(source: own study)

Conclusions

The expert study studies presented in this publication (see fig. 1 - scheme of the method of researching) using: PEST analysis, the brainstorming technique, the Delphi approach and the fuzzy formula of inference, led to the formulation of fifty relational managerial premises linking the macro-environmental conditions of the implementation (10MECI – see fig. 1) of the INDUSTRY 4.0 concept with five attributes (5IMAT – see fig. 1) of this implementation. Numerically expressed in the probability of significance of each of these relational premises can be the starting point for an unsupervised hierarchical classification of their structure. Discovering knowledge about this type of structure is quasi-taxonomic. In addition to its cognitive value, it can support managerial implementation decisions in industrial practice.

The research was conducted in the first half of 2020 using the eMeeting computer application. The source of research funding was the grant of the Faculty of Engineering Management at the Poznan University of Technology entitled: ""Management in Industry 4.0".

According to the criterion of the highest numerical probabilities of the significance of managerial relational premises (0.833 and 0.714 - see Table 5) five levels of the most important twenty-six management premises for the implementation of the INDUSTRY 4.0 concept can be distinguished. These levels were determined by preferring twenty-six most important managerial premises (out of a potential fifty). The basis for scheduling the above-mentioned five levels was the so-called Quasi-Taxonomic Indicator (see - Table 5). A quasi-taxonomy (5QTAX – see fig. 1) developed in this way (starting with the premises with the highest probability of significance) includes:

1) Level one (Quasi-Taxonomic Indicator 3.7), which includes:

    - Four relational premises linking the managerial problem of the threat of cyber-attacks and the protection of the company's knowledge resources with the following attributes of the INDUSTRY 4.0 concept: cyber-computerization of product manufacturing and operation processes, information and decision-making interoperability and autonomy of the mentioned processes, functionality and reliability of these processes and their integration and logistic flexibility.
    - Four relational premises linking the managerial problem of excessive investment costs of the implementation of the INDUSTRY 4.0 concept in the context of its two above-mentioned attributes: cyber-computerization of product manufacturing and operation processes, and information and decision-making interoperability and autonomy of these processes, as well as in the context of the following two implementation attributes: logistic integrity and flexibility of processes and their marketing personalization.
2) Level two (Quasi-Taxonomic Indicators 3.5 and 3.6), which includes:
    - Four relational premises linking the managerial problem of the difficulty of obtaining the reliability and stability of cyber-systems necessary for time-critical computer processing with the following attributes of the INDUSTRY 4.0 concept: cyber-computerization of product manufacturing and operation processes, information and decision-making interoperability and autonomy of the mentioned processes, functionality and the reliability of these processes and their integration and logistic flexibility.
    - Three relational premises linking the managerial problem of the need to constantly maintain the integrity of cyber-systems and processes of product manufacturing and operation with the following attributes of the INDUSTRY 4.0 concept: information and decision-making inter-operability and autonomy of product manufacturing and operation processes, functionality and reliability of these processes and their marketing personalization .
3) Level three (Quasi-Taxonomic Indicator 3.2), which includes:
    - Two relational premises linking the managerial problem of political determinants of professional legislation with regard to the implementation of the INDUSTRY 4.0 concept with its following attributes: cyber-computerization of product manufacturing and operation processes and their marketing personalization.
    - Two relational premises linking the managerial problem of social distrust in cyber-computer supervision over the threats of violating privacy, freedom and cultural identity. These relations mainly concern two attributes of the INDUSTRY 4.0 concept: cyber-computerization of the processes of production and operation of products and their marketing personalization.
4) Level four (Quasi-Taxonomic Indicator 3.1), which includes:

- Two relational premises linking the managerial problem of the difficult adaptation of the company's current business model to the requirements of the INDUSTRY 4.0 concept. These relations mainly concern two attributes of this concept: information and decision-making inter-operability and autonomy of the processes of production and operation of products, as well as the functionality and reliability of these processes.
- Two relational premises linking the managerial social problem of threats, in the context of the implementation of the INDUSTRY 4.0 concept, loss of jobs by people who previously performed work and coordination activities. These relations mainly concern the cyber-computerization of the processes of production and exploitation of products as well as the information and decision-making interoperability and autonomy of the mentioned processes.

5) The fifth level (Quasi-Taxonomic Indicator 3.0), which includes:
   - Two relational premises linking the managerial problem of legislative and implementation complexity of standards and certification of the implementation requirements of the INDUSTRY 4.0 concept. These relations mainly concern the integrity and logistic flexibility of the processes of production and operation of products as well as their marketing personalization.
   - Two relational premises linking the management problem of functional and competence redundancy of the corporate IT department in connection with the implementation of the INDUSTRY 4.0 concept. These relations mainly concern two attributes of this implementation: functionality and reliability of the processes of production and exploitation of products and their marketing personalization.

As part of the general conclusion it should be emphasized that the decision-making management problem regarding the premises for the implementation of the INDUSTRY 4.0 concept in an automotive industry enterprise is primarily related to the macro-environmental technological and organizational conditions.

Within twenty-six most important relations (the dominant relation and the significant relation) half of them (thirteen) belong to this range of premises for implementation. These conditions include the following three conditions:

- the threat of cyber-attacks and protection of the enterprises' knowledge resources,
- difficulty in obtaining the reliability and stability of cyber-systems necessary for time-critical computer processing,
- the need to constantly maintain the integrity of cyber-systems and product manufacturing and operation processes.

The six most important relations concern the premises for the implementation of the INDUSTRY 4.0 concept related to two macro-environmental economic conditions (excessive investment costs of implementation and the difficulty of adapting the enterprises' current business model to the requirements of the INDUSTRY 4.0 concept implementation).

The four most important reports concern the premises for the implementation of the INDUSTRY 4.0 concept related to two macro-environmental political and legal conditions (the problem of political conditions of professional legislation in the field of the implementation of the INDUSTRY 4.0 concept and the legislative and implementation complexity of standards and certification of this implementation).

The three most important accounts concern the premises for the implementation of the INDUSTRY 4.0 concept related to two macro-environmental socio-cultural conditions (lack of social trust in cyber-computer supervision over the threats of violating privacy, freedom and cultural identity and the risk of losing job by people who previously performed work and coordination activities) .

Abstract

The preparation and organizing of task orders is the core of a well-functioning repair company. Many such structures ought to operate correctly to prepare and schedule for repairs. More notably, routine repair machinery reviews, professional files, such as inventory reports, job order background, and regular task schedules. Maintenance repair component stores will perform well. The preparation and organizing of task orders is the nucleus of a well-functioning maintenance company. Many other structures will function well with repair preparation and scheduling. Most notably, routine repair machinery checks, technological records, including supplies bills, job order background, and regular job plans. Maintenance repair parts stores will operate well. An inventory management framework for each organization is necessary to meet client necessities in a convenient and savvy way. The determination and execution of an inventory management framework for the management of each organization are significant. In this article, we will dissect the most utilized inventory management instruments and actualize the case management framework dependent on accurate information from furniture organizations. At last, we will contrast the inventory management framework executed and the current framework and get the outcomes.

Keywords: Maintenance, Operations Management, Operations Planning, Supply Methods.

Introduction

Organizations may imply any organization or corporation, or it may indicate the method of arranging anything (Posch & Garaus, 2019; Mohammadi et al. 2020). The maintenance manager needs to ensure that maintenance is performed correctly and keep everybody satisfied. To accomplish effective results, construction administrators will coordinate operations to their divisions to ensure they can fulfill customers' demands and goals. Only one person of one agency may hold repair organizations (Hartini et al. 2020). Weak management practices, such as job preparation, can result in lousy maintenance. To achieve their aim, maintenance managers are necessary to enforce the management role in departments. There are four management roles that schedule, coordinate, direct, and control. A successful organization is essential to ensure that workers function appropriately. Maintenance workers need to know what research has been accepted, which parts need come, and where parts are stored to maintain things going smoothly. It is necessary to monitor who served on repairs after the job (Seadon & Tookey, 2019).

Maintenance is a blend of both technological and administrative steps to preserve and rebuild it to the degree possible. Support is a work that repairs all aspects of the building and its contents according to the norm. Operation, rectification, and repair are different maintenance elements. Research is done daily or even on a day-to-day basis. Correction function typically happens early in the building and may reduce repair costs (Milana et al. 2017). Replacement testing is undertaken to rebuild objects or structures after a functional breakdown. Subdivides repair into two unplanned operating schemes. Anticipated maintenance involves scheduled preventive maintenance and anticipated corrective maintenance of different meanings. Scheduled preventive maintenance means work carried out to stop the deterioration of objects or equipment within the expected life of the installation when conducting planned corrective maintenance (Stephan & Athanassiadis, 2018). Support can be seen to have value for investment, and multiple maintenance programs may be

enhanced by better supervision. Maintenance will at least be tested at reduced costs by requiring more cash if it is not held next (Kärkkäinen & Pirkkalainen, 2020).

Planning is the mechanism by which the planner plans about the future and steps to make the potential decision. At the preparation point, maintenance managers usually establish or schedule the company's goal to ensure the tenants' happiness. During the planning process, the Maintenance Manager will also plan to achieve the objective, such as to provide a minimum service for the tenant's property. According to the planning horizon, the development process may be split into three primary stages: Long-range, Medium-range, and Short-range preparation (Ngadiman et al. 2020).

Ventures that actualize improved anticipating frameworks to make the manufacturing arranging process progressively effective. Because of this errand's multifaceted nature, organizations decide an extraordinary unit to complete estimating undertakings utilizing factual programming frameworks. In this day and age, organizations contend intently and improve their procedures by making flexible chain management as productive as could reasonably be expected (Alfares & Ghaithan, 2019; Mikulskiene & Vedluga, 2019). The mechanical part needs to settle on anticipating choices, considering vulnerabilities that can influence generally speaking creation. For instance, a diminishing in advertises interest for a specific item over some time could without much of a stretch adjust the estimate. Getting ready for material prerequisites depends on choices to estimate conveyance groups varying for a restricted timeframe. On the off chance that the requirements are known over a period skyline, a static monetary-sized model can produce down to earth and ideal arrangements (Geunes, 2018). Organizations apply EOQ models to decide the practical request parcel's size to diminish requesting and holding costs. Likewise, the conservative production amount (EPQ) is utilized to limit the expense of setting up assembling, and completed items by deciding the size of the monetarily fabricated bunch (Cunha, et al. 2018).

Throughout the years, scientists have utilized various techniques to gauge the presentation of weighing strategies in different time arrangement dependent on the root mean square blunder (MSE), the heart says square mistake (RMSE), the mean total deviation (MAD), and the mean absolute error (MAE). It means a complete blunder in percentage (MAPE) (Murali, & Prabukarthi, 2020). As it may, every technique has its cutoff points and should be known to the client before gauging. This report comprises a contextual analysis of an arranged furniture producer.

Research Questions

- To investigate the more efficient inventory management model
- To examine the different methods of planning, organizing, and controlling the maintenance of the company.

Literature Review

Security building is an advantage that individuals choose to use for housing or jobs. It is necessary to repair the property and guarantee that the house's worth is not depreciated (Shaw et al. 2020). British guidelines (8210) describe a home as an asset that must be maintained not to devalue the property (Biswas & Sarker, 2020). As an owner or occupant, we have to understand that building is a valuable asset that we should keep in good shape to deter any damaging or failing impact (Frick et al. 2020). Any disruption to the structure will be achieved by repairs to prevent serious impact to the house. The minor harm would need less money than severe damage. The owner or renters will then call the repair firm to do construction work on their home (Li et al. 2020).

Maintenance preparation and Organizing are styles of management strategies that coordinate the maintenance staff. Development and planning is a systematic method of using operational tools to reduce productivity and time (Aljazzar & Gurtu, 2019). The repair program is thriving as attempts are taken to remove the source of loss of output due to the machinery's malfunction or to optimize machine performance. Richard also believes that proper management and preparation can accomplish the organization's target (Eybers & Mayet, 2020). The most effective approach to achieve this aim is to prepare appropriate scheduling and development. It can continue to minimize repair expenses when the research is planned (Winarso & Jufriyanto, 2020). Therefore, it would increase maintenance workers' usage by maintenance preparation and scheduling and reduce delays and interruptions. By employing the right techniques and designating professional employees, repair jobs' efficiency may be increased (Azizi, 2019). The standard of repair jobs can be provided by efficient preparation and Organizing by following the right approaches, processes, and appointing the most skilled workforces (Salehzadeh et al. 2020.; Shahbazi & Jönbrink, 2020).

It could be inferred that it is necessary to coordinate maintenance and ensure that maintenance work is completed correctly. Adequate preparation provides the safest and most productive support (Bokrantz et al. 2020). The construction manager appoints the contractor management or direct labor to perform repair service. Research completed by the contractor or direct worker shall be compensated by the maintenance manager, as defined in the contract signed by all parties (Abu et al. 2019). Maintenance research is performed based on preparation designed by the boss. The schedule's management comprises three simple program maintenance levels: long-range planning, medium-range planning, and short-range planning. Once the development has been developed, the activities performed are divided into different maintenance categories, including correction, preventive, and modificatory maintenance. To avoid building deterioration, proactive maintenance should be performed according to the plan. Minor service is usually offered either regular or monthly (Chiputyani, 2019). New activities will be conducted quarterly. The boss will check to ensure the job that has not been done in compliance with the contract due to the rework will take time. Finally, the repair manager is liable for maintaining information on the tenants' properties quickly to operate by repairing the contractor. Active contact also promoted cooperation between consumers and contractors as in the future, and they would need each other (Malik & Kim, 2020).

Yaghin & Darvishi (2020) conducted a study to find how vulnerabilities regarding weakness and absence of information or epistemic vulnerability can be displayed with requirements and fluffy coefficients. This paper proposed another fuzzy programming scientific model that offers a potential demonstrating approach that can be tried with a vehicle seat assembly device and contrasted with other fluffy programming numerical methodologies. The proposed model is valuable for deciding the essential production plan, necessities arranging, inventory, request accumulation, and limit levels for a specific production plan. This work's significant trait is the proposed model, which considers the vulnerabilities with the absence of information in the information and the dubiousness that exists all through the production arranging (Arani & Torabi, 2018). Even though the analysts were chipping away at these two kinds of vulnerability, nobody took a gander at them simultaneously (Das & Edalatpanah, 2020).

There is an" IVB (coordinated merchant purchaser)" framework in which the purchaser's interest rate was consistent, and the maker needed to deliver a similar inventory mentioned by the purchaser. In any case, this model isn't appropriate if the development cost of the producer's production is more noteworthy than the expense of the purchaser's organization (Koch, 2020). As it may, numerous analysts have assessed and created IVB frameworks to be ideal for a solitary provider and purchaser issue. Another model that incorporates crude material gracefully and assembling design is classified" IPP (Integrated Procurement-Production)," which is responsible for upgrading clump sizes for a reasonable conveyance production framework on schedule (Khemri et al. 2017).

There are ideal rules for cluster sizes and crude material requests for production frameworks with a conveyance framework at explicit stretches and on-demand. There was no recognition of the PPI framework thinking about the purchaser's structure amount and capacity costs. He proposed a request essential financial parcel size (JELS) for the maker's crude materials, production part, and application from the purchaser than IVB and IPP frameworks dependent on a coordinated inventory control model (Vicente et al. 2020; Marchi et al. 2020).

Since request determining is a fundamental arranging step, most organizations use PC supported estimating frameworks to make early conjectures and make assessment alterations in later stages. It was analyzed whether evaluative acclimations to anticipation make it increasingly proficient and improve precision. More than 60,000 gauge information was gathered from four organizations in the flexible chain. They found that the more significant changes brought about a more normal improvement in exactness than the littler changes. Moreover, positive alterations (upward modification of conjectures) were less viable in improving precision than negative changes (Bertram et al. 2019).

A contextual investigation was distributed about techniques for altering occasional interest for stock at a substantial vehicle parts vendor. The basic methodology has been created to recognize occasional modifications utilizing an added substance deterioration process that can bring about a noteworthy decrease in estimate blunders and interests in wellbeing activities (Petropoulos et al. 2019). The organization was not intrigued by the outline estimate mistakes found in experimental examinations. Notwithstanding, they dissected the impacts of occasional alterations on inventory execution. The creators assessed the worldwide MAD of conjecture mistakes at any dispersion place, and any reduction in the MAD would diminish interests in security activities without influencing client assistance (Djunaidi et al. 2019).

Methodology

Company Profile

Al Tawan Manufacture LLC is specialized in stylish, sleek, and fashionable furniture and heavy furniture. Our broad range of products with continuous innovation through R&D are office chairs, sofas, multifunctional seating solutions, auditorium seats, Airport Benches.

Al Tawan Furniture Manufacturing LLC also provides its consumers with a wide variety of options, including personalizing unique leather and PVC on chairs and sofas. Our consultants can also evaluate and provide the right choices if our clients have a case that requires custody.

The maker of the highest price managed chairs and sofas is Al Tawan Furniture Manufacturing LLC. The services and amenities include. Experienced Office of science and technology. Specialized Quality Control equipment. More than 200 employees. State of Art Inventory and Management. State of Art Engineering Manufacturing Zone. Whatever the work, we have the equipment, experience, and capacity to produce the goods on time. Our varied capabilities help us distribute products locally and globally. The organization has actualized a procedure arranged quality management framework dependent on the new DIN EN ISO 9001: 2000 norm. It offers ergonomic furniture for the "school of things to come," including adaptable and portable seats. The company works for 250 days a year.

Data Analysis

Time Distribution

The time between sending the request to the purchaser and accepting the Furniture Company store's material is two months. The two months are partitioned as follows.

- The first week covers rates negotiations and finalization of material details.
- The remaining time is allocated for
  - Purchase of raw material
  - Manufacturing
  - Quality Assurance
  - Clearances from Ports

Backup Keeping

There is always a backup of material to cater to urgent orders and incorporate customized demands of the clients even after their order has been received.

Inventory Framework

The company is using a pipeline system to keep up its inventory.

The included items will be

- Chairs for classrooms
- Chairs without armrest
- Chairs for the waiting area
- Revolving Chairs
- Front desks

The gauge was utilized as a contribution to these models. Various sorts of estimating strategies have been used, in particular, two weighted moving midpoints, three weighted moving midpoints, exponential smoothing, and double exponential smoothing. The last two techniques were built utilizing various estimations of the consistent smoothing α. The prognostic outcomes were assessed using regular exactness measures: MAD, MSE and

MAPE. The most exact strategy was relegated to every item dependent on exactness estimations. The aftereffects of the exactness assessment of every article are introduced as follows:

Safety Stock

The company will keep a 15% safety stock of total inventory.

Suggested Models

The following two models are developed.

- "Material Requirement Planning (MRP)
- Economic Order Quantity system (EOQ)"

Table 1:the accuracy measures for chairs without armrest.

Accuracy Measure/Method	Smoothing Constant	Double Exponential Smoothing	Exponential Smoothing	Weighted MA(3)	Weighted MA(2)
MAPE	Alpha (α) = 0.12	32.432	29.7	25.272	24.584
MAD	Beta (β) = 0.16	391.465	388.011	324.644	353.578
MSE		285141.746	320323.126	253638.732	304579.022
Accuracy Measure/Method	Smoothing Constant	Double Exponential Smoothing	Exponential Smoothing	Weighted MA(3)	Weighted MA(2)
MSE	Alpha (α) = 0.15	302051.428	320535.475	253638.732	304579.022
MAPE	Beta (β) = 0.15	36.391	31.541	25.272	24.584
MAD		403.6764	392.694	324.644	353.578
Accuracy Measure/Method	Smoothing Constant	Double Exponential Smoothing	Exponential Smoothing	Weighted MA(3)	Weighted MA(2)
MSE	Alpha (α) = 0.2	319158.8494	325571.985	253638.732	304579.0228
MAD	Beta (β) = 0.15	416.911	399.1	324.644	353.578
MAPE		38.083	33.269	25.272	24.584
Accuracy Measure/Method	Smoothing Constant	Double Exponential Smoothing	Exponential Smoothing	Weighted MA(3)	Weighted MA(2)
MSE	Alpha (α) = 0.3	354062.144	343327.759	253638.732	304579.0228
MAPE	Beta (β) = 0.15	41.5	36.64	25.272	24.584
MAD		444.685	417.505	324.644	324.644

Table 2:Current demand for Chairs without armrest

Component\Month	1	2	3	4	5	6	7	8	9	10	11
Chairs without an armrest steel frame	1242	1291	848	668	1830	734	2452	1262	1200	1000	878
Rear glide right	1242	1291	848	668	1830	734	2452	1262	1200	1000	878
Front glide right	1242	1291	848	668	1830	734	2452	1262	1200	1000	878
Front glide left	2484	2506	1696	1336	1830	1468	4904	2524	2400	2000	1756
Fixing rod right	1242	1291	848	668	1830	734	2452	1262	1200	1000	878
Fixing rod left	1242	1291	848	668	1830	734	2452	1262	1200	1000	878
Shell	1242	1291	848	668	1830	734	2452	1262	1200	1000	878

Forecast demand for Chairs without armrest will be determined through formula "((Demand for period 1) + (2*Demand for period two) + (3*Demand for period 3))/6"
EOQ Forecast
The formula for calculation holding cost is
H= Unit Price * 10.73%
Similarly, Q will be calculated through a formula.
Q*= ((2DS)/H)) ^0.5

Table 3: Forecast of EoQ

Annual				Setup	Unit Price		
Demand (D)	**Qty / Unit**	**Holding Cost**	**Material Description**	**Cost**	**(AED)**	**Q***	**Code**

MRP Calculations

Table 4: MRP Calculations

Month	Nov	Oct	Sep	Aug	July	Jun	May	Apr	Mar	Feb	Jan
Planned Deliveries	851	851	851	851	851	851	851	851	851	851	851
Net Requirements	1108	1108	1108	1108	1105	1113	1107	1080	1200	1000	878
Planned Order Release (EOQ)			851	851	851	851	851	851	851	851	851
Time Phased Net Requirements			1108	1108	1108	1108	1105	1113	1107	1080	1200
Ending Inventory	-2553	-2296	-2040	-1783	-1526	-1271	-1009	-754	-525	-176	-27

Model Analysis

The correlation makes it understood to the leader to pick the best model that guarantees better control of the inventory framework.

Figure 1: Total Inventory Cost through EOQ Model

"Current Cost = 57039.2 AED Forecasted Cost = 55154 AED Percentage Reduced = 3.3%"

	1	2	3	4	5
Current Turnover Ratio	3.5	4.2	15.4	1.5	1.4
Forecasted Turnover Ratio	5.7	7.8	23.9	4.3	3.0

Figure 2:" Inventory Turn-Over of Products"

The turnover of every item was improved in the wake of diminishing the amount requested by executing the EOQ.

Figure 3: Total Inventory Cost through MRP Method

Current Cost = 57039.2 AED; Forecasted Cost = 71224 AED; Percentage Increased = 24.9%"

Reasonable inventory control affects any part of the company, from production costs to efficiently and timely order fulfillment. Unfortunately, resource accounting is a complicated corporate operation by hand. It takes time, and if ever makes a mistake, it can have consequences for months or years that negatively impact the company.

Minimize charges for housing

Every program for material control worth its salt will provide measurements of the essential quantity of economic order (EOQ). By comparing the costs of processing goods against shipping items, EOQ lets find the most cost-effective approach for buying new products. It can be achieved remotely through warehouse tracking tools to raise the warehousing costs and conserve capital.

Reduce Damages

Goods not delivered are simply liabilities to the business — have invested the money on the products now, so one can not reclaim the costs from selling the items. The program for inventory management helps reduce this possibility, as specific approaches provide a prediction. It involves monitoring the number of units sold and predicting the number of units would sell in the future. Also, for an automatic, computerized method, 100 percent prediction is not reliable. Having inventory tracking tools to measure you's details lso a lot more accurate than attempting to smash figures.

Enhance Product selection

Most stock control methods, as we have already described, provide analysis and automatic reorder protocols. It raises the likelihood that when consumers order something, one will have plenty of the commodity in store, which boosts customers' odds of discovering similar products (in scale, color, or other preferences).

Increase consistency of order

Many stock storage systems do provide inventory operations. It lets one retain a structured warehouse that eliminates the possibility of quickly moving fresh inventories into a random location, ignoring that they are there and losing control of the stock. It also lets warehouse workers select products with greater accuracy for consumer orders, ensuring that the company receives what they have requested.

Role of Operations

Attaining operational performance relies on management's willingness to recognize company goals, execute a strategic strategy, and promote the enterprise's approach. Assess the success of the market operations towards expected outcomes. Benchmarking and controlling the activities continuously reduce inefficiencies, such as raw material constraints, surplus supply, or inadequate workforce. For starters, one may assess the productivity of the manufacturing processes by tracking the activities against the output standards – from purchasing raw materials to the delivery of finished products, through controlling or running a small generating business. Some organizations delegate internal auditors and quality managers the task of managing the safety and performance of operations.

Operations area

Operations are the daily operations of the company that generate unique value and achieve core goals. Services perform distinctive functions that lead to the organization's overall performance. The Merriam-Webster dictionary defines an activity as "the execution of a realistic job or something that requires the practical implementation of concepts or procedures."

Resources

Resources are mainly the capital, workforce, machinery, and material components that are needed for growth. The managerial position helps to define and prepare the tools needed to achieve business objectives. The balancing of the capital and development goals would allow improving organizational performance. It is because one can control the operations' speed, efficiency, consistency, and versatility.

Efficiency

Ability implies the capacity to execute activities according to the appropriate levels of quality and quantity. Operations help to analyze and quantify resource’s technological and manufacturing ability. While it is a positive idea to have enough workers, one cannot afford to neglect such employees' ability to execute the tasks given to them—equally significant considerations such as expertise, technical knowledge, college backgrounds, and workplace abilities.

Production Output

Operational efficiency restricts production capacity and employee results, whether calculated in calls, orders filled or production units. Only when the company is responsive to the customers' needs and adaptable will achieve

excellent output efficiency. Consumer experience management operating processes are necessary to improve the client's orders and maximize production.

Recommendations

Focus on Growth – The business will strive to develop its operations, facilities, or goods incrementally. It involves changing the way one handle stuff on-the-go rather than making one-off improvements.
Creating a philosophy of change is the store staff, which is more frequently than not an authority in organizational practices rather than the managers. It will be everybody's duty in the organization (not just the operational management team) to change regularly.

Conclusion

In this article, we attempt to make an economic inventory management framework for a furniture producing organization in the wake of looking into a genuine contextual investigation. The proposed gauging strategy can create ideal inventory-related arrangements and can diminish requesting expenses and support costs. The EOQ and MRP determined for different segments recognized powerful cost investment funds for the anticipating procedure. Proper advancement strategies with probabilistic determining techniques might be helpful for future investigations.

Abstract

Recently, the issues of procurement fraud involving public sector officials and prosecution actions that have been taken on these perpetrators officials have been widely reported by the news. Issues such as bribery and corruption in the public sector in Malaysia can be the principal concern, impacting the quality and performance of the entire procurement process and resulting in large-scale wasting of public funds. Therefore, this study is carried out to examine the determinants of public procurement fraud occurrences among public sector officers in Malaysia. The data were collected through the distribution of questionnaire to the 25 ministries in Malaysia government and being processed using Statistical Package for Social Science (SPSS) software version 25. The findings of this study revealed a significant positive effect of opportunity and rationalization on the procurement fraud occurrences. The findings provide meaningful information from both theoretical and practical aspects to be used by the government and administration sector, ministries and academia. Limitations of the study and recommendations for future researches are also discussed.

Keywords: Public Procurement, Procurement Fraud Occurrences, Pressure, Opportunity, Rationalization, Workplace Spirituality

Introduction

National Fraud Authority recognized procurement fraud as a complex problem as it covers a wide range of illegal activities from bid rigging during the pre-contract award phase through to false invoicing in the post-contract award phase. It can be perpetrated by those inside and outside an organization. It is claimed that bribery in public procurement remains a problem due to individuals or agencies mixing personal interest in delivering their work such as undocumented supplementary fees or bribes for public deals and favouritism of related companies and people when determining policies and contracts (Pricewaterhouse Coopers, 2018).

Therefore, public procurement is claimed to be among the government activities that is most vulnerable to corruption and covers a wide range of illegal activities (Bernama, 2017). The procurement fraud issues have prompted the public

Cite this Article as: Nur Alia Fateha MOHD FAUDZI, Razana Juhaida JOHARI and Sharifah Nazatul Faiza SYED MUSTAPHA NAZRI "Public Procurement Fraud Occurrences: An Analysis of Fraud Triangle Elements Among Public Sector Officers in Malaysia" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

to review government's expenditure (Hui, Othman, Omar, Rahman, and Haron, 2011) and have led to public criticism on the public sector agencies. It is claimed that the officers are jeopardizing the interest of the society (Johari, Ida Rosnidah, Ahmad Nasfy and Sayed Hussin, 2020).

Auditor General's report has continuously revealed deceptive actions in Malaysia's public sector organizations that occurred in development project, equipment procurement and development project's failure. Buor (2019) noted that procurement fraud is due to the officer's lack of knowledge and misunderstanding of the rules and regulations relating to the procurement of project management transport services. From the auditor's work as being reported in the Auditor General Reports, there were many incidences where the public officials have failed to comply with procurement laws that should be followed by all the procurement officers. Earlier than that, a study conducted by Seng (2018) revealed that public sector officers are lacking in delivering their roles and responsibility to effectively discharge their function.

Therefore, by taking into account this issue, this current study is conducted to contribute to literature on the influence of fraud triangle elements that represent the individual factors of the public sector officers i.e. pressure, opportunity and rationalization, on the procurement fraud occurrences among the public sector officials in Malaysia. This study is expected to contribute to the Government of Malaysia with the knowledge in defining the factors that can contribute to corruption occurrences related to procurement fraud among Malaysian public sector officers. The Government may use the findings to enhance the current practices that might mitigate this type of corruption occurrences among Malaysian public sector officers as one of the strategic planning to combat this issue.

Literature Review and Hypothesis Development

Pressure and procurement fraud occurrences

Kassem and Higson (2012) defined pressure to commit fraud as "the source of heat for the fire" but they believed the presence of these pressures in someone's life does not mean he or she will commit fraud as there are other factors that contribute to it. However, Hui et al.'s (2011) study found that as a developing country, Malaysia has been subjected to considerable amount of pressure to agree on multilateral disciplines that limit the ability of domestic enterprises or crony to discrimination when allocating state contracts. Procurement fraud occurrences in government agencies involve corrupted public officials by tampering the tender processes and putting artificial pressure on other bidders in order to ensure their close friends or relative tender would secure the contract being awarded and benefit from it (Seng, 2018). This is the most often fraud that occurs to benefit the tender and public sector officials.

In Malaysia, bribery is the key source of government procurement programs, and political control is one factor that creates the opportunities for fraud (Othman, Shafie, Zakimi, and Hamid, 2014). In their study, they claimed that political and economic interests and power relations can also contribute to pressure from the procurement officer to deviate from the standards of transparency and accountability in procurement. Pressure imposed on public sector officer is high due to abuse of power, political interferences and personal needs; hence, pressure has been identified as a factor that can influence procurement fraud occurrences in the government and administration sector. Thus, from the above discussion, below hypothesis is developed:

H1: Pressure is positively significant in influencing the procurement fraud occurrences of Malaysian public sector officers.

Opportunity and procurement fraud occurrences

While there are thousands of ways to commit fraud, opportunity is one of the factors that contribute to procurement fraud occurrences in Malaysia. Kazemian, Said, Nia, and Vakilifard (2018) defined opportunity as an open door for solving a non-sharable problem in secret by violating a trust. Opportunity arises when the perpetrators sees a way to use their position of trust to solve the financial problem, knowing they are unlikely to be caught (Kassem and Higson, 2012). Fraud and corruption in Malaysian public procurement are associated with the opportunity and economic institutions in distributing public resources and it is highlighted in Azmi and Rahman (2015). Any loophole in the public procurement procedure creates an opportunity that can contribute to the procurement fraud occurrences in Malaysian public sector. While there are thousands of ways to perpetrate procurement fraud, Greer's example illustrates that opportunity is one of the drivers behind fraud (Albrecht, O., Albrecht and Zimbelman, 2016).

Previous studies have shown that opportunity to commit fraud, conceal it, or avoid being punished is one of the reasons people do fraud (e.g., Albrecht et al., 2016; Haron, Mohamed, Omar and Jomitin, 2013; Hui et al., 2011). There are at least six major factors that increase opportunities for individuals to commit fraud within an agency which are lack of supervision that prevents or detects fraudulent behaviour, inability to judge quality of performance during procuring, failure to discipline public officials, lack of access to information from procurer, ignorance, apathy and incapacity, and lack of audit trail (Albrecht et al., 2016) in procurement fraud occurrences.

This is in line with the studies from Seng (2018), Kazemian et al. (2018) and Jones (2013) where they mentioned that opportunity may generally be caused by the weaknesses in the internal control system such as lack of adequate needs assessment and market analysis, poor procurement planning and development specification, failure to oblige with the rules on procurement procedure, non-transparency and decentralization of notice public procurement, opaque evaluation and decision making and lack of external oversight mechanism. Thus, from the above discussion, below hypothesis is developed:

H1: Opportunity is positively significant in influencing the procurement fraud occurrences of Malaysian public sector officers

Rationalization and procurement fraud occurrences

Albrecht et al. (2016) found that most perpetrators rationalize the dishonest acts in order not to feel guilty and this same sort of rationalization often allows fraud occurrences. Usually, fraud involves lying to someone else and it will also involve fraud perpetrators to lie to themselves as what they are doing is justifiable. This is like whenever public procurement officials are involved with procurement fraud occurrences, they will rationalize by tricking themselves to do such act. Having rationalization with procurement fraud occurrences is like having a denial and unable to accept the reality of the occurrences.

Fraudulent activities that occurred in public procurement were also being influenced by rationalization of the officials in discharging their functions. A survey that was conducted by the Pricewaterhouse Coopers in 2018 revealed that 39% of the respondents agreed that rationalization is the third driver behind fraudulent activities after opportunities and pressures. This indicates that procurement fraud occurrences in the government and administration sector were inclined by the ability to rationalize or justify the public officials' action. The rationalization used by these officials is relevant and necessary to neutralize the view that the conduct was criminal or even improper.

In the government context, rationalization could happen when there is no procedure in place for punishment for fraudulent activities during extensive period or overriding of controls by management and officers on grounds of urgent need that makes public sector officers perform inferential judgement since they assume it is acceptable to do fraud as long as there is a solid reason behind it. Therefore, from the above discussion, below hypothesis is developed:

H1: Rationalization is positively significant in influencing the procurement fraud occurrences of Malaysian public sector officers

Research Methodology

Sampling and data collection

The target population chosen was the federal ministry in Malaysian public sector. As for the sample, based on the Ministry Website, there are a total of 300 public sector officers involved in the procurement process at 25 ministries in the federal level of Malaysia's government. Based on the formula proposed by Tabachnick and Fidell (2007) and the three independent variables used in this study, the required minimum number of sample size amounted to 82 respondents. Particularly, the total respondents for this study are 157 public sector officers which are more than the required minimum sample size for this study.

The questionnaire was sent to the head of division of each ministry through e-mail by using Google Doc application and hardcopy as well. Three weeks after the initial sending through the e-mail and hardcopy, a follow-up was made through phone call and reminder emails were also sent to each head of division in the ministries. From the 300 questionnaires sent out, 157 respondents replied that represented a response rate of 52.3 per cent. After the data cleaning process, all the responses were fit and used in this study.

Measurement of variables

This study used eight items to measure procurement fraud occurrences, pressure and opportunity while for rationalization used four items. The items of the variables were adapted from several authors such as Hui et al. (2011), Said et al. (2017) and Kassem and Higson (2012). All the variables under study used a five-point Likert-type rating scale ranging from 1 (strongly disagree) to 5 (strongly agree).

Findings and Discussions

Demographic Information

Demographic information is the descriptive data which is used to explain the characteristics of the sample. In the last section of the questionnaire, the respondents were asked about their demographic information which includes gender, race, age, highest academic qualification, job position, job function, grade and working experience with current position. 157 out of 300 respondents have completed the survey. 50.3% of the respondents or 79 out of 157 respondents were female while another 78 respondents were male. For age group, the major respondents who filled in this survey fell in the category of 31 to 40 years old which comprised of 59.9% from the total respondents and the lowest percentage comes from age 51 years and above with only 1.9%. For highest academic qualification, majority of the respondents have acquired at least a bachelor's degree which comprises of 45.9% while the remaining comes from SPM, Master, Diploma and STPM level with 22.9%, 14%, 11.5% and 5.7% respectively. Meanwhile, for job position, majority of the respondents were in management and professional position with 55.4% or 87 respondents whereby they were responsible in managing and making decision for their departments.

For the job function in the organization, 59.9% or 94 respondents come from the administrative department, 14.6% or 23 respondents from others function involved in procurement, 13.4% or 21 respondents from accounting and finance department, 10.2% or 16 respondent's development and infrastructure and the rest 1.9% or 3 respondents from law and enforcement. The last questions were about the respondent's working experience with current position. About 33.7% of the respondents have been working for more than 5 years in their current position while 23.6% of the respondents have been working between 11 to 15 years. 22.9% of the respondents have indicated that they served in their current position for less than 3 years. From the analysis on the respondent's profile of this study, it indicated that the respondents have much experience in relation to the public sector procurement process; thus, they are able to provide valid responses on corruption occurrences in Malaysian public sector.

Descriptive Analysis

Referring to the table 1, the highest mean score for procurement fraud occurrences was question PFO3 with a mean of 3.36 and standard deviation which equaled to 1.057 while the lowest mean score was question PFO5 with a mean

score of 2.41 and standard deviation of 1.068. This indicates that the respondents for this study agreed that there were several situations of procurement fraud that happened in the ministries or departments. Most respondents agreed that officials received gifts from their contractors. Nevertheless, they appear to believe that invoices have been received, but the goods or services have not been made.

Table 1: Descriptive Statistics on Procurement Fraud Occurrences

Questions	N	Minimum	Maximum	Mean	SD
PFO1	157	1.00	5.00	4.5361	.62854
PFO2	157	1.00	5.00	4.0773	.46561
PFO3	157	1.00	5.00	4.2887	.52815
PFO4	157	1.00	5.00	4.2577	.54399
PFO5	157	1.00	5.00	4.5412	.60297
PFO6	157	1.00	5.00	4.2629	.65812
PFO7	157	1.00	5.00	4.1289	.80084
PFO8	157	1.00	5.00	4.0670	.80840

Normality Test

In this study, skewness and kurtosis tests were used as indicators to test the assumption of normal distribution. The results in this study showed that skewness and kurtosis values for all the variables were in the range of -1.112 to 1.674 (Table 2). The values of skewness and kurtosis in the range of -2 to +2 are considered as normal distribution. This indicates that the mean scores for procurement fraud occurrences, pressure, opportunity, and rationalization were normally distributed.

Table 2: Normality test of sample distribution

Variables	N Statistic	Skewness Statistic	Kurtosis Statistic
Procurement Fraud Occurrences	157	-0.182	0.023
Pressure	157	-1.271	1.674
Opportunity	157	-0.690	-0.686
Rationalization	157	-0.470	-1.040

Validity Test

In order to test the validity of the instrument, this study uses factor analysis method. Based on the results of factor analysis, all variables show the value of Kaiser-Meyer Olkin is greater than .6, in which the minimum requirement needed for the data to be considered as fit for further analysis. Hence, all variables were adequate to be used in this study.

Table 3: Factor Analysis

	Procurement Fraud Occurrences	Pressure	Opportunity	Rationalization
KMO Measure of Sampling Adequacy	0.787	.746	.769	.706
Barlett's Test of Sphericity -Approx. Chi-Square	457.585	648.872	742.226	367.182
Sig	.000	.000	.000	.000

Reliability Test

The Cronbach's alpha value is used to test the reliability of the instrument used in this study for the purpose of this study. The reliability of the data is shown in Table 4. The Cronbach's alpha for procurement fraud occurrences was 0.835 while pressure was 0.851, opportunity was 0.755, and rationalization was 0.810. From the table above, most of the variables contributed positively to overall reliability since all the Cronbach's alpha was higher than 0.70.

Table 4*: Reliability test*

Variable	Number of Items	Cronbach's alpha value
Procurement Fraud Occurrences	8	0.835
Pressure	8	0.851
Opportunity	8	0.755
Rationalization	4	0.810

Correlation Analysis

Table 5 presents the correlation between procurement fraud occurrences with pressure, opportunity, rationalization and workplace spirituality. The Pearson correlation showed that there was moderate relationship between pressure and procurement fraud occurrences since Pearson correlation score was at 0.402 and significant at 0.000 (less than 0.01 levels). The correlation between opportunity and procurement fraud occurrences showed a strong relationship since Pearson correlation score was at 0.536 and significant at 0.000 (less than 0.01). In addition, the correlation between rationalization and procurement fraud occurrences also showed a strong relationship since Pearson correlation score was 0.529 and significant at 0.000 (less than 0.01 levels).

Table 5: Pearson' Correlation

Variables	PFO	P	O	R
Procurement Fraud Occurrences (PFO)	1			
Pressures (P)	0.402**	1		
	0.000			
Opportunity (O)	0.536**	0.451**	1	
	0.000	0.000		
Rationalization (R)	0.529**	0.587**	0.563**	1
	0.000	0.000	0.000	

**Correlation is significant at 0.05 level (2-tailed)*
***Correlation is significant at 0.01 level (2-tailed)*

Multi-Collinearity Analysis

Table 6 below shows that all independent variables were below 10 when the VIF was between 1.091 and 1.920. This highlighted that the variables were suited to predict the independent variables and the variables were not biased. Besides, we can see that the tolerance for all independent variables fell within the range of 0.2 and 0.9 since the table above shows that tolerance values for variables in this study were from 0.521 to 0.916. This indicates that there is no potential problem of multi-collinearity in these variables. It can be simplified that this study is in a good motion as the model has good fit. Thus, the study may proceed to run multiple regression test.

Table 6: Multicollinearity Analysis

Variables	VIF	Tolerance (1/VIF)
Pressure	1.582	0.632
Opportunity	1.517	0.659
Rationalization	1.920	0.521

Multiple Regression Analysis

Table 7 reveals the overall analysis for this study. The R^2 value was at 0.389 and it indicated that 38.9 per cent of the procurement fraud occurrences were explained by pressure, opportunity, and rationalization in Malaysian public sector. The R^2 adjusted compares the explanatory power of regression models that contain different number of predictors. Considering the sample size and number of independent variables, the adjusted R^2 indicated that 37.3 per cent of the variations in procurement fraud occurrences were explained by the variations in pressure, opportunity, rationalization and workplace spirituality.

Meanwhile, pressure variable suggested a positive relationship with procurement fraud occurrences. However, the pressure's p-value was at 0.263 which was more than 0.05 with t= 1.124. Therefore, H1 was not supported since there was no significant relationship between pressure and procurement fraud occurrences. The second variable of opportunity indicated a significant positive relationship with procurement fraud occurrences since the p-value for opportunity was at 0.000 which was lesser than 0.05 with t= 4.162. Thus, H2 was supported. Finally, there was also a significant positive relationship between rationalization and procurement fraud occurrences with t= 3.838 and p-value at 0.000 which was less than 0.05. As a result, H3 was supported.

Table 7: Regression Analysis

Model	Standardize Coefficient (Beta)	Std. Error	t-statistic	Sig.
(Constant)			4.511	0.000
Pressure	0.090	0.299	1.124	0.263
Opportunity	0.325	0.080	4.162	0.000*
Rationalization	0.337	0.088	3.838	0.000*
	R = .624a R^2 = .389 Adjusted R^2 = .373 F-statistic (p-value) = 24.217 (0.000) *Significance at $p < 0.05$			

Discussion of Findings

This study was conducted to examine the relationships between pressure, opportunity, and rationalization with procurement fraud occurrences among the Malaysian public sector officers. From this study, majority of the respondents are working in the service with grade 41 and above, in which they are responsible in making decision in their organization. For academic qualifications, most of the respondents are degree holders that indicate 45.9 per cent. In terms of experience in working as public servant and being involved in the procurement process, most of the respondents (59.9 %) are doing administrative work on procurement process. This indicates that their experience in public procurement process could help them in answering the questionnaire of this study.

Hypothesis H1 anticipates a positive significant relationship between pressure and procurement fraud occurrences among Malaysian public sector officers. From the analysis conducted, it is found that pressure does not have a significant relationship with procurement fraud occurrences. This indicates that pressure has no influence on procurement fraud occurrences among the public sector officers in Malaysia. This finding is not consistent with previous studies conducted by Matthew et al. (2013) and Rustiarini (2019) as their results showed that pressure does influence an individual to commit fraud. Their findings agreed with Kazemian et al. (2018) on the fact that pressure

is imposed to an individual to commit procurement fraud and/or corruption which can be resulted out of financial need, emotional, or job performance.

However, the result of this current study is consistent with previous study conducted in Malaysia, by Said et al. (2017) who found that the existence of pressure does not influence the public sector officers to commit fraud. This finding also supports previous studies that have been conducted by Aprilia (2017), Faradiza (2017) and Handayani, (2018) which showed external pressure does not influence an individual to commit financial fraud. In addition, this current finding can also be used to decline the perception that public sector officers are being pressured by political power as what has been found in (Othman et al., 2014).

The second hypothesis, H2, examined the positive significant relationship between opportunity and procurement fraud occurrences among Malaysian public sector officers. From the analysis, it is found that opportunity has significant positive relationship with procurement fraud occurrences. Therefore, it is established that the existence of opportunities in Malaysian public sector administration is able to influence procurement fraud occurrences. This finding is consistent with the previous study by Kassem and Higson (2012) as they claimed that higher opportunities existed in an organization resulted to higher risk of procurement fraud occurrences. Nevertheless, the finding from a study by (Othman et al., 2015) was also in line with this finding and this explains that lack of control that prevents and/or detects fraudulent behaviour, inability to judge quality of performance and lack of audit trail could influence public sector officials to be involved in procurement fraud occurrences. Lack of implementation in procurement process and procedure could also contribute towards procurement fraud occurrences which is considered as an opportunity to commit fraud (Ismail et al., 2018). All of these are stimulants in opportunity that could influence public sector officials in Malaysia to be involved with procurement fraud occurrences.

The third hypothesis, H3, examines the positive significant relationship between rationalization and procurement fraud occurrences among Malaysian public sector officers. From the analysis, it is found that rationalization has significant positive relationship with procurement fraud occurrences. This finding shows that an individual with high rationalization or an individual who has the ability to rationalize or justify his or her fraudulent behaviour could influence them to be involved in procurement fraud occurrences. A study conducted by Association of Certified Fraud Examiners (2014) and Said, Alam, Karim and Johari (2018) could be used to justify this finding as it is claimed that a person with the ability to reinterpret or justify his or her wrongdoings and fraudulent actions as morally accepted would sometimes claim it as if he or she is the victim of the situation.

Conclusion

This study proves the significant relationship between opportunity and rationalization on procurement fraud occurrences among the Malaysian public sector officers. Thus, the results of this study could give a better understanding of Malaysian public sector in understanding the individual factors that can contribute towards procurement fraud occurrences. From the discussion on the above findings, it can be concluded that two elements of fraud triangle theory, i.e. opportunity and rationalization, are able to support previous empirical studies as two significant factors that could influence the public sector officials to participate in procurement fraud occurrences. However, it is not so for the element of pressure. In this sense, the Malaysian public sector should be able to explore the fundamental causes of the problem and be able to define the policies of an individual's conduct in the battle procurement fraud occurrences. In the meantime, this report will lead to strengthening the procurement process and preventing fraud occurrences.

Nevertheless, this study is carried out with certain limitation that could provide for future research to be conducted. This study only examined three variables in assessing procurement fraud occurrences in public sector which are pressure, opportunity and rationalization. Meanwhile, in the real world, procurement fraud occurrences in public sector could be affected by other related variables such as managerial performance, leadership quality, and social factor of officers like knowledge of the officer etc.

Future studies should take these factors into account to determine the most influential factor on procurement fraud occurrences and the factors should be narrowed down more specifically to cover more aspects of procurement fraud. In addition, future study could apply the most relevant and suitable theory that can best explain procurement fraud occurrences in the context of Malaysian public sector. Nowadays, the theory of fraud triangle has been turned into diamonds, hexagonal and more due to other factors that significantly influence fraud occurrences such as what has

been proven in this study through the element of workplace spirituality. The potential study is therefore welcome to explore the latest model, the scope and new areas of procurement fraud that could improve and cover the area of study accurately.

Abstract

El presente documento hace referencia a los resultados iniciales de una investigación sobre las practicas ciudadanas y la vigilancia estatal en la ciudad de Bogotá durante los meses de marzo a octubre del año 2020. Para el propósito de una investigación de corto plazo y en un proceso cambiante e incierto como el que se presenta bajo la pandemia se utilizó una metodología mixta de investigación, la cual permitió mayor flexibilidad desde sus técnicas su validación. Específicamente para este texto, se toma como fuente la primera fase de la encuesta de percepción realizada a un total de 325 personas de la ciudad de Bogotá. En este sentido se evidenció un incremento constante, en los meses abordados, de las medidas de la legitimación de la fuerza policiva y el uso del miedo para buscar su acatamiento, así mismo mientras las medidas crecían también se incrementaba el descontento ciudadano el cual propicio una cada vez más lejana corresponsabilidad ciudadanía – Estado, la cual desde reflexiones científicas es la opción más eficaz para el control de la pandemia.

