implemented, he systematized the economic and social benefits and disadvantages of digital development. Among the obvious benefits of digitization, the author has identified increasing

productivity as a result of implementing more efficient ICT technologies in business processes, optimizing supply chain, reducing overall costs. Katz attributed the disadvantages of the digital economy to the negative economic impact of disrupting the Internet as a result of natural disasters, cybercrime, technological failures or politically motivated disconnections, as well as the degradation of human relations as a result of intensive digital consumption.

Martin (2005), Hagerstrand (1966), Novak and Hoffmann (2000), Wilhelm and Thierer (2000), Greenstein and Prince (2006), Elohov and Alexandrova (2019), and Shvetsov (2014) studied the specifics of digital economy development in the regional context. For example, Elohov and Alexandrova (2019) conclude that achieving uniform digital development in the regions contributes to balancing their resource capabilities and overcoming the digital lag of the country as a whole.

Results

Analysis of indicators of digital readiness of Russian regions.

The basic condition for the development of the digital economy is the formation of digital infrastructure. In this aspect, the availability of devices and access to the Internet for households, and businesses are important.

The ability of households to access a computer and enjoy the benefits of the Internet varies significantly in different regions of Russia. Availability of computers and alternative access via TVs or mobile phones, as well as access to the Internet can be attributed to the basic indicators of the readiness.

According to a sample survey of the population on the use of ICT by the Federal state statistics service of the Russian Federation, five regions with the highest and lowest indicators of personal computer use in households can be identified (Fig. 1).

Fig. 1: Top-5 regions of Russia with the highest and lowest indicator of personal computer usage in households in 2014 and 2018 (as a percentage of the total number of households in the corresponding subject of the Russian Federation) (compiled by the authors according to Gks (2019d)

According to the data, the gap between the regions of the Russian Federation in the use of personal computers by households in 2014 was 1.96 and increased by 2018 to 2.02 times.

However, in 2019, only 39.7% of households in urban areas and 27.7% in rural areas used a desktop computer to access the Internet. 42.4% of households used mobile computers (laptops), 23.3% - tablet computers, 66% - other mobile devices (mobile phones or smartphones, e-book readers, etc.), 12.6% - TVs with a special device (smart TV) (Gks, 2020).

The situation with access to the Internet for households is as follows (Fig. 2).

Fig. 2: Top-5 regions of Russia with the highest and lowest indicator of household access to the Internet in 2014 and 2018 (as a percentage of the total number of households in the corresponding subject of the Russian Federation) (compiled by the authors according to Gks (2019d)

The data shows that the gap in household Internet access increased from 1.3 times in 2014 to 1.6 times in 2018.

The regions of the Russian Federation with the highest rates of broadband Internet access in 2018 are: Yamalo-Nenets Autonomous Okrug (96.3%), Khanty-Mansi Autonomous Okrug – Yugra (88.9%), the Tyva Republic (87.4%), Saint Petersburg (84.7%), and the Altai Republic (84.4%). Chechen Republic (50.2%), Khakassia Republic (54.5%), Dagestan Republic (58.8%), Chukotka Autonomous Okrug (59.1%), Republic of Sakha (Yakutia) (62%) have the lowest indicators (Gks, 2019b). Thus, in terms of broadband access of households to the Internet, the gap between the regions of the Russian Federation is 1.9 times in 2018 (3.3 times in 2014).

Moscow in 2018 was the leader in the number of connected mobile subscriber devices per 1000 people (2890.9 units), while the Adygea Republic closed the list of lagging regions with a value of 1030.4 units.

Experts emphasize that the digital divide between households depends on income and education (OECD, 2001). As the level of education increases, the likelihood of access to ICT grows. The size and type of household, age, gender, racial and linguistic origin, and location (urban/rural) also affect access to and use of the network.

Digital literacy of the population also determines the level of Internet use and overcoming the virus infection problem. The significant differentiation across the regions of the Russian Federation indicates that the population is unprepared for new threats to the digital economy (Karpunina et al., 2020). Thus,

in 2017 in the Altai Republic, the percentage of the total population aged 15-74 years who used the Internet over the past 12 months and faced the problem of virus infection was 27.4%, while in the Tambov region, the value of this indicator reached 2.2%. The gap between regions for this indicator is 12.5 times.

Currently, there is significant progress in the spread of broadband Internet access in the Russian Federation, but there is still a clear gap between regions in terms of Internet usage in organizations-1.6 times in 2018 (Fig. 3). At the same time, the size of this gap has decreased by 2.2 times since 2010, which indicates that the regions of the Russian Federation are aligned in the use of broadband access by organizations.

Fig. 3: Top-5 regions of Russia with the highest and lowest indicator of organizations that used broadband Internet access, as a % of the total number of organizations in the corresponding subject of the Russian Federation in 2018 (compiled by the authors according to Gks (2019d))

The gap between organizations using ICT technologies in different regions of the Russian Federation is as deep as the gap between households (Fig. 4).

Fig. 4: Top-5 regions of Russia with the highest and lowest indicator of organizations that used ICT, as a % of the total number of organizations in the corresponding subject of the Russian Federation in 2018 (compiled by the authors according to Gks (2019d))

The gap between organizations using information and communication technologies in different regions of the Russian Federation in 2018 is 1.9 times.

In terms of the use of electronic document management in organizations, the gap in 2018 was 2.4 times (the leader is the Ingush Republic (97% of the total number of organizations), and the Chechen Republic had the lowest indicator (40.7%).

One of the indicators for assessing the level of digitalization of the country is the "development of online public services". Without access to the Internet, it is impossible to use either electronic public services or smart cities. In Russia as a whole, the value of the indicator "public receipt of state and municipal services in electronic form" (in % of the population aged 15-72 who received state and municipal services) increased from 35.2% in 2014 to 74.8% in 2018. However, there are still quite a lot of problems, especially in the lagging regions of the Russian Federation with the introduction of modern cellular standards.

Only a third of cellular base stations support the modern mobile Internet standard-4G and LTE (Skolkovo, 2019). In this segment of the digital economy, there is also a significant gap between regions (2.5 times): the Yamalo-Nenets Autonomous Okrug has the highest rate of receiving state and municipal services in electronic form (95.3%), while the Chukotka Autonomous Okrug has the lowest rate (38.6%) (Abdrahmanova et al., 2019). For example, the second position among the regions that are actively implementing digitalization tools at the administrative level is occupied by the Khanty-Mansi Autonomous Okrug (Yugra). More than 1.2 million people are registered on the unified portal of state and municipal services in this region, which is 98% of Yugra residents over 14 years of age. With the help of the mobile app "public Services of Yugra", information about educational and health services is available to residents of the region. In 2018, citizens were able to get 3.7 million services using the app (Invest Foresigth, 2019).

The analysis allows to draw a conclusion about the presence of significant differentiation among regions of Russia on all levels – from the population to the government. On selected indicators of access to ICT and use the Internet for professional activities and for personal purposes, the positive dynamics of reducing the gap. This may be due to the implementation of the national program "Digital economy of the Russian Federation" (2017), as well as numerous regional programs and strategic documents that affect the intensity of the use of digital technologies.

There are also significant differences in the processes of ICT investment and the costs of research and development, which are carried out by both the state and business structures.

As a rule, large regions with a strong scientific and technological base-Moscow, Saint Petersburg, and the Moscow region – have the largest amounts of investment in ICT development. However, according to the indicator "capital expenditures on information and computer equipment", the Nizhny Novgorod region and Chelyabinsk region are close to the leading regions (Gks, 2019d). The situation is similar with domestic R&D expenditures. The Nizhny Novgorod region (24000,6 rubles/per capita), the Tomsk region (15159,7 rubles/per capita), and the Kurgan region (14481,4 rubles /per capita) are close to the capital region (27815 rubles/per capita) (Gks, 2019d).

Calculation of the network readiness index of Russian regions

The initial indicators and calculation of the network readiness index of Russian regions are presented in table 2. The authors excluded Moscow, Saint Petersburg, and the Moscow region from further analysis due to significant asymmetry. Thus, normalization of indicators and calculation of the network readiness index was carried out for each of the 80 regions of the Russian Federation using Microsoft Excel tools.

Table 2: Initial indicators and calculation of the network readiness index of Russian regions

Region	Percentage of households with broadband Internet access	Organizations with broadband Internet access	Advanced manufacturing technologies used	Capital expenditures on information, computer and telecommunications equipment	Users of the Internet among households	The percentage of households making purchases online	Education index	Literacy	Organizations with a website	Online staff training	Using special software tools in organization	Percentage of households receiving public services online	Internal R&D costs	Percentage of the population who used information security tools	Share of high-tech and knowledge-intensive industries in the gross regional product	The index of labor productivity	Healthy life expectancy at birth	Organizations that have implemented innovations that improve environmental safety	The network readiness indexof the region

The range of variation is 0.3097, the average is 0.6821. The coefficient of oscillation of 45.4. Maximum values of the networked readiness index are: Nizhny Novgorod region (0.8447), Tatarstan Republic (0.7689), Tyumen region (0.7623). The minimum value for the Dagestan Republic is 0.5349.

The group of regions with high values of the network readiness index includes: Vladimir region, Kaluga region, Smolensk region, Tambov region, Tula region, Yaroslavl region, Arkhangelsk region, Kaliningrad region, Leningrad region, Murmansk region, Rostov region, Ingush Republic, Stavropol region, Bashkortostan Republic, Udmurtia Republic, Chuvash Republic, Perm region, Penza region, Samara region, Ulyanovsk region, Sverdlovsk region, Khanty-Mansi Autonomous Okrug, Yamalo-Nenets Autonomous Okrug, Altai Republic, Chelyabinsk region, Krasnoyarsk region, Novosibirsk region, Kamchatka region, Khabarovsk region. These regions have network availability index values in the range of 0.69-0.84. Other regions lag behind in the network readiness index (0.53-0.69).

Conclusions

The authors analyzed the processes of digitalization at the regional level and determined the readiness of Russian regions for intensive digital development. The analysis allowed the authors to conclude that there is a significant differentiation between the regions of Russia at the level of population, households, organizations in terms of access and use of digital technologies, the level of digital literacy, as well as the amount of costs for financing the introduction of ICT and R&D. The authors used the Portulance Institute methodology to determine the network readiness index of Russian regions. The indicators for calculating the index were adapted to the existing Russian statistical database and grouped into subgroups (technology, people, governance, impact). The results of calculating the network readiness index allowed the authors to conclude that 32 regions of Russia out of 80 analyzed have high indicators of network readiness. Indicators of ICT investment and R&D expenditures are crucial in determining the network readiness index. Those regions where the value of these expenditures is significant have large index values. The proposed tools for assessing the network readiness of regions can be used as a mechanism for differentiating digital development policies at both the state and regional levels.

Abstract

The studies conducted so far in Poland indicate not only the low environmental awareness of SMEs, but also incorrect reporting of their impact on the natural environment. Due to the fact that SMEs constitute majority of the companies operating on the market, however, their negative impact on the natural environment is significant. For this reason, these units should have access to complete information (both in terms of quantity and value) regarding their impact on the natural environment and the results of the protective measures taken in this regard. Taking this into account, the aim of the article is to present the possibility of using cost accounting to provide information on the environmental costs arising in a small manufacturing enterprise. The literature review and the overview of the legal regulations as well as the case study carried out contribute to extension of knowledge on the role of cost accounting as a tool allowing provision of reliable information on environment exploitation and regarding the assessment of the company's impact on the quality of the environment and the compliance with the principles of environmental protection.

Keywords: Cost Accounting, Environmental Cost, Small Enterprise, Impact on The Natural Environment.

Introduction

Enterprises are viewed as the main generators of the ecological threats. For this reason, while conducting a business activity, companies cannot afford to ignore the environmental protection rules. This necessitates access to relevant and credible information (Szadziewska, 2013) that would allow:

- assessment and control of the impact of economic activity on the natural environment,
- functioning in accordance with the applicable environmental regulations,
- rational management of the natural capital resources,
- reducing the risk of ecological catastrophes,
- implementation of new technological solutions and innovations into production processes and reduction of the negative impact on the natural environment.

An important role in delivering the above-mentioned environmental information is played by the cost accounts recorded by businesses. As part of the information system, it should constitute an important tool in obtaining relevant and credible information, enabling economic entities to undertake activities aimed at prevention, reduction and repair of the damage done to the natural environment. In particular, cost accounting (CA) is meant to:

1) identify, measure, record and analyse the costs related to exploitation of and the changes to the environment;
2) determine the tax burdens on the exploitation of the resources and the use of values of the natural environment;

Cite this Article as: Grzegorz BUCIOR and Arleta SZADZIEWSKA" The Role of Cost Accounting in Environmental Cost Measurement and Control in A Small Enterprise – A Case Study" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

3) provide information enabling assessment and control of the rationality of the conducted business activity, from the perspective of its impact on the natural environment.

In highly developed countries, the use of CA as a source of environmental information has been the subject of many scientific studies since the end of the 20th century (Wendisch, Heupel, 2005; Hörisch, 2015; Shasi et al., 2018; Caldera et al., 2018; Yadav et al., 2018). In Poland, so far, little research in this area has been conducted (Stępień, 2005; Majchrzak, 2006; Szadziewska, 2013). What is more, most of the projects implemented concerned the methods used for measurement of the environmental impact large enterprises exert as well as inclusion of such information in external reporting. By contrast, the studies conducted so far overlook or present little information on the role of CA as a measurement system and a source of information on the environmental costs (EC) in micro and small enterprises. Due to the significant number of these entities, however, in most market economies, their economic activity contributes to the environmental burden caused by pollutants. For this reason, these entities should have access to information on their impact on the natural environment, including information on the resulting EC. Lack of access to this type of data prevents compliance with the applicable environmental regulations. Taking this into account, the aim of the article is to present the use of the CA system as a tool for measuring EC in the small manufacturing enterprise under examination. Based on literature overview, a review of the legal regulations and the case study, the following research questions have been formulated:

1. What EC are identified and recorded in the CA system of a small manufacturing enterprise?
2. Is the small manufacturing enterprise able to prepare valid environmental reporting (ER) based on the environmental information provided by the CA system?

We believe our article extends the knowledge on the possibilities of using CA to obtain reliable information on EC in small businesses. The case study presented also allows identification of the actions that can be taken by every small entity to record, group and control the costs of natural resource exploitation and pollution removal as well as the cost of the protective measures undertaken. However, the main limitation of our article is the inability to apply our conclusions to other companies. For this reason, a need exists for further research, to determine how SMEs obtain the information they need to develop ER.

SMEs and the impact of their economic activity on the natural environment

In the EU countries, SMEs (Small and medium-sized enterprises) are perceived as the source of economic growth and the driving force behind the development of European economy. It is indicated that SMEs play a key role in the creation of new jobs, production capacity improvement, reduction of poverty, and the increase of a given economy's competitiveness (Sokołowska, 2013, p. 83; Shashi et al., 2018, p. 3679). According to the Annual Report on European SMEs 2018/2019, non-financial SMEs were responsible for generating 54.5% of GDP and employed 61.4% of the total workforce. In Poland, the companies classified within this group constitute the majority. In 2018, their share in the structure of all enterprises was 99.8%. These entities comprise micro, small and medium-sized companies. This division is presented in Table 1, in accordance with the legal regulations regarding statistical data collection and the tax system in force in Poland.

Table 1: Definition of SMEs

Enterprise Category	Employees	Turnover	Balance sheet total
Micro SME	0 to < 10	< € 2 million	< € 2 million
Small SME	10 to < 50	< €10 million	< €10 million
Medium-sized SME	50 to < 250	< €50 million	< €43 million

Source: Developed based on the Act on the Law of Entrepreneurs of 6 March 2018

It needs to be noted that the classification presented in Table 1 takes into account quantitative criteria. In order to classify an entity within a specific category, it must meet two conditions, in at least one of the last two financial years, i.e. the number of employees and the value of the sales revenues or the value of the balance sheet total. The division indicated is in line with the EU Commission Recommendation of 6 May 2003. It has been in force since the 1st of January 2005, in relation to all the measures, policies and programs in the EU. This classification was introduced to Polish legal regulations on January 1st, 2005. What is more, changes were made in the accounting regulations, as to include the concept of micro and small entities. The same criterion regarding the number of employees was adopted in the regulation. There are differences, however, in the thresholds adopted for the value of the sales revenues and the value of the balance sheet total. As such, when conducting research, usually the number of employees is used for enterprise classification.

In Poland, non-financial SMEs play a significant role in the building of the Polish economy. Their share in the national GDP in 2017 was 49.1%. In these companies, however, the problems associated with natural environment exploitation and protection are not always noticed. This has been indicated in the research carried out in 2008 by the Environmental Partnership Foundation, which indictaed that 68% of the companies surveyed believed that their activity had low impact on the natural environment (Zbaraszewski, 2010, p. 527). Similar research results were obtained in 2014 by Kubicka and Kupczyk (2016), as part of a project titled "Green company - the key to enterprise competitiveness". 52% of the micro and small companies surveyed (i.e. 26 entities) believed that they exerted no negative impact on the natural environment, while 48% admitted to minimal environmental impact of their business activity. What is more, the research carried out by Osiński et al. (2017) in 2014-2015 indicates not only the low ecological awareness on the part of the SMEs surveyed, but also incorrect reporting of their impact on the natural environment. Such situation in particular occurs in micro and small enterprises, which delay implementation of the obligations resulting from environmental regulations or treat them as insignificant and fail to comply with them at all (see: Osiński et al., 2017, p. 105).

It needs to be noted that the economic activity conducted by entities has direct impact on the natural environment, causing its quality to deteriorate. This state of affairs has been affected not only by the large enterprises operating on the market, but also by the SMEs. As stated by Osiński et al. (2017, p. 97) in unit terms, the impact of a micro or small entity may be minor, but due to the cumulative effect, the total amount of the pollution generated by all companies in this group is of significant importance for the condition of the environment. This results from the fact that these units constitute the vast majority of enterprises in Poland. For this reason, it is important that these entities have access to information on the environmental aspects of their functioning that are associated with their negative impact on the natural environment. Such information includes data on the following in particular:

- water consumption,
- particulate emissions and greenhouse gas emissions,
- solid and liquid waste produced (including hazardous waste),
- the wastewater generated,
- recycling and recovery of waste.

The above-mentioned information groups facilitate SME enterprises in fulfilment of their reporting obligations resulting from environmental regulations. They additionally constitute the basis for assessment of their impact on the natural environment and for undertaking the measures to protect it.

SMES' Environmental Costs in The Light of The Legal Regulations Applicable in Poland

At present, in Poland, enterprises are required to conduct their business activity in accordance with the principles of sustainable development, i.e. in a manner that maintains the quality of the natural environment for the present and the future generations. Such a state of affairs primarily has been influenced by an expansion of the existing legal regulations involving implementation of:

- a country's environmental policy that assumes undertaking activities to reduce the pressure on the natural environment;

- the priorities included in the Strategy for Energy Security and Environment – a perspective until 2020;
- the priorities adopted by the European Union related to implementation of sustainable development, contained.

A list of selected entrepreneurial obligations resulting from the introduced legal regulations is presented in table 3.

Table 3: Selected entrepreneurial obligations resulting from the legal regulations

Entrepreneurial reporting obligations	Legal regulations
Information about the impact of enterprises on the natural environment and the protective measures undertaken in this regard – reports submitted to relevant governmental and local bodies, such as: – a collective summary of the information on the scope of the exploitation of the environment and regarding the amount of the fees due; – a report on the used up electrical and electronic equipment; – statistical reports (the Polish formats, so called: OS-1, OS-3, OS-4, OS-5, M-06, attachment to F-03, SP and SG-01 questionnaire OŚ-29/k); – packaging reports (the Polish formats, so called: OPAK1, OPAK2, OPAK3, OŚ-OP1); – a summary of the data on the types and the quantities of waste, its management as well as regarding the installations and the equipment used to recover or dispose of such waste; – a collective summary of the data on sewage waste; – an annual report on the greenhouse gas emission.	– The Act of 27 April 2001 on the protection of the environment – The Act of 27 April 2001 on waste – The Act of 18 July 2001, Water Law – The Act of 29 July 2005 on waste electrical and electronic equipment – The Act 29 June 1995 on public statistics, – The Act of 11 May 2001 on packaging and packaging waste – The Act of 11 May 2001 on the obligations of entrepreneurs in the field of management of some waste as well as on the product and the deposit fees – The Act of 27 April 2001 on waste – The Act of 22 December 2004 on the trade of greenhouse gases and other substance emission allowances
Ensuring public access to the information on the environment and its protection.	– The Act of 3 October 2008 on provision of information on the environment and its protection, on public participation in environmental protection as well as on assessment of the impact on the environment – Constitution of the Republic of Poland of 2 April 1997 – The Act of 27 April 2001, the Environmental Protection Law
Obligation of large units to disclose non-financial information, including environmental information presented in a non-financial report or in a separate report containing non-financial information.	– Directive 2014/95/EU – The Accounting Act, with the changes introduced in 2017 by the Act of 15.12.2016

Source: Own elaboration on the basis of the current legal regulations

The information contained in Table 3 indicates that in their annual reports SMEs do not have to present any information on the impact of their activity on the natural environment nor on the protective measures taken in this area. This is in line with Directive 2014/95/EU, which assumes that individual Member States should not impose any additional administrative burdens on small and medium-sized enterprises. Nevertheless, entities in this group are obliged to prepare reports on environment exploitation, on the assessment of their impact on environment quality, and on their compliance with the principles of environmental protection. Therefore, in order to meet the requirements in this area, they should have access to information on the EC incurred in the course of running business, including the costs associated with:

- acquisition of permits and authorizations for the release of substances or energy into the environment, if the environment exploitation exceeds the scope of general use;
- the fees incurred for environment exploitation;
- recycling and achievement of an appropriate level of waste recovery;
- incurrence of administrative penalties;
- the measures taken to protect the natural environment.

The structure of SMEs' environmental costs is presented in Table 4

Table 4: The structure of SMEs' environmental costs

Internal EC (environmental protection costs)	Internalized external EC
1. Outlays on projects in the field of environmental protection	1. Environmental fees for: a) emission of gases and particulate matter into the air, b) discharge of sewage into waters or into the ground, c) abstraction of groundwater and surface waters, inland waters and internal sea waters; d) waste storage; e) acquisition of permits for the emission of particulate matter and gases into the air, water permits, etc.
2. Current costs of environmental protection incurred for prevention, reduction, neutralization or elimination of pollution and repair of the damage resulting from the company's day-to-day operations	2. Product charges for packaging, batteries, storage batteries, lubricating oils, charges for electrical and electronic equipment, or for vehicle recycling.
3. The costs of environmental reserves, e.g. land reclamation, purchase of CO_2 emissions	3. The cost of additional fees and penalties for non-compliance with applicable regulations and for environmental degradation.

Source: Developed based on Szadziewska, 2013, pp. 337-361.

In addition to the EC associated with air protection, sewage management and water protection as well as waste and packaging management, which are indicated in Table 4, enterprises may incur costs associated with development of their pro-ecological image. These costs include, in particular, the cost of environmental management system implementation and maintenance or the cost of reporting the socially responsible activities undertaken by companies in order to reduce their negative impact on the environment. It should be added, however, that measurement of EC is not an easy matter. This results

from the complex nature of this category, consisting of a large number of elements. Identification and valuation of these costs is not an easy task. Currently, the solutions used in SME CA do not allow discrete classification nor recording and accounting of the EC arising in these companies.

Cost accounting as a source of information on EC in a small manufacturing enterprise - Empirical Study

Compliance with the principles of environmental protection in business operations applies not only to large enterprises, but also to micro and small ones. These units are obliged to submit, to the relevant state-government and local-government bodies, reports on their impact on the natural environment and the protective measures taken in this respect. Nevertheless, as indicated by the research carried out by Osiński et al. (2017, p. 98), majority of the SMEs surveyed (i.e. 63.6%) did not comply with the obligation to report the amount of gas and particulate matter emissions to the National Center for Emissions management (KOBiZE). Proper waste management was also problematic, in particular with regard to the hazardous waste that ended up in municipal landfills. What is more, the results obtained also indicated that EC, in most of the entities surveyed, have been undervalued. This did not result from the entrepreneurs' reluctance to incur these costs, but from the lack of awareness of the need to incur such costs (Grudzień et al., 2015, p. 306). For this reason, a need exists to establish the role of CA as a source of information on the EC arising in a small manufacturing enterprise.

Research Questions and Methodology

Analysis of the publications presenting the results of research on environmental cost accounting (ECA) in SMEs allows a conclusion that a research gap exists concerning the functioning of ECA in Polish small and medium-sized enterprises. Assuming that the issues addressed in the work deserve researchers' interest, the approach prevalent in the literature should be adopted, according to which qualitative research is recommended when the object, the subject or the phenomenon examined has not been covered by research or when only a few of such studies have been conducted (Creswell 2009). It is all the more justified, as a belief functions in the literature that the existing research on accounting relies overly on quantitative survey methods, which may distort the correct image of the reality under examination (Bogt, Van Helden 2012). Case studies based on observation may be the answer. This call conforms to the general interest in qualitative research in the field of accounting, for better understanding of individual accounting practices aggregated into group behaviors (Hall 2016; Ryan et. al. 2002).

For these reasons, the qualitative research strategy was selected for the study. According to Creswell (2009), in a qualitative study, researchers formulate and seek answers to research questions, as opposed to hypotheses. Taking the above and the importance of the available, previously cited studies into account, as well as bearing in mind the purpose of the work, the Authors formulated the following research questions:

RQ1: What EC are identified and recorded in the CA system of a small manufacturing enterprise?
RQ2: Is the small manufacturing enterprise able to prepare valid ER based on the environmental information provided by the CA system?

Qualitative research requires multiple sources of data and data triangulation, to increase the credibility of the study, whereas any finding or conclusion drawn from the case study may be more convincing and accurate, if it is based on several different sources of information (Yin, 2014). The case study method was selected as the research approach in this study. Selection of the case was related to participant observation on the part of one of the Authors of this work.

The primary source of evidence was the audited entity's documentation. The following documents were analyzed, with regard to the criteria described further:

1. the entity's corporate documents, including: the partnership agreement, copy of the register of entrepreneurs of the National Court Register, copy of the data from the National Official Register of Business Entities REGON;
2. the accounting policy, understood as a document defining the accounting principles and the internal regulations shaping the entity's economy;

3. annual financial statements;
4. environmental reports.

The second source of evidence entailed participatory observation, since one of the Authors participated in activities related to ECA implementation and co-created the ER system in the entity surveyed. The observation was intended to verify how the procedures and the methods implemented as part of CA and ER are carried out.

The Research Procedure

The case studied was assessed according to the criteria defined with consideration of the available publications on the functioning of ECA in enterprises (Wendisch and Heupel 2005, Dyduch 2016, Ferens 2016).

The case assessment criteria have been divided into 3 groups associated with the main areas of analysis, that is:

C1 - the manner in which the entity operates,
C2 – ECA,
C3 – ER.

The first group of criteria refers to the organizational and the functional aspects of the entity surveyed and consists of the following sub-criteria:

C1.1 – the formal aspects of running a business,
C1.2 – the subject of activity,
C1.3 – the principles of economic records,
C1.4 – the CA principles.

Assessment of these criteria was focused on the issues that are significant from the perspective of the research question verification process, which mainly concerned accounting and CA issues.
Within the C2 group, the following criteria have been defined:

C2.1 – measurement and recording of the quantity and the quality of the water collected;
C2.2 – measurement and recording of the amount and the type of the gases or the particulate matter introduced into the air;
C2.3 – measurement and recording of the amount and the type of the liquid and solid waste released into water or soil;
C2.4 – measurement and recording of the amount and the type of the liquid and solid waste stored independently;
C2.5 – measurement and recording of the amount and the type of the liquid and solid waste designated for disposal or treatment;
C2.6 – data records containing information on environment exploitation and the amount of the fees due;
C2.7 – valuation and recording of the fees payable for environment exploitation;
C2.8 – recognition of the environment-related costs, in accordance with function-related taxonomy:

- the cost of environment exploitation,
- prevention costs,
- the cost of pollution reduction,
- restitution costs,
- the cost of environmental management system.

The criteria in this group can be treated as features of ECA, while the assessment made according to these criteria was focused on verifying whether CA exhibited these features after the implementation process and whether CA exhibited these features during the study. As such, owing to these criteria, it was possible to verify RQ1.

Group C3, related to ER, mainly consisted of sub-criteria representing various types of environmental reports produced by SMEs. These criteria, supplemented with criteria related to the method of report development, were intended to help verify RQ2. The criteria structure was as follows:

C3.1 – organization of ER;
C3.2 – the ER process;
C3.3 – the information base for ER;
C3.4 – summary of information regarding environment exploitation and the amount of the fees due;
C3.5 – report on packaged products, on packaging and packaging waste management;
C3.6 – the VOC (Volatile Organic Compound) balance – a report on the compliance with the emission standards for greenhouse gasses and other substances released into the air by entities exploiting the environment;
C3.7 – data summary on the types and the amounts of waste, the methods of waste management and the installations and devices used for recovery and disposal of waste;
C3.8 – report on the weight of manufactured, imported, exported packaging;
C3.9 – report on the amount of the product fee due.

Case Study Findings

The results obtained via the case study analysis, based on the criteria mentioned previously, are as follows:

C1.1 - the enterprise is a legal person, a limited liability company established under the Polish law. The company's share capital was provided by private entities. The company is classified as a small enterprise, as per the criteria specified in the Accounting Act. The average annual number of job positions in the company is 36, 7 of which are administration and accounting positions. The balance sheet total for 2019 was approximately PLN 8 million, while the sales revenues were approximately PLN 12 million.

C1.2 - the company conducts business activity entailing the processing of waterfowl feathers, resulting in the production of down and feathers that are used as filling in the textile industry – quilt, pillow and clothing filling. For this reason, the company has been classified within the manufacturing industry, with the business activity code of the Polish classification PKD 13, 92, Z, i.e. PRODUCTION OF FINISHED TEXTILE PRODUCTS. The production process with the greatest impact on the environment is the feather washing, as it requires consumption of large amounts of water. Other processes, such as sorting and dedusting, show lower environmental impact.

C1.3 - the company keeps accounting books in accordance with the Polish Accounting Act.

C1.4 - the company's cost account is characterized by the following features:

- records of the cost of basic production activity are kept based on the types of activity;
- the type-based system of costs is consistent with the range of costs in a comparative profit and loss account;
- product calculation is carried out in accordance with the division method;
- the types of activity costs, in addition to the standard overheads, include the accounts used in product calculation - direct costs, indirect production costs and purchase costs.

C2.1 - the company measures its water consumption for production purposes and separately for non-production purposes. An internal record of this consumption is kept for control and resource management purposes.
C2.2 - the company does not measure its gas or particulate matter emission into the air. In the company's opinion, such a measurement is not justified, due to the low level of emission.
C2.3 – the company does not measure the amount, nor the type, of the liquid and solid waste discharged into water or soil, since none of its waste is treated in such way.
C2.4 – the company does not measure, nor record, the amount and the type of the liquid and solid waste stored on its own, due to the small amount. Work is currently underway to implement independent

treatment of solid waste. Successful implementation of such a process will result in the necessity to keep such records.
C2.5 – the company measures the level of both the liquid waste (post-production water) and the solid waste. An internal record of the amount of waste is kept for control and management purposes. Liquid waste (sewage) is discharged into the municipal sewage system. Solid waste is transferred to entities authorized to dispose it.
C2.6 –the company has been recording information on environment exploitation and the amount of the fees due. Appropriate registers are kept for this purpose.
C2.7 – the entity measures and records the fees due for environment exploitation. The accounting policy incorporates development of an information subsystem for environmental accounting, through the following:

- definition of the current set of environmental reports that the entity should prepare; this list constitutes part of the document development and circulation regulations, as an attachment to the accounting policy,
- formulation of the scope of the ER obligations assigned to specific positions in the administration and accounting department; description of these obligations is included in the accounting policy, in the part defining the personnel structure of the administration and accounting department,
- indication of the allocation rules for selected EC; this information is included in the accounting policy, in the section describing the principles for calculation of the costs of manufacturing.

C2.8 – recognition of EC, based on the systematics of a given function within the entity surveyed, entails the following:

a) the cost of environment exploitation - recognized separately, via analytics especially-developed within the cost group, divided by the type of activity; this applies to the following costs:
charges for electricity consumption, the costs of water acquisition and treatment, consumption of materials for environmental protection purposes, the energy consumption associated with waste product disposal, waste treatment services, solid waste collection and disposal services, sewage services,
b) prevention costs – not specifically included, fall within the scope of indirect production costs (depreciation of the fixed assets involved in pollution prevention, pollution monitoring costs) or overhead costs (resource efficiency training),
c) pollution reduction costs - currently they are not recognized separately, because the entity has been including these costs within the costs of environment exploitation, due to their low level; since the company is working on development of its own water treatment and recycling installation and a solid waste composting installation, the need for separate recognition of these costs will emerge in the future,
d) restitution costs - none,
e) the cost of the environmental management system – none.

C3.1 – ER organization has been defined in the accounting policy and is applied in accordance with the procedures established,
C3.2 – the ER process, verified for the period covered by the study (2019), should be considered correct, which in turn results in fulfillment of the reporting obligations,
C3.3 – the ER information base has been defined in the accounting policy, as presented in the criteria C2.7 and C2.8; it should be noted that it was used during the period considered,
C3.4 – the information on environment exploitation and the amount of the fees payable was compiled in a timely and complete manner,
C3.5 – the report on the products in packaging, the packaging and the packaging waste management was prepared in a timely and complete manner,
C3.6 – not applicable,

C3.7 – the list of data on the types and the amounts of waste, the methods of waste management and the installations and devices for recovery and disposal of waste was not created on the basis of the entity's assessment that there was no such obligation,
C3.8 – not applicable,
C3.9 – the report on the amount of the product fee due was prepared in a timely and complete manner.

Discussion

The case study shows that the entity has not developed any special subsystem of ECA. This conclusion is not surprising, as most studies on ECA in SMEs show that such entities rarely develop a separate system for recognition of EC (for example: Grudzień et al., 2015; Osiński et al., 2017, Burrit 2004). Meanwhile, it has been acknowledged that proper direction for CA development entails implementation of special procedures and methods for valuation and recognition of EC (Letmathe, Doost, 2000). ECA is a CA system oriented at proper allocation. It is based on a systematic cause and effect analysis. It allows linkage of the production costs associated with emission, removal and disposal of waste and sewage with the factors that cause these costs. In traditional CA systems, which the Authors have dealt with in this study, these costs are treated as other indirect costs and are allocated to the cost carriers, without any clear relation. This results in the inability to properly identify and control EC, as there is no appropriate cost allocation to cost centers. Proper allocation of EC to their centers can help reduce these costs (Ansari et al. 1997).

Referring to the case study, it should be recognized that separation of an EC account in the entity examined would significantly contribute to the improvement of the entire CA system. The condition for this entails implementation of procedures, in accordance with an appropriate pattern. An example of the structure of such a system is shown in Figure 1.

Figure 1: Conceptual structure of cost accounting in an SME.

Source: Based on: Letmathe, Doost, 2000; Jasch, Savage, 2008, Szadziewska, 2013.

The account presented valuates the outlays, the processes and the products, in accordance with their actual costs. This procedure creates a decision-oriented information base for the environmental management system and for the planning, control and supervision of material and energy cost flows.

As a result, integration of environmental aspects into all areas of planning occurs. Apart from that, relevant environmental data improves the understanding of business processes. This is particularly important in the face of the steadily growing importance of EC for enterprise operation. Knowledge of the real costs of environment exploitation is a necessary condition for the change, often necessary, in the way of doing business, including a change in the unit's attitude towards environmental protection.

To achieve this, modification of the existing CA is needed. It should be emphasized that the entity surveyed has the potential for such a change, but it depends on adequate determination on the part of the management staff. Such determination will only emerge when the benefits of additional information outweigh the costs of making the change.
Construction of an environmental cost account, in accordance with the concept proposed, assumes:

- valuation and recording of material and energy costs, along with the related EC - for this purpose, it is necessary to identify and properly describe the significant costs of environment exploitation or the costs of the impact on the environment;

- it is crucial to identify which material and energy costs have significant environmental impact;

- the relevant material and energy costs to be increased by EC can be determined with the real (actual) or standard cost model;

- to calculate EC, it is necessary to register the consumption of materials and energy, in terms of quantity and value;

- by linking the relevant material cost streams with the related EC, the actual cost of material and energy consumption is obtained.

The case study leads to a conclusion that in the entity examined it would be relatively easy to modify the CA applied, as to fit the form of the concept presented. This is evidenced by a fairly extensive set of procedures and methods used by the entity to handle the EC associated with environmentally harmful production. A subjective but clear conclusion from the study is the observation that the entity stopped halfway in the CA modification for the needs of handling the environment-related areas of accounting.

Our research contributes to the extension of knowledge on the role CA in a small manufacturing enterprise plays in the acquisition of environmental information. However, there is a need for future research in this area.

Conclusion

The study confirmed that the CA maintained in a small enterprise does not provide full record nor control of the EC. These results are consistent with previous studies carried out in Poland (Grudzień et al., 2015; Osiński et al., 2017).

Although the entity fulfills the minimum obligations in terms of both the record keeping and the ER, it should be recognized that the lack of an environmental cost subsystem, within the structure of the cost account used, generates a significant risk in this area.

The lack of cost account solutions applied in the field of classification and environmental cost recording (quantitative and valuable), hinders correct fulfillment of the environmental obligations imposed on SMEs by the legal regulations. In particular, it may refer to the requirement of conducting business in accordance with the principles of sustainable development (e.g. taking actions aimed at reducing the negative impact of business activity on the natural environment).

When answering RQ1, it should be stated that only the EC that are significant for the level of the product manufacturing cost valuation are isolated and recognized. The costs that are less important from this perspective, on the other hand, are ignored and fall within the scope of normal operating costs. This can be considered a system dysfunction, since the costs not currently recognized as product manufacturing costs can also be of significant importance in terms of control and management. This state of affairs can be improved by modifying the cost account in accordance with the concept presented in the previous part of the work.

When answering RQ2, it should be noted that based on the environmental information provided by the CA system, the company surveyed is able to prepare ER to the minimum extent required by law. There is no doubt that the CA modification recommended would have positive impact on the ER process - by potentially extending the scope of the data reported. More importantly, CA modification would allow development of internal environmental reports and ER for management purposes. Currently, such reporting does not exist in the entity surveyed, whereas the use of internal reporting could significantly support management processes (Petcharat, 2012).

Analysis of The Causes and Circumstances of Accidents in The Company Management Using the Ishikawa Diagram and The Quality Valuation Method on The Example of The Particular Accident

Stanislaw BRZEZINSKI

University of Economics and Human Sciences in Warsaw, Warsaw, Poland
stanislaw_brzezinski@wp.pl

Abstract

An employer is responsible for the health and safety at work. By means of various methods and management techniques, he tries to make the work environment not only efficient, but also safe. Occasionally, however, work accidents do occur in the work environment. The role of an employer is to investigate the causes and circumstances of their occurrence. The preparation of an accident protocol should not end the accident procedure. It is in the employer's interest to perform an in-depth analysis of the incident in order to find out the organizational or managerial causes of the accident. In this paper, the Ishikawa diagram and the method of quality evaluation were used to analyze the causes and technical circumstances of accidents in enterprise management.

Keywords: Health and Safety Management, Accidents at Work, Ishikawa Diagram, Quality Evaluation Method.

Introduction

Each organization strives to perform in the best possible way through the available methods and techniques. Quality improvement in the organization of work or the production process can take place through the implementation of appropriate standardization mechanisms. Rational action by improving quality and safety does not have to be the motto of large organizations or enterprises. More and more often, the example of large enterprises is followed by small ones and they implement quality methods and mechanisms. It is important that the owner and employees are aware of the purpose of implementing management methods. The implemented solutions are defined as principles, methods, instruments or tools. However, it should be emphasized that any action related to quality can be determined as management improvement (Woźny, 2016).

The aspect of occupational health and safety is of significant importance for the improvement of management. Each improper operation of a human or machine may determine the impediment, downtime or stoppage of the production process. Therefore, organizations and enterprises more and more often pay attention to the quality of solutions in terms of the safety of the work environment. The resulting failure of a machine or a device can be rectified by repair or replacement. It should be pointed out that such an action may significantly affect the condition of the enterprise. The issue of employee safety is also important. In the case of accidents, significant perturbations in the functioning of the company or organization may also occur (Miller, 2011).

It should be pointed out that an employer has more obligations towards an accident than in the event of a machine or a device failure. The employer is obliged to carry out an accident procedure within 14 calendar days, which is concluded with an accident protocol. The essence of the actions of the post-accident commission is to establish the causes and circumstances of the incident, which is why the speed of the procedure and proper analysis are of key importance (Woźny, 2015). An important aspect of post-accident activities is to find out the real causes and implement appropriate solutions that will protect employees from given incidents in the future. When analyzing events, various

qualitative solutions can be used, including the Ishikawa method and Quality Assessment as a method of managing safety and its impact on the occurrence of accidents (Hamrol, Mantura, 2005).
In the presented research paper author decided that the Ishikawa diagram and the method of quality evaluation will be used to analyze the causes and technical circumstances of accidents in enterprise management.

Quality-Based Management

Quality-based management is aimed at collecting and processing data related to events and processes that take place in the management system or the organization's environment. This procedure allows managers to make the right decision regarding the implementation of tasks or organization of the work of the employee team. From the human resource management point of view, management is based on the elements of planning, organizing, motivating and controlling. This process may take place through appropriate quality-based management mechanisms.

Management is not only about managing. It can also be understood as the relation of the company and its resources to the problems that arise during the company's operation (Skowron-Grabowska, Nowakowska-Grunt, 2017). The speed of reaction to a problem or its prediction may prove the quality of management. The use of management methods increases the probability of achieving goals. The use of methods is related to the implementation of deliberate, repeatable and based on scientific experience activities that present real benefits (Saja, Szajt, 2017).

An application of various management instruments based on data collection and processing allow a relatively quick presentation of the results of the activities carried out. The analysis and interpretation of the obtained data allows quick reactions to the occurrence of inconsistencies.

Management instruments can be adapted to the requirements and expectations of the organization, and therefore can be used in various areas of processes. It should be pointed out that individual management instruments can be implemented not only in terms of the production process or service provision (Kleszcz, Ulewicz, Nowakowska-Grunt, 2013). Many management instruments can be implemented in various areas of the organization's operation, including occupational health and safety management (Sęp, Pacana, 2001; Nowakowska-Grunt, 2008).

An example of an instrument that can be implemented in business management is the Ishikawa Cause and Effect Diagram. It allows a detailed analysis of the causes and irregularities in the implementation of an action, process, etc. The structure of the diagram enables the identification and connection of problems with individual categories. Generally, creating an Ishikawa diagram is done through teamwork using the brainstorming technique.

The categories in the root cause analysis using the Ishikawa diagram are divided into:

- Methods,
- Machinery,
- Materials
- Man,
- Management.

When identifying the sources of the problem in individual categories, one should prioritize them, from the most important to the less important ones. Such action will allow presenting the main and secondary causes of the problem (Pacana, Czerwińska, Siwiec, 2018).

In the case of the post-accident procedure, it is possible to indicate in which areas of activity, the company has problems related to safety. The analysis allows improving the process of documenting an accident event itself and to reduce information noise (communication errors) between units participating in the procedure (Woźny, Saja, Dobosz, 2018).

Accident at work – a case study for a warehouse

An accident at work is a sudden event made by an external cause, resulting in an injury or death, occurring in connection with work:

1. during or in connection with the performance by the employee of ordinary activities or orders of his superiors;
2. during or in connection with the performance of activities by the employee for the employer, even without instructions;
3. while the employee is at the disposal of the employer on the way between the employer's seat and the place of performance of the obligation resulting from the employment relationship.

It is the employer's responsibility to appoint an accident team to analyze the causes and circumstances of the incident. It should be pointed out that the actions taken by the team are not aimed so much at determining the causes and circumstances of the event, but at presenting the consequences for the employee and the employer in relation to the event. Such action allows implementing corrective and preventive measures in order to exclude or significantly reduce the probability of a similar accident event in the future (Woźny, 2017).

The subject of the analysis is an accident of an employee working as a warehouse keeper in a high-bay warehouse. The accident team investigated the circumstances of the accident event. As a result of the inspection of the scene and explanations of the injured person and the witness, the commission found that on the day of the incident, the injured person started working at 3 p.m. in the company's warehouse. Around 21.45 while performing official duties related to completing orders for tires, there was an accident at work. The injured employee, working as a warehouse worker, climbed the baskets to the 2nd level while completing the tires to the specification, using the basket arm and the herringbone tires to remove the tires. When leaving the basket along the same path, he slipped and fell to his left side. A witness of the event heard a noise and saw the victim lying on the floor. The witness gave him first aid, notified his superior and called an ambulance.

The explanations of the injured person and the inspection of the scene show that the employee voluntarily climbed onto the basket with tires and then fell off it. He did not comply with the health and safety instructions for loading and unloading and storing tires in force in the company and did not comply with the general health and safety rules provided during initial and periodic training. The knowledge in the above-mentioned scope was confirmed by signatures under the statement on the employee's familiarization with the occupational risk and other instructions. Additionally, before the commencement of each shift, the warehouse manager or shift manager informs employees in which sections they will perform their work activities and what is the course of work and appropriate proceedings.

An analysis of the causes of accidents at work with the use of Ishikawa diagram

When analyzing the causes of accidents at work, attention should be paid to all the factors that may cause it. The determining factors indicated in the Ishikawa diagram are also helpful. In the incident analyzed, several important factors that caused the accident are indicated. It often happens that employees at a given workplace do not know the safety rules and procedures sufficiently. This problem is closely related to the "management" factor. Lack of proper supervision and communication noise on the employee-foreman/manager/employer line may cause the employee to act inconsistently with the adopted safety rules.

Another important element determining an accident at work is the inadequate technical condition of machines and devices, or their incorrect calibration, or use contrary to their intended use and OHS instructions. This state of affairs occurs primarily due to the lack of awareness of the employees

themselves and the lack of supervision over the process. Employers often delay the inspection or repair of machines and devices, as this may generate costs. Nevertheless, this situation is extremely dangerous for the workers themselves. It is also worth paying attention to the awareness of the employees themselves. The employer should make employees understand that they should report all kinds of defects and problems themselves. Probably the fear of material liability means that employees rarely report irregularities.

Employees who use a given material or semi-finished product do not fully know its specification and do not comply with the personal protective equipment assigned to a given material. The main reason for not following the guidelines is the time they have to spend putting on the PPE. It is worth emphasizing that haste and routine are the most common causes of accidents at work.

An employer is obliged to take care of current medical examinations and health and safety training. Disregard for OSH training by employers is a common situation. It is noteworthy that frequent trainings make employees aware of the dangers that occur in the work environment. During the training, the health and safety inspector has an opportunity to discuss in detail the accidents that have occurred in the workplace. Very often, employers also do not pay attention to other parameters that affect the quality and efficiency of an employee's work. An example is the analysis of the norm of overload of the musculoskeletal system or the employee's energy expenditure. While employers pay attention to the weight of a given material, etc., which means that they use appropriate devices, e.g. pallet trucks, electric pallet trucks or industrial trucks, but they rarely pay attention to the dimensions of materials, products, etc. It happens that an employee moves materials in accordance with the standard (up to 30 kg for permanent work), however, the dimensions of the material often cause other overloads and problems with motor coordination.

An employer, in accordance with the applicable regulations, is to ensure safety and a hygienic working environment. A number of activities that must be performed are included in many safety regulations and standards. Therefore, it is important that the employer takes care of the appropriate health and safety service that will perform all activities and will constantly monitor them. Properly functioning health and safety services in cooperation with foremen/ managers and the employees themselves are able to properly care for the work environment. It is important for the employer to support the activities of health and safety services and to approve their activities for safety, creating an increasingly higher safety culture of the company (Woźny, Woźny, 2017).

Table 1: Factors determining an accident at work in a warehouse - Ishikawa diagram

(Author's own research).

An analysis of causes of accidents at work with the use of the quality valuation method

The analysis of the individual factors determining an accident at work in a warehouse makes it possible to enumerate the most important elements that need to be corrected in order to prevent the analyzed accident event in the future. The incident analysis carried out by the Accident Committee and the Ishikawa Diagram show various determining factors. However, it is worth paying attention to the most important factors that can be quickly implemented. It should be pointed out that in every organization (even the one in which all procedures and processes comply with the applicable health and safety regulations), there may be a human factor that has a significant impact on the occurrence of accidents.

Initially, quality assessment was a method of assessing the quality of products, but it can be used as a method of solving decision problems. From the definition of quality itself, one can derive a simple indicator which is the quotient of a set of parameters and requirements, or going a bit further.

Q = Quality = Facts/Expectations

If Q is less than one, one can talk about an insufficient level of quality, i.e. sub-quality. When Q is greater than 1, one deals with excess quality, i.e. exceeding customer expectations, and thus with additional unjustified costs. The Q = 1 level means that customer requirements are fully met, i.e., full quality.

The practical use of such a formula is impossible as both the facts and expectations are usually expressed by many parameters. By applying some modification of the above equation, single features can be investigated (mfiles.pl)

An assessment of the employer's actions to prevent a hazardous event in the work environment, which result in accidents at work as well as breakdowns and events dangerous to general safety and ecological safety. The characteristics of the work environment important for its safety:

- Machines and devices in working order and checked,
- Appropriate health and safety training of employees,
- Providing adequate quality of personal protective equipment,
- Safety procedures,
- Appropriate organization of work,
- Communication between employees and between employees and the employer.

Table 2: Taxation method

State determination	Relative state	Assessment
Very good	0.9	The highest
Favourable	0.7	High
Average	0.5	Average
Unfavourable	0.3	Low
Vary unfavourable	0.1	The lowest

(Author's own research)

Table 3: Assigning relative states for each of the features for the safety of the work environment

No.	Feature's name	State definition according to the taxation method and/or the alternative method	Relative state (quality factor from 0.1 to 0.9 and/or from 0.0 to 0.8)	Our subjective assessment (q_i)
1	Machines and devices in working order and checked	Regular checks (once a year)	0.9	**0.5**
		Irregular checks (once every 2-3 years)	0.5	
		No checks	0.1	
2	Appropriate occupational health and safety training of employees	Very good	0.9	**0.7**
		Good	0.7	
		Average	0.5	
		Poor	0.3	
		Very poor	0.1	
3	Ensuring the appropriate quality of personal protective equipment	The best quality measures	0.9	**0.1**
		Average quality measures	0.5	
		Poor quality measures	0.1	
4	Safety procedures	Exist	0.9	**0.5**
		Partially exist	0.5	
		Don't exist	0.1	
5	Appropriate work organization	Very good	0.9	**0.3**
		Good	0.7	
		Average	0.5	
		Poor	0.3	
		Very poor	0.1	
6	Communication between employees and between employees and the employer	Exists	0.5	**0.3**
		Partially exists	0.3	
		Doesn't exist	0.1	

(Author's own research).

The method consists in formulating the criteria of importance, and then establishing the strength of the relationship between the features and the criteria against which the analysis of the importance of individual features is carried out. Among the 10 universal criteria the following are included:

- B - safety,
- C - novelty,
- K - cost,
- L - benefit,
- N - reliability,
- P - appearance,
- S - effectiveness,
- T - accuracy,
- U - usability,
- W - defectiveness.

The strength of the relationship between the feature and the criterion is marked with points in the table. The sum of the points determines the localization number (LL) - the criterion with the highest number of points is given to LL = 10, the next 9, etc. (mfiles.pl).

- 0 Has no connection,
- 1 Minor relationship
- 2 Small relationship
- 3 Perceived relationship
- 4 Clear relationship
- 5 Very large relationship (mfiles.pl)

Table 4: Assignment of locational numbers (Author's own research)

No.	Feature's name	Importance criteria symbols (in alphabetical order)									
		B	**C**	**K**	**L**	**N**	**P**	**S**	**T**	**U**	**W**
1	Machines and devices in working order and checked	5	4	5	5	5	3	5	4	5	5
2	Appropriate occupational health and safety training of employees	5	2	0	3	3	1	3	3	0	0
3	Ensuring the appropriate quality of personal protective equipment	4	2	4	4	5	1	2	5	5	5
4	Safety procedures	5	2	1	3	4	0	2	2	4	2
5	Appropriate work organization	3	2	3	3	3	0	4	2	2	2
6	Communication between employees and between employees and the employer	2	0	0	2	5	0	5	0	3	0
	Total no. of points	**24**	**12**	**13**	**20**	**25**	**5**	**21**	**16**	**19**	**14**
	Location numbers (ranking)	**9**	**2**	**3**	**7**	**10**	**1**	**8**	**5**	**6**	**4**

$$k_i = \frac{\textit{value of the sum of products for a given feature}}{\textit{the smallest value of the sum of the products}}$$

$$Q_i = \frac{\sum k_i \cdot q_i}{\sum k_i}$$

where:
k_i – importance level

q_i –quality factor for a given feature

Q_i= 0,62

$R_i = k_i (q_{max} - q_i)$ lub $R_i = k_i q_{max} - k_i q_i$

where:
q_{max} - is the maximum value of the relative state that could be assigned to the feature (in our example, i.e. 0.9).

q_i - relative states (our subjective opinion) (mfiles.pl).

Table 5: Product calculation for individual features

No.	Feature's name	Symbols of validity criteria by location number													
		Grades of importance criteria										Sum of products	k_i	q_i	$k_i q_i$
		N	B	S	L	U	T	W	K	C	P				
1	Machines and devices in working order and checked	50	45	40	35	30	20	20	15	8	3	266	1.9	0.5	0.95

(Author's own research)

Table 6: „R"calculations

No.	Feature's name	k_i	q_{max}	q_i	$(q_{max} - q_i)$	R_i
1	Machines and devices in working order and checked	1.9	0.9	0.5	0.4	**0.76**
2	Appropriate occupational health and safety training of employees	1.0	0.9	0.7	0.2	**0.2**
3	Ensuring the appropriate quality of personal	1.6	0.9	0.1	0.8	**1.28**

	protective equipment					
4	Safety procedures	1.2	0.9	0.5	0.4	**0.48**
5	Appropriate work organization	1.1	0.9	0.3	0.6	**0.66**
6	Communication between employees and between employees and the employer	1.0	0.9	0.3	0.6	**0.6**

(Author's own research)

The analyzes show that the most important aspects proving the safety of the work environment are:

- Ensuring the appropriate quality of personal protective equipment (1.28)
- Machines and devices in working order and checked (0.76).

It should be pointed out that in the analyzed accident event, personal protective equipment as well as machines and devices had no effect on the accident.

It is important that as a result of the analyzes, the three indicated features obtained the lowest result, i.e. it should be interpreted that the greatest anomalies may occur in the case of:

- Appropriate occupational health and safety training of employees (0.2)
- Safety procedures (0.48)
- Communication between employees and between employees and the employer (0.6).

Shaping safe working conditions is the responsibility of every employer. On the basis of applicable law, the work environment is organized in such a way as to ensure the safety of employees. However, regardless of the methods and means used by the employer, there may be a number of organizational problems that will determine accident events.

In the analyzed incident, which was classified as an accident due to the employee's fault, since he knowingly entered the warehouse rack to remove the tire. This behavior was inconsistent with the applicable safety rules. When constructing corrective and preventive actions for similar events, it is worth analyzing the causes of its occurrence in detail. The analyzes carried out according to the Ishikawa diagram and quality evaluation indicated that better actions should be taken in employee training, safety procedures, or communication between supervisors and employees.

The incident occurred contrary to the applicable procedures, despite the fact that the employee, with his own signature, stated that he had been acquainted with them. He was also trained in health and safety and had a job instruction. Such behavior of the employee proves that, in spite of the use of appropriate safeguards, there is no awareness of the potential threats among employees that may arise as a result of non-compliance with the procedures.

Conclusions

Employers are obliged to take care of proper working conditions by means of the most available methods. Through appropriate procedures and management methods, they not only strive for quality and efficiency of work, but also want the work environment to be safe.

In order to achieve safe working conditions, apart from the methods and procedures, it is important to properly train and make employees aware of why the safety aspect is so important. The analysis of the accident event clearly indicated that the company lacked a factor building the awareness of safe work in a warehouse.

The analysis of the incident and the analysis according to the Ishikawa diagram, as well as the method of quality evaluation showed that the company had appropriate methods and procedures to manage occupational health and safety. In this case, the human factor failed by acting independently

against applicable regulations. Such behavior is unacceptable in the work environment as it indicates employee's low level of safety awareness.

The main corrective and preventive measure for similar events is to build appropriate mechanisms to make employees aware of the consequences of acting in a way inconsistent with the adopted procedures. The training part should be extended with regard to the issues related to accidents. Showing the causes and circumstances of events and their consequences may increase the level of awareness among employees and draws attention to safety issues in the work environment.

Abstract

Financial technology is the product of technological advances on the financial side of the global economy. It has created a new and emerging form of finance in emerging companies that has posed a challenge to conventional banks. On the other hand, a fierce competitor may reduce its investment opportunities if it does not adjust the pace of the world. This technology contributes to a number of features that are reflected in the financial investors and the beneficiaries of financial services. The development of this type of technology may require a special incubator environment and legislative regulations. This technology also has an impact on conventional and Islamic insurance companies, especially on the quality of the products offered to the insured, particularly with regard to the cost of these products.

Keywords: Financial technology (FinTech), insurance technology (InsurTech), Takaful technology (TakTech), e-Marketing, GCC region.

Introduction

The IT and technology industry is witnessing spectacular developments and rapid changes that require a digital transformation in our lifestyles and business styles. With these developments growing at this stage, the insurance sector remains one of the most important economic and financial sectors that are affected by and interact with the ongoing changes in the digital industry.

There is no doubt that the parties to the insurance relationship all benefit from the development of technology in the insurance business, especially companies and document holders in addition to national economies. Digital transformation, for example, contributes to the creation of new sources of revenue and profits. This is due to the importance of insurance in the business system and the vitality of its role in the economic and social renaissance. Furthermore, helps to provide innovative services to customers in innovative ways to meet their needs and requirements, and helps in creating new jobs.

Digital transformation also makes the insurance markets more innovative and their future more prosperous, supporting the growth of the national economy and enhancing its competitiveness globally. Based on these facts, insurance companies are required to invest in digital data and services in keeping with the knowledge economy and in line with the needs of customers and the market.

Cite this Article as : Abdelmo'ti Suleiman Abdelmo'ti Abu Rub and Mohamed Nejib Ouertani " The Insurtech/Fintech And the Services Marketing Nexus : A Theoretical Framework" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN : 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Relevant organizations should make significant efforts in the digital transformation of their services, which are mostly smart, in order to promote growth and development of the insurance sector. As is necessary and without a doubt and no hesitation starting in the legal and technical and financial regulation of the market. In order to improve the performance of the insurance industry towards new and more advanced horizons, increase its contribution to GDP, enhance the domestic market competitiveness and catch up with IT, and apply everything new and modern in this regard, which will be reflected positively on this vital sector.

In this context, the main aim of this study is to understand the impact of technology and information technology on the quality of the services of the insurance sector, especially the Islamic Takaful one in order to establish a theoretical framework in this context. The study also aims to know the reality of insurance companies from InsurTech, as well as the extent to which insurance companies respond to technological developments and provide services in line with the development Technology and meet the needs and desires of customers, in order to achieve competitive advantage in a sector undergoing major technological changes.

Literature Review

Tan Choom Yan and al (2018) surveyed the main paper dealing with insurance technology and its potential from the perspective of enablement for financial and insurance services. The authors pointed out that digital revolution in the insurance sector had insufficiently changed during the last years. They also conclude that recent innovation in China's digital finance space has shown that emerging entities will impact the industry. They stated that the new statistical tools i.e., big data and Blockchain, will effect the service provided by the insurance sector.

Loannis (2018) examined the effect of the development of FinTech. He also offered various perspectives to help understand the implications of FinTech for the broader financial ecosystem. Based on the most recent research in this area, the author examined the implications of FinTech for financial institutions and regulation, particularly in the global banking and regulatory sector. The author has also attempted to link research conducted by practitioners and academic research.

Anjan (2020) reviewed the theoretical and empirical literature on fintech and its interaction with banking. The author highlighted the most known definition of fintech, surveyed some statistics and stylized facts. The review is organized around four main research questions. The paper summarizes our knowledge on these questions and concludes with questions for future research.

Tianxiang (2020) studied the impact of Fintech on the capability of banks to provide credit to customers, namely small and medium Chines companies over the period 2011-2018. The author concludes that fintech effectively helps the credit supply operation to small and medium enterprises. Also, the author studied whether the effect of fintech varies according to bank size. The author concludes, however, fintech played impact more significantly the increase in credit for small banks compared large ones. Accordingly, the author proposes to use fintech instead of developing several small banks.

Emmanuel et al (2020) examined the relationships between artificial intelligence, digital marketing and financial services in relation to vulnerable customers. Specifically, the authors studied artificial intelligence and its impact on transforming digital marketing practices. They concluded that there is little scientific work on artificial intelligence deployments that intensify the problems of financially vulnerable customers since they have limited access to financial systems, services or technologies. Therefore, the authors proposed the challenges faced by companies who want to integrate artificial intelligence into the digital marketing of their financial services. The authors conclude, therefore, that companies cannot always effectively use technology to target their customers. They also noted that understanding the ethical implications, data challenges as well as modeling is necessary for successful deployment of AI.

Noureddine and Hemrit (2020) investigated the effect the technological innovations and communication, i.e., the internet use, on the demand for life and non-life insurance using a panel of OECD countries over the period 2007-2017, using many panel data models. The authors showed that internet use affect

positively non-life insurance activities. But, they stated that there is no impact of internet use in the case of life insurance.

Financial technology, Fintech: an overview

Raison d'être

Fintech refers to an industry made up of companies that harness technology to serve the payment sector, and financial technology firms are generally emerging companies challenging traditional companies that are less dependent on software.

The National Digital Research Center in Dublin defines the Fintech as an innovation in financial services. More specifically, Fintech companies often use technology to compete with existing financial systems.

The emergence

The first opportunity for the emergence of Fintech was in 2008 (Alt and al (2018)), after the global financial crisis, subsequent bank bailouts and banking corruption scandals that marked a turning point in the banking sector. Industry experts and consumers began skeptical about the future of traditional banking. That only 26% around the world have high confidence in banking institutions.

Traditional banks have started to fall in front of Fintech. Four of the largest banks in the United States and Britain have cut their workforce by 350,000 over the past seven years.

Why does the world turn to financial technology?

Financial technology offers solutions as well as the development of bank-controlled financial instruments such as remittances, business credit cards and other operations, creating attractive alternatives and easy-to-use digital destinations.

The $ 1 billion TransferWise, launched in 2011, succeeded in reducing the value of the money transfer process, away from traditional banks and conversion methods.

Investment in Fintech

Global investments in the financial technology sector have increased significantly, from $ 928 million in 2008 to $ 4 billion in 2013, and then grew to $ 20 billion by 2015.
Investments are expected to reach $ 46 billion by 2020, thanks to technological advances and innovative financial products. Venture capital firms account for 24% of total investments, private equity firms 15%, venture investors 12%, and other investors 49% .
(http://www.banksnews.ps/news/5c8769446aa26760a57437cf)

Potential revolution in the GCC region

Despite the spread of Fintech worldwide, it is still in the slow growth of the Gulf region. The use of online banking, credit cards and alternative payment systems, such as CashU and OneCard, However, studies show that 85% of consumers in the Middle East still prefer to pay on delivery.

Group financing is one of the areas in which Fintech has begun to demonstrate its potential in the region. Although it does not replace traditional sources of finance such as banks, private equity and venture capital, collective financing has provided another option for the region facing a liquidity crisis as oil prices fall Silatech has joined forces with Qatar Charity to launch a collective funding platform to fund young Arab entrepreneurs.

In Kuwait, startups launched mobile applications to stimulate digital payment, such as "Agar" to pay real estate rents, and "May Bill" to pay bills via mobile.
In Jordan, the GreenLet online lending platform was launched where users can get the loan within 15 minutes, and the algorithm is based on assessing the creditworthiness of the user.
Jordan's Sharia-compliant lending platform, Liwa, was established in 2013 and had a $ 500,000 financing round last year from Dash Ventures, Jordan Union Bank and MENA Venture Investments.
It also recently secured a $ 2.3 million financing round from the venture capital fund Badia Impact, which belongs to the Global Fund for Projects group "Silicon Brady".
According to the 2016 Digital Payport report, e-payments are expected to increase in the Arab region to $ 69 billion a year by 2020.

The region is witnessing a growth of 23% in digital payments, driven by an annual growth of 40% in the Saudi market and 24% in UAE.
The UAE continues to lead e-commerce across the region, with 71 per cent of the population in electronic shoppers. Jordan is at the end of the list, with Internet penetration at 50 per cent of the population.

According to the World Bank, the cost of remittances to expatriates amounts to 7.7% worldwide of total remittances, and India is losing $ 5 billion a year in bank transfer costs as it has the highest rate of remittances from the Gulf region and around the world.
This financial technology will impact more on banking companies, financial services and insurance sectors, as demand will be driven by legislation and regulations that are still slow in their age in the region.

UAE experience

Financial technology has attracted large amounts of investment and interest from the public and private sectors in global financial centers. Banks seek to maintain their competitiveness amid increasing competition from new entrants, and governments aim to position themselves as centers of innovation.
The Arab world has a significant impact on the development of this industry, and the UAE in particular is no exception, having expressed its determination to develop the country through the National Innovation Strategy, a national initiative aimed at creating an ecosystem dedicated to innovation.
Financial technology is set to play a key role in the UAE's ambition to become a technology hub. The Abu Dhabi International Market last year launched the Regulatory Lab (RegLab), the first sandbox technology and framework in the Middle East and North Africa aimed at encouraging technology startups and providing regulatory assistance and advice.

The role of financial technology in innovation and technology in the UAE is not limited to Abu Dhabi alone. The Dubai Financial Services Authority (DFSA) has also contributed to the development of financial technology regulations and laws.

The new class of financial services license allows financial technology companies to develop and test their innovative concept within six to 12 months from within the DIFC without being subject to all regulatory requirements normally applied to regulated companies.
In the last few years, the UAE has come a long way in attracting the talents of local and international financial technology from around the world.

The launch of Fintech Hive in January by the Dubai International Financial Center (DIFC) was a major development in the region's renewable financial technology sector, welcoming the first technology-based accelerator. In 2018, Fintech Hayef at the Dubai International Financial Center (DIFC), the region's first-ever financial technology accelerator established by the Dubai International Financial Center (DIFC), has expanded its program to include insurance, Islamic finance and regulatory technology services. But along with emerging financial technology companies, banks and financial institutions have also attracted financial innovation.

For example, NBAD was the first bank in the Middle East to go directly on blockchain[1] for real-time cross-border payments by leveraging the Ripple network. Another example is Abu Dhabi Islamic Bank, which has partnered with Fedor to launch the region's first digital bank.

There are already some success stories now in the UAE in terms of financial technology where incubators, enterprise and program development institutions, and innovation centers support the creation and growth of local entrepreneurs and attract global talent. Batas believes and supports UAE initiatives to make the country and the Arab region a strategic hub for financial technology in the near future.

The 2018 version of the program builds on the success of the accelerator in its launch last year in partnership with Accenture, the global provider of professional technology services. The program continues to bridge the gap between technology innovators and mega financial institutions while providing a platform capable of enabling the development of innovations that are in line with Dubai 2021 and the growth strategy of the DIFC 2024.

The program will be hosted by Abu Dhabi First Bank, Arab Bank and Noor Bank as financial partners, as well as a number of former partners such as Abu Dhabi Islamic Bank, Citigroup, Emirates Islamic Bank, Emirates NBD, HSBC, Mashreqbank, Standard Chartered and Visa. Partners from financial institutions will prepare, collaborate and participate in emerging projects through a 12-week mentoring program.

Fintech Hayef will also be part of the Dubai International Financial Center (DIFC) as a strategic partner. The Dubai Islamic Economic Development Center will seek to target emerging companies operating in the Islamic finance sector, which is an important pillar for this region.

On the other hand, the Fintec Hayef program at the Dubai International Financial Center (DIFC) is collaborating with Accenture's Fintec Innovation Labs to enhance the status of the accelerator among the world's leading financial centers.

Insurance Technology (InsurTech)

InsurTech is a subset of financial technology, it is the equivalent of FinTechs in the banking world. Which is related to using technology to simplify and improve the efficiency of the insurance industry.

In 2017, consulting with giant Capgemini and the non-profit industry body Efma, found that traditional insurers face increasing competitive pressure due to the emergence of a number of emerging insurance companies.

InsurTech: the next revolution

The InsurTech, which concerns the insurance sector, is today one of the main sources of growth. Like FinTech, the InsurTech sector is driven by the growing number of data produced and circulating around the world: Internet browsing, smartphone applications, tracking purchasing behavior, personal data, etc. Moreover, it is estimated that 50% of the data will be collected by connected objects in 2020 (Saha and al (2017)).

The collection of this data can be very useful for both insurers and policyholders as it will help to better anticipate risks and claims. Subsequently, the analysis of this data will lead to a greater personalization of the insurance offers, tailor-made according to the profile of each insured. Finally, the digitization of services and contracts will lead to greater automation of the processing of claims and compensation. The live analysis of these will in return to better anticipate the risks and claims, etc.

Blockchain Is a distributed database that has the ability to manage an ever-growing list of named records (blocks). Each block contains a timestamp and a link to the previous cluster. A series of blocks is designed to preserve and prevent data from being stored, meaning that when you store information in the cluster, you can not later modify that information (wikipedia).

The applications developed under the InsurTech are as varied as they are varied. Here are some examples of benefits that we can soon benefit from:

• We compare and subscribe anywhere and anytime! For example, you will be able to receive an estimate of insurance quotes following the real-time sending of photos of your apartment or the license plate of your vehicle.
• We spare on the best media, chosen for us! By informing your profile and your investment objectives, an algorithm may for example be able to select for you the best investment materials.
• Insurer knows better customers! By collecting certain data (driving, physical activity, shopping, etc.), your insurer will be able to send you the most appropriate protection formulas and prevention messages.
• In case of disaster, my file is processed faster! By declaring your claim online, compensation can be unlocked automatically, through the magic of "Smart contracts". Advances that will also lead to the automation of claims management as well as the detection of fraud.

Can we will be better protected by InsurTech?

Services created by InsurTech start-ups promise three major benefits for users
• More customization - Real-time analysis of data, but also updating your situation will change your premiums and guarantees according to your needs. You will be able to receive in real time insurance offers related to your purchases, your activities or your location.
• More transparency - You instantly know the impact of each claim on your insurance profile and receive a bonus for virtuous behavior.
• More proximity - You use mobile communication channels, such as instant messaging, video calling, or sending photos via a dedicated application.

The Islamic insurance takaful technology: TakTech

Investment in insurance technology helps insurance process, reduce costs and improve the service provided to customers either through the establishment of a technological system or contracting with companies that provide technological service to provide technical support, knowing that Takaful technology TakTech (proposed for the first time by the researcher), represent the technology behind the creation, distribution and management of insurance business using technology consists of two components: Takaful insurance and Technology, a term inspired from FINTECH and INSURTECH. Like INSURTECH, which has become one of the most widely used terms today in many conferences, event and insurance professionals ... TakTech is expected to revolutionize insurance operations and its Islamic management.

Technology-based Takaful companies (TakTech) have made the process of purchasing insurance policies easier, from individual insurance to corporate insurance. As the technological insurance has made it easier for customers to search for and to compare the appropriate type of insurance through the Internet, applications and social media and there is no need to visit the company to complete the insurance process or to report a claim or an accident. TakaTech will play an important role in all the steps of the insurance process and will also contribute to the development of policies and services provided to customers. The applications used by customers, the car monitors and the physical tracking tools that can be worn have facilitated understanding customer, understanding his needs and finding advantages suits his lifestyle. Furthermore, Takaful companies use technology to provide technology-backed services and involve more interaction with customers, the success of TakaTech is expected to make underwriting, pricing risk assessment, claims settlement and asset management more efficient for insurer

Thus, the chain value is the series through which the products pass in order. At each step, the product acquires additional value, beginning with the product design (policy) followed by marketing, subscription and pricing, claims settlement and customer service. TakTech can impact the insurance industry, especially the methods of obtaining data and their analysis, which helps the process of designing the policy in a way that suits the needs of the customer. Use technology to reach the target customers faster, through social media. The technology also provides new data and sophisticated analysis which helps to better know and understand risks and how to reduce them and use those data to determine the fair price. With regard to

claims settlement, technology contributes to the ease of reporting in the case of an accident and accelerates the claims settlement adjustment process. Finally, customer service is done electronically through social platforms on the Internet and mobile to facilitate communication between the customer and the company and save time and effort.

e-Marketing of insurance Takaful service

Internet marketing, known as digital marketing (e-marketing) or web marketing, includes all methods and practices related to the world of Internet marketing: Internet communication, and improve electronic commerce.

There are several sites that promote the marketing of electronic and provide several services for marketing, for example, there is a website dedicated to this matter, namely, electronic marketing in order to promote the advertiser or the goods, relying on marketing and promotion without papers such as the newspaper, but rely on the Internet, mobile and other digital devices that keep abreast of technological development. Today, all the world uses technology and development in the daily life of the individual, as the process of purchasing, distribution, shopping, display of demand and production is developed by electronic methods no longer as it was before. For the traditional process they were expensive and take a long time.

e- Marketing techniques allow the development of customer relationship to an unprecedented level: continuous interaction is now available. Although it has received some resistance from some customers considering this type of marketing intrusive. However, the use of voluntary reporting techniques, among users, especially those who frequented the business site. It also uses e-marketing to get customers in order to maximize the benefit of selling on a site and winning customer loyalty.

Furthermore, it is possible to acquire this commodity and obtain it in a short time so that any marketer can promote its goods and sell, exceeding consequently the territorial limits to enter the universality, which guarantees at least more popular for that product or service. In short, e- marketing has made it possible to obtain a product or service without regarding time or place. e-Marketing helps open the way for everyone to market their goods or experiences without distinguishing between a giant enterprise with a huge capital and an ordinary person or small company with limited resources.

Marketing mechanisms and methods are characterized by low cost and ease of implementation compared to the traditional marketing mechanisms and the possibility of adapting the costs of designing the store and advertising for free or in accordance with the budget according, while it seems difficult to apply such mechanisms to the traditional business. Using the software techniques associated with the e-marketing environment and advertising campaigns in this digital environment, it is simply possible to evaluate and measure the success of any advertising campaign and to identify the strengths and weaknesses. The geographical distribution of the target segments of these campaigns and other targets can also be directed or determined, which seems difficult to achieve when using traditional means.

Advantages of e-marketing of insurance policies

1. Insurance companies have become popular, thanks to e-marketing, using modern technologies in the areas of service design rather than traditional design methods, as there are many software ready and detailed for such insurance services.
2. Producing and providing computer-based insurance services through internet networks.
3. Obtain immediate information on the level of insurance services in the insurance market and marketing quotas through advanced communication networks.
4. Preparing studies for the market, customers and purchasing behavior.
5. E-marketing techniques contribute to the identification of after-sale services for the insurance product.

The nexus between TachTech and the quality of services provided

These start-ups are intended to trigger a disruption in insurance services by incorporating technological developments to improve and simplify the offer by making it cheaper.

All operations are done digitally from product creation to price setting through claims management and marketing operations. TakTech build traditional products or tailor-made products by creating dedicated products for certain companies such as, for example, car dealers.

This branch requires a variety of skills because the products are complex to build and the technological issues must be well understood. But it's a gigantic market!

To understand the sphere of development of this sector, here are some innovations that are in progress:

1. The dematerialization of insurance contracts
2. Subscription and rapid management of contracts online
3. Claims management online
4. Customization of offers and automation of processes via artificial intelligence
5. The individualization of customer relationship management
6. Cost reduction
7. The rise of customer satisfaction and the excellence of the user experience
8. Exploitation of big data
9. The use of connected objects technologies in homes and research on autonomous cars Insurtech has therefore upset the insurance industry with its agility and technological innovation capacity, as FinTechs do in the banking world.

Conclusion

It is clear that financial technology or what is known as FinTech is a financial revolution that swept the economic arena and that was necessary to facilitate transactions to reach the largest segment of the insurance customers in its traditional and Islamic form due to several considerations. With the rapid advancement of ICT, and artificial intelligence, this new momentum has to be matched by financial technology, which has created a new structure for the insurance industry through emerging companies that are active in its context, requiring a customized environment and technological sophistication on the one hand and Along with the laws that regulate the work in various sectors and provide a safety aspect on the other hand.

Adaptation of Polish Legal Acts Regarding Accounting to International Standards

Ewa W. BABUSKA

Cracow University of Economics, Cracow, Poland
babuskae@uek.krakow.pl

Abstract

The purpose of the article is to present the changes in the Polish Act on Accounting related to the changes that have taken place in Poland economy over the past thirty years, during the transition from socialist to capitalist. The main part is preceded by a brief outline of accounting. The novelty of the article is to trace the evolution of Polish accounting regulations in the period of political and economic transformation in terms of their adjustment to EU and IAS / IFRS solution. The research method consists in a reviewing of legal regulations: national, European and international, as the related literature does not synthetically and comprehensively reflect all changes introduced to the Polish Accounting Act during the period. The article is an attempt to fill this gap, i.e. the lack of synthetic and comprehensive studies on this subject in the literature. The Author verifies the research hypothesis by checking what changes and when were introduced to the Polish Accounting Act in accordance with the amendments to EU directives as well as to international accounting and financial reporting standards. It has been shown that changes to the Act were introduced regularly and adequately to region and international laws, which is why the Act was frequently amended and adapted to new regulations on an ongoing basis and the hypothesis has been positively verified.

Keywords: Regulations of Accounting and Financial Reporting, European Union Directives, International Standards, The Polish Act on Accounting.

JEL classification: M41, K20, K29

Introduction

The present accounting in the global dimension is treated as the language of business, which accounts for its international standardization and harmonization despite the existing and applied domestic systems and their unique solutions (Surdykowska, 1999; Jaruga ed., 2002). Basic principles, rules, canons, norms, assumptions, standards on which accounting rests have been shaped over centuries of its historical development which has not been completed. The purpose of the article is to present the changes in the Polish Act on Accounting in connection with the transformations that have taken place in the Polish economy over the past thirty years, during the transition from socialism to capitalism.

The main section is preceded by a brief outline of accounting. The novelty of the paper lies in tracing the evolution in the Polish accounting laws during the system and economic transformation, adjusting them to the EU and IAS/IFRS solutions. The research method consists in a reviewing the legal regulations: national, European and international, as the related literature on the subject does not synthetically and comprehensively reflect all changes introduced to the Polish Accounting Act during the period. The article is an attempt to fill this gap, i.e. the lack of synthetic and comprehensive studies on this subject in the literature. The Author verifies the research hypothesis by checking what changes and when were introduced to the Polish Accounting Act in accordance with the amendments to EU and IAS / IFRS laws. It was shown that changes to the Act were introduced regularly and adequately to region and international laws. It was frequently amended and adapted to new regulations on an ongoing basis, and the hypothesis was positively verified.

The Historical Outline of Accounting

The Polish economy in 1945-1989 was a centrally-steered economy, with social (state) ownership, deprived of private ownership. The socialized economy was in opposition to the capitalist economy and it was modeled on the soviet economy, in close connection with it and with other economies of Eastern and Central Europe, where the socialist system and the model of the so-called "planned" economy was imposed. Poland has "always" used the continental (German) model of accounting, preferring the valuation of assets and liabilities according to their historical cost. It was only in 1994, when the Act on Accounting was passed, that Poland started to implement the solutions of the Anglo-Saxon model and international standards. It must be remembered that in the history of searching for generally accepted principles of accounting in the USA there was a significant change and the major focus was shifted to searching conceptual assumptions as the theoretical foundation for standards that have become their major part. "Concept Assumptions" as FASB document (Financial Accounting Standards Board) was called the "constitution", on which standards were to rely, while the choice of vocabulary emphasized the political essence of standards. "Concept Assumptions", however, were not referred to financial accounting, but to financial reporting. These assumptions, contrary to expectations, did not become a generator in the process of developing standards, but their significance gradually decreased and they became only a source of concepts, preserving their political characteristics (Hendriksen and van Breda 2002, pp.138-148).

At some point the establishment of accounting norms was the subject of the state intervention. In the European area this occurred directly in the legal form, in the English and American area – stakeholders ordered directly the creation of professional standards. The European mode relied on political will, while the American one requires participation of all interested parties and legitimization that is broader than political will. That is why at the beginning of the 1970s the USA became home to the first board in the world (FASB) which represented interests of economic entities more fully and whose task was to establish financial accounting standards. It was also forced to solve the problem of its own legitimization on the intellectual platform and needed theory that would justify the content of standards and the way of establishing them. However, since accounting has never had a generally accepted scientific theory, the Board formulated it independently in the shape of a concept framework of financial accounting in the mid-1960s. It was then that the main focus shifted from measuring income to generating information for stakeholders, who needed it to take economic decisions. This direction is still developing along with the process of globalizing world economies.

In Polish one can read "The Concept Assumptions of Financial Accounting" formulated by IASB (International Accounting Standards Board) with its registered seat in London, which establishes financial accounting and reporting standards. Both Boards originate from English and American areas. Financial statements and corresponding measurement, structure and communication patterns, that is financial reporting standards, are the major products of the current stage of development of accounting (Nowak, 2010, pp. 15-20). The recent study of The Routledge Companion (2015 ed. by S. Jones), devoted to the theory of financial accounting, draws attention to the fact that this theory finds many applications in the accounting practice of many entities and also has political implications. The authors of the new standards rely extensively on theoretical assumptions of accounting, and the regulatory bodies in corporations behave in a similar way when establishing regulations and evaluating existing accounting solutions in practice. The theory of accounting deals with formulating and analyzing rules on which the accounting practices rely and supporting them. In the USA these are Generally Accepted Accounting Principles – GAAP (Delaney et al, 2003).

Changes in Accounting and Financial Reporting Regulations in Poland Adjusting Them to European And International Solutions

Financial reporting is an integral part of accounting, since a financial report is the final product of accounting. Accounting and financial reporting are subject to continuous changes as they try to adjust to the developing global economy as well as regional and national economies. The growing flow of goods, services, capital and people attributed to the progressing process of globalization – in the

1990s brought about a change in the purpose of companies activities and contributed to the increased demand for new information, necessary for management and investment purposes. Since then the top priority has been seen not in increasing short-term profits, but in increasing the value of the company in the long term, whereas financial and non-financial data included mainly in financial reports are used when making strategic decisions and checking their implementation, as well as when managing risk in an enterprise. They are also used by other stakeholders, primarily investors, when choosing an optimal way of allocating capital in selected investment ventures.

The accounting of highly developed countries has been largely harmonized on the basis of international accounting standards [IAS – issued until 2001 by International Accounting Standards Committee (IASC)] and international standards of financial reporting [ISFR – issued Since 2001 by International Accounting Standards Board (IASB) with its headquarters In London]. Standardization and harmonization of accounting and financial reporting resulted from the necessity to standardize various solutions found in accounting theory, practice and policy in particular countries and from the need to develop and implement international patterns of conduct in accounting, as well as in order to make financial reports in global economies comparable (Olchowicz, Tłaczała, 2015, p. 13). These standards are not strictly provisions of law, but they are reflected in legal regulations of particular countries referring to the accounting and the financial reporting used there. In 80. years of XX age the harmonization of financial reports has been greatly affected by the directives of the European Union. These were: Directive IV from 25th July 1978 on principles of making, publishing and auditing annual financial reports, Directive VII from 13th July 1983 on principles of making, publishing and auditing consolidated financial reports, and Directive VIII from 10th April 1984 on professional qualifications of persons authorized to audit annual financial reports and requirements to be met by auditing companies in order to be able to audit annual financial reports. However, since Directives IV and VII, in spite of numerous modifications, did not help to achieve the desired state of comparability and transparency of financial reports, the European Commission implemented a new directive on accounting, aimed at decreasing administrative burden, mainly of small companies, and improving clarity (transparency) of financial reports. It is Directive of the European Parliament and of the Council of 26th June 2013 on the annual financial statements, consolidated financial statements and related reports of certain undertakings. The Directive amended the Directive of the European parliament and of the Council 2006/43/EC and repealed the Directives of the Council 78/660/EEC and 83/349/EEC (OJ of EU 29.06.2013, item L182/19). In 2002 the European Parliament adopted Regulation No 1606/2002 on the application of international accounting standards in the European Union. The regulation included the order to use IAS/IFRS in making consolidated financial reports for issuers of securities allowed for public trade since 2005. Since January 2005 banks and capital groups operating in the EU, including those operating in Poland, are obliged to make annual financial reports in accordance with the IAS/ISFR. It should be emphasized that accounting in Europe, as in other regions of the world, has been shaped by various social, economic and political factors for centuries. These factors have marked significant differences deeply rooted in the practice of making financial reports. These factors include: various legal and tax systems, different perception of goals of financial reporting and various sources of financing economic activity (Bonham et al, 2006, p. 66).

Accounting in Poland, as mentioned, was based on the continental model and was subject to various legal regulations which covered all its issues, namely bookkeeping, cost accounting and financial reporting. As the Polish state underwent constitutional transformation, accounting was governed by new acts of law in order to adjust it to the free market economy conditions and the information needs of both external and internal users. The first of them was the regulation of the Minister of Finance from 15th January 1991 on principles of accounting, which normalized the accounting records and the new financial reporting, whereas in other issues (including mostly cost accounting) it referred interested parties to the principles developed by the accounting science and to accounting practice and customs (Regulation of the Minister of Finance, Journal of Laws No 10, item 35, § 3 point 6).

The key legal act, however, has been the Act on Accounting of 29th September 1994 (Journal of Laws No 121, item 591). The act was passed when the legal order of the IV Directive of the Council of 25th July 1978 on annual reports (78/660/EEC) was implemented into the Polish law. The Act includes provisions concerning financial accounting and financial reporting (Article 4 section 3). The issue of

costs, that is managerial accounting (in German-speaking countries known as controlling), however, was neglected and the provision on applying principles of the accounting science and its practice and customs in matters not regulated by the Act was not repeated, i.e. § 3 point 6 of the above-mentioned regulation of the Minister of Finance. According to Sobańska and Walińska (2018, p. 155), this created „regulation and terminology confusion in the subject literature and in accounting practice".

The act which regulated accounting and financial reporting while ignoring managerial accounting was called "inadequate to the subject scope" (Sobańska, 2012, p. 179). The Act on Accounting (AA) has been amended many times in order to adjust it to social, economic and legal changes and to the EU and IAS regulations. The harmonization of the Polish accounting law with the EU directives started 12 years before Poland's accession to the EU. From the very beginning the Act combined provisions of the IV and VII Directives, while the European Commission did so only in 2013 (Dadacz 2018, p. 5-8). The Act also immediately introduced some solutions from the Anglo-Saxon accounting model. The first significant amendment was introduced in the Act of 9th November 2000 and brought expended definitions, simplified inventory, changes to report templates and adjustment of accounting principles to the requirement of computer bookkeeping (Gnich, 2002, p. 14). Detailed provisions of all changes to the Act on Accounting are presented in Table 1 below.

Table 1: Amendments to the Polish Act on Accounting, presented chronologically

No	Legal act	The goal of the amendment and the introduced changes
1	The Act of 9th November 2000 on Amending the Act on Accounting, Journal of Laws No 113, item 1186 (valid since 1st January 2002, but Article 1 point 42 entered into force on 1 January 2001 and applied to financial statements for the financial year beginning in 2000).	The aim of this amendment was to adapt the Polish Act on Accounting to regulations valid in the EU and the IAS. Some missing provisions were supplemented, concerning, e.g. mergers and takeovers of companies, capital investments, financial leasing, long-term contracts of services, deferred tax; some concepts not used in Polish practice were defined, such as consolidation of financial reports of units in a capital group; the concept of "reporting period" was extended; smaller units were exempted from audit and consolidation thresholds were increased (revenues, balance sheet sum, employment) for small and medium size capital groups; in matters not covered by the Act it was allowed to use national accounting standards (NAS) and if there was a lack of them, IAS. This was the so-called major amendment of the Polish Act on Accounting.
2	The Act of 27th August 2004 on Amending the Act on Accounting Journal of Laws No 213, item 2155 (valid since 1st January 2005).	The amendment was connected with Poland's accession to the EU and the adjustment to the Regulation 1606/2002/EC of the European Parliament and of the Council of 19th July 2002 on the use of IAS. The issuers of securities allowed in one of the regulated markets of the EEA (European Economic Area) and the banks were obliged to make consolidated financial reports in accordance with the IAS starting from 2005. These changes were to allow comparison of data from financial reports of particular units on a global scale as they were made in accordance with the IAS.
3	The Act of 18th March 2008 on Amending the Act on Accounting Journal of Laws No 63 item 393 (valid since 1st January 2009).	The amendment was to implement in the Polish Act the provisions of Directive 2006/46/EC amending directives IV and VII on annual and consolidated financial reports. It defined, inter alia, responsibility of company organs for preparation and publication of financial reports and reports on company activities; it standardized the valuation and inventory of investment in real estate; it specified specific situations when opening and closing books, for example bankruptcy with a possibility of making a settlement, division by separation; the method of combining shares when merging companies was limited only to companies which were under joint control; it regulated the issue of commercial bookkeeping in connection with the growing outsourcing of accounting services. It was then that the wording of the provision on exchange rate differences was changed and the limit of turnover from which it was necessary to run accounting books was increased from EUR 800 000 to EUR 1 200 000.
4	The Act of 11th July 2014 on Amending the Act on Accounting, Journal of Laws item 1100 (valid	The amendment of the Act in 2014 and 2015 was connected with the implementation of the directive of the European Parliament and of the Council 2013/34/EU of 26th June 2013, replacing directives IV and VII on annual financial reports, consolidated and related reports of some entities.

5	since 5th September 2014; The Act of 23rd July 2015 on Amending the Act on Accounting and Some Other Acts, Journal of Laws item 1333 (valid since 23rd September 2015).	The changes were combined with the introduction of some simplifications in financial reporting of micro units in 2014 ("small amendment") and small units in 2015 ("big amendment"). Two annexes were added to the Act, annex No 4 and No 5, which included scopes of information indicated in financial reports of such units. By introducing some simplifications, the law makers took into account the greater susceptibility of smaller entities to economic fluctuations and administrative burden. Amendments to the Act allowed the use of simplifications by a wider group of entities, whereas the amendment from 2015 allowed non-governmental organizations to run a simplified register of revenues and costs in place of accounting books.
6	The Act of 9th May 2014 on Facilitating Access to Some Regulated Professions, Journal of Laws item 768 (valid since 10th August 2014).	This amendment to the Act repealed the provisions limiting the commercial running of accounting books and since it came into force, such services could be performed by anyone with full capacity to conduct legal activities, with clean criminal record for some specific crimes and possessing an insurance policy against third party liability. The Minister of Finance thus stopped issuing certificates of an accountant which were necessary in order to offer commercial bookkeeping. Market mechanisms that increase competition and economic freedom should verify access to these services.
7	The Act of 15th December 2016 on Amending the Act on Accounting, Journal of Laws from 2017, item 61 (valid since 26th January 2017).	This amendment widened the thematic scope of the Act by implementing the directive of the European Parliament and of the Council 2014/95/EU of 22nd October 2014 on the duty to reveal non-financial information in reports on activities of the biggest entities of public interest. This mainly concerns stock exchange security issuers and large financial institutions, if they employ over 500 staff on average in a year and if they have PLN 85 million of the balance sheet sum or PLN 170 million of annual net revenue from sales of goods/ products. These units are obliged to submit "a declaration on non-financial information" concerning social and staff matters, natural environment, respect for human rights and fight with corruption. On top of it, large stock exchange companies must reveal in their reports information on the applied policy of diversity towards persons who are members of company organs, giving their age, sex, geographical origin, education and professional experience. The inclusion of new reporting obligations due to CSR is to ensure coherence and comparability of such information revealed by European companies and large capital groups and to facilitate winning investors, strategic partners and clients. This amendment also referred to financial reports of non-governmental units for which a separate, simplified scope of reporting information was developed, included in Annex No 6 to the Act on Accounting. It reflected the specificity of the activities of public benefit organizations and specific nature of their revenues and costs.
8 9	The Act of 9th November 2017 on Amending Some Acts in order to Improve the Legal Surroundings for Innovative Activities, Journal of Laws item 2201 (valid since 1st January 2018) The Act of 15th December 2017 on Amending the Act on Tax on Goods and Services and Some Other Acts, Journal of Laws from 2018, item 62 (valid since 1st July 2018);	The uniform text of the Act on Accounting of 30th January 2018, Journal of Laws item 395 (this act is now expired) reflects changes introduced by the quoted here acts and changes resulting from provisions published before 26th January 2018. Using Article 3 of the Act of 9th November 2017, in Annex 1 to the Act on Accounting, in section "Additional information and explanations", in section 2 after point 10 point 11 was added, with the following wording: "information on costs connected with research and development work, which have not been classified according to Article 33 section 2 to intangible and legal assets". Using Article 2 of the Act of 15th December 2017, in Annex 1 to the Act on Accounting, in section "Additional information and explanations", in section 1 after point 17 point 18 was added, with the following wording: "money means collected on VAT account, which is specified in: a) article 62a section 1 of the Act of 29th August 1997 – The Banking Law (Journal of Laws from 2017, items 1876, 2361 and 2491, and from 2018, item 62), b) article 3b section 1 of the Act of 9th November 2009 on Cooperative Savings and Loans Institutions (Journal of Laws from 2017, items 2065, 2486 and 2491, and from 2018, item 62)". Thus additional information and explanations were expanded by adding to them further required points.
10	The Act of 26th January 2018 on Amending the Act on National Court Register and Some Other	The uniform text of the Act on Accounting from 17th January 2019, Journal of Laws 2019, item 351, reflects amendments introduced by the quoted acts and changes resulting from provisions announced before 16th January 2019. The change resulting from the amendment to National Court Register was

11 12 13 14 15	Acts, Journal of Laws item 398 and 650 (valid since 15th March 2018); The Act of 6th March 2018 – Provisions introducing the Act Enterprise Law and Other Acts Concerning Economic Activity, Journal of Laws, item 650 (came into force 30 days after its announcement); The Act of 5th July 2018 on Succession Management of an Individual person's Enterprise, Journal of Laws item 1629 (came into force 3 months after its announcement); The Act of 9th November 2018 on Country Housewives Clubs, Journal of Laws item 2212 (came into force on the day following announcement); The Act of 9th November 2018 on Amending Some Acts in order to Make Simplifications for Entrepreneurs in Tax and Economic Law, Journal of Laws item 2244 (came into force on 1st January 2019, with exceptions); The Act of 6th December 2018 on National register of Debtors, Journal of Laws from 2019, item 55 (comes into force on 1st December 2020, with exceptions).	related to the obligation to make unit and consolidated financial reports and report on activity in an electronic form. Units covered by the register of enterprises of NCR were obliged to electronically make reports following the logical structure and format given in Public Information Bulletin on the website of the Ministry of Finance and were exempted from the obligation to submit them to the Tax Office. This change is aimed at improving the security of economic activities and improve insight into the whole information and documentation held by the NCR. On the other hand, amendments resulting from the act on simplifications for entrepreneurs in tax and economic law, known as the so-called Package for Small and Medium-Sized Enterprises, concerned: -raising revenue thresholds (from PLN 17 million to PLN 25.5 million and the balance sheet sum (from PLN 34 million to PLN 51 million), that is to the highest values determined in the directive 2013/34/EU for small entities, whose number thus grew by 3 thousand, that is by over 7%, this is specified in article 3 section 1 c and 1 d of the AA; -increasing the number of micro entities which make financial reports, mostly simplified ones, these entities include individuals, civil partnerships of individuals and enterprises inherited, general partnerships of individuals, partnerships, if their net revenues from sale of goods, products and financial operations amounted to, in Polish currency, at least EURO 2 000 000 and not more than EURO 3 000 000 for the previous financial year, these changes are specified in article 3 point 1a and 1b of the AA; - abolishing the requirement to store the confirmed financial reports for an unlimited period of time and limiting this period to 5 years, as specified in article 74 point 1 of AA; - extending the group of entities which are entitled to use the tax definition of financial leasing, that is to classify leasing contracts in a simplified way, following the rules specified in tax provisions, as stipulated in article 3 point 6 AA; - resigning from determining deferred tax, article 137 point 10 AA; - not valuing assets and liabilities by a micro entity according to their fair value and correcting the purchasing price, article 28 AA; - small entities do not have to apply provisions on financial instruments (regulation of the Minister of Finance on specific principles of acknowledging, ways of valuation, scope of disclosing and way of presenting financial instruments), article 28b, point 1 in connection with article 81 point 2, sub-point 4 AA; - using simplified principles of calculating costs of manufacturing the product – article 28 point 4a AA; Moreover, in micro and small enterprises which are not covered by the directive on accounting, and in non-governmental organizations, changes referred to: - using tax rules of appreciation of tangible and intangible assets, article 32 point 7 AA; - resignation from creating risk reserves, faced losses and effects of other events and resignation from write-offs updating the value of assets, article 7 points 2a and 2b AA; - resignation from creating accruals for future payments to employees, including retirement pension payments, article 39 point 6 AA.

Source: own elaboration on the basis of acts listed in table 1 and Dadacz, 2018, p. 5-8, as well as on the basis of the Accounting Act (consolidated text of 2019, items 351, 1495, 1571, 1655, 1680, of 2020, item 568).

Olchowicz and Tłaczała (2015, pp. 20-21) mentioned that, the Polish accounting regulations were linked to the content included in IAS and IFRS by introducing the principles and standards to the Act on Accounting. This content was usually simplified to easy the workload and to facilitate its accomplishment. At the same time an important provision was included in the Act, namely that in matters not regulated by the provisions of this act and provided they apply the rules (policies) of accounting, entities can use national accounting standards issued by the Accounting Standards Committee. If there is no relevant domestic standard, entities can use IAS / IFRS, excluding those units for which these standards are the law. So far the following national standards have been issued: 1) cash flow account, 2) income tax, 3) unfinished construction services, 4) loss in value of assets, 5)

leasing, rent, lease, 6) reserves, passive cost accruals, provisional liabilities, 7) change of rules (policies) of accounting, estimate values, rectifying errors, events following the balance sheet day – approach and presentation, 8) developer activities, 9) report on activities. National accounting standards are to facilitate the application of accounting regulations by entities, by specifying them and providing interpretations helpful in practical implementation of provisions.

Those entities operating in Poland for which standards are the law obligatorily use all standards, without any exceptions, along with interpretations issued for them, while other entities use only those regulations which were included in the Act on Accounting. IAS / IFRS are the leading accounting patterns of accounting, adjusted to economic transformations in the world, whereas domestic laws are usually traditional. However, the Polish Act on Accounting has been changing rapidly, incorporating immediately right solutions proposed in consecutive standards.

Conclusions

In conclusion, in the period of 25 years which passed since the passing of the first text of the Polish Act on Accounting, many significant amendments have been introduced to it. All these changes resulted from the need to adjust the Polish Act of Accounting to the global and European tendencies in accounting, elevated as "the language of business": in international economic relations. These tendencies reflect the processes of standardizing this language on a global scale and harmonizing and standardizing financial reports as the basic carrier of financial information. Every change in newly-implemented solutions in theory, practice and policy of accounting exerts some influence on financial reporting of entities, constituting the final product and an integral part of accounting. Referring to the purpose of the article, it can be stated that a detailed study of frequent changes to the Polish Accounting Act over the last 30 years of the political and economic transformation in Poland shows that the act is being gradually and immediately adapted to the IAS / IFRS international standards and directives of the European Union. It can also be hoped that the article filled the gap in the literature on the subject in terms of a synthetic and comprehensive presentation of the changes introduced in the Polish Accounting Act in order to adjust it to the EU Directives and the MRS / IFRS standards. The research hypothesis as to whether the changes to the Polish Accounting Act are implemented frequently, regularly and adequately to the changes introduced in EU directives and in international accounting and financial reporting standards has been positively verified. That explains why Poland belongs to a group of countries which update their national provisions on accounting in accordance with arrangements and norms promoted and adopted in the world. Thanks to the updates, the Polish Act on Accounting includes modern trends in decisions concerning accounting and does not lag behind the world solutions in this field. On the other hand, this act reflects the specificity of the Polish economy and its further development prospects. The implemented provisions are deeply analyzed by numerous Polish theoreticians and practitioners in order to ensure their best adjustment to the reality of the economic life in Poland.

Managing Changes when Adding Technology in Financial Sector

Elena MIRCEA

The Bucharest University of Economic Studies, Bucharest, Romania
elenamircea94@gmail.com

Abstract

In a changing world, resources tend to be insufficient and managing them could come with hard challenges for a company. Constant adaptation and evolvement define the basis for a successful business, but behind it comes a strong infrastructure that ensures the operativity. This year turned out to be a major test for humanity and for the economy. Regardless of the business and domain of interests, everyone had to exceed the boundaries and find innovative ways of making business. Increased competition makes businesses recalculate their economic indicators and invest in productive work and efficiency, thinking about overall performance of the company, by using integrated systems. The aim of this paper is to present the change management process for information systems, by analyzing techniques that enhance specific principles and practices, among several implications in business. Strategic implementation of technology in the financial sector can save a business, but the required changes are not easily accepted. Mindsets and old ways of working need to be changed and adapted to the new strategies. This year demonstrates to us that only spontaneous people and flexible processes lead to successful businesses.

Keywords: information systems, change management, agile, business performance

Introduction

The predecessor of information systems is considered to be Hollerith's tabulating machine. Since 1890 when Herman Hollerith developed the tabulating machine, offering a major step to automatization, information systems have known different stages (Zwass, 2011). An information system is an integrating set of hardware and software components designed for collecting, storing, analysing and processing data. Around 1960 was the time when a new domain appeared on the market, "Management Information System" (MIS) describing how information technology, management, finance and accounting can mix together, obtaining an innovative system that can define the success of a company. Only in the late '70s worldwide companies were able to utilize the power of those systems, when some IS software versions for personal computers were released (Hirschheim & Klein, 2012).

In over 60 years of existence, information systems had a spectacular evolution, creating a new domain, different from both information technology and business, but combining knowledge from several fields. The main components come from IT (computer hardware, software and telecommunications and databases) and from the financial sector (principles, practices and procedures). Business relies on this integrated set of components for collecting, storing and processing data in order to carry out specific operations, customer support and remain competitive on the market. IT development has been occurring under Moore's law, the power of the computer devices has been doubling every 18-24 months (Gregersen, 2011), so in order to stay on the market every company needs to measure the organizational performance and the impact of any change done in the environment.

The literature (Zwass, 2011) presents three types of information system, grouped in a pyramidal structure: operational systems – the base of the structure, support of knowledge work – the middle layer and the management support – top layer. Transactional Processing Systems support the processes through which products are designed, produced and sold, using large integrated systems as ERP, CRM and SCM. Knowledge work stands for manipulating abstract content and theories through

professional support systems, collaboration systems and knowledge management systems. Top managers use specific systems as decision support systems or executive information systems, systems that rely on TPS for operations.

Managing Changes for Increasing Organizational Performance

It is widely accepted that the appearance of information systems came as a response to the need of automatization and standardization of all the already existing business processes and practices. Financial success depends on how thoroughly people inside the organization embrace the change, so creating a new organization design, new processes and implementing new technologies may never be seen as an improvement if managers do not bring individuals along.

IT Service Management is the concept that describes the principles and practices used by an organization to maximize business value, using the information technology. Accomplishing international, national and industrial standards, ITSM describes IT as the key concept in developing a reliable business. Besides being a standard, ITSM became a culture, a mindset who guides managers in achieving the desired outcome. Forbes Insights published in collaboration with BCM an analysis done over the state of ITSM presenting also the most used frameworks and processes (Forbes Insights & BMC, 2017):

Figure 1: ITSM Frameworks Popularity (adaptation after (Forbes Insights & BMC, 2017))

The top key performance indicator to measure ITSM effectiveness is Information Technology Infrastructure Library, with over 47% of the market, it is a best practice framework that "*gives guidance on the provision of quality IT services and the processes, functions and other capabilities needed to support them"* (AXELOS, 2011). ITIL processes are organized around five service lifecycle stages (Lindros, 2017):

- Service Strategy – mapping the IT model over the organizational structure, establishing processes for monitoring,
- Service Design – continuous improvement for IT processes and services to best fit organization needs,
- Service Transition – defines and mitigates the risk through change management process,
- Service Operation – daily support for functional operations,
- Continual Service Improvement – KPIs evolution, problems and optimization proposals.

In the 90's, COBIT was designed as a set of IT control objectives and later ISACA founded the idea of IT management and information governance. By helping managers to align business goals with IT practices, COBIT is establishing the link between information systems, business and information technology. Through its five components, COBIT framework offers metrics that measure the achievement while identifying new business responsibilities and ways of accomplishing them using IT processes and minimizing risk (Simplilearn, 2020). The process description acts as a reference model, but also as a common language and by controlling the objectives, the auditors have a clear list of requirements that have to be checked (Information System Audit and Control Association, 2019).

ITIL comes at the same level with COBIT, without excluding the other one. While COBIT explains what should be done, ITIL offers solutions for how to do IT governance in a correct way.

Having the same popularity as COBIT, Business Process Framework (eTOM) delivers a widely agreed and adopted service-oriented architecture especially for telecommunications and entertainment industry. The conceptual level of eTOM has three major areas, reflecting the main focuses within enterprises (tmforum, 2020):

- Strategy, Infrastructure and Product covering planning and lifecycle management;
- Operations presented as the core of day to day operational management;
- Enterprise Management describing corporate or business support management.

The framework can be utilized as a common language between companies, departments or teams when discussing process issues, defining process flow to model and standardize interactions and to define requirements for the IT systems that would be supporting the process flows.

Business Process Framework can be linked with ITIL practices, being described as complementary frameworks that support each other on the official forum (tmforum, 2020).

Change management includes the processes, tools and techniques used to achieve desired outcomes from a business perspective, but focusing also on helping people adopt and utilize the change in day-to-day work. The notion defines a process, but also a competency and everything is driven by a change manager who ensures that every change is documented, tested and understood by the application users.

This paper focuses on understanding the impact of changes in daily business by following a repeatable cycle and using a set of tools that increase organizational effectiveness and measure the performance of the companies. Hiatt and Creasey established in (Hiatt & Creasey, 2003) the 5 tenets of change:

- *We change for a reason;*
- *Organizational change requires individual change;*
- *Organizational outcomes are the collective result of individual change;*
- *Change management is an enabling framework for managing the people side of change;*
- *We apply change management to realize the benefits and desired outcomes of change.*

On Prosci's blog, each tenet is argued with real life examples (Creasey, 2019). For only 26% of the organizations the reason for the change is clear, but the biggest concern is raised by the fact that individuals don't understand that their mindset and the way they currently do their work have to

change completely. 91% of the webinar participants organized by Prosci answered that those crucial individual changes were not defined in their organization (Creasey, 2019). Planning a change on Monday and the go-live on Tuesday is not change management, people need time to understand and adapt their work.

Managing a business can be really challenging, using a wrong configured information system and bringing the agility required by this pandemic situation, without understanding it can turn a successful company into a failure overnight. Business models have to be taken into account and according to the Japanese learning method, SHU-HA-RI (IBM Agile Explorer, 2018), you have to know the stage of your business before implementing any major change. SHU (follow) is the first phase, in which a new business arises and is recommended to understand and respect the previous business examples, following the good practices and learning from other companies mistakes. HA (break) is the intermediate stage in which some more adjustments can be done to the standard processes. RI (transcend) final stage, with a mature and experienced management, adaptability to changes based on trust and communication.

When it comes to technology, the future is marked by Cloud Computing and cloud applications. Many companies are already there and invested in this new technology that brings IT closer to the users. Cloud Computing defines on-demand availability of computer system resources without direct user involvement. Based on the service models classification (SaaS, PaaS and IaaS), evolved the paradigm "Everything as a Service" (XaaS) presenting the new market trends, when the customer pays only for the ordered services; a service for which no maintenance and personal involvement is needed.

In 2012, "Journal of Information Systems" published an article, mentioning about "Information System as a Service" (Hilman, 2012), an era in which companies use a product and manage only its interface, but all the infrastructure, databases and firewall rules are maintained by different providers. Today, the future of the outsourcing companies could be under pressure taking into consideration the pandemic situation, if the main companies are not getting enough business, they would not be able to pay for the outsourcing services. The IT outsourcing companies have adapted quickly, offering constant support even from home offices, but all their income is based on the primary companies and their ability to sustain business during tough times.

An agile company is characterized by the ability to recognize disruptive factors and to respond quickly in a changing and turbulent environment. Agility measurement is the time between the appearance of an opportunity and its capitalization, the shorter the time, the more agile is the company. Big companies such as Oracle, SAP, Microsoft relied on Cloud Computing, offering all their services as packages that can be accessed over the internet. The customer has all the advantages of an integrated system, without knowing the infrastructure behind it.

Patrick Lencioni described in (Lencioni, 2002) the five dysfunctions of a team, by disposing them in a pyramidal form. By analyzing the dynamic inside of a group and gathering the common mistakes, he concluded that at the base of the pyramid can be found the lack of trust, followed by fear of conflict, lack of commitment, avoidance of responsibilities and in the end the team has no result. All those human reactions and feelings make the acceptance of the change even more difficult and at this level constant work and involvement from the management part is needed.

Strategic Implementation of IS in Business

According to Forbes, 84% of companies fail at digital transformation because they do not spend enough time analyzing and changing people's behaviors, culture and the way in which the decisions are taken: "One of the most basic impediment to moving forward on the road to digital transformation is whether or not enough people within the organization are aware of the challenges." (Rogers, 2016).

A good business example when analyzing digital transformation is “Starbucks”, a company that managed to overcome the financial crisis from 2008 by implementing a powerful information system (Thomas, 2014). The worldwide coffee chain suffered important financial losses during the crisis and in order to stay on the market and remain competitive, they had to rethink the whole business strategy together with all their processes. As part of the new strategies, some products had to be retired from the market and for others, price reductions were inevitable. But the biggest question is what to retire, how do you know what exceeds the average budget of a regular consumer and what is affordable? In order to make the best decision in a short period of time, large volumes of data, gathered from all the stores had to be analyzed. This was the time when the management team decided they needed help, extracting relevant data from all the information they had was impossible without a transactional processing system. Today’s success confirms the decision from the past, in 2008 the company was present in 49 countries, owning 17000 cafes (Starbucks Corporation, 2008) and later reaching 31256 locations in 2019, being on the market in 78 countries (Starbucks Corporation, 2019). The case represents an example of an agile management prepared to assume important decisions even when financial indicators would say that it is not the proper time for a costly investment. A good change management determined the rapid adaptation to the new customer requirements.

Over the last 20 years many companies decided to implement an information system as the benefits are hard to ignore. It was observed that an IS can help companies to save money, increase competitiveness and improve performance. After implementing an IS, FedEx moved 3.4 million packages daily inside the United States and UPS over 15 million all over the world (Thomas, 2014). Increasing organizational performance through information technology is a common practice and many companies are choosing to implement an Enterprise Resource Planning system, which contains integrated modules for finance and accounting, human resources, production planning, sales and distributions, material management and marketing. This integrated program runs one database that is accessible for all business units inside a company and is commonly structured to three tier application architecture: database layer, application server and client presentation layer.

An ERP goal is serving the core business processes, by combining as many functions as possible, enabling communication between different departments and simplifying the process flow. However, the success rate of the implementation is very low and could become worse when an organization manages to obtain the IS benefits and the effects do not last for a long period of time (Ming-Tien Tsai, et al., 2011). Changes and variations of the environment can affect the efficiency of the systems if the ERP is not able to adapt to the modifications. Robbins-Gioia published in 2002 a survey result, made on a hundred enterprises, discovering that 46% of those companies were unable to maintain the competitive advantages provided by an ERP for a long period of time (Ming-Tien Tsai, et al., 2011). Also, the Conference Board conducted a survey revealing that 40% of ERP projects fail in one year after go-live (Ming-Tien Tsai, et al., 2011).

Information systems agility consists in the ability to adapt in real time to the new challenges that can appear in the business environment and to embrace changes without any major impact for organizations. A double approach of agile information system benefits is presented in table 1.

Table 1: IS Benefits – Double Approach

Domain	Benefit
Business	Standard processes and practices
	Increase in efficiency of data processing
	IS capacities aligned with the business needs
	Innovation in technical solutions
	Minimizing the risk when implementing changes
	Business processes can change in real time
	Financial benefits, increase in sales value
	Maintenance cost reduction
	Faster development of products/services
Information Technology	Minimizing the time when implementing changes
	Faster recovery in case of outages and downtimes
	Data validity improvement
	Rapid development of new functionalities
	Standardization to internationl standards
	Adaptation for system upgrades
	Rapid response to security threats

Some difficulties can be mentioned when talking about agility and changes, on the top of the list sits people's reluctance to change, lack of trust in new methods and in others, as human interaction is the key, good communication and strong collaboration is needed, also involvement of all company's departments in the scheduled changes that affects the system is essential to ensure success of that change.

A series of assumptions have to be defined from phase one of the change implementation: openness, communication and collaboration, acceptance of the changes and of the new technologies, willingness to help the others in defining and understating a certain process.

George Polya defines in (Polya, 1945) the four principles of solving problems (table 2), later adopted in all the fields and more important in business when it comes to link it with information technology. Those four concepts could be adapted when implementing and managing an organizational change. Similarities can be found between Polya's heuristic and agile principles, work and learn based on repetition: listen, iterate, learn and correct; leading to successful implementations while people understand the necessity of the change and manage to learn how to work with the new functionalities.

Table 2: Polya's Heuristic for Solving Problems

Principle	Approach
Understand the problem	The managers cannot solve the problem simply because they don't understand it. Without having all the information, it is not possible to find a proper solution.
Devise a plan	Choose the appropriate strategy and this may include use a predefined model, draw schemas, look for a pattern.
Carry out the plan	Persist with the chosen plan and only after not seeing the desired results you can chose another model
Look back	Learn from the past mistakes, reflect on what worked ok and what could be improved.

Even the agile rituals, the four well-known regular meetings, are based on the same heuristic:

- Sprint Planning – understanding the existing problems and bottlenecks,
- Daily Stand-up – planning and deciding the daily strategy in order to continue the work,
- Sprint Review – following the chosen solution and presenting the sprint result,
- Retrospective – lessons learned, reflect over the last sprint and decide what improvements can be done.

Conclusions

In conclusion, with a relative short history, information systems managed to influence both finance and information technology markets, by creating a link between business and IT. Managers must understand the necessity of focusing on data flow and collaboration between different departments, mapping processes and practices and less on creating a powerful system only from a technical perspective.

The Internet era opened a new world full of opportunities and a good change management helps organizations and to become even more competitive in an unstable environment, by adapting their business strategies to the market requirements. Every company should follow the trend when it comes to technology solutions that improve the business overall, but the involved changes have to be thorough analyzed. Cloud Computing is the technology on which the biggest IT service providers relied on during the past few years and it seems to be the future of an appropriate system management.

Technology can help solving the existing problems, can bring financial benefits and can improve organizational performance, but is a common effort that has to be done by all the involved parties in adapting and evolving to the new processes and practices imposed by an information system.

In the end of the study some limitations have to be mentioned, as the paper focuses more on change management general principle and practices and less on offering a well-defined methodology and "how to" steps. Every company has to find what best fits depending on their needs and must consider the "best practices" as a starting point. The IS implementation or changing effects have to be analyzed by every organization and decide which factors might affect the overall performance.

Transportation Policy Financing in Europe

Igor MAYBUROV

Ural Federal University, Ekaterinburg, Russia
E-mail: mayburov.home@gmail.com

Yulia LEONTYEVA

Ural Federal University, Ekaterinburg, Russian Federation
E-mail: uv.leonteva@mail.ru

Abstract

Analysis of the choices that European states made regarding their transportation policies brings us some important insights. A major achievement of these policies was the creation of a comfortable environment for living and tourism. The aim of this article is to study the trends in the development of transportation policies and financing in Western European countries in the second half of the twentieth century. Our research hypothesis is that the system of transport taxes and charges in Western Europe evolved for a long time and was largely determined by the priorities in these countries' transportation policies. This study relies on methods of historical research and logical analysis. We analyzed transport policies in Western Europe in historical perspective starting from the 1950s. The article discusses the fiscal processes for the implementation of transport policy in the countries of the European Union: Increasing fiscal significance of road charges and taxes, Growing importance of parking pricing, Use of fuel and road taxes as revenue-raising mechanisms. European experience provides important lessons to learn from in terms of transport policy instruments, which can be used to regulate the demand for personal vehicles and public transport. European countries have managed to develop effective strategies for reducing car dependency and increasing the flexibility and scope of their public transport offers.

Keywords: Transport Policy, Financing, Road Charges, Road Taxes, Parking Pricing.

Introduction

Analysis of the choices that European states made regarding their transportation policies brings us some important insights, especially when we compare these choices with the relevant US experience (Pucher, 1995). A major achievement of these policies was the creation of a comfortable environment for living and tourism. European cities evolved around medieval quarters built primarily for pedestrian use as the streets were planned to be just wide enough to allow for the passage of a horse-drawn carriage. From the very beginning, these cities were highly attractive for tourists. The processes of mass automilization, however, posed new challenges to the development of European cities. The questions arose as to how urban areas should be reconstructed and whether priority treatment should be given to cars or pedestrians (Leontyeva, 2019).

This urbanist dilemma may best be illustrated by the case of post-war Germany. Most German cities were heavily damaged by the bombings in WWII and in the rise of the post-war urban redevelopment could have been planned to accommodate increased car traffic in the central areas. For example, the inner city zones could have been rebuilt to incorporate multi-level highways and extensive parking facilities, like in Chicago, Detroit, Los Angeles or other American cities. However, this did not happen. The committee of urban experts that considered the alternative solutions to the post-war reconstruction of German cities discussed this option and rejected it (Hollatz, 1965), deciding instead to fully recreate the old city look.

The Europeans have chosen to preserve their historic inner cities and this experience is important for other countries, which faced similar challenges of mass automobilization, although much later. In the context of Russia, where mass automobilization started only two decades ago (Leontyeva, 2016), it is particularly relevant to investigate European transportation policies and financing, especially in historical perspective. Such analysis will provide us with a better understanding of successful strategies of creating a comfortable and safe pedestrian-friendly environment.

The aim of this article is to study the trends in the development of transportation policies and financing in Western European countries in the second half of the twentieth century.

Our research hypothesis is that the system of transport taxes and charges in Western Europe evolved for a long time and was largely determined by the priorities in these countries' transportation policies.

Literature Review

A vast body of research is devoted to the role of taxes in the implementation of European transportation policies: increased road charges have proven to be quite effective in discouraging the use of personal vehicles (De Borger, 2007; Söllner, 2018) as this instrument significantly contributes to the cost of a car trip and thus leads individual drivers to compare the car with other modes of transport in such key parameters as the cost and time of a trip, levels of comfort and safety. The cost of a trip is particularly important and it is this parameter that is targeted by policy-makers most often for regulation of people's travel behaviour.

Viewed from the theoretical perspective, people’s choices of travel modes for their work-related daily trips can be explained with the help of a standard hypothesis of expenditure minimization (Dafermos, 1969).

The generalized cost of a trip comprises two components:
first, the direct monetary costs, that is, the costs estimated by comparing the cost of a car travel (fuel, road tolls and parking fees) with the cost of using mass transit modes (Mayburov, 2017);
and second, indirect non-monetary costs, that is, the costs estimated by comparing the car travel time with the time spent by travelling by public transport.

The generalized cost of a trip is calculated by multiplying the time spent traveling by unit costs (these measurement units are determined by individuals themselves) and then by adding up the direct and indirect costs.

There is evidence that individuals tend to focus primarily on their direct expenditures rather than indirect non-monetary costs when calculating the generalized cost of a planned trip. They also tend to ignore the external costs of travel, that is, the costs of this choice for the local community such as the societal or environmental impacts, the noise, and so on (Jackson, 2008). Therefore, the purpose of road charges should be to increase the generalized cost of travel in the eyes of individual citizens and thus raise the individual marginal costs of car travel to the level of the marginal social costs (Bel, 2016).

It should be noted that European countries have accumulated considerable expertise on parking pricing and its effects on people’s travel behavior. For example, A.R. Kuppam et al. surveyed commuters' behavioural responses to different parking pricing scenarios and found that about 35% of the car owners are likely to reconsider their choice of the mode of travel if they have to pay for parking 1-3 dollars in outer neighbourhoods or 3-8 dollars in the city centre (Kuppam, 1998). In case of a fourfold proportional increase in parking tariffs, the percentage of people choosing not to go to an outer location by car rises progressively - by over 5.5 times, while the percentage of those who decide against car use when travelling to the centre grows in proportion to the tariff increase - by 4 times.

Methodology

This study relies on methods of historical research and logical analysis. We analyzed transport policies in Western Europe in historical perspective starting from the 1950s. Based on the results of our analysis, we made some logical generalizations concerning the development of transport policies and their financing in Western European countries.

For the sake of brevity, we won't go into the specifics of transport financing in individual regions and will focus only on general European trends. Our study relies on the analysis of the relevant research literature and EU legislation.

Results

Development of European Transportation Policies

The first wave of mass automobilization swept across Western Europe in the 1950s. In Eastern Europe, this trend started a decade later - in the 1960s. Almost all European cities with historic quarters and narrow streets proved to be unready for this surge in the number of motor vehicles, which soon led to chronic traffic problems and bottlenecks, shortages of parking spaces and so on. These, in turn, caused urban sprawl and the movement of households and businesses out of the city centers.

Within several decades, European communities managed to develop clear-cut policies to regulate car demand and increase the provision of public transport services. Phil Goodwin points out the following result of this policy: until it was introduced, the annual increase in the volume of public transport services in the majority of European cities had not exceeded 3-5% and these growth rates had remained virtually unchanged for 30 years. After the introduction of the transport policies aimed at reducing car use in the 1980s, the demand for mass transit rose by 100% in just 5 years (Goodwin, 1998). The main fiscal processes associated with this policy are shown in the table below.

Table: Financing of transport policies in the EU

№	Process	Description
1	Increasing fiscal significance of road charges and taxes	Various fiscal instruments (charges and tolls) are used to increase the cost of car ownership to the level of marginal social costs
2	Growing importance of parking pricing	There is a growing diversity of parking pricing strategies, involving all types of parking spaces; (differentiated) parking tariffs are used; a dynamic approach to parking pricing (demand-dependent tariffs) in central zones is applied to discourage long-term parking
3	Use of fuel and road taxes as revenue-raising mechanisms	The revenue from fuel excise duties and road taxes levied on car owners goes in equal proportion to the funds for road construction and public infrastructure development.

Increasing Fiscal Significance of Road Charges and Taxes

An increase in the cost of car use and ownership is usually economically justified, although this strategy may be difficult to put into practice since it may cause considerable resentment amongst the public. As a result, there is a variety of practices and strategies in EU countries although the general trend remains more or less the same: there has been a steady increase in the fiscal significance of road charges and taxes.

Let us look at the key fiscal instruments applied in the majority of EU countries. Such countries as Norway, the Netherlands and Denmark make the most active use of fiscal instruments to regulate the traffic volume and car use behaviour.

1) *High costs of car ownership (registration fee, taxes on car ownership).* These charges affect people's decision to purchase a car. To a greater or lesser degree, fiscal instruments are used in almost all EU countries. In Norway, Denmark and the Netherlands, however, transport taxes and charges are traditionally the highest: for instance, the amount of the registration tax may be comparable to the cost of a car itself. These charges signal to the households that car purchase and ownership can be very expensive, thus prompting them to become more rational and prudent in their choices concerning the number of cars they need if at all.

2) *High fuel taxes.* In countries with high fuel taxes, these instruments perform a triple function: first, the fiscal function, as they provide revenue for the funds to maintain public roads and develop public transport; second, the regulatory function, as the fuel prices contribute to the direct costs of a planned trip and, therefore, affect people's decisions of the mode of transport; 3) the environmental function, as high excise duties substantially add up to the cost of fuel and encourage people to switch to lighter, lower-emitting cars with less powerful engines. This instrument is widely used in all EU countries, with the highest fuel excise duties found in Germany and the Netherlands - in some periods fuel excise duties in these countries accounted for up to 45 % of the end price of petrol (Derycke, 1998).

3) *Toll roads.* Tolls add to the direct cost of a planned car trip but at the same time reduce the indirect non-monetary costs by cutting the travel time. Thus, toll roads increase the variety of choice for individual travelers. There is sufficient research evidence of the efficacy of these tools for reducing car use (Schweitzer, 2008; O'Mahony, 2000; Litman, 2012). B. Ubbels and E. Verhoef, for example, show that road pricing measures in the Netherlands not only help reduce the car traffic by 6-15% but also lead to a decrease in the number of car trips and encourage the use of non-motor vehicles (Ubbels, 2006).

4) *Vignettes.* Vignette is a charge of a fixed amount paid in advance for unlimited road use in a certain country within a specific time period (year, month, 10 days). This instrument is widely used in Switzerland, Austria, the Czech Republic, Bulgaria and Hungary. What distinguishes it from other fiscal tools is that the administrative costs of operating vignette systems are quite low. Moreover, it provides a stable and reliable source of revenue for the road fund. Remarkably, this instrument does not affect people's decisions regarding vehicle ownership and usage since the amount of the vignette fee does not depend on how intensively the road will be used by the driver.

5) *Congestion pricing* (a fee or tax charged on car and motor vehicles for entering a restricted area). This instrument has been a subject of active debates in Europe and has garnered considerable attention from policy-makers. Congestion pricing measures have been most widely used in Norway since 1990: this measure is currently implemented in eight Norwegian cities (Oslo, Bergen, Haugesund, Kristiansund, Namsos, Stavanger, Tønsberg, and Trondheim) with road toll tariffs varying between 1 and 4 euro for vehicles weighing not more than 3.5 t and with double fees in peak hours. In other European countries, this instrument is in use in ten cities, including London (2003), Stockholm (2006), Milan (2007), and Göteborg (2013).

Parking Pricing

Since the 1950s, this instrument has been actively used to regulate travel behavior as drivers were encouraged to park in specific locations and required to pay for the time they occupied the parking spot. In general, there was a steady increase in parking capacity until the mid-1970s. In this period, multi-level parking facilities were built in city centres and popular areas in outer neighbourhoods. Since the 1970s, however, the extensive growth in surface parking spaces has almost stopped and parking capacity started to be increased primarily by building underground garages. Differentiated parking fees started to be applied to signal to the drivers that car trips to the city centre are seen as undesirable behaviour.

Moreover, since the 1970s, in many European cities, the parking supply in the city centre has been restricted: first this policy was adopted in Hamburg and then in London. The authorities also took a radical step banning the construction of new parking facilities and changing the requirements for capital construction projects. The restrictions included setting the maximum allowable number of parking spaces (previously it had been required that the projects should specify only the minimum number).

As a result, in several decades, European cities have accumulated considerable experience of parking space management and the use of pricing to regulate parking supply and demand. The most productive approach to parking pricing can be described as non-stationary or dynamic, when on-street tariffs are set depending on the actual demand. If the parking space is fully occupied, it means that a higher tariff may be applied - the price will continue to rise until there are about 15-20% of unoccupied spaces in peak periods.

Use of Fuel and Road Taxes as Revenue-Raising Mechanisms

In Europe, fuel and road taxes levied on car owners provide the revenue that is then allocated in equal proportion to the funds for road construction and public transport development.

Quite illustrative in this respect is the example of Germany, which adopted a program for development of urban public transport in 1967. The program covered a period of thirty years and stipulated the use of fuel excise duties as a source of revenue. The revenue from excise duties was accumulated in the special fund to be later allocated in equal proportion to transport infrastructure projects of German cities. Thanks to this program, in almost all German cities, by 1990-2000, public transport systems had been modernized and the infrastructure for non-motorised travel was created.

France is another example of how public transport can be provided with a long-term source of funding with the help of a special purpose local tax. In France, the *versement transport* (or VT for short) - an urban regional payroll tax - was introduced in 1973 to modernize public transport in cities with over 300 residents. Since 1999, this tax has been applied in larger cities with over 10,000 residents. The VT is levied on companies with the staff of more than 11 employees and is paid at the rate of 11.5% of the total gross salaries of all employees. In recent decades, the VT has covered up to 40% of the operating expenses of public transport operators (Vigrass, 2005).

Conclusion

The European transportation policies, aimed at creating a comfortable environment for living and tourism, have generally received substantial public support and ensured a number of positive long-term effects: environmental, transport, recreation, social, and economic. These effects resulted from the development of modern public transport systems and mass transition towards zero-emission mobility.

European experience provides important lessons to learn from in terms of transport policy instruments, which can be used to regulate the demand for personal vehicles and public transport. European countries have managed to develop effective strategies for reducing car dependency and increasing the flexibility and scope of their public transport offers.

Abstract

In an increasingly competitive world, information plays a key role in organizations for strategic decisions that may ensure success of the company, managers are aware of the importance of controlling this information and using it to achieve better results in their decision-making processes. To this end, this study is conducted to determine the benefits and effectiveness of implementing business intelligence in the decision-making process of companies worldwide. This study includes a comprehensive analysis of 108 articles published between 2015 and 2020 and extracted from various highly important academic sources. During this 5-year period, there have been advances and new trends in the field of business intelligence, and these served as the basis for this study. The results of this study demonstrate the various benefits of business intelligence in companies and its extensive application in different areas, such as the banking sector, with the aim of providing competitive advantages.

Keywords: Business Intelligence, Systematic Literature Review, Data Warehouse, Decision-Making.

Introduction

Decision-making processes in an organization depend on the available information, which is generated and collected by the company itself; the managers are in charge of making decisions. As Jain and Sharma (2017) say this process becomes imprecise when there is a lack of information, thereby resulting in expenses, delays, downtime, risks, etc. Gonzales et al. (2015) mention that few companies implement business intelligence (BI) tools in their processes; some companies in the banking sector do not have BI solutions for their decision-making processes regarding the affiliation of clients worldwide. The difficulties encountered by these companies are delays in the generation of reports, high percentage of risk in the decision-making process, low percentage of reliability in the generated reports, and low levels of satisfaction from the managers in charge of making decisions. These problems would be mitigated if these companies had a BI solution.

Various studies have been conducted to evaluate and demonstrate the effectiveness of BI in decision-making. However, we must understand what BI means. BI provides a set of tools that support business analysis, and their implementation helps improve the performance of organizations. According to Tangsripairoj and Natseevatana (2018) the purpose of this technology is to collect, store, and analyze the generated data. In their research Khatibi et al. (2017) indicate that this is achieved by applying a process involving extraction, transformation, and load (ETL), followed by online analytical processing (OLAP); data mining techniques can also be applied. Rivera and Shanks (2015) state that the results are finally shown in dashboards in a dynamic and interactive manner to facilitate the visual display of information to those responsible for making decisions. Successful decision-making is highly dependent on the quality of information; therefore, it is crucial that the aforementioned processes are performed correctly. This ensures the delivery of information that is true, accurate and, understandable.

The objective of performing a systematic literature review (SLR) is to determine the benefits and effectiveness of the application of BI in improving the decision-making processes in companies worldwide. The remainder of this paper is organized as follows. Section II shows background and related work, section III presents the methodology used for the review of the literature. Section IV details the results of the SLR, section V shows the discussion of results. Section VI provides the conclusions and scope of future research.

Background and Related Works

In recent years, several investigations on BI and its effectiveness in organizations have been conducted. To improve productivity and generate competitive advantage, several researchers designed and implemented various BI proposals. This helped overcome the flaws in information management and achieve the strategic objectives of companies.

BI can be implemented in many areas, as demonstrated in various studies. Authors Neyoy et al. (2017) proposed a BI solution for a small–medium-sized enterprise in the food industry, whose goal was to achieve a competitive advantage over its rivals. For this purpose, a data warehouse was designed using the Ralph Kimball methodology. This process was initiated by defining the business requirements, followed by the creation of a data warehouse using the information regarding the sales made by the restaurant. An OLAP cube was then developed to show the information through dashboards created in QlikView to allow restaurant managers to make better strategic decisions based on the sales information.

Tangsripairoj and Natseevatana (2018) designed a BI tool to provide useful information to executives of the Office of the National Broadcasting and Telecommunications Commission in Thailand, with the aim of improving the effectiveness of strategic and operational decisions regarding a radio license management process. This tool was based on data generated by the frequency management system and the automated spectrum management system; these data were processed, analyzed, and displayed in a dynamic and interactive form on a dashboard to ease the task of decision-making for the executives in charge.

Therefore, it is important for companies to make better use of their information through better management and use of the tools offered by BI. As indicated by the analyses of previous research, there are numerous benefits of BI, and they will help determine the success of companies in an increasingly competitive and demanding world. The purpose of this study is to highlight all the work that has been done on the use of BI in various companies that make their decisions based on their own information.

Methodology

a. Systematic Literature Review

An SLR was used in this study. This research method is characterized by an exhaustive review of articles on a given subject, which is BI in this case. These documents are then evaluated, analyzed, and synthesized to arrive at a rational deduction of the information related to BI.

Fig. 1: Flowchart of SLR

b. Research Questions

Table 1 lists the research questions that are answered through the analysis of the articles selected in this study regarding BI for decision-making.

Table 1: Research questions

Research Question	Motivation
RQ1: How effective is BI in decision-making?	Determining the effectiveness of BI in decision-making.
RQ2: In what areas has BI been applied?	Determining the areas in which BI has been applied.
RQ3: What are the quality and security standards for the development of BI?	Defining the quality and security standards for the development of BI.
RQ4: What types of tools or techniques support the improvement of BI?	Delimiting the tools or techniques that support the improvement of BI.

c. Search Sources

Ten of the most popular academic databases were used to select the scientific articles for analysis.

- Scopus
- IEEE Xplore
- Springer Link
- Google Scholar
- Science Direct
- Dialnet
- DOAJ
- Taylor & Francis Online
- Microsoft Academic
- EBSCOhost

d. Search Equations

Various academic search engines have a defined search structure with which articles regarding a given topic can be precisely obtained. For this purpose, the following equations were defined.

Table 2: Search equations

Source	Search Equations
Scopus	ALL ("Business Intelligence") AND ALL ("Data Warehouse") AND ALL ("Desicion Making") OR ("Methodology")
IEEE Xplore	((("All Metadata":Business Intelligence) AND "All Metadata":Decision making) OR "All Metadata":Ralph Kimball)
Springer Link	"Business-Intelligence" AND "Decision-Making" AND (Methodology OR Method OR Model)
Google Scholar	"Business-Intelligence" AND "Data-Warehouse" AND "Decision-Making" AND (Methodology OR Method)
Science Direct	("Business Intelligence" AND "Decision Making") AND ("Data Warehouse" OR "Kimball")
Dialnet	("Business Intelligence"-"Ralph Kimball") AND ("Decision Making" OR "Data Warehouse")
DOAJ	"Business Intelligence": "AND", "Decision Making"
Taylor & Francis	[All: Business Intelligence] AND [All: Data Warehouse] AND [All: Decision Making]
Microsoft Academic	"Business Intelligence" AND "Decision Making"
EBSCOhost	((Business Intelligence) AND (Decision Making) OR (Ralph Kimball)) AND (Methodology)

e. Consolidated Number of Results According to Source

After applying the search equations, a significant number of scientific articles, which are depicted in Fig. 2, were selected from each source:

Fig 2. Consolidated matrix of the number of results

f. Exclusion Criteria

Table 3 lists the exclusion criteria for selecting the most suitable articles and discarding the remaining.

Table 3: Exclusion criteria

No.	Exclusion Criteria	Does it comply?
EC1	The articles are not less than 5 years old OR	✔
EC2	The articles are not written in English OR	✔
EC3	The articles do not present a methodology in the research OR	✔
EC4	The articles do not propose a BI solution OR	✔
EC5	The articles do not contain any keywords related to the research OR	✔
EC6	The articles have not been cited by other authors OR	
EC7	The authors of the articles have not worked with the sample unit OR	
EC8	The articles have not addressed all the questions OR	
EC9	The articles do not present correct measurements of the indicators.	

g. Consolidated Number of Results after Applying Criteria

Fig. 3 shows the number of articles excluded according to each exclusion criterion, leaving a final total of 108 articles.

Fig. 3: Consolidated graph of results after applying exclusion criteria

h. Criteria for Evaluating the Quality of the Studies

In addition to the exclusion criteria, six quality criteria were formulated to assess the selected scientific articles.

Table 4: Quality criteria

No.	Quality Assessment Criteria	Does it comply?
QA1	Does the article have a well-organized and well-described structure?	✔
QA2	Is the article relevant to our research?	✔
QA3	Are the references of good quality?	✔
QA4	Is the purpose of the research clearly explained in the article?	✔
QA5	Are the research findings clearly explained in the article?	✔
QA6	Does the article describe the limitations or validity of the results?	✔

All the 108 selected articles fully complied with the quality criteria. This ensured that they would provide the necessary information for the development of this study.

i. Mendeley Reports of the Classified Studies

Mendeley was used to store and generate reports of the 108 articles selected for this study.

Fig. 4: Mendeley report

Results

The questions posed in this study were answered after the SLR of the 108 selected studies was completed.

RQ1: How effective is BI in decision-making?

The effectiveness of BI in decision-making can be determined by reviewing the benefits of its implementation in the various scientific studies analyzed in this work. Many authors claimed that BI is the best solution to problems related to information in organizations; BI with its diverse tools can benefit decision-making in the following ways:

- Creation of strategic edge;
- Improvement in data quality;
- Time reductions;
- Reduction in operating costs.

The authors Wieder and Ossimitz (2015) established that BI must be a priority for executives who use information technologies to improve the quality of their decisions. To demonstrate this, they conducted an extensive analysis of the effectiveness of BI in decision-making and surveys involving senior managers in Australia. Their studies provide clear and concise evidence on the effectiveness of BI in management decision-making.

Zellal and Zaouia (2016) investigated the factors that influence the quality of information when designing a data warehouse, which is a fundamental tool of BI. The determined factors include a misunderstanding of business requirements, the selection of unsuitable tools that do not fit the company, not having a development methodology (such as the Ralph Kimball methodology), and failures in the

ETL process. These authors also indicate the methods and quality standards that must be applied to correct these errors and improve the quality of data in any BI project aimed at optimal decision-making. In his research work Tanphet and Wanchai (2018) implemented BI using the Ralph Kimball methodology at CAT Telecom in Thailand, to prepare a maintenance plan for their equipment, such that repairs could be performed in advance. A strategic advantage was generated by reducing operational costs and saving planning time, owing to the correct decision-making of the company managers, who used the BI solution proposed by the authors.

Table 5 lists the benefits of BI in decision-making, when implemented in a company, as mentioned in the selected articles.

Table 5: Benefits mentioned in the articles

Benefits	Qty.	%
Cost Reduction	13	11
Data Quality	55	46
Strategic Edge	39	33
Time Reduction	12	10

RQ2: In what areas has BI been applied?

After analyzing the various scientific articles selected in this study, it was found that BI has been applied in various areas. It is sufficient for a company or institution to generate its own information, as this can be used by BI tools, regardless of the type of source.

In his paper Combita et al. (2020) designed a BI government framework for the Universidad de la Costa to strengthen organizational culture, data management, data analysis, and institution management. This solution allowed for effective controls that guaranteed the success of the university's BI projects. According to the authors, this tool can be replicated in any public or private university that wants to ensure its strategic objectives.

The authors Kao et al. (2016) applied a BI solution named Hospital Business Intelligence System in a clinic in Taiwan; this approach aimed to improve decision-making in hospitals by facilitating medical management indicators. The developed tool managed to maximize the value of the clinic and improve administrative management. Furthermore, the use of BI is increasing in various fields, and more organizations are beginning to understand that their best asset is information and BI can provide the tools to exploit such information to the maximum possible extent.

Table 6 presents all the areas where BI has been implemented, which were determined based on the analyzed studies.

Table 6: Areas where BI has been implemented

Areas	Qty.	%
Bank	14	10
Enterprise	54	38
Hospital or Medic	15	10
Industry	36	25
Telecommunication	7	5
University	17	12

As shown in the table, BI is most widely used in enterprises, which represent 38% of the total areas, and telecommunication accounts for only 5%.

Fig. 5: Implementation areas according to percentage

Among the total number of articles referring to any area where BI has been implemented, it was found that 38% refers to enterprises in general, 25% refers to industries, followed by 12% to universities and 10% to both medical sectors and banks.

RQ3: What are the quality and security standards for the development of BI?

The efficiency of a BI solution depends on factors such as the quality of the solution, for which development standards have been defined. Various authors, including Zella and Zaouia (2016), studied the factors that influence data quality when developing a data warehouse; ISO 25012 (2008) is a factor that enables quality control of data. This prevents information deficiencies such as bad analysis of business requirements, incorrect key performance indicators, wrong measurements, poorly debugged data, poor ETL processes, poor choice of development tools, and inexperience of the team in charge of data warehouse development.

According to Brichni et al. (2017) the ISO standard criteria that help data meet quality standards are accuracy, ability to learn, ease of use, operability, maintenance, portability, and accessibility. Another factor to take into account is information security; data is the asset of a company, and the use of encryption algorithms should be considered to protect the information when developing a data warehouse, while striving to not impair the performance and scalability of the BI project. According to Chandra and Gupta (2018) For the purpose of information security, Bi should be developed with a focus on three aspects: confidentiality, availability, and integrity of data.

Table 7 and Fig. 6 help reinforce this response by providing consolidated insight into the quality and security standards found in the 108 studies reviewed.

Table 7: Quality and security standards for the development of BI

Standards	Qty.	%
Data Security	20	27
Quality Guidelines	8	11
Quality of Development	45	62

Both the table and the figure show that the most widely used standard in BI is quality of development, which represents 62% of all the standards and is the most important in majority of the studies; quality guidelines represent 11% and used the least when compared with all other standards.

Fig. 6: Quality and security standards for the development of BI according to percentage

RQ4: What types of tools or techniques support the improvement of BI?

The authors cited in this study used several tools and techniques to improve their BI solutions; the most widely used ones in the 108 studies were as follows.

- Dashboard
- Data Warehouse
- QlikView
- Pentaho
- Power BI
- Data Mining
- Big Data
- Data Analytics
- Cloud Computing

One of the most important tools that help in decision-making is dashboard; Rivera and Shanks (2015) reported that this is a monitoring tool that aims to provide decision makers with information that is relevant, consolidated, and easy to access, as the information is presented visually with the help of graphics, tables, colors, and notations. The author Șerbănescu (2017) conducted a study on the QlikView tool and the way in which it supports improved decision-making. This tool provides ease of implementation and improved workflow compared with OLAP, lower investment costs than those of other BI solutions, fast response owing to its powerful processing algorithm, and enormous flexibility as it does not require a database.

BI also relies on techniques such as data mining or big data to make its results more effective. In his research work Singh (2017) mentioned that data mining serves as a decision-making support system alongside BI because of its ability to extract and analyze data from large datasets. Balachandran and Prasad (2017) indicated that big data has been used in BI projects when the volume of data is considerably large for data warehouses.

Table 8 lists all the tools or techniques that were used by the authors of the analyzed studies:

Table 8: Tools or techniques that increase the effectiveness of BI

Tools	Qty.	%
Big Data	49	15
Cloud Computing	14	4
Dashboard	34	10
Data Analytics	54	16
Data Mining	56	17
Data Warehouse	72	21
Pentaho	9	3
Power BI	44	13
QlikView	5	1

Discussion

As the results of the questions posed in this study are obtained, the results are discussed. The effectiveness of BI was determined based on the benefits reported by the authors of the reviewed studies;

these were mentioned as achievements in their BI projects. Furthermore, because of the effectiveness of BI, the authors used it in various areas where the use of information does not satisfy the desires of the users. The results of this study demonstrate the importance of following a development methodology that ensures the quality and security standards of a project. It is important to know what types of BI tools or techniques should be used, depending on the business needs, as all tools or techniques are not ideal for a given scenario. The results also show that the data require a special treatment to ensure that BI provides true and reliable information, because flawed BI projects would lead to financial and operational losses for the organizations.

Evidence from this study suggests that BI is a good choice when there are flaws in an organization's decision-making. The decision of selecting the best method to implement in a company is left to the discretion of the professionals as they have to consider the existing development methodologies, tools and techniques that support it, and quality and security standards. All of these aspects require a proper analysis and knowledge of the company in which the BI solution is to be implemented. This study is consistent with the one conducted by Sangupamba et al. (2015) because of the manner in which the SLR was used to determine the interest of the researchers regarding BI and analyze all the studies that can resolve the various questions posed, thereby producing a wide range of results.

Conclusions and Future Research

In this study, an SLR was used in which studies from 2015 to 2020 were analyzed. With the help of 10 academic search engines, search equations that initially provided 24351 articles were formulated and a series of exclusion and quality criteria were applied to finally yield 108 articles. This SLR successfully answered the questions posed in this study, and the findings allowed the identification of the manners in which BI can be implemented to improve decision-making in organizations. Several benefits were determined, including strategic advantages, data quality improvement, time reduction, and reduction of operating costs, thereby demonstrating the effectiveness of BI. Education, medical, and banking sectors are some of the areas in which BI is being implemented more frequently owing to the amount of data they generate, manage, and benefit from. This study also showed that it is convenient to follow development standards for BI solutions. Factors that ensure quality and security in BI were also determined. For this purpose, a development methodology must also be followed; Kimball and Inmon's methodologies were found to be the most widely used. Moreover, it was shown that BI relies on various techniques and tools such as dashboard, data warehouse, data mining, and big data software that help improve the effectiveness. Finally, the articles that support the results of this study pertain to the most active authors on the subject and the most important search sources.