Palabras clave: Vigilancia Estatal, Control Social, Prácticas Ciudadanas, COVID-19, Bogotá.

Introducción

El año 2020 se encontró con una difícil situación a nivel mundial, el avance de una pandemia nacida en China pero que rápidamente recorrió un mundo hiperconectado. Ante esta difícil situación, cientos de países se encontraron en cuarentena, Colombia y su ciudad más importante Bogotá no estuvo exenta de estas particularidades, la cual se sumió en una serie de medidas estatales para confinar a las personas en sus hogares bajo el lema "quédate en casa". Muchas de estas medidas fueron celebradas por la ciudadanía, la población necesitaba del estado y exigía medidas drásticas para mitigar el avance del virus.

Es en ese panorama en que nace la investigación que de su primera fase espera entregar resultados para este documento, la cual pretende indagar por ¿Cuáles fueron las prácticas ciudadanas que se presentaron durante la cuarenta por el virus COVID-19 en la ciudad de Bogotá y que enseñanza pueden dejar en cuanto a las estrategias de vigilancia estatal o empoderamiento ciudadano?

De este modo, este documento estará estructurado de la siguiente forma, en un primer momento se describirán brevemente la metodología y se detallarán los instrumentos y técnicas relevantes utilizados para los propósitos de este texto. Luego, se reflexionará en la discusión desde la revisión bibliográfica sobre el tema y su relación con la situación objetivo. En seguida, se entregará una reflexión sobre los resultados obtenidos desde la óptica particular de los propósitos específicos de este documento, para, por último, conferir una suerte de conclusiones.

Metodología

El proyecto al ser una investigación de corto alcance y en vista de las particularidades mismas de la pandemia para la obtención de las muestras, la validez de los resultados, lo contingente de la situación, el cambio constante de las

medidas y el avance imprevisible en muchos casos de las dinámicas a analizar, se plantea que metodológicamente la mejor apuesta está relacionada con un modelo de investigación mixta que en palabras de Tashakkori y Teddlie (2003) genera una tercera fuerza dentro de los paradigmas de la investigación, puesto que existe una mejor comprensión del objetivo de estudio desde la combinación de paradigmas, así mismo, se referencia la relevancia de la triangulación que traen este tipo de metodologías para la investigación y el desarrollo del conocimiento, dota de solidez y robustez a las investigaciones.

De este modo, la investigación basó sus análisis desde una metodología mixta específicamente un modelo de estatus dominante que en palabras de Johnson y Onwuegbuzie (2004), Onwuegbuzie y Leech (2006), propende por la concordancia entre metodología y objetivos de la investigación, en donde según los intereses del proponente y las necesidades de la investigación se prioriza uno de los enfoques el cuantitativo o el cualitativo, siendo así, esta investigación estará regida metodológicamente por un modelo cualitativo con tintes cuantitativos que la dotaran de solidez, en palabras de Bericat (1998), se propenderá por la complementariedad y la triangulación en el análisis de los resultados, esto indica que existen instrumentos pensados para objetivos determinados de la investigación, pero también resulta que para las conclusiones generales se trianguló la información recabada desde las diversas técnicas o instrumentos utilizados.

Siendo así, la metodología se expuso en 4 fases de implementación de la investigación:

1. Diseño de la implementación investigativa. Revisión bibliográfica extensa sobre las temáticas o categorías principales de la investigación, se realizó una base de datos para compilar la información con la cual se nutrió los marcos conceptuales que guiaron la investigación pero que al mismo tiempo resultaran faros para el presente documento. Así mismo en esta fase se formularon los formatos de recolección de información y su postulación a pares evaluadores para su respectiva validación.
2. Revisión documental en dos aspectos; en primera medida sobre los marcos normativos en cuanto a las medidas estatales determinadas a nivel nacional y a nivel distrital para la contención de la pandemia, se revisaron solo aquellas que estaban relacionados con unas categorías específicas y con antelación escogidas a partir del análisis documental y la revisión empírica de la situación, estas categorías fueron: vigilancia estatal y control social – Prácticas ciudadanas - Solidaridad. Los resultados del análisis de los documentos normativos se consignaron en una matriz de retención documental normativa. Esta resultará de vital importancia para este documento ya que muchos de los análisis y las reflexiones en este escrito estarán derivadas de este análisis documental.
3. Implementación de los instrumentos de recolección encuestas (385) y entrevistas (10) a ciudadanos de la ciudad de Bogotá.
4. Proceso de análisis de la información, puesto que desde su triangulación se espera entregar una propuesta, que pueda servir como base para la implementación de políticas públicas en relación a la temática de la investigación.

A continuación, la tabla No. 1 resume los instrumentos utilizados, su alcance y los objetivos a los que está determinado cada uno de las técnicas de recolección de información, a partir de esta tabla se puede visualizar la trazabilidad operativa de los instrumentos dentro de la investigación.

Tabla 1: Instrumentos de investigación. Fuente: elaboración propia

Vigilancia Estatal Y Control Social (Discusión)

Simone Veil (citado por Surian, 2020) hace noventa años advirtió que cuando reinan de manera universal las nociones de nación, seguridad, orden y autoridad, ya no tiene que ver con responder a situaciones particulares, sino que se trata de promover ideales que favorecen la construcción de una cultura de guerra. Por ello es muy importante reflexionar con respecto al discurso estatal que ha surgido ante esta emergencia sanitaria, que tienen que ver con estas nociones, donde incluso Emmanuel Macron, el presidente de Francia, ha indicado explícitamente que "estamos en guerra" "es una guerra sanitaria".

En coherencia con estos discursos, se ha dado una rápida militarización de la pandemia, lo que masifica una reacción de miedo paralizante y promueve el apoyo social a otras agresiones (Gil, 2020). Sin embargo, no es la única manera que se ha puesto en juego para enfrentar la pandemia, por ejemplo, se ha dado una paradoja entre lo público y lo privado, es así como el poder público promueve estrategias como la de *#quedateencasa* en la que se promueve un discurso de territorialización y del estado de sitio; simbólicamente esto tiene unos efectos de fractura, dado que se empiezan a relacionar los espacios privados como seguros, mientras que los públicos se ven como inseguros e ilegítimos (Surian, 2020). "Esto lleva a traducir la medida de precaución "mantenerse alejado el uno del otro" en lugar de una comprensión profunda de las responsabilidades individuales y colectivas en las relaciones cotidianas– en miradas policiales hacia el espacio público" (Surian, 2020, p.3).

En Latinoamérica, ante el virus "el militarismo crece en la región como espectro que vuelve a proyectarse sobre las sociedades, las resistencias y los grupos más oprimidos" (Vommaro, 2020, p.3). Se instauraron en primera medida los estados de sitio antes que medidas preventivas o de fortalecimiento a la salud pública; lo cual es una estrategia altamente cuestionable, dado que antes de que el virus llegara a la región se estaban desarrollando diversas movilizaciones y manifestaciones callejeras contra los gobiernos y sus políticas. De esta manera, la militarización, con excusa del virus, ha servido para disipar estas expresiones y resistencias sociales; a modo de ejemplo, está el gobierno chileno que dirigió más recursos al reequipamiento de los carabineros (con fines represivos) en vez de al sistema de salud (Vommaro, 2020).

Para Blanco, Gomà y Nel·lo (2020), se han presentado principalmente dos escenarios ante esta pandemia: por un lado, el de los poderes estatales fuertes, con un discurso predominante de protección y seguridad, en el que se presenta rechazo a la diversidad y el cierre de fronteras, aquí se da un fortalecimiento de los autoritarismos, el declive de los derechos individuales y sociales, así como el debilitamiento de la confianza social. Por otro lado, se da la posibilidad a un escenario más alentador de solidaridad, en el que se da cuenta de la importancia de un Estado de Bienestar, donde los servicios públicos son bienes comunes, se cuestiona nuestra relación con el medio ambiente, se promueven y distribuyen equitativamente los cuidados.

La vigilancia y el control por parte de los estados hacia sus ciudadanos ha sido un tema de análisis recurrente por parte de diversas disciplinas sociales, que toma mayor relevancia en medio de esta pandemia y que requiere de una mayor reflexión, puesto que como lo señala Sánchez (2020) "los estados en esta pandemia han tenido el poder de limitar los derechos individuales en defensa de la salud colectiva" (p.117), a través de diversas estrategias policivas. Estas medidas pueden llegar a ser de control extremo, lo que pone en conflicto la protección de la salud y la privacidad de las personas (Surian, 2020).

Las ciencias sociales se han interesado constantemente en el asunto, por lo cual, realizar un rastreo de estado del arte sobre este se hace una tarea bastante compleja. En este sentido, para los propósitos de la investigación el análisis se basará en dos tipos de fuentes; primero, se indagarán aportes de tesis de maestrías y doctorados en los repositorios institucionales de las universidades nacionales, luego se consultarán los análisis investigativos más relevantes a nivel mundial sobre la temática.

Siendo así, con relación a la indagación de los repositorios se encuentra que, existe un amplio repertorio de investigaciones en torno a la vigilancia y la biopolitica del cuerpo, se hallaron varios estudios desde diversas disciplinas como la pedagogía, la sociología, la psicología, etc., que dan cuenta de reflexiones de la vigilancia y el control de los cuerpos en las sociedades, ejemplos de este tipo de reflexiones las encontramos en Melo (2018), Carniglia (2015) y Tarantino (2017). En este tipo de reflexiones se privilegia el análisis de la vigilancia estatal y el control que se ejerce desde el poder gubernamental en la concepción, configuración, reconfiguración, dominio, entre otros del cuerpo de los ciudadanos.

La dimensión biopolítica y de vigilancia por parte del Estado se ha visibilizado notablemente ante el COVID-19, lo cual puede favorecer el autoritarismo. Surian (2020) menciona como estas dimensiones se evidencian en algunas acciones recientes de los Estados que se justifican como maneras válidas para hacer frente a la emergencia sanitaria, por ejemplo, se encuentra la georreferenciación, en la que se realiza un control y vigilancia de la movilidad de los ciudadanos a través de la ubicación de sus celulares; y el reconocimiento biométrico, en el que se reconoce a las personas por características únicas como la huella digital. Estas estrategias pueden ser sumamente peligrosas si se mantienen en el tiempo, son las bases para ejercer un régimen totalitario basado en la vigilancia continua de su población, la cual ya no tendría privacidad (Surian, 2020)

Por otro lado, se encuentran investigaciones que dan cuenta de estudios sobre el control de las sociedades en general y del papel de las políticas públicas en el control y la vigilancia estatal. Reflexiones como las de: Cabanso (2013), Pinzón (2000), Chaparro y Galindo (2009), Gacharna (2014), Huertas y Villa (2006) dan cuenta de estudios sobre las dinámicas propias de los Estados nacionales y su relación con la población.

Estos son estudios que dan cuenta de la interrelación del Estado con sus ciudadanos a partir de los entes de control, por un lado, desde las investigaciones constitucionales o del derecho, o desde los dispositivos de control y vigilancia creados para tales efectos como los son las reflexiones desde la sociología, la historia, la antropología o las mismas ciencias de la salud.

Son proyectos investigativos que como se evidencia desde diversos enfoques disciplinares dan cuenta de análisis del papel del gubernamental como fuente de control y vigilancia de la sociedad y se analizan estas prácticas, desde sus causas hasta sus consecuencias, lo cual resulta de vital importancia para los propósitos investigativos del presente proyecto, puesto que son investigaciones que dan evidencian de la puesta en marcha en muchos casos de la política pública en pro de la vigilancia y el control estatal sobre las poblaciones de un determinado territorio.

En el caso particular del presente proyecto, se intentará dilucidar las practicas subyacentes a las políticas emprendidas bajo la pandemia COVID -19 y el control gubernamental derivado de ellas. También es interesante el análisis histórico del papel del Estado en diversos contextos de contingencia que se hace en algunas de estas reflexiones para determinar así una ruta de análisis y un marco referente para la presente investigación.

En cuanto a las investigaciones relevantes a nivel mundial, podemos encontrar dos visiones importantes en cuanto a la temática, por un lado, se encuentran los análisis que determinan un mayor control estatal desde lo que se denomina vigilancia estatal, o lo que se ha venido denominando el pensamiento acerca de la vigilancia contemporánea anglosajona: David Lyon (1999), Mark Poster (1987) y Reg Whitaker (1999). En ellos subyace la pregunta acerca de si la vigilancia contemporánea constituye una intensificación, un quiebre o una simple continuación de lo que desarrolló Foucault. En la medida en que el fenómeno de la vigilancia más palpable hoy en día es el de su multiplicación tecnológica, se corre el riesgo de confundir el aspecto técnico con el aspecto social de la cuestión. En este tipo de análisis se reflexiona sobre las sociedades modernas y el control estatal dentro de las sociedades de la información contemporánea.

Las otras reflexiones están basadas en las teorías foucultianas de biopoder y de disciplinamiento de las sociedades, el mismo autor decreta una serie de dispositivos sobre los cuales gira el poder y la vigilancia de los cuerpos y de las sociedades. Dentro de este paradigma de análisis son diversos y bastos, diversas disciplinas han utilizado este paradigma para hacer sus reflexiones, la pedagogía, la psicología, la economía y así diversas disciplinas han realizado aportes numerosos a este tópico del pensamiento social. En torno a la disciplina sociología, se pueden retomar los análisis de Marx (2005) y Arteaga (2006), quienes determinan el papel de la disciplina en la configuración de las sociedades y en el aparto de control de las sociedades.

Desde la postura sociológica, Gil (2020) realiza su lectura sobre el manejo que la clase dominante ha dado a esta emergencia sanitaria, quienes mediante su discurso han cargado de mayor responsabilidad a los ciudadanos de la salida de esta crisis, argumentando que es importante la responsabilidad individual de estos para no colapsar los

sistemas de salud, mientras ocultan que el problema es estructural, un desfinanciamiento y la privatización progresiva del sistema de salud en general (escases de trabajadores, recursos, infraestructura, mantenimiento e investigación) que ha favorecido que la crisis se agudice.

Por último, es de resaltar que estas últimas reflexiones que podríamos denominar de disciplinamiento tienen una diferencia con las concepciones de las sociedades de control, en cuanto determinan estas últimas una vigilancia sin encierro y sin disciplinamiento, esto es de relevancia para la investigación, puesto que para los propósitos del proyecto investigativo resultará importante retomar los postulados de las dos visiones, es decir, la pandemia ha reconfigurado de tal manera el pensamiento social sobre la temática que sería imposible hacer un análisis social de las categorías que se piensan reflexionar tomando un bando u otro en cuanto al tema de vigilancia y control de las sociedades, puesto que las medidas tomadas por los gobiernos estatales se encuentran en las fronteras de las dos teorías, razón por la cual la investigación retomara de cada uno las reflexiones que resulten de interés.

Encuesta Percepción Ciudadana. (Resultados)

La encuesta realizada se dividió en tres fases la primera sobre la que gira este documento entregó algunos resultados de interés para la reflexión sobre la pandemia COVID-19, en especial esta primera fase pretende mirar las percepciones sobre las medidas estatales ante la pandemia por la ciudadanía Bogotana. se realizó por medios virtuales: redes sociales, correos electrónicos masivos etc. Para ello se contó con los registros poblacionales de la ciudad de Bogotá DANE 2018 la cual calcula un total de 7.181.469 habitantes para la ciudad de Bogotá. En este sentido:

Habitantes Bogotá 7.181.469
Nivel de confianza 95%
Margen de error 5%
Muestra 325

Grafico 1: Información de los entes gubernamentales. Fuente Propia.

En este grafico evidenciamos que la ciudadanía se encuentra bastante escéptica ante la información que es suministrada por los entes gubernamentales esto tiene repercusiones en cuanto a las posibles razones del escepticismo, pero también en cuanto a las medidas gubernamentales y el acatamiento de las mismas por la ciudadanía.

En cuanto a la primera situación, lo que reflejó el análisis documental y empírico de la pandemia tiene que ver con un desgaste por la ciudadanía ante la información recibida, la cantidad de información que era entregada por el gobierno nacional a diario por un programa, o desde los medios masivos de comunicación, que hacían replicas constantes de los mismos, en la mayoría de los casos propicio contradicciones y desacuerdos, esto generó con el pasar de los días un desgaste en la población ante la multitud de las medidas.

Por otro lado, esto evidencia una repercusión en las mismas prácticas ciudadanas de los pobladores de Bogotá, puesto que al tener este escepticismo sobre la información recibida el acatamiento a la normas y decretos entregados por los entes gubernamentales se veía afectado, en este sentido el Estado debió por un lado, hacer un mejor trabajo en cuanto a la trasparencia de la información y por otro lado, generar medidas comunicativas más amenas y menos bastas, es

decir sintetizar la información y entregar dicha información al ser corroborada y verificada, del mismo modo, las medidas y la información entregada se entiende que cambia constantemente, la pandemia es una novedad y la situación así lo plantea, pero mitigar este escepticismo se podría lograr ante medidas más claras y. menos cambiantes, puesto que los ciudadanos fueron desgastándose ante este tipo de particularidades, así lo evidencia esta pregunta donde el 42.1% de los encuestados encuentran como incompleta la información entregada por los entes gubernamentales, el 37.8% la encuentra parcial, y un 9.2% la encuentra insuficiente, sumando dichas respuesta evidenciamos que el 89.1% de los encuestados desconfían de las información entregada por el gobierno, situación gravísima en un pandemia, donde como se ha postulado desde diversos autores y voces académicas el trabajo mancomunado entre el estado y la ciudadanía es muy importante. Schor-Landman (2020) indica que es una responsabilidad compartida en la que se pone en juego la convivencia social por parte de los ciudadanos con los valores sociales, éticos y solidarios que implica, mientras el Estado es el encargado de las políticas públicas que garantizan los derechos ciudadanos. Pero esta corresponsabilidad necesaria para mitigar los efectos sociales, económicos y en la salud de la pandemia requiere de una confianza mutua la cual según se muestra en esta encuesta no es una realidad.

Gráfico 2: Medidas estatales. Fuente. Propia.

En cuanto a esta pregunta la postura de los ciudadanos de Bogotá encuestados está reflejada hacia dos actitudes; por un lado, un 55.7% encuentra las medidas tomadas como las necesarias, es decir están de acuerdo con las medidas tomadas por más que puedan sentir que la información no es la mejor, o que el acceso a ella no es el adecuado, parece percibirse un sentimiento de conformidad con las medidas tomadas por entes Estatales ante la pandemia.

Esta particularidad resulta interesante en cuanto a los análisis tradicionales de la vigilancia Estatal y el control social desde las ciencias sociales; por primera vez en la historia resiente la población misma fue quien solicito medidas que mitigaban sus derechos de circulación, de privacidad, etc. Estas cuestiones dan cuenta de las características mismas de la pandemia, pero reflejan un aspecto social de interés, puesto que, los controles sociales, los estados de sitio, la vigilancia sobre la circulación de la personas etc, tradicionalmente eran el reflejo de Estados totalitarios, y el análisis se basaba o desde una dirección directa del Estado hacia estas medidas como los casos ya reseñados o desde análisis como los foucultianos en donde la vigilancia y el control se soportaba de forma indirecta sobre los ciudadanos. En cualquiera de los casos, los ciudadanos objeto del control y vigilancia, o no estaban conformes con dichas medidas, o ni siquiera se hallaban plenamente conscientes de la situación, es por ello que resulta interesante determinar las implicaciones sociales, políticas y culturales que estas posturas hacía el control social desde la ciudadanía pueden generar, es claro que este tipo de análisis desbordan los propósitos de esta ponencia pero si es un punto a tener en cuenta a futuro cuando se consoliden reflexiones de más larga data sobre la pandemia y sus implicaciones.

Gráfico 3: Percepción medidas gobierno nacional Colombia. Fuente. Propia.

La distribución del grafico 3 demuestra que en relación a esta pregunta no se encuentra un patrón generalizable en las respuestas, es decir existe una dispersión en las respuestas en cuanto la percepción sobre las medidas Estatales tomadas por el gobierno nacional. A partir de lo dicho, los resultados demuestran que existe una leve tendencia hacia la aprobación de las medidas Estatales tomadas por el gobierno nacional en la pandemia, un 45.9% de los ciudadanos consultados viran su mirada hacia estar muy satisfechos o algo satisfechos con las medidas tomadas por el gobierno nacional. Esto puede verse bajo la luz de la misma exigencia de la ciudadanía de los confinamientos y las medidas drásticas en pro de mitigar el impacto de la pandemia a nivel salud. Queda por determinar esto como se evidencia en el acatamiento a la mayoría de las normas más restrictivas tomadas bajo la pandemia por la ciudadanía. Por último, es de rescatar que 3 de 10 respuestas se encuentran en desaprobación de las medidas sería importante reflexionar el porqué de estas razones, y así mismo en próximos estudios comparar los resultados en el tiempo para dar cuenta de cambios significativos.

Gráfico 4: Percepción medidas gobierno distrital Bogotá. Fuente. Propia.

Esta pregunta se formuló con dos propósitos; uno en razón a que muchas medidas se tomaron antes en Bogotá que el resto del país y muchas de estas se decretaron diferencialmente en Bogotá que en otras ciudades o municipios de la nación; en segunda medida, por interés de algún tipo de análisis político a la situación, la pandemia se politizó en Colombia como en muchos de los países y una de las fórmulas más evidentes de dicha hipótesis, está en relación a las dinámicas entre el presidente de la república y la alcaldesa de Bogotá, quienes en constantes ocasiones tuvieron diferencias notables, que se fueron sumando en los medios de comunicación como una lucha de fuerza políticas con miras de las elecciones presidenciales 2022.

En este sentido se evidencia un leve pero evidente favorecimiento a las medidas tomadas desde el gobierno distrital, según la gráfica 4, un total de 53.3% de los ciudadanos consultados aprueban las medidas tomadas bajo la alcaldía de la ciudad de Bogotá para controla y mitigar los efectos de la pandemia, mientras que en la gráfica 3 el favorecimiento es de 45.9% al gobierno nacional.

Gráfico 5: Percepción libertades individuales y medidas. Fuente. Propia.

Con esta pregunta se buscaba indagar por las libertades que los ciudadanos han perdido o han visto reducidas durante la pandemia, en este sentido las respuestas indican lo que la encuesta ha venido dilucidando en relación a las medidas Estatales tomadas y su consentimiento por parte de la población bogotana; un 41.2% ve como las medidas han restringido de forma moderada las libertades de las personas, pero en la realidad es que las libertades individuales durante la pandemia se han visto reducidas considerablemente, la organización de naciones unidas ha llamado la atención de como en algunos países, muchas de estas medidas rayan en la vulneración de los derechos humanos, y recalcan la necesidad de que sean medidas transitorias, en este sentido se piensa que las respuestas giran en torno no tanto a identificar las medidas como restrictivas, puesto que en la realidad lo son, sino que las personas consultadas respondieron de forma afirmativa consintiendo dichos decretos que restringen las libertades individuales de los ciudadanos durante la pandemia.

Gráfico 6: Percepción Complots y Fake News covid-19. Fuente. Propia.

En este sentido con el grafico 6 se evidencia un hecho particular la mayoría de las personas están en desacuerdo con este tipo de afirmaciones 46.7% de los ciudadanos, en contraposición a un 26.8% de los encuestados aprueban dichas afirmaciones, esto deja ver el sentido amplio de los rumores, puesto que es constante escuchar afirmaciones sobre que las personas no creen en la pandemia, etc, lo que en realidad se evidencia desde esta encuesta es que en la ciudad de Bogotá la mayoría de los ciudadanos están conscientes de la problemática, dan por entendido que muchas de estas afirmaciones no hacen parte de la realidad y que por ello las medidas de precaución y demás son totalmente necesarias. Queda por determinar los rumores, el papel del voz a voz y de los medios de comunicación en pro de afirmar que las personas no usan el tapabocas, que las personas no acatan las medidas, que los ciudadanos no creen que exista el virus etc. de igual modo, es importante resaltar como este tipo de creencias erróneas sobre el acatamiento de las normas sobre creencias infundadas y demás generan desconfianza social, propician espacios de incultura ciudadana y nuevamente no propician un vínculo entre Estado y ciudadanía.

Gráfico 7: Percepción medidas de control social Bogotá. Fuente. Propia.

El grafico 7 demuestra la exigencia de la ciudadanía de controles de vigilancia, la nación entrego muchas de sus facultades y libertades al estado sin reparo alguno, la pandemia genero una necesidad cuasi paternal del estado, el 43.1% de los ciudadanos encuestados de Bogotá están de acuerdo con las medidas que vigilancias extremas tomadas para controlar la libre circulación, indicadores de salud, etc de las personas en la ciudad. La ciudadanía entrego su accionar ante las medidas Estatales, estas dinámicas propias deben revisarse a la luz de la cultura y el empoderamiento ciudadano y las prácticas mismas que esto pueda generar, puesto que es evidente que muchas medidas tomadas paulatinamente han venido no siendo acatadas por la ciudadanía, lo que puede ser resultado en mayor o menor medida de este tipo de estados paternalistas, en donde el accionar ciudadano queda subyugado a infantilismos y decisiones no adecuadas, un estado menos paternalista y una ciudadanía más empoderada podría generar mejores resultados ante las normas de bioseguridad necesarias para el control de la ciudadanía.

Gráfico 8: Papel del estado en la pandemia. Fuente. Propia.

Durante décadas cientos de voces desde la más recalcitrante derecha neoliberal, desde voces políticas y hasta académicas liberales se han evidenciado y promulgado exigencias del fin del Estado, y las mismas dificultades que un estado poderoso representa (estados autoritarios – burocratización – corrupción etc). La pandemia acalló o por lo menos mitigó este tipo de reflexiones, puesto que evidenció la necesidad ante situaciones tan particulares y de emergencia como la pandemia COVID-19 de un estado sólido. En este punto es importante resaltar que cuando se habla de solido no se quiere decir de un estado todo poderoso, sino de un Estado que sea escuchado, un Estado que sea soberano, un Estado que respete los derechos humanos y la democracia y que dote de corresponsabilidad a sus ciudadanos desde prácticas transparentes.

El resultado del grafico 8 evidencia que la ciudadanía en un 50.2% percibe como muy necesario el papel del Estado durante la pandemia, es decir, el mercado solo cayó por su peso, las mismas medidas ciudadanas fueron relegadas ante un Estado que debía ser el salvador ante la situación particular que represento la pandemia; en este sentido, es relevante el nuevo papel protagónico que el Estado ha asumido en la vida de los países y de la ciudadanía y las implicaciones que esto va tener en las dinámicas económicas posteriores a la pandemia y en los análisis sociopolíticos en relación al Estado a nivel mundial.

Gráfico 9: Medidas estatales y vida privada. Fuente. Propia.

La constitución colombiana, los Derechos Humanos y diversos organismos multilaterales han defendido el derecho a la vida privada de los ciudadanos, y cuando se habla de ello se hace referencia a la privacidad; al manejo de los datos personales; a las libertades individuales; todas estas mitigadas, reducidas, o coartadas durante la pandemia por las mismas particularidades del virus. En ese sentido gira la pregunta del gráfico 9, en donde se evidencia que el 30.8% de las personas encuentran de acuerdo con ver coartadas sus libertades y derechos a la privacidad por la pandemia, lo que se evidencia con el siguiente resultado es que, aunque saben que sus derechos fueron coartados dan su consentimiento a ello, el 30.2% de los ciudadanos dan cuenta de lo dicho.

Conclusiones

Las medidas tomadas bajo la pandemia por el gobierno nacional de Colombia y la ciudad de Bogotá evidencian bajo la normatividad analizada un incremento hacia acciones de control y vigilancia policiva cada vez más contundente, para ello utilizan el miedo como soporte y los medios de comunicación como agentes de emisión para este propósito; quizás medidas encaminadas hacia el empoderamiento ciudadano y con propósitos más claros, conocidos y reafirmados desde la cultura y las practicas ciudadanas podría generan mayores impactos a la pandemia y propiciar controles menos restrictivos.

Así mismo, se evidencia una sumisión ciudadana a un Estado cuasi paternalista, asumiéndose así ciudadanías frágiles que no ayudan a empoderan procesos de corresponsabilidad tan necesarios bajo las mismas dinámicas y exigencias de la pandemia COVID-19. Por ello deberían buscarse medidas menos punitivas y menos paternalistas que busquen por otro lado un mayor empoderamiento ciudadano no desde el discurso sino desde las mismas prácticas ciudadanas. Un aspecto que ha cobrado relevancia en el marco de la pandemia y las medidas implementadas en la crisis sanitaria, corresponde al cierre temporal de diversos sectores económicos, dando paso a el asentamiento de una crisis económica en alza, que aunque no se toma como tema central del proceso de investigación aquí plasmado, es un factor que necesariamente tendrá implicaciones en las prácticas ciudadanas, su relacionamiento con las instituciones y las percepciones que emergen frente a la pandemia y su manejo desde la gubernamentabilidad.

Sustainable Development Strategies of China's Transportation Industry Under the Background of COVID-19

Abstract

At the beginning of 2020, the "black swan" of COVID-19 began to wreak havoc in our country and globally, bringing a huge impact to people's lives. At present, the epidemic situation in my country has been clearly controlled, but its impact on economic growth has already appeared. As one of the industries most affected by the epidemic, the transportation industry will face huge challenges in the short term, but there is still room for sustainable development in the long term. Reduce or even completely eliminate the negative impact of COVID-19. This article analyzes and predicts the impact of COVID-19 on traffic from two aspects: road transportation and road construction and proposes countermeasures to ensure sustainable development. In order to ensure sustainable development, while seeking national policy support to resolve investment and financing difficulties, highway companies must take the initiative to turn the epidemic crisis into an opportunity for reform, reduce costs and increase efficiency, explore multiple channels of financing, and let the company pass the difficult period smoothly.

Keywords: COVID-19, transportation, road construction, sustainable development, strategy.

Introduction

In January 2020, COVID-19 occurred in 31 provinces (autonomous regions and municipalities) across the country, and all provinces across the country have successively launched first-level response plans, and the nationwide COVID-19 prevention and control campaign has been fully launched (Xinhua News Agency, 2020). The continuous escalation of the epidemic will have a significant impact on transportation, especially the toll highway industry in the short term. It is worth noting that after the State Council's notice on the national toll road exemption from vehicle tolls during the epidemic prevention and control period, the toll highway operating companies are facing a cliff-like decline in revenue, a significant reduction in operating cash flow, and steep pressure on debt service. Increasing a series of challenges and pressure on solvency will indirectly drag the expressway investment industry. Under this circumstance, it is worth thinking and paying attention to how transportation operations should comply with policies and external conditions and determine the focus of current operations and management with the goal of sustainable development.

Literature Review

COVID-19 is a major challenge to the world economy（Esin, 2020）, with international supply shocks and declining

Cite this Article as: Jun MA and Igor A. MAYBUROV "Sustainable Development Strategies of China's Transportation Industry Under the Background of COVID-19" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

GDP growth in many OECD countries (Welfens, 2020). Affected by COVID-19, countries around the world have implemented a series of measures, including border blockade and social distancing, in order to control the outbreak (H. Lau et al., 2020). Research shows that COVID-19 affects both financial markets (Al-Thaqeb et al., 2020) and the national economy (Banks, J.et al., 2020).

Many experts and scholars have carried out relevant research on the relationship among the epidemic, transportation, road construction, and fiscal revenue. Mayburov (2017, 2018) substantiates that the relationship between traffic taxes and road construction, studied the sources of government funding for highways, and analyzed the possibility of increasing the fiscal and regulatory importance of transportation taxes and charges. Michail (2020) analyzed the impact of Covid-19 on shipping. Aloi et al. (2020) investigated the impact of COVID-19 on urban traffic and pointed out that overall travel dropped by 76%, especially in public transportation users, which dropped by 93%. Ivanov (2020) proposed a simulation of the impact of the outbreak on global transportation, supply chains and COVID-19. Wenhua and Liang (2003) analyzed the negative impact of SARS on different modes of transportation in my country. Guobing (2020) suggested reducing the impact of COVID-19 on China's foreign trade and employment by stabilizing the global supply chain and using fiscal and tax measures to reduce costs. Liu et al. (2020) draw on the experience of the United Nations, the United States, the European Union, the United Kingdom and Japan on the construction of resilient transportation systems and traffic emergency support, and comb out the main points of the system resilience analysis of China's transportation industry.

However, although studies on the transportation supply chain have been conducted in the literature, no attempt has been made to test the impact of COVID-19 on road traffic. Therefore, this article analyzes and predicts the impact of COVID-19 on traffic from two aspects: road transportation and road construction, which is very necessary.

Methodology

To study the impact of COVID-19 on road transportation, this article is based on relevant theories of transportation economics (Small. 2007), econometrics (Pesaran. 1990) and other disciplines, this article uses retrospective analysis to collect data from government reports, the State Administration of Taxation and the Ministry of Transport to analyze the impact of COVID-19 on road transportation. According to statistics, from January to July, the country completed a total of 4.85 billion commercial passengers, a year-on-year decrease of 52.9%. Among them, commercial passenger traffic on roads fell by 53.2%. Among them, in July, a total of 890 million commercial passenger traffic was completed nationwide, which recovered to 58.0% of the same period last year, and the degree of recovery increased by 1.7 percentage points compared with June (Fig. 1.). From January to July, the investment in fixed assets in transportation completed 1.8 trillion Yuan, an increase of 9.4% year-on-year, and the growth rate was 3.4% faster than that in the first half of the year. Among them, 345.8 billion Yuan was completed in July, an increase of 26.7% year-on-year. Among them, the completed highway investment was 1272.2 billion Yuan, a year-on-year increase of 11.3% (Government public information 2020).

Fig. 1: Year-on-year growth rate of commercial passenger traffic from January to July 2020

Source: According to the author

This article uses a combination of theory and empirical methods to select road passenger volume, freight volume, government bonds, transportation fixed asset investment and other indicators that represent the entire industry; in data processing, comparative analysis is used to compare 2019 road transportation data Analyze the impact of COVID-19 on road transportation from two aspects: road transportation and road construction, and put forward corresponding measures, and put forward strategic suggestions for sustainable development.

Research

The Impact of COVID-19 on Road Traffic

In terms of road transportation, the impact of COVID-19 on the transportation industry is huge. According to the "2019 Toll Road Statistics Bulletin", the national toll road toll revenue and expenditure gap in 2019 reached 402.65 billion Yuan. Affected by the epidemic, it is expected that the revenue and expenditure gap of expressway operating companies in 2020 will further expand. Factors such as traffic control measures, the extension of the Spring Festival holiday, and delays in the resumption of work have led to a significant drop in national transportation volume in the short term. From January 10 to February 18 (40 days before and after the Spring Festival), the total number of passengers sent on national roads decreased by 50.8% year-on-year, and the national road freight volume in February decreased by about 51% compared with the previous year (Table 1, Table 2). Wu Chungeng, Director of the Policy Research Office of the Ministry of Transport, said that in the first quarter, 1.85 billion passenger traffic was completed, a year-on-year decrease of 58.4%. In the first quarter, 7.82 billion tons of commercial freight was completed, a year-on-year decrease of 18.4%.

Table 1: National highway passenger traffic during the Spring Festival 2016-2020

Year	2016	2017	2018	2019	2020
Passenger volume (100 million passengers)	24.95	25.21	24.8	24.6	12.11

Source: According to the author

Table 2: National highway freight transport volume in February from 2016-2020

Year	2016	2017	2018	2019	2020
Freight volume (10,000 tons)	144399	179276	167206	167329	82736

Source: According to the author

Anti-epidemic policies continue to increase, resulting in a sharp drop in toll revenue. After the State Council's notice on the national toll road exemption from vehicle tolls during the epidemic prevention and control period (from February 17 to May 5) was issued, toll highway operating companies are facing a cliff-like decline in revenue, and preliminary statistics are used to reduce tolls nationwide every day About 1.5 billion Yuan. On the basis that the original gap has not been effectively suppressed, toll revenue in the first half of 2020 is likely to decline in a precipitous manner.

In terms of highway construction, highway construction funds are an important factor affecting and restricting highway construction. Since 2018, the growth of investment in highway construction has declined, to a certain extent due to the shortage of construction funds. The sources of funds for highway construction under the current system include financial funds invested by governments at all levels in highway construction projects, and construction funds raised by project entities in accordance with market-oriented operations. Important sources of fiscal funds for highway construction include vehicle purchase tax funds and local government bond funds. Local government bond funds are mainly toll road special bond funds.

After falling for two consecutive years in 2015 and 2016, 2017 ushered in a new increase in vehicle purchase tax revenue. In the whole year, 328.67 billion Yuan of vehicle purchase tax was collected, a year-on-year increase of 22.7%. However, the growth rate continued to decline in 2018. The growth rates in 2018 and 2019 were 5.2% and 1.3%, respectively. Including the impact of the epidemic, the outlook for automobile sales in 2020 is uncertain; vehicle purchase tax revenue may further decline; the arrangement of special funds for vehicle purchase tax for road construction is not optimistic, and it may be a certain degree of investment in speeding up road construction Have an adverse effect.

In recent years, the central government has still paid great attention to infrastructure construction and still regards it as an important support point for stimulating national economic growth. The Ministry of Finance has issued a total of 1,848 billion Yuan in 2020 local government debt limits on November 27, 2019 and February 11, 2020, of which the general debt limit is 558 billion Yuan and the special debt limit is 1.290 billion Yuan. The purpose is to implement debt funds into specific projects as soon as possible, form an effective pull on the economy as soon as possible, and drive effective investment support to make up for shortcomings and expand domestic demand. In January 2020, 714.8 billion Yuan of special bonds have been issued nationwide. The adverse impact of the epidemic

on the development of the national economy further reflects the necessity of this fiscal policy to stimulate economic growth. Therefore, it can be expected that the general bond funds invested in general road construction projects and the toll road special bond funds invested in government toll road construction projects will have a significant increase over 2019, effectively promoting the rapid development of road construction.

An important measure for the development of road construction in accordance with the market-oriented direction is to continue the pace of cooperation between the government and social capital in accordance with the policy guidelines of the State Council, the Ministry of Finance and the Ministry of Transport. The Ministry of Finance has carried out a new upgrade and transformation of the national Public-Private Partnership comprehensive information platform (Ministry of Finance, 2020). The launch of the new platform indicates that standardized management has achieved new results and will continue to make new progress in infrastructure construction. The user payment mechanism is the payment mechanism of the Public-Private Partnership model that is mainly advocated by the Ministry of Finance and is sustainable and does not increase government debt. If the Public-Private Partnership adopts a user-paid mechanism, it means that it is developing a commercial toll road. And some policy changes caused by COVID-19 may cast a shadow on the public-private partnership on the highway to further promote the user payment mechanism.

The prevention and control of the epidemic has prevented travel, and the traffic flow of highways across the country has significantly declined. The prevention and control measures of suspending some passenger transportation and exempting tolls undoubtedly have a serious impact on the operational performance of the project company. The direct impact is the loss of project revenue, the increase in costs, and the sharp decrease in revenue, and the project company may face financial difficulties; the indirect impact is the increase in the financing cost of subsequent projects in the expressway industry, and the reduction of project service quality and efficiency.

During the period of COVID-19 prevention and control, the national toll roads are exempted from vehicle tolls. This is a major decision made by the Chinese government for the public interest. It is necessary to correctly handle the relationship between social public interests and safeguarding the legitimate rights and interests of highway investors and operators in accordance with relevant laws and regulations and promote the sustainable development of highway construction and management.

Related Suggestions

It is recommended that the cash flow of the transportation service industry comprehensively consider factors such as the amount of toll free, the net cash flow of operating activities during the extended toll period, time, and discount rate when calculating the toll period that should be extended. The net cash flow that can be obtained in the future by extending the charging period, its discounted value should not be lower than the free toll.

It is recommended that the principal of loans for the transportation service industry be postponed for one year and returned. The interest of the amount of interest-bearing debt (including equity financing) within the toll-free period will be postponed according to the free period, and the final interest will be paid off. At the same time, it is recommended that the rigid expenditures for operation and maintenance within the free pass period should be funded by the government in the form of special bonds.

At present, the country has appropriately increased the effective supply of the financial supply side through a series of quantitative easing monetary policies such as structural RRR cuts. Depending on the progress of the epidemic, the number of RRR cuts may be appropriately increased or the time window for RRR cuts may be advanced. But relying on monetary policy alone is not enough. In the next step, the government should make full use of fiscal

policies such as fiscal deficits and structural fiscal and taxation to stimulate the rapid release of demand, so as to fully hedge the negative impact of the epidemic.

The current epidemic has rapidly escalated into a major global public health event, which has had a serious impact on the development and layout of the global industrial chain. Only when all countries can work together can the epidemic be effectively contained in the short to medium term.

Conclusion and Future Research

COVID-19 has caused a great impact on the global economy. China has adopted a unified deployment of prevention and control methods, and the whole country has jointly resisted. It is a foregone conclusion that COVID-19 will have a greater negative impact on road passenger and cargo transportation in 2020. At the same time, fiscal policies such as increasing fiscal expenditures, lowering corporate income tax rates, personal income tax rates, and value-added tax rates are effective in mitigating the economic impact of the epidemic. Road transportation is an important link in the development of the national economy and an important guarantee for the national economy and people's livelihood. During the epidemic, toll free on expressways is also a social responsibility of toll road owners. To ensure sustainable development, highway companies seek national policy support in resolving investment and financing difficulties. While making good use of the government’s various preferential support policies, they must also take the initiative to turn the epidemic crisis into an opportunity for reform, and make risk prediction and Plan, reduce costs and increase efficiency, explore multiple channels of financing, and actively carry out business expansion and transformation, so that the company can smoothly pass difficult times, minimize losses as much as possible, and finally achieve sustainable development. This research helps to understand the current situation of China's road transportation under the epidemic situation, know the problems it faces, and take necessary measures according to corresponding strategies.

The sudden COVID-19 epidemic has provided a valuable example for the study and practice of how to adhere to the sustainable development strategy of transportation in the context of major public health emergencies. Review the transportation response strategies during the entire process of the outbreak, analyze and predict the impact of the epidemic on traffic from the two aspects of road transportation and highway construction, and improve the transportation response system for major public health emergencies. It is of great value to guide the formulation of policies for the prevention and control of specific epidemics, and to use taxation policies to help the sustainable development of transportation under major public health emergencies.

Abstract

The article addresses the current issue of food waste. The issue of food waste is closely related to food security and food self-sufficiency and, of course, to the economic approach of households to food. The article presents the results of a case study of food waste in a selected region of the Czech Republic. A questionnaire survey and a specific survey of households were used to determine the actual amount of food waste and the amount of financial losses that are associated with this waste.

Keywords: Food Security, Food Sufficiency, Food Waste, Household.

Introduction

The year 2020 has been marked by the fight against the COVID-19 pandemic. However, the current pandemic has given rise to other problems or emphasized the need to solve them (e.g. the issue of food and water supply in crisis situations) (Safarik et al., 2015) (Strohmandl et al., 2015). Food self-sufficiency and economic access to food are very closely linked to food waste, which is typical not only for developed countries, and global food production is estimated to be close to one third. The agricultural area where food is grown "for nobody" is larger than Europe (Hoering, 2014). With the total annual loss, spoilage or discard of food is equivalent to 1.3 billion tonnes of food. In the most basic foodstuffs, as rice, wheat and other cereals, losses are around 30% up to 286 million tonnes of cereal products. This is 5% more for fish than for cereals (35%). Up to 8% of fish caught are thrown back into the sea, when in many cases the fish are already dead, dying or otherwise damaged. Fruit and vegetable losses account for approximately 40-50%. Up to half the world fruit and vegetable production is discarded. Losses for dairy products, meat and oilseeds are around 20%. In Europe, up to 29 million tonnes of dairy products are discarded or otherwise degraded each year. In terms of meat, of the 263 million tonnes produced globally, up to 20% is devalued or discarded. For oilseeds, global waste is 2% higher than for meat (Food Loss and Waste Facts, © 2015, Zábojníková, 2020).

Food waste can be defined as a reduction in the amount of food quality due to the decisions and actions of retailers, food service providers and consumers (Food Loss and Food Waste, © 2020). Food waste is part of food loss and refers to the disposal or non-food use of safe and nutritious food intended for human consumption, which takes place throughout the food chain from primary production to final consumption in the household (Storup et al., 2016,

Zábojníková, 2020). Food losses already occur in the primary sector - in agriculture (e.g. premature harvest, standards of aesthetic appearance of food) (Bremsová et al., 2016). Furthermore, there is a further selection of food due to the standards of traders, in the processing of raw materials for the final treatment of the product or in their packaging. Food losses occur during transport and storage (Gustavsson et al., 2011). End-of-chain food losses - the treatment of food retailers and the behaviour of final consumers - are referred to as food waste. The largest producers of food waste include direct food stores and supermarkets and households (Parfitt et al., 2010).

Food Waste – A Case Study

In the Czech Republic, up to 829,851 tonnes of food are devalued annually, which is about 81 kg per person. The highest share of food waste is in the process of food production 44%, followed by households 31%, gastronomic establishments account for 15% of waste and retail chains 11%. Thus, 254,000 tonnes of food are thrown away in households every year, which is approximately 25 kg per person per year. Fruit and vegetables are wasted the most 27%, beverages 17%, pastries 11%, leftovers of ready-made uneaten meals 10%, milk and dairy products 10%, meat 7%. Nevertheless, the Czech Republic is the 5th EU country that wastes the least food (Ministry of the Environment of the Czech Republic, 2017). One of the key steps in recent years to reduce food waste is the approval of an amendment to the Food and Tobacco Products Act, which requires stores with an area of more than 400 m2 to donate food that they are no longer allowed to sell (e.g. due to poor labelling, or imperfect packaging) to food banks (Zábojníková, 2020).

Based on the above data, a survey was conducted in households in the district of Břeclav, focusing on the issue of food waste. The research in the form of a questionnaire survey took place in February 2020, data were collected from 420 respondents. Based on the statistical evaluation of the survey results, food waste was also measured in selected households (households formed a deliberately inhomogeneous group). The measurement lasted for 14 days, households recorded food waste in a unified form, and the total financial loss resulting from waste generation was also evaluated. The aim was to verify whether the respondents in the questionnaire survey are able to correctly estimate the amount of food waste that their household generates and also the financial loss of the household caused by it. Below there are selected results of a questionnaire survey and the main results of measuring food waste in selected households (Hubálková, 2020).

Within the shopping behaviour of respondents, the following summary of selected results can be given: More than 61% of respondents shop 2-3 times a week, a total of 69% of respondents stock. 77% of respondents check the date of minimum durability and use-by date. There were no statistically significant differences between gender, age and educational attainment in the given responses. 55% of respondents estimated the production of food waste per month at less than a kilogram, 42% between 1-5 kg, and 77% estimated the amount of financial losses due to food disposal at less than 20 Euros per month.

When identifying the main reasons for food disposal, the largest number of responses was selected in the category of spoilage, hardening or other deterioration (292 responses). An overview of the reasons for food discards and the frequency of respondents' answers is given in Table 1.

Table 1: Sources and processing of food waste of respondents

	Number of respondents	Percentage share
Reasons for throwing food away (multiple answers possible)		
Leftovers of ready - made uneaten meals	262	62,4%
Spoiled, hardened, devalued food	292	69,5%
Expired food	160	38,1%
Too much food purchased	19	4,5%
Improper food storage	49	11,7%
Food is not thrown away	51	12,1%
Food waste management		
Further processing	97	23,1%
Animal feed	126	30,0%

Composting	76	18,1%
Mixed waste	121	28,8%

From the results of the questionnaire survey, there were found subjective estimates and opinions of selected people and their households regarding food waste. For a more accurate and in-depth analysis of the specific amount of food waste in some households, the method of measuring food waste was chosen by analysing the form in which specific data were incorporated, the measurement took place in households for 14 days. The form contained data for accurate measurement of food waste, which was divided into types A to G. Food waste A included bread and cereals, B fresh fruit and vegetables, C meat and smoked meat products, D milk and dairy products, type E canned food and F snacks (chocolate and non-chocolate confectionery). A summary of the results of the household survey is given below in graphical terms.

Fig. 1: Comparison of estimates and actual amounts of food waste

The results showed that the initial estimate of the selected respondents does not match the actual amount of food waste. The actual amount of discarded food is always higher than estimated, on average the amount of real food waste is 2-3 times higher. In line with the finding, the estimate of the financial loss and its actual amount vary considerably. It is shown graphically in Figure 2.

Fig. 2: Comparison of estimates and actual prices for discarded food

The financial expression of losses for food waste produced was estimated a little more accurately, however, in all cases the actual values were underestimated. In the worst case, the price estimate for discarded food was four times underestimated. The financial loss per month ranged from 12 to 47 Euros in households.

A total of 29.9 kg of food was thrown away in the monitored households during the experiment. Figure 3 shows the percentage share of individual food groups in the total volume of discarded food for a fortnight of measurement.