This study has some limitations such as the fact that it was completed using articles found over a period of 5 years, thus placing a restriction on time. New methodologies, tools, and techniques may create new BI paradigms, and these will require further investigation. For future studies, it is recommended that articles published within a period of 3 years be used to obtain the most recent trends in BI. This can provide researchers with new concepts and contribute to the development of BI.

Abstract

The main goal of the paper is to identify the differences in customer engagement motivation due to the level of consumer innovativeness and advance knowledge regarding motives of consumer engagement. The research part of the paper presents the characteristics of segments based on innovative predispositions of the inhabitants of the Poznań agglomeration, identification of statistically significant differences between these segments regarding motivational factors, definition of criteria for segmentation of the research population in terms of customer engagement motivation and the relationship between those segments and segments based on innovative predispositions. The study was conducted by means of direct interviews using an interview questionnaire, on a sample of 795 inhabitants of the Poznań agglomeration and its results indicate that material motivation for engagement in value co-creation is far more important than intangible motivation.

Keywords: consumer innovativeness, customer engagement (CE), consumer behaviour, value co-creation, motivation, consumer segmentation

Introduction

Most product innovations introduced to the market are not accepted by customers. To prevent this, companies increasingly engage their stakeholders, primarily customers, in value co-creation. For a long time now, customers are no longer just passive recipients of a company offer, but participate in its co-creation or are even the initiators of its creation. Customer engagement (CE) can take many different forms and is not limited to interactions between the client and the company. The development of information technologies, including social media in particular, enhances the ability of consumers to influence each other's behaviour. Gaining and maintaining a competitive advantage through consumer engagement requires understanding the reasons why customers participate in those types of behaviour.

This paper is a continuation of the previous paper, the aim of which was to identify the relationship between consumer innovativeness and customer engagement. For the purposes of that paper a segmentation of consumers based on their innovative predispositions was performed (Bartkowiak and Michalak, 2020b). The purpose of this paper is to determine the extent to which the drivers of consumer engagement differ across the four previously identified consumer segments and which of these factors are the most important.

Motivations for consumer engagement behaviour

We discussed the different views on the concept of consumer innovativeness and its importance when it comes to innovation adoption in our previous paper. We would like to point out that consumer innovativeness is a personality trait, however the new product adoption is depended (among other factors) on a product category. Moreover, the results of our study confirmed the hypothesis of the existence of a clear relationship between consumer innovativeness and customer engagement (Bartkowiak and Michalak, 2020b).

For a long time the management of consumer relationships has been a top priority for companies all over the world, with increasing interest of non-transactional behaviour (Verhoef, Reinartz and Krafft, 2010). With the emergence of digital era and increasingly networked society, engaging customers has become a strategic imperative for marketers (Rasool, Shah and Ul Islam, 2020). Despite the fact, that scholars (e.g. McEwen, 2004; Patterson, Yu and de Ruyter, 2006; Bowden, 2009; Van Doorn et al., 2010; Brodie et at., 2011; Hollebeek, 2011; Vivek, Beatty and Morgan, 2012; Jaakkola and Alexander, 2014; Harmeling et al., 2017; Pansari and Kumar, 2017) and practitioners have been paying attention to the concept of consumer engagement for many years, there is a lack of unanimity in defining the term in question. The differences in views are also visible regarding the scope of consumer engagement behaviour. For some authors it covers all consumer behaviours towards the company (Kumar et al. 2010) and for other researchers only those behaviours that go beyond the transaction (Van Doorn et al. 2010). Consumer engagement can take various forms e.g.: engaging in cocreation activities for new product development, word-of-mouth (WOM), helping other customers, blogging, recommendations, writing reviews, complaints or engaging in legal action (Van Doorn et al., 2010; Bijmolt et at., 2010). In our view, consumer engagement can be both transactional and non-transactional (Kumar and Reinartz, 2016), positive or negative (Van Doorn et al., 2010) behaviour, can be initiated by both customers (current and potential) and companies (Vivek, Beatty and Morgan, 2012), both in the real world and in a virtual environment (Brodie et al., 2013) and plays a central role in the process of value co-creation (Piligrimiene, Dovaliene and Virvilaite, 2015).

Over more than a decade, many studies were conducted to better understand the motivations for consumer engagement behaviour in e.g.: co-creation process (Martínez-Cañas et al., 2016), co-creation innovation activities (Roberts, Hughes and Kertbo, 2013), co-creation in the new product development (NPD) process (Hoyer et al., 2010), co-production (Etgar, 2007), co-creation of professional and generic services (Neghina et al., 2017), co-creation of brand identity (Kennedy and Guzmán, 2016), virtual co-creation / online co-creation activities (Füller, 2010; Constantinides et al., 2015), co-creation communities / online co-innovation communities (Nambisan and Baron,2009 ; Zhang, Kandampully and Bilgihan, 2015; Fernandes and Remelhe, 2016; Ind, Iglesias and Schultz, 2013; Ind, Coates and Lerman, 2019; Claffey and Brady, 2017), electronic word of mouth (e-WOM) (Strutton, Taylor and Thompson, 2011; Hussain et al., 2018; Cui et al., 2014; Belarmino and Koh, 2018, Sohaib et al., 2018; Vilnai-Yavetz and Levina, 2018), brand-related activities in social media (Kim and Drumwright, 2016; Azar et al., 2016; Osei-Frimpong, 2019; Enginkaya and Yılmaz, 2014) and others. It should be emphasized that motivations differ across various forms of consumer engagement (Roberts, Hughes and Kertbo, 2013). Consumers could engage in co-creation projects because of their intrinsic motives (e.g. fun, kinship, altruism), internalized extrinsic motives (e.g., learning, reputation, and own use) or/and purely extrinsic motives (e.g. payment and career prospects) (Füller, 2010). Furthermore, most consumers are motivated by a combination of intrinsic and extrinsic motivation (Fernandes and Remelhe, 2016).

Hoyer et al. (2010) classified motivators of cocreation into financial, social, technical, and psychological factors. Etgar (2007) grouped drivers that encourage consumers to engage in co-production into: economic, psychological and social drives. Kennedy and Guzmán (2016) identified five main factors of consumer motivation for engaging in co-creation of brand identity: social (peer pressure, popularity, trend and social status), fun (entertainment and excitement), brand identification (similar values and social responsibility), communication appeal (appeal, advertising) and brand commitment (brand loyalty and brand recognition). (Füller, 2010) divided motives for engaging in co-creation projects into several categories: intrinsic playful task, curiosity, altruism – community support, making friends, self-efficacy, information seeking, skill development, recognition-visibility, personal need-dissatisfaction and compensation-monetary rewards. Constantinides et al., (2015) categorized customer motives for participating in online co-creation activities into: learning benefits, social integrative benefits, personal integrative benefits and hedonic benefits. Claffey and Brady (2017) identified five motivational drivers of consumer engagement related to hedonic, utilitarian, social integrative, personal integrative needs and personal self-enhancement needs. Zhang, Kandampully and Bilgihan (2015) proposed three major motivations for customer engagement in online co-innovation communities: brand equity, sense of community and monetary incentive. Fernandes and Remelhe (2016) research on customers' motivations as drivers of engagement in collaborative innovation has

shown that financial motives were far less important than intrinsic motives, knowledge motives and social motives. Nambisan and Baron (2009) distinguish four categories of benefits from participation in virtual customer environments: learning benefits (the most important ones), social integrative benefits (the least important ones), personal integrative benefits, and hedonic benefits. A study conducted by Vilnai-Yavetz and Levina, (2018) has shown that altruism (an intrinsic motive) for social sharing e-business content was more frequently reported than financial incentives and recognition from other SNS users (extrinsic motives). Osei-Frimpong (2019) conducted research regarding consumer motivations in online social brand engagement participation and divided the motivational factors into 5 categories: autonomy-oriented (intrinsic) motivation, integrated regulation, identified regulation, introjected regulation and external regulation. Enginkaya and Yılmaz (2014) identified five distinct motivation factors of consumer engagement with brands through social media: brand affiliation, conversation, entertainment, investigation and opportunity seeking, which turned out to be the highest motivation of consumers to interact with brands over social media. Whereas Azar et al. (2016) proposed five main consumer motivations to interact with brands through social media (Facebook): social influence, search for information, entertainment, trust and reward. Their research indicate that the two most important ones were the motivation to search for information and reward motivation. The analysis of the literature showed that the results of studies conducted by other authors are ambiguous and vary depending on the form of customer engagement. On the one hand, financial (material) motives turned out to be very important in the context of interactions with brands via social media, but on the other hand, they turned out to be least significant when it comes to e.g. engagement in collaborative innovation or social sharing e-business content.

As it has been shown, research on the motivation of consumer engagement has a wide subject scope. Based on an integrative literature review Martínez-Cañas et al., 2016 categorized consumers' motives for participating in co-creation processes into eight categories: (1) financial rewards, (2) career advancement, (3) acquiring social capital, personal relationships, and identity construction, (4) access for social standing and renown, (5) self-esteem, self-efficacy, and self-expression, (6) learning, (7) hedonic motivations, (8) altruistic desire to contribute. The variables used in the research carried out for the purposes of this paper covered all of those categories.

Research Design

The analysis is based on the results of empirical research conducted in the first half of 2019 among the inhabitants of the Poznań agglomeration – the direct interview technique (face to face interviews) was used. The areas of empirical research included: respondents – inhabitants of the Poznań agglomeration, subject – evaluation of innovativeness and customer engagement, spatial – the Poznań agglomeration, and temporary – the first half of 2019. In the process of selecting the sample for the study, a quota selection was used, in which it is assumed that the study is representative if the sample structure is consistent with the structure of the studied population. The comparison of the structure of the research sample and the general population is presented below (table 1).

Table 1: Comparison of the studied population and the research sample

		RESEARCH POPULATION				RESEARCH SAMPLE

Source: Based on Statistics Poland and own study.

The size of the research sample was 795 observations (N = 795). The set of quota selection criteria includes: gender, age and place of residence of the respondents. In the process of analysing the results of empirical research, the IBM SPSS Statistics tool was used, which allowed the analysis of the statistical description, correlation analysis and the analysis of variance. Additionally, it should be emphasized that the presentation of the obtained results is a continuation of previous publications that allowed for identification of segments based on innovative predispositions of the inhabitants of the Poznań agglomeration (Bartkowiak and Michalak, 2020b) and components of motivation related to customer engagement (Bartkowiak and Michalak, 2020a).

In the case of innovative predispositions four segments were identified:[1]

1. the hybrid segment (SI1) in which the combination of pro-innovative, orthodox and conservative predispositions is high,
2. the pro-innovation segment (SI2) in which the pro-innovative predisposition is high,
3. the orthodox and conservative segment (SI3) in which the orthodox and conservative predisposition is high,
4. the neutral segment (SI4) in which the combination of pro-innovative, orthodox and conservative predispositions is low.

The table below shows the characteristics of segments based on innovative predispositions of the inhabitants of the Poznań agglomeration (table 2).

Table 2: Characteristics of segments based on innovative predispositions of the inhabitants of the Poznań agglomeration

Source: Own research.

The analysis of the results by gender shows that most women belong to the orthodox and conservative segment (47.3%). On the other hand, in the case of men, the most numerous segments are: the pro-innovation (33.7%) and the orthodox and conservative (35.4%). On the other hand, the analysis of the results in terms of age shows that most respondents aged <29 (52.2%) and 30-49 (44.7%) belong to the pro-innovative segment, while the oldest (50+) respondents are mainly representatives of the orthodox and conservative segment (62.9 %). In the case of primary, vocational (58.6%) and secondary (39.7%) education, the orthodox and conservative segment is the most numerous, while people with higher education are most often belonging to the pro-innovative (37.4%) or orthodox and conservative (37.4%) segments. The last factor differentiating the respondents' affiliation to the identified segments is their material status. People who assessed their material status below (57.1%) or at national average level (46.2%) most often belong to the orthodox and conservative segment, while people with material status above the national average most often belong to the pro-innovative segment (40.2%).

Based on the results of the literature research and the characteristics of the distinguished segments (age, education level, level of affluence), we put forward two research hypotheses:

H1. The intangible motivation for participation in customer engagement is higher in the group of consumers with a higher level of innovativeness.

H2. Material motivation for participation in customer engagement is higher in the group of consumers with a lower level of innovativeness.

Results

The next step in the research procedure was the comparison of average values of motivational factors of the segments based on innovative predispositions of the inhabitants of the Poznań agglomeration (table 3).

Table 3: Comparison of average values of motivational factors of segments based on innovative predispositions of the inhabitants of the Poznań agglomeration

Motivational factors	Total average	segment SI1 | SI2 | SI3 | SI4	ANOVA
1. financial benefits	4.11	$4.11^1 < 4.31^2 > 4.01^1 \approx 3.95^1$	4.876**
2. discounts, freebies, product samples	4.09	$4.00^1 < 4.26^2 > 4.02^1 \approx 4.01^1$	3.435*

Source: Own research.

The analysis of the results presented in the table 3 allows for the identification of several regularities. First, the importance of material benefit motivators is highest in the pro-innovation segment and overall. Secondly, the importance of intangible benefits motivators is most often highest in two segments: the hybrid segment and the pro-innovation segment. Third, the importance of the motivators related to altruistic participation in customer engagement is the highest in the hybrid segment. The orthodox and conservative segment is the least motivated to participate in customer engagement. The motivation of the respondents from the neutral segment is also low, except for the fifth variable related to new business or private relationships and contacts.

In terms of motivational components of the inhabitants of the Poznań agglomeration the results of exploratory factor analysis (EFA) allowed for the identification of two components (Bartkowiak and Michalak, 2020a). The first component is related to material motivation – it consists of variables 1.financial benefits and 2.discounts, freebies, product samples. The second component is related to intangible motivation – it consisted of variables 3.gaining experience, 4.satisfaction, recognition, self-esteem, 5.new business and (or) private relationships and contacts, 6.identifying with the company, 7.the prospect of permanent cooperation with the company, 8.career opportunity, 9.impact on the development or modernization of the company's offer, 10.participation in the promotion of the company's offer, 11.adjusting the company's product to one's own needs and 12.access to market news, product testing.

The comparison of average values of motivational components of segments based on innovative predispositions of the inhabitants of the Poznań agglomeration (table 4).

Table 4: Comparison of average values of motivational components of segments based on innovative predispositions of the inhabitants of the Poznań agglomeration

Motivational components – Exploratory Factor Analysis results	Total average	segment SI1 | SI2 | SI3 | SI4	ANOVA
Component 1 – material motivation	4.10	$4.06^1 < 4.29^2 > 4.02^1 \approx 3.98^1$	4.979**
Component 2 – intangible motivation	3.03	$3.41^2 \approx 3.42^2 > 2.71^1 \approx 2.79^1$	36.110***
SI: 1–hybrid, 2–pro-innovation, 3–orthodox and conservative, 4–neutral segment Test post hoc – S-N-K Student-Newman-Keuls Significance levels (p values): ***p≤0.001, **p≤0.01, *p≤0.05			

Source: Own research.

The obtained results clearly show that the importance of material motivation is the highest in the pro-innovation segment. It does not support H2 which stated that material motivation for participation in customer engagement is higher in the group of consumers with a lower level of innovativeness. On the other hand, the importance of intangible motivation is high at the same time in the pro-innovation and hybrid segments. It supports H1 which stated that intangible motivation for participation in customer engagement is higher in the group of consumers with a higher level of innovativeness. The respondents' motivation to participate in customer engagement is the lowest in the orthodox and conservative or neutral segments.

In order to deepen the obtained results the criteria for segmentation of the respondents due to their customer engagement motivation were defined. Due to the range of the used measuring scale <1.5>, it was assumed that respondents representing a given type of motivation (material or intangible) are qualified entities for which the value of a given component is greater than 3.00 ($Comp_{(n)}>3.00$). Otherwise, when the value of this component is less than or equal to 3.00 ($Comp_{(n)}\leq 3.00$), the

respondents are not treated as representatives of the extracted type of motivation. Based on the results of the exploratory factor analysis and the assumptions made, the population of respondents was divided into four segments (table 5).

Table 5: Criteria for segmentation of the inhabitants of the Poznań agglomeration based on customer engagement motivation

Components	Component value	Segments			
		SM1	SM2	SM3	SM4
M1. material motivation	+ (Comp1 > 3.00) – (Comp1 ≤ 3.00)	+	+	–	–
M2. intangible motivation	+ (Comp2 > 3.00) – (Comp2 ≤ 3.00)	+	–	+	–
	Sum N=100%	48.7%	35.5%	4.2%	11.6%

Legend:
SM1 – **holistic motivated segment** – material (+), intangible (+) motivation
SM2 – **material motivated segment** – material (+), intangible (–) motivation
SM3 – **intangible motivated segment** – material (–), intangible (+) motivation
SM4 – **unmotivated segment** – material (–), intangible (–) motivation

Source: Own research.

In the identified segments, there is a different intensity of material and intangible motivation. In the case of the holistic motivated segment (which turned out to be the largest one) both the material and intangible motivation are high. In case of the material motivated segment (the second largest) the material motivation variables are high, in case of the intangible motivated segment other variables are high, in turn of the unmotivated segments the values of all variables are rather low. It should be noted that almost 90% of respondents manifests a high degree of motivation (material or intangible) for consumer engagement.

Identification of the segments based on innovative predispositions and based on customer engagement motivation allows to determine the dependencies between them. First, the correlation relationships between the identified segments were verified. For this purpose, the V-Cramer correlation was used, and the obtained result (V = 0.218***) confirms the existence of a statistically significant relationship. The characteristics of segments based on customer engagement motivation according to segments based on innovative predispositions (table 6).

Table 6: Characteristics of segments based on customer engagement motivation according to segments based on innovative predispositions

Customer engagement motivation (%)	Innovative predisposition								Total	
	SI1		SI2		SI3		SI4			
	↕	↔	↕	↔	↕	↔	↕	↔	↕	↔
SM1	67.0	16.9	68.7	43.9	33.2	28.8	35.1	10.4	48.7	100.0
SM2	15.5	5.3	20.7	18.1	49.1	58.4	44.7	18.1	35.5	100.0
SM3	8.2	24.2	4.5	33.3	2.4	24.2	5.3	18.2	4.2	100.0
SM4	9.3	9.8	6.1	16.3	15.3	55.4	14.9	18.5	11.6	100.0
Total	100.0	12.3	100.0	31.1	100.0	42.2	100.0	14.4	100.0	100.0

Legend:
SI: 1–**hybrid**, 2–**pro-innovation**, 3–**orthodox and conservative**, 4–**neutral segment**
SM: 1–**holistic motivated**, 2–**material motivated**, 3–**intangible motivated**, 4–**unmotivated segment**

Source: Own research.

The analysis of the results from the perspective of segments based on customer engagement motivation allows to indicate which segments based on innovative predisposition are most often represented among them. Accordingly:

- in the case of the holistic motivated segment (SM1), the most numerous group is the pro-innovation segment (SI2 – 43.9%), and then the orthodox and conservative segment (SI3 – 28.8%),
- in the case of the material motivated segment (SM2), the largest is the orthodox and conservative segment (SI3 – 58.4%), and then the pro-innovation (SI2 – 18.1%) or neutral segment (18.1%),
- in the case of the intangible motivated segment (SM3), the biggest is the pro-innovation segment (SI2 – 33.3%), and then the hybrid (SI1 – 24.2%) or orthodox and conservative segment (SI3 – 24.2%),
- in the case of the unmotivated segment (SM4), the most popular is the orthodox and conservative segment (SI3 – 55.4%).

A similar analysis can be made from the perspective of innovative predisposition segments. Accordingly:

- in the case of the hybrid segment (SI1), the most popular is the holistic segment (SM1 – 67.0%), the other segments are relatively small,
- in the case of the pro-innovation segment (SI2), the most often is the holistic segment (68.7%), the share of other segments is small,
- in the case of the orthodox and conservative segment (SI3), the most common is the material motivated segment (SM2 – 44.7%), and then the holistic segment (SM1 – 35.1%),
- in the case of the neutral segment (SI4), the greatest is the the material motivated segment (SM2 – 49.1%), and then the holistic segment (SM1 – 33.2%).

Conclusions

The aim of the paper is to identify the differences in customer engagement motivation due to the level of consumer innovativeness. The obtained results allow to indicate the characteristics the most pro-innovative consumers (included in the pro-innovation segment) – these are people up to 50 years old, with secondary or higher education, whose material status is above the national average. The most motivating factors for participation in CE are definitely material factors. The results of the conducted research allowed for the verification of the hypotheses. Hypothesis 1 was confirmed, while the results

did not support H2. The research shown that almost 90% of respondents manifests a high degree of motivation (material or intangible) for consumer engagement.

Practical Implications

The market success of an organization, understood as successfully introducing new products to the market, cannot take the form of a traditional, one-sided organizational process, but must take into account the requirements of various stakeholders, primarily consumers. The obtained results may be useful for companies that want to engage consumers to a greater extent in the value co-creation process and thus increase the chance of acceptance of the introduced product innovations. The results of the segmentation allow for matching appropriate motivational instruments to different groups of consumers. This is important as the results show a potentially high level of customer interest in engaging in value co-creation.

Limitations and Future Research

The study was not national in nature; hence its results can only be referred to inhabitants of the Poznań agglomeration. In the next stages of research, an interesting idea seems to be to examine the main barriers in engaging in value co-creation among the general population of Poland, as well as residents of other countries and comparing results internationally.

Endnotes

[1]The identified predispositions based on the results of exploratory factor analysis (EFA) (Bartkowiak and Michalak, 2020a):

1) component 1 – pro-innovation predisposition (variables: 1.seeking information and testing new products immediately; 3.taking risks associated with new products; 5.passive opinions on new products for the environment; 7.verifying new products earlier compared to the environment; 9.attitude of the leader of product innovation verification; 10.testing new products; 11.quick adaptation of new products; 12.active opinions on new products in the environment; 14.interest in technological innovations; 15.adaptation of market novelties; 16.searching for new market solutions; 18.broadening knowledge about new products; 21.seeking and collecting information about new products; 22.encouraging the environment to use new products; 23.regularly purchasing new products),

2) component 2 – orthodox and conservative predisposition (variables: 2.use of new products after verification by the environment; 4.expecting support from the environment in using new products; 6.use of tested products; 8.leaving verification of new products to the environment; 13.occurrence of barriers related to the use of new products; 17.use of proven market solutions; 19.distrust of new products; 20.late acceptance of product innovations).

Utilization of The Border Guard of the Republic of Poland Preventing Covid-19 Spread

prof. dr hab. Bernard WIŚNIEWSKI

WSB University in Dąbrowa Górnicza, Dąbrowa Górnicza, Poland
bfwiśniewski@o2.pl

Abstract

In polish conditions, many formations are actively involved in preventing the spread of COVID-19, among which the Border Guard holds an important position. This formation struggles daily with numerous problems that call for theoretical support. Today, the greatest threats posed to the said formation are: terrorism, proliferation of weapons of mass destruction, organized international crime, uncontrolled migrations, economic crises, calamities of religious and ethnic origin, natural and ecological disasters, technical mishaps and failures, and pandemics which is of crucial important today. The problem situation outlined above was the basis for conducting research set to assess the effectiveness of the Border Guard in preventing the expansion of COVID-19. During the research, the method of source material analysis, synthesis, comparison, generalization, inference and abstraction have been used. The research resulted in a conclusion that the Border Guard is a kind of first state barrier to the spread of COVID-19. Due to the above, this formation, for the sake of its effectiveness, keeps improving the law regarding its functioning and organizational solutions resulting from mentioned regulations. The research also allowed to identify the causes, conditions and effects of the application of legal solutions, and defined recommendations for improving the use of Border formation in preventing the spread of COVID-19 in the future. simultaneously, these conclusions are general enough so that they may be used in both Polish conditions or other very similar.

Keywords: Threat, Security, Border Guard, Law, Management, Epidemic, COVID-19.

Introduction

Extraordinary threats are the most common phenomenon that endangers human life and health [1]. One of them may be infectious diseases [2].

The first two decades of the 21st century are the period of the emergence of new epidemics caused by human infectious diseases. In December 2019, the SARS-CoV-2 corona-virus, was identified for the first time in Wuhan, China. It bears responsibility for the ongoing epidemic of respiratory system infections causing COVID-19 disease.

Many state institutions got involved in minimizing the effects of the above introduced epidemic in the affected areas . Due to their properties and potential, the institutional circle should also include formations intended for the protection of the state border [3] and border traffic control [More: 4]. According to their purpose and tasks, their capability is built and maintained [5]. The main determinants of said potential are numbers and competences. Both determinants leave mark on the preparation of these formations to operate in conditions of extraordinary threats [More: 6].

The protection of the state border [7] is a multifaceted undertaking [8], requiring the organization of a complex administrative, political and sanitary enterprise, with varying degrees of rigors, endeavored by each sovereign state [9] aimed at prevention of illegal crossings of the state border [10] and unauthorized transport of certain goods [11], the introduction of which into the territory of

Cite this Article as: Bernard WIŚNIEWSKI "Utilization of The Border Guard of the Republic of Poland Preventing Covid-19 Spread" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Poland is prohibited [12] and prevention of the penetration of infectious diseases across the border [13].

Methodology

The main goal of the research was to augment knowledge about the effectiveness of the usage of the Polish Border Guard in preventing the spread of COVID-19, which is consistent with the assumptions of scientific research [14]. On the other hand, the specific objectives were:

- diagnosis of the currently used organizational and legal solutions regarding the operation of the Border Guard in a pandemic;
- definition of assumptions for the improvement of the use of this formation in conditions of idiosyncratic threats, based on the analysis and assessment of its functioning until present.

A system approach and a functional approach were used in the research. The first, hence the use of the Border Guard was analyzed in the context of activities executed by the components of one entity, interconnected within the state security system [15]. The second, due to the fact that the use of this formation was considered by defining its relations with institutions which perform similar functions under the law.

The theoretical methods have been used in the research [16], which in turn allowed to present the results of the scrutiny based mainly on the analysis of the legal provisions in force until the presence of COVID-19 in Poland was registered and those legal acts that were introduced extempore after this fact. They were also supplemented with analyzes of information relating to the effectiveness of the Border Guard's undertakings in preventing the escalation of COVID-19 and scientific literature. The investigation used conclusions from the scientific literature and the author's research conducted in 2005-2020.

Purpose of the Border Guard

A state is an organization governed by the law [more: 17]. Citizens and all components of the state are obliged to comply with this law [18]. This obligation is supervised by a specially appointed apparatus of state authority and administration. This property of the nation is connected with the necessity for its citizens to abide by the binding legal rules and with the possibility of enforcing the compliance with those regulations [19]. Pursuant to the provisions of the constitution of April 2, 1997, the Republic of Poland is a democratic state ruled by law, which is the common good of all citizens [20]. It should also be added that all activities of public authorities and administration [21] and state institutions [22] must result from the provisions of law and may not venture beyond them [23]. Failure to do so may lead to consequences that violate the level of safety expected and accepted by the society [24].

Guaranteeing security [More: 25] is the basic condition for the spiritual and material development of the entire group organized into the state and of human individuals living in that state [26; 27]. This task is affiliated to many state institutions. One of them is obviously the Border Guard [28], which is an unwavering, armed and uniformed formation supervised by the minister responsible for internal affairs, operating in all states and conditions of the nation's functioning [29].

The Minister of Interior and Administration oversees the protection of the state border [30] on land and at sea and is also accountable for border traffic control [31]. The Air Force [32] and the Navy of the Republic of Poland [33], with which the Border Guard cooperates closely, participate respectively in the protection of the state border at sea and in the air space [34].

The issues of border protection are determined by the wellspring of universally binding law, including international agreements with neighboring countries and agreements concluded between

the minister of internal affairs and the minister of national defense, between the Border Guard and other state institutions, and additional legal acts [35].

The track of the state border on land and in Polish internal waters is pronounced with border marks.

The state border at sea is 12 nautical miles from the baseline [36].
The state border is set at [37]:

- land sections and in places where the state border crosses standing waters or flowing waters that pass to the other shore - along a straight line running from one mark to the other;
- rivers, creeks, streams and non-navigable channels - along the center line of the riverbed;
- navigable rivers - along the center line of the fairway or the midway of the mainstream.

In order to protect the state border, a border strip and a border zone have been established. The border road strip is an area 15 meters wide, counting inland - from the state border line or from the shore of border waters or the sea shore. Contrarily, the border zone covers the entire area of municipalities adjacent to the state border. If the width of the border zone does not reach 15 km in that manner, it also includes neighboring communes where the area lies - in whole or in part - at a distance of 15 km from the state border [38].

Road, rail and river border crossing points [39] and the types of traffic allowed at these passage points are laid down in international agreements [40]. In contrast, sea and air border junctions are established by ordinance of the Council of Ministers.

The authorities obliged to maintain the border crossing points on a permanent basis in a condition that allows for effective border, customs, sanitary, veterinary [41], phytosanitary, chemical and radiometric control are the appropriate territorial competent voivodes in relation to rail, road, air and sea border passages, as well as river crossings border and overnight stopping points on border rivers.

Border protection on land and sea as well as border traffic control in Poland was entrusted to the Border Guard. It is responsible, inter alia, for recognition and detection of crimes and border offenses, prevention and prosecution of their perpetrators, to the extent specified by relevant laws. However, the legislator did not specify the catalog of crimes being the subject of this formation's interest. Nevertheless, on the basis of certain provisions of the Act on the Border Guard, it can be stated that the area of its interests are crimes and offenses directly related to border traffic of persons or goods [42]. Therefore, it is assumed that border crime includes three main categories of misconducts: broadly understood illegal migration [43], smuggling of goods and forgery of documents authorizing the crossing of the state border [44].

However, the material scope defined by this method did not exclude the possibility of prosecuting other crimes and offenses by the Border Guard.

Since the establishment of the Border Guard, the capacity of its tasks has been systematically broadened to include police powers related to combating widely understood border crime [45]. It should be acclaimed that with Poland's accession to the European Union, the Border Guard was fully prepared to undertake tasks related to the protection of some of the external borders of the European Union and ready for cooperation with EU / Schengen border formations [46].

The activities launched by the Border Guard in the field of combating border crime are both a provisional control and systematic operational-reconnaissance and investigative activities. An important element supporting the struggle against border crime is the intensified border control implemented by Border Guard officers with the use of modern technical equipment, including the institution of refusal of entry into the territory of the Republic of Poland to foreigners posing a potential threat.

The question of national border protection and border traffic control is nowadays widely discussed in the mass media and scientific studies, which demonstrates its vital role in both the security system of the Republic of Poland [47] and in international security. The dynamically altering level of challenges and threats [48] affecting the security of state borders requires actions appropriate to the situation [49], the effectiveness of which depends directly on the level of the applicable operating procedures of all state structures and knowledge - twain on the practical and theoretical side [50].

On the one hand, the actual level of perils of terrorism [More: 51], border crime, organized crime, natural disasters [52] or technical failures [53], and currently, epidemics, on the other hand, the perception of security of citizens, chiefly those living in border zones - drive to take all possible steps in search new organizational solutions.

Rules for organizing actions

The diagnosis of organizational procedures in force in the Border Guard shows that they are uniform and flexible enough, allowing the methods used to enable the Guards to effectively carry out tasks entrusted to them by law, while exploiting all its possibilities [54].

Depending on the nature of the tasks performed, three levels of management were distinguished in the Border Guard [55; 56; 57], namely:

- III level of command (basic intervention level) - management at this level means managing of the forces currently in service, supervised by the operational duty officer of the organizational unit and includes activities undertaken by officers of the Border Guard post, carried out directly in the area of responsibility;
- II management level - the tactical level, organized in order to coordinate [More: 58] activities of the intervention level forces and assigned reinforcement unit at the disposal of a given organizational body. Activities under Level II are implemented up to the level of the Border Guard unit headquarters;
- I level of management - strategic level, understood as force management as well as coordination and control of actions [59], in the case when the incident covers the area of more than one organizational unit of the Border Guard (or there is a high probability of such a threat), as well as during actions protracted in time, in the conditions of the growing need to strengthen assets and resources and to supplement the logistics facilities. Such a large operation is carried out by the designated headquarters of the Border Guard unit or the Border Guard Headquarters.

Management at level III (intervention) is conducted by the commander of the border guard organizational unit.

The following individuals are entitled to manage the activities of the Border Guard at the 2nd level: the commanding officer of the Border Guard post, territorially competent for the area of the event, or the commanding officer of the Border Guard unit (his deputy), as well as an officer appointed by the commander of the branch or the chief commander of the Border Guard. The operation of the Border Guard at the 2nd level of command is an organized effort carried out by the unit's own forces up to the level of the Border Guard division.

In turn, the management of activities at level I is done at the level of a branch headquarters or the Border Guard Headquarters. The following persons are entitled to lead the activities of the Border Guard on the 1st level: the commanding officer of the Border Guard (his deputy), the commanding officer of the Border Guard unit (his deputy), and an officer appointed by the above-mentioned operators.

In order to effectively implement the scope of tasks concerning border protection, the Border Guard has a set of powers. The most important of them include the possibility [37]:

- to utilize the help of persons who are not officers of the Border Guard;
- conduct operational control;

- use of documents that prevent the determination of identification of a Border Guard officer and the means that the officer might use to perform his official tasks;
- use of information about the person, including personal data obtained by authorized bodies, services and state institutions as a result of operational and reconnaissance activities or operational control.

Additional tasks of the Border Guard in COVID 19 conditions

The factors influencing the effectiveness of the responses of state institutions were, and are, first of all, unpredictable and dynamic ever-changing particular threats menacing the security of the state. Today, such a global threat is the spread of the SARS-CoV-2 coronavirus that causes the COVID-19 disease.

Due to the increase in the level of the aforementioned threat, on March 2, 2020, the Parliament of the Republic of Poland adopted the Act on special solutions related to the prevention, counteraction and combating of COVID-19, other infectious diseases and the crisis situations caused by them [60], as amended by the Act of March 31, 2020 The Act defined the principles and procedures for preventing and combating infection with the SARS-CoV-2 virus and the expansion of an infectious disease in humans triggered by this virus, additionally the tasks of public administration bodies in the field of aversion and withstanding an infection or an infectious disease [61].

Consequently, on March 13, 2020, the Minister of Health of the Republic of Poland issued a regulation on the announcement of the state of epidemic hazard in connection with the spread of the SARS-CoV-2 coronavirus and the increase in the incidence throughout the territory of the Republic of Poland, commencing on March 14, 2020 until the revocation [62]. The introduction of an epidemic emergency was aimed at lessening the spread of the coronavirus and limiting the increase of infection rates. The decision [for more information: 63] meant the introduction of numerous restrictions [64] concerning, among others, the freedom of movement.

As intended, the Border Guard was among the institutions responsible for the enforcement of restrictions [65] on mobility. It was culpable for changing the applicable rules of state border protection. By the Regulation of the Minister of the Interior and Administration of March 13, 2020 [66], border control of persons crossing the state border constituting the internal border was temporarily reintroduced in the period from March 15, 2020 to March 24, 2020. It has been assumed that the scope of the inspection will be adjusted to the degree of threat to public order or state security in connection with the occurrence of a serious danger to public health caused by the SARS-CoV-2 coronavirus, leading to the COVID-19 disease. Temporary border control has been reintroduced for persons crossing the state border constituting the internal border at the state border with the European Union countries neighboring Poland also at seaports and airports within the internal border. Due to the development of the pandemic peril, the regulation of the Minister of the Interior and Administration of March 13, 2020 was twice amended [67; 68].

The tasks entrusted to the Border Guard were carried out effectively. On daily basis about 670 officers of this formation on average, were involved in the undertakings concerning the reintroduced border control. At the internal border, as part of the temporarily reintroduced border control in the direction of entry to Poland, a total of 2,481,848 people were inspected, including the border sections with: the Federal Republic of Germany - 1,969,845, the Czech Republic - 385,415, the Slovak Republic - 14,217, the Republic of Lithuania - 34 623 and in sea ports - 55 026 and air ports - 22 722 [69].

Lessons for the future

Nowadays an increasingly popular belief is that such universal values as: freedom, equality, truth, good, human rights, justice and democracy are not sufficiently appreciated in real social reality. To

the contrary, the attention of public opinion is absorbed by such issues as: spreading violence, increasing number of aggressive behaviors, brutalization of life and mass illness [70].

The conducted research shows that in order to ensure the effectiveness of the Border Guard, a number of legal [71] and organizational solutions are being introduced, relating, inter alia, the management of this formation [72].

A characteristic feature of the pointed solutions is cooperation [73]. Research also indicates that the proper organization of Border Guard activities is one of the basic conditions for limiting the spread of COVID-19.

Effective prevention of the spread of COVID-19 requires the improvement in the operation of many state institutions, including the Border Guard. It ought to include the development of ever more effective rules and methods of potent and comprehensive counteraction against extraordinary threats in general.

As predicted in terms of the development of the pandemic, the world is facing yet another wave of escalating infections.

The conveyed research indicates that the number of tasks assigned to the Border Guard will not change. However, the need to involve an increasing number of officers of this formation will be very likely. At the same time, the possibilities of the Border Guard in this regard may diminish. Officers of said formation will be exposed to infections not only because of their service. This will likely result in a reduction of the tally of officers assigned to direct border surveillance and border traffic control activities. It would therefore be necessary to introduce countermeasures [74] in the form of:

- full assurance of officers' needs concerning means of protection against infection;
- constant examination of officers [75] in accordance with the rules applicable in health care facilities;
- simplification of information flow [More: 76] and documentation of the results of work;
- the possibility of immediate replacement of damaged equipment as well as individual and team equipment;
- gathering and maintaining stocks;
- creation of reserves on the basis of officers serving in education centers and in the administrative division;
- increase in cooperation with citizens in border regions;
- strengthening cooperation with non-governmental organizations whose scope of activities is similar to the nature of the tasks of the Border Guard;
- increase in cooperation [77] with the police [78] and the army [More: 79; 80];
- continuous professional development in the field of education for safety [81], including health protection.

In the event of failures in the implementation of measures to prevent crisis situations [82], including the spread of COVID-19, one should also take into account the necessity to introduce a state of emergency [83; 84] throughout the country, which, in accordance with the applicable legal order, will allow to use the reserves accumulated for situations of special hazards and increase the headcount of the Border Guard.

Conclusions

One of the features of the Border Guard operations is the need to rationalize. It is also imperative that rationalization involves learning, which is not a simple matter. "The learning system must adapt its organizational structure to the environment, and in fact to the changes taking place. It is necessary to develop new variables for action, as only they will allow to maintain effectiveness. It is also essential to acquire knowledge not only from own experience. New solutions and ideas ought to be hunted for, then the knowledge should be put into practice and a common vision of the future has to be created,

moreover as a result, new ideas shall be tested [85]. Their consequence is to be education, which is an important part of preventive activities, aimed mainly at pro-health and environmental learning, and one of the basic ways of teaching safety thus coping with difficult situations [86].

Bearing in mind the aforementioned considerations, it can also be stated that the previously brought forward rationalization [more broadly: 87] included, includes and should continue including institutions responsible for state security. One of them is the Border Guard, being the first barrier to COVID-19.

andrzej.czuprynski@icloud.com

Abstract

The occurrence of internal hazards in each country constitutes an integral part of the natural, biological, social and political conditions of each security entity. In the process of counteracting crisis threats, it is reasonable to take control of their symptoms and jurisdiction over their evolution in such a way as to minimize the negative effects, and thus prevent their escalation into a full-blown crisis. It is reasonable to assume that a calamity is characterized by:

- unpredictability as to the duration and path of the development of perils causing the crisis;
- the mass scale of dangers in a large area causing the crisis;
- long-term and continuous negative impact on the social, economic and cultural life of citizens;
- failure of public institutions aimed at securing the functioning of the society.

Keywords: Crisis, Crisis Management, Security.

Introduction

Crisis is a concept which describes natural, biological, social [7, pp. 13-21], political [8, pp. 125-136] and economic phenomena that seriously threaten the existence of specific beings. In all areas of knowledge, semantic interpretations of the word and concept of crisis in various languages and in assorted problem approaches can be perceived, which shall provide the observer, participant or decision-maker with sufficient insight enabling to organize measures to reduce or counter the symptoms of threats that may cause a crisis [49, p. 10; 21, p. 43; 32, pp. 36-38; 45, pp. 156-173; 34, pp. 83-89; 38, pp. 28-45]. There is also an over-exposure to the concept of crisis, which in social reality is sometimes unverifiable, as long as the cumulative real menace does not escalate. Approaching the symptoms of emergency threats with great responsibility, we may take actions that will largely neutralize their negative effects and might not even be noticed by the society, except for their investigators. Contrarily, by disregarding the symptoms of threats and certain hazards, or by executing amiss decision-making choices, we can lead to crises or leave those unaffected by the process of their own evolution, we take the risk that they might escalate into a crisis or remain at the level of stabilized perils. In the first case, by taking actions based on overly defeatist forecasts, we can use up available resources and expose ourselves to the accusation of mismanagement, and in the second case, by disregarding the symptoms of dangers, we may in the near future cause substantially greater losses and exhaust far more resources in order to tackle and rebuild damage induced by the threat than actual preventive measures might.

Research Assumptions

Taking into account the adopted expectations, it would be reasonable to explain the conditions causing threats which in turn may develop into a crisis. Hence the research problem - what kind of situations are conducive to the development of internal security crises in the state? The problems contained in the question indicate the need to clarify, first of all, two issues, exactly the phenomena and the notion of crisis factors causing deadlock threats in the country and explaining when exactly are we dealing with a catastrophe. Way too often, the concept of crisis is emphasized for each threat, and yet not every menace causes emergency, but only their accumulation in the specific

Cite this Article as: Andrzej CZUPRYŃSKI " Internal Crisis as A Security Challenge for A Nation State" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

environmental conditions of the security entity. Thus, the account of conditions adequate to the concept of crisis and crisis-generating factors that might trigger it were adopted as the cognitive objective.

In the adopted research process, the qualitative research strategy was used, assuming that "(...) the field of qualitative research is defined primarily by a series of tensions, contradictions and fluctuations (...)" [10, p. 5] focusing on explaining the essence of the problem by identifying the specific conditions of the symptoms of the crisis-causing phenomenon and the conditions of the trouble Critical thinking on the problem and the research subject have been used, assuming that:

- one shall strive to critically perceive descriptions of facts, processes and phenomena contained in the literature on the subject;
- use comparisons of similar problems, facts, phenomena, objects and conclusions obtained from aforementioned in the research process;
- to make a multifaceted and deep analysis of data contained in the literature on the subject;
- to analyze and compare cases of deviations from commonly perceived norms [42, pp. 257-273; 41, pp. 29-51; 16, pp. 21-42; 44, pp. 1-20; 11, pp. 19-56; 39, pp. 8-46].

During the investigation process, the content of selected literature on the subject was researched using, the method consisting in the coherent application of reasoning operations (analysis, synthesis, comparison, abstraction, generalization, inference) and the strategies of reductive, taxonomic, heuristic and constructive thinking [35, pp. 325-343; 6, pp. 81-98].

The crisis and its presumptions

The Polish legal system does not define the crisis term [52; 53; 54; 55; 56; 57; 58], and a crisis situation and a state of disaster emergency, indicating that this is a process that should be constantly monitored and in the event of actual hazards, one of the three extraordinary states might be introduced (martial law, state of emergency, state of natural disaster) specified in the Constitution and made more precise in subject acts in question. Despite defining the conditions for initiation of extraordinary measures, the acts determined by perils are left free to interpretation by decision-makers, even in situations where most of the restrictions resulting from legal conditions are applied, e.g. the state of natural disaster in the first half of 2020 in Poland. Similar examples of arbitrary rejection of legal conditions concerning the introduction of states of emergency in justified cases are noticed in many countries and can be observed in connection with the current epidemiological risk.

In the Polish judiciary system, the legislator refers to a crisis situation, threats which require special operating procedures to be applied, but does not specify whether or not a particular event or series of events is or is not considered a crisis for the state. Such a general approach to the problems conditioning the crisis is controversial and allows for freedom of interpretation, usually stemming from political premises, and not actual threats. From a semantic point of view, a crisis is defined as a situation unfavorable to someone or something, that indicates the need to apply radical solutions to the existing situations, e.g. in the case of: the breakdown of the state development processes, the instability of the value system and social apathy, the collapse or serious violation of the political system in the state and the process of exercising power itself, as well as many other events that help predict the escalation of the threat.

The crisis arouses negative, pessimistic emotions because it is associated with fear, an uncertain and dangerous situation and is related to the process of hazards [9, p. 54; 20, pp. 81-92; 26, pp. 199-209; 19, pp. 239-256; 13, pp. 283-296; 4, pp. 344-352]. A calamity does not always have to bring up a feeling of fear, the threat of loss of certain values, but it always arouses a feeling of uncertainty as to which direction it might escalate provided we are unable to control it. "Threats and uncertainty have always belonged to the conditions of human existence, previously in some sense to an even greater extent than today (...)" [2, p. 15], that was related to the poor capability to forecast perils and the organizational and material possibilities to oppose the negative effects. It shall nevertheless be emphasized that in the past, their scope was usually more finite, due to the nature of the threat and the

limitations of space, time, communication, exchange of goods and thoughts, and the current epidemiological, ecological and climate risks concern almost all inhabitants of the Earth.

The definition of the crisis [43, p. 61] emphasizes its sources and negative effects, but at the same time excludes the possibility of application of extraordinary measures in order to de-escalate. A plight is the result of unidentified or neglected symptoms of threats, and then of actual dangers, resulting in a difficult situation, which in fact requires specific actions and material measures taken. A threat is a situation in which unfavorable conditions or unfavorable factors disturb the accepted order and disorder the functioning of the subject or object of security, introducing chaos in the place of harmony [51, p. 21]. Hence, it is concluded that it is vital to use extraordinary measures for a rapid down-scaling of the crisis, which means a return to the acceptable level of menaces. Threats may be initiated by random or non-random causes having a negative impact on the functioning of the security entity or may cause adverse changes in the environment, accumulating unresolved significant problems in a short period of time what significantly violates subject's security system [15, p. 76]. On the one hand, a threat is a mental state caused by the subjective perception of phenomena assessed as unfavorable or dangerous, and on the other hand, there may be objective factors causing states of justified fear of losing deeply cherished values [9, pp. 54-66]. Thus, it is very important to use objective criteria in the assessment of hazards, the perception of which is justified according to Daniel Frei as:

- a state of insecurity that takes place when the actual threat is correctly perceived;
- state of obsession, in which a low threat is perceived as serious;
- state of false security resulting from underestimation of threats and disregard of them;
- proper security condition, where the threat is low and its perception is correct [17, pp. 17-21].

The conclusions from the study of the literature regarding the subject indicate that the crisis is caused by threats, or rather by their accumulation in turn a threat of high destructive power occurring in a short time. We deal with a crisis when there is a certain breach of the balance between threat and actual security [25, pp. 24-29; 46, pp. 33-45]. In many cases, the plight is seen as the culmination of hazards [22, p. 283; 12, pp. 81-86; 23, p. 15; 48, pp. 70-76; 31, pp. 16-17], which can be interpreted as a short-term phenomenon, because the culmination state means that after reaching a critical point as a result of the undertaken actions , the stabilization and spontaneous or forced decline occurs. Therefore, we can conclude that in some situations the crisis manager may seek to escalate it, because after having reaching the peak, hazards will decrease or weak elements of the organizational procedures will come to light, so they can be repaired or replaced by those with better properties [50, p. 63-71].

Generalizations and conclusions from the analysis of the crisis indicate that its essence is a precarious situation that endangers people and property in a given area or there is a significant limitation of the functioning or the activity of public administration bodies due to discrepancies in the resources and powers necessary to implement in relation to the existing risk. A crisis is a process that is predictable, but difficult to neutralize, if we do not possess appropriate operating procedures and measures that detect early and afterwards remove a given situation so as to minimize possible damage.

The sources of the crisis origin may be a consequence of the mutual overlapping of many hazards, which may in turn lead to the creation of a new type of threat with greater negative consequences for the subject and the object of security than a single risk. If we put forward the thesis that the crisis is the result of a process, a combination of various menaces that are identifiable, possible to diagnose and forecast, we can also conclude that the emergency can be identified, diagnosed and forecast on the basis of the dangers that cause it, which gives us the possibility of taking preventive actions in in order to avert its occurrence [36, pp. 54-55]. Therefore, countermeasures should be undertaken at the stage of the incidence of symptoms of threats in order to halt their escalation and ultimately the emergence of a catastrophe. However, for fear of prematurely directing actions and resources to the symptoms of threats, decision-makers consciously or unconsciously allow them to take shape, and if

they fail to take preventive measures against actual hazards, consequently lead to the outbreak of a crisis, which does not have to be only a climax, and may also last as long as purposeful and effective counteractions will be taken with the intention of reduction of the negative effects and rebuild the damage. An example of such action is the storage of dangerous explosives in Beirut since 2014, which ultimately, as a result of various combinations of events, led to their explosion on August 4, 2020. It should be emphasized that any actions undertaken towards the identified crises are considered delayed and much require more expenditure than early preventive actions against symptoms of threats would, and even in the consecutive stage against actual hazards.

A crisis is not a singular event, but a process of intertwining perils occurring at the same time and area, which constitute a threat to the subject or object of security they concern and its environment. The emergency is perceived as a phenomenon that is characterized by a high level of threat that increases in a short period of time and happens as a surprise to the security entity [21, p. 39; 14, pp. 9-17]. A deadlock is not a sudden phenomenon bearing no sign of escalation. In internal relations in the state as well as in the international arena and in other spheres of social life, there are many indications of the impending danger, but we are not always able to interpret them accordingly or for other reasons we ignore them (disregard), because frequently it is difficult to register the context in real time for one or some other event in a random chain of cause and effect [30, p. 110]. This seems to be a kind of excuse for procrastination in action - requiring situations. Many countries, in view of the information about the expanding epidemiological threat, overlooked it as soon as in December 2019, assuming that the problem may not affect them on such a drastic scale. Thus, the decision maker does not make a decision to act hoping that the symptoms of a threat or actual peril might not cause a crisis. The decision maker does not make decisions on the basis of risk anticipation, because he or she usually does not utilize scientific tools for determination [47, pp. 118-152]. Therefore, decision-making attitude is not confirmed by the foreseen risk over which one intends to take control, but the subjective perception of hazard expressed with the hope that the scale will eventually automatically decrease. Risk means anticipating threats, crisis and its consequences and is always a future event with a certain probability of occurrence [3, pp. 22-23]. "Risk is a certain figure of reflection because it considers the benefits and harms and allows you to decide today about the future" [3, p. 37].

Perception of the crisis as a natural, biological, social, political and economic phenomenon provides us with numerous interpretations. In general, within the literature on the subject, among other things, it is indicated that the crisis:

- is seen as an obstacle in the achievement of important goals that cannot be eliminated by usual means;
- prevents the control of threats by a security entity due to self-limitation;
- causes disorganization of social life, both in the individual and collective dimensions;
- is seen as an event that exceeds the ability to manage it by using normal procedures and measures;
- causes emotional, cognitive and behavioral disturbances;
- it is expressed in a subjective reaction to the present difficult circumstances or events;
- creates challenges, opportunities and threats constituting the basis for changes;
- requires innovative operating procedures and resources for its effective administration;
- forces decisions making based on incomplete data;
- causes a high risk of success in neutralizing its negative effects.

Overbearing that we do not treat the dilemma as a phase of organizational management, one should expect that extraordinary measures ought to be applied in order to neutralize the negative effects, and therefore the diagnostic assumptions that despite the threat of breaking or significant weakening social ties, disrupting the functioning of public institutions, it is still justified to apply the measures resulting from the introduction of one of the states of emergency [43, p. 61] is not particularly convincing. Latter would mean that we are not dealing with a crisis, but with a threat and the decision-maker manages towards an acceptable level of hazard. Thence, without negating the features of the crisis described in the literature, but in order to distinguish threat from crisis, we can assume

that the occurrence of internal risks is an integral part of the natural, biological, social and political conditions of each security entity.

The inevitability of threats and crises can be mitigated by an appropriate system of genesis, diagnosis, forecasting and monitoring of the symptoms. In the process of counteracting the dangers of catastrophes, it is reasonable to take control of the manifestations of threats and control their evolution in such a way as to minimize their negative effects, and therefore prevent their development into an accumulation of real perils and a crisis. It is reasonable to assume that a crisis is characterized by:

- unpredictability as to the duration and direction of the development of elements causing the crisis;
- the mass scale of perils in a large area causing the trouble;
- long-term and continuous negative impact on the socioeconomic and cultural life of citizens;
- causing unpredictable losses, the dimension of which results in an increase in expenditure aimed at returning to normal;
- failure of public institutions securing the proper functioning of the society.

The adopted premises for perception of the essence of the crisis distinguish it from threats, the accumulation of which in specific circumstances may cause a crunch, but not every danger should be interpreted as a crisis. The accumulation of hazards may cause a situation if:

- the early detection and diagnosis does not take place in due time;
- no preventive actions or measures are taken;
- no measures are taken to minimize the negative effects;
- are not be monitored after the de-escalation phase to ensure that they do not revive.

Crisis Inducing Factors

In the period dating from the conclusion of the Cold War to 2015, 124 armed conflicts of varying intensity erupted in the world [1, pp. 395-467], which in turn had an impact on the level of security of primarily the parties to the conflict and countries in their immediate vicinity, and indirectly also on safety in the region and in the world as a whole. Armed clashes are still there in the political reality of many countries, but at present a greater danger is caused by socio - civilization hazards which, due to the strongly developed globalization processes, trigger challenges, opportunities and threats for humanity without deliberately targeting specific entities [33, p. 284- 318; 3, pp. 230-268; 29, pp. 17-25; 40, pp. 172-211]. Social and civilization perils are a side effect of development processes and it could be argued that man is the perpetrator of intentional and unintentional dangers and crises as an entity managing all spheres of social life, but at the same time is also a victim of their negative outcomes.

Safety management is achieved in four stages (Fig. 1):

- prevention (monitoring the symptoms of threats and taking ongoing actions to eliminate or neutralize);
- preparation (planning activities and gathering resources to eliminate crises);
- reacting (using prepared procedures and resources assembled for this purpose);
- reconstruction (restoration of destroyed or damaged systems, objects, relations at a level which does not allow for similar hazards and losses in comparable situations).

Fig. 1: Crisis and security management

Source: own study.

In the event of an incorrect diagnosis of the symptoms of dangers and failure to implement appropriate measures, might lead to such an escalation of threats in the prevention phase, which then accumulates into a crisis. A non-monitored crisis may cause irreversible changes in a specific security system [24, p. 15]. Therefore, in the area of broadly understood safety, we use the concept of a crisis situation where there are challenges, opportunities, threats, situations and actions leading to the restoration of a disturbed level of security. Crisis situations are understood as all circumstances leading the security entity to the necessity of making decisions concerning the situation that has occurred. On the other hand, the impasse is the apogee of the symptoms of perils and actual threats that have not been eliminated or neutralized. In a crisis situation, the time and scale of menace play a dominant role. The escalation of threats in a short time determines the actions taken under time pressure, which may as well mean that we take ad hoc actions, not the optimal ones. Such an action results from the failure to identify and diagnose the symptoms of threats, which, the moment they accumulate, escalate into real hazards and may develop into a full-blown crisis.

An emergency situation and a crisis do not always have to be pejorative in meaning. Crisis situations arise not only in the aspect of threats, but above all in the facet of changes. Identifying and acting on the causes of deadlocks is the main task of all state services responsible for security [27, pp. 8-20]. Differently, all actions taken on identified crises are overdue reactions. Crisis situations are determined by the boundary between accepted and unacceptable risks. A defined level of threat always occurs, but it cannot be delineated as a permanent state of crisis. Hence, it is required to exemplify the social acceptance level of perils [21, p. 44]. We will talk about a crisis situation if the level of accepted threat escalates beyond its limits and creates hazards that are unacceptable in the light of international and national law and in the public awareness.

From the very beginning of its existence, humanity had to deal with problematic situations and various crises. International security concerns not only political and military issues, but also financial, energy, economic, ecological, demographic, information and many others [37, p. 15]. They are triggered by: random events, deliberate actions, personal failures and failures of international and national institutions.

We live in an uncertain environment where, apart from positive values, there are also negative ones, causing a state of imbalance and even exclusion [3; 2]. All crises cannot be predicted, and therefore we are not able plan countermeasures against the unforeseen ones. We may however reduce the

symptoms influencing the crisis and minimize the effects. From here the need to identify the critical factors. An emergency is a special phenomenon that occurs within general, sometimes prolonged, processes of change. It is an immanent part of our life, it concerns us all, it is desirable even, because as a result of the crisis we may diagnose all the weaknesses of security management, but for this reason only we ought not to cause it.

The sources of the crisis should be attributed to human activity because man is the direct or indirect perpetrator of taking certain dicey actions or in critical situations responsible for not taking any, or worse taking, wrong actions.

In the literature on the subject, there are crises:

- physiological and psychological related to the functioning of the subject of action;
- social, the source of which is the communal environment of human functioning;
- ecological, threatening and violating the balance in nature;
- economic, based on the functioning shape of the economy;
- political and political-military, which in fact have the same cause, but the level of resources involved in their neutralization or liquidation varies [5, pp. 123-138].

Crisis is a phenomenon that accumulates numerous threats and is rarely homogeneous, therefore it seems reasonable to perceive crises in a heterogeneous perspective. Generalizing the above assumptions, it is purposeful to look for the origins of crises and emergency situations in the conditions:

- political and military, where political contradictions create tense situations leading in extreme form to a military crisis in international or internal relations;
- economic and social, where the disturbance of market mechanisms may result in a set of threats not only to the economic but also to the social sphere;
- social-behavioral, where failure to meet basic human needs causes violent social reactions;
- civilization and ecological, where the processes of controlling nature by humans cause, unintended side effects (disturbance of the balance in nature) causing ecological perils;
- physical-geographic, in which the morphological conditions of the universe or reckless human activity lead to threats [9, p. 66].

Regardless of the nature of the crisis, its key participant will always be a human being who is the subject of action and the object at which the negative effects of the crisis are directed.

Ending

Crisis is identified among many areas of practical and scientific activity and, for the most part, it refers to threats and challenges (much less often to opportunities) for political systems, territorial integrity, economic stability, life and health of people, goods and the environment [18, p. 11]. Classic emergency situations and troubles are characterized by: a violent course of the process, the suddenness of the resulting conflict, the immediate development of events, high social importance of cases, social tension, contradictions of interests, spontaneity of behavior, aggression towards the other party to the conflict, as well as being stretched in time and often remain hidden for a period of time [28, pp. 41-42]. A crisis is a component of an emergency situation, however, hazards do not always escalate into a full scale crisis, because with proper safety management, symptoms of threats and actual perils as a result of their generation, diagnosis, forecasting and monitoring are neutralized or eliminated at an early stage of their development [47]. Overusing the term crisis to describe all difficult situations resulted in its devaluation. By the term crisis, we should describe situations that cannot be dealt with by standard procedures and accumulated resources. A crisis combining many threats is a challenge for security since it requires the use of non-standard operating procedures and the implementation of extraordinary measures to inhibit the development, and then to neutralize its destructive nature also rebuild the damage caused to a certain level that immunizes the security environment against similar dangers. A crisis occurs when the prepared procedures and resources are

inadequate to the existing threats, and the entity managing the crisis does not have the possibility of their elimination or neutralization at the social level accepted. The world is in crisis because it does not have certain procedures (free development of infections or their maximum reduction) and measures (vaccines) that can neutralize the pandemic to a socially acceptable level that would be viewed as a crisis situation, not a crisis.

Abstract

The debate about overreliance on oil and its non-sustainability to resolve major economic problems in Nigeria has shifted more attention to the real sector of the Nigerian economy. Over a few years ago, the government and the monetary authority have refocused their economic and policy decisions to include the growth of the sector. In achieving this, the government has, among its policy approaches, used the monetary policy instrument to improve the sector and addressed some of the problems that have bedeviled the sector over the past years. This study reexamined the channel through which monetary policy affects each sector of the real economy, using the structural vector autoregression (SVAR). Seasonally adjusted quarterly data between the period of 2008Q1 and 2018Q4 were used for the study. The results revealed that credit and asset price channels are the most dominant monetary policy transmission channels to the sectoral real sector. However, the intervening role of credit risk in the effectiveness of monetary policy to the real sector was established, as it reordered the percentage response of sectoral outputs to shocks from the variables that represent channels of monetary policy transmission to the real sector. This study, therefore, recommends that the monetary authority should always consider credit risk, while taking real sector targeted policy decisions in order to predictably forecast the expected results of its policy actions; so as to improve real sector performance.

Keywords: Real Sector, Monetary Policy, Credit Risk, Structural Vector Autoregression (SVAR)

Introduction

In the modern-day discussions on sustainable economic development, the real sector is among the sectors that have been considered as major drivers of economic performance (Adeusi and Aluko, 2015). In the past few years in Nigeria, there has been a deliberate effort by the governments, where they have focused more on the sector, to complement and save the country from frequent economic shock from oil. The Nigerian economy has over the years been tied to her crude oil. This resulted in neglect of the real sector that was the pride of the nation and major source of foreign exchange before and after independence, until the discovery of oil. Monetary and fiscal policies have always been the major tools used by the governments across the globe, including Nigeria, to improve economic performance, and studies have been carried out to assess their effects on the economy (Oboh, 2017; Ajayi and Aluko, 2017 and Adegoriola, 2018). The Nigerian government, through the monetary authority, has embarked on a series of policy actions, which are targeted at reviving the sector. Among these is the transmission of credit to the real sector, by influencing the banking system, through appropriate monetary policy instruments. This has not yielded the expected result, if the recent circulars of the Central Bank of Nigeria (CBN) to the deposit money banks are anything to go by (CBN Circular July 03, 2019; CBN Circular July 10, 2019). In July 2019, the CBN increased the minimum loan to deposit ratio of the

OLADIMEJI, Ebenezer BOWALE and Henry OKODUA "Re-examining Monetary Policy Effects and Sectoral Real Sector in Nigeria" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

deposit money banks from 58.5 percent to 60 percent to mandate them to increase lending to the real sector. This came with a penalty of additional cash reserve requirement of 50 percent of the lending shortfall of the target loan to deposit ratio, for banks that fail to comply with the directives. Another circular was published by the same CBN in September 2019, where it further increased the minimum loan to deposit ratio from 60 percent to 65 percent, with a stiffer sanction for non-compliance by the deposit money banks. In the statement of the CBN, the move is to facilitate greater investment in the real sector. Evidence from all of this is that the banking system sometimes limits their credit to the real sector. One of such reasons for this is the failure of the real sector investors to meet up with their loan repayment obligations, which is called credit risk or default risk in the literature (De Guimarães and Feijó, 2011; Ahiawodzi and Sackey 2013; Doriana, 2015). **This study will reexamine this process of monetary policy effects on each subsector of the real sector**; considering the intervening role of credit risk in the relationship between monetary policy and the real sector. The remaining part of this paper is organized into section two to section six. Section two focuses on the review of relevant literature; section three showcases the methodology and data used for the study, while section four details the results and discussions. In sections five and six, the conclusion and recommendation for policy implications are respectively presented.

Literature Review

Ayodeji and Oluwole (2018) used Johansen co-integration and vector error correction mechanism to examine the impact of monetary policy on the economy in Nigeria. The gross domestic product, broad money supply, interest rate, liquidity rate, and exchange rate were used as explanatory variables in the model. As revealed by the study, the exchange rate and money supply had a positive but fairly insignificant impact on the economy. Further findings showed a long-run relationship between monetary policy and the economy. The liquidity ratio was included in the model to determine output growth. However, the cash reserve ratio would have been a better variable. Liquidity ratio is the ratio of deposit that banks must hold in high liquid assets; cash reserve ratio is the ratio of deposit that must be kept with the central bank, which thereby determines the capacity of banks to lend to the productive sector.

With multiple regression analysis, Ekwe, Ogbonnaya and Omodero (2017) assessed the impact of monetary policy on the Nigerian economy. Their model contained gross domestic product, credit to private sector and money supply. They found that the monetary policy had no significant impacts on the economy, and discovered that that the broad money supply had not been adequately regulated. It was further established that the bank lending rate to the private sectors was so high that it adversely affected the Nigerian economy. However, Ekwe et al., (2017) used money supply and credit to private sector as the only monetary variable to explain the Nigerian economy; this was represented by GDP. The model specification may suffer error of omitted variables, as the model is more of a closed one. Nigeria is an open economy with the rest of the world, so interest rate and exchange rate are key variables that influence the output in Nigeria.

Elem-Uche, Omekara, Okereke and Madu (2019), using the variables that reveal different types of monetary policy transmission channels, employed vector error correction model to forecast real output in Nigeria. According to the co-integration result, the monetary policy variable cointegrated with its channels of transmission, while credit channel, exchange rate and money supply channel accounted for the variations in real output in the short run. In the long-run, real output values adjusted speedily to the changes in the money supply, credit channel, interest rate and exchange rate channel. Taking some variables into account, the authors noted that the success and growth of the real sector depend on the efficacy of the monetary policy to forecast its policy outcome. They concluded that the influence of monetary policy channels is significant to stabilize Nigeria's economy

Abuka, Alinda, Minoiu, Peydro and Presbitero (2019) studied the monetary policy and bank lending in developing countries. According to the authors, a statement of weak or nonexistent bank lending channel in developing countries has existed for a long time, and they tried to revisit it, using Uganda as a case study. Their results showed that monetary policy contraction caused a reduction in bank credit supply to firms and affected economic activity, and the concluded that monetary policy can be an effective macroeconomic tool in developing countries. However, using only one country's result to generalize the experience of all the developing nations is doubtful. More data from more than one

developing countries should have been included in the model for a balanced and more inclusive research outcomes.

CBN (2014) studied the effect of monetary policy on the Nigerian real economy at a disaggregated level with SVAR econometric technique. Using a quarterly data from the period of 1993Q1 to 2012Q4 to show how the outputs from the various subsectors respond to unanticipated monetary policy shocks, the study's result showed evidence of heterogeneous response of sectoral output to contractionary monetary policy shock. As further revealed by the forecast error variance decomposition, the most important variable that explains the variation in sectoral is money supply, which represents the credit channel. The variations in sectoral real output is not significantly explained by monetary policy rate and exchange rate.

Patrick and Akanbi (2017) used Zambia as a case study to assessed the relative importance of the channels of monetary policy transmission in a developing country. Using vector autoregressive econometric method to estimate the variables in the model, the authors found the exchange rate and credit channels to be effective monetary policy transmission channels. Further findings showed that interest rate channel was weak and asset price channel was not important. However, broad money supply was among the variables in the model specification on page 155, but what was eventually used by the authors in their analysis on page 157 and 159 was a narrow money supply. Broad money supply is a better representation of the stock of money in circulation. Patrick and Akanbi (2017) replaced it with narrow money supply without justification. This may have biased the results.

Herradi and Leroy (2019) used twelve advanced economies which included Australia, Canada, Germany, France, Italy, Denmark, Japan. United Kingdom, Sweden, Netherlands, Norway, United States, and Netherlands to assess the implication of monetary policy from a long-run perspective. Using local projections and a panel vector autoregressive method, they considered consumer price index, real gross domestic product, stock prices, national income, and nominal short term interest rate. According to the results, the expansionary monetary policy strongly increased the share of national income held by these countries, but contractionary monetary policy behaved in the opposite direction. This effect of monetary policy was caused by higher asset prices. However, few of the monetary policy transmission channels were considered; only variables that captured exchange rate, interest rate, and asset price channels were captured in their model. For instance, credit channel was not accounted for and no justification was given for this. Even if previous studies had established a weak credit channel in these countries, the authors should have mentioned it.

Ahiawodzi and Sackey (2013) conducted a study on the reasons for the credit rationing behavior of DMBs to the private sector, even when interest rates were liberalized to ensure credit allocation. According to the study, banks consider other factors in determining how they allocate their funds to borrowers. One of such variable is credit risk, which increases borrowers' rate of default, including the real sector investors. They concluded by recommending an active role by the government in the financial sector, while banks should also strengthen their loan monitoring system. This will help to control the rate of default, as against their traditional method of credit rationing. De Guimarães and Feijó (2011) confirmed in their study that the macroeconomic environment contributes significantly to banks' credit risk.

Methodology and Data

A Structural Vector Autoregressive (SVAR) econometric approach is used for this study. All the quarterly data, which were mainly sourced from CBN statistical bulletin, were adjusted for seasonal variations, using Census X-13. These are sectoral real output data on agriculture, manufacturing, construction, trade, and services and respectively represented as $y_{t\,Agriculture}$, $y_{t\,Manufacturing}$, $y_{t\,Construction}$, $y_{t\,Trade}$, $y_{t\,Services}$. Other variables in the model are interest rate (r), monetary policy rate (mpr), exchange rate (ner), maximum lending rate (mlr), asset price (Pa), broad money supply (m2), and credit to real sector (crs). Tests of stability, unit root and autocorrelation were also conducted.

Model Specification and Identification

The structure of the economy is represented by the structural form in equation (1).

$$\Lambda x_t = \varphi + \sum_{j=1}^{p} \omega_j x_{t-j} + \Psi e_t \quad (1)$$

Λ is the coefficient matrix of vector of endogenous macroeconomic variable x_t. φ is the vector of constants. Ψ is the contemporaneous response of the variables to the shocks. ω_j is the coefficient matrix of the vector of lagged values of endogenous variables, where $\omega_j = 1,..., p$. x_t is a vector of macroeconomic variables. e_t is a vector of serially uncorrelated structural shocks with zero mean and diagonal variance co-variance matrix that is time invariant, represented as $\mathrm{E}\left[\varepsilon_t \varepsilon_t^{'}\right] = \Omega$; where $e_t \sim iid\ N_n(0,\Omega)$. This means the random variables are independent, identically distributed with the same distributions, but may be contemporaneously correlated. The structural equation is represented below in its implicit form:

$$mpr_t = f\begin{pmatrix} r_t, ner_t, p_{a_t}, mlr_t, cr_t, crs_t, m2_t, y_t, mpr_{t-j}, r_{t-j}, ner_{t-j}, p_{a_{t-j}}, \\ mlr_{t-j}, cr_{t-j}, crs_{t-j}, m2_{t-j}, y_{t-j} \end{pmatrix} \quad (2)$$

$$r_t = f\begin{pmatrix} mpr_t, ner_t, p_{a_t}, mlr_t, cr_t, crs_t, m2_t, y_t, mpr_{t-j}, r_{t-j}, ner_{t-j}, p_{a_{t-j}}, \\ mlr_{t-j}, cr_{t-j}, crs_{t-j}, m2_{t-j}, y_{t-j} \end{pmatrix} \quad (3)$$

$$ner_t = f\begin{pmatrix} mpr_t, r_t, p_{a_t}, mlr_t, cr_t, crs_t, m2_t, y_t, mpr_{t-j}, r_{t-j}, ner_{t-j}, p_{a_{t-j}}, \\ mlr_{t-j}, cr_{t-j}, crs_{t-j}, m2_{t-j}, y_{t-j} \end{pmatrix} \quad (4)$$

$$p_{at} = f\begin{pmatrix} mpr_t, r_t, ner_t, mlr_t, cr_t, crs_t, m2_t, y_t, mpr_{t-j}, r_{t-j}, ner_{t-j}, p_{a_{t-j}}, \\ mlr_{t-j}, cr_{t-j}, crs_{t-j}, m2_{t-j}, y_{t-j} \end{pmatrix} \quad (5)$$

$$mlr_t = f\begin{pmatrix} mpr_t, r_t, ner_t, p_{at}, cr_t, crs_t, m2_t, y_t, mpr_{t-j}, r_{t-j}, ner_{t-j}, p_{a_{t-j}}, \\ mlr_{t-j}, cr_{t-j}, crs_{t-j}, m2_{t-j}, y_{t-j} \end{pmatrix} \quad (6)$$

$$cr_t = f\begin{pmatrix} mpr_t, r_t, ner_t, p_{at}, mlr_t, crs_t, m2_t, y_t, mpr_{t-j}, r_{t-j}, ner_{t-j}, p_{a_{t-j}}, \\ mlr_{t-j}, cr_{t-j}, crs_{t-j}, m2_{t-j}, y_{t-j} \end{pmatrix}$$

(7)

$$crs_t = f\begin{pmatrix} mpr_t, r_t, ner_t, p_{at}, mlr_t, cr_t, m2_t, y_t, mpr_{t-j}, r_{t-j}, ner_{t-j}, p_{a_{t-j}}, \\ mlr_{t-j}, cr_{t-j}, crs_{t-j}, m2_{t-j}, y_{t-j} \end{pmatrix}$$

(8)

$$m2_t = f\begin{pmatrix} mpr_t, r_t, ner_t, p_{at}, mlr_t, cr_t, crs_t, y_t, mpr_{t-j}, r_{t-j}, ner_{t-j}, p_{a_{t-j}}, \\ mlr_{t-j}, cr_{t-j}, crs_{t-j}, m2_{t-j}, y_{t-j} \end{pmatrix}$$

(9)

$$y_t = f\begin{pmatrix} mpr_t, r_t, ner_t, p_{at}, mlr_t, cr_t, crs_t, m2_t, mpr_{t-j}, r_{t-j}, ner_{t-j}, p_{a_{t-j}}, \\ mlr_{t-j}, cr_{t-j}, crs_{t-j}, m2_{t-j}, y_{t-j} \end{pmatrix}$$

(10)

y_t is the aggregate real sector. At the sectoral level, y_t is respectively replaced by $y_{t\,Agriculture}$, $y_{t\,Manufacturing}$, $y_{t\,Construction}$, $y_{t\,Trade}$ and $y_{t\,Services}$. In the equations, each endogenous variable is a function of all other endogenous variables and lag values of all the endogenous variables in the model. By the explicit form, the equations are represented below:

$$mpr_t = \varphi_{10} - r_t - ner_t - p_{a_t} - mlr_t - cr_t - crs_t - m2_t - y_t + \sum_{t-j}^{p} \varphi_{11} mpr_{t-j} + \sum_{t-j}^{p} \varphi_{12} r_{t-j}$$
$$+ \sum_{t-j}^{p} \varphi_{13} ner_{t-j} + \sum_{t-j}^{p} \varphi_{14} p_{a_{t-j}} + \sum_{t-j}^{p} \varphi_{15} mlr_{t-j} + \sum_{t-j}^{p} \varphi_{16} cr_{t-j} + \sum_{t-j}^{p} \varphi_{17} crs_{t-j} + \sum_{t-j}^{p} \varphi_{18} m2_{t-j}$$
$$+ \sum_{t-j}^{p} \varphi_{19} y_{t-j} + e_t^{mpr_t}$$

(11)

$$r_t = \varphi_{20} - mpr_t - ner_t - p_{a_t} - mlr_t - cr_t - crs_t - m2_t - y_t + \sum_{t-j}^{p} \varphi_{21} mpr_{t-j} + \sum_{t-j}^{p} \varphi_{22} r_{t-j}$$
$$+ \sum_{t-j}^{p} \varphi_{23} ner_{t-j} + \sum_{t-j}^{p} \varphi_{24} p_{a_{t-j}} + \sum_{t-j}^{p} \varphi_{25} mlr_{t-j} + \sum_{t-j}^{p} \varphi_{26} cr_{t-j} + \sum_{t-j}^{p} \varphi_{27} crs_{t-j} + \sum_{t-j}^{p} \varphi_{28} m2_{t-j}$$
$$+ \sum_{t-j}^{p} \varphi_{29} y_{t-j} + e_t^{r_t}$$

(12)

$$ner_t = \varphi_{30} - mpr_t - r_t - p_{a_t} - mlr_t - cr_t - crs_t - m2_t - y_t + \sum_{t-j}^{p} \varphi_{31} mpr_{t-j} + \sum_{t-j}^{p} \varphi_{32} r_{t-j}$$
$$+ \sum_{t-j}^{p} \varphi_{33} ner_{t-j} + \sum_{t-j}^{p} \varphi_{34} p_{a_{t-j}} + \sum_{t-j}^{p} \varphi_{35} mlr_{t-j} + \sum_{t-j}^{p} \varphi_{36} cr_{t-j} + \sum_{t-j}^{p} \varphi_{37} crs_{t-j} + \sum_{t-j}^{p} \varphi_{38} m2_{t-j}$$
$$+ \sum_{t-j}^{p} \varphi_{39} y_{t-j} + e_t^{ner_t}$$

(13)

$$p_{a_t} = \varphi_{40} - mpr_t - r_t - ner_t - mlr_t - cr_t - crs_t - m2_t - y_t + \sum_{t-j}^{p} \varphi_{41} mpr_{t-j} + \sum_{t-j}^{p} \varphi_{42} r_{t-j}$$
$$+ \sum_{t-j}^{p} \varphi_{43} ner_{t-j} + \sum_{t-j}^{p} \varphi_{44} p_{a_{t-j}} + \sum_{t-j}^{p} \varphi_{45} mlr_{t-j} + \sum_{t-j}^{p} \varphi_{46} cr_{t-j} + \sum_{t-j}^{p} \varphi_{47} crs_{t-j} + \sum_{t-j}^{p} \varphi_{48} m2_{t-j}$$
$$+ \sum_{t-j}^{p} \varphi_{49} y_{t-j} + e_t^{p_{at}}$$

(14)

$$mlr_t = \varphi_{50} - mpr_t - r_t - ner_t - p_{at} - cr_t - crs_t - m2_t - y_t + \sum_{t-j}^{p} \varphi_{51} mpr_{t-j} + \sum_{t-j}^{p} \varphi_{52} r_{t-j}$$
$$+ \sum_{t-j}^{p} \varphi_{53} ner_{t-j} + \sum_{t-j}^{p} \varphi_{54} p_{a_{t-j}} + \sum_{t-j}^{p} \varphi_{55} mlr_{t-j} + \sum_{t-j}^{p} \varphi_{56} cr_{t-j} + \sum_{t-j}^{p} \varphi_{57} crs_{t-j} + \sum_{t-j}^{p} \varphi_{58} m2_{t-j}$$
$$+ \sum_{t-j}^{p} \varphi_{59} y_{t-j} + e_t^{mlr_t}$$

(15)

$$cr_t = \varphi_{60} - mpr_t - r_t - ner_t - p_{at} - mlr_t - crs_t - m2_t - y_t + \sum_{t-j}^{p} \varphi_{61} mpr_{t-j} + \sum_{t-j}^{p} \varphi_{62} r_{t-j}$$

$$+ \sum_{t-j}^{p} \varphi_{99} y_{t-j} + e_t^{y_t} \tag{19}$$

The structural shocks $e_t^{mpr_t}, e_t^{r_t}, e_t^{ner_t}, e_t^{p_{at}}, e_t^{mlr_t}, e_t^{cr_t}, e_t^{crs_t}, e_t^{m2_t}, e_t^{y_t}$ are independent, identically distributed; the variance co-variance matrix is constant over time and are serially uncorrelated with zero mean as shown in equation (20).

$$\begin{pmatrix} e_t^{mpr_t} \\ e_t^{r_t} \\ e_t^{ner_t} \\ e_t^{p_{at}} \\ e_t^{mlr_t} \\ e_t^{cr_t} \\ e_t^{crs_t} \\ e_t^{m2_t} \\ e_t^{y_t} \end{pmatrix} iid \left(\begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} \sigma^2_{mpr_t} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & \sigma^2_{r_t} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & \sigma^2_{ner_t} & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \sigma^2_{p_{at}} & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & \sigma^2_{mlr_t} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & \sigma^2_{cr_t} & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & \sigma^2_{crs_t} & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sigma^2_{m2_t} & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sigma^2_{y_t} \end{pmatrix} \right) \tag{20}$$

Representing equations (11) to (19) in matrix form, all the endogenous variables in each equation are expressed in terms of lag values of other endogenous variables:

$$\begin{pmatrix} 1 & c_{12} & c_{13} & c_{14} & c_{15} & c_{16} & c_{17} & c_{18} & c_{19} \\ c_{21} & 1 & c_{23} & c_{24} & c_{25} & c_{26} & c_{27} & c_{28} & c_{29} \\ c_{31} & c_{32} & 1 & c_{34} & c_{35} & c_{36} & c_{37} & c_{38} & c_{39} \\ c_{41} & c_{42} & c_{43} & 1 & c_{45} & c_{46} & c_{47} & c_{48} & c_{49} \\ c_{51} & c_{52} & c_{53} & c_{54} & 1 & c_{56} & c_{57} & c_{58} & c_{59} \\ c_{61} & c_{62} & c_{63} & c_{64} & c_{65} & 1 & c_{67} & c_{68} & c_{69} \\ c_{71} & c_{72} & c_{73} & c_{74} & c_{75} & c_{76} & 1 & c_{78} & c_{79} \\ c_{81} & c_{82} & c_{83} & c_{84} & c_{85} & c_{86} & c_{87} & 1 & c_{89} \\ c_{91} & c_{92} & c_{93} & c_{94} & c_{95} & c_{96} & c_{97} & c_{98} & 1 \end{pmatrix} \begin{pmatrix} mpr_t \\ r_t \\ ner_t \\ p_{at} \\ mlr_t \\ cr_t \\ crs_t \\ m2_t \\ y_t \end{pmatrix} = \begin{pmatrix} \varphi_{10} \\ \varphi_{20} \\ \varphi_{30} \\ \varphi_{40} \\ \varphi_{50} \\ \varphi_{60} \\ \varphi_{70} \\ \varphi_{80} \\ \varphi_{90} \end{pmatrix} + \begin{pmatrix} \omega_{11} & \omega_{12} & \omega_{13} & \omega_{14} & \omega_{15} & \omega_{16} & \omega_{17} & \omega_{18} & \omega_{19} \\ \omega_{21} & \omega_{22} & \omega_{23} & \omega_{24} & \omega_{25} & \omega_{26} & \omega_{27} & \omega_{28} & \omega_{29} \\ \omega_{31} & \omega_{32} & \omega_{33} & \omega_{34} & \omega_{35} & \omega_{36} & \omega_{37} & \omega_{38} & \omega_{39} \\ \omega_{41} & \omega_{42} & \omega_{43} & \omega_{44} & \omega_{45} & \omega_{46} & \omega_{47} & \omega_{48} & \omega_{49} \\ \omega_{51} & \omega_{52} & \omega_{53} & \omega_{54} & \omega_{55} & \omega_{56} & \omega_{57} & \omega_{58} & \omega_{59} \\ \omega_{61} & \omega_{62} & \omega_{63} & \omega_{64} & \omega_{65} & \omega_{66} & \omega_{67} & \omega_{68} & \omega_{69} \\ \omega_{71} & \omega_{72} & \omega_{73} & \omega_{74} & \omega_{75} & \omega_{76} & \omega_{77} & \omega_{78} & \omega_{79} \\ \omega_{81} & \omega_{82} & \omega_{83} & \omega_{84} & \omega_{85} & \omega_{86} & \omega_{87} & \omega_{88} & \omega_{89} \\ \omega_{91} & \omega_{92} & \omega_{93} & \omega_{94} & \omega_{95} & \omega_{96} & \omega_{97} & \omega_{98} & \omega_{99} \end{pmatrix} *$$

$$\begin{pmatrix} mpr_{t-j} \\ r_{t-j} \\ ner_{t-j} \\ p_{at-j} \\ mlr_{t-j} \\ cr_{t-j} \\ crs_{t-j} \\ m2_{t-j} \\ y_{t-j} \end{pmatrix} + \begin{pmatrix} e_t^{mpr_t} \\ e_t^{r_t} \\ e_t^{ner_t} \\ e_t^{p_{at}} \\ e_t^{mlr_t} \\ e_t^{cr_t} \\ e_t^{crs_t} \\ e_t^{m2_t} \\ e_t^{y_t} \end{pmatrix} \quad (21)$$

The structural form equations above cannot be estimated with OLS. This is the major problem with structural equations because the regressors are correlated with the error term and this violates an important assumption of OLS; as a result, no reliable estimates can be arrived at (Claudia and Massimiliano 2014). This problem can however be solved if equation (1) is considered in its reduced form VAR, by pre-multiplying the structural equation by the inverse of the coefficient matrix of the vector of the endogenous macroeconomic variables x_t .

$\Lambda^{-1}\Lambda x_t = \Lambda^{-1}\varphi + \sum_{j=1}^{p}\Lambda^{-1}\omega_j x_{t-j} + \Lambda^{-1}\Psi e_t$; This can further be simplified as $x_t = \Lambda^{-1}\varphi + \sum_{j=1}^{p}\Lambda^{-1}\omega_j x_{t-j} + \Lambda^{-1}\Psi e_t$; Hence $x_t = d + \sum_{j=1}^{p} D_j x_{t-j} + \varepsilon_t$. Where $d = \Lambda^{-1}\varphi$; $D_j = \Lambda^{-1}\omega_j$; $\varepsilon_t = \Lambda^{-1}\Psi e_t$; $For \quad j = 1,...,p$

$\Sigma_\varepsilon = \mathrm{E}\left(\varepsilon_t \varepsilon_t^{'}\right) = \Lambda^{-1}\Psi \mathrm{E}\left(e_t e_t^{'}\right)\Lambda^{-1'}\Psi^{'} = \Lambda^{-1}\Psi\Psi^{-1}\Omega\Lambda^{-1'} = \Lambda^{-1}\Omega\Lambda^{-1^{'}}$; $\Psi\Psi^{-1} = 1$;

$\Sigma_\varepsilon = \Lambda^{-1}\Omega\Lambda^{-1^{'}}$; $\varepsilon_t \sim iid \ N_n\left(0, \Sigma_\varepsilon\right)$

The reduced form VAR of equation (21) now becomes:

$$\begin{pmatrix} mpr_t \\ r_t \\ ner_t \\ p_{at} \\ mlr_t \\ cr_t \\ crs_t \\ m2_t \\ y_t \end{pmatrix} = \begin{pmatrix} d_{10} \\ d_{20} \\ d_{30} \\ d_{40} \\ d_{50} \\ d_{60} \\ d_{70} \\ d_{80} \\ d_{90} \end{pmatrix} + \begin{pmatrix} D_{11} & D_{12} & D_{13} & D_{14} & D_{15} & D_{16} & D_{17} & D_{18} & D_{19} \\ D_{21} & D_{22} & D_{23} & D_{24} & D_{25} & D_{26} & D_{27} & D_{28} & D_{29} \\ D_{31} & D_{32} & D_{33} & D_{34} & D_{35} & D_{36} & D_{37} & D_{38} & D_{39} \\ D_{41} & D_{42} & D_{43} & D_{44} & D_{45} & D_{46} & D_{47} & D_{48} & D_{49} \\ D_{51} & D_{52} & D_{53} & D_{54} & D_{55} & D_{56} & D_{57} & D_{58} & D_{59} \\ D_{61} & D_{62} & D_{63} & D_{64} & D_{65} & D_{66} & D_{67} & D_{68} & D_{69} \\ D_{71} & D_{72} & D_{73} & D_{74} & D_{75} & D_{76} & D_{77} & D_{78} & D_{79} \\ D_{81} & D_{82} & D_{83} & D_{84} & D_{85} & D_{86} & D_{87} & D_{88} & D_{89} \\ D_{91} & D_{92} & D_{93} & D_{94} & D_{95} & D_{96} & D_{97} & D_{98} & D_{99} \end{pmatrix} * \begin{pmatrix} mpr_{t-j} \\ r_{t-j} \\ ner_{t-j} \\ p_{at-j} \\ mlr_{t-j} \\ cr_{t-j} \\ crs_{t-j} \\ m2_{t-j} \\ y_{t-j} \end{pmatrix} + \begin{pmatrix} \varepsilon_t^{mpr_t} \\ \varepsilon_t^{r_t} \\ \varepsilon_t^{ner_t} \\ \varepsilon_t^{p_{at}} \\ \varepsilon_t^{mlr_t} \\ \varepsilon_t^{cr_t} \\ \varepsilon_t^{crs_t} \\ \varepsilon_t^{m2_t} \\ \varepsilon_t^{y_t} \end{pmatrix}$$

(22)

$\varepsilon_t^{mpr_t}, \varepsilon_t^{r_t}, \varepsilon_t^{ner_t}, \varepsilon_t^{p_{at}}, \varepsilon_t^{mlr_t}, \varepsilon_t^{cr_t}, \varepsilon_t^{crs_t}, \varepsilon_t^{m2_t}, \varepsilon_t^{y_t}$ are the reduced-form VAR error terms and are also serially uncorrelated with zero mean and independent, identically distributed; the variance co-variance matrix constant over time.

$$\begin{pmatrix} \varepsilon_t^{mpr_t} \\ \varepsilon_t^{r_t} \\ \varepsilon_t^{ner_t} \\ \varepsilon_t^{p_{at}} \\ \varepsilon_t^{mlr_t} \\ \varepsilon_t^{cr_t} \\ \varepsilon_t^{crs_t} \\ \varepsilon_t^{m2_t} \\ \varepsilon_t^{y_t} \end{pmatrix} iid \left(\begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} \sigma^2_{mpr_t} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & \sigma^2_{r_t} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & \sigma^2_{ner_t} & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \sigma^2_{p_{at}} & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & \sigma^2_{mlr_t} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & \sigma^2_{cr_t} & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & \sigma^2_{crs_t} & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sigma^2_{m2_t} & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sigma^2_{y_t} \end{pmatrix} \right)$$

(24)

However, the structure of the economy cannot be explained by the reduced-form VAR, and as such reduced-form error terms ε_t cannot be interpreted as structural shocks. Hence, it becomes impossible to uniquely determine the parameters $\varphi, \Lambda, \omega_1, ..., \omega_p, \Omega$ from $d, D_1, ..., D_p, \sum_\varepsilon$. The shocks must be correctly identified before the estimated SVAR can be used to generate impulse response functions that explain the time-dynamic effects of the monetary shocks on the sectoral real outputs. One of the solutions to this identification problem, in literature, is by zero short-run restrictions, equally known as Cholesky identification, recursive identification. According to Cooley and LeRoy (1985), the recursive identification procedure is arbitrary and it cannot be interpreted as a structural model since different variable ordering yields different structural parameters. A non-recursive restriction on the contemporaneous interactions among the variables in the model was introduced in the works of Blanchard and Watson (1986) Bernanke (1986) and Sims (1986), where identification allows for a theory based-restrictions which represent a meaningful relationship between the variables and the structural shocks. As long as the identification conditions are met, the restrictions may not be a

triangular form or recursive. If Ω is normalized as an identity matrix in which $\Omega = \mathrm{I}_k$, $\sum_\varepsilon$ becomes $\sum_\varepsilon = \Lambda^{-1}\Lambda^{-1'}$, which is symmetric and represents a system of $K(K+1)/2$ independent equations. The system in this instance can then be solved for the unknown parameters Λ^{-1}, in as much as the number of unknown parameters in Λ^{-1} is not more than the number of independent equations in $\sum_\varepsilon = \Lambda^{-1}\Lambda^{-1'}$. This will require the imposition of additional restrictions on selected elements of Λ^{-1} by making them equal to zero. The restriction is $K(K-1)/2$ zero parameters in matrix Λ. Λ is the coefficient matrix of the vector of endogenous variables in the model. A theoretical fact is used to identify the model below.

$$\begin{pmatrix} c_{12} & 0 & 0 & 0 & 0 & c_{17} & 0 & 0 \\ 1 & c_{23} & 0 & 0 & 0 & 0 & 0 & c_{29} \\ c_{32} & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & c_{59} \\ 0 & 0 & 0 & c_{65} & 1 & 0 & 0 & 0 \\ c_{72} & 0 & 0 & c_{75} & c_{76} & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & c_{89} \\ c_{92} & c_{93} & c_{94} & c_{95} & c_{96} & c_{97} & c_{98} & 1 \end{pmatrix} \begin{pmatrix} mpr_t \\ r_t \\ ner_t \\ p_{at} \\ mlr_t \\ cr_t \\ crs_t \\ m2_t \\ y_{t\,Agriculture} \end{pmatrix}$$

c_{12} represents the contemporaneous response of monetary policy rate to shocks from interest rate. This is theoretically and empirically valid as the monetary authority will adjust the monetary policy rate based on the activities in the banking system and changes in interest rate. c_{17} represents the contemporaneous response of monetary policy rate to shocks from credit to real sector. The bank lending rate and short term interest rate are affected by changes in monetary policy rate; this affects credit to sectoral real sector. So, the indirect effect of the official interest rate on credit to the sectoral real sector by the banking system can be traced. c_{21} represents the contemporaneous response of interest rate to shocks from monetary policy rate. In theory, changes to official interest rate lead to changes in the market interest rate. c_{23} represents the contemporaneous response of interest rate to shocks from exchange rate. A fall in exchange rate will cause assets denominated in local currency to suffer exchange rate risk, making foreign investors demand for higher interest rate in investing in domestic assets. c_{29} represents the contemporaneous response of interest rate to shocks from sectoral real outputs. An increase in real output requires more money to purchase goods and services. This makes owners of real and financial assets offer them for sale thereby bringing down prices of these assets. This however leads to an increase in interest rate. c_{32} represents the contemporaneous response of exchange rate to shocks from interest rate. As domestic interest rate decreases, returns on domestic assets also decrease compared to foreign assets, leading to high capital outflows and depreciation of the domestic currency, which affects the exchange rate. c_{59} represents the contemporaneous response of maximum lending rate to sectoral real output. Perceived risky productive investors are one of the categories of banks' customers. The maximum lending rate is the rate at which credit is advanced to this category of customers for investment purposes, which ultimately leads to an increase in real output. c_{72} represents the contemporaneous response of credit to real sector to interest rate. When market interest rate declines, investment and credit to real sector are expected to increase. c_{75} represents the contemporaneous response of credit to real sector to shocks from maximum lending rate. Among other things, lending rate determines the quantity of credit banks give to their customers. c_{76} represents contemporaneous response of credit to real sector to shocks from credit risk. A high risk of default brings about higher non-performing loans, which makes banks to lower credit to sectoral real sector. c_{89} represents the contemporaneous response of broad money supply to sectoral real output. As real output increases, all things being equal, more money will be needed medium of exchanging it. c_{91} represents the contemporaneous response of sectoral real output to shocks from monetary policy rate. Real output responds to changes in monetary policy rate, through short term interest rates and other monetary policy channels. c_{92} represents the contemporaneous response of sectoral real output to shocks from interest rate. This follows is-lm framework, where changes in interest rate will affect sectoral real output through investment. c_{93} represents the contemporaneous response of sectoral real output to shocks from exchange rate. This follows exchange rate channel of monetary policy impulses. c_{94} represents the contemporaneous response of sectoral real output to shocks from asset price. When stock prices fall, the value of financial wealth decreases which leads to a reduction in consumption and sectoral real output. c_{95} represents the contemporaneous response of sectoral real output to shocks from maximum lending rate. As banks lend to each subsector of the real sector, more investments are made, leading to an increase in real output. c_{97} represents the contemporaneous response of real output to shocks from credit to real sector. Through investment, a rise in credit to real sector will increase output. c_{98} represents the contemporaneous response of sectoral real output to broad money supply. An increase in broad money supply will shift the LM curve to the right, while a decrease in broad money supply will shift the LM curve to the left. In all this, sectoral real output is affected.

The stationarity test was conducted, using Phillips Perron unit root tests. At first difference, all the variables were stationary as detailed in table 4.A.

Lag Selection Criteria

Akaike information criterion (AIC), Final Prediction Error (FPE) Hannan-Quinn information criterion (HQ) and Schwartz information criterion (SC) information criteria were used to determine the lag length. The choice of the optimum lag length used for this study is the lag which most criteria consider to be the optimum. This is indicated with an asterisk (*) in figure 4A.

Figure 4A: Lag Selection Criteria

Stability and Normality Test

The reduced form VARs are stable as detailed in figure 4B; all the roots have modulus less than one and lie inside the unit circle. The normality test results in table 4B satisfies the normality condition, as the probability value corresponding to the Jarque-Bera statistics is more than 5%; meaning that residuals are multivariate normal.

Figure 4B - Stability Condition Table

Table 4C is the SVAR result estimates of agricultural sector, including the intervening role of credit risk. It reveals the contemporaneous response of each variable to shocks from other variables in the system. For instance, the estimate of contemporaneous response of credit to real sector to shocks from credit risk is -10.41415; which indicates a reduction in credit/funds to the real sector during the period of high credit risk.

Source: Author's computation using Eviews 10

Table 4D is the SVAR result estimates of manufacturing sector, including the intervening role of credit risk. It shows the contemporaneous response of each variable to shocks from other variables in the system. The estimate of contemporaneous response of credit to real sector to shocks from credit risk is -11.67059; which suggests a reduction in credit/funds to the real sector during the period of high credit risk.

Construction

Note: ** indicates significant at 5% level, while * indicates significant at 10%
Source: Author's computation using Eviews 10

Table 4E is the SVAR result estimates of construction sector, including the intervening role of credit risk. The contemporaneous response of each variable to shocks from other variables in the system is summarized in the table. Among these is the estimate of contemporaneous response of credit to real sector to shocks from credit risk, which is -10.50587. This indicates that credit to construction sector is reduced, during the period of high credit risk.

Services

Table 4F: Summary of Services SVAR Result

Note: ** indicates significant at 5% level, while * indicates significant at 10%
Source: Author's computation using Eviews 10

The credit to the service sector, as revealed in table 4F, is also affected by high credit risk. This is evidenced by estimate of the contemporaneous response of credit to real sector to shocks from credit risk, which is -11.76111.

Trade

Table 4G: Summary of Trade SVAR Result

Factorization: Structural

In table 4J, the variation to construction output with the intervening role of credit risk is shown. According to the result, about 0.22% variation in construction output is due to shocks from the interest rate. Shocks to exchange rate accounts for 0.26% variation in the output; shocks to asset price accounts for 46.62% variation in the output, while shocks to money supply accounts for 40.36% variation in construction output.

Factorization: Structural

Without the intervening role of credit risk as revealed in table 4Ja, shocks to the interest rate is responsible for 0.30% variation in construction output. Shocks to exchange rate, asset price and money supply respectively account for about 0.09%, 41.75%, and 46.05 variation in construction output.

The trade variance decomposition result with the intervening role of credit risk is detailed in table 4L. While trade output variation of 0.27% is caused by shocks to interest rate, other variations of 0.32%, 43.45%, and 43.16% are as a result of shocks to exchange rate, asset price, and money supply.

Factorization: Structural

In table 4La, the variations of trade real output as a result of shocks to interest rate, exchange rate, asset price, and money supply are respectively 0.51, 0.07%, 40.34%, and 45.94%.

As shown in the sectoral SVAR result estimates in tables 4C, 4D, 4E, 4F and 4G, the interaction among the variables in the model follows the theoretical justifications that underscore the identification process. Most of the estimates are statistically significant at 5% level, including the contemporaneous response of credit to real sector to shocks to credit risk. With the role of credit risk in the relationship between monetary policy and the real sector, it is expected that in the period of high credit risk, less credit will be channelled or transmitted from the banking system to the real sector. This will eventually lead to a reduced impact on the real sector, as the effectiveness of the transmission chain is reduced by the intervening role of the credit risk. This is exactly the case, as shown in tables 4.H, 4.I, 4.J, 4.K and 4.L. These tables detail the channels through which the sectoral real outputs are affected or impacted, as a result of monetary policy actions of the CBN, with consideration for credit risk. When compared with the results in tables 4.Ha, 4.Ia, 4.Ja, 4.Ka and 4.La, it is evident that without the intervening role of credit risk, more money flows to the real sector through the money supply, which represents the credit channel, because money supply increases majorly as banks creates more money through credit/deposit expansion.

For instance, without the intervening role of credit risk, about an average of 42.50% and 44.81% variation or changes to agricultural output are respectively from asset price and credit channels. With the intervening role of credit risk, the monetary policy effects on the agricultural output, through the credit channel, is reduced to 40.08%; which means that during the period of high credit risk, the monetary policy effects on agricultural subsector is majorly through the asset price channel (46.36%). For the manufacturing subsector, the monetary policy effect is majorly through the credit channel, both with and without the intervening role of credit risk. However, the effect is greater without the intervening role of credit risk (63.38%) than when the intervening role of credit risk is considered (61.18%). For the construction subsector, the effects of monetary policy during the period of high credit risk is majorly through asset price channel (46.62%), while the monetary policy effect on the subsector is majorly through the credit channel, without the intervening role of credit risk (46.05%). A similar evidence is established in the trade subsector, where about and average of 43.45% changes to trade output is through the asset price channel in a period of high credit risk and 45.94% variation in the said subsector is through the credit channel, without the intervening role of credit risk. However, the credit channel in the services subsector is the major channel, both with and without the intervening role of credit risk; but the effect is lesser during the period of high credit risk. Further findings revealed that the interest and exchange rate channels are very weak in transmitting monetary policy effects to all the subsectors, as the changes to the sectoral real outputs are insignificant.

Comparing this study's results with the result of the study carried out by the Central Bank of Nigeria (CBN, 2014), the following analysis can be arrived at: The CBN established that (a) There is an evidence of heterogeneous response of sectoral output to contractionary monetary policy shock. (b) As revealed by the forecast error variance decomposition, the most important variable that explains the variation in the subsectors is money supply, which represents the credit channel. (c) The variations in

sectoral real output is not significantly explained by monetary policy rate and exchange rate. This above analysis is similar to the findings of this study, without the intervening role of credit risk. The monetary policy, interest, and exchange rates' contributions to the variations in sectoral outputs is insignificant. The variation to real output is majorly explained by money supply (which represents the credit channel) and asset price variables. However, the result is different, with the intervening role of credit risk. The asset price channel is the most effective in the agricultural, construction, and trade subsectors, during the period of high credit risk; while the effect of credit channel is reduced, in the manufacturing and services subsectors, with the intervening role of credit risk. This is one of the major contributions of this study.

Conclusion

The real sector in Nigeria has been given some level of attention in the past few years. This is a deliberate action to improve the sector and reduce overdependence on oil. This policy action includes influencing the banking system to channel more funds to the sector, through the use of monetary policy instruments. This study reexamined the sectoral effects of this process, using SVAR econometric technique with seasonally adjusted quarterly data spanning from 2008Q1 to 2018Q4. The results showed that monetary policy significantly impacts on the sectoral real sector. The credit and asset price channels are the two major channels of transmitting monetary policy effects to the agricultural, manufacturing, construction, services and trade subsectors. However, in the period of high credit risk, the credit channel transmits lesser monetary policy effects to the real sector than the asset price channel.

Recommendation

Evidence from the research findings revealed that all the subsectors of the real sector respond differently to the monetary policy actions of the Central Bank of Nigeria. Therefore, this study recommends that the monetary authority should always consider each subsector separately, by disaggregating the policy objectives to achieve the desired goals.

Abstract

The ancient Olympia is the birthplace of Olympic Games which have started on 776B.C. in Greece. Ancient Olympia was, also, a place for the worship of Zeus, the Head of the 12 Gods in ancient Greece .Relevant research includes the papers of The Temple of Zeus was the largest and most important building at Olympia and was one of the largest Doric temples in Greece. The statue of Zeus within the temple was made by Pheidias (who had worked on the Parthenon and its statue of Athena) and was a solid gold and ivory representation of Zeus seated on a throne. It was regarded as one of the Seven Wonders of the Ancient World. Every four years the modern Olympic games are taking place in a city around the World and in the place of ancient Olympia in Greece the lightning ceremony is taking place for the lightning of the Olympic flame. Although the Ancient Olympia is a world-famous heritage sports place, few attempts have been made to market this place as an important tourist destination and to increase the loyalty of tourists visiting it. In this paper we attempt to describe the ruins of ancient Olympia, the buildings, the stadium and the history of the Olympic games. We define and we review critically an alternative kind of tourism, the heritage sports tourism. We find some weaknesses in the accessibility of ancient Olympia as a tourist destination. Finally, we suggest some improvements in the image of the tourist destination of ancient Olympia employing the immense power of Social Media and some ways of improving the accessibility to this important place of Greece.

Keywords: Ancient Olympia, Loyalty, Satisfaction, Promotion of tourist destination

Introduction and Literature Review

The Olympic Games started at ancient Olympia, which is a place on the North West of Peloponesse in Southern Greece. The Olympics are an important part of world history, (Callebat,1998). There is an extensive research about the world-famous event, which is taking place every four years, the Olympic Games. The reader can look at the papers of Barringer (2005); Pleket (2004); Crowther (1996); Lee (1998); Gibson, Attle and Yannakis (1998d); Crowther (2010); Tersini (1987); Randall (2011); Gibson (1998a,1998c); and Vitouladiti and Katsari (2014).

In the 10th century B.C., Olympia became the top place for the worship of Zeus. Because of the religious and sports importance of ancient Olympia, this place has one of the highest concentrations of masterpieces from the ancient Greek world. In addition to temples, there are the ruins of all the stadiums built for the Olympics, which were held in Olympia every four years beginning in 776 B.C. The Temple of Zeus was the largest and most important building at Olympia and was one of the largest Doric temples in Greece. The statue of Zeus within the temple was created by Pheidias (who had worked on the Parthenon and its statue of Athena) and was a solid gold and ivory representation of Zeus seated on a throne. It was regarded as one of the Seven Wonders of the Ancient World (Price, 2002; Brida et al, 2016).

The archaeological site of Ancient Olympia attracts thousands of visitors in southern Greece every year, as this popular destination encompasses not only extraordinary natural scenery, but also a cultural treasure – it is the cradle of the Olympic Games.

Description of places of sports, worship and Archaeological Museums in ancient Olympia

Ancient Olympia was a place of worship of Zeus, the father and head of the 12 Gods of the ancient Greeks. Consequently, the largest temple at the center of the Olympia sanctuary is dedicated to Zeus. The pediments of the temple of Zeus depict the race between Pelops and Oinomaos (East pediment) and the dynamic composition of the Centaurs abducting Deidameia on the West. Presently the statues are beautifully reconstructed inside the nearby Olympia museum alongside the metopes of the temple of Zeus, in one large room, (Gardiner, 1926; Wikipedia,2004 Summer Olympics).

The museum exhibits some of the best ancient Greek art and artifacts one would find anywhere. In terms of content, it's one of the top five archaeological museums in Greece. There one can see masterpieces like the famous Hermes of Praxiteles statue.

The stadium of ancient Olympia was the position where the Olympic Games were taking place continuously since 776 B.C. In the middle of the long sides you will see the stone stands where the Hellanodikes (literally "the judges of the Hellenes") stood. The date of the first Olympic games (776 B.C.) is the first accurate chronology of historical Greece since the names of the victors were faithfully recorded and the ancient Greeks measured time back to the centuries by referring to the different Olympic games.

The games had an important meaning for the ancient Greeks, the meaning of peace, freedom and togetherness. During the Games the Greeks were leaving aside their traditional differences, and even were ceasing open hostilities in war time in order to compete in the Olympics.

In ancient Olympia there is the archaic temple of the goddess Hera which was built on 590 B.C. Next to the temple of Zeus is the workshop of Pheidias, where the great sculptor crafted the gigantic chryselephantine statue of Zeus.

The divine precinct in ancient Olympia is packed with history and importance. There are structures used by the priests (Theokoleon), the administration (Bouleuterion), state (Prytaneion), and

accommodation (Leonidaion and Roman hostel) buildings. There are also residences for distinguished guests (Nero's House) and all the sports structures used for the preparation and celebration of the Olympic Games: the stadium and the hippodrome to the east, and the thermal baths, the palaestra and the gymnasium to the south and west.

The Olympic Games in the ancient age

The ancient Greeks have invented the Olympic Games. They started in ancient Olympia on 776 B.C. and they were held in a quadrennial rhythm, without interruption for about 1200 years. The program of the ancient Olympic games was small, compared with the program of the modern ones: running events (over several distances), the pentathlon, and the so-called "heavy" events: wrestling, boxing and pankration. Various equestrian events (with and without chariots) completed the program. This program was discussed with the athletes, their social background and ideology: Although the prize in ancient Olympic Games was a wreath of olive leaves- a forerunner of our modern gold medal, there was no amateurism in Greek athletes, because they were happily participated in highly rewarding money games before and after the Olympics (Pleket, 2004).

The beginning of modern Olympic Games

The concept of Olympic honor was the most important legacy left to modernity. In the ancient age, athletes agreed to a three-month sacred truce and came together from all the Greek cities of the Mediterranean world to compete. This practice demonstrates the most important ideals of Greek humanism: peaceful and loyal competition among free and equal men (Gibson, 1998a; Crowther, 2010; Mandell, 1976; Pierre de Coubertin et al, 2000; Pierre de Coubertin, 1994; Reid, 2006; Young, 1999; Wikipedia, 2004 Olympic Games).

The revival of the Olympic Games in 1896, through the efforts of Pierre de Coubertin, illustrates the lasting nature of the ideals of peace, justice and progress-the most fragile attributes of human heritage. During the ancient Olympic Games, the values of fair competition and sacred truce were established and reman today, among humanity's highest goals. Consequently, the visitor or sports tourist to ancient Olympia can feel the same spiritual and ideological force that drove athletes thousands of years ago.

Fourteen nations and 241, all male, athletes took part in the games of Summer 1896. Participants were all European, or living in Europe, with the exception of the United States team. Winners were given a silver medal, while runners-up received a copper medal. Retroactively, the IOC has converted these to gold and silver, and awarded bronze medals to third placed athletes. Ten of the 14 participating nations earned medals. The United States won the most gold medals, 11, host nation Greece won the most medals overall, 46. The highlight for the Greeks was the marathon victory by their compatriot Spyridon Louis (Randall, 2011; The 1896 Olympic Games, Wikipedia).

The 2004 Summer Olympics, and commonly known as Athens 2004, was a premier international multi-sport event held in Athens, Greece, from 13 to 29 August 2004 with the motto Welcome Home.

The Games saw 10,625 athletes compete, some 600 more than expected, accompanied by 5,501 team officials from 201 countries. Having previously hosted the Olympics in 1896, Athens became one of only four cities to have hosted the Summer Olympic Games on two separate occasions at the time (together with Paris, London and Los Angeles).

The 2004 Olympics were generally deemed to be a success, with the rising standard of competition amongst nations across the world. The final medal tally was led by the United States, followed by China and Russia with the host Greece at 15th place. Several World and Olympic records were broken during these Games,(The 2004 Olympic Games, Wikipedia).

The relationship between Sport and Culture

The concept of civilization, for the ancient Greeks, was meaning the harmonious combination of the following: sports, fine arts and education. In the ancient world the Greek civilization was unique in giving to sports such a prominent position as to determine the humanistic roots of a society (Halloway, 2001; Hinch and Hingham, 2001). For Greeks in the ancient times, the purpose of civilization was to influence all human activities and to promote moral , artistic and spiritual development. In this way harmony between the body and the spirit was achieved. The philosopher Plato was also a great athlete (Middleton and Hawkins, 1998; Middleton, 1992). Plato won victories in wrestling at Delphi, Nemea and Isthmia (Gardiner, 1926; Young, 1999). It is evident that the combination of body exercise and education were the great pillars of ancient pedagogical system (Gibson, 1998b; 1998c).

The founder of the modern Olympic Games, Pierre de Coubertin has accepted the notion that 'an ideal education that, like the Greeks, integrated training for the mind and training for the body' (Mandell, 1976).

The period of the beginning of the modern Olympic Games (1880 to 1900) was characterized by the interest in reviving classical Greek civilization, rapid industrialization and new technological achievements facilitating transportations and communications. Consequently, Pierre de Coubertin, and the society of the late 19th century have adopted the notion' a sound mind in a sound body' (Pierre de Coubertin et al, 2000; Pierre de Coubertin, 1994).

The Athens Games of 2004 promoted the ancient heritage of Olympic Games as their main message and tried to create a link between modernity and antiquity, aiming to emphasize on the ancient values for sport, togetherness and culture. The Logo of the Olympic games of 2004 was the catchword: 'Welcome Home'. This theme gave to the Olympic Games their specific frame of reference.

In modern times, the connection between sports and culture serves a more materialistic purpose. Organizers and marketers of sports events have the justifiable opinion, that they can increase the attention paid to the events by the audiences by incorporating cultural and non-sport events. Cultural activities contribute to sport events by identifying different segments of audiences, like tourists, television viewers, and, consequently, forming a strong relationship with sports events, resulting to the increase of people who are interesting in the sports events and, at the same time, contributing to the economic development of the cities where the sports events are taking place.

Sport Tourism

The classical tourism is the tourism which is expressed with the three (s): Sea, sun and sand. Apart from the classical tourism there exist the alternative form of sport tourism, (Ross, 2001; Gibson, 1998a; Goodall, 1988; Goodall, 1991).

In this section the following definitions of different kinds of sport tourism will be given:

Definition 1: Sport Tourism is the tendency of travelling to engage in or view sport-related activities. It is generally recognized that there are three types of sport tourism: Sport Event Tourism, Active Sport Tourism, and Nostalgia Sport Tourism.

Definition 2: Sport event tourism includes visiting hallmark events such as the Olympic Games and the World Cup Soccer Championships. In fact, both the World Cup in 1994 and the Olympic Games held in Athens in 2004 were actively promoted as a tourist attraction.

Definition 3 : Active sport tourism involves the individuals travelling to participate in sporting events. These participatory events can take on a wide variety of forms in a wide variety of sports. Golf, kayaking, tennis, fishing, snow-mobiling and surfing are just a few examples of the sports that people travel to participate in.

Definition 4: Nostalgia sport tourism or heritage sport tourism involves the individuals travelling to famous sport-related attractions such as the stadium in ancient Olympia or the Panathinaiko stadium in Athens, Greece. Also, Nostalgia sport tourism involves the visits to sports museums like the Archaeological Museum in ancient Olympia.

Loyalty toward tourism destination and relationship with tourist satisfaction and destination image

Regarding marketing research, customer loyalty has been defined in several ways (Jacoby & Kyner, 1973). The first definition of loyalty is with respect to attitudes of customers. Customers' beliefs about the value received lead to their overall attitude toward a product or service, such as the intention to repurchase. The second defines loyalty as behavioral tendencies, including continued patronage and act of recommendation (Hughes, 1991; Sönmez & Graefe, 1998). An alternative conceptualization is the integration of the two views, which defines customer loyalty as the relationship between relative attitude and repeat patronage (Dick & Basu, 1994; Oliver, 1999). Tourist loyalty has been defined as an extension of customer loyalty in tourism setting (Backman & Crompton, 1991); (Baloglu, 2001), that is, if destination experience is considered as a product, tourists may choose to revisit or recommend it to friends and relatives (Yoon & Uysal, 2005). Specifically, tourist loyalty has been conceptualized in one of the following approaches: attitudinal loyalty, behavioral loyalty and composite loyalty (Jacoby and Chestnut,1978). Attitudinal loyalty refers to tourists' psychological tendency such as intention to revisit a destination or recommend to other potential tourists. The composite approach of loyalty suggests the integration of both attitude and behavior (Backman & Crompton, 1991; Iwaskaki & Havitz, 1998); that is, tourists who demonstrate behavioral loyalty toward particular destinations tend to have a positive attitude toward those destinations. At operational level, revisit intention and recommendations to others are the most commonly used measures for tourist loyalty (Alcañiz et al., 2009; Horng et al., 2012; Hung &Petrick, 2012; Oppermann, 2000).

Repeat visitors represent a invaluable market segment for many tourism destinations. They tend to stay longer at a destination (Oppermann, 1998), spread positive word of mouth (Oppermann, 2000; Shoemaker & Lewis, 1999), and participate in consumptive activities more intensively (Lehto, O'Leary & Morrison, 2004). Repeat visitors are also cost-effective as they incur a much lower marketing costs than first-time visitors (Shoemaker & Lewis, 1999; Zabkar, Brencic and Dmitrovic, 2010; Frangos et al. 2014; Zhang, 2012; Zhang and Wang, 2011; Zhang, Fu, Cai and Lu, 2014).

Destination image plays an important role in tourists' decision-making and subsequent travel behavior (e.g. Baloglu & McCleary,1999); consequently, they have been examined extensively in the tourism literature (Pike, 2002). Kim and Richardson (2003) define destination image as follows: A totality of impressions, beliefs, ideas, expectations, and feelings accumulated toward a place over time (Zhang et al, 2014; Backman and Crompton, 1991; Baloglou and McCleary, 1999; Baloglu, 2000; 2001).

Undoubtedly, satisfaction is one of the most relevant variables when analyzing tourist behavior, as it influences the choice of destination, the consumption of products and services, and the decision to return, For this reason, tourist's satisfaction has been a priority subject of research in recent years Tourist satisfaction is defined as follows , according to tourists have previous expectations before receiving the service which they compare with the perceived outcome of the service (Alcañiz, García, & Blas, 2009). Another approach is the equity theory, which reveals that tourist satisfaction can be analyzed as a relationship between the sacrifices and rewards he expects in terms of time, cost or effort and value received Swan (Dick and Basu, 1994; Chi, 2012).

The relationship between tourism and the economic development of a country

The development of tourism leads to the economic development of a country.

During the last twenty years there was already interest in the relationship between the tourism activity and the growth on national income and/or national production although the theoretical ground of such relationship was not explicitly defined. Several researchers investigate the Tourism-Led Growth Hypothesis (TLGH), hence offering a theoretical and empirical link between inbound tourism and economic growth.

The 'new growth theory' teaches that exports have a relevant contribution to economic growth through two main channels: by improving efficiency in the allocation of the factors of production and expanding their volume. The increase in efficiency is obtained by several sources: expanding external and internal competition, developing positive externalities for other sectors by promoting the diffusion of technical knowledge and skills and facilitating the exploitation of economies of scale and scope in the export sector (Mayo and Jarvis, 1981; Mazanec, 1989; Mazanec and Zins, 1994; McKercher, 1995; McWilliams and Crompton,1997; Meidan,1995; Millington and Cleverdon, 1999; Moutinho, 1987; Murphy and Pritchard,1997).

Exports also enhance economic growth by increasing the level of investment. International tourism is regarded as a non-standard type of export, since it implies a source of receipts and consumption in situ. Given the difficulties in measuring tourism activity, the economic literature tends to focus on primary and manufactured product exports, hence neglecting this economic sector.

Analogous to the Exports-led Growth Hypothesis (ELGH), the TLGH analyses the possible temporal relationship between tourism and economic growth, both in the short and long run. The question is whether tourism activity leads to economic growth or, alternatively, economic expansion drives tourism growth, or indeed a bi-directional relationship exists between the two variables. International tourism is regarded as a non-standard type of export, since it implies a source of receipts and consumption in situ. Empirically, this hypothesis has commonly been tested via the so-called Granger no-causality test.

The proliferation of empirical studies, testing whether economic growth is tourism driven, is such that the TLGH is nowadays considered as a key area of research within tourism economics (Brida et al, 2013) review the existing literature on the validity of the hypothesis that Tourism development leads to Economic Growth. Several researchers have written extensive reviews on examining the validity of 'Tourism-led Growth Hypothesis (TLGH). Tourism may stimulate other economic industries by direct and indirect effects. An increase in tourism expenditure may lead to additional activity in related industries, and the overall variation connected with it will be greater than the initial injection in spending (Tian-Cole and Crompton, 2003; Tian-Cole et al, 2002).

If this effect is activated, one of the best ways to enhance economic benefits is to integrate tourism into the national economy by establishing strong linkages between tourism and other economic sectors such as agriculture, fisheries, manufacturing, construction and other service industries.

If the tourism sector makes use of products and services produced within the local economy, it will strengthen these other sectors and provide additional income. In economics, this process is known as the ***multiplier effect*** of the tourism sector on the overall economy which is empirically calculated either through the Tourism Satellite Account or through computable general equilibrium models, which use input–output tables.

One can mention as an economic cause of the relationship of tourism and the economic growth of a country, the rapid expansion of national GDP that encourage even further international tourism. The improvement in the process of globalization tends to enhance trade amongst countries, hence facilitating exports. In a global economy, there is an increasing international ownership and franchising of many hotel and restaurant chains that have become big players across the word. (Andriotis, 2002).

The growing importance of tourism for the economic development of a Region in European Union

Tourism plays an important role in the EU because of its economic and employment potential, as well as its social and environmental implications. Tourism statistics are not only used to monitor the EU's tourism policies but also its regional and sustainable development policies (Eurostat, Statistics Explained, 2018).

In 2015, one in ten enterprises in the European non-financial business economy belonged to the tourism industries. These 2.4 million enterprises employed an estimated 12.7 million persons. Enterprises in industries with tourism related activities accounted for 9.2 % of the persons employed in the whole non-financial business economy and 21.5 % of persons employed in the services sector. The tourism industries' shares in total turnover and value added at factor cost were relatively lower, with the tourism industries accounting for 3.8 % of the turnover and 5.7 % of the value added of the non-financial business economy (Eurostat, Statistics Explained, 2018).

The Management and Marketing Research Regarding A Destination

Destinations are amalgams of tourism products, offering an integrated experience to consumers. Traditionally, destinations are regarded as well-defined geographical areas, such as a country, an island or a town (Weaver and Lawton, 2011; Yuksel, Bramwell and Yuksel, 1999; Wicks and Schuett, 1993; Andriotis, 2002; Baker and Crompton, 2000; Buhalis, 1998; 1999a). Destination is defined as "the focus of facilities and services designed to meet the needs of the tourists". A plethora of destinations comprise a core of the following components which are characterized as the six (A) (Buhalis, 1998; Jamal & Getz, 1996; Yuksel et al, 1999; Palmer & Bejou, 1995; Ekinci et al, 2013; Krippendorf, 1987):

1. Attractions (natural, man-made, artificial, purpose built, heritage, special events)
2. Accessibility (entire transportation system comprising of routes, terminals and vehicles)
3. Amenities (accommodation and catering facilities, retailing, other tourist services)
4. Available packages (pre-arranged packages by intermediaries and principals)
5. Activities (all activities available at the destination and what consumers will do during their visit)
6. Ancillary services (services used by tourists such as banks, telecommunications, post, newsagents, hospitals, etc.)

Special organizations, called Destination Management Organizations (DMOs) are accountable for the planning and marketing of the destinations of tourist interest and they have the power and resources to undertake action towards achieving the strategic objectives of marketing and management of the regions of interest for tourist development.

The specific objectives for marketing of the destinations are the following (Goodall, 1988; 1991; Kent, 1991; Mansfeld, 1995; Mayo & Jarvis, 1981; Sirakya, McLellan & Uysal, 1996; Mazanec, 1989; Mazanec & Zins, 1994; Moutinho, 1987; Ryan, 1997; Woodside & Lysonski, 1989; Goodall and Ashworth, 1988; Gunn, 1994; Law, 1992):

1. Enhance the long-term prosperity of local people
2. Delight visitors by maximizing their satisfaction
3. Maximize profitability of local enterprises and maximize multiplier effects

4. Optimize tourism impacts by ensuring a sustainable balance between economic benefits and socio-cultural and environmental costs

The contribution of marketing research to destination marketing is very substantial and it includes the following areas (Lee, Graefe and Burns, 2004; Levitt, 1983):

1. Identification of the main attributes anticipated by each market Segment.

2. Design and attributes required for tourism products and services
3. Evaluation and development of destination image (Letho et al, 2004; Kim and Richardson, 2003; Kent, 1991; Manning, 2011; March, 1994).
4. Segmentation of market and development of corresponding marketing mixings.
5. Opening new markets and reducing dependency on existing ones
6. Evaluation of the elasticity of demand for each market segment
7. Reduction of seasonality by matching market segments (Sirakaya et al, 1996; Sonmez and Graefe, 1998; Swarbrooke and Horner, 1999).
8. Examination of reasons deterring people (suppressed demand) from visiting destinations
9. Assessment of compatibility with other target markets
10. Examination of alternative distribution channels
11. Assessment of tourism impacts to the destination and selecting the right segments
12. Evaluation of marketing effectiveness and selection of media for Promotion (Jamal and Getz, 1996; Jenner and Smith, 1993; Iwasaki and Havitz, 1998; Jacoby and Kyner, 1973; Jacoby and Chestnut, 1978).

The promotion channels of the destination include television, radio, social media, public relations and a mixture of cultural and sporting events which take place in the broader region where the destination is (Woodside, 1990; McWilliams & Crompton, 1997; Worboys, Lockwood and de Lacy, 2005; Shoemaker and Lewis, 1999).

Suggestions for continuous improvement of Marketing Research and Management of the famous sport and cultural destination of ancient Olympia

Marketing research is a dynamic process and should continue after a first visit to the tourist destination of interest. In particular, marketing Research in ancient Olympia should organize sample surveys during and after visitations to enable the local authorities of ancient Olympia to identify weaknesses and concentrate their corrective action (Dieudonne, 2012; Echtner and Ritchie, 1991; Hede, 2006; Hedges and Olkin, 1985; Hockings et al, 2004; Horng et al, 2012; Hughes, 1991; Hung and Petrick, 2011; 2012; Ioannides and Debbage,1988; Kotler, Bowen and Makens, 2006; Towner and Newton, 1996; Tribe, 1997; Woodside and Lysonski, 1989; Frangos et al, 2014).

Data is often collected by frontier controls, airports and transport authorities, national statistics offices, local councils, tax offices as well as principals such as hotels, travel agencies, etc. The effectiveness of marketing research in destinations will depend on the ability of Destination Management Organizations (DMOs) to co-ordinate the research activities undertaken by the entire range of local authorities and organizations. It is therefore very important to co-ordinate all these surveys and data in order to produce meaningful inferences to inform and guide tourism policy and marketing strategies (March, 1994; Fan, Zheng ,Yao and Mu, 2009).

Museums, culture places and events and top nature and sports activities in ancient Olympia

It is necessary to identify the museums, Culture, festivals and Top Nature and Sports in ancient Olympia and the surrounding cities and ports in order to use them in Marketing Research and Management as attractions of tourists and as sources of economic development of the Western part of Peloponnesse, Greece, where ancient Olympia is located.

In ancient Olympia there exist the following tourist attractions:

Top 10 Museums and Sites

1. Olympia Archaeological Site
2. Archaeological Museum of Olympia
3. History of the (ancient) Olympic Games Museum
4. Museum of the Modern Olympic Games

5. Pier de Coubertin's Monument
6. Temple of Apollo Epikourios
7. Temple of Aphrodite
8. Ancient Ilida
9. Chlemoutsi medieval Castle
10. Nestor's Palace

Top 10 Culture and Festivals

1. Ancient Olympia Festival
2. Olympia International Film Festival for Children & Young People
3. Alfios river Eco-festival
4. Andritsena traditional village
5. Monastery of Sepetou
6. Ancient Ilida Festival
7. Chlemoutsi Castle Music Festival
8. The Andravida horse show
9. Local feasts (panigiria)
10. Monastery of Kremasti

Top Nature and Sports

1. Alfios River
2. Activities in Olympia valley
3. Kato Samiko Beach
4. Kaiafas Thermal Spa
5. Lagoon of Kotychi&Strofilia Forest
6. Nedas' Waterfalls

What can be done to promote tourism in ancient Olympia?

First of all, a good Marketing Research of a cultural heritage place such as ancient Olympia includes the involvement of Social Media. We suggest the following:

1. The creation of a Video with ancient Olympia which will be uploaded in YOUTUBE.

2. Marketing through INSTAGRAM TRAVEL INFLUENCERS. Today, there are people who maintain blogs in Instagram with hundreds of thousands of followers. These people, along with journalists and media executives can be invited to ancient Olympia to see the Museums ,the nature resorts and to participate in cultural events. On their return back ,they will write and upload pictures of ancient Olympia. In this way the sanctuary of ancient Olympia will be known to many cultural tourists who will like to visit this place (Gibson and Yiannakis, 1992; 1994a; Gibson,1994b; Buhalis, 1998; 1999a; Buhalis and Cooper, 1998; Gibson,1998a; Gartner, 1996; Parasuraman, 1985; Parasuraman et al, 1988).

3. Creation of WEB SITES marketing ancient Olympia, in CHINESSE OR IN RUSSIAN language. Today, many tourists to Greece are coming from China and Russia. Naturally, many of these tourists will be impressed and influenced if they can read a Web page in their own language. They will explore ancient Olympia and the famous statues in the Museums reading the Web page in their own Language! This fact will be a strong incentive to visit Greece and ancient Olympia, in particular. Extensive research has been carried out on this subject (Willig, 1985; Woodside, 1990; Woodside and Lysonski, 1989; Ahamefule, 2012; Phillips, 2003; Pigram, 1996).

4. In the port of Katakolon which is near Olympia, the National Tourism Organization should organize an annual yacht racing competition with European television coverage which should attract many tourists who could be encouraged to visit ancient Olympia. In this way, a cultural event which is a visit to ancient Olympia could be marketed together with a sports event which is the yacht racing competition resulting in the arrival of many cultural and sports events tourists (Pearce, 1982; 1989).

5. In Olympia, which is a town near ancient Olympia, the Ministry of Education and various Greek Universities and scientific associations should organize annual scientific Conferences with medical, historical, Archaeological or pure scientific thematic areas (Ritchie, 1986; Rivera and Croes, 2010; Ryan, 1991a; Shen, 2012).

6. The Greek Government and in particular, the Ministry of transport should build an airport in the town of Olympia. In this way, Charter flights with tourists from all over the world should land in Olympia and the nearby ancient Olympia (Poon, 1989; 1993; Porter, 1980; 1985).

Conclusion

A review has been carried out of the research which has been concentrated in ancient Olympia, Olympic Games, the relationship between sport and culture and the attractions of it as a tourist destination. It should be noted that the future of ancient Olympia as a cultural ,ecological and sports destination cannot be assured without broadscale, ongoing societal support and central government financial assistance. The tendency of twinning of ancient Olympia with other cities of the world should be adopted in order to generate a worldwide interest and the subsequent flow of tourists. The education of the people responsible for receiving the tourists should be more systematic and, combined with the Greek value of "filoxenia" (being a helpful and enthusiastic host), should produce the desired results in a reasonable time.

Abstract

In this paper we investigate the association between the level of education and the quality of learning outcomes which are achieved by students and the Unemployment rate expressed by the Real Gross Domestic Product per capita, in the European Union (EU), during the years 2003 to 2018. Using the Report of the Organization of Economic Cooperation and Development (OECD), 2010: The High Cost of Low Educational Performance, we present Educational Performance and Schooling as the key drivers for increasing the Real Gross Domestic Product per capita, because the result is the rise in the supply of well-paid skilled workers who form the backbone personnel and innovative force of many enterprises. We derive two Linear Statistical Models with independent variables the level of education of the population and the educational performance of students and dependent variable the Real Gross Domestic Product per capita, for the countries of European Union. The employment opportunities of young people with special educational needs are emphasized and the efficiency of the educational systems across the Member-States of EU is examined in the light of the Report of the Program for International Student Assessment (PISA), Organization of Economic Cooperation and Development, 2018. Finally, a set of policies is suggested to the Educational Planners of European Countries for the maintenance of Economic growth using Educational tools, school reforms and increasing the ratio of teacher-student.

Keywords: Real Gross National Product per capita, special education, European Union, Program for International Student Assessment.

Introduction and Review of Existing Research

The relationship of the level of education and unemployment rate

The impact of education on unemployment is very important. A country which has an efficient education system can provide the labor market with skilled workers who will be absorbed by employers because of their qualifications, especially, if they have skills in digital Technologies and Communication. Riddell and Song (2011), support the opinion that "graduating from high school increases the probability of re-employment by around 40 percentage points(p.p)". During the economic crisis of 2007 to 2019, governments have increased their higher education investments in order to provide skilled workers to the labor market and to reduce the unemployment rates, according to Marjanovic and Mihajlovic (2014).There must be ties between the courses offered in High Schools and Universities and the specific needs of the labor market in a country (Vytautas Snieska et al., 2015) in order to increase the opportunities for graduates to be employed.

According to Numez and Livanos (2010), the demand for specific skills in different jobs and the capacity of the education system to provide the workers with the skills in demand, leads to a successful transition of graduates from the Educational Institutions to the labor market. The market stratification is strong in the Northern European Countries and this is the reason for the smaller risk of unemployment in Northern European countries rather than in the Southern European ones.

According to Eurostat, Unemployment Statistics (2015), Slovakia recorded in 2018 the biggest gap in the unemployment rate between persons with high level of education (2.8 %) and low level of education (27.6 %).

Research on the Unemployment rate by level of education in European Union Countries (EU-28)

According to Eurostat, Employment Statistics (2019), unemployment rates tend to be higher for persons with low levels of educational attainment rather than persons having a tertiary level of educational attainment. This characteristic was noted in all of the EU Member States in all years from 2002 (except in Luxembourg in 2003).

At EU-28 level, the unemployment rate of persons having a low level of education has increased from 10.1 % in 2002 to 12.5 % in 2018, while it decreased for those having a tertiary level of educational attainment from 4.3 % to 3.9 %. While the average unemployment rate in the EU-28, in 2018, for people aged between 25 and 64 having attained at most a lower secondary education was 12.5 %, the corresponding rate for those that had obtained a tertiary education qualification was much lower at 3.9 %. The gap in unemployment rates between those who had attained a tertiary level of education and those who had attained at most a lower secondary education had widened from 2002 to 2018 in EU-28 from 5.8 p.p. to 8.6 p.p.

Among the EU Member States, the gap was particularly pronounced in 2018 in Slovakia (24.8 percentage points (p.p), Lithuania (16.4 p.p.) and Latvia (13.3 p.p.), while the gap was the narrowest in Cyprus and Portugal (both 2.2 p.p.). In Turkey in 2016, 2017 and 2018, the unemployment rate of persons with a tertiary level of education was slightly higher than the unemployment rate of persons with a low level of education (Figures 1 and 2).

Fig. 1: Unemployment rate by level of education, EU-28, 2002-2018. The line with higher y-axis values corresponds to the level 1-2. The x-axis scale corresponds to years 2001 to 2018. Source of data: Eurostat (2019), Employment Statistics.

Fig. 2: Unemployment rate by level of education in Greece, 2002-201. In Greece, there is no much difference in unemployment rate between people with 1-2 and 3-4 level of education. Source of data: Eurostat (2019), Employment Statistics.

Long-term unemployment is one of the main concerns of policy-makers. Apart from its financial and social effects on personal life, long-term unemployment negatively affects social cohesion and, ultimately, may hinder economic growth. Figure 3 shows the breakdown of the unemployed by unemployment duration. At EU-28 level, a bit more than half (57.0 %) of those unemployed have been

unemployed for less than one year. However, this average hides large differences between countries. More than 81 % of the unemployed in Sweden were in this group, followed by Denmark (78.9 %), Finland (78.2 %) and Luxembourg (75.3 %), meaning that it goes relatively fast to find a new job for the unemployed in those countries. Greece is on the other end of the scale, with 29.7 %, followed by Slovakia (38.2 %), Bulgaria (41.6 %) and Italy (41.9 %). In Greece in 2018 more than half of the unemployed persons were looking for a job for more than 2 years, followed by 44.1 % in Slovakia and 37.3 % in Bulgaria.

Fig. 3: Unemployment by duration, 2018 (%). Source: Eurostat (2019), Employment Statistics (appsso.eurostat.ec.europa.eu/uni/show.do?dataset=une_ltu_a)

The segmentation of the Labor force of EU-28 in 2018 by employment status

The following figure 4 (Infographic) shows the numbers (in thousand persons) of people who were active and inactive with respect to their employment, and their corresponding subdivisions, in 2018, across the EU-28 countries (source: Eurostat (2019), Employment statistics). Figure 4 includes as inactive persons with respect to their employment, the students in their last year of studies. The figure shows that more women than men are inactive or working as part-time workers and that the total of the inactive persons in EU-28 were 133766000.

Fig. 4: The EU labor market

The effect of emigration to the employment prospects for higher education population

Migration of labor force abroad is another important variable influencing the development of unemployment rate. When a country is under development or economically struggling, then, the people with higher education or the people with prolonged periods of unemployment emigrate to the countries of EU or to the United States or Canada. On the other hand, there are countries in EU-28 where the number of unemployed people in the "source" country and the number of people emigrating and working abroad in other "host" countries have a negative association.

One of these countries is Slovakia. According to Vojtovich (2013) and Pryymachenko et al. (2013), there is a negative correlation between the numbers unemployed people in Slovakia during the period 2000 to 2008 and the people emigrating from the country and working legally abroad (without counting

the illegal emigrants to Austria and the other countries of Central and eastern Europe. The following Table 1 is provided by Vojtovich (2013) (Figure 5).

Table 1: Numbers of Unemployed people and residing in Slovakia and number of working people and residing abroad

Year	Unemployed (thousand)	Working abroad (thousand)
2000	506,5	49,3
2001	533,6	64,1
2002	504,1	78,4
2003	452,2	69,3
2004	383,1	103,6
2005	333,8	125,4
2006	273,4	158,1
2007	239,9	177,3
2008	248,6	206,4

Fig. 5: Labor force in Slovakia during 2001 to 2008

The correlation coefficient between the variables:

Number of people unemployed and residing in Slovakia and

Number of people working and residing abroad

is -0,955 and it is statistically significant at the level 0,005. It is observed that as the number of people unemployed and residing in Poland is reduced, at the same time the number of Polish people working abroad is increased.

According to the following Figure 6, from Eurostat, Survey on Employment and immigration, 2014/2008 (LFS AHM2014/2008), the following are concluded:

In 2014, the unemployment rates of the EU population aged 25–54 ranged from 17.2 % in the case of 'first-generation immigrants' with 'non-EU origins' to 7.6 % for 'second-generation immigrants' with 'EU origins' (see Figure 6). Unemployment rates were higher among both groups with 'non-EU origins' while the immigrants with 'EU origins' and the 'native-born with native background' presented unemployment rates below 10 %.

Note: population aged 25–54.
(¹) Origin of first-generation immigrants: country of birth; origin of second-generation immigrants: country of birth of parents.
(²) 2014: estimates do not include Denmark, Ireland or the Netherlands and include estimates for Germany by citizenship.
Source: Eurostat, EU LFS AHM2014/2008

Fig. 6: Causes of immigration among citizens of EU Countries

According to Rakauskienė and Ranceva (2014), the main causes of youth migration are: unemployment, poverty, poor quality of life, problems related to education and difficult political situation. The following adverse effects of emigration are usually cited: depletion of the country's human capital assets, resulting in lower productivity; loss of return on investment in education; smaller tax base; larger inequality in the donor country. It is rather obvious that if country loses its skilled, educated and demanded workforce this could retard its development.

The benefits from the brain drain or brain waste are the following: a. Outmigration has reduced the excess supply of labor and lowered unemployment. b. Outmigration has increased the wages of stayers, especially for socio-economic groups that have become relatively scarce. c. There are potential benefits from return migrants with enhanced human capital. d. Labor migrants send cash to their home economies (Zaiceva, 2014).

European Union states like the UK, Ireland and Sweden were three countries that opened their labor markets for the A8 (Latvia, Lithuania, Estonia, Poland, Hungary, Slovakia and Slovenia, Czech Republic) countries. This consequently resulted in considerable relocation of Latvian labor migrants, particularly to the UK and Ireland. According to Kahanec et al. (2009) almost 70% of the immigrants from the A8 have been absorbed by the UK and Ireland since 2003.

Statistical procedures to prove the relationship between Level of Education, performance in the Program for International Student Assessment (PISA) and Real Gross National Product per capita

Research Methodology

Summarizing the findings of the existing research on the causes of unemployment, one could define as follows the factors which generate unemployment in a country: Inadequate education, parents' unemployment, parent's lack of education, the structure of the educational system, skills mismatch, the financial crisis, the Gross Domestic Product of a country and social problems.

Adequate schooling of the citizens of a country leads to dynamic economic growth of the country. It is obvious that learning does not end with school and an assessment of schooling outcomes such as the Program for International Student Assessment (PISA) cannot reflect the skills which individuals acquire subsequently in their lives. However, evidence from longitudinal surveys in Australia, Canada and Denmark shows that performance in PISA is a strong and consistent predictor for subsequent educational experiences (OECD, 2010).

In this paper ,we shall investigate, with the help of linear statistical models, the relationship of Real Gross Domestic Product (GDP) per capita with the level of education of the citizens of the EU-28 (28 Countries of European Union), in 2018, which has the following three subcategories:

Level of Education:

- Level 0-2 : Less than Primary School, Primary and Lower Secondary Education
- Level 3-4: Upper Secondary Education,Post Secondary Education, Non-Tertiary Education
- Level 5-8: Tertiary Education, Undergraduate Tertiary Education, first stage of postgraduate Education, Second stage of Postgraduate educat., Doctoral Level.

Theories of the influence of Education on Economic Growth

The theoretical base of this approach comes from the "endogenous growth" literature that has developed over the time interval of 1990 to 2000. In this research, a variety of researchers (importantly Lucas (1988), Romer (1990) and Aghion and Howitt (1998)) stress the role of education in increasing the innovative capacity of the economy through developing new ideas and new technologies. This is called endogenous growth model because technological change is determined by economic forces within the model. The theories of technological diffusion such as Nelson and Phelps (1966), Welch (1970), and Benhabib and Spiegel (2005) stress that education and continuous schooling may facilitate the transmission of knowledge needed to implement new technologies.

Construction of a Linear Statistical Model to express the relationship between Real Gross Domestic Product per capita , Educational attainment and quality of learning (PISA Results)

Motivated from the above theories, we suggest the following linear Statistical Model which relates Real Gross Domestic Product (GDP) per capita for each Country of European Union and the performance of its students at the PISA competition for a specific year (t) and we consider the case :

t=2018:

$$\ln(\text{Real GDP per capita})_i = \alpha_0 + \alpha_1 \ln(\text{SCHOOL ATN}_{0\text{-}2})_i + \alpha_2 \ln(\text{SCHOOL ATN}_{3\text{-}4})_i + \alpha_3 \ln(\text{SCHOOL ATN}_{5\text{-}8})_i + \alpha_4 \ln(\text{PISA PERC})_i + \varepsilon_i \qquad (1)$$

where

$\ln(\text{SCHOOL ATN}_{0\text{-}2})_i$ is the logarithm with base (e) of the percentage of school attainment at level 0-2 in country (i) of the European Union on 2018,

$\ln(\text{SCHOOL ATN}_{3\text{-}4})_i$ is the logarithm with base (e) of the percentage of school attainment at level 3-4 in country (i) of the European Union on 2018,

$\ln(\text{SCHOOL ATN}_{5\text{-}8})_i$ is the logarithm with base (e) of the percentage of school attainment at level 5-8 in country (i) of the European Union on 2018,

$\ln(\text{PISA PERC})_i$ is the logarithm with base (e) of the number of points which the students belonging to country (i) have collected at the PISA international competition on 2015,

ε_i is a random error with mean (0) and variance (σ^2),

$\{\alpha_0, \alpha_1, \alpha_2, \alpha_3)$ are unknown coefficients to be estimated by Least Squares method.

ln(Real GDP per capita) is the logarithm with base (e) of the Real Gross Domestic Product per capita for country (i) on 2018. We present the following definition of Real GDP per capita:

Definition. Real GDP per capita is a measurement of the total economic output of a country divided by the number of people and adjusted for inflation. It is used to compare the standard of living between countries and over time (EUROSTAT, 2019).

The data used for model (1), are presented in the following Table 2:

Table 2: Data for Model (1)

COUNTRY	LN(REAL GDP PER CAPITA, 18)	LN(LEVEL $ED_{0\text{-}2}$, 18)	LN(LEVEL $ED_{3\text{-}4}$, 18)	LN(LEVEL $ED_{5\text{-}8}$, 18)	LN(PISA, 15)
BELGIUM	10,47	2,97	3,82	3,56	
BULGARIA	8,78	2,87	3,65	3,39	6,22
CZECHIA	9,78	2,82	3,98	3,39	6,10

LUXEMBURG	11,30	1,77	3,88	3,82	6,16
HUNGARY	9,43	2,92	3,49	3,88	6,18
MALTA	9,98	2,62	4,08	3,31	6,17
NETHERLANDS	10,63	3,69	3,37	3,44	
AUSTRIA	10,54	2,86	3,72	3,73	6,23

COUNTRY	LN(REAL GDP PER CAPITA, 18)	LN(LEVEL ED_{0-2}, 18)	LN(LEVEL ED_{3-4}, 18)	LN(LEVEL ED_{5-8}, 18)	LN(PISA, 15)
POLAND	9,43	2,55	3,94	3,60	6,20
PORTUGAL	9,79	1,82	4,06	3,59	6,22
ROMANIA	9,07	3,76	3,35	3,35	6,22
SLOVENIA	9,91	3,00	4,09	3,01	
SLOVAKIA	9,66	2,17	4,01	3,59	6,24
FINLAND	10,51	1,99	4,18	3,31	6,13
SWEDEN	10,69	2,21	3,80	3,83	6,27
UNITED KINGDOM	10,39	2,56	3,71	3,84	6,20
ICELAND	10,59	2,86	3,60	3,83	6,23
NORWAY	11,15	2,98	3,49	3,86	6,16

We use the Statistical Package for the Social Sciences, SPSS (Version 21), Pallant (2013) on data presenting the variables of model (1) and we find the following results:

Table 3: Results for model (1), year 2018

Statistic	Std Error	p-value
R=0,72		
R^2=0,53		
F=5,87 ,DF1=4,DF2=21		0,002
Coeff. Of y-intercept=-30,98	15,06	0,05
Coefficiect of *ln(PERC0-2, 2018)=0,50*	0.41	0,23
Coefficiect of ln(PERC3-4, 2018)=0,35	0,95	0,72
Coefficiect of ln(PERC5-8, 2018)=0,1,49	0,68	0,04
Coefficiect of ln(PISA, 2015)=5,34	2,02	0,01

From Table 3 we conclude the following:

There is a statistically significant relationship between the dependent variable ln(REAL GDP for 2018) and the independent variables ln(percentage of people in Educational level 0-2), ln(percentage of people in Educational level 3-4), ln(percentage of people in Educational level 5-8), ln(PISA results for 2015), because R^2=0,528 and F=5,874, df1=1, df2=24, p-value=0,002.

The variables : ln(percentage of people in Educational level 5-8), p-value=0,040, and, ln(PISA results for 2015), p-value=0,015, are statistically significant.

Construction of a Linear Statistical Model to express the relationship between the Real Gross Domestic Product per capita and the results of the Program for International Student Assessment (PISA)

The newly developed theory of economic growth of the decade of 1980 to 1990 emphasizes the importance of education and innovation, (elements of human capital) in long-term economic growth. In contrast to this, the theory of market value, shows that many studies have highlighted the influence of intangible assets such as research and development, patents, intellectual capital on the market value of companies and also on their development, leading ultimately to economic growth. There are many research publications which have revealed that one of the most important factors of economic growth is human capital (Aghion and Howitt (1998), Lucas(1988), Mankiw et al. (1992), Romer (1990a; 1990b)).

In this context it is important to emphasize the quality of learning outcomes achieved by students and the ranking of the countries of the organization of economic cooperation and Development with respect to the assessment of their 15 year old students in three main areas of knowledge, Mathematics, Science and Reading comprehension.

The Program for International student Assessment (PISA) has been launched by OECD and it is a examination in Mathematics, Science and Reading of 15 -year old students coming from all the countries of OECD. This exam was held on 2000, 2003, 2006, 2009, 2012, 2015 and 2018. The results of 2018 will be published on December 2019.

According to the report by Hanushek and Woessmann (2010), there is a strong relationship between cognitive skills – as measured by PISA and other international Programs-to economic growth. The relationship indicates that relatively small improvements in the skills of a nation's labor force can have very large influence on future well-being. Moreover, the benefits, put in terms of Real Gross Domestic Product (GDP), far outstrip the value of the short-run business-cycle management. This is not to say that efforts should not be directed at reducing the bad effects of economic recession, but it is to say that the long-run issues should not be neglected.

In the context of the above theoretical basis, we assume for each of the years: t(1)=2012, t(2)=2009 and t(3)= 2003, the following model for the countries of European Union:

$$\ln(\text{Real GDP per Capita})_i = \alpha_0 + \alpha_1 \ln(\text{PISA PERC})_i + \varepsilon_i \qquad (2)$$

where

$\ln(\text{PISAPERC})_i$ is the logarithm with base (e) of the number of points which the students belonging to country (i) have taken at the PISA international competition on year t(j), j = 1, 2, 3.

ε_i is a random error with mean (0) and variance (σ^2)

$\{\alpha_0, \alpha_1)$ are unknown coefficients to be estimated by Least Squares method,

$\ln(\text{Real GDP per capita})_i$ is the logarithm with base (e) of the Real Gross Domestic Product per capita for country (i) on year t(j), j = 1, 2, 3 .

The following table presents the data used in model (2):

Table 4: Data for Model (2)

COUNTRY	LNGDP12	LNPISA12	LNGDP09	LNPISA09	LNGDP03	LNPISA03
BELGIUM	10,43	6,23	8,10	6,23	10,34	6,21
BULGARIA	8,58	6,00	8,52	6,06	8,19	
CZECHIA	9,62	6,23	9,59	6,17	9,41	6,20

ITALY	10,17	6,23	10,19	6,19	10,23	6,11
CYPRUS	9,99	6,10	10,06		9,98	
LATVIA	9,18		9,06	6,18	8,79	6,15
LITHUANIA	9,24		9,07	6,15	8,81	
LUXEMBURG	11,25		11,25	6,16	11,21	6,15
HUNGARY	9,21	6,13	9,19	6,20	9,10	6,14
MALTA	9,71		9,65		9,57	
NETHERLANDS	10,41	6,24	10,55	6,23	10,47	6,21
AUSTRIA	10,50	6,23	10,46	6,15	10,39	6,19
POLAND	9,21	6,18	9,12	6,21	8,84	6,16
PORTUGAL	9,69	6,20	9,72	6,19	9,70	6,13
ROMANIA	8,78		8,76	6,05	8,39	
SLOVENIA	9,76	6,17	9,78	6,18	9,64	
SLOVAKIA	9,48	6,18	9,38	6,17	9,09	6,16
FINLAND	10,46	6,26	10,43	6,28	10,38	6,21
SWEDEN	10,60	6,20	10,54	6,21	10,48	6,19
UNITED KINGDOM	10,31	6,25	10,28	6,20	10,27	
ICELAND	10,41		10,42	6,21	10,29	6,20
NORWAY	11,11	6,22	11,11	6,22	11,06	6,17

The results for model (2) for each of the years 2003,2009 and 2012 are presented in the following table:

Table 5. Results for year 2003, Model (2)

Statistic	p-value	Std Error
R=0,347		
R^2=0,120		
F=5,98 , DF1=1, DF2=19	0,123	
Y-INTERCEPT=-36,34	0,22	28,79
COEFF, OF LNPISA3 = 7,52	0,12	4,66

Table 6. Results for year 2009, Model (2)

Statistic	p-value	Std Error
R=0,41		
R^2=0,17		
F= 5,34, DF1=1, DF2=26		
Y-INTERCEPT=-33,23	0,086	18,63
COEFF, OF LNPISA9=6,96	0,029	3,01

Table 7. Results for year 2012, Model (2)

Statistic	p-value	Std Error
R=0,65		
R^2=0,43		
F= 16,16, DF1=1, DF2=21	0,001	
Y-INTERCEPT=-32,10	0,006	10,47
COEFF, OF LNPISA12=6,79	0,001	1,69

From the above table we conclude for years 2012 and 2009, the variables ln(PISA12) and ln(PISA09) are statistically significant. For years 2012 and 2009 the Statistics F and R are statistically significant meaning that there is a relationship between ln(GDP12) and ln(PISA12) and also between ln(GDP09) and ln(PISA09).

The performance of Greek 15-year-old students in the International Competitions of PISA and the ranking of Greece in PISA ,between the countries of European Union.

From the tables which present the performances of the Students of European Countries, we conclude the following:

a. The rank of Greece was 21st (the last one) out of 21 European countries which have participated in the PISA competition of 2003.The score of Greece was 449 whereas the score of Finland which was the top performer was 500.
b. The rank of Greece was 18th out of 28 European countries which have participated in the PISA competition of 2009.The score of Greece was 483 whereas the score of Finland which was the top performer was 536.
c. The rank of Greece was 25th out of 28 European countries which have participated in the PISA competition of 2015.The score of Greece was 455 whereas the score of Finland which was the top performer was 531.
d. In all PISA international competitions of 2003,2012 and 2015,the score of Greek students ,in the three subjects-Mathematics, Science and Reading- was below the Mean Score of all the European countries which have participated in the PISA competition.
e. The solution to these disappointing results lies in the process of changing the curriculum of schools and educational institutions and establishing the Schools-Models in Greece which will have the best curriculums, the best ratio of teacher -student and, finally ,the best students. According to the report of by E.A. Hanushek and L. Woessmann (2010), applying reforms in schools is a difficult task and the results in terms of student achievement are relatively modest and fruitful ,in the long-run .

At the same time, the results from countries achieving high and impressive learning outcomes in PISA-like Finland in Europe, Canada in North America or Japan and Korea in East Asia-or from those that have seen rapid improvements in the quality of schooling (like Poland) underline that doing better is possible.

Concluding Remarks

From the above research we conclude the following:

a. There is a close relationship between the economic growth of a country expressed in terms of its Real Gross Domestic Product per capita and the level of education of its citizens as well as the quality of learning outcomes which are achieved by its students in successive PISA competitions.
b. The Southern Europe countries, especially Greece and Cyprus, need to reform their educational systems in order for their students to perform better in International competitions, such as PIZA, but ,also, because ,the reform of educational systems will produce better “human capital” which is necessary for innovating the economic systems of these countries. Therefore, particularly important tasks are the following: promoting training and retraining to enhance obsolete skills, in all countries, especially, in Greece and Cyprus.
c. It is important that the policy makers, particularly the educational planners , pay attention to the participation of 4-year old children to programs of pre-school education, as well as, to the participation of disadvantaged children or children with learning and behavioral difficulties to programs of inclusive education for all.
d. Attention must be paid from the educational planners to the sports education for all the citizens of the European countries. The sports education will make possible the maintenance of a healthy population and a dynamic economy.
e. Moreover, since labor shortages are likely to be filled by immigrant labor, accommodating immigration policies is important.

A Main Barriers to Improve the Effectiveness of Execution of IT Projects Intended for the Polish Public Administration

Stefan ROZMUS

Institute of Computer and Information Systems, Faculty of Cybernetics, Military University of Technology, Warsaw, Poland, stefan_rozmus@wat.edu.pl

Abstract

A diagnosis of the condition of key Polish IT projects, subsided by the European Union structural funds, implemented to the benefit of public administration during the period 2004-2015 has shown that practically all large projects have ended up with more or less spectacular failures. The planned corrective actions are included in the document National Integrated Informatisation Programme. Now the next and third evaluation of this document shows that the corrective measures taken are still unsatisfactory. The aim of this article is to assess the reasons for this and to identify main barriers to the success of the programme. The presented paper is based on the analysis of the literature on the subject and the author's experience gained during participation in several large IT projects for public administration.

Keywords: project, system, public administration, informatisation.

Introduction

Achieving the success of an IT project was, and still is, a big problem. The results of studies carried out over the last few decades show that a significant number of IT projects have not been successful. The world-famous organisation The Standish Group International, which has been involved in researching the properties of IT projects and software development methodologies since 1985, published a report as early as 1994, which showed that only 16% of the projects could be considered as successful (TheSGI, 2014). Despite the constant development of methodologies, both for project management and software development, the situation remains unsatisfactory in this respect. This is confirmed by reports from successive studies (TheSGI, 2016; TheSGI, 2019). Over the period 1996-2019, the share of projects completed successfully oscillated around 30%. It should be noted that the attempt to improve this condition of affairs by implementing a new definition of success in 2011 has failed. According to the new definition, the success of a project means that it has been carried out according to the schedule, did not exceed the planned budget and the result of the project was considered satisfactory (*on time, on budget with a satisfactory result*). The adopted definition of success is based on project parameters slightly different from the classical design triangle (Atkinson, 1999). The *quality* parameter was replaced by the *satisfactory result* parameter (time parameter and budget parameter remained). This seemingly small change allows for a flexible elaboration of definition of success for a specific project, with the possibility to take into account e.g. customer satisfaction, benefits for the organisation, benefits for interested parties, etc.

The same applies to IT projects for the Polish public administration, which is one of the largest recipients of dedicated IT systems in Poland. According to data from the Central Statistical Office, in 2013 the number of implemented systems alone, which are sources of data for public statistical surveys, exceeded five hundred, and several dozen more were under implementation (GUS, 2013). Does this mean that each of these projects, which ended with the implementation of a manufactured product or a service, was successful? Yes, if we assume that the mere fact of implementation, taken as a satisfactory result, means the success of the project. However, when considering the success of a project in the scope of maintaining the values of the planned project parameters (scope, time, budget, quality) within the accepted tolerances, it turns out that in relation to many of these projects it is difficult to speak of

its success. However, in this context, referring to only one of the parameters, time, can we call the implementation, in the Pension Office of the Ministry of the Interior Affairs, of the pension system EMERYT with a delay of over ten years (MSWiA, 2014), the success of the project? As in the case of the CEPiK system, which was implemented several years after the planned deadline (CEPiK, 2003). It is also difficult to talk about the success of the project, within which the ŻRÓDŁO application enabling the processing of data collected in the State Registers System, was developed. Since the migration of data from local systems to the database of this system began with the implementation of the ŹRÓDŁO application (1 March 2015), immediately after its implementation, the waiting time for issuing e.g. a copy of a birth certificate has increased from the previous few hours to over three months (NIK, 2016).

These are examples of three projects only where the planned value of at least one of the project parameters has not been met. Nevertheless, these are not exceptional cases. As mentioned in the report summarising the condition of implementation and results of the largest Polish IT projects co-financed from the European Union structural funds in the years 2004 - 2015, practically all large IT projects implemented with the subsidies of EU funds ended in more or less spectacular failures (Nowakowski, 2015; Nowakowski and Klinger, 2015). The implementation of corrective actions was to be ensured by the National Integrated Informatisation Programme (PZIP) (MAiC, 2014) and its subsequent evaluations. Unfortunately, the diagnosis of the condition of informatisation of the State, presented in successive evaluations of the PZIP (MC, 2016b; MC, 2019), shows a number of negative features, some of which have invariably been repeated.

The aim of this article is to assess the reasons for this and to identify main barriers to the success of the programme. The presented paper is based on the analysis of the literature on the subject and the author's experience gained during participation in several large IT projects for public administration. Although some of the original Internet sources are no longer available, however the author has copies of these materials downloaded from the Internet, on the date of access.

The National Integrated Informatisation Programme and the effects of its implementation to date

The National Integrated Informatisation Programme is a strategic document describing the activities of the government aimed at providing citizens with electronic public services of high quality. The aim of the programme is to create a coherent, logical and efficient information system of the State, which such system provides e-services at national and European level in a quality- and cost-efficient manner. Starting from a diagnosis of the condition of informatisation as for today, the programme shows the objectives to be achieved and ways to achieve them, as well as a proposal for measures to monitor the effectiveness of achievement of results.

The diagnosis showed that the informatisation of a number of public administration processes has been underway, and several cross-sectoral IT projects have provided solutions, which are used by many users on a national scale. The services provided, available online, cover a number of key areas, including administrative matters (in particular, citizens' affairs), the labour market, health care (which is currently bearing fruit in the face of COVID-19), justice and the judiciary, running business enterprises, settlement of taxes due to the State and access to statistical data for citizens. Nevertheless, a number of problems, which affect the management of projects and the effects of implementation of IT systems by the administration, have also been identified. One of the main problems was insufficient preparation of the administration for the implementation of the projects, which manifested itself in the weakness of the project approach to the implementation of the tasks, i.e. subject-matter and organisational preparation of the teams responsible for the execution of the projects, and ultimately - due to the lack of a coherent concept of functioning and maintenance of the systems already produced. Among the other problems, the most important ones were identified to be:

- lack of proper coordination of projects’,
- deficiencies in the system for monitoring the progress of project implementation,

- problems in providing financing for the maintenance of the services made available, resulting in the suspension of the project execution or failure to use its effects,
- delays in legislative work causing delays in the execution of projects and the inability to use the implemented solutions in practice,
- problems with the application of public procurement law resulting in delays in the projects' executions.

The analysis of the diagnosed condition resulted in the conclusion that in order to ensure effective implementation of the objectives defined within the PZIP, it becomes necessary to define uniform management standards, common to public administration, which will be applied in the informatisation process. These standards are grouped into three areas:

- the area for management of portfolio, programmes and projects,
- area of the application software development,
- the area of management of implemented IT services.

The diagnosis of the condition of the State informatisation presented in the next evaluation of the PZIP (MC, 2016b) showed that the condition of the State informatisation, found in the evaluated period of activities from 2014, and therefore the effects of the implementation of the PZIP in its previous evaluation, is characterised by a number of negative features. With regard to running IT projects for public administration, this condition can be described as follows:

- the management of IT resources is dispersed and decentralised and therefore uncoordinated,
- lack of sufficient competences on the part of the administration in procurement, designing, building and maintaining IT systems causes delays in implementation, poor quality and may result in unjustified costs for the State. This concerns cooperation with both external and internal suppliers,
- lack of uniform standards and guidelines for the development, maintenance and implementation of ICT projects and lack of cyclical control mechanisms,
- lack of governmental (group ones, common for part of the administration) rules for running IT projects and lack of a leader responsible for coordinating these works.

In the next, planned as the last one, evaluation of the PZIP (MC, 2019), the actions undertaken within the PZIP were assessed as directionally correct. However, their effects have not yet been assessed , as most of the actions were taken late or were executed too fragmented, and some projects are still in the preparatory phase. It has been pointed out that due to the persistence of the problems identified previously and the insufficient effectiveness of the actions undertaken so far, it is justified to continue the directions of works undertaken within the current programme. The approach itself seems appropriate, in particular in view of the continuing (after five years of execution of the PZIP) negative features in the area of IT projects for public administration, such as:

- dispersed and uncoordinated management of IT resources,
- a growing gap in the market for the availability of IT specialists, which is an important element hindering the development of the domestic IT sector,
- insufficient competences of public administration in the area of ordering, designing, building IT systems and their maintenance, related, among others, to the low competitiveness of public administration as an employer for IT specialists.

However, without denying the rightness of the chosen directions of improvement, one may fear that the final assessment of the results of the execution of the National Integrated Informatisation Programme by the Council of Ministers, planned for 2024, will not be fully satisfactory. For, without knowing the assessment of the effects of the measures taken to date, it cannot be assumed that they are appropriate. For the same reason, there is no basis for properly estimating the time needed to achieve the planned final effects of the programme. In this situation, it may be helpful to analyse in detail

projects already completed, in terms of the conditions for their implementation and the achievement of the planned parameters. In addition, it is worth looking at how the public administration body responsible for these projects evaluated their implementation.

The execution of the projects within the priority axis No 7 of the Innovative Economy Operational Programme – case study

Within the priority axis No 7 of the Innovative Economy Operational Programme (IEOP), 40 contracts/agreements for subsidies were signed (together with the system project). The total value of co-financed projects under the priority axis No 7 is PLN 3,820 million. By December 31, 2015, 36 projects (including the system project) for the total value of subsidies of PLN 2,670 million, were completed (MC, 2016a). The analysis of the course of execution of selected projects, compared to the life cycle of an IT project for public administration, brings, in the author's opinion, a number of information allowing for a more detailed diagnosis of the causes of problems included in the PZIP. In comparison with the results of this analysis, the evaluation of project execution, issued by the Ministry of Digitalisation at the time of closing the priority axis No 7 of the IEOP, seems particularly interesting.

Life cycle of an IT system for public administration

The life cycle of an IT system for public administration results from the published recommendations of the Head of the Public Procurement Office, concerning the award of public procurements for IT systems and the supply of computer sets (UZP, 2011). According to them, an entity subject to Public Procurement Law, when constructing a procurement for an IT system, should take into account the system life cycle including the following phases:

- Conceptual phase - it concerns all activities related to the identification of needs, review of available solutions, assessment of their feasibility at the contracting authority (a public administration entity).
- Contractor selection phase - includes activities aimed at selecting a contractor for a specified system, culminated with signing up a contract with the contractor.
- Execution and acceptance phase - includes the execution of the contract with the contractor completed with the acceptance of the ordered/procured system and putting it into current operation.
- Operation phase and further development phase - the system built is used by the contracting authority and administered by the relevant employees of the contracting authority or by a contractor selected for this purpose.

Fig. 1: Project life cycle as part of the IT system life cycle for public administration

The first three phases make the life cycle of the project (Fig. **1**), within which the system is developed. It can be noticed that the success of a project depends to a large extent on the contracting authority. For it is the contracting authority, as part of the preparatory stage (phase 1 and phase 2), that is laying the foundations for the future execution of the system (phase 3). It is important for the contracting authority

to treat the project as a whole, for which he is responsible. It would seem that this is natural. Nevertheless, there are known cases of the use of the tempting possibility of assigning a responsibility for the implementation of the whole project to the system's contractor, although the real presence of the contractor in the project dates back to the beginning of phase 3. In order to better expose this issue, in the author's opinion, it is reasonable to use a case study covering the execution of projects under the e-Cło (eng. *e-Duty*) programme (in one of these projects the author acted as the project manager). Although it is only a group of a dozen or so projects, however the negative results of the report mentioned above (Nowakowski, 2015) allow, to a certain extent, for a generalisation of the considerations, also covering the remaining projects from the period 2004-2015, which, after all, are carried out on the basis of the same rules as those of the e-Cło programme. They were based on the same binding legal provisions.

Programme e-Cło - plans and execution

The aim of the e-Cło programme was to build an electronic environment for the Polish customs administration to provide electronic public services related to the collection of receivables by the customs administration, trade in goods and ensuring the security of international trade. The e-Cło programme included 20 interrelated projects (e-Cło, 2012).

The projects of the e-Cło programme were managed in accordance with the PRINCE2 methodology applicable to projects executed and implemented for public administration. Each project had two management stages (Pękala, 2012) (Fig 1). Stage I, preparatory stage, included actions on the part of the contracting authority, from the preparation of the project to the selection of an external contractor in the tender procedure. Stage II, implementation, is the development by the contractor of an external IT system and other products specified in the procurement, to which he was contractually obliged. This would seem to be a typical project management process with an external/outsourced contractor. The moment of signing up the contract (item U) is tantamount to ordering a group of tasks to be performed by the project manager to the manager of the contractor team. The problem is that the contract and its enclosures do not in any way meet the conditions imposed on the input element of the process, *accepting a group of tasks to be performed*. As a basic principle, before a task force is assigned to a team, the project leader and the team leader should agree on what is to be provided, the reporting requirements, what restrictions apply, what procedures are to be followed and whether the requirements of the task force are justified and whether can be met (Axelos, 2009).

Fig. 2: Management stages of e-Cło projects compared to the current project life cycle

Ignoring the fact that at the time of signing the agreement, a second project appears (Rozmus, 2014), which also needs to be initiated, results in unnecessary chaos at the outset. On the one hand, the contracting authority requires a number of management documents to be prepared, while on the other hand, work on the contractor's side starts from the technical design phase, which does not include the preparation of management documentation. If the required management documentation consists of several dozen documents, including descriptions of the products to be produced, the contracting authority should anticipate and ensure adequate time for their implementation in a framework schedule.

There are also a number of reservations about the framework schedules. First of all, the contracting

authority did not allow for the possibility of postponing the planned project completion date if the planned contract deadline is exceeded. This resulted in bizarre situations where the contract for one of the projects was signed in December and the system, developed within this project, was to be ready for pilot implementation at the end of January next year.

Moreover, the deadlines given for reaching the milestones were often unrealistic. This was mainly due to the imposed deadlines for the production of certain products, the manufacture of which was conditioned by the manufacture of other products. For example, in the technical design phase of the ZEFIR2 system there is, among others, the item *Developing a tests' plan* (IC-Kraków, 2011a). The document specifies that the test plan should contain, inter alia, the scope of the tests, the place where test is conducted, a detailed test schedule, a list of test scenarios.

It would not be surprising if it were not for the fact that the complete document was to be produced at the same time as the requirements specification (and thus even before the system was designed). It is not difficult to notice that the scope of the document defined in this way is, by definition, impossible to achieve under these conditions. Only acceptance tests can (and should) be specified.

Table 1: Scheduled timeframe for the execution of projects within the e-Cło programme

Project	Commencement date	Scheduled completion date	Scheduled timeframe for the execution [months]			Total scheduled timeframe for the project [months]
			Phase 1	Phase 2	Phase 3	
HERMES2	April 2009	March 2014	**26**	15	19	60
Help Desk	January 2010	September 2013	**16**	**17**	12	45
ZISAR	February 2010	December 2013	**21**	13	13	47
MCA	February 2010	December 2013	**31**	**8**	7	46
ZEFIR2	April 2010	March 2014	11	**19**	18	48
SZPROT	July 2010	March 2014	**20**	9	16	45
PDR PL/UE	July 2010	September 2013	**16**	12	13	41
AIS	November 2010	March 2014	**18**	7	16	41
SZPADA	April 2011	December 2013	7	5	**21**	33
AES	July 2011	March 2014	9	8	16	33
ARIADNA2	August 2011	December 2013	8	4	**17**	29
NCTS2	October 2011	May 2014	3	11	**18**	32
OSOZ2	October 2011	December 2013	6	8	13	27
ECIP/SEAP PL	October 2011	December 2013	6	6	**15**	27
ISZTAR4	October 2011	December 2013	6	8	13	27

It is also worth analysing the planned execution times of e-Cło projects (due to lack of data, not all projects were included) in relation to individual project phases (Table 1). Out of 15 projects:

- only in 4 projects the time to execute phase 3 is longer than the total time to execute phases 1 and 2,

- in 7 projects the time to execute phase 1 is longer than the time to execute phase 3,
- in 3 projects the time to execute phase 2 is longer than the time to execute phase 3.

It is not difficult to notice that the proportions of the estimated lead times of the various phases of the projects clearly indicate that only those phases, for which the contracting authority is responsible, are taken care of, and that responsibility for their implementation cannot be transferred to someone else. With the predetermined timeframe of the projects, the average share of the estimated time of the preparatory stage in the estimated duration of the whole project was 60.93%, with the maximum share as high as 84.78%. The share was less than 40% in just one project only.

Although potential contractors made comments on the Terms of Reference (IC-Kraków, 2012), but the comments did not bring any effect. And the end result (MF, 2015; MF, 2016a, 2016b; IC-Kraków, 2016), as you might have guessed, has definitely missed the plan (Fig 3).

Fig 3. Delays in the completion of e-Cło projects in relation to the plan

Apart from one, the projects under consideration were delayed. The average delay by the external contractor (*Phase3*) was about 71% of the planned time and the maximum was as much as 169%. Among the delayed projects, projects with a delay of more than 50% of the planned time (8 projects) prevailed, half of which were projects with a delay of more than 100% (Fig 4).

Fig 4. Number and percentage of projects in the e-Cło programme by groups of delays

Evaluation of the execution of the projects of the priority axis No 7 of the Innovative Economy Operational Programme by the Ministry of Digitalisation

In the presented case study I have pointed out a number of anomalies and deficiencies, which have led to the planned time of *Phase3* execution being exceeded, thus to exceeding the planned project execution date. Due to the lack of complete data, it was not possible to analyse how the real costs of the projects were forming in relation to the planned budgets of these projects. Nevertheless, such an assessment was made by the Ministry of Digitalisation. The information on the closure of the priority axis No 7 of the IEOP (MC, 2016a) shows that none of the 40 projects (including the e-Cło programme) has brought losses, and for a significant part of them (32 projects) savings were even noted. This concerns both completed and uncompleted projects (4 projects). Thus, with the total value:

- of all projects, amounting to PLN 4,206,708,281.57, savings of PLN 249,921,915.69 were achieved, which represents 5.94% of the total value,
- of projects completed, amounting to PLN 2.878.945.048,48, savings of PLN 35.975.474,59 were achieved, which represents 1.25% of the total value,
- of projects uncompleted, amounting to PLN 1.327.763.233,09, savings of PLN 213.946.441,10 were achieved, which represents 16.11% of the total value.

Table 2: Savings made on uncompleted projects

The name of the project	The total value of the project [PLN]	The sum of money saved [PLN]	% of money saved in the value of the project
The IT Project, the System for the Protection of the Country against Emergency Threats (SPCET)	297,132,212.02	5,570,062.97	1.87%
Project pl.ID	294,026,962.00	15,372,714.46	5.23%
The Project, the Electronic Platform for Collecting, Analysing and Sharing Digital Resources on Medical Incidents (P1)	712,640,000.00	192,528,076.25	27.02%
The Project, Building the e-service platform of the Office of Electronic Communications	23,964,059.07	475,587.42	1.98%

Taking into account the above, it should be concluded that the situation in the area of financial management of projects for public administration is very good. This is because, despite significant delays in projects in relation to their planned completion dates, none of the projects exceeded their planned budget. What's more, in case of most of the projects, savings were made, with the greatest savings being made by uncompleted projects (Table 1). Is it therefore *a priori* assumed that delays will not affect the cost of the project? Of course, such an assumption is not to be found in any of the project documents. But it is hard to avoid the impression that this was the idea (probably by the consultants) who were drawing up the timetables for each phase (Table 2). The execution time periods for the phases without the participation of an external contractor (*Phase1* and *Phase2*) have been designed to minimise the risk of delay of any of them. Moreover, contracts with external contractors are fixed price contracts, regardless of changes in the scope of the project, including those resulting from changes in legal regulations (IC-Kraków, 2011b). Therefore, the cost of *Phase3* should not affect the total cost of the project, as long as the contracting authority does not exceed its planned costs for *Phase3*. If the change of scope generates additional costs, they will be borne solely by the contractor. And this was probably the case with the execution of projects within the priority axis No 7 of the (IEOP). This is

clear from the assessment presented, although there is no certainty that all those involved in the projects on the part of the contracting authority were paid only from the project budgets, for the entire duration of the projects. Delays in projects can also mean the loss of benefits (and therefore losses), which was not taken into account at all.

Summary

The case study presented clearly shows a number of discrepancies in the preparation and implementation of IT projects for public administration. The main ones are:

- to strive to provide the contracting authority with maximum security, in terms of maintaining project parameters, during the phase, for which he bears sole responsibility,
- seeking to transfer all responsibility for maintaining the parameters of the project to an external contractor during the phase, in which he is involved,
- manipulating the PRINCE2 methodology processes in order to transfer part of the work to an external contractor, which in the management approach adopted (Fig.3) should be carried out by the contracting authority,
- too much confidence in consultants making subject-matter errors in the formulation of the scope of work to be performed, including in framework schedules, resulting in the need to negotiate, anyway necessary changes, immediately after the contract is signed by an external/outsourced contractor,
- ignoring the fact that some of the requirements elaborated by the contracting authority will be outdated at the time of signing up the contract with the external/outsourced contractor, while satisfying itself that the contract price includes any changes in scope, including changes made during the system's production period,
- provisions of the public procurement law, unfavourable to the life cycle of the project, including rigid procedures for drawing up contracts with an external contractor.

If, despite this fact, the final evaluation of the projects executed this way, issued by the institution responsible for their execution, was positive (because an appropriate criterion was adopted), it is no wonder that the same problems still exist in the current evaluation of the PZIP. And, according to the author, this is not mainly due to the lack of IT competences of the persons involved in the projects on the part of the contracting authority (although it is clear that, in relation to administrative staff as a whole, they can constitute a significant barrier (Rozmus, 2017). The most serious barrier to the success of the PZIP, is rather the attitude of the contracting authority, which, with the approval of the responsible authority, is characterised by avoiding co-responsibility for projects. This is facilitated by the lack of established objective criteria for evaluating the execution of IT projects for public administration.

To conclude, without changing the contracting authority's approach to the projects, little will change in the next period of the PZIP. It is to be hoped that such a change will be achieved through further actions by the Centre for Administrative Competence (MC, 2016b), which is responsible, among other things, for verifying all central projects and for providing subject-matter support of the coordination of projects' implementations and executions.

joamama@gmail.com

Abstract

Employee trust in employers has become a key value nowadays, particularly in the context of shortages on the labor market and the growing importance of people and their impact on enterprises' success. Therefore, the article aims to identify, analyze, and diagnose employees' sense of trust towards the employer and its significant relation with enterprises' action for sustainable development. Quantitative and qualitative research was carried out based on a questionnaire survey among 449 employees of enterprises in Poland and India to verify the theses and hypotheses. The average level of trust of the surveyed employees towards the employer was found. Polish respondents have significantly lower confidence in the employer than employees from India. It was proved that the more sustainable development activities the enterprises introduce, the higher the trust employees have in the employers. Such activities comprise taking environmental and social issues into account when making key decisions, conducting employee volunteering, enabling employees to carry out charity projects during work, communicating and promoting dedication to sustainable development, both among employees and in the environment, supporting employees in striving for a balance between work and personal life, taking care to improve their working conditions, organizing the training on sustainable development and implementing good practices in this area in the company, and enabling employees to initiate and implement changes in the enterprise from the bottom up. The research findings may support the managerial staff responsible for human resource management. Besides, they may prove useful for implementing strategic plans related to sustainable development and social responsibility. They will allow for a better understanding of the existing relationships between employees' sense of trust in the employer and enterprises' sustainable development.

Keywords: employee trust in the employer, sustainable development of enterprises, Poland, India.

Introduction

The Sustainable Development Goals to be achieved by 2030 include, in addition to environmental protection, tasks related to promoting prosperity and equity, full and productive employment, decent work for all, lifelong learning, and achieving gender equality. They are mainly included in Target 8 (SDG8 - Decent Work and Economic Growth) and Target 5 (SDG5 - Gender Equality). Their implementation has a key impact on the trust of employees and their functioning in the professional sphere. Trust is a very complex construct, with multiple levels, bases, and determinants (Rousseau et al., 1998). It has been defined in terms of a personality trait (e.g., the propensity to trust) (Rotter, 1967), but also has been defined as a behavior (e.g., trusting behavior) (Mayer et al., 1995). Regardless of the

differences in definition (Rotter, 1967), researchers have highlighted the importance and role of trust. Employee trust brings many benefits. Thanks to it, effective operation, cooperation, and success of the organization are possible (Torres, Bligh, 2012). It is associated with commitment (Dirks, Ferrin, 2002; Lapierre, 2007; Mayer, Gavin, 2005), employees' creativity (Madjar, Ortiz-Walters, 2009; Tam, Lin, 2009), low intention to leave the job (Ferres, Connell, Travaglione, 2004), job satisfaction (Dirks & Ferrin, 2002; Tam, Lin, 2009), and building good relationships (Mayer, Bobko, Davis, Gavin, 2011; Rotter, 1980). It should be remembered that "as trust in general and therefore also between employees and employers differs across countries, not least because of country-specific traditions and socioeconomic and cultural differences" (Clegg, 1976; Crouch, 1993; Delhey and Newton, 2005; Ferner and Hyman, 1998; Fox, 1974; Möllering et al., 2004; Uslaner, 2002). In an organization, trust can take many forms, from trust between organizations (Gulati, 1995; Moorman, Zaltman, & Deshpande, 1992), trust between associates/members of the organization (Dirks & Ferrin, 2002; Johnson-George, Swap, 1982), trust in the relations between subordinates and superiors (Torres, Bligh, 2012), through the employee's trust in the organization (Caldwell, 2004; McCauley, & Kuhnert, 1992). The latter type of trust has become the subject of various empirical research. However, it has rarely been considered from the point of view of its impact on the Sustainable Development of Enterprises. As it turns out, it increases, e.g., the level of trust in the organization in relations with new employees or cooperators (Renwick, Redman, Maguire 2012). Although this issue is significant, it has been poorly understood. The employees in clear majority would like the companies that employ them to operate in a sustainable manner (Kubicka 2017; Kubicka, Kupczyk 2018; GlobeScan Radar 2016; Cone Communications 2016; Sustainable Brands 2016; Edelman 2018). In this regard, they expect their employers to:

- provide them with good working conditions and fair and equitable remuneration (GlobeScan Radar 2016];
- limit the organization's negative impact on the environment (GlobeScan Radar 2016; Cone Communications 2016);
- support charity and social projects (GlobeScan Radar 2016);
- reduce activities that threaten basic human rights (GlobeScan Radar 2016);
- show individual interest in the fate and situation of individual employees (Cone Communications 2016);
- stop carrying out activities that harm customers or employees (Edelman 2018).

Therefore, it is crucial to recognize how the implementation of the afore-mentioned employees' expectations related to the sustainable development of enterprises affects their trust in the employer. It is worth noting that enterprises still have difficulties in meeting the requirements of sustainable development (Revell, Blackburn, 2005, Drake et al., 2004; Bertelsmann Stiftung, 2020), and they use criteria other than environmental and social issues when making critical decisions (Bonn, Fisher, 2011; Gibson 2006; Ehrenfeld, 2000; Nilsson and Persson 2012; Robért, Broman, Basile, 2013; Baldock & Charveriat, 2018). International statistics and research results indicate an unsatisfactory state of implementation of sustainable development in enterprises, mainly in Poland and India (ROS 2019; Kubicka, Kupczyk 2018; Bertelsmann Stiftung, 2020). According to the global SDG 2020 index, which characterizes the implementation of 17 Sustainable Development Goals 2030, Poland achieved an indicator of 78.1 (23rd place out of 166 countries), and India 61.9 (117th place) (Bertelsmann Stiftung, 2020). Therefore, the article aims to identify, analyze, and diagnose the level of employee confidence in the employer in Poland and India and its relationship with the enterprises' activities for sustainable development.

Theoretical background and research hypotheses

Over the last dozen years, increasingly many researchers have been exploring issues of trust (Li, 2011). It is especially important to study levels of employees' trust in their employers and factors that affect it. Despite employers' expectations, the level of trust of some employees is still low. Close to one in six respondents globally have "very little" or "no trust" in their current employer (EYGM Limited 2016). Although the Trust Index has increased by 1 percentage point compared to last year and it reached 54 points globally, it is still quite low. The results of Edelman Trust Barometer 2020 indicate that none of the four major social institutions: government, business, non-governmental organisations

and media is trusted, although the highest level of trust was recorded in the case of business (58%, increase of 1 percentage points). Strikingly, more than a half of the respondents (56%) believe that capitalism brings more bad than good consequences (Edelman Trust Barometer 2020). The level of employees' trust is correlated with the generation the employees represent. Generation Y has the lowest level of trust, the highest level was observed in the oldest generation, i.e. Baby boomers. The youngest generation, Z, displayed significantly lower level of trust than baby boomers and only slightly higher than the Y generation (EYGM Limited 2016, p. 5). Thus, younger generations are characterized by a lower level of trust in their employers. Cultural conditions affect employee trust. It turns out that India has one of the highest values of Trust Index (79 points) (Edelman Trust Barometer 2020). According to employees in India, the main factors that affect employees' trust in their employers include:

- Having a strong senior leadership team,
- Providing job security (the employer doesn't terminate a large number of employees or terminate employees too frequently),
- Providing opportunities to learn and advance in my career,
- Delivering on promises,
- Communicating openly / transparently (EYGM Limited 2016, pp. 24).

Poles display a lower level of trust than employees in India. Trust in employers is declared by 68% of Poles, 12 percentage points more than two years ago, when 56% of Polish participants of the survey were trustful of their employers (Edelman Trust Barometer 2018).
It should be added that trust reflects conviction that the company is fair, ethical and competent (Caldwell, Clapham 2003). These requirements conform to the framework of modern organisations operating in a sustainable manner. Enterprises are expected to implement corporate social responsibility at the level of responsible company 4.0, where increasing revenues and generating profit are perceived as equally important as attention paid to the environment and stakeholders (Deloitte 2020). In line with this trend, organisations must therefore do more than pursue their official mission or implement social programs, they need to learn to act wisely and ethically, and to focus on people (Deloitte 2019). Importantly, the tensions that led to the rise of responsible company 4.0 are reflected in problems affecting work, the environment and communities around the world. This is why in 2020 HR departments will have to enhance their operations in this area, getting more involved in efforts to liquidate differences due to gender, race or similar factors (Russellbedford 2020). Especially, since it is beneficial. Among companies operating according to the responsible business 4.0 model, 74% recorded greater increase in operations in 2019 than in 2018, as estimated by revenues (Deloitte 2019). Compared with people at low-trust companies, people at high-trust companies report: 74% less stress, 106% more energy at work, 50% higher productivity, 13% fewer sick days, 76% more engagement, 29% more satisfaction with their lives, 40% less burnout (Zak 2017). For example, it has been calculated that improved gender equality in the European Union until 2050 could lead to increase of the EU's GDP per capita by 6.1 to 9.6%, representing 1.95 to 3.15 trillion euro (EIGE 2017).
Many factors can lead to loss of employee trust. International studies have identified the ten most important ones:

- Employee compensation is not fair,
- Does not provide employees with equal opportunity for pay and promotion,
- Lack of strong senior leadership,
- Too much employee turnover (voluntary and/or involuntary),
- Does not foster a collaborative work environment,
- Does not provide opportunities for employees to learn and grow,
- No opportunity for managing my work-life responsibilities,
- Leadership pay (e.g., CEO) is disproportionate to the company's financial performance,
- Does not operate in an ethical manner,
- Lack of strong financial performance (EYGM Limited 2016, pp. 6).

The top factors influencing “a great deal of trust” in employers are:

- delivering on promises,
- providing job security,
- providing fair compensation and good benefits,

- communicating openly/transparently,
- providing equal opportunity for pay and promotion for all people regardless of differences,
- operating ethically,
- providing opportunities to learn and advance in my career,
- having a strong senior leadership team,
- encouraging management of my work-life responsibilities by offering flexibility in when and where I work,
- strong financial performance,
- working for a company that has a diverse environment (EYGM Limited 2016, pp. 9).

The analysis of scientific literature and employees' expectations (GlobeScan Radar 2016; Cone Communications 2016; Edelman 2018) showed that enterprises actions for sustainable development may affect employees' trust in their employers.

The following auxiliary theses were formulated:

H1. The level of trust of contemporary employees in the employer is not high.

H2. Nationality, age, sex, education, place of residence, position held, the size of the enterprise, the type of its activity, and the length of its functioning on the market do not significantly differentiate employees' trust in the employer.

H3. The level of employee trust in the employer shows significant positive relations with the enterprises' activities for sustainable development, e.g., such as: taking environmental and social issues into account when making critical decisions, conducting employee volunteering, enabling employees to carry out charitable projects during work, communicating and disseminating their dedication for sustainable development, supporting employees in striving for a balance between work and personal life, and improving their working conditions.

Methods

To verify the main thesis and auxiliary theses formulated above, the following research methods were applied: the method of analysis and criticism of the literature, the method of a diagnostic survey using the questionnaire technique, and statistical methods. Quantitative and qualitative research was carried out at the turn of 2018 and 2019 in Poland and India based on a survey questionnaire. The conducted empirical exploration on a sample of 499 employees in Poland and India was aimed at finding answers to the research problems posed, which took the form of the following questions:

1. What is the employees' sense of trust in the employer?
2. Are there significant differences in the sense of trust in the employer from the point of view of the criterion of nationality (Poland, India), gender, age, education (higher, lower), place of residence (urban, rural), position, size of the enterprise, and type of its activity (service, production)?
3. What are the relationships between the employees trust in the employer and the activities of enterprises targeted at sustainable development?

The research results presented in this study are the greater part of the research carried out by an international team from Poland and India, which included the authors of the study. The survey questionnaire was developed for the purpose of this study. It was preceded by pilot studies. The respondents gave their consent to participate in the research in advance, and were asked to complete the questionnaire anonymously. In this study, the following terminological findings were made. Sustainable development is one that meets the needs of the present without compromising the ability of future generations to meet their own needs (World Commission on Environment and Development, 1987). From a business perspective, sustainability was defined as a "business approach that seeks to create long-term value for stakeholders by embracing the opportunities and managing risks associated with economic, environmental, and social developments" (Galbreath, 2009). More specifically, business sustainability relates to "integrating the economic, environmental, and social dimensions of

organizational performance" (Harmon & Fairfield, 2014; Fagerlind, Stefanicki, Feldmann & Korhonen, 2019).
Trust in this research referred to the intra-organizational relations between employees and the employer and management; therefore, employees' trust in the employer was limited to aspects related to sustainable development, including, for example, full and productive employment, decent work, meaningful and prestigious, fair remuneration, good working conditions, flexible forms of employment, strong leadership, good communication, lifelong learning, gender equality and non-discrimination, ethical activities, achieving good financial results, as well as environmental protection and social responsibility.

The level of employees' trust in the employer was assessed by the respondents using a five-point Likert scale (Gamst, Meyers, Guarino, 2008), where 1- no trust, 2 - little trust, 3 - medium trust, 4 - high trust, 5 - very high trust. The Mann-Whitney U test was used to compare the responses between particular groups, e.g., employees from Poland and India, women and men, etc. The results of the dependent variable (trust in the employer) were ranked from the smallest to the largest in the studied groups, and then the groups were compared with each other. There were used research procedures, which are applied in a nomothetic approach allowing for the discovery and formulation of general laws, detection of similarities, universal rules and regularities governing the studied phenomena. That enabled the use of statistical methods of inference about the properties of the examined objects. Based on the Shapiro-Wilk test result ($p < 0.05$), a statistically significant discrepancy between the observed distribution of variables and the normal distribution was observed. It required the use of non-parametric tests. The results of the responses on rank scales depending on the grouping variables were analyzed:

• The Mann-Whitney U test (for two groups, e.g., regarding nationality, gender, education, place of residence, position held, type of business)
• The ANOVA Kruskal-Wallis test with the Bonferroni correction, Dunn (Dunn 1961, 2017), for more than two groups, e.g., taking into account the criterion of the respondents' age, the size of the enterprise, the length of its operation on the market.
• The Jonckheere-Terpstra test for ordered alternatives to establish the existence of a trend for subsequent populations.
• Spearman's coefficient of rank correlation (Lieberson 1964) to establish the relationship between the variables "employee confidence in the employer" and "actions for sustainable development used in the enterprise". The test probability was considered significant at the level of $p < 0.05$, and the highly significant at the level of $p < 0.01$. Statistical analyzes were performed using the PQStat statistical package, version 1.6.4.122.

Research sample and its selection

The survey was conducted on a sample of 499 employees of enterprises. There were 64% people from Poland and 36% from India; 61% were men and 39% women. The respondents are mostly young people, under 35 (82%), 13% were middle-aged people (35-50 years old), and 5% were people over 50. Most of the respondents (53%) are employees with higher education, and 47% with secondary education. As for performed functions, the structure of the respondents was as follows: one fourth was the management of various levels, the rest of the respondents were people who did not perform managerial functions. The vast majority (77%) lived in urban areas, and 23% in rural areas. The respondents were mainly employees of large enterprises (43%). 35% were employed in medium-sized enterprises, 17% in small and 5% in micro-enterprises. 54% of enterprises employing the respondents were involved in services and 47% in production. There was used quota sampling, which defined criteria that significantly differentiated the population according to the subject of the study (Lohr 1999; Rao 2000). That approach was chosen because the adopted sample largely corresponded to the structure of the population due to the distinguished features, and moreover, individuals within the group were characterized by greater homogeneity. However, it required resignation from the statistical condition of the research being representative. To determine the percentage share of the selected groups, their actual distribution in the population was used (according to GUS data from 2019). As a result, the studied population was divided into groups according to the following criteria and their selection was deliberate:

- nationality (Poland, India),
- gender (female, male),
- education (secondary, higher),
- age (under 35, 35-50, over 50),
- place of residence (urban, rural),
- position held (a person not holding managerial positions, managerial staff),
- the size of the enterprise (micro, small and medium-sized, large),
- type of enterprise activity (production, service).

G * Power software (Faul, Erdfelder, Lang, Buchner 2007) was used to calculate the minimum sample size. The following assumptions and parameters were adopted for the calculations:
• test family: t test;
• type of power analysis: a priori compute required sample size –given α, power, and effect size;
• input parameters: Tail (s): two; effect size | p | = 0.3; α rr prob = 0.05; power (1- β err prob) = 0.95.
The minimum sample size was 134 people with output parameters: non-centrality parameter δ = 3.6404323; critical t = 1.9862068; Actual power = 0.9509217.

Results

The surveyed employees were asked to assess their sense of trust in the employer. 12% considered it very large and 31% as large. 32% stated their trust level was medium. It seems worrying that as many as 8% do not trust their employer completely, and 16.5% only slightly trust them. The arithmetic mean of the assessment of the respondents' trust towards the employer on a scale of 1-5 was 3.23 (with the standard deviation 1.113701 and the significance level 0.05). The following null hypotheses H01-H06 were formulated to verify the thesis consisting in the statement that nationality, age, sex, education, place of residence, position held, as well as the size of the enterprise, and the type of its activity do not significantly differentiate employees' sense of trust in the employer:

- H01 There are no statistically significant differences in the sense of trust of employees in the employer between employees from Poland and India.
- H02 There are no statistically significant differences in the sense of trust of employees towards the employer between women and men.
- H03 There are no statistically significant differences in the trust of employees towards the employer in groups with different education (university, secondary).
- H04 There are no statistically significant differences in the sense of trust of employees towards the employer in the groups living in urban and rural areas.
- H05 There are no statistically significant differences in the sense of trust of employees towards the employer in the groups employed in service and production enterprises.
- H06 There are no statistically significant differences in the sense of trust of employees towards the employer in the groups employed in enterprises of various sizes (micro, small, medium, large).

It began with the verification of the null hypothesis H01 that there were no statistically significant differences in the employees' sense of trust in the employer between employees from Poland and India. Based on the Mann-Whitney U test, significant differences were found in the assessment of trust in the employer between people from Poland and India (value p (exact) = 0.0001, and value p (asymptotic) = <0.000001). The sense of trust in the employer in Poland is significantly lower than in India (Table 1).

Table 1: Differences in the sense of trust in the employer between the respondents from Poland and India (grades were made on a scale of 1-5, 1- no trust, 2 - little trust, 3 - medium trust, 4 - high trust, 5 - very high trust) (Poland N = 319, India N = 170)

Group name	**India**
The sum of the group ranks	57171,5
Average group rank	319,39386

The dependence of the respondents' sense of trust on their nationality is presented graphically in a box plot Min - Q1 (lower quartile) - Me (median) - Q3 (upper quartile) - Max (Fig. 1). The variable on the vertical axis is the employee's sense of trust in the employer.

Fig. 1. The relationship between the employees' sense of trust in the employer and the country of origin (Poland, India) based on the Mann-Whitney U test. Min - Q1 (lower quartile) -Me (median) - Q3 (upper quartile) - Max.

Source: own research results

Thus, we can say with 95% probability that Indian employees have a significantly higher sense of trust in the employer than Polish employees (p = 0.0001). Hence, the null H1 hypothesis of no significant differences had to be rejected. The remaining H2-H7 null hypotheses were verified analogously. Based on the Mann-Whitney U test, significant differences were indicated in the sense of trust in the employer between people with higher and secondary education. People with higher education have significantly greater trust in the employer (Table 2).

Table 2: Differences between the sense of trust in the employer between people with higher and secondary education (grades were made on a scale of 1-5, 1- no trust, 2 - little trust, 3 - medium trust, 4 - high trust, 5 - very high trust) (people with lower education N = 234, people with higher education N = 264)

Group name	people with secondary education

The relationship between the sense of trust in the employer and education is presented graphically in a box plot (Fig. 2).

Fig. 2. The relationship between the employees' sense of trust in the employer and education based on the Mann-Whitney U test. Min - Q1 (lower quartile) -Me (median) - Q3 (upper quartile) - Max.

Source: own research results

With the Z statistic (6.282842) and p <0.0001, the H02 hypothesis had to be rejected. Based on the Mann-Whitney U test, no significant differences were found in the sense of trust in the employer between women and men (p-value (asymptotic) = 0.875058). Similarly, no significant differences were found in the sense of trust of the respondents from production and service enterprises (p = 0.657021), as well as in different sizes (one-sided p value = 0.494936, two-sided p value = 0.989873). The assessment of the sense of trust in the employer of people living in urban centers turned out to be slightly higher than those living in rural centers. However, these differences turned out to be statistically insignificant (p = 0.119458). The Spearman's coefficient of rank correlation was calculated to verify the thesis of T3 consisting in the statement that the level of employees' trust in the employer shows significant positive relations with the activities of enterprises for sustainable development, such as taking environmental and social issues into account when making critical decisions, conducting employee volunteering, enabling employees to implement on-the-job charity projects, communicating and spreading commitment to sustainable development, supporting employees in their work-life balance, and improving their working conditions. Statistically significant monotonic dependencies were found between the employee trust in the employer and numerous activities for sustainable development. They allow the following conclusion. Employees have greater trust in the employer if:

- the company they work for is more sustainable (r = 0.104238, p = 0.020109);
- the company increasingly often communicates and disseminates its commitment to sustainable development, both among employees and in the environment (r = 0.091636, p = 0.040943);
- they see more benefits after introducing sustainable changes in the enterprise (r = 0.417734, p = <0.000001);
- they have received more training on sustainable development and more good practice for sustainable development has been implemented in the company (r = 0.188649, p = 0.000023);
- the employer acts to keep the employee in good health and condition (r = 0.483125; p = <0.000001);
- supervisors are more interested in obtaining information from employees about their work to make corrections and improvements to the process (r = 0.467868, p = <0.000001);
- they receive higher additional remuneration (financial and non-financial) for the implementation of activities improving the functioning of the enterprise (r = 0.431436, p = <0.000001);
- their superiors and / or the company provide them with greater support and assistance in introducing changes in the organization (r = 0.415062, p = <0.000001);
- their working conditions improve more often (r = 0.177575, p = 0.000068);
- have a greater possibility of bottom-up, independent initiation and implementation of changes in the enterprise (r = 0.164296, p = 0.000235);
- environmental and social issues are taken into account more often when making key decisions in the enterprise (r = 0.149534, p = 0.000816);
- the enterprise more often supports employees in their pursuit of work-life balance (r = 0.147692, p = 0.000947);
- less frequently during the recruitment process, someone checks the candidates' approach to environmental protection (r = -0.145676, p = 0.001127);
- teams developing and implementing changes in the organization are diverse and represent a wide group of stakeholders, i.e., employees, customers, suppliers, local community (r = 0.12739, p = 0.004409);
- the enterprise conducts employee volunteering more often, enabling employees to carry out charity projects during their work (r = 0.119606, p = 0.00754).

Conclusion and Discussion

Our study provided evidence that:

1. The trust among the surveyed employees is at an average level. One in three declared high trust in their employer, while one in four declared slight trust or none. This is a confirmation of previous study results which showed that a significant part of employees in the world (one in six) declared "very low trust" or "no trust" in their employer (EYGM Limited 2016). It is worth noting that among the respondents this proportion is higher (one in four). It may suggest that among employees from Poland and India there are more people who trust their employers to a small degree or do not trust at all.

2. Respondent employees from India declared significantly higher sense of trust to their employers than employees from Poland. The above results confirm those obtained in other studies (Edelman Trust Barometer 2020). In India sustainable development indicators achieve lower levels than in Poland (Bertelsmann Stiftung, 2020), yet the level of employees' trust in their employer is higher in India. So, it may be affected by other factors, e.g. by local culture.
3. Respondents of higher education declared significantly higher trust in their employers than people with secondary-level education. This may reflect their better treatment at enterprises and application of more sustainable development-related solutions for them.
4. No significant differences were recorded in trust in employer between women and men, enterprises specialising in production or services, different sizes of enterprises or between respondents living in cities and countryside. Thus, it seems reasonable to conclude that gender, education, place of residence, size of the enterprise, type of business do not differentiate the sense of employees' trust in their employer significantly.
5. The employees' trust in their employers grows when the employer companies are more sustainable, communicate and spread their commitment to sustainable development more frequently, consider environmental and social issues in key decision-making, offer higher remunerations, organise more relevant training and implement more good practices in this area, ensure good working conditions, maintaining employees' health and form, support their work/life balance, enable implementation of charity projects at work, as well as bottom-up initiatives of changes at the enterprise.
6. Companies' actions for sustainable development increase employees' trust in their employer.

Acknowledgments

The authors thank all those involved in the research, as well as Madhumita Chatterji and MH Sharieff for conducting the survey in India.

Development of Military Logistics in The Discipline Of Science and Quality Management

Tomasz JAŁOWIEC

War Studies University, Faculty of Management and Command, Warsaw, Poland
t.jalowiec@akademia.mil.pl

Abstract

Development of military logistics theory is one of the key factors in improving the functioning of the armed forces. The experience of the Armed Forces of the Republic of Poland (AF RP) so far shows unequivocally that conducting modern and planned military operations places particular demands on entities responsible for their security and logistical support. Logistics issues are an important point of reference in scientific research conducted in the military environment, whose priority is to seek optimal solutions. The complexity of modern logistic processes requires, among other things, a multidimensional approach to solving problems which are the subject of studies of modern military logistics.
The aim of the article is to identify, evaluate and attempt to indicate the directions of development of military logistics in the field of social sciences. within the integrated scientific discipline – management and quality sciences.

Keywords*:* Development, Multidimensionality, Logistics, Management, Quality, Armed Forces

Introduction

The development of any science requires constant efforts aimed at verifying the existing theory and searching for new, previously unknown mechanisms of approaching problems solved on the basis of theory and practice. One of the guiding principles of science development was formulated by Niels Bohr (1885-1962) with reference to physics, but it is applicable to all sciences. It is a principle of correspondence, according to which a new theory replacing the existing one in a given field is its generalisation, as well as modification and deepening at the same time. This situation also applies in its entirety to logistics, including its particular variety of military logistics, which is characterized by a variety of directions, forms, concepts, and methods of management and acquired logistical potential. They are a necessary response to the dynamically changing internal and external conditions of functioning and development of the armed forces. The multidimensional nature of the problems that need to be "measured" in military logistics today requires an interdisciplinary approach, in which the leading role is played by problems solved in the area of management and quality science, a new discipline functioning in the Polish classification of sciences since 2018. Combining management science (in the field of economic sciences) and commodity science (in the field of quality and product management), management science and quality science are very closely related to the area of interest of modern military logistics.

On the basis of own research carried out and conclusions and postulates submitted by experts dealing with modern military logistics, the aim of the work was to identify and evaluate and indicate the directions of military logistics in the field of social sciences. within the integrated scientific discipline of management and quality sciences. The aim of the work was subordinated to the structure of the article which includes two main parts. The first one, theoretical one, is devoted to the identification of the so-called "problem fields" of contemporary military logistics, and the second one indicates, on the basis of empirical research, the dilemmas of development of military logistics in the area of integrated scientific discipline, i.e. management and quality sciences.

Problem areas of modern military logistics

The development of logistical concepts is the result of a combination of so-called shaping forces. Most often these are forces of a macroeconomic nature: economic, political, social, technical and other. Functioning in such a conglomerate of forces implies a serious difficulty in distinguishing the influence of a particular force only on logistics. It can be pointed out that there are different forces that shape changes in logistics. Existing forces that cause desirable changes in logistics may, in the long run, favour the development of logistics (driving forces) or counteract it (inhibiting forces). If the balance of driving and inhibiting forces indicates a predominance of the former, then the development of logistics in the area can be observed. Driving and braking forces are different in nature, they interact with different forces and in different ways: the nature of these forces is variable over time; the degree of complexity of these forces is very different: some have direct consequences, but their impact may be small, while others exert indirect consequences on logistics, but their impact may be significant; there are still new forces emerging whose impact may be difficult to determine at any given time (Rokita, 2005, p. 335). These forces influence both the choice and the degree of achievement of the goal (in the form of ensuring accessibility), the principles of logistics (of economy, profitability and effectiveness) and priorities (like profit, quality of life and safety), as well as the degree of freedom for logistics (Twaróg, 2016, p. 548). The existing relationships between the driving and inhibiting forces, purpose, principles and priorities of logistics, as well as the scope of logistics activities, are shown in Figure 1.

Fig. 1: Forces that shape changes in logistics

Referring directly to military logistics in the process of forecasting its development, special attention needs to be paid to the provisions in such documents as: *Priority Research Directions in the Ministry of National Defence for 2017-2026"* and *the Strategic Defence Review.* The former was introduced by the decision of the Minister of National Defence of 26 June 2019, while the latter is a result of the works by the Ministry of National Defence team launched in mid-2016 and completed in 2017. Detailed analysis of the provisions under the document *Priority Research Directions in the Ministry of National Defence for 2017-2026* and their confrontation with the views presented in the source literature make it possible to indicate that it is justified to conduct scientific research and development works in the area of military logistics focusing on two main aspects: operational and technical. **The operational aspect** refers to obtaining answers as to what capabilities should characterise the logistic system and determining capabilities which should remain the responsibility of the combat support subunits of the

Polish Armed Forces. According to the opinions presented, it is necessary to make optimal use of the technical and material resources available and to determine the capabilities necessary for acquisition. **The technical aspect** is in turn connected with carrying out research aimed at obtaining tools enabling to ensure the implementation of an effective logistic security that would permit the full use of the operational capabilities of the Polish Armed Forces. It includes technologies in the scope of: use of armaments and military equipment, delivering and storing supplies, technical reconnaissance and evacuation, service, maintenance and repair of armaments and military equipment, new technologies in the scope of: integrated information technologies enabling to obtain LCOP - Logistic Common Operation Picture (Decision, 2019, p. 46).

The broad problem areas of interest in military logistics, as an area of great importance from the perspective of the proper implementation of tasks currently faced by the armed forces in all states of country functioning, i.e.: peace, crisis and war, are constantly expanding. Particularly important in this respect is the fact that, according to the assumptions presented in the "Methodology for planning and programming the development of the Polish Armed Forces in 2013-2022", scientific research financed from the state budget constitute an element of the process of achieving operational capabilities by the Polish Armed Forces. They include primarily such capabilities as: ability to command, ability to conduct reconnaissance, ability to fire, ability to support operations and to transfer and maintain mobility, ability to survive and protect troops, including the ability to secure the medical battlefield, ability to support the non-military system in situations of non-military threats (Decision, 2019, p. 46). Moreover, as the experience to date and the provisions in doctrinal documents indicate, the strategic and operational, legal, standardisation and functional conditions resulting from the multinational character of contemporary military operations and the conclusions from participation in missions and operations abroad determine the qualitative changes in the logistics system of the armed forces.

In the light of the above, it should be noted that modern military logistics should not only harness the latest achievements of science and technology, especially in the field of applied research and development works, but also make widespread use of the achievements of management and quality sciences for the improvement of applied solutions and, consequently, work out optimal solutions. Nowadays, it seems justified to state that the area of special exploration of military logistics is the theory and practice aimed at optimising the management of organic and acquired logistic resources with a particular aim to improve the effectiveness of applied solutions. Therefore, the overriding objective of scientific research undertaken in the area of military logistics within the framework of the discipline of management and quality science appears to be a precise definition of challenges and expectations in relation to all elements of the logistics system, as a necessary condition for proper management of the logistics potential used in all states of country functioning for the benefit of military units and institutions. The pursuit of a holistic approach to solving logistical problems has resulted in the past from – and is nowadays related to – the need to constantly seek optimal solutions in logistic activity. Optimisation, which is in essence the choice of the best solution from the perspective of a given criterion, is the primary task of logistics in both its theoretical and practical dimensions. It translates into its specific tasks, which include above all (Skowronek, Sarjusz-Wolski, 2008, p. 20-21): improving the management of material goods flow processes and, consequently, ensuring full satisfaction of the material needs of participants in logistics processes; subordinating logistics activities to the requirements of the recipient (customer) servicing; increasing the efficiency of flow, which in the civil sector is expressed primarily in the pursuit of reducing flow costs and, to the broadest possible extent, logistics costs. In the military environment, the approach to maximising efficiency takes on a slightly different character, as in many cases its economic plane (cost-effectiveness) takes the back seat, giving way to its other dimensions (Jałowiec, 2013; 2017).

To sum up, it is worthwhile to pay particular attention to the multidimensional nature of modern military logistics once more. Current and forecasted conditions of the functioning of the armed forces, and consequently their logistics systems, result in an ever wider area of interest of specialists involved in the theory and practice of improving military logistics processes. It is always worth remembering that the development of military logistics is inextricably linked to the constant search for and discovery of newer and newer connection forming in the complex reality of the functioning of military logistics processes taking place both in the national and multinational dimension.

Dilemmas of Military Logistics Development Within the Discipline of Management and Quality Science – Empirical Research

The relevance and complexity of the area under consideration in the article and the attempt to solve the assumed research problem brought in the necessity to carry out empirical qualitative research of the analysed phenomenon. The basis of scientific research in this area was the method of diagnostic survey, carried out using the technique of expert interview. Due to the limitations introduced, the research tool was developed in the form of an interview sheet and included three detailed questions addressed to a group of four experts with at least a PhD degree and over 20 years of experience in the area of security and logistical support provided for the army. In addition, in order to obtain a cross-sectional character of the material, the research was extended to include two recognised specialists in the civilian environment, representing directly the area of management sciences (classified before 2018 as belonging to the area of economic sciences). This approach made it possible to obtain a general material, which is the basis for detailed and general conclusions. They were based primarily on a comparative listing of the views presented, which were often partially different.

The relevant studies, preceded by a pilot, started in March and were completed in May 2020. The developed research tool – the interview sheet included three questions in total:

1. To what extent do you think that the area of interest in military logistics coincides with the subject of management and quality sciences cognition?
2. What do you think should be the priority for the further development of military logistics within the field of management and quality science?
3. What actions should, in your opinion, be a priority in the further development of military logistics in the field of management and quality science?

The scope of the questions was aimed at getting to know the detailed opinions of the surveyed experts on the dilemmas of the development of military logistics within the field of management and quality science.

Answering the first question, the experts agreed that the area of interest of military logistics is very much in line with the subject of management and quality sciences cognition. The respondents indicated that regardless of cyclical modifications of formal classifications of sciences in Poland, logistics, including military logistics is an important element of the management process. They pointed out in particular that it is impossible to consider the problems of contemporary military logistics without referring them to the resources of an organisation, among which people are the most important. In the presented views, the dominant position was that the destiny of any organization, including the hierarchical one, i.e. the armed forces, is to systematize (organize) the activities of its participants in such a way as to enable it carry out its mission, achieve the expected results and perform its tasks with maximum efficiency with the optimal use of its own or acquired resources. In the case of the first question, when comparing the answers of experts representing the military environment with the civil sector, different opinions in the examined area are obvious. All experts noticed a clear convergence of the area of interest of military logistics with the subject of management and quality sciences cognition, emphasising at the same time that modern conditions require looking for and implementing solutions resulting from interdisciplinary approach. Interesting in this respect is the opinion of one of the experts that currently logistics perceived as a scientific field of expertise shows the strongest links with two fields, i.e. social sciences and engineering and technical sciences. Within the field of social sciences, this applies most to the following disciplines: economics and finance, socio-economic geography and spatial management, security science, management and quality science. Within the field of engineering and technical sciences, however, such disciplines as: civil engineering and transport, automation, electronics and electrotechnology, and technical informatics and telecommunications should be indicated. Moreover, another specialist pointed out that logistics is a field of knowledge (a significant group of logisticians adds the adjective "practical"), and as such it is subject to development using the research instruments borrowed from other scientific disciplines. In the light of the above, it should be noted that it is significant that logistics has not developed its own research instruments – it mainly uses the scientific output of the other, previously formed disciplines of management science, although it

applies methods from outside this area more and more frequently. It is dominated by methods borrowed and adapted, mainly from economic cybernetics, accounting, operational research, computer science and systems theory. Nevertheless, logistics also uses its own specific rules and procedures. In view of the above, it should be noted that the links between logistics, including military logistics and management sciences, are now widely spoken of among specialists and, as it seems, even this view has fewer and fewer opponents.

The second question of the interview sheet referred to an indication of what, according to the experts, is the greatest opportunity for the development of military logistics within the field of management and quality science. In the obtained research material two main streams of the presented views can be seen. The first one indicates that such an opportunity should be seen in the combination of the achievements of military logistics to date with the much greater achievements of the management sciences. Such an approach pointed to the important role and importance of disseminating the rich publishing output of management sciences in the environment of logistics professionals conducting research on optimisation of military logistics processes. The experts pointed to the key importance of using the assumptions of the benchmarking concept (learning from the best, from someone else's mistakes, etc.) to "practice" military logistics within the management and quality sciences. The second group of answers indicated that, most of all, such an opportunity should be seen in the joint conducting of interdisciplinary research by representatives of the environment directly related to military logistics in cooperation with scientists carrying out research on management in the civil environment. When we compare the obtained research material, we can also see that the experts are convinced that the allocation of logistics within the management and quality sciences should in the near future bring measurable effects to the theory and practice of military logistics. An integrated, interdisciplinary and multidimensional approach to the problems of securing and supporting military logistics is a prerequisite for improving the efficiency of military logistics processes.

The answers to the third question contained in the interview sheet clearly indicate that experts see real opportunities for the development of military logistics within the field of management and quality science. Among the priority actions in this respect, the following were predominantly indicated:

- the need to identify the paradigms of military logistics in the light of the paradigms of modern management, especially with regard to defence resources management;
- the need to closely correlate the research conducted in the military sector referring to the management of processes taking place within the framework of securing and logistic support for the military with logistic innovations functioning on the national and international market of logistic services;
- the possibility of developing procedures to combine the efforts of research teams conducting research in civil and military logistics;
- ensuring interdisciplinarity of the research carried out through the widespread inclusion of representatives of other scientific fields and disciplines in research teams;
- establishing close cooperation with foreign, military and civil scientific centres conducting research in the field of development of military-civil logistic cooperation;
- the need to carry out innovative research works in the area of security and logistic support of the military integrating research in social sciences and engineering and technology.

When summarising this part of the research it can be pointed out that the priority in the further development of military logistics in the field of management and quality science has been recognised, first of all, as the necessity of adapting an interdisciplinary approach in the process of cognition of scientific military logistics. As the results obtained show, one of the key ways of developing military logistics is to closely correlate the achievements of military logistics practised within the framework of military sciences, defence and security sciences with the toolbox of management and quality sciences.

Summary

The results obtained in the research process give rise to the following general

Conclusions

1. A significant number of problems considered from the theoretical perspective within the sphere of military security and logistical support of the military are closely linked to the area of interest of the field of management and quality science.
2. Further development of military logistics requires an interdisciplinary approach to the problems to be solved, where social sciences and engineering together with technical sciences should lead the way.
3. Military logistics, especially in peacetime, shares many features with logistics relating to the civilian sphere. Combining the achievements of both types of logistics can bring measurable benefits for both the military environment and free market operators.
4. The main direction of research conducted in the field of military logistics within the discipline of management and quality science is to seek optimal solutions to improve the management of military supply chains in order to fully meet the needs reported by soldiers, units and military institutions.

In conclusion, it should be emphasised that military logistics as a source of cognition of complex phenomena and processes taking place within the framework of securing and logistic support of troops requires ordering and linking the formulated individual views with other theories. Conducting research in the field of military logistics within the framework of the discipline of management and quality science gives new possibilities to achieve that objective, while at the same time determining further problem areas, the cognition and ordering of which is necessary for its further, dynamic development.

Formal, Legal, and Infrastructural Aspects of Competing – Survey Results from The Polish Road Freight Sector

Malgorzata KEDZIOR-LASKOWSKA

University of Warmia and Mazury in Olsztyn, Olsztyn, Poland
Malgorzata.kedzior@uwm.edu.pl

Abstract

Polish road carriers constitute an essential part of the European transport market. They are responsible for approximately 10% of the cargo transport volume, also effectively competing with foreign carriers. The Polish road transport sector is characterised by a relatively high interference of the state (direct and indirect). This article attempts to assess the impact of formal, legal, and infrastructural determinants on the competitiveness of Polish road carriers. The research survey was conducted twice, in 2013 and 2019, which allowed for the comparative analysis and determination of the directions of changes. The sphere of regulations was described by 8 factors of legal and formal nature and infrastructural conditions. These factors were subjected to the respondents' evaluation. The statistical analysis employed measures of location and variation. The changes in the influence of the studied determinants were established with the Mann–Whitney U test. The research results prove the increased importance of formal, legal, and infrastructural factors in shaping the competitiveness of road carriers. Furthermore, they show a greater heterogeneity in a group of micro-enterprises than in a group of enterprises employing more than 9 persons.

Keywords: Transport, Competitiveness, Poland, Freight.

Introduction

The international scale of business activity underlies the development of competition on transport markets. Globalisation and integration affect the dynamics of changes and conditions of enterprise operation, while the EU transport policy requires respecting international agreements dedicated to transport activity (see Cieślik et al. 2019; Cheba and Szopik-Depczyńska 2017; Kiseľáková et al. 2019).Transport is one of the most important sectors of the global economy (OECD/ITF 2009; Ślusarczyk 2010). Determinants of the sustainable development, also these perceived in the regional context (Charalampidis et al. 2019; Song and Geenhuizen 2015; Pawlak 2020), make the transport play a special role in shaping the economic and social governance. The multi-faceted development of transport, including formal and legal standards dedicated to this sector, is also essential to the functioning of other sectors of the economy (Bollard and Pickford 1998). Therefore, transport's importance in the economic development creates circumstances for interference in the market.

The consequences of Poland's accession to the EU include, among others, a change of legal and formal determinants under which the market and road transport enterprises operate. The purpose of these regulations is to liberalise operating rules and harmonise the competition conditions of road carriers. Poland's accession into the EU structures changed the rules of, among others, accessing the profession of a carrier and driver, drivers' working time, social aspects, fees, and taxes accompanying this business, or emission standards. On the other hand, financial resources were launched, a significant part of which was earmarked for the modernisation and development of road infrastructure (Melecký 2018). In accordance with the transport policy, actions undertaken in this aspect positively affect the safety of road traffic and minimisation (close to zero) of fatalities (Directive 2008/96/EC).

Poland's geopolitical situation and competitive freight rates determined a substantial participation of the Polish carriers in the EU structure of cargo transport. It has not changed for a couple of years. The Polish carriers are deemed one of the major competitors with approximately 10% of the total cargo transported, compared to Germany answering to the greatest number of transport needs in the EU and

Cite this Article as: Malgorzata KEDZIOR-LASKOWSKA "Formal, Legal, and Infrastructural Aspects of Competing – Survey Results from The Polish Road Freight Sector" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain

transporting over 20% of the total cargos in 2018 (counted in the number of transported tons). In Poland, transport services are one of the key elements of the generic structure of services. Transport is responsible for almost 1/3 value of the Polish export services to the EU markets, and this share is continuously growing (Szypulewska-Porczyńska and Suska 2020; Jędrzejczak-Gas and Wyrwa 2020).

It should be noted that the road cargo transport sector is fragmented, with a characteristic oversupply of services and consumer market. The EUROSTAT data indicate that in most EU member states, this sector is predominated by micro-entrepreneurs employing up to 5 persons (e.g., 95% in Spain, 87% in Italy, 69% in Austria, 96% in Poland, and 93% in Slovakia). This significant fragmentation has also been noticed by the European Commission (European Commission 2014). Moreover, Laufs and Schwens (2014) point out to the fact that these are usually enterprises poor in human and financial resources.

The liberalisation of the service market in road cargo transport has strengthened competition processes (Poliak et al. 2019). Access to geographically remote markets has contributed to the development of international road transport, including enterprises from the Polish sector. Considering the above, it seems important to determine the impact of formal, legal, and infrastructural determinants of competitiveness of Polish road carriers. This study aimed to determine the impact of these determinants on the competitiveness of road transport enterprises. These determinants were described by 8 factors that are relevant, directly or indirectly, to road carriers' competitiveness. These factors have been subjected to the respondents' assessment. The research survey has been conducted in two independent samples (in 2013 and 2019). The results of the statistical analysis proved, among others, that respondents' answers were influenced by time (research year).

Literature Review

The conditions of service provision at the European road freight transport market were established in the middle of the 19th century. These rules and conditions were stipulated in agreements and conventions. One of the most important conventions pertaining to road transport is the CMR Convention (the Convention on the Contract for the International Carriage of Goods by Road), which standardised conditions of cargo transport, in particular in cross-border trade in goods, and allowed eliminating unnecessary bureaucracy and improving transport processes (Defossez 2013).

Fuel prices, drivers' working time, technical measurements of vehicles, fees for using roads, or emission standards are regulated at the national and the Community level. In the last few years, the major subject of interest was transport decarbonisation (see Jonek-Kowalska 2019). The goals of the transport policy mainly focus on reducing gas emission and congestion at transport routes. This goal may be achieved by service substitution (transfer of demand to more ecological forms of transport) and the development of competences and skills of motor vehicle drivers (Monios 2019; Wheeler and Gilmour 1974). Nevertheless, the actions undertaken so far have failed to modify the branched structure of transport.

Undoubtedly, intervention in the market should be substantively justified (MacGregor Pelikánová 2019; MacGregor Pelikánová 2017). From the macroeconomic perspective, the economic and transport policies cannot facilitate the appearance of barriers for new entrants, including the foreign ones. From the microeconomic perspective, service export represents one of the possibilities for developing competitiveness potential (Smallbone et al. 1998; Thrassou and Vrontis 2008).

A significant element of the interference into the transport market is identifying the needs being one of the cornerstones in determining the economic growth (Eberts 2000). It is assumed that transport regulations are based on three pillars: economy, safety, and environment (Slack t al. 2020). From this article's perspective, the economic aspects (infrastructure, competitiveness) and safety aspects (safety of transport processes) are of particular importance. They influence the efficiency and effectiveness

of road carriers' activity and are directly reflected in an increased safety and punctuality of deliveries that underlie the competitiveness of high-quality services.

Fig. 1: Transport regulations

Undoubtedly, market regulation is indispensable in limiting market failures, including negative external effects of transport (Begazo et al. 2018). On the other hand, formal and legal regulations can curb the competitiveness processes and lead to an increase in the costs of transport and goods (Lebogang 2014; Lacey 1990), particularly if they limit the access to the market (introduction of permits, licenses, certificates) and affect service prices. Excessive regulations (e.g., these in the Polish motor vehicle sector) (Burnewicz 2005) may determine the competitiveness of transport enterprises in the country and abroad as well as the efficiency and effectiveness of the business. Furthermore, the results of Kidoro's research (2003) confirm that, i.a., regulated prices contribute to the deteriorating quality of services and competing conditions (for instance, in public transport). On the other hand, liberalisation of the market contributes to the development of qualitative forms of competing and to a decrease of costs and prices (Yind and Keeler 1991), also in the low-income countries (Wheat et al. 2019).

Events at the road traffic effectively limit transport activity. They contribute to problems with keeping determined delivery deadlines and safety of shipments, thus lowering the carrier's competitiveness. Furthermore, the vibrant development of individual motorisation (faster growth in the number of vehicles than in the society's incomes) (Estache and de Rus 2000) significantly affects the average vehicle speed. Research conducted by OECD/ITF (2015) showed a positive correlation between economic development and road traffic safety. An increasing number of vehicles (individual and commercial ones) increases the likelihood of accidents. Stanton and Salmon (2009) indicated a human mistake to be the most frequent cause of road accidents. What is equally important, is that the infrastructure constitutes a significant element of road transport, particularly in the low-income countries (Promoting open… 2018).

The safety of road traffic largely depends on the qualifications and skills of vehicle drivers. The International Road Union (IRU 2020) has undertaken actions aimed at safety improvement, including e.g., developing a safety culture, modernising and constructing additional safe parking lots for heavy-load vehicles, or launching complex trainings in the scope of safety. The last ones seem to notably support transport processes. The safety can also be increased by the legal criteria of preliminary qualification and periodic trainings that determine drivers' skills, knowledge, and competences (Łacny 2009), thereby supporting the competitiveness of road carriers.

The intervention of the state seems indispensable to improve the rules of transport activity. It should facilitate the elimination of pathological phenomena at the national and international levels. The EU transport policy indicates directions of the state's impact and transport market development. Nevertheless, each country has its own internal regulations. National transport policies should not compete with each other, protect internal markets, and resident carriers (De Borger and Proost 2012).

Research Background and Methodology

The competition for contracts in road cargo transport is determined by service characteristics. The significant ones among the non-price related characteristics include safety, delivery time, timeliness/scheduling, flexibility, and promptness of deliveries (Rudel 2005; Coyle et al. 2005; Meidute-Kavaliauskiene et al. 2017; Kędzior-Laskowska 2020). One of the areas of road carriers' operation is determined by legal and formal regulations as well as infrastructural conditions of service provision, which can directly or indirectly influence the implementation of transport postulates. They include:

- access to the profession of a carrier,
- access to the profession of a driver,
- periodic trainings of drivers,
- quality of road infrastructure,
- technical condition of roads,
- safety of road traffic,
- protection in transport processes (of drivers, vehicles, and cargos),
- international agreements and conventions.

These factors were selected based on relevant literature (e.g. Łacny 2009; Rydzkowski and Wojewódzka-Król 2009; Marciniak-Neider and Neider 2006) and preliminary interviews with mangers of road transport enterprises. They were subjected to respondents' evaluation in a six-point scale (1 – factor completely unimportant to the shaping of competition, 6 – factor highly important to the shaping of competition), whereby those scored at ≥ 4 were considered as having an impact.

The research survey was conducted twice, in 2013 and 2019. In 2013, 134 respondents participated in the survey, and statistical material was collected based on interviews (personal and via telephone) with the use of a questionnaire. This method of collecting data was costly and time consuming. In 2019, the survey was conducted using an electronic questionnaire created in Google Form (the questionnaire was not publicly available). In total, 73 properly filled forms were obtained. In both (independent) research samples the respondents were chosen randomly on a basis of the Polish classification of activities. In both samples questionnaires were addressed to owners, managers, and persons responsible for transport. The respondents represented entities registered in one of Poland's voivodships (Warmińsko-Mazurskie), operating on the international markets, and representing the sector of small and medium enterprises. Microenterprises prevailed in both samples (70% in 2013 and 56% in 2019). In those two samples there were no enterprises with employment over 25 persons. W województwie warmińsko-mazurskim w ok 2% przedsiębiorstw zatrudnienie było większe niż 50 osób. In the structure of road transport enterprises in the Warmińsko-Mazurskie voivodship, 2% of enterprises employed 10-49 people and 0.12% (24 entities) were characterized by higher employment (in 2013 and 2019). Worthy of notice is that the structure of the respondents was similar to the structure of enterprises in Poland and in many EU countries.

This survey aimed to determine the influence (importance) of formal and legal conditions on the competitiveness of road carriers. Secondly, it attempted to identify changes in the perception of dependencies between these determinants and competitiveness (based on the results of surveys conducted in 2013 and 2019). Finally, the structure of employment was considered in the analysis to establish whether enterprise size affected the research results.

Research Results

In the respondents' opinions from 2013, the legal, formal, and infrastructural determinants did not affect changes in the competitiveness of road carriers (average score of the factors < 4). In contrast, an increase in the importance of these determinants (based on average score) could be observed in the 2019 survey. The majority of the assessed factors were considered important from the perspective of competitiveness. Respective results are presented in Fig. 2.

Fig. 2: Average scores of competitiveness factor

Descriptive statistics provided information regarding the absence of homogeneity of research samples (Tab. 1). In 2013, the respondents' opinions regarding the importance of competitiveness factors were divided, as confirmed by a relatively high value of the range or variation coefficient. Particularly large differences and divided opinions can be observed in regarding the factors associated with infrastructure, i.e., road infrastructure quality and technical condition of roads (V=51 and R=5 as well as V=47 and R=4, respectively). Factors with the highest scores were associated with widely understood safety. Road traffic safety ($\bar{x}$=3.81) and the protection of drivers, vehicles, and cargos ($\bar{x}$=3.81) directly determine the efficiency of processes, including competitiveness compared to other entities providing transport services. Worthy of notice is that, in the respondents' opinion, none of the factors was relevant to their competitiveness.

Table 1: Descriptive statistics

Variable	Year of the research*	Valid N	Average ($\bar{x}$)	Median (Me)	Mode	Mode size	Minimum	Maximum	Range (R)	Standard deviation	Coefficient of variation (V) (in %)
Access to the profession of a carrier	2013	134	3.60	4	4	44	1	6	5	1.286830	36
	2019	76	3.99	4	4	23	1	6	5	1.252699	32
Access to the profession of a driver	2013	134	3.61	4	4	74	1	5	4	0.900380	25

	2019	76	4.48	5	5	25	1	6	5	1.131734	23

**2013 and 2019 – 95% confidence interval for average*

A non-parametric Mann-Whitney test was used in further statistical analysis to verify hypotheses regarding the insignificance of differences in perceiving the competitiveness shaping factors. The null hypothesis (H_0) was adopted, claiming about no effect of the research year on the assessment of competitiveness factors, that was confronted with an alternative hypothesis (H_1) assuming the effect of the research year on the assessment of these factors, with the adopted significance level of α=0.05. Respective results are presented in Tab. 2. In the case of all factors shaping the competitiveness of road carriers, H_0 had to be rejected and H_1 had to be assumed.

Table 2: The results of the Mann-Whitney U test

Tested value[a]	Mann–Whitney U test	W Wilcoxon	Z	Asymptotic significance (bilateral)
Access to the profession of a carrier	4067.000	13112.000	-2.068	.039
Access to the profession of a driver	3423.000	12468.000	-3.843	.000
Periodic trainings of drivers	2608.000	11653.000	-5.709	.000
Road infrastructure quality	3306.000	12351.000	-3.959	.000
Technical condition of roads	3804.000	12849.000	-2.730	.006
Road traffic safety	3639.000	12684.000	-3.108	.002
Protection of drivers, vehicles and cargos	3852.000	12897.000	-2.574	.010
International agreements and conventions	3228.000	12273.000	-4.153	.000

a. Grouping variable: research year

The significance of differences between the scores of competitiveness shaping factors in particular years of the research was also analysed considering the employment size at respondents' enterprises. The results were expected to allow establishing statistically significant differences in the opinions of respondents from particular groups of enterprises. Respective results are presented in Tab. 3 and Tab. 4. The research year influenced the perception of factors affecting competitiveness in a group of enterprises employing more than 9 persons. The null hypothesis (H_0) was rejected, and the alternative hypothesis (H_1) was adopted. Three factors were scored significantly higher: access to the profession of a carrier, periodic trainings of drivers, and road traffic safety. In respondents' opinion, the importance of the remaining factors has not changed (no significant differences in average scores). In a group of enterprises employing less than 10 persons (micro-enterprises), the research year had no statistically significant effect on the assessed importance of the access to the profession of a carrier and road traffic safety in shaping the competitiveness of road carriers (H_0 had to be adopted). In contrast, the importance of the remaining factors was observed to increase (H_0 had to be rejected and H_1 had to be adopted). The research year analysis showed that enterprises employing more than 9 persons were characterised by greater homogeneity in the perception of factors compared to a group of the smaller enterprises.

Table 3: The results of the Mann-Whitney U test in a group of enterprises employing more than 9 persons

Tested value[a]	Mann–Whitney U test	W Wilcoxon	Z	Asymptotic significance (bilateral)
Access to the profession of a carrier	358.000	709.000	-2.316	.021
Access to the profession of a driver	424.000	775.000	-1.507	.132
Periodic trainings of drivers	358.000	709.000	-2.300	.021
Road infrastructure quality	449.000	800.000	-1.108	.268
Technical condition of roads	437.000	788.000	-1.272	.203

International agreements and conventions	952.000	6838.000	-3.976	.000

a. Grouping variable: research year

Conclusions and Discussion

According to the respondents, there was a change in the importance of formal, legal, and infrastructural determinants in shaping competitiveness. They were found irrelevant in 2013, but the research conducted 6 years later demonstrated that regulatory and infrastructure spheres did affect the competitiveness of road carriers. What was the reason behind the change in the entrepreneurs' perception? A likely (and unverified) reason could be the changes proposed in the Community's regulations. They pertain to the functioning of markets and transport enterprises and are described as a "New Mobility Package". The IRU (2019) points out to problems arising from changes related to, i.a., social conditions, the necessity of ensuring hotel conditions in weekly rest of the drivers, and the necessity of providing minimum wages binding in the country in which the transport takes place (except for transit transport). In particular, the last factor will contribute to diminished competitiveness of the Polish carriers and those from Central and Eastern Europe countries. The increased business activity costs will contribute to the increase of prices, being one of the major instruments in competing for contracts in international markets (Poliak et al. 2019; Transport przyszłości 2019; Lazauskas et al. 2012). It seems interesting to continue the research in this respect.

Including the structure of enterprises in the analysis provided important information. In the enterprises employing 1-9 persons, the competitiveness shaping factors were scored significantly higher than in the enterprises employing 10-25 persons. Large fragmentation of services supply suggests lower resourcefulness of entrepreneurs (Laufs and Schwens 2014). Poor human and material resources can constitute a barrier in adjusting to the varying operating conditions, in particular, if these changes are driven by new legal frames of providing services in foreign markets. Greater homogeneity of answers could be observed in the group of enterprises employing more than 9 persons (subject to the fact that micro-enterprises and enterprises employing 10-25 persons constituted heterogeneous samples). A hypothesis assuming that the employment size could affect the homogeneity of the sample seems interesting. Its verification could extend knowledge in the research field of the road carriers competitiveness with consideration given to the regulatory sphere.

The analysis of quality shaping factors demonstrated a significant increase in the importance of the road infrastructure quality in shaping the competitiveness of road carriers. The development of road transport infrastructure in Poland, attempts to limit congestion, and attempts to create safe parking lots in Poland and the EU countries, significantly affect the competitiveness of carriers. This quality is identified with the safety and promptness of deliveries, the implementation of which requires high-quality infrastructure.

Study limitations

The research sample structure was similar to the structure of road carriers in Poland and in many EU countries, but limiting the survey to one voivodship in Poland did not allow for data generalisation. However, reaching similar results in a representative sample could not be excluded. It is worth noticing that the research into the market supply of services is sparse compared to the research focused on the demand in the scope of competitiveness.

The survey results provide an impetus for the continuation of the research and extension thereof by larger entities (with employment rate exceeding 25 persons). As indicated by the research results, the size of the employment can affect perception of the importance of formal and legal conditions to the road carriers' competitiveness.

The survey results provide a platform for further deliberations on the importance of regulatory and infrastructure spheres in the operation of road carriers. The research needs to be continued considering the implementation of the Mobility Package (since August 2020) and formal and legal changes associated with promoting sustainable transport development.

Abstract

Entrepreneurship is an ambiguous concept, and has been described differently over the centuries, both in scientific terms and in practice. There are many definitions, concepts of entrepreneurship in the literature, but there is not a consensus regarding their essence. The article presents a review of selected approaches to entrepreneurship. In addition, the aim of the paper is to seek to answer the question: what is entrepreneurship in practice and what does it do? How is the concept of entrepreneurship defined in the literature? Is it possible to discuss the paradigm of entrepreneurship, considering entrepreneurship as an interdisciplinary science?

Keywords: entrepreneurship, entrepreneurial concepts, multidimensionality, entrepreneurial paradigm

Introduction

The multidimensionality and dynamism of the phenomenon of entrepreneurship makes it a complex issue, a subject of interest for many scientific disciplines, and it is difficult to find a consensus over the meaning of this term. (Siuta-Stolarska, Siuta-Brodzińska 2011). Analysing the issue of entrepreneurship, it can be concluded that it is something natural in today's economic life, because, as M. Bratnicki emphasises, it can be said that '(…) we are entering an era where entrepreneurship is not so much a king as a dictator of economic life'. (Bratnicki 2002). In the theory and practice of many scientific fields, the concept of entrepreneurship is encountered. The multiple of definitions of entrepreneurship and their constant development, determines the need to systematically classify them (Matusiak 2006). However, without this it is difficult to interpret and expose the complexity of the problem. The article is an attempt to answer the question: what is entrepreneurship in practice and what does it do? How is the concept of entrepreneurship defined in the literature? It is also worth considering: is it possible to talk about an entrepreneurial paradigm, meaning entrepreneurship as an interdisciplinary science?

Entrepreneurship as A Science

Entrepreneurship is a discipline of knowledge combining economics and management science. However, until now, it has been difficult to determine its scientific status. According to sceptics, entrepreneurship has not yet developed all the structures characteristic of a separate science, therefore, entrepreneurship is rather complementary to other sciences, mainly economics and management.

Cite this Article as: Anna KOMARNICKA, Pawel MICKIEWICZ and Bartosz MICKIEWICZ" Interdisciplinarity and Multidimensional of Entrepreneurship: Review of The Main Definitions" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Difficulties in fulfilling criteria appropriate for science are related to the fact that entrepreneurship is interdisciplinary in nature (Zajdel 2015) (Kurczewska 2013). Moreover, entrepreneurship, as opposed to other sciences, has not developed uniform, clearly specified definitions, theoretical concepts and ideas, research rules, unified principles and an independent methodology (Kurczewska 2013). Therefore, the use of terminology, concepts and theories established by other sciences may indicate a flaw or weakness, due to the problem of disproportionality - interdisciplinary research is difficult to be compared. In entrepreneurship, that aspires to be a science, paradigms should be distinguished, but this is not that easy, because the concept of a paradigm is understood in different ways, secondly, interdisciplinarity is in contradiction to paradigm, and thirdly, in social sciences, paradigms are controversial (Kurczewska 2013).

On the other hand, entrepreneurship can be regarded as a paradigm serving to show and understand human behaviour, hence do not look for entrepreneurial paradigms, but treat entrepreneurship as a paradigm in social sciences. P. Davidsson argues that entrepreneurship as a science should deductively test theories taken from sociology, economics, management sciences, but it should also ask new questions, building theories based on an inductive approach (Katz, Shepherd 2003). As K. Kuciński emphasises, along with the complexity of social process conditions, the research fields of separate sciences intermingle. In this way, the multidimensional and wide development of entrepreneurship, enhances it with new content, new approaches, which is a sign of scientific progress (Kuciński 2010). Moreover, there are also views that entrepreneurship as a young science has the right to 'experiment' in the area of applied methodology, and that its openness to 'experiments' encourages development. Furthermore, it is worth stressing that entrepreneurship studies a social phenomenon that is not completely addressed by any other field of science. This is a strong point to acknowledge the autonomy of entrepreneurship as a science. Despite being fragmented, it tries to understand the progress of a one, specific and complete process, which has until now been only randomly studied by other sciences (Kurczewska 2013).

In conclusion, entrepreneurship makes use of the achievements of many sciences and other fields, although its results contribute to the development and enrichment of the areas from which it initially benefited. Therefore, we can talk about the feedback.

The evolution of entrepreneurship

Originally, entrepreneurship began to appear in economic sciences as a function of the market. It was also defined as: risk-taking [Cantillon, Say], activity [Austrian school] and innovation [Schumpeter]. The evolution of entrepreneurship as a field of science and the increased interest in behavioural and entrepreneurial management sciences have caused increased focus on entrepreneurial characteristics and the concept of entrepreneurship as a process (Corbetta, Huse, Ravasi 2004). In the period 1850-1870 in economic sciences - entrepreneurship was defined as a function of the market and the entrepreneur has the ability to identify profit opportunities. Between 1890-1920 in economic sciences - entrepreneurship continued to be understood as a function of the market and the entrepreneur as the creator of instability and creative destruction. In turn, in the years 1950-1970 in behavioural sciences - the entrepreneur was defined as an entity with certain attributes. However, since 1985 in the management sciences -entrepreneurship is considered to be a process (Kurczewska 2013).

The modern, multidimensional concept of entrepreneurship has the following eight dimensions (Siuta-Stolarska, Siuta-Brodzińska 2011):

- the economic dimension (efficiency criteria),
- subjective (entrepreneur),
- process (implemented process),
- educational (education),
- institutional (organisation),
- psychological (psychological factors of entrepreneurship),
- personal (personal characteristics affecting entrepreneurial activities),
- cultural (values, cultural norms).

Nowadays, entrepreneurship is considered as the fourth traditional factor of production, besides the land, labour and capital. In 1924 A. Marshall recognised entrepreneurship as the fourth factor of production, in addition to the classic economy, which had been known before - capital, labour and land (and other natural resources). It has had not only an economic significance, but also an ethical and political meaning (Oleksyn 2012). However, considering entrepreneurship as a factor of production means that entrepreneurship binds together and mobilises capital, labour and natural resources; without entrepreneurship they would be useless (Oleksyn 2012). (Figure 1.).

Figure 1: The modern approach to entrepreneurship - effects of production factors

The concept and definition of entrepreneurship

The concept of entrepreneurship does not have a single, coherent definition. Entrepreneurship is defined according to different criteria and covers many dimensions. Table. 1 presents different ways of defining the phenomenon of entrepreneurship described by researchers and scientists representing a variety of scientific disciplines.

Table 1: Review of the definition and concept of entrepreneurship

AUTHOR	DEFINITION OF ENTREPRENEURSHIP
M. Bratnicki	Entrepreneurship is manifested in the action of an entrepreneur who gains riches and, at the same time, increases the rate of change in the economy through the use of his talent and, often, luck.
R. Griffin	Entrepreneurship is the process of arranging and running a business and taking the risks involved.
K. Kaczmarzyk	Entrepreneurship means creating something new, which is unprecedented, it is about making changes and taking action by the entrepreneur.
R. Kao	Entrepreneurship is the process of creating something new in order to generate added value for society.
T. Kotarbiński	Entrepreneurship is a certain set of people's behaviours that aims to achieve the intended goal through the implementation of projects.

AUTHOR	DEFINITION OF ENTREPRENEURSHIP
T. Kraśnicka	Entrepreneurship is understood as the process of creating richness, setting up a company, creating innovations, making changes, creating new workplaces, creating new values, the growth of companies (as well as economic growth), and taking advantage of opportunities.
D. Kuratko	Entrepreneurship is a dynamic process of creating added value. This value is created by people who accept the risk of financial, time and/or career related to adding value to a product or service.
J. Machaczka	Entrepreneurship is all the activities related to the setting up of a new business.
J. Macieja	Entrepreneurship is a great method of creating and building something new, basically from nothing, that is to say, it is the ability to use ideas and resources that are invisible to others.
T. Pszczółkowski	Entrepreneurship means to set goals or tasks for ourselves and others on a personal initiative and to make sure that they are implemented efficiently (especially successfully).
S. Shane **S. Venkataraman**	Entrepreneurship is a dynamic process of transforming new knowledge into products and services.
J. Siekierski	Entrepreneurship is the ability to be active individually or as a team in a specific area.
M. Strużycki	Entrepreneurship is not a field of ideological action, but a well understood interest for each entrepreneurial individual and enterprise.
J. Targalski	Entrepreneurship is the process of setting up and running a business.
A. Wiatrak	Entrepreneurship can be considered as an attitude or as a process for the development of current activities or for the setting up of new business undertakings, based on observation, the search for market opportunities, as well as management strategies and leadership in its implementation.
A. Żur	Entrepreneurship is the resourcefulness of life.

Source: own work based on (Bieniok 2012, Glinka, Gudkova 2011, Kraśnicka 2002, Łochnicka 2016, Lisowska, Rogala 2011, Ropęga 2016, Piecuch 2010, Zajdel 2015)

Conclusions

On the basis of an analysis of the various ways of defining the phenomenon of entrepreneurship expressed by representatives of many scientific disciplines, it should be concluded that a uniform, comprehensive, commonly accepted by individual institutions and researchers definition of entrepreneurship has not yet been developed. However, the difficulties in defining the notion of entrepreneurship should not hinder further attempts at it. In addition, it would be difficult to clearly define the paradigm of entrepreneurship, and, assuming that different paradigms coexist, to determine the level of mutual communication and understanding between the paradigms. It should be concluded that a wide discussion on the scientific nature of entrepreneurship, the presence of paradigms in entrepreneurship and interdisciplinary approaches are undoubtedly contributing to its development.

A Method of Assessing the Feasibility of Realization Enterprise Project Portfolios

Stefan ROZMUS

Institute of Computer and Information Systems, Faculty of Cybernetics, Military University of Technology, Warsaw, Poland, stefan_rozmus@wat.edu.pl

Abstract

The need for simultaneous implementation of many projects in modern enterprises forces a change in the approach to project management. The operational attitude focused on managing individual projects is replaced by a strategic approach focused on managing project portfolios. The purpose of the article is to propose a method to improve the process of building the enterprise project portfolio strategy, which is understood as a set of projects that bring the highest benefits together within the accepted risk tolerance limits. The first part of the article explains the essence of the project portfolio and the project portfolio management process, with particular emphasis on the stage of portfolio components assessment. The second part of the article describes the proposed method for automatically generating project portfolios, which can be realized with a set of available resources. This part presents a model of permissible sharing of resources between projects, a method for assessing feasibility of the project portfolio, and a method that minimizes the number of project portfolios required to assess the feasibility of all established enterprise projects. The proposed method can be used both when switching the enterprise to project portfolio management and when designating a new project portfolio during the implementation of the currently selected one (acquiring new projects or loss of resources). The whole is complemented by elements of the sample application of the proposed method together with graphic illustrations.

Keywords: Project, Project Portfolio, Resources, Graph, Boolean Function.

Introduction

The requirement of simultaneous implementation of multiple projects in modern companies necessitates a change in the approach to project management. The operational approach, aimed at managing individual projects, is being replaced by a strategic approach, aimed at managing project portfolios. Companies generally have established strategies and business objectives. Individual organizational units can submit and implement various projects to achieve these business objectives. Consequently, this leads to competition for access to usually limited company resources. Therefore, company management should implement project portfolio management to ensure that it is able to select and approve projects that are not only in line with the company's business strategies and objectives, but as a portfolio they guarantee an optimal return on possible project investments.

(PMI, 2017) defines project portfolio as a set of projects, programmes, ancillary portfolios and operations managed as a group, in order to achieve the strategic objectives of an organization. Project portfolio management, on the other hand, is the (Thiry, 2007) process of analyzing and allocating the organization's resources between projects and programs in order to achieve the organization's objectives and maximize value for its stakeholders. It should be noted that the base unit of project portfolios (as well as programmes) is a project. Therefore, further considerations, without losing their generality, can be reduced to the case where the project portfolio is simply a set of projects. The projects within the portfolio are quantifiable, which means that they can e.g. be identified, categorized, evaluated, prioritized and authorized. From the point of view of realizability of such a project portfolio with limited resources for which individual projects compete, it is irrelevant whether the projects within the portfolio are related or unrelated, are independent or interdependent and have related or unrelated

business objectives. What is important, however, is that a given portfolio project cannot be implemented unless it is possible to allocate the resources required to implement this project.

The selection of the best project portfolio with regard to the criteria adopted by a given company takes place as part of the project portfolio management process. The project portfolio management process can be divided into stages. Although the names and scope of the various stages of this process, as perceived by various authors (Brzozowski, 2014; Levine, 2005; Bible and Bivins, 2011), differ, the following tasks can be distinguished in each of them, significant from the point of view of assessing the realizability of the project portfolio, with limited resources available for their implementation. These are:

- identification of potential projects within the portfolio,
- allocation of resources to projects,
- pre-selection of project portfolios, i.e. selection according to the criterion of their realizability with the allocated resources.

Identifying and submitting projects to the portfolio is an activity closely linked to the strategic planning process. Projects should be submitted for the portfolio as a consequence of carried-out analyses (both of the environment and the inner workings of the organization) and conceptual activities (Sońta-Drączkowska, 2012). Regardless of the project identification methods employed (e.g. strategic analysis methods, heuristic methods), the result of this task is the creation of a list of currently implemented and potential portfolio projects. Then, each project from such list should be assigned the resources necessary for its implementation. Assignment of a resource to a project is understood here as a declaration of actual allocation of the resource to said project in case it is accepted for implementation. It should be noted here that the projects on the list that are currently being implemented have already been assigned resources. The resource requirements of individual projects are determined for each of them individually, according to the adopted project management methodology, of which the most commonly used are PRINCE2 (Axelos, 2018) and PMBOK® Guide (PMI,2013).

From the point of view of assessing the realizability of the project portfolio, the resources for the implementation of the portfolio's projects (e.g. personnel, technical or financial resources) can be divided, generally, into two groups, i.e. shared resources and resources that cannot be shared. A shared resource is a resource that can be simultaneously allocated to more than one portfolio project. A characteristic feature of a shared resource is a certain total value of the resource, e.g. number of people, number of processors, amount of money. Assignment of a shared resource involves assigning a portion of the resource to the project by providing a value that is a fraction of the total value of the shared resource (which does not exclude the possibility of providing a total value of the resource). Although a shared resource can be assigned to various projects, only these subsets of projects for which the sum of shares in the value of the resource does not exceed its total value are considered realizable (with regard to the resource). A resource that cannot be shared is a resource that can be allocated to only one project within a portfolio. Similarly, as in the case of shared resources, it can be assigned to various portfolio projects. Nevertheless, after approving the portfolio of projects to be implemented, only one project can be included in this portfolio with such a resource assigned to it.

Moving on to the selection of potential project portfolios based on projects from the list of identified projects, it is quite obvious that the number of possible project portfolios for the J-item list of identified projects is $2^J - 1$. This means that the number of potential project portfolios can be very large. From among these potential project portfolios, only one portfolio can be selected for implementation, the one considered the best in terms of the criteria adopted. Nevertheless, each of the potential projects should be considered. Note that only the project portfolio in which each of the projects in the portfolio has been allocated all required resources can be selected for implementation. Therefore, it will be rational to make a pre-selection of potential project portfolios based on such a criterion of the realizability of the portfolio. This will allow to limit the number of portfolios to be considered at subsequent stages of project portfolio creation.

An interesting perspective on the process of creating a project portfolio is presented in (Cabała, 2018), where the selection of portfolios based on the criterion of the possibility to allocate resources was preceded by the generation of all possible potential portfolios for a set of identified projects. The method of portfolio pre-selection presented in this paper does not require generating a full set of portfolios and at the same time reduces to a minimum the number of portfolios that need to be reviewed in order to determine the set of all potential project portfolios meeting the criterion of their realizability. The proposed method assumes that available resources belong to the group of resources that cannot be shared.

Model of possible execution of project portfolios

Let:

$$\mathbb{PR} = \{pr_1, \dots, pr_j, \dots, pr_J\} \tag{1}$$

be a set of all projects under examination which are to be taken into consideration while making a project portfolio,

$$\mathbb{Z} = \{z_1, \dots, z_n, \dots, z_N\} \tag{2}$$

be a set of resources which may be utilized in the execution of the respective projects (from $\mathbb{PR}$ set), whereas let

$$\mathbb{ZG} = \{zg_1, \dots, zg_s, \dots, zg_S\} \tag{3}$$

be a set of groups of resources viz. a set of all those subsets of resources ($zg_s \in \mathbb{ZG}$) which the designer deemed as indispensable for executing the assigned projects. In the general case, so determined subsets are not disjoint. Therefore, if we assume that each resource z_n may be simultaneously assigned for the execution of only one project, then, after selecting any group of resources whose element is z_n, for the execution of a given project, no other group of resources whose element is z_n may be used any longer for the execution of any other project.

It is convenient to illustrate the relation between the projects and possible groups of resources to guarantee their disjunctive execution by means of a graph:

$$\mathbf{GT} = \langle \mathbb{XT}, \mathbb{UT}, PT \rangle \tag{4}$$

where: $\mathbb{XT}$ – a set of graph vertices, $\mathbb{XT} = \mathbb{PR} \cup \mathbb{ZG}$; $\mathbb{UT}$ – a set of graph branches, $\mathbb{UT} = \overrightarrow{\mathbb{UT}} \cup \widetilde{\mathbb{UT}}$ whereby $\overrightarrow{\mathbb{UT}} \subset \mathbb{PR} \times \mathbb{ZG}$, $\widetilde{\mathbb{UT}} \subset \mathbb{ZG} \times \mathbb{ZG}$; PT – a three-segment relationship which satisfies the following conditions:

$$\begin{aligned} &a)\ \forall u \in \mathbb{UT}\ \exists x, y \in \mathbb{XT}: \langle x, y, u \rangle \in PT \\ &b)\ \forall u \in \mathbb{UT}\ \forall x, y, z, v \in \mathbb{XT}: \\ &\quad \{[\langle x, y, u \rangle \in PT \wedge \langle v, z, u \rangle \in PT] \Rightarrow [(x = v) \wedge (y = z) \vee (x = z) \wedge (y = v)]\} \end{aligned} \tag{5}$$

From now on, graph **GT** will be referred to as the graph of opportunities to execute project portfolios. The edge connecting the two groups of resources means that in those both groups there is at least one common element (but it is not a group of identical resources). Absence of an edge between the groups means separation of those groups. Such an exemplary graph is shown in Fig 1., where:

- upon determination of the project portfolio, four projects are taken into consideration, viz. a set of projects $\mathbb{PR} = \{pr_1, pr_2, pr_3, pr_4\}$,

- the set of resources which may be utilized for the execution of each of those four projects contains twelve different resources, $\mathbb{Z} = \{z_1, z_2, z_3, z_4, z_5, z_6, z_7, z_8, z_9, z_{10}, z_{11}, z_{12}\}$, without being able to share them.

Fig 1. A graph of opportunities to execute project portfolios

- upon examination of possible alternative sets of resources indispensable for the execution of each of the projects under examination, it was ascertained that a prerequisite for their execution is the assignment to each of them of one of the following subsets of the set of resources:
  - pr_1: $\{z_2, z_5, z_7\} \mid \{z_1, z_3, z_8\} \mid \{z_9, z_{10}\}$,
  - pr_2: $\{z_1, z_2, z_8\} \mid \{z_1, z_3, z_8\} \mid \{z_3, z_4\}$,
  - pr_3: $\{z_6\}$,
  - pr_4: $\{z_7, z_{11}, z_{12}\}$,
- eventually, a seven element set of groups of resources has been obtained $\mathbb{ZG} = \{zg_1, zg_2, zg_3, zg_4, zg_5, zg_6, zg_7\}$, gdzie: $zg_1 = \{z_2, z_5, z_7\}$, $zg_2 = \{z_1, z_2, z_8\}$, $zg_3 = \{z_1, z_3, z_8\}$, $zg_4 = \{z_3, z_4\}$, $zg_5 = \{z_6\}$, $zg_6 = \{z_9, z_{10}\}$, $zg_7 = \{z_7, z_{11}, z_{12}\}$.

Graph **GT** will be used for ascertaining whether a given subset of project set $\mathbb{PR}$ (viz. the indicated project portfolio can be executed for a determined set of resources and principles of their disjunctive sharing, viz. for a determined $\mathbb{ZG}$ set.

Identification of the feasibility function for the project portfolio

Each subset of project sets PR can be unequivocally determined by a binary (Boolean) vector

$$\mathbf{L} = \langle \mathrm{l}_1, \dots, \mathrm{l}_j, \dots, \mathrm{l}_J \rangle \tag{6}$$

whose component $\mathrm{l}_j = 1$ means that project numbered j is an element of the project subset under examination $\mathrm{l}_j = 0$ – that it is not an element of that subset.

Let $\mathbb{L}$ stand for a set of all vectors **L** (6). For an established set of resources $\mathbb{ZG}$ (3), for each $\mathbf{L} \in \mathbb{L}$ one may evaluate the feasibility of a project subset determined by vector **L**. By assuming that the value 1 stands for a possible execution of the given project subset, while 0 – stands for its lack, it should be ascertained there will exist a certain binary (Boolean) function $g(\mathbf{L})$ defined as follows:

$$g: \mathbb{L} \to \{0,1\}$$
$$g(\mathbf{L}) = \begin{cases} 1 & when\ a\ subset\ of\ projects\ determined\ by\ vector\ \mathbf{L} \\ & can\ be\ feasibility \\ 0 & otherwise \end{cases} \tag{7}$$

It can be concluded from the essence of function g (7) that it is an increasing, monotonic function. Thus, if there exists a possibility of executing a project subset determined by a certain vector **L**, it is also feasible to execute each subset of such a set. Moreover, be stressed that function g is a coherent

function. Therefore, function g can be unambiguously determined by a set of its maximum vectors. It should be clearly stressed that the method of determination of maximum vectors, described hereinafter, is actually something different from the determination of maximum vectors of a known function, defined, for example with an appropriate Boolean formula (Rudell, 1989; Courdert, 1994; Łuba, 2005).

In order to find the maximum vectors of function g one can successfully apply the method of identification of a non-decreasing binary monotonic function which boils down to finding its minimum vectors (Rozmus and Kozina, 2020) after adequate modification of that method. For this purpose, let us introduce some designations and dependences. Let $B = \{0,1\}$ stand for a set of Boolean values (respectively, false and true), let $\mathbb{L}$ continue to stand for a set of all J dimensional Boolean vectors $\mathbf{L}$ determining the project subsets (from set$\mathbb{PR}$) and let relation $\preccurlyeq \subset B \times B$ be a relation

$$\preccurlyeq = \{\langle 0,0\rangle, \langle 0,1\rangle, \langle 1,1\rangle\} \tag{8}$$

and let relation $\prec \subset \mathbb{L} \times \mathbb{L}$ be a relation defined as follows:

$$\forall \mathbf{L}', \mathbf{L}'' \in \mathbb{L}: [\mathbf{L}' \prec \mathbf{L}''] \Leftrightarrow [\forall 1 \leq s \leq I: l'_s \preccurlyeq l''_s] \tag{9}$$

where $\mathbf{L}' = \langle \mathrm{l}'_1, \dots, \mathrm{l}'_j, \dots, \mathrm{l}'_J \rangle$, $\mathbf{L}'' = \langle \mathrm{l}''_1, \dots, \mathrm{l}''_j, \dots, \mathrm{l}''_J \rangle$. Vector $\mathbf{L}'$ is referred to as a predecessor of vector $\mathbf{L}''$, and vector $\mathbf{L}''$- a successor of vector $\mathbf{L}'$. Interval $[\mathbf{L}', \mathbf{L}'']$, defined in space $\mathbb{L}$, is the set of those $\mathbf{L}$ vectors which are simultaneously successors of vector $\mathbf{L}'$ and predecessors of vector $\mathbf{L}''$. At this point be stressed that $\mathbf{L}' \prec \mathbf{L}'$, and also $\mathbf{L}'' \prec \mathbf{L}''$. Let the function be referred to as φ, and also a monotonic, non-decreasing Boolean function then and only then when for each ordered vector pair $\mathbf{L}', \mathbf{L}'' \in \mathbb{L}$ the following implication is true:

$$[\mathbf{L}' \prec \mathbf{L}''] \Rightarrow [\varphi(\mathbf{L}')] \leq \varphi[\mathbf{L}''] \tag{10}$$

As a minimum vector of function φ will be defined each such a vector $\mathbf{L} \in \mathbb{L}$, that $\varphi(\mathbf{L}) = 1$, and for all predecessors of such a vector, different from L, the value of function φ is equal to 0. If the set of minimum vectors is designated as $\mathbb{L}_{min}$, then, the formal description of function φ is as follows:

$$[\mathbf{L} \in \mathbb{L}_{min}] \Leftrightarrow \left[(\varphi(\mathbf{L}) = 1) \wedge \left\{\forall \mathbf{L}_p \in \mathbb{L}: \left[\left(\mathbf{L}_p \prec \mathbf{L}\right) \wedge \left(\mathbf{L}_p \neq \mathbf{L}\right)\right] \Rightarrow \left(\varphi\left(\mathbf{L}_p\right) = 0\right)\right\}\right] \tag{11}$$

Let vectors $\mathbf{a}, \mathbf{b} \in \mathbb{L}$, $\mathbf{a} = \langle \mathrm{a}_1, \dots, \mathrm{a}_j, \dots, \mathrm{a}_J \rangle$, $\mathbf{b} = \langle \mathrm{b}_1, \dots, \mathrm{b}_j, \dots, \mathrm{b}_J \rangle$ stand, respectively, for the lower and upper end of any interval defined in space $\mathbb{L}$, and let vectors $\mathbf{1}, \mathbf{0} \in \mathbb{L}$, $\mathbf{1} = \langle 1_1, \dots, 1_j, \dots, 1_J \rangle$, $\mathbf{0} = \langle 0_1, \dots, 0_j, \dots, 0_J \rangle$ stand, respectively, for a vector representing a full set of $\mathbb{PR}$ projects, and a vector standing for an empty set. Each interval $[\mathbf{a}, \mathbf{b}]$ in space $\mathbb{L}$ can be unambiguously defined by an appropriate characteristic function Π (Karpiński and Korczak, 1993; Korzan, 1986), assuming the value 1 (true) for vectors $\mathbf{L}$ ($\mathbf{L} \in \mathbb{L}$) belonging to that interval, and the value 0 (false), for vectors from outside that interval. A formula describing such a function may be put down as follows:

$$\Pi_{\mathrm{a,b}}^{(J)}(\mathbf{L}) = \begin{cases} 1, \ gdy\ \mathbf{a} = \mathbf{0} \ \wedge \ \mathbf{b} = \mathbf{1} \\ \prod_{j \epsilon \mathbb{D}_1} l_j \prod_{j \epsilon \mathbb{D}_0} \tilde{l}_j, \ gdy\ \mathbf{a} \neq \mathbf{0} \ \vee \ \mathbf{b} \neq \mathbf{1} \end{cases} \tag{12}$$

where: l_j – Boolean variables (components of vector of Boolean variables $\mathbf{L}$), $\mathrm{a}_j, \mathrm{b}_j$ – Boolean constants (components of vectors $\mathbf{a}$ and $\mathbf{b}$), $\mathbb{D}_1 = \{j \epsilon \mathbb{D}: \mathrm{a}_j = \mathrm{b}_j = 1\}$, $\mathbb{D}_0 = \{j \epsilon \mathbb{D}: \mathrm{a}_j = \mathrm{b}_j = 0\}$, $\mathbb{D} = (\mathbb{D}_1 \cup \mathbb{D}_0) \subset \{1, \dots, j, \dots, J\}$. By making use of the characteristic function of interval (12), it can be ascertained whether a given vector belongs to the interval or not. Be noticed that the set of vectors for which a non-decreasing Boolean function assumes the value of 1 is covered by (non-disjoint) intervals whose lower ends are minimum vectors of that function, and the upper end of each of those intervals is vector $\mathbf{1}$ (in this case, its number of components is J). From now on, those intervals will be referred to as intervals generated by minimum vectors. Starting from any vector, for which function φ assumes the value 1 and examining the predecessors of that vector, we will always reach a minimum vector of

this function. It means that upon identification of function φ , the examination of space $\mathbb{L}$ may be performed sequentially by eliminating entire intervals in which function φ assumes the value 1.

The entire space of vectors $\mathbb{L}$, defined with interval $[\mathbf{a}, \mathbf{b}]$, can be divided dychotomically into two intervals - $[\mathbf{0}, \mathbf{b_1}]$ and $[\mathbf{a_1}, \mathbf{1}]$, where $\mathbf{b_1} = \langle 1_1, \dots, 1_j, \dots, 0_J \rangle$; instead, $\mathbf{a_1} = \langle 0_1, \dots, 0_j, \dots, 1_J \rangle$. Dividing similarly each interval obtained in subsequent stages, after *J*-1 steps we will arrive at a binary tree (Banachowski and Kreczmar, 1989; Wirth, 1985), whose vertices are intervals having a form $[\mathbf{a}_k, \mathbf{b}_k]^n$ where: *k* stands for the number of the step (binary tree level), $k = \overline{0, J-1}$; *n* stands for the interval number for k-th level, $n = \overline{1, 2^k}$. A general rule governing the determination of intervals for the k-th binary tree level - basing upon each interval obtained on k-1th level ($[\mathbf{a}_{k-1}, \mathbf{b}_{k-1}]$), at $k > 0$ - is as follows:

- in vector $\mathbf{b}_{k-1}$, we insert the value of component 0 into position numbered *k*, obtaining vector $\mathbf{b}_k$ (upper end of the first interval),
- in vector $\mathbf{a}_{k-1}$ we insert the value of component 1 into position numbered *k* obtaining vector $\mathbf{a}_k$ (lower end of the second interval),
- by substituting the upper end of interval $[\mathbf{a}_{k-1}, \mathbf{b}_{k-1}]$ with the defined vector $\mathbf{b}_k$, we obtain the first interval $[\mathbf{a}_k, \mathbf{b}_k]'$ whereby $\mathbf{a}_k = \mathbf{a}_{k-1}$,
- by substituting the lower end of interval $[\mathbf{a}_{k-1}, \mathbf{b}_{k-1}]$ with the defined vector $\mathbf{a}_k$,we obtain the second interval $[\mathbf{a}_k, \mathbf{b}_k]''$ whereby $\mathbf{b}_k = \mathbf{b}_{k-1}$.

The binary tree made in line with the rule said for a four dimensional space of vectors **L** is presented Fig 2.

Fig. 2: An exemplary binary tree made in line with rule aforesaid

Determination of minimum vectors of function φ boils down to looking for such vectors in the intervals of so constructed a binary tree. By making use of the properties of a non-decreasing Boolean monotonic function (10) and the characteristic function of interval (12), it can be stated that:

$$[(\mathbf{a} \prec \mathbf{b}) \wedge \varphi(\mathbf{b}) = 0] \Rightarrow [\forall \mathbf{L} \in [\mathbf{a}, \mathbf{b}]: \varphi(\mathbf{L}) = 0] \qquad (13)$$

$$[(\mathbf{a} \prec \mathbf{b}) \wedge \varphi(\mathbf{a}) = 1] \Rightarrow [\forall \mathbf{L} \in [\mathbf{a}, \mathbf{b}]: \varphi(\mathbf{L}) = 1] \qquad (14)$$

A conclusion resulting from the aforesaid is that for identification of function φ it is not necessary to examine all the defined intervals. However, when the value of function φ is equal to 0 for the upper end, there is no need of analyzing that interval. This corresponds to the removal of all subspace of vectors from the analysis (the sub-tree whose vertex is interval $[\mathbf{a}, \mathbf{b}]$). Similarly, removed is the subspace of vectors if for the lower end of interval φ is equal to 1. Therefore, we can minimize the number of indispensable queries leading towards identification of function φ. For searching the binary tree discussed in this paper, the so-called *pre-order* strategy has been intentionally applied (Wirth, 1985). As it can be noticed, each vector belonging to the right-side sub-tree of any vertex of that tree has at least one predecessor in the left-side sub-tree of that vertex. Hence, the adopted searching strategy enables working out of an effective algorithm to guarantee that:

- any vector once examined, will not be re-examined,
- the examination will not cover either the successors of the vectors at which function φ assumes the value 1 or the predecessors of the vectors for which function φ assumes the value 0,
- none of vectors $\mathbf{L} \epsilon \mathbb{L}$ will be left over.

As aforementioned, after a slight modification, the method for identifying function φ will be used for identifying function g, which boils down to the determination of its maximum vectors. For this purpose, we will introduce some designations and dependences. A negated vector of vector L (6) will be vector

$$\tilde{\mathbf{L}} = \langle \tilde{\mathrm{I}}_1, \dots, \tilde{\mathrm{I}}_j, \dots, \tilde{\mathrm{I}}_J \rangle \qquad (15)$$

where sign ~ stands for Boolean negation. The veracity of the following dependences can be proved:

1. For each vector pair $\mathbf{L}_i, \mathbf{L}_j \in \mathbb{L}$, is valid the dependence $[\mathbf{L}_i \prec \mathbf{L}_j] \Leftrightarrow [\tilde{\mathbf{L}}_i \prec \tilde{\mathbf{L}}_j]$.
2. Let Boolean function $g: \mathbb{L} \to \{0,1\}$ be a non–growing monotonic function. Then, function $g': \mathbb{L} \to \{0,1\}$, whose values are defined by the equality $g'(\mathbf{L}) = g(\tilde{\mathbf{L}})$ is a non- decreasing monotonic function.
3. Let g be a a non-growing Boolean monotonic function, and function g' be defined with the equality $g'(\mathbf{L}) = g(\tilde{\mathbf{L}})$ and this, in line with theorem 2 - a non-decreasing Boolean monotonic function. Then, the negated minimum vectors of the non-decreasing Boolean monotonic function g' are maximum vectors of the non-growing Boolean monotonic function g.

Therefore, basing upon dependences 2 and 3, and by using the method for defining minimum vectors of function φ we can determine the maximum vectors for each function $g(\mathbf{L})$ under examination as follows:

a. The vector defined in a successive step is negated.
b. Based on **GT** graph, the possibility of feasibility a subset of projects described by this negated vector is checked. If this is possible, function g assumes the value 1; otherwise, function g assumes the value 0.
c. Operations a, b are repeated for all vectors subsequently defined.
d. All minimum vectors obtained are negated, which is tantamount to obtaining a set of maximum vectors of function g.

Fig 3(a) shows a sequence of project portfolio feasibility queries and responses for the **GT** graph example described earlier (see Fig1). Subsequent vectors were generated in accordance with the already mentioned method of determining minimum function φ vectors, while the value of function φ for each of these vectors was determined (after negating this vector) in accordance with the method described in the next chapter. Function φ identified in the example and function g determined on the basis of minimum vectors of the former function have been illustrated (Fig 3(b), 3(c), respectively), each in a four-dimensional binary space (Korzan, 1978). The vertices of the cube for which the value of the function is equal 1 has been presented in color. In addition, the minimum (function φ) and maximum (function g) vectors were encircled.

Fig. 3: Example of determining the maximum vectors of function g: sequence of project portfolio feasibility queries (a), graphic representation of the identified function φ (b), graphic representation of the defined function g (c)

Method for determining the values of the function of project portfolio feasibility

Let $\mathbb{PR}_{\mathbf{L}}$ stand for the set of projects described with this vector $\mathbf{L}$, $\mathbb{PR}_{\mathbf{L}} \subset \mathbb{PR}$. If now we should remove all vertices not belonging to subset $\mathbb{PR}_{\mathbf{L}}$ from graph **GT**, then we will obtain graph $\mathrm{GT}^{\mathbf{L}}$ (sub-graph of graph **GT**) which will define the feasibility of the set of projects described with vector **L**. Determination of values of function $g(\mathbf{L})$ boils down to checking whether in graph $\mathrm{GT}^{\mathbf{L}}$ there exists an association of the graph of cardinality $|\mathbb{PR}_{\mathbf{L}}|$ such that each branch of that graph association is an arc; instead, each two vertices belonging to set $\mathbb{ZG}$ (3) are not adjacent to each other in graph $\mathrm{GT}^{\mathbf{L}}$. Thus, if the association number of graph $\mathrm{GT}^{\mathbf{L}}$ is equal to $|\mathbb{PR}_{\mathbf{L}}|$, then $g(\mathbf{L}) = 1$. Otherwise, $g(\mathbf{L}) = 0$.

Due to the imposed constraints (resulting from the interpretation of graph $\mathrm{GT}^{\mathbf{L}}$ branches), none of the generally known algorithms for determining the maximum cardinality graph matchings (Korzan, 1980) can be used directly in relation to graph $\mathrm{GT}^{\mathbf{L}}$. Therefore, in graph $\mathrm{GT}^{\mathbf{L}}$, let us consider subgraph ZG containing only the vertices from set $\mathbb{ZG}$. For this subgraph ZG, all its maximum internally stable subsets are determined. Based on the assumption proved in (Korzan, 1980) that "a subset of vertices $\mathbb{X}'$ in graph $G = \langle \mathbb{X}, \mathbb{U}, \mathrm{P} \rangle$ is an internally stable set only if the subset $\mathbb{X} \backslash \mathbb{X}'$ forms the base of this graph", the problem of determining the maximum internally stable sets of subgraph ZG can be reduced to determining its minimum bases.

Let $n = |\mathrm{ZG}|$ represent the cardinality of the set of vertices of sub-graph ZG, $m = |\widetilde{\mathbb{UT}}|$ be the cardinality of the set of branches of sub-graph ZG and $\mathbf{A} = [a_{ij}]_{n \times m}$ be the binary incidence matrix of this sub-graph. If by **zg** we define a binary (Boolean) characteristic vector describing a subset of set $\mathbb{ZG}$, then the condition for this vector **zg** to define the base of the ZG subset takes the form:

$$\prod_{j=1}^{m} \sum_{i=1}^{n} (a_{ij} \wedge zg_i) = 1 \qquad (16)$$

where zg_i is a component of vector **zg** and the symbols of the product and the sum indicate the conjunction and the alternative respectively. The expression to the left of the equality sign (16) defines function

$$f_b(\mathbf{zg}) = \prod_{j=1}^{m} \sum_{i=1}^{n} \left(a_{ij} \wedge zg_i\right) \tag{17}$$

explicitly designating all bases of graph ZG. If $f_b(\mathbf{zg}) = 1$ then the subset of vertices defined by vector **zg** is the base of graph ZG, otherwise it is not the base of this graph. It can be seen that function f_b is a monotone non-increasing Boolean function, the minimum vectors of which will determine the sets of vertices forming the minimum bases of subgraph ZG. To determine the minimum vectors of this function, the method of identification of φ function could be used as well, where for each vector **zg**, determined in the next step of the algorithm, the value of the function (17) for this vector **zg** is calculated. Fig 4 illustrates subgraph ZG and its designated minimum bases for the example graph **GT** in question (see Fig 1).

Fig. 4: Example of graph ZG and its minimum bases

On the basis of such obtained minimum vectors, maximum internally stable subsets of sub-graph ZG are determined. For each of these subsets a graph is created, in which the set of vertices is the sum of sets: $\mathbb{PR}_{\mathbf{L}}$ and this maximum internally stable subset. Fig 5 illustrates an example of such graphs for the last vector generated according to the method presented in the previous chapter (see Fig 3(a)).

Fig. 5: Graphs created for each of the example internally stable sets and set $\mathbb{PR}_{\mathbf{L}}$ for $\mathbf{L} = \langle \mathbf{1}, \mathbf{1}, \mathbf{1}, \mathbf{0} \rangle$

For each of the graphs created in this way (these will be bipartite graphs), it is possible to determine the maximum cardinality matching, using one of the known algorithms. It can be seen that in order to determine the value of function g, it is not necessary to determine matchings for all these subgraphs, as long as for any of them a matching of a graph with cardinality of $|\mathbb{PR}_{\mathbf{L}}|$ exists. In the case of the discussed subgraphs, for determining the maximum cardinality matching of any of these sub-graphs it is convenient to use an algorithm bearing the historical name of maximum independent loops search algorithm (Korzan, 1980). This will determine the value of function $g(\mathbf{L})$.

Conclusions

The paper presents a method for assessing the realizability of project portfolios with specific limited company resources, necessary for implementation of projects included in individual portfolios. The presented proposal is based on the following assumptions, resulting from the practice of project portfolio management:

- during the implementation of the defined project portfolio, it may be necessary to build a new portfolio (submission of a new project, canceling a project already in implementation due to loss of allocated resources or outdated business rationale, acquisition of new resources),
- creation of a new portfolio requires considering the possibilities of allocation of resources to projects from the identified set of projects, with the set of resources including both the resources currently available and the resources allocated to projects in the current portfolio,
- company's resources are limited,
- it is not worth considering project portfolios that will not be realizable due to lack of required resources.

Considering the above, a model of realizable project portfolios has been developed, taking into account, on the one hand, the possible assignment of resources for the implementation of projects and, on the other hand, the possibility of their disjunctive use in the project portfolio. Given that if the resources allocated make a given project portfolio realizable, each portfolio, which is a subset of the projects of that portfolio, can also be implemented, a method for identifying the binary function of the project portfolio's realizability is proposed (7). The identification of this function comes down to the determination of its maximum vectors, which unambiguously determine all the portfolios that can be implemented with the defined set of resources and their allocation to the portfolio projects.

The proposed method reduces the number of portfolios requiring consideration to the necessary minimum and may be used, after implementation, in various systems supporting project portfolio management. This refers to a functionality covering the broadly understood distribution of resources, allowing users to allocate company resources “as needed” (El Hannach, Marghoubi, El Akkaoui, and Dahchour, 2019). This functionality enables management and distribution of financial, inventory, technical and human resources.

The developed method applies to cases where resources cannot be shared between projects. This is the only limitation of the presented method. Extension of this method to groups of shared resources is the subject of further research by the author.

Abstract

Non- Profit Organisation (NPO) is the third sector after the public and private sectors that aims to provide welfare services. The NPO has received an increasing demand for services from the society and community. NPOs are highly depending on the skills and knowledge that are attached to their volunteers and employees. The lack of focus on profit maximization of NPOs and the shift from the non-profit environment to commercialization, pose new challenges to their management. Researchers argued that most of NPO failure is due to ineffective strategy, however these can be solved by using intellectual capital (IC) as their strategic tool. Previous studies in IC has largely researched on profit organisation leaving the issue of IC and NPO being inadequately explored. Each NPO inherits different characteristics such as different missions, different targets of community, different nature of services and the different ways delivery services. Thus, this study examines measurement of IC from the perspectives of NPO in Malaysia. Questionnaire survey was applied and sixty-seven representatives of NPO in Malaysia participated in this study. Factor analysis was used to identify the themes of IC best suited the NPO. The analyses resulted in twenty-eight indicators which were further classified into three themes representing the IC. Descriptive statistics were applied to identify the best indicators of IC from Malaysian NPOs perspective. Among the new finding is that IC indicators in NPOs are slightly different from those in the profit organisations.

Keywords: intellectual capital, Non-Profit Organisation, organisational capital, human capital, relational capital.

Introduction

The main objective of Non- Profit Organisation (NPO) is to fulfill the society demand rather than making money (Benevene et al., 2017). NPOs support citizens' participation in community life through several different kinds of organizations: some more informal (such as associations and volunteering groups), others more formal or public (such as charities and foundations) (Buonomo et. al, 2020). Recently, IC have emerged as significant for nonprofit organisations. Kong (2007) suggested that NPOs can apply the IC approach due to two main reasons. First, NPOs are facing performance challenges and therefore, they need to have a managerial tool in the same manner as the profit-making organisations. Secondly, NPOs apply more IC elements as compared to the profit-making organisations. However, there are limited number of studies that have examined IC among NPOs (Joia,

2000). There is a need to examine the potential of IC approach in NPOs and how this approach is applied in the NPOs (Sillanpää et al., 2010).

IC was originally developed to study the contribution of intangible resources in profit-making organisations (Roos et al., 2001). However, intangible resources are also crucial in NPOs although their primary goal is not to make profit. NPOs raise their revenues through various sources such as fundraising, membership fees, funds from the government among others (Lyons, 2001). They depend on their employees' and volunteers' skills, knowledge and experience to achieve their goals (Hudson, 1999). Therefore, NPOs believe that they also need to invest in their employees and volunteers to improve their competencies.

The reformation of the public sector has somewhat pressured the NPOs to compete among themselves of which, could be destructive as they are competing for resources rather than collaborating to solve community problems. Despite the advantages of the IC approach, failing to account for IC in an organisation may lead to misallocation of IC resources. Misallocating intangible resources may cause poor informed decision and consequently, lead to poor strategic planning processes, insufficient trainings and developments, high employees' turnover, less experience top management and incapable to transform data into information (Kong, 2012).

Problem Statement

To date, the NPOs have adopted the IC approach similar to the profit-making organisations (Guthrie, 2001). Reddy et al. (2012) believed that NPOs do need to compete among themselves in order to obtain and sustain community's support and confidence. They also need to secure government grants or contracts. NPO highly depend on the skills and knowledge that attached to their volunteers and employees thus it is importance to invest in improving their competencies. Incorporating IC approach in NPOs seem to be more challenging since the definitions, models, constructs and assumptions of IC are mainly for profit-making organisations (Mesa, 2010). It is even more challenging in understanding the application of the IC approach in NPOs due to their diversity of services and nature (Kong, 2010b). Each NPO inherits different characteristics such as different missions, different targets of community, different nature of services and the different ways delivery services (Ferulano, 2016).

In terms of valuing IC components, it is difficult to decide the best method to value IC components since there are more than fifty IC measurement methods (Ferulano, 2016). Andriessen (2004) has identified ten IC measurement methods that can be used to value IC components. Most organisations reported and valued their IC components without applying a particular method (Dumay, 2009). If they could properly understand how to identify and value their IC components, then their performance can be further improved since IC provides meaningful information for the managers in decision-making process and contributes in building a better organisational strategy (Kong, 2010a). Based on a study done by Sillanpää et al. (2010), they found that there is a potential in applying the IC approach in a NPO that caters for the elderly. They argued that this is possible despite the limited evidences on using the IC approach in a NPO context since there are a variety of knowledge, widespread, non-formalised and unstable assets. In fact, if the NPOs can understand and strategically manage their IC components, then they can make innovation in knowledge creation and bring new values to their organisations (Benevene et al., 2017). The IC is a new form of capital for the NPOs which can be utilised effectively and efficiently provided they understand the components of IC components in their organisations (Kong, 2010a).

Thus, the current study aims to identify the indicators that represents IC (Human Capital, Organisational Capital, and Relational Capital) from perspective of Malaysian NPOs.

Literature Review

Intellectual Capital

Karp (2003) defined IC as "a sum of everything that everybody knows about company that could give competitive advantage". There are three components of IC namely, human capital (HC), organisational capital (OC) and relational capital (RC). Organisation members are required to assess their core competencies, the areas that they can achieve or already achieved in order for them to understand the IC components embedded in their organisation. The embedded IC refers to the wealth of ideas and innovation abilities in determining the future of the organisation (Sharabati et al., 2010). Studies have also shown that IC is usually used in profit-making organisations, thus continuous IC developments are introduced in the profit-making organisations. However, (Benevene et al., 2010) noted that the intangible assets in NPOs should be emphasized more since their primary goal is to improve the wellbeing of their beneficiaries and not to perform financial success.

Intellectual Capital Components

HC is related to human skills, motivation and employees' experience. HC can be increased by hiring employees that possess high skills generated from the external market. Several studies have shown HC management is much more complex in a NPO rather than in profit-making or public organisations (Benevene et al., 2010). HC brings various elements of resources to an organisation including tacit knowledge, competencies, valuable skills, innovation and talents (Kong, 2010a). In NPOs, there are various stakeholders with different expectations, thus managers need to treat the elements of HC efficiently so that they can satisfy and be responsive to their stakeholders (Bontis & Serenko, 2009).

OC comprises of organisation process, patents, databases and management system. In order for HC to function, the organisation must have supportive infrastructure known as organisational capital (OC). In leveraging organisation capability, OC such as systems and organisational philosophy is required in an organization. Learning and knowledge enacted in an organisation on day to day activities is referred to as OC (Kong, 2012). OC assists an organisation to achieve overall organisation performance and supports employees in achieving optimum intellectual performance through organisational structure and mechanism. Even though the organisation hires employees with high skill level, the overall IC would be not able to function if the organisational system and procedures are weak and fail to support HC (Bontis, 1998).

On the other hand, RC relates to relationship networks that the organisation is able to form (Kianto et al., 2014). The RC comprises of knowledge on marketing channels and relationship with customers. To become a leader in the competitive sector, an organisation must be able to understand what goods and services that the customers desire (Bontis, 1998). There are an increasing number of collaborative arrangements among the NPOs with the organisations from different sectors, thus highlighting the importance for the NPOs to effectively manage their external relations (Balser & McClusky, 2005). If the NPOs fail to properly manage their external stakeholders, then there is a high tendency that they would lose their valuable external resources such as fund and volunteers.

Kong and Prior (2008); Buonomo et al. (2020) asserts that the three IC dimensions propose a potential opportunity for competitive advantage, as long as they are interrelated and satisfy organizational, donor, and user needs. A strategic IC management would offer an adequate control over the knowledge flows within and outside the NPO which would lead to better strategic decisions and creation of values in the organization.

Research Methodology

Population and Sample

According to official web page for NPO, there are 60,484 registered NPOs in Malaysia in 2017. There are 12 categories of NPO in Malaysia namely welfare, social, trade, professional, human right, security, culture and art, politics, recreation, mutual benefit, and religion. This study focuses on welfare category in Wilayah Persekutuan Kuala Lumpur, a federal territory in Malaysia. The number of NPO under welfare category in Wilayah Persekutuan Kuala Lumpur is 2,723. Thus, according to Sekaran and Bougie (2010), the appropriate sample size for this study is larger than 30 and not more than 500. This study applied a simple random sampling technique. Thus, it is sufficient to obtain 350 sample size of NPOs under the selected welfare category.

Data Collection

Three hundred and fifty questionnaires were distributed to managers or the NPOs' representatives that possessed comprehensive knowledge about the organisations. The questionnaire adapted Bontis (1998) with few modifications. The questionnaire was distributed through email and some were delivered by hand. Out of 350 questionnaires distributed, only 67 questionnaires were returned which represented a response rate of 19%.

The survey instruments

The managers or representatives were required to give the opinion about IC in their NPO using 5 point Likert scale ranging from "1" for strongly disagree and "5" for strongly agree. It is appropriate to use perceptual measurement in measuring IC in NPO. Perceptual measurement method is usually applied in examining the organisational factors which contribute to organisation performance (Kannan and Aulbur, 2004).

Results and Discussion

Factor Analysis

The data was analysed using Factor Analysis. Factor analysis, which is data reduction method, is applied to reduce a large number of variables to a smaller set of factors. Factor analysis was used to group the IC in the NPOs into three components namely, HC, OC and RC. Only the items with coefficient of above 0.40 were accepted. Further consideration was used when using factor analysis, being Kaiser-Meyer-Olkin (KMO) and Bartlett's Test of Sphericity. KMO is used to measure sampling adequacy and the value must be greater than 0.50. As per Table 1, the value for KMO is 0.729 which indicates sampling adequacy. Bartlett's Test of Sphericity is significant when $p < 0.05$.

Table 1: KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.	Bartlett's Test of Sphericity		
	Approx. Chi-Square	df	Sig.
.729	1478.730	496	.000

The result for total variance explained is shown in Table 2. Factor 1 explains 37.599% of total variance, Factor 2 explains 8.225% of total variance and Factor 3 explains 6.553%. Thus, the total cumulative

variance explained is 52.377%, an indication that 52.377% of IC can be explained by the three components of IC.

Table 2: Total Variance Explained

Factors	Initial Eigenvalues		
	Total	% of variance	Cumulative %
1	12.032	37.599	37.599
2	2.632	8.225	45.824
3	2.097	6.553	52.377

Table 3 displays the results for factor loading. The items in the questionnaire with coefficient above 0.40 are considered significant in this study. There are 28 out of 32 items that produced factor loading above 0.40. As depicted in Table 4, the items that were loaded under the HC category are "the organisation recruitment program is comprehensive", "we are dedicated to hiring the best candidates available", "employees are excited to voice opinions in group discussions", "organisation employees consistently perform at their best the employees are satisfied with the organisation", "we focus on our customers or beneficiaries wants" and "needs by continually make effort to make them satisfied, organisation employees learn from others" and etc. Under the second category which is RC, the items which were classified under this category are "the organisation is able to get the most out of its employees", "the employees work closely with each other" and "the organisation shared with the employees' feedback from beneficiaries". Under the third category which is OC, items that were included are "the organisation develops more new ideas and products than any other organisation in the social network", "the employees are widely considered as the best within the social network", "the employees of organisation are considered creative and bright", "the longevity of the relationships we have with our customers or beneficiaries admired by others in the social network", "our customers or beneficiaries are loyal to our organisation more so than to any other in the social network", "the time it takes to complete one whole transaction or activities has been decreasing over the past few years and etc.

Table 3: Rotated Component Matrix[a]

	Component		
	1	2	3
The organisation develops more new ideas and products than any other organisation in the social network.	.774		
The employees are widely considered as the best within the social network.	.774		
The employees of organisation are considered creative and bright.	.711		
The longevity of the relationships we have with our customers or beneficiaries admired by others in the social network.	.708		
Our customers or beneficiaries are loyal to our organisation, more so than to any other in the social network.	.703		
The time it takes to complete one whole transaction/ activities has been decreasing over the past few years.	.652		
The systems and procedures of the organisation support innovation.	.624		
We continually meet with our customers or our beneficiaries to find out what they want from us.	.583		
The organisation gets the most out of its employees when they cooperate with each other in team tasks.	.530		
The organisation supports the development of new ideas	.522		
The organisation consistently comes up with great new ideas.	.443		
The organisation recruitment program is comprehensive, we are dedicated to hiring the best candidates available.		.729	
Employees are excited to voice opinions in group discussions.		.712	
Organisation employees consistently perform at their best.		.687	
The employees are satisfied with the organisation.		.675	
We focus on our customers or beneficiaries wants and needs by continually make effort to make them satisfied.		.669	

Table 3: Rotated Component Matrix[a] (continued)	Component		
	1	2	3
Organisation employees learn from others.		.658	
A poll of our customers/beneficiaries would indicate that they are generally satisfied with our services.		.598	
We feel confident that our customers/ beneficiaries will continue to use our services.		.579	
Organisation employees generally give it their all which makes this organisation different from the others in the social network.		.567	
The competence of organisation employees as a whole is equal to the most ideal level we could ever hope to achieve.		.552	
The organisation's culture and atmosphere is supportive		.545	
The organisation supports the employees by constantly upgrading their skills whenever each of them feels it is necessary.		.525	
Our data systems make it easy to access relevant information.		.510	
We have greatly reduced the time it takes to resolve a customer's/ beneficiaries problem		.417	
The organisation able to get the most out of its employees.			.755
The employees work closely with each other.			.716
The organisation shared with the employees' feedback from beneficiaries'			.677

Table 4: Intellectual Capital Components (HC, RC and OC)	
Category	Items
Human Capital (HC)	The organisation recruitment program is comprehensive, we are dedicated to hiring the best candidates available.
	Employees are excited to voice opinions in group discussions.
	Organisation employees consistently perform at their best.
	The employees are satisfied with the organisation.
	We focus on our customers or beneficiaries wants and needs by continually make effort to make them satisfied.
	Organisation employees learn from others.
	A poll of our customers/beneficiaries would indicate that they are generally satisfied with our services.
	We feel confident that our customers/ beneficiaries will continue to use our services.
	Organisation employees generally give it their all which makes this organisation different from the others in the social network.
	The competence of organisation employees as a whole is equal to the most ideal level we could ever hope to achieve.
	The organisation's culture and atmosphere is supportive
	The organisation supports the employees by constantly upgrading their skills whenever each of them feels it is necessary.
	Our data systems make it easy to access relevant information.

Table 4: Intellectual Capital Components (continued)	
Category	Items
	We have greatly reduced the time it takes to resolve a customer's/ beneficiaries problem
Relational Capital (RC)	The organisation able to get the most out of its employees.
	The employees work closely with each other.
	The organisation shared with the employees' feedback from beneficiaries'
Organizational Capital (OC)	The organisation develops more new ideas and products than any other organisation in the social network.
	The employees are widely considered as the best within the social network.
	The employees of organisation are considered creative and bright.
	The longevity of the relationships we have with our customers or beneficiaries admired by others in the social network.
	Our customers or beneficiaries are loyal to our organisation, more so than to any other in the social network.
	The time it takes to complete one whole transaction/ activities has been decreasing over the past few years.
	The systems and procedures of the organisation support innovation.
	We continually meet with our customers or our beneficiaries to find out what they want from us.
	The organisation gets the most out of its employees when they cooperate with each other in team tasks.
	The organisation supports the development of new ideas
	The organisation consistently comes up with great new ideas.

Descriptive Analysis

Human Capital

There are 14 items of HC listed in the questionnaire. The respondents were asked on the agreement towards HC in their NPOs based on a 5-point Likert scale, ranging from '1' as strongly disagree to '5' as strongly agree. According to the descriptive statistics in Table 5, the indicator "we feel confident that our customers/ beneficiaries will continue to use our services" achieves the highest mean value which is 4.12. This result is inconsistent with Bontis (1998) and Sharabati et al. (2010) that found this item is under RC. The item for HC with the highest mean value is the best indicator to represent HC in NPOs. There are 8 items of HC indicators with high mean value which is above 4.00. Majority of the variables of HC have recorded mean value above 3.00. This indicates that the level of respondents' agreement towards HC items are between 3.00 to 4.00.