Households threw the most vegetables and fruits. The percentage of vegetables and fruits in the total amount of food waste corresponds to 31%. The second most discarded type of food were the leftovers of ready-made uneaten meals, which accounted for 28% of the total. Cereal products, most often spoiled bread, accounted for 18% of food waste. Meat products and sausages accounted for 11% of the volume of discarded food, dairy products for 9%. Sweets and other delicacies, which accounted for 3% of the volume of waste, were the least discarded, and no canned and cooked products were thrown away in households during the entire fourteen-day measurement period (Hubálková, 2020).

Fig 3. Composition of the total volume of discarded food

Fig. 4: Reasons for disposing food by households

The figure of reasons for disposing food in households shows that people most often threw away food due to spoilage, in as many as 47% of cases. The most common were fruits and vegetables and dairy products. The second largest

share in the amount of food that was thrown away during the fourteen-day measurement period were ready-made food leftovers. This was followed by hardened or otherwise degraded food, where the most common discarded commodity was bread and other cereal products. On the contrary, none of the participants selected the possibility of error in food storage techniques, although in some cases the underestimation of the factor was obvious.

Conclusion

The issue of food waste is a very important and current topic. There is a number of negative consequences of wasting food. Food waste has a profound impact on the environment. It is clear that food waste aggravates the already very negative way of treating the soil. Agriculture is deeply loaded; a considerable amount of chemicals gets into the soil and at the same time its fund is depleted. According to UN statistics, on average up to a third of the food produced is discarded. This equates to up to 1.3 billion tons of food. This food waste is also a waste of water resources. Hundreds to thousands of litres of water are needed to grow any crop, which is unnecessarily and irretrievably lost as a result of the food being thrown away. This corresponds to about a quarter of the total volume of water consumed in agriculture. Discarded food accounts for about 8 percent of greenhouse gas emissions worldwide. Wasting food means wasting resources (Glopolis, 2014).

In addition to environmental impacts, it is also possible to talk about significant economic impacts, estimated at up to 770 Euros per household per year. However, food waste is also an ethical problem, as on the one hand millions of tonnes of food are thrown away, on the other hand there are 870 million starving people in the world (Glopolis, 2014).

There are several options for reducing food waste, and it should be noted that there is a need to focus significantly on reducing food waste at the household level, i.e. at the microeconomic level. According to the FAO, key activities to reduce waste include, for example, raising awareness of the problem, redistributing food from unnecessary to needy, using food that is unfit for human consumption as animal feed, giving more space and importance of composting bio-waste. (FAO, 2013, European Court of Auditors, 2016). There are several pieces of advice and recommendations for households (individuals) in the field of food waste reduction, including, for example, planning purchases and creating a diet for the household for the week; monitoring of consumption date and minimum durability, financial planning; proper food storage; processing of leftover food instead of discarding it, freezing food, which is approaching the expire date and the date of minimum durability, and making home compost.

Abstract

Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs (WCED, 1987). The aim of the article is to emphasize the need of incorporating the sustainability into the strategic management process. The article is based on information gathered through extensive literature review (research publications, research studies) using internet and research databases. The sustainable strategy must support companies' goals, creates values not only for company, but also for stakeholders/society without compromising the ability of future generations to meet their own needs. It is important that sustainability is incorporating into the strategic management process from the beginning

Keywords: Strategy, Sustainability, Strategic Management, Sustainable Development.

Introduction

In recent years, a growing number of companies around the world voluntarily adopt and implement a broad range of sustainability practices as a response to emerging challenges and stakeholder expectations across the Environmental, Social and Governance (ESG) domains. In doing so, they try to integrate sustainability into their strategy, business models, and organizational processes and structures (Eccles et al., 2014; Ioannou & Serafeim, 2019).

The term *sustainability* covers environmental issues, wider corporate social responsibility (CSR), the long-term continuity, and economic survival of business (Scottish Enterprise, 2011). One of the best known and used definition of sustainable development was first introduced in 1987 in the Report of the World Commission on Environment and Development: Our Common Future (World Commission on Environment and Development, 1987): *Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs*.

It contains within it two key concepts (World Commission on Environment and Development, 1987):

- the concept of "needs", in particular the essential needs of the world's poor, to which overriding priority should be given,

- the idea of limitations imposed by the state of technology and social organization on the environment's ability to meet present and future needs.

By now most companies have sustainability programs. They're cutting carbon emissions, reducing waste, and otherwise enhancing operational efficiency. But a mishmash of sustainability tactics does not add up to a sustainable strategy. To endure, a strategy must address the interests of all stakeholders: investors, employees, customers, governments, non-governmental organizations, and society at large. To do that, it has to increase shareholder value while at the same time improving the company's performance on environmental, social, and governance dimensions (Eccles & Serafeim, 2013).

Cite this Article as: RADOSLAV JANKAL and Miriam JANKALOVA "Through Strategy to Sustainability Development" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The aim of the article is to emphasize the need of incorporating the sustainability into the strategic management process. The paper is based on information gathered through extensive literature review (research publications, research studies, documents about the strategic management and sustainability) using internet and research databases (Scopus, WoS, Google Scholar).

Theoretical background about strategy and Strategic Management

Fleisher and Bensoussan (2003) understand strategic management as a way of conducting the organization that has as its ultimate objective the development of values, managerial capabilities, organizational responsibilities, and administrative system that link strategic and operational decision making, at all hierarchical levels, and across all lines of authority. According to Dess, Lumpkin and Taylor (2004) strategic management consists of the analysis, decisions and actions an organization undertakes in order to create and sustain competitive advantage.

They have defined four key attributes of strategic management (Dess et al., 2004):

- Directs the organization toward overall goals and objectives,
- Involves the inclusion of multiple stakeholders in decision making,
- Needs to incorporate short-term and long-term perspectives,
- Recognizes trade-offs between efficiency (doing things right) and effectiveness (doing the right thing).

The strategy reflects one of the key manifestations of strategic management, which is to focus on longer-term vision of development activities and managing social and societal system. The business strategy is a relatively independent planning category, which is based on precise knowledge of the conditions (based on the analyses carried out), a clearly formulated vision, mission and objectives of the company and creates a suitable starting point for subsequent tactics and more specific activities of the management process. The business strategy represents a certain concept of its behaviour set for a longer time horizon.

According to David (2011) strategies are the means by which long-term objectives will be achieved. Business strategies may include geographic expansion, diversification, acquisition, product development, market penetration, retrenchment, divestiture, liquidation, and joint ventures. Strategies are potential actions that require top management decisions and large amounts of the company's resources. In addition, strategies affect a company's long-term prosperity, and thus are future-oriented. Strategies have multifunctional or multidivisional consequences and require consideration of both the external and internal factors facing the company (David, 2011).

Sustainable Strategy

Since a sustainable strategy is about integrating financial and nonfinancial performance, the inevitable consequence of this is that a company should report on how well it is doing this in an integrated way (Eccles & Krzus, 2010). By building sustainable strategies, the world's most influential and innovative companies can pave the way to a sustainable society, one that meets the needs of the current generation without sacrificing those of generations to come (Eccles & Serafeim, 2013). For a comprehensive corporate sustainability strategy, it is necessary to consider all dimensions (economic, ecological and social), their impacts and their interrelations (Baumgartner & Ebner, 2010).

Baumgartner and Korhonen (2010) discussed in their paper three central dimensions of strategic thinking derived from the mainstream of strategic management literature and the relevance of these dimensions when addressing the problem of reductionism. To evaluate sustainability performance from a strategic perspective following three dimensions are helpful: strategy content, strategy process and strategy context (Baumgartner & Korhonen, 2010; Baumgartner, 2012):

- ***Strategy Content*** - This dimension secures that the framework, approach or project in question contributes to sustainability. What is the substance and the added value in light of sustainable development? Focusing on

strategy content means that one seeks to avoid pitfalls; one is clear about the contribution attempted. The strategy content is the substance of the constructed framework, approach or project. To substantiate the content the framework for strategic sustainable development is a suitable approach the measure especially the environmental dimension. For the social dimension the ISO 26000 guidance document on social responsibility provides a comprehensive overview.

- ***Strategy Process*** - Strategy process outlines the way in which the entire strategy of the framework, approach or project in question is formulated and constructed to achieve the intended content and purpose. It is important to include all primary stakeholders, e.g. the managers, the tool developers or designers and the actors who implement the approach in practice. Primary stakeholders should all be aware of the expected outcome of the project and they should have a system understanding/awareness, not only understanding of their own subsystems or isolated system components. From system understanding it should follow that actors know how to act and when to act to contribute to the desired outcomes in the system under focus.

- ***Strategy Context*** - The dimension of strategy context is about the perception of the secondary stakeholders. It is also important to acknowledge the overall environment of the work in question, which always includes the larger socio-economic environment, i.e. the cultural context, the political context, the regulatory context and the market context under which the work must be performed.

Baumgartner (2009) and Baumgartner and Ebner (2010) discussed in their papers following Corporate Sustainability Strategies:

- ***Introverted*** – risk mitigation strategy: An introverted strategy is characterized by one central question: Is the action for sustainable development necessary and useful for the company? The focus of all activities is the compliance with legal and other external standards concerning environmental and social aspects in order to avoid risks for the company. The pressure for this strategy emanates from outside the company, but the action is mainly internally oriented, therefore it is named “introverted”. Action will only be taken if standards force an organizational answer.

- ***Extroverted*** – legitimating strategy: An extroverted strategy focuses on the external relationship of a company. The focus is on public acceptance and the so-called “license to operate and grow”. Stakeholders are informed about all relevant activities in order to generate a trustful relationship. These companies create ambitious environmental programs, but effort and progress in the light of the sustainability principles can be still minimal. In many cases there seems to be more ‘green’ communication than real activeness. This strategy aims to create new market opportunities in the light of sustainable development, including elements of the conservative and visionary strategies.

- ***Conservative*** – efficiency strategy: A conservative strategy focuses on eco-efficiency. Products and services are provided with low costs and low consumption of materials and energy. Emissions and waste are avoided. Efficient production processes lead to competitive advantages while environmental impacts are reduced. Frequently cleaner production activities are aligned with a conservative strategy. Opportunities due to integration of sustainable development are detected systematically. As the actions and measures of this strategy are usually within the company, this has a strong internal orientation.

- ***Visionary*** – holistic sustainability strategy: A visionary strategy focuses on sustainability issues within all business activities. Sustainable development is incorporated in vision and strategy. Competitive advantages are derived from differentiation and innovation, offering customers and stakeholders unique advantages. Visionary strategies occur in two different forms: in a conventional way and in a systemic way. Conventional visionary strategies are based on market opportunities in an opportunistic manner. As long as sustainability issues lead to market advantages, they are part of the strategic management of conventional visionary oriented companies. So, the focus is outside in; inputs for the strategy formulation are derived from the market perspective. Systemic visionary strategies combine this view with an inside-out perspective; the marked based view is supplemented with a resource-based view and sustainable development is deep seated in the normative level of the company.

Visionary strategies have a very strong orientation on sustainable development; the entire organization is committed to this. There is of course the risk of market acceptance. Chances of the systemic type are higher due to the integrated view of sustainable development than the visionary conventional type. The evaluation of these strategies shows different levels of sustainability orientation, so they could be seen as different stages of corporate development towards sustainability: the weakest sustainability strategy would be the introverted, the strongest the visionary strategy; conservative and extroverted strategies are middle stages (Baumgartner, 2009).

Integrating sustainability principles into businesses

According to a McKinsey survey from 2011, many companies are actively integrating sustainability principles into their businesses and they are doing so by pursuing goals that go far beyond earlier concern for reputation management - for example, saving energy, developing green products, and retaining and motivating employees, all of which help companies capture value through growth and return on capital (Bonini & Görner, 2011).

Part of the survey was also to clarify how the companies integrating sustainability across business processes. For example, respondents indicated into which business processes sustainability was integrated: 67% mentioned the option "mission and values", for example "corporate culture" chose up to 59% and "strategic planning" chose up to 57%. In the last two places with the lowest number of respondents were the options "supply chain management" and "budgeting process" (Bonini & Görner, 2011).

McKinsey survey from 2017 asked how integrated sustainability is into 11 core business functions, and respondents indicate that integration into "strategic planning" is the most common (44%) (Bové et al., 2017).

Sustainability has long been on the agenda at many companies, but for decades their environmental, social, and governance activities have been disconnected from core strategy. Most still take a fragmented, reactive approach - launching ad hoc initiatives to enhance their "green" credentials, to comply with regulations, or to deal with emergencies - rather than treating sustainability as an issue with a direct impact on business results (Bonini & Görner, 2011).

Recommendations and conclusion

Sustainability cannot be implemented as a stand-alone activity, e.g. with the fact that the company focuses only on areas that are positively perceived in the eyes of stakeholders. E.g. it focuses only on philanthropic activities and ignores others. Sustainability must be an integral and inseparable part of business. We agree with the Peter White (2009) that the key is to build sustainability into the business, rather than present it as an additional activity; to have it owned by the business rather than by a corporate ''CSR group''.

Therefore, it is important that *sustainability* is incorporating into the *strategic management process* from the beginning. Therefore, in the next section, there will be recommendations on how to proceed.

The initial step is to define a vision, mission, purpose, values and principles (can be compared to human DNA) (Figure 1). These elements must already *reflect* and take into account *sustainability*, as they lead to the formulation of goals that will help company on the path to sustainability. An important part of this step is also to *define the stakeholders* with whom dialogue is needed and can also help companies on the path to sustainability. It is important for companies to incorporate sustainability also in the *goals* (Figure 2) they are pursuing. The process of setting goals is very important, because it lays the grounds for the future position of the company and sets the direction of all efforts in the company.

Fig. 1: Business DNA

Fig. 2: Sustainable SMART Goals

To ensure that the company's commitment to sustainability permeates the entire organization, *the goal-setting process* must be extended into the *development of functional strategies*. Furthermore, sustainability goals should cascade throughout the organization so that they are included in individual employee performance plans. If a company's sustainability efforts are to provide long-term value to both the company and society, sustainability must be integrated into the company's strategy in a way that complements the company's goals and overall mission. (Galpin et al., 2015)
The *analysis of the current situation* is also *focused on sustainability*, where it is important to identify internal areas that have an impact on sustainability, as well as external opportunities that can be focused on. Companies that have been involved in sustainability for a long time and are successful in doing so can be an inspiration (see White, 2019; Galpin et al., 2015).

Management needs to develop and evaluate strategic alternatives and then select strategies that are compatible at each level and that allow the company to best capitalize on its strengths and opportunities (Hittmár & Jankal, 2015).

Many types of strategies appear in the literature (Barney & Hesterly, 2018; David, 2011; David, 2017; Dess et al., 2004; Fleisher & Bensoussan, 2003; Hittmár et al., 2014; Hittmár & Jankal, 2013; Lendel et al., 2015; Pettinger, 2004; Strenitzerová, 2005). Regarding sustainability strategies, the third part of the paper characterizes 4 types of *corporate sustainability strategies*. The weakest sustainability strategy would be the introverted, the strongest the visionary strategy (see part 3 - sustainable strategy).

The sustainable strategy must support companies' goals, creates values not only for company, but also for stakeholders/society without compromising the ability of future generations to meet their own needs.

But do not overlook the fact that even the best strategy when implemented poorly, may cause more harm than good. One of the most important tasks for a manager, entrepreneur or business owner there is a need to start working with good ideas for the future and then at the stage of its own functioning know how to manage their activities (Hittmár & Jankal, 2015).

Integrating sustainability into strategic initiatives is especially important because these issues play out over the long term. It's easier for companies where they are core concerns to understand trends and make strategic bets in advance of consumer preferences, stakeholder pressure, or regulation. The choice for companies today is not if, but how, they should manage their sustainability activities. Companies can choose to see this agenda as a necessary evil - a matter of compliance or a risk to be managed while they get on with the business of business - or they can think of it as a novel way to open up new business opportunities while creating value for society. (Bonini & Görner, 2011).
The best formulated and best implemented strategies become obsolete as a company's external and internal environments change. It is essential, therefore, that strategists systematically review, evaluate, and control the execution of strategies (David 2011).

Abstract

The contemporary tourism market is characterized by the dynamic development of internet solutions and the growing share of seniors (60+ people) in the group of tourists. Therefore, the purpose of the article was to indicate the main socio-demographic factors conditioning access to modern information technologies and making a comparison between the use of tools dedicated to tourism by people over 60 years old and younger. In the introduction to the article, based on desk research and critical literature analysis presents considerations on the use of the Internet by seniors, which focus on the concept of digital divide, and points to arguments showing the growing potential of seniors in the European tourism market. The main body is based on statistical analysis of data obtained from the survey conducted in 2019 on a group of 1067 inhabitants of the Zachodniopomorskie province (Poland). Using the Pearson chi independence test ^{2}, the Mann-Whitney U test, and the Kruskal-Wallis test, it was confirmed that the relationship between the age and access to a computer and the Internet is significant. In addition, it was found that features such as place of residence and education are statistically significant, although their strength is weakening. Detailed analyses have shown differences in the use of modern solutions between seniors and younger groups, which proves still existing digital division of these groups. It was stated that actions leading to digital inclusion of seniors are necessary, which will reduce the differences in access to tourist services. It should be emphasized that despite the local nature of the case study, the considerations and conclusions carried out may be useful in a global context.

Keywords: Senior, Modern Information Technologies, Internet, Digital Divide, Tourist Activity of Seniors.

Introduction

Modern information technologies based on the use of the Internet play a special role in the functioning of modern economy. One of the markets affected by rapid increase in their use is the tourism market. This sector is characterized by the development of online booking platforms, which are an increasingly important distribution channel for tourist services and supporting traditional forms of sales. The Internet is also an important source of tourist information. The use of modern technological solutions in tourism most often refers to younger generations of users, which naturally is associated with the characteristics and IT skills of younger people. Among the trends that will affect the functioning of the tourism market in the near future, there are demographic changes manifesting in the aging of the European society. The tourism market is already experiencing an increase in tourist activity of the elderly (who are most often referred to as people over 60 years old). Seniors, whose number is constantly increasing, are becoming an important group of consumers of many services, which tourist companies can no longer ignore.

The combination of these two mega trends (development of modern information technologies and aging of European society) has become a premise to ask whether seniors as a promising segment of the tourism market use modern solutions dedicated to tourism and whether this group should be considered digitally divided? The answer to these questions was defined as the main goal of the article.

The background for the conducted research is theoretical and empirical considerations regarding the problems of a senior as an Internet user and arguments indicating the potential of senior citizens as a growing segment of the tourism market.

The main goal was implemented through achieving the following partial goals:

(1) An indication of the main socio-demographic factors conditioning access to a computer and the Internet,
(2) The characteristics of the use of modern information technologies dedicated to tourism by 60+ people compared to other age groups.

The empirical part of the article is based on surveys conducted in the third quarter of 2019 among 1067 people, residents of Zachodniopomorskie province in Poland.

Senior as an Internet user

A review of the literature on the use of the Internet by seniors shows that most often these considerations focus on issues related to social and digital divide of older people (Inglot-Brzęk, 2011; Batorski, 2009, Szmigielska and all, 2012; Łukaszewicz, 2016).

Social exclusion, which can be considered as a superior concept in relation to the concept of digital divide, refers to situations in which individuals are deprived of the possibility of full participation in the society (Inglot-Brzęk, 2011, p. 375). This can lead to economic (both in the sphere of production, participation in the labour market and consumption), political (limitation of active participation in political life) and social (poor participation in the life of the local community, limiting the possibilities of social relations) exclusion. Szarfenberg (after: Majer 2013, p. 107), referring to the problems of participation in social or collective life, points out that the condition of exclusion is the fact that the individual remains a member of the local community and, despite his or her will, cannot participate in normal social activities for reasons that are out of his or her control.

The concept of digital divide is associated with modern technologies, especially the Internet. J. van Dijk (2010, p. 248) defines digital divide as a stratification of those who have access to computers and the Internet, and those who do not have such an access. In turn, Polańska (2016, pp. 239, 242) and other authors (Batorski, 2009ab; Popiołek, 2013) indicate that the division into those who have access to the Internet (along with the necessary computer equipment) and those who do not have it, does not illustrate the complexity of digital divide. It is necessary to take into account unequal access to the Internet combined with the ability to use the Internet, which is referred to as the "digital division". It means inequalities in access to the Internet, varying intensity of its use, unequal degree of knowledge about how to search for information, unequal quality of connection and social support, helping in using the Internet, as well as inequalities in the ability to assess the quality and diversity of the use of network" (Batotski, 2009a, pp. 2-4; Inglot-Brzęk, 2011, p. 375).

The phenomenon of social exclusion is therefore a complex one. The levels of digital and social exclusion include (Widawska, Wysocka and Wieczorek, 2014, p. 12):

- motivation to use new technologies,
- physical access (having a computer, Internet access),
- skills (strategic, information, operational),
- different ways of using the Internet).

In turn, Batorski (2009b, p. 225) emphasizes that digital divide is more than just a digital divide and stresses that it is not only about differences in access, skills or ways of using but, most of all, it is about the ones that lead to social and economic exclusion.

It is specified that digital divide affects people in the sphere of social exclusion or marginalization as well as those who are unable, despite the possibility, to take advantage of current development of information technologies. In other words, digital divide therefore refers to the possibility of regular access to digital and information technologies and to having digital competences that allow the use digital goods in an effective manner (Łukaszewicz, 2016, p. 86).

As Łukaszewicz (2016, p. 86) points out, digital divide of the elderly can be seen on two levels. The first concerns the lack of access to the Internet and equipment enabling the use of this medium, the second is the lack of skills to use them, i.e. digital competences. This author also claims that currently, most often, exclusion occurs in the second plane (Łukaszewicz, 2016, p. 86).

As pointed out by Batorski (2009b, p. 236), definitely, the largest differences in the use of the Internet are related to age and education. In 2009, the vast majority of young people (87% of people aged 16-24) and very few older people (6% aged 65 and older) used the Internet. The inter-generational digital division is very strong and durable, although according to the Social Diagnosis (2015, p. 383), 97.5% of people aged 16-24 and 17.9% of people over 65 already used the Internet (taking 60+ people already included, it was 58.7%). This means a lot of progress.

In turn, according to the latest research of the Central Statistical Office of Poland (2020, p. 15.68), the percentage of people using computers is increasing from year to year in the elderly population of Poland. In 2018, 31.7% of people aged 65-74 used computers, which means an increase of 2.5 percentage points per year. People at this age are increasingly using computers regularly (i.e. at least once a week), however, the percentage of regular users in the analysed age range is still lower compared to younger people. In 2018, 29.8% of people of this age regularly connected to the Internet, and 19.4% of people aged 65-74 used computers every day or almost every day. Over a half of people aged 65-74 have never used a computer. In 2018, the share of these people was 59.7% (compared to 62.1% in 2017). This ratio was similar for both women and men. The percentage of people not using a computer varied depending on the level of education. The largest number of people who have never used a computer was in the group of older people with primary and lower secondary education (91.3%) (GUS, 2020, p. 15.68).

Also Niehaves and Plattfaut (2014) emphasize that age is still an important factor determining the use of the Internet, while emphasizing that the elderly are not a homogeneous group. Research conducted in Switzerland (Friemel, 2014) also confirms that Internet use is strongly distorted in the seniors group, which leads to the partial exclusion of older seniors (70+).

According to Szmigielska and co-authors (2014, p. 143), financial and technical limitations were indicated as the main reason for not using the Internet for a long time, i.e. no computer at home, no Internet access due to high costs or technical problems. Nowadays, attention is paid to factors such as: lack of motivation, beliefs and competence barriers in the use of the Internet by seniors (Hejduk, 2016, p. 75). The lack of knowledge as to the possibility of using modern information technologies or the lack of trust in this medium is also emphasized. The generally accepted and stereotypical opinion that older people are more willing than young people to accept new technological solutions should be added to these conditions. As Damodaran, Olphert and Phipps (2013) emphasize older people value very highly the benefits and independence that computer use gives them, and they are often exceptionally tenacious in trying to remain digitally connected.

It should be emphasized that disproportions in access to the Internet can lead to many negative social phenomena, because as the importance of modern information technologies in various areas of life increases, those who do not use them will be increasingly excluded (Hejduk, 2016, p. 74). Tourism is also such a field, which today is characterized by a high degree of use of modern information technologies during the preparation and organization of travels. The consequence of digital divide is unequal access to information. Therefore, digital divide generates the phenomenon of information exclusion (Popiołek, 2013, p. 311). In the case of the tourism sector, this can be very important, because tourist information (both about natural values, anthropogenic values or development of tourism) is considered the basic need conditioning tourism. Limited access to information provided on the Internet or booking systems may therefore deepen the marginalization of seniors as potential tourists.

As Trzcińska-Król (2018, p. 52) indicates, in order to find their place in the information society, seniors must master IT and media skills and competences that enable them to use modern IT solutions. Education, computer and internet training as well as non-institutional support play a key role. Friemel (2014) points out that the use of the Internet by seniors is influenced by the social context, namely encouragement and help from family and friends.

The literature also recognizes the fact that the use of information technology by seniors can bring a number positive effects for this group of society. Information technology allows seniors to remain independent for longer, facilitates access to services and information, which undoubtedly improves the quality of their lives (Niehaves and Plattfaut, 2014; McMurtrey and all, 2008). However, as McMurtrey and all (2008, p. 121) rightly points out, IT products should be designed in a senior-friendly way. Niehaves and Plattfaut (2014) emphasize that research should be conducted on the acceptance of technology, especially the adoption of the Internet by older people. One should agree with Damodaran, Olphert and Phipps (2013) that taking steps to digital inclusion of seniors will benefit not only the elderly, but also the economy and society.

Senior as a Promising Segment of the Tourism Market

The main prerequisites for treating seniors as a promising segment of the tourism market include, first and foremost, the aging of European society, the growing share of 60+ people in the structure of travellers, and changes in the lifestyle of contemporary seniors.

Aging of society is visible throughout the European Union. However, this process is spatially diverse. The median age of EU residents in 2018 was approximately 43 years and is almost 4 years higher than in 2004. The average age of Polish residents also increased during this time by more than 4 years to about 40 years. In all countries (except Luxembourg and Cyprus), currently, people in working age fall into more people in post-working age than in 2004. In most countries, also in Poland, the burden of older people on people in working age is greater than the burden of children. This is a fundamental change compared to 2004, when this relation was usually the opposite (Poland in the European Union. A statistical portrait, GUS, 2019, p. 21)

The aging process of Polish society should be considered advanced. At the end of 2018, people aged 60 and over accounted for almost 25% of the total population in Poland, while in 2010 this indicator was at the level of 19.6%. The structure of older people was dominated by relatively young people (in the age group 60-64), the share of other groups was lower with the increase in age. According to the CSO forecast, the population aged 60 and more in Poland in 2030 will reach the level of 10.8 million people, and in 2050 - 13.7 million. In 2050, the population of this age will constitute about 40% of the population (GUS, 2020, p. 13).

The growing share of older people in the structure of European society translates into the growing share of older people in tourism consumption. According to Eurostat the data presented in Table 1, people aged 65 constitute an increasing share of the population in tourist trips in countries where the aging process is becoming more and more advanced. For example, in Poland in 2012 this share was just over 14%, and in 2018 it was almost 31%. In turn, in countries where the aging process began earlier, as in Germany, for example, this share is still high, although in 2018 compared to 2012 a decrease by over 3 percentage points was recorded.

Table 1:1 The share of% 65+ in the population of residents of selected EU countries in national tourist travels

	2012	2014	2016	2018	**change 2018/2012**

Source: Own study based on Eurostat statistics (https://ec.europa.eu/eurostat/web/tourism/data/database, tour_dem, access date March 1, 2020)

The age structure of the inhabitants of the West Pomeranian Voivodeship, adopted later as a case study, also confirms the advanced process of aging of the society. In 2008, the inhabitants aged 60+ accounted for 17.4% of the total population of the voivodship. In 2018, this share was almost 26% (Central Statistical Office). Taking into account the trends indicated in Table 1, despite the lack of detailed statistical data on the tourist consumption of seniors in the West Pomeranian Voivodeship, it should be concluded that the share of older people in tourist consumption is also increasing and in line with the trends.

The survey "Tourist activity of the elderly in Poland" carried out in 2018 on behalf of the Ministry of Sport and Tourism on a group of 1500 people showed that the share of people over 55 years old who participated in at least one tourist trip in the last 12 months was 62 %. Greater participation in trips was observed among people living in the city. 38% of respondents have not travelled in the last 12 months, and 36% of respondents said they were not planning it. The most common reason for resigning from travel was poor health - this reason was indicated by 40% of people who did not travel in the last year and 44% of people who do not plan to travel. Most domestic trips were organized on their own (79%). Foreign trips were organized to a similar extent by a travel agency (43%) as well as on their own (42%). The same percentage of respondents went on domestic and foreign trips organized by family or friends (14% each) (Tourist activity ..., 2019, p. 4,7).

Treating the changes in the lifestyle of seniors as a premise for treating this group as a promising segment of the tourism market, it is worth paying attention to the new face of a modern senior emphasized in literature. As emphasized by Kociszewski (2016), citing other authors (Bondos, 2012, p. 32; Jurek, 2013, p. 32, Błędowski 2012), the qualitative evolution of the senior client model is currently taking place. The traditional perception of the senior as full of pragmatism, the desire to save and reluctant to technological novelties and with great restrictions gives way to a group of new consumers - seniors who are well-versed in the market economy and enjoy satisfaction from the consumer lifestyle, have many interests and are in a much better financial situation. These changes are also accompanied by new roles played by older people, a clearer sense of subjectivity and greater activity, including on the tourism level (Kociszewski, 2016, p. 228).

To sum up, the growing number of older consumers contributes to the increase in demand for various types of services, including tourist services. Bearing in mind the growing importance of modern information technologies in the organization of tourist trips and the fact that the Internet creates many new opportunities to associate tourism services which are distant in time and space with the individual needs of tourist recipients, it allows pricing, taking advantage of promotions, choosing a convenient date and other conditions. It is therefore necessary not only to adapt existing services to the needs of these consumer groups, but also to adapt distribution channels to the needs of seniors. Lack of actions aimed at levelling the differences in access to modern IT systems may lead to widening inequalities between generations in access to tourist services /discrimination of seniors on the tourism market.

Materials and Methods

In order to verify the main purpose of the work, the results of a survey conducted on a group of 1067 respondents, residents of the West Pomeranian Voivodeship, were used. The survey questionnaire was developed by a team of experts in the field of tourism and spatial planning at the University of Szczecin. The actual research was commissioned to an experienced research company with a reliable database. The research technique CATI (Computer Assisted Telephone Interview) was used. This method is increasingly used in the social sciences (Alen

and all, 2014; Huh and Pork (2010). This method consists in conducting a telephone conversation with the respondent while the telequestioner enters the respondent's answers to the online survey form.

The choice of the method was dictated by the low cost of carrying out such studies, the speed of obtaining information and the need for information of a general nature. Bearing in mind the limitations of the CATI method, the questionnaire was constructed in a way that allowed it to be filled once. The database from which the respondents were drawn was reliable and the quota selection corresponded with the structure of the inhabitants of the West Pomeranian province (sex, age, place of residence). In order to assure representativeness of sample, the stratified sampling was assumed. A sample was reflected the size of general population of habitants of Zachodniopomorskie province in a particular age, gender and the structure of residence. The sample was assumed as min. 1067 people (maximal permissible error of estimation 3%, confidence level 0,95).

As the attributes differentiating the availability of modern information technologies in tourism, apart from age and gender, the place of residence was also determined, which is dictated by the fact that in countries there are still differences in access to the Internet in urban and rural areas (Budziewicz-Guzlecka, 2019, p. 217; Lisha Ye and Huiqin Yang, 2020).

The test results were subjected to statistical verification. Due to the fact that the survey primarily has qualitative questions, the Pearson chi independence test ^{2}, Mann-Whitney U test, and Kruskal-Wallis test were used to determine the statistical significance of relationships between the variables. The analysis assumed the significance level of $\alpha = 0.05$. However, the V-Cramer coefficient and the contingency coefficient were used to test the strength of the relationship (Francuz, Mackiewicz, 2007, pp. 411-420).

Results

Main socio-demographic factors conditioning access to a computer and the Internet

Statistical analysis was performed in order to indicate the main socio-demographic factors conditioning access to modern Internet-based information technologies. For this purpose, the Pearson chi independence test was used, which verifies the alternative hypothesis that there is a significant relationship between the two variables. In addition, the V-Cramer coefficient was calculated for each significant relationship, and the contingency coefficient for four-field tables. In addition, to confirm the results obtained with the chi^2 test and to determine the direction of the relationship between the variables (coefficient V, informs only about the strength of the relationship), the following tests were used: Mann-Whitney and Kruskal-Wallis tests. Tables 2-9 present only statistically significant relationships.

One of the factors determining the availability of devices connected to the Internet is gender. Pearson Chi^2 test showed that there was a statistically significant relationship between these variables (Table 2). However, a contingency coefficient of 0.061 was obtained, which indicates a very weak strength of this relationship.

Table 2: Availability of a computer or other device with Internet access by gender

M1. Gender	**Q. Is there a computer or other device with Internet access in your household?**		**Chi^2**	**p**
	No	**Yes**		
Woman	22.60%	77.40%	3.961029	p=.04657
Man	17.70%	82.30%		

Source: Own study

Table 3: Mann-Whitney U test - availability of a computer or other device with access to the Internet by gender

Variable	Mann-Whitney U test (corrected for continuity) In relation to variable: M1. Gender The marked results are significant with p <.05000			
	Sum of ranks woman	Sum of ranks man	With corrections	p
Q. Is there a computer or other device with Internet access in your household?	288338.5	281439.5	-1.98916	0.046685

Source: Own study

Analysing the results of the U Test (Table 3), it can be seen that women's access to a computer and the Internet is slightly higher than for men. This is indicated by the higher sum of ranks in women. This is a surprising result, because from the analysis of Table 2 one could draw a completely opposite conclusion.

Attention should be paid to the results regarding the relationship between access to the computer and the Internet, and age (Table 4). In this case, the highest value of the V-Cramer's coefficient (0.615) was obtained, which indicates a very strong relationship between these features. Against the background of previously presented statistics of the CSO, this is not a surprise. Older people (60+) have less internet access than young people (18-39). This may be due to a lack of need or lack of skills, or lack of resources (urgent needs).

Table 4: Availability of a computer or other device with Internet access by gender

M2. Age	Q. Is there a computer or other device with Internet access in your household?		Chi^2	p
	No	Yes		
18 - 39	1.54%	98.46%	404.0364	p = 0.0000
40 - 59	6.07%	93.93%		
60 and more	56.93%	43.07%		

Source: Own study

The confirmation of these observations is the test statistics in the Kruskal-Wallis's test, which is highly significant (p = 0.000). Therefore, it can be concluded that the availability of computers and the Internet for different age groups differed significantly from each other. The Kruskal-Wallis test is basically an analysis of variance carried out at ranks. The sum of ranks shown in Table 5 indicate that the higher its value (I have access to a computer and the Internet) in the 18-39 age category, the lower the sum of the ranks (I don't have a computer and Internet access) for age 60 and more. In this case, analysing the average ranks, the conclusion is identical.

Table 5: Kruskal-Wallis test - availability of a computer or other device with Internet access based on age

Dependent: Q Is there a computer or other device with Internet access in your household?	ANOVA of Kruskal-Wallis rank; Independent (grouping) variable: M2. Age Kruskal-Wallis test: H (2, N= 1067) =403.6578 p = 0.000			
	Code	N valid	Sum of ranks	Average rank
18 - 39	1	389	246537.0	633.7712
40 - 59	2	346	210928.5	609.6199
60 and more	3	332	112312.5	338.2907

Source: Own study

The respondents were also asked if a person aged 18 or less lives with them. As it might be expected, the relationship between the answers to this question and access to a computer and the Internet was statistically

significant. Both the chi^2 test and the Mann-Whitney U test confirmed this relationship. However, as in the case of the gender variable, the contingency coefficient assumed a fairly low value of 0.079. Nevertheless, one may risk the statement that such accessibility is easier where the elderly live with people aged 18 and younger. The direction of this relation in the results of the U test appeared very clearly (Table 6). A much higher sum of ranks was obtained for the answer "yes, a child of 18 and less lives with me".

Table 6: Availability of a computer or other device with Internet access against the background of living with a person in the age of 18 or younger

Variable	Mann-Whitney U test (corrected for continuity) In relation to variable: M3.1. Does children under also live in the household? The marked results are significant with p <,05000			
	Sum of ranks Yes	Sum of ranks No	With corrections	p
Q. Is there a computer or other device with Internet access in your household?	348560.0	221218.0	2.599373	0.009340

Source: Own study

Equally interesting are the results of the analysis of the relationship between the availability of the computer and the Internet and the place of residence. It has been hypothesized that this accessibility will increase as the population of the inhabited city increases. This means that it will be the smallest in the villages and the largest in large cities. Meanwhile, the analysis of both the contingency table and the sum of ranks from the Kruskal-Wallis test indicates that we have the highest availability both in large cities and in the village. The V-Cramer coefficient obtained for this compound was 0.2556, which indicates a moderate relationship.

Table 7: Availability of a computer or other device with Internet access against the background of the place of residence

M4. Place of residence	Q. Is there a computer or other device with Internet access in your household?		Chi^2	p
	No	Yes		
1. village	31.04%	68.96%	70,28592	p=,00000
2. town up to 19999 inhabitants	29.05%	70.95%		
3. city with 20,000 to 99,999 inhabitants	11.39%	88.61%		
4. city with 100,000 to 499,999 inhabitants	8.75%	91.25%		

Source: Own study

The observation mentioned above is confirmed with the analysis for this relation presented in Table 8. The reason for this may be the fact that the survey could have been conducted mainly among residents of the metropolitan area (e.g. Szczecin), where access to the Internet and modern technologies is generally higher than in communes distant from this centre or located on the periphery of the province. On the other hand, the villages within it are basically villages by name only.

Table 8: Kruskal-Wallis test - availability of a computer or other device with Internet access based on age

Dependent: Is there a computer or other device with Internet access in your household?	ANOVA of Kruskal-Wallis rank; Independent (grouping) variable: M4. Place of residence Kruskal-Wallis test: H (3, N= 1067) =70.22005 p =,0000			
	Code	N valid	Total ranks	Average rank
1. village	1	335	159586.0	476.3761
2. town up to 19999 inhabitants	2	210	102276.5	487.0310
3. city with 20,000 to 99,999 inhabitants	3	202	117413.5	581.2550
4. city with 100,000 to 499,999 inhabitants	4	320	190502.0	595.3188

Source: Own study
**two highest sums of ranks have been underlined*

Another statistically significant relationship, although not showing significant strength (V-Cramer = 0.094), is the relationship between access to modern technologies and education.

Table 9: Kruskal-Wallis test - availability of a computer or other device with Internet access in relation to education

Q. Is there a computer or other device with Internet access in your household?	ANOVA of Kruskal-Wallis rank; Independent (grouping) variable: M5. Education Kruskal-Wallis test: H (3, N = 1067) = 9.569447 p =,0226			
	Code	N valid	Sum of ranks	Average rank
1. Primary	1	18	11022.5	612.3611
2. Basic vocational	2	67	35545.0	530.5224
3. Secondary	3	384	195845.5	510.0143
4. Higher	4	598	327365.0	547.4331

Source: Own study

Despite the very weak relationship, it can be stated that accessibility increases with the increase in education, which is very clearly illustrated in the sums of ranks in Table 9.

60+ The characteristics of the use of modern information technologies dedicated to tourism by 60+ people compared to other age groups

The results of the research presented earlier confirmed the significant relationship between age and access to a computer with Internet access, which, according to the authors, translates into access to modern information technologies dedicated to tourism. The collected empirical material allowed describing the diversity in access to modern information technologies depending on the age group of respondents, which was a partial goal of the discussion. As already mentioned, 1067 people took part in the study. The research group was diversified in terms of age, however the distribution turned out to be fairly even - 36.5% of the respondents were people aged 18-39, 32.4% were forty and fifty years old, while the percentage of the oldest (60+) people is 31.1%.

79.8% of respondents had a computer or other device with Internet access in their household. This percentage drops significantly in the oldest group - only 43.1% of seniors declared having this type of device in their home. The opposite situation was noted in the youngest group of respondents - in this case almost every respondent (98.5%) has a computer or device with Internet access (Fig. 1)

Figure 1: Internet access in households in particular age groups

Source: Own study

Respondents were asked about the frequency with which they use the Internet for the following purposes related to tourist activity: purchase of trips, accommodation booking, purchase of transport tickets (air, bus, train), purchase of tickets for events or searching for information on tourist attractions.

When booking accommodation via the Internet, the differences in the frequency chosen by seniors compared to people younger than them should be considered very large. As can be seen from figure 2, in the case of people over 60 years old, only slightly more than 30% of them answered that they always do it or sometimes, and in the case of people aged 40-59 it was almost 66%.

Figure 1: Frequency of booking accommodation via the Internet in individual age groups

Source: Own study

When it comes to buying travel packages over the Internet, nearly 41% of seniors have never done it (Figure 3). The difference between seniors and younger people is no longer as high as for accommodation booking, as it is 11.2 percentage points between people aged 40-59 and 9.1 percentage points compared to people from the youngest group of respondents. This may be due to the fact that younger people increasingly prefer to organize tourist trips on their own.

Figure 3: Frequency of booking accommodation via the Internet in individual age groups

Source: Own study

For people over 60 years old, booking a car via the Internet should be emphasized. Despite the fact that only nearly 13% of seniors replied that they always do it via the Internet, which was close to the values calculated for younger people, only 32.5% said that they never do it. In the case of respondents in the 40-59 age group, as many as 72% of respondents answered that they never book a car via the Internet. The reasons for this can be seen in the fact that younger people travel more often in their own cars or other means of transport.

Figure 4: The frequency of booking a car via the Internet in individual age groups

Source: Own study

For older people, the Internet is also less often used to buy tickets for various events. Only less than 7% of respondents aged 60+ make such reservations "always", and nearly 50% replied that they do not do it at all. In the case of respondents aged 18-39, as much as 44% declared that this is the way they always buy such tickets.

Figure 5: Frequency of purchasing tickets for events (cultural, sporting) via the Internet in individual age groups

Source: Own study

Figure 6: Frequency of searching for information on tourist attractions on the Internet in particular age groups

Source: Own study

Based on the analysis of the conducted surveys, it can be concluded that for all age groups the Internet is a source of searching for information on tourist offer or tourist attractions. Most often, however, people under the age of 60 search for information in this way. About 40% of them replied that they always use the Internet when searching for such information. In the case of seniors, 12% answered definitely yes and over 42% said yes, but sometimes. (Fig. 6)

Summary

The results of the research and literature analyzes confirmed that age is the most important socio-demographic factor determining the availability of modern information technologies in tourism, based on the Internet. (Niemczyk, 2016; Niehaves and Plattfaut, 2014; Abbey and Hyde, 2009; Friemel, 2014).

Furthermore, noteworthy is the fact that the availability of modern information technologies is influenced by the presence in the household of persons under 18 years old. It allows to recognize that thanks to the integration of generations, the degree of digital divide of seniors may decrease. The research has shown that internet access is less and less dependent on the place of residence. This may result from actions taken in Poland and other EU countries aimed at compensating for differences in Internet access in cities and in rural areas. This does not mean, however, that the opportunities offered by digitization of the village were equally used by both younger and older residents. The valuable information is that the research showed a weak relationship (although statistically significant) between the accessibility and education of the inhabitants of Zachodniopomorskie province. The reason for this situation may be the fact that in Poland the level of education will start to rise, and generations that exceed the threshold of 60 are more and more educated than it was years ago. Therefore, the strength of this relationship may weaken further in the following years. A detailed analysis of the frequency of using modern internet solutions dedicated to potential tourists, showed differences between people 60+ and younger groups. The biggest differences concerned booking accommodation. Seniors have done this much less frequently than younger people. On the other hand, when buying tourist packages via the Internet, the differences between younger respondents and older ones were not very high. This does not necessarily mean that seniors make better use of such purchases in this respect, and it may be the result of younger tourists preferring independent organization of tourist trips. Seniors definitely less often than other respondents, use online methods of booking tickets for various types of cultural or sporting events.

The differences presented, the results of own research and a review of secondary sources allow to state that seniors are still a group affected by digital divide, which also translates into their lower availability of information technologies dedicated to tourism, facilitating planning and organization of tourist trips. Undertaking actions aimed at levelling inequalities in access to modern information technologies concerns a number of entities, both entrepreneurs and local governments, or central organizations. These activities should aim to improve the digital competence of seniors. The digital inclusion of seniors can in fact bring many positive effects. Improving the digital skills of older people can translate into increased motivation and willingness to use modern solutions dedicated to tourism. One should agree with Batorski (2009a, 2009b) that the Internet may become a source of equal opportunities if it is used by particularly vulnerable people, otherwise it may perpetuate old inequalities or contribute to new ones. In the face of the growing importance of modern technologies in tourism, the lack of

activities conducive to digital inclusion of seniors may contribute to widening the inequalities in tourism accessibility. Digital divide may aggravate inequalities in tourism activity.

It should be emphasized that the considerations and studies carried out do not fully cover the topic. Although the research did not show significant differences in the group of seniors, it is worth emphasizing that this segment is heterogeneous. There is a gap in world literature regarding the use of modern information technologies by the elderly, which is also pointed out Niehaves and Plattfaut (2014).This creates a premise for further research among seniors. It is postulated to perform analyses regarding the motives for (not) using modern IT solutions, knowledge about the possibilities of using modern technologies in tourism, and acceptance of introduced innovations. In addition to research related to demand, it is worth looking at solutions of the tourism industry in terms of their functionality and usability for seniors. Finding solutions to bridge the digital divide among seniors will not only benefit the elderly, but will also contribute to socio-economic development.

Acknowledgement

The project is financed within the framework of the program of the Minister of Science and Higher Education under the name "Regional Excellence Initiative" in the years 2019 - 2022; project number 001/RID/2018/19; the amount of financing PLN 10,684,000.00

Accessibility of Tourism and Leisure Services as an Attribute of an Urban Space

Beata MEYER
University of Szczecin, Faculty of Economics, Finance and Management, Institute of Spatial Management and Socio-Economic Geography, Department of Spatial Management, Szczecin, Poland
beata.meyer@usz.edu.pl

Abstract

The contemporary lifestyle contributes to a much higher level of both indoor and outdoor recreational activities. Despite a progressive increase in the number of people participating in tourism and recreation, there is a clear difference in the spatial accessibility of this type of services. Rural residents seem to use tourist and recreational services to a lesser extent than urban residents. The aim of this paper was to compare and evaluate the availability of tourist and recreational services in urban and rural areas, based on the example of the West Pomeranian Voivodeship (Poland). The terms "availability" and "accessibility" are used interchangeably throughout the paper, as it deals with the issue of tourism and leisure activities existing (being available) in different areas as well as whether they are easy to participate in (accessible) for the areas' residents. Computer-aided telephone interviews (CATI) and the non-parametric correlation method (Spearman's rank order correlation) were used in the study. The conducted research has shown that in the West Pomeranian Voivodeship the availability of recreational services in urban areas is much higher than in rural areas, while the availability of tourist services does not show significant differences in urban and rural areas (these results require a wider multi-factor analysis). However, on the basis of the conducted research it can be assumed that the availability of recreational services is an attribute of an urban space.

Keywords: urban space, tourism, leisure, West Pomeranian Voivodeship (Poland).

Introduction

Changes in preferred lifestyles which promote, i.a. healthy, environmentally friendly and active behaviours, contribute to the evolution of leisure activities, thus increasing the importance of both indoor and outdoor active recreation. The growing number of tourists and their travels are also a result of the recognition of traveling as an element of modern life and, to some extent, a determinant of life status. Despite the increase in the number of people participating in tourism and recreation, a clear difference in the spatial accessibility of this type of services is visible. Rural areas, despite the fact that they have the potential for development of the infrastructure and recreational services, are often deprived of them, the inhabitants of these areas also use tourist services much less frequently. Privileged areas, i.e. urban areas fulfilling many diversified functions, also those ensuring a high quality of life for the inhabitants, are nowadays becoming dominant. Among them, services providing satisfactory use of free time, related to tourism and recreation, are of significant importance. The aim of this paper is to compare and evaluate the accessibility of tourist and recreational services in urban and rural areas, based on the example of the West Pomeranian Voivodeship.

The dynamic development of urban areas in the 21st century is strongly connected with the process of globalisation (Koutrit, Nijkamp and Partridge, 2015; Spooner, 2015; Haggag, 2004; Maik, 2003; Nijkamp & Koutrit, 2013; Clark, 1967; Szmytke, 2013; Elmqvist et al., 2018), and one of its consequences is the deepening diversification of urban areas, visible also in their nomenclature. Cities, metropolises, metropolitan areas, urban agglomerations, conurbations, big cities or urban areas are defined in various ways, most often depending on the purpose of the study, using legal, demographic, functional, physiographic or economic attributes (Hall and Pfeiffer, 2013; Gregory, Johnston, Pratt, Watts and Whatmore, 2009; Ben Amer, 2016; Dijkstra and Poelman, 2012; Dijkstra, Poelman and Veneri, 2019). For the purpose of this study which aims only at providing a general distinction between urban (including metropolitan) and rural areas, a legal criterion was adopted, which states that in Poland rural areas are any terrains outside the administrative boundaries of towns and cities (The Act of 29 August 2003 on official names of localities and physiographic objects.). Referring to any areas that are not rural areas, this paper will alternatively use the terms 'urban area', 'urbanised area' and 'urbanised areas'.