Table 5: Mean and standard deviation of Human Capital		
	Mean	Std. Deviation
We feel confident that our customers/ beneficiaries will continue to use our services.	4.12	.729
Organisation employees consistently perform at their best.	4.10	.819
The organisation's culture and atmosphere is supportive	4.09	.866
The employees are satisfied with the organisation.	4.06	.814
We focus on our customers or beneficiaries wants and needs by continually make effort to make them satisfied.	4.06	.886
Organisation employees generally give it their all which makes this organisation different from the others in the social network.	4.01	.826
The competence of organisation employees as a whole is equal to the most ideal level we could ever hope to achieve.	4.00	.739
Organisation employees learn from others.	4.00	.888
Employees are excited to voice opinions in group discussions.	3.99	.913
A poll of our customers/beneficiaries would indicate that they are generally satisfied with our services.	3.96	.684
The organisation supports the employees by constantly upgrading their skills whenever each of them feels it is necessary.	3.81	.957
The organisation recruitment program is comprehensive, we are dedicated to hiring the best candidates available.	3.60	.871
Our data systems make it easy to access relevant information.	3.46	.804
We have greatly reduced the time it takes to resolve a customer's/ beneficiary's problem	3.43	.701

Relational Capital

There are 3 items of RC listed in the questionnaire. Table 6 indicates the mean value and standard deviation for RC. The result shows that the NPOs were "able to get the most out of their employees" which recorded the highest mean value of 3.58. This indicates that this item is the most suitable indicator to represent RC in NPOs. Most of the respondents agree that their employees always performed their best and the employees strived to give their full effort to ensure the organisations' activities and routines go well. "The organisation shared with the employees' feedback from beneficiaries" is the next reliable indicator to represent RC in NPOs. This reflects that information on beneficiaries' feedback is crucial in order for the NPOs to enhance their performance. When the customers' feedbacks were disseminated throughout the NPOs, it became easier for the employees to develop strategies and activities that offer satisfaction to their beneficiaries.

Table 6: Mean and standard deviation of Relational capital

	Mean	Std. Deviation
The organisation able to get the most out of its employees.	3.58	1.061
The organisation shared with the employees' feedback from beneficiaries'	3.54	1.035
The employees work closely with each other.	3.33	1.260

Organisational Capital

There are 11 items of OC listed in the questionnaire. Table 7 shows the mean value and standard deviation for OC. Two OC items have same mean value comprising 'the organisation gets the most out of its employees when they cooperate with each other in team tasks" and "the organisation supports the development of new ideas". The mean value for both items is 4.03. The results imply that NPOs achieve their best and perform well when the employees cooperate with each other and build a healthy team task. They need to continuously produce new ideas and be innovative in order to attract more customers and donors.

All the OC items have recorded mean value above 3.00 which is above the average scale. This indicates that most of the respondents agreed that their organization possesses good organisational capital. Since the items under OC are above average rate, it can be assumed that the 11 items represent OC in NPOs.

Table 7: Mean and Standard Deviation of Organisational Capital

	Mean	Std. Deviation
The organisation gets the most out of its employees when they cooperate with each other in team tasks.	4.03	.852
The organisation supports the development of new ideas	4.03	.758
The employees of organisation are considered creative and bright.	4.00	.759
The organisation consistently comes up with great new ideas.	3.96	.843
The systems and procedures of the organisation support innovation.	3.94	.919
We continually meet with our customers or our beneficiaries to find out what they want from us.	3.93	.822
The longevity of the relationships we have with our customers or beneficiaries admired by others in the social network.	3.84	.931
The employees are widely considered as the best within the social network.	3.73	.898
Our customers or beneficiaries are loyal to our organisation, more so than to any other in the social network.	3.73	.963
The organisation develops more new ideas and products than any other organisation in the social network.	3.69	.925
The time it takes to complete one whole transaction/ activities has been decreasing over the past few years.	3.69	.957

Conclusion

The current study contributes to the identification of the suitable indicators for IC components in Malaysian NPOs under welfare category. This study found that IC elements in this study fall under different IC components as compared to the original IC components developed by (Bontis, 1998). This implies that the indicators of IC in NPOs are different from those in the profit organisations. IC perspective in the non-profit organisation differs from the industry's viewpoint.

In view of the importance of IC in assisting NPOs to achieve a competitive edge in the current complex environment, the current study contributes to the organisation and management research on the role of intangible assets in value creation and organisation process. It sheds light on the consideration of knowledge and IC in the NPOs operations. It also highlights the importance of realizing and investing in IC as a solution for all NPOs in general (Laallam et.al, 2020),

Future study can focus on examining IC in other categories of NPO such as social, recreation, mutual benefit, culture and art, trade, professional, human right, security and religion. IC indicators could be different due to the different nature of organisation, mission and objective of the NPOs. A qualitative approach can be applied in order to develop the measurement of intellectual capital.

vtzelin@mail.ru

Abstract

The article focuses on the current topic of evaluating the regional mortgage inequality. Based on an analysis of Russian and foreign resources it is clear that currently two aspects remain poorly studied in this area despite a large amount of research on the development of mortgage lending. First of all, it is about the problem of regional inequality in the mortgage lending progress, and then, the issues of measuring the capacity of mortgage markets. Thereby, the purpose of the article is to develop a comprehensive assessment of the mortgage development potential of regional systems of mortgage housing lending in the context of socio-economic inequality in the regions of the Russian Federation. To achieve this goal, the article solves four objectives. First, it is the development of a methodology for assessing the mortgage potential of the regions of the Russian Federation. Secondly, based on the formation and processing of initial data, the selection of the main factors and modeling of a complex criterion for assessing the Russian Federation regions mortgage potential. Third, the practical implementation of the proposed methodology based on a comprehensive assessment of the mortgage potential of all 85 Russian regions. Fourth, the development of management decisions to increase the mortgage potential of regions with low ratings (level C). These areas, together with the proposed approaches to their practical implementation, can serve as the basis for a model of state support for regional mortgage markets.

Keywords: Economic and Mathematical Modeling, Mortgage Potential, Region, Comprehensive Assessment

Introduction

Mortgage loan is one of the biggest innovations in real estate and the financial sector (Dong, 2015). A developed mortgage market contributes to the growth of the economy due to the prosperous real estate development, more efficient allocation of resources, stimulating the development of housing construction and related industries, creating additional workplaces. Mortgages are one of the main mechanisms for improving the housing conditions of the population.

In this regard, the very topic of sustainable development of mortgage is very relevant in both Russian and foreign financial and economic resources. Scientists around the world are discussing a wide range of problems related to the efficient functioning of national mortgage and housing markets, as well as the impact of these segments on the stability of the banking systems of individual states and the world economy generally. For example, a significant part of modern scientific research, in particular the works of Grodecka-Messi (2019), Lyapina et al. (2020), Ge (2014), Cho and Kim (2012), is devoted to studying the effect of investments in mortgage markets on financial stability. Another part of modern research, for example Zhihua (2020), Kharabara (2017), Korosteleva (2013), is focused on the specific problems to specific territories of the development of mortgage lending.

Cite this Article as: Tatyana S. KOROSTELEVA And Vladimir Y. TSELIN " Economic and Mathematical Modeling of a Comprehensive Assessment of the Mortgage Potential of the Regions in the Russian Federation" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

These problems are especially urgent for developing countries, characterized by underdeveloped mortgage instruments in the territories of their states.

However, despite the relatively large amount of research on the topic of mortgage lending development, two aspects remain insufficiently explored in this area. Firstly, this is the problem of regional inequality in the development of mortgage lending, and secondly, the issues of measuring the "depth" of mortgage markets.

Thus, the main studies in these areas are often focused on identifying the specifics of the development of housing markets and mortgage lending in their territories (for example, Davydovich et al., 2019), assessing the impact of this specificity on the state of the housing problem in the whole country (for example, Guzikova, 2017), an analysis of the prospects for the development of this financial and credit instrument (for example, Shkurkin, 2017) in specific (subjects). At the same time, the task of measuring the "depth" of this development in the conditions of socio-economic inequality of their subjects is not set.

In turn, a number of authors study the problem of measuring the depth of mortgage markets in a country context (for example, Kutlukaya and Erol, 2016). Some authors base their models on one or two factors, studying their influence on the resulting variable, which characterizes, from their point of view, the level of development of mortgage lending in the country. For example, a study by Josphat (2013) assesses the effect of interest rates on mortgage financing, Kaplan (1996) measures mortgage activity by two parameters, comparing a variable that measures the percentage of rejected loan applications with a variable that measures the number of loans per 1000 housing units.

Other authors base their models on one or several clusters of factors, for example, Mogaka et al. (2015) analyze the influence of macroeconomic variables (such as the average annual inflation rate, average annual (GDP) growth rate, average annual exchange rate, and the percentage of people employed in the informal sector and others) on the growth of the mortgage market in Kenya. Ghosh (2016) considers banking and economic conditions as regional economic determinants that influence the development of mortgage lending. Kieti and K'Akumu (2018) explains the availability of mortgage lending in several clusters of factors related to the socio-economic factors of households, characteristics of ownership, characteristics of loans and the macroeconomic environment.

In this study, the authors link regional development topics with an assessment of the level of development of local mortgage markets. The problem of regional inequality of mortgage markets is one of the most interesting and relevant in countries with special territorial differentiation, for example, the USA, Canada, England, Spain, Greece, China, Russia and others. However, only a small part of scientific works is currently devoted to its solution, which include, in particular, the Patatouka (2014) study, which identifies imbalances in the development of housing and mortgage markets in the regions of Greece, simplifies their assessment, the Aranaz and Marquez (2013) study, where the authors compare the features of retrospective development and assess regional differences in the Spanish mortgage market using the sheaf methodology, papers by Grezina (2011), Ivashkov (2011), where the authors, using cluster or factor analysis (or both) assess the mortgage potential of Russian regions.

Therefore, this study is aimed at filling the gap in this field of knowledge, and aims to develop a comprehensive criterion for assessing the development potential of residential mortgage in the context of socio-economic inequality in the regions of the Russian Federation.

Materials and Methods

Data

For analysis and assessment of regional mortgage inequality, as well as modeling a comprehensive criterion for assessing the development potential of regional mortgage lending systems, panel data of state statistics (Rosstat and the Central Bank of the Russian Federation) was used.

In this study, the authors propose the option of moving from particular criteria for assessing regional mortgage potential to a comprehensive indicator. It's based on 23 primary indicators, divided into 4 functional blocks. In particular, the following were identified: a block of economic indicators (5 indicators), a block of housing indicators (5 indicators), a block of socio-demographic indicators (2 indicators) and a block of indicators for assessing the current development of the mortgage market (11 indicators) (Tselin and Korosteleva, 2020). To increase the reliability of the study, data sets were generated for 85 constituent entities of the Russian Federation, including the Republic of Crimea and the city of Sevastopol, during 2014-2018. Note that in this case the source data for the first, most of the second and half of the third blocks of indicators are based on the annual statistical compilation of the Federal State Statistics Service of the Russian Federation "Regions of Russia. Socio-economic indicators. 2019. " The initial data for the fourth block is mainly based on the annual statistical compilation of the Central Bank of the Russian Federation "Some information on the residential mortgage in Russia. No. 5, 2013-2017", as well as the official website of the Central Bank of the Russian Federation (for indicators of 2018). An insignificant part (3 of 23 indicators) was formed on the basis of studies by the Institute for Urban Economics (housing affordability coefficient), the Information and Analytical Portal "All about the mortgage" (the number of existing social mortgage programs), and the "RIA Rating" Rating Agency (share of families who are able to buy a home with a mortgage).

Methodology

To determine the level of the mortgage potential of the region, a methodology was applied based on statistical factor analysis, the principal components analysis.

Principal component analysis is one of the most commonly used methods of reducing the dimension of the initial set of indicators, implemented in most well-known application software set, for example, Statistica, SPSS and others. Of greatest practical interest is the use of the method for classifying objects, when, based on the analysis of the factor loadings, it is possible to divide the primary variables into groups according to the degree of their influence on the main factors (Orlov, 2016).

The methodology for determining the level of mortgage potential in the region includes the following steps:

1. The formation of an array of source data and the formation of a matrix of standardized values.
2. Definition of the main components.
3. The selection and implementation of the rotation procedure.
4. The formation of a model for assessing the mortgage potential of the region and the rationale for the analysis of the structure associated with the main components of the primary indicators.
5. Formation of a matrix for assessing the mortgage potential of the region.
6. Determining the class of the mortgage situation in the region based on the matrix for assessing the mortgage potential of the region.

The ***first stage*** involves the formation of a matrix of source data for indicators that are presented in the Data section.

$$X = \begin{bmatrix} X_{11}, X_{12}, \ldots, X_{1p} \\ X_{21}, X_{22}, \ldots, X_{2p} \\ \cdot, \cdot, \ldots, \cdot \\ X_{n1}, X_{n2}, \ldots, X_{np} \end{bmatrix}, \quad (1)$$

where X_{ij} represents the value of the j-th variable for the i-th region;

i – index number of the region $i = \overline{1 \ldots n}$;

j – index number of the variable $j = \overline{1 \ldots p}$;;

n – number of regions;

p – number of original variables.

Thus, for the purposes of the study, 5 matrices corresponding to 2014-2018 researches were formed. The standardization of the values of the initial variables consists in eliminating the mean values $\bar{x}_i$ from them and dividing the obtained residues by the mean square value σ_i, $i = \overline{1 \ldots n}$.

$$x_{ij} = \frac{(x_{ij} - \bar{x}_i)}{\sigma_i}, \quad (2)$$

At the ***second stage***, the method of principal components determines an ordered set of principal factors. This allows to convert the set of multicollinear vectors of the source data into another reduced complex - orthogonal variables. Thus, the source variables are combined into principal components.

The orthogonal variables Z_j $(j = \overline{1 \ldots k})$ are represented by a combination of the original variables x_{ij} $(i = \overline{1 \ldots n})$.

$$Zj = \Sigma A_{ji} \cdot x_{ij}, \quad (3)$$

where A_{ji} — weight of the j-th component in the content of the i-th variable;

Z_j — principal components.

Replacing the real, normalized variables x_i with a smaller number of variables Z_j, ensures the reduction of the initial variables and a decrease in the multicollinearity effect of many factors.

The total multiple dispersion explained by the main components should be at least 70%.

To fulfill this requirement, at the ***third stage***, the rotation procedure of the axes of the main components is performed. The highest values of the group dispersion fraction were obtained using the varimax method.

The varimax method is based on maximizing variances of variable pressure for each factor, which leads to an increase in large and a decrease in small values of factor loads and facilitates the understanding and interpretation of factors. When interpreting a factor, those initial variables are taken into account that have maximum loads on it in absolute value (Zhgun, 2013).

The criterion for a satisfactory solution is usually to obtain an understandable (interpreted) load matrix, and, accordingly, the possibility of a clear meaningful interpretation of the resulting factors.

The selected factors (principal components) are based on the projected model for assessing the mortgage potential of the region at the ***fourth stage*** of the proposed methodology.

A model for assessing the mortgage potential of a region can formally be represented by the following formula:

$$k_i = \varphi\ (F1_i\ ;\ F2_i\ ;\ F3_i), \quad (4)$$

where k_i –a comprehensive indicator of the level of development of mortgage lending system of the i-th region;

$F1_i$ – the value of the first factor (the first principal component);

$F2_i$ – the value of the second factor (the second principal component);
$F3_i$ – the value of the third factor (the third principal component);
i – region number (Tselin and Korosteleva, 2020).

At the ***fifth stage*** of the methodology, a discrete scale is constructed for each of the selected factors, which involves the allocation of three levels of values of the obtained components:

- level A (high value);
- level B (average value);
- level C (low value).

The result of the implementation of the fifth stage is at least a three-dimensional matrix for assessing the mortgage potential of the region, including 27 possible combinations of coordinates in the space of alternatives.

The resulting matrix is a visual tool for assessing the current mortgage potential of the region for regional authorities, as well as a strategic tool for choosing the "desired" position when setting goals to increase mortgage activity in its own territory. The definition of the class of the mortgage situation in the region on the basis of the matrix for assessing the mortgage potential of the region is carried out at the ***sixth stage*** of the proposed methodology.

Results

We apply the described methodology to obtain a comprehensive assessment of the mortgage potential of the Russian regions. To do this, use the Statistica application package. Table 1 presents the results obtained, namely, the matrix of factor loads, which are the correlation coefficients of the initial variables and the first selected factor for 2014-2018. Moreover, the criterion for the formation of the structure of the factor is the strength of the connection between it and the original variables, interpreted as "high" or "very high".

Table 1: The values of factor loads for the <u>first</u> factor for 2014-2018

Variable	2014	2015	2016	2017	2018

Source: authors' own calculations using the Statistica software package

Note that the entire five-year period of the study of Factor 1 was formed by almost the same composition of the initial variables. At the same time, the following primary indicators showed a high and very high relationship between it and the entire set of source variables:

- Var 3 - the number of economically active population, thousand people;
- Var 13 - the volume of issued mortgage housing loans according to the Central Bank of the Russian Federation (in rubles and foreign currency), thousand rubles;
- Var 14 (for 2017-2018) - the number of issued mortgage housing loans according to the Central Bank of the Russian Federation (in rubles and foreign currency), pcs.;
- Var16 - total debt on housing mortgage loans according to the Central Bank of the Russian Federation (in rubles and foreign currency), thousand rubles;
- Var17 - the number of credit organizations issuing mortgage housing loans, pcs.;
- Var18 - the number of credit organizations attracting refinancing in the secondary market of mortgage lending, pcs.;
- Var19 - refinancing of mortgage housing loans with the sale of a pool of mortgage housing loans (rights of claim for HMLs) without the formation of an additional financial instrument, million rubles;
- Var20 - refinancing of mortgage housing loans with the sale of a pool of mortgage housing loans (rights of claim for HMLs) with a further issue of mortgage-backed securities, million rubles;
- Var21 - the amount of overdue debts on HMLs, million rubles;
- Var22 - the volume of prematurely repaid mortgage housing loans in the reporting period, million rubles.

The obtained results also throughout the entire period of the study demonstrate a rather high proportion of the explained variance for the first factor - from 0.43 (for 2017) to 0.488 (for 2018).

Analyzing the structure of Factor 2 (Table 2), it can be noted that a stable composition of its primary indicators has been observed for the past four years, namely from 2015 to 2018.

Table 2: The values of factor loads for the <u>second</u> factor for 2014-2018

The share of the explained variance (Prp.totl)	0,153	0,152	0,149	0,171	0,144

Source: authors' own calculations using the Statistica software package

Its composition in the specified time period is formed by such primary indicators as:

- Var1 - GRP per capita, rubles;
- Var2 - average per capita cash income of the population, rubles;
- Var4- average per capita nominal accrued wages of employees of organizations, rubles;
- Var10 - housing affordability coefficient;
- Var23 - the proportion of families who are available to purchase a home with a mortgage,%.

The minimum share of the explained variance for Factor 2 is 0.144 (for 2018), the maximum is 0.171 (for 2017).

As for the structure of the third factor, here the composition of its primary variables is less stable, however, during 2015-2018 two indicators are clearly distinguished in its design (Table 3), namely:

- Var7 - commissioning of residential buildings per 1000 population, sq. m. total area;
- Var8 - commissioning of apartments per 1000 population, units.

Table 3: The values of factor loads for the third factor for 2014-2018

Eigenvalue (Expl.var)	2,254	2,951	2,898	2,9	3,06
The share of the explained variance (Prp.totl)	0,113	0,134	0,138	0,132	0,115

Source: authors' own calculations using the Statistica software package

The proportion explained by Factor 3 of the variance is from 0.113 (for 2014) to 0.138 (for 2016).

In general, the obtained results prove a stable composition of the initial variables in the structure of the identified factors for almost the entire period of the study. An exception is the structure of the second and third factors for 2014, however, an analysis of the results shows that the second and third factors in 2014 simply changed ranks in terms of the share of the explained group variance of the source variables, preserving the structure. This can be explained by the lack of data on some indicators for 2012, for example, the share of families who are available to purchase housing through mortgages. In turn, the correlation coefficient of this variable with the second factor according to the results of data processing for subsequent periods always has a significant level of statistical dependence in the range from 0.897 (2013) to 0.922 (2015).

The total percentage of the variance explained by the selected factors is calculated in table 4. For all five years of the study, the multiple variance is higher than 70% and ranges from 73.3 (2017) to 75.3 (2014) percent.

Table 4: Percentage of variance explained

Years/Factor	Factor 1	Factor 2	Factor 3	Total percentage of variance explained
2014	48,7	15,3	11,3	75,3
2015	45,8	15,2	13,4	74,4
2016	45,1	14,9	13,8	73,8
2017	43,0	17,1	13,2	73,3
2018	48,8	14,4	11,5	74,7

Source: authors' own calculations using the Statistica software package

An analysis of the composition of primary variables in the structure of the principal components of the factors selected on the basis of the method allows us to give them the following meaningful interpretation (Fig. 1):

- F1 - an indicator of the effectiveness of the functioning of the regional mortgage market;
- F2 - an indicator of the availability of mortgage lending in the region;
- F3 - an indicator of business activity in the field of housing.

Fig. 1: Meaningful interpretation of the obtained factors

Source: authors' own elaboration

According to the developed methodology for assessing the mortgage potential of regions, at the next stage of the study, a scaling procedure is carried out by levels A, B, C based on the quantile approach. Its application made it possible to divide each of the obtained series of the differential indicator values (F1-F3), including a differential assessment for 85 regions, into three equal groups, where level A forms the first percentile, level B forms the second percentile, and level C forms the third percentile of Russian regions. In turn, the results were tested on the economic indicators of 85 Russian subjects at the last stage of the study. The detailed results of a comprehensive assessment of the mortgage potential of Russian regions for 2018 presented in Table 5. Based on the testing of the proposed methodology, a matrix for assessing the mortgage potential of the entire set of the Russian Federation regions was obtained, including 27 possible combinations of estimates of the differential indicator. Each of the selected cells lists the ordinal numbers of the regions that received one or another rating.

The results of assessing the mortgage potential of Russian regions are clearly shown in Figure 2.

Fig. 2: Illustration of the results of assessments of the mortgage potential of the regions of the Russian Federation

Source: authors' own elaboration

Discussion

The methodology for assessing the mortgage potential of regions developed by the authors has the following advantages:

1. Obtaining a quantitative assessment of the mortgage potential of each of 85 Russian entities and its meaningful interpretation.
2. Possibility of comparing the imbalances in regional mortgage development.
3. Elaboration of management decisions aimed at the implementation of such a "course" of development, which will not only align the mortgage inequality in Russian regions but also increase the level of mortgage development in the country as a whole.

The last point is the most important advantage of the developed approach over existing analogues. In addition, the administrative decisions obtained on the basis of the model for assessing the mortgage potential of the regions can form the basis of the program of state support for mortgage lending in the regions of the Russian Federation.

Thus, as part of the implementation of state support measures for Russian regions, subsidized mechanisms for financing mortgages can be applied to all regions that received low marks (level C) for one or more components of the differential indicator. At the same time, state aid should have a strictly targeted nature, it should be provided on the basis of such instruments as subventions and subsidies. Within the framework of the projected system, in the current economic conditions for the regions of level "C", the following management solutions can be proposed to increase the mortgage potential:

I. For the first component of the differential indicator (F1) - the efficiency of the regional mortgage market:

1. Subventions to federal (DOM.RF) and regional mortgage operators for funding credit institutions that carry out mortgage lending activities on the territory of regions, through the organization of mortgage loan buyout. Such a redemption can be carried out through cession, as well as the purchase and sale of mortgages. This mechanism will allow credit institutions to carry out the procedure for refinancing mortgage loans in the most simplified and quick manner, which in this case will be carried out without the formation of an additional financial instrument, to be specific the organization of the mortgage securities issue. As a result, banks and other financial and credit organizations will receive an almost unlimited resource for issuing "cheap" loans in the territory of the region and that will inevitably lead to an increase in the key primary components for the first factor: the volume of mortgage loans issued in rubles and pieces, as well as the total volume debt on mortgage loans.

2. State subsidies for operating expenses for issuing mortgage loans. These costs include the fixed costs of the credit institution such as rental costs, office maintenance, staff salaries, social security contributions, equipment depreciation, etc. Covering part of operating expenses at the expense of the state source of financing will allow credit institutions to reduce interest rates on mortgage loans without lowering the rate of return. The economic effect of the implementation of such a measure is obvious - stimulating the demand for mortgage lending will lead to the growth of the regional housing and mortgage market.

II. To increase the second component of the differential indicator, specifically the availability of mortgage lending for housing in the region, it is advisable to develop a regional program of targeted assistance to socially significant segments of the population in need of better housing conditions. Such a regional subsidy should be provided to cover part of the monthly mortgage debt service payment. At the same time, the competence to determine the degree of need and the choice of categories of socially significant strata of the population who are entitled to such a subsidy will belong exclusively to the regional authorities. Note that such a measure will allow, first of all, state employees, such as doctors, young scientists, teachers, etc. compensate for their "lost cash income"

and increase their mortgage opportunities. As a result, the share of families with the possibility of obtaining a mortgage loan will grow in the region.

III. An increase in the quantitative assessment of the third component of the differential indicator, namely business activity in the field of housing construction, is possible through the implementation of such measures of state support in the regions as:

1. The development of project financing, including the use of the interest rate subsidy mechanism for the developer. Such a measure can be implemented on the territory of regions with high construction costs due to the remoteness from logistics centers, high utilities, and social burden, as well as the load on parking spaces, etc., which ultimately increases the cost per square meter of housing being built. Using the mechanism of subsidizing the interest rate for the developer in this context will reduce the selling price per square meter. In turn, an increase in the population's effective demand for construction projects will ultimately ensure the growth of housing commissioned in the region (Eremenko and Gareev, 2019).

2. Preparation of construction sites and technical conditions at the expense of the state with their further implementation to the developer. Such a measure will allow the state to shift all the costs associated with the supply of communications and facilities, as well as the resettlement of citizens, often from dilapidated housing located in the territory of the proposed development of the region with low construction activity. In the proposed model, the state, for example, represented by the Housing and Mortgage Fund or the regional Ministry of Construction, prepares a construction site using its own financial resources with its further implementation at a “fair” price to the developer, including through the auction mechanism. The practical implementation of such a measure will remove the extra burden from construction companies, thereby reducing the cost per square meter of housing for the region's population. In addition, the participation of the state in the organization and preparation of sites for the development of residential neighborhoods will make it possible to transfer the issues of citizens resettlement from dilapidated housing located in the built-up areas to a civilized channel, as well as to solve the problem of infill development, which has become urgent today in the most regions of the Russian Federation.

Note that if a region received several low scores for the differential indicator components, assistance should be provided to improve each component. At the same time, according to the results of the financial period, it is possible to redistribute aid between the components of the differential indicator. In this regard, it is necessary to constantly monitor the results of the growth policy of the mortgage market in the regions.

It should also be noted that in order to increase the effectiveness of measures to support the mortgage market, financial resources can be provided to the regions on the terms of co-financing of regional mortgage programs. The co-financing scheme will make it possible to fully involve regional authorities in the process of continuous work aimed at achieving the effectiveness of the mortgage mechanisms being implemented. In this setting, the model of state support for mortgage markets, projected on the basis of the developed differential indicator, will also acquire stimulating character.

Conclusions

Based on the study, the following results were obtained:

1. A methodology for assessing the mortgage potential of regional markets has been developed. Using the method of principal components is proposed as a basic method for the formation of a comprehensive indicator for assessing the mortgage potential of a region.

2. Based on the Statistica application package, five data arrays were processed for 85 regions of the Russian Federation for 2014-2018. A three-factor model is obtained, the structure of each of the main components of the factors identified by the method is substantiated, their meaningful interpretation is given.

3. The results of the assessment of 85 regions mortgage potential in the Russian Federation were obtained, the disproportions of their mortgage development were quantitatively and qualitatively assessed.

4. Recommendations are given for increasing the mortgage potential of regions with low ratings (level C). These areas, together with the proposed approaches to their practical implementation, can serve as the basis for a model of state support for regional mortgage markets.

In general, the proposed approach will make it possible not only to assess the "depth" of regional mortgage markets based on the calculation and subsequent assessment of a complex indicator characterizing the level of the region's mortgage potential, but also to methodologically substantiate options for management decisions aimed at the growth of mortgage lending both within individual regions and in the whole country.

Abstract

Risk is the main cause of uncertainty in any banking industry. Thus, banks increasingly focus on identifying risks and managing them before they even affect the investor. The ability to manage risk will help banks make confident decisions that impact the future of the business. Their knowledge of the risks they are facing will give them various options on how to deal with potential problems. Risk management is the process of identifying possible risks, problems, or disasters before they happen. This allows bankers to set up procedures to avoid the risk, minimize its impact, or at the very least help cope with its impact. A bank should make a realistic evaluation of the true level of risk and plan accordingly. The banking industry is one of the riskiest industries. Many countries and international organizations have come out with rules and regulations regarding risk management. In the case of Malaysia, risk governance guideline was introduced on 1st of March 2013 and has been effective since then. However, the banks are given additional time to bring the existing practices and policies in line with the principles provided in risk governance guidelines. There might be a possibility that some of the banks might delay complying immediately due to the flexibility in the time given by the governing body. Furthermore, to the extent of our knowledge, no research has been conducted on risk governance practices of banks in Malaysia. Thus, it is necessary to find out the awareness, compliance, practices, and effectiveness of risk governance guidelines in the banking industry of Malaysia.

Keywords: Risk, Shari'ah Governance, Banks and Malaysia

Introduction

Risk is the possibility of an adverse effect on any organization by preventing it from achieving organizational objectives (Htay et al., 2014; Salman, 2018). Risk management consists of the activities and actions taken by the organization starting from risk identification until risk communication to the top management as well as the risk managers (Salman, 2015). Managing risk requires careful consideration of the key concepts of minimizing loss, maximizing opportunity, and preparing for uncertainty (Commonwealth of Australia, 2008). The 2007/2008 global financial crisis has underscored the inability of financial institutions to protect themselves from exposures of threats from risk (Bank for International Settlements, 2009; Htay & Salman 2015).

According to Dermine (2003), there are at least 15 risks that the banking system is exposed to and can be divided into four major groups of risks. The first group of risks is credit risk, which is defined by Dermine as the non-payment on time by the borrower or potential losses from credit. Under this group are retail and corporate credit risk, counterparty risk, settlement risk, environmental risk, and country risk. The second group is the market risk group, which is defined as the loss or decline in return because of the adverse movement of the market. The market risk group includes interest rate risk, foreign exchange risk, equities, and commodities. The third group is liquidity risk, which is according to Dermine, a shortage of cash from many factors such as the bank's deposit loss and an unexpected bank run. Lastly, the final group is operational risk, which is "risk of inadequate or failed internal processes, people and systems" (Dermine, 2003). This group of risks includes execution risk, model risk, fraud, legal risk, and regulatory risk (Dermine, 2003).

In addition to the above four main categories risk, this research will also focus on transparency risk, Shari'ah non-compliance risk, displaced commercial risk, equity investment risk, and rate of return risk. Since the risk can cause the whole banking industry collapsed and consequently, it will affect badly to the country's economy as a whole, many countries and organizations have introduced the guidelines and frameworks regarding risk management of banks. In Malaysia, BNM has introduced a risk governance guideline in March 2013. Thus, this research will focus on the effectiveness of the above-said guideline.

This proposal is presented in six sections. The second section discusses the research questions. The third section outlines the research objectives. The fourth section provides the relevant literature to this research. The fifth section discusses the research methodology and the last section concludes.

Research Questions

1. Are the banks aware to comply with risk governance guidelines issued by BNM?
2. To what extent, do the banks comply with the risk governance guideline?
3. What are the current risk governance practices by the banks?
4. Is there any significant difference between Islamic banks and conventional banks in terms of awareness, compliance, practices, and effectiveness of risk governance guidelines?

Research Objectives

1. To examine the awareness of risk governance by the banks in Malaysia
2. To investigate to what extent the banks comply with the risk governance guideline in Malaysia
3. To find out the current risk governance practices by the banks in Malaysia
4. To analyze whether there is any significant difference between Islamic banks and conventional banks in terms of awareness, compliance, practices, and effectiveness of risk governance guidelines.

Literature Review

Risk management is the main task of the board of directors. The board as the highest author needs to provide the risk management strategy which molds the whole risk management environment of the banks. For this research, we plan to focus on risk governance practices on nine types of risks, namely, market risk, operational risk, liquidity risk, credit risk, transparency risk, Shari'ah non-compliance risk, displaced commercial risk, equity investment risk and rate of return risk. These risks are discussed in the following paragraphs.

Market Risk

Market risk is a risk that arises due to the fluctuation in the market prices of shares, bonds and Sukuk, and any other money market instruments. Normally, the banks are holding the portfolio of these assets

with the expectation of getting a higher and good return. However, holding these assets might cause loss or incur a lower return than what has been expected. Thus, the banks should be very careful in choosing the assets and the investment decision should be done after all the relevant observations and tests have been done (Reserve Bank of Australia Bulletin, 1996; IFSB, 2005). This risk can be faced by both Islamic and conventional banks.

Operational Risk

Operational risk refers to the inefficiency and ineffectiveness of banks' operations due to internal management failure (Htay & Salman, 2014). It can be caused due to inadequate information technology systems and human resource management. This risk can cause a substantial amount of loss to the banks. Therefore, banks need to monitor their personnel very closely so that this risk will not arise (IFSB, 2005; Htay & Salman, 2013). This risk can be faced by both Islamic and conventional banks.

Liquidity Risk

Liquidity risk is a risk when the banks have a shortage of liquid money to pay back to the depositors and any other relevant parties. The main cause of this problem is due to the inadequate asset-liability of the banks (Htay & Salman, 2014). Normally, the liabilities of the banks, for instance, deposits are mostly short-term in nature while the assets of the banks such as loans and Islamic financing are long-term in nature. Besides, the depositors in the general deposit accounts or current accounts can withdraw their deposits any time and consequently, it creates the liquidity risk to the banks. This type of risk can be minimized if the banks strictly monitor and estimate the cash inflows and outflows of assets and liabilities (IFSB, 2005; IFSB. No 12; BNM, 2012). This risk can be faced by both Islamic and conventional banks.

Credit Risk

Credit risk usually refers to the defaults or delays in either payment or delivery of goods. In the case of conventional banks, this risk incurs especially when the customers delay or default in payments (Htay & Salman, 2014). For the Islamic banks, this risk can be caused by two main factors, first is due to delay or default in payments by the customers and the second is when the suppliers delay in delivering the goods or do not meet the specification required by the customers in producing the product. An inefficient and inadequate management information system is also another risk driver because if there is any discrepancy between the actual and predetermined times, the system should alert the credit risk manager, otherwise, it is not easy for the person in charge to detect the cases manually (IFSB, 2005; BNM, 2009; Varotto, 2011). This risk can be faced by both Islamic and conventional banks.

Transparency Risk

Transparency risk is the risk for the market participants when the Islamic banks do not disclose all the material information. Transparent disclosure is necessary for the market participants to make investment decisions. According to the market discipline, only if the information is available, the market participants will be able to predict and know the performance of the banks and then will be able to discipline the management (IFSB No.4). Transparency risk is a generic risk as it also exists in all financial institutions irrespective of Islamic banks or conventional banks. This risk can be faced by both Islamic and conventional banks.

Shari'ah Non-Compliance Risk

Muslim scholars have proposed Islamic banking due to the non-Shari'ah compliant nature of conventional banking activities. The later banking system is based on the interest which is one of the prohibited elements from the Islamic perspective. Shari'ah compliance is the backbone and paramount to Islamic banking business operations. Shari'ah non-compliance risk in Islamic banks is a failure to comply with Shari'ah in performing banking business activities and operations. Shari'ah compliance is unique and considered as the fundamental element of Islamic Banking and Finance. If any failure to

comply with it will adversely affect the reputation of the Islamic banks and the confidence of the market participants including the depositors and investors. Therefore, the Islamic banks need to ensure that this unique risk, non-Shari'ah compliant is monitored and manage properly; otherwise, there will be no difference between Islamic banks and conventional banks (IFSB No.5, BNM, 2012). This risk can be exposed to Islamic banks only.

Displaced Commercial Risk

The displaced commercial risk is the risk when the depositors withdraw unexpectedly due to the dissatisfaction with the Islamic banks. The unsatisfactory performance of the Islamic banks from the depositors' point of view is mainly due to a lower rate of return. When the banks are not able to pay the profit rate what has been expected by the investors, there is a tendency that the depositors will withdraw their deposits. The expected rate of the investors is influenced by the market rate which is offered by the conventional banks. One of the ways to control the displaced commercial risk by reserving some portion of the profits in the reserved accounts, namely profit equalization reserve and rate of return reserve. The practice of reserving some portion of the profit is to smooth the rate of return paid to the depositors by paying the profit rate which is equivalent to market rate when the banks are not making profit during the bad economy period (IFSB, 2005; Toumi & Viviani, 2013). This risk can be exposed to Islamic banks only.

Equity Investment Risk

The equity investment risk can be defined as the risk faced by the Islamic banks when entering to the partnership agreement with the customers. This risk is associated with Mudarabah or Musharakah partnership contracts. In these types of partnerships, the banks are sharing the risk with the partners, and profit and loss will be shared between the customers and banks. The risk can be due to the underperformed business and impairment of capital. In the case of misfortune, normally, the banks will forgo their profit portion to ensure that they can pay the profit rate which is equivalent to the market rate. Therefore, it can be summed that equity investment risk faced by the Islamic banks results in a lower rate of return to the banks, impairment of banks' investment and finally it will lead to the displaced commercial risk if the banks are not able to pay the expected rate by the market participants (IFSB, 2005). This risk can be exposed to Islamic banks only.

Rate of Return Risk

The rate of return risk is faced by Islamic banks when there is fluctuation in the market rate. This risk is associated with asset-liability management. Normally, the banks' assets are long-term in nature and liabilities are short-term in nature. The changes in the market rate will affect the depositors' expected rate of return from the Islamic banks. Although the expected return is high from the liability side, the long-term asset side is not that easy to generate the income for the Islamic banks as quickly as the liability side. Thus, there will be a mismatch between the rate paid to the liability side and earned from the asset side. This risk will cause other risks, i.e. displaced commercial risk (IFSB, 2005; add more reference). This risk can be exposed to Islamic banks only.

After discussing the major types of risks faced by the banks, the following paragraph will present briefly on the risk governance guideline.

This policy document on Risk Governance sets out a framework of principles on risk governance to guide the board and senior management in performing their risk oversight function. This policy applies to all institutions licensed under the Banking and Financial Institutions Act 1989 (BAFIA), Islamic Banking Act 1983 (IBA), Insurance Act 1996 (IA), Takaful Act 1984 (TA), and Development Financial Institutions Act 2002 (DFIA), hereinafter referred to as financial institutions. There are 10 principles regarding board practices, and they are as follows:

Principle 1: The board must ensure that the financial institution's corporate objectives are supported by a sound risk strategy and an effective risk management framework that is appropriate to the nature, scale, and complexity of its activities.

Principle 2: The board must provide effective oversight of senior management's actions to ensure consistency with the risk strategy and policies approved by the board, including the risk appetite framework.

Principle 3: Senior management is responsible for ensuring that the day-to-day management of the financial institution's activities is consistent with the risk strategy, including the risk appetite, and policies approved by the board.

Principle 4: The risk management framework must enable the identification, measurement, and continuous monitoring of all relevant and material risks on a group- and firm-wide basis, supported by robust management information systems that facilitate the timely and reliable reporting of risks and the integration of information across the institution. The sophistication of the financial institution's risk management framework must keep pace with any changes in the institution's risk profile (including its business growth and complexity) and the external risk environment.

Principle 5: Risk management must be well-integrated throughout the organization and embedded into the culture and business operations of the institution.

Principle 6: Financial institutions must establish an independent senior risk executive role (chief risk officer or its equivalent) with distinct responsibility for the risk management function and the institution's risk management framework across the entire organization. The executive must have sufficient stature, authority, and seniority within the organization to meaningfully participate in and be able to influence decisions that affect the financial institution's exposures to risk.

Principle 7: Financial institutions must establish and maintain an effective risk management function with sufficient authority, stature, independence, resources, and access to the board.

Principle 8: Effective implementation of the risk management framework must be reinforced with an effective compliance function and subjected to an independent internal audit review.

Principle 9: Financial institutions must have appropriate mechanisms in place for communicating risks across the organization and for reporting risk developments to the board and senior management.

Principle 10: Executive remuneration must be aligned with prudent risk-taking and appropriately adjusted for risks. The board must actively oversee the institution's remuneration structure and its implementation and must monitor and review the remuneration structure to ensure that it operates as intended.

Regarding corporate structure, this policy lays down three principles and they are as follows:

Principle 11: The board and senior management must be aware of and understand the financial institution's operational and organizational structure and the risks it poses and be satisfied that it is not overly complex or opaque such that it hampers effective risk management by the financial institution.

Principle 12: Where a financial institution operates through special-purpose structures, its board and senior management must understand the purpose, structure, and unique risks of these operations. Appropriate measures must be undertaken to mitigate the risks identified.

Principle 13: The board and management of subsidiary financial institutions will be held responsible for effective risk management processes at the subsidiary level and must have appropriate influence in the design and implementation of risk management in the subsidiary. Conversely, the board and management of a parent financial institution with local and overseas operations is responsible for the risk management of the group and must exercise oversight over its subsidiaries with appropriate processes established to monitor the subsidiaries' compliance to the group's risk management policies.

The next section presents the research methodology that will be used to conduct this research.

Research Methodology

Data

Both primary and secondary data will be used in this study. Primary data will be collected by questionnaires and interviews. Secondary data will be gathered from books, journals, articles, and internet resources related to risk governance.

Sample

The questionnaire will be distributed to all the Islamic and conventional banks in Malaysia. Interviews will be conducted to the risk managers from the Islamic as well as the conventional banks in Malaysia.

Statistical Method

Descriptive statistics, t-test, and Mann-Witney U-test will be used to analyze the questionnaire and content analysis will be used for interviews.

Limitation, Significance, and Contribution of the Study

The limitation of this study is the findings of this research are based on the primary data, i.e. the questionnaire and interviews. It is because the risk governance is effective from March 2013 and it is still very new. Also, the banks are still given a flexible time to comply with it completely. Thus, we believe that for time being, the primary data is the most suitable data to investigate the current risk governance practices of banks in Malaysia.

So far, to the extent of our knowledge, no research has been conducted on the risk governance practices of banks in Malaysia, the findings will be value-added to the current literature. It is believed that the results will be the interests of investors, industrial players, policymakers, Shari'ah advisors, depositors, and the general public.

The findings will provide hints to the investors about the risk management of the banking industry in Malaysia and hence, the investors will be able to make the informed investment decision. The industrial players will be able to estimate to what extent his bank complies with risk governance guidelines compared to the whole industry benchmark. The findings of this research will make the policymakers understand the current compliant status and the policymakers will be able to incorporate this awareness in making future rules and regulations. The Shari'ah advisors are mainly responsible for the Shari'ah compliance of the Islamic banks and thus, these findings will provide the signal to the Shari'ah non-compliance risk exposure management of the Islamic banking industry. The contractual relationship between the depositors and Islamic banks are different from the relationship between the depositors and conventional banks. Thus, the risk exposures of depositors of Islamic banks and conventional banks are different and hence, the depositors will be able to compare and evaluate the effective risk governance practices of these two different groups of banks. The findings will contribute to the knowledge of the general public as well.

Abstract

The growth of the Islamic banking and finance industry has developed a demand for innovative and more complex Islamic financing products to serve the needs of various banking customers, especially among corporate consumers, ranging between mid-corporate to large corporate firms. A mid-corporate and large corporate firm are defined by a minimum annual turnover of USD25 million and USD250 million, respectively. Corporate clients are important to commercial banks because they provide immense profit opportunities through their various financial needs. Islamic Syndicated Financing (ISF) has been increasing in demand among corporate customers. ISF is a financing technique involving joint participation by a group of Islamic financial institutions (Islamic banks) to allocate funds to consumers. ISF is typically recommended by the banks to cater to specific needs of corporate firms. ISF standard transaction includes a team of Islamic banks that produces the same set of documents while providing funding to a corporate client. The transaction could also extend under the same financing package to a group of clients. The structure of ISF was built based upon Islamic principles derived from several sources, primarily the Quran and the Sunnah. The academic research on the ISF topic is insufficient, such that even the factors driving its usage and market development have remained unexplained and yet to be empirically explored and tested. Much of the research on the development of syndicated bank financing is focused on the SL market in the U.S and European countries. There has yet to be a study documenting the development of the Islamic alternative to SL, which is ISF, even in an Islamic finance pioneer country such as Malaysia. Islamic Syndicated Financing has been plagued by several challenges since its inception and one of the main challenges has been the understanding and the permissibility of Islamic Syndicated Financing. Therefore, the objective of this paper is to understand the functionality of Islamic Syndicated Financing.

Keywords: Islamic Syndicated Financing, Academic Research & Permissibility.

Introduction

According to (Islamic Finance News [IFN], 2016;2017;2018), the number of ISF deals obtained by corporate firms has increased between 2016 and 2018. A total of 30 deals worth USD19.96 billion were signed in 2017 compared to 28 deals amounting to USD9.38 billion in 2016. In 2017, Malaysia had the highest market share totaled 50 percent, followed by the Kingdom of Saudi Arabia (KSA) with a 23 percent market share. By 2018, the growth of global ISF issuance had further risen by 11.42 percent to USD22.4 billion, which accounted for 0.60 percent (2017: 0.32 percent) of total debt syndication issuance worldwide. In 2018, global participation in ISF issuance is dominated by the GCC banks of

Cite this Article as: Aida Noraini MANAP and Rusni HASSAN "A Brief Overview of Islamic Syndicated Financing" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

the KSA, UAE, Bahrain, Kuwait, and Oman; collectively they have arranged and participated in a total 68.3 percent or twenty-eight (28) out of forty-one (41) new issues in 2018 and hence recorded a positive year-on-year growth of 11.42 percent. This steady growth is expected to be uninterrupted, driven by the SDGs opportunities and steady economic growth of unbanked Muslim countries including the *Shariah*-compliant corporate firms (United Nations Development Programme [UNDP], 2018).

Despite the positive outlook coupled with the rising performance of the international ISF market, Malaysia's participation in ISF has dwindled over the years, both globally and locally. Malaysia has since slipped off the league of ISF global market leaders in tandem with the declining ISF activities within the Malaysian banks, after experiencing rapid ISF growth of more than 800 percent between 2006 and 2017 (Bank Negeri Malaysia [BNM], 2019). Based on the in-country performance over the past decade of the total syndicated loan volume in Malaysia, ISF accounted for less than 15 percent except for 2015 where ISF recorded 22 percent of the volume contribution due to the sudden influx of one-off large issuances as large corporations rushed to enjoy stamp duty exemption through ISF. Noticeably, the stamp duty discounts had been introduced by the Malaysian government since 2010 in incentivizing large corporations to source their funding through ISF. However, the take-up rate was discouraging, not until a year before its cessation.
In the subsequent year, the ISF share of issuance plunged as low as 2 percent following the expiry of the stamp duty exemption. In 2017, the ISF market contribution improved to 13 percent yet the bulk of the banking syndication deal issued by the corporate customers was dominated by the syndicated loan instead of ISF (CIMB, 2017). In 2018, a total of 10 percent growth in ISF issuance was recorded (BNM, 2019). The minuscule contribution of the ISF market was purportedly attributed to various challenges faced by the market (CIMB, 2017; Khaleq & et al, 2016).

ISF has been plagued by several challenges since its inception, which made it difficult for it to obtain mainstream acceptance, resulting in it having to still navigate through the ever-changing landscape. The pricing capacity of Islamic banks has been affected by the liquidity constraint, and it is becoming the biggest challenge so far. Moreover, ISF involves a series of transactional lags because of the procedures involved between the client and the facility agent which together act as a deterrent for clients looking for a less time-consuming and structurally simpler solution (IFN, 2018). These contemporary challenges which emerge from the underdeveloped ISF market indicate the presence of high information asymmetry problems in many areas which have yet to be studied, also, academic research on ISF topic is insufficient, such that even the factors driving its usage and market development have remained unexplained and yet to be empirically explored and tested (Godlewski & Weill, 2012; Hutan, 2009).

On the contrary, the conventional alternative of ISF, SL has been extensively studied by the academic researchers since 1990s (Simons, 1993; Dennis & Mullineaux, 2000; Jones, W. Lang, & Nigro, 2005; Wild, 2004; Altunbas, 2004, 2010; Godlewski, 2008, 2010, 2014; Champagne & Coggins, 2012; Rarasati, 2014; Howcroft, Kara, & Marques, 2014; Neuhann, 2016; Donker, Ng, & Shao, 2018; Botsch & Vanasco, 2019).

Islamic Syndicated Financing has been remained disturbed by various difficulties since its beginning, amongst them, the perception and the permissibility of Islamic Syndicated Financing are the central challenges. Consequently, the purpose of the research is to understand the functionality of Islamic Syndicated Financing.

Islamic Syndicated Financing (ISF)

As defined by AAOIFI (2015), ISF is a method that requires the involvement of a group of Islamic banks to make available funds to a single corporate client. Conceptually, the functions of ISF are comparable to a conventional syndicated loan. ISF also takes similar commercial considerations as a syndicated loan except that there are some material differences between the two (2) transactions that must be considered (Khaleq et al., 2016).

Similar to other Islamic banking transactions, the structure of ISF is founded on Islamic codes and law that stemmed from the Quran and the Sunnah (together referred to as the Shariah). Islamic finance structures and techniques have been developed following Shariah principles, and, fundamentally, these codes must be strictly followed when assessing the appropriateness of a proposed loan framework or product. In particular, proceeds raised through ISF must be channeled towards investment activities that are acceptable in Shariah. It should not be completely or partly targeted towards projects that are restricted by Shariah restriction or cause riba (AAOIFI, 2017).

As concluded by Ali and Sarkar (1995), the Islamic banking system is based on these Shariah principles: (i) it should ensure the prohibition of riba (interests); (ii) the prohibition of gharar (uncertainty, risks, speculation) must be abided; (iii) it should only involve halal activities (permitted by Islam); and (iv) the system must practice justice (founded on the ethics and aims of the religion). Therefore, the same principles also apply to the ISF instrument (Khaleq et al., 2016; Visser 2013).

Technically, from the perspective of both the customers and the participating financiers, ISF provides similar protections as syndicated loan which include:

(i) allowing the bank to mitigate their exposure by sharing the customer's credit risk; and
(ii) giving the bank an avenue to participate in more transactions than they may have otherwise and thereby diversify their loan portfolios because they are only taking a portion of each loan transaction.

The main distinguishing feature differentiating ISF from that of conventional syndicated loans is the philosophical underpinning of these transactions. These incidentally make ISF appealing to the customers. In conventional loan syndications, commercial and legal considerations are generally the only issues that determine the terms and forms of these transactions and the rights of the parties. On the contrary, in ISF, (i) parties to the transaction have to observe Shariah principles including ruling out riba, gharar and matter; (ii) products and services that are haram cannot be invested in including the manufacture or sale of tobacco products, alcohol or pork or involved in gambling or pornographic activities or services; and (iii) require the approval of Shariah Supervisory Committees.

According to Godlewski and Weill (2012), although the funders in the financial transactions are not permitted to impose riba (interests), it does not mean that all modes of returns are prohibited. In its place, the revenue or interests can be substituted by the profit-sharing as well as the sharing of loss. In terms of gharar (contractual uncertainty or speculation), it is firmly forbidden based on the fact that in Islamic banking transactions, it is the requirement that the signed contract must be clearly described, specific, and unambiguous to avoid the possibility of one party being exploited by the other.

Another salient feature of ISF is that the profits cannot be defined as interest. Therefore, Shariah cannot guarantee as stipulate the investors' profit. The Shariah compliance of syndicated must strictly observe Islamic financing modes (Hutan, 2009). Besides, the majority of Islamic finance scholars are of the view that when the lead arranger looks to syndicate the debt, it must sell down the debt at par and not at a discount or a premium. Usually, the lead bank in conventional banking will sell the debt further at a discount or a premium rate to other banks. Nevertheless, an administration or management fee can be allocated to the lead arranger for managing the syndication process (Iqbal, 2007).

Notwithstanding, Islamic banks are as interested in protecting their investments and making a return as their conventional counterparts. While an ISF transaction must abide by the conditions outlined in Syariah, it must also make financial sense. As a result, any structure that is ultimately adopted must give the lenders the same rights, benefits, and protections as they would have in conventional syndicated lending. This is especially important in transactions involving conventional lenders or the Islamic windows of conventional banks who may not be as aware or sensitive to Shariah principles.

Permissibility of Islamic Syndicated Financing

According to AAOIFI (2015), the permissibility of ISF is derived from the contract of Musharakah (equity financing). Musharakah is coined from the Arabic root verb shirkah meaning to conjointly take

part in. It symbolizes the joining of two parties in the business. Musharakah is the core of Islamic financing philosophy, where both the risk and return are shared between the investors and entrepreneurs. Musharakah is a business undertaking that draws capital from all individuals in society and is used to fund business ideas.

Despite several shirkah (partnership) found in Islamic law, Shirkah Al 'Inan is most relevant to the partnership between banks and financial institutions. There is a consensus of the jurists that shirkah is the favored mode based on trade and leasing apart from being a legitimate contract in Islam. The term "Musharakah" was initially presented by contemporary Shariah scholars as joint commercial efforts (Taqi Usmani, 1998).

Sharikah Al 'Inan is referring to a partnership between two parties or more whereby each partner underwrites a portion of the money required and giving each contributor the right to have a claim of the assets of the partnership, on the condition that both the profit and loss are shouldered according to their initial contribution to the capital. It is also known as a limited investment partnership where the partners have equal equity but unequal rights to profit, unequal equity with equal rights to profit or unequal equity and unequal rights to profit (Zuhairah & Hartinie, 2018).

Shirkah Al 'Inan does not comprehend mutual surety, instead, it comprehends mutual agency. As a result of mutual agency, the individual partner in the partnership is free from liability for what is owed by any of the other partners as their liability is not joint. Nevertheless, their liability to a third party may be several. It should also be noted that the liability for accountabilities from the partnership affairs is jointly shared. This rule includes all the transactions involving the firm within the limit of what the partners are allowed to engage (Zuhairah & Hartinie, 2018).

Similarly, ISF also adopts the same design through which it enters into a collaborative relationship for funding specific project where more than two parties who are interested to finance. The syndicate banks will share the profit based on the agreement. ISF is the agreement by several banks to participate in a joint investment transaction using one of the instruments of investment with one party leading the investment.

Besides, as implied by the concept of Shirkah Al 'Inan, the syndicate partners need not have equal responsibility in managing the investment. As a result, their profit share may not be equal as indicated very early in the partnership agreement to steer clear of gharar. Similarly, the partners' share of losses would also be determined according to their capital contributions. According to Jaquir Iqbal (2009), the partners will play the role of agents in the syndicate, instead of sureties for the other partners.

Conclusion

ISF is a financing technique involving joint participation by a group of Islamic financial institutions (Islamic banks) to allocate funds to consumers (AAOIFI, 2015). Usually, a bank will be appointed as the lead arranging bank, while for a larger deal that requires extensive funding, a few lead arrangers could be appointed. ISF is typically recommended by the banks to specific needs of corporate firms. ISF standard transaction includes a team of Islamic banks that produces the same set of documents while providing funding to a corporate client. The transaction also could extend under the same financing package to a group of clients. The structure of ISF was built based upon Islamic principles derived from several sources, primarily the Quran and the Sunnah (together referred to as the Shari'ah). By Shari'ah permissibility, ISF is derived from the contract of Musharakah. Musharakah is derived from the Arabic root verb Shirkah which means to jointly participate or Shirkah Al Inan which refers to the business partnership between banks and financial institutions (AAOIFI, 2015; Taqi Usmani, 1998). By application, ISF can be structured using various Shariah-compliant modes. The structure that is adopted depends on the purpose of the financing, assets that will be used to repay the loans, nature of the customer's business, amount of flexibility the parties require, and financier's view of the Shariah-compliant nature of the transaction (Hassan, 2014). Besides, ISF can also be packaged together with conventional SL tranche (AAOIFI, 2015). Project financing, separate conventional and Islamic facilities are considered as large ticket transactions. Those activities are linked through the same term's

agreement but with separate facility agents and cash flow streams. ISF can be split further according to the client's needs to incorporate multiple-funded and non- funded facilities for multiple purposes facilities. The transaction structure also determines shares of the financiers under these respective facilities.

Abstract

The formation of information competence of specialists in any industry is one of the main factors in the process of digital transformation of society. Continuous postgraduate education of people occurs in adulthood. The paper presents the authors' experience related to teaching information technologies based on a scientifically grounded andragogical methodological approach, taking into account the age of the students, social and professional experience. The concept of 'vitagenic' experience is discussed. It has been proven that the transition of life experience into vitagenic experience is possible only if life experience has social and value significance and helps to construct the future, taking into account past mistakes and achievements. Learning information technology for adults on the basis of vitagenic experience contributes to the formation of not only the technical aspects of the issue of mastering digital technology, but also a value, analytical and responsible attitude to information.

Keywords: andragogic approach, continuing education, information competence, vitagenic experience.

Introduction. The features of the adult student

We present our experience in applying the andragogical approach in postgraduate professional training of health professionals In this article.

The rapid growth and qualitative changes in data processing technologies determine the relevance of the issue of the formation of information competence of specialists in the framework of lifelong education.

The formation of information competence occurs in adulthood. Therefore, we have chosen the andragogical approach as the general scientific basis of our research.

Interesting works on the application of the androgogical approach in the context of the digital transformation of society (González and Montoyab, 2019; Bîrsanu, 2020) and the development of elearning (Tomos and Clark, 2018) can be noted. The work introduces the concept of "androgogical competence of a teacher" (Lebedeva, 2017).

The object of andragogy is the process of adult learning. The subject of andragogy research is the patterns of activity of adult learners and educators in the organization and implementation of the learning process. Considering all of the above, andragogy is defined as the science of adult learning, which substantiates the activities of adult learners and educators in organizing the learning process, which forms its subject.

The specificity of the andragogical foundations of education is determined, first of all, by the social and psycho-physiological characteristics of an adult learner: economic independence, life experience, a level of self-awareness sufficient for responsible self-governing behavior.

There are a large number of definitions of an adult, but in general, researchers agree that this is a person performing socially significant productive roles (citizen, employee, family member), possessing physiological, psychological, social, moral maturity, relative economic independence, life experience, and a level of self-awareness sufficient for responsible self-directed behavior (Zmeyev, 2019).

The age, in the case of advanced training of medical personnel, will vary from 25 years (the age of obtaining higher medical education) until the end of professional activity. The literature usually indicates the age of 65 years, however, with the increase in the duration of active life in recent years, the age limit is shifting towards an increase in age.

S.I. Zmeev pointed out five fundamental characteristics that distinguish an adult from a non-adult learner: 1) realizes himself as an increasingly independent, self-governing person; 2) accumulates a larger stock of life (everyday, professional, social) experience, which becomes an important source of training for himself and his colleagues; 3) readiness for learning (motivation) is determined by his desire to solve his

vital problems and achieve specific goals with the help of learning activities; 4) strives for the urgent implementation of the knowledge, skills, abilities and qualities acquired; 5) educational activity is largely due to temporal, spatial, professional, everyday, social factors (conditions).

Опыт применения андрагогического подхода в обучении специалистов здравоохранения

The application of andragogical methods in the training of healthcare professionals is discussed in (Cox and Gunderman, 2017)

Our further research will be based on the principles of andragogy formulated by S.I. Zmeev, and taking into account the specific features associated with the organizational, professional and psychological aspects of the process of forming information competence of managers and specialists of the healthcare system Based on the identified prerequisites, we will determine further algorithms for organizing and implementing the learning process.

1. The student has a leading role in the learning process.

This statement is true in the sense that a healthcare professional is a highly qualified professional who knows how and is accustomed to learning. Even before the start of training, he has clearly defined requirements for training organizers and teachers. In the event that they do not meet expectations, participants in professional development cycles are rarely passive about the current situation, not attending classes or doing their own thing while in the classroom. On the contrary, a mature awareness of the need to acquire knowledge promotes operational contact with course leaders and resolving the issue.

With age, some of the physiological functions of the human body associated with the learning process are somewhat weakened: vision and hearing decrease, memory, speed and flexibility of thinking deteriorate, and the speed of reaction slows down (Lorge, I., 1952).

These negative phenomena are partially compensated by other factors that contribute to learning: life experience, thoroughness, rationality of inference, and a tendency to analyze. But in almost all cases, adults lose to young ones in speed, in the speed of mastering the material, and in performing educational tasks.

Advanced training groups are always of different ages, and the difference can reach forty or more years. Therefore, preliminary preparation is necessary in terms of such a preparation of training programs, educational material and training computer programs, so that, if necessary, there is an opportunity both to slowly familiarize with them and to reflect on the lessons.

The leading role of trainees in planning and building the educational process is not so obvious. Nevertheless, the organizers of training or the leadership of the department need to be prepared to address questions about the competence of teaching staff. It is competence, that is, the successful performance of actions within certain competencies - within the framework of teaching information technology in medicine. The teacher may be an excellent specialist in their field, but this field will be too far from the needs of medicine. For example, the study of the theoretical foundations of computer science or the features of the functioning of software and hardware medical diagnostic complexes that are not used in connection with the modernization of healthcare and their replacement with more advanced devices, with a time limit for studying computer science of 8-16 hours, is clearly not constructive. The application of the junior approach, the essence of which will be described below, is intended to exclude such situations as much as possible.

2. An adult learner strives for self-realization, for independence, for self-government and is aware of himself as such.

A health care specialist or head of health care in advanced training courses feels like an independent, independent person. Students are trained in groups formed according to professional principles: a group of heads of health authorities and institutions, a group of deputy chief physicians for clinical and expert work and doctors responsible for examining disability, specialists of medical and preventive institutions for working with personnel, doctors of organizational and methodological departments, statisticians, clinical residents. In some cycles, several people may be trained from one health care institution.

Health care professionals are people who train and take part in meetings, consultations or conferences every day. Therefore, training is perceived not as a new type of occupation, but as a continuation of the usual professional activity, in the process of which they strive for self-realization and independence.

In the process of practical work on the above cycles, the author and his colleagues in the department faced the problem of the students' reaction to the results of the intermediate and final assessment of knowledge. If positive grades in the academic sense (“excellent” and “good”) were perceived adequately, then the grade “satisfactory” caused irritation and misunderstanding, and not a constructive desire to improve the level of knowledge. This was due to the fact that for the chief physician, the prospect of submitting a document with satisfactory grades in computer science to the personnel department did not cause positive emotions. As a result, it was decided to switch to the "passfail" system or to indicate the absolute number of points scored when passing a test or solving an educational problem.

M.Sh. Knowles wrote: ‘Nothing makes an adult feel like a child to the same extent as the very fact of being judged by another adult. It is an extreme expression of his dependence and disrespect for him’(Knowles, 1980).

3. An adult learner has life (everyday, social, professional) experience that can be used as an important source of learning.

In the late 90s. XX century A.S. Belkin put forward the idea of vitagenic education (Belkin, 1999) or education based on the actualization (demand) of the individual's life experience, his intellectual and psychological potential.

We are in solidarity with the author with his proposal to separate the concepts of "life experience" and "life experience". According to A.S. Belkin, a person has the experience of life - information related only to his awareness of certain aspects of life and activity, but not having sufficient value for him, and life (vitagenic) experience is information that has become the property of the individual, deposited in reserves long-term memory, which is in a state of constant readiness for actualization (demand) in adequate situations. The transition of life experience into vitagenic experience is possible only if life experience has social and value significance and helps to construct the future, taking into account past mistakes and achievements.

Adult education based on vitagenic experience is presented as an andragogic theory of vitagenic education, which has generalized features: actualization and attraction as a source of the entire spectrum of personal and universal human experience in its everyday, vital, vitagenic components; understanding education as a process of attracting and constructively transforming vitagenic experience into a new quality; recognition of the intrinsic value of the vitagenic experience of an adult as the basis for his further self-education, professional and personal self-development.

Adaptation of A.S. Belkin and N.O. Verbitskaya to the construction of a methodology for the formation of information competence of specialists and managers of the health care system contributes to the formation of not the technical aspects of the issue of owning digital technology, but a value, analytical and responsible attitude to information.

The program of classes on information technology at the cycles of professional development of health organizers necessarily includes the topics: "Information security", "The impact of digital technology on

the human body", "Legal aspects of the use of computer programs" and others. We have developed a technology for conducting classes in such a way that all the issues under consideration are presented from the point of view of:

- social significance;
- contained examples of life situations associated with overcoming difficulties, both objective and subjective;
- returned trainees to their personal experience in solving this issue (both successful and unsuccessful, contributing to the awareness and understanding of the reasons for their own failures).

After studying the topic, we presented a constructive optimistic prospect of solving the problem in the case of following the knowledge gained and mastered technologies. Since the consideration of issues was organized in such a way that it touched upon the problems of each person personally, then (according to the results of surveys conducted at the Department of Public Health and Health after each cycle of advanced training), the listeners noted the emerging feeling of self-confidence, the desire to carry out active transformations, related to the implementation and competent and safe use of digital equipment and technologies.

The model of information competence of a healthcare professional that we are developing partially takes into account the ideas expressed in this theory. Competence does not arise at once, but is a complex, indivisible structure that unites and integrates learning indicators, psychological and physiological personality traits, potential abilities, motivation and value attitudes of a person, manifested in the process of professional activity.

Our main task in building a model of information competence is to show its multidimensionality and versatility, to identify factors and connections that to a greater extent affect the achieved result.

For example, if a person in everyday life quite often uses digital household appliances intuitively, without reading instructions or recommendations, then such a habit can be transferred to the professional sphere, which is unacceptable. In this case, medical equipment or software will be used superficially, without using functions hidden from the first glance. However, if the specialist is professional and responsible, then such a transfer of the action pattern will not happen.

The model of information competence of a healthcare specialist we are creating, together with modern means of data mining, allows, based on the forecast of possible scenarios for the development of actions, to identify factors that to a greater extent affect the level of information competence. Therefore, if you design a lesson taking into account the ideas of the holographic approach and the concept of vitagenic information, then you can take timely measures and correct the gaps in the knowledge, skills or skills of the student.

4. An adult learns to solve an important life problem and achieve a specific goal (contextual learning).

Completing professional development courses for healthcare professionals is a must. After graduation, in accordance with the order of the Ministry of Health and Social Development of Russia "On the approval of qualification requirements for specialists with higher and postgraduate medical and pharmaceutical education in health care", once every five years, health care professionals need to undergo advanced training cycles. If a specialist doctor moves to another position, for example, related to the organization of health care, then there is a need for an extraordinary passage of training corresponding to the qualification requirements (general or thematic improvement or professional retraining).

Thus, on the one hand, the motivation for learning is due to administrative requirements. On the other hand, according to surveys of 108 students conducted at the Department of Public Health and Health Care of the Ural State Medical Academy of Additional Education, 98% of respondents agreed with the correctness and necessity of these requirements. The survey also showed that 94% of medical organizers

of health care who are trained at the department come with prepared questions related to specific situations in their professional activities, and are confident that they will receive an answer or advice in solving a question or problem.

Accordingly, the training course is focused on solving specific problems and requires the obligatory allocation of time for the lesson to answer the questions of interest, and the active activity and personal interest of the students provide high motivation and, therefore, the effectiveness of the learning process.

5. An adult learner counts on the immediate application of the skills, knowledge and qualities acquired in the course of training.

In the field of application of information technologies in the health sector, this statement became true in the late 10s. XXI century. due to the fact that the healthcare modernization program has practically solved the problem of equipping medical and preventive institutions with digital technology to solve medical, diagnostic and organizational problems.

The exchange of views, carried out after the completion of the study of each topic, showed that some problems that previously seemed insignificant and related, for example, information security issues (organizational issues related to the receipt, storage and destruction of electronic keys, generation and storage of passwords, distribution of access rights and much other) and the peculiarities of the impact of digital technology on the physiological and psychological health of people, require an urgent solution.

In the case when the application of the acquired knowledge is potentially impossible, the adult's interest in learning disappears. This once again forces us to carefully think over the content of the material and present only those theoretical knowledge that can either be implemented in medical practice or relate to the preservation of personal information and people's health.

6. The learning activity of an adult learner is largely determined by temporal, spatial, everyday, professional, social factors that either limit or contribute to the learning process.

There are a number of factors that directly affect the learning process, but which the teacher (or andragogue) cannot influence: each student learns against the background of personal and professional situations; the need, duration and main content of training in the cycles of professional development of health care professionals are strictly determined by law.

However, there is a factor that can significantly improve the microclimate of the group. The listeners of the group come from different settlements of the Russian Federation and, as a rule, do not know each other. After passing the official registration, classes begin. The duration of the cycles varies from one to two weeks to three months, therefore, with a group size of 15-20 people, in short-term courses, students do not have time to get to know each other and feel more constrained and passive than in a familiar environment.

Long-term observations have shown that if, on the first day after or before the classes, an informal meeting of the listeners is organized (acquaintance with tea drinking) and one of the first classes is to arrange an out-of-the-box visit for informational purposes of the basic medical institution, the microclimate of the group changes to a positive one. side. Students come to classes in a familiar audience, communicate with familiar people who have a similar social and professional level, take interest and consult with each other in solving professional problems. In this case, the classes really take place in the form of a joint activity of the teacher and students.

7. The learning process of an adult learner is organized in the form of a joint activity of a learner and a teacher at all stages.

The survey showed that all medical organizers of health care who are trained at the department come to receive an answer or advice in resolving an issue related to their own professional activities. Questions or problems related to various aspects of the introduction of information technologies, from technical to organizational, arose among all students, regardless of their place of work - a large federal medical center or a village center. Analysis of the problem together with the entire group of students made it possible not only to find the best solution, but also to identify the teacher's needs in a given period of time and to adjust the content of the next lesson in this group and the entire cycle of lessons in the next group.

Such a technology of conducting classes is possible only when teaching qualified adults.

Let's add two factors that need to be taken into account when conducting classes related to the study of information technology in the cycles of postgraduate professional development of health professionals.

- Features of the specialty of the doctor.

Doctors are highly qualified specialists who know how to study and learn all their lives. People who have received medical education do not accept a single fact without its argumentation and proof and tend to critically compare their experience with the proposed educational material. Therefore, teaching any discipline in a medical classroom must be clear, logical and evidence-based.

Every day, healthcare professionals take part in meetings, consultations, conferences. People in this specialty are characterized by the ability to communicate, and the main characteristic of communication is a respectful attitude towards colleagues and their opinions. According to our observation, holding mini-conferences with short (3-5 minutes) messages from listeners on the experience and problems of introducing information technologies in medical institutions and the subsequent joint analysis of facts and opinions make the lesson more productive and diverse.

- Attitude towards information technology.

Computer science is not a specialized subject for physicians, therefore, unlike professional courses, it is not associated with the need for in-depth study. The need for knowledge of information technology appears later, when a doctor is faced with practical problems that have to be solved independently.

Both in everyday life and in medicine, many believe that they have sufficient experience and knowledge to work with any device without reading the instructions. But all software in medicine is created by professionals and is aimed at professionals. Intuitive work with medical and diagnostic equipment, even with a general correct policy, will always be superficial, without using functions that are not externally visible (Ovsyanitskaya, 2015).

Medical equipment designed to perform the same tasks, but from different manufacturers, always has a different interface. In order to switch from work from one high-tech equipment to another, you either need to undergo specialized training, or have a high level of information competence, which allows you to transfer skills and abilities to work with one device to another, taking into account all the specific features. Moreover, it is necessary to approach this responsibly (after carefully reading the documentation) and consciously (without neglecting safety requirements, since many medical and diagnostic devices can affect the environment, causing an excess of the permissible parameters of electric, magnetic fields, X-rays, ultrasonic frequencies, etc. .).

In our opinion, conscious safe work with medical software and hardware-software complexes is the main indicator of a high level of information competence of a healthcare specialist.

A full-fledged teaching of the topic of information security is possible only within the framework of andragogy. In order to realize the importance, relevance, significance of the issue, you need to have life and professional experience, foresight and understanding of real responsibility when working with virtual data.

Currently, the change not only in software, but even generations of information technology is taking place very quickly. Therefore, periodic professional development, the formation of information competence of employees in the field of information security through participation in seminars, conferences, through self-preparation, is the main factor contributing to the fact that the above points will be carried out consciously, competently and will really protect personal and professional confidential information from illegal distribution and theft.

Results

1. The introduction of modern information technologies in medicine is becoming one of the priority areas for the development of the industry. One of the main factors in the successful development of health informatization is the formation of information competence of doctors based on scientifically based methodological approaches, taking into account the characteristics of the subject, age and professional characteristics.
2. The presence of life, everyday, social and professional experience, the desire for independence and self-government, high motivation for learning, as well as the specificity of the medical audience, due to the fact that doctors have a high professional and social status and know how to study, study and take part in meetings , councils, conferences every day, lead to the impossibility of training healthcare professionals in information technology based on standard methods focused on university education and require the use of andragogical foundations for the use of specific technological techniques and teaching methods.
3. The study of information technologies of adults on the basis of vitagenic experience contributes to the formation of not only the technical aspects of the issue of mastering digital technologies, but also a value, analytical and responsible attitude to information.

Abstract

The work carried out the development of a generalized algorithm for the comparative analysis of indicators of the results of socio-economic development based on multivariate models of macroeconomic indicators of the development of society. The study of the 16-factor complex of global indices, which includes five indicators of results, made it possible to identify its systemic characteristics and main interrelationships. It is shown that the Human Development Index and Social Progress Index have a dominant influence on various performance indicators. In addition to the high level of influence on other indicators of results (0.3–0.7 total influence), they have a cooperative effect on other indicators within the framework of complex predictors. The GDP per capita indicator is interconnected within the framework of complex predictors, mainly with the World Happiness Index.

Keywords: Human Capital, Happiness Index, Social Progress Index, Human Development Index, GDP per capita, forecasting, optimization, regression analysis

Introduction

For a long time, the main indicator of the state of the economy was considered the Gross Domestic Product - GDP, proposed in the 30s of the 20th century by the American economist Simon Kuznets. The ratio of the GDP to the population (GDP per capita) is interpreted as an indicator of the well-being of the population. In 1954, purchasing power parity exchange rates - PPP - were first published. This approach became widespread after 1978, when a worldwide database of PPP exchange rates was created.

In connection with the growth of the well-being of the population, material prosperity ceased to correspond to the role of the ideal of social development. This has led to increased criticism of GDP as a universal measure of country performance. At the same time, the developers of the 2011 system of national accounts noted that "the GDP indicator was never intended to measure well-being" (Peter van de Ven, 2014).

SCHENNIKOVA "Formation of Multivariate Models of Macroeconomic Indicators of Society Development" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

In 1990, a group of economists led by Pakistani Mahbub ul-Haq developed the Human Development Index (UNDP, 2018), which is published annually by the United Nations Development Program (UNDP). An essential advantage of the Human Development Index (HDI) is that it is based on two indicators of a natural type (life expectancy and the number of years of education), and the third ensures the inheritance of the relationship with GDP per capita at PPP. Its simplicity is, however, both an advantage and a disadvantage, since it takes limited account of the characteristics of the socio-economic development of countries.

The concept of the economy of happiness has been proposed as a fundamentally different approach to assessing the results of social development (Easterlin, 1974; Veenhoven, 1991; Argyle, 2003; Layard, 2011). This concept received support at the 65th UN session in 2011. At the same time, the resolution "Happiness: A Holistic Approach to Development" was approved. One such approach is implemented as the World Happiness Index (Helliwell at al., 2019). Among the disadvantages of this index, it can be noted that highly intangible indicators such as the feeling of positive or negative emotions make a significant contribution to it. It is characteristic that the dependence of the World Happiness Index (WHI) on a number of predictors is bimodal, and at a certain stage of the development of society, a decrease in the level of happiness may occur with an increase in well-being. This led to a lengthy debate among economists about the Easterlin paradox, which is that GDP growth only within certain limits leads to an increase in the level of happiness (Easterlin, 1974; Diener, 2013).

Since the share of human capital (Schultz, 1962; Becker, 1962) in the national wealth of countries began to grow rapidly since the end of the 20th century, and, according to some estimates, it reaches 80% in developed and large developing countries (Koritsky, 2013; Korchagin, 2005; Suvorov et al; 2014), then human capital (HC) actually also begins to play the role of an indicator of social development (Prichina, 2019). The difficulty lies in the fact that different methods for assessing human capital do not give fully consistent results. For example, the two human capital indices developed by the World Economic Forum (WEF, 2019) and the World Bank Group (World Bank Group, 2019) are based on significantly different indicators.

Finally, under the leadership of M. Porter, the Social Progress Index was developed in 2013 (Porter, 2015; Stern, 2018), the first version of which was released in 2014. The index is formed on the basis of 54 indicators, structured in three areas: basic needs of people, the basics of well-being and opportunities, and for each area 4 groups of indicators were formed, 3-5 in a group. It is fundamentally important that among the indicators used there are no those that characterize the economy and business, which makes it possible to establish the relationship between the economy and the social characteristics of society.

The presence of a wide range of indicators of the development of society, the active improvement of their design, makes the question of the relationship between these indicators urgent.

The aim of the work is to develop a method for comparative analysis of indicators of the results of socio-economic development based on multivariate models of macroeconomic indicators of the development of society.

To solve this problem, in this work, a statistical analysis of the dependence of various indicators on a complex of 15 global indices, including those that can also serve as the resulting indicators, is carried out.

Research Methodology

The methodological foundations of this work are systematic and statistical analysis. As indicators of the results of the socio-economic development of countries, the indices presented in Table 1 are used.

Table 1: indicators of the results of socio-economic development

i	Abbre-viation	Full name	Indicators
1.	GDP/C	GDP per capita at PPP	Gross domestic product at purchasing power parity в долл. США 2018 года, по данным World Bank
2.	HDI	Human Developmen Index	Life expectancy, length of study, log GNI at PPP (UNDP, 2018)
3.	IHC	Index of Human Capital	A comprehensive indicator of human capital, formed from indices: Global Human Capital and Human Capital Index
4.	WHI	World Happiness Index	Life expectancy forecast, freedom to choose a life path, support from other people and social, low corruption, positive or negative emotions, people (Helliwell, 2019)
5.	SPI	The Social Progress Index	- food and low mortality from disease, sanitation and water, housing and electricity, personal safety; - coverage by secondary education, communication and access to information, healthy life and ecology; - rights and freedoms, tolerance for minorities, access to higher education (Porter, 2015; Stern, 2018)

The research program is as follows. Using five indicators of countries' development results, on the basis of a statistical analysis of the database on global indices (factors) shown in Table 2, form a series of complex predictors that provide the minimum regression error with the corresponding performance indicators. The weights of the indices in these predictors presumably reflect the level of influence of these indices on the corresponding development results. Comparison of these indices and their coefficients in various predictors will be used to identify the systemic characteristics of mutual influence, both performance indicators and the complex of global indices used.

Table 2: indices used as factors

i	Abbre-viation	Full name
1.	IEF	Index of Economic Freedom (Miller, 2019)
2.	EDB	Ease of Doing Business Ranking, (Doing Business, 2020)
3.	WGI	Worldwide Governance Indicators (Kaufmann, 2010)
4.	GCI	Global Competitiveness Index, (Schwab, 2019)
5.	MYS	Mean Years of Schooling (UNDP, 2018)
6.	GHC	Global Human Capital (WEF, 2019)
7.	HCI	Human Capital Index (World Bank Group, 2019)
8.	RDE	R&D Expenditure (Knoema, 2017)
9.	LPI	The Legatum Prosperity Index (Legatum, 2019)
10.	CPI	Corruption Perception Index (Transparency, 2020)
11.	LEI	Life Expectancy Index (UNDP, 2018)
12.	KIG	KOF Index of Globalization (Savina, 2019)

It should be noted that the indicators presented in Table 1 were also used as factors on which other indicators of results depend. In addition, the number of indices shown in Table 2 includes those that are not formally global indices, for example, Mean Years of Schooling, but are important from the

point of view of the completeness of this system of indices. For ease of comparison with other arguments, the MYS index is normalized to the average duration of tertiary education (16 years). The value of R&D Expenditure is given in terms of GDP, Life Expectancy Index in years.

The work used data for 72 countries, for which data were available for all indices. A number of fuel producing countries (Qatar, Kuwait, Saudi Arabia) that deviate significantly from the general trends in GDP / C were not included in the sample under study. All countries were ranked according to the value of GDP at PPP and the largest samples were formed, differing in the number of countries: G72, G48, G24, G12, G6. For each of these samples, regression dependencies, coefficients of determination (R^2), and regression error ($\Delta R^2 = 1 - R^2$) were determined. In addition, the mean value of the regression error ($\Delta R^2_m = 1 - R^2_m$) was determined for five samples (G6 – G72). Optimization of predictors was carried out by minimizing ΔR^2_m .

To track the regular nature of the interdependence of performance indicators on a multidimensional complex of factors, at the first stage of the study, for each performance indicator, the dependence of the indicator on single and optimal paired predictors was studied. Paired predictors were formed by a linear composition of indices according to formula (1).

$$P_2 = k\, In_1 + (1 - k) In_2 \qquad (1)$$

Here In_1 and In_2 are the values of two indices for a particular country, k is the contribution coefficient of the first index (1> k> 0), P_2 is the value of the paired index. Complex predictors were formed similarly to paired ones, which included the maximum appropriate number of indices, according to formula (2), where $\Sigma ki = 1$.

$$P_C = \sum k_i\, In_i \qquad (2)$$

The search for the coefficients ki when optimizing complex predictors was carried out by varying them, defining a regression model and estimating the value of ΔR^2_m . Further, the optimal values of ki were determined by the gradient descent method with cyclic change of variables.

Optimizing predictors for GDP / C

First of all, the dependence of GDP per capita at PPP on various global indices was investigated. At the first stage, the values of the regression error ΔR^2_m of the dependence of GDP / C on the single indices presented in Table 1 were calculated. The lowest regression error was demonstrated by the Human Development Index, for which $\Delta R^2_m = 5.5\%$ with a trend as a power of number. The dependence of GDP / C on the Human Developmen Index for the G24 is shown in Fig. 1. Trends in the form of a power of a number and an exponent (dotted line) are close to each other in the considered range of the argument.

Fig. 1: Dependencies of GDP / C on Human Development Index, G24

It should be noted that the Human Development Index, as one of the three main components, includes gross national income (GNI), which is quite close in size to GDP. Therefore, the correctness of including HDI in the GDP / C predictor complex is somewhat questionable. In this regard, special attention was paid to GDP / C predictors that do not include HDI. Those that provide the smallest ΔR^2_m are shown in Table 3.

Table 3: indexes-predictors of GDP / C with the smallest ΔR^2_m,%.

	G6	G12	G24	G48	G72	mid
LPI	18.2	15.9	16.6	19.5	17.3	17.5
HCI	16.6	11.5	8.9	28.3	22.0	17.4
MYS	8.5	11.7	13.6	29.2	23.4	17.3
SPI	12.4	13.3	9.1	22.8	19.1	15.3
HDI	2.2	2.2	4.6	11.4	7.0	**5.5**

Next, we considered paired predictors formed according to formula (1). HDI and SPI were used as the first of the pairs of indices, which showed the best individual results. The optimal paired predictors of GDP / C are presented in Table 4. The left half of the table shows the values of ΔR^2 for various samples and ΔR^2_m (column - mid), and the right - the values of the coefficients ki of the contribution of the indices to the predictors.

Table 4: regression error of paired GDP / C predictors,%

	G6	G12	G24	G48	G72	mid	IEF	EDB	MYS	GHC	HCI	WHI	SPI	HDI
HDI +IEF	1.7	2.8	3.1	8.5	5.3	4.3	0.20							0.80
HDI +EDB	1.4	2.3	4.3	9.8	6.4	4.8		0.20						0.80
HDI +WHI	1.5	2.8	3.6	10.0	6.2	4.8						0.15		0.85
MYS+SPI	6.7	5.8	6.6	18.2	13.1	10.1			0.40				0.60	
GHC+SPI	4.5	4.1	7.4	19.1	14.9	10.0				0.42			0.58	
HCI+SPI	7.5	6.2	6.4	16.9	13.7	10.1					0.35		0.65	

It can be seen that the predictors that include HDI are characterized by approximately half the values of ΔR^2_m than those with SPI, and the smallest ΔR^2_m = 4.3% is provided by the predictor P = 0.8HDI + 0.2IEF. Among paired predictors that do not contain HDI, the minimum ΔR^2_m = 10% for the predictor P = 0.42GCI + 0.58SPI. Note that the optimal paired predictors, including SPI, contain as the second index those that individually provide low ΔR^2_m. The predictors containing IHD, as the second component, include indices with low individual ΔR^2_m.

At the third stage of the study, complex predictors were identified, which include three indices and an arbitrary number of them, and this was done, both with the inclusion of the Human Development Index, and without it. The found optimal predictors are presented in Table 4 (ERD and CPI indices with a weight of ~ 0.01 are not shown in Table 5).

Table 5: error of regression of complex predictors of GDP / C,%

	G6	G12	G24	G48	G72	mid	IEF	EDB	GCI	MYS	GHC	HCI	WHI	LPI	SPI	KIG	HDI
Pc_1	1.3	2.6	2.9	8.4	5.2	4.1	0.15						0.1				0.75
Pc_2	1.0	2.1	3.1	8.1	5.2	3.9	0.1	0.1					0.1				0.7
Pc_3	4.3	7.1	7.9	16.0	11.3	9.3				0.2			0.25		0.55		
Pc_4	2.4	2.6	5.8	13.1	9.6	6.7	0.03	0.06	0.2	0.12	0.08	0.15	0.15	0.04	0.26	0.07	

Complex predictors including HDI, as in the case of simpler predictors, are characterized by approximately half the regression error, about 4%. Since HDI individually has a very low regression error (ΔR^2_m = 5.5%), adding other indices to it does not contribute to a significant decrease in ΔR^2_m. Therefore, the optimal complex predictor Pc_2, including HDI, contains only 4 components and is marginally superior (ΔR^2_m = 3.9%) compared to the predictor of three Pc_1 indices.

Predictors that include SPI benefit significantly from adding other indexes. The optimal complex predictor Pc_4 includes 12 components and has ΔR^2_m = 6.7%. The SPI index (ki = 0.26) makes the largest contribution to this predictor, which is consistent with the results of studies of ΔR^2_m for individual and paired predictors. Also, the contributions of HCI (ki = 0.15) and GHC (ki = 0.08) are quite high. Overall, the group of human capital indexes (HCI, GHC, MYS) contributes the most to the composite optimal predictor of GDP / C - 0.35. The contribution of the World Happiness Index is also quite large (0.15). The dependence of GDP / C on the Pc_2 predictor for the G24 sample is shown in Fig. 2.

Fig. 2: Dependences of GDP / C on the predictor Pc_2, G24

In Fig. 1, 2 sample points G6 are marked with special symbols from left to right: India, China, Russia, Japan, USA, Germany. It can be seen that all points except for the USA (circle) lie very close to the trend. This means that there is a natural relationship between GDP / C and the found optimal predictor, and the countries under consideration, including Russia, have GDP / C close to this relationship.

Optimization of predictors for Human Development Index

Let us consider the possibilities of forecasting the Human Development Index using the global indices presented in Table 2. Table 6 shows the indices, when used as predictors for HDI, the minimum regression error ΔR^2_m is provided for various samples with a trend in the form of a second degree polynomial.

Table 6: indexes-predictors of HDI with small ΔR^2_m,%

	G6	G12	G24	G48	G72	mid
LPI	12.8	12.7	16	13.2	11.7	13.3
MYS	6.5	9.9	10.7	18.7	16.0	12.4
HCI	10.3	8.8	4.8	14.1	12.8	10.2
SPI	0.6	9.0	5.6	12.5	11.1	7.8
GDP/C	0.2	1.7	5.0	10.3	9.8	5.4

It can be seen that the best individual predictor in this sense is GDP / C with ΔR^2_m = 5.4%, and this value is close to the GDP / C regression error depending on HDI. Some of the difference is due to the fact that these two relationships have different trends. Social Progress Index ranks second in terms of ΔR^2_m = 7.8%. Table 7 presents paired, triple, and complex predictors that provide low regression biases for HDI.

Table 7: complex HDI predictors with small ΔR^2_m,%

	G6	G12	G24	G48	G72	mid	MYS	HCI	SPI	LEI	GDP/C
MYS+SPI	1.28	2.41	3.69	7.31	6.19	4.18	0.4		0.6		
MYS+GDP/C	1.50	2.31	4.21	5.85	5.30	3.83	0.35				0.65
HCI+SPI	2.53	2.56	2.43	4.45	5.58	3.51		0.45	0.55		
HCI+GDP/C	1.51	2.14	2.41	5.27	5.22	3.31		0.4			0.6
SPI+GDP/C	0.31	1.74	2.49	6.52	5.44	3.30			0.4		0.6
MYS+SPI+GDP/C	1.63	1.65	2.77	4.74	4.01	2.96	0.35		0.35		0.3
MYS+LEI+GDP/C	0.95	1.36	1.45	2.81	2.80	1.87	0.33			0.33	0.34
HCI+SPI+GDP/C	0.39	0.82	1.45	2.28	3.43	1.67		0.35	0.4		0.25
Pc_5	0.20	0.55	1.13	1.87	2.32	1.21	0.2	0.2	0.3	0.1	0.2

The first column of the table contains abbreviations of the indexes that make up the predictor, and the last five columns show the proportion of these indexes in complex predictors. Among paired predictors, the smallest average regression error ΔR^2_m = 3.3% is provided by the combination SPI + GDP / C with an SPI share of 0.4, which is consistent with the low individual values of ΔR^2_m for these indices.

Adding the third index to the predictor (HCI + SPI + GDP / C) allows to reduce the regression error by half, to 1.67%. An even more complex predictor Pc3, which includes five indices (MYS + HCI + SPI + LEI + GDP / C), provides a very low level of regression error – 1.2%.

It is interesting that among the paired predictors there are those that do not contain GDP / C and MYS and have a fairly low regression error of ~ 3.5%. This allows HDI to be predicted without having these values included in the HDI definition.

The dependence of the Human Development Index on the optimal complex predictor Pc_3 for the G48 sample is shown in Fig. 3. It can be seen that all points, including G6, are very close to the trend line (polynomial of the second degree - P2).

Fig. 3. Dependencies of HDI on the optimal complex predictor

Optimization of predictors for the World Happiness Index

Similarly to the previous indicators, we will consider the multi-factor models of the World Happiness Index. Table 8 shows the indices, when used as predictors for WHI, the minimum regression error ΔR^2_m is provided for various samples. In this case, we used a trend in the form of a polynomial of the fifth degree (for G6 – the third).

Table 8: indexes-predictors of WHI with minimum ΔR^2_m,%

	G6	G12	G24	G48	G72	mid
MYS	4.2	27.3	41.1	39.2	47.5	31.8
HDI	7.4	22.6	34.6	27.5	30.7	24.5
GDP/C	4.8	18.9	35.5	29.5	28.4	23.4
LPI	13.5	26.8	25.3	22.5	25.3	22.7
SPI	12.0	14.7	20.3	26.1	32.3	21.1

It can be seen that the regression error for the WHI is much larger than for the GDP / C and Human Development Index. Comparison of tables 4, 6 and 8 shows that the indices providing the minimum ΔR^2_m for the three indicators of the results of society development are represented by the same group of indices: GDP / C, HDI, SPI, MYS, HCI, LPI.

Table 9: regression error of optimal predictors WHI, %

	G6	G12	G24	G48	G72	mid	IEF	WGI	GDP/C	LPI	SPI	LEI	KIG
IEF+SPI	12.1	19.5	15.6	21.1	28.6	19.4	0.15				0.85		
WGI+SPI	11.4	13.5	15.3	22.1	29.2	18.3		0.15			0.85		
WGI+ GDP/C	3.24	7.88	17.9	27.1	28.4	16.9		0.4	0.6				
LPI+ SPI	12.3	8.7	15.6	21	26.7	16.9				0.45	0.55		
SPI+ GDP/C	0.67	10.6	17.7	20.2	28.1	15.5			0.35		0.65		
IEF+SPI+ GDP/C	0.84	11.7	15	18.1	27.1	14.6	0.15		0.3		0.55		
WGI+SPI+ GDP/C	0.08	5.09	12.7	19.5	28	13.1		0.15	0.37		0.48		
Pc_6	0.29	6.45	11.4	17.3	26.6	12.4	0.14	0.13	0.25		0.45	0.01	0.02

Table 9 shows paired, triple, and more complex optimal complex WHI predictors. The Social Progress Index makes the largest contribution to all types of World Happiness Index complex predictors, with its contribution to the complex predictor Pc_6 being 0.45 compared to 0.26 for the complex Pc_4 predictor for GDP / C and 0.3 for the HDI predictor (Pc_5). This is a consequence of the proximity of these indices in terms of characteristics of the results of socio-economic development. GDP / C has the second largest share (0.23), which indicates that material well-being makes a relatively small contribution to the happiness of the population.

The indices characterizing human capital, as well as the Human Development Index, in the WHI predictors that provide the minimum regression error are not presented. This is a very important phenomenon, which indicates that an increase in educational level and an improvement in health does not make the population happier, at least in the considered World Happiness Index model. At the same time, human capital has a very significant impact on the GDP / C value. Instead of HC factors, the WHI is significantly influenced by the Index of Economic Freedom (0.14) and Worldwide Governance Indicators (0.13).

Characteristically, the trend for WHI is bimodal, as can be seen from Fig. 4, which shows the dependence of the World Happiness Index on the optimal complex predictor Pc_6 and the trend in the form of a polynomial of the 5th degree (P5).

Fig. 4. Dependence of WHI on the optimal predictor P_{C6}, G24

In Fig. 4 large icons represent the countries in the G6 sample from left to right: India, China, Russia, Japan, Germany, and the United States. It can be seen that most of the corresponding points are close to the trend line, which corresponds to a low regression error $\Delta R^2 = 0.3$ for the G6 sample. Also, they are all in uptrend parts.

Discussion

This paper continues a series of studies that examine the multifactorial system of global indices and their relationship with the results of socio-economic activity. In these works, the number of involved indices was constantly increasing and it happened more than once that the new index had a very significant impact on the system of interconnections. Among the latter of such indices are the Social Progress Index and Human Developmen Index and, as it turned out, they are the most important in this system. At the same time, the Human Developmen Index was taken into account from the very beginning, since it includes an analogue of GDP per Capita and therefore its use for forecasting GDP / C is not entirely correct. However, in connection with the involvement in the study of other indicators of development results, the Human Developmen Index was introduced into the system of

the studied indices and it turned out that it is key. This forces us to pay attention to the possibility of the presence of other global indices that can play a significant role in this predictive system.

Among such indicators, an important role can be played by the indicator of natural resources; however, at present, such a correctly formed index is not known to the authors. The existing private components of such an index are rather controversial. For example, the most valuable natural resource in Russia is considered to be forest resources, the value of which is estimated at $ 29 trillion. However, in reality, these resources cannot be used, in particular, due to the lack of appropriate transport opportunities. The cost of arable land in different countries differs tenfold, and these prices are very unstable, as well as the prices for energy carriers. Nevertheless, the relevance of the development of a natural resource value index is very significant from the point of view of the development of investment forecasts.

Conclusion

The studies carried out allow us to draw the following conclusions:

1. A method of statistical analysis of indicators of the results of socio-economic development of countries has been developed and successfully tested, which makes it possible to identify the system characteristics of a complex of 16 global indices, including five indicators of the results of socio-economic development (GDP / C, HDI, WHI, IHC, SPI).

2. Comparison of the interdependencies of the system shows that the Human Developmen Index and Social Progress Index have the greatest impact on the performance indicators. Their influence on other indicators of results is the greatest and amounts to 0.3–0.7 of the total influence and have a cooperative effect on other indicators within the framework of complex predictors. In third place in terms of influence is GDP per Capita.

3. The developed complex optimal predictors for various performance indicators provide a low level of average regression error, which is: for GDP per Capita - 3.9%, Human Developmen Index - 1.2%, World Happiness Index - 12.4%, Index of Human Capital - 5%, Social Progress Index - 5.2% (for the average of five samples, including 6, 12, 24, 48 and 72 countries, ranked by GDP). For a sample of 24 largest economies, the corresponding values of the regression error are: 3.1%, 1.1%, 6.5%, 2.3%, 3.2%, which is significantly less than for the predictors from individual indices.

Acknowledgments

The reported study was funded by RFBR, project number 19-29-07328.
The work was supported by the Government of the Russian Federation (Resolution No. 211 of 16 March 2013), contract No. 02.A03.21.0011.

Universiti Utara Malaysia (UUM), Malaysia.

Email: *wonghuasiong@yahoo.com

Abstract

Since the enforcement of the Franchise Act 1998, Malaysia has been promoting the Franchise Industry extensively via the government bodies by providing financial assistance to the would be Franchisors and Franchisees. Some people in the Franchise Industry commented that the Act was said to be more pro Franchisee rather than pro Franchisor as some salient terms and conditions in the Act are stricter on the Franchisors. Others commented otherwise. This is where we will look in depth of the Act as Islam does not allow oppression in dealings. Nevertheless, with a few amendments recently made by the Domestic Trade, Co-operatives and Consumerism Ministry have in a way try to balance the interests of both parties concerned. This paper will look into whether the terms and conditions in the Franchise Act deviates from the Syariah principles and if yes, this paper will look into some proposals on how to make the Franchise Business and Industry Syariah friendly and thus making it competitive in the Islamic Finance Industry. The objective of this study is to ascertain the importance of amending the Franchise Act to be in Syariah compliance as in some circumstances the Franchisors and Franchisees are Muslims and to ensure no element of *usury* and *gharar* exist. Meanwhile, the author would like to evaluate the operation of the Franchise Industry in Malaysia as not to be in contradiction with Syariah principles. This will not only by looking at the Franchise Agreement but also the Franchisor's Standard Operating Procedures and Operation Manuals. The research methodology requires gathering relevant data from both primary and secondary sources. Quran, Hadis, reports, statistics, specified journals and online articles help in order to analyze the material and arrive at a more complete understanding and historical reconstruction of the importance amending the Franchise Act and subsequently the Franchise Agreement to be Syariah compliance. This is qualitative study that involves a systematic study of philosophical and academic views though literatures. Therefore, this study is not an empirical study but rather a library study from various primary data sources such as Quran, Hadis, franchising agreement and secondary data sources namely articles and journals from online database. The study found that challenges faced by local entrepreneurs in franchise industry in Malaysia include the issues of prohibition against the same business, financial concern and monopoly by the franchisor. As such, it is suggested that the need for unique legal framework for Islamic franchising business in Malaysia in order to protect the local entrepreneurs, especially Muslim entrepreneurs in franchise industry.

Keywords: Franchising law, Syariah legal framework, Syariah compliant business, Malaysia.

Introduction

Since the enforcement of the Franchise Act 1998 ("the Act"), Malaysia has been promoting the franchise industry extensively via the government bodies by providing financial assistance to the would be franchisors and franchisees. Some people in the franchise industry commented that the Act was said to be more pro franchisee rather than pro franchisor as some salient terms and conditions in the Act are stricter on the franchisors. Others commented otherwise. This is where we will look in depth of the Act as Islam does not allow oppression in dealings.

Cite this Article as: Hua Siong WONG "Syariah-Compliant Legal Framework for Franchising: A Malaysian Legal Perspective" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Nevertheless, with a few amendments recently made by the Domestic Trade, Co-operatives and Consumerism Ministry of Malaysia have in a way try to balance the interests of both parties concerned. This paper will look into whether the terms and conditions in the Franchise Act deviates from the Syariah principles and if yes, this paper will look into some proposals on how to make the franchise business and industry Syariah friendly and thus making it competitive in the industry, including Islamic finance industry.

Methodology

This is qualitative study that involves a systematic study of philosophical and academic views though literatures. Therefore, this study is not an empirical study but rather a library study from various primary data sources such as Quran, Hadis, franchising agreement and secondary data sources namely articles and journals from online database.

The research methodology requires gathering relevant data from both primary and secondary sources. Quran, Hadis, reports, statistics, specified journals and online articles help in order to analyze the material and arrive at a more complete understanding and historical reconstruction of the importance amending the Franchise Act and subsequently the Franchise Agreement to be Syariah compliance.

The research methodology requires gathering relevant data from both primary and secondary sources, that includes looking into the Act and Regulations, such as:-

1. Franchise Act 1998 (Act 590) and Regulations (hereinafter referred to as 'the FA 1998')
2. Franchise Operation Manual
3. Franchise & Licensing Agreement
4. Contracts Act 1950
5. Publications of books, journals and articles by academicians and also the players in the industry with regards to the Franchise Business
6. Newspaper cuttings on the topic of Franchise
7. Competition Act 2010

Reports, statistics, specified journals and online articles help in order to analyze the material and arrive at a more complete understanding and historical reconstruction of the importance amending the Franchise Act and subsequently the Franchise Agreement to be Syariah compliance.

Literature Review

The relationship between franchisor and franchisee is contractual in nature and a mutually beneficial business arrangement (Bradach, 1998). The franchise contract requires the franchisor to guide the franchisee in operating the business operation and system including operating hour, menu, providing training, financial obligations, etc. and to create a framework for their relationship. In order to achieve objectives, both franchisor and franchisee need to be interdependent and to cooperate with each other.

Franchising is also classified as a form of strategic alliance from the business perspective (Mclntyre & Huszagh, 1995; Hoy & Stanworth, 2003), because the formal franchise contract listed out the rights and obligations of both parties. It is submitted that the franchisor-franchisee relationship is very complex that requires the complex delineation and integration of individual roles for both franchisor and franchisee (Kaufman & Dant, 1998). This complexity in franchising partnership can potentially lead to hazards for the franchisor (Davies et al., 2011) and conflicts between franchisors and franchisee regarding priorities, timing and revenue stream (Garg & Rasheed, 2006). This situation arose due to dissimilarities between franchisor and franchisee in handling the franchise business. For example, a franchisee had taken legal action against Burger King (franchisor) over the $1 double cheeseburger promotion (Heher, 2009). In this case, the

restaurant owners contended that the offer, which was launched in October 2009, forces them to sell the product at a loss. As a result, the franchisees may have their contract terminated due to non-compliance by the franchisor. The franchisees stand to lose their investments. Thus, Khan (1999) argued that mutual understanding between franchisor-franchisee plays important role to ensure the success of the relationship in franchise business.

Apart from relationship between franchisor and franchisee, the earlier studies have not been much focus on legal issues relating to franchising whereas they were more focused on marketability, product offering, and the issues of dispute resolution and insolvency recently (Oseni, 2012; Oseni & Hassan, 2011). Further thereto, currently most of the Muslim-majority countries namely Gulf Cooperation Council (GCC) region and Association of Southeast Asian Nations (ASEAN) which practising franchise laws are not based on the Islamic law but either based on civil law or common law (Oseni, 2016). Thus, it is indeed a need to come up with a Syariah compliance legal framework that will regulate Islamic franchising industry which will benefit the local Muslim entrepreneurs (Oseni, 2013).

An excerpt from the Malaysian Franchise Act 1998:

> "Franchise is defined in Section 4 of the Malaysian Franchise 1998 as:
> "Franchise" means a contract or an agreement, either expressed or implied, whether oral or written, between two or more persons by which—
>
> (a) the franchisor grants to the franchisee the right to operate a business according to the franchise system as determined by the franchisor during a term to be determined by the franchisor;
>
> (b) the franchisor grants to the franchisee the right to use a mark, or a trade secret, or any confidential information or intellectual property, owned by the franchisor or relating to the franchisor, and includes a situation where the franchisor, who is the registered user of, or is licensed by another person to use, any intellectual property, grants such right that he possesses to permit the franchisee to use the intellectual property;
>
> (c) the franchisor possesses the right to administer continuous control during the franchise term over the franchisee's business operations in accordance with the franchise system; and
>
> (d) in return for the grant of rights, the franchisee may be required to pay a fee or other form of consideration.

After an amendment to the Franchise Act 2012, the requirement for the franchisor to provide operations assistance to the franchisee such as providing materials and services, training, marketing and business or technical assistance has been removed from the definition. Another limb of the definition, which previously stated that the franchisee had to operate the business separately from the franchisor and the relationship could not be a partnership, service contract or agency, has been subsumed into another part of the Franchise Act.

Under the Malaysian Contracts Act 1950, Section 10 of the Act states what agreements are contracts:

> 10. (1) All agreements are contracts if they are made by the free consent of parties competent to contract, for a lawful consideration and with a lawful object, and are not hereby expressly declared to be void.
>
> In common law, a contract (or informally known as an agreement in some jurisdictions) is an agreement having a lawful object entered into voluntarily by two or more parties, each of whom intends to create one or more legal obligations between them. The elements of a contract are "offer" and "acceptance" by "competent persons" having legal capacity who

exchange "consideration" to create "mutuality of obligation."”

Contract in Malaysian Contracts Act 1950 in summary states that elements such as offer, acceptance, consideration and intention to create legal relationship forms a contract. It has the similarities in a typical buying and selling (Aqad) in Islam. The differences will come into the issue of interest (usury).

In Malaysia, every contract shall be governed under this Contracts Act as to ensure that the contract made is not null and void.

In reference to franchise, it is still under the Contracts Act 1950 only it has another specific Act which governs the franchise industry on its own. The basic elements of forming a contract will still fall under the Contracts Act 1950 as a contract will consists terms and conditions agreed by parties entering without having malice and ambiguity and thus defeats the formation of contract. The Franchise Act will focus solely on the formation of Franchise and the relationships between the Franchisor and the Franchisee.

In Islam, contract or Aqad is al-bai’ (jual beli) from the language aspect it means that exchanging one asset/thing/property/cash to another. From the Syaraq perspective, Al Bai has many meanings which has been given by the Ulamaks.

According to Hanafi, buying and selling is the exchange of one’s property with another property according to some specific ways or exchanging something which he likes with some other things which he likes with some other beneficial ways by making an offer or proposition.

According to Syafie, buying and selling is the exchange of a property to another property, whereby both can be handled with an offer and acceptance which is allowed by Syaraq. Al-Bai’ too is a contract of exchanging properties which gives one the ownership and the benefits forever and not for the reason of Qurban.(to be near to Allah SWT) (Mughni al-muhtaj, jld.3, hlm.2).

The buying and selling concept has been promulgated in the Quran, Hadith and consensus of the ulamaks (ijmak). There are more than ten types of transactions in Islam which can happen in a different form and method. Some of the transactions are listed below:

Bai’ al-sil’ah bi al-naqd (بيع السلعة بالنقد)
Bai’ al-muqayadhah (بيع المقايضة)
Bai’ al-salam (بيع السلم)
Bai’ al-sharf (بيع الصرف)
Bai’ al-murabahah (بيع المرابحة)
Bai’ al-wadhiah (بيع الوضيعة)
Bai’ al-tauliah (بيع التولية)
Bai’ al-urbun (بيع العربون)
Bai’ al-talji’ah (بيع التلجئة)

In Malaysia, the industry of franchise is regulated and governed by the Franchise Act 1998. All businesses involve in franchising must first and foremost register their franchise business with the Registrar of Franchise as required under Section 7 of the Act. Prior to registration of the said franchise, the potential franchisors must ensure that its brand and logo has been registered for its trademark. There are documentations that need to be submitted for this registration process under Section 7. Some of the documents that need to be submitted is the Franchise Agreement. We will look into the Franchise Agreement as to highlight the clauses that are not Syariah compliance.

In a standard Franchise Agreement as to follow the requirements under section 17 of the Act, it lists down the terms and conditions that must be incorporated in a Franchise Agreement.

1) A Franchise Agreement must be in writing.

2) A Franchise Agreement must contain but not limited to:-
a) the name and description of the product and business under the franchise;
b) the territorial rights granted to the Franchisee;
c) the franchise fee, promotion fee, royalty or any related type of payment which may be imposed on the Franchisee, if any;
d) the obligations of the Franchisor;
e) the obligations of the Franchisee;
f) the Franchisee's rights to use the mark or any other intellectual property pending the registration or after the registration or after the registration of the franchise;
g) the conditions under which the franchisee may assign;
h) a statement on the cooling off period as provided in subsection (4);
i) a description pertaining to the mark or any other intellectual property owned or related to the franchisor which is used in the franchise;
j) if the agreement is related to a master franchisee, the franchisor's identity and the rights obtained by the master franchisee from the franchisor;
k) the type and particulars of assistance provided by the franchisor;
l) the duration of the franchise and the terms of renewal; and
m) the effect of termination or expiration of the franchise agreement."

Above are some of the salient terms and conditions that need to be incorporated in the Franchise Agreement, however there are clauses that should be in as to protect the franchise industry such as Section 26 of the Act talks about confidential information and

Section 27 of the same Act states on prohibition against similar business. We shall look into the sections mentioned above in the Act that may not be Syariah compliance and what is drafted in a standard Franchise Agreement currently in used.

Section 17(2)(c) refers to the franchise fee, promotion fee, royalty or any related type of payment which may be imposed on the franchisee, if any; this clause will also include the penalty clause in the event the franchisee is late in paying any fee as stated below

Late Payment Charges

"In the event that any sums due to the Franchisor are not paid by the Franchisee on the due date/s as specified by the Franchisor or the terms of this Agreement, such sums shall bear late payment charges calculated on a daily basis at a rate of one point five per centum (1.5%) per month in respect thereof from the due date up to the date of full settlement".

In Malaysia Order 42 r 12 of Court Rules 2012:

12. Subject to rule 12A, except when it has been otherwise agreed between the parties, every judgement debt shall carry interest at such rate as the Chief Justice may from time to time determine or at such other rate not exceeding the rate aforesaid as the Court determines, such interest to be calculated from the date of judgement until the judgment is satisfied."

This clause must be read with Order 42 r.12A of Court Rules 2012 which states:

12(A) "Every judgement debt arising from financial transactions in accordance with Syariah shall carry a late payment charge calculated from the date of judgement until the judgement debt is fully satisfied at the rate provided under Order 42, rule 12and subject to the following conditions:;

a) the judgement creditor shall only be entitled to ta'widh as a result of late payment;

b) the amount of late payment charge shall not exceed the outstanding principal amount; and

c) if the amount of ta'widh is less than the amount of late payment charge, the balance shall be channelled to any charitable organisations as determined by the Syariah Advisory Council."

2) "For the purpose of this rule:-

(a) "Syariah Advisory Council" means the Syariah Advisory Council established under the Central Bank of Malaysia Act 2009 (Act 701) and the Capital Markets and Services Act 2007 (Act 671) and;

(b) Ta'widh means compensation for actual loss and shall be calculated at the rate determined by the Shariah Advisory Council."

To summarise the effects of the above law:

a) "Every judgment debt arising from an Islamic Financial transaction carries a late payment charge at a rate determined by the Chief Justice, say 4% per annum.

b) The judgment debt refers to the outstanding principal amount. The outstanding principal amount is the balance due subject to ibra, where applicable and does not include late payment charge prior to the date of judgment and other costs.

c) The late payment charge is arrived at by multiplying the outstanding principal amount by the number of days of the delay from the date of judgment until the date of full satisfaction at 4% per annum. That will give the amount of the late payment charge, say RM10,000-00. This amount must not be more than the outstanding principle amount otherwise it would be limited to that amount.

d) Ta'widh is arrived at by multiplying the outstanding principal amount by the "daily overnight Islamic Interbank rate" on the date of judgement calculated monthly on daily rest basis for the period of the delay. That will give the amount of Ta'widh, say RM6,000-00.

The difference between late payment charge and the ta'widh is the gharamah which is to be channeled to charitable institutions, for example RM10,000-00- RMRM6,000-00= RM4,000-00. In this example the RM4,000-00 is to be channeled to charitable institutions.

Prior to enforcement of Court Rules 2012, which is the merging of Subordinate Court Rules and High Court Rules 1980, there was no Order 42 r 12(A) in the previous High Court Rules 1980. With the introduction of Order 42 r 12(A), the lawyers can advise their franchised clients to draft the Franchise Agreement according to the new rule above.

Rather than just highlighting this issue with regards to Islamic transactions which involves Gharamah and Ta'widh in the Court Rules 2012 and its interpretation of Order 42 Rule 12(A), this should also be included in the Franchise Act 1998 as to make it known and clearer especially to the Muslim Franchisors and Franchisees. The Franchise Agreement should be amended with regards to the clause of late payment above as to have certainty that whatever late payment incurred is not riba and it is called as late payment charge rather than interest.

There should be a monitoring body as to monitor the funds which are channeled into the charitable institutions and again this should be highlighted in the Franchise Act 1998 rather than just mentioning it in the Court Rules 2012.

The second controversial term in the Franchise Agreement will be the Liquidated Assessment Damages ("LAD") as below:

"*The Master Franchisee acknowledges that, because of the substantial value and importance to the Franchisor of the Franchise described in clause 2.1, the Marks described in clause 11, the Intellectual Property described in clause 12, the Confidential Information described in clause 14 and Continuity of the Business described in clause 18(f), any breach of clauses 2.1, 11, 12, 14 and 18(f) will injure the goodwill of the Business and the Franchisor or the Franchisor's Affiliates. The Parties agree that, at the time of execution of this Agreement, damages for such breaches are difficult to estimate.*
Accordingly, the Parties agree that if the Master Franchisee, the Owners, the Key Operator, the Master Franchisee's directors, officers or employees fails to use its best efforts to prevent or stop such breaches and the breach results in material damage to the Franchisor and/or the Franchisor's Affiliates, the Master Franchisee will pay to the Franchisor, in addition to any right or remedy the Franchisor may have whether at law, liquidated damages of a one-time fee of an amount equal to 4 times of the Master Franchise Fee preceding the breach. The Master Franchisor will not be required to prove the occurrence or quantum of losses arising from the breach of the Master Franchisee."

This clause will certainly have riba (usury) in it as it is additional relief that the Master Franchisor has apart from those remedies it has in law. This clause is used as a deterrent to the Franchisees as not to breach the salient terms in the Franchise Agreement. The Franchisee has no right to say anything on this as this is the term imposed by the Franchisor in the Agreement and it is allowed in the Act. There is no specific LAD formula and it is totally the discretion of the Franchisors to impose whatever amount they wish.

The third controversial term in Franchise Agreement with regards to Restriction of Trade. Is this Clause Syariah friendly? What is this clause all about? Section 27 of the Franchise Act 1998 states:

Section 27 - Prohibition Against Similar Business

(1) "A franchisee shall give a written guarantee to a franchisor that the franchisee and his employees shall not carry on any other business similar to the franchised business operated by the franchisee during the franchise term and for two years after the expiration or earlier termination of the franchise agreement.

(2) The Franchisee and his employees shall comply with the terms of the written guarantee given under subsection (1).

3) A person who fails to comply with subsection (1) or (2) commits an offence."

Section 39 of the Act states the General Penalty clause:
(1) "A person who commits an offence under this Act for which no penalty is expressly provided shall, on conviction, be liable-
a) for the first offence, to a fine of not less than five thousand ringgit and not more than fifty thousand ringgit; and

b) for a second or subsequent offence, to a fine of not less than ten thousand ringgit or to imprisonment for a term not exceeding five years or to both."

Upon sentencing a franchisor for a first offence, the court may-
a) "declare the franchise agreement between the Franchisor and the Franchisee to be null and void;

b) order that the Franchisor refunds any form of payment which he has obtained from any franchisee; or

c) prohibit the Franchisor from making any new franchise agreement or appointing any new franchisee."

Whereas section 40 states the offences made by the body corporate:

"If an offence against any provision of this Act has been committed by a body corporate, any person who at the time of the commission of the offence was a director, manager, secretary or other similar officer of the body corporate or was purporting to act in any such capacity, or was in any manner or to any extent responsible for the management of any of the affairs of such body corporate, or was assisting in such management, shall be deemed to have committed that offence unless, having regard to the nature of his functions in that capacity and to all circumstances, he proves—

(a) that the offence was committed without his knowledge, consent or connivance; and

(b) that he had taken all reasonable precautions and had exercised due diligence to prevent the commission of the offence."

Allah's Command about Justice

"*O you who believe! Stand out firmly for justice, as witnesses to Allah, even though it be against yourselves, or your parents, or your kin, be he rich or poor, Allah is a Better Protector to both (than you). So follow not the lusts (of your hearts), lest you avoid justice; and if you distort your witness or refuse to give it, verily, Allah is Ever Well-Acquainted with what you do*. [Surah An-Nisa (4:135)]"

In Islam, even the highest official, the Caliph, is subject to the same rules of justice as all humanity. There is a famous incident in which Ali Ibn Abu Talib lost a court case to a Christian because he lacked evidence, even though Ali was the Caliph at the time.

Sha'bi reported: Ali ibn Abu Talib found a Christian man with his armor. He decided to take up the matter legally, so he brought the dispute to the judge, Shuraih. Ali said, "This is my armor and I have not sold it nor given it away." Shuraih said to the Christian, "What do you say about what the leader of the believers has said?" The Christian replied, "It is my armor, but I do not consider the leader of the believers to be a liar." Shuraih turned to Ali and said, "O leader of the believers, do you have proof?" Ali laughed and said, "Shuraih is correct. I do not have proof." So Shuraih ruled in favor of the Christian. The Christian took the armor and began to walk away but then he returned. The Christian said:
"*As for me, I testify that this is the judgment of the Prophets. The leader of the believers himself takes me to his judge and the judge rules against him! I testify that there is no God except Allah, and I testify that Muhammad is the Messenger of Allah. By Allah, the armor isyours, O leader of the believers. I followed the army when you were on your way to the Battle of Siffin and the armor fell from your equipment*."

Ali said:

If you have accepted Islam, then the armor is for you."

The clause was in there in the first place as the fear on the Franchisor that all the franchisees and its employees after learning about the system will open up another similar business and be in competition with the Franchisor who may have spent time, effort and millions of dollars in developing the research and development building up the system.

It would be highly recommended if the prohibition against the employees of the Franchisees to be taken out as not to cause them harm in their livelihood as unlike the Franchisee who may have other skills to depend on too.

The fourth controversial issue in Islamising franchise is that in franchises selling liquors by Muslim operators/franchisees for example the franchise of running 7-11 convenience stores. The franchise is in Malaysia with the main Franchisor is from Japan. They operated in Malaysia by appointing one Master Franchisee who has the authority in the Master Franchise Agreement to open up unit Franchises in Malaysia. As to date, the Franchise Act 1998 is silent on all products in franchise shall have halal certification unless the franchises which involves the business of Food & Beverages from very beginning is a non halal restaurant, café and etc.

Eventhough in practice any food and beverages franchises that wishes to operate its franchise in Malaysia, it is encourageable and advisable for them to make it halal compliance as majority population in Malaysia is Muslims. In business point of view, they may lose a lot of money if they do not make their food and beverage business a halal thing. They may restrict themselves to the larger Malay market.

This is the time when Franchise Act 1998 should be amended with the inclusion of the Syariah compliance terms and conditions with regards to obtaining halal certification for all franchise businesses in Malaysia whether its homegrown franchise or abroad. For this paper we had interviewed En Ahmad Faizal, the General Manager of Malaysian Franchise Association who affirmed that now all the franchise business in Malaysia not necessarily must have the Halal certification.

It can either be included in the Franchise Act or regulation to state a requirement that due to the sensitivity of the majority Muslim population in Malaysia, all franchised businesses operating in Malaysia whether homegrown or overseas must acquire the Halal Certification first unless the franchised food business is non-halal food and beverages in the very beginning due to the demand of the non-Muslims in Malaysia.

However in view of our discussion in Franchise in Islamic Finance, below is the excerpt from Global Islamic Finance Magazine with regards to the big business opportunity in franchising Halal products and services.

> "The Halal brand of food chains and restaurants around the world has been increasingly establishing opportunities for franchising through Islamic finance.

Many Halal restaurant franchises have been set up with funding from Islamic banks around the world, paving the way for the use of Shariah compliant instruments in dealing with the lucrative business opportunities developed by the Halal brand. Al Islami has made significant progress in advancing the franchising of the Halal brand and has plans to expand to the UK and France.

Al Islami first entered the European market in 2007 through a deal with UK food distributor 3663 First for Foodservice. The joint venture supplies meat products to the food industry, predominantly in the UK and France. Saleh Abdullah Lootah said "We'll be launching in the UK and France shortly; either the end of 2010, or early 2011. We'll be offering the chain as a franchise… I think the French deal will be closing very soon." Mohamed El-Fatatry, founder of integrated marketing agency, Muxlim, says the Muslim consumer is predicted to account for 30% of the world's population by 2025. "Halal food brands need to learn from Islamic banks," says El Fatatry. "These banks are taking Halal mainstream by highlighting that Islamic banking is no different from mainstream banking, apart from having new ethical values." There will be further scope for many investors to tap into unique and innovative Halal branding for franchising through Islamic finance."

The fifth non Syariah friendly term in the Franchise Agreement will be the 'Monopoly by Franchisors'. This is silent in the Act. It depends on the franchisors to dictate as who is the supplier of the products and equipment that the franchisee must use. This is where most of the Franchisors will try to gain more profit for themselves by manufacturing, producing and supplying the products

and equipment to the Franchisees at higher cost price.

In 2010, Malaysia has enacted Competition Act as to promote the economic development by promoting and protecting the process of competition, thereby protecting the interests of the customers.

> "Malaysian Competition Commission (Mycc) has laid down specific guidelines for Franchise Agreements:
>
> 1. Mycc will assess the Franchise Agreements on the extent to which the agreement significantly forecloses competition in the relevant market. For most franchises, the relevant market will be wider than the franchise products and so unlikely to lead to any foreclosure to the market.
>
> 2. Franchise Agreements normally include the license of intellectual property rights in relation to trade marks, signs and know how for the sale of goods and services. Franchise agreements usually contain a number of vertical restraints including exclusive distribution and non-compete clause.
>
> 3. Vertical price fixing is likely to be more anti-competitive than the non-price vertical arrangements. Vertical non-price restrictions maybe anti-competitive because they foreclose part of the market to the competitors.
>
> 4. In determining whether a vertical agreement significantly prevents, restricts or distorts competition, regard will be given to the market power of the enterprise imposing the vertical restrictions, the justification claimed for the restriction and the extent to which a market in the vertical relationship may be foreclosed.
>
> 5. Anti-competitive non-price vertical agreements may not be considered to have a significant anti-competitive effect if the market share of both the seller and buyer is less than 25% of their relevant market."

Eventhough there is now a Competition Act 2010 as to monitor competition in pricing, this Act should also be looked into as whether it is Syariah compliance and whether all the guidelines proposed by Mycc is in accordance with the Syariah principles as below are some of the verses in the Holy Quran which Allah has stated that for us to be just in life and in trade dealings.

Surah Al Ma'idah (5), Verse 9, says

> "*O you who believe! Stand out firmly for God, as witnesses to fair dealing, and let not the hatred of others to you make you swerve to wrong and depart from justice. Be just; that is next to piety; and fear God. For God is well acquainted with all that ye do*."
>
> Al Quran, As shu`araa' (26), Verse 181-184, Prophet Shu`aib tells his people:
>
> "*Give just measure, and cause no loss (to others by fraud). And weigh with scales true and upright. And withhold not things justly due to men, nor do evil in the land, working mischief. And fear Him Who created you and (Who created) the generations before (you).*"

It is important that any franchise adheres to Shariah principles, which are governed by the Shariah regulatory body of the country. There are many opportunities worldwide for franchise businesses in the areas of Takaful, Sukuk, infrastructural development, Islamic banking and the very popular Halal brand sector, which runs chains of Halal foods under Islamic finance instruments. Major Islamic financial hubs, such as those found in the Middle East, Asia and Europe, are tapping into Islamic franchising opportunities around the world and collaborating on a united front in order to drive the Islamic financial industry forward. Every investor or entrepreneur wishing to start up a

franchise must adhere to the principles of Shariah."

Findings/Results

There are few legal issues in the franchise industry which are arguably not Syariah-compliant.

(i) Prohibition Against Similar Business

Section 27 of the FA 1998 states on prohibition against similar business. Section 27(1) of the FA 1998 states a franchisee shall give a written guarantee to a franchisor that the franchisee and his employees shall not carry on any other business similar to the franchised business operated by the franchisee during the franchise term and for two years after the expiration or earlier termination of the franchise agreement. In this provision, the franchisee is not allowed to conduct similar business within two years after the expiration of the franchise agreement. This section may not pass the fair-trade test of Islamic commercial law. The issue is whether this clause Syariah friendly and fair to entrepreneurs in franchise industry, especially Muslim? Section 27(3) of the FA 1998 states a person who fails to comply this section shall commit an offence. The issue of prohibition against similar trade is non Syariah friendly in the sense that it restricts the livelihood not only the franchisee but its employees too. There have been cases whereby the employees of the franchisee are also forced to sign the non-disclosure and non-competition letter or agreement for not to disclose the trade secret to the third parties and will not compete with the current employers in the similar business. However, in Islamic law, there are authorities in the Quran and Hadith with regards to being fair and just in the trade dealings.

Allah's command about justice in surah An-Nisa (4) verse 135:

> "*O you who believe! Stand out firmly for justice, as witnesses to Allah, even though it be against yourselves, or your parents, or your kin, be he rich or poor, Allah is a Better Protector to both (than you). So follow not the lusts (of your hearts), lest you avoid justice; and if you distort your witness or refuse to give it, verily, Allah is Ever Well-Acquainted with what you do*."

Furthermore, Al Quran Surah An-Nisa (4), verse 29, says:

> "*O ye who believe! Eat not up your property among yourselves in vanities: But let there be amongst you Traffic and trade by mutual good-will: Nor kill (or destroy) yourselves: for verily Allah hath been to you Most Merciful*!"

Al Quran Surah Al-Baqarah (2), verse 188 also says:

> "*And do not eat up your property among yourselves for vanities, nor use it as bait for the judges, with intent that ye may eat up wrongfully and knowingly a little of (other) people's property*."

The prohibition against same business clause was in there in the first place as the fear on the franchisors that all the franchisees and its employees after learning about the system will open up another similar business and be in competition with the franchisor who may have spent time, effort and millions of dollars in developing the research and development building up the system. This situation is unfair to the franchisors as they have spent so much capitals in investment of this business, skills and times in training the franchisees to set up this business. Although this clause is to protect the franchisors but the livelihood of the franchisees and its employees should not be neglected.

The FA 1998 has clearly stated the rules of prohibition against same business by the franchisees. In any event, Islam looks important to livelihood of human being. In Holy Quran Surah Az-Zukhruf (43), verse 32, says:

> "*Is it they who would portion out the Mercy of thy Lord? It is We Who portion out between them their livelihood in the life of this world: and We raise some of them above others in ranks, so that some may command work from others. But the Mercy of thy Lord is better than the (wealth) which they amass*."

On a hadith narrated by Abu Huhairah RA, the Prophet said, "When a man dies, his acts come to an end, but three, recurring charity, or knowledge (by which people) benefit, or a pious son, who prays for him (for the deceased) (HR. Muslim number 1631)." From this narration, it shows that as a human being, the hands of giving is better than the hands of receiving (charity of the finger). Imam Nawawi in explaining this hadith states: the scholars say, the meaning of this hadith is that the practice of the deceased will be cut off from the cause of death and will also be renewed for the merit of the reward except for these three practices. All the knowledge from the franchisor may be considered as giving from Allah and it can be rewarded by Allah.

(ii) Financial Aspect in Franchising Business

The author found that another issue is with regards to the financial aspect in franchising business for example the term of Liquidated Assessment Damages ('LAD') in the franchising agreement. Section 18(2) of the FA 1998 explains the requirement of franchise agreement including but not limited to the issues of payment of fees, rights to use the trademark, obligations of the parties, duration of the agreement and etc. Failure to comply with this subsection (2) shall render a franchise agreement null and void. Accordingly, the parties agree that if the master franchisee, the owners, the key operator, the master franchisee's directors, officers or employees fails to use its best effort to prevent or stop such breaches and the breach results in material damage to the franchisor and/or the franchisor's affiliates, the master franchisee will pay to the franchisor, in addition to any right or remedy the franchisor may have whether at law, liquidated damages of a one-time fee of an amount equal to four times of the master franchise fee preceding the breach (Adam, 2010). As a result, the issue of unfair and inequality of bargaining power will arise as the master franchisee has to follow all the instructions from the franchisor resulting franchisee has no right to bargain if there is a breach of the franchising agreement.

In Islamic law of contract, the parties should not state an amount of damages in the event of a breach of a fundamental term in the said contract (Hassan, Kayed, & Oseni, 2013). The parties cannot predetermine amount which is unquantifiable as this could amount to issue gharar (uncertainty) which is prohibited in Islamic law of transactions. Furthermore, if the parties predetermine the LAD, there will certainly have riba (usury) in it as it is additional relief that the master franchisor has apart from those remedies it has in law. This clause is used as a deterrent to the franchisee as not to breach the salient terms in the franchise agreement. As such, the franchise agreement should also be amended with regards to this issue (Mohamad, 2012; Zakaria, 2013). However, the franchisee has no right to bargain on this as this is the term imposed by the franchisor in the agreement and it is allowed in the FA 1998. Unfortunately, there is no specific LAD formula and it is totally the discretion of the franchisor to impose whatever amount the franchisor wish.

In the Holy Quran Allah has stated regarding fairness among the human beings and doing of good to kith and kin. He forbids injustice, unfairness and inequality.

Al Quran Surah Al Nahl (16), verse 90, says:

> "*Allah commands justice, the doing of good, and liberality to kith and kin, and He forbids all shameful deeds, and injustice and rebellion: He instructs you, that ye may receive admonition*."

> Al Quran Surah Al Nisa (4), verse 135, says:

> "*O ye who believe! stand out firmly for justice, as witnesses to Allah, even as against*

yourselves, or your parents, or your kin, and whether it be (against) rich or poor: for Allah can best protect both. Follow not the lusts (of your hearts), lest ye swerve, and if ye distort (justice) or decline to do justice, verily Allah is well- acquainted with all that ye do."

Al Quran Surah Al Maidah (5), verse 8, says:

"*O ye who believe! stand out firmly for Allah, as witnesses to fair dealing, and let not the hatred of others to you make you swerve to wrong and depart from justice. Be just: that is next to piety: and fear Allah. For Allah is well-acquainted with all that ye do*."

Al Quran Surah Al A'raf (7), verse 181, says:

"*Of those We have created are people who direct (others) with truth. And dispense justice therewith*."

Thus, the issue of LAD in franchise business needs to deal with carefully. The Holy Quran teaches the mankind to be fair and justice in dealing the business. As such, the LAD clause may not be suitable to exist in the franchise agreement.

(iii) Monopoly Of The Business

The next challenge to the Muslim entrepreneurs in franchise industry will be the monopoly by franchisors. Although this issue is silent in the FA 1998, it is actually the consequence from the section 27 of the FA 1998, namely prohibition against similar business. It means there is only one player for the same business in the market and this sole player will monopoly the business in the market. The franchisors can dictate as who is the supplier of the raw materials and equipment that the franchisee must be used. This is where most of the franchisors will try to gain more profit for themselves by manufacturing, producing and supplying the raw materials and equipment to the franchisees at higher cost price. This is against the concept of 'economics of scale' in franchise business. When the franchisor buys the raw materials in bulk, the price so be lower. Thus, the franchisor should not charged higher price to the franchisee.

In 2010, Malaysia has enacted Competition Act 2010 (Act 712) (hereinafter referred to as "CA 2010") as to promote the economic development by promoting and protecting the process of competition, thereby protecting the interests of the customers. Although there is now a CA 2010 as to monitor competition in pricing, CA 2010 should also be looked into as whether it is Syariah compliance and whether all the guidelines proposed by Malaysian Competition Commission ('MyCC') is in accordance with the Syariah principles.

There are some of the verses in the Holy Quran which Allah has stated regarding to be just in life and in trade dealings.

Al Quran Surah Al Ma'idah (5), verse 8, says

"*O you who believe! Stand out firmly for God, as witnesses to fair dealing… Be just; that is next to piety; and fear God. For God is well acquainted with all that ye do*."

Al Quran, As Shu`araa' (26), verses 181to184, Prophet Shu`aib tells his people:

"*Give just measure, and cause no loss (to others by fraud). And weigh with scales true and upright. And withhold not things justly due to men, nor do evil in the land, working mischief. And fear Him Who created you and (Who created) the generations before (you)*."

Monopoly in a business could be derived from the greediness of people and resulting to cause unfair in trade dealings. Market monopoly or iḥtikār is prohibited in Islamic law as

this would cause unfair in trade dealings as there is only one party who controls all the businesses in the market (al-Douri, 2000). In the Holy Quran which Allah has stated that for us to be fair and not greedy, especially in trade dealing. Islam does not encourage iḥtikār as stated in Al Quran Surah Fajr (89), verse 20:

"*And you love wealth with immense love*."

Al Quran Surah Al-Aadiyaat (100), verses 6 to 8, says:

"*Truly man is, to his Lord, ungrateful; And to that (fact) he bears witness (by his deeds); And violent is he in his love of wealth*."

Al Quran Surah Al-Humazah (104), verse 2, says:

"*Who pileth up wealth and layeth it by …*"

Islamic law seeks protection to all parties, including both franchisors and franchisees. However, when the term of restriction becomes unreasonable until one party monopolies the business which caused the unfair dealings, the Islamic legal concept of sū isti'māl al-ḥaq shall apply to prevent a party to exercise the right which will have adverse effect on others' right (Oseni, 2016). Thus, it is suggested that reasonable restrain which are fair to both franchisors and franchisees should be adopted pursuant to the Islamic teaching.

Recommendations

In Malaysia, the only Act which governs the Franchise Industry will be the Franchise Act 1998 and Regulations. There are certain clauses like restriction of trade which is not found in the Contracts Act 1950 but only found in the Franchise Act 1998 & Regulations. This part in the Franchise Act 1998 & Regulations where it says it is too restrictive that it protects the Franchisor more compare to the Franchisee and with the implementation of Syariah compliance clauses would thus be able to make the Franchise Act 1998 & Regulations a fair and just Act for both the Franchisors and the Franchisees. It is thus the intention of this paper to harmonise these two laws and to ensure that complications and issues will not arise in near future.

Many Halal restaurant franchises have been set up with funding from Islamic banks around the world, paving the way for the use of Shariah compliant instruments in dealing with the lucrative business opportunities developed by the Halal brand. Al Islami has made significant progress in advancing the franchising of the Halal brand and has plans to expand to the UK and France.

It can either be included in the Franchise Act or regulation to state a requirement that due to the sensitivity of the majority Muslim population in Malaysia, all franchised businesses operating in Malaysia whether homegrown or overseas must acquire the Halal Certification first unless the franchised food business is non halal food and beverages in the very beginning due to the demand of the non muslims in Malaysia.

Recommendations:

1. The relevant sections in the Franchise Act & Regulations 1998 should be amended and more Syariah compliance.
2. Making Malaysia as a vast known international franchise halal hub.
3 Encouraging and promoting Foreign Franchises to customise their products and services to be in Syariah compliance as to cater the needs of the Muslim population.
4. To create awareness and educate the non-Muslim franchisors and franchisees on the benefits of converting the franchise system to be in Syariah mode.

The Contracts Act does not interfere with any Syariah transactions in Malaysia as Order 42 Rule 12A of Court Rules 2012 has safeguard any judgment debts for Syariah matters and as such the Franchise Agreement needs to be amended according to such.

Malaysia has vast opportunities in expanding its franchise industry however there are some sections in the existing Franchise Act 1998 which are not Syariah compliance. However before one starts the franchise business on a Syariah platform, the key ingredients below must be fulfilled by the Islamic franchisors and franchisees beforehand:

1) Prohibition of Riba (interest) and uncertainty
2) Profit sharing/ Risk sharing
3) Prohibition of forbidden assets
4) Existence of underlying assets

Once we have acquainted ourselves with the Shariah principles necessary in building up our franchise, then we can look into the various fully fledged Islamic financial opportunities for franchises around the world.

Conclusions

Franchise is still one of the vehicle which can spearhead the fastest economic growth in the country. Malaysia at present is as one of the key players in Islamic Finance Industry should look in depth how the Franchise Industry in Malaysia can be Syariah compliance and to attract foreign investors in especially by offering Syariah compliance franchise products and not just in the banking and finance sectors.

The FA 1998 is a valuable Act to regulate and develop the franchise industry in Malaysia to greater heights. It provides for monitoring and quality control over a potential franchise business before it is offered to potential franchisees. Moreover, certain rights and protections to both franchisors and franchisees are offered in the FA1998. Franchise industry is still one of the vehicles which can spearhead the fastest economic growth in the country.

The presence of a successful Muslim entrepreneurs, especially in franchise industry can be a role model in the economic success of the Muslims. Thus, the relevant sections in the FA and Regulations 1998 should be amended and becoming more Syariah compliance. It would be highly recommended if the prohibition against the employees of the franchisees to be taken out as not to cause them harm in their livelihood as unlike the franchisee who may have other skills to depend on too. However, these employees shall not take advantage on this issue.

One of the forms that is considered appropriate for practice in this Islamic-based franchise is to apply ‘akad hibah’ from franchisor to franchisee (Naiimi et al., 2018). Previously this ‘akad hibah’ is only applied in Islamic finance and Islamic property management. Akad hibah in a franchise business can occur when a franchisor alters the format and its complete franchise business system together with the business system to the franchisee without any financial rewards as it does in the conventional franchise system today.

Thus, the Government of Malaysia and the respective ministry namely Ministry of Domestic Trade and Consumer Affairs have to create awareness and educate the non-Muslim franchisors and franchisees on the benefits of converting the franchise system to be in Syariah mode.

Abstract

The article analyzes the research and development market operating in various countries of the world. The analysis revealed three basic models for the development of interaction between market participants, features of their modifications, and formed recommendations for the Russian system. Also shows main trends of international market research, based on key indicators, clustering of countries was also carried out, with a description of their specific profiles.

Keywords: international research market, scientific clusters, scientific collaboration, trends in the development of the research and development market.

Introduction

The main condition for competition between participants in international innovation projects is the speed of innovation creation and the growth of the variety of goods produced, and the scale and volume of output are fading into the background. Therefore, project participants create alliances, combining their competencies and resources with other manufacturers, suppliers, business partners and direct competitors, in order to create innovations aimed at improving the productivity of all network participants, which could not be created by participants alone in the time dictated by the market (Vasilenko, 2016; Chen 2019). Such a development strategy is also true for scientific communities, where the current rate of formation of current research trends is so high, and the lag between the development and production of intelligent products is increasingly reduced, which automatically implies the need to form scientific alliances that allow rapid accumulation of resources and the realization of the benefits of complementarity.

Horizontal network alliances can use network platforms and interactive communication technologies, as well as use new principles of cooperation, which include organizational openness (free entry of participants), information openness (interaction of participants in the network in full access to information), the principle of online cooperation on equal terms for all participants, global partnerships, etc. All of the above reflects new mechanisms of competition and profit-making (Ferguson 2007; Inshakov 2009).

We can say that a scientific project is developed according to different business models, which show different degrees of efficiency and are applied depending on the set of incoming conditions of cooperation. At the moment, the following models of cooperation in the innovation sphere are being implemented in practice:

Cite this Article as: Liliia MATRAEVA, Ekaterina VASIUTINA and Nataliya KOROLKOVA " Analysis of The International Research and Development Market: Main Trends in The Development of Participants ' Interactions" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

1. the "Capsule" model is a collaboration in the field of various scientific research, which are of a single nature. In other words, research alliances are constantly emerging on the international research market, which are temporary in nature and are tailored to the solution of a specific applied problem. Achieving the goal automatically stops interaction, and participants of the research project will look for new contractors (partners), provided that new research tasks are updated.

2. Rollover model – i.e. reproduction of a new research project under identical conditions relative to the previous project. Due to the rapid development of technologies and the economy, participants in the international research market prefer to reduce the transaction costs of finding contractors, especially in the field of new knowledge and high technologies. Working out the channels and conditions of interaction in an experimental way, leaving the developed schemes, business models and partners.

The advantages and disadvantages of the rollover model include:

"+"implementation costs are significantly lower, since the technologies and resources involved in the production of the old project are used;

"+"low transaction costs of "searching for information", "entering into a contract", etc.;

"- "it is possible to reproduce "errors", accompanied by an increase in transaction costs."»;

"- "reduced competition between members of the Alliance.

3. Cluster model, i.e. formation of clusters based on collaborative relationships between participants of scientific projects.

Innovative scientific clusters are defined as the concentration of activities on a certain territory of one or several related industries that have a synergistic effect of all their elements and are expressed in increasing their competitiveness (Delgado 2015; Smorodinskaya 2017). In this form of interaction, the main mechanisms of competitiveness are the creation of new chains, relevant innovative projects, non-standard business ideas, management decisions, informal exchange of knowledge, information, and creative ideas typical of high-tech industries.

The characteristics of the cluster organization of scientific research allow us to classify clusters as a collaborative type of network. Cluster organization of interaction is based on a complex of technologies and formats of communicative management, which provides an Advisory nature of communication and replaces the traditional type of interaction between stakeholders with an adhocratic one, typical for collaborative networks, providing an atmosphere of mutual trust and a mechanism for informal knowledge exchange specific to innovation clusters (Korobkina, 2017; Hamari 2016; Qinchang 2019).

The basis of this model, which ensures the generation and effective implementation of scientific projects in the cluster, is created by collaborative network interaction and meaningful communication, covering a wide network of independent agents of various profiles (industry, functional and institutional) – members of the cluster (i.e. those who directly launch and lead projects).

The composition and roles of participants may vary depending on the development of the country and the stage of the cluster life cycle, but in all cases there are institutions for collaboration that coordinate the activities of participants through network platforms (Schuh 2014; Thomson 2016).

A key feature of the cluster model is the functional interrelatedness of participants and their geographic proximity, the advantage of which is the ability to use the resources that are present on this territory, which was originally the Central idea of clusters, and subsequently received a priority factor of economic proximity (effects estimate adjusted for the opportunity cost of participants) (Smorodinskaya 2015; Jia 2017; MacGregor 2012).

When analyzing the key characteristics of such interactions and communications, we can draw the following conclusions:

First, the collaboration based on the principles of the spiral, leads to a reduction of all types of costs in research and development, due to the strengthening of various agglomeration effects, and by reducing the level of uncertainty in a continuous exchange of information.

Secondly, for the implementation of joint research projects, the participants of the innovation cluster combine their assets, knowledge and competencies in various interrelated combinations, which allows them to increase productivity by expanding the variety of products and services created. The result of the joint project is a joint innovative production model, the sustainability of which is achieved by the harmonized development of the three sectors.

Third, the same collaborations take the cluster's network connections beyond its borders (through outsourcing, creating new firms, and knowledge flows). this leads to the emergence of technology transfer on the one hand, and to the emergence of new network clusters on the other.

Based on the described models, the analysis of the main trends in research and development of production of intelligent products on the international market was carried out.

Methodology

The critical analysis showed that the most representative is the comparison of the effectiveness of scientific research in the countries of the G20 grouping, which includes 19 countries with the most developed economies located on different continents. The EU is also a member of the G20. Together, according to the world Bank, these countries represent more than 80% of the world's GDP and 65% of the world's population (World Bank, 2018). According to the OECD, these countries together spend 90% of the funds allocated to R & D in the world, and employ 87% of researchers (OECD, 2015).

Conventionally, the indicators characterizing the efficiency of research can be divided into 2 groups in accordance with the directions of the analysis : a resource (material, financial and human resources) and indicators of scientific knowledge production (number of publications or number of patents, as well as derivatives of these parameters). According to the G20 annual research performance assessment report, the country's scientific profile includes the following key statistics:

- number of researchers per 1,000 people;
- gross domestic expenditure on R & D (PPP in US $ billion) (GERD) relative to GDP;
- number of patents in relation to business sector investment in R & d (BERD);
- normalized average citation by category (Category Normalized Citation Impact). This indicator is increasingly used instead of (or mandatory) addition to the indicator "number of papers per researcher", because it also reflects the demand for publications by the scientific community, which is a kind of indicator of the quality of these works.

Conditionally, the first two indicators are aimed at evaluating the resources directed by a particular country to the production of scientific knowledge, and the last two characterize the effectiveness of "output" or the increment of new knowledge in the field of applied and fundamental research.

In the future, based on the analysis of the presented indicators, the multi-dimensional classification tool (k-means) is used to identify groupings of countries in the international research and development market with specific profiles.

Results

A comparative analysis of the selected indicators showed the following distribution by country:

I. number of researchers per 1,000 people

Unfortunately, there are no data available for this indicator for the following countries: Australia, Brazil, Canada, India, Indonesia, Saudi Arabia and the United States. If you build a rating without regard to these countries, Russia will occupy 8th place: 1,000 people in Russia have a 2.49

researcher (Fig. 1). Leaders for this indicator is South Korea and the UK where the number of researchers ha1 000 people more than 3 times higher than the Russian value.

Figure 1: number of researchers per 1,000 people

Gross domestic expenditure on R & d (PPP in us $ billion) (GERD) relative to GDP

Brazil, India, Indonesia and Saudi Arabia are not included in the rating for this indicator due to lack of data. Gross domestic expenditure on R & D in Russia is 1.11% of GDP (11th place). The undisputed leader in this indicator is South Korea: gross domestic expenditure on R & D in relation to GDP for this country is 4.55 %, followed by Japan -3.2% and Germany – 2.2% (Fig. 2).