The development of urban areas, which can be observed on many levels, becomes a key determinant of development opportunities in all regions, regardless of their current level of advancement. The number of urbanised areas is

Cite this Article as: Beata MEYER "Accessibility of Tourism and Leisure Services as an Attribute of an Urban Space" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

increasing, and so is the total urban population and the space taken up by cities (also as a result of the 'urban sprawl'). Apart from the size (in terms of population and surface area), urbanised areas are distinguished by an increasingly wider spectrum of functions (endogenous and exogenous), greater concentration of capital and new technologies, the number and level of services provided (mainly of a higher level) and growing impacts on the environment in global and/or local terms. In the context of creating a 'network of cities' in a global system, a loosening of ties with the immediate environment for close cooperation and exchange of diversified goods and services with similar entities is observed. Progressive qualitative and quantitative urbanisation intensifies the phenomenon of competition between urban areas, whose attractiveness is nowadays mainly related to (Kolko, Glaeser, and Saiz, 2000):

- The multiplicity and diversity of available goods and services, of both global and local character,
- Aesthetics of the surroundings and comfort of life, including climate, weather, clean environment, location, attractiveness of the area,
- Availability and quality of public goods (one of the consequences is the level of security),
- Ease of movement within the urban area, determining access to consumer goods.

Contemporary urban areas are multifunctional spaces that provide an environment for diverse human activities. Many elements forming a system of mutual connections and relations, attractive for both permanent and incidental users, are combined within an urban space (Gorzelak, 2008). The most important determinants of urban development are factors such as living conditions, aesthetics of the environment or attractiveness for tourists, reducing the importance of such factors as: infrastructure, land rent or agglomeration benefits (Bontje and Musterd, 2009). This is a reflection of the contemporary trend of creating XXQ cities (XXQuality), i.e. offering quality of life at the highest possible level, which is directly related to the character and quality of the city space (Nijkamp, 2008). The overriding goal of an urban system should be the maximum optimisation of all its elements leading to the highest possible quality of well-being, life and work in urban areas.

Changes in the preferred way of life mainly concern the increase in leisure time and changes in the preferred types of activities, with a particular emphasis on healthy and pro-ecological behaviours (Meyer, 2015). This increases the importance of tourism and recreation for quality of life assessment, especially in urban areas, the development of which has so far taken little account of the needs of inhabitants related to the standard of living in the city. Tourism and recreation create various possibilities of undertaking leisure time activities (in the long and short term) important from the point of view of functioning of both individuals and entire communities. Tourist services such as: organisation and sale of tourist events, tourist information, travel counselling and agency services, tourist guidance and piloting, tourist transport, accommodation and catering services, etc., enable implementation of leisure time activities outside the place of permanent residence. Recreation, understood most often as an activity undertaken by people voluntarily in their free time (i.e. also during tourist trips), may take place on a daily basis in the area of permanent residence. Recreational spaces are created, the nature of which allows to distinguish between open space (outdoor activity) and closed space (indoor activity), and within their framework it is possible to distinguish spaces occupied by specific types of recreational activities (e.g. swimming, dancing, walking). Moreover, each type of space may represent a formal space (organised and/or paid activities) or an informal one (free-of-charge activities, carried out in an individual way) (Meyer and Niezgoda, 2018). Recreational spaces are often located in close proximity to places of residence, and the form of their development affects the aesthetics of the environment.

Tourism and recreation services not only enrich the service offer available in urban areas, contributing to improvement of their competitive position, but also enhance the quality of life of the inhabitants, shaping important aspects of modern lifestyles. The growing importance of tourist and recreation services among factors contributing to the quality of life and as a sector of the economy, together with their growing concentration in urban areas, makes them one of the most important attributes of an urban space.

Materials and Methods

The West Pomeranian Voivodeship is situated in the Baltic Region (Klemeshev, Korneevets, Palmowski, Fedorov and Studzieniecki, 2017), in the north-western part of Poland. It has an area of almost 23,000 km^2 and is inhabited by 1.7 million people, which is about 4.5% of the population of Poland. The West Pomeranian Voivodeship is characterised by a small predominance of women (51.4%) over men (48.6%). In the urban areas the prevalence is even greater (52.3%), while in the rural areas women are slightly less numerous than men (49.6%). The urbanisation rate in the West Pomeranian Voivodeship (68.5%) is one of the highest in Poland (60.5%), next to Śląskie and Dolnośląskie Voivodeships. The high urbanisation rate results from a fairly evenly distributed network of cities and low population density of the average village (http://eregion.wzp.pl/wskaznik/wskaznik-urbanizacji). In 2018, there were 3,081 localities in the voivodeship, including 66 towns and cities and 3,015 villages. The West Pomeranian Voivodeship is dominated by small towns with a population of 2000 - 5000 (there are 27 of them), only in two cities

the population exceeds 100,000 inhabitants (Szczecin and Koszalin). In terms of population density, the West Pomeranian Voivodeship is one with the lowest population density in Poland (75 persons/km^2, while the country average is 123 persons/km^2), next to the Warmińsko-Mazurskie, Podlaskie and Lubuskie Voivodeships.
In order to determine the differences in the availability of tourist and recreation services between the urbanised and rural areas in the West Pomeranian Voivodeship, computer-aided telephone interviews (CATI) were used. The questionnaire included 12 closed and semi-open questions of a cyclical and disjunctive nature, aimed at learning the respondents' opinions on the accessibility of tourist and recreation services, and also 8 demographic questions.

The following formula was used to calculate the minimum sample size:

$$n = \frac{u_\alpha^2}{4d^2}$$

where:

d - maximum estimation error allowed - accepted at the level of ± 3%;
u_α^2– value read from the distribution tables of the normal distribution for the significance level □□□□□□□□
The minimum sample size was 1067 people.

The study covered 1067 persons living in the West Pomeranian Voivodeship, of whom: 31.4% lived in rural areas and 68.6% in urban areas; 51.8% of the respondents were women, 48.2% were men.
The non-parametric correlation method (Spearman's rank order correlation) was applied in the study, which allowed for the identification of statistical relevance of the correlations as well as the determination of their intensity and direction.

Diversification of accessibility to tourist and recreation services in the West Pomeranian Voivodeship

The use of tourist services is associated primarily with tourist travel and related services such as accommodation, catering, tour guiding or use of tourist attractions. According to the Polish Centre for Public Opinion Research, in 2018 60% of Poles went abroad for tourism purposes for at least 2 days. They were mainly urban residents - 59% of the town dwellers from towns with fewer than 20,000 inhabitants, and 81% of the city dwellers from cities with at least 0.5 million inhabitants. In the group of rural residents, 44% of the people travelled. In the following year, almost 64% of Poles were planning to go on a tourist trip, including 90% of those who travelled in 2019 and 27% of those who did not.

A detailed multi-dimensional analysis confirms that tourist trips are an element of the lifestyle of well-educated, wealthier Poles, most often those living in cities. Taking such trips is much less frequent among rural residents, especially family farm owners and their family members.

However, tourist services are also provided in the place of residence of a potential tourist and most often they are a precondition for taking a trip. Due to the objective of the study, which was to determine the diversification of accessibility of tourist and recreational services in urban and rural areas, other determinants of tourist trips, such as leisure time, economic situation, health condition and the like, were deliberately omitted. Services that consist in organising tourist events, sale (or agency sale) of tourist packages and selected tourist services, booking and sale of transport services, tickets for cultural and sports events, tourist insurance, as well as travel counselling, agency and tourist information services are provided mainly in tourist offices (both in-store and online).

One visit to a travel agency per year was declared by 15% of the rural population (RP) and 25% of the urban population (UP), among whom the inhabitants of the smallest urban units (up to 20,000 inhabitants) chose this possibility most often (30%). Visiting a tourist office twice a year was the choice made by almost 7% of RP and about 11% of UP, and 3-4 times a year by ca. 15% of RP and ca. 6.5% of UP. 60% of RP and 53% of UP declared that they had never been to a travel agency and had never availed themselves of its tourist offer. Among other respondents, 18.5% of RP and 26.5% of UP indicated that they bought services from a travel agency once a year. Buying the largest number of tourist products in a travel agency (more than 3 during the year) was declared by approx. 15% of RP and approx. 7.5% of UP.

Residents of the rural and urban areas used the tourist information services similarly, about 43% declared that they did not use them at all, and about 20% indicated that they used them once a year. Among the city dwellers, tourist information services were the least used in medium cities (from 20,000 to 100,000 inhabitants), 13% indicated one-

off use of such services, while 53% did not use them at all. This group of city dwellers was also the least likely to visit tourist offices and buy their services.

Tourist services may also be provided by entities other than tourist offices. Tourist events are organised by schools, parishes or associations. Approx. 52.5% of RP and 47.5% of UP availed themselves of this type of offer, and over 30% of RP used them more than once a year, i.e. more often than any services of professional tour operators (travel agencies). Among UP, there was a clear tendency that the larger the city, the less often the residents used this type of offer.

Tickets for means of transport related to tourist travel were purchased by approx. 56% of RP and almost 70% of UP, while over 20% of the inhabitants of the largest cities bought them more often than four times a year.

Summing up the responses concerning the use of particular tourist services, it was found that about 14% of the respondents used all the services listed in the questionnaire, which accounted for about 8% of RP and 16.5% of UP. The remaining persons stated that the main reason for refraining from using tourist services in the place of residence was organising trips on their own (this response was chosen mainly by the inhabitants of the largest cities, and villages), lack of need to use such services and lack of time, and financial reasons (mainly RP). Both the inhabitants of the rural and urban areas did not indicate the lack of entities providing such services as the main reason for not using tourist services in their place of residence.

Tourist services were available not only in the form of in-store offers, but also online. Over 69% of RP and 85% of UP declared that they had a computer or another device with internet access in their households, and about 18.5% of RP and UP always bought tourist services in this way. 40% of RP and 31% of UP never bought tourist products via the internet, the others used this method occasionally. Cars were hired online much more often by rural inhabitants (51%) than by city dwellers (42%), also tickets for means of transport connected with travel were purchased by most of the respondents living in rural areas and cities (65% of RP and 78% of UP). Tourist information was always sought on the internet by 19% of RP and 27% of UP, and this source of information was most frequently used by the inhabitants of the largest cities (41%).

The assessment of availability of recreational services (Table 1), understood as the possibility of practicing a specific form of recreation in the place of residence (availability of an appropriate infrastructure, distance to it, opening hours) is definitely different among the inhabitants of the rural and urban areas of the West Pomeranian Voivodeship. Residents of the rural areas assessed the availability of most forms of recreation as very poor (usually over 20% of such responses), while among the urban residents this opinion was shared by fewer than 5% of the surveyed. UP rated the availability of cultural services in the form of theatre as the worst (12.2% of very bad ratings, and 19.5% of the smallest towns) and indoor swimming pools (about 10% of very bad ratings). The availability of gyms/fitness clubs was assessed as very bad by one-third of RP, and 25% of them thought the access to outdoor gyms was very bad, too. Over 20% of RP also considered the availability of an indoor swimming pool, organised sports and recreation activities, cinema and theatre as very bad. This was related to the declared lack of such facilities/ an appropriate offer in the place of residence of the respondents. The best opinion of the inhabitants of the urban and rural areas was given for the availability of an outdoor park and gym (very good opinion in both cases was given by approx. 43% of UP and approx. 23% of RP), of pitches and bicycle paths (approx. 38% of UP and 23% of RP). UP also rated very highly the access to cinemas (39%) and gyms/ fitness clubs (37%). The conditions of using the recreational services (access, parking lots, marking, cleanliness and equipment of facilities) were assessed as average by both groups of respondents. However, the main factor limiting the participation in recreation activities by RP was the distance to the recreational facilities (almost 26%, UP below 4%), while for UP it was lack of time (17.3% UP, 12.5% RP). For UP the limiting factor was also the health condition (10.7%, RP 1.8%), especially in the smallest towns (19.7%).

Table1: Assessment of availability of recreational services by urban and rural population in the West Pomeranian Voivodeship

Source: own elaboration

The presented relations were additionally confirmed using the non-parametric correlation method (Spearman's rank order correlation), selected due to the presence of qualitative and quantitative variables in the study, indicating a monotonic relationship for any distribution of variables. Apart from statistically insignificant (apparent) correlations,

positive and negative correlations of different intensity were found. It was confirmed, among other things, that the use of tourist information services was not determined by the place of residence, and the assessment of availability of facilities such as a cinema, theatre, performance halls, or organised sports activities was highly dependent on the place of residence.

Conclusion

The presented research results allow us to conclude that the West Pomeranian Voivodeship is characterised by a clear difference in the availability of recreational services in urban and rural areas. One-fifth of the rural population assessed the availability of all forms of recreation as very bad and at the same time they declared that a long distance from the place of residence was the main factor limiting their participation in recreation activities. On the other hand, over ¼ of inhabitants of the urban areas assessed the availability of all forms of recreation as very good, and lack of time was for them the main factor limiting their recreational activity. For both analysed groups, other factors (e.g. prices of services, health condition, opening hours) did not constitute a significant limitation for using recreation facilities. In the case of tourist services, the results of the study did not show any significant differences in their availability in the urban and rural areas, and they were so diverse that they require a wider multi-factor analysis which may make it possible to find links between different factors influencing the availability of tourist services in the studied areas.
However, on the basis of the conducted research it can be stated that the availability of recreational services in the urban areas was much more extensive than in the rural areas. Their particularly positive evaluation by the respondents may confirm the fact that the contemporary lifestyle promoting recreational activity clearly influences the development of the possibility of implementing such activity in urban areas, and the availability of recreational services is one of the main attributes of an urban space.

Abstract

Text analysis is a fundamental tool in the development of education. However, UNESCO figures indicate that the majority of children have comprehension difficulties, which can result in reasoning problems, difficulty in understanding the theory, and gaining knowledge. This article presents a systematic review of the literature (SRL) regarding text analysis and the use of machine learning (ML) to improve this process. The results indicate that ML learning techniques are effective in the improvement of text analysis.

Keywords*:* Machine Learning, Text Analysis, Natural Language Processing, Systematic Literature Review.

Introduction

Text analysis is one of the most important activities when reading as it enables the understanding of the message that a certain text conveys. However, it is frequently hindered due to the lack of a good reading habit. According to UNESCO figures (UNESCO, 2019), six out of every ten children do not reach the minimum comprehension levels, which is alarming as this can seriously affect children's development. Studies have shown that the use of machine learning (ML) techniques can improve the text analysis process. Furthermore, studies indicate that the use of natural language processing (NLP) enables the analysis of different text fragments by ML techniques. Therefore, in this study, we aim to demonstrate the effectiveness of ML techniques to improve text analysis. The rest of the article is organized as follows: Section II describes the background and related works. Section III details the methodology used to elaborate the systematic literature review (SLR), Section IV shows the results obtained to answer the research questions posed, and Section V reports the discussion and future work.

Background and Related Work

In recent years, ML has been used in researches in different areas [60]. In the field of text analysis, it is used to

Cite this Article as: Mayte MODESTO-JAVIER, Smart VELÁSQUEZ-TAMAYO, Javier GAMBOA-CRUZADO, Guillermo PAUCAR-CARLOS, Juan GAMARRA-MORENO And Fernando SINCHE CRISPÍN "Machine Learning for Text Analysis: A Systematic Review" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

analyze keywords and quotations [20]. Combined with NLP, which focuses mainly on identifying the text, ML helps in extracting information and summarizing documents [23].

One of the topics investigated in ML is the analysis of feelings, which is applied in different areas such as marketing, politics, and news analysis, enabling the extraction of the point of view through the text [22] [54]. Gamal [16] stated that sentimental analysis uses ML algorithms to extract relevant information and classify opinions as positive or negative, and it solves problems through techniques for data processing in websites, blogs, and social networks [40][38]. This process also applies NLP for textual linking, which allows text comprehension and the organization of syntactic relations [24][37][66]. In NLP, the human understanding of the language depends on the target language [4][6][10], and it focuses on learning each word or phrase for the training [69].

Budhiraja & Wizard [9] indicated that reading large quantities of documents is time-consuming; however, the use of ML enables reading at a higher speed with the required accuracy [68] and assists in the classification of the text [35]. From the above, it can be concluded that text analysis has only been applied to the evaluation of fragments or short texts. Hence, in this SRL we will focus on applying ML techniques to analyze texts from documents, books, among others, thus helping readers to improve their analysis.

Review Method

The SRL is composed of studies of a particular subject with summarized information (Manterola et al., 2013) aiming to collect data for a research (Garcia-Peñalvo, 2020). In addition, a good practice of analysis is important to obtain better evidence (Óscar A. & Beltrán G, 2005).

- The SRL guarantees validity and accuracy of the study performed, and quality and reliability of the results obtained (Manterola et al., 2013);
- It uses observational design and major preparatory studies (Garcia-Peñalvo, 2020);
- In quantitative studies, meta-analysis can be used for better results (Óscar A. & Beltrán G, 2005).

This article was based on the SRL of ML. The research questions, sources of search, search equation, exclusion criteria, quality criteria, selected studies, and findings are presented as follows.

Research Questions

The review starts by the formulation of the research questions, which will be the basis of the search for studies on ML techniques in text analysis. Thus, the following questions were proposed:

RQ1: *What are the criteria for measuring the effectiveness of ML developed by means of NLP in the improvement of text analysis?*
RQ2: *Who are the most active authors in the area?*
RQ3: *In which areas has ML been applied?*
RQ4: *What type of computer support have ML techniques provided?*
RQ5: *Which ML tools have been used with text analysis?*

Data Sources and Search Strategy

In this study, ten different search engines were used for the review of articles in journals and conferences, as shown in Table 1.

Table 1: Manual Search Sources

Search Sources
ProQuest
Science Direct
IEEE Xplore
Taylor & Francis Online
DOAJ
ERIC
IOP

EBSCOhost
Scopus
Wiley Online Library

The search was automatically performed in the search engines using search terms grouped by variables, as shown in Table 2.

Table 2: Search terms

Search Terms	Description
Machine Learning	Independent Variable
CRISP-DM (Cross Industry Standard Process for Data Mining)	Intervening Variable
Methodology Method Model	
Text Analysis	Dependent Variable

CRISP-DM is the intervening variable that provides an orderly research and text analysis. The search terms resulted in equations for each source, which are shown in Table 3.

Identified Studies

A large number of documents were found using the search performed in the search engines. The largest number was reported by Ebscohost followed by ProQuest. The specific numbers for each search engine are shown in Fig 1.

Fig. 1: Results by source

Exclusion Criteria

Due to the extensive volume of information found, exclusion criteria were chosen. The first was to exclude articles that are more than three years old because this study topic is rapidly evolving. Second, information languages were selected (English or Spanish), excluding the other works. Subsequently, articles not related to technology and those that do not apply ML were excluded. In sequence, works that do not use algorithms or predictive methods, which are fundamental to this research, were excluded.

In addition, articles containing qualitative data, articles that do not conduct experimentation fundamental to the predictive methods, and studies with samples smaller than 30 were also excluded.

Study Selection

A total of 24769560 results were found with the use of search equations. The first five exclusion criteria were sequentially applied. The last two criteria were grouped. The final result was 80 items, as shown in detail in Fig 2 and Table 4.

Fig. 2: Study selection process

Table 4: Study selection process

Source	Search chain	N° of base result	N° of excluded results 1st filter (criterion 1, 2 and 3)	N° of excluded results 2nd filter (criterion 4 and 5)	N° of excluded results 3rd filter (criterion 6 and 7)

Quality Assessment

In this step, the quality criteria were formulated and applied, as follows:

QA1: The findings of the investigation are clearly explained.
QA2: The research methodology is clearly explained.
QA3: Research objectives are clearly identified in the document.
QA4: Results are clearly identified and reported from the experiments performed.

The review of the quality criteria was done after the exclusion criteria, and it helped in filtering the selected items to choose the most relevant for the research. All 80 articles met the four quality assessment criteria.

Study Classification

The 80 selected articles were sorted by a search source using the Zotero tool to store the items, as shown in Fig 3.

Fig. 3: Reports in Zotero

Study Review

A manual review of the selected articles was performed, assessing whether each study contributed to answering the research questions and analyzing the relationship between the variables to determine if the articles were suitable for research. Then, the most relevant data from each article was extracted.

Synthesis of findings

The selection process (Fig 2) resulted in 80 studies, which were extracted and analyzed. Fig 4 shows the number of studies found per year and their source.

Fig. 4: Articles by year and source

18.99% of the articles were published in the US, followed by 15.1% in China, as shown in Fig 5.

Fig. 5: Map of items by country

Results and Discussion

RQ1: *What are the criteria for measuring the effectiveness of ML developed by means of NLP in the improvement of text analysis?*

Accuracy, precision, sensitivity, and specificity were the criteria found in the articles analyzed, as shown in Table 5.

Table 1: ML effectiveness criteria using NLP in text analysis

Idea	Reference	Total	Percentage
Accuracy	[2], [3], [4], [6], [7], [9], [10], [11], [14], [15], [16], [17], [19], [21], [22], [23], [24], [25], [26], [28], [29], [30], [32], [33], [34], [35], [36], [40], [41], [44], [45], [47], [48], [49], [50], [51], [52], [53], [55], [57], [59], [60], [61], [62], [64], [65], [66], [68], [69], [71], [73], [74], [75], [76], [78], [80]	56	50.90%
Precision	[2], [3], [4], [8], [9], [10], [11], [13], [15], [16], [17], [21], [22], [25], [27], [28], [30], [32], [37], [39], [40], [42], [43], [47], [48], [49], [51], [56], [57] [64], [66], [67], [68], [70], [73], [76]	36	32.72%
Sensitivity	[8], [9], [12], [17], [28][40], [44], [47], [59], [75]	10	9.09%
Specificity	[9], [12], [17], [27], [28], [31], [44], [47], [63]	9	8.18%

Accuracy was the most mentioned criterion for the effectiveness of ML on text analysis, followed by precision.

RQ2: Who are the most cited authors in the area?

The authors that have been generating and publishing the most literature regarding the study topic are shown in Fig 6.

N° of Quotes per Author and Range of the N° of Quotes

Authors	<5	≥15	≥5 and <15	Total
Adams O, Makarucha A, Neubig G, Bird S, Cohn T		63		63
Salawu Semiu He, Yulan Lumsden Joanna		48		48
Marcello Benedetti, Erika Lloyd, Stefan Sack, Mattia Fiorenti...		38		38
Daniel W. Otter, Julian R. Medina, Jugal K. Kalita		32		32
Tellez Eric S, Moctezuma Daniela, Miranda-Jímenez Sabino,...		31		31
Trotzek M, Koitka S, Friedrich, C.M		23		23
Zhang Hr, Sproat R, Ng A.H., Stahlberg, F, Peng X, Gorman ...		16		16
Sboev A, Moloshnikov I, Gudovskikh, D, Selivanov, A, Rybk...			14	14
H. M. Keerthi Kumar, B. S. Harish, H. K. Darshan			12	12
Sampo Pyysalo, Simon Baker, Imran Ali, Stefan Haselwimm...			12	12
Total	63	251	154	468

Fig. 6: Most cited authors

We found a large number of authors who were cited in various research articles on ML and are active in the area.

RQ3: *In which areas has ML been applied?*

ML has a good reception in several areas, as show in Table 6.

Table 6: Areas that applied ML

Area	Reference	Total	Percentage
Education	[4], [9], [12], [14], [15], [24], [27], [35], [36], [37], [38], [40], [44], [48], [49], [50], [55], [57], [59], [60], [64], [65], [71], [75], [77], [79]	26	21.31%
Literature	[2], [3], [4], [5], [6], [7], [9], [13], [14], [15], [18], [20], [21], [22], [25], [26], [27], [30], [31], [35], [36], [37], [38], [39], [44], [45], [46], [47], [48], [51], [52], [53], [55], [59], [60], [61], [62], [63], [64], [65], [66], [68], [70], [74], [75], [76], [77], [78], [79]	49	40.16%
Medicine	[14], [17], [27], [28], [38], [50], [70], [80]	8	6.56%
Linguistics	[1], [2], [4], [6], [7], [10], [11], [13], [14], [16], [23], [24], [25], [31], [32], [36], [37], [38], [40], [42], [46], [47], [48], [49], [51], [52], [56], [59], [61], [62], [63], [64], [67], [68], [72], [74] [77], [78], [80]	39	31.97%

In recent years, several advancements have been made in ML technology, which have been applied to different areas. In our research, we found that most articles belonged to literature and linguistics, followed by education. ML is used to measure satisfaction and to analyze feelings through text. In the area of medicine, ML is used to identify diseases by the analysis of patterns or to analyze clinical trials, which is also performed by text analysis. Thus, ML is applied in different areas with positive impacts.

RQ4: *What type of computer support have ML techniques provided?*

In Table 7, some ML techniques are listed.

Table 75: ML Computer Support

Computer Support	Reference	Total	Percentage
NLTK	[16], [20], [24], [32], [40], [60], [63], [67]	8	18.60%
Numpy	[22],[60]	2	4.65%
SciPy	[22],[57], [60]	3	6.98%
Py Torch	[24]	1	2.33%
Sklearn	[9],[16], [19],[68]	4	9.30%
openNLP	[10],[16], [17], [18], [21],[23], [24], [28], [35], [36], [37], [38], [43], [47], [49], [50], [53], [56], [60], [61], [63], [67], [70], [71], [74]	25	58.14%

There are different computer platforms for the use of ML. OpenNLP and NLTK, through the use of NLT tools allow sentence analysis and tokenization, which is very feasible and recommended in this type of study. In contrast, to analyze vectors, we recommend using Sklearn along with Numpy and Scipy, which allows the analysis of Support Vector Machines (SVM).

RQ5: *Which machine learning tools have been used with text analysis?*

Table 8 presents the tools that have been used for text analysis through ML (Ali et al., 2020).

Table 8: ML tools in text analysis

Tools	Reference	Total	Percentage
NLP	[1], [2], [3], [4], [6], [7], [8], [9], [10], [11], [13], [15], [17], [18], [19], [21], [23], [24], [27], [28], [31], [35], [36], [37], [38], [40], [42], [43], [47], [49], [50], [51], [53], [56], [60], [61], [62], [63], [66], [67], [69], [70], [71], [74], [76], [79], [80]	47	38.52%
N-grams	[1], [4], [7], [8], [10], [11], [15], [22], [24], [26], [31], [40], [42], [48], [52], [55], [57], [59], [63], [64], [70], [77]	22	18.03%
LSTM	[1], [6], [13], [15], [23], [27], [30], [33], [35], [41], [59], [66], [67], [76], [78]	15	12.30%

Word2vec	[1], [5], [11], [22, [23], [27], [37], [42], [56], [59], [66], [74]	12	9.84%
Computationa l linguistics	[2], [6], [11], [13], [16], [23], [31], [32], [36], [37], [38], [40], [47], [48], [49], [56], [61], [62], [64], [67], [72], [74], [77], [78], [79], [80]	26	21.31%

All the tools are used to analyze the text in large amounts of data, but the most used and recommended tool for text analysis is NLP because this tool allows training of a large amount of data and can be used in conjunction with the other tools. Therefore, NLP is recommended for the analysis of text as it has more methods to perform this process.

Conclusion and Future Work

In this study, 24, 796, 560 articles were selected and later reduced to 80 items after applying exclusion criteria. These articles were approved by the established quality evaluation criteria. The rigorous review of the articles enabled us to appropriately and efficiently respond to the research questions posed. Hence, we conclude that ML can assist and facilitate the analysis of all types of reading. Thus, several people that face difficulties with text analysis will be able to do it easily and rapidly using ML. This would have been unimaginable a few years ago, but today it is a reality. Thanks to the ML effectiveness criteria, it is possible to reach a point of less analysis in a number of items, which are found in different recognized sources and with a long list of recognized and important authors. ML has been used in several different areas and most articles are from the fields of literature and linguistics, followed by education. In these fields, ML assists in measuring satisfaction and analysis of feelings through the text. In medicine, it provides considerable support in the analysis of clinical trials. Different methods have been used, and NLP is one of the most used to perform training in ML, but it requires computer support and tools. Currently, Peru is on the 64th place in the world text analysis ranking. An improvement could be made with the conjunction of efforts of research groups, educational institutions, and providers, to achieve a society with a higher intellectual quotient and to be able to become a developed country.

Abstract

The paper concerns the expenditure on services in the Visegrad Group countries. The aim is to analyze the differentiation in the level of these expenses in the period of 1995-2016. In the study, the Working-Leser model extended to quadratic form by Blundell, Pashardes and Weber (1993) was used. The choice of this form of the model was dictated by the possibility of indicating on its basis the level of disposable income at which services change their character from a higher-order good to a basic good. Based on the model estimation results, the income elasticity of demand for services for each country from the Visegrad Group was calculated. Assessment of the formation of the income elasticity value over time allowed to proceed with the analysis of changes in the nature of services in each country. In addition, this paper deals with the problem of the unification of the nature of goods connected with services in the analyzed countries. The σ-convergence concept was used to assess the unification process. The analysis of the coefficient of variation of the income elasticity of demand for the considered category of goods over time allowed to estimate the degree of uniformity. The downward trend in the variation coefficient shows that the value of elasticity is becoming more uniform among countries, and consequently the nature of services is becoming similar.

Keywords: Household Expenditure on Services, Income Elasticity of Demand, Process of Unifying the Nature of Services.

Introduction

Currently the economic development of countries is a very dynamic process. Determinants of the development include, first of all, the progressive process of globalization, financialization and digitization of economies (Balcerzak, Pietrzak, 2017a; Pietrzak, Ziemkiewicz, 2018a, 2018b; Bilan et al., 2019; Shkolnyk et al., 2019; Sánchez-López et al., 2019), as well as the degree of their openness (Pietrzak, Łapińska, 2015; Łapinska, 2016). Additionally, the factors determining the development of economies are: level of competitivess, innovations, investments, situation on the labor market (Balcerzak, 2015; Cheba, 2015; Cheba, Szopik-Depczyńska 2017; Pietrzak et al., 2017; Bieszk-Stolorz, Dmytrów , 2019; Dmytrów, Bieszk-Stolorz, 2019; Kijek, Matras-Bolibok, 2019, Balcerzak, 2020) and the standard of living of the society. The improving the economic situation of states is also reflected in the shaping of the level and consumption structure of the society (Horáková, 2015; Balcerzak, 2016; Šoltés, Nováková, 2016, Balcerzak, Pietrzak, 2017b; Simionescu et al., 2017, 2018; Miłek, 2018; Nowak, 2018; Pietrzak, 2019; Kuc-Czarnecka et al., 2020; Jankiewicz 2020a; Pietrzak, 2020). The society of well-developed economies is able to consume more goods and services than the others because of better living conditions. The reason for this is the differences in the level of disposable income of households, which is the main determinant of consumer decisions (Gavurova et al., 2017; Głodowska, 2017; Tvaronavičienė, Gatautis, 2017; Jankiewicz, 2018a, 2018b). Moreover, consumption in such economies is more diverse than that of people in less developed countries. Along with the improvement of the economic conditions of countries, and at the same time the standard of living of the society, households begin to spend more and more of their income on services. Such a trend in the literature is called the servicisation of consumption (Grzega 2005; Radziukiewicz, 2012). With time, when households reach a certain level of income, in many of them services from a higher-order good become a necessity good. Some researchers point to the process of

Cite this Article as: Mateusz JANKIEWICZ, Michał Bernard PIETRZAK and Elżbieta SZULC“ Modeling Expenditure on Services for The Visegrad Group Countries” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

servicisation of consumption as the one that favors the development of sustainable consumption by, among others, replacing private transport with public transport services, which reduces air pollution and slows down environmental degradation (Filipiak, 2018).

Changes in household consumption are also associated with the process of economic and social convergence (Dall'Erba, Le Gallo, 2008; Kuc 2017a, 2017b) taking place among the economies. These processes cause the leveling of disposable income of households (Pietrzak, 2020), which leads to a convergence of the level and structures of household consumption. The unification of the households consumption structures should be followed by the standardization of the nature of the goods consumed. Therefore, this analysis covers the changes over time in the nature of goods such as services as well as its unification among households in the Visegrad Group countries (V4). In this research the level of household expenditure on services in the years 1995-2016 was analyzed. The nature of the goods can be assessed using the elasticity measure, relating to changes in the level of consumer spending caused by changes in disposable income, i.e. the income elasticity of demand. The downward trend in the coefficient of variation shows that the value of income elasticity of demand is becoming more uniform among countries, and consequently the nature of services is becoming similar. The study used the quadratic Working- Leser model proposed by Blundell, Pashardes and Weber (1993).

Data

The data was taken from the database of the European Statistical Office (EUROSTAT). The study was based on information about the level of household expenditure on services per capita (Y) and the values of gross disposable income of households per capita (X). Table 1 shows the values of variables Y and X in selected years of the study, while Figure 1 shows the evolution of these values over time. The highest level of disposable income per capita in 1995 was noted in households in the Czech Republic (EUR 2478.33), and the lowest level was observed in households in Slovakia (EUR 1716.14). Moreover, values of the variable X in Hungary (EUR 2252.27) exceeded the values for Polish households (EUR 2020.55). The dynamic economic development of Slovakia meant that in 2016 the disposable income of households (EUR 8,889.19) even exceeded there the disposable income of the Czech society (EUR 8785.33), while the relatively faster economic growth in Poland than in Hungary caused that in the last period of the study it was households in Hungary which were characterized by the lowest level of disposable income per capita (EUR 6592.96). Despite the lower level of disposable income, in 1995, households in Slovakia spent more on services (EUR 681.51) than the polish ones (EUR 552.50). A similar situation occurred in 2016, when the poorer Hungarian society spent more on services (EUR 2640.49) than the Polish one (EUR 2582.22).

Table 1: V4 households' expenditure on services and disposable incomes in selected years

Level of services expenditure per capita (Y)						
Country	**1995**		**2008**	**2009**		**2016**
Czech Republic	826.53		3438.25	3263.40		3610.16
Hungary	735.03	…	2402.57	2217.21	...	2640.49
Poland	552.50		2384.20	2059.41		2582.22
Slovakia	681.51		3090.05	3129.42		3651.19
Households' disposable income per capita (X)						
Country	**1995**		**2008**	**2009**		**2016**
Czech Republic	2478.33		8241.86	7941.08		8785.33
Hungary	2252.27	…	6093.73	5480.92	…	6592.96
Poland	2020.55		5942.70	5240.60		6797.39
Slovakia	1716.14		7171.60	7527.50		8889.19

The trends in the shaping of the analyzed processes are very similar in all Visegrad Group countries in 1995–2016. In the years 1995–2008, there was a dynamic, permanent increase in both disposable income and the amount of expenses on services in the Visegrad Group countries, except for Poland where in 2002 and 2003 (just before joining the European Union) there was a temporary recession. Mainly due to the financial crisis, in 2009 the mentioned upward trend in the Czech Republic, Poland and Hungary collapsed. The slowdown in economic growth was accompanied by declines in the value of disposable income and the amount of expenditure on services. In the Czech Republic, there was a decrease from EUR 3439.25 to EUR 3263.40, while in Poland and Hungary, respectively, from

EUR 2384.20 to EUR 2059.41 and from EUR 2402.57 to EUR 2217.21. In Slovakia, there was only a slight slowdown in the upward trend in the value of the analyzed processes, however, Slovak households did not experience a decrease in the amount of disposable income, which did not induce them to give up the current level of consumption of services.

Fig .1: Changes in the level of expenditure of V4 households on services and of disposable income per capita in the years 1995 – 2016

Methodology

The basic tool used in our study was the econometric model of demand by Blundell, Pashardes and Weber (1993), in which the level of household expenditure depends only on their disposable income. This model is an extended quadratic version of the model known as the Working-Leser model (Working, 1943; Leser, 1963). Its advantage is the possibility of determining the disposable income threshold, at which the good ceases to be of a higher-order nature and becomes the basic good. The model is described by the following formula:

$$Y_t = \alpha_0 + \alpha_1 lnX_t + \alpha_2 (lnX_t)^2 + \varepsilon_t, \qquad (1)$$

where: Y_t denotes the level of household expenditure on services per capita over time t, X_t means household disposable income per capita over time t, ε_t is a random component of the model, $\alpha_0, \alpha_1, \alpha_2$ stand for structural parameters of the model. For verification of the estimated models, the standard statistical techniques, such as t-statistics, Jarque-Bera normality test and White homogeneity test were used.

In the second stage of the analysis the income demand elasticity coefficient, determined on the basis of model (1) estimates, was used. This coefficient informs about the percentage increase of expenditures on the considered good (or group of goods) caused by a 1% increase in disposable income. The demand elasticity determined for the model (1), is expressed by the formula:

$$IE = \frac{\partial Y}{\partial X} \cdot \frac{X}{Y} = \frac{a_1 + 2a_2 \cdot lnX}{a_0 + a_1 \cdot lnX + a_2 \cdot (lnX)^2}, \qquad (2)$$

where: IE stands for income elasticity, Y, X – as above, a_0, a_1, a_2 – estimates of model (1) parameters. It should be noted, that the value of the income elasticity of demand, calculated on the basis of the Blundell, Pashardes and Weber demand model, depends on the value of disposable income, which means that households, differing in the value of this demand determinant, show different behavior in the case of its 1% increase. If $IE > 1$, then the good (or group of goods) is of the nature of a higher order good, otherwise ($IE < 1$) the good (or group of goods) is the primary good.

The next stage of the analysis concerns the process of unifying the nature of services within the V4 countries. For this purpose, the σ-convergence concept was used. In this approach, changes in the coefficient of variability of income elasticity of demand over time, determined by the formula:

$$V_{IE,t} = \frac{S_{IE,t}}{\overline{IE_t}}, \quad (3)$$

where: $V_{IE,t}$ – coefficient of volatility of income elasticity of demand over time t, $S_{IE,t}$ – standard deviation of income elasticity of demand in the group of V4 countries over time t, $\overline{IE_t}$ – average value of income elasticity of demand over time t, were analyzed.

Finally, the trend-autoregressive model describing the changes of the $V_{IE,t}$ coefficient over time was estimated. A significant, decreasing tendency in the value of the coefficient of variation over time will testify to the unification of the nature of services in households of the Visegrad Group countries. In order to verify the model, the Breusch - Godfrey test for the residual autocorrelation was used as well.

Empirical Results

First, the models of household demand for services in the Visegrad Group countries were estimated. The estimation was made on the basis of the data from the period of 1995–2016. The borderline significance level adopted in the study is 5%. Table 2 presents the results of the estimation and verification of these models. The structural parameters α_1 and α_2 of the models for each country are statistically significant. Thus, we are dealing with a statistically significant parabolic influence of disposable income on the level of household expenditure for services. The determination coefficient R2 for each of the models takes the value of 0.99, therefore the models explain to a very large extent the development of household demand for services. Moreover, the results of the White and Jarque-Bera tests indicate, respectively, the homogeneity of the model residuals and the normality of distribution of the residuals. In light of all the tests used, the obtained empirical models were of high quality. They can be considered as describing the demand for services reported by households in the V4 countries very well.

Note: In parentheses p-value.

In the next stage of the analysis, the values of the income elasticity of demand for services in households of the V4 countries were determined. This values are presented in Table 3. This Table presents also the values of the coefficient of variation in the years 1995–2016. In the first year of the analysis, the elasticity coefficient for the Czech Republic,

Hungary and Slovakia has similar values. However, it is of a much higher value for Poland. In the next few years, the value of this ratio in Poland decreased very quickly. As a result its value in 2001 approached the value in other countries. At that time, all the countries were characterized by the most similar level of the income elasticity coefficient. Later, a slight deterioration in economic in Poland caused a decline in disposable income and the increasing the rank of services, which was reflected in the increase in the value of the coefficient of income elasticity of demand. In the following years its value was again approaching that of other countries. Since 2008, the level of income elasticity of demand in Poland, the Czech Republic and Hungary was constantly leveling off, until 2016 inclusive. Nevertheless, it had a relatively constant value. At the same time, , there was a further decline in the value of income elasticity in Slovakia (see Figure 2), which could have been caused by the lack of a collapse in the upward trend of household disposable income during the global financial crisis. In the last year of the study, this indicator in Slovakia was 0.80, which is much lower than in the Czech Republic or Hungary. In all V4 countries, the income elasticity of demand reported by households for services in the analyzed period dropped to a level below one, which means that services become daily goods and lose their character of a higher-order goods.

Table 3: Values of income elasticity of demand and values of the coefficient of variation

Year	Income elasticity (IE)				V
	Czech Republic	Hungary	Poland	Slovakia	
1995	1.15	1.23	1.96	1.22	0.24
1996	1.24	1.23	1.77	1.27	0.16
1997	1.26	1.24	1.64	1.28	0.12
1998	1.27	1.24	1.53	1.27	0.09
1999	1.27	1.24	1.53	1.28	0.09
2000	1.26	1.23	1.37	1.25	0.04
2001	1.23	1.18	1.25	1.23	0.02
2002	1.18	1.12	1.27	1.20	0.04
2003	1.18	1.10	1.35	1.17	0.08

2016	0.94	0.94	0.97	0.80	0.07

Fig. 2 : Dynamics of the income elasticity of demand for services in the V4 countries over the period 1996–2016

Figure 3 shows the development of the coefficient of variation of the income elasticity of demand for services in the V4 countries over the period 1996 – 2016. From 1995 up to 2001 there was a dynamic decrease in the value of the coefficient of variation, which was undoubtedly influenced by the approaching the value of the income elasticity of demand in Poland to those in other V4 countries, as those were at a similar level. In the next three years, we are dealing with an increase in the value of the convergence measure (so it points to divergence; see Figure 3), which was certainly caused not only by a slight economic recession in Poland, but also by the emergence of disproportions between other countries of the V4. Since the V4 economies joined the structures of the European Union, the coefficient of variation of the income elasticity of demand for services decreased again, until the financial crisis appeared, when in 2009 the convergence measure increased from 0.06 to 0.09. The observed divergence process was related with V4 countries' different dealing with the crisis –Slovakia's economy was the only one that did not experience a recession, but only a slight slowdown in development. The economic disproportions that emerged in this period also resulted in disproportions in the disposable income of households, and thus in the consumption of services by them. After 2009, the difference in the values of the income elasticity of demand for services between Slovakia and other economies of the Visegrad Group remained relatively constant. Thus, the value of the coefficient of variation did not change significantly. The indicator remained stable at around 0.07.

Fig. 3: Values of the coefficient of variation of the income elasticity of demand in 1995-2016

In Figure 3, two sub-periods can be distinguished in which the values of the convergence measure behave quite differently. The first period is 1995–2001 and the second covers 2002–2016.

Then, the trend-autoregressive model was estimated, wherein the threshold trend and the first-order autoregression concepts were used. The model took the form as follows:

$$V_{IE,t} = \beta_0 + \beta_1 t_1 + \beta_2 t_2 + \beta_3 V_{IE,t-1} + \varepsilon_t, \quad (4)$$

where: $V_{IE,t}$ denotes the value of the coefficient of variation of income elasticity of demand for services at the time t, t_1 and t_2 mean the time variables for the periods 1995-2001 and 2002–2016 respectively, and $V_{IE,t-1}$ stands for the lagged value of variation coefficient of income elasticity of demand for services. Table 4 shows the results of model (4) estimation and verification.

Table 4: Results of estimation and verification of the model (4)

Parameter	Estimate	p-value
β_0	0.050	~0.00
β_1	-0.017	0.01
β_2	-0.001	0.15
β_3	0.534	~0.00
R^2	0.85	
JB-test	1.64 (0.44)	
White test	7.04 (0.53)	
BG-test	0.31 (0.59)	

Note: Numbers in brackets refer to the p-value.

A negative and statistically significant value of the β_1 parameter (p-value for the t-Student test is lower than 0.05) indicates a significant decrease of the variation coefficient in the period of 1995–2001, ceteris paribus . Thus, the income elasticity of demand for services in countries considered was leveling out. Therefore, we can believe that the character of services in the V4 countries becoming similar in this period. However, in the second period, the downward trend of the considered coefficient of variation is not statistically significant. In this period, there is no clearly defined direction of changes (increase or decrease) in the value of the variation coefficient of income elasticity of demand for services. The evaluation of the β_3 parameter indicates a significant decrease in the value of the σ-

convergence measure, in relation to the previous year, ceteris paribus. The value of the determination coefficient R^2 indicates a high degree of the model fit to data. Moreover, the statistical tests for the random component confirm homogeneity, normality of distribution and lack of residual autocorrelation.

Conclusion

Changes in the economic development of the Visegrad Group countries are causing changes in the standard of living of the society, as well as in their wealth. Improving the socio-economic situation causes households to become richer and, consequently, changes in the level and structure of their consumption. In particular the level of expenditure on services is increasing. The increase in disposable income per capita of V4 households in the years 1995–2016 also resulted in an increase in their per capita expenditure on services. As V4 economies became richer, the value of the income elasticity of demand for services decreased (according to the Blundell, Pashardes and Weber demand model, down to the level below one) . Thus, the nature of services changed − from a higher-order good, over time, they became a necessity good. Moreover, the economic convergence of the Visegrad Group countries also results in the leveling up of the wealth of the society and consumption expenditure, including those for services. On the basis of the σ-convergence approach, it has been shown that this is also followed by the leveling of the value of income elasticity of demand for services, which is clearly visible in the years 1995–2001. In the following years, a horizontal trend in shaping the value of the convergence measure is observed. It is related to the economic recession in Poland in 2002-2003 and the world financial crisis in 2009, which caused a recession in the V4 countries, except Slovakia, where only a slowdown in economic growth was recorded. After the crisis, the differences in the income elasticity of demand for services between Slovakia and the other V4 countries were relatively constant, which stopped the process of convergence of the nature of services. In order for this process to continue in the economies of the Czech Republic, Hungary and Poland, there should be some impulse to develop faster than in Slovakia, which would improve the standard of living of the society. Then, the value of the income elasticity of the demand for services reported by households would decline. As a consequence, the tendency to equalize the income elasticity of demand for services in the countries under consideration would increase.

Influence of the Choice of the Function Form on the Income Elasticity Value of Demand for Food in the Visegrad Group Countries

Mateusz JANKIEWICZ

Nicolaus Copernicus University, Toruń, Poland
m.jankiewicz@umk.pl

Abstract

The households' demand is one of the main aspects covered in economic research. The level of consumption expenditures and their structure indicate the level of economic development in country, and also resulting from it the level of households wealth. The aim of this paper is to analyze the households' food expenditures in selected European countries in the period of 1997-2016. The research is conducted for the Visegrad Group countries, which includes the Czech Republic, Hungary, Poland and Slovakia. The level and the structure of food expenditures are a good reflection of the households' wealth and show the differences between them very well. It must be noted that, independently from the level of wealth, food remains a basic commodity. The nature of this group of goods does not change over the time too. There are a lot of forms of the demand function used in the literature, which show dependence of households' expenditure, e.g. on food consumption, on the households' disposable income. In this paper five forms of demand function, including function proposed by Törnqvist and also function known as Working-Leser, are used. The obtained results allowed to indicate the differences in the use of an additional unit of disposable income in terms of food expenditure between households' in the Visegrad Group countries and the relationship of these differences with the level of an economic development of considered countries. Moreover, the differences in the income elasticities of food demand, resulting from the choice of the form of the demand function, are also presented.

Keywords: Demand Function, Household Expenditure on Food, Income Elasticity of Demand, Necessity Goods

Introduction

The consumption expenditure level and structure testifies the wealth of all economies. The households' consumption expenditures account for the majority of all consumption spending of the economy. Consumption is influenced, among others, by the social and economic development of the country (see: Cheba, 2015; Łapińska, 2016; Cheba, Szopik-Depczyńska, 2017; Kuc, 2017; Simionescu et al., 2017, 2018; Kurowska-Pysz et al. 2018; Miłek, 2018; Nowak, 2018; Simionescu et al., 2018; Cyrek, 2019; Pietrzak, 2019; Kuc-Czarnecka et al., 2020). The food expenditures are the most important part of the expenditure plan for all households around the world. Food is a group of goods that is necessary for the proper functioning of the human being. The disposable income is the greatest determinant of the level and the structure of the households' expenditure plan – including in particular food expenditures (Banks et al. 1997, Cupák et al. 2015, Jankiewicz, 2018b, 2019a). Changes in the disposable income of society and in result changes in the level and structure in households' consumption are determined by economic growth (see: Bretyn, 2013; Gavurova et al., 2017; Głodowska, 2017; Jankiewicz, 2018a, 2018c, 2019, 2020a, 2020b; Jankiewicz, Pietrzak, 2019; Pietrzak, Jankiewicz, 2019). The first law indicating the relationship between food expenditures and disposable income was formulated by Ernst Engel (Engel, 1895). He showed that the level of food expenditures grows along with the increase in disposable income of households, however their share in final consumption expenditures decreases (see also: Jankiewicz, 2018a; Jankiewicz, Pietrzak, 2019). The decrease in the share of the food expenditures in the final consumption expenditures is the result of a faster increase in total consumer spending than in food spending. Additional percentage of disposable income causes that the households' food expenditures grow by less than a percentage. The measure of percentage change of consumption expenditures due to one percent change of the level of disposable income is named an income elasticity. Many researchers deal with the subject of the consumption demand and its changes (Ishida et al., 2003; Kónya and Ohashi, 2007; Test, 2011; Piekut, 2013, 2015; Aepli, 2014; Horáková, 2015; Benda-Prokeinova and Hanova, 2016; Jovanovic, 2016; Verba, Kudinova, 2019). Income elasticity indicates the nature of consumer goods. For the necessities, the value of income elasticity is less than one, however, for the superior goods is above one. In previous research, the food is characterised as basic consumption good (Gracia and Albisu, 2001; Liu and Zhong, 2009; Hayat et al., 2016; Ulubasoglu et al., 2016) and

Cite this Article as: Mateusz JANKIEWICZ" Influence of the Choice of the Function Form on the Income Elasticity Value of Demand for Food in the Visegrad Group Countries" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

in this research this regularity is confirmed. But in different studies, different methods to get the values of income elasticities are used. The differences refer to the form of the consumption function.

The aim of this research is to show that the choice of the form of the consumption function has an influence on the value of income elasticity. Food is the group of goods chosen in this study. The households' demand for food in four European countries in the years 1997-2016 is considered. These countries are the Czech Republic, Hungary, Poland and Slovakia – forming the Visegrad Group. To show the differences in the income elasticity values, five forms of the demand models are estimated.

Data

The data for this analysis are taken from European Statistical Office (EUROSTAT) database. They relate to the level of the households' food expenditures (variable Y) and household's gross disposable income per capita (variable X) in the years 1997-2016 for the Visegrad Group countries. The values of variables are obtained through own calculations. Table 1 shows the lowest and the highest values of disposable income in the Visegrad Group countries and accompanying level of food expenditures.

Table 1: Extreme values of disposable income per capita in Visegrad Group countries in the years 1997-2016 and accompanying food expenditures

Country	Lowest DI	Food exp	Highest DI	Food exp
Czech Republic	3,090.37	453.95	8,785.33	1,162.51
Hungary	2,485.33	430.54	6,592.96	905.29
Poland	2,641.79	558.41	6,797.39	1,008.30
Slovakia	2,229.96	372.20	8,889.19	1,218.10

In the Czech Republic the lowest values of disposable income (3,090.37 EUR per capita) are accompanied by food expenses about 450 EUR per capita. In this country, in the considered period, the highest value of disposable income is 8,785.33 EUR per capita and around 1,162 EUR is intended for food. In Hungary, the lowest disposable income is at the level of about 2,500 EUR per capita and the highest is slightly above 6,500 EUR per capita. These values are accompanied by food expenses 430.54 EUR and 905.29 EUR per capita, respectively. We can see the similar situation of disposable income in Poland, however, the food expenditures range between about 560 EUR and 1000 EUR per capita. In Slovakia, we can notice the biggest difference between the highest and the lowest level of disposable income (about 6,600 EUR per capita). Food expenditures shape from 372.20 EUR to 1,280.10 EUR per capita. Besides Slovakia, the extreme values of disposable income come from extreme years of analysis (1997 and 2016 respectively). Figure 1 presents the dependence of the food expenditures on the disposable income. Based on the plots in the figure 1 in all countries it can be seen that the increase in the level of food expenditures is the result of the increase in the household's disposable income. It is noticeable that the dependence between these two processes can be approximately linear, so estimation of the food demand is started with the linear form of consumption function.

Fig. 1: Dependence of the food expenditures on the disposable income in the Visegrad Group countries

Methodology

The first step in the analysis is to estimate a few consumption demand functions for the household's food expenditures. Firstly, the linear demand model is used in the following form:

$$Y_i = \alpha_0 + \alpha_1 X_i + \varepsilon_i, \tag{1}$$

where: Y_i – level of the households' food expenditure, X_i – gross households' disposable income per capita, ε_i – random component of the model. Secondly, the next four models are estimated: double-logarithmic model (2) – first used by Engel in his research (1895), model proposed by Törnqvist in 1941 for necessities (3), known by the name Working-Leser model (4) – first used by Holbrook Working in his analysis in 1943 (also known as semi-logarithmic model) and model proposed by Prais in his article from 1952 (5). The last model is also known as Working model (Dudek et al., 2002).

$$ln(Y_i) = \alpha_0 + \alpha_1 ln(X_i) + \varepsilon_i, \tag{2}$$

$$Y_i = \frac{\alpha_0 X_i}{\alpha_1 + X_i} + \varepsilon_i, \tag{3}$$

$$Y_i = \alpha_0 + \alpha_1 ln(X_i) + \varepsilon_i, \tag{4}$$

$$ln(Y_i) = \alpha_0 + \alpha_1 \frac{1}{X_i} + \varepsilon_i, \tag{5}$$

where: Y_i, X_i, ε_i – as above.

In statistical verification tests for normality (Shapiro-Wilk test) and heteroscedasticity (Goldfeld-Quandt test) of the residual distribution are implemented. Models are compared with the Bayesian Information Criterion (BIC), which takes the following form:

$$BIC = n \cdot log\hat{\sigma}_p^2 + p \cdot logn, \quad \hat{\sigma}_p^2 = \frac{RSS}{n-p} \tag{6}$$

where: n – sample size, p – total number of parameters estimated, RSS – sum of the residuals squared. Model with the lowest value of BIC is the best fit for the empirical data.

From all models, the average income elasticities are calculated. The forms of income elasticities resulting from the forms of demand models are characterised as follows:

$$IE_1 = \frac{a_1 \cdot X}{a_0 + a_1 X}, \quad (7)$$

$$IE_2 = a_1, \quad (8)$$

$$IE_3 = \frac{a_1}{a_1 + X}, \quad (9)$$

$$IE_4 = \frac{a_1}{a_0 + a_1 lnX}, \quad (10)$$

$$IE_5 = \frac{-a_1}{X}, \quad (11)$$

where: a_0, a_1 – estimation of parameters α_0 and α_1 respectively, X- level of households' disposable income per capita. Income elasticities (7) – (11) correspond to the models (1) – (5). For most of models used in this investigation, the income elasticity depends on the households' disposable income. Richer households' spend a different part of their additional incomes for food than the poorer ones. Only for double-logarithmic model the income elasticity in constant.

Empirical Results

The first step in the analysis is the demand model estimation. Models are estimated for households' food demand in the Visegrad Group countries in the period of 1997-2016. Adopted significance level in the analysis is 5%. Table 2 shows the results of demand models estimation and verification.

Table 2: The results of demand models estimation and verification

The dependence of the level of the households' food expenditures on the disposable income is statistically significant (test probability for t-Student statistic is less than 0.05) for all demand models in each of the countries. Moreover, estimate values of the parameter α_1 show that an increase in disposable income causes an increase in households' food expenditures. All of estimated models show good fit to empirical data. The coefficient of determination (R^2) is over 0.9 for all models. Based on the Shapiro-Wilk test results, we can notice that residuals of demand models have normal distribution, excluding Törnqvist model and Working model for Slovakia, where test probability is near the boundary value. In turn, an imperfection of demand models for Czech Republic is the heteroscedasticity of residuals. It is a result from Goldfeld-Quandt test (test probability is near 0, so we reject the zero hypothesis about homoscedasticity of model residuals). Finally all the models are compared with the Bayesian Information Criterion. The lowest values of considered criterion accompanied Törnqvist models. Based on this criterion, we can recognize the Törnquist models as better than the others. It is worth emphasizing that in this analysis models with lower values of BIC have higher values of R^2, but it is not a generally accepted standard. The Törnquist model has one more advantage – in this model we can find the saturation level of the households' food expenditures, characterised by estimate of parameter α_0. It is the level of expenditures that will not be exceed despite the increase in disposable income. The saturation level is the highest for the Czech Republic (3,689.13 EUR per capita) and the lowest for Hungary (2,389.31 EUR per capita). It is compatible with formation of the disposable income. Figure 2 presents the empirical and theoretical values of food expenditure based on results of the Törnqvist models.

Fig. 2: Comparison of real and theoretical values of the food expenditure – Törnqvist models

Next step in the analysis assumes the comparison of average food demand elasticities values. Table 3 shows calculations of average income elasticities, according to all demand models.

Table 3: Calculations of average income elasticities for food in the years 1997-2016 for Visegrad Group countries

Country	Average income elasticities from models				
	Linear	Double logarithmic	Törnqvist	Working-Leser	Working
Czech Republic	0.858	0.828	0.783	0.846	0.762
Hungary	0.795	0.758	0.709	0.723	0.659
Poland	0.729	0.747	0.739	0.739	0.718
Slovakia	0.889	0.861	0.797	0.986	0.830

Results of the demand elasticities calculation confirm that food belongs to the group of basic goods in each of the Visegrad Group countries. Values of average income elasticities are less than 1 what means that an one percent increase in the disposable income causes less than one percent increase in food expenditures. Moreover, for the same data, estimated demand models show different values of an income elasticity. For demand in the Czech Republic this difference is about 0.096 (0.858 for linear model and 0.762 for Working model). We get the most similar values of the income elasticities of the food demand in Poland – the difference is 0.029. In this study, there is higher heterogeneity in the food demand in Hungary and Slovakia, because differences between income elasticities are even about 0.18. As Table 3 shows, the choice of the demand model form has significant impact on the final results in conducted research.

Conclusion

Households' food expenditures as a basic group in the households' spending plan are in the field of interest of many researchers. In analyses of any consumption expenditures, disposable income (as the main determinant of the consumption spending) cannot be omitted. The amount of the disposable income (and in result level of consumption) depends, among others, on macroeconomic situation of countries (Pietrzak, Łapińska, 2015; Łapinska, 2016; Tvaronavičienė, Gatautis, 2017; Rollnik-Sadowska, Dąbrowska, 2018; Dmytrów, Bieszk-Stolorz, 2019), institutional changes (Balcerzak, Pietrzak, 2016; Hadaś-Dyduch et al., 2019; Balcerzak, 2020), innovation level (Kijek, Matras-Bolibok, 2019) and digitization, financialization and globalization processes (Balcerzak, Pietrzak, 2017; Trębska, 2018; Bilan et al., 2019; Jakimowicz, Rzeczkowski, 2019; Pietrzak, Ziemkiewicz, 2018a, 2018b; Sánchez-López et al., 2019; Shkolnyk et al., 2019; Victor et al., 2019). All demand models contain a factor characterising an influence of the disposable income on expenditure level. They differ in an analytical form. Some of researchers use linear models to estimate households' demand, others use non-linear form of them. Based on the results of estimation models, income elasticities of different group of goods can be appointed. In this paper, it is showed that the model proposed by Törnquist is the best to characterize households' food demand in the Visegrad Group countries. This model shows the lowest values of Bayesian Information Criterion and the highest level of the coefficient of determination. This model is one of the few, which implies that food expenditures increase to a certain level. Calculations of income elasticities confirmed that food belongs to basic consumption goods – values of income elasticity are less than one. Moreover, food income elasticities are different for different demand models. The differences of it in the Visegrad Group countries are significant, while in each of the models, food does not change its nature of basic good.

Factors Limiting the Improvement of Managerial Competences In High Technology Enterprises

dr hab. Gabriela Roszyk-Kowalska

PhD, DSc, prof. of the Poznań University of Economics and Business
Poznań University of Economics and Business
Poland
g.roszyk-kowalska@ue.poznan.pl

Abstract

By filling the theoretical cognitive gap, an attempt was made to clarify the definition of competences. Based on the analysis of the available literature on the subject, it was assumed that the concept of competence is understood as the general knowledge, experience, skills and attitudes, where:

- knowledge is the content preserved in the memory of a person in a managerial position, which results from the learning process;
- experience is the totality of knowledge and skills acquired on the basis of observations and own experiences of a person holding the position of a manager;
- skills constitute a manager's ability to function efficiently in an organization;
- attitudes are beliefs and behaviours towards someone or something.

In the process of acquiring competences, knowledge, experience, skills and professional attitudes complement each other, but this does not mean that they are of the same importance.
The course of the managerial work process is influenced by specific situational factors called, inter alia, conditions, determinants, indicators of the efficiency of managerial work in the process of managing an organization. These factors condition the manager's achievement of the efficiency of his/her work.
As a result of the conducted research, the factors existing both in the environment of high technology enterprises and within them, limiting the improvement of key competences of management staff in high technology enterprises, were demonstrated.

Keywords: High Technology Enterprises, Managerial Competences, Competences

Introduction

Undertaking activities aimed at identifying and assessing factors limiting the improvement of managerial competences in high technology enterprises, a critical analysis of literature on the subject was performed, which enabled the systematization of dispersed knowledge on managerial competences. Filling the theoretical cognitive gap, an attempt was made to clarify this ambiguous concept, because so far no coherent definition of 'competence' has been introduced that would be adopted by all theorists. On the basis of a critical analysis of literature on the subject, it was found that the concept of competence is understood as the totality of knowledge, experience, skills and attitudes, where: (1) knowledge is the content preserved in the memory of a person in a managerial position, which results from the learning process, (2) experience [Thomas and Cheese, 2005, pp. 24-29] is the totality of knowledge and skills acquired on the basis of observations and own experiences of a person holding the position of a manager, (3) skills constitute a manager's ability to function efficiently in an organization, (4) attitudes are beliefs and behaviours towards someone or something. Theoretical considerations allowed for the formulation of a conclusion that individual elements of competences are interrelated, and it is difficult to indicate their clear divisibility. However, such attempts were made because key competences of managers in high technology enterprises were proposed using the method of source critique and logical analysis, interview technique, questionnaire technique, the method of competent judges, comparative analyses and statistical tests of measuring relationships between variables. These competences were related to the characteristics of high technology enterprises due to the positively assessed role of this sector in stimulating socio-economic development [Roszyk-Kowalska and Kraśniak, 2020, p. 38].

Cite this Article as: Gabriela Roszyk-Kowalska " Factors Limiting the Improvement of Managerial Competences In High Technology Enterprises" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Managerial competences were selected on the basis of an analysis of literature on the subject and with the involvement of experts from the area subjected to empirical research. It was found that managerial competences differ depending on the industry [Tiruneh, Fayek, 2019, p. 3], the specificity of managerial work or the requirements set for a manager. Therefore, in economic practice it is postulated to construct key competences, i.e. those that all people in managerial positions need in order to satisfy the needs of self-realization and being active in an organization, for which they should constitute capital.

Key competences of managerial staff in high technology enterprises include entrepreneurship, creativity, knowledge management, teamwork, innovation, cooperation in relational systems, employee empowerment, R&D activity management, basing communication systems on modern IT technologies according to the level of education (supplemented with additional qualifications), seniority, key skills and key attitudes [Roszyk-Kowalska, 2018, pp. 19-22].

In the process of acquiring competences, knowledge, experience, skills and professional attitudes complement each other, but this does not mean that they are of the same importance.

The course of the managerial work process is influenced by specific situational factors called, inter alia, conditions, determinants, indicators of the efficiency of managerial work in the process of managing an organization. These factors condition the manager's achievement of the efficiency of his/her work [Kraśniak and Roszyk-Kowalska, 2019, p. 54].

As a result of the conducted research, the factors existing both in the environment of high technology enterprises and within them, limiting the improvement of key competences of management staff in high technology enterprises, were demonstrated.

Research procedure

Based on the analysis of literature on the subject and observation of the economic practice of high technology enterprises, a conclusion was formulated that the factors of change that exist both in the environment and in an organization itself are sources of limitations in the improvement of managerial competences. Therefore, a pilot study (2019) was carried out among managerial staff of all levels, asking them to indicate (open-ended questions) elements of the political and legal, economic, technological, socio-cultural, international and internal environment of an organization that had an impact on their changes in attitude and/or skills and/or experience and/or education. After listing a specific factor from a given environment, managerial staff was also asked to specify the time period when this change took place. The purpose of such a procedure was not only to identify the factors that, according to managerial staff, influenced their changes in competences, but also to "make" respondents think about this factor from the point of view of the criterion of time. Fifty-six people took part in the research, of which thirteen people were from a strategic management level, thirty people from a tactical management level and thirteen people from an operational management level (random selection).

Then, all the factors identified in individual areas of the political and legal, economic, technological, socio-cultural, international and internal environment of an organization, using the method of competent judges, were aggregated and flattened in each group to the six most important ones from the perspective of the research problem.

For this purpose, eighteen experts were appointed, including representatives of economic universities. The deliberate selection of competent experts was guided by the principle of specialization, hence people with significant scientific achievements (scientific publications in a given field) were invited to participate in the research.

Electronic means were used to communicate with the experts. Each of the experts received a list with the factors indicated by respondents in a given area (in line with the scientific achievements) and was asked to aggregate and flatten the number of factors considered by the expert to be the most important to six.

After receiving the material from the experts, research questionnaires were developed which were used during the actual surveys. In this research procedure, senior management was asked to distribute ten points among no more than five statements, depending on the extent to which they believe a factor in their environment has influenced (or influences) changes in attitude and/or skills and/or experience and/or education of people employed in the enterprise where they work at the tactical and/or operational level. In contrast, managerial staff of the tactical and operational

level was asked to distribute ten points between no more than five statements, depending on the extent to which a given factor has influenced (or influences) changes in their attitude and/or skills and/or experience and/or education (self-assessment).

After completion of the research procedure, information was obtained on the factors of the external and internal environment of an organization from 504 people.

The indicators of importance of individual factors were determined as the average indication for managerial staff of an appropriate level and given as a percentage of the maximum possible indication. For example, a value of 10 for the factor "frequent changes of the government" means that managerial staff of the strategic level gave this factor 10% of their points (Fig 1). Firstly, such a transformation allowed to compare the ratings of managerial staff of the strategic level with the ratings of lower-level managerial staff, despite significant differences in the size of the two groups, and secondly, it illustrated the differentiation of ratings of individual factors, maintaining appropriate relationships.

Results of the Research Procedure

The analysis of the received ratings shows that for managerial staff of the strategic level the most important factor is an increase in formal requirements for jobs. Instability of law follows in second place, though it is clearly less important. The remaining factors obtained significantly lower values. On the other hand, for managerial staff of the operational and technical level, the most important are integration with the European Union and an increase in formal requirements for jobs, while other factors: instability of law and frequent changes of the government received only slightly lower ratings. The ratings of lower-level managerial staff are distributed more evenly, the importance is spread over several factors, while the ratings given by managerial staff of the strategic level focus on one or two factors.

Fig. 1: The importance of factors from the political and legal environment for managerial staff of high technology enterprises

Source: own elaboration.

In order to assess the convergence of the ratings of the importance of factors, the following correlation coefficients were calculated: Spearman's rank - due to the small number of factors (six in each group) and additionally Pearson's linear correlation. The rank correlation coefficient examines the sequence dependence, so it takes into

account only the order of the factors, while it ignores the size of the difference between the indications of subsequent factors. The difference between the factor "an increase in formal requirements for jobs" that received 30% and "instability of law" with 17% importance is treated in the rank correlation coefficient in the same way as the difference between "frequent changes of the government" (10%) and "systemic changes in Poland" (9%). Pearson's linear correlation coefficient is sensitive to these differences and is therefore used here. Due to the small number of observations, it can only be treated as a supplement to the rank correlation coefficient.

Table 1: Correlation between the indications of managerial staff of the strategic level and managerial staff of the tactical and operational level in high technology enterprises in the area of factors from the political and legal environment

	Correlation coefficient	Value *p*
Spearman's rank	0.77	0.0724
Pearson's linear	0.66	0.1499

Source: own elaboration.

The value of the coefficients indicates the existence of an average relationship in the sample, which means that the indications are moderately convergent. However, this relationship is not statistically significant at the significance level of 0.05 (Spearman's correlation coefficient is significant at the significance level of 0.1).

Therefore, it should be recognized that in the area of factors from the political and legal environment, the most important factor influencing decisions on the improvement of key competences of managerial staff in high technology enterprises is an increase in formal requirements for jobs, and then instability of law (too frequent changes in legal regulations). On the other hand, for managerial staff of the tactical and operational level, the first factor influencing actions taken in the process of improving key competences of managerial staff in high technology enterprises is integration with the European Union and the resulting legal consequences, followed by an increase in formal requirements for jobs and instability of law (too frequent changes of legal provisions) in third position.

On the other hand, analysing the factors of the economic environment (Fig 2), it was shown that for managerial staff of the strategic level, the consumption rate (propensity to consume) is most important, followed by the unemployment rate and the rate of economic growth and return on capital in improving key competences of managerial staff in high technology enterprises. On the other hand, for managerial staff of the tactical and operational level, the unemployment rate is most important, followed by the consumption rate (propensity to consume) and exchange rates.

Fig. 2: The importance of factors from the economic environment for managerial staff of high technology enterprises

Source: own elaboration.

Table 2: Correlation between the indications of managerial staff of the strategic level and managerial staff of the tactical and operational level in high technology enterprises in the area of factors from the economic environment

	Correlation coefficient	Value *p*
Spearman's rank	0,89	0.0188
Pearson's linear	0,82	0.0453

Source: own elaboration.

A positive, quite strong relationship has been shown, which means that the opinions of managerial staff of the strategic, tactical and operational level are similar. It is a statistically significant relationship (at the significance level of 0.05).

Then, analysing the factors of the technological environment (Fig 3), it has been shown that for managerial staff of the strategic level, the most important factor is the development of new technologies in Poland, followed by expenditure on R&D in Poland and the share of expenditure on R&D in high technology industries and access to new technologies in improving key competences of managerial staff in high technology enterprises. On the other hand, for managerial staff of the tactical and operational level, expenditures on R&D in Poland and the share of R&D expenditures in high technology industries are most important, followed by access to new technologies and the development of new technologies in Poland.

Fig. 3: The importance of factors from the technological environment for managerial staff of high technology enterprises

Source: own elaboration.

Table 3: Correlation between the indications of managerial staff of the strategic level and managerial staff of the tactical and operational level in high technology enterprises in the area of factors from the technological environment

	Correlation coefficients	Value *p*
Spearman's rank	0.83	0.0416
Pearson's linear	0.82	0.0447

Source: own elaboration.

A positive, quite strong relationship has been shown, which means that the opinions of managerial staff of the strategic, tactical and operational level are similar. It is a statistically significant relationship (at the significance level of 0.05).

Subsequently, the factors from the socio-cultural environment were analysed. In the group of these factors, mobility was the most indicated one by senior management, followed by the demand for innovative products and changes in the social structure. Therefore, it can be concluded that these factors constitute an important source of information in the implementation of the process of improving key competences of managerial staff in high technology enterprises. Meanwhile, for managerial staff working in these enterprises, the factors that determine changes in key competences are: mobility, demand for innovative products and globalization processes (Fig 4).

Fig. 4: The importance of factors from the socio-cultural environment for managerial staff of high technology enterprises

Source: own elaboration.

Table 4: Correlation between the indications of managerial staff of the strategic level and managerial staff of the tactical and operational level in high technology enterprises in the area of factors from the socio-cultural environment

	Correlation coefficient	Value *p*
Spearman's rank	0.87	0.0237
Pearson's linear	0.99	0.0000

Source: own elaboration.

In this case, the relationship is very strong and positive. This means the convergence of indications made by managerial staff of all management levels. The relationship is statistically significant (at the significance level of 0.05).

Moving on to the analysis of the last group of factors from the organization's environment, it was shown that among the factors from the international environment (Fig 5), the highest rated factors in the opinion of managerial staff of the strategic level include trips, contacts abroad, and the complexity and speed of changes taking place on the international market. Both these factors received the highest percentage of ratings. A slightly lower percentage (13%) was achieved by the following factors: institutional solutions adopted in other countries, economic competition, removal of legal barriers. On the other hand, for tactical and operational level managers, three factors (15%) are rated identically: global changes in the area of generational differences, meeting(s) with (a) new business partner(s) from abroad, trips and contacts abroad.

Fig. 5: The importance of factors from the international environment for managerial staff of high technology enterprises

Source: own elaboration.

Table 5: Correlation between the indications of managerial staff of the strategic level and the tactical and operational level in high technology enterprises in the area of factors from the international environment

	Correlation coefficient	Value *p*
Spearman's	0.24	0.6429
Pearson's linear	0.28	0.5952

Source: own elaboration.

Indications of senior managerial staff, middle management and managerial staff of the lowest level do not coincide. Correlation coefficients indicate an insignificant relationship (at the significance level of 0.05). This indicates that the opinions of managerial staff as to the factors from the international environment that may affect the process of improving key competences of managerial staff in high technology enterprises are divergent. Therefore, it can be assumed that the motives for action in this area may differ as to the motivation for taking action in this area, depending on the groups of managerial staff.

Significant factors influencing activities of any organization are those that are inherent in itself. The group of factors coming from inside the organization include those which, according to literature on the subject, directly affect the functioning of a given enterprise. These are the factors with the greatest potential to influence it from the point of view of people operating in a given organization. Among the internal factors of an organization, the most important (24%) in the opinion of managerial staff of the strategic level are the educational offer and the development of the organization. Changes in the financial condition of an organization constitute a slightly lower rated but quite important factor. On the other hand, for managerial staff of the tactical and operational level, the factors that may affect the process of improving key competences of managerial staff in high technology enterprises are: educational offer in a given organization, change in the financial condition of a given organization and change of job position (Fig 6).

Fig. 6: The importance of internal factors for managerial staff of high technology enterprises
Source: own elaboration.

Table 6: Correlation between the indications of managerial staff of the strategic level and the managerial staff of the tactical and operational level in high technology enterprises in the area of intra-organizational factors

	Correlation coefficient	Value *p*
Spearman's rank	0.67	0.1442
Pearson's linear	0.78	0.0667

Source: own elaboration.

Indications obtained in the research are moderately similar. The correlation coefficients show a moderate correlation. However, this correlation is statistically insignificant (at the significance level of 0.05).

Conclusions

It should be acknowledged that in individual groups of factors from the environment of a given organization (political and legal, economic, technological, socio-cultural, international) and internal factors, in the research process differences were identified as to the importance of individual factors for managerial staff at the strategic level and managerial staff at the tactical and operational level. The largest statistical discrepancy occurs among the factors inherent in the international environment, then the political and legal environment, and in high technology enterprises themselves. Such a situation may lead to the conclusion that managerial staff may have different priorities in making decisions within their competences, both in the area of education, additional qualifications, experience, skills, and attitudes. Therefore, it is postulated to attempt to overcome these barriers, which may be of significant importance in the improvement of key competences of managerial staff in high technology enterprises. Therefore, the following actions should be undertaken:

- clearly and precisely define competencies (the list of competencies of managerial staff may be used to identify competency gaps [Tyrańska 2016, p. 21]) and avoid any ambiguities in this respect,
- structure the competency model to make it as easy to use as possible,
- be aware that appropriate quality standards must be applied in the development of key managerial competences.

These quality standards should assume that the structure of the process of improving key managerial competences should:

- be transparent and generally understandable,
- be suitable for an appropriate application to all personnel for which it is designed,
- take into account anticipated changes,
- be characterized by a clear separation and divisibility of components (skills and attitudes cannot overlap),
- be fair and not cause unjustified discrimination against any of the persons within its reach.

Only when employees of a given organization are aware of the purpose of the process of improving key managerial competences, and the structure of the process itself corresponds to the above-mentioned quality standards, it is possible to proceed with its implementation [Whiddett and Hollyforte 2003, p. 209]. Therefore, the following actions should be undertaken:

- involve the employees who will be affected by the actions of managerial staff in the formation of the process of improving key managerial competences;
- during the formation of the process of improving key managerial competences inform employees about what actions are taken and why on an ongoing basis;
- make sure that the process of improving key managerial competences is adequate to the planned applications and goals, and that the competences reflect the specificity of individual positions and roles [Whiddett i Hollyforte 2003, p. 210].

The choice of a method or methods of improvement should depend not only on the competence to be improved, but also on the individual learning style of a given person [Musioł-Urbańczyk 2010, p. 75].

Unfortunately, there are no shortcuts in improving key managerial competences. This process requires constant analysis, observation and formulation of conclusions. Nevertheless, there are many methods that can help any manager with this, and each has its pros and cons. In order to develop competences (especially in the short term), trainings, workshops, and courses can be used. It is postulated to choose those in which activating methods are used, such as role-playing, recording scenes with a video camera, behaviour analysis, coach's feedback, working on specific problems. This form of education does not guarantee that managers will completely master a given skill, or change their attitude, because the development of these elements of competences also requires practice, i.e. hands-on training. However, it can be a good start on their career path. The undoubted advantage of trainings, workshops, and courses is that managers receive knowledge in a given area in a nutshell, often supported by real-life examples. It is also a great opportunity to make new friends among participants, which in itself means developing relationship building skills.

It is also postulated to "nurture" organizational culture, which in high technology enterprises (from the point of view of their characteristics) should be flexibility-oriented, and therefore its attributes should include passion, power-sharing and continuity of change.

Ending

The analysis of the research procedure results shows that for managerial staff of the strategic level, the most important factors influencing changes in managerial competences should include an increase in formal requirements for jobs and the consumption rate (propensity to consume). The slightly lower rated but important factors should include development of new technologies in Poland, development of a given organization and the educational offer in high technology enterprises. On the other hand, for managerial staff of the tactical and operational level, the above-mentioned factors are important, but according to the ratings the most important factors are mobility and expenditure on R&D in Poland and the share of R&D expenditure in high technology industries. It is also worth emphasizing that the importance of the factors "change of job position" and/or "change of the immediate superior" is higher than in the ratings of managerial staff of the strategic level. The importance of factors influencing changes in managerial competencies according to managerial staff of the strategic level in comparison to managerial staff of the tactical and operational level varies, which is a reason for the conclusion that managerial staff, depending on the management level, may have different priorities in making decisions regarding changes in their competences both in the area of knowledge, experience, skills and attitudes. Therefore, an attempt was made to propose methods to overcome barriers in the process of improving key competences of managerial staff in high technology enterprises.
In conclusion, it should be emphasized that not a single person is fully competent. In such a situation, first of all, it is necessary to perform tasks related to key competences very well and to follow certain rules, which can be called the principles of competent management. This is the minimum to be expected and required of a manager. Violation

of this minimum is not only a violation of managerial duties, but also of universal ethical principles. Someone who does not want or is unable to meet this managerial minimum should not occupy a managerial position [Kietliński, Reyes and Oleksyn 2005, p. 197]. It is also worth remembering that the development of competencies is a process that should be continued throughout the entire period of holding a given position in a given company.

Acknowledgement

I started my research and scientific work at the University of Economics and Business in Poznań (former Academy of Economics in Poznań).

My research interests focus on managerial staff. Already at the stage of preparing my master's thesis, I was interested in managerial work and the role of managerial staff in organizations. Subsequently, my research interests have evolved towards key business competences.

After receiving a PhD in economics (2007), I continued my research interests in managerial staff, key competences of enterprises, intellectual capital of enterprises and high technology enterprise management.

My research work and the resulting scientific publications fall within the discipline of management science and can be attributed to the following areas:

- managerial work and the role of managerial staff in organizations (in this research area I have published 12 publications in scientific journals, seven chapters in scientific monographs and two monographs as a co-author);
- management of intellectual capital of enterprises (the most important publications in this research area include two publications in scientific journals and three chapters in scientific monographs);
- key competences of enterprises (in this research area, the most important scientific publications include seven publications in scientific journals and four chapters in scientific monographs);
- management of high technology enterprises. As part of this research area, an original monograph was created, five publications in scientific journals and three chapters in scientific monographs.

In 2018 I received a PhD, DSc degree, and since 2019 I am a professor at the University of Economics and Business in Poznań (Poland).

Résumé

L'entrepreneuriat social et solidaire attire, de plus en plus, les femmes et les encourage à entreprendre collectivement et solidairement. Elles y sont plus présentes que les hommes, et réussissent à grande échelle à changer leurs vies grâce au travail solidaire cadré par les coopératives. Ces dernières sont censées contribuer au développement économique des régions et générer une restitution des droits économiques, sociaux et politiques de base au profit des personnes en situation de vulnérabilité et de précarité. Ainsi, les membres de la coopérative se voient emprunter un chemin qui leur permet d'améliorer leurs conditions de vie et de devenir des personnes autonomes et créatrices de valeurs à petite et grande échelle.

Dans l'objectif d'approcher la réalité des coopératives de femmes au Maroc, nous pouvons à priori dans le cadre de cette recherche, questionner la dynamique entrepreneuriale coopérative féminine quant à sa capacité de déclencher un changement réel dans la vie des coopératrices amenant à libérer leurs pouvoirs d'agir qui contribue à leur autonomisation globale. Nous positionnons alors notre recherche dans une vision constructiviste appuyée sur une méthodologie mixte en quête d'une validité et une fiabilité de plus. Ainsi, la partie empirique sera traitée par une étude exploratoire de deux volets documentaire et qualitative, et une étude quantitative analysée par la méthode PLS.

Introduction

Entreprendre collectivement et conquérir des espaces d'action socioéconomique, révèle l'ingéniosité de l'économie sociale et solidaire, les personnes dans ce cadre, entreprennent solidairement dans des domaines économiques à finalité sociale. Dans cette logique, l'économie sociale et solidaire innove en contribuant à la création de la valeur

Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN : 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

sociale, en œuvrant via l'entrepreneuriat solidaire pour répondre à des besoins économiques et/ ou sociaux non satisfaits par les secteurs classiques. À travers sa démarche de proximité, elle concourt à repenser et modifier l'environnement des personnes fragilisées en mobilisant parallèlement les trois sphères économiques, sociales et politiques.

La place des femmes dans ce secteur est distinguée en raison de leur forte présence par rapport aux autres types d'entrepreneuriat, au point d'en faire le constat que l'économie sociale et solidaire se féminise, par exemple en France 67% des salariés du secteur sont des femmes selon le conseil national des chambres régionales de l'économie sociale en France (2012). Au travers le monde, les femmes sont au cœur des groupes de l'économie sociale, elles s'organisent en groupement d'entraide et de soutien (exemple des pratiques populaires en Amérique latine et en Afrique). Cela leurs permet d'exercer une activité en temps partiel qui facilite la conciliation de la vie professionnelle et la vie personnelle, de partager les connaissances et les coûts, d'améliorer les compétences, et de valoriser les activités marchandes de nature domestique...etc.

A ce propos, les travaux de Favreau et Lévesque (1996), Laville (2005) et Lemaitre (2009), montrent que la mobilisation des ressources et des personnes qui s'organisent en groupe, aide à éduquer aux valeurs du travail collectif, à initier à la solidarité organisationnelle et à remodeler les relations entre les différents acteurs économiques et sociaux. L'entrepreneuriat social et solidaire incite donc, à plusieurs changements individuels et collectifs, comme la participation à la gestion des espaces publics, et le changement des comportements des personnes actives vis-à-vis d'elles-mêmes, de leurs entourages et de la communauté. Son importance et son utilité à rallier les personnes et les organisations autour d'un projet collectif de toute la société sont de toute évidence selon Salamon et Anheir (1996), en l'occurrence pour l'Afrique où la solidarité est vivifiante et constitue un patrimoine immatériel, les apports des travaux de Alphandéry, Fraisse, Ghezali (2009) et O. Ahmed (2010), affirment que ce constat été démontré par plusieurs expériences réussies dans le continent.

Dans cette dimension, les coopératives en tant qu'organisations classiques de l'économie sociale et solidaire détiennent un potentiel émancipateur, notamment en générant des innovations au niveau des pratiques de production et de gestion et en favorisant l'acquisition de l'autonomie économique, de la capacité d'agir sur l'environnement social et sociétal des adhérents.

La coopérative est admise comme un outil pertinent vers l'égalité de sexe, la lutte contre la vulnérabilité, la création de synergie collective et la croissance inclusive. Elle est ainsi l'une des domaines fondamentaux de la prise de pouvoir des femmes, dans la mesure où elle participe à leur autonomisation générale en favorisant l'acquisition de l'autonomie économique, de leur capacité d'agir sur leurs environnements sociaux et sociétaux, tout en favorisant leur accès aux espaces de la gestion publique.

Cette prise du pouvoir s'effectue par le biais d'un processus de conscience critique des réalités sociales et économiques marquant l'environnement de la personne suivant la pédagogie des opprimés de Freire, P (1968). Elle est alors d'ordre individuel et collectif, partant de la conscience dominée à une conscience libérée et mène vers l'acquisition de l'autonomie dont la démarche conjugue plusieurs dimensions, à savoir la dimension économique, socioculturelle, familiale / interpersonnelle, juridique, politique et psychologique.

Le concept de l'autonomisation s'est vu ainsi attribué une caractéristique de multidimensionnalité d'après les travaux de Malhotra, Schuler et Boender (2002) comme mentionné dans la recherche effectuée par Dohmwirth (2014), elle se construit au fil du temps grâce à l'accumulation des expériences, résulte d'un processus selon Rowlands (1995), se mesure et se constate d'après Pradhan (2003).

Cela a donné lieu à un ensemble de recherches théoriques et pratiques, de mécanismes d'accompagnement et d'instruments de mesure des différents aspects de la condition féminine au sein de l'organisation coopérative. La mise en œuvre de ces moyens et outils, est présumée être utilisée, entres autres à définir des indicateurs d'estimation et à évaluer éventuellement l'impact réelle de cette organisation solidaire de l'économie sociale sur les différents aspects de la vie (financière, sociale, sociétale et politique) de ses membres ou salariés.

Dans ce même ordre d'idée, la pertinence de notre recherche dans le présent article réside dans l'évaluation de l'impact de la coopérative de femmes sur ses membres dans un contexte marocain où on enregistre une insuffisance d'études réalisées dans ce sens. Ceci afin de pouvoir identifier les caractéristiques, voire la typologie et la dimension, de l'autonomisation que les coopératives de femmes au Maroc peuvent procurer à leurs membres.

Notre objectif est de pallier l'absence desdites études d'impact, et de contribuer à l'enrichissement de la production scientifique à ce sujet, compte tenu que, les recherches existantes sont basées sur des études de cas limitées à un nombre restreint de coopératives.

Ainsi, suite à une revue des principaux concepts en relation avec notre thématique et le contexte marocain en termes d'exclusion et de pauvreté, nous mettons en éclair la relation entre l'entrepreneuriat coopératif et la construction de l'autonomisation des femmes, pour proposer ensuite un cadre théorique détaillant la problématique et méthodologie de recherche afin d'approcher le terrain via la réalisation d'une étude exploratoire de deux volets documentaires et qualitatives, et une étude quantitative, la discussion des résultats s'ensuit pour conclure l'article tout en soulignant les perspectives de recherche futures.

L'emploi féminin et autonomisation des femmes

De l'emploi des femmes à l'entrepreneuriat féminin

Les femmes sont moins payées que les hommes et ne bénéficient pas des mêmes avantages sociaux à l'échelle mondiale, du fait de leur forte présence dans l'économie de "care" (travail domestique non rémunéré, soins aux personnes âgées, enfants…) et dans les emplois vulnérables, d'après la banque mondiale. Leur part dans le marché d'emploi est aussi en décroissance permanente, avec un taux d'activité de 47,14 en 2019 contre 51.024 en 1990. Et seulement 1,379% des chefs d'entreprises sont des femmes en 2019.

Le Forum pour le Partenariat avec l'Afrique, dans son rapport (2011) estime, que la journée de travail d'une femme africaine est en moyenne 50% plus longue que celle d'un homme. A savoir que les employées du secteur agricole ne détiennent que moins de 1 % des terres sur le continent africain, et les agricultrices africaines ne bénéficient qu'uniquement de 1% du montant des crédits alloués à l'agriculture. Ce qui impacte effectivement leur accès aux ressources, économiques, financières et naturelles (spécifiquement la terre).

D'après l'ONU (2020), le salaire moyen des femmes dans le monde est inférieur à celui des hommes de 20% (14% en Afrique du nord). Outre l'écart salarial, une disparité de détention des actifs agricoles est constatée dans toutes les régions, les femmes possèdent 20% des propriétés foncières agricoles dans les pays en développement avec un pourcentage moins de 5% dans l'Afrique du Nord et d'Asie de l'Ouest selon les données du FAO (2010). Tout en notant que les propriétés détenues par les hommes sont de taille supérieure aux celles appartenant aux femmes.

Battagliola (2001) explique que le travail des femmes s'est principalement accru dans les secteurs négligés par les hommes, et du fait qu'elles sont majoritairement salariées dans des catégories socioprofessionnelles moins valorisées, cela risque de favoriser une conjugaison entre l'emploi féminin et la fragilisation économique.

Dans ce sens, Cohen (2016), mentionne que 48 % des femmes actives sont employées dans des fonctions maintenues au bas niveau en termes de salaire et des conditions de travail, en fait, elles sont plus présentes dans quatre secteurs d'activité, à savoir : la santé et les services sociaux, l'éducation, l'administration publique et le commerce de détail, et dans le travail à temps partiel qui est devenu un terrain de la discrimination sexuelle du marché de travail par excellence. Ces conditions ont fait de l'activité des femmes dans plusieurs régions, une impérative et une quête de survie plus qu'un choix de vie ou une opportunité d'épanouissement.

La non reconnaissance de la contribution de l'économie du ''care'' exercée habituellement par les femmes et les tâches domestiques et éducatives non rémunérées et pourtant vitale pour le maintien des liens sociaux, impose, d'après Zelizer (2008), une évaluation et valorisation de la participation économique des femmes.

Ainsi, l'entrepreneuriat féminin a émergé dans le monde entier, et est devenu de plus en plus courant, car considéré comme un pilier et levier d'encouragement et de développement des activités économiques pouvant avoir des retombées positives sur les entrepreneures femmes. En effet, cette situation fragile anime la mission de plusieurs regroupements féminins dans le monde et les encourage à œuvrer pour remédier à la carence en droits économiques, sociaux et politiques élémentaires à l'instauration de la justice sociale au profit des femmes essentiellement. L'Afrique suit le flux, et dès les années quatre-vingt, l'entrepreneuriat est considéré comme source de création d'emplois et de richesses. Entreprendre donc, permet de gagner en autonomie économique qui suppose de son côté avoir accès aux différents types de ressources pour s'assurer et se défendre contre les détresses de la vie. Cette

autonomie facilite aux femmes de faire des choix essentiels dans leurs vies, de gagner un salaire plus élevé, d'effectuer des actions éclairées en matière de gestion de foyer, d'être en meilleure santé.

Ces femmes entrepreneures ne sont pas nécessairement des fondatrices d'entreprises, mais peuvent être des gestionnaires d'affaires selon l'approche canadienne. D'après Belcourt, Burke et Lee-Gosselin (1991), l'entrepreneure est la femme qui cherche l'autonomisation économique et l'épanouissement personnel en se lançant dans l'aventure de la création de son entreprise. Tandis que Lavoie (1988), considère que toute femme qui possède une entreprise ou qui participe régulièrement à sa gestion courante en assumant des risques financiers et administratifs est une entrepreneure.

L'aventure entrepreneuriale est initiée généralement grâce à plusieurs motivations, de nature complexe, fruits d'un mélange de facteurs pull et push selon Lavoie (1988). Les traits de personnalité de l'individu, l'aspect socioculturel de son entourage, ainsi que l'environnement économique et politique de la région marquent grandement cette décision et constituent une base clé de succès de la démarche entrepreneuriale.

Dans ce contexte, Kirkwood (2009) distingue un continuum de facteurs provoquant la prise de l'initiative d'entrepreneuriat :

- Désir d'indépendance : c'est le besoin d'être son propre patron ;
- Motivations économiques : le souhait de saisir une occasion d'affaire prometteuse ;
- Motivations d'emploi : liée à l'insuffisance des perspectives d'évolution dans le salariat ;
- Motivation d'ordre familial : en relation avec l'articulation entre vie familiale et vie professionnelle.

Quant aux entraves, les préoccupations des femmes entrepreneures vues d'un angle, sont communes à tous les entrepreneurs en dépit du sexe, et d'un autre angle, elles sont perçues sexuées et liées au genre féminin. En fait, Lavoie (1988) met l'accent sur le financement, le manque d'expérience en termes de tactique de gestion et le manque de formation comme étant les principales entraves devant les entrepreneures, alors que d'autres comme Alexandre (2016), Cornet et Constantinidis (2004) ont énuméré des problèmes liés au financement, à la conciliation du travail avec la vie familiale et aux faibles liens avec les réseaux.

Pour synthétiser il est important de dénoter qu'il apparait complexe d'appréhender cette réalité des femmes et de l'entrepreneuriat comme une unité monolithique, étant donné que ce phénomène est traversé par plusieurs rapports sociaux, ceux liés au diplôme et à la qualification, ainsi que l'âge, l'origine ethnique et la culture de l'environnement. Ce qui signifie que même les motivations et les contraintes sont personnalisés parfois et à étudier au cas par cas.

Au Maroc, concernant le taux d'activités des femmes, d'après les données du Haut-Commissariat au Plan (2013), le pays est en dessous de la moyenne mondiale et des niveaux enregistrés par des pays arabes comme le Qatar, le Bahreïn et le Kuweit. Selon le même établissement (2016), la contribution des femmes au marché de travail demeure faible avec un taux d'activité de 23,6% contre 71,5% pour les hommes, ce qui positionne le royaume en dessous de la moyenne des pays à revenu intermédiaire de tranche inférieure, ayant un taux d'activité des femmes qui atteint les 39%, contre 57% dans les pays à revenu intermédiaire de tranche supérieure.

Quant à l'entrepreneuriat, les femmes sont bloquées par des stéréotypes et des craintes psychologiques développées depuis le jeune âge, il s'agit des idées qui grandissent avec le temps et se transmissent par l'environnement à proximité ou lointain. Dans ce cadre, l'ONU Femmes (2013) affirme l'influence de l'environnement socioculturel et l'auto-crainte sur la perception de l'entrepreneuriat par les femmes. Aussi, à l'exception de quelques produits et services financiers et non financiers dédiés à l'action d'entrepreneuriat, les femmes entrepreneures s'orientent vers les offres standards de crédit destinées aux particuliers.

L'exclusion et la pauvreté des femmes au Maroc

L'autonomie économique des femmes est un enjeu de développement pour lutter contre la pauvreté d'après Jetté (2009). Les droits des femmes légitimes et basiques quant à la capacité d'acquérir, de vendre, de posséder ou de

louer une propriété, ou de contracter des prêts sur la base de leurs biens ou de leurs terres ne sont pas toujours accordés, surtout dans les communautés à culture qualifiant les femmes de personnes non émancipées et en besoin d'assistance. L'exclusion des femmes de l'accès aux ressources, principalement, l'éducation, l'héritage, la terre etc. entravent leur autonomisation financière. La discrimination au travail, l'exclusion des soins médicaux et de la couverture médicale sont autant des éléments qui influencent l'autonomie économique des femmes.

Ninacs (2006) mentionne dans son intervention lors d'un forum sur la sécurité du revenu et l'emploi, que les deux chercheurs, lesemann (1994) et Mercier (1995) jugent que l'exclusion sociale et la pauvreté peuvent constituer un phénomène multidimensionnel, qui dépasse la carence financière pour en toucher l'aspect psychologique des personnes, ce qui risque de causer une perte d'estime de soi, de la liberté du choix, de la dignité, ou encore l'isolement social, etc. d'après Fresno, Spencer, Zaouche-Gaudron (2005).

Une personne pauvre, ne dispose pas d'autonomie financière, ne dispose pas généralement d'un pourvoir d'action, et de communication, est une personne qui ne jouit pas de ses droits économiques et politiques. Dans notre recherche, par exclusion, nous désignons la situation subie par la personne et qui correspond à un processus qui dépasse largement la pauvreté, où les personnes combinent différentes disqualifications économiques, sociales ou politiques.

Dans le contexte marocain, les résultats de l'enquête nationale sur la consommation et les dépenses des ménages communiqués par Lahlimi Alami (2014) montre que la pauvreté est une donnée structurelle à vocation rurale. En fait, en 2016, 1,6 millions de marocains étaient encore en situation de pauvreté absolue et 4,2 millions en situation de vulnérabilité. Pour la même période, à l'échelle nationale, le taux de pauvreté monétaire est passé à 4,8 % et celui multidimensionnelle à 6 %. Quant à la vulnérabilité à la pauvreté, elle a enregistré un indice de 7,9 % en milieu urbain contre 19,4 % en milieu rural. L'incidence de la pauvreté multidimensionnelle en 2014 d'après les statistiques du HCP montre que la moitié des régions enregistrent un niveau de pauvreté supérieur à la moyenne nationale (8,2%).

Il apparait selon les résultats de la même l'enquête sur la pauvreté (2014) réalisé par le HCP, que 3,5 millions de personnes souffrent une seule pauvreté (10,3 % de la population) : 2,3 millions la pauvreté multidimensionnelle (6,8%) et 1,2 million la pauvreté monétaire (3,5%). Tandis que, 463 mille personnes (1,4% de la population) sont frappées à la fois par la pauvreté multidimensionnelle et la pauvreté monétaire. Ainsi, 3,9 millions de marocains sont en situation de pauvreté globale (monétaire et multidimensionnelle), soit un taux de 11,7% à l'échelle nationale, 3,9% en milieu urbain et 23,7% en milieu rural.