Figure 2: Gross domestic expenditure on R & d (GERD) relative to GDP,%

The most striking indicator that characterizes the level of scientific research implementation is the indicator that reflects the number of patents per billion dollars of investment. In international statistics, it is calculated as the ratio of the number of patents in relation to the investment of the business sector in R & d (PPP in billions of us dollars).

Despite the fact that South Korea was the leader in previous indicators, it is inferior to Japan and China in terms of patent implementation, where $ 1 billion of R & D investments account for 3,421 and 3,394 patents,

respectively. For Russia, this figure is more than 3 times less and is 1103. Brazil, India, Indonesia, and Saudi Arabia are not included in this rating.

Figure 3: number of patents per billion dollars of R & d investment by G20 countries in 2019

Normalized average citation by category

The normalized average citation by category (CNCI) of a particular publication is calculated by dividing the actual number of citations by the expected citation of publications of the same type, year of publication, and scientific topic. CNCI is an important and objective performance indicator that does not depend on the age of publication, scientific field, or type of document. It allows you to compare scientific organizations of different scales and specializations. If the CNCI value is equal to one, it means that it corresponds to the world average, a value greater than one is higher than average, and less than one is lower than average.

As can be seen from the data shown in Figure 4, the highest values of this indicator are the United Kingdom (1.41), Australia (1.38), Canada (1.31) and the United States (1.31). Russia ranks last in this indicator – 0.59. This means that the normalized average citation for the category in the Russian Federation is almost 2 times lower than the global average. Additional data provided in the Report shows that this indicator has been increasing recently, but its growth is facilitated by international cooperation. Among the works taken into account when calculating this indicator, 38% were performed by international teams. Nevertheless, the share of the most cited publications (10 % of the most cited works) the share of Russian authors is very low and amounts to 4.2% (this is the lowest value among the G20 countries). For comparison: in the UK, this figure is 14.5%, Canada-12.8%, Germany -12.6%, China -10%.

Figure 4: Normalized average citation by category (CNCI) for G20 countries in 2019

Using the multi-dimensional classification (k-means) tool, the analyzed countries can be divided into 4 groups. India, Indonesia, Saudi Arabia, Australia and Brazil were excluded from the classification due to the lack of data for 2 of the 4 indicators analyzed.

Table 1-End cluster centers

Indicators	Cluster			
	1	2	3	4
Gross domestic R & d expenditure (GERD) relative to GDP, %	2,11	0,70	1,75	3,29
Number of patents in relation to business sector investment in R & D (BENZ) (number of patents per billion dollars of investment)	1734,43	798,95	1315,47	3316,97
CNCI	1,30	0,88	1,05	0,92
Number of researchers per 1,000 people	5,18	1,45	1,85	6,08

Source: compiled by the authors.

The first cluster included 4 countries: Great Britain, Canada, France, and Germany. A striking feature of this cluster is the highest CNCI values, which are 1.3 times higher than the global average, as well as a high share of investment in science (on average, 2.11 of GDP for the group). This group is also characterized by a fairly high number of researchers per 1000 people. The number of patents in relation to business sector investment in R & d is not the highest, but is just above the median level. In these countries, great importance is given to basic science, with a very high proportion of researchers present in the 10% of the most cited publications. Conditionally, this group can be described as countries with a high level of resources directed to the scientific sphere, a high level of return in basic science, and an above-average level of return in applied science.

The second cluster consists of 4 countries: Argentina, Mexico, RSA, and Turkey. This group is characterized by a low level of R & D resources, both financial and human. Their gross domestic expenditure on R & D (GERD) in relation to GDP does not exceed 1%. The average number of researchers per 1,000 people in the group is 1.45, which is also the lowest value among the analyzed clusters. The return on research in these countries is also one of the lowest. Nevertheless, Argentina and RSA have become actively involved in international cooperation, which has contributed to an

increase in the share of their publications in the top 10% of the most cited. However, they have a fairly bright industry specialization. Argentina in the social Sciences and Humanities, and RSA in medicine and health. At the same time, Turkey remains quite closed in terms of international scientific cooperation compared to the countries of its group.

The third cluster includes Russia, Italy, and the United States. These countries are primarily united by the average level of return on applied science: the number of patents in relation to the investment of the business sector in R & D for this group is 1315.47. However, the US has a fairly large R & D expenditure relative to GDP-2.79%, while Russia has only 1.11%. The share of US international cooperation in science is quite low. In Italy, the situation with regard to international scientific cooperation is completely different: 55% of publications are the results of international research. In Russia, this indicator is at the level of 38% and, as mentioned above, significantly affects the citation index.

The fourth cluster consists of China, Japan, and South Korea. These are the countries with the highest resource expenditures on research: gross domestic expenditure on R & D in relation to GDP is on average 3.29% for this group. These countries also have the largest number of researchers per 1,000 people. At the same time, the impact in the framework of basic science is quite low (the group value of the citation index is below the average level). The exception is China, where this figure has reached the G20 average, and 10% of the works are among the 10% most cited publications in the world.

Comparing the obtained cluster profiles with the interaction models described earlier, it was found that the total share of organizations that participated in joint research and development projects in the total number of organizations that implement technological innovations is decreasing and is close to the level of 2005 (Fig. 5). At the same time, it is interesting to consider collaborative relationships in the innovation sphere by type of economic activity (Table 2).

Figure 5: Share of organizations that participated in joint research and development projects in the total number of organizations that implement technological innovations, 2005-2017

A source: Indicators of innovative activities, 2019.

Table 2: Organizations that participated in joint research and development projects, by type of economic activity

Economic activity	Share of organizations that participated in joint research and development projects, %		
	In total number of organizations	*among the organizations, who carried out technological innovations*	*among the organizations, who didn't perform technological innovations*
Industrial production	3,3	27,4	0,7
Extraction of minerals	2,8	33,0	1,2
Coal mining	4,6	**75,0**	3,2
Manufacturing activity	4,9	29,5	1,0
High-technology	**15,4**	**40,8**	**3,5**
Production of medicines and materials, used for medical purposes	**12,1**	25,5	**5,9**
Production of computers, electronic and optical products	**16,1**	**44,3**	3,0
Medium-tech high-level	8,5	35,0	1,9
Manufacture of other vehicles and equipment	10,0	**53,1**	2,1
Medium-tech low-level	4,3	36,3	0,7
Production of coke and petroleum products	11,3	**45,9**	0,8
The production of metallurgical	12,1	**59,8**	1,4
Low-tech	1,4	9,3	0,5
Service sector	3,8	37,7	1,6
Activities in the field of telecommunications	1,8	13,1	0,4
Activities in the field of information technology	1,6	24,1	0,5
Consulting on the following issues management	0,6	6,8	0,5
Research and development	**27,6**	**61,1**	**14,3**
Agricultural industry	0,4	7,9	0,1
Construction	0,4	–	0,4

A source: Compiled by authors based on Indicators of innovative activities, 2019.

The table shows that the greatest potential for implementing scientific collaborations is in the research and development sector, which is represented by research and educational centers and higher education institutions.

In this regard, it is necessary to pay attention to the distribution of organizations that participated in joint projects by the types of partners in the research and development segment. In the segment we are interested in, universities are in third place after research organizations and consumers of goods, works and services. In this regard, they can potentially identify opportunities from the external environment.

At the same time, cooperation within individual ("capsule") projects is fundamental, which accounts for 69.2% of technological partnerships in the implementation of research and development organizations among higher education organizations.

At the same time, universities are almost not considered as one of the main sources of information for technological innovations, either in industrial production or in the service sector. Scientific organizations of academic or industry profiles, as well as professional associations (associations) are not included among the main ones. Preference is given to internal sources, consumer opinion, and Internet sources.

Conclusions

Thus, the analysis of the international research and development market allowed us to identify the following main trends in the development and interaction of participants:

- the most promising model of interaction between participants in research and innovation is the cluster model based on collaborative relationships, but since 2010 its use in world practice has tended to decrease. Currently, the "capsule" model of interaction dominates, which accounts for about 70% of partnerships.
- groups of countries allocated to clusters show specific profiles that differ primarily in the volume of investment and return on investment in science. Russia is part of the third cluster, which is characterized by an average level of return on applied science, but the amount of R & d expenditures in the group varies significantly. Although this indicator is the lowest in the group, Russia also actively participates in scientific alliances and collaborations, which significantly affects the citation index and allows it to stay in the group along with the United States and Italy.
- the greatest potential for implementing scientific collaborations is in the research and development sector, which is represented by research and educational centers and higher education institutions. In the international market of research and development, universities are currently undervalued from the position of sources of information for innovative developments. They are also poorly engaged in forming professional communities, which could expand the possibility of expert evaluation of various innovative projects.

Abstract

The paper deals with the analysis of issues regarding the legal regulation concepts of economic security in Russia and the USA. It is noted that economic security as an object of scientific knowledge and legal regulation is extremely complex due to the fact that that the situation in this area is constantly changing under the influence of institutional changes, aimed at modernizing socio-economic institutions, as well as public administration activity in the field of the economy, civil society development, the national economy sustainable functioning, overcoming technological and industrial backlogs as well as various external and internal threats to the protection of economic rights, freedoms and legitimate interests of the individual, society and state. The paper presents the results of a comparative analysis of the features of legal regulation and ensuring economic security in Russia and the USA with the prospect of using the positive experience of these countries in solving problematic issues that arise in this area.

Keywords: Legal Regulation, Economy, National Security, Economic Security, Concept, The Russian Federation, The USA.

Introduction

Before proceeding to the study of the issues reflected in the paper's title, it should be noted that issues of legal regulation and economic security are always of scientific, theoretical and purely practical interest. However, economic security as an object of scientific knowledge and legal regulation is extremely complex because the situation in this area is constantly changing under the influence of institutional changes, aimed at modernizing socio-economic institutions, performing public administration in the field of the economy, developing civil society, sustainable functioning of the national economy, overcoming technological and industrial backlogs, as well as various external and internal threats to the protection of economic rights, freedoms and legitimate interests of the individual, society and state [1; 2; 3].

Furthermore, economic security is achieved by a combination of specific forms and methods of public administration, which constitute a special mechanism for the legal ensuring of economic security led by a state. In modern conditions, the basic functions of the modern state continue to be

Cite this Article as: Galina S. Belyaeva, Andrey S. Mamin and Irina Kapustina "Legal Regulation Concepts of Economic Security in Russia and in the USA: Comparative Analysis" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

adjusted in order to create special conditions for the development of economic rights and freedoms of economic entities, and to determine strategic guidelines for economic development, including the context of the global technological and industrial crisis.

In the United States, economic security issues in the context of national security are on a par with democracy and human rights and are the main attribute of liberal legal consciousness. It originates in the English Bill of Rights of 1689, where security is identified with the world unity, public order and the state welfare [4], and in the Declaration of Independence of the United States of 1776, which states that the ensuring public security and happiness is the main task of the state [5].

In contrast to the North American legal tradition, Russia did not have its own concept of national security (this is precisely about national security, which includes the triad - personal, public and state security - Auth.) until the 90s of the last century. Moreover, at the end of the twentieth century, there was actually a reception of the North American and Western European model of designating combined personal and public security as "national," since the concept of "state security" was previously used in the legal system and political practice of Soviet Russia.

In this article, we will not touch the issues of the acceptability of designating security as "national" in the Russian political and legal tradition. We note just the fact that in the United States the formula for identifying the nation and the state is widespread: any person with an American passport is a citizen here, regardless of his/her original history, ethnic culture, ancestral traditions.

Considering the above mentioned, the current task is to make a comparative analysis of the features of legal regulation and ensuring economic security in Russia and the USA with the prospect of using the positive experience of these countries in solving problematic issues arising in this area. Accordingly, within the framework of this article, it would be useful to identify the features of these two legal systems and to identify certain debating and problematic aspects and prospects for solving them.

Methodology

The methodology of the study is based on the application of various general scientific techniques and scientific knowledge methods (analysis, synthesis, deduction, induction, systemic-structural, formal-logical approaches), as well as private scientific methods - historical-legal, formal-legal and comparative-legal.

Discussion and Results

It should be noted that, despite the available evidence of experience in the legal regulation of economic relations and ensuring economic security in the Russian (and Soviet - Auth.) history, it should still be recognized that the emergence of the first conceptual studies on economic security precisely as a certain way of understanding, interpreting any phenomena, the main point of view, the guiding idea, etc., occurs during the Great Depression and is associated with the implementation of the "New Deal" by F. D. Roosevelt. In order to protect the US economic system and the need for state regulation of the economy, in 1934 President Roosevelt created the Federal Committee on Economic Security and its Advisory Council [6].

However, it was premature to speak about the creation of an economic security independent concept, since the Committee's competence included the security of individuals in the context of unemployment control and their labour rights protection. Moreover, the term "economic security" is now used in a number of English-speaking countries in its original meaning, as the protection of individuals and households from a sharp deterioration in the financial situation. Moreover, most of the studies in this area are aimed not at developing a general concept of economic security legal support, but at purely narrowly modernization applied aspects of existing state economic programs [7].

The next step towards the of economic security legal support in the United States was the National Defense Education Act (NDEA) of 1958 [8], aimed, inter alia, at regulating the economic security of the state.

Further, largely under the influence of the confrontation of two superpowers - the USA and the USSR, the USA, with the help of geopolitics and diplomacy institutions, begins to implement policies in the field of ensuring national economic security aimed at disruption of the rival's competitive position. It is at this time that the problem of ensuring national security in the United States is getting a complex scientific character - the doctrine of North American national security is being formed, and it can be defined as "an intellectual product, a systematized set of ideas, values, principles, concepts, which considers modern current and predicted management trends to protect the interests of individual, society and state" [9].

A number of American scientists pay their attention to the importance of the economic component of national security (in the context of our study - economic security). Thus, D. Nanto, analyzing in his work the mutual influence of global politics and national economy and security, concludes that "the economy can't be separated from the processes of ensuring national security, its main role is to provide society with the necessary amount of resources to guarantee the security of citizens, reduce the unemployment rate, create conditions of economic security at all levels" [10].

In turn, his colleague B. Buzan, studying the essence of economic security, writes that this is "a state of the economy which ensures high and steady growth in indicators of the economic well-being of public relations entities. The researcher believes that the stable functioning of the domestic market is determined by the positive influence of external factors. The negative impact of the factors is leveled with the help of insurance reserves and reserve funds of economic entities, that allows to keep the market in stable condition [11].

Foreign scientists also address the impact of globalization on the state and transformation of the definition of economic security, taking into account the risks caused by the variability of economic processes under the influence of the new environment [12]. So, according to M. Kahler, the main role in the mechanism of ensuring economic security should belong to the state [13], and the concepts of the United States and Russia do not differ in this position.

Certain attention is paid to the problems of socio-economic inequality of territories (regions) in particular countries. For example, S. Lessmann basing on the analysis of a group data system on the economic inequality of various world powers (56 countries and 835 regions) over the period of 1980 - 2009 made a conclusion about negative impact of the regions' inequality and the progressive threats to their economic security [14].

If we talk about the institutional framework for ensuring economic security (including cyber security) in the United States, then it is quite efficient and effective. Thus, the Federal Bureau of Investigation has the National Security Agency with all the necessary resources to obtain the necessary information about the controlled facility, process it and take appropriate measures to eliminate threats to national economic security.

The latest version of the US National Security Strategy (NSS) issued on December 18, 2017 [15] is also devoted to the matters of economic security through a prism of existing and potential challenges to the security of the country, as well as ways of counteractions against existing threats. Its main idea is expressed in the words of the President of the United States, who presented the Strategy. He declared that the primary duty of the state to the citizens is to serve their interests, ensure their security, uphold their rights and advance their values [16].

A significant place in the US National Security Strategy of 2017 is taken by issues of promoting American prosperity - maintaining a strong economy that protects the American people, preserves their way of life and advances American power. It also says about the need for leadership in the field of research, technology and innovation, America's energy superiority.[15]

Turning to domestic scientific and practical experience in the field of ensuring economic security, it should be noted that at the doctrinal level the conceptual apparatus, issues of economic security state management and the effectiveness of the mechanism of its legal support were considered in more detail in our country (compared with North American tradition).

The discussions in the area under consideration started in the late 80s - early 90s of the 20th century against the background of negative trends in the national economy, hyperinflation and the resulting decrease in the standard of living of the Russian population.
One of the first definitions of economic security, essentially the introduction of this concept into scientific paradigm, was proposed by V. A. Legasov in 1987 [17].

The first official document that fixed the basis for the economic security legal support of the Russian Federation was the National Economic Security Strategy of the Russian Federation, approved by the Executive Order No. 608 signed by the President of the Russian Federation on April 29, 1996, which includes the description of external and internal threats to the economic security of the Russian Federation as a combination of conditions and factors that threaten the vital economic interests of the individual, society and the state; determination and monitoring of factors that undermine the sustainability of the state's socio-economic system for the short and medium term (three to five years); determination of criteria and parameters characterizing national interests in the field of economy and meeting the economic security requirements of the Russian Federation, etc. [18]. This document was aimed at ensuring the economy development which would make it possible to create acceptable conditions for the life and development of the individual, the socio-economic and military-political stability of the society and the preservation of the state integrity, counter the influence of internal and external threats.

Currently, the main document aimed to counter economic security challenges and threats, prevent crisis situations in the raw materials, production, science, technology and financial sectors, and maintain people's leaving standards is the Russian Federation Economic Security Strategy until 2030 [19], which is the basis for shaping and implementing state economic security policy at the federal, regional, municipal and sectoral levels.
The current the Russian Federation Economic Security Strategy until 2030 contains an updated definition of the economic security concept, a significantly adjusted system of indicators for its assessment.

Conclusions

Basing on the study of the concepts of economic security legal regulation in the United States and the Russian Federation, the following conclusions can be drawn.

First, the problems of economic security, including the theoretical development of its concept and practical legal support to create an appropriate mechanism, are urgent for both the United States and Russia. The main attention is paid to the preserving state sovereignty and sustainable economic development.

Second, there are different approaches to the definition of "economic security"; the North American legal tradition is characterized by a "narrow" approach to understanding this category.

Third, both states are characterized by the "programmatic" type of economic security legal regulation, that is, the consolidation of the main indicators for determining its effectiveness and ensuring it in doctrinal, strategic documents.

Abstract

The article describes a cybernetic model of improving the information security system (ISS) in an organization as a complex security system, whose functioning has been illustrated on the basis of a certain steering/control system with a loop feedback. The cybernetic model of improving the information security system assumes that its organizational structure consists of the elements that minimize both internal and external threats - defense mechanisms, which also include good practices. The authors outlined a concept of applying good practices that concern various issues of improvement the information security system. In accordance with the assumptions of the control theory, the model may be divided into a controlled system and controller.

Keywords: cybernetic model, good practices, improvement of security system

Introduction

The improvement of the information security system (ISS) in the organization means continued implementation of new organizational and technical solutions. It is an advanced process for creating and using models, methods and tools, which should be properly applied to not only increase the degree of efficiency of the ISS, but also to allow the achievement of better and acceptable levels of information security in the organization. More detailed issues related to cyber-security are discussed in Stanik and Protasowicki (2020).

The security management methods should be based on good and reliable patterns, whose numerous examples may be found in the best specialist publications worldwide. Such publications and other available sources, especially on-line, include many formal and informal models related to the information security in organizations. However, such models do not refer only to the selected security elements of the information security systems (ISS), but may be generally divided into:

1. models controlling access to the information, e.g. lattice model, Bell–LaPadula Model (BLP), Biba Model,
2. models protecting the information in databases, e.g. Wood's model, Seaview model,
3. models of theoretical limitations of the information protection systems, e.g. Graham-Denning model, HRU security model (Harrison, Ruzzo, Ullman model) – see Pfleeger (1997) and Stokłosa et al (2001),
4. models of the ICT security system – in a research study by Kowalczyk (2011),
5. models measuring information security performance – e.g. in research of Hoffmann et al (2020) and Protasowicki (2020):
   a) oriented at the loss of the information security attributes,
   b) oriented at the change of the values of security attributes,

6. models based on the potential of the risk system and security system – see Ficoń (2011),
7. security models based on the quality assessment criteria for the functioning of the security system,
8. information security models based on the practices and principles of the risk-based approach – see Hoffmann et al (2020).

The models mainly used for risk identification and estimation prevail in the group of the above-mentioned types of models. Furthermore, such models are primarily used at the stage of establishment and implementation of ISS. Only several publications include a proposal to implement the models referring to the phases of exploitation, monitoring, maintenance and improvement of information security, using the elements of good practices and selected methods for data collection to obtain the information necessary for the purposes of risk analysis and assessment.

Therefore, one of the objectives of this article is to convince the Reader that efficient information security in the organization must also include good practices implemented at all stages of the ISS life cycle, in particular at the stage of development and improvement of ISS.

The subsequent part of the article includes a description of two cybernetic models of improving information security, which meet the requirements of a simple cybernetic system and automatic control system with positive feedback loop. When building the feedback loop model, the dynamic factors that constitute good practices have been taken into account, even though the model could be also developed using other factors, for example, security efficiency potential or probability of using vulnerability of the system.

Good practices in the ISS improvement

For the purposes hereof, it is assumed that the term "good practices" should refer to all solutions and methods of operation exceeding the commonly applied solutions based on typical standards, norms and tools. When appropriately described, they may constitute a pattern and point of reference for the development and implementation of similar solutions in different areas of operations of the organization.

In the article, it is also assumed that "good practices" mean the most efficient manner of implementing: a process, method, methodology, procedure, pattern, technique or tool, for example, methods using as few resources as possible, for example, security measures, bringing extraordinary results, establishing an example for other solutions that may be used to provide information security, while observing standards of ethical conduct.

The ISS improvement is the process that consists in the changing of a complex object, having positive impact in terms of a specific criterion or set of criteria. In other words, the process means that the object should change its status, which is considered less efficient, to the status that is more desired, better and more powerful from the point of view of a specific criterion or set of criteria.

Some issues related to the increased risk of achieving the required/acceptable level of security of the organization's information resources may be at threat can potentially trigger changes in the ISS. In such case, the improvement of the information processing processes is reactive. However, in practice, the organizations also undertake certain improvement activities, which are proactive.

Therefore, Sienkiewicz (1994) mentioned, by improving the ISS, it is possible to apply a systemic approach or system analysis method. It should be mentioned that the improvement of processes is not an easy task and not always brings the expected results. Rummler and Brache (2000) outline typical mistakes made when improving systems or processes, such as:

- the process of improvement of the security systems or information processing systems is not related to the strategy of the organization in terms of security,

- an idealistic approach to the introduction of new processes, without considering the existing limitations and without any reflection on how such an approach may affect the whole organization,
- the organization focuses more on re-designing the processes than on implementing changes,
- the lack of preparation of the measurement and assessment system and other tools necessary for continuous improvement of the ISS.

The prerequisite for appropriate application of good practices in terms of the ISS improvement should be knowledge of the facts or principles that constitute the foundation for information security management and the methodology of security engineering.

A description of the information security system allowing the construction of a cybernetic model

It is very difficult to find in the literature on the security methodology or engineering a definition or explanation of the information security system (ISS). On the other hand, the information security management system (ISMS) is often described. According to standards of PN-EN ISO/IEC 27001 (2017), the information security management system (ISMS) is a part of the entire management system, based on an approach as resulting from the business risk, referring to the establishment, implementation, use, monitoring, maintenance and improvement of security. The ISMS refers to the organizational structure, policies, responsibilities, planned activities, processes, resources and procedures. The security requirements, business goals and needs, executed processes as well as the size and structure of an organizational unit have impact on the process of planning and implementing the ISMS.

In light of the above definition, the basic rule of researching information security in the organization is the systemic principle of mutual correlations and main conditions. Therefore, it may be assumed that the information security system (ISS) is a complex object designed for a specific purpose, i.e. to ensure the required level of information security in the organization. The acceptable level of security may be reached by appropriate control of the performance characteristics of the ISS. Furthermore, the level of information security in the organization may be increased by the development and improvement of the ISS.

For the purpose of this article, the short name “ISS” means a deliberate action system aimed at ensuring the highest possible level of information security in the organization. The process of building information security consists in the elimination of any risk categories that may occur within the ISS organization (internal risks) and its environment (external risks). Through appropriate organizational or technical actions/decisions, it is possible to control, assess and measure the risk of information resources processed in the ISS and the status of information security (Fig.1).

Fig.1: Illustration of the information security system in the organization.

Therefore, the so defined ISS may be compared to a certain system controlling the level of information security on the basis of the assumed sets of security criteria, e.g.:

- infringement of laws and/or regulations, decreased business performance, damaged reputation/negative impact on reputation, national and international law,
- discontinued provision of services, loss of funds/assets, loss of clients,
- financial, technical, environmental and time constraints.

With the above in mind, the information security system (ISS) is expressed by the following formula:

$$ISS = \langle E, R \subseteq E \times E, C, V \rangle, \tag{1}$$

where:

E – a set of objects (active and/or passive) of the ISS,
R – a set of relations defined by the Cartesian product $E \times E$,
C – a set of constant factors determining appropriate functioning of the ISS,
V – a set of variable factors controlling the functioning of the ISS.
The set of objects E is very broad and varied, thus, there are many different systems of classification and division. The entirety of ISS objects may be divided according to the following criteria:

$$E = \{E_i^u;\ u = \overline{1,U}, i = \overline{1,I}\}, \tag{2}$$

where :
U – a set of numbers of the distinguished types of ISS objects, e.g.: a set of information resources (u = 1), a set of business processes (u = 2), a set of support resources (u = 3), a set of security measures (u = 4), a set of vulnerability indicators (u = 5), etc.;
E_i^1 – a data-like information resource (i = 1), a information-based information resource (i = 2), a knowledge-based information resource (i = 3);
E_i^2 – the processes whose loss or deterioration makes it impossible to complete the mission of the organization (i = 1), the processes including confidential processes or using the technology subject to

intellectual property rights (i = 2), the processes that may have significant impact on the completion of the mission of the organization, if modified (i = 3), the processes that are essential for the organization to ensure compliance with the requirements stipulated in contracts, laws or regulations (i = 4);
E_i^3 – support resources, which very often in practice are "carriers" of basic resources, such as a process or an information resource; e.g. a set of resources of the type hardware (u = 1), a set of resources of the type of software (u = 2), a set of resources of the type of personnel (u = 3), a set of resources of the type of organizational structure, etc.,
E_i^4 – organizational protection (i =1), technical protection (i = 2), program protection (i = 3).
The set of relations R can be decomposed as follows:

$$R = R^W \cup R^O \tag{3}$$

where:

R^W – a set of relationships between elements of the ISS, ensuring its specific operation,
R^O – a set of relations between elements of the ISS and elements constituting its environment.
The set of constant factors $C = \{c\}$ often identified with the concept of the ISS infrastructure or structure represents its static nature and refers to a group of factors, which include four basic categories of factors:

$$C = \{c_1, c_2, c_3, c_4\}, \tag{4}$$

where:

c_1 – natural factors,
c_2 – technical factors,
c_3 – geographic factors,
c_4 – social factors.
The set of variable factors $V = \{v_j, j = 1, J\}$ represents the ISS dynamics, hence, they are referred to as the operational factors. The variable factors β include, among other things:

$$V = \{v_j, j = 1,5\}, \tag{5}$$

where:

v_1 – the dynamics of development of the ISMS security subsystem;
v_2 – technical and technological advancement;
v_3 – the scope and maturity of security documentation in the organization;
v_4 – the maturity level of the ISMS organizational structure;
v_5– the scope and maturity of the application of good practices in the field of security engineering.
The operational factors $v_i \in V$ have direct (dynamic) impact on the security level of sensitive resources in the organization, the scope and degree of information security, safety and efficiency of the entire ISS.

ISS cybernetic model as a simple cybernetic system

The cybernetic model providing grounds for detailed block models of actual objects and allowing the analysis of changes in the system is shown in Fig.2.

Fig.2: Cybernetic model of the object/system.

On the basis of the cybernetic model (Fig.2), the following simplified relations may be derived:

$$\boldsymbol{G(t)} : \boldsymbol{Z(t)} \times \boldsymbol{S(t)} \longrightarrow \boldsymbol{X(t)} \tag{6.1}$$
$$\boldsymbol{\Phi(t)} : \boldsymbol{Z(t)} \times \boldsymbol{S(t)} \longrightarrow \boldsymbol{B(t)} \tag{6.2}$$
$$\boldsymbol{F(t)} : \boldsymbol{X(t)} \times \boldsymbol{S(t)} \longrightarrow \boldsymbol{B(t)}. \tag{6.3}$$

Relation (6.1) represents the general notation of the “input - status” of cybernetic model whereas relations (6.2) and (6.3) represent general notations of the "input - output” model and “status - output” model.

The physical quantities in the cybernetic model, which characterize input, status and output are described through certain variables, which are usually in the form of the linear independent time functions. The argument of function t ∈ T represents short time axis in T time frame. For the purpose of empirical and - sometimes - theoretical studies (e.g. research of models of automatic control models), the variables are divided into three sets, namely:

1) input variables: $\boldsymbol{z_1(t)}$, $\boldsymbol{z_2(t)}$, ..., $\boldsymbol{z_N(t)}$ – representing different ways of forcing input of the system model ensuring its functioning;
2) internal variables: $\boldsymbol{x(t)}$, $\boldsymbol{x_2(t)}$, ..., $\boldsymbol{x_i(t)}$ – helping to describe the analyzed statuses or attributes of the system;
3) output variables: $\boldsymbol{b_1(t)}$, $\boldsymbol{b_2(t)}$, ..., $\boldsymbol{b_N(t)}$ – describing the functioning of the model output.

The cause and effect relationship between the input and output included in the cybernetic model may be presented as:

$$\boldsymbol{G(t)}[\,\boldsymbol{z(t)}, \boldsymbol{s(t)}] = \boldsymbol{x(t)} \tag{7.1}$$
$$\boldsymbol{\Phi(t)}[\,\boldsymbol{z(t)}, \boldsymbol{s(t)}] = \boldsymbol{b(t)} \tag{7.2}$$
$$\boldsymbol{F(t)}[\boldsymbol{x(t)}, \boldsymbol{s(t)}] = \boldsymbol{b(t)}. \tag{7.3}$$

Relations (7.1), (7.2) and (7.3) represent different types of the cybernetic model. Each of them may form grounds for the creation of the physical and mathematical model of the analyzed system. Relation (5) defines the dependency relationship between input and output and constitutes a typical task which consists in the examination of the “black box”, whereas relation (8) shows a general form of the diagnostic task: Due to the cause and effect relationship between input and output, for the purposes of mathematical modeling, hence, also for the purposes of identification and simulation of the systems, the size of the status and output of the cybernetic model are treated as one category. In such case, the statuses and output constitute the reaction of the system to the forced input; the reaction is sometimes generally referred to as the status.

With the above in mind, in terms of cybernetics, the information security system in the organization may be presented as a classic controllable system with input, output and certain control mechanisms (procedures, directives). The input stream is in the form of the risk vector (***Q***), which is converted in the ISS into the security vector (***SV***) that constitutes the output stream. The cybernetic “black box” is

the information security system that transforms the risk vector ($\boldsymbol{Q}$) into the security vector ($\boldsymbol{SV}$), which may be symbolically noted as the following function:

$$\boldsymbol{SV} = \boldsymbol{ISS}(\boldsymbol{Q}) \text{ or } \boldsymbol{ISS}: \boldsymbol{Q} \longrightarrow \mathbf{SV}\,, \tag{8}$$

where:

ISS – security function (information security system);
Q – risk vector of information security;
SV – security vector of the information security management system;
whereas:

$$Q = \langle Q_n\,, n = \overline{1,N}\rangle, SV = \langle SV_n\,, n = \overline{1,N}\rangle. \tag{9}$$

It must be stressed that the entire ISS information security in the organization is a complex open system, practically non-controllable, thus, it may only theoretically be the subject of research and formal deliberations. To ensure appropriate control of the ISMS, it is essential to know the Q input vectors and SV output vectors as well as their analytical correlations, which raises significant research problems, especially in practical terms. Therefore, the very attempt to identify such problems constitutes progress and a starting point for further theoretical work. The components of the risk vector Z are divided according to different criteria of risks. The traditional threats to information security Z are divided into five categories:

$$Q = \langle Q_n\,, n = \overline{1,5}\rangle$$

where:

Q_1– a subset of information risks;
Q_2 – a subset of natural risks;
Q_3 – a subset of technical risks;
Q_4 – a subset of social risks;
Q_5 – a subset of cyber risks.

The above-mentioned risk categories $Q_n \subset$ Q are further divided into detailed types $Q_{i,n} \in Q_n$, which describe the specificity of a given category. For instance, the information risks (Fig.3) Q_1 may be divided into: $Q_1 = \{q_1^j,\ j = 1,J\}$.

Fig.3: Classification and division of information risks.

The specific security categories$SV_n \subset$ SV, SV= $\langle SV_n\,, n = \overline{1,7}\rangle$ are assigned to the distinguished risk categories $Q_n \subset$ Q

where:

SV_1 – information security;
SV_2 – personal security;
SV_3 – technical security;
SV_4 – business security;
SV_5 – physical security;
SV_3 – ecological security;
SV_6 – social security.

To achieve an appropriate level of security SV, it is crucial to eliminate (or decrease to the minimum) the effects of the specified risks Q, which is symbolically noted as:

$$\mathrm{SV} = \langle SV_n, ; n = 1, N\rangle \longrightarrow max \iff \mathrm{Q} = \langle Q_n, ; n = 1, N\rangle \longrightarrow min. \quad (10)$$

The transformation of risk vector $\boldsymbol{Q}$ into security vector $\boldsymbol{SV}$ is made through the ISMS function (system), i.e.:

$$\boldsymbol{Q} \xrightarrow{\boldsymbol{ISMS}} \boldsymbol{SV}$$

Graphic illustration of equation (10) is shown in Fig 4.

Fig. 4: Information security management system as a simple cybernetic system.

The steering (control) function of the ISS is formally illustrated using information security operator S. By including the concept of "operator S", the formula (10) is noted as the product:

$$\boldsymbol{SV} = \boldsymbol{S} \times \boldsymbol{Q} \quad (11)$$

where: **S** – a symbol of security operator.

The conventionally applied operator S in formula (11) transforms input status **Q** into output status **SV** and the transformation is made according to the procedure included in operator **S**. In the case of such an advanced system, as the ISS, it is extremely difficult to define the nature of operator **S**, since, among other things, it is random and functions in a very complex and dynamic security environment including, for example, political, social, economic, technological and cybernetic security, etc. According to formula (11), the input status, i.e. the expected information security level (**SV**) depends on the risk level (**Q**) and functional structure of the **ISS**, i.e. the action procedures applied thereby. Formula (11) may be expressed in a secret form as the following function:

$$\mathbf{SV} = \mathrm{g}\ (\mathbf{Q}, \mathbf{S}), \quad (12)$$

where:

g (**Q, S**) – the secret function of two variables Q and S;
Q – the ISS risk vector;
S – the security operator (the action operator of the information security system)

In the traditional theory of control, the number $S = {}^{SV}/_{Q}$ is referred to as the capacity limit or transmittance of the system, and it is usually an abstract number. In the case of the analyzed ISS, the actual form of the transformation operator (**S**) is an expression of efficiency and effectiveness of the operations of the entire ISS and implies significant consequences for the information security level. Theoretically, depending on the value (technology) of operator **S**, it is possible to examine three cases of its impact on the input information security vector (**SV**):

$$\mathbf{S > 1 \Rightarrow SV} \nearrow \text{ – acceptable (security) level;} \quad (13.1)$$
$$\mathbf{S = 1 \Rightarrow SV} \longrightarrow \text{ – tolerable level;} \quad (13.2)$$
$$\mathbf{S < 1 \Rightarrow SV} \searrow \text{ – non-tolerable level.} \quad (13.3)$$

In the closed reference system, where transformation S meets condition S > 1, the input vector (SV) may theoretically increase only at the expense of the output vector (Q), which implies the following correlation:

$$\mathbf{(S > 1 \Rightarrow SV > Q) \Rightarrow (SV \rightarrow max \wedge Q \rightarrow min).} \quad (14)$$

In practical experience in the area of the security engineering, formula (14) may be interpreted in the following manner: Thanks to appropriately advanced technologies in the field of security engineering **S ≡ ISS**, the information security (SV) increases and the risks posed by vector Q decrease. It is the best strategy for the ISS development and improvement, as it leads to the achievement of the main goal, which means that the sensitive resources in the organization are guaranteed the required or desirable/acceptable level of security (Fig.1).

ISS cybernetic model as an automatic control system

The cybernetic model providing grounds for detailed control models of actual objects (with feedback loop) and allowing the analysis of changes in the system is shown in Fig.5.

Fig. 5: ISS cybernetic model as an automatic control system.

The information security system (ISS) model, with transmittance **S**, described in the chapter *Cybernetic model as a simple cybernetic system*, has only represented the so-called infrastructure of business processes, which, in accordance with formula (4), mainly refers to the so-called constant determinants. For the purposes of the study, it was assumed that the determinants represent criteria or principles of the information processing processes in the form of a specific fixed platform used for protecting assets processed thereby.

Currently, the additional system (Controller – R) is added to the scheme (model) presented in figure 4 allowing to include *dynamic factors* characterizing the variability of the selected ISS structures and

rules for implementing the information processing processes. By including such factors, it is possible to dynamically control the process of vector transformation Q → S, depending on the relationship between the input status and output status (Fig.5).

The ISS system output (SV) is compared to the set W value, which represents the specificity of the requirements of the information security policy, and the difference between their values, called a deviation or adjustment $\boldsymbol{\Delta Q}$ is subject to the controller's input. Therefore, the controller has the information about the present steering error and may change the SV input value or ΔQ object of control so that the deviation is decreased $\boldsymbol{\delta}$ to zero. As a result, the input value of the system is constantly maintained at a level as close to the requested value as possible.

In the above-described extended ISS cybernetic model, the attached control system R illustrates the activity of the so-called operational factors $v_j \in V$, which reflect current dynamics of the ISS and a possibility of the system's deliberate adjustment.

Controller R, which symbolizes the impact of the operational factors$v_j \in V$, transforms some part of the **SV** input stream into an adjustment $\boldsymbol{\Delta Q}$, adjusting the security level **SV** according to the required level of security (**W**). If we assume that the transformation in controller R is proportional, then the adjustment made by such controller at the input of the controlled system is:

$$\boldsymbol{\Delta Q = R \times SV,} \tag{15}$$

where:

$\boldsymbol{\Delta Q}$ – the adjustment made in the ISS;
R – the transmittance of the controller connected with operational factors;
SV – an output information security vector.
By making adjustment $\boldsymbol{\Delta Q}$, the output status of the whole controlled ISMS may be eventually noted as:

$$\boldsymbol{SV = S\,(Q + \Delta Q) = S(Q + R \times SV) = S \times Q + S \times R \times SV,} \tag{16}$$

where:
$\boldsymbol{S}$ – the transmittance of the controlled system identified with the impact of external factors $c_n \in C$, hence, after simple transformations, the following formula is obtained:

$$\boldsymbol{SV = \frac{S}{1 - S\,R}\,Q.} \tag{17}$$

Formula (17) is the simple formula for the theory of controls, showing a correlation between the output status – in this case, the information security level (**SV**) – and the input status – i.e. the risk level related to information security (**Q**), after considering adjustment $\boldsymbol{\Delta Q}$, which controller $\boldsymbol{R}$ makes in the entire ISS. According to formula (17), if there was no controller R (**R = 0**), the capacity of the entire control system would be **S**. By including controller $\boldsymbol{R}$, the right part of $SV = S\,Q$ should be multiplied by the product characterizing the operations of controller R:

$$\boldsymbol{\frac{1}{1 - S\,R}} \tag{18}$$

and finally, the following formula would be obtained:

$$\boldsymbol{SV = \frac{1}{1 - S\,R} S\,Q.} \tag{19}$$

On the basis of formula (19), it is determined that the first factor defines the operations of controller R, whereas the second one - the controlled system S. Factor (18) shows the activity of feedback loop in the control system, therefore, it is called the feedback loop operator. By way of analogy, in formula (12), equation (19) may be noted in the form of the following secret function:

$$\mathbf{SV} = g\,(\mathbf{S, R, Q}), \tag{20}$$

where: g (**S, R, Q**) – secret function of three variables S, R and Z.

By interpreting adjustment $\boldsymbol{\Delta Q}$ on the basis of security engineering, it must be noticed that in accordance with formula (5), it is a complex functional of such functions ($g_i(t)$) as:

$$\boldsymbol{\Delta Q = G(g_i(t)\ \ i = 1,5\ ),} \tag{21}$$

where:

$g_i(t)$– the current potential of the ISMS (the potential of organizational and technical security measures);
$g_2(t)$ – the current level of vulnerability of the ISMS to cyber attacks;
$g_3(t)$– the current level of maturity of security documentation;
$g_4(t)$– the current level of use of such elements as "good practices";
$g_5(t)$– the current level of security culture in the organization.

What is important in formula (21) is the fact that all internal functions $g_i(t)$ are variable time functions t. It means that adjustment $\boldsymbol{\Delta Q}$ developed by controller R is in the form of a dynamic parameter characterizing current aspects of control and improvement of the ISS, current scope of application of good practices and current level of security culture in the organization. The present level of such variables has direct impact on the status and value of assessment of the current security level of the ISS (SV), hence, the value of the potential system risks (Q).

On the basis of formula (19), it is possible to determine the input status (***Q***) to obtain the required results at the output $SV = \boldsymbol{\delta}$ with given values $S \parallel R$. To that end, in formula (19), the $SV = \boldsymbol{\delta}$ is used and the input vector (**Q**) set.

$$\boldsymbol{Q = \delta \Leftrightarrow Q = \frac{1 - S\,R}{S}\delta = \ \ Q^{*},} \tag{22}$$

where: $\boldsymbol{Q^{*}}$– the expected level of the vector of information security risks.

However, if the input vector has already been set and assumed the value of e.g. $\tilde{Q}$, it is possible to determine the capacity of controller R, necessary to obtain the required level of output vector $SV = \boldsymbol{\delta}$:

$$\boldsymbol{SV = \delta \Leftrightarrow R = \frac{\delta - S\,\tilde{Q}}{S\,\delta} = \ \ R^{*},} \tag{23}$$

where: R* – the desirable value of transmittance of controller R.

By introducing controller R to the ISS, the SV output status may be controlled on an ongoing basis depending on the Q input status. As a result, it is possible to shape the characteristics, parameters and attributes of the ISS in a flexible manner and at such a level that guarantees the maintenance of the input status at a required information security level ***SV= W***.

On the basis of formulas (22) and (23), to ensure the desired level of security ***SV= W***, it is possible to control either the risk vector Q = $\tilde{Q}$ (22) or the mechanism of controller operations R = R* (23). The direct control of risk vector Q is a truly complex process that requires a lot of effort on the part of the entire ISS spread over a longer period of time. It is much easier to shape the level of information security (*SV*) through controller R by selecting appropriate parameters or structures of its functioning. In the categories of security engineering, it means appropriate increase of the ISS security level by introducing proper infrastructure of the security system - the number of security measures and links between them or good practices understood as additional dynamic operational factors $v_i \in V$.

If the interpretation of the system responsible for shaping operational factors $v_j \in V$ has been assigned to controller R: $V = \{v_j, j = 1, J\}$ = f ($v_j, j = 1, J$), then, in compliance with the above assumptions, using such elements as "good practices, it is essential to control the development of the security system ($v_1 \in V$), ISS level of vulnerability to cyber attacks ($v_2 \in V$), level of maturity of security documentation ($v_3 \in V$), efficiency of good practices in the area of security engineering ($v_4 \in V$) and the level of information security culture ($v_5 \in V$). Certainly, the selection of good practices (operational factors) may be freely changed and, depending on the needs, new categories of

factors/good practices, most adequate in a given security environment, may be added. Another issue is the choice of the function formula (19), its validity and usefulness in the discussed control model with feedback loop.

Summary

In practice, there is no model/pattern for the ISS improvement that would be based on the elements of good practices. It is in line with the equifinality principle, according to which there might be many different ways of reaching a given final state in an open system, such as the ISS – see Morgan (2013). Being aware of certain limitations related to the introduction of the ISS improvement models, methods and manners, which bring positive, extraordinary results, the authors decided it was justified to use them.

Particularly in the present situation, when modern organizations are under increasing pressure to quickly and efficiently improve their competence, also in the field of security. Of course, the point is not to copy other solutions without a second thought, but to skillfully and appropriately adapt good practices to the reality and capabilities of the ISS or the organization. Furthermore, it should be also remembered that the very identification of good practices is merely the starting point. Their conditions must be determined and adapted to the conditions of a given security entity, all the while bearing in mind the fact that such good practices will not instantly become the source of success. The industrial application of at least the so-called "mini-practices" becomes indispensable.

The presented method for modeling the information security system (ISS) using the theory of control is a new approach, based on reliable theoretical foundations. Therefore, there are real grounds to engage in a broader thinking about the use of the cybernetic systems with feedback loop while analyzing such complex issues of the information security engineering as, for example, the building of information security according to the norms adopted in the international affairs practice or ISMS improvement based on the elements of good practices.

The article outlines only a concept for using the theory of automatic control to establish the risk functions in the information security system. This extremely complex system belongs to a group of large systems, with a high level of complexity and multi-criteria formulas of operation. The implementation of the theory of control requires the establishment of adequate mathematical or cybernetic models describing the ISS in terms of cybernetic categories of the control systems. The main issue is to define the input and output vectors using open functions of many variables or appropriate functionals.

Abstract

This article summarizes the changes flow during the vehicle's life cycle phase and presents an analysis of the changes' implementation ratio. In the automotive industry, harsh competition, the need for optimization of costs and continuous improvement leads manufacturers to improve their products to remain competitive in the marketplace continually. Following the data collection through the 3-year analysis regarding the modifications on the series vehicles, the article presents the stages of implementing the modifications on the vehicles in the production phase and their distribution depending on the nature of these changes. The permanent evolution to continually modify vehicle's parts, even during the production phase, appears necessary. This research presents the main stages of implementing the changes in the series vehicles, the types of changes, the sources of these changes, and the people involved in process. The series changes require special attention considering the implementation costs significantly exceeding the project phase's costs. Essential factors, such as fast implementation time, analysis and rapid solution identification, costs of modifying equipment, and the entire implementation management, but also the resources involved in this process, should be monitored. Considering the importance of these changes on series vehicles, the article summaries the stages of implementation of these changes and details the main areas of intervention.

Keywords: Process Management, Continuous Improvement, Process-Based Guidance.

Introduction

According to [1] automobile industry has experienced a continuous industrial transformation due to the competition in this field of activity, and car manufacturers have paid more attention to the production process by continuously streamlining its product by ensuring integrity, design, fuel efficiency, emission control carbon and the development of various types of efficient engines. The automobile industry is one of the most importantly adding value industries in the international trade market by developing economies and research [2]. Lately, the car market competition is increasing, the demands of the consumers have increased, and the manufacturers have to adapt to their requirements continuously [3]. Managing changes in the automotive field involve identifying opportunities for improvement through various means and requiring several resources to extract the

necessary information. Continuous vehicle improvement is essential to meet customer requirements, but it is necessary to remain relevant and succeed in maintaining market position in some cases. In the automotive industry, the extent to which a vehicle is improved is linked to internal and external factors. Several factors have influenced car development in recent decades, for example, customer requirements for increased power, space, and comfort, environmental issues such as noise reduction, exhaust emissions, and fuel consumption, economically oriented influences such as production, fuel consumption, durability, service and not lastly, vehicle safety measures[4][5].

Some of the factors listed above are customer-oriented, and many of them are influenced by government legislation. For example, vehicle and passenger safety regulations emerged in the 1960s and were strengthened in the decades or regulations on carbon emissions proposed by governments, which led to the evolution of technologies and standardization of emissions throughout the automotive field [1].

The management of changes during the production phase of the product life cycle in the automotive field is a complex process through which several stages are completed, and many people are involved in participating in the successful implementation. Considering that the vehicle is a complex product, there are many modifications from different sources in the production phase, being necessary to implement the modifications starting from the identification of the need for modification, going until its realization. Some changes are made to correct certain defects of parts, called quality changes, other changes are made to save financial resources, time or material resources, called economic changes, and others are improvement changes, made after benchmarking analysis of direct competitors [6].

According to [7], 77% of changes are due to internal reasons, while 23% are external reasons. An essential aspect to consider, in addition to the costs and people involved in the process of series changes, is the spread of changes that lead to the involvement of various perimeters of the vehicle related to the change, and the spread changes generate 32.4% of all changes. Therefore, the changes during the production phase of the product life cycle have an essential impact on the costs, time, and human resources involved.

Depending on their nature, these changes can bring benefits to the business: (1) when product evolutions are implemented or (2) economic changes that save money or represent a financial effort for the manufacturer by correcting defects when defects are identified. This research aimed to describe the implementation process and analyze the changes during the production phase of the product life cycle made over three years and finally to offer the picture of changes sequences and ratio.

Types of changes on series vehicles

The need for change is due to several factors and may arise from different directions. In production, the changes implemented on vehicles are of significant importance because they end up being applied following relevant analysis for the car manufacturer or for customers.

Fig. 1: Implementation of the changes on series vehicles

In the production phase, a series of checks are required when the vehicle leaves the factory. Following the verifications, a series of modifications are identified and proposed for the improvement resulting from the non-conformities resolution.

According to [8], flexibility is considered a competitive advantage, and it is essential for manufacturers to permanently develop their products to be relevant in the market and market their vehicles. For this purpose, benchmarking tests and analysis are performed to adjust their products [9]. Thus, the levels of equipment, design, product quality, and price are studied according to the market's relevant products. Therefore, following analysis, a series of measures are identified to adjust the products to the market requirements and align them with the best competitors.

This type of analysis can lead to product improvement or adjustment, depending on its market strategy. The profitability seen by the manufacturing costs, the used materials, the components manufacturing place, the suppliers are significant for the car manufacturer, so for these reasons, several changes have resulted.

Fig. 2: Types of changes

Economic changes

The decision to implement a change aimed at reducing vehicle manufacturing costs comes from large-scale analysis of the manufacturing process, consumer perception, competitive analysis, and the overall effects on the whole process. These changes are reflected in the quality of the products, quality of used materials, thickness and finishing of parts, and the level of vehicle equipment. Thus, through these types of changes, we find a reduction in the thickness of materials, change type of material, changes regarding the finishes of the parts, or the elimination of specific options or their replacement with cheaper ones, such as manual mirrors instead of automatic mirrors, equipping the vehicle with the air conditioning on a single area or even eliminating it.

The decision for economic changes such as reducing the material or replacing it with lower quality, removing a part, or an option from the vehicle depends on the target market and customer's needs. The changes applied to the vehicle insofar as they do not affect the vehicle's functionality, and the customer's perception correlated with the target market segment.

Quality changes

Quality is one of the main concerns of car manufacturers. Quality expectations must be met and require constant control of all processes, from product design and development to sales and service. Quality management is essential for manufacturing, and continuous improvement of products is imperative for customer satisfaction [10][11].

Customer Return

According to [12], auto repair services have an essential role in solving problems during and after the vehicles are under warranty. Thus, they began to develop their technical expertise to provide services with high profitability. For car manufacturers, the customer's return with the vehicle in service is an opportunity to improve the vehicles in the manufacturing process. The manufacturer analyzes the reasons and non-conformities for vehicles, and following these analyses, improvement measures are proposed for future vehicles to be manufactured.

Customer dissatisfaction

The level of satisfaction is continuously measured and analyzed, and for this, the car manufacturer collects, measures, and acts by the degree of customer satisfaction. For this process, market research is done, and questionnaires are collected from customers. Customer involvement [13] through data collected from market analyses and questionnaires collected from customers is fundamental input data regarding quality improvement decisions or adapting the vehicle to customer preferences.

Mounting problems

The plant's assembly line is another vital source from which opportunities for improvement are identified following inspections [14] and remedied before they reach the customer. These types of changes are dealt with directly by the suppliers responsible for their manufacture.

Product Developments Changes

Competitiveness in the automotive field is growing and leads to product developments in this domain of activity. This competitiveness is translated by the producers' preoccupation with developing new products and improving the existing ones [15]. This competition starts with the design of vehicles [3][16], the applied technologies, and their continuous development [17], but also from the optimization of manufacturing processes [18].

Interchangeability and standardization of components [19] are processes on which car manufacturers rely and help them develop new models and optimize their processes quickly. Competitiveness in the automotive sector leading to product and process evolutions [20] is mainly due to the optimization of processes and costs, the variety of models, and the coverage of market sectors

Development of limited / special series

The evolution is given by the products manufactured in limited series, which involve developing particular components and involving changes in the manufacture of series vehicles. These vehicles are manufactured to satisfy a specific market sector that the car manufacturer intends to open. These products enter the market with individual specifications compared to the standard ones and often lead to innovation in the automotive field.

Government Regulations

Legislation on automotive regulations has begun to tighten, which is reflected in the number of developments on out-of-production vehicles. These regulations require legislation to reduce and control carbon emissions [21] the implementation of passenger and pedestrian safety systems [22, 23], legislation on certifications for new models, global harmonized testing of light vehicles (WLTP, Worldwide Harmonized Light Vehicle Test Procedure) [24].

Changes from suppliers

The suppliers could propose these changes on vehicles, and they can discover an opportunity for improvement for a part or propose a change for reducing the costs or time of manufacturing the product.

Stages of implementing changes

According to [25], in case of a change, regardless of the nature of the change, the organization must define, verify compliance with the requirements and validate the implementations before implementation.

Proposal of the changes

Fig 3. Proposal of the changes

As seen in fig 3, the proposed change stage involves analyzing the sources from which the manufacturer collects information and processes it to continuously improve and optimize the manufacturing process, costs, and time. In order to identify these opportunities, the interested parties are engaged in the process, starting from the clients, suppliers, the management, climbing up to the people engaged in the implementation of the changes.

Starting the changes

Fig 4. Starting the changes

The change involves documenting it, starting with analyzing the causes that lead to the problem and identifying the solutions. The analysis includes data about the perimeter where the problem or the opportunity for improvement is, the vehicle type, and the number of units. Based on the information, a plan is made, implementation of the parts' modification and delivery, negotiated, and established with the supplier to have a vision on manufacturing implementation. An essential aspect of this process is the economic analysis negotiated with the supplier responsible for making changes to the part and delivery.

Validation of the changes

Fig. 5:Validation of the changes

In the validation stage, the documents underlying the change are launched, and the approvals are received from the specialists. The documents are signed by the supplier and the car manufacturer's representatives, representing the agreement of the two parties regarding the technical, economic, and planning part.

Officialization of the changes

Fig 6.Officialization of the changes

Any change made to a vehicle component must be based on recordings, such as changing the 3D and 2D model of the part, updating cost information, and planning. All these are made in the car manufacturer's systems, as well as of the supplier, and will be validated.

Implementation of the changes

Fig 7.Implementation of the changes

The last stage of making a change on a vehicle implementation and involves testing after the manufacture of new parts. Following the validation of the tests, the parts are ordered, and the parts delivery schedule is observed.

Fig. 8 : Changes on series vehicles

Following the data collection during the three years on series changes and taking into account the large volume of vehicles' changes, the article summarized the main stages of implementing the changes on series life vehicles.

Following the research, based on the data collected in the three years, analyzing 5770 changes, fig 8 shows the share of changes for series vehicles. From the data presented, a percentage of 38.15% of changes represent car manufacturers' concern for the continuous evolution of products with the market evolution and maintaining a competitive advantage through continuous improvement.

This type of change involves implementation costs but which are recovered by maintaining a competitive advantage. The quality changes with a percentage of 26.33% show the manufacturer's care for delivering vehicles without defects, following customer expectations. These changes involve increasing the production costs borne by the manufacturer by correcting the issues on the vehicles.

Another significant type of change is represented by the economic changes with a percentage of 22.30%, through which financial resources are saved and support the manufacturer to adjust its manufacturing costs. A percentage of 13.22% are included other changes than those presented above.

Conclusion

The vehicles' manufacturing process is very complex and requires several stages, but the involvement of several parties in the process to achieve the objectives, too. Most of the time, the manufacturing process's result does not entirely follow the objectives and the initial planning. All of this is due to the complexity of the manufacturing process and the product. As described above, after leaving the production line, the vehicle undergoes various modifications, some of an economic nature, others for the improvement of individual parts or assemblies, or modifications for the alignment at the level of direct competitors on the market. These interventions require rigorous planning of the vehicles' interventions in the manufacturing stage to optimize the costs, the time, and the continuous improvement of the quality of the vehicle to maintain at the level of the market competition.

From the studies so far in the automotive field, we can see that 77% of changes are due to internal reasons in the production phase of vehicles, while 23% are due to external reasons. The high percentage of vehicle changes in the production phase may be due to several factors, as we see most are due to internal reasons, we deduce that preparing the vehicle for the production phase requires improvements and more rigorous analysis.

At the same time, we must keep in mind that the vehicle is a complex product that requires a manufacturing process with many people involved in, many parts suppliers, and most of the time, numerous identified problems in the series production phase. The percentage of 38.15% improvement demonstrates the high level of competition in this field, in which car manufacturers seek to continuously improve vehicles compared to direct competitors and maintain their competitive advantage.

The percentage of 26.33% of quality changes can represent the project phase's mistakes or the need for more rigorous management in this stage to avoid the risks in the production phase. The economic changes, with a percentage of 22.30%, represent how the car manufacturer saves money or other resources, time, human or material resources; 13.22% are necessary changes in the process and are seen as administrative changes for the entire manufacturing process' proper functioning. Following the collection of data over the three years on series changes and considering the large volume of vehicle changes, the article summarized the main steps of implementing the changes in series vehicles by strengthening the image of their effective implementation.

The Identification of Spatial Dependence in The Development Level of Selected Stock Exchanges in The Period Of 2004–2018

Elzbieta SZULC

Nicolaus Copernicus University in Torun, Poland
eszulc@umk.pl

Abstract

The paper concerns the level of development of selected stock exchanges in the context of spatial dependence. The dependence is considered in geographical space on the one hand and economic space on the other. A taxonomic measure of development was constructed to determine the level of development of the stock exchanges. The synthetic measure was calculated on the basis of seven diagnostic variables that were considered as important determinants of the level. The spatial dependence was identified with the use of the join-count test. The main question is whether the objects analyzed, within framework of each separated class as well as between them are grouped based on the existing spatial dependence in the physical sense or create groups featuring similar economic development. The research includes 45 largest trading floors analyzed in the period of 2004–2018. The data used in the analysis was derived from the World Federation of Exchanges (www.worldexchanges.org). Based on the research we have found that both geographic closeness and the similarity of market capitalization as relation to GDP are important factors in the relationships between the level of development of stock markets.

Keywords: stock exchange, spatial dependence, physical and economic distance, join-count test.

Introduction

The question of spatial dependence among world stock exchanges is gaining importance in the context of contemporary processes of globalization and integration of financial markets. The analysis of this issue is possible thanks to appropriate tools offered by spatial econometrics. Applying spatial econometrics makes it possible to evaluate the level of stock exchange development related to the location of markets analyzed and distance between them.

The spatial perspective of the stock markets functioning was considered by a number of studies. Some of the earlier papers, such as e.g.: Erb, Harvey and Viskanta (1994); Longin and Solnik (1995; 2001); Karolyi and Stulz (1996), focused on correlations between stock market returns. Slightly later, the first research on the issue of risk spillover across markets appeared (e.g. Bekaert, Harvey and Ng (2005); Asgharian and Bengtsson (2006); Asgharian and Nossman (2011); Osińska, Fałdziński and Zdanowski (2012)).

There was also an interest in the channels through which stock markets are related to each other. Spatial tools and methods have been used more and more (e.g.: Arnold, Stahlberg and Wied (2013); Weng and Gong (2016); Kisla and Önder (2018); Zhang et al. (2020). In particular, the problem of choosing physical distance vs. economic distance to analyze dependencies between stock markets, was discussed (see e.g.: Eckel et al. (2011); Suchecka and Łaszkiewicz (2011); Fernández-Avilés, Montero and Orlov (2012); Asgharian, Hess and Liu (2013).

The subject of the investigation contains the selected stock exchanges characterized in terms of their level of development. The study includes 45 largest trading floors analyzed in the period of 2004–2018. The specification of the exchanges with the symbols and assignment to the relevant country is presented in Table 1.

Ljubljana Stock Exchange	LJSE	Portugal	Japan Exchange Group*	OGSE	Japan

Note: The stock exchange signed by * was established as a result of consolidation of Japan Exchange Group Osaka and Japan Exchange Group Tokyo.

The level of stock exchange development was defined by a synthetic measure based on seven diagnostic variables, i.e.: X1 – the stock market capitalization, X2 – the number of companies listed on the stock exchange, X3 – the total value of share trading, X4 – the share of five per cent of domestic companies with the highest capitalization in the total stock market capitalization, X5 – the five per cent share of domestic companies with the highest value of share trading in the total turnover, X6 – GDP per capita, X7 – the ratio of market capitalization to GDP.

The theory and empirical analyses were taken into account when selecting the diagnostic variables (see e.g.: Pagano (1993); Demirgüç-Kunt and Levine (1996); Levine and Zervos (1996); Garcia and Liu (1999); Beck, Demirgüç-Kunt and Levine (2003); Seetanah and Ramessur (2008)). It was recognized that the specified variables are important determinants of the development of stock exchanges.

The range of information provided by the World Federation of Exchanges (www.worldexchanges.org), whence we get the data, played a significant role for the spatial and time scope of the investigation.

Methodology

In the investigation there was used the aggregate characteristic of the stock exchange in the form of a taxonomic measure of development. This indicator is understood as a synthetic normalized formula expressed by (Szulc et al., 2014, pp. 129–130; Szulc and Wleklińska, 2015, p. 9):

$$q_i' = 1 - \frac{q_i}{\bar{q} + 2S_q}, \tag{1}$$

where: q_i denotes the synthetic variable determining the level of development of the *i*-th exchange in relation to a development standard, $\bar{q}$ is the average value of the synthetic variable and S_q stands for the standard deviation of the variable.

In this approach the values of the synthetic variable q_i are calculated according to the formula:

$$q_i = \sqrt{\sum_{j=1}^{m} \left(z_{ij} - z_{0j}\right)^2}, \tag{2}$$

where: z_{ij} denotes the value of *j*-th diagnostic variable for *i*-th exchange standardized to 0–1, z_{0j} denotes the value of *j*-th diagnostic variable for the standard of development standardized to 0–1. Thus, q_i means a distance between *i*-th exchange and the development standard.

Based on the values of the taxonomic measure of development, the analyzed exchanges were divided into groups, as follows:

Group 1: $q' > M_e + Q$;
Group 2: $M_e + Q \geq q' > M_e$;
Group 3: $M_e \geq q' > M_e - Q$;
Group 4: $q' \leq M_e - Q$,

where: M_e denotes second quartile (median) and Q means quarter deviation in the distribution of the synthetic measure.

In order to investigate the spatial dependence among the stock exchanges analyzed the join-count statistics were used. The idea underlying the test was borne out of the need to study the dependence between the qualitative variables. The data on such variables may be classified into two or more nominal level categories, which are often marked with different colors. It is then possible to count the numbers of adjacent pairs whose categories are the same, or the numbers whose categories are different. In the case of positive dependence the number of joins of the same category will tend to be 'large' and there will tend to be relatively few joins where categories are different. In the case of negative dependence the opposite will apply (Haining, 2005, p. 79).

The join-count test for categorical data is based on counting the number of adjacencies of particular colors. The basis is a two-color layout – Black-White (BW). Suppose black indicates the presence of the phenomenon or its high level, and the sites where the event of interest does not occur are marked in white. The join-count statistics determine the frequencies of joins: Black-Black (BB), Black-White (BW), White-White (WW). If there is a tendency for similar values to be found together, then the

number of joins where adjacent colorings are the same (BB or WW) will be 'large', the number of joins where adjacent colorings are different (BW) will be 'small' relative to the counts for a random map pattern. This means the positive spatial autocorrelation. In the case of negative spatial autocorrelation where the tendency is for dissimilar values to be found together BB and WW join counts will be 'small' and the BW join count will be 'large' relative to the counts for a random map pattern (Haining, 2005, p. 242). More about the test, see e.g.: Dacey (1968); Cliff and Ord (1973; 1981); Schabenberger and Gotway (2005).

The test can be generalized to more than two colors and for general definitions of adjacency in terms of the distance measure and connectivity matrices. In this study, the proximity between stock exchanges was determined using two approaches. The first uses a matrix of connections with weights established on the basis of the physical distance between the centers of the countries where the stock exchanges are located. The second consists in the consideration of the economic distance in the connectivity matrix. This approach for determining the weights $w_{ij,t}$ consisted in the determination of the economic distance between pairs of stock exchanges according to the following formula:

$$d_{ij,t} = \left| \frac{capital_{it}}{GDP_{it}} - \frac{capital_{jt}}{GDP_{jt}} \right|, \tag{3}$$

where: $\frac{capital_{it}}{GDP_{it}}, \frac{capital_{jt}}{GDP_{jt}}$ – market capitalization as relation to GDP in country *i* and *j* respectively, in the period *t*. Subsequently, the components $d_{ij,t}$ were inverted and entered into the connectivity matrix **W**.

The test in question examines the autocorrelation within as well as between groups, i.e. the test for same-colour joins and the multi-join-count test for same-colour and different colour joins (Bivand et al., 2008, p. 261).

In our investigation the join-count test, as a test applying for qualitative variables, will be used to identify the spatial dependence for four variants of the synthetic variable measuring development of the stock exchange (taxonomic development measure – TDM). The application of join-count tests should allow to verify the preliminary conclusions based on the visual presentation of shaping the values of the TDM.

Results of the Empirical Analysis

Stock Exchange Classification

A taxonomic analysis of the level of development of the exchanges under consideration leads to the conclusion that in all years covered by the study, the American stock exchange NYSE takes the first position in terms of TDM value. The highest capitalization value with a relatively large, though not the largest, number of listed companies, strengthened this stock exchange's leadership position. However, it can be noticed that the value of taxonomic development measure in 2009 fell below and remained at this level until 2015. In the next three years of the analysis this value increased.

The dominance of the United States on the analyzed global market was also emphasized by the fact that in most years of the period considered, the Nasdaq exchange came second. An exception are the years in which the Tokyo TSE Stock Exchange came second in the rankings, i.e. 2005, 2006 and 2013. It can also be noticed that with each successive year, more and more Asian stock exchanges are strengthening at the expense of European and American markets.

Facing the growing interdependences between the world's capital markets and the impact of modern financial products and services on the functioning of market as a whole as well as individual assets, the perception of the global financial market had to change. Development distance between stock exchanges located in America, with the United States at the fore, so far considered the main financial center of the world economy, and Asian stock exchanges with dynamically developing emerging economies, such as China or India, began to decrease.

Figure 1: Bar charts of TMD for the investigated stock exchanges in the years 2004–2018.

Figure 1 shows the locations of the studied exchanges on the world map and bar charts of TDM values in the years 2004–2018. This presentation allows us to observe dynamics of changes in the development of the analyzed markets in the arrangement of their location. It can be noted that some Asian trading floors did not see any decline in the value of the taxonomic measure of development after outbreak of the 2007 financial crisis. In the worst case scenario, these exchanges reacted by slowing down or stagnating the pace of growth. This situation can be observed, for example, in the case of the ASX, KRX, SZSE and HKEX exchanges.

There is no doubt that the crisis of 2007 worsened the condition of the American stock exchanges, but it also had a stimulating effect on the process of catching up with the distance between emerging and well-developed exchanges. Especially, in the period of 2016–2018, many European exchanges saw a marked increase in the synthetic measure of development, for example, LSE, SIX, DBOE, TASE and OSLE.

In the conducted study, the analyzed exchanges were divided into groups according to the TDM value. The results of the classification of exchanges considered into groups are presented in Table 2.

In each year of the analyzed period, there are two American trading floors (NYSE, NASDAQ) in the group of the most developed exchanges. Until 2013 inclusive, this group was also co-created by the Tokyo Stock Exchange (TSE). After the consolidation of TSE and the Osaka Stock Exchange (OSE) in 2014, the Japan Exchange Group Tokyo (OGSE) belonged to this group. In most years, they are among the markets representing this group exchanges the once based in Hong Kong and Singapore, i.e. HKEX and SGX respectively.

Table 2: Division of the exchanges into groups by values of the taxonomic measure in 2004–2018.

Note: The groups are numbered from most to least developed.

About 10 trading floors were classified on average in the period considered into the second group, which according to the synthetic measure includes well-developed exchanges. In all years, except 2015, BME belonged to this group. While, until 2015 inclusive, this group was co-created by AEX and PaSE. KRX on the other hand, belonged to it invariably from 2008.

In each year of the adopted 15-year time horizon, the third group is clearly the most numerous group. It includes many of the so-called emerging stock markets. This provides their high development potential. The stock exchanges classified in the third group are characterized by a moderate level of development and their composition has changed slightly in individual years.

The fourth group, represented by trading floors with the lowest development level, usually included European markets located in countries such as Greece, Cyprus, Turkey and Malta, as well as Asian markets, located in the Philippines and Iran, among others.

In the period of 2009–2015, the size of this group increased, which can be explained by the deteriorating economic condition of the countries where the analyzed markets are located, due to the effects of the subprime crisis 2007–2009.

Spatial dependence among the stock markets

Regarding the division of exchanges into groups (see Table 2), the study of spatial autocorrelation was carried out. The use of the join-count statistics allowed for the evaluation of the autocorrelation both within groups and between them.

The motivation for this study was the conviction that the spatial dependence among stock markets can reveal itself in the perspective of the level of development of the exchanges under consideration. The spatial autocorrelation may occur to varying degrees and of different significance depending on this level.

The study was conducted in two variants. In the first variant, a connectivity matrix based on the geographical distance was used to measure the autocorrelation. In the second variant, the connectivity matrix was built on the basis of the difference module between capitalization indices of the analyzed markets. Selected results of the join-count test application are presented in the Tables 3–6. Only the results showing a significant autocorrelation were included.

In the first variant of the analysis, a significant autocorrelation was found only within the second group in 2009 and 2010 as well as within the fourth group in 2011–2015 (see Table 3). It means that in the period of 2009–2010 the well-developed stock exchanges clustered while in the period of 2011–2015 this applies to exchanges with the lowest level of development.

Table 3: Join-count test results within groups for the matrix W based on the geographical distance.

Year	Group	Join-count statistic	p-value	Year	Group	Join-count statistic	p-value
2009	II	1.219	0.003	2013	IV	0.984	0.003
2010	II	1.915	0.000	2014	IV	1.560	0.000
2011	IV	1.068	0.043	2015	IV	1.422	0.000
2012	IV	0.610	0.002	–			

Table 4: Join-count test results between groups for the matrix W based on the geographical distance.

Year	Groups	Join-count statistic	z-value	Year	Groups	Join-count statistic	z-value
2007	I : II	3.419	2.718	2013	I : II	3.072	2.136
					II : III	2.211	-2.032
					III : IV	2.306	-1.659
2008	I : II	3.526	3.446	2014	I : IV	1.965	-3.022
2010	I : IV	2.567	-1.638	2015	I : IV	1.993	-2.676
					III : IV	2.129	-2.143
2011	I : IV	2.248	-1.633	2016	I : III	4.839	-1.694
	II : III	2.396	-1.804				

For example, Figures 2 and 3 show a graphic illustration of the results obtained for 2010 and 2015, respectively.

Figure 2: The taxonomic measure of stock exchanges' development in 2010.

Note: The surface of the wheel signals the value of the synthetic variable. The symbols of stock exchanges have different colors depending on the group they belong to. The red color refers to group I. Groups II, III and IV are marked with the following colors: blue, grey and green, respectively.

In Figure 2 it can be seen that most of the exchanges from the second group are located in close proximity. On the other hand, the exchanges from groups I and IV are rather not adjacent to each other.

In turn, in Figure 3 we can see some concentration of exchanges from group IV confirmed by the join-count test, while from group II not confirmed by the test. The underdeveloped exchanges (group IV) are rather not adjacent to the exchanges from groups I and III (see the results of the join-count test for the year 2015 in Table 4).

Figure 3: The taxonomic measure of stock exchanges' development in 2015.
Note: Explanations, as above.

It is interesting to study the spatial dependence between groups as well. In this case, statistically significant autocorrelation means more frequent or less frequent associations of objects from different groups relative to random map pattern.

A positive autocorrelation between groups I and II was found in 2007, 2008 and 2013. A negative relationships between groups I and IV were identified in 2010, 2011, 2014 and 2015 as well as between groups II and III in 2011 and 2013, and between III and IV in 2013 and 2015. Negative autocorrelation means that adjacent objects are characterized by a different levels of development. Thus, for example in 2010 and 2015, very well developed exchanges were not neighbors with the poorly developed ones. It is worth noting that in 2016, the negative dependence also applies to very well developed and underdeveloped exchanges. Because this year, none of the analyzed exchanges was qualified to the fourth group, we are talking about the relationships between groups I and III.

In the second variant of the analysis, the exchanges under consideration are characterized by a similar capitalization ratio within groups IV or III, depending on the year of the study (see Table 5). Only in 2016, this 'clustering' also applies to group II.

The study also found a positive autocorrelation between groups III and IV. In turn, the exchanges from groups I and IV as well as I and III, are not similar in terms of the capitalization ratio (see Table 6).

Table 5: Join-count test results within groups for the matrix W based on the economic distance.

Year	Group	Join-count statistic	p-value	Year	Group	Join-count statistic	p-value
2009	IV	2.239	0.003	2015	IV	1.479	0.012
2010	III	2.159	0.005	2016	II	1.337	0.001
					III	6.661	0.000
2011	IV	1.412	0.026	2017	III	6.002	0.020

Table 6: Join-count test results between groups for the matrix W based on the economic distance.

Year	Groups	Join-count statistic	z-value	Year	Groups	Join-count statistic	z-value
2004	I : III	3.229	-3.121	2013	I : IV	1.539	-1.973
	III : IV	3.880	3.225		III : IV	3.907	2.257
2005	III : IV	3.637	2.332	2014	I : IV	1.836	-2.048
					III : IV	4.204	3.032

	III : IV	3.876	1.885		II : III	2,454	-3,173
2008	I : II	1.794	-1.653	2017	I : III	4.790	-2.516
2011	I : IV	1.658	-1.905	–			

Conclusions

The study has shown that there are spatial dependencies among stock markets under consideration. Their strength and scope vary depending on the level of stock exchange development as well as the year covered by the analysis. Overall, the dependencies are greater between less developed exchanges (classified into the third or fourth group) and they tend to increase somewhat in and after the financial crisis. This is in line with the opinion of many economists, that the strength of interdependences between financial markets increases in times of economic downturn and decreases in times of prosperity.

Geographical proximity plays an important role in the co-functioning of these markets. The financial distance between the markets is also important, such as the one measured by the capitalization ratio which was used in this study. Identifying the spatial dependence among stock markets, we provide some premise for specifying the spatial econometric models of financial phenomena.

Abstract

The Malaysian Employers' Federation (MEF) has attempted to paint the minimum wage as being more beneficial to foreign than local employees, suggesting a lack of coherence in employers' use of their managerial prerogatives, and blaming retrenchments on the minimum wage. The objective of this article is to analyze critically the laws, procedures, and the principles of retrenchment in Malaysia. The research question is whether employers are terminating workers in Malaysia, actually after having made poor or unsustainable business decisions, but apparently under the specious guise of a claimed unfettered prerogative of retrenchment. Argument tries to show that employers exercising mere prerogative claims necessarily leads to capricious termination decisions, and that redundancies must instead be grounded entirely in law. The configuration of the rules suggests the state recognised the likelihood of underlying employer unreasonableness, *mala fides* and capricious departures from the LIFO requirement. Companies may, in actuality, retrench workers purely to solve errors in their management structure.

Keywords: Managerial Prerogatives; Retrenchment in Malaysia; Capricious Termination Decisions; Employer Unreasonableness; *Mala Fides*; Capriciousness; LIFO Requirement.

Introduction

The Malaysian Employers' Federation (MEF) has attempted to paint the minimum wage as being more beneficial to foreign than local employees. The MEF executive director estimated that a planned increase in the minimum wage would add RM2.5 billion annually to foreign remittances to these workers' home countries. He argued this would impact the strength of the ringgit, adding that employers were forced to depend on the more expensive foreign workers, because of a shortage in local manpower, noting that journalists in media companies had recently been retrenched due to newly mandated minimum wage rules. This suggested a lack of coherence in employers' use of their managerial prerogatives, in seeking foreign workers where locals declined to work for them, and blaming retrenchments on the minimum wage, where employers had failed to adapt to new

technological and market conditions (Malhotra, 1973). Therefore, the objective of the present study is to analyse critically the laws, procedures, and the principles of retrenchment in Malaysia.

Retrenchment infers a reduction or curtailment of cost or expenses (McCashin, 2019). It is a cutting of expenses, or spending, in response to economic difficulties. However, it does spell out the basic idea of retrenchment, that is, a step that must be taken to reduce business expenses. The Ministry of Human Resources, Malaysia, has defined the word in the ambit of labour law, including closure situations. It states that retrenchment arises from "several factors such as closure of business, restructuring, reduction in production, mergers, technological changes, take-over, economic downturn and others", the causes of redundancy arising from factors such as global economic slowdowns (Muniapan, 2015), declining profits (Muniapan, 2006), change in the nature of work (Parasuraman, 2004), or change in contractual terms of service (Todd & Peetz, 2001). Thus, employers maintain a prerogative to reorganize or execute other kinds of cost-savings (Mohamed & Baig, 2012). The reader might ask how the employer balances these prerogative issues against its mandate to run the business in the interests of the investors by adapting adroitly and quickly to market fluctuations.

Managers describe managerial prerogatives, broadly, as the manager's claim to a right to manage. These so-called prerogatives are said to be entirely discretionary, (Storey, 1983, p. 65) apparently on the basis of managers' high levels of skill. Due to the necessarily bureaucratic and hierarchical nature of managerial prerogatives, management appears in practice to ignore how a prerogative claim might be circumscribed heavily by the administrative law, the industrial relations law and by the general law. This may represent a serious disengagement with both the private and public law.

In the light of these issues, the question arises as to whether employers are terminating workers in Malaysia, actually after having made poor or unsustainable business decisions, but apparently under the specious guise of a claimed unfettered prerogative of retrenchment. Argument tries to show that employers exercising mere prerogative claims necessarily leads to capricious termination decisions, and that redundancies must instead be grounded entirely in law.

The research paradigm is legal analysis, and the research methodology is therefore library research. The article is structured in the logical order of major sections on (a) Principles of Retrenchment, (b) Explaining Retrenchment, (c) The Malaysian Laws of Retrenchment, and, (d) Procedure for Retrenchment.

The configuration of the various Malaysian rules suggests the state had recognised the likelihood of underlying employer unreasonableness, *mala fides* and capricious departures from the LIFO requirement. Companies may, in actuality, retrench workers purely to solve errors in their management structure.

Principles of Retrenchment

Though retrenchment is an exercise of a managerial prerogative, and there is no legal provision that can prohibit any company from cutting their workforce. However, there are certain salient points within employment related regulations that set conditions when conducting any retrenchment exercise. For instance, Section 60N of the Employment Act 1955 clearly states that if there is a situation arises for staff reduction, then the company must retrench their foreign workers first. The Termination and Lay Off Regulations 1980 under Regulations 5(1) indicates that if an employee is not provided a minimum of 12 days' work continuously or pay 12 days' wages in 4 weeks shall be deemed that he/she has been "laid off". Regulation 6 further states that employers are obligated to pay lay off benefits based on the following conditions: (a) 1 – 2 years of service - 10 days' wages for each year of service; (b) More than 2 years – 5 years - 15 days' wages for each year of service; and, (c) More than 5 years - 20 days' wages for each year of service

The Industrial Relations Act 1967 on the other hand provides an avenue for employees who may feel that the retrenchment is conducted in a *mala fide* manner or without valid reasons or as a window dressing with the intention to hire foreign workers. Section 20(3) provides an opportunity for the retrenched employee to file case for 'unfair dismissal' and claim for reinstatement. For employees who

are not covered by the Employment Act 1955, they can file their case and seek any possible remedy if they are not paid any lay off benefits. There are some cases of which the Industrial Relations Court has instructed employers to pay retrenchment benefits.

Explaining Retrenchment

Economic crises bring about layoffs, hiring freezes, and temporary or permanent closures of business divisions. Institutions such as the United States Army, Hewlett Packard, Schlumberger, Microsoft, JP Morgan Chase & Co., or Procter and Gamble, among many others, announced massive layoffs in 2015 (Fortune et al, 2015). Likewise, out of the 1208 executives interviewed by Bain & Company's 14th Management Tools & Trends survey, 61% resorted to downsizing as a management tool (Bain et al, 2013). This suggests that, in times of economic difficulties, the most prevalent strategy for managing human resources is downsizing (Cascio, 2002; Chadwick, et al, 2004; Luan et al, 2013; Trevor et al, 2008; Tsai et al, 2008; Zatzick et al, 2009), to ensure company performance (Luan, 2013) and an attempt to survive and compete in the global economy (Bhattacharyya, 2005).

The Industrial Court has handed down an abundance of awards involving retrenchment. All its awards observe the principle that the reorganization of business is a function within the power and prerogative of the management and no arbitrator should intervene with a *bona fide* exercise of that power. It is not up to the courts to dictate to the management the number of workers it should have. The argument that the company was merely profiting from downsizing had not been accepted either, as it was not necessary to show loss in order to justify retrenchment. The Court, while recognizing the right, rather than prerogative, of the employer to determine the size of his workforce, has however consistently maintained that it must be convinced that the exercise of that power was carried out without any semblance of victimization or unfairness. For example, in *Wha Hay Mooi v Acterna Malaysia Sdn Bhd* ([2010] 2 LNS 0002 (Award No. 2 of 2010)) ([2010] 2 LNS 0002), Khadijah Mahmud, Chairman of the Industrial Court stated:

> The company has the right to reorganize its business for reason of better economy or better management and to retrench any personnel found to be redundant. When the company reorganizes its business operation, the company is entitled to economize its operations including reducing labour court. It is the company's right and privilege to structure its operation in the manner that best fits its requirements. The court finds that the reorganization of the company was a bona fide need and as such the court has no reason to interfere with the company's prerogative ([2010] 2 LNS 0002).

Due to retrenchment, job security may be at stake, which can be a distressing experience inflicting severe economic hardship on affected workers (Mohamed & Baig, 2012). This leads to a worker's shattered life, as he or she is deprived of his major source of income (Benach, 2014), leaving him financially and psychologically distressed. A retrenched worker would face difficulty in finding another job with similar status, and the labor market would be flooded with other job seekers possessing very similar job skills and work experience. Thus, many retrenched workers would not be able to change from one job to another with complete ease.

The effect of job loss would become more apparent if the worker had been in service for a long time and if his job involved only specific skills, which might be of little use to potential new employers (Maslach, 2001). Workers who are unable to use their skills in their new employment, are likely to experience psychological adjustments (Giger, 2011). Coping with these problems, in turn, can create an enormous amount of physical and mental stress, which may contribute to further social and psychological disorders (Giger, 2011). This could lead to dissatisfaction with life and general psychological depression, which increases with continued unemployment (Bester, 2018).

The stability of employment is generally dependent on the economic situation of the country. Although Malaysia is a developing country, it is not spared the impact of globalisation. Over the last three decades the Malaysian economy has experienced tremendous economic development, but with the nation's main commodities prices, such as for rubber, tin, palm oil, among others, falling sharply (Afroz, 2003).

In Malaysia, for example, in 1986 the price of major export commodities, such as rubber, tin and palm oil fell sharply (Afroz, 2003). In consequence of this, the Malaysian economy started undergoing an economic decline, with jobs becoming increasingly scarce. Several large companies, previously considered to be stable, underwent retrenchments. The later economic recession in 1997 was the worst Malaysia had ever experienced. It emanated principally from a financial crisis and stock market collapse, with a massive reversal of foreign capital flow, which had in turn dramatically affected the economy of the country (Thavalingam, 2009).

The September 11 incident in 2001, in the United States of America, had worsened conditions for the Malaysian business community. Being an export-orientated economy and one of the leading exporters of semiconductors and air-conditioners, Malaysia suffered the effects of the drop in exports to major buyer countries such as the United States.

Two years later, the coalition forces' war on Iraq, led by the United States, and an outbreak of severe acute respiratory syndrome (SARS), also adversely affected the Malaysian economy (Thavalingam, 2009). This resulted in slump in business that led many of the biggest corporations into trouble, because of their severely reduced profits. They suffered big losses, some even having to restructure or reorganize their businesses through take-overs and mergers. The worst affected suffered business closures. This caused a rise in unemployment, owing to retrenchments in many sectors of the economy. Newcomers to the labour market found it even more difficult to get jobs. The hardest hit sectors were mostly in manufacturing, commerce, transport, communication, finance and other business services (Aminuddin, 1999). However, the retrenchment of workers on grounds of redundancy is a difficult area of labor law as it has to do with the industrial relations. It raises concerns about economic efficiency, industrial autonomy and social justice (Ramayah, 2004). Also, if the employer carried on business during times of difficulty, it might lead to a situation where both the employer and the workers would be at risk of losing their livelihoods. Therefore, in terminating the employment of some workers, thereby saving both the business and the employment of the remaining employees, it is necessary to restructure the organization (Ariffin, 1997).

In Malaysia, the existing provisions on retrenchment are scattered through regulations, codes, Ministry guidelines and decided cases. Retrenchment of workers cannot be done solely using the labor law, as the courts cannot intervene with the management's decisions of how many employees a company should have and how many should be retrenched (Mohamed & Baig, 2012). As the employer is entitled to organize his business in the manner he considers best, so long as the managerial power is exercised bona-fide, the decision is immune from examination even by the industrial court. However, the industrial court is empowered, and indeed duty-bound, to examine the facts and circumstances of the cases to determine whether retrenchment was procedurally fair (Mohamed & Baig, 2012). Although the code may not be legally binding, the Industrial Court encourages compliance with the Code. Should there be any blatant disregard to the Code, the Industrial Court may conclude that the retrenchment exercise was carried out mala fide and for other collateral purposes. For example In *Kurnipulan Jetson Bhd v Tai Ai Ling* ([2000] 3 ILR 377), the termination of an employee was apparently justified on the ground that the claimant's position was redundant. The Industrial Court observed that the evidence before the Court suggested that the company was financially stable and the fact that one of its subsidiaries was facing financial problems cannot be adopted as an excuse to justify the retrenchment of the employee employed by the parent company. The Court then ruled that there was a breach of the Code of Conduct for Industrial Harmony when the company had failed to consult her or give her early notice of a possible situation of retrenchment and found that she was victimized ([2010] 2 LNS 0002)

Normally, redundancy will lead to the retrenchment of workers. Retrenchment must be carried out according to the prescribed procedures. Unless it is done in line with the requirements of labour law and court practices, the retrenched employees may invoke s 20 of the Industrial Act 1967 and bring an action against the employer for wrongful dismissal. In determining whether the employer has made the right decision in exercising retrenchment, the court will normally look into two main factors as described in the case of *Radio & General Trading Sdn Bhd v Pui Cheng Teck & Ors* ([1990] 2 ILR 242) that is: first, did redundancy situation arise leading to retrenchment; and second, if there is a redundancy situation, whether the retrenchment is done in conformity with the accepted standards of procedure. According to labour law, retrenchment is considered justified if it fulfils these four criteria:

it must be bona fide; it must comply with the collective agreement; it must comply with the statute; and, it must observe the "last in first out" ('LIFO') principle (Award 243 of 1990).

Also, In Malaysia, the Employment (Termination and Lay-off Benefits) Regulations 1980 (the 1980 Regulations), enacted pursuant to s 60J of the Employment Act 1955, provide legislative protection to employees for involuntary termination of employment. The above Regulations are applicable only to certain categories of employees covered by the Employment Act 1955, as specified in the Schedule to the said Act. Workers who do not come within the purview of the Act may have their legal rights protected in a collective agreement, and in the absence of any specific provision in individual contracts of employment, will not be entitled to any termination benefits in the event of retrenchment. For example, in the case of *Harris Solid State (M) Sdn Bhd and Ors v Bruno Gentil Pereira & Ors [1996] 3 AMR 3546; [1996] 4 CLJ 747*, the court held that, where the termination of the claimants was started to be on operational grounds, and the claimants were all union members, it was actuated by victimization and unfair labor practice.

Retrenchment of workers on grounds of redundancy is a difficult situation as it involves employees who have done no wrong. They are, in most cases, to be regarded as competent and loyal workers to be dismissed due to economic needs. Therefore, the procedure involved in making an employee redundant should be carried out properly and the employee must have been justifiably dismissed. To avoid a claim of unjustified dismissal, an employer must be able to prove that the redundancy was genuine and that it followed a fair procedure in implementing the redundancy. For example, in case of *Gabungan Persahaan Minyak Lengkap Sdn V Heng Mee Oo (1990) 2ILR 33* Radio & General Trading Sdn Bhd v Pui Cheng Teck & Ors, where the claimant was made redundant but the job with the same duties and functions remained, retrenchment was held to be not genuine. Therefore, termination of an employment contract must flow from justifiable grounds of redundancy and this includes grounds of redundancy, which must be bona fide and untainted by unfair labour practice. An employer's unilateral declaration of redundancy must be justified on the basis of genuine commercial reasons and the decision to dismiss must be done in good faith and carried out with fairness (Mohamed & Baig, 2012).

Third, as for provision of termination benefits, the term 'termination', in industrial law, refers to the termination of the employment relationship. The employer may terminate the contract when retrenching the employee. In Malaysia, the Employment (Termination and Lay-off Benefits) Regulations 1980, ('the 1980 Regulations'), provide legislative protection to employees for involuntary termination of employment. The above Regulations are applicable only to certain categories of "employees" under First Schedule of the Employment Act 1955. This Act only applies to manual laborers, meaning those whose wages are RM 2000 or below. Workers who do not come within the Act may have their legal rights protected in a collective agreement, as concluded by the employer and the workers' trade union. However, those not governed by a collective agreement, and in the absence of any other specific provision in individual contracts of employment, will not be entitled to any termination benefits, in the event of retrenchment (Mohamed & Baig, 2012). Also, when a redundancy situation has caused a worker's retrenchment, the affected worker must receive retrenchment benefits based on the length of his or her service with thes former employer. The aim of these benefits is to help the employee cope with the difficulties of job loss and to act as a reward for loyalty and service to the company. Therefore, there is a need to critically examine the formulations for compensation of these employees.

The Malaysian Laws of Retrenchment

In Malaysia, the laws of redundancy are embodied in statutes. The Employment Act 1955 and Employment (Amendment) Act 1998 requires the employer to give adequate prior notice of retrenchment. S. 12(3)(c) states that the minimum statutory notice to an employee shall be as per s. 12(2), providing it shall not be less than the following:

a) four weeks' notice if the employee has been employed for less than two years

b) six weeks' notice if the employee has been employed for two years or more but less than five years;

c) eight weeks' notice if the employee has been employed for five years or more.

The employer may also make a payment, in lieu of prior notice, which must be equivalent to the notice given. In default of this requirement, the employer may be liable for prosecution under s 99A of the Employment Act, which carries a maximum fine of RM 10,000.

According to the First Schedule of this Act, a person is an employee under the Act if his or her wages are less than or equal to RM1,500 per month, or is a member of an excluded categories. Otherwise, the situation is governed by the employer applying all the terms and conditions stated in their contract of service.

The Act also entitles employees to certain retrenchment benefits, based on their employment terms and conditions, unless the collective agreement is silent on retrenchment notice and benefits, so that the provisions of the Act should prevail. Section 60J provides that the Ministry can order the employer to pay termination, lay-off or retirement benefits. Regulation 3(1) of the Employment Regulations (Retrenchment and Lay-Off Benefits) 1980 provides that the employee should be compensated, whenever terminated or retrenched, and his or her employment was not less than twelve months. There are categories of employee who may be exempted from receipt of this payment. They are as follows.

a) whose service under the contract of employment is less than twelve months

b) whose contract of service has been terminated by reason other than retrenchment or lay-off, for example due to retirement, misconduct or voluntary termination by the employee

c) if the employee 's contract of service has been renewed, or if he is re-engaged by the same employer under a new contract of service has been renewed, or if he is re-engagement by the same employer under a new contract of service on terms and conditions which are not less favourable than the previous contract, and the renewal or takes effect immediately upon the expiry of the previous contract of service

d) If within seven days from the date of expiry of the termination notice, the employer has offered to re new or to re-engage the employee under the new contract of service on terms and conditions which are not less favourable than the previous contract, and the renewal or re-engagement takes effect on or before the termination date and the employee has refused to accept the offer without any reasonable excuse.

Regulation 6 states further that the number of days of wages entitlement, for each year of employment is as follows:

(a) 10 days between one and two years' service

(b) 15 days between two and five years

(c) 20 days f the employee has served for more than five years

The Act has also laid down guidelines for selecting types of employees to be retrenched. According to s 60N of the Employment Act 1955 (Amendments 1998), when exercising retrenchment, the employer shall not terminate the services of the local workers unless he has first terminated the services all foreign employees working in a similar capacity to the local employees.

Procedure for Retrenchment

In retrenching the employee due to reorganizing or redundancy, the employer has to follow The Code of Conduct for Industrial Harmony 1975 where Clause 20-24 of the Code emphasizes redundancy and retrenchment. The Code, in the document on “Areas for co-operation and agreed industrial relations practices” provided under Clause 7, stipulates the guidelines for employers in the event of redundancy and retrenchment. When redundancy is imminent, the Code recommends that the employer should take steps to minimise reduction of workforce by adopting the following measures:

- Limitation on recruitment;
- Restriction of overtime work;
- Restriction in number of shifts or days worked in a week;
- Reduction in the number of hours of work;
- Re-training and/or transfer to other departments/work.

The code also recommends that prior consultation should be made with the employees and the trade union before steps are taken to reduce the workforce, i.e. if retrenchment becomes necessary, the employer should adopt the following measures:

- Provide early warnings to the workers concerned;
- Implement schemes for voluntary separation and retirement including payment of redundancy and retirement benefits;
- Retire employees who are beyond their normal retirement age;
- Spread termination of employment over a longer period;
- Ensure that no announcement on retrenchment is made before the workers and their representatives or trade union have been informed.

The code also encourages the employer to select employees to be retrenched in accordance with some objective criteria. Such criteria should be worked out in advance with the employees' representative or trade union, as appropriate.

Although the code may not be legally binding, the industrial court encourages compliance with the code, the industrial court may conclude that the retrenchment exercise was carried out mala fide and for other co-lateral purposes.

Also, he should follow the process the certain procedures that has been provided by the Employment Act 1955 and Court of Industrial Relation IRA Act 1967. Besides the Code the employer has to follow the principles of LIFO as a basis to select the employee(s) to be retrenched. However, for foreign workers, the principle of although senior, must go first (FWFO) rule is applied. The LIFO principle states that:

> All things being equal, the employee with the least number of years' service should be the first employee to be identified to be retrenched (*Radio & General Trading Sdn Bhd v Pui Cheng Teck, Gan Sek Teng, Foo Say Tuan & Goh Tok Eng* ([1990] 2 ILR 242).

It ensures that the senior employee is rewarded for his loyalty and lengthy service. The junior who is retrenched, although will suffer some hardship as a result of the loss of employment, will find it less difficult to secure or retain for another job when compared with a senior member of the workforce (Parasuraman, 2004). It is fair not only on the employees but also on the employer. Retrenchment in accordance with the LIFO principle will be less costly to the employer, in terms of retrenchment benefits that are payable (Chen, 2007). For example,

An early exposition of this principle may be found in *Sharikat Eastern Smelting Bhd v Kesatuan Kebangsaan Pekerja-pekerja Perusahaan Logam Sa Malaya* (Award No 16 of 1968) wherein the Industrial Court made the following observation in respect of this principle:

> It is well-established and accepted in industrial law that in effecting retrenchment, an employer should comply with the industrial principle of last come first go unless, there are some valid reasons for departure. This means that the employer is not entirely denied the

> freedom to depart from that principle but that he can only do so for sufficient and valid reason.

The principle of LIFO is to avert the discrimination of employees in retrenchment exercises. The principle of LIFO accords with the principle of equality and unlawful discrimination guaranteed by Art 8 of the Federal Constitution, which precludes persons in a similar situation from being treated differently. LIFO operates on the premise that management should retrench the latest recruit in a particular category.

Firex Sdn Bhd v Cik Ng Shoo Waa ([1990] 1 ILR 226) provides a clear illustration of the principle of LIFO. The Court held, inter alia, as follows:

> When an employer claims to have dismissed a workman in accordance with seniority, i.e.' last come, first go, he must show that he made the choice from among workers doing like work. If the evidence shows otherwise, the dismissal may be regarded as not being made bona fide.

The limitations of the LIFO principle were elaborated by the industrial Court in *Association Pan Malayisa Cement Sdn Bhd v Keatuan Pakerja-pekerja* Perusahaan *Simen (M) Perak* ([1986] 2 ILR 1612), which adopted the principle laid down by the Supreme Court *in Indian Cable Co Ltd v Its Workmen* (1962 (1) LLJ 409). In the *Associated Pan Malaysia Cement Case* ([1986] 2 ILR 1612) the learned Chairman observed that "the LIFO principle is subject to two limitations; Firstly, it operates only within the establishment in which the retrenchment to be carried out. Secondly, rule applies only to the category to which the retrenched the workers belong. According to the Chairman:

> The "establishment" should be construed in its original sense, which means "the place at which the workmen are employed, and it is of essence of the concept of an industrial establishment that it is local in its set-up.

LIFO requires the employer to select the more junior employee in the category of employment for retrenchment. Category refers to a particular description of work and is distinguishable from a grade or scale within the employment structure. Category essentially means similar or like work; while a grade is generally closely linked to the salary structure (Malhotra, 1973).

Malhotra in *The Law of Industrial Disputes* provides a distinction between grade and category:

> The doctrine of last come first go' has to be borne in mind only with respect to different categories of workmen working in an industrial establishment and not to the whole industrial establishment (Malhotra, 1973). There is, however, a clear distinction between a class or category and a grade. The class or category is a group in which posts of particular description are included and the grade has reference exclusively to scales of pay. The word 'category' is therefore, not synonymous with grade. Category means a class or trade such as turner, motor mechanic, electrician, etc. But for this safeguard, very absurd and anomalous situations giving rise to a spate of industrial disputes would arrive (Malhotra, 1973).

An illustration of the distinction between category and grade is also found in *Guoman Port Dickson v Ahmad Akmal Mohd Yunos* ([2001] 1 ILR 875). In this case, an assistant beverage manager was retrenched. He claimed that there was a breach of LIFO as he was more senior in service to another Chinese restaurant manager who joined the hotel after him. The Industrial Court ruled that there was no breach of the LIFO principle as the Chinese restaurant manager was employed as full manager, which was a position higher and more senior in rank (or grade) as compared to the position of assistant beverage manager. Similarly, in case of *Dr HC Huang Consultancy Engineers Sdn Bhd v Lim Choon Ntia* ([2000] 2 ILR 330), there was no breach of LIFO as the employees who were retained were employed as draughtsman and clerks, which were of a different category from the claimant, who was employed as an engineer.

If there was failure to comply with the LIFO principle, the retrenchment is *prima facie* invalid and the dismissal would be without just cause or excuse, unless the employer is able to show reasonable and cogent excuse for departing from the principle. The Industrial Court would then have the power to order reinstatement of the employee to his former position together with the necessary monetary compensation.

Where there is only one employee in a particular category, LIFO would not be applicable. This is because there would be no basis for a comparison to be made when there is only one position to be discharged. This can be seen in case of *Behn Meyer & Co (M) Sdn Bhd v Puan Jariah bte Baharum & Anor* ([1994] 1 ILR 165), where the Industrial Court held that the LlFO principle could not apply to the claimant as she was the only employee in the category of executive in the insurance department in the company (Thavarajah & Low p. 30).

Thavarajah & Low (2009) stated that the following must be borne in mind when applying the LIFO principle.

> 1. The employer is merely required to examine the length of service in the category and not the entire length of employment in the organization.
>
> 2. The application of the LIFO principle is limited to within the establishment in which the retrenchment is to be made and the category to which the redundant employees belong. (Thavarajah & Low, 2009, p. 50).

In the 1986 case of *Associated Pan Malaysia Cements Sdn Bhd v Kesatuan Pekerja-Pekerja Perusahaan Simen(M) Perak* ([1986] 2 ILR 1612), the company retrenched 21 of its employees in an economic downturn, which had caused excess production capacity and low consumption of the company's cement product. The company selected for retrenchment 21 of its most junior lorry drivers, however 12 of those drivers were more senior to some lorry attendants. The company then offered the 12 drivers alternative employment as lorry attendants. Eleven of them accepted this offer. Therefore, 11 lorry attendants with less service were retrenched in favour of the lorry drivers. The union claimed a violation of the LIFO principle, arguing that the company did not take into consideration its employees at another location. The Industrial Court held that it would be impractical to consider the employees at the other location, because the two works were entirely separate operations. It also ruled as reasonable that the company viewed the lorry drivers and lorry attendants as one unit (Malhotra, 1973).

Malhotra (1973) viewed the above case such that the company had the inherent right to select how the workmen would be retrenched so long as its decision is not capricious, without reason or is *mala fide* or actuated by victimization or unfair labor practice. The selection must not be unfair between or among comparable employees, for such reasons related to trade union activities or against an agreed procedure with the trade union or against customary practice, such as the principle of "LIFO".

A starting point of the court’s inquiry would be to examine the corporate history to the company, and its affiliation with its related companies. One should also enquire whether the companies operated their business alike, whether the terms and conditions of employment were generally consistent with each other, whether an employee was transferable within the group companies and whether the composition of the board of directors of the respective companies was substantially similar (Chen 2007).

The employer must produce documentary evidence to satisfy the Industrial Court that it had cogent reasons for departing from the rule. Attendance records, performance appraisals, the quantum of annual increments or bonuses or the lack of the same, in addition to warning letters, minutes of counselling sessions, etc., are some of the evidence. In the absence of any such documentary evidence, it is unlikely that the Court would endorse the departure from the LIFO principle. The Court would be reluctant to rely on subjective or purely oral evidence. There are few circumstances on which LIFO principles may be departed. The circumstances are per Article 22(b) of the Code of Conduct of Industrial Harmony, which stipulates selecting employees in accordance with objective criteria, as had been worked out in

advance with the employee's representative or trade union, including: efficiency; ability and qualifications; length of service and status; age; family matters; national public policies.

In the 1991 Malaysian case of *Malaysia Shipyard & Engineering Sdn Bhd D Mukhtiar Singh & 16 Ors* [1991] 1 ILR 626, the Industrial Court expressly endorsed an independent selection criterion adopted by the company, instead of the LIFO principle. The company applied selection criteria using a point system that weighed age, performance, medical, and disciplinary records of the employees in the organisation. The Industrial Court held that the onus of proof was on the employer to show these selection criteria were fair. The employer was also expected to act reasonably in determining the issues.

Conclusion

The research question was whether employers were terminating workers in Malaysia, actually after having made poor or unsustainable business decisions, but apparently under the specious guise of a claimed unfettered prerogative of retrenchment. Argument tried to show that employers exercising mere prerogative claims necessarily led to capricious termination decisions, and that redundancies must instead be grounded entirely in law.

There is no Malaysian legal provision that can prohibit any company from cutting their workforce, suggesting the possibility of employer capriciousness. There are only regulatory fetters on retrenchment procedures. Employees feeling that the retrenchment was *mala fide* or without valid reasons could file cases for 'unfair dismissal' and further claims for reinstatement.

The principle that the reorganization of business is a function within the power and prerogative of the management and no arbitrator should intervene with a *bona fide* exercise of that power, suggests that it is not based in law, but solely in some measure of an employer's bona fides. The employee argument that the company was merely profiting from downsizing had not been accepted by the courts. This is because it is unnecessary for the company to show loss in order to justify retrenchment. This shatters the employer argument that retrenchments are solely for economic reasons beyond their control.

Thus, retrenchment must be carried out according to the prescribed procedures. The Code of Conduct for Industrial Harmony 1975 may not be legally binding, but the industrial court encourages compliance with the code. When employers do not comply with it, it is open to the industrial court to conclude that the retrenchment was *mala fide* or for other unstated collateral purposes. The employer is therefore also constrained into producing documentary evidence to satisfy the Industrial Court that it had cogent reasons for departing from the LIFO rules for retrenchment. Overall, employers are expected to act reasonably in determining the issues prior to retrenchment.

The configuration of the rules suggests the state had recognised the likelihood of underlying employer unreasonableness, *mala fides* and capricious departures from the LIFO requirements. Companies may, in actuality, retrench workers purely to solve errors in their management structure.

Abstract

The aim of this paper is to explore the COVID-19 hashtag data from March 2020 Twitter posts. We conduct emotional profiling of anger. We use bigram analysis and the analysis of the tweets volume dynamics. We treat COVID-19 as a black swan for the stock market in which we enter the behavior of Twitter users around the selected hashtag. Presented exploratory data analysis suggests that anger comes during periods of increased Twitter activity. Thus, we argue that it can influence the decision-making process of an individual.

Keywords: social media, Ekman's model of emotions, stock market, COVID-19

Introduction

Since March 2020, many works related to COVID-19 has been created (Kufel, 2020; Lyu et al, 2020). In the field of social sciences, they are related to mental health, behavioural economics, or sociology. They introduce data mining methods to process large body of textual data from social media. Twitter was chosen as the narrative space because it represents a fertile field for user opinions, expert views and news (Xue et al, 2020). In the time of lockdown social media replaced real communication and increase the intensity of the discussion. New cyber landscape of pandemic has formed. For example, English tweets related to COVID-19 hashtag reach over 600,000 in March compared to the S&P500 hashtag in previous years (around 250,000 tweets). This represents a significant percentage of world's (public) discussion. Twitter become a mirror of emotions and social mood. We can treat it as a representative sample for pandemic case studies.

Social media data are multidimensional. They capture trends on a global and local scale (Ahmed et al, 2020), presents the opinion of writers and influence the emotional state of readers. Information varies in quality, from official news to disinformation – especially during a pandemic a community is susceptible to conspiratorial thinking (Sharma et al, 2020). Scientists considering about the role of feelings in creating and spreading information as well as related them social groups in social networks (Pastor-Escuredo, 2020). As shown in next section, papers from area of data science and behavioural economy tends to detect and predict patterns in pandemic but not asking why pattern exists. Explanatory theory is complementary for these researches and must be carry also. During the time of uncertainty, the emotional processes that taking place in virtual community even more influence decision-making processes and feelings of individual. The susceptibility of an individual is strengthened by higher role of emotions than rationality in thinking. In such processes, social media is one way to calm down after posting your thoughts (Ahmed et al, 2020). From the other side emotions and sentiment are driven forces for dynamics of information and can affect some real indicators – especially stock market when information is conductive to spread of emotions such as fear or angry.

Summary up, big social dataset has some psychologically meaning and attributes by which we can insight on human behavior and behavioural changes (Michalak & Samek, 2020).

With this, we present a pilot study on the mining patterns of psychological categories of human behavior during a pandemic based on big social data. The aim of this paper is to explore the COVID-19 hashtag data from March 2020 Twitter posts and present emotional profiling with an example of anger. Anger is an emotion that should naturally arise during events like a pandemic.

Emotions

According to Plato, we are driven by two opposing forces. One of them is calm and predictable, the other is wild and unpredictable. Due to its unpredictability, the second is dangerous. Since the time of Plato, many philosophical and later scientific works on the nature of emotions has been written. Nowadays, although the biological mechanism of emotions is known we still are not able to fully control or correct them. Thus, due to the evaluative nature of emotions, they significantly influence behavior and decision-making process. Emotions cause somatic responses, behaviors and thoughts (simplifying) according to the direction of emotions, positive (pleasant) valance or negative (unpleasant) valence. For example, fear activates the sympathetic nervous system, a component of the autonomic nervous system responsible for mobilizing the body (Pocock & Richards, 2006). Consequently, increased levels of cortisol and epinephrine accelerate the heart rate, breathing, stomach tightness, increased muscle tension, etc., which we read as stress and act within the fight-or-flight response. Decisions are not directed by an analytical and balanced thinking but result from the stimuli that appeared seconds ago, thus they are biased by high error. Summarizing, emotional processes are psychological processes which are the source of emotions and guide cognition, behavior and determine the importance of objects, events, information as well as other peoples. This is one of many ways for understanding emotions, as there is no consensus which way is right. Depending on the cognitive orientation, emotions are identified with feelings while others separate them. In effect they introduce such terms as mood, affect, sentiment. With the increase in the resources of big social data, the discussion on terminology went beyond the framework of psychology. In NLP there is the concept off sentiment analysis. Over time, emotions recognition, emotion processing or emotion analysis was added.

The global experience of 2020 COVID-19 pandemic provide us to observe people's attitudes in case of new stimuli, previously not observed. First, the scale of the epidemic is unprecedented. Second, the socio-economic changes that have occurred since previous similar events are one of the factors determining the incomparability. Third, real-time communication (social media) influences certain phenomena such as disinformation, affective contagion or drives the dynamics of information. The presented factor are additional stimuli that affect the emotional states. Situation of COVID-19 caused many different emotions and feelings among individual, as well as social mood.

Among all emotions, in research, the value of anger and irritability caused by reports on COVID-19 has become particularly important. These reactions are strong enough to determine the decision-making process of individual as well as group. We use the commonly Ekman's model of emotions. Paul Ekman came to important conclusion that facial expression of certain emotions is the same in representatives of different cultures and different times. This universality of facial expressions made him recognize that the emotions that cause it are typical for homo sapiens, regardless of the phenotype developed by the individual. Ekman originally pointed out that these universal emotions are wrath, grossness, scaredness, joy, loneliness and shock. Then he expanded the list of basic emotions (positive or negative) by these that are not necessarily encoded in facial muscles. It consists of amusement, contempt, contentment, embarrassment, excitement, guilt, pride in achievement, relief, satisfaction, sensory pleasure and shame (Ekman, 1999). The listed emotional states arise in the limbic system (or paleomammalin cortex) which, is short, organizes the organism's vegetative processes related to its survival, and therefore regardless of will and consciousness. Action patterns are aimed at regaining a sense of control, concentrating energy, realizing from suffering, suppressing other emotions (Alia-Klein, 2020). It seems to that anger, scaredness, loneliness and shock can arise during pandemic and can be amplified by information from social media.

The underlying cause of irritability is fear and other stressors. It can be assumed that although irritability is not controlled, it can be easily predicted by knowing the factors that cause it. Complications in emotional profiling begin when irritability has a long duration. Then we use the term anger, the components of which are more complex. The components include thoughts and behaviors, the content of which is determined by socio-cultural factors. Phenotypes are created based on educational environments; models presented to an adolescent shaping their own patterns. For irritability, the range of potential human attitudes can be included in catalogue, but reactions caused by anger contain a huge number of variables. Also, there is a difficulty in precisely determining the duration of irritability as well as anger and ambiguity, when the reaction is still uncontrolled by the individual (irritability), and when it is potentially controlled (anger). Hence, in this article both irritability and anger are treated the same, although the authors are aware of the controversial nature of this connection. There are at least two aspects to the discussion. The first is the terminological aspect: since anger is processed by thoughts and is controlled, it is a feeling rather than an emotion. Irritability, on the other hand, occurs only in the extra-voluntary space. Secondly, understanding both responses at the level of neuroscience: irritability and anger arise in other areas of the brain (Toohey & DiGiuseppe, 2017). Activation of anger involves cortical structures, e.g. frontal lobe of the brain. Of course, both reactions are related to the activation of the sympathetic nervous system.

Methods

The state of art is in initial phase, the activities are aimed at getting to know the feelings that appears in the network and the nature of messages. The description is mainly statistical in nature. Part of the works focuses on the semantic layer (Fetzer et al, 2020) when others on network layer and the effectiveness of communication network (Stella et al, 2020). This affect the set of used methods and the metadata that describes the tweets. A review of the literature indicates that many topics covered in presented tweets are characterized by following groups: (1) restrictions and their effects, (2) mental and economic consequences of lockdown, (3) reopening. As indicated, there are many aspects and social issues that peoples raise in tweets therefore each of the categories is examined with sub-topics (for example: travel possibilities, symptoms). Relevant messages are filter by Twitter API with various keyword sets: *corona*, *wuhan*, *#coronavirus*, *#covidoutbrake*. A significant number of studies focus on the development of coronavirus dataset (general dataset, domain-dependent set, question set or language set). Methods including topic models and topic distribution over time, sentiment analysis and sentiment distribution, network analysis. Thus, analysis tends to explanatory analysis with most common words, descriptive statistics of tweets (sub) volumes, n-gram representation and visualization. Latent topics are covered with LDA algorithm. In order to know trends in discussion and its dynamics by percentage shifts in topics/clusters. Sentiment analysis is carried out by using the lexicon-based approach (NRC Emotion Lexicon, LIWC), as there is no domain-specific learning set with good quality.

Our goal focused on findings anger in the dataset and describe it by its dynamics and the semantic layer. Based on literature review, an exploratory data analysis was adopted. The 1st step is the process of data cleaning and normalization. Natural language is characterized by a high degree of redundancy so dimensionality reduction to relevant feature set is first step taken in sentiment analysis. Big social data are noisier due to: (1) Twitter characters (RT, @, #, URLs and emoticons), (2) informal nature of communication and (3) multilingual content. Adequate sub-steps have been taken to manage these problem groups, including: Twitter filtering with English restriction, removing numbers, removing Twitter characteristic, dealing with negation and contractions, lemmatization. The 2nd step is sentiment analysis based on lexicon approach. A two-step procedure was carried out for sentiment analysis process. For first stage VADER dictionary from NLTK module was used. VADER provides positive and negative scores. Second, for a set of negative valance messages NRC lexicon has been used. The NRC Emotion Lexicon is a list of English words and their associations with eight basic emotions (anger, fear, anticipation, trust, surprise, sadness, joy, and disgust) and two sentiments (negative and positive). The annotations were manually done by crowdsourcing (Mohammad). Tweets due to limitation are problematic set for sentiment analysis. With the disadvantages of the dictionary approach, the two-step procedure was intended to ensure lowest possible of errors. For anger set,

visualization was performed, the fraction was calculated, and a representation of bigrams was presented.

Results

Data Description

Data was collected for the period of March 2020 as the month in which most of the restrictions were introduced. By hashtag *#covid-19* we collected 555, 958 tweets (in English) marked with date and ID. Aggregated data with daily time window are presented in figure one. As shown, we are interested in two periods. First, March as whole month. Second, from 31 March to 1 April – when a significant outlier in dataset is observed. After aggregation to the one-minute window in the outlier period some variability can be seen (Figure 2) in the series. Thus, the topics discussed were intensively commented, with emphasis on jumps (in plus and in minus). This imply strong social emotions. Figure 3 presents top bi-grams extracted for period of March in negative-valanced tweets. By bigram we represent the general issues covered in tweets. Figure 4. presents the dynamic of anger emotion in tweets in the period of outlier. Due to disadvantages of the dictionary approach (no information about the structure of sentence, lack of domain dependent word list) scores are divided for 4 groups. Groups 1-2 represents tweets for which results oscillated between different emotions (like fear and anger or joy and anger). Groups 3-4 are most representatives. Figure 6 presents percentage of total tweets by minutes for 2-4 scores. Score 1 has been omitted for the clarity of the visualization. It accounts for 30-40 percent of the total in minute-window.

Fig. 1: All daily tweets divided for: 'positive- red', 'negative – blue', 'all – orange' category for March 2020 (calculated using the lexicon-based approach by Vader in NLTK module).

Fig. 2: Tweets aggregated to the one-minute time window for March 31th.

Fig. 3: Top bigrams in March 2020.

.

Fig. 4: The volume of tweets related to anger emotion (identified by NRC-Lexicon) for March 31th

Fig 4 and Fig 5 show the dynamics of the tweets for the outlier on March 31st. On the basis of the ratings obtained from the NRC dictionary, 4 levels of anger were distinguished. Blue line or anger 1 are messages that on the basis of the score were classified as anger, but also classified under other emotions, such as fear or joy. The scoring was unclear. The red line or anger 4 indicates messages for which the function assigned a grade only in the anger class.

Fig. 5: The volume of tweets related to anger emotion (identified by NRC-Lexicon) in March

Fig. 6: Percentage of tweets for 2-4 anger scores in total sum of tweets for March 31th

Fig 1-6 show the dynamics and semantic layer of public emotion of anger. For March 31, the average number of tweets sent per minute is 108 with standard deviation = 33,5 and coefficient of variability = 31%. N for anger 1 score = 39 799 with min-max(2;86), n for anger 2 score = 11541 with min-max(1;33), n for 3 score with min-max(2;65) and n for anger 4 score = 806 with min-max(0;6) score. Fig 1 we conclude that the discussion regarding COVID-19 is intense. Fig 2 indicates that the daily dynamics of tweets may have a biological rhythm. Anger plays a significant role in world conversation, especially during outlier periods (Fig 5). However, Fig 6 indicates that the number of messages with the highest score obtained from the NRC dictionary is small.

Discussion

Ahmed et al (2020) showed that fear was the dominant emotion in March after lockdown. However, Kumar et al (2020) points out that anger and fear play a key role in network. Pandemic is related with stress and trauma and effects of which will be visible in long run. British Psychological Society [www1] suggest that some can be affected by stress, anger and confusion after lockdown. Additionally, these emotions are related with lack of contacts, lack of reliable information or loss of finance. So, we observe here multiple stress factors and other negative valance emotions factors. The presented conclusions show us the users which are flooded in information negatively affecting them. Our study is limited to one-month window and emotion of anger; hence the representatives of the data sample is questionable. Since we focused on psychological profiling of anger, we extracted some insights for future research. As Kumar et al (2020) and BPS we can emphases the occurrence of anger during first stage of pandemic. Throughout March, 3 periods corresponding to outliers can be identifies (visual assessment). By mining of anger in these set we conclude that periods of outliers are only in which anger is detected (Fig 5). We argue that these outliers are reactions for WHO and governments decisions. The first outlier arrives on March 13th, two days after the WHO declared a pandemic, on the

day of the suspension of arrivals from Europe in the US, in the time that Europe becomes the epicentre of the coronavirus pandemic. Second outlier comes after the US president introduced his social distance recommendations. From March 31 to April 1, it is difficult to clearly identify a global decision causing a sudden jump in data. In-depth analysis of bigrams in March 31th points that they are similar to those explored for whole month (Figure 3); 'death tool': 1046, 'stay home': 355, 'death rate': 351, 'social distancing': 302. It is possible that the intensity of the discussion since March 31 has increased significantly for most periods, the study will be further developed. Feeling of angry is related to top bigrams, which seems to be related with group of official news from news agencies, WHO or governments, like social distance, death, new case. In summary, social emotions revolve around current events. Research shows similar results (Stella et al, 2020; Lucas et al, 2020; Samuel et al, 2020). Based on Fig. 2 we can assume that intraday data cyclicality may be caused by biological rhythm. According to Sharma et al (2020) we also confirm that references to 'fake news' are a significant part of Twitter discussion. Bigram 'toilet paper' refers to changes in the structure of the basket of goods. Especially visible in the first period of pandemic. These are caused by changes in Maslow's pyramid of needs (Suh et al, 2020). These concern not only the structure of products but also their quantity. Suh et al (2020) makes a conclusion that pandemic affects all category of needs: psychological, socioeconomic and physiological.

Most people report mild to moderate anger anywhere, from several times a day to several times a week. We argue that a large number of tweets in which words may indicate anger can exacerbate this tendency. Also, the dynamics of the social network can increase the affective contagion process. Lerner, Gonzalez, Small, and Fischhoff (2003) identified anger as the emotion most commonly experienced by U.S. citizens in response to the 9/11 terrorist attacks. Which proves that anger naturally occurs in extreme situations. When the emotion of anger arises, it can influence people's perceptions, shape their decisions, and guide their behavior, while they remain angry, regardless of whether the decisions are related or not. to the source of their anger. Thus, anger is likely to be a frequently used judgment cue, especially at the implicit level. So-called short route of information transfer makes these decisions impulsive and biological at the same time. Anger last longer than irritability and is backed by thinking. An individual may search for information's about the source of the treat and (caused by them) correct his own attitude. Moreover, while irritability mechanism will rather incline people to withdraw from activity, anger may lead to its pre-formulation, to the search for alternative forms of activities, for example investors may concentrate on searching alternative investor strategies. Third, once activated, anger can colour people's perceptions, form their decisions, and guide their behavior while they remain angry, regardless of whether the decisions at hand are related to the source of their anger. In the aftermath of the September 11th attacks, experimentally inducing anger not only influenced U.S. citizens' risk perceptions about terror-related events (e.g., being attacked) but also their perceptions about routine events (such as getting the flu) and their policy preferences concerning matters of life and death (Lerner et al, 2003).

Economic perspective for future research

The individual's behaviours are at the core of the interest of many scientists given that those behaviours are critical to understand sudden changes of many economic indicators. Some of their thoughts and emotions can develop expectations and attitudes that influence future economic decisions. Investor sentiment is one of crucial determinants of stock market dynamics. Early works confirms the relationship between events and changes in the stock market. Emotions, herding behaviour can lead to deviations in price from their fundamental values. Herding behavior and emotion is a particularly interesting direction of analysis during the pandemic periods, when investors can share similar emotions and be susceptible to large-scale financial panic. Rehan et al (2020) study if short term stress can move stock market indicators, including volatility. Study reveals that there is increase in volatility in stock market after first death case of COVID-19 in country level. Anxiety which occurs during pandemic affect trust in financial markets. In many papers google search is treated as proxy for anxiety. However, they do not interpret why such set of information is considered for building a proxy variable for psychological attributes. Day et al (2020) investigate impact of COVID-19 cases and deaths, local spread and Google Search on the US stock market. They suggest that those indicators have impact on abnormal stock process and exhibit cause relation on price volatility. The spread of the new coronavirus

has significantly affected economic activity on a global scale by set of restrictions and reduction of economic activity (production, services and trade). Yarovaya et al (2020) argue that lockdown and quarantine cause long-term consequences that are still hard to estimate.

Some of the reactions can be written into the concept of Taleb's black swan theory. Taleb (2007) introduced the concept of black swan and cognitive biases around black swan events. Black swan is an event that meet the following 3 attributes: (1) Event is an outlier because it lies beyond the realm of regular expectations and there are no indications that it may occur. (2) Black swan has an extreme impact on the social and economic space. (3) After the phenomenon occurs, we try to explain the phenomenon to make it predictable. Yarovaya et al (2020) treat COVID-19 as black swan, but their analysis does not include emotions. According to Yarovaya et al (2020) because of 1-3 black swan makes precise prediction challenging for existing risk models. Still, research into the pandemic as black swan is low. Stock markets typically react of a lot set of events, but pandemic is a case of non-financial event. Some studies investigate natural diseases (and see them as black swans), hurricanes and earthquake as well as Ebola and SARS cases on financial markets, but none of them had that large scale. Albulescu (2020) argues that reduction of COVID-19 effects (in medium to long term) should start with understanding the demand side of market. The COVID effect for consumers is showing up in reduction of incomes, job insecurity, weak economic stability and affect their economic moods. He emphasizes the harmful effect of low economic sentiment. Through the prism of anger, we have indicated how public information influence economic anxiety. It generates additional stress, fear and angry, causes panic which lead to uncertainty. As a result, for example, may increases volatility in stock market (Albulescu, 2020). McKisney (www2, 2020) argue that economic sentiment affects expectations and forecasts. Depending these can change day by day according to information flow. Two types of information affect the demand side. First, the number of officially published news about COVID-19, infection and death cases as well as new restrictions, ad its already described in works. This part of information set affects the emotional state. Creating initial attitude towards pandemic. The second set is about big social data. a flood of data in which an individual move significantly affects his condition and activities. Uncontrolled, it can create a collective mood in which individuals react together under the influence of emotions

Conclusions

Based on big social data, we have indicated that anger is activated during periods of increased activity in social media and its related to the typical news (death cases, social distance, fake news, new cases). We treat pandemic as a black swan case for stock market. A description of the mechanisms of emotions was carried out along with their in-depth understanding to help in the interpretation of the impact of emotions from Ekman's model on the stock market. We used anger as an example, as shown in early works like Bollen et al (2011), Ekman's model is widely used in analysis but without in-deep interpretation. We are trying to fill this gap by interdisciplinary research. Upcoming months will be full of analysis of peoples aroused by the danger of COVID-19. Our analysis concerns the exceedingly early stage of global pandemic. Currently, after several months, we are dealing with second wave of COVID-19. People in a situation of long-term treat have a natural tendency to adapt. Thus, the impact of COVID-19 on economic dynamics will also be different. Over time, they get used to the harsh environment, and consequently the biological response (irritability) weakness, giving the way to anger and other responses. We show the psychological mechanism of anger during the early stage of pandemic with explanation of its biological basis.

The presented study is a pilot study. The study showed emotional profiling for feelings of anger during the COVID-19 pandemic. In the future, the study will be conducted for the period from January to May 2020, taking into account pandemic decisions made by authorities for selected countries. The authors will also perform emotional profiling for all emotions in the Ekman model. The study is important in explaining the volatility of financial markets during a pandemic. Big social data has great potential. They make it possible to collect data on an unprecedented scale, with appropriate granularity. The analysis of emotions allows you to know their dynamics with semantic layer.

Abstract

Purpose: This article is dedicated to the formation of a pension system based on fundamentally new accumulative principles. Each state applies its own model of accumulative system. The future of senior citizens, which, in the conditions of demographic distortion, makes up a significant percentage of the population, depends on how balanced its construction is. **Methodology**: The following research methods and techniques were applied during the study: evaluation and data processing, statistical method, study of economic processes, determination of patterns and trends in their development, identification of areas of further improvement of these processes. **Conclusions**: Assessment of the parameters of the introduction of the accumulative component of pension insurance allowed to determine the advantages and disadvantages of the chosen model in Ukraine. Special attention should be paid to the factors, that will affect the efficiency of the system: the architecture of the system; macroeconomic situation; the state of the domestic stock market; level of administrative costs; problem of securing the money savings of citizens. **Implications**: The accumulative system is vulnerable to economic and financial risks, which requires special care in developing the conceptual framework for its implementation and paces additional responsibility on the government for the consequences of such steps.

Keywords: Pension Reform, Accumulative Pension System, Legislative Proposal, Pension Treasury, Investment Potential.

Introduction

The world experience of the evolution of the pension system shows that the main source of provision for the elderly has long been a solidary pension system based on distributive principles. However, negative demographic trends, economic and social changes in society have raised questions about the efficiency and financial capacity of national pension systems and have been the impetus for pension reform in almost all countries. The main task of such reform was the transition from a solidary pension system (social protection) to a multilevel one, with an emphasis on cumulative financing principles.

Cite this Article as: Mykhailo KUZHELIEV, Valerii PAVLIUK, Vita FEDYNA and Alina NECHYPORENKO " Formation of the Accumulative System of Compulsory State Pension Insurance in Ukraine" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Ukraine was not an exception. The concept of pension reform, enshrined in the Laws of Ukraine of 09.07.2003 “On Compulsory State Pension Insurance” № 1058 IV and “On Non-State Pension Provision” № 1057-IV, provided for the change of the traditional one-tier system of state pension insurance to three-tier, in which solidarity system is supplemented by two cumulative levels. Though the pension reform started in 2004, the configuration of the multi-level pension system in Ukraine has not been implemented. Therefore, the problem of finding an effective model of the accumulative component in the domestic pension system becomes extremely relevant.

The need for a scientific search for a mechanism to protect against the global problem of population aging has attracted considerable attention from Western and domestic economists to study the experience of reforming pension systems. Scientific papers on the theory, methodology, and organization of funded pension systems often analyze the impact of pension assets on the economic development of the state and social welfare. Particularly, the works of A. Borch-Sapan, F. Coke, J. Winter, V. Roik, R Holtzman, R. Goldsmith, R. McKinnon. Problems of formation of the accumulative component were considered in the works of A. Fedorenko, O. Koval, V. Rudyk, G. McTaggart.

The reform of pension systems, including the funded component, has been the subject of much theoretical and empirical research initiated by the World Bank, the European Union, the Organization for Economic Co-operation and Development, the International Organization for Pensions (IOPS), the International Labor Organization (ILO), and the United States. International Development (USAID), etc.

Analysis of scientific publications and recent research shows that the study of the problem of introducing a mandatory funded pension system in Ukraine is insufficient. The problem of a comprehensive study in which the funded pension system would be a separate object of study is ignored by domestic economics.

Therefore, the purpose of this paper is to analyze the domestic bill on the introduction of the accumulative system of compulsory state pension insurance in terms of proposed approaches to the mechanism of its introduction, identifying the advantages and disadvantages of the proposed model and factors influencing its efficiency.

Conceptual principles of introduction of the accumulative system of obligatory state pension insurance

Accumulative pension systems have a special place in the configuration of the pension system. Since the distribution (solidarity) component does not have financial stability in the context of an aging population, it is the system based on the cumulative principle of financing that has become a mechanism of protection against demographic distortions for most countries.

In the systems of this group, pension contributions are accumulated in the individual pension accounts of the participants, and together with the investment income received from the investment of pension savings, create a personal fund, which in the future becomes a source of pension payments.

As a result, the introduction of the accumulative level in the pension system allows:
- to increase the total amount of pension benefits;
- to strengthen social justice due to the direct dependence of the size of the pension on the labor contribution (insurance record) of the person;
- to inherit pension savings from the relatives of the insured person;
- balance the demographic and economic risks inherent in the distributive and accumulative components of the pension system, respectively;
- to create a powerful domestic source of investment resources for the growth of the national economy.

Nowadays, legal framework that governs functioning of the accumulative pension system (the second tier) in the national pension model is the Law "On Compulsory State Pension Insurance" and the Law "On Measures to Legislate Pension Reform." However, even though the concept of the accumulative

component of the compulsory state pension insurance was declared 16 years ago, it has not actually been implemented on practice yet.

The main reasons for postponing the introduction of the second accumulative level include the following: (1) non-compliance with the conditions set out in the Final Provisions (first edition) of the Law of Ukraine "On Compulsory State Pension Insurance" (The Law of Ukraine, 2003) (balanced budget of the Pension Fund; GDP growth by 2% during the last two years; funding provision from the state budget for the lost part of insurance funds in the solidarity system due to the transfer of insurance contributions to the Accumulative Fund; adoption of legislation on the accumulative pension insurance system); (2) lack of political will; and (3) vector change from structural to parametric in pension reform.

We believe, that further postponement of the introduction of the accumulative system of compulsory state pension insurance may lead to an imbalance in the current pension system and, consequently, to the deterioration of the financial and social conditions of the elderly population.

As practice shows, according to the UN, Ukraine is among the 15 countries with the fastest declining population. Low birth rates, high mortality (especially among the working-age population), and migration rates will reduce the population by 28% by 2050, while the share of people over 60 will increase to 32% (United Nations, 2020). Along with the increase in the share of the elderly, pension expenditures will also increase. The actual budget deficit of the Pension Fund for the period 2014-2019 increased from UAH 15.652 billion. to UAH 183.419 billion, which is 4.6% of GDP (State price (online calculator), 2020). The average amount of the assigned pension payment as of January 1, 2020, was UAH 3,082.98; 69% of pensioners receive pension benefits for UAH 1501-3000 (The Pension Fund of Ukraine, 2020). For 20 years, the non-state pension system has not become a significant addition to the joint pension system both in terms of the level of coverage of the population with voluntary pension programs (7% of employees) and the number of pension benefits.

In our opinion, a comprehensive pension reform, a key element of which should be a mandatory funded pension system (subject to a balanced approach to the choice of its model and implementation strategy), can address both decent pensions and economic growth through the accumulation of large long-term national financial resource.

One of the main conditions for the start of operation of the second level of the pension system is the adoption of a separate law that will regulate the introduction of the accumulative system of compulsory state pension insurance in Ukraine. During the period 2006-2019, several bills on the introduction of the second tier of the pension system were submitted to the Verkhovna Rada, most of the provisions of which contain the same approaches to determining the mechanism for introducing the accumulative component, as well as regulating relations in this area. In our opinion, the legislators did not get a single look at the type of organizational model of the system, the administrative body, the number of pension contributions, determining the number of participants, the need for state guarantees of savings.

The research conducted by the authors (Kuzheliev, 2015; Kuzheliev, Fedyna, 2017) provides an opportunity to indicate the stages of evolution of the legislative path of development of models of the accumulative pension insurance system (Fig. 1).

Fig.1: Stages of the evolution of models of functioning of the accumulative system of compulsory state pension insurance

Source: built by the authors based on materials Kuzheliev & Fedyna, 2017.

On December 7, 2019, the Verkhovna Rada registered the draft Law № 2683 "On Compulsory Accumulative Pension Provision", which testified to the emergence of a new financial institution in the country - the Pension Treasury and a change in the ideology of the pension system. From now on, the pension insurance system has its mechanisms for the accumulation and distribution of funds and, most importantly, has involved other social partners - employers and workers - in financial participation in addressing pension issues.

Draft Law №2683 proposes the creation of a centralized system of accumulative pensions, which should be based on four key entities: The State Tax Service of Ukraine, The Pension Fund of Ukraine, The Central Administrator, and The Pension Treasury with the further assignment of certain functions (Fig. 2).

Fig. 2: Functions of key subjects of the accumulative system of compulsory state pension insurance

Source: built by the authors on the basis Draft Law of Ukraine "On Compulsory Pension Insurance", 2019.

According to Article 1. ROM "On mandatory funded pension provision" funded system of mandatory state pension insurance "is based on the principles of accumulation of funds <<…>> in the Pension Treasury or authorized private pension funds and financing the costs of pension payments on the terms of provided by this Law" (Draft Law of Ukraine" On Compulsory Pension Insurance", 2020).

The accumulative component of the pension system is a specific product. On the one hand, it (namely the subsystem - mandatory state-funded pension insurance) can be defined as an integral part of social insurance, and on the other - private pension funds are subjects of the financial services market, which prompted to take as a basis for building the second level of the pension system combined model. The basic parameters of the mandatory accumulative level of the pension system are shown in Table 1.

Factors influencing the efficiency of the functioning of the accumulative component of the pension system

The introduction of a funded system of compulsory state pension insurance is a complex and socially acute process that requires a balanced approach to the choice of implementation strategy and tools. International experience shows that the mandatory funded pension system should be (Mandatory funded pension systems (level 2). International experience: lessons for Ukraine, 2020; OECD Pensions Outlook 2012):

- cheap (centralized administration of pension accounts and low operating costs);
- downtime (reasonable restriction of investment choice, passive investment in index funds and life cycle funds);
- reliable (adequate financial regulation aimed at protecting participants).

Table 1: Analysis of the model of the accumulative component of the system of compulsory state pension insurance

Criterion	The main provisions of the draft Law №2683 "On Compulsory Accumulative Pension Provision"
Type of organizational model	combined - Pension treasury or authorized private pension funds
Subjects	Pension Treasury; Central Administrator; Pension fund; authorized asset management companies; authorized custodians; authorized administrators; authorized private pension funds; authorized insurance companies; payment representatives; system participants; audit firms that audit the financial statements of the Pension Treasury, the Central Administrator, and authorized entities.
Participants	participation is mandatory for all employees before reaching retirement age
Voluntary participation	provided
Acceptance of risks	participant - independent choice of the type of pension portfolio of the Pension Treasury with a simultaneous selection of an authorized asset management company

The number of costs for services	1. The annual maximum amount of expenses for the payment of services of service entities, which are reimbursed from the pension funds of the participants, may not exceed 0.5 percent of the net value of such assets; 2. The annual maximum amount of expenses for the services of the Council and the Administrative Office, the payment of the cost of liability insurance may not exceed 0.1 percent of the net value of such assets
The amount of deduction rates	payment on a parity basis of employees and employers, respectively, in the ratios - (1% + 2%); (2% + 3%); (3% + 4%), (4% + 5%) at the employee's choice
Administration	Central administrator
Executive authority	Administrative office designed for organizational and technical support of the activities of the Board of the Pension Treasury and the Pension Treasury
State guarantees of savings	Missing - The Pension Treasury, the Pension Fund, the Central Administrator, the authorized non-state pension fund are prohibited from assuring or guaranteeing the growth of income of system participants (paragraph 6 of Article 4, paragraph 5 of Article 24, paragraph 6 of Article 34, paragraph 4 of Article 57 of the ROM)
Types of pension products	one-time pension payment; accelerated payments; program payments; lifelong pension.
State regulatory and supervisory body	National Commission on Securities and Stock Market
The need for primary funding	62789250,75 UAH

Source: compiled by the authors on the basis Draft Law of Ukraine "On Compulsory Compulsory Pension Insurance", 2019.

All this considered, the following points should be taken into account:

- system construction architecture;
- macroeconomic situation;
- the state of the domestic stock market;
- level of administrative costs;
- system of guaranteeing the preservation of pension funds.

System architecture. The structure of the proposed mandatory funded pension system should be simple and clear to system members.

Appearance on the pension market of a new financial institution of the Pension Treasury, which will be managed by two structures at once - the Central Administrator (administration of participants' accounts) and the Pension Treasury Board (case management and control), as well as the Administrative Office for organizational and technical support of the Pension Council Treasury and Pension Treasury - complicate the understanding and perception of the participants of the mechanism of the system.

In our opinion, it is more expedient to entrust the functions of the Central Administrator to the Pension Fund, which already carries out personalized accounting of information in the system of compulsory state pension insurance, has a well-established mechanism of the administrative system for quick registration of all insured persons, provides control over insurance premiums.

Macroeconomic situation. Accumulative systems function well in ascending economic cycles and vice versa - in descending ones are completely inefficient. This is due to the investment component of funded pension systems. To be profitable in downward economic cycles, the investment must outpace the market, which is extremely difficult, if possible at all. Conversely, in ascending cycles, non-fatal

miscalculations in asset management, although reducing the efficiency of investment, still leave it profitable (Koval, 2012; Hinz and Holzmann, 2005).

Considering the abovementioned, we believe that the fulfillment of the requirement of the economic growth of the country remains relevant for the creation of appropriate conditions for the introduction of the savings system.

The state of the domestic stock market. Analysis of world practice shows that the funded pension system can have a powerful impact on the socio-economic situation in the country. According to A. Borch-Sapan, F. Koke, J. Winter, the favorable effect of pension reform is the fact that it entails more intensive economic growth by increasing the rate of accumulation and efficiency of the securities market (Borsch-Supan, Koke, & Winter, 2005).

The development of the financial market and the efficiency of the funded pension system are interdependent: the growth of pension savings stimulates the development of the financial market, the developed financial market through an expanded set of financial instruments of proper quality, and sufficient market capacity - increases pension capital.

It should be noted that experts have some concerns about the ability of the domestic financial market to absorb the assets of the savings system. The low capacity of the domestic stock market is confirmed by the structure and volume of trades on the Ukrainian Stock Exchange, wherein 2019 agreements on purchase and sale of securities were concluded for only UAH 3,840 million. (The Ukrainian Stock Exchange, 2020).

According to our calculations (Table 2), if the funded pension system is introduced according to the planned date in 2023, the amount of financial income from the payment of minimum insurance premiums to it in the first year will be 4155.646 million UAH. (the amount of the consolidated contribution is 3%).

Table 2: Investment potential of the accumulative system of compulsory state pension insurance

Year	Number of participants, persons	On average monthly salary, UAH	Remuneration fund, UAH million	The annual amount of the consolidated contribution (rate 1% + 2%), UAH million	The annual amount of the consolidated contribution (rate 4% + 5%), UAH million
2023	22547,34	12496,97	128998,41	4155,646	12752,631
2024	22078,84	13372,56	141042,14	4426,618	13475,210
2025	21610,34	14248,15	153085,87	4687,077	14155,731
2026	21141,84	15123,74	165129,61	4937,019	14794,187
2027	20673,33	15999,33	177173,34	5176,445	15390,581

S*ource: calculated by the authors based on data of the State Statistics Service of Ukraine*

The dependence of the amount of pension savings on the size of the deduction rate is shown in Fig.3

Fig. 3: Financial potential of the accumulative pension insurance system depending on the size of the deduction rate, UAH mln.

Source: calculated by the authors based on data of the State Statistics Service of Ukraine

In our opinion, it is necessary to pay special attention to the problem of declining asset value, which other countries faced during the financial crisis (the phenomenon of "investment trap").

This is a phenomenon in which people who retire after the crisis receive lower pension benefits than "pre-crisis" retirees, although they have similar and sometimes higher participation rates in the system-seniority and pension contributions. Given this fact, it is necessary to provide mechanisms that would differentiate the riskiness of pension assets for different age groups of participants in the savings system.

The level of administrative costs. According to international practice (Hirose, 2011; Orenstein, 2013), high administrative costs (commissions for services of administration, investment, and storage of pension funds) reduce the future amount of pension benefits. The total increase in commissions from 1 to 2% of the average annual value of pension assets reduces the size of future pensions by an average of 20-25%.

Because retirement benefits are delayed, losses due to a failed investment or large administrative costs may not be immediately apparent.

Pension guarantee system. The existence of a mechanism for the protection of pension savings and state guarantees is one of the key points in the introduction of the accumulative system of compulsory state pension insurance.

Given that the system is mandatory for participation, initiated by the state, the mechanism and conditions of introduction are enshrined in law, the state in the person of the government is responsible for macroeconomic indicators of development, the state must be the ultimate guarantor of from their depreciation (Kuzheliev, Fedyna, 2018).

In the context of the problem under consideration, we consider it expedient to create a Fund for Guaranteeing the Preservation of Pension Savings (by analogy with the Fund for Guaranteeing Deposits of Individuals).

Analysis of the bill "On mandatory funded pension provision" for key parameters allowed to determine the advantages and disadvantages of the proposed model of the funded system of mandatory state pension insurance (Table 3).

Haste in the adoption of the Bill, ignoring the problematic issues may discredit the very idea of funded pension insurance and lead to a further imbalance of the current pension system and the deterioration of the financial and socio-economic condition of the state.

During the global crisis of 2008, the weaknesses of second-tier systems became quite apparent and many countries had to deal with rising current government spending on the minimum and social pensions by reducing funded pension contributions or abolishing second-tier systems altogether and transferring accumulated pension assets. to the state pension system (USAID Financial Sector Transformation Project, 2018; Ortiz (ed.), 2018).

Another aspect that revealed the weakness of the funded pension system was gender. The system does not take into account the de facto unequal employment situation of certain social groups of workers, especially women. As their length of service is shorter, their incomes are lower than those of men, and the amount of insurance premiums they will pay to the savings fund is lower, the amount of pension savings will also be lower. According to experts, in 20-30 years the pension of women will be 20-30% of the pension of men (Fultz & Steinhilber, 2003; Kozlovskyi (ed.), 2018; Fedyna, 2017).

Table 3: Advantages and disadvantages of the model of the accumulative system of compulsory state pension insurance

Advantages	Disadvantages
Payment of contributions on an equal basis with employees and employers	Mandatory participation of all categories of working people until they reach retirement age without the possibility to leave the system for citizens who have 5 years or less to retire
A diverse choice of pension products (one-time pension payment; accelerated payments; program payments; lifetime pension)	Inability or unwillingness of citizens to choose appropriate investment strategies due to low financial literacy
Limitation of administrative costs	High costs associated with the implementation of the storage system
Strict restrictions on authorized capital	Scattering and duplication of functions among the main actors of the system
Centralized administration	Taxation of accumulative pensions
Existence of a liability insurance system for members of the Board of the Pension Treasury	Lack of state guarantees for the preservation of pension savings

and members of the board of an authorized private pension fund to third parties	Lack of gender mainstreaming
	Lack of a clear mechanism for accrual and payment of contributions
	Existence of one regulatory and supervisory body in the system - the National Commission on Securities and Stock Market
	Payment of the cost of liability insurance of members of the Board of the Pension Treasury and members of the Board of the authorized private pension fund at the expense of pension assets of system participants

Source: compiled by the authors based on data of Draft Law of Ukraine "On Compulsory Pension Insurance"

The funded pension system can help solve demographic problems in the long run and improve the adequacy of pension benefits, but only if it is properly built, properly managed, and regulated.

Conclusions

The current configuration of Ukraine's pension system is not optimal and necessitates the search for an alternative source of pension benefits, which can fully become its accumulative element. The accumulative pension insurance system allows to reduce the financial burden on state pension funds, create a long-term powerful source of financial resources, strengthen social protection, improve the living standards of the elderly. The increased vulnerability of the savings system necessitates special diligence in developing the conceptual framework for its implementation and places additional responsibility on the government for the consequences of such steps. Particular attention should be paid to those factors that will affect the efficiency of the system: the architecture of the system; macroeconomic situation; the state of the domestic stock market; a level of administrative costs; the problem of reliable preservation of citizens' savings.

Analysis of the model of the accumulative system of compulsory state pension insurance, proposed in the Draft Law "On Compulsory Accumulative Pension Provision", revealed both its strengths and those aspects of the provisions that need to be finalized:

- high additional costs associated with the introduction of the storage system;
- scattering and duplication of functions among the main actors of the system;
- the expediency of taxation of accumulative pensions;
- lack of state guarantees for the preservation of pension savings;
- lack of consideration of gender aspects;
- the presence of one body of regulation and supervision of the system - the National Commission on Securities and Stock Market;
- lack of a clear mechanism for accrual and payment of contributions;
- payment of the cost of liability insurance of members of the Board of the Pension Treasury and members of the board of the authorized private pension fund at the expense of pension assets of system participants.

Instead, the accumulative system of compulsory state pension insurance will be able to fulfill its dual purpose - to become a social stabilizer in the state through a source of additional pensions and provide the state with a unique national source of long-term financial resources.

Areas of further research will be the development of a mechanism for effective regulation and supervision of the subjects of the accumulative system of compulsory state pension insurance.

Impact of Revitalisation on The Tourist Attractiveness of the City

Anna GARDZINSKA

University of Szczecin, Institute of Spatial Management and Socio-Economic Geography, Szczecin, Poland, anna.gardzinska@usz.edu.pl

Agnieszka SAWINSKA

University of Szczecin, Institute of Spatial Management and Socio-Economic Geography, Szczecin, Poland, agnieszka.sawinska@usz.edu.pl

Abstract

Revitalisation contributes to the social and economic development of degraded urban areas. Moreover, the issue of revitalisation is addressed in terms of competition between cities over potential tourists. The revitalisation of urban areas improves the image of the area, ensures free use of the renewed rest and recreation zones by residents and tourists and contributes to the increase of tourist attractiveness. The area attractive for tourists in which revitalisation activities are undertaken is the city of Szczecin. The main aim of the article is to evaluate the process of revitalisation in Szczecin by the inhabitants of the city and to indicate its impact on tourist attractiveness. The diagnostic survey method was used to assess the impact. The survey was conducted using the CAWI technique among the members of social networking services associating the residents of Szczecin. The obtained results enabled the determination whether the city's residents notice the changes taking place in the city as a result of revitalisation activities and how they assess these changes as well as their impact on the tourist attractiveness of Szczecin.

Keywords: Revitalisation, Tourist Attractiveness, Tourism, City.

Introduction

Revitalisation is a complex process aimed at introducing spatial, technical, social and economic changes in degraded areas of the city. Moreover, this process contributes to the social and economic development of urban areas by increasing the income, employment rates of the residents and the value of property. As a result, numerous Polish cities consider revitalisation as an opportunity for growth and overcoming the crisis of the most damaged and neglected city districts.

The revitalisation additionally contributes to the increase of the tourist attractiveness of the city and an increase in the number of tourists. Historic urban areas, connected with the local community and its heritage, are usually revitalised. Revitalised spaces attract tourists because they are usually characterised by culturally rich spatial planning or a modern urban structure.

The revitalisation process takes place in many European cities, including Szczecin. The city centre has been distinguished as a unique area of revitalisation which, despite intensive utilisation, needs a surge in popularity and restoration of socio-economic value, monuments and the solution of current social problems.

The main aim of the article is to evaluate the process of revitalisation in Szczecin and to indicate its impact on tourist attractiveness. The results of the survey conducted among the residents of Szczecin indicate that the planned and implemented revitalisation process is only partially effective both socially and in terms of tourism.

Revitalisation and the tourist attractiveness of the city

The concept of revitalisation has already been defined very broadly in foreign and Polish literature. This is due to the complexity of the issues related to the transformation of degraded areas and the large variation in the interpretation of this process. Revitalisation is a concept used by geographers, sociologists, spatial planners, architects, urban planners as well as economists.

The source literature provides numerous definitions which describe revitalisation as the renewal of the urban area. According to the definition offered by S. Kaczmarek (2001, p.16), revitalisation is a sequence of planned activities aimed at economic recovery and a change in the spatial and functional structure of degraded areas of the city. Urban areas may be revitalised for various purposes, e.g. industrial, military, and transportation. Therefore, revitalisation may be understood as overall activities targeted at changes in the functioning of territorial units, especially in cities, of a social, organisational, ecological, planning and economic nature (Noworól, 2010, p.199). A similar opinion is expressed by many other researchers dealing with this issue, including Thomas, Bromley (2000, p. 1403-1429), Rofe (2004, p. 193-205), Markowski, Stawasz eds. (2007, p. 92), Czyżewska (2009, p.45-74), Lorens (2010), Webb, Webber (2017, p. 48-57).

Urban revitalisation is perceived as a coordinated process, jointly run by local authorities, local community and other participants under development policy, which is aimed at counteracting degradation of urban space and crisis phenomena, as well as stimulating development and qualitative changes, by increasing social and economic activity, improving living environment and protection of the national heritage, while maintaining the principles of sustainable development (Jarczewski (ed.), 2009). Revitalisation of an urban area may concern: degraded downtowns and multifunctional pre-war urban developed areas, post-industrial, railroad and post-military areas, blocks of flats (including especially blocks of flats constructed using large panel system-building technology), as well as the city landscape with particular emphasis on the public space system, including urban greenery.

The subject of revitalisation is also raised in terms of the competitiveness between cities over potential tourists. Revitalisation of urban areas improves the image of the area, ensures free use of the renovated leisure and recreation zones for residents and tourists, as well as contributes to the increase of tourist attractiveness.

As many authors emphasize, tourist attractiveness is a complex concept which is difficult to assess clearly. This is due to the fact that tourist attractiveness is determined by, on the one hand, objectively existing natural or socio-cultural conditions, and on the other, by their subjective perception by tourists. Tourist attractiveness should be understood as the properties of an area or an inhabited place resulting from a set of natural or non-natural features that arouse interest and attract tourists. tourist attractiveness may be universal or relative. Universal attractiveness is used when the area is attractive to the general public, whereas its relative nature concerns specific forms of tourism, e.g. attractiveness – usefulness for cycle or nautical tourism, etc. (Kurek, (ed.), 2007).

According to Gołembski, tourist attractiveness consists of tourist values, the condition of the natural environment, effects of its protection and transport accessibility of the area (Gołembski, (ed.), 2002). In the source literature, many authors emphasise that tourist attractiveness is a subjective concept, as a given area is assessed through the prism of own experience, beliefs and values (see e.g. Potocka, 2009, Nowacki, 2012, Nowacki, Kruczek, 2020).

Tourist attractiveness concerns diverse spatial units: regions, inhabited places and also cities. tourist attractiveness of a city consists of a complex system of elements as well as internal and external conditions (see Fig. 1).

Fig. 1: The factors of tourist attractiveness of a city

Source: A. Kowalczyk, 2005, Nowe formy turystyki miejskiej, Prace i Studia Geograficzne, Tom 35, Wydział Geografii i Studiów Regionalnych, Uniwersytet Warszawski, Warszawa, p. 159.

The main element of the city's tourist attractiveness is its tourist resources. Their quality determines the attractiveness of the area to the greatest extent, which additionally depends on the infrastructure and services, ensuring the satisfaction of the needs of the tourist, interesting leisure activities and transport accessibility in the area. In terms of functionality, the recreational, sightseeing and specialist resources may be indicated. Recreational resources are such complexes of natural environment elements which ensure the best possible regeneration as well as physical and mental well-being. These include a set of essential features, which need to be present to ensure conditions conducive to recreation, and a set of beneficial features which increase the recreational value of the area. The essential features include: climatic and weather conditions, silence, high level of forestation, the presence of aesthetic qualities of the landscape. Beneficial features include: special qualities of the landscape, conditions for active recreation, favourable bioclimatic conditions and medicinal qualities (curative waters, curative gases). Sightseeing resources include material objects or expressions of spiritual culture which the tourists are interested in seeing. Specialist resources allow the performance of various forms of recreation and qualified tourism.

At present, it is assumed that an important element influencing the tourist attractiveness of the city is manner of tourist traffic organisation and especially the promotion and service of tourists. Hughes (2003) believes that the “4 A” components, often mentioned by authors analysing the attractiveness of tourism (attractions, amenities, accommodation, access), should be supplement by another element – “atmosphere” (after: Kowalczyk, 2005).

According to Seweryn (2002), the tourist attractiveness of the area is a collection of those features, phenomena and objects which attract with a certain uniqueness and uncommonness, and at the same time allow the achievement of the purpose of the trip and satisfaction of the needs related to travel and staying in a given area. This definition of tourist attractiveness emphasises its elements which in the best possible way meet the primary need that has led to defining the purpose of the trip (tourist resources) and elements satisfying secondary needs result from the change of the place of stay (adequately developed transport, accommodation, food and complementary infrastructure).

Characteristics of the research area

Szczecin is the capital of Zachodniopomorskie province (see Fig. 2) and one of the most attractive cities for tourists in Poland. It is located in Western Pomerania, in the Pobrzeże Szczecińskie macro-region, comprising 11 mesoregions, 4 of which are part of the city: The Lower Oder Valley, Goleniowska Plain, Szczecin Hills and Beech Hills. The city has a large area (over 300 sq km) and a diverse natural environment, in which water and green areas dominate (25% and 20% respectively).

Fig. 2: Location of Szczecin on the map of Poland
Source: http://mapa.livecity.pl/miasto/Szczecin,0977976/10.10.2019

The unique location of the city at the mouth of the Oder River flowing into Dąbie Lake and the Szczecinski Lagoon, in a relatively short distance from the Baltic Coast and Berlin, contributes to its high tourist attractiveness. A major attraction of Szczecin, distinguishing it from other cities in the country, are the landscape values of the surrounding area: hills and large complexes of forests and landscape parks surrounding the city, the flat area of Międzyodrze with arms of the Oder River, numerous city parks with unique tree stands, monuments of material culture, museums, port areas, interesting spatial layout of the city and its buildings. The main element determining the structure and functions of Szczecin is its location in the estuarial area of the Oder River, which divides the city into three main parts: The left bank (city centre, recreation areas), the right bank (housing estates, recreation areas), and the Międzyodrze (industrial, storage and transport functions).

According to GUS [Central Statistical Office] data, in 2018 in Szczecin there were 55 accommodation facilities with 7,357 beds, of which 5,054 (69%) are year-round facilities (https://bdl.stat.gov.pl/BDL/dane/15.11.2019). The accommodation rate per 1,000 inhabitants is fairly high and amounts to 18.24. In 2018, approx. 925,383 tourists visited Szczecin, of which 350,321 (38%) were foreign tourists. The largest number of foreign tourists was from Germany. In comparison with the whole Zachodniopomorskie province, in 2018, approx. 20% of tourists used the Szczecin accommodation facilities.

Revitalisation Activities Undertaken in the City

Revitalisation activities are one of the tasks of local authorities aimed at improving the state of development and living conditions in crisis areas. Each city needs individual plans and methods to implement revitalisation activities depending on the economic or social situation. In order to enable the self-governments of communes [*gminas*] to carry out these tasks, a number of initiatives have been taken at the central level to organise the revitalisation issues. The adoption of the Act on revitalisation in 2015, which introduced statutory tools for the effective implementation of remedial processes, should be considered a crucial step. One such tool is local revitalisation programmes developed at the commune level.

The Local Revitalisation Programme for the City of Szczecin for the years 2017-2023 is in force in Szczecin. The Programme was adopted by resolution No. XXXVII/1098/18 of the Szczecin City Council of 30 January 2018. The document assesses the general situation in the city and provides a diagnosis of the social, economic, environmental, spatial, functional and technical areas. Using multidimensional ratio analysis, the most degraded areas of the city were identified and the areas on which revitalisation activities will be carried out were categorised. In respect of the designated areas, an in-depth examination of the revitalisation area was carried out, and a revitalisation plan was prepared, i.e. a set of objectives, courses of action, as well as targeted revitalisation projects and undertakings.

The proposed area of revitalisation in Szczecin comprises three adjacent housing estates located in the city centre: Centrum, Śródmieście-Zachód and Turzyn – consequently, single area of revitalisation within the administrative boundaries of these estates was designated. The main problems identified in the revitalisation area include (Local Revitalisation Programme for the City of Szczecin 2017 - 2023):

- unemployment and economic marginalisation of residents;
- population ageing and the outflow of residents outside the area of revitalisation;
- loss of economic function;
- deficiency of green and recreational areas;
- poor technical condition of residential buildings, low standard of apartments.

The list of main revitalisation projects specified in the Local Revitalisation Programme for the City of Szczecin includes, inter alia, renovations of tenement houses, construction of community centres, construction of day care centres as well as facilities promoting entrepreneurship and culture. The total value of projects planned for implementation in 2017-2023 is approx. PLN 257 million.

Test Methodology

The aim of the study, which has become the basis for this publication, was to determine how the objectives provided for in the Local Revitalisation Programme for the City of Szczecin are compatible with the residents' needs and whether, in the opinion of the residents, the implemented tasks increase the tourist attractiveness of the city. To this end, the diagnostic survey method was used. The survey was conducted in July and August 2019 using the CAWI technique among the members of social networking services associating the residents of Szczecin. 85 people agreed to participate in the survey[1]. The research tool was a questionnaire designed by the authors for the purpose of the study.

The following research questions were formulated:

[1] With small research samples, it is necessary to interpret the results with caution and refrain from generalisation. Nevertheless, such a sample provides a view on the presented phenomenon and contributes to further in-depth research in this area.

1. What has changed in Szczecin in recent years and which housing estates are undergoing the greatest changes?
2. How do citizens evaluate the activities carried out in the city?
3. What actions contribute to the increase of tourist attractiveness of Szczecin?
4. What should change in the city?

Structure indicators were used to obtain answers to the formulated questions. To recognise the significance of the relationship between the variables the correlation coefficient C – corrected Pearson correlation coefficient – was adopted.

Study Results

Among 85 respondents there were 58 women (62.8%) and 27 men (31.8%). The clear prevalence of women among the respondents may have been determined by factors, such as greater willingness to participate in this type of research or greater activity on social networking sites. The age structure of respondents is dominated by people in the 35-44 age range (Fig. 3). Almost every fourth respondent is in the 25-34 age group (23.5%), more than 25% of respondents are in the 45-64 age group. People under the age of 25 constituted only approximately 5% of the respondents. The fact of conducting the survey on-line and the interest in its subject matter certainly had some influence on such age distribution.

Fig. 3: Gender and age structure of respondents

Source: own work based on surveys

Almost 86% of the respondents are university graduates, only 13% completed secondary education. Approximately 45% of respondents live in the Prawobrzeze district, while every fourth respondent lives in the Srodmiescie or Szczecin-Zachod district. Only 10 respondents come from the northern part of the city.

At the beginning, it was examined whether the respondents noticed the changes occurring in the city and areas of these changes were identified (Fig. 4). All the respondents notice the changes occurring in Szczecin, and the main changes mentioned in the survey included: the management of unused areas (65%), followed by the development of outdoor recreation areas (56%) and renovation of tenement houses (45%).

Fig. 4: Identification of changes occurring in the city as a result of revitalisation

Source: own work based on surveys

Moreover, the inhabitants indicated that there are more bicycle paths in the city (35.3% of the respondents), as well as the infrastructure in parks, i.e. benches, shelters and lighting, has improved (30.6%). In this respect, however, it should be indicated that the respondents are not able to indicate whether the above changes are the result of revitalisation activities or, for example, the implementation of EU projects.

The respondents who indicated that the aesthetics of the tenement houses in Szczecin has improved significantly in recent years, also much more frequently positively assessed that the greatest changes are taking place in the Podjuchy district (table 1).

Table 1: Selected statistics depicting the relationship between the changes occurring in individual districts of Szczecin

FEATURE 1	FEATURE 2 - districts of Szczecin			
	Podjuchy	**Słoneczne**	**Załom-Kasztanowe**	**Majowe**
Aesthetics/appearance of tenements	C-Pearson_kor 0.29608 p-value 0.048382	-	-	-
Use of tenement houses for commercial purposes	C-Pearson_kor 0.4937 p-value 0.000593	C-Pearson_kor 0.29457 p-value 0.049597	C-Pearson_kor 0.44562 p-value 0.002205	-
Availability of transport	-	-	-	C-Pearson_kor 0.38877 p-value 0.008389

Source: own work

The respondents who indicated that tenement houses in the city are being utilised as commercial premises believe that the most significant changes are taking place in the following districts: Podjuchy, Sloneczne and Zalom-Kasztanowe. On the other hand, people who notice the improvement of transport accessibility believe that significant changes are taking place in Szczecin, in the Majowe housing estate.

Next, the respondents were requested to evaluate particular activities conducted in the city (Fig. 5).

Fig. 5: The evaluation of individual activities

Source: own work based on surveys

The respondents do not notice any changes in the improvement of the public transport system (bus, tram). The system of individual transport and the renovation of roads in the city were assessed negatively. The development of outdoor recreation areas was assessed as good, while the management of unused areas as very good.

According to the respondents, revitalisation activities mainly improve the image of the city (Fig. 6). This answer was given by almost 86% of respondents. More than half of the surveyed inhabitants (55.3%) associates revitalisation with greater opportunities for spending free time. Moreover, every third respondent noticed an increase in the number of tourists in the city and an improvement in housing conditions. The assessment of changes occurring in the city is not related statistically in a significant extent to any other feature of the survey.

Fig. 6: Areas affected by revitalisation

Source: own work based on surveys

Among the elements which directly enhance tourist attractiveness, resulting from the revitalisation activities carried out in the city, the respondents indicated the management of previously unused areas and the renovation of tenements. The living conditions in the city have been to the greatest extent improved on account of the improvement of the public transport system and the renovation of roads.

The respondents were also requested to suggest changes which should be introduced in the city of Szczecin and which would increase the city's tourist attractiveness and thus the number of tourists (Fig. 7).

Fig. 7: Suggestions of changes

Source: own work based on surveys

According to the respondents, the revitalization of Kolumba Street would increase tourist attractiveness of the city the most. It is one of the major transport routes connecting the northern and southern housing estates of Szczecin. The area of Kolumba Street is degraded in respect of social, infrastructural and functional aspects. The area has the potential to offer very good housing conditions as well as diverse cultural and recreational services. The respondents who pointed this out were additionally much more likely to assess positively the changes occurring in the city centre, and to indicate the need to develop the Miedzyodrze district, improve transport routes and increase the number of zones for families with children (Table 2).

Table 2: Selected statistics indicating the relationship between the proposed changes that should take place in Szczecin

FEATURE 1	FEATURE 2 – Renovation of Kolumba Street	
	C-Pearson_kor	p-value
Changes taking place in the Centre	0.32603	0.02894
Development of Międzyodrze	0.32138	0.031443
Improvement of transport routes	0.35041	0.018377
More zones for families with children	0.31408	0.035725

Source: own work

Among their own suggestions of changes that should take place in the city, the respondents indicated the construction of the Dąbie ring road and a second swimming pool in Prawobrzeże, further expansion of bicycle paths and connection of new paths with the existing ones, solving the problem of insufficient number of parking spaces in the city, renovation of tenement houses in Stołczyn (Szczecin district) and renovation of road surfaces.

Conclusions

Revitalisation has become a tool for many communes to renew degraded areas in the city. The revitalisation measures are to serve the residents directly, however, indirectly, through their influence on the tourist attractiveness of the city, they contribute to the development of tourism and increase the number of tourists. Renovation of neglected areas or giving them new functions, renovation of tenement houses (often located in the city centre) improves the aesthetics of the landscape and thus diversifies the tourist and recreational offer of the city.

Revitalisation activities carried out in Szczecin result from the assumptions of the Local Revitalisation Programme for Szczecin for the years 2017-2023. The revitalisation area was identified on the basis of multidimensional ratio analysis.

The survey conducted among the residents of Szczecin was aimed at determining whether the residents of Szczecin notice the changes taking place in the city and whether revitalisation affects the tourist attractiveness. The presented results clearly demonstrate that revitalisation is particularly valuable and significant for the development of the city. According to the respondents, this process contributes to the increase in the tourist and recreational attractiveness of Szczecin, but also affects the spatial development of the area.

On the one hand, the selection of the area to be revitalised in the city seems justified and homogeneous, supported by the values of individual indicators, while on the other hand, the city's residents notice the need to revitalise areas in the city other than those indicated in the Local Revitalisation Programme for the City of Szczecin. These include unused and undeveloped areas. The respondents indicated mainly Kolumba Street, the Międzyodrze area, as well as the airport located in the Szczecin-Dąbie district.

In the case of Kolumba Street, the tender procedure for reconstruction is to be announced in the autumn of 2020, while the tender procedure for the first project, carried out as part of the

modernisation of the road to the port of Szczecin and reconstruction of roads in Międzyodrze, was announced in early December this year.

The research may constitute a basis for more detailed analysis, the aim of which will be to examine the residents' awareness of the revitalisation activities carried out in the city and their impact on tourist attractiveness.

Acknowledgement

The project is financed within the framework of the program of the Minister of Science and Higher Education under the name "Regional Excellence Initiative" in the years 2019 - 2022; project number 001/RID/2018/19; the amount of financing PLN 10,684,000.00

Abstract

The article explains the use of the comparative method to the research the cryptoasset market. The question of the purpose of using this method in legal research remains debatable. Despite the differences in comparative approaches, most scientists agree to define comparative legal research's main practical goals: legal transplantation and harmonization of legislation. In many states, legislators and legal experts are faced with the need to solve global problems related to the regulation of crypto-assets, which requires rethinking the use of the comparative method. To date, no country in the world can claim that it has formed the optimal legal regulation of crypto assets, with breakthrough potential. Analysis of the legislation on the blockchain and crypto-assets in Malta, Liechtenstein, and Russia shows significant conceptual differences. That indicates, first of all, that at the moment, there is no standard approach and understanding of the legal essence of crypto assets, which provides a possibility to form a complete and consistent regulation of this area. At the same time, significant harmonization was achieved by States united in solving the most critical supplementary task such as the fight against money laundering. The article concludes that the study of legal phenomena that are essentially cross-border at the current stage should take into account the legal regulation that is being formed both within the legislation of the most technologically advanced countries and in the international economic space. For this, it is necessary to use the method of comparative legal research.

Introduction

There has always been a space for the comparative method among the wide range of methods studying legal phenomena that jurisprudence usually uses. This method became very significant at the beginning of the last century when comparative legal research in the private law field became more dynamic. The needs of trade practice determined the trends of unification and harmonization of national legislation. As a result, comparative research has started to develop in quality. In modern civil science, the comparative method is considered one of the most common cognition methods.

However, it should be admitted that selecting this method for legal research is primarily because of socio-political reasons. For example, in Eastern European countries during the Soviet period, comparative research was not approved and was admitted mostly as an exception. Interest in comparative studies increased sharply in the late XX- early XXI centuries since some social and legal changes took place in these countries. In particular, the sudden switching from the socialistic economic system to the market economy also required other legal instruments that legal experts were looking to borrow from the leading developed countries' legal systems. European scientists' particular interest in the comparative method is primarily due to the integration processes taking place within the EU.

Cite this Article as: Larisa V. SANNIKOVA and Julia S. KHARITONOVA " The Comparative Method in Legal Research of The Cryptoasset Market" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

In the last decade, the comparative method's relevance has increased due to the processes of globalization (Watt, 2006, pp. 579-607). Furthermore, even though at the moment, there is an apparent crisis of the globalism model, the world market continues to develop and requires some new universal legal mechanisms. With the discovery of end-to-end digital technologies, the modern economy's cross-border nature has become even more vital: «Decentralized and autonomous technology as well as the structure of blockchain, absolute independence from any state institutions and governing bodies, reveal hidden challenges for the government and international institutions» (Broy, 2018, p. 19). Under these conditions, the value of comparative research increases significantly.

Main approaches to comparative law

Quite a large number of studies in legal literature are devoted to the comparative method. At the beginning of the twentieth century, some European scientists proposed to consider comparative law, not as a research method, but as an independent legal science – comparative law (Schmitthoff, 1939, pp. 94-110). In their view, a comparison of legal systems would explain «the reasons underlying the origin, development, and vanishing of legal institutions» (Kamba, 1974, pp. 485-519). However, this approach was not widely supported, and the view of comparative law dominates modern legal science as a research method.

Thus, many researchers believe that comparative studies can exist only in the form of the method of cognition of legal reality used by all legal sciences (Gutteridge, 1974). From G. James and A. Taylor von Mehren (2006), the comparative method as an element of the methodology involves an appeal to the foreign experience of civil law regulation of a particular area of public relations. Simultaneously, scientists allow the comparison to be carried out within the framework of domestic legislation.

Simultaneously, the question of the purpose of using this method in legal research remains debatable. We cannot disagree with those researchers who emphasize that the goal of comparative law cannot only be to gain knowledge about another legal system or its individual institutions (Peris, 2016). Although this is the doctrinal comparison most often found in research. Along with it, other comparative approaches, in particular, functional and cultural-legal approaches, have become widespread and theoretically justified.

The ideologues of the functional comparative approach were K. Zweigert and H. Katz (1998). They assumed that the legal order in different countries faces the same problems, which are solved with different legal institutions' help. However, these institutions perform the same function and can act as an object of comparison. They selected four functions of comparative law that are of particular practical significance: the results of comparative legal research as a material for legislation, as a tool for interpreting legislation, the importance of comparative law for legal education, and its role in the unification of law (Zweigert and Ketz, 1998, p. 29).

The so-called cultural approach proponents, who advocate comparing legal cultures, have a fundamentally different position. In their opinion, the legal order is the normative aspirations of a particular society with its unique way of life and priorities (Jung, 2017, pp. 1-17). Interestingly, representatives of this approach argue differently about the need to study legal cultures. Some consider this a necessary condition for preserving the diversity of legal cultures: «in our approach to legal institutions, we must also recognize the individual and collective achievements of all human attempts to create order, provided that they have created values, and we must value and try to preserve them as such» (Varga, 2012). On the contrary, others believe that studying different countries' legal culture will help smooth out cultural differences and contribute to the significant development of international economic law legislation (Picker , 2013, pp. 21-48).

The position of the outstanding French comparativist Rene David seems to be more balanced. On the one hand, he argued that «legal science by its very nature is cross-border», on the other hand, he stressed that «the science of law has developed independently within different legal systems» (David and Zhoffre-Spinozi, 1990, p. 11, 17).

The critical approach, which is based on the idea of competition between legal systems, also deserves attention (Monateri, 2012). As rightly noted in the literature, «harmony can be achieved not only through «integrative» comparative legal research but also through «contrasting» comparative legal research» (Örücü, 1999). This approach allows us to take into account not only the positive but also the negative experience of other countries in the field of law-making and law enforcement.

From this point of view, the discussion about the greater cost-effectiveness of common law compared to codified civil law, which developed after the publication of the World Bank report «business Development in 2004: understanding regulation», is of interest. This point in the report was based on the fact that codified law regulates economic relations more strictly, which leads to more significant inefficiency of public institutions, longer delays and higher costs, more unemployed people, corruption, lower productivity, and investment attractiveness, but not the high quality of private or public goods. However, the conclusions of the World Bank have suffered from severe critics of the French comparativists. Although they acknowledged that «economic rivalry now affects all legal systems around the world», they pointed to the need to take into account «the paradigmatic values of the legal system» (Fauvarque-Cosson and Kerhuel, 2009, pp. 811-829).

Thus, the variety of approaches to the comparative method of legal research indicates not only its extreme demand but also its lack of development. Simultaneously, this method's scope of application has long gone beyond the limits of comparative law itself and has extended to all legal disciplines. Therefore, legal experts should carefully justify the use of the comparative method in their research.

Despite the differences in comparative approaches, most scientists agree to define comparative legal research's main practical goals: legal transplantation and harmonization of legislation.

The study of various legal systems is necessary for a contemporary researcher better to understand the legal essence of the object under study. Comparing different countries' legal regulation approaches of the legal phenomenon under study allows us to identify their advantages and disadvantages to form an optimal legal regulation model. However, the goal of improving legal regulation should not be replaced by another one, namely, the search for a better law.

As a rule, this replacement is allowed by lawyers from countries with transition or developing economies; they often insist on the reception of individual legal institutions that have been successfully established in the leading developed countries. In this regard, the statement of M. L. Peris (2016), that «law is deeply rooted in its historical, social, cultural and economic context, and there is no such thing as a «better law» deserves support». The search for «a better law» involves attempts to transplant a particular legal institution into the national legal system.

The article by P. Legrand (1997, pp. 111-124), where he strongly opposed legal transplantation, received a great response. Of course, there are many examples in history proving successful legal transplantation, so the cultural approach supporters rightly quote (Watson, 2000), but likely a much larger number of unsuccessful attempts are not mentioned. It seems that a complete rejection of legal transplantation is impossible, but abuse of this method is unlikely to lead to the desired result.

In addition, this way is sometimes not only unjustified but also inapplicable. For example, Russian scholars primarily focus on improving national legislation by borrowing appropriate foreign legal models and institutions. However, to date, no state has a universal recipe in the field of legal regulation of the cryptoasset market.

The unification and harmonization of legislation are recognized as an equally crucial practical goal. In 1900, at the International Congress of comparative law, it was proposed to develop a universal legal regulation through a comparative analysis of national legal systems. Despite this idea's attractiveness, it has not received any significant practical implementation, even in the context of globalization.

Nevertheless, it is difficult to deny that the processes of harmonization of legislation are intensive, especially in the sphere of legal regulation of the world economy. As foreign researchers rightly point out, private law is the optimal area for comparative legal research, since it is less susceptible to political influence. That is why private law can be considered a promising area for harmonizing legislation, which involves the rejection of national characteristics to create a single legal regulation, includes the convergence of legal positions, taking into account existing national legal traditions and features in contrast to unification. The validity of this approach is confirmed by the European Union's experience, which did not create a Single code of private law, despite numerous proposals from scientists, but preferred a mechanism for implementing EU directives in the national legislation of EU Member States.

Applying the comparative method to develop legal regulation of the cryptoassets market

In many states, legislators and legal experts are faced with the need to solve global problems related to the regulation of crypto-assets, which requires rethinking the use of the comparative method. Even though more than a decade has passed since the first cryptocurrency appeared, no country in the world has formed a comprehensive regulation of crypto assets. There are objective reasons for this. First, the cross-border nature of crypto assets does not allow for adequate legal regulation exclusively at the national level. Secondly, there are concerns that the regulatory impact may negatively affect the development of distributed ledger technology in the country, particularly blockchain.

To date, no country in the world can claim that it has formed the optimal legal regulation of crypto assets, with breakthrough potential. In these circumstances, the pattern for borrowing is essentially absent. Some countries, such as Malta and Liechtenstein, have taken the way of creating special laws, but it is not yet clear if they are efficient.

The innovative legal regulation model is based on forming a legal framework for crypto assets by adopting special laws that exclusively regulate relations bounded to crypto assets. Malta was the first decided to do this by passing three interrelated laws:

- The Malta Digital Innovation Authority Act (MDIA);
- The Innovative Technology Arrangement and Services Act (ITAS);
- Virtual Financial Assets Act.

The Malta digital innovation authority act establishes the Malta digital innovation center to certify the distributed ledger technology (DLT) platform. The Innovative Technology Arrangement and Services Act regulates the registration procedures for crypto exchanges and other crypto markets. The Virtual Financial Assets Act defines the legal regime of DLT assets, including ICO procedures.

DLT assets include a virtual token, a virtual financial asset; electronic money; or a financial instrument.

A virtual token means a digital record which usefulness, value, or applicability is limited solely to the purchase of goods or services, either on the DLT platform on which it was issued or within a limited DLT network. Based on a virtual token definition, we can conclude that we are describing a utilitarian token.

Virtual financial assets are defined as digital records used as an exchange and accounting unit, or a way to accumulate value. This definition does not apply to electronic money, financial instruments, and virtual tokens due to its direct order.

The Malta financial services authority (MFSA) has developed a unique financial instrument test to determine whether the virtual financial assets Act's provisions apply to the DLT asset being tested. Whether it is indicated that the DLT asset is a VFA, then the ICO will require licensing and compliance with other procedures provided for by the Act.

Thus, Malta's legislation provides comprehensive regulation of relations related to the creation and circulation of crypto assets.

This way was also chosen by another European state – Liechtenstein. The law on tokens and secure technology service providers (Gesetz über Token und VT- Dienstleister - TVTG) came into force on January 1, 2020. Unlike in Malta, the Liechtenstein legislator did not identify a specific technology, using the concept of «secure technologies» (VT). However, it is clear from the text of the law that it is a distributed registry technology. In this regard, this law is often referred to as the Liechtenstein blockchain Law.

The TVTG law defines a token «as a piece of information in the VT system that may represent a person's claim or membership rights, ownership rights, or other absolute or relative rights and is linked to one or more VT identifiers» (VT ID is the public key in the blockchain). This definition is based on the concept of the token Container Model (TCM). A token as a container can contain the right to a real asset (shares, bonds, gold, real estate, exchange-traded goods, etc.). If the token is not secured, it is an «empty container» that exists as a digital code, such as bitcoin. Utility tokens within this concept contain the right to use the software (Software Usage Right). Thus, the token is a new legal construct in Liechtenstein law and acts as a tool for the digital representation of law (right).

Russia has also taken the way of creating special legislation in the field of crypto assets. In 2019-2020 a number of laws were adopted, which should provide comprehensive regulation of the blockchain industry, according to the legislator:

- The Federal law No. 34-FZ of 18.03.2019 «On amendments to parts one, two and the article 1124 of part three of the Civil code of the Russian Federation»;
- The Federal law No. 259-FZ of 31.07.2020 «On digital financial assets, digital currency and amendments to certain legislative acts of the Russian Federation» (hereinafter-the DFA Law);
- The Federal law No. 259-FZ of 02.08.2019 (as amended on 20.07.2020) «On attracting investments using investment platforms and on amendments to certain legislative acts of the Russian Federation» (hereinafter - the law on investment platforms);
- The Federal law No. 258-FZ of 31.07.2020 "On experimental legal regimes in the field of digital innovations in the Russian Federation."

Digital rights were included in the list of civil rights objects, stipulated in clause 1 of article 128 of the Civil code of the Russian Federation, as a type of property rights.

The concept of digital rights is described in the article 141.1 of the Civil code of the Russian Federation, so «digital rights are recognized as obligation rights and other rights named in this capacity in the law, their content and conditions are determined following the rules of the information system that meets the criteria established by law».

It should be noted that the category of «digital rights» was not used in the literature before it was enshrined in the law. A Russian legislator introduced this term without any theoretical justification. Complaints are primarily caused by the term «цифровые права» («digital rights»), which is entirely borrowed from the English term «digital rights». In English-language legal literature, «digital rights» refers to the set of human rights to use a computer, access the Internet, publish content in a digital environment, process it, transmit it, and other rights of Internet users (see, for example: Marcus, 2015; Goggin et al., 2017). Moreover, the term «digital rights» is used in the term «Digital rights management», used to refer to any system that controls access to copyrighted material using technological means. However, the Russian term «digital rights» is used in a completely different meaning. It seems that the aim of the Russian legislator to form a new terminology does not contribute to the harmonization of Russian legislation in the field of the digital economy. Moreover, this can negatively affect the investment attractiveness of the Russian digital asset market.

Under Russian law, digital financial assets have become a different type of digital rights recognized as digital rights:

1) monetary claims;
2) ability to exercise rights under equity securities;
3) rights to participate in the capital of a non-public joint-stock company;
4) the right to demand the transfer of equity securities.

In addition to digital financial assets, article 1 of the DFA Law defines a digital currency. It is noteworthy that it is purely technocratic: «a set of electronic data (digital code or designation) contained in an information system». Perhaps this definition should emphasize the restriction of digital currency circulation in the Russian legal order.

It seems that the legal concept of «digital financial assets» is used to refer to security tokens. According to clause 2 of article 2 and clause 1 of article 3 of the DFA Law, a decision on digital financial assets must contain information about the type and scope of rights to be certified. The law also provides the possibility of generating hybrid tokens when issued digital financial assets certify several rights types.

Analysis of the legislation on the blockchain and crypto-assets in Malta, Liechtenstein, and Russia shows significant conceptual differences. That indicates, first of all, that at the moment, there is no standard approach and understanding of the legal essence of crypto assets, which provides a possibility to form a complete and consistent regulation of this area.

On the other hand, significant harmonization was achieved by States united in solving the most critical supplementary task such as the fight against money laundering. Regulation in this area has a distinct cross-border character due to the FATF's intergovernmental organization (Financial Action Task Force, FATF). The report «Virtual currencies. Key definitions and potential AML/CFT risks» were issued. Based on it in 2015, the FATF has developed a guide for applying a risk-based approach to virtual currencies, which focuses on the risks that arise when exchanging virtual currencies for fiat. In 2018. amendments to this Guide and Recommendations 15 were adopted, extending their scope to all «virtual assets,» not just cryptocurrency. Besides, it has introduced the definition of «provider of services in virtual assets». In general, the FATF recognized the risks of money laundering and terrorist financing not only in transactions involving the exchange of virtual currencies for Fiat money but also in transactions involving the exchange of various crypto assets among themselves.

The 2019 FATF memorandum to Recommendations 15 detailed the requirements for regulation, supervision, and monitoring of virtual asset service providers. The providers' activities are subject to mandatory licensing or registered in the jurisdiction they are created to apply AML/CFT legislation to them. Besides, they are obliged to pass on information about clients to each other when they make money transfers between exchanges. However, this requires providers to follow the «know your customer» (KYC) principle, which contradicts crypto assets' pseudo-anonymity.

The 2019 guidelines for applying a risk-based approach to virtual assets and service providers in the field of virtual assets explicitly state that the supervision and control of providers' activities should be carried out by the competent state authorities (national financial regulators), and not by self-regulatory organizations.

Although the FATF recommendations are not binding, the FATF member countries strive to ensure that they are implemented in their national legislation within the next 12 months. The FAFT strictly monitors countries' compliance with the adopted recommendations. So, in its report on the United States of March 30, 2020, the FATF pointed out that there are «minor shortcomings» and «technical gaps» related to virtual assets that may allow unscrupulous participants in the crypto market to evade compliance with AML / CFT requirements.

Thus, countering crypto assets to launder illegal income and finance terrorism is mainly carried out by establishing licensing requirements for crypto exchanges and monitoring the transfer of crypto assets.

Following the way of taking into account the FATF recommendations, the European Union has established its rules on the turnover of crypto-assets (Directive (EU) 2018/843 of the European Parliament and of the Council of May 30, 2018, amending Directive (EU) 2015/849 on the prevention of the use of the financial system for money laundering or terrorist financing, and amending Directives 2009/138/EC and 2013/36/EU -MLD5). In this Act, Crypto assets are defined more narrowly than in the FATF acts. So, virtual currencies mean «a digital representation of value that is not issued or secured by a Central Bank or government authority, is not necessarily linked to a legally established currency, and does not have the legal status of currency or money, but is accepted by individuals or legal entities as a medium of exchange that can be transferred, stored, and sold electronically». Accordingly, not all types of crypto assets are subject to the legal regulation of anti-fraud legislation.

Following the MLD5, the legislation of the AML/CFT applies to «obligated persons». They include providers that provide exchange services between cryptocurrency and Fiat money and providers who keep wallets. The obligated persons do not include those providers that provide services for exchanging crypto assets among themselves, although some may be subject to regulation as wallets' keepers.

The MLD5 rules were to be implemented in the EU Member States' national legislation before January 10, 2020. Thus, the implementation of the MLD5 recommendations in German legislation, on the one hand, creates additional barriers and costs for companies working with crypto assets, and on the other hand, allows banks that have received the appropriate licenses to conduct operations with crypto assets.

It should be noted that national AML/CFT legislation, although developing in one direction, also has certain specifics. Therefore, we cannot talk about forming a single legal framework for the crypto market, which is cross-border, which creates both threats to States associated with illegal activities using crypto assets and legal uncertainties for participants in the crypto market. Against this background, calls for the creation of global standards seem entirely justified.

The study of AML/CFT rules in the European Union and the world allows us to see how the comparative research method allows us to generalize different jurisdictions' rules. The most common issues for different States are being solved, although the crypto-assets' approach may vary significantly. We see that the goals of legal transplantation and harmonization of legislation of different States can be achieved by combining approaches and principles of legal policy for different territories and observing pluralism of opinion to avoid borrowing non-obvious and risky legal solutions before their implementation and verification by time.

Conclusion

It seems that in the context of the global economy and the Internet, the study of legal phenomena that are essentially cross-border at the current stage should take into account the legal regulation that is being formed both within the legislation of the most technologically advanced countries and in the international economic space. That will allow harmonizing national legislation initially, facilitating the country's integration into the world market. We believe that this is the fundamental ability of the comparative method of legal research to develop the legal system of an individual state and at the same time enrich general legal approaches to improve the legal environment, so in our example, it is related to digital markets that do not have a domicile.

The Effects of the Operation of Individual Pension Accounts in Poland in the Voluntary Pension Insurance System, Taking into Consideration the Tax Preferences Applied

Zbigniew OFIARSKI

University of Szczecin, Szczecin, Poland
zbigniew.ofiarski@usz.edu.pl

Abstract

In the study, the development of voluntary pension insurance in Poland in the form of individual pension accounts was examined and assessed, using the legal-dogmatic and statistical approaches. The accounts are run by authorised financial institutions on the basis of agreements concluded with natural persons. It has been shown that the quantitative growth rate of new pension accounts and the growth of the value of assets accumulated on these accounts are gradually decreasing. The intended purpose of the research was successfully achieved, which was to show that individual pension accounts, as a pension product potentially available to every citizen, actually arouse the interest of a relatively small group of people with above-average income who have relatively extensive knowledge of the pension insurance market. Moreover, it was determined that state action is necessary to strengthen the tax preferences encouraging more people to voluntarily accumulate savings for pension purposes. The state should also become more involved in the processes of educating the society about the principles of the pension insurance system and about the market risks associated with investments in the financial market.

Keywords: Financial Institutions, Pension Insurance, Tax Preferences, Financial Market.

Introduction

The demographic structure of inhabitants and the related inefficiency of universal (compulsory) pension insurance is currently a problem in all modern countries (Carone et al., 2016; Natali, Stamati, 2013; Schneider, 2009; Hughes, Stewart, 2004). The amounts of obligatory insurance premiums paid do not guarantee a sufficiently high pension benefit for the insured person. In Poland, this phenomenon is of particular importance, because the effect of lowering the age limit entitling to pension, as well as the increasing life expectancy, is the constant growth in the number of people receiving these benefits. The resources of people of working age who contribute to the compulsory pension insurance system are diminishing, while the number of people of retirement age (professionally inactive) is growing. The intergenerational pay-as-you-go system no longer provides adequate pension security for contributors.

The system of compulsory pension insurance, supported by subsidies from the state budget, now fails to fulfil its basic functions. As a result, the index reflecting the ratio of the amount of pension to the last remuneration from employment of a previously economically active person is decreasing. Despite the nominal increase in the amounts of pension benefits, as well as their indexation, their real value is falling, which is mainly due to inflation and the increase in prices for basic goods and services.

These phenomena have been recognised in Poland for almost 25 years by various environments (government administration, independent experts, social organisations and scientists). In fact, the dominant view is that a system of voluntary pension insurance needs to be developed, which should, to a significant extent, complement the pension benefits financed from the compulsory system. One of the forms of voluntary pension insurance in Poland are individual pension accounts introduced in 2004. A characteristic phenomenon is the strong interference of the state in the way these accounts

function, hence the voluntariness feature is significantly disturbed, especially from the point of view of people who would like to accumulate more money in this form.

Voluntary pension insurance is an instrument that is frequently used in modern countries, e.g. in the Czech Republic, the Netherlands (mainly in the form of company and sectoral pension funds), Germany, Switzerland and Slovakia (primarily individual pension plans), Great Britain (private pension plans). The differences, however, involve the use of certain forms of such insurance, the scope of state interference, and incentives to encourage citizens to choose to accumulate funds for additional pension, as well as protection of the accumulated capital against market risk. The forms of voluntary pension insurance, detailed solutions applied in this area, the problem of market risk and protecting accumulated capital against it are issues frequently analysed in Polish literature (Brenk, Wnuk, 2017; Ciura, 2008; Dopierała, 2016; Dopierała, 2018; Herbich, 2010; Jedynak, 2016; Koćwin, 2017). There also have been attempts to assess the effectiveness of partial reforms implemented in this area (Matyjaszczyk, 2016; Pacud, 2012; Ratajczak-Tuchołka, 2013).

Research conducted in Poland also concerns the barriers to the development of voluntary pension insurance, including the lack of a proper system for educating the society about the need to accumulate funds for additional pension (Ostrowska-Dankiewicz, Pieńkowska-Kamieniecka, 2013), limited resources of savings in households (Kwiatkowska, 2016; Leśna-Wierszołowicz, 2017; Rutecka, 2014), unequal treatment in terms of taxation of various forms of voluntary saving for pension purposes (Leszczyłowska, 2016), low effectiveness of the tax preferences applied (Rusinowicz, 2011; Rutecka, 2015). The effects of the functioning of voluntary forms of pension insurance in other countries, compared to the results achieved in Poland, indicate, above all, the need to strengthen various incentives of material interest to more effectively influence decisions made by citizens. In particular, these should be tax exemptions applied at the fund-raising stage and lower tax rates on generated income used after the fund-raising period.

The purpose of this study is to present the quantitative and qualitative effects of the functioning of individual pension accounts (IKEs) in 2012-2019. The choice of this period is not accidental. Its starting point is related to the subsiding of the effects of the 2008-2011 financial crisis, while the end point is connected with the expected deep economic and financial crisis caused by the COVID-19 pandemic. The analysis of the effects of the functioning of IKEs concerns the period of relative stabilisation, which, by definition, should favour making rational decisions regarding long-term capital investments.

The study analyses and assesses the applicable legal regulations in the context of the quantitative and qualitative effects of IKEs based on official statistical data obtained from reports of the Polish Financial Supervision Authority, which is the state authority that supervises the activities of financial institutions authorised to run IKEs in Poland on the basis of agreements concluded voluntarily with citizens. The empirical analysis identified positive and negative phenomena resulting from the functioning of IKEs. In particular, attention was paid to the relatively low popularity of this form of voluntary fund-raising for additional pension, as well as the waning dynamics of the quantitative and qualitative growth in IKEs and financial assets accumulated on them.

Defining the rules of maintaining IKEs in the act gives them the value of a legal institution with universal features, the specification of which takes place in agreements concluded by authorised financial institutions with their clients. It was assumed that IKE is a product of the financial market potentially available to every citizen interested in increasing their pension in the future. There are also social and economic problems accumulating in the legal institution of IKEs. Therefore, analysis and assessment of the effects of the functioning of IKEs require the use of the legal-dogmatic approach (with regard to the basic elements of the legal structure of IKEs) and the statistical approach (to enable the presentation of the quantitative and qualitative structure of IKEs and identification of trends in their development).

It was shown that throughout the analysed period, IKEs fulfilled only a complementary role in relation to the basic pension benefit paid from the resources of public pension funds that make up the

obligatory pension insurance segment. Under the functioning IKEs, the possibilities of making payments up to the statutory annual limits are not even fully used. This is conditioned by the limited free financial resources at the disposal of households, as well as the lack of strong incentives to accumulate savings along with the appropriate resignation from some current expenses of a consumption nature. Therefore, the summary proposes to strengthen the stimulating function of tax preferences, which, however, requires legislative action by the state authorities.

The originality of this study consists in submitting a proposal to strengthen tax instruments in creating greater social activity in the sphere of planning one's income after reaching retirement age. It was further proposed that the state should undertake educational activities to raise the level of knowledge and social awareness regarding pension insurance in the cause and effect aspect. Only such a comprehensive approach creates conditions for solving problems of strategic importance for the state and household finances.

Legal Structure of Individual Pension Accounts - Selected Aspects

The legal structure of IKEs is determined by regulations of a subjective and objective nature. The first group includes the regulations specifying the parties to an IKE agreement, and the latter - the regulations regarding the types of IKEs, annual payment limits, and effects connected with payments from or liquidation of an IKE before becoming entitled to pension payments. The person accumulating funds on an IKE may be a natural person who is an adult without additional restrictions, or a minor who is 16 years of age but only if in a given calendar year they receive income from work performed under an employment contract (Ofiarski, 2020, p. 46). The person accumulating funds on an IKE may be either a natural person residing in Poland or a person residing abroad. The condition of having Polish citizenship or citizenship of another European Union Member State has not been introduced in relation to natural persons saving on IKEs.

A party to an IKE agreement may also be a person who inherits from the person saving on the IKE, or a person indicated in the instruction in the event of death, which the saver may submit to the financial institution operating their IKE. In the latter case, the person purchasing funds accumulated on an IKE cannot continue saving on this IKE. The funds acquired in this manner are payable to the entitled person. If that person has not yet had an IKE, they may conclude a new IKE agreement with a financial institution of their choice. Acquisition by inheritance of funds accumulated on an IKE is exempt from taxation with inheritance and donation tax.

A natural person may only have one IKE; however, it is possible to change the financial institution operating the IKE even multiple times. At the time of concluding an IKE agreement or changing their financial institution, the saver must submit a written statement, under pain of criminal liability for submitting a false statement, that it is their only IKE. Violation of this prohibition is also associated with an additional sanction in the form of high taxation of income from each IKE (income tax is then determined using the 75% rate). In this respect, the saver is equated to a person hiding their income from taxation, i.e. a person committing a tax offence.

The types of IKEs, the way they are operated and the market risk related to the accumulated capital are connected primarily with the category of the financial institution to operate the IKE. The following entities are authorised to operate IKEs: an investment fund, an entity conducting brokerage activities, an insurance company, a bank, and a voluntary pension fund. Taking into account the categories of these financial institutions, five types of IKEs can be distinguished. Individual financial institutions offer different financial services, which consist in maintaining a separate: entry in the register of participants (investment fund), securities account (entity conducting brokerage activities), account in an insurance capital fund (insurance company), bank account (bank), bank account in a voluntary pension fund. Each person saving for pension purposes independently chooses the financial institution in which they wish to keep an IKE.

Accumulating funds is associated with the most risk in a securities account or in an investment fund, and the least - in a bank. Completion of an IKE investment and the use of the generated income is

often distant in time and, especially when choosing capital investing forms associated with more risk (investment funds, financial instruments purchased through a brokerage house), the final result of the investment is uncertain. The risk of even a partial loss of deposited funds in the event of an improperly pursued investment policy by a financial institution should be taken into consideration.

Development of IKEs in 2012-2019

Both economic and social factors determine the quantitative and qualitative development of IKEs. The tendency to collect funds for additional pension depends mainly on the amount of financial resources, the structure of current household expenses, incentives for material support in connection with collecting funds for pension purposes (tax reliefs and exemptions), education level, awareness of the need for adequate financial security after the end of professional activity period. In addition, the development of IKEs may be determined by specific preferences applied to financial institutions where IKEs are offered. In Poland, these mainly include: lower requirements for calculating minimum reserves in banks (Wajda, 2010, pp. 27-28), guaranteeing solvency in the event of bankruptcy of a financial institution, properly exercised state supervision over the activities of financial institutions accumulating funds for pension purposes (Sowiński, 2019, pp. 206-2010), and simplified procedures to prevent the use of financial institutions for the purposes of money laundering or terrorist financing (Ochman, 2016, pp. 329-330). All these solutions have a positive impact on the growth of public trust in financial institutions (Ofiarski, 2017, p. 23).

It should be emphasized that the lowest fees for keeping IRA accounts are charged by banks, and only if the agreement is terminated by month 12 from the agreement date. Relatively high fees are charged by brokerage houses and insurance companies for fund management services (from 1% to 2% on transactions made). In general, financial institutions charge the following fees: processing fees (for processing transactions made by the account holder), cash deposit fees (for funding accounts), depreciation fees (for purchasing participation units), conversion fees (for changing the investment fund). The amount of fees is usually proportionate to the transaction value and is not dictated by the inflation rate.

It should be emphasized that the lowest fees for keeping IRA accounts are charged by banks, and only if the agreement is terminated by month 12 from the agreement date. Relatively high fees are charged by brokerage houses and insurance companies for fund management services (from 1% to 2% on transactions made). In general, financial institutions charge the following fees: processing fees (for processing transactions made by the account holder), cash deposit fees (for funding accounts), depreciation fees (for purchasing participation units), conversion fees (for changing the investment fund). The amount of fees is usually proportionate to the transaction value and is not dictated by the inflation rate.

The index illustrating the real interest in saving on IKEs, the wealth of savers and the use of the possibility of collecting as much funds as possible is the proportion between the annual limit of payments and the average amount of payments to IKEs, shaping in individual years. This is shown in the table below.

Table 1: The amounts of the average payment to IKEs in relation to the annual limit of payments

Year	Annual deposit limit (in the Polish currency)	Average payment to IKE (in the Polish currency)	Average payment in relation to annual limit (%)
2012	10 578	2 600	24,58
2013	11 139	3 100	27,83
2014	11 238	3 400	30,25
2015	11 877	3 500	29,47
2016	12 165	3 700	30,42
2017	12 789	3 900	30,49
2018	13 329	4 200	31,51
2019	14 295	4 600	32,18

Source: Calculated on the basis of numerical information on IKEs from 2012-2019 provided by the Financial Supervisory Commission, www.knf.gov.pl

In order for readers outside Poland to better understand the qualitative relations presented in the tables below, information on the exchange rates of the Euro to the Polish currency is included. In individual years (as at December 31, according to the exchange rate table of the National Bank of Poland), the average exchange rate of EUR 1 to the Polish currency was as follows: PLN 4.08 (in 2012), PLN 4.15 (in 2013), PLN 4.26 (in 2014), PLN 4.26 (in 2015), PLN 4.42 (in 2016), PLN 4.17 (in 2017), PLN 4.30 (in 2018), PLN 4.26 (in 2019). The maximum annual limit of payments to IKEs in the analysed period was 300% of the forecast average monthly salary in the national economy for a given year, as specified in the Budget Act. A characteristic phenomenon is the increase in the annual limit of payments to IKEs, determined by the increase in the average monthly salary. However, this has no significant impact on the increase in the average payment to IKEs. The average payment to IKEs in the following years did not exceed 1/3 of the annual limit of payments set by the legislator. In addition, many savers have inactive IKEs, i.e. ones where no payments are made for several years after their opening. This is due to the low level of affluence of households in Poland and their high burden of current expenses, taxes and compulsory social security contributions, as well as repayments of high instalments of loans taken mainly for housing purposes. In the analysed period, there was a strong increase in household indebtedness.

The structure of IKEs should be examined with consideration of the categories of financial institutions authorised to operate them as well as the amounts collected on particular types of IKEs. It can also be analysed according to the age of IKE holders.

Table 2: Number of IKE accounts managed by financial institutions in 2012-2019 (in pcs.)

Financial institution category	2012	2013	2014	2015	2016	2017	2018	2019
Insurance companies	557595	562289	573515	573092	571111	568518	562476	462171
Investment funds	188102	182807	174515	205494	236278	275796	316966	355031
Banks	47037	49370	51625	52371	64031	71922	78288	88460

Source: Official information from 2012-2019 collected by the Financial Supervisory Commission, www.knf.gov.pl

The largest number of IKEs in the analysed period was operated by insurance companies and even the slight decrease in the number of IKEs operated by insurance companies since 2015 did not deprive them of their dominant position on the voluntary pension insurance market. Insurance companies are particularly active in the sale of the offered products, including through brokers and agents, therefore they attract more people interested in pension insurance than other financial institutions (Dopierała, 2017, p. 26). Moreover, IKEs maintained by insurance companies are assessed by many clients as relatively safe for the protection of accumulated capital against inflation. The decrease in the number of IKEs maintained by insurance companies since 2015 was mainly due to savers transferring their accounts to investment funds, who, taking greater investment risk, expected higher profits from accumulated capital. The lowest share in the number of IKEs maintained are voluntary pension funds, but they only obtained the authorisation to operate IKEs in 2012. The number of IKEs maintained in banks, which by the end of 2019 operated almost twice as many IKEs as they did in 2012, has been systematically growing. The 2019 decrease in the total number of IKEs by 44,884 compared to 2018 was mainly due to the acquisition of entitlement by the oldest savers, who made a one-off payment of the accumulated funds together with the generated income.

The level of awareness and the needs of planning financial security for the period after ending one's activity on the labour market may be reflected in the age of people saving on IKEs. The possibility of using the income generated from the accumulated capital without incurring the obligation to pay income tax appears only after the saver reaches 60 years of age. Before this point, it is possible to use this income if the saver acquires pension rights, reaches 55 years of age and meets one of the following conditions: he/she at least made payments to the IKE in any 5 calendar years or made more than half of the payments no later than 5 years before the date of submission of their request for withdrawal of funds. The table below presents the age structure of IKE savers.

Table 3: Number of IKE holders in 2012-2019 by their age structure

Savers' age	2012	2013	2014	2015	2016	2017	2018	2019
Up to 30 years old	53010	41536	32477	28491	27668	30064	32590	36204
31-40 years old	199945	193195	188220	181625	175419	169498	160921	141832
41-50 years old	197082	199948	205666	216412	227126	240683	253102	242380
51-60 years old	238892	240283	238918	242674	249349	255859	263217	245932
Over 60 years old	124363	142689	159204	189523	223053	255472	285821	284419
Total	**813292**	**817651**	**824485**	**858725**	**902615**	**951576**	**995651**	**950767**

Source: Official numerical information on the IKE market from 2012-2019 collected by the Financial Supervisory Commission, www.knf.gov.pl

In the analysed period, people in the 51-60 age group dominated among IKE savers until 2017. Their share in the total number of savers in the following years was almost 30%. Since 2016, the share of IKE savers of the over 60 age group significantly increased, and in the last two years of the analysed period they became the dominant group. The smallest number of people saving on IKEs was among the youngest people, i.e. the age group of up to 30 years, and their number at the end of the period decreased by 16,806 people compared to 2012. Among relatively young people, the need for retirement security is treated as a very distant future. However, this is not due to recklessness. In this age group, the dominant position is held by other needs, such as expenses for housing purposes, purchase of furniture and household appliances, purchase of cars, expenses related to raising and educating children. Saving for pension purposes is also strongly dependent on education and

profession as well as earned income. More determination to save is observed among the wealthier people who expect that they will live longer than others (Olejnik, 2016, pp. 165-166).

The development of IKEs is also determined by the overall value of assets accumulated on IKEs in particular types of financial institutions. This is presented in the table below.

Table 4:Value of assets accumulated on IKEs in 2012-2019 (in PLN)

Year	Total on IKEs	Insurance companies	Investment funds	Brokerage houses	Banks	Voluntary pension funds
2012	3530313000	1397176000	1128873000	524254000	477896000	2114000
2013	4271150000	1618173000	1337534000	676461000	627587000	11395000
2014	5030537000	1903628000	1513289000	790231000	804440000	18949000
2015	5644982000	2060309000	1695828000	902974000	960453000	25418000

2018	8691153000	2582688000	2724667000	1434683000	1886458000	62657000
2019	10167365000	2738852000	3266396000	1784709000	2296661000	80747000

Source: official numerical information on IKEs from 2012-2019 provided by the Financial Supervisory Commission, www.knf.gov.pl

As at 31 December 2004, PLN 168.5 million was accumulated on IKEs. In 2019, after 16 years of the functioning of IKEs, the total amount of assets exceeded PLN 10 billion, which is a 60-fold increase. However, this is not a significant amount compared to the deposits accumulated in banks at the end of 2019, which amounted to almost PLN 894 billion. At the end of 2019, the largest amount of funds was accumulated on IKEs operated by investment funds (over PLN 3.2 billion), but the highest growth dynamics was recorded in voluntary pension funds (from slightly exceeding PLN 2 million in 2012 to over PLN 80 million, which was a forty-fold increase in assets). Assets on IKEs operated by banks have been systematically growing, as this is generally recognised as the safest form of collecting funds for pension purposes. A negative phenomenon is the low active account ratio, which has been maintaining for many years, ranging from 30% to 34%. This means that only one third of the IKE system participants make payments to their IKEs in a given year.

Table 5: Growth rate of the overall value of funds in Individual Retirecement Accounts (IRA) and the number of accounts kept over the years 2012-2019

Year	Total funds in IRA (in PLN)	Year-on-year growth rate of the value of funds in IRA account (in %)	The number of IRA accounts run by financial institutions (in single accounts)	Year-on-year growth (decline) rate in the number of IRA (in %)
2012	3530313000	100,00	813292	100,00
2013	4271150000	120,99	817651	100,54
2014	5030537000	117,78	824485	100,84
2015	5644982000	112,21	858725	104,15
2016	6655497000	117,90	902615	105,11
2017	7961329000	119,62	951576	105,42
2018	8691153000	109,17	995651	104,63
2019	10167365000	116,99	950767	95,49

Source: Growth rate indicators were calculated based on official statistics on IRA accounts for the 2012-2019 period drawn up by the Polish Financial Supervision Authority.

The growth in the value of assets in IRA accounts was varied throughout the study period, which was mainly due to the changing rate of returns on investment in given financial instruments and partial withdrawals of funds by savers. The growth in the number of new IRA agreements was very low, and the situation got even worse in 2019 when several thousands of people closed their accounts, thereby giving up the plan to have an additional retirement savings option.

The general public interest in saving on IKEs is also low, as only 6.1% of the working age population are IKE holders. This is the result of a number of objective and subjective factors. The first group of factors includes, above all, the low level of wealth in the society, high burden of various public levies on salaries or other income of natural persons, low interest rates offered by financial institutions, constantly rising costs of running a household (rising prices of energy, food, services, rents for the use of residential premises), inflation, increase in debt due to loans taken, risk of losing a job. The subjective factors include the lack of interest in one's own future in the long-term perspective, low level of financial knowledge and the lack of willingness to educate in this area, as well as an illusory perception of security resulting from the functioning of the compulsory social insurance system.

Conclusions

As a result of the conducted research, including the analysis of the quantitative and qualitative effects of the functioning of IKEs, it was found that the possibilities of their dynamic development while maintaining the current incentives used by the state have been exhausted. Gradually, IKEs are becoming a form of accumulation of funds for additional pension by a relatively small group of people with above-average income and well-educated about the phenomena concerning the financial market. The tax privilege in the form of the exemption of IKE income from income tax, which may be used only when the funds are withdrawn after acquiring pension rights, where the basic condition is the age of 60, does not stimulate the dynamic development of IKEs. The positive effects of this tax privilege may be noticeable for the IKE saver only after many years. From this perspective, it is difficult to assess the purchasing power of financial resources in such a distant future and what needs can be satisfied with them. Therefore, the decision to start accumulating funds on an IKE is postponed to later years. The effect is that agreements for maintaining an IKE are more and more often concluded by middle-aged people, at least 40 years of age.

The main reasons for the declining interest in voluntary fund-raising for additional pension were identified. Most of them are objective, and the most important ones are: low level of wealth, high household running costs, inflation and rising prices for basic goods and services, high taxes and other public levies, growing debt due to loans and credits and the need to allocate a large part of the current income to pay loan instalments. The subjective reasons include primarily the reluctance to learn about the mechanisms of the compulsory and voluntary pension systems and the related financial risk, as well as focusing on current problems while neglecting plans for the period after the end of professional activity. The lack of knowledge about the amount of pension from the compulsory system means that the insured are not able to determine the desired level of income after acquiring the right to pension (Cichowicz, Rutecka-Góra, 2017, pp. 94-96). There is also a noticeable decline in social trust in the state caused by frequent changes within the pension system (Dybał, 2019, p. 110).

Therefore, the postulate to introduce an instrument with a much stronger stimulus effect is justified. This could involve an exemption from taxation of expenses of a natural person at the time of making a payment to an IKE (Szumlicz, 2009, pp. 37-38). The tax exemption could consist in deducting part or even all of the saver's expenses in the form of payments to an IKE from the tax base or reducing the amount of the calculated income tax by the respective part of contributions to IKE. The ongoing use of such a tax privilege would be more noticeable for the taxpayer, thus its stimulating effect towards the intention of systematic and long-term savings on an IKE would be strengthened. The right to a tax relief should, however, be conditional on systematic saving by making payments to the IKE every year, and not only occasionally every few years. Increasing the scale of tax preferences for people saving for pension purposes should be correlated with the state's real possibilities of financing them. Tax preferences applied in this area should be a derivative from the state's fiscal policy. Often, more important than the size of tax preferences is their structure (Jedynak, 2016, pp. 16-17).

The conducted research also shows that it is necessary to strengthen educational activities regarding the need to collect funds under voluntary pension systems. An important role in this respect is played not only by financial intermediaries and financial institutions offering pension products, but also by the mass media. However, these are short-term actions, while in the long term, continuous education of the society in this area is necessary. In Poland, despite the fact that the economy based on market mechanisms has been operating for 30 years, the activities of making independent decisions on saving for future retirement have not yet become popular. Taking the reported postulates into account may contribute to the improvement of the attractiveness of saving on IKEs and the interest of a larger group of natural persons in this pension product. Each action increasing the attractiveness of IKEs, stimulated with tax reliefs, will cause a temporary decline in budget revenues. However, it is necessary to undertake this effort due to the growing problems related to maintaining balance in the obligatory state pension insurance system. In Poland, failure to adequately promote voluntary fund-raising systems for pension purposes will in future lead to even greater budgetary expenditure necessary to guarantee the payment of pensions from the state system. It cannot be ruled out that a more dynamic development of individual voluntary forms of collecting savings for pension purposes may take place when the society becomes convinced that benefits from the state pension system will be insufficient to ensure an adequate standard of living during the retirement period.

Abstract

Organizations and institutions, including security, must consider whether their development and future direction are in line with accepted, ethically acceptable principles (Brown and Trevino, 2006). This also applies to the state security institution Army of the Czech Republic (hereinafter referred to as CAF). According to the authors of this text, it is possible to further develop the CAF in accordance with the ethical principles that are binding on it, by applying ethical leadership to its leadership and management system. The text, which has the character of a descriptive study, in its first part deals with the theoretical foundations of ethical leadership and on their basis, generates the concept of functional ethical leadership. In the second part of the text, the authors apply this concept to CAF conditions. The main method of acquiring knowledge was the content analysis of the results of already performed research and the subsequent synthesis of acquired knowledge. This descriptive study confirmed that the application and development of ethical leadership in CAF are possible. At the same time, it sets out the conditions that need to be met in this context: sufficient time, the right setting of educational and development processes, the adoption of ethical standards and norms at the tactical, operational, and strategic levels, and the emphasis on ethically responsible behavior and actions of military leaders.

Keywords: Ethical Leadership, Moral, Value, Behavior.

Introduction

There have been a number of highly debated scandals and frauds all over the world in recent decades (Enron and Satyam, Sanlu Milk, WorldCom, Lehman Brothers, BNDES Brazilian Development Bank, and many more). These scandals have forced institutions and large corporations to seek redress for their ethical violations and to be aware of their social responsibility and the need for ethical behavior (Ahmad and Gao 2018; Tu and Lu 2016). In this context, a number of studies devoted to ethical leadership began to appear in the specialized literature.

The article was written by Treviño, Hartman, and Brown entitled "Moral Person and Moral Manager: How Executives Develop a Reputation for Ethical Leadership" from 2000 (Treviño et al. 2000) is an important example, which summarizes the results of exploratory research and identifies factors leading to the creation of functional ethical leadership and positive and negative impacts on the organization and its members. This key research was followed by other researches.

These surveys have provided the following findings:

- Respect, sincerity, and honesty play an important role in successful negotiations (Duggan 2018).
- Creating an atmosphere of cooperation is a prerequisite for building management confidence in employees (Salas-Vallina and Fernandez 2017).
- There is a positive relationship between specific leadership styles and the perception of working conditions of followers - subordinates (Bower 2003).
- The leader and the way of leadership significantly influence the level of, the positive inspiration of subordinates (Malhotra et al. 2007) and the development of visions of the organization (Salas-Vallina et al. 2018; Mistry and Hule 2015).
- Inspiring and motivating elements of ethical leadership are respect and good behavior towards the followers of the leader (Salas-Vallina et al. 2018; Riivari and Lämsä 2014; Walumbwa et al. 2017).
- Leaders and leadership developing the psychosocial dimension of the work environment have a very positive impact on the level of the physical working condition of their followers (Gilbreath and Benson 2004; Salas-Vallina et al. 2018).
- Inspirational ethical leaders have followers (Salas-Vallina et al. 2018; Baas et al. 2008) who can be expected to have a higher degree of close rapport with the organization (Sosik 2006) and co-creation of a better working atmosphere (Murnieks et al. 2016).
- Unethical leaders destroy the reputation of the organization and discourage employees, (Brown and Mitchell, 2010).

According to Brown, Treviño, and Harrison, ethical leadership can be defined as **"the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making"** (Brown et al. 2005, p. 120). The development of ethical leadership based on this definition has yielded the finding confirmed by the research that the theoretical background (knowledge), personal value orientation (attitudes), and the moral and prosocial reasoning, decision-making, and actions of the leader (skills), i.e. **moral competency** (Mikulka et al. 2017), are the key to fulfilling the prerequisites of ethical leadership. An objective assessment of its level means to identify the values that the ethical leader emphasizes, assess the extent, to which his actions are in line with these values and whether his prosocial actions contribute to the positive development and direction of individuals and the whole team (military units, civil organizations). An essential part of the development of moral competency is, therefore, ethical education and leadership (Mikulka and Fedorková 2019). For a military organization made up of mostly specialized military professionals with the prospect of facing an asymmetric war conflict and hybrid threats in the future, the importance of value-based leadership continues to grow. In the second part of this study, the authors, therefore, aimed at the issue of the already mentioned ethical approach to human resource management, the possibilities of its implementation and use in the military environment, specifically in the Czech Armed Forces (hereinafter referred to as CAF).

The text was created as part of the project entitled "Development of social competencies of the military leader", which is implemented by the Department of Leadership, the Faculty of Military Leadership of the University of Defence, the Czech Republic. It answers the basic question: How can the principles of ethical leadership be successfully applied in the specific environment of a national security institution such as the CAF? The text has the characteristics of a descriptive study. The main method for obtaining knowledge was the content analysis of documents, texts, research reports of the research implemented, and the subsequent synthesis of the acquired knowledge.

The theoretical basis of ethical leadership

Ethical leadership did not become more prominent until the year 2000. For the first time, the issues of ethical leadership and the topic of ethics in leadership, in general, were primarily interpreted in 1996 (Northouse 2013, p. 423). Prior to 2000, theories of authentic (charismatic), spiritual and transformational leadership were secondarily concerned with the ethics of leadership (Brown et al. 2005, pp. 117–134).

The theory of ethical leadership itself was significantly developed until after the year 2000. The basic topic was the definition of an ethical leader as opposed to a transformational, spiritual, and authentic (charismatic) leader. Authors Brown and Treviño (2006a, pp. 599–616) state that ethical leadership is linked to authentic (charismatic), spiritual, and transformational leadership by perceiving the leader as a role model, a personality with high ethical and moral standards. Research in this area confirms that the leaders who behave ethically and have high moral standards are perceived as transformational leaders (Brown and Treviño 2006b; Treviño et al. 2000; Weaver et al. 2005). At the same time, however, Brown and Treviño (2006a) emphasize that ethical leadership also has common elements with transactional leadership: normatively clear rules and the requirement for the responsibility of followers for their observance, performance appraisal, and a functional system of rewards and punishments. Ethical leadership thus partially uses both approaches; however, it cannot be unambiguously identified with either (Mikulka et al. 2018).

A questionable element of ethical leadership is the normatively (ethically) correct behavior of the leader and his followers, linked, in a broader context, with situational and culturally conditioned factors. This is due to the fact that "normatively (ethically) correct behavior" is often professionally, situationally, or culturally conditioned, and in different environments and social contexts, its standards may be perceived and set differently (Brown et al. 2005, p. 120). For an objective definition of the term "ethical leadership," it is, therefore, important to identify the content of the role of the ethical leader and demonstrate the connection between the fulfillment of this role and his success. Based on the results of research aimed at finding out the connection between the leader's actions and his honesty, integrity, credibility, and efficiency (Den Hartog et al. 1999; Kirkpatrick and Locke 1996; Posner and Kouzes 1993; Posner and Schmidt 1992; McAllister 1995; Dirks and Ferrin, 2002), Treviño et al. (2000, 2003) implemented the research, the objective of which was to understand what was meant by the term "ethical leadership". The research revealed a number of connections between the personal characteristics of leaders and the quality of their leadership. Treviño et al. (2000, 2003) characterized this fact as *a moral person dimension of ethical leadership* based on personality traits, character, and the altruistic motivation of the leader.

However, research has also shown another important aspect of ethical leadership, which Treviño et al. (2000, 2003) identified as a *dimension of the moral manager*. This dimension represents a proactive effort of the leader to ethically influence subordinates - followers and lead them to an ethical responsibility for their own decisions and actions. Subsequent research using the Ethical Leadership Scale (ELS) tool developed by Brown, Treviño, and Harrison to measure the level of ethical leadership (Brown et al. 2005) has demonstrated and confirmed the following:

- Ethical leaders are characterized as honest, caring, and principled individuals.
- Ethical leaders communicate with their followers about ethics.
- Ethical leaders set clear ethical norms and standards and with the help of rewards and punishments, they demand their observance.
- Ethical leaders are proactive role models for ethical behavior.

In reaction to these findings, Northouse (2007), in his research, suggested and confirmed five major personality traits of an ethical leader that enable normatively (ethically) correct behavior:

- Fair dealing.
- Fair and impartial decision-making.
- Respect for colleagues and subordinates.
- Service to others in the first place.
- The need to build a community.

The research has also shown positive and negative links between personality traits and prerequisites for ethical leadership (Brown and Treviño 2006, p. 602; Hřebíčková et al. 2002, pp. 7-8). *A positive link* was demonstrated between the prerequisites for ethical leadership and personality traits of friendliness (the tendency to trust others; honest and direct conduct; generosity; consideration and helping others; prioritizing cooperation over competition; humility; solicitude; compassion; tendency

to fondness) and conscientiousness (the tendency to be ready and able to solve tasks effectively; the art of organizing everything well; proceed methodically; follow rules; propensity for reliability; the tendency to assign and complete demanding tasks; the ability to be motivated to complete a task and to resist disruptive influences and the ability to think things over in advance). A *negative link* was demonstrated between the ethical prerequisites for leadership and neuroticism (the tendency to worry and fear of how everything will turn out; feeling of anger and bitterness; feeling of sadness and despair; feeling of embarrassment, shame and misgivings; the tendency to succumb to the temptation of food, alcohol, cigarettes, drugs, shopping, etc.; the tendency to be engulfed by extraordinary events or stressful situations and the tendency to act in a panic).

The concept of functional ethical leadership

The analyses of the knowledge and research findings allow the creation of a basic concept of functional ethical leadership. This concept is based on six basic principles:

Fig1. Concept of ethical leadership

The commentary on individual principles of the concept of functional ethical leadership:

1. Values and ideals are a positive part of the practice of ethical leadership.

According to Moorhouse (2002), ethical values should include faithfulness, honesty, integrity, probity, respect, an open mind, responsibility, and courage. According to Karaköse (2007), honesty and integrity are the most beneficial qualities of leaders from the perspective of their followers. Honesty is defined as the quality of justice, openness, and truthfulness towards others, while integrity emphasizes the morally sound attitudes of man.

2. The value responsibilities of the leader and the orientation to others are a prerequisite for functional ethical leadership.

Being ethical involves thinking about good working conditions for others and understanding the consequences of one's own attitudes, decisions, and actions. Ethical leaders in this sense are those who think about the drawbacks and benefits of their attitudes and decisions and their long-term consequences (Mihelic et al. 2010). Ethical leadership positively transforms the leader's decisions made for the benefit of followers and the organization (Brown et al. 2005).

3. Ethical responsibility orientation has a positive impact on the development of the organization.

Ethical leaders are those who act and behave in accordance with norms and standards and who support and develop interpersonal, two-way communication (Brown et al. 2005). Many studies aimed at ethical leadership have confirmed that good leadership was related to the focus on the ethical level of decisions made (Treviño 1986; Treviño and Weaver 1996; Jones and Ryan 1998, Toor and Ofori 2009; Butterfield et al. 2000).

4. **The level of two-way communication has a positive impact on the development of the organization.**

Karaköse (2007) described the importance of the ethical level of communication for organizations. He emphasized that the ethical level of communication of leaders had to be recognized according to the way they discuss with followers. Effective ethical assertive communication is a basic prerequisite for functional ethical leadership (Karaköse 2007).

5. **Ethical leadership is appropriately connected and combined with other approaches in the field of leadership.**

There are three styles of leadership, namely transformational, spiritual, and authentic, that are interconnected and overlap with ethical leadership (Burns 1978; Kanungo and Mendonca 1996; Avolio et al. 2004; Brown and Treviño 2006a; Fry 2003; Reave 2005; Reddy 2016).

6. **Ethical leadership is beneficial due to the outputs that it creates and influences in the organization:**

- Ethical leaders create a two-way communication tool in their followers, an awareness of responsibility for their own behavior and performance and motivation to follow (Brown and Treviño, 2006).
- If leaders create a healthy value system in an organization, they can win their followers' trust and loyalty (Tasneem 2015).
- Ethical leaders motivate their followers to create positive behaviors for the benefit of the organization.
- Ethical leadership strengthens trust between the organization's management and employees.
- Through ethical leadership, responsible leadership can influence the results of the organization (Haque et al. 2019; Doh et al. 2011; Doh and Quigley 2014).

Ethical leadership in the environment of the Czech Armed Forces

Building an ethically high-quality military environment places demands not only on soldiers - individuals but also on military leaders. It requires military leaders at all levels to purposefully build and develop Warrior Ethos, to reinforce value-based manifestations of professional behavior and to dampen unwanted ones (Mikulka et al. 2018). This chapter is, therefore, devoted to the specificity of the military environment and the application of ethical leadership in the conditions of the CAF.

Military environment and its specifics

The military environment can be characterized as a system of elements that, in mutual interaction, enable ensuring state defense. This system can be divided into the inner and outer parts. The external elements may include, in particular, the security policy of the state, financial, recruitment, logistical, and technological resources. The development of external elements of the military environment is interconnected with the development of information and communication technologies, with the requirements for the operational capabilities of the armed forces and with the operational capabilities of potential adversaries. The further development of the external elements of the military environment is greatly influenced by the globalization of military and security organizations, as well as the activities of nationalist, extremist, and religious radical organizations and limiting the influence of national governments (Pokorný et al. 2013).

The internal elements of the military environment may include sets of activities related primarily to the management of human resources, information, and material inputs and outputs. In the military environment conditions, it is primarily an operational task, the command, and control process and the system management dealing with the structure and armament of the enemy and friendly troops, the operational environment, the conduct of military operations, and the management of information and material outputs. The internal elements also include selected secondary activities, which encompass, e.g. the processes for creating organizational structures and logistical support (Pokorný et al. 2013).

The military environment is very specific and at the same time very complex. In the area of internal elements, the specifics of the military environment are manifested *mainly in the area of human resource management - HRM* (Pokorný et al. 2013):

- The basic purpose of HRM in the military environment is to ensure the security and defense of the state, its inhabitants, and territorial sovereignty.
- The military environment creates conditions for activities, the legitimate aim of which is, to injure or kill a person and to destroy the results of human labor.
- Certain processes taking place in the military environment may result in death or trauma with lasting psychological, physical, social, and economic consequences for winners and losers.
- The military environment generates the risks in the form of traumas, lasting changes in thinking and acting, and consequently changes in relationships.
- The military environment leads to creating strong, intense, and personal ties based on shared experience in dealing with limits and extreme situations.
- In the military environment, it is important to work with a change, transformation, and the burden associated with it, such as coping with and realizing the change and the burden associated with it (Ullrich et al, 2018a). The level of the psychophysical fitness is the basis for efficient handling of changes by an individual or for an effective solution of tasks (Ullrich et al. 2018b).
- The military environment often replaces the individual's close social environment (family) in the performance of professional activities that are associated with the separation (foreign missions).
- The military environment places increased demands on moral, ethical, character, and value aspects (Warrior Ethos), free and social aspects (relationships), on competencies for performing specific military activities (conduct of battle), on the acceptance of specific attitudes and customs (military traditions, customs, and ceremonies);
- The military environment requires adequate mental condition with the required levels of cognitive abilities, specific qualities of thinking and acting, work with change and stress, appropriate psychophysical condition, vitality (Štikar et al. 2003, pp. 282 - 284; Hroník 2002, p. 80) and job-involvement.
- The military environment requires a combination of expertise (expert specialization) with polyfunctionality and loyalty.

Applying ethical leadership to the environment of the Czech Armed Forces

The natures of current operations of military and non-military character, and especially the requirement for the functional team cooperation of many individual specialists demand a change to HRM. It is necessary to take advantage of leadership. This requires shaping the personality of the current commander as a leader, who at the same time retains the skills of a manager at all levels of command: tactical, operational, and strategic (Ministry of Defence of the Czech Republic 2019).

Military leadership, in the broadest sense of the word, means a process of social influence leading to the achievement of common goals (Kaiser et al. 2012, pp. 119-135; Spendlove 2007, pp. 407-417; Yukl 2012. pp. 66-85). It represents a way of working with followers - subordinates in a certain type of hierarchically arranged organization, in a specific professional environment. The essence of military leadership is, therefore, social interaction, the relationship between the person who leads (leader) and those who are led (followers). This relationship arises voluntarily.

In order to be a successful ethical leader, a commander must have several basic skills:

- To be able to trust his subordinates.
- To be able to respect his subordinates.
- To be capable of self-reflection and to receive or provide feedback (the two-way communication principle).

Therefore, among the required qualities of a commander - ethical leader, there are mainly *exemplarity, honesty, integrity, empathy, impartiality, determination, loyalty, courage, and patience.*

The commander does not become an ethical leader at the moment of taking office. He must prove this competency together with other professional and social competencies for management, which are expected of him, in relation to subordinates. These competencies are "teachable" only in part, their performance is not possible without personal prerequisites (abilities) and opportunities for their implementation and improvement. The required level of competencies and personal prerequisites (abilities) is differentiated according to the level of command, at which the commander is located (Nekvapilová 2018, pp. 26 - 30).

At the level of tactical (direct) leadership (team, workplace, swarm, platoon, company, battery, and their equivalents), it is direct ethical leadership ("face to face"). Ethical leaders work with a lower level of risk and uncertainty and with less complexity. They focus on coordinating the efforts of the unit (team), providing a clear and concise intent on how to perform tasks, and setting performance requirements. They are expected to manifest a personal example and the role of a moral model and to have a professional skill, initiative, and appropriate organizational skills. They strengthen their position on the basis of formal authority, which rests upon the achieved rank, function, and position in the unit and at the same time on the basis of informal authority, which rests mainly upon character, personal qualities, attitudes, relationship to subordinates and professional experience.

Commanders and ethical leaders at the level of organizational leadership (battalion, division, squadron, wing, regiment, brigade, base, force headquarters, and their equivalents) influence hundreds to thousands of people by their decision-making. To do this, they use and manage their own work team (staff), which is able to obtain, sort, and evaluate the required information and thus to prepare the conditions for decision-making. They are an important element in the military hierarchy since they transform strategic concepts into the form of operational or tactical plans, build functional teams, and define tasks for the level of tactical leadership. They take advantage of indirect leadership through subordinate levels of tactical leadership. They determine the level of organizational culture, Warrior Ethos, and overall climate in the organizational unit. Their priority is to support subordinate commanders and leaders. Within their organizational unit, they set rules of conduct and behavior, priorities, create medium-term visions and development concepts, solve complexly structured problems and work with a higher degree of uncertainty and possible unpredictable consequences and effects of their decisions. They emphasize the control of subordinates (personal and delegated) and the fulfillment of adopted priorities.

The level of strategic leadership (the General Staff headed by the General as the highest leader at the strategic level) is the highest in the hierarchical structure of the army and determines the goals and tasks at the operational level. At the strategic level, the military ethical leader identifies trends, opportunities, and threats and creates strategic visions of a long-term reach. He is responsible for growing the competence of the organization; he shapes and influences it by establishing its organizational structure, allocating human, material, and financial resources, and creating concepts for preparing commanders, staffs, and units for their future roles. He works with a high degree of uncertainty and risk and deals with complex problems that affect but are also affected by political influences and events outside the military organization (outside the CAF). A military "strategic" ethical leader, in the viewpoint of his personal prerequisites (abilities), represents a balanced combination of a thinker, a successful fighter, and an expert in the geopolitical situation, who can pass on his thoughts and opinions to the wider community.

In the context of these requirements, it is apparent that attention must be paid to the development of professional and social leadership competencies in the entire training system of military professionals at all levels. In practice, this means that the issues of leadership and specifically ethical leadership must be part of departmental tertiary education, career courses as well as professional courses. Leadership and specifically ethical leadership is for the ACR and the entire Ministry of Defence not only a method of building units as teams but also a tool that enables the formation of the ACR and especially its individual components as a progressive moral-value organization (Senge 2007).

Conclusion

In the current conditions, which are characterized by instability and a large number of risk factors, finding an effective leadership style and directing the organization (institution) is very important. One of the possibilities offered is ethical leadership, which - is applied to the life of the organization in a functional way - can make it internally stabilized and dynamically and successfully developing. The key is the personality of the ethical leader himself, who here plays the role of a model that teaches lessons of practical applied ethics and hands over values for an honest personal and professional life.

The research has proven that values and ideals, honesty and integrity, people-orientation, decision-making responsibility, and two-way communication are important characteristics of ethical leaders that have a positive impact on the whole process of ethical leadership. Trust between the ethical leader and his followers are a crucial bond as it builds a positive perception of ethical leaders and motivation to follow them. At the same time, the research has shown that followers' trust in ethical leaders helps to develop their own organization and strengthen their sense of organizational identification.

Every organization, including the military ones, must, from time to time, deal with the dilemma of how to continue to develop, where to head for and whether this development will be in accordance with ethically acceptable principles (Brown and Trevino, 2006). At the same time, developing ethical leadership is a lengthy process that requires sufficient time, resources, and the right setting of educational and development processes to enable students to develop into ethical and value-based leaders. At the same time, this study has demonstrated that the adoption of ethical norms and standards, ethically responsible behavior and actions, and functional ethical leadership significantly contribute to the functionality and effectiveness of an organization (Brown and Trevino, 2006).

Abstract

Microfinance has existed in the history of India for over a century and proves to be one of the most significant tools towards poverty alleviation. The Indian microfinance institutions (MFI's) have attained an outreach of over 30 million clients. A large portion of the population is still not catered making India a favorite market for Microfinance programs. The Sachar Committee Report stated that out of India's poor the deeply impoverished is the Muslim population who also suffer from huge illiteracy, a high drop-out rate, depleting asset base, below-average work participation, and lack of stable and secure employment. Traditional microfinance has not been able to solve the poverty alleviation problem of the Muslims who stay away from conventional microfinance due to religious reasons. Also, the Interest-free microfinance has not been of much use due to its limited availability and scope of operation. The number of customers of IMFIs has quadrupled in recent years but still has only managed to reach one million Muslims compared with 650 million Muslims who are below the average poverty line. However, Intellectual capital based Islamic microfinance seems to be a way out because it does not only deliver the microcredit to the destitute but also provides technical and professional support. Moreover, it eases the securing of finance by making use of social collateral instead of a physical one. This study investigates the importance of the intellectual capital-based model of Islamic microfinance in India. The study will concentrate mainly on social capital, human capital, and spiritual capital. It is hoped that the study will be significant to Muslim communities as the conventional microfinance products have just worked on the surface and have not been able to address the needs of Muslim clients.

Keywords: Islamic Microfinance, Intellectual capital, Social capital, Human capital & Spiritual capital

Introduction

Islamic microfinance plays a dynamic role in the social and economic upliftment of poor borrowers as well as their society (Khandker, 2005). The presence of Islamic microfinance institutions (IMFIs)

addresses the financial and consumption needs of poor entrepreneurs. However, to the extent of researchers' knowledge, it has not been able to discourse some of the issues of Islamic communities like job creation, illiteracy, and non-availability of physical collateral in India. A dire need for an advanced Islamic microfinance model that targets all these issues is the requirement of the time. Therefore, this research focuses on the importance of the intellectual capital-based model of Islamic microfinance in India. Four important facts make this research valuable.

The first valuable fact, Islamic microfinance service providers in India focus on providing only the financial capital to the borrowers. However, it is established by a lot of studies that providing a candidate with financial capital alone is not enough for their overall development (Hadisumarto and Ismail (2010). It needs to be balanced with other elements of intellectual capital like human capital (providing training and skills) and spiritual capital (religious classes and Islamic study circles).

Secondly, the borrowers in India cannot secure a loan due to the absence of physical collateral. This gap is bridged by social capital by the formation of groups that can secure finance using a peer guarantee mechanism as a replacement for security (i.e. collateral). The incentive that microfinance service providers have in lending to these groups is the 'social collateral' which ensures higher repayment rates and is safer than lending to individuals (Besley and Coate, 1995).

The third fact is that the Islamic microfinance in India has not been able to tackle the menace of unemployment in India. Indian job market paints a sorry picture as far as job creations, shortly, are concerned. Only 33% of Muslims find employment despite higher qualifications (Census, 2011). The intellectual capital-based Islamic microfinance model focuses on human capital which in turn arrests the unemployment.

Finally, interest-free microfinance models all over India cater to just a small section of society (El-Komi and Croson, 2013). Also, self-help groups and other cooperative and credit societies cater to women candidates in selected Indian states. On the other hand, the intellectual capital-based Islamic microfinance model will operate with a wider focus which includes not just the economic capital but social capital, human capital, and spiritual capital.

Intellectual Capital

Stewart (1997), while defining Intellectual capital said that it has been reflected upon by a lot of people, defined by a few, comprehended by even fewer, but no one has come forward to properly appreciate it. Scholars have not yet reached a consensus on the definition or even the shape of intellectual capital. However, Tovstiga and Tulugurova, (2009); Bontis, (2002); Stewart, (1997); Edvinsson and Sullivan, (1996); Lynn, (1998), agree that it consists of human capital, relational capital, and structural capital. Intellectual Model (CIC, 2002) further divides the relational capital into business capital and social capital. It can thus be conferred that social capital is a component of intellectual capital. Nahapiet and Ghoshal (1996); Koening (1998); Prusak (1998), in their works have assumed the social capital to be founded on specific values which gives rise to indicators as ethics, confidence, honesty, loyalty, responsibility, sincerity, solidarity, compromise and transparency. The already existing framework of intellectual capital was extended by Ismail (2005), who added spiritual capital to it as a fourth construct. A person's religious outlooks along with the moral principles constitute the spiritual capital of a person.

Sofian et al. (2008), describe intellectual capital as the synergy resulted from an individual's dominion over professional know-how and experience, expertise and skill, goal relationships, and technological aptitude, that affects the performance of an organization positively.

Reed (2000), carried out a study on the company's performance and the effect of intellectual capital on it. It was found that Intellectual capital is a strong predictor of a companies' performance in the banking industry. A study on financial performance by Riahi-Belkaoui (2003), found a positive association between the intellectual capital of multi-national companies in the United States of America and the performance. The performance of an organization was suggested to be significantly dependent on the variable of spiritual capital by Ismail (2005) who studied the bearing of intellectual capital on

performance. Enough of empirical evidence is available to affirm the application of the asset of intellectual capital as an agent to improve the profitability of a firm.

Lack of Intellectual Capital in Islamic Microfinance

Islamic microfinance is the microfinance services that operate according to the principles of Shari'ah. The Islamic Microfinance Institutions (IMFIs) operate as per Shari'ah or Islamic law providing financing to the poor as per the pre-requisite contract. The last three decades saw the Islamic financial services industry developing considerably. However, the Islamic microfinance services were left behind (Obaidullah and Khan, 2008). Rahman and Rahim (2007), identify it as the biggest challenge to the Islamic Microfinance that it has not yet come out of the shadow of conventional microfinance and is repeatedly accused of being drafted on the same lines. Islamic Microfinance needs to exhaust all the possibilities of financing as per the Islamic financial instruments. Obaidullah and Khan (2008) recognize challenges and suggest rectifications at various levels of implementation of microfinance, which are the micro, and macro levels. Among the other, the one which concerns us is the Meso level initiatives which include "provision of education and training, better coordination and networking, technical assistance through Awqaf and Zakah Funds".

The past researches have established a significant association between the organizational performances and intellectual capital (IC) irrespective of the industrial sector (Bontis et al., 2000). Hashim et al. (2015), confirms the same highly significant relationship between the IC and the microfinance institutions. Yet IC components do not work in isolation. Firms that employ all the components of IC are better equipped to compete as compared to the firms that employ only one. (Amrizah and Rashidah, 2013).

Human Capital

The world is rapidly shifting to a knowledge-based economy. In such a scenario, a country is dependent on the human capital of extraordinary superiority to become a developed nation and maintain that status. This makes human capital the most valuable asset in an organization, a few notches more than other capitals or equipment (Hashim, Osman, and Alhabshi, 2015). Khan, Farooq, and Hussain (2010) reaffirm this statement and consider human capital the most prized asset or a liability to the firm. An exit path out of poverty and the holistic development is via the Human capital and natural capital route (Hassan, 2014).

Spiritual Capital

Tripp (1999), is of the view that mere technical help cannot make an impact in the life of poor people as long as it is not combined with spiritual commitment. The combination of customer capital, social capital, technological capital, and spiritual capital along with practical support proves more effective in improving organizational performance (Hashim et al., 2015).

Obaidullah (2008), claimed that capacity building can be influenced by statistically significant contributions of spiritual capital, technical assistance, and managerial assistance. There is a positive impact on macro and microeconomic variables from an Islamic economic Institution that is borne out of spiritual capital (Yusuf, 2011).

Social capital

Social capital plays a crucial role in facilitating adoption and overcoming constraints of lack of financial, human, and natural capital. The empirical evidence indicates that Islamic Microfinance programs that built social capital can indeed make a significant contribution to poverty alleviation (Hassan, 2014). The social capital variables play a very important role in the economy to increase business productivity and efficiency (Ma'ruf and Restiawati, 2016). Gomez and Santor (2001), found

that social capital is more likely to enhance the economic performance of entrepreneurs through social interactions and network resources.

Selected Literature on the Importance of Intellectual Capital Based Microfinance

Ma'ruf and Restiawati (2016), analyze the social capital in Islamic Microfinance based on three inseparable and dependent factors viz a viz trust, social networks, and norms. The study is conducted as a case study of Baitul Maal Waa Tamwil (BMT). Researchers found the 'trust' variable to have the highest value when compared to the other two factors of 'norms' and 'social networks. They inferred that since trust forms the basis of the establishment of a social network it has such wide applicability in BMTs. 'Social network' establishes good cooperation between BMT and members it also helps to circumvent information asymmetries. Among the 'Norms', 'Islamic value', religion value and proximity of the location directs the BMT members towards common goals.

Antoh, Mensah, and Edusah (2015), empirically studies Sinapi Aba Trust (SAT) microfinance services in Ghana to find out how it affects the development of human capital (beneficiaries) and reduce poverty. The study finds that SAT education programs and beneficiaries' efforts enable beneficiaries to expand their human capital assets enhancing outlook regarding the non-financial aspect of poverty reduction. The programs of SAT are focused on awareness creation and sensitization to inform the beneficiaries about topical issues that prove to be fruitful for the development of beneficiaries and their households. The study revealed that there is a positive relationship between microfinance and human capital theories as the services enabled beneficiaries to improve their knowledge, skill development, and health resulting in overall human capital development.

Lybbert (2008), explored the Role of Spiritual Capital in Poverty Traps and Microfinance. The study recognizes the difficulty in observing and defining spiritual endowments, It explores the meaning and merit of spiritual capital in the context of the Perpetual Education Fund (PEF), which is established by The Church of Jesus Christ of Latter-Day Saints to provide low-interest loans for occupational training to young LDS members in Central and South America, Asia, and Africa to help them escape the perpetual poverty. The study uses The Galor and Zeira (1993) poverty trap model to discusses if the development of spiritual capital might affect poverty differently. Fogel (2000) had explicitly identified fifteen spiritual resources that constitute spiritual capital, including a sense of purpose, a vision of opportunity, a strong family ethic, an ethic of benevolence, a work ethic, discipline, a thirst for knowledge, and self-esteem. The authors explore spirituality and sociality as capital assets and find that by enhancing relationships and adding meaning and depth to one's self-worth, spiritual capital magnifies both human and social capital

Conclusion

Goel (n.d), Chakrabarty (2015), Basargekar (2010), and Jose and Chacko (2017), have presented a snapshot of the current economic and microfinance scenario in India. It reveals that Islamic microfinance that is based on intellectual capital is completely missing from the Indian economic scenario. Therefore, this study looks into the importance of the intellectual capital-based model of Islamic microfinance in India. The study concentrates mainly on social capital, human capital, and spiritual capital. Muslims in India have stayed at the bottom of the pyramid despite traditional and Islamic microfinance operations in India. An advanced model of microfinance is the need of the hour that focuses not only on providing the economic capital but intellectual capital as well. Intellectual Capital includes human capital, social capital, and spiritual capital. The intellectual capital-based model uses a three-pronged strategy to address the problems of the Indian poor that takes into consideration not just financial but human and spiritual capital as well. The added-up benefits ensure the social and economic upliftment, job creation, and building of Ukhuwah (brotherhood) among the Muslim ummah.

Monitoring Solution For A Set of Computer Applications of E-Business Type

Alexandru COCIORVA

Academy of Economic Studies – Doctoral School of Economic Informatics, Bucharest, Romania,

E-mail: cociorvaalexandru@yahoo.co.uk

Abstract

In the context of today's information society is necesary to implement some modalities for monitoring the e-business solutions. Online business environment, being in a continuous development, needs robust applications, from a technical point of view and of the business criteria. Creating applications that can monitor e-business solutions is more necessary as the number and type of transactions or processes grow exponentially. This paper presents a simple but effective monitoring model for a set of computer applications. The implementation and configuration of such a model can significantly improve the monitoring process for incidents that occur in applications.

Keywords: Monitoring, Model, Implementation, Configuration.

Introduction

One of the premises for the development of e-business applications is monitoring, this notion coming with its technical specifications as well as with the related business requirements. Today, it is increasingly necessary to take into account the administrative aspect of resources in the economy, which is also transposed in the online business environment. Thus, different types of applications have emerged as a natural need to monitor and manage resources, in a constantly growing, online environment. With the development of technology, the possibilities of developing such monitoring applications have increased and adapted to the extremely complex framework of today's information society. The main feature of a monitoring application is to capture incidents that may occur at the level of e-business solution, both technically and procedurally.

In the context of complex applications or application systems, the development of a monitoring solution can be a technical challenge, due to the multiple implications at the business level, but also due to the organization of information. The relationship of an application or set of IT applications with a monitoring solution can be a two-way one, so that an efficient, complex monitoring model can lead to the capture of technical problems and solve them, which would inevitably contribute to the improvement of the application or set of applications. Once improved, other technical problems may appear, much more subtle, which require an update or development and the monitoring solution to meet the new technical challenges. Thus, the initiation of a biunivocal process cycle is observed. This development cycle can continue until the maximum performance level of the application is reached and no further improvements are needed or at the stage when the available technological capacity is reached. There may also be various technological barriers for closing the cycle.

In order to create a monitoring application is necessary to take into account: what is an information system, systems theory, as well as the empirical framework (making measurements and comparisons). The proposed solution must take into account the specifics of the application to be monitored as well as its connections or integrations with other systems, secondary applications. Furthermore, elements configurations represent a main key that must be taken into consideration when designing the solution, in relationship with the metrics that must be estimated and calculated. Thus, it is necessary to make an evaluation of the metrics involved: CPU, disk space, page load rate, server validity, URL, application

Cite this Article as: Alexandru COCIORVA " Monitoring Solution For A Set of Computer Applications of E-Business Type" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

preview, as well as other application-specific elements. The way the application is monitored depends, to a large extent, on the business requirements, but, regardless of its complexity, some basic criteria must be considered in any model of monitoring solution. This aspect includes: the validity of the server on which the application resides, the validity of the application URL, the space on the server. In addition to these basic criteria, the following components necessary for running the application can be monitored as a proactive method of assessing system status: IIS application pools status, web server overview, SQL Server status, database connection or services necessary for the operation of other components (email, reporting tools, preview, objects inserted in the page or even integrations with APIs, etc.).

The model of the monitoring solution that I will present in the next pages, contains mainly the following elements: server status check, URL verification, host status, application preview, as well as information about the applications themselves. The model can also include the following functions: ping, traceroute for detailed checks. The highlighted elements that I will come up with in this monitoring model refer to: services check, applications preview directly on the monitoring solution page as well as the way the alerts are displayed. Also helpful is the inclusion of specifications for the monitored applications, as well as related links, directly in the monitoring solution. A significant contribution can be made, in this framework of the development of monitoring solutions, with the involvement of a monitoring platform that captures various metrics of project efficiency as it is developed. Thus, what is presented in this paper is a start for the realization of a complex monitoring solution. There may be the problem of creating a monitoring solution that provides indicators of project performance which is, in turn, the development of a simple or complex, integrated monitoring system for an application or a set of e-business applications. Highlighting performance metrics through dedicated monitoring solutions for software development projects is a necessity in the context of the current information society. Thus, metrics are of paramount importance in all disciplines involving engineering activity and especially in the development of software that implies critical systems, as mentioned in a research study by García-Valls et al (2019) [1].

As a premise for the development of monitoring applications in various contexts, there may be the problem of intervention or involvement of a monitoring mechanism that extracts data from the activity of each application in a set of e-business applications or portfolio under development in order to provide an overview of the project activity. Thus, it is necessary to implement a data warehouse technique. The use of such a procedure can be the premise for the development of an integrated information system, which would provide valuable business intelligence information, also mentioned in a paper by Muñoza et al (2015) [2]. In order to create a monitoring system for a set of applications, is necessary to consider two parts: the initial phase, the analysis of elements involved in the development of the set of applications and then the reporting phase, in which necessary metrics can be defined, needed to provide the most comprehensive and relevant reports possible, as mentioned by Eric Bouwers (2019) [3]. Here are specified descriptive elements of the monitoring process not only from finished product point of view, of the activity of the applications that have become operational, but also during those applications' creation or development phase.

The aspects described are applicable in the broad sense of monitoring systems, but the solution proposed in this paper is a starting point, a way of representing the concept of monitoring system applied to an application or a set of e-business applications. The quality of the monitoring system created depends largely on the input data provided by applications, their complexity and quality, as well as the ways of achieving the flow of information, which is most often characterized by biunivocity, constituting the premises of an integrated computing system.

Current stage in the development of monitoring applications

Monitoring solutions for e-business applications or application systems have developed a lot in the last 20 years. Today, there is the problem of their implementation in cloud environments, being a helpful element in the progressive development of IoT solutions. Most current monitoring solutions focus on the following parameters: server status, CPU, memory, network activity, URL accessibility, hostname, page load speed, integration validity, as stated by Michael Churchman (2018) [4].

In the cloud area, increasingly used for e-business solutions, service providers give monitoring solutions for both the performance of the infrastructure and the platform itself, through dedicated APIs. Today, the trend of these monitoring solutions is to implement many components related to the market, to everything that can capture the online market. Thus, monitoring tools are no longer simple utilities that we use to highlight some indicators and produce some reports, they must provide directions for business development, involving elements of Business Intelligence. The challenge is to be able to capture the widest possible range of activities and to present most relevant information to decision makers, in the context of Big Data, due to the increasing complexity of e-business solutions, in an increasingly visible way. The tendency, in creating monitoring solutions, is to have a holistic approach and to achieve a framework, as suitable as possible, for integrations, especially those used in the cloud environment. In principle, monitoring solutions in the area of cloud applications are not yet sufficiently developed to cope with the increasing number of elements and functionalities, although the trend is to improve existing algorithms, as the resources monitoring is increasingly efficient. The framework of cloud migrated solutions can create the premises for compact, efficient monitoring solutions, with all elements at their disposal to make an analysis of the resource distribution as close as possible to the standards imposed by Big Data, IoT and 5G. Thus, hardware resources that were 10-15 years ago purchased and managed through very large investments, are now accessible within a platform, through APIs, on demand, by hourly payment, as stated in the article „Cloud applications monitoring: An industrial study", by Tamburri et al (2020) [5].

Taking into consideration that some of the first monitoring systems were made using RTU (Remote Terminal Units) and communication systems like LAN lines, the inclusion of complex cloud monitoring systems represents a major improvement that significantly increased process supervision and helped the technological development from the last years, large scale productivity indicators in different domains being such a consequence. Remote monitoring grew to be more complex as the technology developed rapidly in 1990s, with an enhancement of network technology, as stated in the article „Past is Present: The History of Remote Monitoring" (2014) [6]. In first studies of monitoring systems, as in industrial machine monitoring, architectures were primarily focused on fault detection and diagnosis (as stated in an article from Journal of Manufacturing Systems, 2020) [7]. The same can be applied for early monitoring systems for applications, as basic metrics regarding server and URL status were primarily monitored. Nowadays monitoring systems can comply with complex busines demands, not only making supervision reactive operations but also correcting (in some cases) through dedicated tool integrations different defects and resolving incidents up to a certain level. This aspect creates the premises for the introduction and development of IPCC framework, with accent on incidents and changes affecting the monitored systems. Currently, this segment is mostly developing in the cloud systems monitoring area, especially for the IoT demands. Thus, business cases represent the main guiding element when constructing a dedicated monitoring solution.

First generation monitoring tools were focused on watching the infrastructure (taking into consideration the following aspects: server uptime, server load, network equipment and storage) and generated simple descriptive logs dumped into text files [8]. Since the information society grew and complex data started to come into picture, the second generation of monitoring tools developed and highlighted the following aspects more oriented to the gathering of information: error agregation; APM (Application Performance Monitoring), website monitoring, transaction monitoring and also specific application predefined metrics [8]. Nowadays, we conduct our activities/ operations supervised by the third generation of monitoring tools where contextual intelligence is introduced [8]. The previously mentioned ideas are adapted using an article entitled „The evolution of the world of app monitoring" (2014) [8]. This generation of monitoring applications introduce new metrics related to frequency of process/ system interruptions, localization of the incident and root cause analysis. These points request a bigger involvment of software developers into the application support side, making possible the introduction of devops engineers, having also the qualification of monitoring specific business case elements. This aspect would imply that devops engineers could not only operate and monitor on the platforms but also take corrective actions like modifying the code in order to improve the processes based on the results of the monitored indicators/ metrics. As cloud solutions are developing rapidly in the last years, a devops engineer with application monitoring skills would be suitable for answering

different complex business demands. Also, system/ platform architects could take into account the measurable aspects when designing complex cloud solutions.

For important and impacting business, the APM field becomes increasingly important since resources have a bigger demand for monitoring. Without this aspect, lack of performance monitoring can lead to costly downtime affecting budgets, operations and infrastructure, as well as affecting employees in their daily activities, as stated in an article entitled „The rise of Application Performance Monitoring" (2017) [9]. The same article highlights the fact that with the adoption of Service-Oriented architecture, Cloud, Hybrid IT and Big Data, applications are now more distributed then ever, hundreds upon thousands being managed by third party services [9]. Around year 2009, modern APM tools emerged aiming distributed systems running in virtualized, cloud environments. Today, we have lots of APM solutions that can cope with complex applications and business, major vendors including tools by: New Relic, Dynatrace, App Dynamics (now owned by CISCO) [9]. Another important, enhanced and extensively used monitoring tool is Nagios, suitable for many IT solutions.

In recent years, the development of IoT and connected devices created the premises for huge data transfers; bilions of users or devices get connected to applications on the internet, resulting in trilions of gigabytes of data being generated and processed in cloud datacenters (Taherizadeh et al, 2018) [10]. This large data volume conducts to inefficient utilization of communication band-width and computing resources [10]. All the resource capacity and specific algorithms, computational intelligence, reside in the cloud-centric datacenters, data analytics for current cloud solutions like: Amazon AWS IoT and Google Cloud Dataflow [10]. This aspect still represents an open research platform and in order to solve it, modern cloud frameworks have been introduced (edge, fog and osmotic) aimed at increasing capabilities and responsibilities/ administration of resources using new data transfer protocols to improve the interaction with datacenter-based services [10].

Descriptive elements related to the creation and implementation of the model

The monitoring application model consists of the following elements: status check (server, URL, hostname, service), application preview, informational pages and application access links, validation of disk space status reporting automation.

The application is created in PHP, with dedicated functions for monitoring, and uses elements such as: JavaScript, CSS Bootstrap, iFrame. It can be installed on any type of machine, using Apache web server, either as a stand-alone service or within a tool such as XAMPP, WAMP / LAMP, as a development platform that includes utilities such as: PHP, MySQL, phpMyAdmin, Maria DB. For various changes to code as well as to database it is necessary to install one of the development platforms mentioned above (XAMPP, WAMP / LAMP). PHP is required to perform development and testing, with the help of the related configuration files, MySQL is required for the functionality of the database, also with the help of the related configuration files, and phpMyAdmin is the utility through which the database can be managed and administered.

In the proposed model, the server status is checked by the predefined *chkServer* function, using hostname and port as input parameters. Basically, the function checks server status through the connection port (port 22 for a Linux / Unix machine; ports 80, 8080 for a Windows machine). To display alerts related to the status of the verified server (valid server or inaccessible server), two gif images are used, through which, on the page, the green color for the traffic light appears (if the server is accessible), respectively the red color (if the server is down). The function performing this check can only be used when the server connection ports are open. The structure of this function is presented below:

```php
<?php
// check if a server is up by connecting to a port
function chkServer($host, $port)
{
    $hostip = @gethostbyname($host); // resloves IP from Hostname returns hostname on failure

    if ($hostip == $host) // if the IP is not resloved
    {
        echo "Server is down or does not exist";
    }
    else
    {
        if (!$x = @fsockopen($hostip, $port, $errno, $errstr, 5)) // attempt to connect
        {
            //echo "Server is down";
            echo '<img src="2.gif" title="Server is down">';
        }
        else
        {
           // echo "Server is up";
            echo '<img src="1.PNG" title="Server is up">';
            if ($x)
            {
                @fclose($x); //close connection
            }
        }
    }
}
?>

<?php
```

Fig. 1 : Function for verification of server status

Verification of validity status of the URL is performed by the predefined PHP function *isDomainAvailible*, which uses full web page address of the monitored application:

```php
<?php
    if (isDomainAvailible('URL_pagina_web'))
    {
        echo '<a href="URL_pagina_web" target="_blank"><img src="1.PNG" title="Status of web page: OK!"></a>';
    }
    else
    {
        echo '<a href="URL_pagina_web" target="_blank"><img src="2.gif" title="Status of web page: NOT OK! - Check server!"></a>';
    }
?>
```

Fig. 2 : Function for verification of URL status

Checking the status of the hostname or machine name is done using the predefined PHP function *fsockopen*:

```php
<?php
$host = 'denumire_maşină';
if($socket =@ fsockopen($host, 80, $errno, $errstr, 30)) {
echo '<img src="1.PNG" title="Status of host: OK! - Check: denumire_maşină">';
fclose($socket);
} else {
echo '<img src="2.gif" title="Status of host: NOT OK! - Check: denumire_maşină">';
}
?>
```

Fig. 3 : Function for verification of hostname

Checking the status of services is done through PHP functions built to use the entries defined in services.msc or the output generated by a separate script, made in VBScript, which checks the functionality of the web server and associated elements (IIS web server, application pool workers, or

associated services), SQL Server in SQL Server Configuration Management, or an associated tool (SQL Server, Reporting Services, SQL Server Agent, etc.).

The checks presented so far appear in a single PHP page, in the following form:

Fig. 4 : Example of fully functional set of applications monitored with the proposed solution

Above image represents the framework of monitoring functionalities for: server, host, services and related applications, according to the presented data. In this case, all servers, applications, hosts and services are valid and functional. For accuracy of the real-time verification of server situation, a convenient refresh rate is established for the applications, through a dedicated html tag, added on each page that provides information regarding the monitoring, in the head section:

```
<head>
  <meta http-equiv="refresh" content="30">
</head>
```

In the following image, one or more services are not functional; in this situation, given that the server on which these services are located is accessible, a thorough check is required directly on the machine to find the cause and resolve the incident affecting the application, in a timely manner:

Fig. 5 : Example of a set of applications affected by an incident, monitored by the proposed solution

A preview of the applications directly in a dedicated section within the web page of the monitoring solution model, is done through the html iframe tag. This tag allows you to enter the URL as a parameter along with the size settings, in the following form: *<iframe src = "URL-page-monitored" width = "x" height = "y"> </iframe>*

This tag will be included in a slide show made in JavaScript, with the specification that each slide represents the first page (login page) related to the application to be monitored, which is an indicator of the validity of the application and the possibility of connection. Thus, it is possible to monitor, in real time, all the login pages related to the applications, in a single frame.

Information pages and application access links are included in separate sections within the monitoring solution, facilitating access to infrastructure and related information in the event of a system outage, with the entire dataset in the same frame. The pages were created using the following technologies: HTML, CSS Bootstrap, JavaScript.

Server space situation will be monitored through VBScript automation. The script will automatically send the situation through email via an SMTP server. Then, through another script, the presented situation can be displayed directly on a dedicated page within the monitoring solution. This operation can be performed via an API. For functionality, the script must be placed on one of the Windows/ Linux servers that is being monitored, and then a task must be created in the Task Scheduler/ Crontab for it to run according to certain conditions, the time required for reporting. In order to perform the task, it must be taken into account that the user under which it runs is a system user/ root. Ping and trace route functions are provided through scripts made in Batch, through calls to the cmd ping and trace route commands.

For the monitoring solution to work, associated package containing the scripts must be copied on the machine to be monitored, in the localhost root subdirectory in XAMPP or WAMP / LAMP directory (as appropriate), after the XAMPP / WAMP (LAMP utility, in the case of a Linux operating system) has been installed on the machine.

After these operations take place, the necessary configurations are made, possibly for the development and appearance of errors / notifications in the pages, in the dedicated php.ini and php.conf files. Create the database or import (as appropriate) into phpMyAdmin, then establish the connection ports to the

database. Connection verification can be done by accessing a page in the browser that contains database queries; if the data appears on the page, then the connection is possible.

The scientific purpose of the presented model is to collect, as much as possible, specific metrics data from different sets of applications in order to realize a simple but effective and easily customizable monitoring solution, that can be later enhanced based on technological capabilities of different integrations, as per busines case. Therefore, the solution represents a starting point (as simple platform or simple communication element/ middleware) for the further development of more complex solutions, that can be integrated with systems at a large scale. The solution is also adaptable, being configurable on multiple servers that represent monitoring stations, assuring live performance and status monitoring, in sync, with relevant results.

Along with the hostname monitoring we should also monitor services on TCP ports, since the application's URL could actually be referencing a Windows or Linux service. This operation can be easily done with the help of Windows Process Monitor (in Windows OS) or netstat command (on a Linux machine) which also have the posibility of saving the logs in order to be later analyzed. The analysis includes the investigation of opened and occupied ports in relationship with the processes that are related to a service. Although, most likely, if a process is down (for example Tomcat process, Apache) the hostname cannot be accessed and URL will not be available in the browser, there could be situations in which, due to browser cache memory, the session of the application will remain opened but after making an operation like page refresh or access a GUI element from the page (eg. button, link), the unavailability message of the service will appear. Therefore, this is the reason why is necessary to include a page refresh meta tag with a propper/ suitable refresh rate when developing the monitoring solution, in order to have a realistic status of the monitored applications/ services. Also, it is important to mention that, a high refresh rate could overload the pages and make the GUI elements (alerts, message notifications) inaccessible; on the other hand a low refresh rate could affect the relevance of the monitor page. For enhancing the presented PHP solution, a useful integration could be PHP Server Monitor, which has a series of relevant features like: monitor services and websites; email, SMS notifications; view history graphs of uptime and latency, logs of connection errors, outgoing emails and text messages; easy cronjob implementation to automatically check the servers.

Experimental method used for testing the model

The following activities and operations are performed to test the model of the monitoring solution:

1. Verifications for the accessibility of all targeted ports (21, 22, 80, 8080) both locally and on a server, in order to ensure the connection with the servers through dedicated PHP functions.
2. Development of the application involves successive tests of connection with the servers, by choosing convenient ports, so as to reach a valid port for each type of server. This test is required to perform the server status check functionality.
3. Election of a set of PHP functions through which the basic checks can be performed: server status, hostname status, URL validity.
4. Election of both functional and non-functional applications in the test environment to test: URL status, hostname, services.
5. The creation of script variants that allow the verification of the presented elements and the choice of optimal solutions.
6. Movement of the package of the developed solution on different machines to check the accessibility both on a server and on the stations of the system operators / engineers.
7. Adding / modifying parameters in the configuration files (php.ini, php.conf) to test the response of the monitoring solution and verify the results on different machines.
8. Establish successive refresh rate values to verify how long it takes to update and accurately reflect changes in status for infrastructure and applications.
9. Develop and test, in DEV environment or directly in UAT, specific functions (preferably PHP of Java) for the calculation of IPCC measurements like incident and change requests reports. This test can be done for verifying multiple integrations with different platforms

or access/ connections with the database where IPCC reports are stored. If the functions have the desired result then GUI element can be developed in CSS, Javascript as alert in the main monitoring page.

10. Test the solution on multiple SSL, TLS versions environments in order to see how the pages and functionalities are affected when enabling/ disabling different security protocols. This test is recommanded also for setting the propper security configurations of the monitoring solution.

This set of tests is performed to find the optimal way to implement and configure the monitoring solution.

Benefits of using the model

The benefits of using proposed monitoring solution model are the following:

1. Portability of the solution on local station or on a server with operating systems: Windows, Linux, Solaris.
2. Monitoring solution users do not need access credentials, which facilitates the monitoring operation.
3. The solution is intuitive and, as such, easy to use by any user, without the need for training or instruction manual.
4. Pages with information about infrastructure, applications are a plus and can be a real help when an incident occurs and you need quick access to certain data.
5. The html tag iframe structures, together with the implementation of a JavaScript slideshow, create the necessary framework, in a single page, for viewing the accessibility status of the login pages related to the monitored applications, as well as performing checks directly into the applications.
6. Costs of the solution will be reduced, due to the lack of integrations or special technical specifications.
7. Through the implemented ping and trace route functions, an immediate check can be made, at the moment of occurrence of some incidents that affect the validity and accessibility of the machine.
8. The presented monitoring solution is usable for all applications developed using server-side technologies.
9. Integration with other PHP monitoring tools can be easily made, for IPCC processes monitoring. Also, different metrics could be calculated and designed into specific pages, in the main monitoring tool framework based on the information provided from multiple sources, since the PHP technology allows the usage of multiple functions in order to create complex connections.

The disadvantages of using proposed monitoring solution model are as follows:

1. Lack of monitoring for some components related to operations in the database: degree of loading, number of transactions, etc.
2. The lack of complex integrations, with other components cannot make the model usable, by it's default status, at a high level for complex solutions, offering only the results of some basic verifications.
3. The solution, by it's default settings, cannot provide data on complex metrics, cannot create reports as well as graphs of activities.
4. In some situations, the solution could be difficult to adapt (configure and upgrade), due to possible incompatibilities between newer PHP versions and Apache/ MySQL components from XAMPP/ LAMP. The PHP upgrade could be required if old versions of XAMPP/LAMP are installed, since they represent security risks.
5. Although the solution has a major degree of customization, when facing very complex monitoring demands, integrations with other technologies could lead to a redesign of the architecture.

6. If too many applications are included in the monitoring tool, as monitored elements with alerts, without enhancements (PHP redirections and possible inclusions of iframes), the PHP pages could have difficult loading.
7. The solution does not have (by default) the necessary characteristics for the monitoring of specific cloud environments parameters.

Conclusions

The conclusions that can be drawn from the study regarding the possibility of implementing a monitoring solution with basic functions are the following:

1. Developing a model with basic functions for a monitoring solution can help a wide range of applications and can be the premise for developing the existing solution or other adjacent solutions with a higher degree of impact.
2. The model of the presented monitoring solution uses predefined php functions and can represent the basis for creating useful integrations for different applications developed in other programming languages. Solutions from other programming languages can also be added within the created PHP framework.
3. Ensuring basic functions for checking the IT system is vital for detecting incidents in a timely manner as well as for carrying out proactive activities.
4. The use of several technologies (PHP, HTML, CSS, Javascript, Batch Scripting, VBScript) in creating the monitoring solution is the premise of developing other scripts and integrations that can complete the verification framework.
5. The lack of integrations with vendor solutions (in this case APIs) for monitoring solution functionalities creates the premise of a cost-free model that can be widely used for basic checks.
6. The presented model can be easily configurable and, as such, implemented on various infrastructures.
7. Making the connection between the PHP functions and the results offered by other scripts / automations (Batch scripting, VB Script) creates a variant of a monitoring solution in which different integrations can be done, practically, easily, without making the call to highly complex solutions and scripts. This aspect facilitates the realization of functions, with a higher degree of complexity, for monitoring, without the involvement of costs by making connections with various vendors.
8. The model of a simple monitoring solution is suitable for detecting incidents of a general nature, of systematic damage to applications, but it is not suitable for detecting aspects of subtlety such as: CPU load, memory, I / O for host servers. After integrating with the results of other scripts (PowerShell, Batch scripting, VB Script) this aspect can be improved, but it will not have the characteristic of a complex, high-performance and flexible solution at the same time, necessary for complex applications with different integrations, API type, for example.
9. The model can integrate different PHP platforms in order to calculate relevant IPCC metrics like: incident affection measurement, changes in the system (through change requests), as a share in the total, as per specific process or as share in total set of activities registered in the system. These elements can be related to the presented server functionality features (through the development of the functions presented above) or new ones integrated through other incorporated PHP functions, as well as other technologies improvements/ enhancements, like Java.
10. The described model (with all it's functions and integrations) represents my contribution in the monitoring solutions field, especially through the posibility of customization and portability. Extensions of the existent solution can be done not only through dedicated or predefined PHP functions but also through: Java, .NET/ ASP .NET, VBScript, SQL insertions directly into the platform or in connection with other communicating platforms.
11. Other aspect of personal contribution in the field of monitoring solutions for a set of e-business applications is represented by the holistic approach in a dedicated simple but effective monitoring solution which encapsulates the following: dedicated iframe pages for login

verification purposes (combining javascript slideshow and iframe tag in order to see multiple login pages into the same frameset, a single page, with a user friendly approach); dedicated PHP functions for verifications of basic elements (server, URL, hostname); predefined functions which calculate (in relationship with other platforms or directly through database queries) relevant IPCC metrics for the system (especially incidents and change requests). All the presented features have been tested, as per indications and guidelines from the section „Experimental method used for testing the model".

12. In terms of personal contribution, I also include the development of a relatively simple monitoring tool with the help of IPCC framework (Incident, Problem, Change, Configuration). In this case, the monitoring solution could act as a primary platform (into which different alerts and notifications must be included through the contribution of different specific functions) or as a relational or communicating platform which establishes the relationship between two other systems or platforms with the scope of resources/ processes monitoring. As per below representations, the monitoring solution could be applied for multiple sets of applicatons (with bidirectional dependencies) as well as a middleware component, serving the communication between other main/ principal systems/ platforms.

Fig. 6: Primary monitoring platform/ system for multiple sets of applications

Fig. 7 : Middleware monitoring platform/ system as communication element between other monitoring systems

13. Above representations take into consideration the following aspects of personal contribution: IPCC framework for elements monitoring management; extension of current solution capabilities, depending on the involved general system and business case (features/ functions can be created with the help of the following technologies: VBScript, Batch scripting, PowerShell, PHP, as extensions of the initial simple monitoring solution); communication element that, as monitoring solution, receives information from one system and sends it as output that will be interpreted as input by other major monitoring systems. In this process data transformation might be possible with the help of ETL (Extract, Transform, Load) processes implementations.
14. It is important to take into consideration that, in the presented models, different perturbation factors can occur like: technological barriers, inconsistent data, transient process failures, technical configurations of the involved elements/ systems. All these factors can be eliminated through a control and fix mechanism which can be implemented as a separate application or as an enhancement into the current monitoring solution/ system. Therefore, we have a cybernetic system which can be adjusted through the specific control and adjustement component while the input data is transformed into output, valid information which will be used by other systems. The control and fix mechanism can be created through enhanced PHP functions with SQL, VB Scripts, Batch scripting, without involving the creation of APIs or other complex solutions.
15. With the presented monitoring solution, characterized by portability, IT operators and engineers can efficiently visualize both basic and performance metrics of the infrastructure in a few application pages or tabs. Also, the use case of the platform can be easily extended with other PHP integrations and platforms. These aspects would solve problems like: high costs with vendor applications, multiple inefficient integrations, lack of portability due to complex configuration parameters and even redundant data.

Abstract

The aim of the article is to present the development, key solutions, benefits and costs of telemedicine in Poland. It shows how the development of new technologies resulting from the fourth industrial revolution (REV 4.0) and the coronavirus pandemic, accelerated the development of telemedicine. The lockdown conditions imposed by the pandemic and the introduction of social isolation in the name of patient and physician safety, froze traditional medical visits and services, shifting the medical market to a remote mode of operations, expanding the provision of telemedicine services. To diagnose the level of telemedicine development, literature studies and original primary research were conducted on the example of one of the primary healthcare clinics in Krakow, Poland. The research presents the challenges posed by Revolution 4.0 and the COVID-19 pandemic for the healthcare sector as well as the benefits and costs of new ways of delivering medical services. The conducted analyzes have provided arguments confirming the thesis that the COVID-19 pandemic has stimulated the use of telemedicine tools in practice. The presented research results and recommendations may be used to build social awareness regarding the need to expand digital competences.

Keywords: telemedicine, e-health, effectiveness of the healthcare system, REV 4.0, COVID-19

Introduction

There is no turning back from the digital transformation of the healthcare system associated with the fourth industrial revolution. Supporting or replacing traditional healthcare services with the possibility of providing medical services at a distance may be a way to slow down the growth rate of healthcare costs without compromising efficiency (Ruzik-Sierdzińska, Sierdziński, 2018, 51). In the current reality, there is an exceptionally rapid progress in telemedicine, with new, unique technologies appearing, and existing ones being continuously improved. Devices and applications for remote diagnostics and monitoring of the patient's health, equipped with artificial intelligence, are beginning to be treated not as a technological curiosities, but as valuable supplements to medical consultations and improvement of the quality of health services.

Telemedicine and its importance on the health services market

In the absence of an unambiguous definition of telemedicine[2], various definitions are commonly used, as shown in Table 1.

[1] This project has been financed by the Ministry of Science and Higher Education within the "Regional Initiative of Excellence" Programme for 2019-2022. Project no.: 021/RID/2018/19. Total project budget: PLN 11 897 131,40. https://rev4.uek.krakow.pl/
[2] A pioneer in the field of telemedicine was NASA, which monitored the vital functions of astronauts.

Table 1: Selected definitions of telemedicine

Definition of telemedicine	Author
Telemedicine is the provision of medical services by specialists where distance is a key factor, using communication technologies to exchange information relevant to diagnosis, treatment, prophylaxis, tests, consultations or medical knowledge in order to improve the patient's health (WHO, 1997, 1998).	World Health Organization (WHO)
Telemedicine is a form of exchange of medical information between two parties using telecommunications tools, the purpose of which is to improve the patient's health.	American Telemedicine Association (ATA)
Telemedicine is the provision of health services using ICT in a situation where the health professional and the patient (or two health professionals) are in two different locations. The European Commission also refers to the concept of telemedicine services which "involve the transmission of medical data and information (as text, image, audio or other form) necessary for preventive measures, diagnosis, treatment and monitoring of the patient's health (Komisja Wspólnot Europejskich, 2008, 3).	European Commission of the EU
The medical activity consists of providing health services through teleinformation systems or communication systems (Dz. U. 2020, poz. 295, 567).	The Council of Ministers of the Republic of Poland

Source: development based on: (Olszanowski, Gierek, Skrzypek, 2016, 7).

The definitions presented in Table 1 allow to distinguish a common element for the concept of telemedicine, which is the use of data transmission with the use of ICT technologies to improve the patient's health. The term telemedicine is very broad in terms of content, so it is worth presenting in detail the issues it deals with (Olszanowski, Gierek, Skrzypek, 2016):

- Telecare - care for chronically ill patients, including those with functional limitations. This type of telemedical activity consists of measuring the patient's vital parameters by various sensors, e.g. pulse, blood pressure, saturation, ECG, KTG. The measurements are sent to the monitoring center, where they are processed and initially interpreted by specialized software. If necessary, the results will be sent to the doctor (many experts and practitioners believe that telecare is not included in the field of telemedicine, due to the fact that no medical data is processed as part of this service)[3] (Jarczewski, 2020).
- Telediagnostics - a description of the examination made on the basis of medical multimedia data (digital, text, image, audio data) and sent via telecommunication networks (e.g. telephone) or ICT networks (e.g. Internet) as saved data files.
- Teleconsultation - an opportunity to conduct an online conversation with a high-class specialist.
- Telelearning - most often carried out through internet telemedicine platforms supporting medical workers and patients. This category also includes various types of information bases for obtaining and exchanging information on treatments.

[3] According to A. Jarczewski, telecare is an additional care service that uses modern technologies. Its aim is to increase the safety of elderly, disabled, sick and others who stay alone in their homes. Telecare is a care system tool that allows many people to function better, regain a sense of security and independence. The main factor in the care of this system is a special "SOS" button, which is built into a landline or portable telephone. It allows, in health or life-threatening situations, to connect to the alarm center and call for help adequate to the situation. The possibility of using the "SOS" button is also a greater sense of security.

- Teletreatments, teleoperations - a type of procedure, operation performed with a remote-controlled surgical robot. This is the most technologically advanced type of telemedicine service. It combines elements of surgery, telecommunications, IT and robotics.

The presented division proves that telemedicine should not be perceived as a separate, new branch of medicine, but as an integral part of the healthcare system, enabling a fuller use of resources, including human resources, with the use of appropriate technologies for providing health services (Czarnucha, Grabowski, Najbuk, Kołtowski, 2015).

The telemedicine market shows great potential, taking into account the multitude of applications of its solutions in all branches of modern medicine. When analyzing the classification of telemedicine services according to the method of medical data transmission (communication), the following models can be presented (Research and Markets, 2020):

- real-time data transfer - the patient and the entity performing medical activities communicate via video-conference "live" (most often used in telepsychiatry, telecardiology, teleconsultation),
- storage and transmission (store & forward) - digital data in the form of photos, videos, audio files are acquired and stored on the patient's computer, mobile device or in the cloud and sent via a secured link.
- remote monitoring - the patient is monitored by a system that collects data from monitoring devices and transmits them to an external headquarters, from where healthcare workers supervise his health (most often used in the case of chronic diseases such as diabetes, asthma or heart disease).

The Report (Research and Markets, 2020) shows that the global telemedicine market will reach USD 25.4 billion by 2020, and as much as USD 55.6 billion by 2025. Figure 1 shows the share of individual regions of the world in the global telemedicine market in 2018-2025 in USD. The largest share of North America and Europe in this market is due to the development of technology, civilizational diseases (lifestyle diseases), the size of the geriatric population and the need to reduce healthcare spending. This market is projected to grow rapidly in Asia Pacific due to chronic disease and overcrowding in hospitals (Research and Markets, 2020).

Figure 1: Share in the global telemedicne market by world regions in the period 2018-2025 (in USD billions). In 2020, spending on the global telemedicine market is 25.4 billion USD, while it is forecast to reach 55.6 billion USD in 2025.

Source: development based on (Research and Markets, 2020)

The telemedicine service sector will grow as a result of demographic changes, including an aging population that will increasingly require medical care, a shortage of doctors, and rapidly rising healthcare costs, while research has confirmed that telemedicine can deliver medical care with greater cost-effectiveness (Research and Markets, 2020). This is particularly important as the cost of healthcare in developed countries is expected to soon account for the largest share of all social protection expenditures (Ruzik-Sierdzińska, Sierdziński, 2018, 50).

Telemedicine may be an opportunity to reduce costs for the Polish healthcare system, which has been one of the least effective in Europe for many years. In the overall ranking of healthcare systems, Poland was placed 32nd out of 35 European countries (Björnberg, Phang, 2018, 26) (Table 2).

Table 2: Basic data on healthcare in European countries and related effectiveness in 2018

	Source and Report page number:	H&G p. 133	H&G p. 135	EHCI p. 26	Own study	Own study

Source: H&G (2018), Health at a Glance: Europe 2018, State of Health in the EU Cycle, The OECD Report, pp. 133-135, EHCI (2019), Euro Health Consumer Index 2018, Health Consumer Powerhouse Ltd., p. 26. Płonka M., 2019, p. 866-867.

The presented data on the financial efficiency of the healthcare system (HCS)[4] in the form of the EHCI[5] index for European countries in 2018, show that the relationship between healthcare expenditure and the position of a given country in the EHCI index are high, but the EHCI is more influenced by spending on HCS per capita[6]. At the same time, it should be noted that European countries have public-private healthcare systems. The dominance of a public system over the private one in Poland means that redistributive allocation mechanisms, supplemented with market allocation mechanisms, dominate the healthcare market. Under these conditions, the distribution of publicly available medical services is largely politically regulated (the basket of guaranteed health services, the list of reimbursed drugs and treatments), and thus non-transparent and blocking universal access to medical services (Płonka, 2017, 321-329, Płonka, 2019, 37-47, Płonka, 2019, 864-870).

Telemedicine gained additional importance during the COVID-19 pandemic, which forced patients to use this form and thus accelerated the pace of its development. The social isolation resulting from the pandemic confirmed that in many cases teleconsultation is sufficient without the need to visit a doctor in person. IBISWorld analysts monitoring the impact of the global COVID-19 pandemic on the US telemedicine market in real time concluded that the impact of the pandemic on the telemedicine market is large because (Research and Markets, 2020):

- a society isolated at home, avoids interaction with others;
- public health institutions encourage people to use telemedicine services whenever possible;
- hospitals and other healthcare providers are finding ways to use telemedicine technology to visit quarantined patients.

New tools in the e-health project on the market for medical services in the economy 4.0

The fourth industrial revolution (REV 4.0)[7] aims to unite material and digital resources and differs from previous technological revolutions in that - by integrating existing technologies - simultaneously in production processes it blurs the boundaries between the physical, digital and biological spheres (Schwab, 2018, 11-12). The most important solutions driving the development of Industry 4.0 include the Internet of Things (IoT), machine learning, artificial intelligence, and augmented and virtual reality (AR and VR) (Deloitte, 2018). Information and communication technologies introduce new possibilities for the provision of medical services. The digital transformation of healthcare that supports direct treatment methods through remote medical services may be a way to slow down the growth rate of healthcare costs without sacrificing efficiency (Ruzik-Sierdzińska, Sierdziński, 2018, 51). In medical services, technology is progressing especially rapidly. New, unique technologies are appearing, while many of the existing ones are being improved.

[4] It is understood as an expenditure-effect relationship in which the expenditure is expenditure on healthcare per capita or as a share of GDP, and the effect is the level of healthcare measured by the EHCI (Euro Health Consumer Index) value included in the H&G (Health at a Glance) report.

[5] synthetic index, the maximum value of which is 1000 points, taking into account the following factors: patient rights and information (max. 125 points), accessibility, waiting times for treatment (max. 225 points), outcomes (max. 300 points), range and reach of services provided (125 points max), prevention (125 points max), pharmaceuticals (100 points max).

[6] The Pearson correlation coefficient between expenditure on HCS per capita and the EHCI index is 0.827, and between expenditure on HCS as a share of GDP and the EHCI index - 0.719.

[7] The concept of the fourth industrial revolution (originally Industry 4.0) was created at the Hanover Fair in 2011 to indicate how the organization of global value chains will be revolutionized. The concept of REV 4.0 was discussed at the Economic Forum in Davos, and its essence was presented in 2016 by Klaus Schwab in the book: The Fourth Industrial Revolution. K. Schwab is the founder and president of the World Economic Forum in Davos.

In the subject literature, the terms telemedicine and e-health are used interchangeably, but in Poland (Dz.U. 2019, poz. 1590) the term e-health[8] (GUS, 2020) is most often used to describe digital changes in healthcare. According to the European Commission, "e-health is the application of information and communication technology tools and services to healthcare". The latest e-health solutions in Poland concern the following projects (Jankowski, Klimczak-Wieczorek, Kloc, Matuszewski, Rozum, 2016, 6):

- P1 - Electronic Platform for Collection, Analysis and Sharing of Digital Resources on Medical Events;
- P2 - Platform for Online Access for Enterprises of Digital Medical Register Services and Resources;
- P3 - Improving the quality of management in healthcare by disseminating knowledge about ICT (e-health projects of the Ministry of Health);
- P4 – Domain-specific teleinformation systems of the healthcare information system - completed in 2016.

It is especially worth paying attention to the innovative tools of the P1 platform (table 3), which significantly facilitated and accelerated contact between patient and doctor, namely: e-prescription, e-referral, e-sick leave, e-advice, individual patient account, electronic medical records

Table 3: Key e-health tools used in Poland

Tool name	Expiry date
E-prescription	From January 1, 2020, a statutory obligation
E-referral	From 1 January 2021 statutory obligation. The e-referral pilot ran from October 2018 to September 30, 2019 (Ministerstwa Zdrowia i NFZ)
E-sick leave	From December 1, 2018, a statutory obligation
E-visit	There is no statutory obligation
Internet Patient Account available via free application of the Ministry of Health (Ministerstwa Zdrowia i NFZ)	
Electronic medical records	There is no binding date set. As of January 1, 2019, it was planned to introduce the obligation of electronic medical documentation.

Source: own study based on the sources provided in the table and (Telemedyczna Grupa Robocza, 2018, 59-61)

The lockdown conditions imposed by the pandemic froze traditional medical visits and services, forcing a new reality and exposing Poland's technological mismatch in the field of telemedicine and

[8] E-health is an effective, economical and safe use of information and telecommunications technologies to support all activities related to health protection, including the provision of health services, systems for observing health-related fields, health education, development of professional literature and knowledge, scientific research, definition of the Polish Central Statistical Office.

remote healthcare services, which have been developing in Western Europe for years (Torchała, 2020). In 2018, Poland was ranked 31st in Europe in the following categories: 24-hour telephone access to health information with the possibility of interaction and availability of electronic prescriptions, and 25th in the category of access to the online visit booking system (Björnberg, Phang, 2018, 52-75). In this respect, the private market was faster than the public health system.

Social isolation also confirmed that in many health situations a teleconsultation is sufficient, without the need to visit the doctor in person. The more so as Polish law and principles of professional ethics allow for the provision of telemedicine services, which are considered to be an equvialent health service, provided on the same terms as personal consultation in the office, the only difference is mediation (Telemedyczna Grupa Robocza, 2020). Since the end of March 2020, the interest of Poles in healthcare e-services that can be used without leaving home and thus minimize the risk of infection with the virus, has definitely increased. The growing role of telemedicine is confirmed by a study for the Biostat Research and Development Center, which shows that as many as 72% of Poles consider remote assistance in the form of teleconsultation to be the safest form of contact with a doctor (BioStat, 2020). An exemplification of the observed trends was presented on the data from one of the clinics in Krakow (Table 4) and concerned the number of consultations provided on-site and as teleconsultations.

Table 4: Number of consultations provided at the point of service and remote at the primary healthcare clinic in Krakow between February and July 2020

Types of consultations	**Number of consultations provided (in persons)**					
	February 2020	March 2020	April 2020	May 2020	June 2020	July 2020
In-clinic consultations	1 950	2 257	1 494	1987	1511	1434
Teleconsultation	0	3	163	228	600	737

Source: own study based on data provided by the primary healthcare clinic in Krakow (N = 5,800 patients).

The data in Table 4 show a sharp increase in the number of teleconsultations since April 2020 caused by the COVID-19 pandemic. There is a noticeable steady increase in remote consultations, the number of which in July compared to April 2020 increased almost fivefold. They are a great help for people who need to obtain medical advice, discuss test results, have another prescription issued for medications that are constantly taken or receive a medical leave certificate for work purposes. In July 2020, almost 13% of clinic patients benefited from teleconsulting, while 24.7% of patients used on-site, in-clinic advice. In February 2020 (before the outbreak of the coronavirus), 33.6% of patients benefited from in-clinic consultations, and no teleconsultations were provided.

Benefits and costs of using e-health tools

Health and health safety of the society are paramount values, therefore the so-far "fledgling" telemedicine market in Poland has been dynamized by the state of higher necessity brought about by COVID-19. On the Polish market, this type of services has been available for several years, and the National Health Fund reimburses certain forms of telemedicine, primarily those related to monitoring of elderly and patients with cardiological problems (Persona, 2020). Experts estimated that the implementation of e-health tools in an optimistic variant may take about two years. However, the coronavirus pandemic has greatly accelerated this process (Polityka Zdrowotna, 2020). This resulted in a partial release of healthcare providers from excess bureaucracy by removing unnecessary

procedures and formalities, allowing, inter alia, use of telephone consultations (Gałązka-Sobotka, 2020).

At the same time, the pandemic increased social awareness of the need for skills necessary to use new technologies, which give access to specialized medical assistance. However, it is worth knowing, which methods of treatment - given the funds allocated to health protection - give a more beneficial effect in the form of better health of the population (Ruzik-Sierdzińska, Sierdziński, 2018, 50). Table 5 shows the benefits and costs of using e-health tools.

Table 5: Benefits and costs of using e-health tools

Benefits	Costs / difficulties
• reducing the number of traditional visits • reducing "queues" to doctors • shorter visit time • improving the quality of patients' health • lower travel costs for an appointment • more efficient use of the time of qualified medical personnel • improving the quality and comfort of doctors' work, • creating a database for medical, economic and social sciences • lower treatment costs • preventing areas with shortages of specialists from being excluded from diagnostics • reducing the time needed to complete medical documentation	• system implementation costs • hardware and software purchase costs, • costs of training medical personnel, • costs of collecting and storing databases • digital exclusion of the 60+ generation • lack of trust in modern technologies

Source: own study based on individual interviews with the management of healthcare facilities in Poland.

One of the greatest advantages of telemedicine is accessibility, which is extremely important in the case of a shortage of specialists in specific fields. This prevents long waiting times for an appointment and the limited availability of doctors in small towns, especially those distant from larger agglomerations. When contacted via the Internet, the physician can admit more patients, minimize visit delays, and contact patients who would have difficulty arriving at the office, for example due to distance or mobility problems (Persona 2020). Therefore, it can be concluded that telemedicine solutions prevent the exclusion of disadvantaged areas from medical diagnostics. Telemedicine solutions save time and assure speed of contact with a doctor, especially in emergency cases requiring a quick response. It is a convenient and easy way for the patient to contact a doctor.

In addition to many benefits, telemedicine can be perceived through the prism of costs and challenges, especially for the elderly, who are the largest group of recipients of medical services. For them, the biggest barrier to using e-tools is digital exclusion and lack of trust in modern technologies. Simultaneously, there is a mental barrier due to the lack of physical, personal contact between the patient and the doctor, which is the reason that medical care is seen as dehumanized.

The Gartner report "e-health for a healthier Europe" lists the use of e-health tools as one of the most effective means of reducing costs and rationalizing expenditures on healthcare in European Union countries (Olszanowski, Gierek, Skrzypek, 2016, 25). According to the Regulation of the Chairman of the Polish National Health Fund (Dzienniki resortowe NFZ.2019.177), the financing of primary care

physician services according to the capitalization rate[9] adjusted using the coefficient appropriate to the age group of the recipient increases significantly from the age of 66 and the coefficient amounts to 2.7 (it is PLN 461.7), and from the age of 75 the coefficient is 3.1 (PLN 530.1). This means that the cost of providing medical services is the highest for age groups of 66 and above.

Conclusion

Civilizational (lifestyle) diseases, aging of society and growing needs in the field of long-term care, in the conditions of limited budgetary resources, imply growing supply and demand mismatches, which must be minimized within the framework of systemic solutions. Telemedicine is a future-oriented field of healthcare, the development of which is a natural consequence of changes – the Fourth Industrial Revolution (REV 4.0) and the COVID-19 pandemic. It enables the provision of medical services at a distance using modern information technologies, allowing for remote communication between the doctor and patient, and monitoring of physiological parameters. This field has even greater potential, since it enables the use of commonly used 3D printers for direct medical assistance (a prototype of a respirator has been created in Poland, which can save the lives of many people in crisis situations). 3D printers can also be used in pharmacology (in 2015, the first tablets approved by the US Food and Drug Administration were "printed") (Persona 2020).

The presented results of research from the primary care facility clinic in Krakow, Poland, allow us to confirm the thesis that the COVID-19 pandemic has stimulated the use of these solutions in practice (number of teleconsultations). At the same time, the presentation of the benefits and costs of using e-tools proves the advantage of the former. The use of telemedicine solutions ensures more effective patient care and greater than before support for doctors in the process of diagnosis and treatment by non-medical personnel.

Abstract

El presente artículo tiene como objetivo contribuir al conocimiento en el área del emprendimiento, específicamente a los factores para emprender en personas de la tercera edad. Esta investigación es de carácter cualitativo, con fundamento filosófico interpretativista, bajo la técnica relato de vida. Los resultados tienden a estar en línea con investigaciones anteriores del área del emprendimiento, no obstante, el principal hallazgo de la investigación corresponde a la relación entre la espiritualidad y la fe como elementos que reducen la aversión al riesgo en los emprendedores. La originalidad de este trabajo se basa en la incipiente investigación del tema a nivel nacional.

Palabras clave: Emprendimiento adulto mayor, Relato de Vida.

Introducción

Según la OMS (2017), en la mayoría de los países, la población de edad mayor de 60 años está considerablemente aumentando y las personas esperan vivir hasta los setenta años o más, edad definida como un adulto mayor y contemplada para cualquier efecto legal en Chile.

Cid et al (2012) proyectan que la población con más de 65 años pasará de un 10% hasta un 15% aproximadamente en 2025, y a más de 20% hacia el año 2050.

Se estima que acciones emprendedoras en la tercera edad, podría generar beneficios bidireccionales, favoreciendo el aumento de bienestar en su conjunto. Kibler et al (2015), concluye que existe posibles beneficios sociales como la reducción de costos para el bienestar, superación del desempleo entre personas mayores y un despliegue productivo de trabajadores de más edad (Weber y Schaper, 2004; Botham y Graves, 2009).

A pesar de lo anterior, existe la presunción que trabajadores de más edad son a menudo juzgados como más caros y menos capaces de manejar un cambio tecnológico rápido, en contraste de los más jóvenes (Duval, 2003, Loretto y White, 2006), provocando discriminación dentro de las organizaciones (Platman, 2003; Weber y Schaper, 2004).