Les femmes constituent bien évidement un capital humain énorme, qui en s'activant contribue fortement dans développement économique du pays, d'où la gravité de dénuement économique et/ou sociale qu'il endurcir car il engendre une pauvreté humaine des femmes qui se transmet de génération en génération, du fait que la population féminine subit des conditions de vie économique et sociale déplorable en affichant des taux d'analphabétisme, de déscolarisation, des niveaux d'inactivité et des taux de chômage amplement plus élevés que ceux enregistrés au niveau des hommes. Ainsi, le processus d'appauvrissement s'accélère à cause de ces facteurs et subséquemment peut engendrer l'exclusion sociale à double vitesse au niveau des femmes.

D'après les données du HCP (2014), 45,1% de la population âgée au plus 25 ans ne savent encore ni lire ni écrire et le pourcentage est plus élevée chez les femmes que chez les hommes (59,1% contre 29,3% successivement). Le nombre des chômeurs a atteint 86000 personnes, en touchant le plus les jeunes et les femmes dans le milieu urbain.

Tableau n°1 : Indicateurs annuels d'activité, d'emploi par milieu de résidence (Effectifs en milliers et taux en %)

Indicateurs	Année 2015		
	Urbain	Rural	Ensemble
Activité et emploi (15 ans et plus)			
- Population en âge d'activité	15263	9702	24965
- Population active	6326	5501	11827
- Taux de féminisation de la population active	21,7	33,3	27,1

- Taux d'activité	41,4	56,7	47,4
. Selon le sexe			
Hommes	67,3	78,2	71,5
Femmes	17,4	36,6	24,8
- Population active occupée	5402	5277	10679
-Taux de féminisation des actifs occupés	19,9	34	26,8

Source : Construit par l'auteure d'après les données tirées de la note d'information du haut-commissariat au plan au sujet de la situation du marché du travail en 2015

L'accès des femmes au marché du travail demeure moyen et en dessous des attentes, d'après les données du HCP (2015), seulement 24.8 % des femmes est actif contre 71,5 % des hommes. Selon les chiffres communiqués par le même organisme en 2016 sur la tendance d'évolution des caractéristiques démographiques et socioprofessionnelles des femmes marocaines, au niveau national la présence des femmes est plus intense dans le secteur de l'agriculture, forêt et pêche avec un pourcentage dépassant 41%.

Par milieu de résidence, en 2017, les femmes dans la ville sont actives plus dans les activités non agricoles avec un pourcentage qui atteint 64,6% dans des entreprises privées non agricole, tandis qu'en compagnie, c'est dans les exploitations agricoles qu'elles exercent plus avec un taux de 92,8%.

Par professions principale, les statistiques du HCP (2016) montre que, 52,4% des marocaines occupées sont des ouvrières, 45.4% sont des cadres moyens et 35.0 % sont des cadres supérieures ou membres de professions libérales. En outre, les femmes au foyer en 2014, affichaient un taux qui embrasse 76,9% de l'ensemble des inactives.

La portion d'aides familiales est prépondérante par rapport aux autres types de fonction des occupés actifs, et ce, essentiellement chez les femmes, estimée à 49% des occupées étaient des aides familiales en 2015. Les femmes fournissent 73,7% du travail non rémunéré dans le milieu rural.

Également, il apparait que la majorité des actifs occupés (80,9%) ne bénéficient pas de couverture médicale. Chez les femmes la proportion touche à 81,6%, dont 49,9% appartient au milieu urbain et ne dispose pas de contrat de travail, en milieu rural, uniquement 8,7% des femmes actives bénéficient d'un travail dans les normes juridiques tandis que 86% œuvrent sans contrat.

C'est dans ces conditions que l'économie sociale et solidaire peut revêtir une importance extrême pour, instaurer des stratégies de développement humain et social et permettre une lutte contre la pauvreté et ainsi améliorer les conditions des femmes.

L'entrepreneuriat social coopératif et l'autonomisation des femmes, quelle intersection ?

Entreprendre en économie sociale et solidaire désigne s'organiser pour entreprendre autrement et collectivement dans la réalisation d'un projet à finalité sociale, cela consiste à adhérer à une organisation de l'économie sociale et solidaire et à s'engager dans un projet collectif.

Lévesque et Mendell, dans leur article sur l'économie sociale (2005), définissent l'entrepreneur social comme étant un entrepreneur et militant, qui combine, le bénévolat et l'engagement avec l'entrepreneuriat et la prise de risque. Draperi (2007), en traitant les fondements et les enjeux de l'économie sociale explique que l'entrepreneur social qui est engagé, associe l'autre dans sa démarche entrepreneuriale et milite pour sa cause, en conséquent, l'entreprise dans l'économie sociale et solidaire regroupe des personnes associées autour d'un projet commun qui prend l'une des formes organisationnelles classiques (selon l'approche normative francophone) du secteur à savoir la coopérative, l'association ou la mutuelle et éventuellement toute configuration à vocation sociale.

Dans une approche économique, l'entreprise en économie sociale se procure nécessairement des moyens humains, économiques et financiers, mais, sa finalité s'éloigne de la maximisation du profit et tend à service l'Homme à travers la réalisation des objectifs partagés par plusieurs personnes. Avec une gérance démocratique par des

associés intègres à sa mission, les membres ont le souci de la finalité du travail et de sa destinée. Ces entreprises sont considérées comme des moyens efficaces pour la valorisation des territoires et le développement local d'après Draperi (2007).

Sur le plan opérationnel, la coopérative est censée créer des possibilités de travail décent et productif aux membres ou usagers marginalisés et leur permet de renforcer leur puissance sur tous les niveaux. Les membres sont amenés à prendre conscience de leurs rôles et droits dans ladite organisation et bénéficient des formations techniques et/ou managériales en leadership coopératif. Cela est spécialement pertinent dans les centres où les femmes jouent habituellement le rôle des inféodés, moins influant dans leurs ménages et communautés.

En pratiquant ses principes universels de solidarité à savoir : l'adhésion volontaire, le pouvoir démocratique, la participation économique des membres, l'autonomie et indépendance et l'engagement envers le milieu, la coopérative joue le rôle d'un catalyseur de rénovation sociale en faveur de l'intégration des femmes, de la favorisation de leur inclusion sociale et économique et de l'évolution de leur statut. Elle peut résoudre plusieurs problèmes et favoriser le développement des régions comme l'a mentionné Develtere (1999).

En tant que telle, la coopérative réussit à modeler et à élaborer au fil du temps et grâce aux expériences réussies des principes et des valeurs universelles mondialement reconnus, comme le souligne les travaux de recherches de Lévesque (2001), Laville (2000), Alphandéry (2009), Guérin (2003), Ninacs (2006), Charlier (2006), Charlier et Caubergs (2007), Lemaître (2009). Elle devient alors un espace privilégié de réflexion démocratique fondée sur le principe de la solidarité, de la liberté, de l'égalité, elle implique chacun dans une action commune, et le responsabilise à la justice sociale. En défendant sa finalité ultime, servir l'Homme et améliorer ses conditions de vie, et surtout ses capacités d'agir, elle assure un espace d'éducation à l'autonomisation.

C'est ainsi que le mouvement coopératisme féminin est désigné nécessairement comme solution à l'enclavement des femmes d'après les travaux de Jones, Smith et Wills (2012), Zouhair et Lhajji (2016) et Charlier (2006).

Par ailleurs, Martin, Molina et Lafleur dans leur rapport sur le paradigme coopératif (2008), soulignent que la coopérative sert d'école pour éduquer à plusieurs valeurs humaines, une éducation qui produit un citoyen conscient apte à innover et porter un projet de société, elle en fait une école humaniste et humanisante.

Dans ce sens, la présidente de l'Alliance Coopérative Internationale à l'époque Green (2015), a indiqué que l'enquête conjointe de l'Alliance et de l'OIT révèle l'efficacité du modèle coopératif pour fournir aux femmes un moyen de valeur pour lutter contre la pauvreté et de fuir la violence et les abus. Il apparait donc, que la coopérative représente un cadre efficient pour apporter des solutions de bienêtre et d'autonomisation ; Esim (2015) cheffe de l'Unité des coopératives de l'OIT ''COOP'', rappelle que les coopératives ont une tradition de contribution à l'égalité ainsi qu'à l'autonomisation économique et sociale. En fait, 80% des réponses reçu par l'organisme de son études réalisée auprès de 600 de praticiens, coopératives et organisations civiles au travers le monde, jugent que les coopératives participent à instaurer le principe de l'égalité entre les femmes et les hommes plus que les entreprises privées et les établissements publics.

Par ailleurs, Il ressort des travaux de plusieurs chercheurs et organisations sur l'étude de l'autonomisation comme Keller et Mbwewe (1991), Batliwala (1994), PNUD (2010), Kabeer (2001) ; Malhotra et al. (2002), Alsop et Heinsohn, (2005), Ibrahim et Alkire (2007), comme mentionné par Dahoun, Manlan, Vodonou, Mongan, Mededji, Alofa (2013) dans leur working paper, que le concept va au-delà du bien-être individuel, il permet de saisir comment, elle s'attribue au niveau des individus et des organisations et produit ou augmente leurs capacités d'agir de façon autonome.

L'analyse des féministes comme Bacqué et Biewener (2012), permet de dégager que le terme de l'empowerment (dont la traduction française est l'autonomisation) comporte une dimension double, il est expressif en désignant à la fois le pouvoir à rechercher, à obtenir, à conquérir, et le processus de conscientisation qui permet d'y accéder. Ceci renvoie à la capacité d'aller vers, la capacité d'acquérir et d'en jouir, de cette force, il s'agit d'un parcours cumulatif et évolutif vers la possession de ce pouvoir. En fait, de ''à chercher à'', à ''conquérir'', chaque échelon du processus et chaque action devient une finalité en soi (possession du pouvoir) et exige d'être armé d'un pourcentage du pouvoir et de prise du risque. Cette acquisition du pouvoir, dans le cadre de la coopérative, s'effectue essentiellement par le biais d'un processus de conscience critique des réalités sociales et économiques

marquant l'environnement de la personne comme l'explique Freire (1968) dans le cadre de sa pédagogie des opprimés comme mentionné par Monteagudo (2002), ce qui mène à des changements sociaux à partir de la prise de conscience individuelle et collective des populations.

En outre, Malhotra, Schuler et Boender (2002) expliquent que l'autonomisation est caractérisée par une multidimensionnalité, comme souligné par Dohmwirth (2013), ceci se manifeste par les dimensions à impliquer et/ou qui sont impliquées dans sa démarche de construction, à savoir : la dimension économique, socioculturelle, familiale / interpersonnelle, juridique, politique et psychologique.

Cette autonomie se construit donc au fil du temps grâce à l'accumulation des expériences et résulte d'un processus comme montrée par Rowlands (1995), elle se mesure aussi et se constate d'après Pradhan (2003).

Dans ce sens, les recherches de Ninacs (2006), sur l'empowerment individuel, organisationnel et communautaire ainsi que les apports de Tilman et Grootaers (2016) dans le cadre de leur article sur l'empowerment et l'émancipation, permettent de cerner clairement l'important rôle joué par une organisation autogestionnaire dans le processus d'autonomisation. C'est au sein de cette organisation que l'empowerment individuel se développe en offrant ainsi un terrain vers la construction de l'autonomisation collective à l'aide de la coopération avec les autres, afin d'avoir une emprise plus grande sur l'environnement socioéconomique et d'aller ensuite vers l'empowerment collectif, qui permet à son tour d'acquérir le pouvoir de modifier les rapports sociaux de domination dans un sens plus équitable et de transformer les institutions vers une vision globale de l'autonomisation des communautés ou des territoires.

C'est dans ce cadre que nous apprécions la contribution des organisations de l'économie sociale et solidaire qui se révèle forte utile dans le processus d'autonomisation des personnes, en l'occurrence, les femmes en situation de vulnérabilité.

Figure 1 : Le processus d'autonomisation dans le cadre d'une organisation autogérée : construit par l'auteure et inspiré des travaux de Tilman, Grootaers (2014).

L'étude du terrain

La problématique, la pertinence et la méthodologie de notre recherche

L'organisation coopérative est contextualisée et influencée par la réalité socioéconomique, culturelle et politique de chaque pays, à cet effet, elle ne pourra pas produire les mêmes résultats partout dans le monde. Au Maroc, malgré l'envergure qu'elle a connue depuis les années 90, les études d'impact et les retombées de ce mode entrepreneurial sur le pouvoir d'agir des personnes sont insuffisantes, voire rare d'après A. Azenfar l'ancien directeur de l'office de développement de la coopération au Maroc (2016). Dans ce contexte, il devient fort

intéressant de cerner les changements réels que les coopératives marocaines provoquent dans les conditions de vie de leurs membres, en l'occurrence, les membres ou salariées femmes de la coopérative, notamment que la coopérative est plus présente dans le monde rural que dans les zones urbaines, et que la pauvreté comme déjà présenté, est à penchement rural. Corroborer donc ce phénomène suppose de poser une question centrale :

Comment la coopérative contribue à transformer ces femmes en situation de vulnérabilité économique, sociale, et sociétale en des personnes autonomes, capables d'agir sur leur entourage et territoire ?

Cet aboutissement de l'autonomisation des femmes par l'entrepreneuriat coopératif représente la variable dépendante latente de notre modèle de recherche, tandis que la coopérative représente la variable indépendante latente. Capter cette corrélation et l'analyser représente le noyau de notre étude, ceci nous permettra d'un côté, d'identifier la nature de l'autonomisation engendrée par l'entrepreneuriat coopératif et d'évaluer son niveau d'opération, et de l'autre côté, de cerner les valeurs pratiques dans la coopérative, qui influent le plus sur ce processus de conscientisation et de construction de l'autonomisation individuelle, collective et éventuellement communautaire.

A l'issu de la revue de littérature et des résultats de la recherche qualitative réalisée par l'auteure elle-même, nous déduisons que l'autonomisation globale des femmes est fondée sur quatre principales dimensions, à savoir :

- **La dimension économique** : La sécurité de revenu, l'accès à des ressources financières ou à des moyens de production et l'amélioration des conditions de vie ;
- **La dimension psychologique** : L'estime de soi, la confiance en soi, l'acquisition des connaissances, l'amélioration des compétences, la prise de conscience et la prise de décision ;
- **La dimension sociale** : L'accès aux droits (sanitaire, éducation), l'inclusion sociale, la réduction des inégalités, et le changement du comportement de l'entourage envers les femmes ;
- **La dimension sociétale** : La participation des femmes dans la gestion des espaces publics (comme la gouvernance des collectivités locales), la valorisation des territoires et la défense des intérêts des femmes dans la région.

Quand l'une des dimensions n'est pas accessible, l'autonomisation est partielle et non complète, ou elle en cours construction.

Concernant les valeurs et les principes de la coopérative constituant la valeur explicative, nous nous sommes basés essentiellement sur les principes déclarés par l'organisation représentative du mouvement coopératif français en 2010 (COOP FR) vu leur caractère synthétique. Il s'agit des valeurs qui découlent des principes universels déclarés par l'alliance coopérative internationale, avec plus de concision et de précision ce qui les rend plus facile à manipuler. A savoir : la démocratie, la solidarité, la responsabilité, la pérennité, la transparence, la proximité, rendre service.

Conséquemment et dans un souci de simplification du modèle de recherche, nous rassemblons les principes proches, et nous élimons d'autres qui n'ont pas été assez soulevé dans la recherche qualitative. Pour obtenir par la suite une liste de trois familles de variables explicatives comportant cinq principes de la coopérative, à savoir : la Démocratie et Transparence ; la Solidarité ; la Pérennité et Service.

Donc du postulat central qui consiste à ce que l'entrepreneuriat coopératif constitue un levier de développement local et individuel, et que l'organisation coopérative contribue à l'autonomisation de ses membres à différents niveaux : psychologique, social, économique et sociétal, nous détaillons cette réalité en des suppositions dérivées, à analyser par l'étude quantitative à réaliser auprès des coopératives et coopératrices :

S.1 : Les valeurs de solidarité dans la coopérative contribuent fortement à l'autonomisation des femmes coopératrices
S.2 : Les pratiques de démocratie et d'égalité sont des facteurs essentiels à l'autonomisation des coopératrices ;
S.3 : Rendre service dans et par la coopérative participe à l'autonomisation des femmes coopératrices ;
S.4 : l'acquisition d'un pouvoir économique est la principale conséquence de l'autonomisation des coopératrices ;
S.5 : L'acquisition du pouvoir psychologique est un résultat essentiel de la coopérative sur les coopératrices.

S.6 : L'acquisition d'un pouvoir sociétal par les coopératrices est un résultat essentiel de la coopérative ;
S.7 : L'acquisition d'un pouvoir d'agir social par les coopératrices est un résultat essentiel de la coopérative ;
Ainsi, la pertinence de cette étude réside dans l'estimation de l'impact économique, social, psychologique et sociétale de la coopérative de femmes sur ses membres. En effet, la finalité est d'évaluer l'autonomisation globale construite au niveau individuel, collectif et territorial par la contribution de l'organisation coopérative qui est censée théoriquement offrir un cadre propice à son aboutissement à travers ses valeurs et principes de gestion.

Ceci nous a conduit à établir le modèle structurel ci-après afin d'analyser l'intersection et les interrelations entre les valeurs de la coopérative et l'autonomisation des femmes membres. Le modèle est de type réflexif, où chaque construit comprend plusieurs items. Il décrit les liens de causes à effets entre les variables ; ces liens sont basés sur les chemins de causalité dans laquelle une variable peut avoir une influence directe ou indirecte sur une autre variable.

Le degré d'influence implique l'estimation du poids de la variable dans la construction de l'autonomisation des femmes.

Figure n° 2 : le modèle structurel d'analyse conçu par l'auteure

Dans le sens où la recherche dans l'économie sociale et solidaire emprunte un cheminement spécial autre que celui scruté par l'orientation objective, étant considérée comme un mouvement d'entreprises originales qui offre un espace d'inspiration, d'éducation et de modélisation, menant à entreprendre un processus de changement des rapports sociaux d'après Draperi (2007), et une ''science citoyenne'' qui remet en question la séparation de l'objet du sujet dans la mesure où cette transformation résulte de la conclusion éducative et émancipatrice de cet agissement au profit de l'objet qui est aussi un acteur de changement selon Vallat (2014). Il devient problématique de positionner ces travaux qui intègrent la dimension humaine dans une démarche de recherche, puisqu'ils sont considérés complexifiant les « lois de la nature » qui règnent dans le modèle des sciences de la nature.

La réalité de l'économie sociale et solidaire qui mène à le positionner en tant qu'un travail d'ensemble qui mobilise la collectivité pour construire le projet et qui s'inscrit dans une dimension de transformation de la société à travers ses organisations, selon les travaux de Demoustier (2016), Draperi (2007, 2011), Laville (1994,1999, 2003) exige selon Vallat (2014) une science citoyenne qui remet en question la séparation de l'objet du sujet dans la mesure où cette transformation résulte de la conclusion éducative et émancipatrice de cet agissement au profit de l'objet qui est aussi un acteur de changement.

Dans cette vision, la recherche s'inscrit dans une démarche multidisciplinaire afin de constituer un tout cohérent d'après Paille (2006), ainsi, plusieurs théoriciens d'après Draperi (2007) se sont intéressés à la coopérative pour élaborer des théories générales, et ce, via l'analyse (démarche interprétativiste) des pratiques, des discours et les logiques d'action qui y règnent, comme le cas de l'économiste Thévenot et le sociologue Boltanski quand autres comme Desroche et Vienney se sont orientés vers une démarche compréhensive spéciale.

Les travaux de recherche dans ce champ disciplinaire se positionnent implicitement ou explicitement dans le cadre d'une recherche-intervention selon Argyris (1996) comme indiqué par David lors de la conférence de l'AIMS (1999), ce qui les intègre dans une dimension de socioconstructivisme d'après Draperi (2007) ou d'interprétativisme selon Paille2006).

Il convient de préciser que le positionnement éthique du chercheur comme nous y invite l'épistémologie constructiviste, et en s'inspirant de la même démarche du chercheur Ninacs (2002), dans sa vie quotidienne, l'étudiante chercheuse est loin d'être une observatrice passive de son objet de recherche. En fait, elle est militante engagée dans des associations de développement communautaire et ouvertement solidaire avec la démocratisation et la justice sociale visées par cette nouvelle économie et croit énormément à la démarche de l'empowerment que à la solidarité pour changer la réalité des défavorables au Maroc. Également l'étudiante est une femme, maman et issue de la culture d'un Maroc où les femmes sont souvent disempowered à cause de leur genre et consciente évidement des implications de l'absence de l'autonomisation sur le vécu des femmes et sur l'élargissement des fossés entre les aspirations d'égalité et la réalité économique et sociale endurée.

Notre méthodologie de travail s'inspire donc d'une perspective de constructivisme, où la tradition veut que l'approche herméneutique domine du fait qu'elle ne se limite pas à expliquer mais consiste à comprendre. Nous nous positionnons dans une posture coopérative découlant d'une vision constructiviste-transformative, nous choisissons une méthodologie de recherche axée sur une approche mixte comme proposé par Dépelteau (2002) en faisant appel à la méthode mixte d'analyse qui consiste à l'analyse et la combinaison simultanées des données qualitatives et quantitative comme le souligne Small (2011). D'après Creswell et Clark (2007), cette mobilisation combinée des données mène vers une meilleure compréhension et plus de validité qu'en se reposant sur l'une des méthodes.

Nous optons donc en premier lieu, pour une étude qualitative exploratoire à effectuer à l'aide d'une étude documentaire et une étude qualitative du terrain. La 1ère est à réaliser en explorant les bases de données de l'Office de Développement de la Coopération qui chapeaute le secteur des coopératifs et en analysant les numéros disponibles de la revue marocaine des coopératives. La 2ème est à effectuer auprès des représentants 11 établissements appartenant aux secteurs social et coopératif sous forme des entretiens individuels semi-directifs, le guide d'entretiens est organisé en trois parties traitants trois thématiques différentes mais complémentaires, il s'agit de : L'économie sociale et solidaire ; L'entrepreneuriat coopératif au féminin et l'autonomisation des femmes et les données sont à traiter par le logiciel INVIVO et à analyser manuellement à l'aide d'une grille manuelle.

Et en deuxième lieu pour une étude quantitative sur un échantillon de 100 coopératives de femmes situées dans différentes régions du Maroc (Essaouira, Oujda, El Hoceima, Casablanca, Tanger…) et actives dans différents secteurs (Artisanat, Elevage, Service, Agriculture, l'huile d'argane, les herbes aromatiques et médicinales…).

Étude Qualitative Exploratoire

La présente étude exploratoire documentaire s'est effectuée en explorant les bases de données communiquées par l'ODCO que nous avons filtrées par genre, par secteur et par localisation, et en analysant plusieurs numéros de la revue marocaine des coopératives édités par le même organisme (n°3, n°4, n°5 et n°6), puisque observer l'entrepreneuriat coopératif féminin au Maroc dans le cadre d'une étude documentaire, revient à se baser

principalement sur les données communiquées par l'Office vu le manque des données académiques dans ce sens. Cette étape a été consolidée par les données des entretiens individuels semi-directifs opérés avec 13 personnes par la chercheure elle-même avec des représentants de 11 établissements appartenant aux secteurs social et coopératif. La durée moyenne d'un entretien est de 50 min et le choix des interlocuteurs est fait par les organisations elles-mêmes.

En fait, la coopérative est la première forme des organisations appartenant à l'économie sociale et qui a profité d'un décollage fleurissant précoce au Maroc. Ce qui s'explique, par le fait que les coopératives ont été implantées par les autorités du protectorat parmi les producteurs marocains à partir de 1922 (secteur de la consommation), spécialement pour consolider les efforts de production des agriculteurs (principalement dans les filières laitière et sucrière), des artisans (1937 et 1938 respectivement) et pour des raisons politiques aussi.

Actuellement, l'économie sociale et solidaire prend le cheminement du courant francophone en adoptant une démarche statutaires (mutuelle, coopérative et association) et se définit (en l'absence d'un texte de loi cadre) comme suit d'après la stratégie de l'ESS 2010-2020: «L'économie sociale et solidaire est l'ensemble des initiatives économiques cherchant à produire des biens ou des services à consommer et à épargner autrement de manière plus respectueuse de l'Homme, de l'environnement et des territoires».

Les entreprises coopératives sont principalement présentes dans les secteurs de l'agriculture, l'artisanat et l'habitat, et enregistrent d'après les recherches de Zouhair et Lhajji (2015), une rentabilité faible en participant avec 1,5% du PIB seulement. En comparaison, l'Égypte en 2014 comptait 18000 coopératives qui servent 12 millions de membres et participent avec 7,75% du PIB.

A propos de l'emploi, la coopérative est censée favoriser la création de l'emploi et des activités génératrices de revenus avec un capital réduit. Dans cette logique, dans le Mexique par exemple, le taux de pénétration des coopératives est de l'ordre de 7.81 %, du fait que le secteur emploie 5 millions de citoyens qui sont membres de plus de 15000 coopératives (un nombre de coopérative proche de celui marocain). Sur le terrain marocain, le taux de pénétration dans notre pays s'établit à 1.424% (nombre d'adhérent coopératifs par rapport à la population totale), un taux qui reste très faible en comparaison avec celui mexicain

En effet, au Maroc, la coopérative des femmes a pris autant d'envergure avec le projet lancé par l'Organisme Allemand de Coopération Bilatérale (GTZ) en 1990 pour préserver l'arganier. L'idée était de sensibiliser la population aux dangers que représente la surexploitation de l'arganier toute en l'incitant à la préservation de leur patrimoine. Le secteur connait un essor important depuis la fin du 20ème siècle, selon la base de données arrêtées en fin d'année 2015, qui nous ont été communiquées par l'ODCO, sur un ensemble de 15.735, les coopératives de femmes sont à 2.280 unités, avec une proportion qui s'établit à 14,48%.

La réparition sectorielle des coopératives de femmes montre une concentration importante dans l'artisanat et l'agriculture avec respectivement, 43,29% et 33,46%. Quant à la branche de l'huile d'argane elle affiche 12%.

Ces coopératives jouissent d'un total des capitaux très faible qui se reflètent par un seuil qui atteint 17 012 212 Dhs, une proportion qui effleure 0.26% des capitaux mobilisés dans le secteur.

Les régions qui embrassent le plus grand nombre des coopératives féminines sont notamment la région de Laayoune-Sakia El Hamra qui chapeaute 393 coopératives, la région de Souss-Massa qui comprend 352 coopératives, les régions de Marrakech-Safi et Fès-Meknès qui enregistrent respectivement un nombre de 227 et 226 coopératives, et s'ensuivent par les régions de Tanger-Tétouan-Al Hoceima avec 216 coopératives et Guelmim-Oued Noun avec 199 coopératives.

Les femmes de la région de Souss-Massa sont très intéressées par l'entrepreneuriat coopératif, avec 352 coopératives qui siègent dans la région et qui engagent 8947 femmes coopératrices, la région se positionne au sommet (en terme d'adhérence) notamment qu'elle enregistre une différence de 4235 femmes coopératrices de la région qui vient ensuite et qui chapeaute le plus grand nombre de coopératives à savoir Drâa-Tafilalet.

L'analyse des motivations des femmes à entreprendre dans une coopérative, a révélé des caractéristiques de nature "push" liés à l'entrepreneuriat de nécessité et de la recherche d'une suffisance financière d'après les travaux de

Elghiat (2011) et Lhajji (2011). Ces femmes en se lançant dans l'aventure de création ou d'intégration d'une coopérative, sont principalement à la recherche d'une autonomie économique. Souhaitant améliorer leurs conditions de vie, elles sont poussées généralement par un manque de revenus et de ressources plutôt que par un choix libre.

La recherche d'un statut institutionnalisé de coopératrice en quête de ses avantages permettant aux adhérentes de participer à des évènements, de rencontrer d'autres personnes et de se libérer du rôle classique, est une raison qui a été soulevée fréquemment mais vient toujours après la motivation économique. Il s'agit d'une motivation sociale voire psychologique vers la recherche de l'affirmation, de l'amélioration du statut social ou de l'estime de soi d'après Zouhair (2015).

Également, ces entrepreneuses optent pour la coopérative pour valoriser des activités domestiques, améliorer la qualité des biens et des services par la combinaison des efforts ou pour diminuer les coûts de revient.

Quant aux contraintes de l'entrepreneuriat coopératif féminin, qui sont d'ailleurs générales à tout le secteur, elles touchent la sphère interne et externe.

Au niveau interne, Azenfar et Mahfoudi (2015), Bouchafra (2011), soulignent qu'elles concernent essentiellement, la faiblesse des capitaux mobilisés, la faiblesse du niveau d'instruction des coopératrices et des membres du conseil d'administration, et le taux d'analphabétisme élevé parmi les membres. Les problèmes d'ordre commercial sont aussi récurrents, particulièrement ceux de packaging, de communication, de tarification de planification des actions et de certification des produits, d'après Ennesraoui (2015).

D'autres difficultés sont aussi signalées par Bouchafra (2011), Elghiat (2011) et Bouroua (2016) comme le manque de la tenue d'une comptabilité régulière et fidèle et la mauvaise gestion de l'entité en termes d'investissement des excédents, ainsi que le manque de la culture entrepreneuriale chez les coopérateurs; à titre d'exemple 90% des coopératives d'huile d'argane et d'huile d'olive déclarent que généralement, les coopérateurs n'ont pas une mentalité d'investisseurs.

Le tissu coopératif souffre d'un manque général de formation pointue et adaptée à chaque cible et d'accompagnement technique d'après les travaux des auteurs cités ci-dessus.

Au niveau externe, les obstacles sont relatifs aux difficultés d'accès au marché, aux problèmes d'accès au financement, et à la faible structuration des coopératives en unions (3 unions seulement pour une trentaine de coopératives) selon Ennesraoui et Ezzahiri (2014), Azenfar et Mahfoudi (2015).

L'aspect informel qui caractérise l'environnement des coopératives, la faiblesse des infrastructures et l'absence d'un système social (assurance, CNSS, retraite,), dédié aux coopératives, pénalisent aussi lourdement ces projets d'entrepreneuriat et pénalisent encore la coopérative.

Concernant les effets escomptés de l'entrepreneuriat coopératif sur les membres femmes comme les indiquent Zouhair, hajji (2016) et Azenfar (2016) sont les suivants :

- L'amélioration des conditions de vie,
- L'augmentation de la confiance en soi
- La conscientisation des femmes,
- L'augmentation de la l'intelligence collective et de la créativité des femmes
- L'éducation à la citoyenneté et à l'esprit entrepreneurial,
- L'alphabétisation,
- La favorisation de l'égalité des sexes.

Ce passage sommaire sur la situation des coopératives des femmes à travers les données officielles communiquées par l'organisme tuteur du secteur coopératif a permis de constater que malgré l'évolution du

nombre des coopératives de femmes, leur croissance ne suit pas le même rythme. Le secteur souffre alors de lourdes conséquences au niveau de la pérennité et de la croissance des coopératives.

Côté terrain, l'étude qualitative ambitionne complémenter l'étude documentaire et permettre d'explorer mieux le secteur et de fournir ainsi une base pour élaborer le questionnaire de l'étude quantitative. Elle s'est réalisée avec des acteurs actifs sur le secteur social, le secteur coopératif et des acteurs civils ou privés choisis en convenance ; nous avons projeté réaliser 15 entretiens, mais quand les réponses commencèrent à se ressembler nous sommes arrêtés à 13 entretiens opérés avec des représentants de 11 établissements.

Les entretiens ont fait apparaitre que les motivations économiques sont au sommet de la liste des raisons à provoquer la décision de se lancer dans l'entrepreneuriat coopératif par les femmes. Réellement, la recherche de l'indépendance financière de la personne (cité 10 fois) est la principale raison qui oriente finalement la décision, la motivation sociale et la recherche de l'affirmation et l'amélioration du statut social (7 fois) est la deuxième raison qui motive la décision de l'entrepreneuriat coopératif. En troisième lieu c'est la motivation psychologique qui est citée 3 fois. Il s'agit principalement de la recherche d'estime, de se sentir utile et de s'épanouir.

D'autres raisons sont aussi citées, comme l'encouragement des ONG, de la famille, ainsi que la solidarité avec un proche ou un voisin ou encore l'ambition et la volonté de saisir une opportunité sur le marché.

Concernant les entraves, les plus évoquées sont ainsi signalées par ordre d'importance :

- Les stéréotypes qui confirment l'image traditionnelle des femmes,
- L'analphabétisme,
- Les engagements familiaux,
- Le manque de moyens financiers,
- Le manque de formation,
- Le manque de technicité,
- La difficulté d'entreprendre au Maroc et la mauvaise interprétation de la religion.

Les experts affirment que l'autonomisation financière est la première résultante à constater éventuellement au niveau des entrepreneurs dans le secteur coopératif, en étant évoquée 10 fois par les interrogés, suivie par l'augmentation de la confiance en soi et la conscientisation des femmes.
L'augmentation de la l'intelligence collective et de la créativité des femmes ainsi que leur éducation à la citoyenneté et à l'esprit entrepreneurial, sont des effets prévus en deuxième niveau.

Cependant l'alphabétisation, l'impact sur tout le foyer, l'augmentation de la capabilité de négociation des femmes et la favorisation du dialogue, ainsi que l'égalité des sexes et l'accès aux droits, sont des impacts que les experts prévoient réaliser en troisième niveau en étant cités respectivement 2 et 1 fois.

Les impacts sur les entrepreneures et les territoires sont ainsi estimés par les experts.

A. Sur les membres femmes

- L'amélioration des conditions de vie ;
- L'amélioration des revenus ;
- Le développement de la confiance en soi ;
- Stimule la prise de conscience des femmes ;
- Augmente la capacité de prise de décision ;
- La vulgarisation de la culture de l'entrepreneuriat coopératif ;
- L'alphabétisation, la formation et la sensibilisation.
- Facilite l'indépendance de la domination du mari ;
- Provoque des changements dans le foyer ;
- Favorise l'égalité des sexes ;
- Facilite l'accès aux droits ;

- Encourage l'activité des femmes en leurs permettant de jumeler vie professionnelle et familiale ;
- Valorise les produits fabriqués par les femmes (produits domestiques) ;

B. Sur les territoires

- La création d'une dynamique économique régionale ;
- La promotion d'un éveil économique, social et environnemental, culturel, gastronomique ;
- L'amélioration des infrastructures ;
- La création de l'emploi direct et indirect ;
- L'implication des élus et autorités publics ;
- La dynamisation du tourisme local.

En questionnant les interviewés sur la signification qu'ils donnent à l'autonomisation des femmes, plusieurs expressions ont été utilisées pour expliquer ce concept, dont notamment, la capacité à décider librement (mentionnée 8 fois), et l'indépendance financière (mentionnée 6 fois) : On peut pour dire que l'autonomisation passe inévitablement à travers une capacité financière et un accès aux droits et ressources (cités 4 fois).

Également d'autres expressions ont été évoquées, il s'agit des définitions que nous pouvons référer au champ d'acquisition du pouvoir social, comme la responsabilité, la prise de conscience et la possibilité d'influencer l'entourage.

Par ailleurs, d'après les avis des intervenants, les entraves de l'entrepreneuriat coopératif au féminin sont nombreux et ainsi soulignées par ordre d'importance :

- Les stéréotypes qui confirment l'image traditionnelle des femmes ;
- L'analphabétisme ;
- Les engagements familiaux ;
- Le manque de moyens financiers ;
- Le manque de formation ;
- Le manque de technicité ;
- La difficulté d'entreprendre au Maroc en général vu que l'environnement socioéconomique est hostile à l'entrepreneuriat ;
- La mauvaise interprétation de la religion.

Etude Quantitative

Suite à la phase exploratoire, nous entamons l'étude quantitative à effectuer auprès des coopératives à l'aide d'un questionnaire détaillant la thématique de notre recherche : l'autonomisation des femmes via l'entrepreneuriat coopératif.

L'étude quantitative comme déjà expliqué, s'inscrit dans le cadre d4analyse de la nature de l'autonomisation des femmes et son importance. Ainsi, notre souci va au-delàs de fournir des données chiffrées incontestables sur le plan expérimental, il vise d'approcher la réalité et d'explorer une grande partie des facettes du phénomène. La collecte des données s'est effectuée à l'aide d'un questionnaire qui comprend des items agrégés, que nous analyserons par le biais des méthodes statistiques.

L'association de plusieurs indicateurs permet d'évaluer des variables latentes, ce qui est facilité par la méthode d'équation structurelle qui donne la possibilité de construire des modèles incorporant plusieurs variables, cela nous permettra d'évaluer simultanément les relations entre plusieurs variables latentes endogènes et exogènes, d'où notre recours au logiciel SmartPLS comme outil d'analyse de données.

L'analyse de la conformité de notre modèle de recherche

L'analyse de la conformité de notre modèle de recherche est obtenue essentiellement à travers la vérification de la fiabilité, la cohérence interne, la validité convergente et la validité discriminante.

Le concept de validité a été formulé par Kelley (1927), qui a déclaré qu'un test est valide s'il mesure ce qu'il prétend mesurer. Il peut être défini comme la mesure dans laquelle une mesure empirique reflète adéquatement la signification réelle du concept considéré d'après Babbie (2008).

Afin de garantir la validité apparente de notre questionnaire, nous avons, demandé à deux professionnels actifs dans le secteur coopératif et à deux professeurs universitaires d'examiner et de commenter la clarté du libellé, la mise en page et le style utilisé. Les commentaires reçus nous ont aidés à rendre la formulation plus pertinente, à dépasser certaines ambiguïtés, et à travailler sur les questions dans l'objectif de les rendre compréhensibles autant que possible pour les répondants. Nous l'avons fait plusieurs fois jusqu'à ce que nous ayons la confirmation des personnes interrogées.

La validité du contenu est un type de validité non statistique comme le souligne Anastasi et Urbina (997), qui estime dans quelle mesure les divers items d'un instrument sont représentatifs du ou des construits mesurés et de leurs différentes facettes.

Deux étapes principales ont été suivies dans notre recherche, la première concernait la justification du choix de nos items par l'étude bibliographique et la deuxième consistait à justifier les choix des items par l'étude exploratoire, ce qui a permis d'identifier 79 items. Cette sélection minutieuse des éléments comme suggèrent Anastasi & Urbina (1997) et Kerlinger & Lee (2000) est la clé de la validité du contenu dans notre recherche. Les items ont été ensuite présentés dans un premier questionnaire à des experts et universitaires qui, grâce à leurs commentaires et remarques sur la couverture des dimensions pertinentes du sujet examiné par les items, nous ont guidés à un changement de la 1ère version de questionnaire pour réduire les items au nombre de 33 en quête de simplicité.

Concernant la validité du construit nommée *validité de construction*, les auteurs Campbell et Fiske (1959) ont proposé deux dimensions de validité de construction : la validité convergente et la validité discriminante.

La validité convergente est le degré de confiance que nous avons qu'un élément est bien mesuré par ses indicateurs, elle permet d'apprécier la relation de corrélation existant entre les indicateurs mesurant le même phénomène. Le critère de Fornell-Larcker (1981) a été couramment utilisé pour évaluer le degré de variance partagée entre les variables latentes du modèle. Selon ce critère, la validité convergente du modèle de mesure peut être évaluée par l'indice de variance moyenne (AVE) et la fiabilité composite (CR).

Pour établir une validité convergente acceptable, d'un côté, la variance moyenne extraite (AVE) pour chaque facteur devrait représenter 0,50 ou plus de la variance totale, telle que recommandé par Fornell & Larcker (1981), Chin (1998) et Hair &William &Barry & Rolph (2010), d'un autre côté, la valeur de la validité composite (CR) acceptable pour chaque construit devrait être 0,7 et plus d'après Fornell & Larcker (1981) et Hair &William &Barry & Rolph (2010). La fiabilité composite estime la mesure dans laquelle un ensemble d'indicateurs de construction latente partagent leur mesure d'une construction.

Dans la présente recherche, l'indicateur de l'AVE (Average Variance Extracted) est satisfait dans trois construits à savoir la solidarité (0.537), le pouvoir économique (0.540) et démocratie & égalité (0.537).

L'indicateur n'est pas satisfait au niveau de l'autonomie psychologique, le pouvoir d'agir social, rendre service et le pouvoir agir sociétal, ce qui signifie que la variance d'erreur dépasse la variance expliquée au niveau de ces construits, ils ne sont expliqués par les items qui les mesurent que à moins de 50%. Mais la fiabilité composite est supérieure à 0,7 pour tous les construits comme l'indique le tableau ci-après :

Tableau n° 2 : la fiabilité composite

	Fiabilité composite
Démocratie, égalité	**0,808**
Pouvoir agir social	**0,730**
Pouvoir agir sociétal	**0,817**
Pouvoir économique	**0,847**
Rendre service	**0,806**
Solidarité	**0,820**
Pouvoir psychologique	**0,722**

Source : Extrait du rapport SmartPLS

Puisque la fiabilité composite est supérieure à 0,7 pour tous les construits, nous pouvons confirmer que notre modèle de recherche assure une validité convergente satisfaisante. Aussi nous n'avons pas des valeurs supérieures à 0,90, car cela indiquerait que tous les éléments de construction sont sensiblement identiques selon Fornell & Larcker (1981).

Ainsi nous pouvons juger que la validité divergente est moyennement assurée dans notre modèle, ce que nous estimons satisfaisant vu qu'il s'agit d'une étude à des fins exploratoires en premier dégrée.

Concernant la validité discriminante, elle vérifie si des mesures non censées être liées ne le sont pas effectivement ; selon le système de test de Fornell-Larcker (1981), l'établissement d'une validité discriminante fait référence à une analyse appropriée de l'AVE (Average Variance Extracted). Les résultats de la figure ci-dessous indiquent qu'il n'y avait en aucun cas une corrélation entre les constructions supérieures à la racine carrée de l'AVE (diagonale principale). Cela suggère que les mesures de l'étude sont distinctes et unidimensionnelles, ce qui signifie que la validité discriminante des données du point de vue psychométrique est adéquate pour cette étude.

Tableau n° 3 : le Critère de Fornell-Larcker

	Pouvoir psychologique	Pouvoir économique	Pouvoir d'agir social	Solidarité
Pouvoir psychologique	**0,590**			
Pouvoir économique	0,025	**0,735**		
Pouvoir d'agir social	0,427	-0,023	**0,536**	
Solidarité	0,352	0,112	0,207	**0,733**

Source : Extrait du rapport SmartPLS

La validité externe concerne la viabilité des résultats et l'éventualité de généralisation dans d'autres cadres, par exemple pour des personnes, des lieux ou des moments différents. Étant donné que la présente recherche est contextualisée et s'est réalisée sur un échantillon qui comprend des coopératives de femmes appartenant à des zones géographiques caractérisées par des modes de vie différents et des cultures différentes mais qui reste limité en termes de nombre et de secteurs étudiés, nous pensons alors que les résultats ne peuvent pas être généralisés mais représentent une piste pour des prochaines recherches d'approfondissement.

La fiabilité de l'instrument est une mesure de la stabilité ou de la cohérence des résultats des tests, elle concerne la mesure dans laquelle une procédure de mesure donne les mêmes résultats lors des essais répétés comme l'indique Carmines & Zeller (1979). Un questionnaire est considéré comme fiable si nous obtenons des réponses identiques / similaires à plusieurs reprises. Bien qu'il ne puisse pas être calculé exactement, il peut être mesuré en estimant des coefficients de corrélation. L'alpha de Cronbach exprime le degré d'homogénéité d'un instrument càd la cohérence avec laquelle les items mesurent une variable. Il est la mesure la plus commune de la fiabilité,

mais d'après David Garson (2016), l'alpha de Cronbach est une mesure conservatrice qui tend à sous-estimer la fiabilité.

Le seuil d'acceptabilité de l'indice varie selon l'objectif de la recherche, pour une étude confirmatoire, il doit dépasser 0,8, ce qui est considéré comme une bonne échelle et 0,70 pour une échelle acceptable selon Nunnally (1978) et Hair, William & Barry & Rolph (2010), tandis que, pour une échelle à des fins exploratoires d'après Garson (2016) et Nias Ahmad & Mat Roni (2014) le seuil d'acceptabilité est de 0,60.

Tableau n° 4 : Indice de l'alpha de Cronbach

	Alpha de Cronbach
Pouvoir psychologique	0,534
Pouvoir économique	0,816
Démocratie, égalité	0,722
Pouvoir d'agir social	0,580
Rendre service	0,699
Solidarité	0,723
Pouvoir d'agir sociétal	0,723

Source : Extrait du rapport SmartPLS

Dans notre sujet, la limite acceptable DE l'alpha de Cronbach est satisfaite au niveau du "pouvoir économique" avec 0.816, de "la solidarité" avec 0.723, le "pouvoir d'agir sociétal" avec 0,723, la "démocratie & égalité" avec 0,722 et "rendre service" avec 0,699. ET non pas au niveau du *Pouvoir psychologique et Pouvoir d'agir social* même si leurs indices sont proches du seuil d'acceptabilité (respectivement 0.534 et 0.580) dans un cadre d'exploration.

Pourtant nous pouvons utiliser la fiabilité composite (CR) plutôt que Cronbach Alpha pour confirmer la fiabilité de notre instrument de recherche, car Cronbach Alpha a été critiquée pour sa valeur limite inférieure qui sous-estime la fiabilité réelle selon Peterson & Kim (2013) et parce que l'alpha de Cronbach peut surestimer ou sous-estimer la fiabilité de l'échelle, le plus souvent c'est le dernier cas qui se présente. Pour cette raison, Garson (2016) mentionne que la fiabilité composite est préférée parmi les chercheurs dans la recherche basée sur le PLS. Dans notre cas la CR est satisfaite pour l'ensemble des construits

Afin d'évaluer le modèle structurel, nous avons opté pour le coefficient de détermination R^2, les coefficients de chemins et l'indice de colinéarité (VIF).

Le R au carré indique la proportion de la variabilité totale expliquée par le modèle, c'est ainsi que nous nous appuyons sur le seuil de 0,2 recommandé par Tenenhaus (1998) pour accepter le niveau prédictif d'une variable. En fait, dans un modèle d'équation structurelle, le coefficient de détermination R^2 n'est applicable qu'aux variables latentes endogènes, il indique dans quelle mesure toutes les variables exogènes expliquent cette variable latente endogène. La valeur R-carré (R^2) va de 0 à 1 avec 1 définit la précision prédictive parfaite. C'est une mesure qui nous indique quelle proportion de la variabilité totale est expliquée par le modèle, par exemple, une valeur de 0,6 indique que 60% de la variance de la variable endogène est expliquée par les variables latentes exogènes

Il n'existe pas de ligne directrice standard pour déterminer le niveau d'acceptation prédictive, les chercheurs ont des opinions différentes sur ce qui constitue une bonne variance du carré, Henseler (2009) a proposé une règle empirique pour les R^2 acceptables avec 0.75, 0.50 et 0.25 respectivement décrits comme substantiels, modérés

et faibles, tandis que Tenenhaus (1998) estime que les valeurs de 0.26, 0.54, 0.33 sont jugées modérées et 0.07 et 0.05 faibles, Falk et Miller (1992), comme mentionné par Maghni et Amine dans leur article 'Socialisation organisationnelle et engagement des nouvelles recrues d'une banque marocaine' en 2017, suggèrent qu'un « bon modèle » doit afficher des coefficients de détermination supérieurs à 0.1, alors que Chin (1998) considère que les coefficients structurels standardisés devraient être au minimum égaux à 0.20, et idéalement supérieurs à 0,3 pour pouvoir être considérés comme significatifs. Cohen (1988) suggère que les valeurs évaluées à 0.26, 0.13, 0,02 sont respectivement, substantielles, modérées et faible.

Pour notre modèle, nous avons obtenu les résultats suivants :

Tableau n° 5 : Coefficient de détermination R^2

	R^2
Pouvoir psychologique	0,206
Pouvoir économique	0,043
Pouvoir d'agir social	0,224
Pouvoir d'agir sociétal	0,243

Source : Extrait du rapport SmartPLS

Sachant bien que ce calcul permet une statistique de prédiction, se baser sur le coefficient de détermination R^2 seulement pour juger la qualité du modèle est insuffisant, notamment qu'il y a des mécanismes sous-jacents que notre étude (orientée à des fins exploratoires) ne va prendre en charge. L'objet ici est en relation avec la vision humaine de la personne et non pas avec un phénomène chimique neutre.

Les coefficients de chemin entre les chargements de variables devraient être analysés en termes de signe, d'ampleur et de signification algébriques comme l'indique Chin (2010). L'amplitude des coefficients de chemin montre la force des relations entre deux variables latentes, le signe (+) positif signifie un effet positif et le signe (-) montre un effet négatif. Les poids les plus proches de l'absolu 1 reflètent les chemins les plus forts et les poids les plus proches de 0 reflètent les chemins les plus faibles d'après Garson (2016).

Certains auteurs recommandent que les coefficients de cheminement doivent dépasser 0,1 ou 0,2 pour tenir compte d'un certain impact dans le modèle comme Lohmöller (1989) et Chin (1998).

Les calculs obtenus font apparaitre que la démocratie de gestion détient une relation positive avec trois autres variables exogènes à savoir l'autonomie psychologique, l'autonomie économique et le pouvoir d'agir social, alors qu'elle a une relation négative forte avec la variable ''le pouvoir d'agir sociétal'', sinon dans la sphère psychologique même si la variable démocratie et égalité a une relation positive, mais elle reste faible avec un coefficient de 0,037. La variable rendre service est liée par une relation négative avec la variable autonomie économique et positive avec la variable autonomie psychologique, le pouvoir d'agir social et le pouvoir d'agir sociétal. Le facteur solidarité détient un effet positif sur les quatre variables exogènes.

L'examen de multicolinéarité, qui permet de se prononcer sur le niveau de corrélation entre les items des variables explicatives les uns aux autres, a validé l'absence de multicolinéarité dans notre modèle.

En fait, tous les items affichent un VIF inférieur à 5 le seuil recommandé par les auteurs comme Bourbonnai (2018).

Nous avons effectué trois tests qui ont permis d'écarter les items dont la charge interne est inférieure à 0,4 comme le recommande Hulland (1999) et ce dans l'objectif d'assurer plus de fiabilité de mesure, en fait les données sont normalisées automatiquement dans SmartPLS, les chargements doivent être significatifs et varient de 0 à 1. Plus les chargements sont importants, plus le modèle de mesure est solide et fiable. C'est dans ce contexte que nous sommes amenés à écarter par exemple dans le cadre du construit pouvoir psychologique et pouvoir agir social les items traitant la fierté d'appartenance ayant une charge interne de 0.222, la prise de conscience de ses insuffisances

avec une de charge négative 0.099, les changements affectant la relation avec le mari 0.023, la participation dans la prise de décision 0.130 et la distribution des tâches familiales 0.147.

Le modèle final validé par la PLS contient 4 construits exogènes mesurés par un total de 22 items. Les variables pouvoir psychologique, pouvoir économique et pouvoir agir sociétal sont mesurées par 5 items chacune, et la variable pouvoir agir social est mesurée par 7 items. Les 3 construits endogènes sont mesurés par 13 items en total, les variables dimension solidarité, et dimension rendre service sont évaluées par 4 items chacune, tandis que celle de la dimension démocratie et égalité est évaluée par 5 items.

Sur la base de ces tests et la significativité des coefficients estimée par une procédure de bootstrap (300 réplications), nous avons pu estimer la qualité de modèle structurel afin de se prononcer sur notre problématique de recherche.

Le coefficient de chemin entre la variable démocratie, égalité et le pouvoir agir sociétal est négatif (-0,270), ainsi que le coefficient liant la variable rendre service avec le pouvoir économique (-0,095). Les autres coefficients sont positifs mais enregistrent des influences dont l'importance est variante.

Présentation de l'échantillon

Nous avons pu collecter suffisament de réponses afin d'analyser les données par l'algorithme PLS. L'administration des 104 questionnaires renseignés a été effectuée par la chercheure elle-même auprès de 104 coopératrices membres des coopératives de femmes. Généralement les questions ont été posées en arabe dialecte vu que les sondées ne maitraisent pas la langue française, et dans les régions d'Essaouira et Ain louh une vingtaine de questionnaires ont été administrés en Amazigh vu que les intéroggées ne parlent ni l'arabe ni le français, et ce toujours par la chercheure elle-même.

Sur les 100 coopératives qui composent notre échantillon, nous avons obtenu un taux de retour de 70%, ce qui représente 3,1% du nombre total des coopératives des femmes. Les questionnaires ont été renseignés par 104 membres, soit un taux de 0.27% des 37960 coopératrices marocaines. 34,28% de notre échantillon a été involontairement constitué par des coopératives appartenant au moyen atlas dans la région de Fes-Meknes, les régions de Souss-Massa et Settat-Casablanca ont été représentées chacune par 15,27 % de l'échantillon.

Parmi les coopératives interrogées, 44,28% disposent d'un local octroyé par des acteurs économiques, sociaux ou publics, tandis que 37,14% se sont orientées vers la location et 5% des coopératives questionnées ne disposent pas d'un local, et seulement 12,86% sont propriétaires d'un local. Également, 53 coopératrices parmi les 70 ne sont membres d'aucune forme de regroupement économique, ni d'union, ni de groupe d'intérêt économique ou autres. Les activités des coopératives cibles sont diverses mais sont concentrées dans cinq secteurs à savoir l'agriculture, l'artisanat, l'agroalimentaire, l'industrie cosmétique et la servuction, en tenant compte que 88% des coopératives des femmes exercent dans les secteurs d'agriculture, d'artisanat et d'argane.

Par ailleurs, le nombre des adhérents dans les coopératives étudiées varie entre 5 à 91 coopératrices, avec une moyenne de 14,64 de l'ensemble des 70 coopératives.

69,44% de l'échantillon ont un nombre d'adhérentes qui varie entre 6 et 18 membres, les coopératives à un nombre grand (au-delàs de 57 personnes) sont limitées à 3 coopératives.

Discussion des résultats

Comme nous l'avons détaillé dans le cadre théorique, la majorité des chercheurs et praticiens, tant dans l'économie sociale et solidaire, que dans le champ de l'autonomisation des femmes, ou encore dans l'entrepreneuriat coopératif. A ce point on cite, Lévesque (2001), Laville (2000), Alphandéry (2009), Guérin (2003), Ninacs (2006), Charlier (2006), Charlier & Caubergs (2007), Lemaître (2009), Defourny & Develtere (1999), Jones & Smith &Wills (2012), Zouhair & hajji (201, 2016), Ennesraoui & Ezzahiri (2014), Azenfar & Mahfoudi (2015) et Azenfar (2015, 2016), Green (2015), Esim (2015), ont abouti à la mise en valeur de l'impact positif de la coopérative sur l'amélioration des conditions de vie des personnes engagées ou bénéficiaires de l'entrepreneuriat coopératif. Cet impact concerne

essentiellement le volet économique des coopératrices, leur autonomisation et inclusion sociale, la lutter contre la pauvreté et même la promotion des territoires.

Aussi, les résultats de notre recherche permettent de valider le modèle explicatif de la construction de l'autonomisation des femmes par l'entrepreneuriat social dans le cadre des coopératives de femmes, et s'inscrivent dans une approche exploratoire du moment que les travaux sur cette thématique sont peu nombreux au Maroc.

En effet, un questionnement de recherche est étudié par l'analyse de l'importance des relations entre les variables exogènes et les variables endogènes sur le modèle, dans notre sujet, les résultats ont dévoilé des relations fortes et d'autres très faibles entre les différentes variables. Notre donnée de départ consiste à considérer la coopérative comme un espace d'autonomisation des personnes à différents niveaux et un levier de promotion des territoires et communautés. Les suppositions dérivées de ce postulat ont formé les points les liens que nous avons analysé au niveau de l'étude empirique, notamment celle quantitative.

Effectivement, **le modèle permet de constater que les valeurs et les pratiques de solidarité dans la coopérative contribuent assurément à l'autonomisation des femmes coopératrices** (décortiquée en 4 dimensions dans notre modèle de base)**.** Notre modèle a révélé que les corrélations entre la variable solidarité et les variables latentes endogènes sont positives et significatives, réellement, **les pratiques de solidarité participent à l'acquisition du pouvoir psychologique avec un coefficient de 0.269, à l'autonomie économique avec 0.182, à l'acquisition du pouvoir d'agir social à hauteur de 0.113 et à l'autonomie sociétal par 0.165. Les valeurs de solidarité expliquent donc l'acquisition de l'autonomie psychologique plus que les autres aspects de l'autonomisation.**

De cette manière la "solidarité" émerge comme un facteur clé dans la construction de l'autonomisation des femmes en favorisant leur prise de pouvoir psychologique, autrement dit, toutes les valeurs de prise de conscience, de la confiance en soi, de l'estime de soi, la prise de parole en public…sont construits à travers les pratiques de solidarité au sein de la coopérative.

D'autres travaux de recherche soulignent que la coopérative par ses valeurs universelles et pratiques de gestion participe dans le développement de la responsabilité individuelle des membres, comme Lévesque (2001), Laville (2000), Alphandéry (2009), Guérin (2003), Ninacs (2006), Zouhair et Lhajji (2016), Charlier (2006), Charlier et Caubergs (2007), Lemaître (2009), Auroi, Yépez et Castillo (2006), ceci sans distinction entre les valeurs qui caractérisent l'organisation coopérative. Par notre recherche, nous avons pu déceler dans le contexte marocain**, la principale pratique coopérative origine de cette contribution à l'autonomisation globale des femmes en influençant positivement la construction de leur autonomie psychologique.**

La participation des pratiques de démocratie & **d'égalité dans l'explication de l'autonomisation des coopératrices est moyenne voire partielle.** En fait, leur contribution est limitée à former l'autonomie économique de 0.165 et le pouvoir d'agir social à 0.138, ces résultats rejoignent les travaux de Nyssens (2001), Ghezali (2009) Zouhair et Lhajji (2016), Charlier (2006), Laville (2000), Guérin, (2003), Charlier et Caubergs (2007). Pourtant, les valeurs de démocratie & d'égalité, ne définissent l'autonomie psychologique que très faiblement avec un indicateur de 0.037, tout en ayant un impact négatif sur l'acquisition du pouvoir d'agir sociétal avec un indicateur de -0.270.

Ce résultat mène à considérer que les pratiques de l'égalité et de gestion démocratique ne sont pas associées à une implication dans la gestion du territoire et d'autonomisation de la communauté et bien évidement de la population, et se différencie des travaux d'Auroi, Yépez et Castillo (2006) qui mettent en avant l'autonomisation des femmes dans le cadre des organisations de l'économie sociale et solidaire en leur permettant un accès au pouvoir économique, social et sociétal.

Cet aboutissement, nous pousse à s'interroger sur le lien entre les pratiques de démocratie et d'égalité et le capital social. Nous pensons que ces pratiques ne sont pas bien claires dans les esprits des coopératrices, non pratiqués comme elles sont censées être faites, par méconnaissance de l'organisation coopérative et à cause de la non scolarisation de la majorité des membres, comme il a été avancé durant les entretiens réalisés avec les coopératrices, les assemblées générales et les réunions du conseil d'administration ne leurs permettent pas d'approfondir leurs connaissances sur les situations de leurs coopératives. Même en étant informées, elles ne comprennent pas la

signification et les implications de cette information et donc ne s'impliquent pas réellement mais du fait que la plupart font confiance à leurs présidentes elles votent sans hésitation sur la validation des rapports.

L'importance des liens qui relient la variable **''rendre service'' avec les variables mesurant l'autonomisation des coopératrices est forte d'après le modèle structurel,** effectivement, nous constatons que les coefficients de chemins sont positifs et significatifs avec trois construits : le pouvoir psychologique est expliqué à hauteur de 0.294, le pouvoir d'agir social est déterminé avec 0.409 et le pouvoir d'agir sociétal est défini à hauteur de 0.309. L'effet constaté sur l'acquisition du pouvoir économique est négatif et faible.

Ces résultats sont confirmés par l'indice f^2 qui permet de conclure que l'effet d'abandon du facteur ''Rendre service'' sur le ''pouvoir d'agir social'' est élevé (0.191) tandis qu'il est moyen sur le ''pouvoir d'agir sociétal'' et ''l'autonomie psychologique'' et très faible sur l'autonomie économique avec un indice f^2 qui atteint 0.008.

La corrélation faible, voire négative des coefficients du chemin qui lie la variable à expliquer **"acquisition d'un pouvoir économique" et les variables explicatives, tend à ne pas confirmer la construction de l'autonomisation économique dans l'espace coopératif comme escompté par les praticiens que nous avons interviewés ou même des travaux de recherches passés en revue.** En fait, les influences positives des valeurs explicatives sont très faibles, c'est ainsi que les pratiques de solidarité ne l'expliquent qu'à la hauteur de 0.182, la variable démocratie et égalité ne contribue qu'à hauteur de 0.165, tandis que, la variable rendre service a un impact négatif sur la constitution de l'autonomie économique de ces femmes.

Ce résultat est confirmé par le coefficient de détermination R^2 obtenu et qui signifie que l'acquisition d'une autonomie économique n'est pas expliquée par les variables explicatives (la solidarité, rendre service et démocratie & égalité) que de 043 ; un seuil considéré faible et non significatif par Cohen (1988). **Il est révélateur, d'autant plus que les travaux académiques et professionnels soulignent que l'entrepreneuriat coopératif a un effet direct et de premier plan sur la situation financière des coopérateurs comme déjà vu au niveau du cadre théorique et de l'étude qualitative**.

En analysant la situation de près pour trouver une explication, nous constatons que les statistiques descriptives montrent que le nombre des coopératrices (dans notre cible) en désaccord partiel ou total sur l'amélioration de la situation financière dans une coopérative, est important. Ainsi, **le pourcentage des femmes qui déclarent que leur revenu individuel n'a pas connu une amélioration est de 22% sachant bien que 15% sont neutres et n'ont pas exprimé une opinion, aussi, 26 % et 40% des coopératrices estiment, respectivement, que le budget du foyer et la nature des dépenses n'ont pas connu un changement après leur intégration dans une coopérative.**

Néanmoins, d'après nos observations lors de notre participation à la résolution de quelques problèmes managériaux des coopératives, nous pensons que la non constitution de l'autonomie économique dans le cadre coopératif est liée au contexte marocain plutôt qu'à une défaillance des valeurs et pratiques de la coopérative. En effet, le manque d'accès des femmes à l'éducation, à l'information et à la formation adaptée -Notons dans à ce niveau que sur 1017 membres des coopératives étudiées, 610 femmes ne sont pas scolarisées- l'absence de la culture entrepreneuriale, et la carence de formation en gestion et management sont à notre avis les principales causes den cette situation.

La majorité des coopératrices ne comprennent pas le principe de la coopérative, ce qui alourdit la tâche de la gestionnaire car par nécessité, les membres demandent à ce qu'elles soient remboursées de leur travail au fur et à mesure (payement hebdomadaire ou mensuel) même si la production n'est pas vendue. Ce qui implique une absence de fonds de roulement, absence de politique d'investissement et la situation ne s'améliore pas. Ceci s'ajoute au manque de financement et absence des solutions adaptées à ce mode entrepreneurial ce crée un cercle vicieux difficile à rompre.

Dans ce cadre, plusieurs coopératives dans la région de Souss Massa Deraa sont créées pour la forme, où le statut de coopérative cache une réalité déguisée, celle d'une entreprise où un investisseur (e) généralement un homme, un proche à la présidente, finance toutes les dépenses de la coopérative dans l'attente de tirer profit autrement. Les membres reconnaissants envers cette personne qui leur offre cet emploi ne posent pas trop de questions et se limitent être payé par kg concassé ou litre extrait (entre 30 à 45 Dh pour le kg selon la situation financière de la coopérative).

Aussi, les estimations obtenues au niveau de la corrélation entre les variables explicatives et l'acquisition d'un pouvoir psychologique affirment l'acquisition d'une **''autonomie psychologique'' comme étant un résultat essentiel de l'organisation coopérative sur les femmes coopératrices.** Autrement dit, le pouvoir psychologique est expliqué par les variables exogènes à hauteur de 0.206, et est obtenu essentiellement grâce à la variable ''rendre service'' avec un indice estimé à 0.294 et les pratiques de ''solidarité'' avec un indice estimé à 0.269, par contre, les pratiques de ''démocratie & d'égalité'' ont une faible corrélation avec l'autonomisation psychologique, ce qui les rend insignifiantes. Ce résultat tend à se rapprocher des conclusions tirées de l'étude exploratoire et des travaux réalisés par les chercheurs en économie sociale et solidaire, l'entrepreneuriat social ou l'empowerment, comme ceux de Drainville (2001), Zouhair & Lhajji (2016), Charlier (2006), Guérin (2003), de Ninacs (2006), Lemaître (2009).

Concernant l'acquisition d'un **''pouvoir sociétal'', le modèle montre que ce type d'autonomie a été expliqué par les variables exogènes à hauteur de 0.243**, ce qui représente la plus grande valeur enregistrée parmi les autres dimensions d'autonomisation. Ce résultat est obtenu grâce à la forte corrélation qui lie ''pouvoir sociétal'' à la variable 'rendre service' qui l'explique à hauteur de 0.309. L'effet de taille f^2 avec un indice moyen de 0.112 confirme ce résultat puisque l'abandon de la variable ''rendre service'' aura plus d'effet comparativement à l'abandon des autres variables explicatives ''démocratie & égalité'' et ''solidarité'' ayant enregistré respectivement des indices f^2 de 0,089 et 0,030.

Également les corrélations positives estimées entre les trois variables explicatives et **le ''pouvoir d'agir social'', permettent de confirmer l'acquisition d'un pouvoir d'agir social par les coopératrices**, en étant définie par lesdites variables à hauteur de 0.224. Ce type d'autonomie est constitué grandement grâce la variable ''rendre service'' avec un poids de 0.409.

A ce niveau, nous pouvons dire que la coopérative de femmes au Maroc offre effectivement un espace adéquat à la création et consolidation d'une capacité d'agir social au profit des coopératrices, en leur offrant l'occasion de pratiquer et de s'éduquer sur les compétences de prise de parole, d'influence, de gestion des problèmes inter-collègues entre autres.

Finalement, nous concluons que notre étude a révélé que les variables de la coopérative **expliquent l'autonomie sociétale avec 24,3%, l'autonomie psychologique à hauteur de 20,6%, et le pouvoir d'agir social avec 22,4%**. Cependant, elles n'expliquent **l'autonomie économique que faiblement avec un indice qui atteint seulement 4,3%**. En conséquence, nous pouvons dire que la coopérative contribue assurément à la détermination de l'autonomie des femmes**, mais fragilement et partiellement tant qu'elle ne satisfait pas le principal besoin des femmes membres** à savoir augmenter les revenus et améliorer les conditions de vie. En effet, elle **ne s'agit pas d'une autonomisation multidimensionnelle tant qu'elle ne couvre pas le volet économique qui est d'ailleurs la principale motivation des femmes à intégrer une coopérative.**

Les résultats de la présente étude nécessitent d'être discutés au vu d'un certain nombre de perspectives. Les données de l'étude ont été collectées auprès de 104 coopératrices membres de 70 coopératives de femmes, cependant les caractéristiques de notre échantillon tant en termes de taille qu'en termes de secteur n'autorisent pas la généralisation de nos résultats. Bien que notre objectif soit de nature exploratoire au premier degré, l'absence d'échantillonnage suivant la filière, le contexte géographique ou la taille de la coopérative peut représenter une limite au niveau de la généralisation des résultats, il serait alors intéressant en futur d'élargir l'étude sur des échantillons plus vastes et multisectoriels en vue de généraliser les résultats obtenus.

Abstract

Most classical mathematical inventory management models assume that the decision-maker has full knowledge about all cost groups (ordering, holding and shortage costs), demand is normally distributed and lead time is constant. However, in real situations it is not always true. The first and most often existing limitation is that shortage cost is not known (there are situations when it is very difficult, even impossible to be reliably estimated). In such case the inventory models with service level constraints are applied. The other limitation is that lead time is not always constant. There might be two situations – lead time can be a random or decision variable. In the latter case, lead time can be decreased by bearing some additional costs. Also, the demand distribution might not be normal (or even only some parameters, not the shape of the distribution may be known). The aim of the article is comparison of results obtained for the continuous review $\langle Q, r\rangle$ inventory model for backorders case with Type I and Type II (with iterative procedure and procedure proposed by Chu et al. (2005)) service level constraints and lead time demand as a decision variable. Obtained results indicate that the lowest total inventory costs were obtained for Type II service level constraints with iterative procedure. However, simpler procedure, proposed by Chu et al. (2005) yielded results that were worse only by 2% at most.

Keywords: inventory management, continuous review inventory model, service level constraints

Introduction

When managing inventories in conditions of uncertainty or risk, the probability of not satisfying the current demand for the product should always be taken into account. In this case, it is difficult to take account of the shortages and to determine their optimal amount. However, the biggest problem is to estimate the shortage costs. There are several ways of their determination. If the criterion for division is the type of inventory, the shortage costs can be estimated and divided as follows (Chen & Krass, 2001, p. 86):

- In case of raw materials, shortage costs will be costs of production line downtime, costs of special orders or contractual penalties for failure to perform production obligations arising from contracts with contractors,
- In the case of machine and equipment spare parts, shortage costs will be costs of inactivity of machines and labour force, delays in the execution of orders, or waste of materials,
- In the case of finished products and goods, the shortage costs will be the lost income and market position.

It should be noted, however, that even knowing which group the product range under consideration belongs to, it is very often difficult, if not impossible, to estimate the shortage costs. This is because apart from measurable components of these costs (contractual penalties, costs of line downtime, loss of profits), there are also non-measurable components such as loss of company's image, or threats to health or even life of people (e.g. lack of blood or insulin stocks in the hospital).

Apart from the type of inventory, there are the two types of shortage (Hadley and Whitin, 1963):

- backorders – excess demand is not lost, but will be satisfied when the normal replenishment order arrives,
- lost sales – excess demand is lost,

When the shortage costs can be estimated, a full cost information approach shall be used for mathematical inventory model, otherwise *service level constraints* models shall be used.

In the literature on the subject there are three ways of determining service levels (Chen & Krass, 2001, p. 126; Engelmeyer, 2016, p. 9-10):

1. α *service level* – this is the probability that stock levels at the end of any period will not fall below the critical level. It is often called *the ready rate* or *Type I service level*.
2. β *service level* – it means the expected fraction of demand satisfied from stock in any period. It is often called *the fill rate* or *Type II service level*.
3. γ *service level* – the expected ratio of cumulative demand satisfied from inventory to total cumulative demand during the delivery period and inventory review period. This measure is similar to the fill rate, but the ratio is estimated on the basis of a number of periods, not a single period. An additional difference is that the previous approach is most commonly used in continuous review models, while this approach is typical for periodic review models. It is also called the *Type II service level*.

All approaches of full cost information and service level constraints can be applied for two main groups of inventory models: continuous and periodic review (Nahmias and Olsen, 2015). Continuous review inventory model assumes that the inventory level is monitored continuously and, if the inventory position falls beneath the *reorder point* – r, replenishment order in quantity of Q units is placed. The ordered quantity arrives after the lead time (denoted by τ). Therefore, it is often called the continuous review $\langle Q, r\rangle$ inventory model. Change of the inventory level in the $\langle Q, r\rangle$ model is presented on Figure 1.

Figure 1: Inventory level in continuous review $\langle Q, r\rangle$ inventory model for backorder case.

Periodic review model, on the other hand, assumes that the inventory position is reviewed every T time units. T is called the review period. The subsequent step of the procedure can be different with respect to accepted assumptions. There are two general approaches. The first one assumes that a replenishment order is placed if the demand occurred since the last review. The order quantity is not constant – such a quantity is ordered, to raise the inventory position up to level R. Therefore, the model, based on these assumptions, is often called the *up-to-R* model, or the periodic review $\langle R, T\rangle$ inventory model. The second approach assumes that if the inventory position falls beneath the reorder point R, the quantity, raising the inventory position up to level R, is ordered. Therefore, such model is also called the periodic review $\langle r, T, R\rangle$ inventory model. Change of the inventory level in the $\langle R, T\rangle$ model is presented on Figure 2.

Figure 2: Inventory level in periodic review ⟨*R*, *T*⟩ inventory model for backorder case.
Source: own elaboration.

It is worth noting that the continuous review model is relatively easy to solve, while the situation for the periodic review models is much more complicated (Nahmias and Olsen, 2015). Therefore, numerical approximations for several periodic review models were proposed by Evan Porteus (Porteus, 1985).

The question arises, which model should be used in practice. Before universal access to computers, periodic review models were more commonly used, because continuous review of inventories would have been very expensive. Nowadays, when companies use ERP-like systems, continuous review of inventories do not generate additional costs. When comparing the results generated by two types of models, continuous review ones generally generate lower costs because of lower safety stocks (Hadley and Whitin, 1963). However, the main drawback of continuous review models is that every product must be considered individually, because for each of them the moment of placing a replenishment order is different. If a company sells thousands of products, such drawback makes application of continuous review models virtually impossible. The periodic review models, on the other hand, allow to make the group replenishment orders. When the inventory review is done, then all the products that need to be replenished, can be ordered. Moreover, because in the economic practice, demand for most products follows sporadic, or intermittent pattern, for such products the periodic review models are the most obvious choice (Syntetos, 2001). However, in case of single or small number of items, the continuous review model is a better choice, as it generates lower inventory level, thus lover inventory costs.

Although it is more natural that we do not have full information about the shortage costs, models with full cost information are more common. This is mainly because more advanced models with service constraints are mathematically more difficult than models with full cost information.

An additional element that often cannot be ignored in inventory models is the variability of lead time. This can be treated in two ways:

- lead time may be a random variable,
- lead time may be a decision variable.

In the first case, no specific lead time distribution is assumed, as this makes calculations very complicated. Only such parameters as the average value of the delivery time and its variance are taken into account. On the basis of these parameters, the average value and the variance of lead time demand are modified.

In the latter case, it is assumed that the lead time can be reduced at some additional cost. It is a cost of placing a supplementary order. The first model in which lead time was a decision variable was proposed by Liao & Shyu (1991). In their approach the lead time was the only decision variable – the order quantity was assumed to be predetermined. They assumed the continuous review model. Ben-Daya & Raouf (1994) extended the Liao & Shyu model by considering both lead time and order quantity as decision variables. Further extension of their model was done by Hariga & Ben-Daya (1999). They added the reorder point in the continuous review model as a decision variable and also applied assumption of lead time as decision variable to the periodic review, ⟨*R*, *T*⟩ inventory model. Both continuous and periodic review models were assumed to have full or partial demand information. Further

consideration of lead time as a decision variable can be found in works by Chu, *et al.* (2005), or Moon *et al.* (2014), for example.

The aim of the research is comparison of results generated by the continuous review ⟨*Q*, *r*⟩ inventory model in backorder case with α and β service level constraints, when lead time is a decision variable.

Notations and Model

In this paper the classical, single-product continuous review ⟨*Q*, *r*⟩ inventory model for backorder case with time as a decision variable was examined. For full cost information, the model's goal function has the following form:

$$K(Q,r,\tau) = [A + R(\tau)]\frac{D}{Q} + h\left(\frac{Q}{2} + r - \mu\right) + s\frac{D}{Q}\bar{\eta}(r) \tag{1}$$

where:

D	annual demand for product,
A	fixed ordering (setup) cost per order,
Q	order quantity (decision variable),
h	holding cost per unit per unit time,
r	reorder point (decision variable),
μ	average lead time demand,
s	shortage cost per unit per unit time,
τ	lead time,
$R(\tau)$	crashing cost related to lead time,
$\bar{\eta}(r)$	the expected amount of shortages in one replenishment cycle, calculated by means of the following equation:

$$\bar{\eta}(r) = \int_r^{\infty}(x - r)f(x)dx \tag{2}$$

where *f(x)* is probability density function of lead time demand.

The principle of the model is that the stock level is monitored continuously and when its level falls below *r*, a replenishment order of *Q* units is placed. Optimal quantities of *Q* and *r* are determined by calculating the first partial derivatives of equation (1) with respect to *Q* and *r* and equalling them to 0. After appropriate transformations, the formulae for optimal values of decision variables are as follows:

$$Q = \sqrt{\frac{2D[A+R(\tau)+s\bar{\eta}(r)]}{h}} \tag{3}$$

and:

$$F(r) = 1 - \frac{hQ}{sD} \tag{4}$$

where $F(r) = \int_0^r f(x)dx$ is the cumulative distribution function of the lead time demand at the reorder point *r*. Since both equations (3) and (4) have both values of decision variables, therefore their optimal values are obtained by a numerical procedure. The initial estimate of *Q* value is the Harris-Wilson formula $\left(Q_1 = \sqrt{\frac{2AD}{h}}\right)$. Q_1 is then substituted to formula (4) and r_1 is determined. Next, r_1 is substituted to formula (3), and the value Q_2 is obtained. Q_2 is then substituted to (4) and r_2 is obtained. The above steps are repeated until the consecutive values of *Q* and *r* converge with sufficient accuracy.

In our case, the shortage cost *s* is unknown, i.e. the above model with full cost information should be replaced by a model with service level constraints. In the case of α service level, the procedure is very simple:

- we determine *r* such that:

$$F(r) = \alpha \tag{5}$$

- the optimal order quantity is determined by the first derivative of equation (1), excluding the last component $s\frac{D}{Q}\bar{\eta}(r)$, i.e.:

$$Q = \sqrt{\frac{2D[A+R(\tau)]}{h}} \tag{6}$$

Value α is interpreted as the proportion of replenishment cycles in which no shortage occurs. It should be large enough for shortages to occur relatively rarely. Most often it takes values from 0.9 upwards.

The Type II service level (β service level) is the probability that the demand at any replenishment period is met from on-hand inventory. Thus, the probability that demand is not be met equals 1 – β. It can be written down as follows (Nahmias and Olsen, 2015):

$$\frac{\bar{\eta}(r)}{Q} \leq 1 - \beta \tag{7}$$

The fill rate must also be set at a sufficiently high level (usually above 0.9).

To solve the model given by equation (1) with β service level constraints s must be eliminated from it. This can be done by solving equation (4) to obtain the value of s:

$$s = \frac{hQ}{D[1-F(r)]} \tag{8}$$

The value calculated by means of equation (8) is often called the *imputed shortage cost*. It is then substituted to the formula for the optimal order quantity (3):

$$Q = \sqrt{\frac{2D\left\{A+R(\tau)+\frac{hQ\bar{\eta}(r)}{D[1-F(r)]}\right\}}{h}} \tag{9}$$

As Q exists on both sides of equation (9), in order to be able to solve it, we need to raise it to the second power. We obtain a quadratic function in variable Q. After several algebra operations, we obtain:

$$h[1-F(r)]Q^2 - 2h\bar{\eta}(r)Q + 2D[A+R(\tau)][1-F(r)] = 0$$

The above equation has a positive solution, given by the following formula:

$$Q = \frac{\bar{\eta}(r)}{1-F(r)} + \sqrt{\frac{2D[A+R(\tau)]}{h} + \left[\frac{\bar{\eta}(r)}{1-F(r)}\right]^2} \tag{10}$$

Equation (10) is solved simultaneously with the equation:

$$\bar{\eta}(r) = (1-\beta)Q \tag{11}$$

that we get from equation (6).

The numerical procedure for finding the optimal values of Q and r is as follows:

- give an initial value of r_1,
- determine $F(r_1)$ and $\bar{\eta}(r_1)$ from the formula (2), place it in the formula (10) and determine Q_1,
- from equation (11) we determine $\bar{\eta}(r_2)$, and from formula (2) – r_2,
- The above steps are repeated until the consecutive values of Q and r converge.

Another approach to Type II service level constraints with lead time being a decision variable has been presented in the paper [2]. The goal function is as follows:

$$K(Q,\tau) = [A+R(\tau)]\frac{D}{Q} + h\left(\frac{Q}{2} + k\sigma\sqrt{\tau}\right) \tag{12}$$

where k *is* the safety factor and σ – standard deviation of annual demand.

The limiting condition is, as in the previous model, inequality (7). For a normal distribution of lead time demand, $\bar{\eta}(r)$ can be expressed as follows (Chu et al., 2005, p. 287):

$$\bar{\eta}(r) = \sigma\sqrt{\tau}\psi(k) \tag{13}$$

where $\psi(k) = \varphi(k) - k[1-\phi(k)] > 0$, $\varphi(k)$ – probability density function and $\phi(k)$ – cumulative probability function of the standard normal distribution in k. Therefore, the constraint (7) can be rewritten as follows:

$$\frac{\sigma\sqrt{\tau}\psi(k)}{Q} \leq 1 - \beta \tag{14}$$

Determining the optimal order quantity from equation (12) is very simple, after calculating its first partial derivative relative with respect to Q and comparing it to 0.

The optimal order quantity, given by formula (6) is the minimum value of the function (12) if we do not consider the constraint (14). However, the optimal order quantity determined by formula (6) does not always satisfies the condition (14). This condition can be rewritten as follows:

$$\frac{\sigma}{1-\beta}\sqrt{\tau}\psi(k) \leq Q \tag{15}$$

If the order quantity Q obtained from formula (6) satisfies the constraint (15), then it is the optimal order size. If Q does not satisfy the condition (15), then the left-hand side of the above inequality is the optimal order quantity. Thus, the optimal order quantity is obtained as follows:

$$Q_{opt} = \max\left\{\sqrt{\frac{2D[A+R(\tau)]}{h}}; \frac{\sigma}{1-\beta}\sqrt{\tau}\psi(k)\right\} \tag{16}$$

Numerical Example

The example uses data from the paper written by Ouyang & Wu (1997). They are as follows: D = 600 units/year, A = 200 \$, h = 20 \$/unit, σ = 7 units/week, α, β = 0.985 (safety factor k = 2.432), standard lead time = 8 weeks. This period can be reduced by incurring additional costs. The appropriate data for lead time duration and lead time crashing costs are presented in Table 1:

Table 1: Lead time (τ) and crashing cost [$R(\tau)$].

i	τ (weeks)	$R(\tau)$ (\$)
0	8	0
1	6	5.6
2	4	22.4
3	3	57.4

Source: Ouyang & Wu (1997, p. 290).

Calculations were performed for every lead time duration and all three considered approaches of service level constraints:

- α service level – formulas (5) – (6),
- β service level with iterative procedure – formulas (10) – (11),
- β service level with procedure proposed by Chu et al. (2005) – formulas (13) – (16).

It was assumed that the demand was normally distributed. Results are presented in Table 2. The table shows optimal values of decision variables (Q, r), amounts of shortages ($\bar{\eta}(r)$) and total inventory costs (K).

Table 2: Optimal values of decision variables and total costs (the best results within each approach were bolded)

Parameters	**Lead time duration**

K (\$)	2,618.56	**2,530.71**	2,546.98	2,690.43

Source: Own calculations based on Chu et al. (2005).

The best results (lowest total inventory costs) were obtained for lead time duration of 4 weeks (α service level and β service level with iterative procedure) or 6 weeks (β service level with procedure proposed by Chu et al. (2005)). Both approaches to the β service level generated lower total inventory costs than application of the α service level. Generally, application of the α service level constraints yielded in the lowest optimal order quantities (for lead time duration of 4 and 3 weeks they were the same as application of the β service level with procedure proposed by Chu et al. (2005)). For every lead time duration, reorder levels for α service level approach were the highest. In consequences, expected amounts of shortages were for this approach the lowest and total inventory costs – the highest. The reason for the highest total inventory costs was the highest holding costs.

When comparing the two best approaches – β service level with iterative procedure and β service level with procedure proposed by Chu et al. (2005) – for lead time duration of 8 and 6 weeks reorder levels were higher and optimal order quantities were lower for the former. When the lead time duration was 4 or 3 weeks the situation was opposite. For every lead time duration, total inventory costs for β service level with iterative procedure were lower than for β service level with procedure proposed by Chu et al. (2005), but the difference never exceeded 2%. Therefore, the easy-to-implement procedure, proposed by Chu et al. (2005), performed almost the same well as more difficult, iterative one. This was in line with similar studies carried out in this area (Geunes, Ramasesh and Hayya, 2001).

If we compare all approaches, then the best results were obtained for β service level with iterative procedure when the lead time duration was equal 4 weeks. optimal order quantity was 123.9 units. It meant that there ought to have been 4-5 replenishment orders a year (replenishment order should be placed every 76 days). Reorder level was equal 56.4 units and the expected amount of shortages was 1.86 units. Total inventory costs (ordering and holding costs) were equal 2,524.05 USD.

Conclusions

This article compares the results of using the continuous review $\langle Q, r\rangle$ inventory model for backorders with the Type I and Type II service level constraints. Better results (lower total inventory management costs) were generated by models with the Type II. Additionally, within this class of models, the results generated for the iterative procedure and the procedure proposed by Chu et al. (2005) were compared. It turned out that the expected total inventory management costs for the iterative procedure were lower than the costs obtained for the procedure proposed by Chu et al. (2005) by less than 2% at most, i.e. the benefits of using a more labour-intensive iterative method were practically insignificant.

Further research in this area will compare the results obtained for other demand distributions than the normal distribution and for different combinations of ordering and storage costs. The analysis should also be extended to the case of lost sales and the mixture of backorders and lost sales.

Abstract

Expenditures connected with conducting active labour market policy force the necessity of conducting research on effectiveness of applied instruments and conducting evaluation studies. The aim of the article is to assess the impact of changes in the calculation methodology on cost and employment effectiveness of basic forms of professional activisation. These changes were introduced in 2015 and concerned two aspects: the definition of the end of participation in activisation and the definition of employment. In the analysis one of the basic counterfactual methods was used - the method of regression discontinuity design. The study was conducted on the basis of statistical data published by the Ministry of Family, Labour and Social Policy. The conducted survey did not show any significant change in the value of both effectiveness in the threshold, i.e. in 2015. The change occurred only in the slope of the regression line for cost effectiveness after 2015 for both procedures of its calculation.

Keywords: Registered Unemployment, Forms of Professional Activisation, Cost and Employment Effectiveness, Regression Discontinuity Design.

Introduction

The phenomenon of unemployment has a negative impact on both the national economy and the functioning of households. Therefore, governments can and should use appropriate tools to mitigate its effects and, in particular, limit its duration. Active labour market policies use various forms of support and activisation of the unemployed. The results of specific programmes cannot always be foreseen. It is therefore important to conduct research and indicate the degree of effectiveness of the tools used and to conduct evaluation studies. From the social point of view, it is important to employ as many job seekers as possible. On the other hand, from the side of institutions financing active support programmes it is necessary to assess the spending of funds. In the case of unemployment, the research may concern many aspects such as: identification of groups of people at risk of long-term unemployment, assessment of the impact of the implemented programmes on exiting unemployment and monitoring the spending of funds allocated for these purposes. These analyses are largely based on the scientific contribution of James Heckman – Nobel Prize winner in economics. In different countries, efficiency research focuses on different aspects of labour market policy. In the United States, income effects of active employment programmes are mostly studied (Heckman et al., 1999). In the European Union, on the other hand, employment effects are mainly analysed, as the main objective is to avoid high costs of long-term unemployment. Labour market research indicates that increasing unemployment benefits and extending the duration of their collection has an impact on the duration of seeking employment (Moffitt, 1985; Katz and Meyer, 1990; Hunt, 1995; Card and Levine, 2000; Hahn et al., 2001; Lalive, 2007; Bieszk-Stolorz and Markowicz, 2015b). This in turn may lead to long-term unemployment. Therefore, various programmes are introduced to increase the economic activity of people seeking employment. Due to the incurred expenses for the implementation of these programmes, there is a need to monitor them. Two basic indicators serve this purpose: cost effectiveness (expenditure from the Labour Fund per person employed as a result of the application of the programme) and employment effectiveness (percentage of persons who obtained employment after taking part in the programme). There are big concerns about the way the number of these people is determined. Under the influence of constant

criticism, in 2015, the Ministry of Family, Labour and Social Policy changed the method of counting these indicators. It is interesting to examine whether the changes introduced have significantly influenced their values.

The aim of the article is to assess the impact of changes in the calculation methodology from 2015 on the cost and employment effectiveness of basic forms of professional activisation. The analysis uses the method of regression discontinuity design. The study was conducted based on statistical data published by the Ministry of Family, Labour and Social Policy (MPRPiPSa; MPRPiPSb).

Activisation of the Unemployed

After Poland's accession to the European Union, the scope of activities related to professional activisation of the unemployed, addressed to groups of people in a difficult situation on the labour market, increased. In 2004, the Act on employment promotion and labour market institutions was introduced (Journal of Laws of 2016, item 645). Its aim was to adjust the Polish labour market policy to the European Employment Strategy. The Act divided activities directed to the unemployed into labour market services and instruments. Labour market services included assistance in job search. It consisted of job placement, vocational counselling, professional information, assistance in active job searching and organisation of training. Professional activisation of the unemployed was related to the introduction of such labour market instruments as: intervention works, public works, professional preparation in the workplace, internships and funds for job creation. Since 2004, several dozen modifications have been made in the Act. New services and instruments of the labour market were changed, extended and introduced. The aim of these changes was to use them more effectively and to adapt them to the changing needs and socio-economic conditions. Thanks to the Act, the access to the labour market services was extended, lifelong learning programmes were promoted, and the system of unemployment benefits was modified, as well as the system of incentives for starting business activity and creating new jobs was implemented.

The registered unemployment rate in Poland in 2004-2018 was changing. In 2004 it was equal to 19% and in the following years it decreased to 9.5% (2008). Then, as a result of the global financial crisis it increased to 13.4% (2012). It remained at the same level in 2013 and then decreased to 5.8% in 2018. The number of registered unemployed people changed similarly (Table 1).

Table 1: Registered unemployment rate and number of registered unemployed persons

Year	Number of registered unemployed (thousands)	Unemployment rate (%)
2004	2999.6	19.0
2005	2773.0	17.6
2006	2309.4	14.8
2007	1746.6	11.2
2008	1473.8	9.5
2009	1892.7	12.1
2010	1954.7	12.4
2011	1982.7	12.5
2012	2136.8	13.4
2013	2157.9	13.4
2014	1825.2	11.4
2015	1563.3	9.7
2016	1335.2	8.2
2017	1081.7	6.6
2018	968.9	5.8

Numerous studies indicate the spatial diversity of unemployment in Poland (Murawska, 2016; Tatarczak and Boichuk, 2018; Woźniak-Jęchorek, 2015). This may result from the fact that the Polish labour market is strongly distorted by annual fluctuations of other macroeconomic factors (Hadas-Dyduch et al., 2016).

Catalogue of basic forms of professional activisation

The catalogue of basic forms of professional activisation is established by the minister in charge of labour. In years 2005-2018 this catalogue was changing. In 2005, it covered 7 forms: training, employment within intervention works, employment within public works, internships with employers, preparation of adults for profession in the workplace,

granting the unemployed one-off funds for financing their business activity and granting employers refunds of costs of equipment or additional equipment of the workplace for unemployed directed to those workplaces. In years 2006-2009 an eighth form was added: performing socially useful work. In 2010-2013, there were 7 forms – preparation of adults for profession in the workplace was removed from the catalogue. In the years 2014-2018, the catalogue included 6 forms – without socially useful works. Due to its ancillary nature or insignificant share in incurred expenses, in years 2005-2018 some forms of support were not included (e.g. activisation allowance, scholarships in the period of continuing education, reimbursement of travel and accommodation costs, reimbursement of social security contributions for farmers dismissed from work, training loans). In the analysed period, most people benefited from trainings and internships.

Table 2 shows the number of unemployed persons participating in the programmes and the percentage of those ending their participation and employed after the end of participation in activisation programmes in 2005-2018. In the initial period (2005-2010), this number increased and was much higher than in subsequent years. There are clear differences between the number of people participating in different activisation programmes and the number of those ending their participation and those employed after the end of participation in the programmes. In the analysed period, on average, slightly more than 92% of the newcomers ended their participation in selected forms of economic activisation, but only 59% of them found employment (Table 2). In 2011, a clear decrease in the number of unemployed people participating in the programmes is visible, as well as a large percentage of people employed after completing their participation in the programmes (over 70%) and ending their participation (over 100%). This is due to the fact that a large number of people started to participate in forms of activisation in the previous year and ended in the following one.

Table 2: Number of unemployed persons participating in activisation programmes

Year	Number of participating unemployed persons	Percentage of persons	
		ending their participation in the programmes	employed after the end of their participation in the programmes
2005	561,703	89.33%	42.29%
2006	594,262	95.54%	52.44%
2007	672,788	96.30%	55.58%
2008	652,314	93.11%	52.13%
2009	684,624	95.12%	50.61%
2010	788,674	96.27%	52.13%
2011	302,002	126.58%	70.48%
2012	428,298	88.38%	53.80%
2013	460,773	99.45%	63.00%
2014	442,187	93.29%	71.13%
2015	484,337	74.44%	56.49%
2016	450,342	81.97%	64.55%
2017	404,455	81.06%	66.45%
2018	335,644	86.44%	73.44%

Measures to assess the effectiveness of forms of professional activisation

To assess the effectiveness of the applied forms of professional activisation in Poland two basic measures are used: employment and cost effectiveness. The very concept of effectiveness is the subject of many discussions and analyses. First of all, it is a tool for measuring management effectiveness, as it allows to determine to what extent the set objectives are achieved. It describes the relation of achieved effects to incurred outlays. In economic theory, economic effectiveness is considered in two aspects. One of them is connected with the aim of maximising effectiveness, i.e. achieving the highest possible result from a certain amount of expenditure. The second one results from the pursuit of saving resources, i.e. achieving certain degree of the effect while minimising outlays (costs) (Poskart, 2014). In the case of assessing the effectiveness of the public sector, actions are taken to assess the effectiveness of the use of state policy instruments, and in particular to assess the legitimacy of further use of a given instrument and identify more effective solutions. Support programmes for the unemployed are monitored in the labour market. From the social point of view, it is important to employ the maximum number of job seekers. On the other hand, from the side of institutions financing active support programmes, it is important to assess the spending of funds in a reliable way. In order to assess the effectiveness of the implemented programmes, the cost of participation in the form of activisation and employment and cost effectiveness coefficients are determined. These figures are determined for basic forms of professional activisation.

Employment effectiveness (re-employment rate) is an indicator for determining employability after the end of participation in the programme. It is determined using a formula:

$$EE = \frac{number\ of\ persons\ employed\ after\ the\ end\ of\ participation}{number\ of\ persons\ that\ completed\ their\ participation} \cdot 100\% \quad (1)$$

Cost effectiveness (cost of re-employment) allows to assess the cost of bringing an unemployed person into employment. It is expressed by a formula:

$$CE = \frac{amount\ of\ expenditure\ from\ the\ Labour\ Fund}{number\ of\ persons\ indicated\ as\ employed} \quad (2)$$

The cost of participation in the form of activisation informs about the average cost of activisation of one person. It is calculated from the formula:

$$PC = \frac{amount\ of\ expenditure\ from\ the\ Labour\ Fund}{number\ of\ persons\ that\ participated\ in\ the\ given\ form} \quad (3)$$

In 2015, there was a change in the methodology of effectiveness calculation. This change concerned two aspects: the definition of ending participation in activisation and the definition of employment.

Before 2015, the date of completion of participation in activisation was the date of completion of participation in a given form of support (training, internships) or the date of completion of financing from the funds of the Labour Fund (public works, intervention works, socially useful works, refunding of equipment or furnishing the workplace). The provisions of the Act of 20 April 2004 on employment promotion and labour market institutions (Journal of Laws of 2016, item 645, as amended) specified the date of activisation completion as the end of the obligation period. In the case of reimbursement of costs of retrofitting or equipping a workstation, it is the period in which an employer is obliged to maintain a workstation created or retrofitted from the Labour Fund funds.

The change in the definition of employment is related to a change in the conditions under which the activated person can be considered as employed. Before 2015, a person who after the end of participation in a specific form of activisation did not register again in the poviat labour office within 3 months was considered an employed person. It could have happened that some people had lost their jobs and did not register again, and in the calculations were considered as employed. In order to avoid such situations, from 2015, it is required that an unemployed person, after participation in activisation, should work for at least 30 days within a period of 3 months and on this account (with few exceptions) social insurance contributions were paid to the Social Insurance Institution (Polish abbreviation ZUS). These changes were of particular importance in the case of subsidising business activity and refunding the costs of equipment or retrofitting the workplace. Both these forms of activisation were connected with a one-off payment of funds. At the same time, the duration of these forms is long. The assessment of employment effects after three months from the payment of funds, i.e. during the period of mandatory business activity, resulted in the employment effectiveness for both these forms being 100%, while the cost effectiveness was equal to the average amount of a subsidy or refund. The modifications made were supposed to improve the data quality.

Persons participating in a given form of activisation are understood as persons for whom the expenditure from the Labour Fund was made in a given year, regardless of the duration of activisation and repeated use of the same form of activisation.

Persons who have completed participation in a given form of activisation are those who, in the analysed year, completed participation in a given form of professional activisation financed from the Labour Fund, including persons who have completed activisation initiated in previous years.

Persons who had been employed were those who during or within 3 months from the end of their participation in a given form of activisation took up work and performed it for at least 30 days - according to the data obtained from ZUS. In such case, employment should be understood as:

- performance of work on the basis of an employment relationship, business relationship and a contract of employment;
- performing work or providing services under civil law contracts;
- conducting business activity on the basis of an entry in the register of entrepreneurs.

The study compared the efficiencies determined after the change from 2015 (new procedure) and those determined under the old regulations (old procedure). Figure 1 presents the cost of participation, cost and employment effectiveness and activisation programmes in Poland in the years 2005-2018 determined on the basis of the new and old procedure. After the introduction of a new way of defining people who took up employment from 2015, the cost of participation did not change, but the value of both efficiencies changed. The cost incurred per person employed (cost effectiveness) was still much higher than the cost per person starting to participate in the programme.

Fig. 1: Total participation cost, cost and employment effectiveness of activisation programmes in Poland

In the years 2006-2010, a large increase in cost effectiveness (from about PLN 6.5 thousand to about PLN 13 thousand) was accompanied by a relatively stable employment effectiveness at the level of about 55% (Fig. 1). In 2011, there was a significant decrease in cost effectiveness compared to the previous year from about PLN 13 thousand to about PLN 9 thousand. This was related to the correction of the general government deficit. Then, by 2015, both effectiveness showed upward trends, and after 2015, the employment effectiveness continued to increase with a decreasing value of cost effectiveness. While the increase in cost effectiveness should be seen as a negative phenomenon (from the point of view of public finances), it should be noted that at the same time the absolute difference between this effectiveness and the cost of participation has decreased. All this indicates a better use of funds for economic activisation of the unemployed in 2015-2018.