En consecuencia, conforme a la evidencia se han realizado pocos estudios a nivel nacional e internacional sobre las características que podrían mantener el emprendimiento de adultos mayores (Levesque y Minniti, 2006; Kibler et al, 2015). Luego, el objetivo de este estudio se realiza para llenar los vacíos detectados, a partir de los siguientes objetivos:

- Identificar los determinantes que afectan la intención empresarial en las personas de edad mayor en el corto plazo.
- Verificar la relación entre los determinantes y la intención empresarial en las personas de edad mayor en el largo plazo.

Breve Revisión De La Literatura

La revisión de la literatura se realizó en seis bases de datos, obteniendo una cantidad de trece artículos de investigación. Los *key word* utilizados son: "*entrepreneur older worker", "older entrepreneur", "elderly entrepreneurship" y "third age entrepreneurs".*

Los resultados encontrados son homologables a los definidos por Oelckers (2015), quien destaca perspectivas complementadas por quienes suscriben este estudio, detallados en la tabla 1.

Tabla 1: Revisión adaptada de Oelckers (2015)

	Variable	**Autores**
(1)	Ambiente cultural y contexto.	Weber y Schaper, 2004; Kautonen et al, 2009.
(2)	Acceso financiero, ahorros y patrimonio.	Hart et al, 2004; Kibler et al, 2011.
(3)	Capital humano (experiencias)	Singh y DeNoble, 2003; Weber y Schaper, 2004.

(11b)	Desempleo.	Webster et al, 2005.
(11c)	Horarios flexibles	Karoly y Zissimopoulos, 2004; Zissimopoulos y Karoly, 2007.
(11d)	Autonomía e independencia	Bond et al, 2005; Walker y Webster, 2007.
(11e)	Oportunidades de aprendizaje y desarrollo	Bond et al, 2005.

La literatura existente muestra que la experiencia laboral previa de los jubilados, modifica la naturaleza de los procesos empresariales utilizados para entrar a los negocios (Baucus y Human, 1994). Además, se sugiere que los adultos mayores poseen una predisposición a emprender que depende de la carrera laboral realizada y la experiencia adquirida (Weber y Schaper, 2004). Esto confirmado por Kutonen et al (2013).

Otras características de emprendedores de la tercera edad según Botham y Graves (2009) son el ingreso razonable o una reserva financiera acumulada, experiencia laboral previa en puestos de trabajo con conocimiento en gestión, ventas y marketing o como profesional, están mejor educados que el individuo promedio de la tercera edad.

Por otra parte, estudios evidencian que la proporción de adultos mayores que están comenzando un negocio es la mitad en comparación a los jóvenes (Hart et al, 2004; Kautonen, 2008a), pero que la tasa de sobrevivencia en el largo plazo de un negocio fundado por emprendedores de la tercera edad es mayor en comparación a su contraparte joven (Kautonen y Luoto, 2008b). No obstante, personas mayores están menos dispuestas a participar en actividades empresariales debido a problemas de salud o asignación de tiempo de preferencias (Singh y DeNoble, 2003, Levesque y Minniti, 2006).

Rotefoss y Kolvereid (2005) encontró que mientras las competencias empresariales aumentan con la edad, las intenciones empresariales disminuyen. Estas intenciones son influenciadas por el grado de dificultad en la puesta en marcha de un negocio, por falta de dinero y ayuda o salud (Tornikoski y Kautonen, 2009; Kautonen et al, 2008c).

Metodología

El diseño de investigación tiene un carácter cualitativo con un sustento filosófico inspirado en el interpretativismo, enfoque de investigación que ofrece una visión rica respecto a la naturaleza de las experiencias del individuo.

La técnica metodológica ha sido el relato de vida, dando espacio a partir de la propia voz para la interpretación sobre el propio estilo de vida y así, articular y explicar quién es el entrevistado (Bruner, 2001).

Para la recopilación de datos se realizó una entrevista semiestructurada centrada en examinar aspectos sugeridos por la revisión de la literatura, motivaciones para convertirse en emprendedor, formas de aprendizaje y desarrollo del capital humano y social, fuentes de financiamiento, innovación y barreras para emprender. Las entrevistas fueron transcritas y codificadas utilizando una adaptación de la teoría fundamentada. El entrevistado fue informado sobre la naturaleza del estudio y su contribución al conocimiento.

Instrumento

La pregunta de investigación corresponde a: ¿Cual es (son) el factor (es) por la cual un adulto mayor opte a emprender dada su edad? A partir de lo anterior, diferentes preguntas giran en torno a aspectos, tales como: de la experiencia, los riesgos y desafíos. Para esto, se usó un conjunto de preguntas de distintos autores que se citan en la entrevista, más las inquietudes de los autores de este estudio.

En este contexto, también se escuchó la voz de dos de los hijos y la de su esposa, quienes han experimentado dicho proceso.

La entrevista tiene un sistema de codificación de respuestas a partir de la grabación y toma de apuntes, inspirado en (Watson, 1994), quien afirma que los investigadores en el ámbito de la gestión seleccionan y modelan sus hallazgos, pero no inventan lo que dicen los entrevistados, el proceso consistió en la lectura y relectura de los datos, los cuales se organizaron una serie de nodos o categorías.

Procedimiento

Se realizaron tres entrevistas en el año 2017 y una entrevista en el año 2020. Esta fue desarrollada operativamente en el hogar del emprendedor.

Desarrollo

La siguiente sección refleja la interpretación que hace el investigador respecto al relato de Ramón Osvaldo Peña Montecinos, quien comenzó a trabajar a los 9 años, en un almacén como vendedor donde trabajaba en las vacaciones por entretención. El segundo trabajo fue en una fábrica de tizas a la edad de 15 años y a los 18 años consiguió un trabajo en una papelera de la comuna de Puente Alto.

En el año 1974 empezó a estudiar Ingeniería en Minas finalizando sus estudios en 1978. En 1986 comenzó a trabajar en Mina el Teniente. En 1990 se fue a trabajar a una empresa en Los Andes y adquirió mayor experiencia laboral, trabajando por 20 años en la ENAMI.

Tuvo logros personales importantes como encontrar a la mujer ideal (Hilda) para su persona, casándose en 1985. Tuvo su primera hija (Karla) en 1987, el segundo (Ignacio) fue en 1990, el tercero (Pablo) en 1991 y su última hija (Rosario) en 1997.

Esta narración se lleva a cabo geográficamente en la III Región de Atacama, Chile. Lugar, donde la principal actividad económica es la minería, donde el período 2014-2016 estuvo marcado por una baja sistemática del precio del cobre, provocando en muchas empresas desvinculaciones por ajustes en los costos.

A. Primera parte, 2017

Sobre el camino al cambio de la vida laboral.

El entrevistado tiene un estilo narrativo bastante discreto y preciso.

¿Qué hizo antes de convertirse en un emprendedor? (Small, 2012).

Trabajé durante 20 años en la Empresa Nacional de Minería [silencio] y antes en empresas contratistas que prestaban servicio a mineras.

¿Qué tan interesado estaba usted antes convertirse en un emprendedor? (Kautonen et al, 2011).

Nunca pensé en convertirme en emprendedor… como trabajaba, no había necesidad, el sueldo que yo tenía alcanzaba para todo, estaban las comodidades [silencio] aunque mis hijos, de mucho antes querían que yo emprendiera, cuando yo aún estaba trabajando [silencio] había pensado en hacer algo después que me jubilara.

¿Después que jubilara?

Sí, porque la plata que uno recibe con la pensión es poca [silencio] pero nunca había pensado en tener un negocio.

Cuénteme sobre ¿cuándo se hizo emprendedor y qué evento catalizó la situación? (Small, 2012).

Ehhh todo esto nace después de haber salido de la empresa [silencio] por una necesidad de ver que no había "ingresos" por no estar trabajando, había que invertir en algo la plata que recibí, el dinero que había era para poder sustentarse.

¿Cómo es eso de no estar trabajando?

Dejé de trabajar por decisión del gerente [silencio] era un problema, yo creo, que la gente que estaba arriba quería ingresar gente de su confianza.

En este tiempo ¿Cuánto se ha preparado para ser emprendedor?, ya sea en términos de tiempo y contenido.

Nunca me he preparado para hacer emprendedor [silencio], sólo la experiencia de mi antiguo trabajo [silencio] yo siempre fui más de ejecutar que de dirigir [silencio] dentro de la ejecución claro uno dirige, la gente que trabajan con uno.

Dada sus circunstancias profesionales y laborales de Ramón, tiene una fuerte tendencia a los aspectos técnicos y operativos de proceso. Se evidencian incipientes rasgos previos de gestión, como lo es el manejo de personas.

B. Segunda parte, 2017

La conversación avanza y se percibe más confianza y soltura en la conversación.

Sobre la empresa en acción.

¿Cómo ha sido el proceso de transición de pasar de empleado dependiente a emprendedor?

Gracias a Dios, no ha sido complicado [silencio] la ayuda de la familia, el apoyo [silencio] como se dice todos tiramos el carro para que sea más fácil.

Me puede hablar sobre el negocio que empezó. ¿Estaba en un contexto que había trabajado?

No, siempre trabajé en la minería.

¿Cómo dio con la idea?

Bueno, yo quería una bencinera… pero un día que fui a comprar un repuesto del auto iba pasando por "Acquabella" y Dios me iluminó y que tenía que ir por la parte del agua [silencio] y por eso me empecé a preocupar del tema.

La espiritualidad en el lugar de trabajo puede ayudar a comprender mejor por qué los individuos muestran diferentes actitudes. La espiritualidad en el lugar de trabajo es una necesidad humana (Hart y Brady, 2005) y las organizaciones no deberían ignorarlo (Afsar y Rehman, 2015).

¿Cómo llevó a la acción la idea de negocio que identifico?

Ehhh, [silencio], fuera de las conversaciones y la aceptación de que este proyecto por el lado de la familia, bueno, ehhh empecé a buscar, buscar [silencio trata de recordar] más menos un mes buscando que planta comprar, como funcionaban, cuáles eran los procesos… hasta que se compró la planta.

¿Con que recursos financió la inversión?

Con la plata que recibí de la empresa cuando salí.

¿Pensó en otra alternativa para invertir ese dinero que recibió?

Ehhh, a ver, si, en algún tipo de depósito… pero no quise porque no es continuo lo que entrega y muy poco.

¿Cómo lo ha hecho para gestionar el negocio?

Ehhh en conversaciones y la ayuda de mis hijos… mi esposa, tratamos de hacer cosas innovadoras para llegar atraer más clientes, ehhh usando la tecnología, esto lo de las redes sociales, es

decir hay que hacer cosas comunicacionales haciendo cosas que puedan ir a la gente, la idea es que las ventas aumenten, pero estas cosas la tienen que llevar acabo mis hijos… cosa que las ventas crezcan.

¿Qué funciones y roles cumple en la empresa?

De todo casi, [risas], porque hasta que no se afirme la empresa, hay que hacer de todo [silencio] Pero va a llegar un momento en que me tengo que hacer un lado para dejarlo en manos de los hijos.

¿Me puede contar como es un día cualquiera en su trabajo?

Ehhh, bueno me baño, se empieza a cargar el vehículo para ir a repartir a los negocios, en algunos sectores de la ciudad, ehhh restaurant algunos locales hasta que quede agua. Bueno, ehhh a la vuelta a casa lavar los bidones, secar y seguir procesando [silencio] La idea es sacar el mejor bidón. Eso es más o menos el training del día.

¿Todos los días son iguales?

No todos los días son iguales, pero en general todas las mañana se vende [silencio] porque hay que ir a entregar o llaman por teléfono, entonces hay que ir a repartir [silencio] y en la tarde se procesa ehhh hasta una hora prudente para no meterle bulla a los vecinos.

¿Cuáles han sido las principales dificultades para convertirse en un emprendedor? (Kautonen et al, 2011).

Dificultades [silencio], en la parte emocional [silencio], los miedos yo creo.

¿Miedos a qué?

A la competencia, aaaah que el cliente no esté a gusto, miedo a que ehhh baje las ventas, miedo a no cumplir con lo que uno al final se propone en cuanto a lo que pueda dar este negocio a las necesidades y gastos que se producen en la familia y la empresa en sí.

¿Y respectos a las dificultades emocionales?

Ehhh, bueno he dormido tranquilamente [risas], no ehhh bueno en el día a día uno se angustia… por las ventas, por llegar luego con el bidón al cliente [silencio], por las contingencias a última hora [silencio] hay empresa que quiere 100 bidones de un día para otro o de una mañana para la tarde.

¿Qué espera ud. de la empresa?

El haber iniciado esta empresa nunca fue con el fin de ser yo el beneficiado, sino que todos [silencio] toda la familia y la familia son los hijos que van llegando también [silencio] Mis hijos, los nietos [silencio] todo va a depender si los hijos se entusiasman con el negocio y lo trabajan.

Al escuchar a Ramón, existe la sensación de estar con un padre que tiene un fuerte vínculo familiar, está plenamente arraigado el modelo masculino de sostén de familia.

¿Cómo es su red de contacto?

Ehhh no tengo [silencio] sólo la familia [silencio] contacto de mis hijos, mi esposa… eso.

C. Tercera Parte, 2017

Sobre los futuros, miedos y desafíos.

¿Cómo ve la empresa en los próximos cinco años?

Mas automatizada… con más volumen de producción.
Pero para eso necesitará recursos. ¿Me puede contar si conoce alguna organización o instrumento público en el cual se pueda apoyar?

Ehhh [silencio] hay una que entrega plata pero no sé si me puede entregar a mí por la inversión que he hecho [silencio] desconozco un poco sobre eso.

Y respecto a la gestión de la empresa, ¿Cómo la ve en los próximos años?

[Silencio], ehhh en la medida que se vayan integrando el que está más arriba le vaya enseñando al de más abajo, que haya comunicación, respeto…

¿Cuánto tiempo pretende vivir como empresario?. ¿Qué hará que se retiren? (Krueger et al, 2000).

Ehhh, yo pienso que un tiempo más, hasta cuando estemos en condiciones de sustentarnos [silencio] para después dejar a alguien de la familia a cargo [silencio] Yo creo que Pablito o Ignacio deberían ser la cabeza del negocio y yo dedicarme a pensar.

¿A pensar? ¿En qué?

Bueno, el emprendimiento debería crecer o sea ampliar el rubro [silencio] como por ejemplo la fabricación de hielo [silencio] a lo mejor tener agua gasificada [silencio] es decir, agrandar el negocio del agua. Ehhhh bueno el crecer implica contratar personal, pero la idea es que siga dando frutos para el conjunto de la familia.

¿Qué piensa hacer después que deje el emprendimiento?

Descansar [risas]

Desde el punto de vista del compromiso y la intención de trabajar autónomamente (Kerr y Armstrong, 2011) establecieron un nivel de asociación significativa respecto a las necesidades de satisfacción personal, los cuales se ven reflejado al cierre de la entrevista.

¿Cuáles son las lecciones más importantes que usted ha aprendido en el camino? (Small, 2012).

Hay que hacer un sacrificio, comprometerse, esforzarse más para poder para cumplir con esa meta [silencio] que a la edad que uno tiene se puede [silencio] no tiene por qué echarse uno a morir.

Finalmente, ¿Está satisfecho con lo que ha logrado hasta el momento?

Si, gracias a Dios.

D. Entrevista 2020

En el año 2020, se contacta con el emprendedor con el objetivo de detectar las razones por las cuales el cree que la empresa a la fecha aún sigue sobreviviendo y como esto ha impactado en su calidad de vida.

Para que el lector interprete la respuesta debe recordar dos hechos que marcaron la agenda nacional en el último tiempo, el estallido social del 18 de octubre del 2019 y la pandemia desde marzo 2020.

Para ello, se abre la conversación con las dos últimas preguntas realizadas en 2017.

¿Cuánto tiempo pretende vivir como empresario? Y aún su empresa sobrevive, me puede explicar que pasó? .

Bueno, el negocio fue creciendo, se agregó la venta de nuevos formatos de agua, la fabricación de hielo [silencio tratando de recordar] y otros productos que complementan la recarga del bidón, por ejemplo: los dispensadores manuales y eléctricos.

¿Cómo lo logró?

Bueno, con la ayuda de mis hijos y por supuesto la inspiración y guía de Dios.

Ahora, respóndame lo siguiente ¿Cómo ha estado su salud física en los últimos años?

Bueno, esto es agotador [silencio], físicamente con dolores en la espalda, [silencio, mueve la mano hacia la espalda] porque el trabajo de cargar y transportar el agua es pesado.

Y en términos ¿emocionales?, le gustó la idea de ser emprendedor.

Ehhhh, [silencio] sí, aunque siento que a veces uno tiene más responsabilidades.

¿A qué se refiere?

Hay que tener el dinero para pagar los proveedores, Ehhh tener una buena calidad del agua para que los clientes no reclamen, [silencio] las deudas.

¿Qué hará que se retire del negocio?

Bueno, mi salud, ehhh esto agota.

¿El negocio seguirá?

[Piensa en silencio], Ehhh no lo sé, Dios sabrá qué pasará, si lo vendo o unos de mis hijos se queda a cargo.

Discusión

Un tema importante de discusión son las características personales del emprendedor. Respecto a la edad, los resultados reafirman lo encontrado por Hart et al (2004), quienes concluyeron que los adultos mayores son mucho menos probables respecto a las personas más jóvenes a tomar medidas para actuar de manera emprendedora (Lévesque et al, 2006; Kautonen, 2008a).

Así mismo, corroborar lo indicado por Bond et al (2005) cuando indica que los hombres mayores (en un 80 por ciento) tienen más probabilidades que las mujeres mayores (62 por ciento) estar casados o vivir con una pareja, lo que proporciona una fuente importante de apoyo.

El perfil de Ramón se ajusta a lo encontrado por Botham y Graves (2009) sobre algunas características de emprendedores de edad mayor, como lo son: una reserva financiera acumulada, experiencia laboral previa en puestos de trabajo con mejores características profesionales que el individuo promedio de la tercera edad.

A partir del relato se tiene que Ramón toma la decisión de emprender producto de su desvinculación inesperada de la empresa donde trabajó por 20 años y a la incertidumbre que esto conlleva en el contexto familiar. Lo anterior, reforzado por Webster et al (2005) y Cahill et al (2006).

Además, confirmar que el emprendimiento de la tercera edad tiene un particular interés de complementar las bajas pensiones (Wainwright y Kibler, 2014; Small, 2012).

Loretto y White (2006) sugieren un fenómeno generacional, donde la noción del modelo masculino de sostén de familia está plenamente arraigada y afecta las expectativas de ampliar la vida laboral tanto para hombres como para mujeres.

El entrevistado no reconoce discriminación por la edad, en contraste a investigaciones que hacen hincapié en cómo empresarios de más edad encuentran difícil encajar en una cultura de empresa dominante, que tiende a enmarcar el emprendimiento como una actividad para individuos más jóvenes (Kautonen et al, 2011; Mallet y Wapshott, 2015).

Finalmente, el principal hallazgo de la investigación corresponde a la relación entre la espiritualidad y la fe como elementos que reducen la aversión al riesgo en los emprendedores. Esto es ratificado en la entrevista a Ramón y su círculo familiar, esposa e hijos. Estos últimos, señalan que sus temores y aprensiones del proyecto son mitigados por su inquebrantable fe en Dios el cual es evidenciado en las entrevistas del 2017 y 2020.

Un segundo hallazgo interesante es el hecho que la literatura previa no hace alusión al nivel de profundidad de tipo de emprendimiento de trabajo, es decir puede existir una gran idea de negocio, pero con alto contenido de carga laboral medido en términos psíquicos y físicos. Esto es interesante comprender pues puede acelerar un deterioro de la calidad de vida y la retirada del emprendedor mayor de su negocio.

Un tercer hallazgo, es haber comprobado que la acción emprendedora involucrada en la creación, movilización y comercialización de los recursos, hacen que el emprendedor pueda percibir un alto grado de autonomía, valorización propia y expectativas, cuyas implicancias se puede apreciar en tres niveles, esto es a nivel individual, respecto a su función en la sociedad inmediata, en este caso su familia y la del entorno como agente de movilidad económica.

Limitaciones Y Futuras Líneas De Investigación

La principal limitación se encuentra dada la naturaleza de la técnica ocupada como lo es el relato de vida. Esta investigación se encuentra abierta a una amplia gama de diferentes interpretaciones.

Respecto a las futuras líneas de investigación, en primer término, si bien, esta investigación se realizó a una persona y dos integrantes del círculo familiar, se recomienda complementar la investigación con dos o más adulto mayores, con el objetivo de disminuir el grado de subjetividad de las observaciones.

En segundo término, Weber y Schaper (2004) sostienen que los empresarios de mayor edad son predominantemente masculinos. Sería interesante contrastar que sucede con el género femenino.

En tercer término, sería interesante comprender como opera la fe dentro de los emprendedores adultos y como esta puede estar en marcada dentro un sistema de creencia global. Esto es interesante debido a que los países de Latinoamérica no poseen modelos de transcendencia espiritual en comparación con los países del Medio Oriente.

Por último, se sabe que en el envejecimiento la persona atraviesa cambios psicológicos y sociales importantes que pueden hacer que la dinámica cotidiana del adulto se altere (Alvarado et al, 2017), por tanto, los resultados sugieren indagar, si el adulto mayor podría presentar un estado de bienestar mayor en la medida que incursiones en acciones emprendedoras, cuando están sujeta al nivel de riesgo (financiero y operativo), tipo (producto o servicio) y nivel de trabajo (estructura organización) del negocio.

Abstract

La presente investigación tiene como objetivo determinar la intención que puedan adoptar estudiantes de educación superior en el aprendizaje electrónico dentro del contexto de la pandemia COVID19, desde la teoría del comportamiento planificado. Las hipótesis planteadas fueron estructuradas de acuerdo a las dimensiones de actitud, normas subjetivas y el control de comportamiento percibido, modelado estadísticamente a través de ecuaciones estructurales. Se ha encuestado a 266 estudiantes de una universidad pública y acreditada de Chile. Los resultados obtenidos han confirmado parcialmente las hipótesis planteadas debido a que sólo actitud y el control del comportamiento percibido han arrojado influencia hacia la intención de adoptar el aprendizaje electrónico. Los hallazgos deben ser comprendidos de acuerdo a las limitaciones del estudio. Finalmente, se presentan las implicancias y las futuras líneas de investigación.

Palabras clave: Aprendizaje electrónico, Teoría del Comportamiento Planificado, Educación Superior, Pandemia.

Introducción

La pandemia mundial de COVID-19 que ha afectado a la mayoría de las partes del mundo con altas tasas de contagio y mortalidad, ha alterado el quehacer natural de los países (Hadi et al, 2020). Las medidas de control impuestas por las naciones han impactado todos los sectores de la población mediante el congelamiento de sus actividades en forma parcial o total (Seetharaman, 2020), acelerando el cambio y la incorporación de las vías digitales para mantener la comunicación entre los individuos (WFE, 2020).

El sector de educación tales como escuelas, colegios y universidades, no se encuentra apartada a estas acciones. En todo el mundo hay millones de estudiantes afectados por el cierre de las instalaciones de las universidades debido a la pandemia (Chavarría et al, 2020). Así, algunas instituciones han suspendido las clases de tipo tradicionales como medida preventiva para proteger a los estudiantes y profesores, las cuales han sido reemplazadas por plataformas virtuales, no sólo a nivel nacional sino también internacional (Lechner et al, 2020).

Una Aproximación Desde La Teoría Del Comportamiento Planificado TPB" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Esto, trasuntó en el uso creciente de la tecnología de la información en la educación superior, pasando rápidamente desde materiales en papel con soporte presencial a materiales electrónicos de soporte en línea, lo que genera una incertidumbre respecto a las consecuencias para la experiencia de aprendizaje de los estudiantes (Ebner et al, 2020). Por esta razón, se hace necesario y factible evaluar el impacto de las innovaciones tecnológicas en cada aspecto del currículum.

Esta adopción asume que el alumno debiera encontrarse en condiciones psicopedagógicas adecuadas para enfrentar los desafíos pedagógicos tradicionales de un semestre académico. Por lo tanto, en el contexto del sistema de aprendizaje electrónico, la aceptación del aprendizaje electrónico por parte de los estudiantes se considera uno de los principales criterios para el éxito del sistema de aprendizaje electrónico (Almaiah et al, 2020).

A pesar que existe un cuerpo importante de investigaciones sobre la relación entre el COVID y los procesos de aprendizajes virtuales, curiosamente, poco se ha indagado del nivel de adopción percibida respecto al proceso de enseñanza y aprendizaje virtual en la educación de la administración, negocio y gestión, ocupando la teoría del comportamiento planificado, en adelante TPB (Ajzen, 1991).

El modelo TPB identifica creencias específicas que pueden influir en la intención de aprender y como consecuencia con su comportamiento futuro del alumno el cual se ve reflejado en su rendimiento. Comprender los factores que influyen en la intención de adoptar el aprendizaje electrónico en tiempo de pandemia ayudará a crear un entorno predictivo que permita establecer estrategias favorables para una mayor adopción, así como ayuda para diseñar, planificar y organizar acciones para promover su aceptación.

En consecuencia, el propósito de esta investigación es establecer los factores que determinan la intención de adoptar el aprendizaje electrónico en el sistema educativo superior como consecuencia de la pandemia.

Breve Revisión De La Literatura

Pandemia COVID19 y el proceso académico

La pandemia se ha intensificado en Latinoamérica en el primer semestre del 2020, traducido en términos de contagios y muertos, amenazando el bienestar general de los seres humanos, afectando a todos los ámbitos de la sociedad. En específico, esta investigación ahonda a la educación superior universitaria. Los actores involucrados como estudiantes, académicos, investigadores, personal de administración no sólo han estado ajenos a dificultades en el quehacer cotidiano ya sea en su docencia, investigación, vinculación y procesos de gestión administrativo, sino también a las necesidades de satisfacer simultáneamente las demandas de estudiantes, padres, y organizaciones vinculadas a la entidad universitaria.

En efecto, los estudiantes universitarios, en un semestre académico normal, son sometidos a cargas psicológicas que se pueden traducir en inseguridades, ansiedad, stress, producto de procesos académicos tradicionales como son los exámenes, trabajos, laboratorios, trabajos de titulación, entre otros. Con la pandemia, probablemente muchos estudiantes deberán adicionar a dichas cargas, la ansiedad de retrasar su egreso y prácticas laborales, pérdida de fuente laboral parcial, disconformidad respecto al proceso, resistencia al cambio, entre otros.

Esta generación de estudiantes universitarios enfrenta un desafío sin precedentes a raíz del brote de COVID-19 como lo es la adopción de un nuevo proceso de enseñanza y aprendizaje denominado aprendizaje electrónico. Esta adopción asume que el alumno se encuentra en condiciones psicológicas adecuadas para enfrentar los desafíos pedagógicos tradicionales de un semestre académico. Sin embargo, esta emergencia de salud pública genera incertidumbre, caos y temor con amplias consecuencias psicológicas clínicas y sociales (Holmes et al, 2020).

En condiciones normales del entorno, el proceso de enseñanza y aprendizaje ha presentado desafíos para los investigadores. En este sentido, no ha sido menor pasar de una educación presencial a una virtual. Existe una amplia investigación sobre educación e-learning, existiendo preocupación con respecto al énfasis percibido en lo pragmático más que en lo teórico (Randall et al, 2010).

Algunos investigadores expresan preocupaciones de que los estudiantes en entornos virtuales tienden a sentirse más confundidos, aislados y frustrados, y como resultado su efectividad de aprendizaje y la satisfacción puede reducirse (Zaborova y Markova, 2016). Sin embargo, otros hallazgos indican que los estudiantes tienden a asociarse fuertemente a la interacción social efectiva con el disfrute del aprendizaje en línea y la efectividad del aprendizaje en línea (Damary et al, 2017). Estos resultados contradictorios demuestran que la efectividad del aprendizaje es un concepto complejo, con múltiples dimensiones y debe evaluarse con múltiples medidas (Markova et al, 2017).

Dado lo anterior, suponemos razonablemente que la efectividad del proceso de enseñanza y aprendizaje está dado por el grado de percepción que tiene el estudiante, el cual incluye sus creencias y aprensiones previas, las cuales podrían predecir el comportamiento frente al proceso tecnológico global presente en la entrega del contenido académico.

En este sentido, determinar los factores que influyen en la intención de adoptar el aprendizaje electrónico ofrece una gran oportunidad de indagación puesto que hoy enfrentamos una variable contextual sin precedentes.

Por tanto, es necesario presentar una teoría que pueda incorporar las características involucrada en el comportamiento con elementos predictores de naturaleza tecnológica. En este sentido, la teoría del comportamiento planificado, TPB, podría ofrecer una guía para comprender el fenómeno en estudio.

Teoría del comportamiento planificado

La TPB es una teoría que explora las actitudes, normas subjetivas y el control del comportamiento percibido (PBC), basado en la estructura de creencia del individuo.

Actitudes

Respecto con las creencias actitudinales de Ajzen (1991), se considera pertinente considerar la ventaja relativa, complejidad y compatibilidad, como variables relacionadas con las decisiones de adopción tecnológica. Esto basado en la estructura de Taylor y Todd (1995).

La ventaja relativa (Rogers, 1983) o utilidad percibida Davis (1989) se refiere al grado en que una innovación proporciona beneficios que reemplazan a los de su precursor y puede incorporar factores tales como beneficios económicos, mejora de la imagen, conveniencia y satisfacción.

La complejidad de (Rogers, 1983) o facilidad de uso (Davis, 1989) representa el grado en que se percibe que una innovación es difícil de entender, aprender u operar.

La compatibilidad (Rogers, 1983) es el grado en que la innovación encaja con los valores existentes del adoptante potencial, las experiencias anteriores y las necesidades actuales.

Normas subjetivas

La norma subjetiva de Ajzen (1991) se encuentra relacionada con la posible divergencia de opinión entre los grupos referentes diferentes desde el punto de vista del uso de la tecnología de información. Por ejemplo, para esta investigación se propone compañeros (otros estudiantes), superiores (profesores) e institución.

Control del comportamiento percibido.

Por último, el control del comportamiento percibido de Ajzen (1991), se refiere a la autoeficacia individual. Desde la perspectiva de la adopción tecnológica según aduce Taylor y Todd (1995) se puede ocupar las limitaciones de recursos externos y las condiciones facilitadoras de recursos y tecnológicas.

Así, desde las proposiciones establecidas en la revisión de la literatura se pueden construir las siguientes hipótesis:

H1: La actitud del alumno influye hacia la intención de adoptar el aprendizaje electrónico.
H2: La norma subjetiva del alumno influye hacia la intención de adoptar el aprendizaje electrónico.
H3: El PBC del alumno influye hacia la intención de adoptar el aprendizaje electrónico.

Luego, el modelo hipotetizado es el que presenta la figura 1.

Figura 1: Modelo Hipotetizado

Metodología

Tipo de metodología

La preferencia epistemológica de esta investigación corresponde al modelo hipotético-deductivo.

Tipo de diseño

La investigación presenta un tipo de diseño no experimental, de cohorte transversal, con cuestionario auto-reportado y de unidad de análisis a los estudiantes de pregrado de jornada diurna en una universidad estatal acreditada de Chile.

Población y muestra

La población está conformada por estudiantes de educación superior de una Universidad perteneciente al CRUCH, acreditada, del norte de Chile. Se utilizó una muestra probabilística estratificada por tipo de Facultad con un n = 266 estudiantes.

Procedimiento

El período de toma de muestra fue entre la primera y tercera semana de julio del 2020. La figura 1 presenta las preguntas de la encuesta que fue enviada a través de e-mail a los estudiantes. Esta debió ser completada a través de la plataforma Google Forms.

Las preguntas de la encuesta se adaptaron según la fundamentación de Taylor y Todd (1995). El cuestionario tiene 12 preguntas en las cuales los estudiantes debieron seleccionar una preferencia por pregunta. Esta se detalla en la tabla 1. Para esto, se ha utilizado la escala Likert, donde la puntuación = 1, corresponde a la afirmación "completamente en desacuerdo" y la puntuación = 7, corresponde a la afirmación "completamente de acuerdo".

Tabla 1: Cuestionario a estudiantes de educación superior

ID	Dimensión	Afirmaciones	Fuente
P1	Actitudes	Estoy consciente que el medio tecnológico de aprendizaje ha sido beneficioso para mí.	Adaptación de Taylor y Todd (1995).
P2		Las herramientas utilizadas (moodle, meet, zoom, classroom, entre otras) por la Universidad como medio tecnológico de aprendizaje ha sido compatible con mi forma de trabajar/estudiar/aprender.	
P3		Ha sido fácil aprender a utilizar (moodle, meet, zoom, classroom, entre otras) el medio tecnológico de aprendizaje.	
P4	Normas Subjetivas	Uso el medio tecnológico de aprendizaje por la influencia que ejercen mis compañeros de curso porque ellos consideran que es favorable para mi aprendizaje.	
P5		Uso el medio tecnológico de aprendizaje porque mis profesores creen que es favorable y tiene ventaja para mi aprendizaje.	
P6		Uso el medio tecnológico de aprendizaje porque la institución considera que el medio tiene ventajas para mi aprendizaje.	
P7	PBC	He invertido más tiempo (más del que tradicionalmente ocupo en el proceso tradicional de enseñanza), para aprender a través del medio tecnológico de aprendizaje.	
P8		El costo monetario ha sido alto en imprimir (guías de trabajo, clases, etc) producto del medio tecnológico de aprendizaje.	
P9		Ha sido importante para mí poder contar con un computador cuando lo necesite para acceder al medio tecnológico de aprendizaje.	
P10	Intención	El próximo semestre (espero/quiero/tengo la intención) de participar activamente el medio tecnológico de aprendizaje propuesto por la universidad.	
P11		El próximo semestre (espero/quiero/tengo la intención) de complementar las acciones propuesta por el medio tecnológico de aprendizaje propuesto por la universidad.	
P12		El próximo semestre (espero/quiero/tengo la intención) de promover mejoras al medio tecnológico de aprendizaje propuesto por la universidad.	

Modelo Conceptual

El modelo conceptual propuesto contiene los factores que determinan la intención de adoptar el aprendizaje electrónico en el sistema educativo superior como consecuencia de la pandemia desde la teoría del comportamiento planificado. Así, la variable endógena queda determinada por (η_1 = intención) y las exógenas por (ξ_1 = actitud), (ξ_2 = norma subjetiva) y (ξ_3 = percepción de control de comportamiento).

Además, entre las variables observadas de carácter exógenas se encuentran (□□□= utilidad percibida), (□□□= compatibilidad), (□□□= facilidad de uso), (□□□= compañeros), (□□□= profesores), (□□□= institución), (□□□= autoeficacia), (□□□= condiciones de facilitación tecnológica), (□□□= condiciones de facilitación de recurso). Por último, se tiene que las relaciones entre las variables independientes y dependientes las cuales están determinadas por □□□ (Actitud-Intención), γ_2 (Norma subjetiva-Intención), γ_3 (Percepción de control de comportamiento - Intención).

Figura 2: Modelo de ecuación estructural general hipotético

Luego, si la matriz de varianza / covarianza estimada por el modelo, no es significativamente diferente de la matriz de covarianza de datos observados, S, entonces se tiene que el modelo se ajusta a los datos bien, y se acepta la hipótesis nula es decir el modelo apoya la plausibilidad de relaciones postuladas entre las variables, de lo contrario, el modelo no se ajusta a los datos, y la hipótesis nula debe rechazarse (Wang y Wang, 2019).

Resultados

Estadística Descriptiva

La tabla 2 presenta un resumen de las principales estadísticas descriptivas de la muestra. Se indica que un 57,14% corresponde al género femenino y un 42,86% al masculino. Si se considera la Facultad de procedencia, se ilustra lo siguiente: 8,27% pertenece a la Facultad de Ciencias Jurídicas y Sociales, 13,90% a la Facultad de Ciencias de la Salud, 1,50% a Medicina, 12,40% a Humanidades y Educación, 45,86% a Ciencias de la Ingeniería, 13,53% a la Facultad Tecnológica y 4,54% a la Sede

de Vallenar. Así mismo, se expresa en la tabla 3 los resultados de género por nivel y la tabla 4 que muestra los resultados descriptivos de cada Facultad por nivel.

Tabla 2: Resultados descriptivos de la muestra por Facultad

Facultad	Femenino	Masculino	Total
Cs. Jurídicas y Sociales	16	6	22
Cs. de la Salud	30	7	37
Medicina	1	3	4
Humanidades y Educación	21	11	33
Cs. de la Ingeniería	62	60	122
Tecnológica	15	21	36
Sede Vallenar	7	6	13
Total	152	114	266

Tabla 3: Resultados descriptivos de género por nivel

Género	1°Año	2°Año	3°Año	4°Año	5°Año	6°Año	Total
Femenino	42	43	27	28	9	3	152
Masculino	32	35	16	13	11	7	114
Total	74	78	43	41	20	10	266

Tabla 4: Resultados descriptivos de cada Facultad por nivel

Facultad	1°Año	2°Año	3°Año	4°Año	5°Año	6°Año	Total
Cs. Jurídicas y Sociales	8	9	1	4	0	0	22
Cs. de la Salud	9	8	9	10	1	0	37
Medicina	3	0	1	0	0	0	4
Humanidades y Educación	7	5	5	11	4	0	32
Cs. de la Ingeniería	29	34	19	15	15	10	122
Tecnológica	10	17	8	1	0	0	36
Sede Vallenar	8	5	0	0	0	0	13
Total	74	78	43	41	20	10	266

La tabla 5 presenta un resumen de los resultados descriptivos de la encuesta en cada una de las preguntas asociadas a los constructos evaluados. Se ilustra que en general, los estudiantes tienen una evaluación moderadamente alta en todos los ítems que miden la actitud (A), las normas subjetivas (NS) y el control del comportamiento percibido (PBC) con respecto al aprendizaje electrónico como consecuencia de la pandemia. Se destaca el hecho que la pregunta 3 (A) tiene un promedio mayor a 5. Por otro lado, la pregunta 4 (NS) tiene una valoración menor a 3.

Tabla 5: Resultados descriptivos encuesta

Variable	Obs	Mean	SD	Mín	Máx	Carga Factorial	Conbrach Alpha
P1	266	4,003	1,896	1	7	0,6907	0,8331
P2	266	3,661	2,077	1	7	0,8156	
P3	266	3,981	1,956	1	7	0,7613	
P4	266	2,849	1,711	1	7	0,4329	0,8176
P5	266	3,650	1,871	1	7	0,5633	

P6	266	3,924	2,035	1	7	0,5191	
P7	266	5,428	1,864	1	7	-0,2717	0,3716
P8	266	5,086	2,064	1	7	-0,2164	
P9	266	6,511	1,032	1	7	0,2083	

Además, la tabla 5 informa sobre las cargas factoriales que explica el 60% de la varianza total de los datos. Así mismo, se determina la validez del instrumento mediante el Alfa de Cronbach. Ésta, indica valores mayores o iguales a 0,8176 corroborando la confiabilidad del constructo en la muestra de investigación (a excepción de las preguntas 7, 8 y 9, con un valor de Alpha Cronbach de 0,3716).

Modelo de ecuaciones estructurales

El modelo de ecuaciones estructurales probó las hipótesis en el marco de investigación mediante análisis de regresión. La figura 3 muestra los caminos, coeficientes y varianzas explicadas para el modelo.

Así, el camino desde la actitud hacia la intención fue significativo (b = ,96, z = 6,39, p > 0,05), apoyando H1. Luego, la relación entre desde la norma subjetiva hacia la intención no fue significativo (b = ,18, z = 1,55, p < 0,05), no apoyando H2. Por último, la relación ente el PBC y la intención presentó un efecto positivo (b = ,4, z = 2,10, p > 0.05), apoyando H3.

Luego, se reportan los parámetros del modelo de ecuaciones estructurales ajustado, a saber, $\chi 2$ (Chi cuadrado), CFI (Comparative fit index), TLI (Tucker-Lewis index), AIC (Akaike´s information criterion), BIC (Bayesian information criterion), RMSEA (Root mean scuared error of approximation), SRMR (Standardized root mean squared residual) y CD (Coefficient of determination). Se calculó el ajuste del modelo propuesto. Los resultados del ensayo del modelo indicaron un ajuste aceptable: $\chi 2$ (48, N = 266) = 80,590, CFI = 0.976, TLI = 0,967, AIC = 11.684, BIC = 11.834, RMSEA = 0.051 [90% IC: 0.003 / 0.069], SRMR = 0,049 y CD =0,994.

Por último, se presenta en la figura 3 el *path* modelo de ecuaciones estructurales en el que se aprecia que el camino más fuerte para llegar a la intención es la actitud, el cual es seguido por el PBC.

Figura 3: Modelo Conceptual Aplicado

Así, la figura 3 muestra gráficamente los resultados del modelo de ecuación estructural para la muestra de estudiantes de pregrado. Se verifican las relaciones existentes entre las variables latentes y las observables. En ella se evidencian 12 variables observadas, así también 78 elementos conocidos en la matriz de covarianza (12 x [12+1])/2 = 78) y 66 grados de libertad (78 - 12 = 66).

Discusión

Se logra determinar los factores que influyen en la intención de adoptar el aprendizaje electrónico en el sistema educativo superior como consecuencia de la pandemia. Los resultados del modelo de adopción de aprendizaje electrónico propuesto sugieren que los estudiantes pueden ser capaces de adoptar la tecnología como aprendizaje electrónico total. Esto es similar a los resultados presentados por Chu y Chen (2016).

Los hallazgos apoyan parcialmente la TPB, esto es que sólo dos variables independientes, la actitud y la PBC, explican la influencia hacia la intención de adoptar el aprendizaje electrónico. Además, permite sugerir que el camino más fuerte hacia la intención es la actitud seguido de la PBC. Estos resultados son consistentes respecto a los valores de referencia de Liaw (2008).

En el caso de la norma subjetiva, ésta presenta cifras no significativas. Esto ha sido frecuente en investigaciones de carácter indirectos de los autores, probablemente se deba a que esta generación, los nacidos en el año 2000 y que hoy se encuentran en la universidad, sean poco influenciables por el entorno social. No obstante, este hallazgo es inconsistente con la investigación de Valencia et al (2016).

El modelo de ecuaciones estructurales presenta un ajuste adecuado según los criterios informados por Schumacker y Lomax (2004), esto quiere decir que la especificación hipotética previa determina relaciones apropiadas entre las variables. No obstante, el modelo fue modificado a través de las covarianzas de las variables independientes, el cual es aceptado por la literatura previa (Azjen, 1991).

Los hallazgos encontrados permiten demostrar una aparente preferencia sobre la educación no presencial. Esto quiere decir, que al parecer no existe una brecha desde la perspectiva de las competencias y uso de las plataformas digitales de los estudiantes.

Desde la perspectiva de las implicancias prácticas, la pandemia ha requerido, en un futuro cercano, que las universidades identifiquen y busquen reemplazos digitales para ejecutar sus actividades académicas con mínimo contacto físico y de forma segura.

Así mismo, los resultados permiten proyectar la importancia de la capacidad de gestión y liderazgo de los directivos superiores universitarios para mitigar el impacto de la pandemia y a su vez, para promover nuevos proyectos que habiliten el desarrollo de un proceso de aprendizaje no vulnerable que enfrente cualquier tipo de desafío futuro. Por ejemplo, la promoción de un campus virtual, inclusivo, seguro y accesible.

Respecto con las limitaciones del trabajo, se tiene las de orden teórico. En este caso se tiene que en la literatura existen numerosos estudios que utilizan distintos modelos para evaluar la adopción de e-learning en estudiantes, como por ejemplo el TAM de Davis (1989) y la teoría despuesta del comportamiento planificado de Taylor y Todd (1995).

Las limitaciones de orden metodológico reflejan que en este caso, los datos obtenidos son de cohorte transversal lo que inhabilita la predicción. La muestra es de carácter regional, es decir sólo una universidad a lo largo del territorio nacional. El formulario es de auto-reporte, así mismo el instrumento no realiza preguntas sobre el comportamiento, pues los estudiantes aún se encontraban en período lectivo. Esto último, es interesante puesto que la evidencia previa sugieren un efecto significativo de la intención sobre el comportamiento (Pedersen y Nysveen, 2002; Lee, 2006).

Así también no queda claro, la brecha en las competencias, acceso y uso de los académicos en el contexto de pandemia. Esto es relevante pues son parte importante del proceso de enseñanza y aprendizaje que involucra al estudiante, por lo cual debieran ser parte de la discusión.

Por consiguiente, algunas líneas de investigación futuras son profundizar sobre los factores que determinan la brecha de adopción de la tecnología entre los académicos de las universidades y su impacto en los estudiantes. Además, de dar respuestas a las limitaciones teóricas y metodológicas presentes en esta investigación. Esto podría significar en ampliar la muestra y determinar el impacto en el aprendizaje final de los estudiantes post pandemia.

Conclusiones

Como conclusión relevante, se establece que los factores como la actitud y PBC determinan la intención de adoptar el aprendizaje electrónico en el sistema educativo superior como consecuencia de la pandemia, donde la actitud tiene la magnitud más alta para llegar a la intención.

La teoría del comportamiento planificado es parcialmente verificada, esto debido a que la norma subjetiva no presenta niveles de significancia estadística aceptable.

El modelo de ecuaciones estructurales ajustado presenta valores aceptables.

La investigación presenta limitaciones en cuanto a su diseño metodológico por lo cual se sugiere contrastar en futuras investigaciones.

Abstract

In this paper, exergy analysis is used to evaluate the performance of a micro-cogeneration unit using an alpha type Stirling engine. Exergetic efficiency is calculated for the whole system according to the second law of thermodynamics. Exergy analysis of each sub-system leads to the choice of the optimum physical parameters for minimum local exergy destruction ratios.Power generation, thermal efficiency and exergetic efficiency are used as successive objective functions. The best distribution of heat exchanger area is found by the optimization of each objective function. Energy, entropy and exergy balance are used for a control volume, assuming a steady-state operation of the engine, in order to deduce the overall irreversibility of the heat exchangers. Energetic, entropic and exergetic analyses are also presented for the whole system, taking into account the limiting physical constraints such as the maximum pressure and volume of the Stirling engine, imperfect heat exchangers, limited heat capacity of the source and the sink (temperature variation of each external fluid during heat transfer) and imperfect internal heat restitution in the regenerator. Hence, an endo- and exo-irreversible Stirling engine cycle is considered and optimized according to several performance criteria: energetic and exergetic. Functional diagrams are proposed in order to show internal and external irreversibility's (destroyed exergy flow and entropy flow generation) and to represent graphically entropy and exergy balance. The models developed in this work allow us to optimize the engine operation according to four criteria: maximum power, maximum thermal efficiency and maximum exergetic efficiency.

Keywords: Micro-Cogeneration, Exergy, Exergetic Efficiency, Stirling Engine.

Introduction

In the current energy economy context many studies focus on renewable energies use and evaluation of lost energies. Therefore, the Stirling engine draws attention of the researchers for its many advantages: strong potential of energy conversion, environmental-friendliness, quietness and great adaptability to any type of heat source.

The study of the Stirling engine presents great complexity due to the oscillatory character of the working fluid evolutions. Stirling engines present many features which are recommended for the micro-cogeneration applications. They have a remarkable energetic efficiency, a noiseless operation and require maintenance at long intervals, having a long lifetime and a great adaptability to any type

of heat source. However, Stirling engines require efficient cooling in order to operate correctly. This last characteristic was explored by the studied micro-cogeneration unit, and the engine can provide simultaneously heat water and electricity. Cold water, which is the cooling liquid for the engine, is heated in the cooling process of the engine and used afterwards by the central heat system of the house. Theoretical thermodynamic models and predictions of the performances of Stirling engines have already been proposed in the literature with various assumptions. There are three modeling levels of Stirling engines. The ideal analysis in Grosu, L., Rochelle, P., Martaj, N., (2012) (of the first order) predicts the ideal theoretical performances of an engine with a nil or unlimited convective heat transfer coefficient. The uncoupled analysis in Hosseinzade, H., Sayyaadi, H., (2015) (of the second order) takes the results of the ideal analysis and corrects them, taking into account a certain number of finite coefficients and losses in the engine (Hosseinzade, H., Sayyaadi, H., Babaelahi, M., (2015)). The coupled analysis (of the third order) is based on a fine discretization of the engine in various control volumes, taking into account all the main losses. In this paper, an advanced first order model is presented in Petrescu, S., et al., (2012). Power generation, thermal efficiency, entropy generation and exergetic efficiency are used as successive objective functions.

Finite Speed Thermodynamics (FST) (Petrescu, S., et al., (2003)) and Finite Physical Dimensions Thermodynamics (FPDT) (Rochelle, P., Grosu, L., (2011)) are two 0-D analytical methods usually used to simulate and to optimize the Stirling engine operation with limited time calculation.

The Direct Method (Petrescu, S., et al., (2002)) from Finite Speed Thermodynamics has been used in order to study classical Stirling engines in Grosu, L., Dobre, C., Petrescu, S., (2015), solar Stirling engines in Petrescu, S., et al., (2010), Stirling refrigeration and Stirling heat pumps in Grosu, L., et al., (2012), Otto cycle in Petrescu, S., et al., (2008), Diesel cycle in Petrescu, S., et al., (2009), Carnot cycle in Petrescu, S., et al., (2012) and Otto–Stirling hybrid cycle in McGovern, J., et al., (2010). For 12 of the most performing Stirling engines (working in 16 regimes of operation), for 4 (the most performing) solar Stirling engines and for a refrigeration Stirling machine (Petre, C., (2007)), the authors have validated the developed schemes of computation based on the Direct Method.

If in the FST method, the main parameter of the model is the working gas speed which is considered as a finite parameter, in the FPDT method, physical dimensions are considered as finite such as heat transfer area and working piston speed, which are more appropriate for an engineer point of view. Petrescu, S., et al., (2015) have proposed a possible view to unify the FST method and FPDT method.

Mathematical Model

In the present study the Stirling engine performances are analyzed by introducing external irreversibility's of heat transfer with finite temperature difference. In addition, calculation takes into account internal irreversibility's due to the incomplete regeneration of heat in the regenerator, which are related and determined function of the finite speed of the process cycle (piston speed or engine speed).

In this way, the detailed analysis of the processes with finite speed in the regenerator, coupled with the First Law of Thermodynamic carry out to an analytical expression for the regenerative losses' coefficient, X.

The Stirling engine cycle is studied here, assuming limited heat exchanger areas, finite heat transfer coefficients and a defined rotation frequency, which induces speed-dependent fluid flows and time-dependent processes.

Fig 1: p-V and T-S diagram of an endo- and exoirreversible Stirling cycle

Assumptions:

- The temperature differences between the external fluid and the working gas (ideally isothermal) along processes 3-4 and processes 1-2 are constants;
- Temperature variation of each external fluid during heat transfer (limited heat capacity);
- Imperfect heat exchangers, with respective η_h and η_l effectiveness but assumed to be perfectly insulated ($\eta_h = \eta_l = 1$);
- Imperfect internal heat restitution in the regenerator with a regenerator efficiency <1;
- The working gas is an ideal gas.

In the following expressions of the model, energies and powers are considered as positive and index "g" is used throughout for the working gas. The model assumptions related to the processes, heat flows and temperatures pointed out on Fig. 1. This model is applied to a Stirling engine used for domestic micro-cogeneration, presented on fig 2. The used engine is an alpha type Stirling engine with four double effect pistons. The complex geometry of the heat exchangers was determined by optical measurements. In a previous work (Grosu, L., Dobre, C., Petrescu, S., (2015)) authors have compared results of three thermodynamic models: Direct Method from Finite Speed Thermodynamics (FST), isothermal model (Schmidt) and adiabatic model (Finkelstein) and have confronted them to experiment.

Fig. 2: General scheme of the engine and section of three heat exchangers around a piston.

Engine Energy Analysis

The difference between the efficiency of a real engine and that of an idealized Stirling cycle operating between the same temperature limits is due principally to the heat transfer losses that occur in the regenerative processes.

The analyzed Stirling engine regenerator is composed of several vertical meshes (Fig. 3). The relationships validated for 12 Stirling engines in Petrescu, S., et al., (2012), with horizontally meshes at the regenerator, are based on a formula for the pressure losses depending of the piston speed, deducted by Petrescu, S., et al., (2010), from an Organ's graphic (Organ, AJ., (1992)). This graphic is based on hundreds of experiments for the gas flow through the horizontally meshes. In Grosu, L., Dobre, C., Petrescu, S., (2015), the authors established equivalence assumptions of the two types of regenerator, from the point of view of fluid flow through the regenerator, as well as the analysis of the adjustment parameters, the calculation of the regenerator mass, its heat exchanger surface, and the equivalent number of meshes.

The coefficient of regenerative losses, X, introduced by Feidt, M, (1996), is the term that includes all of the losses due to the incomplete heat transfer in the regenerator. An analysis to calculate these losses has been made by Petrescu et al. (2012). This coefficient clearly depend on a large number of parameters and variables: piston speed w_p, cylinder dimensions (diameter D_C and length L), properties of the solid porous material in the regenerator (density ρ_r, specific heat c_r), dimensions of the screens (d, b, N), gas properties (density ρ_g, specific heat c_p, γ, r) and the range of operating conditions ($\varepsilon = V_{\max}/V_{\min}$, $\tau = \frac{T_h}{T_l}$, T_m, p_m).

The other values involved in the above relations are evaluated, taking into account the average values of gas pressure and temperature in the cycle.

Fig. 3: The regenerator scheme

where:

h_r- is the height of regenerator;
l_{mr}- is the width of one mesh screen;
e_r- is the thickness of a metal wire from the mesh.
Based on Feidt, M, (1996), an equation for *X* that includes the effect of these parameters has been evaluated in Petrescu, S., et al., (2012) using First Law and Heat Transfer Laws. This analysis of these losses produced differential equations that were then integrated. The integration of the equations was based on either a lumped system analysis from Petrescu, S., et al., (2012), which gives

relatively unfavorable results, X_1, or on a linear distribution of the temperature in the regenerator matrix and gas, which gives relatively favorable results, X_2. The resulting expression for X is:

$$X = X_1 + (1-y)X_2 \quad (1)$$

where:

$$X_1 = \frac{1+2M+e^{-B}}{2(1+M)}, \qquad X_2 = \frac{M+e^{-B}}{1+M}, \qquad M = \frac{m_g c_{v,g}}{m_r c_r} \qquad \text{and} \qquad B = (1+M)\frac{hA_R}{m_g c_{v,g}}\frac{S}{w_p}$$

The value of y has been determined from experimental data of 12 of the most performing operating Stirling engines in Petrescu, S., et al., (2012). Setting $y = 0.72$, provided the best fit between analytical results and experimental ones, so this value is used as an adjusting coefficient in the theoretical analysis. Organ, AJ., (1992) makes a remarkable analysis of the different methods for treatment of the details of Stirling engines. Petrescu, S., et al., (2012) obtained from Organ's graphic in Organ, AJ., (1992) (based on hundreds of experiments for the gas flow through the horizontally meshes) the expression of the convective heat transfer coefficient in a porous medium h which depends on a large number of parameters and variables: Prandtl number (Pr) of the gas passing through the regenerator screens, regenerator dimensions (diameter D_{ech}) properties of the material in the regenerator (specific heat at constant pressure $c_p(T_m)$, specific constant r), dimensions of the screens (d, b), gas properties (kinematics viscosity at constant temperature $\nu(T_m)$, and the range of operating conditions (T_m, p_m).

The convection coefficient h is computed as:

$$h = \frac{0.395\left(\frac{4p_m}{rT_l}\right)w_g^{0.424}c_p(T_m)\nu(T_m)^{0.576}}{(1+\tau)\left[1-\frac{\pi}{4\left(\frac{e_r}{l_{mr}}+1\right)}\right]D_{ech}^{0.576}\,\mathrm{Pr}^{2/3}} \quad (2)$$

where the gas speed in the regenerator w_g is computed with:

$$w_g = \frac{A_p w_p}{A_R} \quad (3)$$

By expressing all these parameters as a function of the piston speed w_p, the engine rotational speed n is introduced in the model:

$$w_p = \frac{2nS}{60} \quad (4)$$

The values for the heat exchangers volumes (hot, cold and regenerator volume) and also the dead compression volume and the dead expansion volume are obtained from the experimental measurements, and used to calculate the V_{max} and V_{min} for the cycle.
The minimum pressure of the engine is calculated taking into account the characteristics data of the engine.

$$p_{\min} = \frac{m_g r T_l}{V_{\max}} \quad (5)$$

In addition,

$$m_g = \frac{p_{\max} V_{\min}}{r T_h} \quad (6)$$

In the regenerator, the temperature difference between hot and cold flows is assumed to be constant at each point of the device (Fig. 4).

As regeneration is assumed to be imperfect, the gas temperature history remains the same but the storage/clearance is incomplete and a part of regeneration heat must be continuously compensated by

a supplement of heat $\dot{Q}_{p.R}$ provided by the hot source for each cycle (Grosu, L., Rochelle, P., Martaj, N., (2012)).

$$\dot{Q}_{p.R} = (1-\eta_R)\dot{Q}_{R_T} \tag{7}$$

where $\dot{Q}_{R_T} = \dot{m}_g c_v (T_h - T_l)$ and $\eta_R = 1 - X$.

The heat flow rate on the regenerator, the hot-end and the cold-end heat exchangers can be expressed as follows:

$$\dot{Q}_R = h_R A_R (T_{x'} - T_l) = \dot{m}_g c_v \eta_R (T_h - T_l) = \dot{m}_g c_v (T_h - T_{x'}) \tag{8}$$

$$\dot{Q}_h = h_h A_h \Delta T_{\log}^h = \eta_h \dot{m}_H c_p (T_H^{in} - T_h) = \dot{m}_H c_p (T_H^{in} - T_H^{out}) \tag{9}$$

Fig 4. Temperature differences in the regenerator

where $\Delta T_{\log}^h = \dfrac{T_H^{in} - T_H^{out}}{\ln \dfrac{T_H^{in} - T_h}{T_H^{out} - T_h}}$ is the mean logarithmic temperature on the hot-end heat exchanger

and $\eta_h = \dfrac{T_H^{in} - T_H^{out}}{T_H^{in} - T_h}$ - the hot-end heat exchanger effectiveness.

$$\dot{Q}_l = h_l A_l \Delta T_{\log}^l = \eta_l \dot{m}_L c_p (T_l - T_L^{in}) = \dot{m}_L c_p (T_L^{out} - T_L^{in})$$

where:

$\Delta T_{\log}^l = \dfrac{T_L^{out} - T_L^{in}}{\ln \dfrac{T_l - T_L^{in}}{T_l - T_L^{out}}}$ is the mean logarithmic temperature on the cold-end heat exchanger and

$\eta_l = \dfrac{T_L^{out} - T_L^{in}}{T_l - T_L^{in}}$ - is the cold- end heat exchanger effectiveness.

The overall heat flows delivered by the hot source and respectively received by the heat sink are:

$$\dot{Q}_h = \dot{Q}_{3-4} + \dot{Q}_{p.R} = \dot{m}_g r T_h \left[\ln \varepsilon + \frac{X}{(\gamma - 1)} \left(1 - \frac{T_l}{T_h} \right) \right] \tag{10}$$

$$\dot{Q}_l = \dot{Q}_{1-2} + \dot{Q}_{p.R} = \dot{m}_g r T_l \ln \varepsilon + X \dot{m}_g c_v (T_h - T_l) \tag{11}$$

The energy balance of the cycle leads to the calculation of the engine power:

$$\dot{W} = \dot{Q}_h - \dot{Q}_l = \dot{m}_g r (T_h - T_l) \ln \varepsilon = n \frac{p_{\max} V_{\max}}{\varepsilon} \left(1 - \frac{T_l}{T_h} \right) \ln \varepsilon \tag{12}$$

with: $\dot{m}_g = m_g \cdot n$ and $\varepsilon = \frac{V_{\max}}{V_{\min}}$.

Thus, the thermal efficiency depends on the parameter X:

$$\eta_{th} = \frac{\left(1 - \frac{T_l}{T_h}\right)\ln\varepsilon}{\ln\varepsilon + \left(\frac{X}{\gamma - 1}\right)\left(1 - \frac{T_l}{T_h}\right)} \tag{13}$$

Engine Entropy Analysis

The different entropy flows associated to the heat transfer on the heat source and heat sink, as well as the internal entropy generation is presented on a entropy flow diagram (Fig. 5).

The entropy balance leads to the expression of the internal entropy generation due to the irreversibility in the regenerator.

Fig 5. *T-V* diagram of the Stirling engine.

$$\dot{S}_l - \dot{S}_h = \dot{\Pi}_{\Delta T_R} \tag{14}$$

This expression may also be obtained by the entropy balance in the regenerator:

$$\dot{\Pi}_{\Delta T_R} = \dot{S}_{2-x} - \dot{S}_{4-x'} \tag{15}$$

The entropy flow received by the working gas in the hot-end heat exchanger is the entropy flow delivered by the source added to the entropy generation flow due to the temperature between the two fluids.

$$\dot{S}_h = \dot{S}_H + \dot{\Pi}_{\Delta T_h} \tag{16}$$

In the cold heat exchanger, as well, the entropy delivered by the working gas is:

$$\dot{S}_l = \dot{S}_L - \dot{\Pi}_{\Delta T_l} \tag{17}$$

Thus, the engine overall energy balance takes external and internal irreversibilities into account:

$$\dot{S}_L - \dot{S}_H = \dot{\Pi}_{\Delta T_l} + \dot{\Pi}_{\Delta T_H} + \dot{\Pi}_{\Delta T_R} \tag{18}$$

1.3. Engine exergy analysis

The exergy flows associated to the heat exchanged by the working gas with the hot source Q_h and the cold sink Q_l are shown in the fig. 6, at different temperatures: T_h and T_H^m for the source and T_l and T_L^m for the sink, respectively.

Fig 6. Stirling energy flow diagram

The irreversibilities due to the heat transfer under finite temperature differences, lead to the exergy losses: $\dot{I}_{\Delta T_h}$, $\dot{I}_{\Delta T_l}$ and $\dot{I}_{\Delta T_R}$.

The overall engine exergy balance is:

$$\dot{I}_l = \left|\dot{E}x^{Q_l}_{T_l}\right| - \left|\dot{E}x^{Q_L}_{T^m_L}\right| = \dot{E}x_l^{lost} \tag{19}$$

$$\dot{E}x^{Q_l}_{T^m_L} + \dot{E}x^{Q_h}_{T^m_H} + \dot{W} - T_0\dot{\Pi}_{\Delta T_R} - T_0\dot{\Pi}_{\Delta T_l} - T_0\dot{\Pi}_{\Delta T_h} = 0 \tag{20}$$

or:

$$\dot{E}x^{Q_{34}}_{T_h} + \dot{E}x^{Q_{12}}_{T_l} + \dot{E}x^{Q_{xh}}_{T^m_{xh}} + \dot{E}x^{Q_{x'l}}_{T^m_{x'l}} + \dot{W} - T_0\dot{\Pi}_{\Delta T_R} = 0 \tag{21}$$

with:

$\dot{E}x^{Q_{xh}}_{T^m_{xh}} = \left(1 - \frac{T_0}{T^m_{xh}}\right)\dot{Q}_{xh}$; $\dot{E}x^{Q_{x'l}}_{T^m_{x'l}} = \left(1 - \frac{T_0}{T^m_{x'l}}\right)\dot{Q}_{x'l}$; $\dot{E}x^{Q_{12}}_{T_l} = \left(1 - \frac{T_0}{T_l}\right)\dot{Q}_{12}$; $\dot{E}x^{Q_{34}}_{T_h} = \left(1 - \frac{T_0}{T_h}\right)\dot{Q}_{34}$ and $\dot{\Pi}_{\Delta T_R} = \left|\dot{E}x^{Q_R}_{T^m_{hx'}}\right| - \left|\dot{E}x^{Q_R}_{T^m_{lx}}\right|$.

It results:

$$\dot{E}x^{Q_{34}}_{T_h} + \dot{E}x^{Q_{12}}_{T_l} + \dot{W} = 0 \tag{22}$$

Hence, the exergetic efficiency is:

$$\eta_{ex} = \frac{\dot{W}}{\dot{E}x^{Q_h}_{T^m_H}} = \frac{\dot{E}x^{Q_{34}}_{T_h} - \dot{E}x^{Q_{12}}_{T_l}}{\dot{E}x^{Q_h}_{T^m_H}} \tag{23}$$

Results and Discussion

Geometrical dimensions calculated in Grosu, L., Dobre, C., Petrescu, S., (2015) were used to supply the mathematical model. The simulation results are compared with experimental one published in De

Paepe, et al., (2006). External Stirling parameters are measured: electrical power, external water temperature, water mass flow rate and combustion heat flow rate. T_k and T_l are not measured on this bench test as their values were chosen according to a previous simulation model (Clucas, DM., Raine, JK., (1994)).

Table 1: Geometrical and functional engine parameters

p_{max}[bar]	$V_{max}\cdot 10^4$ [m^3]	$V_{min}\cdot 10^4$ [m^3]
30	2.07	1.45
A_h[m^2]	A_l [m^2]	A_R [m^2]
$21112.37\cdot 10^{-6}$	$1590.43\cdot 10^{-4}$	0.00119

For the optimisation the parameters established are: p_{max}, V_{max}, T_H^{in} , T_L^{in} ,ε, η_h, η_l, X; the independent variable A_h,A_l, n; the dependent variables: T_h, T_l.

Table 2: Central parameters

T_H^{in} [K]	T_L^{in} [K]	$\eta_h = \eta_l$
2000	313	0.8

An equality constraint is imposed on the total heat exchanger area: $A_T = A_h + A_l$.

From fig. 7-9, the existence of optimal values of the area ratio for engine is obvious. With the parameters used for this application, the equipartition of heat exchanger areas is near optimal for the three chosen criteria, especially concerning power and thermal efficiency.

The engine rotation frequency has a noticeable influence on power, which increases with frequency, and a slight influence on thermal and exergetic efficiencies, which decrease with an increase in speed. For the improvement of the proposed analytical model, one also has to consider, among other things, the aerodynamic and mechanical losses in the energy and exergy balances - losses which reduce power and efficiency.

This figure highlights and justifies the choice of the engine constructer referring on engine speed n=25 rot/s. The chosen option is a compromise in terms of power and mechanical efficiency values. It can be observed that, in order to have a greater mechanical efficiency at the expense of the power supplied. The higher rotational speed is, the higher mechanical power is (fig. 7), but the Stirling engine efficiency decrease (fig. 8).

Fig. 7: Engine power versus cold-end heat-exchanger area ratio and engine frequency

Fig. 8: Engine exergetic efficiency versus cold-end heat exchanger ratio and engine frequency

Fig 9. Engine thermal efficiency versus cold-end heat exchanger ratio and engine frequency

If it is necessary for other application for more power, at a smaller value for the Stirling efficiency or less power at a higher value of efficiency, the corresponding optimal speed can be chosen. Thus, for example, it will result from the graph that at a speed engine frequency of 25 tr/s (equivalent of of 2 m/s) would get the maximum power but the value for the efficiency would not be lowered too much.

Taking into account that in this application, the heat from the cold source of the Stirling engine is recovered and used for cogeneration, the decrease of the Stirling engine efficiency would be balanced by the increase of the cogeneration efficiency, and global efficiency is practically constant.Analyzing the results from the graphs, we can propose another design construction for the studied Stirling machine, which can achieve a maximum mechanical power corresponding to a lower efficiency.
This proposal involves resizing the studied engine (the dimensions of the pistons and/or the engine speed) and optimizing the design for the heat exchanger areas.

Conclusions

In a more efficient energy management context, an optimization of an exo- and endo-irreversible Stirling engine with imperfect regeneration is presented for three criteria: power, thermal efficiency and exergetic efficiency with fixed parameters, such as maximum cycle pressure and volume, compression ratio and with a constraint of constant heat transfer total area of heat exchangers. The assumptions related to the heat reservoirs and the regenerator is classical and typical of a study within

Finite Dimension Thermodynamics: limited heat transfer areas, finite speed of thermodynamic process development and heat transfer cc efficient linked to engine speed.

The results showed the influence of the finite heat transfer area on the engine operation optimization. With the imposed parameter values, the optimal heat exchanger area partition is approximately given by a near equality between the cold and hot transfer areas with, in some cases, a slight superiority of the cold transfer area.

Pressure drop losses are major cause of reducing the Stirling engine efficiency; due to this fact we are studying the optimum transient state operation, as an extension of these analyses, taking into account the friction losses, to get a more realistic model.

Nomenclature

A	Heat exchange area [m^2]
c	Specific heat of working fluid [J/kgK]
ek	Specific kinetic energy [J/kg]
ep	Specific potential energy [J/kg]
ex	Specific exergy [J/kg]
E	Energy [J]
$\dot{E}x_T^Q$	Exergy flow of heat Q at temperature T [W]
$\dot{I}$	Irreversibility [W]
h	Convective heat transfer coefficient [W/m^{2}K]
$\dot{m}$	Mass flow rate [kg/s]
n	rotational speed [rot/s]
p	Pressure [Pa]
Q	Heat [J]
$\dot{Q}$	Heat transfer rate [W]
r	Specific working gas constant [J/kgK]
s	Specific entropy [J/kgK]
$\dot{S}$	Entropy flow rate [W/K]
S	Entropy [J/K]
t	Time [s]
T	Temperature [K]
V	Volume [m^3]
$\dot{W}$	Power [W]

The Method of Averaged Quality Traits in The Management of The Quality of Marketing Information

Joanna MAJCHRZAK

Poznan University of Technology, Poznan, Poland
joanna.majchrzak@put.poznan.pl

Abstract

The paper considers the problem of studying and assessing the quality of the company's marketing information. The main objective of the research is to adjust and apply the method of quantifying quality, i.e., the method of averaged quality traits, to compute the indicator of marketing information quality. In the research into the quality of marketing information, a selective model of information processing was adopted. Referring to the basics of marketing management, i.e., the marketing mix model and the structure of marketing relationships, the distinguishing features of marketing information are presented. Selected concepts of information quality were considered and the quality of marketing information was determined. The essence of the applied method of quantifying quality and the essence of calculating and interpreting the value of the quality indicator, *J*, was explained. The concept of using the averaged quality traits method in assessing the quality of marketing information was developed. The quality of marketing information is assessed by the value of individual states of features belonging to marketing information. The developed method was used in the study and it evaluates the quality of marketing information of industrial enterprises. The results show the effectiveness of the method in terms of calculating the value of the marketing information quality indicator and the classification of information into individual quality classes. The obtained results are important at the stage of planning the quality of marketing information, i.e., studying, analyzing and designing qualitative changes in managing the quality of marketing information.

Keywords: Quality Management, Qualitology, Information Quality, Marketing.

Introduction

In specialist literature, various approaches to the concept of information are noted (Stefanowicz, 2004). The term information is used as the original concept, without giving any definition or interpretation. In particular, this approach underlies the theory of information developed by Claud Shannon (Shannon, 1948), which does not specify the meaning of the term information, but merely deals with defining its quantity. The term is defined by adopting certain principles tailored to the needs of a given research field, generally referring to other well-known concepts. This term is described (interpreted) by its features, properties, functions. In the most general terms, the information is understood as a basic element of our mental activity. Information flows to us from the physical reality that surrounds us, and their quantity increases with the process of our deeper recognition of this reality. In this sense, information is considered as part of binding processes, with different types of relationships being involved. For example, it may relate to human relationships with other people, with nature, and relationships between various elements that create dynamic structures (Kowalczyk, 1981). In the study of information, two different perspectives can be distinguished, such as, infological perspective and datalogical perspective. The infological perspective, proposed by two Swedish specialists, is related to the person who created or received the information (Sundgren, 1973; Langefors, 1980). In the datalogical perspective information is assumed to be independent of the recipient's mind. This work, to model the marketing information quality, adopts an infological approach. Here, it is assumed that the observer, *U*, deals with some fragment of reality, *R*, which in consequence causes that in his mind a specific mapping (reflection, content, description) of this fragment arises, the so-called infological model of *R* reality in *U*'s

consciousness. This model is created as a result of the received description of R reality subjected to analysis, interpretation and evaluation based on *U*'s current knowledge and experience, his the so-called frame of reference (Stefanowicz, 2004). The condition for obtaining information is the existence of an observable physical phenomenon or some associations. Occurrence of a certain variety in this phenomenon enabling choice (making specific decisions or drawing a conclusion). The existence of an observer representing some system of intentional action, who makes observations, makes decisions due to the usefulness of certain observation in achieving the objectives of the system. The value of these decisions depends on the degree to which they affect the system's approach to its target state, i.e., achieving the goal (Kowalczyk, 1981, pp.9-11). Studies and practice in the field of information quality management most often adopt the axiological, evaluated approach to information quality referring to usability of information as the criterion of its value, according to Juran's definition of quality which is "fitness for use" (Bizer and Cyganiak, 2009). Substantial amount of research (Michnik and Lo, 2009; Chen and Tseng, 2011; Raghunathan, 1999; Shankaranarayanan and Yu Cai, 2006; Majchrzak, Goliński, Mantura, 2019; Majchrzak et el., 2019) in the field of information quality management, refer to the information quality model used in the method of assessment and information quality improvement, AIMQ (Wang, 1998; Lee et al., 2002). In this paper the information quality is defined by four features, such as (Nowicki, 1979): (1) Completeness, i.e., the information is complete (according to the criterion of the purpose for which we collect information), (2) Trueness, i.e., information is true (free from errors consisting in missing or distorting important features), (3) Timeliness, i.e., information is fast (received at a time that is shorter than the change in the state of the object it concerns), (4) Relevancy, i.e., information reaches the appropriate recipient in the company. In the following chapters, the specificity of marketing information is discussed. The qualitative essence of the method of averaged quality traits is presented and the sequence of actions in this method leading to the calculation of the value of the marketing information quality indicator. The research takes into account the quality of marketing information shaped as part of company relations, such as: relations with the supply market, relations with the sales market, relations in the competition system, relations with the government system, relations with the education system, as well as relations with the research system, between the company and research institutions.

The concept of marketing information

Analyzing the information situation, which is determined by the creation, transmission or receipt of information, depending on the purpose, one can refer to communication theory. In this work, in order to analyze and assess the quality of marketing information, reference is made to the selection model (Westley and MacLean, 1957). In this model, it is assumed that reality, *R*, consists of elements, *X*, understood as any object (or event) that has characteristics capable of being transmitted in some abstracted form. From the standpoint of the observer, *B*, the world consists of a confusion of *X*s. It is assumed that B maps a specific set of *X*s as a means of orienting itself in its environment and as a means of securing problem solutions and need satisfactions. Observer, *B*, has learned that in order to maximize satisfactions and solve security problems he must, first, orient toward *X*s selectively, second, does not orient toward *X* alone, but tends, in the presence of another observer *A*. Observer, *B*, based on own observations and information obtained to Observer *A*, in his own immediate sensory field, is capable of acting upon information thus transmitted to him and must do so if he is to maintain an adequate orientation to his immediate environment. If, *A*s and *X*s relevant to such orientation lying outside his immediate reach, there is need for another role, which is call *C*. Element *C*, understood as the "gatekeeper" (Lewin, 1951) or the "encoder" (White, 1950) is conceived of as one who can select, transform (into some form of symbol containing meanings shared with B) the abstractions of object *X* appropriate, to *B*'s need satisfactions or problem solutions. And, transmit such symbols by means of some channel or medium to *B* (see Figure 1).

Here, *X*1, *X*2, …, *X*∞ - elements of reality, *R*, understood as any object that has characteristics capable of being transmitted; *A*, *B* – observers; *C* – observer (the role of the "gatekeeper"); *xi* – piece of information, *f*- feedback information.

Fig. 1: The selective model of information processing (Source: own study based on Westley and MacLean, 1957)

Marketing information is treated as a distinctive piece of information, considering the objective criterion to extract varieties of information corresponding to the specificity of the *X* objects they map. And, the subject criterion, where the main factor is the type of observers, *A*, *B*, and *C*, involved in creating, transmitting, or receiving information.

At the initial stage of the development of the scientific foundations of marketing, a functional approach dominated, among others (Shaw, 1915; Weld, 1917). In subsequent concepts, the aspects of market activity of enterprises in relation to various classes of products, the so-called commodity approach to marketing (Copeland, 1923; Breyer, 1931), or in relation to geographical factors of the market environment, the so-called geography-related approach (Reilly, 1931) were examined. The geography-related approach initiated the idea of market segmentation and matching marketing functions to specific market segments (Chamberlin, 1933). The concept of so-called marketing mix and the idea of mapping marketing as a set of elements, was first introduced by Borden (1964), who defined 12 marketing components. The marketing mix model has been developed in numerous studies, shaping various models of marketing composition (see Goi, 2009). In subject literature and practice of marketing activities, the most often referred to is the marketing mix model proposed by McCarthy (1964), the so-called four Ps of marketing: product, price, promotion, and place. Referring to the objective criterion for determining marketing information, it is assumed that this is a kind of information that maps individual elements of the marketing mix.

Adopting the basics of system thinking in marketing was an important stage in the development of marketing. Defining the concept of marketing system was initiated by the so-called direction of system thinking in marketing considerations (system-oriented approaches; Fisk and Dixon, 1967). The basics of system thinking are visible in contemporary developing marketing concepts. Studying and shaping the relation-ships between organizational units of an enterprise and organizational units of surrounding entities is the subject of consideration, among others, of networks of relationships approach (Grönroos, 1982), interaction, network approach, relationship marketing concept (Gummesson, 1987; Parasuraman et al., 1991; Christopher et al., 1991; Payne and Frow, 2017). Modeling of the integrated system of marketing elements, including in particular elements of marketing communication, is the subject of consideration of the concept of integrated marketing communication, IMC (among others Duncan and Moriarty, 1998; Schultz and Schultz, 1998; Kitchen et al., 2008). Referring to the criterion of subjective determination of marketing information, it is assumed that this is a kind of information that is created, transmitted, or received by entities in the structure of marketing relations. Evert Gummesson (1994), one of the creators of the concept of relationship marketing, specifies thirty types of relationships in the structure of marketing

relationships, e.g., the relationship between the supplier and the customer, the interaction between the customer and front line personnel, the relationship between internal and external customers, relationships via full-time marketers and part-time marketers, the quality providing a relationship between production and marketing, the relationship to the customer's customer.

In this studies it is proposed to apply the marketing mix model proposed by McCarthy (1964) as the objective criterion for marketing information classification (here, $X1$ stands for product, $X2$ stands for price, $X3$ stands for promotion, $X4$ stands for place). In the subject criterion, the collection of thirty types of relationships in the structure of marketing relationships is applied (Gummesson, 1994).

The essence of the averaged quality traits method

The method of averaged quality traits was developed by Romuald Kolman (Kolman, 1973, 2009). The essence of the method consists in calculating the average quality indicator from the value of the so-called quality traits that represent averaged states of the quality criteria classified to individual meaning groups resulting from the most important aspects of considering quality. The method makes it possible to evaluate the quality of items, i.e., quantification of the quality. The issues of quantitative (numerical) quality assessment, or the "science of measuring" quality, are developed within the qualimetry. Qualimetry, recognized as an independent scientific discipline, was initiated by G.G. Azgaldov (Azgaldov, 1968) and is still being developed today, in particular by Russian scientists (Azgaldov and Kostin, 2011; Azgaldov, Kostin and Padilla Omiste, 2015). In qualimetry, it is assumed that the category of quality can fulfill a general, significant and universal cognitive function in relation to any object. Qualimetry, treated as a scientific discipline, has interrelationships with other disciplines, distinguishing (Azgaldov, 1982): (1) a set of sciences that are used in the quantitative study of quality (e.g. metrology, experimental psychology, and applied mathematics), (2) sciences which themselves use data obtained as a result of quality study (including efficiency theory, operations research, and axiology). In Polish literature, the concept of developing an interdisciplinary field of knowledge, qualitology, dealing with all issues related to quality is still being developed (Kolman, 1973; Kolman, 2009; Mantura, 2010; Borys, 1980; Borys, 1984; Skrzypek, 1995). The current achievements of qualitology provide the basis for the use of the quality category in solving not only axiological problems related to the category of the value of objects, but also in resolving epistemological questions leading to cognition and shaping models of reality. The general course of action when applying the qualitative method of averaged quality traits can be attributed to (Kolman, 1973, p. 111-138):

1. Selection of criteria out of the relevant requirements and conditions.
2. Selection and segregation of criteria into semantic groups represented by individual quality traits.
3. Quantification of the states of criteria by their reduction in the areas of variability and transformation to a uniform scale of states.
4. Calculations of nominal discriminants as mean of transformed criteria states.
5. Calculations of the quality indicator as the average of the nominal indicators.

The most general form of the formula for calculating the quality indicator, J, according to the method of averaged quality traits is as follows:

$$J = \frac{1}{z}(\alpha A^a + \beta B^b + \gamma C^c + \delta D^d + \varepsilon E^e).$$

Where,

z – number of quality traits taken into account,
$\alpha, \beta, \gamma, \delta, \varepsilon$ - correction coefficients regulating the intensity of the mutual interaction of the nominal discriminants,
A, B, C, D, E – nominal discriminants,
a, b, c, d, e – power exponents taking into account the specificity of the influence of individual nominal discriminants on the quality indicator.

The individual nominal discriminants are calculated as arithmetic means of the criteria discriminants using the formula:

$$X = \frac{1}{n}\sum_{i=1}^{n} W_{iX}^{piX}.$$

Where,

X – A (or B, C, D, E) – nominal discriminants,
n – number of criteria considered in a given semantic group,
W_{iX} – a criterion discriminant with the current number i in the X semantic group,
p_{iX} – the exponent taking into account the specificity of the influence of the W_{iX} criterion discriminant on the nominal discriminant X (most frequently $pi = 1$).
The value of the criterion discriminant for features with the nature of values (i.e. the value favorable for large values from the range of the feature variability) is calculated using the formula for transforming states and calculating the criteria discriminants (Kolman, 2009):

$$W_w = \frac{k_{wz} - k_{wi}}{k_{wa} - k_{wi}}.$$

Where,

W_w – criterion discriminant,
k_{wz} – measured value of the item,
k_{wa} – the greatest value of the item,
k_{wi} – the lowest value of the item.
The quality indicator J should take values from 0 to 1.

Table 1: Classes of the universal interpretative scale of the evaluated states of object's quality.

Class of the quality	Representative value	Basic quality degrees	Name of classes of quality
0	0.95	Set of acceptable states of quality	excellent
1	0.85		exceptional
2	0.75		beneficial
Boundary of normality $N = 0.7$			
3	0.65	Set of unacceptable states of quality	convenient
4	0.55		moderate
5	0.45		average
6	0.35		inconvenient
7	0.25		not beneficial
8	0.15		critical
9	0.05		bad

Source: Kolman, 2009, Majchrzak, Goliński and Mantura, 2019.

The values of the quality indicator are interpreted according to the adopted interpretation pattern, the so-called universal scale of relative states developed. This scale is 0 to 1 scale (in terms of value), universal (in use) and is based on a set of uniformly interpreted (in terms of naming) relative states (Kolman, 2009, p. 64). The set of quality classes with the values of the quality indicator assigned to each of the quality classes is presented in Table 1.

For the cases, relatively frequent in practice, when correction coefficients $\alpha = \beta = \gamma = \delta = \varepsilon = 1$ and exponents $a = b = c = d = e = 1$, the formula for calculating the quality indicator, J, takes a simplified form (Kolman, 2009):

$$J = \frac{1}{z}(A + B + C + D + E).$$

Therefore, in the method of averaged quality traits, it is assumed that the quality is the arithmetic mean of the nominal discriminants, the values of which can be regulated in substantively justified cases with the use of power exponents, and the mutual proportions between the traits - with the use of correction coefficients (importance coefficient, i.e. the so-called wag) (Kolman, 1973).

Marketing information quality assessment

In this study, the method of averaged quality traits was used to assess the state of quality of marketing information shaped as a result of the marketing communication processes of industrial enterprises. The scope of the research refers to the presentation of individual stages of the assessment of the quality of marketing information obtained by organizational units of industrial enterprises in the processes of marketing communication with organizational units of market environment entities. Organizational units of industrial enterprises assess the quality of the acquired marketing information on the basis of its usefulness in the decision-making processes of the company's management. There are six types of marketing communication processes, such as:

- the process of marketing communication with the customer's organizational unit,
- the process of marketing communication with the supplier's organizational unit,
- the process of marketing communication with the competitor's organizational unit,
- the process of marketing communication with an organizational unit of local authority,
- the process of marketing communication with an organizational unit of the education system,
- the process of marketing communication with an organizational unit of a research organization.

As a result of the use of the averaged quality traits method, the current state of the quality of marketing information is recognized as a result of the processes of marketing communication of an industrial enterprise with market environment entities. The correctness of the quality of marketing information is assessed using the universal scale of relative states and assuming the value of the normality limit at the level of N = 0.7 (see Table 1. In the first stage of research activities, the selection of the research sample is adopted, e.g. (1) the research subject is an organizational unit of an industrial enterprise that maintains market relations with the environment entities, such as the customer, supplier, competitor, local authority, education system, research and science system, (2) the research subject is an organizational unit of an industrial enterprise that makes decisions in the area of enterprise marketing activities. The second stage of preparation for the research is to formulate a set of questions leading to the assessment of the marketing information quality. When determining the quality of marketing information, reference was made to the information quality model used in the study of enterprise management information systems (Nowicki, 1979, p. 21). The rationale for choosing this model was, firstly, a synthetic approach to the quality of information, which is important when examining the quality of marketing information as part of research relating to various aspects of industrial enterprises' operations. Secondly, the selected model is suitable for assessing the quality of information in management processes, thus it is possible to assess the usefulness of the quality of marketing information in marketing decision-making processes. The quality of marketing information is defined by a set of four qualities of value, such as:

- the truthfulness of the information, which consists in the compliance of the information with the item it relates to,
- the completeness of the information, which relates to the necessary variety of information obtained, which leads to a full knowledge of the subject it concerns,
- the timeliness of the information, which refers to the time of information circulation, the speed of obtaining information,
- the addressability of the information that relates the information to its recipient; it is assumed that the recipient can use the information only if he understands it.

Using the above features of the value of information, research questions are formulated, leading to the assessment of their condition. An example question leading to the determination of the quality of marketing information shaped in the processes of marketing communication with the company's customers is presented below:

- Is the information you obtain from your clients useful in decision-making processes?

When answering the above question, the respondents define the state of the four features of the value of marketing information:

- Is the information true?
- Is the information complete?
- Is the information fast?
- Does the information reach the right recipient?

The condition of individual value features belonging to marketing information is determined using the basic quality scale. It was created by dividing the entire area of variation into ten different parts, designating successive decimal fractions of perfection. Number 1 denotes the state of perfection, and the number 0 - the state of imperfection, simultaneously assuming the uniformity of the distribution of fractional intermediate values (Kolaman, 2009, Kolman, 1973). Particular features pertaining to marketing information are treated as nominal discriminants.

$$X = \frac{1}{n}\sum_{i=1}^{n} W_{iX} .$$

Where,

$X = A, B, C, D$ – nominal discriminants, where A - refers to the assessment of the status of the marketing information feature, such as completeness, B - refers to the assessment of the status of the marketing information feature, i.e. truthfulness, C - refers to the assessment of the status of marketing information feature, such as timeliness, D - refers to assessments of the status of the marketing information feature, such as relevancy; $n = 4$, W_{iX} – the criterion discriminant with the current number i in the semantic group X, i= 1, 2, ..., m; m- number of enterprises participating in the assessment of the quality of marketing information.

In the research on the assessment of the quality of marketing information, it is assumed that the value of the correction coefficients and power exponents equals 1. When calculating the value of the quality indicator, J, a simplified form of the formula used in the averaged quality traits method is applied. Determining the number of quality classes (see Table 1) on the basis of the calculated value of the quality indicator, the following formula is used (Kolman, 2009):

$$K = 10 - (10J + u).$$

Where,

K – quality class number,
J – quality indicator in the form of a decimal fraction,
u - decimal fraction supplementing the product of $10J$ to the nearest integer up, u=0, when the product of $10J$ is an integer and u=1 when J=0.

As a result of the above operations, the value of the marketing information quality indicator and the number of marketing information quality status class of participating enterprises are calculated. The status of the quality of marketing information is considered correct if the value of the marketing information quality indicator is greater than the specified boundary of normality (N= 0.7) and is classified as 0 (excellent quality status), 1 (distinguishing quality status) or 2 (favorable quality status) of the quality class.

Conclusion and Outlook

The complexity of business management problems, including the marketing management function, is a premise for considering the problem of marketing information quality management. This paper presents the concept of applying the qualitative method of averaged quality traits at the stage of research, assessment and analysis of the quality of marketing information in a given group of enterprises. The research adopted an infological perspective on information, i.e., it is assumed that information is related to the person who created or received the information. The types of entities in the structure of marketing relations are defined according to the collection of thirty types of relationships in the structure of marketing relationships (Gummesson, 1994). The selected models of information quality were considered and the marketing information quality was reflected as the set of features which belonging to information, such as, completeness, trueness, timeliness, and relevancy. The information situation, i.e., the one which is determined by the creation, transmission or receipt of information, was defined with the reference to the communication theory. The selective model of information processing (Westley and MacLean, 1957) is applied. It is assumed that companies' market reality consists of elements characterized by the marketing mix model proposed by McCarthy (1964). The information about the specified elements of marketing mix has characteristics capable of being transmitted in some abstracted form. In order to study and evaluate the quality of marketing information, reference was made to the basics of qualitology and the method of averaged quality traits was used. This method makes it possible to calculate the value of the marketing information quality indicator and to classify it into one of ten quality classes. The presented concept of applying the method of averaging quality traits in the study and assessing the quality of marketing information was used in the study of the quality of marketing information of Polish industrial enterprises (n=89, Majchrzak, 2017). The obtained results constituted a premise to indicate the need to improve the quality management methods of marketing communication processes and to improve the quality of marketing information of organizational units of industrial enterprises.

Abstract

The article outlines the characteristics of the code of good practice that may be used to ensure business continuity of the production company. The elements of the code, understood as the rules of procedure, good practices or recommendations have been divided into six areas representing all stages of the lifecycle of the Business Continuity Management System (BCMS). The specification of the professional practices for each area is based on several main assumptions: each production process or its activity should be performed with integrity and due care, the processes or tasks should be executed considering the goals and needs of all stakeholders of the process or tasks, using knowledge, methods and tools based on evidence that confirms their reliability or efficiency and guarantees competence and professional application.

Keywords: Production Company, Business Continuity, Code of Good Practice.

Introduction

Under the conditions of increased competition in the market, the issue of building good, solid and mutually respectful relationship between the production company and its stakeholders becomes particularly important. The tool that allows to achieve this goal is the code of good practice [9]. Even though it is of a declaratory nature, it constitutes an important platform laying down significant principles, which the company should follow when dealing with different groups of interested parties. Business Continuity Management (BCM) is the prerequisite for the successful operation of the production company. BCM concept refers to all areas of activity, as every event concerning the operations of the production company may have negative impact on its business.

Business Continuity Management of the production company should not be treated as a narrow discipline practiced by professionals only, but rather as a wide range of activities including risk management, crisis management, security management and recovery of IT systems and data lost after disaster. It is part of the corporate governance, which constitutes a set of good practices providing guidelines for designing production processes and services to improve the company's resilience to potential interruption of the production process and the risk of losses – see Rut and Kulińska (2011). Furthermore, business continuity must form a part of the company's culture, its corporate governance and processes, and must have production process owners assigned thereto.

Cite this Article as: Maciej KIEDROWICZ, Jerzy STANIK and Kazimierz WORWA "Code of Good Practice Regarding Business Continuity of The Production Company" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The set of good practices in the field of crisis management and emergency plans constitutes the grounds for efficient business continuity management. In 2006, British Standard 25999-1: 2006 – Business Continuity Management was created to include present knowledge of business continuity. Its international equivalent was ISO 22301:2012 – Societal security, Business continuity management Requirements. According to the above-mentioned standard, the Business Continuity Management System:

- is the norm for business continuity management, including the set of good practices in this area, and
- constitutes a documented response of the company to critical events, such as fire, flood, pandemics, technical failure or adverse change of laws.

What is more, other legal standards also govern the rules of procedure aimed at maintaining business continuity – by Zawiła-Niedźwiecki (2008). They include, among other things, the so-called "soft" tools, such as codes of good practice. Such codes do not include any statutory or legally imposed norms, but the principles established by entrepreneurs or their associations (i.e. self-regulatory systems). Their implementation should, among other things, improve the transparency of the company's operations and hence strengthen its brand and relationships with third parties. The manner of using the code of good practice changes and evolves together with the company.

The main objective of this article is to present a model set of good practices and recommendations, i.e. the code of good practice, in the area of business continuity management in the production company.

Production company and its basic components

The production company is a legally and economically separate business (operating for its own account), which produces material goods to obtain financial gains by satisfying the needs of consumers – by Dendera-Gruszka (2017). Its objective is to achieve a high level of productivity and development, with low own costs.

The operations of the production company depend on the production process, during which the employees produce goods using various machines, devices and tools. It is the entirety of activities aimed at creating the finished product with specific economic value.

When analyzing the internal structure of the production company, it may be observed that it is clearly well-organized, which means that its organizational units, departments and divisions are interrelated through business, hierarchical and managerial links. What is more, the following three fundamental zones may be distinguished – see Ficoń (2008):

- provision – transport of purchased materials from warehouses of the supplier to warehouses of the company,
- production – efficient movement of raw materials, materials, semi-products during the entire production process,
- distribution – transport of finished goods from distribution warehouses to destination warehouses. Figure 1 shows correlations and tasks of the above-mentioned sub-systems.

Figure 1: Correlations and tasks of individual systems in the production company. On the basis of Ficoń (2008).

According to Figure 1, the production system in the company is a relatively separate arrangement, which means that it lacks direct links with the market environment. However, the relations include the supply provision system and demand-based distribution system. In the research work of Fertsch (2011), production is one of the main and most important activities of the production system, as it creates new economic values. From the technical and organizational point of view, it allows to adapt and change the object of work into a product, using the means of works and human labor. What is more, the production system also includes the process of maintenance, repair and refurbishment of machines as well as technical infrastructure and means of internal and external transport – see Łunarski (2010). Figure 2 shows the correlations inside the production system.

Figure 2: Production system – correlations. On the basis of Dendera-Gruszka 2017.

Internal and external conditions have impact on the management of the production system. Both internal and external environment of the company is exposed to risk and its adverse effects on business continuity. Since the situation is volatile and uncertain, the companies have to show flexibility in order to take quick actions and decisions.

Figure 3 presents the production company model, including the risk impact on its operations.

Figure 3: Operations strategy of the production company in the context of risk management and business continuity

The risk of the production system does not refer to situations strictly connected with the technological processes or work safety – see Kulik (2003). The overall factors affecting business continuity management of the production company also have impact on the production system. The production system is the most important element of the production companies, which not only adds values but also allows the company to exist. Therefore, the production system is very sensitive to all risk factors having impact on the organization. The majority of such risk factors are predictable, hence, it is possible to avoid hazardous or unexpected situations. Another group of risk factors affects the company and its production system in a long-lasting manner. The inability to solve the problem successfully may be irreparable for the company.

The purpose of maintaining business continuity of the production company is appropriate management so as to protect the production processes against unplanned interruptions and to facilitate flexible introduction of changes in accordance with the expectations and needs of clients.

Business continuity of the production company

When implementing the BCM system in the company, it must be remembered that its environments includes not only clients, contractors and competitors, but also state bodies and public administration, which may have significant impact on the company.

The British Business Continuity Institute defines the Business Continuity Management as: “a holistic management process that identifies potential threats to an organization and the impacts to business operations those threats, if realized, might cause, and which provides a framework for building organizational resilience with the capability for an effective response that safeguards the interests of its key stakeholders, reputation, brand and value-creating activities” – see Business Continuity Institute (2007).

Figure 4: Holistic process of Business Continuity Management Source: The BCI "Good Practice Guidelines" – base on Business Continuity Institute (2007)

The Business Continuity Management System in the production company is one of the components of the whole management system, thus, should be compatible with other services such as: Information Security Management (ISM), Quality Management System (QMS), IT Services Management (ITSM) [Figure 5]. The purpose of the Business Continuity Management System is to establish, implement and then use, monitor, maintain and constantly improve the functioning of the most important processes in the company (BCM), including guarantee of the information security (ISM) and quality (QMS).

Figure 5: Illustration of relations between the BCMS and other systems in the production company

All operations of the Business Continuity Management System in the production company are included in the so-called Plan-Do-Check-Act PDCA) - Table 1.

Table 1: PDCA

Stage of cycle	Description – the scope of activities to ensure business continuity of the production company
Plan - P	The planning stage of the management system includes the collection of basic information on the company and its production processes, taking inventory of resources and security technologies applied, performance of a two-stage risk analysis, including the analysis of impact of incidents on the production process (Business Impact Analysis) and detailed analysis of threats and vulnerability in terms of continuity of critical processes and information security, preparation of the required system documents (e.g. business continuity policy, business continuity strategy and declaration on the use of security measures, system plans and procedures).
Do - D	The stage of the management system implementation includes the implementation of incident management mechanisms, implementation of security measures, including careful development and use of the Business Continuity Plans, training of personnel in business continuity, implementation of the risk mitigation methods selected as part of the business continuity management strategy, establishment of the operational system management, creation of internal and external communication channels.
Check - C	The stage includes the monitoring and review of the management system, together with the analysis of data in the system, internal audits, review of the system operations by senior management, planning of system improvements.
Act - A	The stage refers to the maintenance and improvement of the security/continuity management system, which includes corrective and preventive measures as well as other system improvements in the form of update of current procedures, BCP plans and risks analyses in accordance with the evolving business processes that describe the organization and changes in the legal and business environment.

The Business Continuity Management Program is the continuous improvement process aimed at developing and maintaining action plans at an appropriate level in case of a potential crisis, which may cause the interruption of the most important production processes in the company. The entire Program is composed of six main parts: incorporation of the BCM into the culture of the organization, management of the Business Continuity Plan, understanding of the organization, establishment of the Survival Strategy, development and implementation of the Business Continuity Plan, Testing, maintenance and audit (Figure 6).

Figure 6: Lifecycle of the Business Continuity Management Program (BCMP)
– based on BS 25999, Part 1

In the production company that is well-developed in terms of its organization, the Business Continuity Management process covers all employees, workplaces, ICT systems, information, technical systems, providers of utilities, shareholders. Sudden interruption of the IT or ICT system may interrupt the continuity of the production process or the functioning of the entire company.

Project of the code of good practice for the production company

The code of good practice is a set of principles of conduct, in particular professional standards for entrepreneurs who agree to follow them with respect to one or more market practices. The codes of good practice may be established by members of a given industry and hence become applicable to such members only. The internal bodies of the organization, which determined such standards, are responsible for checking if they are complied with.

The objective of the code of good practice is to promote the highest standards of operations of the industrial companies in the market. The code of good practice, with respect to Business Continuity Management, includes the most important principles of conduct and professional practices that may be used in the entire lifecycle of the Business Continuity Management System (Fig. 3). The professional practice are based on the following assumptions:

- the knowledge as well as applied methods and tools are mainly based on proofs of their correctness or efficiency, and the guarantee of their reliable and professional application,
- the processes or tasks are performed with regard to the goals and needs of all stakeholders in the process or tasks,
- each process or task is performed with integrity and due care.

The code of good practice to ensure continuity of the production company is illustrated in Table 2 and includes a set of examples of rules of conduct, good practices and recommendations that may be implemented.

The code of good practice has been divided into six areas referring to particular stages in the lifecycle of the Business Continuity Management System – see Good Practice Guidelines (2002):

1. incorporation of the BCM into the culture of the organization,
2. understanding of the organization (process modeling, BIA and RA),
3. establishment of the Survival Strategy,
4. management of the Business Continuity Program,
5. methods of response, testing, maintenance and audit
6. development and implementation of the Business Continuity Management Program,

Table 2: The code of good practice

Stage	Principles of conduct, good practices, recommendations
Incorporation of the BCM into the culture of the organization,	1. If the production company wants to conduct its activities safely and ensure business continuity, it should implement the BCMS as the basis for its operations. 2. Regardless of the size, business profile, industry, region, the Business Continuity Management System should be implemented, enhanced and developed not only in the perception of the managers, but also all employees of the company. 3. The production company should analyze and assess the impact of the disruptions on the Business Continuity Management System, financial goals as well as environmental, quality and OHS aspects with respect to the following: – impact on damages or losses, premises, technologies or information – effects of infringement of statutory or regulatory duties – damage to reputation - financial instability – deteriorated quality of the product or service - environmental damage. The above-mentioned events should be documented. 4. It is important that all personnel in the production company understood the correlations in the company, both inside and outside, potential consequences of disruptions, actions that need to be undertaken in case of a crisis, and reasons of such disruptions. 5. The production company should ensure appropriate communication in the business continuity process, since: the clients, partners, media are awaiting such information, which is of key importance, 6. the production company should prepare crisis communication plans in the form of a set of potential communication channels to communicate with the stakeholders. 7. The production company should appropriately secure such communication with the stakeholder so that no important facts are disclosed, which could have negative effect on the business activity. Furthermore, it is recommended to develop emergency rules of communication inside and outside the production company.

Understanding of the production company	1. The understanding of the production company in the context of its business continuity must be based on specific objectives of the company and knowledge of all key aspects of its functioning with respect to the company's resources and processes, inputs and outputs, processing, production processes as well as additional and management resources. 2. To describe its operations, the production company should use the process-based approach, establish a model of the company processes [Figure 2] and distinguish those processes that are of key importance in terms of the production activities (BIA). 3. The production company should prepare the analyses of potential risks and preventive actions and, on the basis thereof, prepare documents to record such risks, undertaken preventive actions and their effects on the company's business activity. To that end, the production companies should: – assess at the time of occurrence of the aforesaid potential effects whether the business activity could be disrupted, – determine maximum acceptable time of interruption of any type of activity, by specifying: – maximum time after the disruption, during which the activity must be resumed, – minimum level, at which the activity must be performed to restore such level, – time period, during which the levels of activity must be restored.

Establishment of the BCM strategy	1. The production company should ensure that all its employees/subject of work knew and understood – depending on their position - the business continuity strategy in the company; in case of a crisis, they will have to act according to the plans, procedures and instructions, which will be much easier if they know the areas presented in Figure 3. 2. By establishing the Business Continuity Management strategy, the production company should: - include appropriate means for reducing the likelihood of the risk or its effects, - include specific measures mitigating or increasing the company's resilience to risks and disruptions, - define means to ensure the continuity of critical activity during and after the disaster, - include the activities that have not been classified as critical. 3. The production company should consider as accurately as possible every strategy scenario in terms of the resources used, paying special attention to the following: - maximum acceptable time of interruption during the occurrence of risks and disruptions, - costs of implementation and execution of the strategy, - consequences of failure to undertake preventive actions. 4. The production company should each time reduce the likelihood of the occurrence of the same disruption causing interruption in business activity.
Management of the Business Continuity Program	1. The Business Continuity Management Program should be implemented in stages, for example: a) assign responsibility; persons involved in the implementation of the Business Continuity Management Program should be fully competent and responsible for the part of the implementation process entrusted thereto, b) development of the implementation methodology including design, creation and execution of the program. The company should provide all stakeholders with the information on the implemented system, organize necessary training for the implementing personnel and ultimately for all other employees, in stages. c) maintain continuity of the implementation process and constant improvement of the management system. The management of the Business Continuity Management System should be aimed at continuous analysis of the operating system, including the analysis of risks and threats, prevention and mitigation of threats, organization of training, exercises and audits, implementation of updates, administration and monitoring of system continuity. 2. To protect the company, its Management Board and executives should prepare the BCM documentation, which will include, for example: - BCM policy with the described declaration and tasks - analysis of impact on the business activity of the company - analysis of risks and threats - prevention strategy - awareness raising programs - training programs - planning of incident management - business continuity plans - economic recovery plans - schedules of exercises and reports - maintenance and outsourcing contracts

Methods of response, testing, maintenance and audit	1. As part of the developed plan of implementation of the Business Continuity Management System, the company should determine clear and comprehensible structure of response to incidents by preparing detailed action plans for particular units of the production company. 2. Each time a disruption, threat or accident occurs, the company should be able to quickly and easily appoint the team responsible for: - confirming the nature and scope of the incident, - taking control over the situation, - limiting and preventing the spread of the event, - communicating with the stakeholders. The same team should react to the event, report and inform on the preventive steps undertaken and, if necessary, refer the crisis management to a higher level of management or inform the Incident Management Team (IMT) or Crisis Management Team (CMT). 3. The planning process should include the development of the Incident Management Plan (IMP) and Business Continuity Plan (BCP). 4. The IMP constitutes grounds for all areas of the BCM, thus, it should be flexible, easy to read, comprehensible and include all essential elements.

	5. The company is obliged to fully support the IMP in terms of providing the funds for the development and training courses, attaching significance, monitoring. The IMP should contain lists of tasks and control lists of actions for the purpose of Business Continuity Management. 6. The documentation must be supplemented with clear and comprehensible rules of notification, which should be constantly updated. Both the managing staff and personnel involved in the BCM activities should have easy and unlimited access to plans and documents. 7. The IMP activities must ensure security, be based on the BIA results, be structured in such a manner so as to provide strategic and tactical options of actions, and prevent loss of continuity of critical business. In case of the disruption or risk, the report on the event must be drafted - the company should have templates of the standard documents to be used for such purposes. 8. Therefore, it is obligatory to re-conduct the risk analysis and document which part of the present analysis was too simplistic and which corrective measures should be implemented. If the disruption or risk threaten escalation outside the organization or the escalation has already happened, the company should to undertake appropriate steps planned for such a situation and contact external rescue services to prevent further escalation. The above-described circumstances may require official announcement to the public via media. 9. The Business Continuity Plan (BCP) is another element of Business Continuity Management (BCM) allowing the company to recover and maintain its business in case of the disruption and to restore it to the original state. 10. The system of the business continuity plans is activated to support key and supplementary actions (i.e. critical action path) required to achieve the company's goals. It may be used in whole or in part, where the disruption or risk occurred. 11. The business continuity planning should reflect the structure of activities and tasks and provide, on the basis of the control list, the information on all actions that need to be undertaken in case of the disruption or other event. 12. For the purpose of the business continuity management planning, the company must determine its resources for the time of implementation of the preventive measures and maintenance of business continuity. 13. The company must appoint an authorized person responsible for crisis management and give them all powers necessary to manage the company in case of an emergency. 14. The emergency plans must be tested in practice. Various types of tests are developed, for example, 1. notification test – verification if the plan is complete; 2. paper test – verification of the roles assumed by the participants; the test may be in the form of a game; 3. operational test – complete test. 15. The business continuity plans are created on the assumption that the plans are tested and the test results contribute to the improvement of test scenarios and plan modification. 16. It should be remembered that it is very difficult to run tests in production environments, hence, their number is limited to the minimum. 17. The times and measurements of the following must be duly recorded: RTO, RPO, MTPD. The adopted values should not result only from paper analyses, even if based on knowledge and experience, or simulations, but from actual tests showing how the whole procedure goes, where the bottlenecks are and where potential problems may occur. Here come to the aid all sorts of IT solutions, which are not only used to create backup copies or protect data from loss, but also to ensure recovery after the incident or disruption of business continuity. What is the most important is not the back-up copy of data, but a possibility of quick recovery of business.
Deve lopm ent	1. The implementation of the Business Continuity Management System in the company is a turning point marking its transition from theoretical to practical actions, i.e. the time when the company should maximally involve its funds and

	resources to efficiently and quickly implement the Business Continuity Management System. 2. At this stage, the company should have all its critical actions defined, risks connected therewith assessed, strategies for reducing the likelihood of disruptions or threats and strategies for maintaining business continuity and recovery established. 3. Before physically launching the Business Continuity Management System, the company must have a plan for the implementation of such system and its components, with the clearly stipulated goal and scope. 4. Each plan should refer to the effects of its actions in an explicit and comprehensible manner, while maintaining consistency with other plans, especially those that are of key importance for the entire implementation process. 5. The action plans should include clearly defined methods for obtaining and accessing such plans, documents and procedures necessary for their implementation, and the roles and responsibilities of persons implementing the system. 6. The company should describe the personnel structure of persons and teams responsible for the implementation of the system, assign their roles, duties and responsibilities. 7. The company should also develop emergency recovery plans, methods for mobilizing teams, schedules of meetings and execution of tasks and other methods of control and audits at each level of the company's hierarchy. 8. The business continuity planning should allow to answer the questions on how preventive measures are implemented, who is responsible for the response to the event at all levels of the organization, which procedures should be launched, which persons should be informed and consulted before implementing the preventive measures, which decisions have been made, how the evacuation is to be managed and location of the meeting point.

Summary

In today's urbanized, automated and computerized world, the risks are increasing in volume and affect the functioning of whole societies, institutions and production companies. We are often unaware of the how our life depends on efficient operations of the production, power, banking or IT systems and how often they are interrelated. To ensure the continuity of such systems requires a lot of effort from both the companies and public administration.

The code of good practice governs standards and rules of behavior, including good practices used by all subjects of work in the production company as part of their business activity, in particular when working with clients, recipients, IT service providers and other partners.

The codes of good practice are not implemented in the form of legal documents. They are treated as the "manuals of good behavior". Their significance is due to the fact that the production companies in a given market make declarations concerning the use of such practices, which are required by certain industries.

Numerous opinions and analysis of the examined production companies show that, from the point of view of the "good practice" principle, the concept of good practices has not been favorably adopted by many of such enterprises. In compliance with the assumptions underlying the concept of good practices, all members of the provision and sales market should benefit from raising the standards. However, for many of them, such an initiative is unclear, thus, they treat it merely as one of the many tools in the company or capricious idea of the management. Generally speaking, the reason for this is mainly low awareness of the significance of the "good practice" principle. Furthermore, it may not be guaranteed that the efforts undertaken in the field of good practices will be appreciated by the stakeholders.

As indicated by numerous opinions and analyses of production entities, the areas of further research and development of Codes of Good Practice should be focused on:

1. Application of the policy of open access to databases or repositories of codes of good practice based on the following principles:
   - openness - free open access (free and open access) or *libre* open access (free and open access),
   - parallel paths - access to codes of good practice should be provided by publishing them in open peer-reviewed journals and specialist books and placing their content in electronic repositories
   - quick access - descriptions of good practices contained in individual codes should be made available as soon as possible from the date of their publication, preferably immediately.
2. Development of effective procedures for identifying good practice taking into account the following criteria:
   - formal criteria (e.g. in available databases or repositories we are looking for all good practices concerning our problem, we are looking for good practices concerning our problem, tested in other organizations operating in similar areas).
   - substantive criteria (e.g. we are interested in good practices that are applicable in our conditions, and therefore realistic, consistent with the principles of sustainable development, based on local human and material resources, and innovative.
3. Treating good practice as an activity that:
   - brings concrete positive results,
   - contains a certain potential for innovation,
   - it is durable and repeatable, it can be used in similar conditions elsewhere.
4. Treating the code of good practice as a key source of information used to improve business standards and as a good tool for improving the quality of human capital; teaches how you can enrich your knowledge using the experience of others.
5. Promoting/propagating the Code of Good Practice not only as a set of regulations and guidelines, but also as a determinant that inspires Investors who, not limiting themselves to strict rules, will take an active part in the process of improving the existing codes of good practice.
6. Avoidance of creating overly laconic codes, containing too few explanations that do not help to understand the functioning of entire societies, institutions and production companies.

Abstract

The authors of the article focused on the issue of measurement and assessment of sustainability of the production processes. The analyses of the durability potential of the production processes require many different areas of factors and conditions to be taken into consideration. The research task refers to a possibility of implementing or using a multifaceted risk model in the assessment of sustainability of the production process, which is understood as one of the fundamental characteristics of reliability and safety of operations of the actual production systems. The event in the form of an external or internal risk or formal destruction phenomenon constitutes a basic concept in the modeling of management of sustainability of the production process. Each event is connected with the descriptive information, i.e. the information describing a given event in the situational context. The iterative approach was used to build the mathematical model, analyze its potential practical applications and search for the manner of illustrating such potential applications. The testing method was in the form of the intuitive method, allowing to use expert experience in the analyses of possibilities of benefiting from the sustainability of objects and adapting exploitation processes thereto.

Keywords: Production Process, Sustainability Potential, Risk Model.

Introduction

New challenges faced by the production companies (high competitiveness, complexity of manufacturing process or production processes) require changes in the modeling of the sustainability potential - the utilization of workforce is affected by the destruction processes resulting from the environment, exploitation and services. Furthermore, to address such challenges, some innovative methods of data collection, ordering, analysis and processing are needed. What is most important here is responsiveness to changes of internal (fluctuations in service quality) and external conditions (changes in consumer expectations, environmental norms, etc.) – by Downarowicz (2007). The above also includes world trend to improvement of competitiveness by increasing the sustainability potential. It is important for the owner/user of the production process (and better to understand in an intuitive manner than the concept of sustainability) to know how much of the potential workforce does their object have so that they may be used during exploitation to achieve a certain goal. Additionally, it is also crucial to know how much of the sustainability potential is used while storing products, waiting to start another task or rendering other services. The utilization of workforce of the object/process, its lifetime or sustainability potential cause (at the beginning - in a non-explicit manner) deterioration of the parameters of the object/process necessary to implement the process supporting the work of the object.

With the development of the theory of reliability (Idziaszek et al (2008)), theory of keeping objects in motion (Benner et al (2003), theory of exploitation (Banham et al (2015), Borup et al (2004), Borkowski (2009), Fender et al (2010), Herterich et al (2014)) and theory of recovery, the concept of the sustainability potential has been used more often to describe the operating life of inherent object resources object (Gapp et al (2008), Kiedrowicz et al (2018)), sustainability resources (Borup et al (2004) and Fender et al (2010)), exploitation resources (Borkowski et al (2009)), work resources (Dwiliński (2009)), production potential (Dwiliński (2009)), sustainability potential (Gabryelewicz et al (2014), Gupta et al (2006)). This, in turn, generates the demand for modern methods/models allowing to measure the sustainability potential of the resources held (material, human, financial, information, management) by using a set of potential or actual disruption/risk factors that have adverse effect on such resources. Every risk is assessed according to several criteria, where each criterion describes the probability and/or effects of such risk. The result of risk assessment z_k (= 1, 2 … , N) according to k_i criterion (= 1, 2, … ,) is the risk component r_i (z_k) (= 1, 2, … , M), which reflects one or more risk attributes from set X_i (= 1, 2, … , M) [Figure 1]. The initial discussion of the issue by the authors is in Fuqing et al (2017).

On the basis of own expert knowledge, results of the literature analysis and intuitive method, it was established that to analyze the sustainability potential indicator, based on the risk components and vulnerability of the production processes, it would be reasonable to divide the production resources of the process/system/organization into inherent (related to technical, technological, reliability and sustainability potential of objects) and non-inherent production resources (mainly based on human decisions, such as work organization, exploitation strategies, pro-quality activities, diagnostic activities and selection of environmental conditions, i.e. existing human, training, cultural potential, etc.).

Figure 1: Illustration of relations between inherent work resources of the object and non-inherent service resources assigned thereto, which are generated by the process of using such object (including its lifetime and durability potential), and illustration of the location of the proposed risk model.

There is a number of publications devoted to the measurement of sustainability potential and describing the lifetime indicators in case of assessment of the production processes discussed in study Gebryelewicz et al (2014). Many studies also focus on the methods for improving lifetime (e.g. Herterich et al (2014)) and tackle the issues related to the monitoring of efficiency of use of a given production system, which, however, do not constitute such a general indicator as the sustainability potential. This is the origin of the idea to combine all risk factors concerning the production system means (De Nicolo et al (2011), Gebryelewicz et al (2014)), including their division into inherent and

non-inherent resources (see Dwiliński (2006)), which are necessary to achieve the production or service goal in the form of a number that may be interpreted in different ways, e.g. as a loss, effect, remaining risk, etc.
Neither international nor national literature does mention any mathematical model for measurement of sustainability of the production process, which would be adequate for such a spectrum of risk factors, characteristics describing such risks and vulnerability of the resources. It is only mentioned (in the aforesaid publications) that the appropriate selection of such model determines its effect.
The method proposed in the article, which replaces traditional measurements, is consistent with the theory describing a multifaceted approach, based on the generalized risk model used to assess the sustainability of the production process objects.

Method of assessment of sustainability of the production processes using the generalized/multifaceted risk model

Production process and description of its elements for the purpose of measurement of sustainability potential of the production processes

If something exists, it has certain features. The production process may be characterized by a set of attributes, which are shaped at particular stages of the lifecycle of the production system. A feature is a separate property of each material object (concrete) or piece of work (abstract). Therefore, the characteristics of the object of the production process refer to its structural, technological and exploitation properties/attributes, which may be defined (or preferably measured) and shaped during its operation. Such characteristics mainly result from the fact that the object of the production process should meet certain requirements established at the stage of formalization of assumptions. For the purposes hereof, the following definition of the production system was adopted – see Askarany (2007): "The production system is an intentionally designed and organized material, energetic and informational arrangement used by a person to create specific products, goods and services for the purpose of meeting the needs of consumers" [Figure 2].

Figure 2: Illustration of basic objects of the production system and their relations.

According to PN-EN ISO 9000:2006 (currently PN-EN ISO 9000:2015-10), the concept of inherence is defined as the "... degree to which a set of inherent characteristics fulfills requirements". On this basis, the authors suggested using the aforesaid concept to describe a set (C) of characteristics of the object work resources, which, in light of the above-mentioned definition, are referred to as quality/reliability/sustainability of the object being an element of the production system/process. The inherent resources are composed of all elements that result from Y^{io} the set of inherent factors present

in the production process. One of the examples may be the sustainability potential of the object (P_t) described by sustainability of inherent object resources) (T^{io}). The maximum value of the object's sustainability (T^{io}_{max}) with respect to inherent resources limits its production capacity (as well as technological, structural, service capabilities and the possibility to execute other tasks, such as removal of natural disasters, etc.). The above may also include the general ability to manufacture both material and service products (e.g. transport products). However, the sustainability (level of use of inherent resources) (hence, (T^{io}_{max}) is strongly affected is strongly affected by the types and volumes of non-inherent resources (Dhillon (2006)), which may be described on the basis of operating life/sustainability with respect to non-inherent resources of the object (T^{nio}) – resulting from the attributes assigned thereto derived from the object management system. The method and quality of use (T^{nio}) are mainly described (according to the authors) by non-inherent factors (Y^{nio}) assigned and dependent on the so-called human factor, thus, they were called non-inherent resources of the object. It is difficult and sometimes even impossible to specify/distinguish (T^{io}) and (T^{nio}) in the operating time of the production/service product described herein as (P_t) in dependency relationship (1)). It is much easier to define Y^{io} and Y^{nio} as well as assess their impact on P_t. The result are the sets of ((C^{io}), (C^{nio}) attributes of the object work resources, both inherent and non-inherent, which are called the working potential of the object – P_t and described by dependency (1),

$$P_t = f\left((T^{io}), (T^{nio})\right); \quad P_t = g\left((C^{io}), (C^{nio})\right) \tag{1}$$

where:

C^{io} - the set of attributes, which may be used to describe the numerical indicator T^{io} (T^{io}_{max}),
C^{nio} - the set of attributes, which may be used to describe the numerical indicator T^{nio} (T^{nio}_{max}).

Mathematical model to measure sustainability of the production process

The following abbreviations are introduced [Figure3]:

- $\boldsymbol{C^{io}}$ - the set of inherent features used to describe the sustainability potential of the production process
- $\boldsymbol{C^{nio}}$ - the set of non-inherent features used to describe the sustainability potential of the production process
- **PO** - the set of vulnerability values, characteristics of weaknesses of the objects in the production process as regards their sustainability
- $\boldsymbol{Z}$ **-** the set of potential (hypothetical) or real (actual) risks, which constitutes a potential spectrum of external risks, external security, reliability and sustainability of the system production process
- **K** **-** the set of criteria for risk assessment
- **Ω** - the set of values $\mathbf{s} = \boldsymbol{\omega_{l,k}}$ used in the loss assessment process with respect to the set of **K** criteria
- $\boldsymbol{A}$ - the set of validity of the criteria from the set **K.**

The value of the sustainability potential in the production system and the risk of its loss is determined on the basis of the set of objects from the set of risks, including the limitations illustrated in Figure 3.

Figure 3: The illustration of the relations between the set of objects in the production system and other sets of: attributes, factors, risks, vulnerability included in the method for assessing the sustainability potential risk.

While assuming that the following transformations are known (see Idziaszek et al (2008)):

1) for the set of inherent and non-inherent characteristics describing the object from the production system in the context of sustainability potential

$$\Gamma : 2^{C^{IO}} \times 2^{C^{NIO}} \longrightarrow \mathrm{P};\ \gamma\left(C_i^{IO}, C_j^{NIO}\right) = p_{i,j} \in P_t; \tag{2}$$

2) for the set of criteria characterizing particular risk components

$$\Psi : 2^X \times 2^{PO} \longrightarrow \mathrm{K};\ \psi(X_i, PO_i) = k_i \in K \tag{3}$$

3) for the set of risks

$$\Phi : 2^K \longrightarrow \mathrm{Z};\ \phi(K_i) = z_k \in Z \tag{4}$$

It is possible to set a general risk measure expressed as dependency (5), illustrated in figure (Figure 3), used to measure the risk of loss of sustainability/production process:

I. Variant one (I):

$$\boldsymbol{\mathcal{R}^I} : \boldsymbol{Z} \longrightarrow \boldsymbol{V^I} \subset \mathbb{R};\ \mathbf{r}^{\boldsymbol{I}}(\boldsymbol{z_k}) = \mathbf{s} = \boldsymbol{\omega_{m,n}};\ \boldsymbol{\omega_{mn}} \in \boldsymbol{\Omega^I} \tag{5}$$

$$\boldsymbol{R}(\boldsymbol{z_k}) = \boldsymbol{f}\left(\boldsymbol{a_i}, \boldsymbol{r_i}(\boldsymbol{z_k})\right);\ \mathrm{k} = 1,2,\dots,\mathrm{N};\ \mathrm{i} = 1,2,\dots,\mathrm{M}. \tag{6}$$

$$\boldsymbol{R^I} = \textstyle\sum_i \boldsymbol{f}\left(\boldsymbol{a_i}, \boldsymbol{r_i}(\boldsymbol{z_k})\right), \tag{7}$$

where:

$\boldsymbol{r_i}(\boldsymbol{z_k})$ - the risk component for the kth risk from the point of view of the *i*-th criterion
$\boldsymbol{a_i}$ - validity of the kth criterion; $\boldsymbol{a_i} \in A$,
N - the number of the set of risks
M - the number of the set of criteria

II. Variant two (II):

$$\boldsymbol{\mathcal{R}^{II}} : \boldsymbol{\Omega^I} \times \boldsymbol{SZ} \times \boldsymbol{SP} \longrightarrow \boldsymbol{V^{II}} \subset \mathbb{R};\ \mathbf{r}^{\boldsymbol{II}}(\boldsymbol{s_i}, \boldsymbol{sz_j}, \boldsymbol{sp_k}) = \mathbf{s} = \boldsymbol{\omega_{ijk}};\ \boldsymbol{\omega_{ijk}} \in \boldsymbol{\Omega^{II}}. \tag{8}$$

where:

$\boldsymbol{\Omega^{II}}$ - the set of values reflecting the level of losses in the sustainability potential, based on the knowledge of the function: $P_t = f\left((T^{io}), (T^{nio})\right)$, $P_t = g\left((C^{io}), (C^{nio})\right)$ or the set of values, reflecting easy use of objects of the production process by the Z risk system with respect to the selected sets of K criteria,

$\boldsymbol{SZ}$ - the set of risks from set Z valuated by experts,

$\boldsymbol{SP}$ - the set of vulnerability from set PO valuated by experts,
$\boldsymbol{V^{II}}$ - the set of risk values.

The values s_i, sz_j, sp_k and the risk value are determined by the expert-mathematical method classified as heuristic methods. This method uses expert opinions. The method of determining individual values s_i, sz_j, sp_k and risk values using the mathematical method and its illustration are described in section 2 this article.

To make further considerations real and offer an insight into the sustainability measurement of the production process, the following assumptions are made:

I. The set of potential risks will be initially divided into three categories: natural risks, technical risks and social risks. The individual categories are then divided into the subcategories, classes and types. The static set of potential risks is transformed into the dynamic categories (kinematic) of real risks having direct impact on the security of a given production system/process, using the function of the system risk (Idziaszek et al (2014)), which is usually defined in the literature as the impact of uncertainty on the objectives or, in a more descriptive manner, as a random attribute of the decision-making process.

II. The set of criteria for risk assessment **K** = { k_i : (= 1,2, …)} may be decomposed into the following subsets:
   1) according to the role specified in the generally accepted definition of risk:
$$\boldsymbol{K_r} = \boldsymbol{K_r^M} \cup \boldsymbol{K_r^S}, \tag{9}$$
   where:

   $\boldsymbol{K^M}$ - the criteria describing the possibility of risk materialization
   $\boldsymbol{K^K}$ - the criteria describing the consequences of risk materialization
   2) according to the representative factors causing change of the sustainability potential (sustainability) of the production object/process/system:
$$\boldsymbol{K_t} = \boldsymbol{K_t^D} \cup \boldsymbol{K_t^{UZ}} \cup \boldsymbol{K_t^J} \cup \boldsymbol{K_t^{ZZ}}, \tag{10}$$

where:

a. $\boldsymbol{K_t^D}$ – the set of criteria describing changes in the properties of the production process, determining the change of its sustainability/workforce based on diagnostic parameters (Pd), e.g.:
   i. the criterion for change of parameters in the process of changing the workforce - $k_{zzp} \in \boldsymbol{K_t^D}$:
   ii. the criterion for change of parameters in the process of changing the usability - $k_{zu} \in \boldsymbol{K_t^D}$:
   iii. the criterion for change of parameters in the process of changing the workload - $k_{zo} \in \boldsymbol{K_t^D}$:
   iv. the criterion for change of parameters in the process of services - $k_{zob} \in \boldsymbol{K_t^D}$:
b. $\boldsymbol{K_t^{UZ}}$ - the set of criteria describing the change of task-based usability of the object:
   i. Change of work efficiency– $k_{ep} \in \boldsymbol{K_t^{UZ}}$.
   ii. Change of work parameters - $k_{pp} \in \boldsymbol{K_t^{UZ}}$,
   iii. Change of residual sustainability - $k_{tr} \in \boldsymbol{K_t^{UZ}}$,
   iv. Change of reliability - $k_{zz} \in \boldsymbol{K_t^{UZ}}$;
c. $\boldsymbol{K_t^J}$ – the set of criteria describing service change of the object:
   i. service quality - $k_{jo} \in \boldsymbol{K_t^J}$,
   ii. type of exploitation strategy - $k_{se} \in \boldsymbol{K_t^J}$,
   iii. materials used - $k_{sm} \in \boldsymbol{K_t^J}$,
   iv. service procedures used - $k_{po} \in \boldsymbol{K_t^J}$,
d. $\boldsymbol{K_t^{ZZ}}$ - the criteria for reduction the workforce of the object (consumption:

i. total sustainability - $k_{tc} \in \boldsymbol{K}_t^{ZZ}$:
ii. maximum object sustainability - $k_{tm} \in \boldsymbol{K}_t^{ZZ}$.

Bearing in mind the nature of impact of one or several criteria on other criteria from the $\boldsymbol{K}$ set and quantification scheme of the risk components, the set of risk criteria $\mathbf{K} = \{ k_i : (= 1,2, \ldots)\}$ may be decomposed into the following subsets:

$$\mathbf{K} = \mathbf{K}^T \cup \mathbf{K}^W, \tag{11}$$

where:

$\mathbf{K}^T$ - table criteria,
$\boldsymbol{K}^W$ - risk enhancers.

The table criteria, shown in the form of tables, may refer to any element from the $\mathbf{K}^T$. set. The table criteria are also called quantification schemes of the risk component for the selected criterion. They directly describe the effects of risk materialization. The quantification scheme of the risk component for a given criterion, i.e. "consequences of risk materialization", organized in the form of a table, is presented as an example in Table 1.

Table 1: Quantification scheme of the risk component for the criterion "consequences of risk materialization"

[j]	Level [$\omega_{1,j}$]	Description
1	Low/green [value – 1]	**Incident**, i.e. every event other than an accident or serious accident, having impact on the sustainability, reliability or security of the production system.
2	Medium/yellow [value – 3]	**Accident/damage**, i.e. unwanted or unintentional sudden event or sequence of events having serious impact on the sustainability, reliability or security of the production system
3	High/red [value – 5]	**Serious accident/failure**, i.e. an accident resulting from a collision or failure, causing substantial damage to the objects of the production system or environment, and other similar accident having the same effects and obvious impact on the sustainability, reliability or security of the production system.

The authors of the article assumed that the risk components resulting from some criteria are in the form of coefficients affecting the risk value resulting from other criteria. A similar concept was put forward in study Marais et al (2012). Furthermore, it is assumed that:

- risk enhancers are characterized by natural numbers w ($w \in \mathbb{N}$), such as the number of technical features or number of diagnostic services in 24 hours.
- the maximum permissible value of characteristics is known and designated as w_{MAX}.

The impact of such enhancer on the general risk measure is defined by its coefficient, determining the set of measured risk levels according to a given criterion:

$$\Omega_w = \{1 + \alpha \cdot \frac{0}{w_{MAX}}, 1 + \alpha \cdot \frac{1}{w_{MAX}}, , \ldots ,1 + \alpha \cdot \frac{w_{MAX}}{w_{MAX}}, \}, \tag{12}$$

where:

Ω_w - the set of measured risk levels,
A - risk enhancer coefficient,
w_{MAX} - the highest permitted value of characteristics.

In such case, the level of the risk component is defined using the following formula:

$$r_w = 1 + \cdot \frac{w}{w_{MAX}}, \tag{13}$$

where:

r_w - the level of the risk component according to the risk enhancer,
w - the value of the analyzed characteristics,

α - risk enhancer coefficient,
w_{MAX} - the highest permitted value of characteristics.
Due to the nature of the risk enhancers, it is assumed that their validity is always 1.

Illustration of the examples

Illustration of the example for variant I

To present the assumptions of the developed risk model, seven examples of criteria referring to both the possibility of risk materialization and its effects have been used in this article. The model consists of four types of segments divided according to the representative processes that have impact on the change of workforce of the object. The chart of such criteria for risk assessment are shown in Figure 4.

Figure 4: Chart of risk analysis criteria used in the proposed risk model

Due to editing requirements of the article, subsequent chapters do not include any discussion of the quantification schemes for risk components for K4-K7 criteria.

K1 criterion called "movement situation" allows to include the load of the analyzed production process. The value of the risk component according to the said criterion is defined by the following formula:

$$r_w = 1 + \cdot \frac{w}{w_{MAX}}, \tag{14}$$

where:

r_w - the level of the risk component according to the risk enhancer,
w - the value of the analyzed characteristics, e.g. daily usage of total sustainability - Tc
α - risk enhancer coefficient,
w_{MAX} - the highest permitted value of characteristics, e.g. maximum object sustainability - Tm

The above-mentioned criterion is in the form of the risk enhancer.
Another criterion, i.e. K2 "culture security ratio", is aimed at reflecting the general level of security of the production system. The most adequate means for describing the general security level of the production system is one of the ratios from the set of *Common Safety Targets* (CST) expressed as the following formula:

$$OPB = \frac{fatalities\ and\ weighted\ seriously\ injured\ (FWSI)}{number\ of\ man-hours}, \tag{15}$$

The group of the so-called *weighted serious injuries* includes persons, who spent more than 24h in hospital due to an accident. The OPB ratio is calculated for the subsequent calendar years and compared to the *National Reference Value*. The proposed quantification scheme of the risk component for K2 criterion is shown in Table 2.

Table 2: Quantification scheme of risk component for K2 criterion "culture security ratio" (explanation in the text)

j	Level	Description
1	Green	OPB≤0,5·NRV
2	Yellow	0,5·NRV<OPB≤NRV
3	Red	OPB>NRV

The values of the risk components according to the following four criteria are calculated separately for each of the segments. The quantification scheme of risk component for K3 criterion called "effects of risk materialization" is shown in Table 1 of this article.

The K1-K7 criteria (Figure 4) applied herein may be classified in two groups reflecting their functions in the widely accepted definition of risk:

- the criteria describing the possibility of risk materialization: K1 "movement situation" and K3 "effects of risk materialization" and K5 "change of parameters in the process of changing the workforce"
- the criteria describing the consequences of risk materialization: K1 "movement situation", K2 "effects of risk materialization", K4 "change of residual sustainability", K6 "availability of diagnostic services".

On the basis of the presented quantification, it is evident that K1 criterion "movement situation" may belong to two groups at the same time. The criterion describes a possibility of risk materialization – the quicker the objects of the production process lose their sustainability potential, the more probable becomes the loss of continuity of the production system.

The sets of measured risk levels for the adopted risk assessment criteria are as follows:

$$\Omega_1 = \{\ 1 + 0{,}1 \cdot \frac{1}{T_m},\ 1 + 0{,}1 \cdot \frac{2}{T_m},\ \ldots,\ 1 + 01 \cdot \frac{T_c}{T_m}\ \}, \tag{16}$$

for K1 risk enhancer called "movement situation" and $\Omega_i = \{1,2,3\}$; i = 2,3,4,5,6 for other table criteria. It is usually assumed that the criteria referring to the effects of risk materialization should have twice as high impact on the final risk value. Therefore, the following set of validity measures of the analysis criteria have been proposed: ={1,1,3,3,3}. Eventually, the risk may be assessed in accordance with the following formula:

$$R(z_k) = a_1 \cdot r_1(\textstyle\sum_{i=2}^{7} a_i \cdot r_i). \tag{17}$$

The obtained results must be then compared with the threshold values of the risk levels, which should facilitate to make appropriate decisions concerning the maintenance of the production process.

Table 3: Risk valuation scheme

Risk measure value	Risk category
$R(z_k) \leq V^{ra}$	Acceptable risk, V^{ra} – value of acceptable risk
$V^{ra} < R(z_k) \leq V^{rt}$	Tolerable risk V^{rt} – level of tolerable risk
$R(z_k) > V^{rt}$	Non-acceptable risk

Illustration of the example for variant II

As mentioned in section 1.2. the risk value for option II is determined based on the formula (18):

$$\mathcal{R}^{II} : \Omega^{I} \times SZ \times SP \longrightarrow V^{II} \subset \mathbb{R};\ \mathbf{r}^{II}(s_i, sz_j, sp_k) = \mathbf{s} = \omega_{ijk};\ \omega_{ijk} \in \Omega^{II}. \tag{18}$$

The values s_i, sz_j, sp_k and the risk value are determined by the expert-mathematical method classified as heuristic methods. This method uses expert opinions. The results of applying the mathematical expert method are illustrated in Figure 5.

Name of the production process object / The name of the vulnerability for the resource	Vulnerability refers to the attribute	Expert assessment 1	Expert assessment 1	Expert assessment 1	Expert assessment 1	Expert assessment 1	Average rating for agiven threat
Vulnerability name 1	availability integrity	M	M	H	H	M	**H**

Summary

In summary, it may be stated that the above-described method seems correct and appropriate and allows to analyze the lifetime of the object of the production system due to the nature of changes of the diagnostic parameters or sustainability potential. The presented calculation model for variant 1 and illustration of the method for setting risk values for variant 2 could make it possible to verify the developed model and highlight the application values of the discussed method. The method may be useful in further studies on streamlining both the production processes and production system. Furthermore, due to its universal character, the described method may successfully be used to define residual sustainability of any technical object, whose technical condition is determined on the basis of the analysis of diagnostic parameters, including the sustainability potential. The method outlined in this article may be further improved and extended to cover other cases of accumulation of random changes in the production environment and its surrounding. It also seems that the aforesaid method may be used to assess security, reliability and continuity of the production processes.

This article constitutes the first step for developing the method for assessing sustainability of the production process, which will support managers in their daily work. While considering the lack of objectivity in the opinion of experts, the limited access to essential data and many other well-known methods or models for assessment of usability, reliability or sustainability of the production processes, the authors believe that such an area of research still requires further studies allowing to establish a

comprehensive approach to the measurement and assessment of sustainability of the production processes or systems.

The studies and measurement of sustainability are becoming more and more significant not only as the grounds for improving production processes, but also as one of the possibilities of obtaining reliable information necessary to interpret and forecast events or create scientific theories. Therefore, a theory may be treated as a certain doctrine, encouraging to take specific practical actions on the basis thereof.

Abstract

Adherence to legislation of section 135 by India has witnessed a huge increment in the course of the last five years. Organizations on a growing rate comply with a major part of the regulations as determined in the Companies Act,2013 concerning Corporate Social Responsibility. India's pattern on CSR consumption obviously demonstrates their enthusiasm to contribute towards nation building. This study intents to examine the pattern of current CSR expenditure by a giant Indian corporate and on the basis of this pattern anticipate its future spending through regression analysis. The paper culminates on the note that inclusion of compulsion in the CSR Act has achieved a significant increment in the CSR spending by Indian Companies, which shows Indian corporate's readiness to add to stakeholder prosperity.

Keywords*:* Corporate Social Responsibility, CSR Expenditure, Regression Analysis, Time Series Data.

Introduction

Every business organization has an obligation to consider the stake of buyers, suppliers, investors, society and environmental contemplations in all dimensions of their activities. This commitment is termed as Corporate Social Responsibility (CSR). In the words of Mahatma Gandhi," a businessman has to act only as a trustee of the society for whatever he has gained from the society. At the end of the day all the resources belong to the general public". Society offers to organizations the power to claim and use land and assets of the environment. In the fullness of time all of the resources belong to the general public. Srivastava AK et al (2017) mentioned that according to the most recent change in the Indian Companies act 2013 specifying the social obligation of corporate called Corporate Social Responsibility, it's required that organizations with a turnover of Rs. 1000 crore or net profit of Rs 5 crore or more, devote 2% of their average net profits for the previous consecutive 3 financial years towards Corporate Social Responsibility. In India the business concerns have been extremely circumspect and rational in conducting socially responsible initiatives and inculcating them into the core of their business.

Over these years, since its inception, it has been conspicuously developed inchmeal in the background of Indian corporate sector since businesses have perceived and accepted the fact that other than scaling heights in business, it is additionally imperative to build mutually dependable and congenial connections with the society on the whole. Organizations these days have distinct departments and committees that formulate well-defined goals, procedures, and strategies for their socially inclined projects and develop discrete financial plans to achieve those.

Cite this Article as: Veena M and N Ajithkumar "CSR Expenditure Pattern of Indian Corporates-A Case Study of Bharat Petroleum Corporation LTD-KOCHI Refinery" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

More often than not, such initiatives rely on utmost characterized social convictions as well as painstakingly aligned with the concerns' business space. The most appropriate CSR plans guarantee that while business concerns follow enactments, their ventures likewise regard the development and prelation of the less fortunate segments of the society and the nature. CSR ought to be having a long-lasting impact comprising of organizational affairs that can be carried out without adversely influencing their business objectives. The basic target of CSR activities of businesses at present is to elevate the companies' functional imprint in the minds of general public and stakeholders. CSR approaches, strategies and endeavors are in effect extensively adopted by a tremendous number of organizations all throughout their core activities and decisions.

Bharat Petroleum Corporation Ltd (BPCL), Fortune 500 organization, with an aggregate equity of US$ 5.1 billion, is a major entity in the oil division in the nation. It has processing plants at Mumbai, Kochi, Numaligarh and Bina. BPCL obtained authority over Kochi Refineries Limited (KR) by purchasing the state's stake in March 2001.As a result of the merger, the organization was renamed as BPCL-Kochi Refinery (Bharat Petroleum Corporation Ltd (BPCL)-Company History,2019). This processing plant is perceived as a standout amongst other refineries in India with worldwide degrees of greatness. Subsequently, this processing plant is one of the most appreciated, respected and profitable organization with Maharatna status setting a footprint for others to follow.

Need and Significance of the study

Since the enforcement of compulsory CSR spending in 2014, CSR expenditure by business concerns of India has expanded astoundingly. In 2018, organizations disbursed 47 percent higher when contrasted with the sum in 2014-15, contributing US$1 billion to CSR activities, as indicated by a review. Listed organizations in India spent more than INR 100 billion (US$1.4 billion) in different projects extending from education related projects, skill improvement, social government assistance, medical services, to nature protection, while the contribution to Prime Minister 's Fund alone witnessed an expansion of 139 percent in CSR commitment over the recent one year. Considering the recent alterations to CSR legislations, industrial studies and research gauges CSR adherence to rise and extend up to 98% by the year 2019-2020 (Shira, D ,2020). Bharat Petroleum Corporation Limited is a significant organization in India focused on society's welfare through its Corporate Social Responsibility activities the nation over. Being a leading company, BPCL perceive their duty considering the society and have been operating faithfully for the advancement of weaker sections of the society for quite a long time. Therefore, it is imperative to analyze the trend of CSR spending by this giant corporate based on which the current and maturing organizations in India can figure out the CSR spending by this top organization other than their future turnover and benefits and can in like manner plan their CSR procedures also.

Objective of the study

The intention of this paper is to look over the trend of CSR spending of BPCL towards CSR initiatives post the time of deliberate spending which is from financial year 2014-2020 (i.e. after the execution of CSR Act 2014) and depending on the outcomes, assess whether inclusion of such an amendment in the Companies Act 2013 was significant or not and also to identify the trend of CSR expenditure by BPCL in Kerala. Moreover, the study also intends to predict the CSR expenditure for the coming financial years 2021 and 2022.

Hypothesis

Based on the objective of the study the following hypothesis was formulated:
H_0: There is no significant linear trend on the amount spent in CSR activities by BPCL.

Methodology

In order to analyze the trend of CSR expenditure by BPCL-KR for the period 2014-20, secondary data has been used to assess the amount spent on CSR activities by BPCL in Kerala. The aggregate

figure invested by BPCL-KR from 2014 to 2020 (post the implementation of CSR Act) has been taken by clubbing the amount spent in each CSR activity to arrive at a consolidated figure. The secondary data has been retrieved from the BPCL'S CSR reports published in their website. This study is a time series analysis where time is taken as the Independent Variable and the amount spent in CSR activities each year is the Dependent Variable. ANOVA was used to test the formulated hypothesis and to analyze the results regression analysis was used.

Scope of the study

The study is aimed to predict the CSR amount that will be spent by BPCL in the future for the period 2021 to 2022. From this trend the future turnover of BPCL can be predicted by the company itself as well as by other companies. Besides it aids the company to forecast its future worth, control the cash flow accordingly and take informed as well as prompt business decisions. Added to this the competing firms can plan their moves against the company.

Results and Discussion

Now it is imperative to examine the model fit of the amount spent in CSR activities by BPCL for the period 2014-2020. Based on the data, F test was done, F -value is 29.68. P value is .0028 which is lower than the normally accepted level of significance (5%). Consequently, the null hypothesis is rejected which means, there is significant linear trend on the amount spent in CSR activities by BPCL. This implies the model is fit for prediction, based on which the r^2 (regression) value was examined and, in this study, it is 85.6%. This implies that, with the support of period, the amount spent for CSR activities by BPCL can be predicted as to the extent of 85.6%. The correlation value is 92.5%.

Table 1: Regression Analysis

	r^2	0.856	n	7	
	r	0.925	k	1	
	Std. Error	48030448.4	Dep. Var.	**Amount spent in Rupees (in Crores)**	
ANOVA table					
Source	*SS*	*df*	*MS*	*F*	*p-value*
Regression	68,47,15,74,70,39,94,900.	1	68,47,15,74,70,39,94,900.0	29.68	.0028*
Residual	11,53,46,19,90,41,23,700.0	5	2,30,69,23,98,08,24,740.0	Result

Based on the regression output the OLS equation is formulated as follows:

*Amount spent in CSR activities= -99,63,82,21,780.4286 + (period * 4,94,51,121.1429)*

Table 3: Predicted Values for amount spent in CSR in Rupees (in crores)

			95% Confidence Intervals	
t	**Amount spent in Rupees (in Crores)**	**Predicted**	**lower**	**upper**
2,014	1,11,25,000.0	-4,36,63,798.7	-12,77,91,832.1	4,04,64,234.6
2,015	1,40,84,000.0	57,87,322.4	-6,02,08,136.6	7,17,82,781.4
2,016	1,98,30,210.0	5,52,38,443.6	30,64,452.1	10,74,12,435.0
2,017	3,98,34,209.0	10,46,89,564.7	5,80,23,728.1	15,13,55,401.3
2,018	13,21,53,000.0	15,41,40,685.9	10,19,66,694.4	20,63,14,677.3
2,019	21,35,50,000.0	20,35,91,807.0	13,75,96,348.0	26,95,87,266.0
2,020	30,22,50,534.0	25,30,42,928.1	16,89,14,894.8	33,71,70,961.5
2,021		30,24,94,049.3	19,81,46,066.4	40,68,42,032.2
2,022		35,19,45,170.4	22,62,93,559.9	47,75,96,780.9

The above table explains about the consolidated amount spent by BPCL-KR each year based on which prediction for the years 2021 and 2022 is done. If the trend continues like this, the amount spent will be Rs.30,24,94,049.3 and in 2022 it will be Rs.35,19,45,170.4.

The above details are depicted in the chart below. The chart shows a rising linear trend from the year 2014 to 2020.

Chart 1

Chart 1: Trend of CSR expenditure

Conclusion

It can be culminated from the study that after the insertion of CSR legislation, the company in this study has shown a rising trend in the CSR expenditure till date and further it could be predicted that the company would continue to contribute immensely to the society's welfare .Overall the study supports other continuing and new companies to plan their firm's strategies to face cutthroat competition. Besides companies can decide on their CSR strategies as well. The Act indicates a tremendous progress in the CSR expenditure by the Indian companies which is threefold since 2014-15 according to many industrial researches. Therefore, it can be undoubtedly concluded that mandatory CSR legislation in India has accelerated the CSR expenditure of corporate sector. This indeed specifies India's willingness to add to the wellbeing of its stake groups specially the community in its proximity, which in a way brings about improved brand review among the stakeholders.

Abstract

During the last decades enormous efforts and development attempts have been made regarding the research and expansion of the Unmanned Aerial Vehicles due to their outstanding usefulness in a wide range of applications. Hexacopters have a stable flight behavior at high wind speeds and high load capacity. However, the most common problems arise when it leaves the nominal conditions (hover flight) or tries to perform aggressive maneuvers. The lack of horizontal force control makes it almost impossible to preside over the position independently from the vehicle's attitude, limiting the possible control solutions. This is the reason why Computational Fluid Dynamics (CFD) combined with structural analysis regarding propellers behavior during hovering can help the designer to gather valuable information which, combined with different flight regimes, may contribute to appropriate control solutions. This work is focused on a practical combination of Computer Aided Engineering techniques that enforce traditional design of hexacopters. The aerodynamics of an improved hexacopter model is employed to demonstrate the efficiency of the new design strategy in product development. A study comprising three scenarios with different horizontal wind speeds is presened and remarks regarding the modeling and simulation procedures are included. The novelty of the work consists in the innovative solution of CFD parameter extraction to emerge data for the control system, as well as for the verification of the stability and maneuverability of the hexacopter.

Keywords: hexacopter, high-speed wind, CFD, horizontal airflow.

Introduction

The hexacopter model presented in this paper has six rotors, each of them consisting of a brushless DC motor and a 2-blade fixed-pitch propeller. The propeller disk planes are all mounted within a plane which is parallel to the ground. In this case the changes in drone's attitude are accomplished by varying each of the rotors speeds, in order to create six different thrust forces, thus lift forces, and rotation torques around the rotation center axis, respectively. The hexacopter can perform hover flight, short vertical take-off and landing (SVTOL) as well as roll, pitch and yaw movements, respectively. From another perspective, the improved hexacopter model is an unstable dynamical six-degree of freedom system consisting of three-dimensional translation and rotational movements. The vertical translation motion is obtained by modifying all six rotor speeds simultaneously, thus altering the magnitude of the six vertical thrust forces. Therefore, the hexacopter has highly nonlinear multivariable dynamics, coupled and underactuated, since it has six degrees of freedom and only four actuators (throttle, roll, pitch and yaw), thus making it impossible to operate without a feedback controller action.

Cite this Article as: Mihai Alin STAMATE, Adrian Florin NICOLESCU and Cristina PUPĂZĂ "Hexacopter Model Development Using Advanced Simulation Procedures" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Design and development of heavy lift hexacopter for high payload has recently been analyzed to assure flight in stable attitude (Suprapto et. al, 2017). Assessment was focused on the frame displacement and stress analysis to assure the expected payload. Lei and Cheng (2019) recently reported CFD experimental and simulation investigation of a small dimension UAV model at light breeze wind influences. The study is comprehensive, but the geometry of the prototype, as well as the flow regimes proved to be below common UAV applications. The downwash flow fields at different hovering heights were simulated and analyzed by Zeng et al (2018) for plant protection. Even though the study is compelling, the accomplishments are very particular for the agricultural science and engineering. An interesting approach based on surface morphing technologies for aircraft blade structures was completed in an original Computer Aided approach (Rusu et al, 2018). Although numerous studies were undertaken on hexacopters from different perspectives, CFD analysis for this type of hexacopters was stated mainly by software development companies, in order to prove the solvers capabilities, because it is still considered a tough modeling and simulation problem, not been appropriate for common design purposes. The reduction of the computational model, tuning the size of the mesh with the computational resources and the choice of suitable computational models is considered difficult to be achieved. In the case of six rotors, the propellers rotating domains are so close to each other that the narrow space induces even more modeling issues.

The novelty of the research consists in the combination of the CFD approach with the structural evaluation to provide useful knowledge for the hexacopter developer in order to achieve stable hovering flight. The effect of the wind interference amongst rotors was also investigated. This work is structured as follows: after a brief introduction, aerodynamic issues related to Hex-rotor UAV are discussed with respect to Computer Aided Engineering (CAE) procedures. Then the model preparation and remarks about the computational strategy are introduced in detail in the next section. Numerical simulation scenarios with two different horizontal airflow inlets and results discussion are included in the fourth section and concluding remarks, as well as future development of the work are described in the last section.

The structure of a hexacopter UAV

A hexacopter UAV is a Short Vertical Take-off and Landing (SVTOL) multirotor device, equipped with six rotors, each one consisting of a brushless DC motor and a two-blade fixed-pitch propeller, mounted on top of the motor. Fig. 1 illustrates the improved hexacopter, developed and employed within this approach. All rotors are located on a plane which is parallel to the ground surface. They are arranged in a circle around the main body axis of the aircraft, spaced at 120 degrees apart, with legs attached to the body to allow a safe and steady landing.

Fig. 1: Hexacopter developed and used in CFD study

Compared to a quadcopter, which is one of the most common used types of multirotor drone due to its characteristics: fast, highly maneuverable, relatively cheap and easy to build - the hexacopter brings several important advantages:

- first, two additional motors mean 30% additional power, which results in an increased lift force and thrust force respectively, thus offering the possibility of carrying much heavier payloads. Also, the increased thrust force makes the hexacopter reach faster speeds than the quadcopter. The two extra rotors also allow the hexacopter to fly at higher altitudes;
- due to its 6-rotor system, it provides a more stable flight and can be reliably controlled even at high wind speeds;
- the most important and critical feature of a hexacopter is its robustness and therefore a lower chance of crashing. The 6-rotor system not only provides a more stable flight and more powerful, but it also is an important safety feature. Thus, in case of a motor or propeller failure, a hexacopter can still be controlled and maintained in flight along the path, with the remaining 5 rotors. The flight controller can use the remaining five rotors to balance each other out and preserve a stable flight long enough until the operator can land the drone safely.

Hexacopter Design Approach

The proposed approach consists of three main stages: a geometry modeling and defeaturing step followed by the CFD computation in order to calculate the thrust force on each propeller and to evaluate the displacements on the mechanical structure of the hexacopter. The last stage is a novel fluid-structure interaction strategy to evaluate the effect of the air turbulences on the hovering of the hexacopter.

The improved UAV model was designed in SolidWorks, defeatured and imported in the preprocessing system - CAD & Geometry defeaturing stage (Fig.2). The rotors are arranged within a radius of 350 mm as illustrated in the detail. Then the propellers faces were mapped and the topology was edited and checked for mesh reliability. The flow domains were built with respect to the mesh motion approach that express the rotation of the air around each propeller, where a particularly fine mesh was generated - CFD Simulation step. Inflation layers were built around propeller faces and the size of the elements was decreased to avoid continuity issues during computation. Due to the relative proximity of the six rotors and the rotating meshes, contact regions overlapping were carefully avoided. The last stage consists in a Structural dynamics simulation that enables the designer to emphasize the effect of the flow turbulences on the mechanical structure and to retrieve suitable data for the stability and maneuverability of the hexacopter.

Fig. 2: Novel design approach for the improved hexacopter development

Simulation scenarios and results discussion

The previously described CAE project was completed for three simulation scenarios with respect to the wind speed on the horizontal direction: no wind, wind speed of 4 m/s and 10 m/s respectively. The angular velocity of the rotors had the maximum value of 6500 rpm. The velocities contour in the central vertical plane for wind velocities of 0 and 10 m/s correspondingly are illustrated in Fig. 3. Wind influence on the turbulent flow of the propellers that appear in this plane section can be observed and the dissipation of the central turbulence is noticeable. The turbulences are diverted by the side wind.

a. v=0 m/s, Z=0; rotors 4 and 1

b. v=10 m/s, Z=0; rotors 4 and 1

c. v=10 m/s, Z=-0.349m; rotors 5 and 6

d. v=10 m/s, Z=0.349m; rotors 3 and 2

Fig. 3: Pressure distribution in the rotors vertical plane

The response thrust force values of the six blades were between 0 and 9 N in absolute values as reccomended. The lift forces were exported to a dynamic analysis and the spatial orientation of the hexacopter structure according to air pressure caused by the interfered turbulences, rotational velocity of the six rotors and the acceleration of the hexacopter was evaluated. Finally, a static analysis was performed and the maximum displacement of the rotors at different simulation times was processed. Fig. 4 illustrates the deformed structure of the hexacopter superposed with the undeformed one, in the YZ plane. The directional deformation at 0.25s proves a low maximum value of 0.5 mm and assures the hovering stability.

Fig. 4: Directional deformation of the mechanical structure after 0.25 s hovering

Conclusion

CFD simulation is essential for the aerodynamic stability, assurance of low power consumption, a stable flight behavior at high wind speeds, as well as a high payload capacity and drone autonomy, which are mandatory requirements when launching a new powerful hexacopter in order to meet the customer's requirements. The work presents a novel approach for modeling and simulation of an increased performance UAV system, considering the maximum rotational velocity of the rotors and the influence of two high wind scenarios acting in the horizontal plane. The pressure distribution and the thrust forces were exported in a structural analysis of the propellers to emphasize the influence of the CFD response parameters on the stability and maneuverability of the hexacopter. Future work will extend the aerodynamic flow conditions to different wind regimes and action angles. A wide-ranging research on flow regime optimization is now in progress. The forward flight speed of the hexacopter should also be considered in a realistic simulation approach and the rotational velocity of the propellers will be tuned with experimental data.

Abstract

The relevance of this research is because the introduction of innovative customs technologies allows you to speed up and simplify customs operations, increase the efficiency of customs control and ensure the formation of a new «artificial intelligence», quickly reconfigurable, «smart» electronic customs. The article deals with the customs technology of remote release of goods used by the customs authorities of the Russian Federation. In this paper, the authors identified the main problems of using customs technology for remote release of goods by customs authorities and gave recommendations for its improvement.

Keywords: Customs Technology for Remote Release of Goods, Electronic Customs, Electronic Declaration Centers, Customs Control.

Introduction

The world of information technology is transforming all spheres of society, influencing on characteristics of the implementation of state functions and ways of exercising state power.

One of the strategic directions for the development of the customs service of the Russian Federation is to improve customs regulation. Now, this is not possible without the introduction of customs information technologies.

The purpose of introducing customs information technologies is to speed up and simplify customs operations, improve the efficiency of customs control, and reduce the time and financial costs associated with foreign economic activity.

BORISOVA "Problems and Ways to Improve the Technology of Remote Release of Goods" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

One of the most promising and actively used customs information technologies is the technology of remote release of goods, aimed at optimizing the actions of customs authorities to speed up customs operations without losing the quality of customs control.

At the moment, the Russian Federation is undergoing a restructuring of customs authorities – customs authorities are being formed that specialize in electronic Declaration of goods, using the technology of remote release of goods, such as electronic Declaration centers, on the basis of which electronic customs are being formed. The technology of remote release of goods is one of the resources to the formation and improvement of e-customs, so the analysis practices, identifying problems of application of this technology is necessary for maximum automation and simplification of customs processes – hence the relevance of the chosen topic.

The purpose of the study is to develop proposals for solving the problems of using the technology of remote release of goods by electronic Declaration centers by the customs authorities of the Russian Federation.

Problems arising from the application of technology of remote release of goods

In order to create favorable conditions for foreign economic activity and increase the competitiveness of the economy, customs authorities are taking measures to improve customs administration and introduce new promising technologies, such as: electronic Declaration technology, remote release of goods, automatic Declaration technology for goods, automatic release of goods, electronic Declaration technology for customs transit procedures, pre-notification technology, etc.

Remote release technology is based on the use of remote release in electronic Declaration centers. They are essentially a specialized customs body whose competence is limited exclusively to performing customs operations in respect of goods declared in electronic form, including using the Internet. The work of e-customs centers is based on the use of remote release-customs Declaration technology, in which the Declaration of goods is submitted to the internal customs authority and the actual control is carried out at the border customs. With the help of remote release technology, participants in foreign economic activity can submit a Declaration for goods in electronic form to the electronic Declaration center, and in this case the cargo, that is actually located at the border can be released into free circulation.

Due to the increase in the concentration of the Declaration array in the centers of electronic Declaration and the active spread of the use of remote release technology, a number of problems arise when using this technology, namely:

– problems of the process of remote product release technology;
– problems of interaction of electronic Declaration centers with external customs authorities and functional departments.

More than 8 years have passed since the introduction of remote release technology, customs infrastructure and new customs information technologies have been actively implemented, but the legislative framework has not changed since its adoption-which leads to the irrelevance and inconsistency of the regulatory process with the actively changing reality.

Thus, the problem of the process of remote release of goods technology is related to the non-relevance and lack of information of reconciliation by an external customs authority.

The report on reconciliation results requires the division of information by product, but the information in the transit Declaration about the product batch can be presented with generalized and mixed information: the name of the product batch, product code, total gross weight, total cost. Thus, when comparing information about a multi-item batch, the report is not informative and the comparison time may take a long time, almost not fitting into the specified time – which also affects the quality of the reconciliation.

In identifying obvious non-compliances, details of the transit Declaration and the goods Declaration at customs on the possibility of issuing instructions to customs inspection (customs inspection) that would have a positive impact on the quality of verification.
If automatic registration of the goods Declaration and the automatic release of goods manually verification of the data external customs authority produces, and verify the completion of the customs procedure of customs transit is not provided, that is, the release of goods may be effected before the completion of the customs procedure of customs transit, and therefore, when applying for the temporary storage of the notification on release of goods which entails the issuance of goods from the warehouse of temporary storage without completing the customs procedure of customs transit.

Thus, the reconciliation process is a problematic issue and requires attention, review of relevance and new regulations for its implementation.

The problems of the remote release technology process also include software flaws in the form of duplicates of the goods Declaration. Duplicates of the goods Declaration appear when the declarant submits several goods declarations for the same consignment, which leads to double work of customs authorities and even double automatic release of goods.

The technology of remote release of goods implies active cooperation and interaction of external customs authorities, internal customs authorities with functional departments of customs authorities both in the framework of customs operations, and in conducting customs control before and after the release of goods.

If the technology of remote release of goods has been used for more than 8 years, the interaction system is still not fully debugged and is accompanied by a number of problematic issues.

There are difficulties in interacting with external customs authorities located in a different time zone. On the territory of Russia there are 11 time zones, if the region of the internal customs marked the whole of Russia, respectively for 8-and 12-hour work shift period of time of active interaction of the short – term of customs Declaration and release of goods increased, accordingly, there are temporary workers costs like customs authorities and business.

Despite the active development and promotion of electronic document management in the customs authorities, electronic Declaration centers still maintain paper document management with functional customs departments within the framework of customs control forms and measures.

One of the shortcomings of the bundles functionality is that the external customs authority does not have the ability to notify the internal customs authority about the extension of the deadline for completing the customs procedure of customs transit in connection with the actual control in accordance with measures to minimize the risk profile. The deadline for comparing information is 3 hours, and the extension of the completion of the customs procedure of customs transit is possible up to 10 working days, which leads to violation of many deadlines (the deadline for reconciliation, registration of an electronic Declaration for goods, etc.).

Thus, at the moment, when using the technology of remote release of goods, there are a number of problematic issues that can be grouped as shortcomings of the technological process and shortcomings in the interaction of customs authorities when using this technology and conducting customs control. The solution of the identified problems is necessary for further improvement of the technology of remote release of goods.

Recommendations for solving the identified problems of using remote product release technology

The first group of problems includes the shortcomings of the technological process of remote release of goods.

To solve the problem of reconciliation and generate a report on its results, the following is proposed:

– unification of information required for reconciliation in accordance with the structure of the goods Declaration and transit Declaration;
– development of a new report form on reconciliation results, taking into account the opinion of an expert group of external customs officials on this issue;
– review of the relevance of «manual» reconciliation and consideration of the possibility of implementing an algorithm for automatic reconciliation of the Declaration of goods and transit Declaration, other information and documents-use of the reconciliation algorithm used for automatic registration of the Declaration of goods and automatic release of goods.

In order to prevent the delivery of goods from temporary storage without completing the customs procedure of customs transit, when applying automatic registration of the Declaration for goods and automatic release of goods, several measures must be taken, for example, changes in legislation – the regulation of the use of technology of remote release only after the completion of the customs procedure of customs transit, as well as the introduction of a software tool validates the completion of the customs procedure of customs transit in the form of auto completion message transit.

As part of the functioning of the software used by declarants, it is necessary to consider a measure to identify duplicates, for example:

– software of the customs authority-automatic comparison of several columns of the array of the Declaration for goods from this declarant and notification of the customs inspector about finding identical declarations;
– declarant's software-when creating an identical Declaration for goods – notification of possible submission of a duplicate Declaration.

In addition, when eliminating the possibility of submitting duplicate declarations, one of the problems identified in the interaction of external and internal customs authorities when using remote release of goods technology is solved: the presence of several requests for placing goods in a temporary storage warehouse.

To minimize time costs and improve interaction between customs authorities in different time zones, it is proposed to transfer internal customs authorities to 24-hour work, which will increase the speed of customs operations and reduce the burden on customs inspectors in the morning.

For the development of electronic document management and full transition to it, it is necessary to create new systems:

– providing access to functional departments to electronic versions of the goods Declaration with a set of documents;
– creation and development of platforms using the blockchain system for obtaining documents and information of participants in foreign economic activity for customs purposes.

In General, the solution of the identified problems is necessary for the most convenient and efficient work of customs authorities, as well as for expanding the potential of remote release of goods technology as the main base for accepting the entire Declaration array.

Improving the technology of remote release of goods

One of the ways to improve the technology of remote release of goods can be the use of foreign experience. As noted earlier, the technology of remote release of goods is a complex technology that operates with the help of many resources.

Since the technology of remote release of goods is the basis of the new customs system-electronic customs, this technology must contain digital, electronic resources. When considering the foreign

experience of using electronic Declaration technologies, the most interesting information is about the use of the Internet platform «NTP» by the Singapore customs service since 2018.
The government of Singapore for foreign trade participants, including those from abroad, created this platform. The essence of this Internet resource and its difference from the «single window» was briefly described by the Minister of Finance of Singapore Heng Swii kit: «NTP is a transformational platform that will take us from the traditional national single window, which gives trading companies a universal interface for all regulated transactions related to trade, to a universal interface that will allow it to interact with all business partners, stakeholders and regulators». To organize the interaction of all participants on this Internet resource, the blockchain system is used.

The blockchain is a digital storage of data-documents that are digital records combined in a «chain» of cryptographically and chronologically related «blocks».

Using complex mathematical algorithms, the «block» is linked to the previous one, meaning that new «blocks» are added only at the very end of the «chain». Next, computers on the same network perform encryption, and after receiving the same result, a unique digital signature is assigned to the «block». After updating the registry and creating a new «block», the data cannot be changed, that is, it is impossible to fake it. If you try to change the original documents, they will get a new digital signature, which will indicate a discrepancy in the system.

In other words, the blockchain will allow both external customs authorities and internal customs authorities to conduct customs control without requesting information and documents from participants in foreign economic activity, which minimizes the possibility of submitting forged documents, which, for example, is very important in verifying the certificate of origin of goods. Using this system when using remote product release technology will allow you to:

- be sure of the authenticity of the submitted documents (permits, transport, transaction, etc.);
- establish communication between all participants of foreign economic activity and their business partners;
- full transition to paperless operation;
- prevention of financial crimes;
- quickly get the necessary information and documents.

Thus, the creation of a new blockchain platform for interaction between participants in foreign economic activity and their business partners, following the example of the government and the customs service of Singapore, will help to improve the technology of remote release of goods and solve problems such as paper document circulation and document forgery.

The new system can also be integrated into the actively used «personal account of a foreign trade participant».

In order to extend the use of remote goods release technology in the customs territory of the Eurasian economic Union, attention should be paid to the experience of the European Union member States in the General legal regulation of centralized clearance and work on the harmonization of electronic Declaration systems for interaction between customs services.

Conclusion

The study identified the main problems associated with remote release technology.

We have developed possible recommendations for improving the remote product release technology:

- development of a new report form on reconciliation results and an algorithm for automatic reconciliation of information;

– changing the legal framework for applying the technology of remote release of goods only after the completion of the customs procedure of customs transit – implementation of the algorithm for checking the fact of completion of transit in software;

– automation of the process of finding duplicates of the goods Declaration;

– carrying out analytical work to identify the necessary «links» for the interaction of the external customs authority, the internal customs authority and the functional departments of customs;

– transfer of internal customs authorities to a 24-hour working day;

– providing functional departments with access to electronic product declarations and electronic documents and information;

– development of an Internet platform based on the blockchain system for interaction of all interested and involved persons in foreign economic activity and for fast and effective customs control when using remote release of goods technology.

Abstract

At present, almost all state, professional and personal information of a person is displayed and stored in digital format. It has been shown that the loss or disclosure of this information can lead to serious reputational or financial losses. Attention is paid to the issues of the influence of a new phenomenon in society - a passive and active digital footprint of a person on his safety. The article shows that training in information security is not limited to the traditional study of technical and organizational aspects of the issue. It is proved that when teaching this subject in higher education, it is necessary to attract the vitagenic experience of students, which contributes to the awareness of the need to comply with information security rules. The paper presents the pedagogical approaches and methods used by the authors, teachers of higher educational institutions, to achieve this goal. Shown are specific examples of practical training with students based on vitagenic learning and using the described technologies.
Authors are winners of the grant competition of the Vladimir Potanin Scholarship Program 2018/2019. This work is supported by the Vladimir Potanin Foundation, project ID GK190001792.

Keywords*:* Vitagenic Learning, Information Competence, Bachelors.

Introduction. Information security training features

Currently, all household, social and professional activities of people are subject to digital transformation. According to statistics, the number of users of the portal of Public Services is already more than 75% of the population of Russia and continues to grow (Audience and statistics of the portal of public services, 2020). More than 2/3 of the country's population entrusted all their personal data to the electronic system. Other portals: banking systems, numerous personal accounts in online stores, educational, entertainment sites and others, in total, may have even greater coverage.

As you know, to ensure security and confidentiality, software and hardware systems are used, which are based on mathematical algorithms that have the highest degree of resistance to hacking. But not a single algorithm can resist the human factor, which is expressed in illiterate actions or, on the contrary, inaction, when implementing the procedure for entering and working with electronic resources, using standard

Cite this Article as: Larisa Yu. OVSYANITSKAYA and Yulia V. LYSENKO "On the Experience of Using Vitagenic Learning in Teaching Information Security in Higher Education" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

passwords of the same type, refusing to install antivirus software, noncompliance with organizational and legal norms during work with electronic signature keys.

Compromise of personal data can now threaten not only temporary and reputational, but also financial losses.

These actions are caused by three reasons: lack of knowledge about the consequences of their actions, careless and irresponsible approach to the situation, ignoring danger, acting according to a single template and naivety and excessive trustfulness and frankness with virtual interlocutors.

The next factor, which was not very important a few years ago, but is gaining special importance now, is the digital footprint. The term has synonyms: (digital fingerprint, digital shadow, cyber shadow). A digital footprint is information about a user that remains on the Internet after browsing sites (Shamsutdinova, 2020; Buchanan, 2016). The trail will be passive if the user only views the pages, and

[2] Authors are winners of the grant competition of the Vladimir Potanin Scholarship Program 2018/2019. This work was supported by the Vladimir Potanin Foundation, project ID GK190001792

active if he leaves comments, conducts correspondence, leaves "likes". Taken together, the analysis of a person's Internet activity creates his virtual image, which is actively used by Internet marketers. The term appeared: doxing (search for open and confidential information about a person without his knowledge).

On the one hand, receiving targeted advertising in reasonable amounts is beneficial to users and commercial organizations, leads to an improvement in the quality of customer service, on the other hand, the situation is much deeper and more serious.

The interaction of social and technical sciences promotes the research and development of automated methods for extracting and analyzing digital footprints to predict a person's personality traits. These forecasts can be used for a variety of purposes, including tailoring online services to improve user experience (Azucar, Marengo and Settanni, 2018).

The user's virtual image can be represented by a kind of system of filters (Shamsutdinova, 2020), which track, analyze and rank goods, places, friends according to the degree of importance for the user. An informational "microclimate" is gradually created around a person. His personal virtual space on social networks is likely to include the products and services recommended to him, friends who share his opinion and interests. A large number of such friends can gradually influence a person's worldview and motives, contributing to the purchase of goods or services (Sjöberg M. et al, 2016).

According to research (Boudlaie, Nargesian and Keshavarz, 2019), employers are increasingly recognizing that information available on social networking sites influences recruitment decisions, including recruitment, training, promotions and firing (Brown and Vaughn, 2011). Moreover, 70% of recruiting managers surveyed rejected candidates due to their unreliable online reputation (McGrath, 2012).

In our opinion, information security issues receive very little attention in the process of secondary, higher and additional professional training.

Let us analyze how the basics of information security are taught in higher education. A special subject is provided only for areas of training related to computer networks or programming. In other areas of training, the basics of information security are considered one topic in the subjects "Informatics" or "Information technology in professional activities", which is given several academic hours.

The technology and pedagogical approaches to teaching are most often standard: lecture and practical tasks, familiarization with the theoretical aspects of the issue, problem solving.

However, such traditional methods are absolutely inadequate to realizing the vital importance of the issue. After listening to the lecture and solving the problem, the student may be aware of the existing regulations, organizational and legal norms and technical measures, but he will not realize the rigor of their implementation, because he does not understand that the risks that the teacher is talking about are not virtual, but directly concern him, his friends and relatives. He will not waste his personal time and money on information security.

Therefore, we have developed a technology for teaching information security students based on their vitagenic experience.

The Vitagenic Experience of Man. Literature review

Any student has a domestic, social or professional life experience that should be used as a useful and important source of learning.

In the late 90s. last century A.S. Belkin proposed a vitagenic approach to learning (Belkin, 1999). This approach is based on the actualization or demand of a person's life experience, his intellectual, psychological, moral potential.

A.S. Belkin shared the experience of life and life (vitagenic) experience. Life experience can be understood as all the information received by a person during his conscious life. It can be everyday information, facts heard or read in the media or heard from friends or acquaintances, and are not of sufficient value for him. Under life or vitagenic experience, one can represent information that is already the property of the individual, is stored in long-term memory, and is in a state of readiness for use. It is important and relevant to a person.

At the same time, the transition of life experience into life or vitagenous experience is carried out only when it turned out that life experience has social or value significance, it is necessary to solve a problem that has arisen, or allows you to predict and design the future by analyzing your own mistakes or achievements (Belkin and Verbitskaya, 2007.

Analyzing our own pedagogical experience (Ovsyanitskaya, 2015), works (Belkin and Svinina, 2007; Krivenko, 2009; Bicheva and, Kitov, 2015), we understand that it is the vitagenic approach to teaching information security to students of higher education that will allow developing a technology for conducting classes in such in such a way that all studied topics:

- considered and discussed from the point of view of the personal safety of the student, his relatives or friends;
- could confirm the social significance of a particular issue and the scale of the problem raised not declaratively, but based on the results of a scientific experiment that was initiated and conducted by the student;
- based on situations that occurred in real life of students, their friends or relatives;
- demanded the involvement of life (vitagenic) experience in solving this problem. At the same time, a student's vitagenic experience can be not only successful, but also negative. It is this attraction of negative vitagenic experience that is reflected in the proverb ‘learn from mistakes’.

Approaches in adult education based on vitagenic experience is considered as an andragogic theory of vitagenic education (Khodjaev, 2019; Isyanov, 2020), which has the following characteristic features: actualization and use as a source of the entire spectrum of personal and universal human experience in everyday, life, vitagenic components; awareness of education as a process of using and transforming vitagenic experience into a new quality; awareness of the intrinsic value of an adult's vitagenic experience as the basis for his future continuous self-education, development as a professional and personality (Cox and Gunderman, 2017; González and Montoya, 2019; Tomos and Clark, 2018).

Below we present an adaptation of A.S. Belkin and N.O. Verbitskaya to create a methodology for the formation of students' competence in the field of information security, that is, to contribute to the formation not only of the technical aspects of the issue of compliance with the rules and regulations and the competent use of software and hardware tools, but a conscious, valuable, analytical attitude to this issue.

Pedagogical methods and technologies required to implement the vitagenic approach for teaching information security students

To solve the set task, we analyzed the pedagogical approaches, methods and principles on the basis of which the developed teaching technology will be. We have chosen the following approaches and methods.

Holographic (multidimensional) approach.

As you know, a holographic image is an image that allows a person to observe an object from different angles, from different sides. The principle of a physical phenomenon formed the basis of a holographic or, it is also called, a multidimensional approach to education.

In the work (Belkin, 2000), the author argues that in order for a person to master understanding, and not to have a list of knowledge, he needs a holographic portrait of the phenomenon, and this is possible only if there are different interpretations of the question. The holographic or multidimensional approach involves the use of various technologies, methods, techniques, forms and means that allow one to represent the studied object in all its dimensions and manifestations, from a different angle of view (Belkin and Vozzhenikova, 2004).

An example of the application of the holographic approach.

Topic of the lesson: ‘Spam’.

Spam is the mass mailing of advertising correspondence, mainly emails or messages, to people who have not expressed a desire to receive it. Most often, spam contains advertisements for products or services.

Some people do not pay attention to spam, to others it seems to be: an annoying factor, an action that carries a danger through possible malicious inclusions, a phenomenon that takes away expensive employees' time, the work of fraudsters. However, there are also those who receive money from spam: advertisers, advertising agencies, spam providers and senders. Some recipients find useful information in spam because spam becomes targeted. The legal interpretation of this phenomenon is also quite complex.

Such a different view of one phenomenon requires consideration of it from the point of view of all participants in the process, from customers of spam to executors and recipients.

During the lesson, a holographic approach is used, which allows you to evaluate one phenomenon from different positions and develop your own judgment. During the business game, students imagine themselves in different roles, study this controversial phenomenon from different angles.

The result of the lesson is the understanding that:

- behind every case of malware or spam, there is a financially interested person who finances the project. Creating viruses and sending spam is not an annoying factor, but a well-organized business;
- understanding the need to install modern licensed software to protect against malware;
- skills and abilities to perform elementary actions that prevent viruses from entering the computer.

Topic of the lesson: ‘Information protection by transforming it. The main directions of using cryptographic methods’.

In the classroom, we simulate the process of electronic document flow: students create electronic encryption keys, exchange self-encrypted and / or signed e-mail messages, work out patterns of behavior of bona fide participants in the document flow, imitate the actions of intruders trying to replace the text or authorship of a document and using social engineering methods to access passwords. Learn about common social engineering techniques.

Familiarization with the psychological aspects and basic patterns of social engineering - methods and techniques of deceiving people, leading to the fact that they themselves provide passwords or other information that helps attackers to breach the security of the system, as well as considering objects of study from different, opposite sides allows:

- to realize the almost absolute reliability of algorithms and procedures for electronic document management for the protection of transmitted information, but, at the same time, the possibility of compromising information if users violate elementary rules.
- to form a competent attitude to the generation, use, storage and destruction of electronic signature keys, excluding human factor interference in information security algorithms.

Heuristic learning (Greek Heurisko - looking for, finding, opening).

The purpose of heuristic teaching is the student's search and awareness of his own meaning, goals and content of phenomena and processes, the constant discovery of new, often unexpected, aspects and aspects of the studied subject.

An example of using heuristic learning.

Topic of the lesson: ‘Rules for choosing passwords. Calculation of entropy and password bit space’.

In the lesson, we first calculate the entropy and bit space of passwords and substantiate, on the basis of the data obtained, the required number and variants of symbols for various information systems, and conduct brainstorming sessions that allow us to create our own mnemonic rules for the ability to remember a password that is cryptographically resistant to attempts to crack a password.

Result:

- the formed skill of recognizing the attack of malefactors aimed at users of the information system in order to master the information about passwords.
- the ability to calculate the required number and variants of the symbols used in the generated password, depending on the purpose of the information system.

3. The principle of interactivity and facilitation. These principles are based on the interaction between the participants in the educational process, the teacher and students, students among themselves using modern means of communication. When facilitating learning, the teacher takes a position not "above", but "together" with the trainees, he forms the ability to draw conclusions, find new facets of problems in the situation under consideration (Tatarenkova and Kibets, 2015).

The purpose of using this principle is to create a comfortable learning environment that helps students feel their success and intellectual consistency. The learning process involves discussions and dialogues leading to the joint solution of personally significant problems for each student.

Topic of the lesson: “Identification, authentication, authorization of users. Mutable attacks and mutable defense. "

In the lesson, specific examples are analyzed, ranging from fabulous ("Sesame, open up", to modern ones - the information system of the university, ATM, Internet store, bank information system, and the identification of the identifier, authenticator, owner, authentication mechanism, access control mechanism. make and substantiate proposals on the required and sufficient number and types of authenticators in each case (password, smart card, e-token, biometric data).

The result of the lesson is knowledge about modern threats and the skill of recognizing malicious attacks aimed at users of the information system.

4. Participant observation is a research method that allows you to conduct research in everyday life circumstances and study the problem "from the inside", to find out the reasons for the internal motivation of people who have performed certain correct or erroneous operations with information through their activities.

Starting from the first lesson, we initiate students' own scientific research related to information security. The beginning of the research is the interviews conducted by them with relatives, acquaintances, friends about various aspects of information security, about the observance of security measures at the enterprises in which they work. Seeing a real, not a hypothetical theoretical situation, and having received information not from virtual, but real respondents, students:

- see the real and current situation in the field of information security;
- are convinced of the truth or falsity of their assumptions;
- can make scientifically and practically based proposals to reduce the risk of threats of various kinds;
- analyze existing threats from your own home computer, perform operations to minimize risks.

The result of the lesson is the awareness of the possibility of obtaining real damage if the simplest rules of information security are not followed. Students offer specific ways to counter the identified threats and form recommendations for the leaders of the hypothetical considered organizations that will maximize the reduction of information security threats. For example, the rules for delimiting user access to the resources of the information system, conducting periodic training of personnel, organizing security and access to the system, organizing accounting, storing, using and destroying documents and media, organizing explicit and hidden control over the work of users, creating physical obstacles to ways of penetration of violators, etc.

5. Authentic assessment - assessment of the formation of students' abilities and skills to protect information by placing them in a situation as close as possible to real everyday or professional life.Topic of the lesson: “Identification, authentication, authorization of users. Features of processing, storage and transfer of personal data ”.

After studying theoretical material, students imitate the roles of the operator and owner of personal data. Scenarios of actions in the case of personal and remote communication of participants, the use of well-known information systems with the storage of information about personal data in the "cloud" located in Russia and abroad are being worked out. Existing threats from your own smartphone or home computer are analyzed, measures are developed to minimize risks.

Result: awareness of the possibility of real damage if the simplest rules of information security are not followed. Ability and skills to minimize risks on a smartphone and home computer. Understanding that the home computer also contains information, discrediting which can lead to financial and temporary losses.

Students who are interested in this topic continue to study it in more depth. The topic becomes the basis for future articles for the conference.

Results

The use of vitagenic training, based on the analysis of the many years of experience of the authors of teaching information security in universities, made it possible to achieve:

- to consider all the studied topics and tasks from the point of view of the student's personal safety, relying not only on theoretical knowledge, but to a greater extent on the students' experience. The result is a deep understanding and realization that the slightest violation of the simplest rules of information security can lead to real financial or reputational damage;
- the teacher to observe from the sidelines the course of the discussion, thoughts and intervene at the moment when it is necessary to transfer the discussion to a new channel or, on the contrary, having heard an interesting proposal, not to let it get lost, but to develop the conversation in this direction;
- teach students to identify and eliminate obvious internal and external causes of various types of threats and eliminate the causes of their occurrence, as well as to acquire the skill of recognizing an attack by malefactors aimed at users of information systems in order to master information about passwords;
- to make it clear that behind every case of malware or spam there is a financially stakeholder who finances this project.

Abstract

The aims of this paper are to analysis potential of honey plants for an intensive beekeeping. This research on biological diversity has shown that pollination is a primary service within the ecosystem that is threatened worldwide. By harnessing the potential of honey plants, in this way, more productive intensive beekeeping systems can be developed that offer the benefit of sustainable ecosystems. The place of honey bees in terms of pollination of agricultural crops should be left to the wild bees that can be introduced through specific measures within agro-ecosystems and can do the pollination of agricultural crops much better than honey bees.

Keywords*:* intensive beekeeping, honey plants

INTRODUCTION

Honey production and honey consumption in the member countries of the European Union (EU) are indicators based on which the EU is considered the second largest producer of bee products in the world and a major player in the bee products market. According to EUROSTAT data, EU honey bee production was around 250 000 tonnes in 2018, accounting for 13.3% of world production. The European production of honey bees, according to statistics, covers only 60% of the annual needs of European consumers. The consumption of honey at European level, according to EUROSTAT, represents about 20-25% of the world consumption of honey, representing an average consumption of 0.70 kilograms per person per year. The EU is thus one of the largest importers of bee honey, with annual honey bee imports ranging from 120 000 to 150 000 tonnes. The main suppliers of honey bees are China, with 63 900 tonnes (43% of total EU imports), Argentina, with 22 300 tonnes, Mexico, with 21200 tonnes, and Ukraine, with 8 900 tonnes of honey. At the same time, the lower price of bee products from China is a determining factor leading to a decrease in honey bee exports from EU Member States.

Amid the shrinking populations of wild bees, modern agriculture has become almost dependent, we could say, on honey bees to meet the needs of pollination services. There are over 20,000 species of bees worldwide, and 750 of them are found in Central Europe. Some of the wild bee species are considered general pollinators because they can pollinate a diverse range of flowers, while others are described as specialized and dependent on certain plant species in terms of their survival, as noted by (Lowenstein et. al, 2015). That said, not all bees prefer the same plant species. Nature specializes in diversity, so that certain species of plants must be compatible with the species of bees that perform pollination. The efficiency of pollination activity is particularly important for the optimal yields that can be obtained in agricultural crops. Thus, for the production of strawberries, a combination of wild bees and honey bees is recommended to obtain quality fruits. Analyzing the state of research regarding the pollination crisis, it becomes clear that the diversity of wild bee species is considered essential for the sustainable production of agricultural crops. Honey bees have long been considered the most important in crop pollination, but there is a growing body of scientific evidence that indicates that wild honey bees contribute substantially to agricultural crop pollination services, much more than previously thought (Lowenstein et. al, 2014). Thus, in a reference study on the problem of pollination that analyzed different production systems in plant cultivation, it was found that even though honey bees deposit a large amount of pollen, they make it quite inefficient (Koh et. al, 2016). Wild pollinators, represented mainly by wild bees, have had remarkable results in pollination efficiency in agricultural crops and have also been able to increase fruit production at least twice as compared to honey bees. Moreover, flowers pollinated by wild pollinators have also produced results in terms of fruit production. Thus, we can say that honey bees that are generally considered as a substitute for wild pollinators, not only do not maximize pollination results but also fail to fully replace the contributions of wild insect pollinators in terms of pollination for the whole range. of agricultural crops and on all types of agricultural land. Research presented by Groff et. al (2016) confirmed that these pollinator communities represented by wild bees offer the best pollination services, better adapted to agricultural crops and wild plants than honey bees. Moreover, research has shown that the yields of pollinated agricultural crops are more unstable when in that region we have a pollinating community that consists of fewer species. Thus, in order to increase the yields of agricultural crops through successful pollination, different populations of wild bee species are therefore essential. The activity of pollination of agricultural crops by bees generates a significant increase in crop yields.

Impact of Cultivation Method

The bees need access to a semi-natural habitat for survival, to ensure nesting sites and also to provide them with pollen feed and nectar from wild flowers. Thus, natural and semi-natural habitats are needed to support bees. The presence of high quality natural and semi-natural habitats on farms and in agricultural landscapes such as: strips of honey plants interspersed in agricultural crops, wooded areas, living hedges and the edges of grassy fields are essential for the survival of wild bees.

The mint crops of the species Lophantus Anisatus, offer the advantage of a perennial crop with a vegetation period of 9 months per year of which 6 months is flowering. Scientific studies have shown that the areas in which the share of semi-natural habitat in farms and in the agricultural landscape has increased have favored increasing diversity and populations of wild bees. In contrast to semi-natural habitats, industrially managed intensive agricultural fields, which are typically cultivated with large-scale monocultures, which offer only a small semi-natural habitat, have the lowest biodiversity and the smallest populations of wild bees.

The landscapes of industrial intensive agriculture do not support the populations of wild bees and also the pollination services they offer. Organic farming has shown that agriculture without synthetic chemical pesticides and biological pest control is viable. Organic farming does not use synthetic chemical pesticides and measures are being used to increase the biological control of pests. These measures include encouraging natural enemies, such as birds, certain cockroaches, spiders and parasitoids, which are means of biocontrol of pests in agricultural crops. Some scientific studies have shown that natural enemies can suppress harmful insects from crops, thus providing a biological means of controlling natural pests. Scientific research has also shown that the diversity and abundance of natural enemies are enhanced in organic farms (Barratt et. al, 2018).

Agricultural landscapes that have greater heterogeneity and diversity, which are represented by small outgrowths of the semi-natural habitat, support a greater number of natural enemies and thus have the greatest potential for pest biocontrol. The simplified agricultural landscapes that are typical of intensive industrial agriculture do not favor the biodiversity of the natural enemies of the pests of agricultural crops. The use of synthetic chemical pesticides also affects these species which can be used for the biocontrol of pests. Functional agro-biodiversity is a concept that refers to those elements of the biodiversity of land or agricultural landscapes, which provide ecosystem services and which support sustainable agricultural production. Successful implementation of agro-biodiversity has also included measures to develop mixtures of wild flower seeds that are sown alongside or within agricultural crops to provide pollen and floral nectar resources for bees. These seed mixtures have also been developed to enhance the biodiversity of natural enemies and which are used for pest control. The key factors known as the main causes for the decline of bee populations are as follows:

• intensification of land use due to industrial production methods that led to habitat loss;
• the use of toxic pesticides for bees and the use of herbicides on the edges of agricultural lands that destroy the wild flowers that the bees feed on;
• pathogens, diseases and parasites;
• the effects of climate change.

Results And Discussions

The intensification of agricultural land use, urbanization and intensification of agriculture were thus the main causes that led to the destruction and fragmentation of natural habitats. These destroyed habitats refer to the loss of live fences, shrubs, old fields, natural grasslands, field edges and forests. With the loss of this natural and semi-natural habitat, there was a decrease in the diversity of wild plants. Loss of these habitats and loss of wild flower diversity have resulted in loss of nesting habitat and bee feed resources. Research shows that habitat loss can cause both a reduction in wildlife diversity of bees and biodiversity of natural enemies (Morin et. al, 2009). Intensive agriculture has also led to a shift from traditional hay meadows, flower-rich habitats that represent a very important food resource for wild bees, for silage production. To the loss of habitats, agricultural practices represented by soil processing, irrigation and elimination of woody vegetation, which destroy the nesting sites of wild bees (Holmes et. al, 2015).

Rapeseed crops can provide an alternative source of food for some species of wild bees, which can effectively exploit crop flowers. This food source cannot be used by all species. The integration of intensive beekeeping with aquaponics offers an efficient production model, which attaches great importance to wild bees in pollinating agricultural crops. The agricultural crops offer food resources for a limited period only during the summer season for several weeks. This surplus of food is thus a limited resource for wild bees and honey that need pollen and nectar resources throughout the feeding season. The acclimatization and introduction into the culture of the Asian mint species Lophantus Anisatus, thus offers a permanent source of food for bees from the beginning of spring to the time of frost. Different species of wild bees are active at different times, so floral resources are needed from early spring to late summer to provide adequate feeding for all species of bees (Hanula et. al, 2016). The widespread overuse of synthetic pesticides is a common practice in today's intensive farming systems. Many wildflowers, nesting areas for pollinators and the living environment of bees, are thus contaminated with harmful chemicals. These insecticides, herbicides and fungicides that are used in intensive agricultural technologies come into contact with bees through pollen, nectar, air, water and soil. These pesticides are toxic to bees, generating short-term chronic effects that weaken and eventually kill bee populations. Landscape analyzes on the living environment of wild bees and butterflies show that the biodiversity of these species appears to be reduced as a result of the application of these intensive pest control measures using pesticides. The widespread application of herbicide on cultivated agricultural fields and around these agricultural lands has drastically reduced diversity and weeds and also the abundance of wild flowers. This weed control technology limits pollen and nectar and therefore the availability of food resources for bees (Usman et. al, 2019). Another factor that resulted in the reduction of bee populations was the invasive external parasitic mite, varroa (Becher et. al, 2013). This parasite poses a serious threat to honey bee colonies globally. Viruses and pathogens are threats that further affect bee colonies (Gulson et. al, 2015). The ability of

bees to withstand these threats from diseases and parasites is influenced by a number of factors, in particular a nutritionally balanced diet and the exposure of these bee populations to the effects of toxic chemicals (Wilfert et. al, 2016). Some pesticides mainly affect honey bees, so they are more exposed to parasitic infections and infestations (Bommarco et. al, 2013).

Many of the effects of climate change, such as temperature rise, changes in precipitation patterns and extreme weather events, have had a negative impact on pollinator populations. Climate change has greatly affected the relationship between pollinators and their main food sources, ie flowering plants, by changing flowering periods and patterns. The pollination of crops by wild bees and honey bees is absolutely essential for ensuring global food security. Bees pollination of wildflowers is particularly important for maintaining the balance of wild plant ecosystems. The demand for pollinators is increasing and this could lead to a limitation of pollination in the near future. This is also due to the fact that the phenomenon of declining pollinator populations is being recorded. In addition, it is known that a variety of wild bees is essential to provide adequate pollination services for agricultural crops and wildflowers.

Granting a central role in the pollination of agricultural crops of honey bees is a high risk factor, given that this species may become vulnerable. I believe that this species should be used in intensive beekeeping that can be integrated into aquaponics systems, rationalizing transhumanity and thus limiting the spread of varroa virus within bee populations. In this way, more productive intensive beekeeping systems can be developed that offer the benefit of sustainable ecosystems. The place of honey bees in terms of pollination of agricultural crops should be left to the wild bees that can be introduced through specific measures within the agro-ecosystems and can do the pollination of agricultural crops much better than honey bees.

Research on biological diversity has shown that pollination is a primary service within the ecosystem that is threatened worldwide. Recent studies have shown that pollination services are increasingly limited. Thus in the UK rape research has shown that insect pollination has been drastically limited in recent times (Vanbergen et. al, 2014).

Limiting pollination services has disastrous implications both for the yield that can be obtained in the crop and for the quality of the seeds. This phenomenon is particularly worrying because there is a growing dependency on pollination services of agricultural crops. Research has shown that rapeseed is highly pollinated by wild bee species. For this reason, it is necessary that the land around agricultural crops be managed in such a way as to increase the number of pollinators (Chandler et. al, 2019). This conclusion was also presented by the results of a separate study on rape farms in northern Canada (Carreck, 2013). In these studies it was found that the land cultivated with rapeseed near the remaining uncultivated areas benefited from the advantage of a rich and diverse community of wild bees and, consequently, they obtained an increase in yields per hectare on the basis of pollination services obtained free of charge. from natural sources (FAO, 2016). Research has shown that farmers could maximize their yields and profits per hectare through these practices to leave 30% of their farms uncultivated (Blaauw and Isaacs, 2014), (Dicks et. al, 2015). In this way, the pollination services offered free of charge by the populations of pollinators that grow on these areas that are not cultivated and which can ensure the increase in yields per hectare can benefit (Bailes et. al, 2015), (Carvell et al, 2016). We analyzed the effects of stimulation of pollination in the pepper culture by introducing in the immediate vicinity of the experimental batches a strip of bushes, flowers specific to autumn. These flowers offer the advantage of attracting insect wild pollinators which thus offers pollination services for late autumn crops. The lots of peppers that were intensely pollinated by these insects have registered yields almost 5 times higher than the elbows that were not pollinated.

Bees do not usually fly when the temperature is below 10°C. There may be flights even if the temperature is around 12-14°C if the day is warm and sunny. The flight in good conditions starts at 16 °C, and at 19°C it reaches a high level. In adverse weather conditions, bees can only fly about 150 meters from the hive. Wild bees are better adapted to the specific autumn weather conditions and can be successfully used to pollinate autumn crops.

The late autumn periods have several windows in which the temperatures rise, are favorable conditions for the flight of bees, but the food resources were destroyed the first episodes of frost. The culture of broccoli for seed provides important food resources for wild bees during these late autumn periods. This crop is very resistant to low temperatures and has inflorescences to freezing.

Organic farming promotes these practices to leave larger areas of semi-natural habitats on farms. These practices favor an increase in the biodiversity of wild bees. Pollination can thus be more effective in organic farms against the background of increasing biodiversity and populations of wild bees and other pollinating insects (Baldock et. al, 2015).

A study conducted in Sweden on the efficiency of pollination in organic farms, analyzed the results of pollination in strawberry crops, analyzing comparatively the results obtained in organic and respective farms (Andersson et al., 2012). Strawberries have been visited by a wide range of pollinating insects on organic farms. The study thus showed that the yields obtained from the pollination of strawberries were significantly improved in the strawberry crop, with 45% in organic farms compared with 17% in conventional farms. This research has demonstrated the high efficiency of much higher pollination in organic farms that can increase both the quantity and the quality of agricultural production.

The intensification of agriculture has usually led to homogeneous landscapes, represented by cereal fields. This led to the loss of uncultivated habitats on farms that supported pollinating insect populations. Uncultivated habitats are represented by live fences, ditches, forests and field margins. At the same time, there were large amplitude losses regarding semi-natural pastures as a result of their transformation into arable land and coniferous plantations. This loss and degradation of semi-natural habitat in agricultural holdings, destroys nesting and wintering sites and is one of the main causes of species decline in cultivated landscapes. Wild bees place their nests in perennial habitats to ensure their reproductive functions. Thus, semi-natural habitats within the farm are essential for the survival of wild bees in the agricultural landscape. In Europe, there is a particular concern about the sustainability and sustainability of intensive agricultural practices.

Organic farming is a model of a production system that encourages sustainable management of all farm-level habitats, in order to support biodiversity. The proportion of semi-natural habitat in organic farms is higher than in conventional farms. Biodiversity is considered to be higher in organic farms compared to conventional farms. The management of organic farming can ensure a greater wealth of pollinator species and at the same time an abundance of wild plants on arable land, invertebrate species, birds and mammals.

Within the organic farms, integrated management techniques based on biocontrol can be applied. Thus the techniques promoted by organic farming have increased the biodiversity of natural enemies represented by cockroaches and spiders that as predators reduce harmful insects.

Agricultural policy measures that support organic farming models contribute to supporting biodiversity in the agricultural landscape. This finding is frequently encountered in scientific studies that have shown the positive effect of organic farming on pollinating insects. It has thus been demonstrated that in organic farms there is greater diversity and at the same time greater coverage of insect-pollinated plants compared to intensive farms.

Organic farming benefits the diversity and numbers of wild bee populations. The integration of intensive beekeeping into aquaponics systems represents an ecologically intensive production model that thus offers more flowers for wild bee feed.

On agricultural land intensively exploited in industrial agriculture models, the diversity of flowers was much lower due to the use of herbicides. Chemical herbicides reduce the diversity of flowering plants and thus reduce the nectar and pollen resources available to bees. Flower strips grown on cereal farmland provide sufficient food resources for wild bees nested in these strips of honeycomb flowers grown in the field, alongside cereals. Analyzing the effect of landscapes, it was found that a

larger area of ecological arable land increased the number of species of wild bees in the strips of honeycomb flowers grown next to these cereal crops.

Scientific research on the impact generated on the richness of the biodiversity by the wild flowers from the organic and intensive pastures managed within the dairy cows farms. Moreover, the introduction of honey flowers in organic pastures offers the advantage of increasing milk quality. It has also been found that land occupied with organic grassland contains a greater number of pollinating insect species than intensively managed grassland.

Organic farms and agri-environment measures of the common agricultural policy encourage the introduction into legumes of leguminous crops, plants that provide generous food resources for wild bees during the late autumn period. Ecological management in agriculture represents a sustainable model of promoting biodiversity within the farm, with adverse effects in terms of supporting wild bee populations.

In order to ensure efficient pollination of agricultural crops, pollinating insects, especially wild bees, need to ensure feeding and nesting requirements to be placed within the same isolation. The wild bees return to the fixed places of the nests, so that the close proximity of the nesting and feeding habitats, from the agricultural lands, are essential for the pollination of the crops.

Agri-environment schemes are an important component of the EU's common agricultural policies, in which direct payments are granted to farmers who adopt sustainable ecological agricultural practices regarding the conservation and restoration of natural habitats. Also the forested areas of the agricultural landscape are important habitats for bees and at the same time for pollination services provided by wild bees.

One way to do this is to plant long-flowering honeycomb species such as Asian mint, Lophantus Anisatus. Asian mint stripes on the edges of arable land or interspersed between crops can provide important floral resources for bees that can last throughout the season if the right flower species are selected. These strips of Asian mint provide food for a wide range of bee species. The flowers of this species of mint offer the advantage that they bloom throughout the season, thus providing nectar and pollen sources for bees.

CONCLUSIONS

The monoculture and the lack of diversity of wild flowers within the agricultural lands, limit the feeding possibilities that the bees have on the agricultural lands. Bees may suffer from a lack of food resources as agriculture becomes more and more intense.
Organic farming promotes these practices to leave larger areas of semi-natural habitats on farms. These practices favor an increase in the biodiversity of wild bees.

Abstract

The aims of this paper are to analysis impact of potential of EU policy measures for beekeeping. The agricultural policy measures related to technical assistance in beekeeping have decisively contributed to the increase of productivity and quality. The result of applying these measures to the beekeeping sector was an essential contribution to stabilizing honey production in the EU, which was achieved by increasing productivity and quality.

Keywords*:* Beekeeping, Agricultural Policy

INTRODUCTION

The main agricultural policy measures had as their main objective really to support the production of honey at current levels, despite the increase in the cost of production costs and the value of competitive honey imports from third countries. All these measures were aimed at combating the effects and in the main threats caused by diseases and pests.

The technical assistance was mainly through professional training measures, allowing the dissemination of technical information with novelty character among all beekeepers and facilitating the purchase of the latest equipment that offers efficient solutions for honey production and for obtaining other bee products.

Analyzing the impact on production caused by measures that support the fight against the varroa parasite, a virus that is a major threat and which requires high costs, the European Commission considers that the effect of these measures has been very positive. Although positive results have been obtained in some EU Member States, the adoption of measures has been limited (Vanbergen et. al, 2014). These deficiencies found in the fight against varicose veins were due to the fact that the procedures required to obtain the assistance needed to combat varicose veins were considered difficult by the beekeepers (Wilfert et. al, 2016). One of the most effective measures proved to be the one that supports the rationalization of transhumance (Becher et. al, 2013). This measure has been highly appreciated in the case studies conducted in Greece and Spain (Blaauw and Isaacs, 2014). I believe that the extension of this measure can be applied in intensive beekeeping systems integrated within an aquaponic system. These superintensive production systems thus offer the opportunity to

increase productivity and reduce the level of transhumance, while also providing support in controlling the spread of the varroa mite. The economic efficiency of this measure is obtained through the integration of several branches of production both horizontally and vertically within the same production capacity, without introducing additional factors of production (Anderson et. al, 2012), (Baldock et. al, 2015). By developing intensive and integrated beekeeping systems, it is thus possible to apply this measure of streamlining of transhumance and for beekeepers with small bee herds who can achieve a considerable increase in beekeeping income against the background of its location within integrated aquaponics systems. Through this measure of integration of beekeeping in aquaponics systems the measure of transhumance reduction is transformed from a compensatory measure of production losses, to a measure of productivity growth and of stimulating sustainable economic development with positive effects on environmental resources and which thus offers the possibility of biodiversity conservation. The pollination of agricultural crops should be based primarily on the herds of wild bees that should be protected and reintroduced within the agro-ecosystems through specific measures (Bailes et. al, 2015), (Barratt et. al, 2018).

When the bee hive repopulation measure was applied, those beekeepers who received general support recorded a positive effect on production. The repopulation of agricultural land with wild bees specialized in pollination of crops would also generate positive effects for all other branches of agricultural production. The associations and the individual beekeepers who were consulted in the evaluation of the effects of the policy measures applied within the beekeeping sector at European level, unanimously expressed their firm conviction regarding the potential importance of the applied research measure on honey production (Ollerton et. al, 2014), (Orford et. al, 2016).

MATERIAL AND METHOD

In general, the measures aimed at promoting honey obtained in the EU have not had a substantial expected impact on the composition of national and international honey marketing channels. For example, almost all of the honey produced in Germany has been sold locally through direct sales channels, while about 50% of the honey produced in Spain is still sold through wholesaler-specific channels. Analyzing the effects of the measure to support the modernization of specialized laboratories that carry out the analyzes, the physical and chemical properties of honey, we can say that this has contributed to improving the quality of honey and thus facilitated the development of the market by marketing certified quality products. The promotion of native honey bees is supported by the actions that are also carried out within the national programs. These measures have led to an increase in awareness and training of consumers' preferences regarding the quality of honey produced locally. Thus, new types of honey and the availability of local consumers to pay a higher price for quality products have appeared. This consumer behavior was also encountered in Germany and Hungary, against the backdrop of the introduction of the quality certification label. The development of a European digital market, through blockchain technology, for quality beekeeping products can thus offer the support of the native beekeepers, for the superior use of quality products and at the same time an incentive for increasing the quality of bee products.

In principle, in order to support EU domestic production, the measures of the common agricultural policy could have helped stimulate honey exports. Analyzing these changes in consumer perception and behavior we can say that, the direct substitution between these various types of honey produced in the EU and the imported honey from China seems to have been quite limited on the European market. The factors that determine the formation of domestic and global demand are very complex, which is why it is difficult to accurately assess the level of growth of the commercial effect as well as the positive effect of honey production, determined by the bee measures.

However, when analyzing the effect of bee measures, it seems that some effects considered positive on local trade in bee products, targeted by the measures aimed at promoting quality, have occurred. The quality of honey and all bee products is a major factor in maintaining the level of competitiveness. The cost of production, the quality and the associated services are essential attributes of the competitiveness, for the fulfillment of this wish, several beekeeping measures can be applied. The rationalization of bee transhumance represents a measure that directly contributes to the

reduction of production costs, but also indirectly by reducing the losses of bee herds, determined by the impact of the varroa virus, but also as a result of the quite high cost reductions with the treatments. This rationalization measure applied by integrating beekeeping into aquaponics systems thus offers the opportunity to maintain competitiveness through the sale price of bee products. The integration of beekeeping with aquaponics offers the opportunity to increase the production by intensifying and at the same time by increasing the duration of the production cycle at the level of the entire calendar year. In addition, the fixed costs are thus reduced by integrating several production branches within the same production capacity. We refer here to beekeeping, aquaculture, aromatic plants, volatile oils and the obtaining of biomass with a very high calorific power, determined by the concentration of oils in the vegetable debris. The integration of beekeeping offers the opportunity to obtain different assortments of honey in high quality ecological conditions. The quality of bee products is a very important strategy in terms of competitiveness. The general maintenance of high levels of quality in EU honey production was an important factor contributing to a (positive) gap between the average export price of honey and the average import price. A third important element of competitiveness, by price and quality, is the services associated with bee products at the time of sale. Here we refer to the specific measures to support apitherapy, a field with huge potential in the field of social and health services. If apitherapy is well known in terms of the positive, valuable effects in the health field, social apitherapy refers to the social integration of vulnerable and marginalized people by engaging within these integrated intensive beekeeping platforms within aquaponics systems. The success of social apitherapy comes against the backdrop of the interaction of vulnerable people with bees, which are a near-perfect example of social behavior.

It seems that the beekeeping measures applied to the growth of bees, had a moderate positive effect on the keeping and marketing of live bees. The level of trade in live bees remained largely local and limited. Most beekeepers usually grow their own queens, and their own swarms to repopulate their hives and cover their losses during winter and other causes.

The use in the competitiveness analyzes of such average prices, there can be nothing more than an indicator, and this, because the origin and type of the assortment of honey, as well as the channel through which the sales are made, the market structure and the local market in the country, are factors that influence the price level of honey.

Market analyzes based on case studies, interviews and surveys represent marketing research on the bee products market, based on which it was found that the factors that determine the market conditions are also the main engine that generates the producer price trend.

In terms of comparing the level of competitiveness between European beekeepers and their competitors elsewhere, we can say that EU beekeepers face relatively high production costs. These measures of intensification of beekeeping by integrating within aquaponics systems offer the possibility of reducing production costs by increasing the duration of the production cycle by almost 4 times and by reducing fixed production costs that are thus distributed over at least 7 distinct production branches: beekeeping, aquaculture, aromatic plants, volatile oils and vegetable biomass with high calorific power that can be used for pellet production, social apitherapy services, education and health services. Interestingly, this integration of the various production branches also offers the advantage of reducing the costs associated with the production activities indirectly. Integration actually solves the problems associated with or generated by each of these activities if it were developed independently and not within an integrated system. Thus we can give as an example aquaculture that requires a high consumption of water and generates organic residues. The integration of aquaculture with the intensive cultivation of aromatic plants comes with the advantage of eliminating the quantities of organic residues generated by the non-consumed food and the excrement of the fish by exploiting these nutrients at the level of the roots of the aromatic plants, which thus reduce the water consumption level and at the same time do not need any input regarding nutrients. Aromatic plants are obtained without additional input from production factors, both in terms of nutrients and the land surfaces needed in classical crops, irrigation and herbicide or pesticide treatments. Chemical treatments cannot be applied in any form as a result of direct interaction with

fish. Thus, high quality organic products can be obtained under controlled conditions in various production branches.

The EU's relatively limited exports of honey are at higher prices than imports. Analyzing comparative, we can say that, on average, a kilogram of honey imported into the EU in 2016 costs 2.23 euros, while a kilogram of honey exported to non-EU countries costs 5.69 euros. This situation is also observed in terms of comparative analysis of prices for honey import and export and for the period 2017-2018.

RESULTS AND DISCUSSIONS

Analyzing the structure of production costs, we noticed that, in recent years, there has been a strong increase in production costs for beekeepers. This was determined by an increase in bee mortality rates of over 30-50%. The increase in the mortality rate thus led to an increase in the cost of honey production, in some cases even five times. This increase in the cost of production was accompanied by the increase in fuel costs, which also affects the cost of transhumance. It was found that in the countries affected by the drought period, the beekeepers had to increase the duration of transhumance periods, thus being able to cover much greater distances, in order to provide the necessary food for the bees in sufficient quantities. In addition to all these cost increases, there was also an increase in the cost of treatments against varroosis and also an increase in the costs related to supplements needed for the feeding of bees (sugar, corn molasses) (Usman et. al, 2019). The measures proposed in this doctoral thesis, for the integration and intensification of beekeeping, eliminate all these problems related to the increase of the production costs due to the climatic, biological (varroa), and economic factors (referring here to the transport costs, supplements) (Schulp and Verburg, 2014). All of these price increases have substantially affected the incomes of beekeepers and farmers, because the substantially higher production costs have not been offset by the corresponding increase in sales prices. An intensive approach to sustainable organic production is also found in the work (Bommarco, 2013). The strategy of developing the agriculture branches through the intensive ecological approach is also found in the works of Professor Regenstein, (2011).

These measures to support beekeeping by raising bees have had a limited impact on production costs, which have increased in several ways. Although these policy measures have supported the use of medicines for combating varroa virus and the repopulation of beehives, the most economically efficient measure is the rationalization of transhumance, which thus offers economic benefits to beekeepers who obtain a substantial increase in income against intensification and diversification. production.

Supporting transport costs is a measure that has been applied in countries such as Spain or Greece, where we find widespread transhumance. Also through the beekeeping policy measures, support was offered for investment in beekeeping, in order to support honey production. At the same time, the measures of beekeeping policy also took into account the sector of processing bee products. In this respect, the support provided was aimed at supporting the extraction, processing and conditioning of honey more efficiently. Apicultural policy measures also included support for investments in specialized equipment for handling and moving hives (eg trailers, pallets, loading equipment, cranes). In many European countries, beekeeping measures have also been incorporated into national beekeeping development programs. These measures and national programs for the development of beekeeping have also encouraged the diversification of the sources of income of beekeepers. These measures also increase the potential of exploiting other bee products, and the development of specific market segments, such as the market for milkweed products (Senapathi, 2017).

Within the apicultural policies we find also the applied research measure, which made it possible to finance the qualitative and quantitative evaluation of the honey components, as well as the study of propolis. The demand for these types of specific products exceeds the supply, however it is found that beekeepers are not sufficiently aware of the value of the full potential of these niche markets specific to bee products (Sharp et. al, 2016).

With the main aim of production stability, the measures to support the beekeeping sector have decisively contributed to price stability. The success of these measures in terms of price stability is due to the fact that 60% of EU consumption is represented by the output obtained on the domestic market. However, the structure of the European honey market is the only factor influencing prices. In all the studies carried out on the factors that influence the price of honey on the European market, it was not possible to find in the evaluation a general relation between the measures of beekeeping and prices (Scheper et. al, 2013). The global conditions on the honey market and the supply structure of the national markets of EU member countries are largely responsible for the favorable effects generated by the beekeeping policy measures on honey production and prices. The benchmark product that sets the price evolution of all bee products on the world market is standard honey. However, the supportive beekeeping measures have generated an influence on the prices on the local markets for those specific types of honey that are more expensive and of high quality that are marketed on the organic products markets.

By analyzing the structure of the costs of administration of the bees we can have a perspective on the saving possibilities. The cost of buying the queen represents a total production cost of 11%. Sugar has a large share in the production cost structure (17% of the total). The work of the operator in beekeeping has the highest weight in the structure of the production cost (37% of the total) and therefore must be analyzed very carefully in terms of cost reduction (USDA, 2017).

The concept of intensive beekeeping of bee colonies is a viable and sustainable model when considering strategies to reduce production costs. Profitability is essential for the sustainability of the beekeeping sector. Like other agricultural producers, beekeepers can produce fruit and fish. In the case of the diversification of the production branches, various factors can affect the production of beekeeping. Exposure to chemicals, losses in plant diversity, adverse climatic conditions or deterioration of natural bees' habitats, hive capacity are factors that contribute to health problems and determine mortality rates. Not only colony losses affect the economic viability of beekeeping, but the threat and food production. The integration of beekeeping with the agricultural production branches can be realized within an aquaponic system that integrates within an ecological production system the apicultural production with the production of fruits and vegetables, fish and honey aromatic plants.

As for the market, global competitors with lower production costs and cheaper prices pose a threat to the market share of EU producers. The European Commission has highlighted the risks posed by the practices of counterfeiting sugar as well as non-compliance with EU standards and norms.

Agricultural policy measures have an impact on beekeeping, either directly or indirectly. Indirectly, these can contribute to improving the impact of agricultural practices on the environment and on bees. An example of this is represented by the measures aimed at maintaining permanent pastures. As far as direct support measures for farmers are concerned, bee products are part of the EU agricultural markets.

Through these measures of agricultural policy in beekeeping, funds are provided to finance support actions in the field of bee health, hive management, technical assistance, analysis and research on the monitoring of the market and the quality of bee products. This direct support covers up to 50% of the total expenses. In order to substantiate these support measures, EU Member States are developing national beekeeping programs for a period of three years in cooperation with beekeeping organizations. Each Member State has such a program in place. The total amount of 216 million euro was allocated to the EU member countries during the period 2017-2019. The EU has developed a mechanism to promote bee products, based on co-financing through a budget of over 100 million euro per year. Honey is a product that is included in several promotional campaigns both inside and outside the EU. Thus, over 30 types of honey products produced in the EU received quality labels for the product with protected designation of origin (PDO) or protected geographical indication (PGI). These measures to promote local products are tools that can contribute to the development of local markets and increase the value of local products.

CONCLUSIONS

The concept of intensive beekeeping of bee colonies is a viable and sustainable model when considering strategies to reduce production costs. Profitability is essential for the sustainability of the beekeeping sector. Like other agricultural producers, beekeepers can produce fruit and fish. In the case of the diversification of the branches of production, various factors can affect the production of beekeeping. Exposure to chemicals, losses in plant diversity, adverse climatic conditions or deterioration of natural bees' habitats, hive capacity are factors that contribute to health problems and determine mortality rates. Not only colony losses affect the economic viability of beekeeping, but the threat and food production. The integration of beekeeping with the agricultural production branches can be realized within an aquaponic system that integrates within an ecological production system the apicultural production with the production of fruits and vegetables, fish and honey aromatic plants.

Abstract

Even if their history can be tracked down to 40 years ago, from a scientific point of view, Esports can be considered as a new area of research. Until now, most of the literature on eSports focuses on the psychological and conceptual dimensions of this domain, and on legal concerns. The purpose of this article is to discuss the different sources of earnings in eSports and to analyze the earnings of a certain group of stakeholders, professional players of StarCraft II. We focus on the earnings and performance of the first 96 best players in the world and we find great variance in their earnings, according to performance. We conclude that if you are not top of the top, maybe should have a plan B as a career and source of income.

Key words: Esports, Starcraft II, Professional Players' Earnings, Descriptive Statistics, Correlation

JEL Classification codes: C00, Z20, Z21, Z22

Introduction

Esports are quite a new domain, both in sports and in scientific research, even if now they have 40 years of history. One of the signs proving their novelty is the fact that researchers haven't been able to decide yet what is the correct spelling – eSports or e-Sports or Esports or esports; for now, these and probably, many others, coexist. The good news is that regarding definition, researchers seem to agree more, and, in short, we can say that "eSports can be defined as organized competitive gaming" (Gawrysiak et al., 2020). The significance of this new study domain comes from the increasing popularity of video games and eSports tournaments, the increasing earnings for different stakeholders in this field and increasing importance of online activities that became especially obvious since the beginning of the SARS Cov 2 pandemic.

The debate regarding the classification of eSport (can they be considered sports or not?) plus the psychological motivation and consequences of playing video games (in a professional way or as amateurs) are the focus for most of the research in this field. Also, some studies analyze earnings in eSports especially as a consequence of in game microtransactions and loot boxes. These were also the focus of some scientific

studies because of legal aspects, as some countries consider this type of activities gambling, and others don't (Zendle et al., 2020; King, Delfabbro, 2020; King et al., 2019).

Our paper aims to start filling a gap in this area of research, by focusing on the gains received by professional players in eSports. The case study presented in this paper concerns StarCraft II professional players, as this game has some of the most popular tournaments (Gawrysiak et al., 2020). After analyzing the descriptive statistics of earnings in StarCraft II and correlating them with the players' performance we find that there is a moderate correlation between performance and gains, and also that only top players can make a living out of professionally playing the game.

The second part of our paper presents the main findings in research regarding eSports, while the next one shows the scientific methods used and the source of data. In the fourth part we present the results of our findings, and in the last section we conclude, and we offer our ideas for further investigation.

The World of Esports

As mentioned before, one thing researchers seem to agree on is the definition of eSports; though it is expressed in different ways, the idea is same and it says that "eSports are organized video game competitions that serve as a non-traditional model of sport that has established itself as a commercialized entertainment enterprise" (Gawrysiak et al., 2020). A more plastic description is offered by Martoncik (2015), who says that "eSports represents a kind of a merge between electronic games, sports, business, and media".

The first eSports event took place in 1980 – Atari's Space Invaders Championship – and since then, their number has been increasing, as well as their recognition, their live attendance, their audiences and their prize pool, with the DOTA Tournament from 2016 having the highest prize pool until now – more than 20 million dollars (Gawrysiak et al., 2020; Duersch et al., 2020; Funk, 2018; Hallmann, Giel, 2018). In their 40 years history, eSports has developed in a real industry, acquiring an economic dimension: venues built in order to accommodate more and more spectators, tickets sold out, increasing prize pools, online streaming and in game transactions (Gawrysiak et al., 2020; Hallmann, Giel, 2018).

As a consequence of this rapid development, major companies all over the world have become sponsors of eSports events and eSports teams, helping to sustain and expand the industry: Microsoft, Samsung, Red Bull, Intel, Coca - Cola, Comcast, Xfinity, Mountain Dew, T Mobile, Mobil 1, Audi, Airbus, Korean Air (Funk et al., 2018, Meola, 2018).

It is true that the prize pools and the industry itself grew with the help of advertising and sponsorship, but what makes eSports attractive for stakeholders in this domains is the viewer loyalty and the opportunity of reaching online the influential cohort of 12 to 34 years old via streaming platforms and social media (Gawrysiak et al., 2020; Sjöblom et al., 2019). One of the most popular platforms used is Twich, which added to television and Youtube valuable characteristics like real time human interaction between streamers, viewers and even players (Hilvert – Bruce et al., 2018).

Before going analyzing the social implications and monetization aspects regarding eSports, it is worth mentioning that a great part of scientific research on electronic sports is devoted to the debate on the concept itself: can they be considered sports, or not?

Arguments in favor of the first hypothesis are: professional player require physical skills like high precision, motor coordination, agility (Duersch, 2020; Abanazir, 2019; Funk et al., 2018) – which complies with one of the characteristics of sports, physicality –, they need to train regularly, most of the times they belong to a team, they think of strategies and they have to apply them perfectly, there are uniforms, there are coaches, managers and agents, there are deals, transfers and transfer fees (Martoncik, 2015; Funk et al., 2018). We even find in eSports the other side, the bad side of sports, like match fixing, doping, gender and race related

scandals (Funk et al., 2018). Moreover, as it happens for all the traditional sports, eSports players can now receive athlete scholarships and they can belong to college or university teams (Gawrysiak et al., 2020; Funk et al., 2018). And last, but not least, the status that eSports hold now is emphasized by the inclusion of an eSports medal event in the 2022 Asian Games that will take place in China (Gawrysiak et al., 2020; Hallmann, Giel, 2018).

On the other hand, those who do not agree with including eSports in the same category as traditional sports claim that the essence of sports is its athletic dimension, that lacks in the case of electronic sports, and that there is a non-human component that has a considerable effect on the outcome of the game (Mora-Cantallops, Sicilia, 2019; Funk et al., 2018). Unlike traditional sports, the electronic ones have a great dependence on the producers of the games, who offer the software needed in order to compete (Funk et al., 2018).

Another significant part of the studies regarding electronic games deal with their psychological dimension and look for the motivation behind playing and the social interactions that take place online. These studies are not necessarily concentrated on professional players. In short, the researchers found that the main reasons for playing electronic games were sociability, fun and performance, as these games satisfy needs like belonging – to a community or a team –, or the need for being in control, having power as team leader etc. (Martoncik, 2015). Psychological discussion can emphasize another similarity between traditional athletes and eSports athletes: both types of athletes are exposed to great levels of stress and psychological strains when taking part in competitions (Hallmann, Giel, 2018).

It is also interesting to mention some aspects regarding the labor market and the jobs connected to eSports. Of course, the first job one thinks about is the professional player. At the beginning, players only gained from the prizes they obtained (if they obtained them); if they were part of a team, it was customary for the team to cover travel expenses for the events they were taking part in (Connors, 2012). Nowadays, many organizations pay salaries to their players, but the lowest of them are only a few hundred dollars a month, while the highest reach several thousand dollars a month (Connors, 2012). One serious disadvantage for those employed in this domain is the fact that employment can be precarious, as precarious as the player's success (Funk et al. 2018). As a consequence, or maybe, because of this, researchers that studied the industry reached the conclusion that in eSports most professional players are young, they have short carriers and are always in danger to be surpassed by even younger and sometimes more skilled challengers (Funk et al. 2018).

Other jobs related to eSports are in the marketing area, in event planning, or as a streamer or broadcaster on Twich and other similar platforms (Nguyen, 2017). Of course that the recent health crisis has affected those employed in physical event planning, as popular eSports leagues were cancelled, rescheduled or moved online (Nicola, 2020) and those involved in building bigger and bigger venues, while streamers and broadcasters were less affected or even see an increase in their activity, as isolation and lock-downs all over the world increased the number of online game players but also the number of viewers.

This paper will analyze the incomes of only one category from all these stakeholders, the professional players, with a focus on StarCraft II athletes.

Methodology

The data used in analyzing incomes of professional StarCraft II players comes from the site www.alligulac.com, which is dedicated to data, statistics and predictions about this game; the rankings used in the study is the one available on the 22nd of July of 2020. From 2653 players that have been playing the game since its 2010 release in a professional manner, we have selected the first 96, as we consider they are the most representative for the game. The number selected is not random, tournaments in StarCraft II are organized starting with 64 or 32 competitors; we have added another 32, reaching 96, as they have the chance to challenge the others and maybe obtain a place in the tournaments.

In order to analyze data, we have used instruments offered by descriptive statistics, and in assessing the correlation between performance and earnings, we used Spearman's rank correlation coefficient.

Results

StarCraft II is a multiplayer real-time strategy game that in professional tournaments is played in one to one matches (usually best of 3, best of 5 or best of 7 games). It was released in 2010 by Blizzard Entertainment.

As mentioned before, this analysis focuses on the professional StarCraft II players' earnings. We discussed before that tournament winnings and salaries received from teams are the sources of income for a professional player. Besides that, Connors (2012) presents other sources of income: streaming – at first streaming platforms were used in order to communicate with their fans, but after they started offering partnerships that included some ad revenue, players began using streaming as o source of income; coaching – a professional player can charge between $25 and $300 an hour for teaching others how to play (Connors, 2012); casting – explaining the game to the audience of an event.

Unfortunately, there is no data available for the other sources of income, so this analysis will only take into consideration winnings obtained in tournaments. We have chosen the first 96 players on a performance basis, as we consider them the most representative; because some of the players from the earnings ranking are no longer in top 96 players in the world, we excluded them from the list, and we adjusted the others' positions accordingly.

The first step in our analysis was to compute the indicators used in descriptive statistics. We analyzed total earnings during each players career. We have computed the descriptive statistics for four sets of data: earnings for all 93 players (I), earnings of the first 32 (II), earnings of the next 32 (III), and earnings of the last 29 players (IV). Table 1 shows the results obtained.

Table1: Earnings in StarCraft II – descriptive statistics

	Earnings (I)	***Earnings (II)***	***Earnings (III)***	***Earnings (IV)***
Mean	167246.5806	352935	86426.25	51530.1
Standard Error	21836.1989	44964.06	16203.73	11791.98
Median	79720	262714	65862	25199
Mode	#N/A	#N/A	#N/A	#N/A
Standard Deviation	210580.6762	254355.1	91662.15	63501.77
Sample Variance	44344221175	6.47E+10	8.4E+09	4.03E+09
Kurtosis	2.462182434	-0.89116	2.995357	2.921119
Skewness	1.774609236	0.590266	1.756589	1.830085

Count	93	32	32	29

Source: authors' calculations based on data from www.alligulac.com

For the same four categories, we have generated the boxplots, in order to better see the differences between them. They are presented in Figure 1.

Figure 1: Boxplots for the four earnings categories

Source: authors' calculations based on data from www.alligulac.com

In Figure 1 blue is dataset I, orange, dataset II, grey, dataset III, and yellow, dataset IV.

Correlating data from Table 1 and Figure 1, we find that except players from rank 33 to 64, the other datasets are not homogeneous and there is great variance in values, which means the average income computed is not representative; in this case, median values offer a better image of what happens in each group. The highest standard deviation is registered in the dataset with all 93 players and it gets lower as we split them into 3 categories and as we go lower in the ranking.

We can also notice that most outliers appear when we consider all 93 players in the same set (I). From the three categories of ranks (II, III, and IV), as expected, the first 32 best players of the world have a median value of earning almost 4 times higher than the next group, and over 10 times higher than the last 29 players. As in many other sports, there is a great difference between the top athletes and the others. It can also be observed that the interquartile range is greater in the case of top 32, than in the other two cases, which means that there is more variability in the top of the ranking; moreover, the greater difference between the top 32 is shown by the taller boxplot, comparatively with the other 2 groups. Also, the first 50% of the first 32 players have greater variation in income compared to the others in the same dataset.

The idea that needs to be extracted from here is that if you are not among the very few at the top, living only from tournament winnings is not a good idea, especially because the data present here shows total winnings, in 5 to 9 years of professional career. It is also worth mentioning that out of 2653 players whose winnings are listed on www.alligulac.com, only 27% have earned in their careers at least one thousand dollars from tournament winnings. As a consequence, players on the lower part of the ranking have to make an important decision: to continue playing in a professional manner and hope for significant improvement of their position and income or pursue another career. In this case, analyzing carefully the opportunity costs is vital for the decision (Golescu et al., 2010) and can probably influence the entire life of the professional StarCraft II player.

After this first look on the earnings of players from different positions of the ranking, we wanted to see if there is a connection between performance and total earnings. In order to see that, we have computed Spearman's rank correlation coefficient and we obtained a value of 0.685. As expected, there is a positive correlation between position in the performance ranking and earnings rankings, the relationship is moderate.

This means that earnings in eSports depend not only on performance, but also on the wise choice of tournaments to participate in. Also, as we considered total earnings during a player's career, and the performance ranking is constantly changing, the duration of one's activity can also influence on the total gains. Even if we consider this a limitation of our study, that will be addressed in future research, we believe that the overall result will not change significantly.

Conclusions

ESports are a new area of research and until now there was little research on this topic, even if the number of scientific studies in now increasing (Lokhman et al., 2018). Most of the literature on eSports focuses on the psychological and conceptual dimensions of this domain, for example on the inclusion of eSports between sports, and on legal concerns. With our article we aim to discuss the different sources of earnings in eSports and to analyze the earnings of a certain group of stakeholders, professional players of StarCraft II, focusing on the earnings and performance of the first 96 best players in the world.

One of our conclusions is that unless you are an exceptional player, earnings from playing StarCraft II cannot be sufficient to make a living, and as a professional player under 32nd position in the world's ranking, you should also have a plan B for your career and future earnings. We also find that there is a medium correlation between performance and earnings. Our further research will focus on a deeper analysis of StarCraft players' income, if data regarding their salaries and publicity earnings are available, and also on the income other categories involved in professional eSports, like casters, as their profession offers the opportunity of more steady earnings and for a longer period of time.

Slowbalisation – Evidence of a Slowdown in Internationalisation

Abstract

In recent years, the term 'slowbalisation' has appeared in the economic literature, meaning changes in the global economy slowing down the process of the internationalisation of economic activity. These changes are characterised by a marked slowdown and even a regression of international economic relations. The article attempts to scrutinize the symptoms and characteristics of a new stage of globalisation. Based on analyses of international trade in goods, services, FDI and international production, it demonstrates that there are grounds for 'slowbalisation', especially in the context of observed geopolitical activities, with trade war being the most important of them, and technological progress focussed on digitisation, automation and artificial intelligence.

Keywords: internationalisation, globalisation, international trade, global value chains (GVCs).

Introduction

The process of globalisation has been of key importance to the world economy since the mid-1980s. Ongoing globalisation, a dynamic phenomenon, brought about continuous growth and spectacular development of international economic links, reflected in a rising volume of international trade; a marked acceleration of foreign direct investment (FDI); globalising financial markets; the internationalisation of production and the development of global value chains (GVCs); impressive technological development, especially in the area of information and communication technology (ICT); the intensification of international migration and other economic linkages. Globalisation seemed to keep gaining momentum incessantly as networks of global economic relationships had reached a critical mass that would further intensify their development and the creation of new links. It was also obvious that occurring crisis developments temporarily slowed down or even reversed international economic linkages; afterwards, however, as crises receded, those economic links would return to the path of buoyant growth, mainly in international trade and FDI.

In January 2019, The Economist (2019a) announced that globalisation had entered a new stage – a path of sluggishness – and referred to the new era of globalisation as 'slowbalisation'. As the turning point in globalisation, The Economist indicated the financial crisis of 2008–2009, having caused cross-border investment, trade, bank loans and value chains to shrink or stagnate relative to global GDP. The Economist contributed to the debate on the process of globalisation and its changes (as mentioned also by Felbermayr (2020)). At the same time, as an opinion-forming magazine, it adds inspiration for scholars (including us) to investigate the nature of 'slowbalisation' (we are aware that The Economist is a popular science magazine rather than a scientific source. However, as it is internationally renowned, we decided to cite it in a scientific article).

This article aims to scrutinize the symptoms and characteristics of 'slowbalisation'. The paper is composed of two parts. Part one focusses on a review of the existing literature on globalisation slowdown, taking account of prior considerations of semi-globalisation and deglobalisation. Part two comprises the authors' studies intended to identify ad describe the symptoms and characteristics of

Cite this Article as: Pawel FOLFAS and Anna ODROBINA "Slowbalisation – Evidence of a Slowdown in Internationalisation" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

'slowbalisation'. The research covers relative indicators, concerning the share of trade and inward FDI in global GDP and those related to production internationalisation and GVCs in the long term. The research hypothesis adopted is that the transformations observed in international economic linkages provide grounds for claiming the emergence of a new stage of globalisation: 'slowbalisation'.

Semi-Globalisation, Deglobalisation and 'Slowbalisation'

As early as more than a decade ago, disruptions (a slowdown) in the globalisation process were addressed in the literature, although in a slightly different context (see e.g. Ghemawat 2003; Nuti 2003; Ferguson 2005; Zorska 2007, p. 33). In the early 21st century, after international flows declined between 2001 and 2003, it was noted that globalisation was only continuous integration of economic activities rather than a specific state of the world economy. Consequently, just as any process, globalisation could slow down, stop or even become reversed. Various authors wrote that statements about a globally integrated economy were significantly exaggerated. The integration levels of particular markets in goods, services and production factors were on the increase, but they remained differentiated and far from the highest potential values.. It resulted from the existence of various obstacles to the free movement of goods, services and production factors. Such partial possibilities of integrating cross-border activities, limited by those barriers, were then referred to as incomplete globalisation or semi-globalisation.

One symptom of semi-globalisation is the alternate occurrence of periods of buoyant growth and of stagnation or declining world trade and FDI flows relative to global GDP. Such fluctuations reflect the fact that there are periods of slowdown in globalisation processes, e.g. during a slump or an economic crisis. Those are characterised by particularly steep decreases in flows of services and production factors.

In the early 21st century, an idea of deglobalisation was added to the notion of semi-globalisation. An extremely pessimistic and controversial concept of deglobalisation was presented by Bello (2006), who identified globalisation with trade, business and profits given priority over equality, equity, the environment, solidarity and social well-being. Therefore, his vision of deglobalisation included a postulate for taking revolutionary actions such as depriving WTO of its mandate to further trade liberalisation or re-orientation national policies from exports to only local production However, globalisation has always been a process based on the principles of the market mechanism; therefore, the reverse process would presumably be caused by the world economic processes as well.

After the intensity of international flows dropped in 2001–2003, the following few years saw a marked increase in the value of international trade and in international flows of production factors, which contributed to the mitigation of opinions that globalisation had slowed down or even become reversed. The situation changed with the onset of the world economic crisis and the post-crisis economic stagnation. Whereas the distinct fall in the share of international trade in goods and services in world GDP in 2009 against 2008 and significant falls in international capital flows relative to global GDP in 2008–2009 as compared to 2007 were attributable to the global economic crisis, the lower proportions of world trade in goods and of FDI in global GDP in the past few years in comparison with 2010–2012 (i.e. the period of recovering international flows after the crisis) were not. As a result, the question has arisen whether we are facing the beginning of a new stage in the development of the world economy, characterised by a (short- or long-term) slowdown in globalisation ('slowbalisation'), or even the reversal of the phenomenon (deglobalisation).

Since then, opinions have been expressed that the changes caused by the 2008–2009 crisis triggered permanent evolution of world trade in goods and services, having resulted in deglobalisation as the next stage of the evolution of the world economy (WTO 2013; Postelnicu, Dinu and Dabija 2015). Questions have also been asked about the limits of globalisation (see e.g. Miśkiewicz and Ausloos 2010).

The present-day deglobalisation related to the collapse of world trade is compared to the 1930s crisis (Campbell et al. 2009; van Bergeijk 2017), but with indications of a much more dramatic and faster

fall in both exports and imports as a result of the 2008–2009 crisis (van Bergeijk 2017, pp. 10–12). Various authors have identified the occurrence of deglobalisation with the consequences of the economic and financial crisis but also with armed conflicts or natural disasters (Postelnicu, Dinu and Dabija 2015). According to James (2017), present-day deglobalisation is a response to the costs and losses arising from the previous acceleration of globalisation. It gave rise to increased protectionism and aggressive trade policies of the USA or Brexit on the international agenda (Martin 2018; The Economist 2019a; 2019c).

It is indicated that the key condition for the currently observed deglobalisation is the effect of production fragmentation and the functioning of value chains (van Bergeijk 2017; Baldwin and Evenett 2009; WTO 2009; James 2017).Trade in manufactured goods depends on the international division of labour, including the organisation of production in value chains, increasingly frequently regarded as the reason for the spilling over of crises and drastic trade shocks.

Studies of deglobalisation basically rely on three major groups of measures: the dynamics of world trade in goods and services at the global and regional levels, inward and outward FDI and portfolio investment. However, a more comprehensive picture of the phenomenon requires further analyses, such as investigations of changes in technology transfers, trade barriers, restrictions related to the movement of labour, incentives to purchase local goods or agricultural production subsidies, often introduced during a crisis, although those should not be identified solely with economic crises (Postelnicu, Dinu and Dabija 2015, p. 5).

According to the article mentioned in the introduction and published by The Economist (2019a), having initiated the debate on the emergence of a new stage of globalisation, or 'slowbalisation', its recognised symptoms include the stagnation and shrinking of world trade, cross-border investment, bank loans and supply chains as the conditions of the so-called 'golden age of globalisation' of 1990–2010 (declining costs of the transport of goods, of communication, tariff reductions and the liberalisation of the financial system) ceased to fuel globalisation. Other causes arose that triggered a permanent slowdown in the process, e.g. a decelerated fall in transport costs, increased competition for transnational corporations (TNCs) from local competitors, a greater role played by services, rising self-sufficiency of Chinese production. In addition, The Economist referred to the US trade war, indicating an increase in the average tariff in the US to a level unheard-of for 40 years (3.4%). The influence of geopolitics is much broader in scope, e.g. changes in the US tax system aimed at the repatriation of capital and China's changed policy towards foreign firms. Increased protectionism is considered to have slowed down globalisation, although it is only the most evident cause; other changes in geopolitics, such as Brexit, challenges of multilateral agreements, the US policy regarding additional tariffs (The Economist 2019a; 2019c), restrictions on Huawei (The Economist 2019e) or extended powers of the Committee on Foreign Investment in the United States (Marantz 2019). Furthermore, certain industries will be particularly affected by the slowdown: telecommunications, semi-conductors, the automotive industry, capital goods, IT hardware and the Internet giants, as sectors sensitive to the protection of the national and economic security interests of their home countries and simultaneously using globally located value chains, which may mean that they must be ready to take costly steps to ensure compliance with those interests of their home countries. At the same time, such a situation may favour regional firms, e.g. the Chinese web industry, small and medium-sized web enterprises in the US that do not rely on access to the foreign geopolitical markets of their rivals (Marantz 2019).

It must be noted that The Economist repeatedly addressed the issue of 'slowbalisation' in 2019, indicating its various symptoms. It raised the problem of the functioning of GVCs (The Economist 2019b), identified as the cause of 'slowbalisation' since ca. 60% of world trade was performed between corporations, having developed internationally their value chains due to tax battles and trade wars. China, involved in the trade war, tends to be at the end of various chains; therefore, the US enormous imports from China also include components produced in other countries, also in the US. But the gains from participation in GVCs for the Chinese economy are much slimmer than the value of exports would suggest. In addition, other countries engaged in value chains have already been adversely affected by the growing role of China in GVCs (The Economist 2019e).

Furthermore, transnational corporations, previously excessively expanding their GVCs (The Economist 2019d; Stapleton 2019), causing ICT-based hyper-globalisation (Baldwin 2016), have become exposed to increasing risks resulting from the complexity and non-transparency of the production process. Therefore, they have been making deep and simplification-oriented changes in their value chains to increase velocity and efficiency (The Economist 2019c, 2019d; Coe and Yeung 2019). The reconfiguration of global operations of corporations towards the shortening and relocation of supply chains has also been shaped by geopolitics, especially between the US and China (The Economist 2019e).

Those distinctly changing conditions have been causing 'slowbalisation' that will involve deeper links within regional blocs (see also Meng et al. 2019), enhanced regional integration but also new challenges such as pressure between regional trade models and the global financial system or labour market problems resulting from the automation of production.

It must be added that the issue of 'slowbalisation' has been raised in various studies and reports of international organisations and institutions. According to the recommendations from the OECD and the WTO (2019), developing countries should adopt export diversification strategies and create regional cooperation frameworks within developing countries to mitigate the effects of the downturn in trade in goods. The UNCTAD (2018; 2019) has given particular attention to analyses of GVCs, indicating a steep fall in the growth rate of participation in GVCs in advanced economies and developing countries. In its predictions for 2020, PWC (2020) expects the continuation of the slowdown trend in the integration of the world economy in trade, financial flows and other aspects. It also points out that corporations should build various scenarios for complicated and complex supply chains. It attributes the development of trade in services to the fact that those have not been affected by the trade war, whereas the US and the UK remain the world's major exporters of services. McKinsey Global Institute (2019) indicated a deep transformation of globalisation. Recommendations for development in 'slowbalisation' conditions have also been prepared for individual regions (Toussaint et al. 2019).

The Symptoms and Characteristics Of 'Slowbalisation'

As already indicated, globalisation – as a dynamic phenomenon – has been repeatedly subject to deceleration and deglobalisation in crises. To identify the symptoms of 'slowbalisation', it seems necessary to take a closer look at long-term trends in world trade and FDI as well as in the internationalisation of production processes, considered to be the most important measures of globalisation. To illustrate those economic linkages against the backdrop of the global economic situation, the analysis covers relative indicators expressed as a share of global GDP in the long term (Fig. 1).

As regards exports of goods, over five decades, their share in global GDP increased from 9.3% in 1970 to 22.8% in 2018 but with evident periods of stagnation (or even decreases): 1974–1978, 1982–1987, 1991–1993, 2009, 2011–2017. All those periods, except for the last one, are unambiguously attributable to crisis developments in the world economy. There was also a marked rise in world exports relative to GDP from 1992 to 2008, to a record high of 25.4%. It is worth pointing out that world trade in goods grew more quickly than global GDP even during the Asian financial crisis (1997) or the dot-com bubble crisis (2001). Despite a fast recovery in world exports after the collapse in 2009, from 2011 the share of exports of goods in GDP showed a slight decline, although there was a minor rise in 2018 (by 0.73%). But exports markedly stagnated as in 2011 the respective proportion was 24.9% of global GDP and dropped to 22.0% in 2017.

Fig. 1: Trends in world exports of goods, services and FDI (as a percentage of global GDP)
Source: calculated by the authors based on UNCTAD databases (2020b).

World exports of services showed an upward trend, from 3.2% in 1980 to 6.9% in 2018, a record-high share of trade in services in GDP. Furthermore, in that case, decreases in the share in global GDP were relatively insignificant. Even 2009–2010 saw a fall by less than 0.4% against 2008, whereas in 2013 the share of trade in services in GDP exceeded the 2008 figure. Therefore, it is possible to conclude that exports of services steadily rose faster than global GDP. In this case, it is hardly possible to indicate a slowdown since data reflect a steady increase in the share of trade in services in global GDP. It is a surprising trend because trade in services was previously claimed to be even more vulnerable in crisis periods. However, trade in services showed not only a relatively less abrupt decline during the global financial crisis but also a gradual increase from 2011, in contrast to trade in goods. Therefore, it seems that trade in services could become the driver of present-day globalisation in the context of the growing role of digital technologies and trade in intangibles. There has been a very buoyant rise in international payments for intangible goods – in 2010–2016, the growth rate was 60% (UNCTAD 2019, p. 15–16). As indicated by Braga (2019), trade in services has been gaining in importance in the world economy for the following reasons: (1) in conditions of the current production structure, demand for higher-level services, such as R&D, human resource management, marketing, sales; (2) increased demand from consumers for support services, training, software; (3) the role of ICT in effective management and information flow. Digital corporations have also been growing markedly in the global economy; in 2019, seven out of the top ten firms by market capitalisation were digital companies (Apple, Microsoft, Amazon, Alphabet, Facebook, Alibaba and Tencent Holdings). E-commerce is on the rise as well (Braga 2019).

By nature, FDI is characterised by significant volatility and susceptibility to crisis developments. In the 1980s, its share in global GDP rose slowly from ca. 0.5% to ca. 1%, whereas the highest growth rates were noted in 1996–2000, to 4.1% of world GDP, a record high. The subsequent collapse and slow recovery allowed to reach 3.3% in 2007; afterwards, FDI relative to GDP declined until 2014. FDI inflows bounced back in 2015 (2.73%) and then again showed a downward trend of the share of global GDP: in 2018, it was a mere 1.5% (the lowest level from 2004).

Whereas inward FDI in developing countries was stable in the last years, 2017 saw a dramatic fall in FDI inflows to advanced economies (by 37%), accompanied by a decline by nearly 30% in cross-border mergers and acquisitions, and the trend was observed in all sectors (UNCTAD 2018, pp. XI–XII). In 2018, inward FDI dropped further, although the value of merger and acquisition deals showed an increase (UNCTAD 2019, p. 3).

An analysis of long-term global capital flows (UNCTAD 2018, p. 11) indicates that fast-growing debt instruments in the form of bank loans were the driving force before the outbreak of the financial crisis, but the situation changed in 2008. First and foremost, there was a marked decline in capital flows (in 2007, their share in GDP was 21.4%, whereas in 2017 – merely 6.9%); in particular, bank lending shrank dramatically and did not recover (accounting for 2% of global GDP in 2017). At the same time, FDI can be identified as the most stable component of global capital flows in 2002–2017.

To recapitulate the above analyses, it can be pointed out that in the 2010s exports of goods grew at a much lower rate than global GDP, as reflected in the generally falling share of GDP (except for 2018), inward FDI relative to world GDP dropped as well, whereas there was an increase in the share of trade in services in global GDP.

In addition to world trade and FDI, a major role in globalisation is played by the processes of production internationalisation, related to production fragmentation and the functioning of GVCs. Those processes intensified from the 1990s, as *signum temporis* of the accelerating globalisation of 1990–2010. Imports of intermediate goods and services, reflecting international trade in parts, components, semi-finished products, seem to be an appropriate measure for analysing the present trends in the internationalisation of production (Fig. 2). Whether analyses concern data on world imports or global GDP, in 2008 both measures showed the highest values (64.6% of world imports and 20.5% of global GDP respectively). Those indicators dropped due to the global crisis in 2009 and then clearly recovered until 2011; however, afterwards, they showed a minor but steady decline. In 2015, imports of intermediate goods and services represented 61.0% of total world imports (the lowest share in the period covered), whereas the proportion of imports of intermediate goods and services in global GDP reached 17.6%, i.e. below the 2005 level. Therefore, marked stagnation was observed in the internationalisation of production.

Fig. 2: World imports of intermediate goods and services

Source: calculated by the authors based on OECD data (2020).

International production developed in absolute terms: in 2018, the sales and value added of foreign affiliates of corporations rose by 3% and 8%, respectively, on the previous year. But the increase was related to the upward trend of digitisation and intangible activities (UNCTAD 2019, p. 18). The assets of and employment by foreign affiliates showed a rise, but there was a fall in the rate of return on inward FDI – in 2016–2018, it remained at 6.8%, whereas it had been 8.6% in 2005–2007. A similar trend was observed for the rate of return on outward FDI: 6.1% to 6.4% in 2015–2018 against 9.6% in 2005–2007 (UNCTAD 2019, p. 18).

The above is also confirmed by a falling share of foreign value added in total exports of goods and services (Fig. 3). As regards the world economy as a whole, before 2008 there was an upward trend reflecting the development of GVCs; after the 2009 collapse as a result of the crisis, a rise was observed until 2011, followed by a steady decline – the 2016 figure was 14.3% (the lowest value in the period under examination). Similar trends were noted by the world's two largest economies. The US, where the crisis drove down the share of foreign value added to 9.4% (2009), noted higher rates of decrease than the whole world economy from 2011, to a mere 9% in 2016. It is also worth pointing out that as early as the period preceding the global financial crisis US exports were characterised by a declining share of foreign value added. In the case of China, the country to use foreign value added at 26.3% of exports of goods and services in 2005, the 2016 figure was as low as 16.7%. Those trends clearly show that GVCs are in recession. It is also corroborated by statistics collected by the UNCTAD (2020, p. 123), indicating a steady fall in the share of foreign value added in exports (approx. 32% in 2011 against ca. 29% in 2015–2019).

Fig. 3: Share of foreign value added in exports of goods and services
Source: prepared by the authors based on the OECD database (2020).

Such a clear downward trend of the share of foreign value added in total exports suggests that export-oriented production increasingly relies on domestic value added replacing imported value added. It indicates an ongoing process of transformations towards shrinking GVCs. Undoubtedly, it is a major change showing the nature of the new phenomenon, marked by the gradual disintegration of GVCs resulting from changes in strategies adopted by transnational corporations.

It is worth mentioning that some of the reasons behind the transformations in GVCs are considered to be robotisation, automation and artificial intelligence, decreasing trends for production offshoring to developing countries and introducing revolutionary changes in the GVCs structure (Stapleton 2019). As a consequence, the opposite of offshoring (reshoring) can already be observed: the relocation of production back to the home markets (de Backer et al. 2016; Stapleton 2019, pp. 11–12). It seems to explain the evident process of shrinking GVCs, indicated by the data presented in Fig. 2 and 3.

Global value chains and world trade have also been affected by the development of artificial intelligence; for example, the use of AI for machine translation into foreign languages in electronic commerce facilitates its rapid growth; in logistics, AI allows to cut commercial expenses and to optimise supply chains (Stapleton 2019, p. 15); it also reduces communication costs and changes business organisation (Puaschunder 2019).

Conclusion

To recapitulate the above considerations, it is possible to confirm the adopted hypothesis that at present we are facing a new stage of the globalisation process, reflected in the development of essential international economic linkages. It has been demonstrated that international trade, FDI as well as the internationalisation of production and the functioning of GVCs are in stagnation or even in regression. Although a slowdown or decreases have been observed in the case of the previous foundations of globalisation, such as trade in goods, FDI and GVCs, robust growth has been noted in other linkages, previously underdeveloped, e.g. trade in services or intangibles. The development of the world economy observed since 2011 seems to provide grounds for rejecting statements of the sole occurrence of deglobalisation.

Those changes have very complex and multifaceted causes, economic, geopolitical and technological, and their impact on the shape of the world economy is firm and strong. Taking into account those new and significant conditions of globalisation and the already noted changes in international economic linkages, it is possible to conclude that there are clear grounds for recognising the onset of a new stage of globalisation: 'slowbalisation'. Moreover, one may believe that the shape of this stage of globalisation will keep evolving in material aspects.

Therefore, it remains open to question whether 'slowbalisation' is the most appropriate term to refer to the new stage of globalisation; perhaps, as the phenomenon develops, a more adequate name for the new era of globalisation will be coined. However, it is a secondary issue.

It is certainly necessary to conduct broader and in-depth analyses of the ongoing changes and to seek patterns in the new stage of globalisation to fully describe its new nature and development directions and, perhaps, to redefine its foundations as well.

The Factors Affecting Evolution of Cooperative Innovation Network on Platform: Based on the Prospect Theory

Yang LIU
School of Management, Shanghai University
Shanghai, China 200444

School of Management, Shanghai University, Shanghai, China 200444

Abstract

To explore evolutionary mechanism of cooperative innovation network on platform which collects users' needs, this paper divides the technical ability of cooperators into the ability of identifying and implementing users' needs. And based on the prospect theory, evolutionary game is adopted to analyze the cooperative behavior of finite rational participants. According to the topological structure of the cooperative network on platform built by core enterprise, this paper uses MATLAB to simulate on the BA scale-free network. It is found that the sensitivity degree of marginal diminishing of perceived gains or losses as well as the coefficient of loss avoidance affect the frequency of cooperation negatively. And there is optimal value of strengths to increase the gains of cooperative innovation and achieve win-win cooperation. It is difficult for the participants with high weaknesses to cooperate with others steadily.

Keywords: Cooperative innovation network on platform; Ability oriented to users' needs; Evolutionary games; BA scale-free network; Prospect theory

Introduction

As more and more platforms emerge to collect users' needs(Achtner, Nanda et al. 2018, Ben Arfi and Hikkerova 2019), platform provider and platform participants cooperate with each other to realize users' expected needs and exciting needs(Kano and Takahashi 1979) which need enterprises identify users' requirement accurately, design and implement it successfully. Collaborators cooperate based on their strengths. Then platform-dependent innovation ecosystem emerges, such as Haier and Xiaomi innovation ecosystem in China.

Platform link collaborators(Sedera, Lokuge et al. 2016, Sun and Wei 2019) and heterogeneous resources to create the value (Eckhardt, Ciuchta et al. 2018). And the factors affecting performance include not only technology but also the factors influencing the cooperative behavior of participants. Because the order and time of cooperative decision is different and participants are all finitely rational, there is a dynamic game of sharing innovation resources and sharing risks among participants of innovation. And complementarity of technical resources, the ability of independent innovation, risk appetite, risk aversion and loss avoidance of participants all can influence the participants' expectation of earnings and experience of co-creating value.

Evolutionary game is an effective analysis method combining the game behavior of finite rational individuals and dynamic evolution. The game process will be affected by structure of network(Nowak and May 1992) and the network structure will also evolve due to the dynamic process of game(Zimmermann, Eguiluz et al. 2004). Because of the existence of core members, platform provider, the cooperative network is scale-free. BA scale-free network is the best topological structure of cooperation(Zhang, Aziz-Alaoui et al. 2014). So, this paper distinguishes the abilities of participants

oriented to users' needs with ability to identify and implement needs, builds the games model of participants in platform innovation ecosystem with the prospect theory and stimulates on the BA scale-free network.

Theoretical Basis

Ability to Identify and Implement needs

As the Fig 1 shows(Deng and Sun 2009), '1'is the needs which is recognized by users, '7' is the objective demand reflected by users' behavioral information indirectly but not actually recognized by users themselves. The two are effective information of users' needs. And due to the existence of noisy information, as '5' and '6' in Fig 1, enterprises need the ability to identify effectively users' needs and transform it into professional demand of product functional. This ability is called 'ability to identify needs'. In order to complete the new product, enterprise also has 'ability to implement needs'.

Fig. 1: Description of users' needs

Prospect Theory

The Prospect Theory holds that individuals make decisions according to perceived value in the face of uncertain gains or losses (Xu and Xu 2015), and also points that individuals are more sensitive to the perceived losses, meaning that perceived gains are less than actual gains and perceived losses are greater than actual losses(Levy 1996).

Research Method

Basic Assumptions

There are the two game players, participant i and participant j, which are enterprises or research institutions. And they are finitely rational individuals who seek the better returns and strategies by repeated games. According to prospect theory, the perceived value v of uncertain income or loss is composed of value function $v(q)$ and weight function $w(p)$. $w(p_s)$ is the function of p_s , represents the objective probability of event s. $w(0)=0$ and $w(1)=1$ are given. $\Delta q_s = q_s - q_0$ is the deviation between the actual return obtained by the players and the reference point after the event s. And assume that $q_0 = 0$.

$$v = \sum_s v(\Delta q_s) w(p_s) \tag{1}$$

$$v(q)=\begin{cases} q^{\varepsilon} & q\geq 0 \\ -\kappa(-q)^{\varepsilon} & q<0 \end{cases} \tag{2}$$

$\varepsilon\in[0,1]$ is sensitivity degree of marginal diminishing of perceived gains or losses. The player is risk neutrality when $\varepsilon=1$. κ is the coefficient of loss avoidance, and player is sensitive to losses than gains when $\kappa>1$.

There are two strategies, either cooperate or betray halfway. No matter which strategy players choose, they all aim to maximize their own interests.

The cooperation is built on the basis of complementing each other's strengths and sharing resource. There is technology spillover and the absolute benefit of cooperative innovation is determined by the ability of identify and implement users' needs of collaborators. While the absolute benefit of independent innovation is affected by participants' own ability of identify and implement users' requirement.

Notation

According to the prospect theory, there is no deviation between the perceived value and the actual utility of the definite losses or gains. δ is punishment for default, which mainly related to the breach clauses signed between participants and the ruler of platform. And the cost of cooperative innovation, $\lambda_a h\pi,(a=i,j)$, is certain when player choose to cooperate. And $h\pi$ is the total cost of cooperation and $\lambda_a,(a=i,j)$ is the coefficient of cooperative cost paid by player i or player j.

$\alpha_a,\beta_a\in[0,1],(a=i,j)$ represents the ability of identify and implement users' needs of player i and player j respectively.

If the possibility of collaborative innovation successfully is p_1, the perceived gains of player i is $w(p_1)(l_i\pi)^{\varepsilon_i}+w(1-p_1)*0=w(p_1)(l_i\pi)^{\varepsilon_i}$, and $\pi=(\max(\alpha_i,\alpha_j)*\max(\beta_i,\beta_j)*\sigma)^m$ is the actual benefits of cooperative innovation, m represents the elasticity coefficient of cooperative innovation, and σ is the conversion rate of ability and return.

If the possibility of the thing that player i or player j innovates successfully by itself is p_2 or p_3 .For example, the perceived gains of player i is $w(p_2)\pi_i^{\varepsilon_i}+w(1-p_2)*0=w(p_2)\pi_i^{\varepsilon_i}$, among the formula, ε_i is the coefficients of player i's risk appetite, and π_i is the actual gains of successful innovation by player i independently.

$$\pi_i=\begin{cases} \alpha_i\beta_i\sigma & \alpha_i,\beta_i>0 \\ \beta_i\sigma & \alpha_i=0 \\ \alpha_i\sigma & \beta_i=0 \end{cases} \tag{3}$$

If the possibility of the thing that player i or player j absorbs from the other one is p_4 or p_5 , $w(p_4)\theta_{ij}^{\varepsilon_i}+w(1-p_4)*0=w(p_4)\theta_{ij}^{\varepsilon_i}$ and θ_{ij} are the perceived and actual technology spillover benefit absorbed by player i from player j, and the follower is also the actual technology spillover loss from j to i. And $w(p_5)(-\kappa_i\theta_{ji}^{\varepsilon_i})+w(1-p_5)*0=w(p_5)(-\kappa_i\theta_{ji}^{\varepsilon_i})$ is perceived technology spillover losses. κ is the coefficient of loss avoidance of player i. All same for player j.

Game Model and Equilibrium Analysis

The matrix of perceptive income of the two players is shown as Table 1.

Table 1: Matrix of perceptive income

Player j **Player i**	**cooperate(y)**	**betray(1-y)**
cooperate (x)	$A_i = w(p_1)(l_i\pi)^{\varepsilon_i} + w(p_4)\theta_{ij}^{\varepsilon_i} - \lambda_i h\pi + w(p_5)(-\kappa_i\theta_{ji}^{\varepsilon_i})$ $A_j = w(p_1)[(1-l_i)\pi]^{\varepsilon_j} + w(p_5)\theta_{ji}^{\varepsilon_j} - \lambda_j h\pi + w(p_4)(-\kappa_j\theta_{ij}^{\varepsilon_j})$	$B_i = \delta - \lambda_i h\pi + w(p_5)(-\kappa_i\theta_{ji}^{\varepsilon_i})$ $B_j = w(p_3)\pi_j^{\varepsilon_j} + w(p_5)\theta_{ji}^{\varepsilon_j} - \delta$
betray (1-x)	$C_i = w(p_2)\pi_i^{\varepsilon_i} + w(p_4)\theta_{ij}^{\varepsilon_i} - \delta$ $C_j = \delta - \lambda_j h\pi + w(p_4)(-\kappa_j\theta_{ij}^{\varepsilon_j})$	$D_i = 0 \quad D_j = 0$

Suppose that player i chooses to cooperate with probability x and chooses to betray with probability 1-x. And suppose that play-j chooses to cooperate with probability y and chooses to betray with probability 1-y.

According to Table 1, the expected revenue of player i choosing to cooperate or betray are U_{i1} and U_{i2}, and the average of the expected revenue is $\overline{U_i}$.

$$U_{i1} = y[w(p_1)(l_i\pi)^{\varepsilon_i} + w(p_4)\theta_{ij}^{\varepsilon_i}] - \lambda_i h\pi + w(p_5)(-\kappa_i\theta_{ji}^{\varepsilon_i}) + \delta - y\delta \tag{4}$$

$$U_{i2} = y[w(p_2)\pi_i^{\varepsilon_i} + w(p_4)\theta_{ij}^{\varepsilon_j}] - y\delta \tag{5}$$

$$\overline{U_i} = xU_{i1} + (1-x)U_{i2} \tag{6}$$

Similarly, the expected revenue of player j choosing to cooperate or betray are U_{j1} and U_{j2}, and the average of the expected revenue is $\overline{U_j}$.

$$U_{j1} = x\{w(p_1)[(1-l_i)\pi]^{\varepsilon_j} + w(p_5)\theta_{ji}^{\varepsilon_j}\} - \lambda_j h\pi + w(p_4)(-\kappa_j\theta_{ij}^{\varepsilon_j}) + \delta - x\delta \tag{7}$$

$$U_{j2} = x[w(p_3)\pi_j^{\varepsilon_j} + w(p_5)\theta_{ji}^{\varepsilon_j}] - x\delta \tag{8}$$

$$\overline{U_j} = yU_{j1} + (1-y)U_{j2} \tag{9}$$

Over time, the player continuously adjusts its strategy by learning and imitating. The dynamic process can be expressed by replicator dynamic equations:

$$\frac{\mathrm{dx}}{dt} = x(1-x)\{y[w(p_1)(l_i\pi)^{\varepsilon_i} - w(p_2)\pi_i^{\varepsilon_i}] - \lambda_i h\pi + w(p_5)(-\kappa_i\theta_{ji}^{\varepsilon_i}) + \delta\} \tag{10}$$

$$\frac{\mathrm{dy}}{dt} = y(1-y)\{x[w(p_1)(\pi - l_i\pi)^{\varepsilon_j} - w(p_3)\pi_j^{\varepsilon_j}] - \lambda_j h\pi + w(p_4)(-\kappa_j\theta_{ij}^{\varepsilon_j}) + \delta\} \tag{11}$$

Let $\frac{dx}{dt}=0,\frac{dy}{dt}=0$, the five equilibrium points, (0,0), (0,1), (1,0) and (1,1) $(x^*,y^*)=(\frac{\lambda_j h\pi-w(p_4)(-\kappa_j\theta_{ij}^{\varepsilon_j})-\delta}{w(p_1)(\pi-l_i\pi)^{\varepsilon_j}-w(p_3)\pi_j^{\varepsilon_j}},\frac{\lambda_i h\pi-w(p_5)(-\kappa_i\theta_{ji}^{\varepsilon_i})-\delta}{w(p_1)(l_i\pi)^{\varepsilon_i}-w(p_2)\pi_i^{\varepsilon_i}})$ are obtained. And the Jacobian matrix can be written to judge the stability of these five points, as formula (12) shows.

$$J=\begin{bmatrix}(1-2x)\{y[w(p_1)(l_i\pi)^{\varepsilon_i}-w(p_2)\pi_i^{\varepsilon_i}]-\lambda_i h\pi+w(p_5)(-\kappa_i\theta_{ji}^{\varepsilon_i})+\delta\} & x(1-x)[w(p_1)(l_i\pi)^{\varepsilon_i}-w(p_2)\pi_i^{\varepsilon_i}] \\ y(1-y)[w(p_1)(\pi-l_i\pi)^{\varepsilon_j}-w(p_3)\pi_j^{\varepsilon_j}] & (1-2y)\{x[w(p_1)(\pi-l_i\pi)^{\varepsilon_j}-w(p_3)\pi_j^{\varepsilon_j}]-\lambda_j h\pi+w(p_4)(-\kappa_j\theta_{ij}^{\varepsilon_j})+\delta\}\end{bmatrix} \tag{12}$$

The stability of the equilibrium points is determined based on the value of the DetJ and TrJ of Jacobian matrix. Since $TrJ|_{(x^*,y^*)}=0$ constant holds, (x^*,y^*) is an equilibrium point but is not always a stable point. Let $V_i=w(p_1)(l_i\pi)^{\varepsilon_i}-w(p_2)\pi_i^{\varepsilon_i}$, $V_j=w(p_1)(\pi-l_i\pi)^{\varepsilon_j}-w(p_3)\pi_j^{\varepsilon_j}$, $U_i=-\lambda_i h\pi+w(p_5)(-\kappa_i\theta_{ji}^{\varepsilon_i})$, $U_j=-\lambda_j h\pi+w(p_4)(-\kappa_j\theta_{ij}^{\varepsilon_j})$. The stability of four equilibrium points, (0,0), (0,1), (1,0), (1,1), is analyzed and four cases are got as shown in Table 2 and Table 3. And Fig 2 shows the evolutionary phase diagram of case 4.

Table 2: Stability of the equilibrium points in case 1 and case 2

Equilibrium Points	$\delta>-U_a,V_a>0;(a=i,j)$			$\delta>-U_a,\delta+V_a<-U_a;(a=i,j)$

Simulation on BA Scale–free Network

Simulation Steps

Step 1: Each node was linked with four neighborhoods. And then this paper build different scale of BA scale-free networks based on the mechanism of growth and preference.

Step 2: Each node selects the strategy randomly at the initial moment.

Step 3: The evolutionary rule of the network is related to the mechanism of old nodes to disconnect and reconnect. After each one game, the cooperator i breaks the connection with the defector j who has the greatest benefit(Zimmermann, Eguiluz et al. 2004, Santos, Pacheco et al. 2006). According to the mechanism of compensation, i will select a new player which does not have a cooperative relationship with i from the neighbor of j, and the other party acknowledges the partnership unconditionally(Santos, Pacheco et al. 2006).

Step 4: The rules of updating strategy is Paired Comparison. Player i randomly selects one player j to compare their benefit and imitate player j's strategy with a certain probability W, if the benefit of player j is greater than the benefit of player i. Otherwise, player i will keep strategy.

$$W(i \to j) = \frac{1}{1+e^{-(R_j - R_i)/n}} \tag{13}$$

The n is the uncertain factors such as noise in the environment, which is usually set as 0.1. R_i and R_j represent the sum of the gains obtained by player i and player j in the process of game with all neighbors respectively.

Step 5: Repeat steps 2, 3 and 4 until that a certain number of games steps is reached or stable state of evolution is reached. After experiments and referring to previous studies, this paper sets the number of game steps as 50 steps.

According to the above steps, this paper simulates with MATLAB and measures the evolutionary result with the cooperative frequency which is the number of participants adopting the cooperative strategy divided by the total number of resource providers. In order to avoid the experiment error, tests were repeated for 50 times and the average of the results was taken as the final result for each group of different parameters.

Simulative Results and Discussion

By consulting existing studies(Zhao and Zhao 2016, Li, Cao et al. 2020) and relevant experts in the field of management science and complex network, this paper fix some parameters to analyze the factor influencing the evolutionary behavior in case 4.

$$\alpha_i = 0.2, \beta_i = 1, \alpha_j = 1, \beta_j = 0.2, w(p_4) = w(p_5) = 1, \lambda_i = \lambda_j = 0.5, h = 0.4, \sigma = 10, m = 1.5, \delta = 5, \theta_{ij} = \theta_{ji} = 4$$

Sensitivity Analysis of ε and κ

(Tversky and Kahneman 1992) found that it can represent the general behavioral preferences of any decision maker when $\varepsilon = 0.88$ and $\kappa = 2.25$.

To analyze the sensitivity of ε and κ, set $\varepsilon = 0.2, 0.5, 0.88, 1$ and $\kappa = 0.25, 1.25, 2.25, 3.25$. And $\varepsilon = 0.88$ or $\kappa = 2.25$ when this paper does not analyze the indicator.

1) The sensitivity of ε: As the Fig 3 shows, the evolution of players' behavior is sensitive to ε very much. The smaller ε is, the easier the frequence of cooperation in the game system evolves to 1. And as long as the ε of one player is 0.2, the game system will evolve to (cooperate, cooperate). The smaller ε is, the faster the system evolves. On the contrary, expected that the ε of opponent player is 0.2, as long as the ε of one player is 0.88 or 1, the game system cannot evolve to (cooperate, cooperate) and the frequence of cooperation will decrease compared with the initial status. The higher ε is, the faster the system evolves.

2)The sensitivity of κ: As the Figure 4 shows, the evolution of players' behavior is sensitive to κ too. The smaller κ is, the easier the frequence of cooperation in the game system evolves to 1. And as long as the κ of one player is 0.25, the game system would evolve to (cooperate, cooperate). The smaller κ is, the faster the system evolves. And expected that the κ of opponent player is 0.25, as long as the κ of one player is 2.25 or 3.25, the game system cannot evolve to (cooperate, cooperate) and the frequence of cooperation will decrease compared with the initial status. The higher κ, the faster the system evolves.

Fig 3. The sensitivity of ε.

Fig 4. The sensitivity of κ.

The Influence of Ability of Players

1) The influence of strengths α_j or β_i: It is known that the complementary ability influence the gains of cooperation. However, as the Fig 5 shows, as long as the strengths of one player is weak ($\alpha_j = 0.2$ or $\beta_i = 0.2$), the frequence of cooperation in the game system can to evolve to 1. On the contrary, expected that the strengths of opponent player is 0.2, as long as the strengths of one player is strong especially ($\alpha_j = 1$ or $\beta_i = 1$), the game system cannot evolve to (cooperate, cooperate). It indicates that stable cooperation are more likely obtained between the strong and the weak or

between the weak in the game system. Because that the weak can get much more gains by cooperating with others compared with innovating independently and they have no ability to betray halfway. The reason why stable cooperation cannot be formed between the strong is that the strong have a high perceived return on independent innovation. It is especially possible for the strong to betray halfway to get speculative gains and avoid technological spillover losses brought by cooperative innovation.

2) The influence of weaknesses α_i or β_j : As the Fig 6 shows, the evolution of players' behavior is sensitive to participants' weaknesses too. And different from the impact of strengths, as long as the weaknesses of one player is especially high ($\alpha_i = 1$ or $\beta_j = 1$) , the game system would not evolve to (cooperate, cooperate). The higher weaknesses are, the faster the frequence of cooperation in the game system evolves to 0.

Fig 5. The sensitivity of strengths α_j, β_i .

Fig 6. The sensitivity of strengths α_i, β_j .

Conclusion

The research object of this paper is the cooperative innovation network based on the platform collecting users' needs and cooperating depends on the strengths of participants. The research method is evolutionary game on complex network, the theory used includes the evolutionary game theory and the prospect theory. The main purpose of research is to analyze the factors influencing the evolution of the cooperative innovation. According to the simulative results, the following conclusions are obtained:

1) According to Prospect Theory, individuals' perception of gain or loss is diminishing marginal. And it is found that the effect of the sensitivity degree of marginal diminishing of perceived gains or losses on the frequency of cooperation is negative. The less sensitive participants are to diminishing marginal returns, the smaller the perceived value of marginal decline returns, and the more likely they are to build stable cooperative relationships with other participants.

2) The coefficient of loss avoidance affects the cooperative frequency negatively. The prospect theory holds that most individuals are more sensitive to loss than gain. Actually, the less sensitive participants are to loss, the smaller the perceived loss of cooperation, and the more likely the game system evolve to (cooperate, cooperate).

3) To meet users' needs, participants join in the platform ecosystem cooperate with the another one who complement its ability to identify or implement users' needs. Although, the strengths of cooperators affect the gains of cooperation, there is the optimal strengths to ensure the benefits of cooperation and achieve win-win cooperation. It is less likely for the game system evolve to (cooperate, cooperate) between the strong.

4) The weaknesses affect the evolution of the game system negatively by influencing the participants' perceptive value of independent innovation. And as long as the weaknesses of one player is especially high, the win-win cooperation would not be achieved.

In sum, participants, who participate in the platform collecting users' needs and cooperate depends on the strengths of participants, should investigate and measure the one's sensitivity to marginal gains or losses and risk preference in advance before choosing the cooperators.

Abstract

Information is an essential element of human life. The means of communicating information has evolved over the centuries - people have striven to transmit more and more information. With the transmission of information is related to energy consumption and one of the goals has always been to minimize the energy required. For this purpose, a number of methods are used – eg. eliminating redundant information without loss of information content, but also decides to limit some information content in a manner to avoid any damage transmitted information - eg. reducing image resolution. Information transmission methods are also optimized in terms of channel capacity and transmission energy efficiency. All these activities allow to send more information faster and with less and less energy consumption.

Keywords: Information Technology, Modulation, Compression, Radiocommunication Systems, Electromagnetic Environment, 5G.

Introduction

The main task of telecommunication is to transmit information from the sender to the recipient. Usually, information is sent in the form of a message and the entire procedure is based on a typical scheme:

information → information preparation → sending message → receiving message → retrieving information from message.

This universal scheme is a subject of various modifications depending on the type of information and the way it is transmitted, but in each case, it is possible to distinguish individual stages and always note that a specific amount of energy is required to achieve them. It has always been tried to minimize the energy needed to transmit information, and this also applies to telecommunication, and in particular radiocommunication. The paper presents examples of the use of various techniques to optimize the amount of messages and energy necessary to transmit information in various telecommunication systems.

Information in Telecommunication

As mentioned in the introduction, information is usually provided in the form of a message - and it must be remembered that not every message can carry information, and at the same time - the amount of information in one message can be very different. In the "digitized" world, the smallest unit of information is a bit, so information content of a message can be determined in bits/message, which already gives the first estimates of the information density in various messages - of course, the main aim is to fit as many bits as possible in a given message. The number of messages sent in time is limited - it is limited by the so-called channel bandwidth (Cisco, 2017). If the limitation concerns the number of bits that can be transferred, there is nothing else but to rationally manage these bits and maximize the amount of information content in the available number of bits. It is directly connected to the compression, and the coding of information supporting it. Compression can be lossless and lossy. In the case of lossless compression, the source information can be reproduced at the recipient's end in the same form as before compression. Examples of lossless compression can be found in compression of digital files - the popular "ZIP" or "RAR". It consists in "clever" processing of information in such a way as to arrange the information as well as possible - for example, instead of sending a long string of

zeros, one can send information about the number of consecutive zeros or ones. It is also worth noting that the currently used file formats have in many cases built-in mechanisms of such compression - an example of this is MS Word's save formats - doc and docx. It can be observed by saving the same large text file in both formats and then "zip them up". The second direction used in lossless compression is concerning the elimination of redundant information. The analog color TV signal is a good example from telecommunication. To maintain compatibility with "black and white" television, it was necessary to send the Y luminance signal – which consists information about the brightness of the image. It was sent together with information about the chrominance of the three RGB colors. There is a clear redundancy here - luminance information is also transmitted in the full chrominance signal. What was done? The chrominance signal was converted into the so-called differential signals - R-Y and B-Y, i.e. the difference between the signal representing the red color R and the luminance signal Y. The same was done with the low color B. But the green color G was omitted - why? In short - subtracting the R and B colors from the luminance will leave what belongs to the G color – so why send it additionally? Hence, it was noticed for example in (ITU-R M.2320, 2014) that the chrominance signals can be reduced without losing the quality of the received image - and this is where the field for lossy compression begins. It consists of eliminating from the source information those elements, which - very generally speaking - are not necessary for the correct interpretation of the information by the recipient as example we can refer to (International Standard ISO/IEC 11172, 1993). Of course, the information received in this way will not be identical to the source information - but it will be useful for the recipient. Lossy compression is used in particular for information that is interpreted by our senses - sound, image, but also the written word. In the implementation of lossy compression, certain features of our senses are used and these senses are somewhat cheated. The aforementioned chrominance may be once again used as an example. The sense of sight is much more sensitive to brightness than to color - so information about the color can be impoverished - it can be sent, for example, with "lower resolution". There are other examples, e.g. image details are "masked" by dominant planes, especially bright - glare, or inability to notice details when the object is moving rapidly. It is a similar situation in case of sound - with appropriate algorithms, the number of bits intended to transmit the same - in fact almost the same – information can be significantly reduced what was described in many papers:(Berg J., Bustad Ch., Jonsson L., Mossberg L., Nyberg D. 2013), (Gafer A.Y., Elsadig S., Varun J. 2012). Music and a CD can be used as an example - 1MB of data on CD corresponds to about 7 seconds of music. The same music in good quality MP3 format will take only about 80kB - so it is compressed 13 times. The possibilities of various compression levels are used, for example, in digital radio. Table 1 shows the typical bit rates used in the two standards DAB (Digital Audio Broadcasting).

Table 1: Required bitrate for various radio programs1) in DAB and DAB+ standard

Type of program:	**DAB**	**DAB+**
Stereo sound (high quality music)	192kb/s	80kb/s
Stereo sound (good quality music)	128kb/s	64kb/s
Stereo sound (standard quality music)	112kb/s	48kb/s
Mono sound (good quality music)	96kb/s	48kb/s
Mono sound (music/voice services)	64kb/s	32kb/s
Mono sound (announcements: weather, traffic)	48kb/s	24kb/s

Therefore, depending on the needs and the type of transmitted information, the differences in bitrate can reach up to 400% within one system. Additionally, thanks to the use of more efficient methods of encoding and compression, the newer DAB + standard is practically two times more efficient than its predecessor DAB. Same is true about images. One photo of 1024x768 pixels in uncompressed version - the so-called RAW - with 8-bit sampling of each RGB color it will have approx. 2.4MB. When it is in jpg compression, it will have only several dozen kilobytes.

The following conclusion may be drawn - when we want to send a lot of information quickly - we must try to optimize this information to make sure that redundant elements are not included. It calls for the

need to "censor" this information, depriving it of "unnecessary" elements. At the same time, it must not be forgotten that such preparation of information takes time and energy. Time is an important factor as the speed of the compression process is of great importance when transferring “live” information.

Transmission of Information

In telecommunication systems, the information should be prepared for optimal transmission over the transmission channel. This is achieved by broadly understood modulation. From the point of view of current considerations, its primary role is to make the best use of the available resources - the transmission channel - to send as much information as possible. In the case of digital modulation, the smallest "quantum" of transmission is a single modulation symbol. And here comes another optimization plane - the so-called valence modulation. The simplest modulation allows to send only one bit in one symbol - e.g. modulation OOK (*carrier On-Off-Keying*) or BPSK (*Binary Phase Shift Keying*) or BFSK (*Binary Frequency Shift Keying*). Commonly used multi-value modulations allow sending 2 (np. QPSK - *Quadrature Phase Shift Keying*) to 8 bits – e.g. 256QAM (*Quadrature Amplitude Modulation*). Moreover - the use of appropriate modulation formulas and transmission standards allows for optimal use of the channel band. As a rule, optimization consists in obtaining the possibly uniform spectral density. This is achieved, inter alia, by the use of broadband techniques - e.g. WCDMA (*Wideband Code Division Multiple Access*) used in the UMTS mobile phone standard (*Universal Mobile Telecommunications System*) or an increasingly more often used technique called OFDM (*Orthogonal Frequency-Division Multiplexing*) – e.g. on digital television and terrestrial radio (DVBT and DAB) or LTE system (*Long Term Evolution)* superseding UMTS in mobile phone technologies (3GPP TR 38.913 V15.0.0. 2018), (ITU-R M.2083 2015) and (Spectrum used for LTE 2017). By optimally using the transmission bandwidth, the best possible channel capacity is obtained, and selecting the appropriate modulation additionally improves the energy balance of the system. In detail i

Information Energy

It takes a certain amount of energy to send each piece of information. Depending on the type of transmission channel and the used modulation, sending one bit will require different energy. Overall, it can be said that different modulations have different energy efficiency η_E, which can be described as the ratio of the energy used directly to transmit information E_i to the total energy emitted by the system E_t. – formula (1):

$$\eta_E = \frac{E_i}{E_t} \cdot 100\% \tag{1}$$

It should also be remembered that for the correct reception of information by the receiver, it is necessary to supply the input with a signal of appropriate energy. However, this is not a sufficient condition - the appropriate ratio of the useful signal to the interfering signals must also be maintained (SNR - *signal to noise ratio or CNIR - carrier-to-noise-and-interference ratio*). Moreover, the ratio required for the proper operation of the system usually increases with the modulation valency (i.e. the more efficient the modulation, the higher the signal to noise ratio required). This issue is particularly important in radiocommunication. This is one of the reasons why it may happen that in one place, despite the high level of the Wi-Fi signal, we have a very slow transmission - because there are other networks in the area and our signal-to-noise ratio is small, and elsewhere even though there is a weak signal - the transmission is much better because there is an "electromagnetic void" in the vicinity.

And the last piece of the puzzle - energy efficiency – concerns the part of the energy emitted by the transmitter can be used by the receiver. There are two aspects here - energy losses, e.g. by attenuation of the transmission path (e.g. cable or optical fiber or attenuation of the microwave signal by rain) and signal scattering - the problem of all radio transmissions, but also e.g. optical transmissions in free space. It results from sending information "over the air" - by an area much larger than needed for signal reception by the receiver. This is illustrated quite well by the example of a mobile telephony base station. Let us analyze the following situation. Let us assume a typical sector of base stations - with an antenna half power angle equal to 60° in azimuth and 12° with 2° tilt in the elevation. Let us assume

that the range is limited by the area determined by the signal decrease by half in azimuth and elevation. The radius of such a cell will be about 400 m with a width of about 90º in azimuth. The area of a cell defined in this way can be estimated at approx. p = 120 000 m^2. To simplify the analysis, let us assume that the energy needed to transmit at any point in the cell is constant and is described by the power density at the receiving point S_1=1 mW/m^2. Since the energy is transmitted through the antenna to the entire sector - that is, the required radiated power described by EIRP (*Equivalent Isotropical Radiated Power*) is equal to $EIRP_1$ = 120 W for one connection. If there are 100 users in a cell – EIRP os the station is $EIRP_{100}$=12 000 W, and the power density at any point in the cell is S_{100}=100 mW/m^2. If it was possible to send this energy exactly to the area of e.g. 1 m^2 to the place where the receiver stands - the necessary EIRP power would be only 1 mW, and apart from the "channel" from the transmitter to the receiver with an area of 1 m^2 electromagnetic fields from this system would not exist at all. Of course, this is an ideal situation. However, let's consider another case, that the analyzed cell, without changing the other parameters, was divided into 4 smaller ones - each with the same area. In each of the new sectors, the required power density remains S_{1n}=1 mW/m^2, so nothing changes. However, if there is only one user in the area of the old cell, the electromagnetic energy must be emitted only to one of the new sectors, the area of which will be p_n=30 000 m^2, so the needed EIRP = 30 W and although the power density in the sector where the user is currently present is the same as for a single large cell, no electromagnetic energy is emitted to the other three new sectors. If there will be 100 users, evenly distributed in four new sectors - S_{25}=25 mW/m^2 should be ensured in each sector, so $EIRP_{25n}$=25·30 000 = 750 000 mW = 750 W, and as an effect it will be 3000 W in all sectors – which gives a 4-fold reduction in energy emitted to the environment and a 4-fold reduction in power density in places where users are present. Of course - if all users are gathered together in one small cell - the power density in that cell will be the same as in the large cell before the split - but ¾ of the old cell will not emit electromagnetic energy at all. Therefore, ¼ of previously emitted energy is sufficient. Hence, a significant improvement in the energy efficiency of the system is achieved, while acting pro-ecologically - reducing the emission of electromagnetic energy to the environment. To sum up, in the first approximation - the n-fold reduction in the cell surface allows for an n-fold reduction in the energy necessary to ensure transmission, and thus the n-fold increase in the "energy efficiency" of the system. In a real system, the effect will be even greater, because the energy necessary to transmit at the edge of the cell is at least several times greater than in its center, and thus the energy emitted by the base station to the entire cell will also be several times greater.

Conclusions

Information is energy - sending any information requires a certain amount of energy and the task of engineers is to optimize these systems in order to send information with as little energy as possible and using available resources as optimally as possible. That is because not only energy is important here - but also the possibility of sending as much information as possible in the shortest possible time. It should be emphasized that we are dealing here with a synergy of the amount of information and energy - but in real conditions, increasing the energy will not always bring about the expected increase in the amount of information that can be sent - because we must remember about the *carrier-to-noise-and-interference ratio*. It is certainly worth to direct efforts towards the optimal use of the emitted energy - especially in radiocommunication - and this is what the 5G technology with a large number of small cells and antenna systems allows for. Of course, it should be taken into account that the beginnings of the implementation of this technology will be based on the expansion of the already existing base stations - as was the case with the introduction of next generations of mobile telephony, but this is not the direction that can ensure obtaining optimal system parameters as described in (Okumura Y. 2014), (ITU-R M.2376 2013), (Rangan S, Rappaport S, Erkip E 2014) and (Wu T, Rappaport S, Collins C 2015). Only the construction of a large number of small base stations with relatively low power each will allow for high network capacity with a reasonable energy balance. The only concern may be based on the economic aspect - building a large number of small base stations may turn out to be much more expensive than extending the existing ones

Acknowledgment

The research was conducted thanks to internal resources of Wroclaw University of Science and Technology for the scientific research. The support is appreciated very much.

Abstract

Each organization strives to achieve market leadership. To be competitive, organizations need to use human resources efficiently. In the current conditions, it is crucial to stimulate employees to increase labor productivity and improve the quality of work and services. Organizations need to focus on the practical sphere of management and scientific interests and to develop a system of incentives to motivate research scientists. TAnalyzing this problem and the conditions in Russia and abroad, the authors came to the conclusion that the personnel incentive system needs to be improved to motivate the research scientists. Since the technological progress brings about better working conditions, staffs need to improve their professional qualifications. However, there are even more problems in the sphere of personnel management. In most organizations, especially in non-profit organizations, managers do not aspire to find the ways to motivate their research staff. The authors made a number of theoretical conclusions and proposed the ways to develop a system of material incentives for research scientists, which can be a basis for further research in the field of personnel management of organizations. As for the practical significance of the research, the authors gave some useful recommendations to personnel managers of all kinds of research organizations.

Keywords: personnel management, staff incentives, scientific staff, incentive system

Introduction

Motivation and incentives play the most important role in management because the goals of the organization can be achieved only in case its employees work as a team. The task of a competent leader is not only to encourage the staff to work efficiently and to take into account the interests of the employees, but also to make the personnel feel satisfied with the results of their work. Following a number of recommendations, employees try to work creatively. Currently, in the scientific and educational literature the terms "motivation" and "stimulation" are defined in different ways, which means that both concepts are complex and multifaceted and need to be studied thoroughly. The authors analyzed different approaches to the definitions of these terms and made a conclusion that motivation depends on our needs and views on life. M.D. Ivanova and N.S. Zalutskaya use different approaches to defining the concept of "motivation". M.D. Ivanova believes that motivation depends only on the internal, physiological and psychological sides of the personnel. Whereas N.S. Zalutskaya

claims that this process depends not only on the internal side but also on the external forces of motivation: the knowledge, emotions and experience. A.K. Suetov notes that the process of motivation can affect not only an individual, but also a team of employees who have common motives and goals at work.

Thus, the authors of the article concluded that such methods of labor management as motivation and incentives are interrelated concepts that complement each other.

he purpose of the article is to prove theoretically the necessity of the development of the incentive system within an organization.

Methods

The research is based on the scientific works that deal with the problem of stimulating and motivating research scientists in an organization. To collect and study theoretical and empirical material, the authors applied the method of analysis, the method of synthesis, methods of cognition and classification, methods of comparison and generalization. Statistical analysis methods were used to determine the criteria for assessing the performance of employees. As for the regulatory framework, the authors studied the following legal acts: Labor Code of the Russian Federation; Federal Law of the Russian Federation "On Personal Data"; Federal Law "On Information, Information Technologies and Information Protection"; Federal Law "On Science and State Scientific and Technical Policy". As for the resource base of the work, the authors studied various kinds of materials (articles, calculations etc.); publications from the e-library; publicly available financial reports of the company.

As for the methodological basis of the research, a number of scientific approaches were used. According to the systemic approach, stimulation is a set of interrelated elements. According to the process approach, stimulation is defined as a number of sequentially performed operations (there is an algorithm for the formation of incentive payments). The authors applied an integrated approach to study the methods of stimulating employees and the ways to assess labour efficiency. The research methodology has two stages.

At the first stage, the authors studied the job description of research scientists. At the second stage, the incentive system was analyzed.

Job description of research scientists.

According to the Federal Law "On Science and State Scientific and Technical Policy", a research scientist (a researcher) is "an employee who has the necessary qualifications and is professionally engaged in scientific and (or) scientific and technical activities."

Research scientists work in research organizations, institutions of higher education, training organizations delivering vocational education programs and other scientific institutions. Researchers can do their work individually and in a team.

Research scientists can hold the following positions:

– a junior research assistant focuses on specific objectives of the study (carries out observations and experiments, makes measurements, etc.). Under the supervision of the principal investigator, a junior research assistant analyzes the work of other researchers dealing with the problem under study and improves his/her qualifications;

– a principal investigator conducts scientific research within specific project sections, makes observations, etc. A principal investigator is involved in the development of the research plan and its practical implementation. He/she arranges an educational process in universities and scientific institutions (develops and delivers special courses, supervises students who write course papers or work on diploma projects, etc.);

– a senior researcher independently conducts research and works on challenging projects, he/she is in charge of various groups of employees he/she sets goals for. A senior researcher develops and implements personnel training programs. He/she is also involved in the development of the research

plan and its practical implementation. He/she arranges an educational process in universities and scientific institutions (develops and delivers special courses, supervises students who write course papers or work on diploma projects, etc.);

– a leading research scientist supervises a group of researchers who perform their work in accordance with the regulations. He/she is directly involved in research (develops theoretical and practical methods and substantiates his/her proposals, organizes and coordinates the work of the employees and comes up with the ideas where the science projects can be implemented). A leading research scientist develops and implements personnel training programs and conducts training courses for specialists taking part in the educational and scientific process in universities and scientific institutions;

– a chief researcher mainly supervises subordinate staff conducting scientific research. Apart from that, he/she is also involved in the development of the research plan and its practical implementation (defines the research direction, selects methods, techniques and tools, coordinates the work of research workers, analyzes the work of domestic and foreign researchers dealing with the problem under study, comes up with the ideas where the theoretical and practical findings can be implemented, and participates in the work of research scientists). A chief researcher develops and implements personnel training programs and conducts training courses for specialists taking part in the educational and scientific process in universities and various scientific institutions.

Taking into account the job description of research workers, the authors of the article made a conclusion that researchers can get a financial reward in accordance with their publication activity and applied developments.

The performance results should be differentiated.

A researcher can work independently or in a team. However, the incentive payment does not depend on the number of participants working on the project.

Taking into account the job description of research scientists, the authors of the article proposed an incentive scheme.

Specifics of the incentive system

Before considering the specifics of the incentive system, the authors of the article analyzed the concept of system and specifics of its elements. They took into consideration the general theory of systems proposed by L. Bertalanffy, I.V. Blauberg, A.A. Bogdanov, S.V. Leontyev, M.A. Parkhomchuk, S.A. Starykh and other researchers.

Then the authors analyzed the specifics of the concept of system and its components.

A system is a collection of related elements which are linked together to achieve a specific goal. An element is the smallest indivisible object which has specific properties. A system consists of such elements as a subject, a goal, objectives, principles, mechanism (techniques and tools), and an object. The goal defines the principles, objectives of the development and application of the mechanism. Objectives are a set of interrelated benchmarks that specify the goal. The subject influences the object of the system through the mechanism techniques and tools. An object is process or a phenomenon which is under the influence of the mechanism techniques and tools. A mechanism is a means of achieving the goal. It determines the way the subject influences the object.

Techniques are a system of operations and procedures carried out by the subjects of management in a certain sequence. A set of tools is used to perform these procedures. Alongside with the applied mechanism and techniques, tools are used to solve a particular task.

After examining the concept of system, the authors analyzed the specifics of the incentive system. An incentive system is a set of related elements and measures motivating employees. These elements and measures are linked together to achieve a specific goal.

The incentive system is a collection of elements linked together to stimulate research scientists to work more efficiently, which will improve the profitability of the organization. To understand how an incentive system works, the authors analyzed the specifics of its elements and their interrelation (Fig. 1).

Fig. 1: Incentive system for researchers

Results and Discussion

The system includes subject-object relations, where the head of the organization, heads of structural divisions and moderators are the subject. In the system of material incentives, research scientists are the object.

The goal of the incentive system is to stimulate research scientists to work more efficiently, which will improve the profitability of the organization.

- the objectives are: to increase motivation, to develop creative initiative, to determine the maximum potential, to introduce differential assessment practice, to improve working efficiency and to monitor results;

- the basic principles of the incentive system are:

• fairness (researchers are rewarded in accordance with the rating and the merit pay depends on the quality and quantity of work);

• equal opportunities (all employees have equal opportunities and can be engaged in all activities). This means that every researcher can work in a team and be rewarded for any achievement, regardless of his/her position, qualifications, salary, gender, age, ethnicity and other distinctive characteristics);

• objectivity (the employee performance is objectively assessed);

• flexibility (the present Regulations on incentives for research scientists can be changed at any stage of the development of the organization);

• perceptibility (the incentive system is effective and stimulates researchers to improve working efficiency);

• consistency (the criteria of the performance assessment system do not contradict the goals and results of the organization);

• transparency (the incentive system is transparent, clear and verifiable);

• awareness (all research scientists are informed in a timely manner);