Criticism of the effectiveness measures used concerns primarily the method of determining the number of people employed after the end of participation in a selected form of activisation. The analysis conducted by the Ministry of Family, Labour and Social Policy (Polish abbreviation MRPiPS) concerned a short period, i.e. three months. The Supreme Audit Office (Polish abbreviation NIK) carried out an audit on the permanence of employment after two years from the beginning of the activisation process. In the opinion of the Supreme Audit Office, the employment effectiveness indicators set by poviat labour offices were overstated. Due to the inclusion of forms of activity with a predetermined 100% effectiveness, the phenomenon of *cream skimming*, or *cherry picking* may occur (van Thiel, Leeuw, 2002). According to the methodology adopted by NIK, employment can be considered permanent if after 2 years (or more) a person does not return to the list of unemployed people. The survey conducted according to this principle indicated that public works and internships turned out to be the least effective form of activisation. The permanence of employment in the case of business grants remained at a high, almost unchanged level. It was shown that the greatest chances of finding a permanent job were provided by new forms of support: an employment voucher and a settlement voucher. 72% of people who took advantage of these vouchers did not return to the register of the unemployed after two years from granting these forms of support. Unfortunately, these instruments were used to a small extent. Moreover, previous studies have shown that the effectiveness of forms of economic activisation in Poland is territorially diverse (Bieszk-Stolorz, Dmytrów, 2019, 2020). Studies conducted so far on the effectiveness of basic forms of professional activisation indicate that active labour market policy in Poland brings a positive effect for the labour market consisting only in temporary reduction of unemployment.

Research Methodology

In order to assess the effectiveness of the various programmes to counteract unemployment in the Member States benefiting from EU funds, the European Commission proposed counterfactual methods contained in the publication *Design and Commissioning of Counterfactual Impact Evaluations. A Practical Guidance for ESF Managing Authorities* (2012). The aim of the methods contained therein is, among other things, the assessment of the average impact effect is related to the analysis of cause and effect relations between the occurring phenomena. The basic element of the models is a random variable describing two states: impact (Y_1) and no impact (Y_0). The relationship between the observed result and hypothetical results can be presented as follows:

$$Y = dY_1 + (1 - d)Y_0 \text{ for } d\epsilon\{0, 1\} \tag{4}$$

The value of the dependent variable Y is modelled as a conditional value expected at the known realisation of the vector of observed characteristics X. The *average treatment effect* (*ATE*) is determined by the formula:

$$ATE = E(Y_1 \mid X) - E(Y_0 \mid X) \tag{5}$$

A popular method of evaluation research in this area is the *regression discontinuity design* (*RDD*).

The literature lists two types of such models: *sharp design* and *fuzzy design* (Trochim, 1984; Hahn et al., 2001). The sharp design can be used when the cut-off point (threshold) fully identifies the experimental group. If this is not the case and the individuals have yet to fulfil an additional condition, the fuzzy design must be used. In the case of a test carried out, due to the single condition set, the fuzzy model form is used.

On each side of the cut-off point X_0 (left – l, right – r), parameters for two separate regression functions are estimated (Lee and Lemieux, 2010):

$$Y = \alpha_i + f_i(X - X_0) + \varepsilon \text{ for } i \in \{l, r\} \tag{6}$$

where ε is the error term. It is assumed that it is normally distributed. The model (6) can be written as follows:

$$Y = \alpha_l + \tau\, D + f_l(X - X_0) + D[f_r(X - X_0) - f_l(X - X_0)] + \varepsilon \tag{7}$$

where: $\tau = \alpha_r - \alpha_l$. D is a binary variable. Its form depends on the position of the experimental group relative to a defined eligibility threshold X_0.

If variable D is defined as follows:

$$D = \begin{cases} 0 & \text{for } X < X_0 \\ 1 & \text{for } X \geq X_0 \end{cases} \tag{8}$$

the experimental group is defined by the condition $X \geq X_0$ and the control group by $X < X_0$.
If the functions f_l and f_r are linear, they are as follows:

$$f_i(X - X_0) = \beta_i(X - X_0) \text{ for } i \in \{l, r\} \tag{9}$$

and the model (7):

$$Y = \alpha_l + \tau\, D + \beta_l(X - X_0) + \beta D(X - X_0) + \varepsilon \tag{10}$$

where:

$\beta = \beta_r - \beta_l$.
Y – dependent variable,
X – independent variable,
X_0 – threshold,
τ – average impact effect at the threshold X_0,
D – dummy dichotomous variable.

In the model (10) the parameter τ informs about a change in the value of the Y variable when passing through the threshold. If it is positive, there is an increase in the value in the threshold, if negative – a decrease in the value of the dependent variable. Because the model (10) is a linear one, it is estimated by means of the ordinary least squares (OLS) method.

The construction of regression discontinuity design in research was first proposed by Thistlethwaite and Campbell (1960), while Lee and Lemieux (2010) stated that one of the main advantages of this approach was the possibility of presenting the results using simple charts, which significantly increases the transparency of this method. In labour market research, models of average impact are useful, among the other things, to assess the impact of unemployment benefit on the process of unemployment (Lalive, 2007; Schmieder et al., 2012), the impact of culture on the duration of unemployment (Brügger et al., 2009), the impact of activisation measures on the probability of exiting unemployment (Bieszk-Stolorz, Markowicz 2015a).

Assessment of the impact of a change in the calculation of effectiveness on their value

In 2015, the methodology of calculating employment effectiveness for basic forms of professional activisation changed and the conditions under which an activated person can be considered an employed person changed. This resulted in a change in the value of both effectiveness, while the cost of participation of the unemployed in forms of economic activisation did not change. The differences concern the value of both effectiveness in 2015-2018.

Since the change in the calculation of effectiveness took place from 2015, it was decided to take that year as the threshold in the regression discontinuity design models. The model parameters were estimated in two subgroups. The first one included actual effectiveness values, i.e. according to the new way of calculating them (new procedure). The second sub-group consisted of the efficiencies calculated according to the old rules (the old procedure). Then, using a regression discontinuity design models, it was assessed whether and to what extent a change in the way the effectiveness was calculated significantly influenced their change in the threshold.

The first stage of the study consisted of estimating cost effectiveness models. In order to preserve the monotony, the sub-periods included data from 2011-2018. Subsequent years were marked as X_i for i = 1, 2, ..., 8. In this case the threshold is $X_0 = X_5 = 5$. To estimate the difference in cost effectiveness Y_i in the threshold $X_0 = 5$ (2015) the model was used:

$$\hat{Y}_i = \alpha_l + \tau D + \beta_l (X_i - X_0) + \beta D (X_i - X_0) \tag{11}$$

where:
Y_i – cost effectiveness,
X_i – year number,
τ – average impact of the change on cost effectiveness at the threshold X_0,
$X_0 = 5$.

Dummy variable D is defined as follows:

$$D = \begin{cases} 0 & \text{for } 1 \le X_i < 5 \\ 1 & \text{for } 5 \le X_i \le 8 \end{cases} \tag{12}$$

Parameter estimates are shown in Table 3.

Table 3: Results of the estimation of parameters of the regression discontinuity design models (cost-effectiveness)

Parameter	Parameter's estimator	Standard error	*p*-value	Parameter's estimator	Standard error	*p*-value
	New procedure R^2 = 0,8542			Old procedure R^2 = 0,8016		
α_l	12,219.64	698.17	0.0001	12,219.64	673.41	0.0001
τ	488.77	845.52	0.5942	-203.41	815.54	0.8153
β_l	689.96	254.94	0.0537	689.96	245.89	0.0485
β	-1,479.89	360.53	0.0148	-1,084.45	347.75	0.0356

For the cost effectiveness calculated according to the new procedure, the following models were obtained:

$$\hat{Y}_i = 8769.84 + 689.96X_i \text{ for } D = 0 \quad (13)$$
$$\hat{Y}_i = 16658.06 - 789.93X_i \text{ for } D = 1 \quad (14)$$

For the old procedure of effectiveness calculation, the models are as follows:

$$\hat{Y}_i = 8769.84 + 689.96X_i \text{ for } D = 0 \quad (15)$$
$$\hat{Y}_i = 13988.68 - 394.49X_i \text{ for } D = 1 \quad (16)$$

Formulas (13) and (15) describe the linear model of cost effectiveness before 2015.

Formula (14) describes the linear model of cost effectiveness from 2015 onwards according to the new counting procedure.

Formula (16) describes the linear model of cost effectiveness from 2015 onwards according to the old counting procedure.

Regression discontinuity design models for cost effectiveness are shown in Figure 2.

Fig. 2: The regression discontinuity design models for cost effectiveness (new and old procedure)

The estimates in Table 3 lead to the following conclusions:

- The change in the calculation method did not result in a significant jump in the cost value at the threshold, i.e. in 2015 (lack of statistical significance of the parameter τ at variable D)
- All obtained models have significant slope parameters. Signs of these parameters' estimators indicate that before 2015, cost effectiveness was increasing in subsequent years and decreasing since 2015.
- The change of calculation method has resulted in a significant change in the slope angle of the regression line since 2015 (significance of the parameter β). The estimator of this parameter has decreased, which means that the cost effectiveness calculated according to the new procedure has decreased faster than according to the old procedure.

In the second stage of the study, employment effectiveness models were estimated. Due to the monotonicity, data from the period 2009-2018 was included in the sub-periods. Subsequent years were marked as X_i for $i = 1, 2, \ldots, 8, 9, 10$. In this case the threshold (2015) was $X_0 = X_7 = 7$. To estimate the difference in employment effectiveness Y_i in the threshold $X_0 = 7$ (2015), a model (11) was used in which the dummy variable D is defined as follows:

$$D = \begin{cases} 0 & \text{for } 1 \leq X_i < 7 \\ 1 & \text{for } 7 \leq X_i \leq 10 \end{cases} \quad (17)$$

The estimators of the parameters are presented in Table 4.

Parameters τ and β for both models are statistically insignificant (at the level of $p = 0{,}05$). These are the parameters for the variables associated with the variable D, which was decided to be removed from the model (11) and a simple linear regression model was estimated:

$$\hat{Y}_i = \alpha + \beta X_i \tag{18}$$

where α, β are the parameters of the model.

All parameters are statistically significant. The following models were obtained:

- according to the new procedure:

$$\hat{Y}_i = 0.4675 + 0.0396X_i \tag{19}$$

- according to the old procedure:

$$\hat{Y}_i = 0.4624 + 0.0418X_i \tag{20}$$

The results of the estimation of model parameters (18) for the new and old procedure are shown in Table 4 and the regression line graphs in Figure 3.

Table 4: Results of the estimation of parameters of the regression discontinuity design and linear regression models (employment effectiveness)

Parameter	Parameter's estimator	Standard error	*p*-value	Parameter's estimator	Standard error	*p*-value
	New procedure			Old procedure		
Regression discontinuity design models						
α_l	0.7545	0.0294	0.0000	0.7545	0.0295	0.0000
τ	0.0038	0.0396	0.9267	0.0315	0.0397	0.4579
β_l	0.0424	0.0076	0.0014	0.0424	0.0076	0.0014
β	-0.0119	0.0160	0.4855	-0.0183	0.0161	0.2975
fit	$R^2 = 0.9558$			$R^2 = 0.9604$		
Linear regression models						
α	0.4675	0.0196	0.0000	0.4624	0.0212	0.0000
β	0.0396	0.0032	0.0000	0.0418	0.0034	0.0000
fit	$R^2 = 0.9518$			$R^2 = 0.9492$		

Fig. 3: The linear regression models for employment effectiveness (new and old procedure)

In order to examine whether the change in the procedure of calculating of employment effectiveness after 2015 affected the pace of its growth, a test for equality of two linear regression slope coefficients was performed. Student's-*t* test was applied. The calculated value of *t* statistics was equal 0.481. The *p*-value was equal 0.637, so there were no grounds to reject the null hypothesis that the rates of increase of employment effectiveness calculated by the two procedures did not differ significantly.

The estimates in Table 4 lead to the following conclusions:

- The changes in the method of effectiveness calculation introduced since 2015 did not result in a significant jump in the cost value at the threshold, i.e. in 2015 (lack of statistical significance of the parameter τ at variable D) and did not cause a significant change in the slope of the regression line since 2015 (no significance of the parameter β).
- Since 2009, employment effectiveness has been increasing for both the new and old method of its calculation.
- The change in the procedure of calculation of the employment effectiveness virtually did not cause any differences in its growth in the examined period (the Student's t did not show the significance of differences between the relevant slope parameters of the regression function).

Conclusions

The analysis of the effectiveness of applied economic activisation programmes for the unemployed is not an easy task. There are often objections to the definition of persons taking up employment after the end of participation in programmes. This is indicated by comments contained in the NIK report. The two-year period of employment suggested in this report as an effect of the programme seems to be correct. However, some evaluation studies require the programme to be settled in the annual period. The changes in the definition of termination of participation in activisation and the definition of employment introduced from 2015 have solved this problem only partially. This is visible in the results of the conducted survey. The new procedure for calculating the effectiveness slightly decreased the value of employment effectiveness, but the change was statistically insignificant. As far as cost effectiveness is concerned, its variability slightly increased, but the change was also statistically insignificant. What turned out to be significant was only the change in the rate of decrease in cost-effectiveness after the change in the procedure of its calculation (it was slightly faster).

The methodology used in the presented study is relatively simple and the results obtained with its help are easy to interpret. The sharp model presented in the article is suitable for the analysis of socio-economic phenomena, for which there has been a change in conditions or a change in the method of their measurement. The results obtained by using a regression discontinuity design model allow to assess whether these changes have significantly affected the further course of the studied phenomenon and whether there has been a significant change in its eligibility threshold.

The sharp form of the model applies in particular if the changes in the phenomena have their origin in a change in legislation or as a result of the introduction of new social programmes which take effect at a specific moment. An additional advantage of this method is its recommendation by the European Commission for evaluation studies.

Abstract

This literature study aims at examining the variables used to predict intention to choose an entrepreneurship career and the success of the business. Attitude to entrepreneurship, family support, and competency of being an entrepreneur conceptually have roles in explaining the intention to choose an entrepreneurship career and the success of the business. The millennial generation becomes the subjects of the generation who have a unique characteristic in doing business as entrepreneurs.

Keywords: Growth Intention, Business Success, Millennial Generation.

Introduction

Business or entrepreneurship activities have already been regarded as the engine of the long-term economic growth of a nation (Romer, 1994). Increasing numbers of entrepreneurs in the economy have become a center of interest for the government, policymakers, and researchers. The interest emerges because of two reasons: Firstly, entrepreneurship accelerates economics growth (Baumol, 1990, 2004; Acs, 2006; Audretsch, 2007), and secondly, entrepreneurship decreases unemployment (Evans & Leighton, 1990; Reynolds, Storey. & Westhead 1994; Santarelli, Carree. & Verheul, 2009; Campbell, 1996; Carree & Thurik, 1996; Lee, Florida, & Acs, 2004).

Although the mainstream of researches about entrepreneurship shifted to the perspectives of economics and strategy in the period from the year 1980 until 2005, the mainstream has shifted back to the perspective of psychology, because entrepreneurship basically has or relates to a personal characteristic. Aspects of the characters become important for the individual in determining attitudes and behaviors. (Sutarman et al., 2020; Tjahjono et al. 2019, Fachrunnisa et al., 2018; Zuhaena et al., 2018)

Until now, the model which is dominant in the literature about the intention to choose an entrepreneurship career is *the Theory of Planned Behaviour* (TPB) (Ajzen, 1991). Theoretical specifications in TPB are more detailed and consistent. Moreover, there have been much researches specialized to test, enhance, and criticize TPB in many fields (Fayolle, Gailly, & Lassas-Clerc, 2006; Shook., Priem, & McGee, 2003).

Most empirical studies implementing TPB to predict entrepreneurship behavior revealed that attitude of behavior, subjective norms, and control over the behavior had a significant effect on the intention to choose an entrepreneurship career (an example is given: Autio. Keeley, Klofsten, Parker, & Hay, 2001; Fayolle et al., 2006; Gird & Bagraim, 2008; Kolvereid, 1996; Souitaris, Zerbinati, & Al-Laham, 2007; Tkachev & Kolvereid, 1999; van Gelderen, Brand, van Praag, Bodewes, Poutsma, & van Gils, 2008).

Nevertheless, some studies, for example, a study by Kolvereid and Isaksen (2006), showed that the impact of control over the behavior on the intention to choose an entrepreneurship career was not significant. Besides that, some studies only found partial support for TPB (an example is given: Liñan & Chen, 2009; Krueger et al., 2000). In those two studies, the only attitude of behavior and control over the behavior had a significant direct effect on the

Cite this Article as: Singgih Santoso, Zaenal Mustafa EQ and Sutarno "Propositions About IntentionTo Choose Entrepreneurship Career Among Millenial Generation in Indonesia" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

intention to choose an entrepreneurship career. Meanwhile, the effect of subjective norms on the intention to choose an entrepreneurship career was not significant. Those inconsistent results show that there is still a gap for research examining those three individual concepts of TPB, namely, an attitude of behavior, subjective norms, and control over the behavior in predicting the intention to choose an entrepreneurship career

The chance to succeed on a big scale is widely open for entrepreneurs from the millennial generation because the digital era in doing business like nowadays is very favorable for flourishing their business. Besides that, especially in Indonesia, the number of entrepreneurs from the millennial generation is quite big. A report titled Youth Entrepreneurship in Asia and the Pacific 2018 - 2019 released by Global Entrepreneurship Research Association (GERA) stated that 18,9 percent of start-up businesses in Indonesia were managed by entrepreneurs aged 18 – 34 years old (millennial generation). That number was higher than the number of start-up businesses managed by entrepreneurs aged 34 – 64 years old which only attained 16.6 percent. That number was the highest, compared to the other countries like Australia, China, India, Malaysia, Philippines, Republic of Korea, Thailand, and Vietnam.

However, it does not mean that becoming a successful entrepreneur is something easy for the millennial generation. Most start-up businesses established in Indonesia were micro-scale businesses, meaning a productive business which belongs to an individual, or an individual business entity with employees maximum of 10 people. This micro-business has the ability and characteristic of a craftsman but with less-capability in developing the business. (Bank Indonesia, 2015). This study considers the millennial generation has a unique characteristic in doing business as an entrepreneur which differs from the previous generation.

Problem Statements

- Theoretical Aspects

How is the modification of the TPB model, in this respect, the roles of attitude, family support, and competency of being an entrepreneur, in explaining the intention to choose an entrepreneurship career among the millennial generation?

- Empirical Aspects

How is the increasing intention to choose an entrepreneurship career among the millennial generation?

Model Development

This literature study aims at developing a model based on TPB in the hope that the model can be used to clarify the roles of attitude, family support, and competency of being an entrepreneur in explaining the intention to choose an entrepreneurship career and the success of the business.

Fig. 1: Proposed Business Success Model

Proposition

1. Entrepreneurial attitude has a positive effect on growth intention as an entrepreneur among the millennial generation.
2. Family support has a positive effect on growth intention as an entrepreneur among the millennial generation.
3. Entrepreneurial competencies have a positive effect on growth intention as an entrepreneur among the millennial generation.
4. Entrepreneurial attitude has a positive effect on the success of entrepreneurial businesses among the millennial generation.

5. Family support has a positive effect on the success of entrepreneurial businesses among the millennial generation.
6. Entrepreneurial Competencies have a positive effect on the success of entrepreneurial businesses among the millennial generation.
7. Growth Intention has a positive effect on the success of entrepreneurial businesses among the millennial generation.
8. Growth intention mediates the relationship between entrepreneurial attitudes and the success of entrepreneurial businesses among the millennial generation.
9. Growth intention mediates the relationship between family support and the success of entrepreneurial businesses among the millennial generation.
10. Growth intention mediates the relationship between entrepreneurial competencies and the success of entrepreneurial businesses among the millennial generation.

This study proposes a theoretical model so that empirical investigations are also needed to examine the effect of entrepreneurial attitudes, family support, and entrepreneurial competence on growth intention and its consequences in the form of business success. Future qualitative studies may be able to reveal some further insights into the determinants of growth intention. However, even more, important are the quantitative studies that are needed to validate the model and generalize it. Furthermore, cross-cultural evaluation of the model can add useful insights.

Selected Aspects of External Encumbrances on Poland's Banking Sector in Comparison to Banking Sectors in Other EU States

Bogdan WLODARCZYK

Aleksandra OSTROWSKA
University of Warmia and Mazury, Olsztyn, Poland,
E-mail: aleksandra.ostrowska@uwm.edu.pl

Abstract

As well as imposing new encumbrances on banks, the regulations introduced in years 2015-2019 significantly altered tax burdens, contributions, and capital requirements of banks. A significant increase in taxes, charges and contributions was not without impact on the lending activities, development and profitability of the banking sector. The present article investigates selected aspects of external fiscal burdens imposed on Poland's banking sector compared to banking sectors in other EU economies. The analysis focuses on contributions due to deposit guarantees, banking tax, CIT tax, capital endowments and capital profitability. The research suggests that due to the negative impact of the latest financial crisis, the scope and magnitude of financial contributions imposed on the entities of the banking sector have increased. The imposed contributions have an adverse effect on the profitability of Poland's banking sector, which is corroborated by the deteriorating values of the ROE indicator. Poland has one of the lowest values of the ROE measure among the EU states. The profitability of the banking sector is further challenged by the persistent low interest rates, which adversely affect banks' earnings.

Keywords: banking sector, capital requirements of banks, financial encumbrances on the banking sector

Introduction

The financial crisis that started in 2008 had many negative effects in the financial and banking sectors as well as in the real economy. Its genesis was related to the inappropriate policy of central banks focused mainly on fighting inflation, too liberal policy of banks and the lack of appropriate legal provisions regulating the activity of the banking sector. Governments of many countries, primarily the American economy and European countries, have allocated large sums to rescue systemically important financial institutions exposed to the risk of bankruptcy, while increasing public debt.

The deteriorating situation of the banking sector and individual economies plunged into crisis prompted supervisory authorities to tighten the existing prudential regulations and to introduce new financial encumbrances for this sector. These activities include increasing capital requirements for banks or introducing new levies in the form of both contributions and taxes. An example is the bank tax, which has been in force for a long time in most European Union countries, and has been in force in Poland since 2016, or the growing contributions to the Bank Guarantee Fund. Their goal was, first of all, to ensure the safe operation of the banking sector in the future, and in the case of the banking tax, to ensure budget revenues for the return of funds intended for its rescue.

In the case of the Polish banking sector, it was not necessary to save the institutions operating in it, but due to their affiliation to the European banking system, they are obliged to comply with the capital requirements applicable to all European banks, and to take into account the burdens imposed by Polish law.

On the one hand, growing capital requirements force banks to increase their capital, which may lead to a reduction in lending. On the other hand, growing financial encumbrances reduce the profits accumulated by banks. As a result, these activities may adversely affect the activities conducted by banks, and thus deteriorate their profitability.

Due to the growing capital requirements and the encumbrances on the banking sector, which may have a negative impact on the activities conducted by banks, the purpose of this article is to present the most important changes

Cite this Article as: Bogdan WLODARCZYK and Aleksandra OSTROWSKA " Selected Aspects of External Encumbrances on Poland's Banking Sector in Comparison to Banking Sectors in Other EU States" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

introduced in the encumbrances on the banking sector and their impact on the profitability of Polish banks as measured by the ROE ratio. The profitability of the Polish banking sector is also presented compared to other European Union countries.

Encumbrances on the banking sector – characteristics

Banks, like other commercial enterprises, are subject to various financial charges imposed by the provisions of law. The regulatory processes intensified following the latest financial crisis and led to the introduction of new charges or the increase of the existing ones (Włodarczyk, Ostrowska, 2017, p. 1). The crisis negatively affected the banking environment and threatened the stability of the whole financial system. These burdens, however, have adverse effect on the banking business through diminishing their equity, limiting the lending activities, decreasing the business profit; if the burdens exceed a certain level, they may lead to the general deterioration of the bank's financial situation. In general, financial encumbrances imposed on banks fall into two groups. The first includes fiscal burdens, such as the corporate income tax, VAT tax, property tax and other taxes levied on banks by specific provisions of law. The second group includes other financial burdens (Cichy 2017, p. 10), such as contributions to the Bank Guarantee Fund (later: BFG). It should be noted that fiscal burdens concern all economic entities operating in the real economy, while the type and magnitude of other financial encumbrances are specific to particular groups of entities.

As far as fiscal encumbrances are concerned, the most important one is the CIT tax. According to Corporate Income Tax Act, the subject of the tax in this case is the income from capital gains and the income from other sources (Act …). The Act also includes the economic events determined as the income of legal persons. According to Article 19, the rate of this tax in Poland amounts to 19% of the tax base.[1] Other taxes include the value added tax or property taxes, which are not of interest in the present article.

Apart from fiscal contributions, banks are also obliged to pay other charges based on separate legal provisions. Every bank operating in Poland belongs to the system of deposit guarantee, supervised by BFG; banks pay compulsory contributions into the system. The manner of calculating these contributions was significantly changed in 2016. Until 2016, banks had to pay an annual contribution into an assistance fund and precautionary charges into a stability fund (since 2013). In years 2010-2015, that charge amounted to 12.5 times of the capital requirements due for exceeding the limits and breaching other norms defined in the Act; in 2016, this value reached the total amount of risk exposure. In 2017, the annual contributions to the assistance fund were replaced with quarterly contributions to the guarantee fund, and the stability fund was replaced with a compulsory restructuring fund, where mandatory charges are paid on an annual basis.[2]

Another type of fiscal encumbrances includes charges for supervision over banks. In line with the Prime Minister's Regulation on charges for covering the cost of supervision over banks issued in 2007, the rate of this charge is calculated on the annual basis as a multiplication of the percentage share of the bank in the total of balance sheet assets of all the banks in a given year and the cost incurred by banking supervision in this year, not exceeding the multiplication of the share the bank has in the total of balance sheet assets of all the banks and the amount of 0.21% of the total value of balance sheet assets of all the banks in a given calendar year. Each bank determines the quarterly deposit towards the cost of supervision in the amount of 0.00525% of the total of balance sheet assets in the month preceding the quarter for which the deposit is paid (Regulation …).[3]

One of the significant encumbrances imposed on the banking sector in Poland in 2016 through the Banking Tax Act is the so-called banking tax, or a tax on certain institutions (Witczak 2015, p. 105-106). The banking tax is a non-refundable public-private performance charged by the state and delivered by a group of financial entities (Dec, Masiukiewicz, 2013, p. 17). The banking tax is mainly precautionary in character, with the purpose of collecting funds towards future financial crises, limiting the risk taken by banks and enhancing the stability of the financial system. It may also have been introduced to expand national budget revenues (Muszyński 2017, p. 83). The motives and forms of the banking tax introduction varied between the EU member states. If the banking sector needed financial aid as a result of the crisis, then the introduction of the tax was fiscal in character to regain the funds. In other cases, when the sector did not need additional funds, the reason for the introduction of the banking tax was to secure the stability of the system through the increase of the held assets (Borowski, Jaworski, Tymoczko, 2016, p. 11). In Poland, the introduction of the tax was mainly supposed to expand the national budget revenues (Cichy 2017, p. 14; Wojciuk 2017, p. 39). The tax base for calculating the banking tax is the surplus in the asset value of the taxpayer, following from the trial balance determined on the last day of the month, based on entries in the general ledger, in accordance with the provisions of Accountancy Act of September 29, 1994 (Journal of Laws 2013, pos. 330, with later amendments 5), or the standards of accountancy practiced by the taxpayer on the basis of Art.2, par. 3 of the same Act – if the amount exceeds PLN 4 billion. The tax amounts to 0.0366% of the tax base per month.

Apart from the above encumbrances, European banks are also obliged to follow supervisory regulations CRD IV[4] and CRR[5] concerning capital requirements, which generates further cost. These regulations have been binding for every member state of the European Union since January 1, 2014. The CRR Regulation contains precautionary requirements concerning the capital, liquidity and credit risk of the banking sector institutions and investment companies. It requires that banks hold as much capital as necessary to cover unforeseen losses and remain solvent in the time of crisis. This capital is classified according to its quality and risk sensitivity and defined as Tier 1 or Tier 2 capital. The first type allows the bank to perform normal operations and provides financial liquidity; the other type allows it to satisfy the depositors and preferential creditors in a case of withdrawal of liquidity. The total amount of capital held by banking and investment institutions should amount to the minimum of 8% of risk weighted assets, of which the primary capital Tier 1 should be no less than 4.5% of the risk weighted assets. As for liquidity requirements, a financial institution should hold such an amount of liquid assets which will allow it to cover their net withdrawals for 30 days in a time of crisis. Other requirements concern financial leverage, or the relation between the bank's own capital and the total assets. Directive CRD IV in turn contains provisions on capital buffers, remuneration and financial incentives to bankers, precautionary supervision and internal management of banks. The directive specifies that every bank should have a security buffer made of the highest quality capital (Tier 1 primary capital), which should amount to 2.5% of the bank's total risk exposure and anti-cyclical capital, which could be used for crediting real economy entities in times of adverse economic conditions.[6] The tightening of capital requirements raises concerns of the decrease in lending activities, which may lead to deterioration of the banking sector profitability in the long term.

For the purposes of this research, the present article will only analyze the pivotal encumbrances imposed on the banking sector, namely the CIT, the BFG contribution, the banking tax and capital requirements.

Analysis of The Selected Encumbrances on The Banking Sector Contributions Towards Deposit Guarantees and The Banking Tax

Poland maintains a relatively high level of deposit protection as compared to other EU countries (Table 1). From this perspective, the domestic banking sector is one of the most secure banking sectors in Europe. At the end of the first year of the operation of the bank guarantee fund, the ratio of coverage for the deposits reached 1.69%, while in Italy or in Ireland it stood at 0.16%. It is worth noting, however, that Romania's (3.17%) or Norway's (2.72%) systems of deposit guarantees had a much higher ratio of coverage. The lowest values of the deposit coverage ratio were in the countries where contributions to the guarantee fund were collected *ex post*, after events which triggered payouts from the guarantee fund. In the overwhelming majority of the EU countries, including Poland, the collection is made ex ante; the funds are collected towards possible payouts in the future.

Table 1: Deposit coverage ratio and forms of collection for deposit guarantee systems in Europe (data as of 31.12.2017)

Country	Ratio of coverage %	Form of fund collection
Romania	3.17%	*Ex ante*
Norway	2.72%	*Ex ante*
Estonia	2.64%	*Ex ante*
Croatia	2.50%	*Ex ante*
Island	2.46%	*Ex ante*
Finland	2.10%	*Ex ante*
Latvia	1.83%	*Ex ante*

Source: own elaboration based on data by European Banking Authority: https://eba.europa.eu/

The discrepancy between EU countries in their policies of taxing and encumbering banks has also manifested itself with regard to taxes on some financial institutions (Table 2). In most countries, it was introduced as a bank tax, and in three countries as a banking charge. These countries are Belgium, Latvia and Sweden. It should be noted that in most cases the tax value was determined by the total of liabilities of the taxed entities. In Poland and Hungary, the tax base for this contribution depended on the value of assets. Bank tax was first introduced in Sweden and Hungary; Poland was the last to implement it. The annual tax rate of 0.44% in effect in Poland turned out to be the highest in all the studied countries. The final beneficiary of the bank tax/charge is, in most countries, the national budget, except for four countries were the funds go to stability funds. These countries are Belgium, Germany, Slovakia and Sweden (Mielczarek 2020, p. 127-128).

It should be stressed that taxing assets or liabilities has one serious shortcoming; it does not take into account the financial condition of these entities, or their off-balance sheet items. Besides, it may lead to a decrease in the lending activities or a desire to only engage in high-margin products. It may also cause a decline in the interest income and price inflation of banking services.

Table 2: Bank tax in selected EU countries and final beneficiaries

Country	Tax base	Annual rate (%)	Year of introduction	Final fund
Austria	Financial result	0.024-0.029	2011	National budget, stability fund (until 2017 r.)
Belgium	Liabilities	0.13231	2012	Stability fund
Cyprus	Liabilities	0.15	2011	National budget, stability fund
Finland	Risk weighted assets	0.125	2011	National budget
France	Min. capital requirement	0.222	2011	National budget
Latvia	Liabilities	0.072	2011	National budget
Netherlands	Liabilities	0.022-0.044	2012	National budget
Germany	Liabilities and derivatives	0.02-0.06	2011	Stability fund
Portugal	Liabilities and derivatives	0.01-0.085	2011	National budget
Poland	Assets	0.44	2016	National budget
Slovakia	Liabilities	0.2	2012	Stability fund
Sweden	Liabilities	0.036	2009	Stability fund
Hungary	Assets	0.15 or 0.21[1]	2010	National budget
UK	Liabilities	0.16 or 0.08[2]	2011	National budget

CIT tax and the effective tax rate on banks in Poland and other EU countries

During the research, the banking sector was the largest taxpayer of the corporate income tax (CIT) of all the industries in Poland.[8] In 2018 banks paid PLN 5.2 billion of CIT into the national budget. It is worth noting that the scale of burden to other large sectors of the economy was distinctly smaller and amounted to, respectively:

• PLN 2.73 bn for manufacturing sector;
• PLN 1,57 bn for commerce;
• PLN 1.56 bn for energy sector;
• PLN 1.35 bn for fuel industry.

Table 3 presents the values of CIT for the banking sector in years 2015-2018, which demonstrate a steady increase in this encumbrance, from nearly PLN 3 bn to 5.2 bn, or over 70%. As a result, despite the earned profit, the banks' competitiveness based on the capital potential has steadily declined. During the time of this study, the growing encumbrances also contributed to the declining profitability of the sector.

Table 3: CIT tax (in PLN bn), paid by the banking sector in Poland

Item	2015	2016	2017	2018
CIT tax	2.970	4.347	4.758	5.166

Source: developed by the authors, based on ZBP data.

The effective CIT tax rates varied between particular European countries, with the lowest rates in 2018 in Hungary and Montenegro, where they were only 9% (Fig. 1). A slightly higher rate of 10% CIT tax was introduced in Bulgaria. The highest rate of this tax, 35%, was valid in Malta. It is worth adding that in 2018 the average CIT rate in Europe was 19.48%, so it was slightly higher than the rate effective in Poland (19%).

Fig. 1: CIT tax rate in Europe in 2018

Source: developed by the authors, based on KPMG data. Data effective on 31.12.2018. https://home.kpmg/xx/en/home/services/tax/tax-tools-and-resources/tax-rates-online/corporate-tax-rates-table.html

As the largest compulsory encumbrances of the banking sector in Poland are excluded from the so-called tax cost, it is worth investigating the effective tax rate and compare it to the situation in other European countries.

In the case of Poland's banking sector, the introduction of new encumbrances (apart from the bank tax) made the effective income tax rate increase from 18.3% to 25.9% between 2015 and 2018 (Table 4). However, if the bank tax were also included, the average effective rate would significantly increase to 48% in 2018.[9] At the same time, the average effective tax rate for banks in CEE and CESEE countries was, respectively, 16.3% and 15.3%. We can then conclude that the level of public burden imposed on banks in Poland is distinctively higher than in other countries in this part of Europe. This may threaten the competitive position of the Polish banking sector compared to the neighboring countries.

Table 4: Effective tax rate (in %) of banking sectors in Poland[10] and other European countries

Item	2015	2016	2017	2018
Poland	18.3	24.1	26.8	25.9
EU15: Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxemburg, Netherlands, Portugal, Spain, Sweden, United Kingdom	26.8	32.1	27.4	25.4
CEE: Bulgaria, Czech Republic, Estonia, Hungary, Lithuania, Latvia, Poland, Romania, Slovenia, Slovakia	23.8	19.8	16.9	16.3
CESEE: Albania, Belarus, Bosnia and Hercegovina, Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Kosovo, Latvia, Lithuania, Macedonia, Moldova, Montenegro, Poland, Romania, Russia, Serbia, Slovakia, Slovenia, Turkey, Ukraine	19.6	16.4	16.2	15.3

Capital Endowment and Profitability

In years 2015-2019, own funds of Poland's banking sector tended to increase and were dominated by the highest quality capital – the primary Tier 1. Despite the surplus regulatory capital held in the Polish banking sector[11], the capital condition of most of the largest entities turned out to be less favorable than that of key banks in other European countries. In 2018, the institutions which had a comparable level of capital adequacy were PKO Bank Polski SA, mBank S.A., Bank Handlowy S.A., and Bank Pekao S.A., where CETI indicators[12] were, respectively: 17.54%,[13] 17.47%,[14] 16.8%[15] and 15.8%[16]. In other cases, the Tier 1 indicators were as follows: 14.75 in ING Bank Śląski S.A.,[17] 14.11% in Santander Bank Polska S.A.,[18] 12.89% in Bank Millennium S.A.,[19] 12.81% in Alior Bank S.A.,[20] 12.38% in BGŻ Paribas S.A.,[21] 9.0% in Getin Noble Bank S.A.[22] It is worth noting that the lowest level of the capital indicator among commercial banks was reported by Idea Bank S.A. (1.35%), whose financial problems affected the overall results of the whole banking sector.[23]

Figure 2 serves to compare the capital condition of some large banks in Poland and in other European economies. As far as foreign banks are concerned, the levels of the primary Capital Tier 1 indicators at the end of 2018 were significantly higher than the minimal capital requirements. The highest reading of this indicator was reported by National Building Society in the United Kingdom, which exceeded 30%. The second highest indicator was found in the Dutch bank ABN Amro Group NV, 17.95%.

Fig. 2: Banks with the highest indicators of Primary capital Tier 1 in selected EU countries

Source: EBC, 2018, ZEB European Banking Study 2018, https://www.ebf.eu/wp-content/uploads/2018/11/ZEB-European-Banking-Study-2018.pdf

During the period covered by this study, Poland's banking sector faced a significant problem of declining capital profitability. It should be stressed that despite the persistent low interest rates, this problem was not common in the EU. Divergences in the ROE indicator for particular national banking sector were wide. In 2018, the Polish banking sector belonged to the 10 economies of the lowest return on equity in the EU. As demonstrated in Figure 3, its highest level (13.3%-14.6%) was then reported in Hungary, Romania and the Czech Republic. Among the causes of low profitability of Poland's banking sector are high financial encumbrances and higher levels of financial assets of low quality than it is in other countries. Further increase in the magnitude of encumbrances may reduce the net profit, and consequently, the profit will not cover the value of capital, which will lead to the deterioration of the banking sector's profitability measured by ROE (Report of the situation ..., p. 15).

Fig. 3: Value of ROE (in %) for banking sectors in EU countries in 2018

Conclusions

The measures undertaken to improve the situation of the financial sector in the form of increasing capital requirements and imposing new encumbrances were supposed to increasing its stability and to offset the consequences of emergency operations by particular countries. However, the expansion of encumbrances imposed on the banking sector has adverse effects on banking operations. It is a major factor contributing to the decline in the lending activities and deterioration of profitability of the banking sector. Poland's banking sector has to endure one of the highest financial encumbrances among the EU countries, which also leads to one of the lowest profitability indicators, which is a negative phenomenon phenomenon and raises questions about the future of this sector and its international competitiveness.

As the Polish Bank Association (ZBP) points out, apart from high financial encumbrances imposed on the banking sector, the low interest rate environment will have a adverse effect on banks' financial statements in the long term, mostly because of the diminishing interest income, which constitutes the main source of banking revenue. Furthermore, the adverse macroeconomic situation causes banks to limit their lending activities and results in the deterioration of quality of the credit already held by banks, which generates additional cost for the banking sector[24]. It should also be remembered that the costs associated with the growing encumbrances on the banking sector are borne directly by banks, but also indirectly by the entire society. The main channel of their impact on the real economy, as well as on its overall economic condition, is the weakening of lending activities. As a result, investments that may inhibit economic growth are reduced in the long term.

Therefore, there is a need to take actions that would improve the situation of both banks and their clients, which are suffering from the effects of the global deterioration in the condition of economies. Supervisory bodies and public authorities are faced with the selection of both an adequate number of regulations of the banking sector to prevent over-regulation of this sector and the size and level of its financial encumbrances.

Quand la Recherche de Qualité dans l'Enseignement Passe par une Etude Statistique entre les Langues Anglaise et Française

The Research of the Teaching Quality: a Statistical Study on the Influence of the Knowledge of English on French Teaching

Abstract

The term "quality" has become an established topic and the concept of quality assurance and quality improvement is widely used at Defense University. In addition, since 2018, student success rates have become one of the criteria for university funding. The Defense Language Institute at the University of Defense is no exception when it comes to finding ways to improve the quality of the students' education. Therefore, the French lectures there asked themselves a question whether the knowledge of English could have any effect on the teaching of French. Based on the survey and the subsequent evaluation of statistical results carried by experts, the lectures came to the conclusions presented in this article. The knowledge of English positively and significantly influences the teaching of French.

Keywords *:* French, Language Teaching, Factor of Success Rate, Examination in Accordance with STANAG 6001.

Préambule

La «qualité» a toujours été un critère primordial dans l'enseignement et son amélioration constante est un souci permanent de tous les établissements en charge de l'éducation et de l'enseignement à tous les niveaux (Noha, 2015).

Parmi les moyens dont nous disposons pour améliorer la qualité de l'enseignement, le contrôle des résultats y contribue et fait d'ailleurs l'objet de l'attention de nombreux auteurs et pédagogues (citons Čechová, Neubauer and Sedlačík, 2019).

Des conseils universitaires pour l'évaluation interne de la qualité ont été créés et le Ministère en publie régulièrement les données. Depuis 2018, le taux de réussite des étudiants est même devenu un des critères de financement des écoles supérieures (Doleček, 2019).

L'Université de Défense de BRNO surveille les résultats de ses étudiants par l'intermédiaire du Conseil pour l'évaluation interne de la qualité mais aussi grâce au travail concret des personnels académiques (Čechová, Neubauer and Sedlačík, 2019).

Qui sommes-nous?

L'Institut de formation linguistique, dans lequel on'exerce comme professeurs de français, est intégré à l'Université de Défense. Il ne fait pas exception quant à la recherche constante de solutions pour améliorer la qualité de son enseignement linguistique et il assure aussi le contrôle des résultats de ses propres étudiants à tous niveaux et dans toutes les langues enseignées. (Hrubý and Staňková, 2019; Čechová, Skybová a Koukalová, 2018; Sedlačík and Čechová, 2016).

Dans sa mission, il est chargé de l'enseignement des langues étrangères au profit des personnels militaires et civils de la Défense. On y étudie actuellement l'anglais, le français, l'allemand, le russe (aussi le tchèque au profit d'étudiants étrangers).

Outre l'enseignement proprement dit, l'Institut est aussi chargé de l'élaboration des tests qui sont établis selon les normes STANAG 6001.

L'accord NATO STANAG 6001 (STANdardization Agreement - Pour plus d'information: https://www.unob.cz/cjv/Documents/Stanag6001_FJ.pdf) est un outil de normalisation des niveaux linguistiques destiné aux Etats membres de l'OTAN afin d'en assurer l'interopérabilité. Les tests réalisés suivant ces normes ont pour objectif de «mesurer les compétences linguistiques d'une personne dans la vie courante et/ou dans un contexte spécifique bien défini»(Shohamy, 2001). Ces compétences sont mesurées indépendamment de la manière et du temps d'étude de la langue et leur évaluation repose essentiellement sur la capacité du candidat à réagir dans la langue (Hughes, 1992).

L'édition 5 du STANAG 6001 décrit en détail les niveaux de langue de 0 à 5 pour les quatre compétences que sont:

- La compréhension et l'expression orale et
- la compréhension et l'expression écrite.

Table 1 : Compétences linguistiques

NIVEAUX	Compétences linguistiques du candidat
Niveau 0	Aucune compétence
Niveau 1	Compétence de survie
Niveau 2	Compétence fonctionnelle
Niveau 3	Compétence professionnelle
Niveau 4	Compétence experte
Niveau 5	Compétence du locuteur natif.

Un nombre à quatre chiffres précédé du sigle P(profil),L(linguistique), S(standardisé) (SLP en anglais) indique le niveau du candidat dans les quatre compétences.

A titre d'exemple: PLS 3321 signifie niveau 3 en compréhension orale, niveau 3 en expression orale, niveau 2 en compréhension écrite et niveau 1 en expression écrite.

Ainsi donc, comme vous pouvez le constater, l'accord NATO STANAG 6001 régit dans son ensemble l'enseignement des langues à l'Institut de formation linguistique, la priorité pour celui-ci étant de former des personnels aptes à assurer à tous niveaux des missions internationales au sein de l'OTAN.

Pour rappel, l'anglais et le français sont les deux langues officielles de l'OTAN. Elles sont donc les plus demandées avec toutefois une nette prédominance pour l'anglais.

L'étude Statistique

Dans l'esprit de la recherche permanente pour améliorer la qualité de l'enseignement évoqué en début d'article, il nous est venue à l'idée d'étudier si la connaissance de la langue anglaise pourrait avoir une quelconque influence sur l'apprentissage de la langue française. Nous avons débuté cette étude par le recueil de données obtenues à partir d'un questionnaire de 14 questions distribué à 43 étudiants ayant tous plus ou moins de connaissances dans les deux langues. L'ensemble des données ainsi obtenues a été confié à un expert en statistiques dont le travail est décrit ci-après. Le sujet posé était: «*Est-ce que les connaissances de l'anglais peuvent influencer l'apprentissage du français?*» Pour ce spécialiste en statistique, il s'agissait donc de savoir s' il existait une corrélation entre l'étude de l'anglais et du français et de la démontrer. Pour ce faire, il a utilisé le test de corrélation de Spearman. Le principe du test est de mettre en évidence un coefficient de corrélation qui permet de préciser l'existence ou non d'une liaison entre 2 variables quantitatives et son intensité. Les calculs s'effectuent à partir de la formule de Spearman appliquée aux différentes données recueillies dans le questionnaire. Les tableaux et graphiques suivants décrivent le déroulement de cette étude.

Fig. 1 : Classement selon l'âge

Le graphe ci-dessus fait apparaître le classement des personnes interrogées selon leur âge. l s'avère que les personnes âgées entre 30-35 ans ont été les plus nombreuses à répondre avec près de 24% suivie des répondants âgés entre 20-30 ans avec 21,4%, puis 9,5% pour les répondants âgés de 40-45 ans, 7,1% pour les 45-50 ans et enfin 2,4% pour les 50-55 ans.

Fig. 2 : Niveau d'études

On a aussi analysé le niveau d'études suivi par les personnes interrogées. 50% d'entre elles ont étudié à l'université, 45% ont suivi des études secondaires. Les personnes ayant suivi une formation professionnelle représentent 2,4%, un pourcentage identique pour celles ayant suivi une formation continue.

Fig. 3 : Motivations pour le français

Concernant les motivations pour étudier le français, les réponses ont été multiples mais 81% des personnes interrogées ont exprimé la raison professionnelle.

Fig. 4 : Formation des candidats

Pour ce qui est de savoir où l'anglais et le français ont été étudiés, nous constatons sur le graphique que l'anglais a été principalement étudié au cours de la formation habituelle, c'est à dire à l'école primaire puis secondaire, moins à l'université. Le français quant à lui a été étudié plus tard surtout pendant les études post-universitaires. Il ressort clairement du graphique qu'il existe une différence significative entre les lieux où les langues ont été étudiées. L'influence entre les langues est prouvée par le test $\chi 2$ (p-valeur $1{,}36 \cdot 10^{-9}$).

Fig. 5 : Fréquence d'utilisation des deux langues

Ce graphique montre qu'il y a une différence importante concernant la fréquence d'utilisation des deux langues. L'anglais est utilisé quotidiennement par 42,9% des personnes interrogées, souvent ou parfois par presque 24% des répondants et jamais par 9,5%. Quant au français, il est étudié probablement pour des raisons spécifiques (par exemple l'attachement à la langue etc.) mais, d'après les réponses des personnes interrogées, le français n'est presque jamais utilisé. Influence entre les deux langues prouvée par le test $\chi 2$ (p-valeur $4{,}68 \cdot 10^{-7}$).

Fig. 6 : Utilisation des compétences individuelles

Ce graphique montre que le pourcentage d'utilisation des compétences individuelles est plus élevé en anglais qu'en français. Cependant, le test n'a pas prouvé cette différence (valeur de p- 0,8621). Chaque langue est utilisée de manière proportionnée et semblable.

Il existe toutefois des différences importantes entre ces deux langues qui sont dues aux critères suivants: Où, quand, comment ont-elles été étudiées et au final comment sont-elles utilisées? Le test prouve, en tout cas, que l'anglais est plus utilisé que le français.

Fig. 7 : Auto-évaluation

On peut voir sur ce graphique que l'auto-évaluation en anglais est plus élevée qu'en français. Le test a prouvé la différence (valeur de p- $9.29 \cdot 10^{-12}$). L'anglais a été étudié plus longtemps donc la différence de niveau entre les langues est évidente

Table 2 : Stanag – anglais

Absolute freq.	**0**	**1**	**1+**	**2**	**2+**	**3**	**4**
Listening	1	3	0	14	4	15	1
Speaking	0	4	2	16	5	10	1
Reading	1	2	2	13	3	16	1
Writing	1	2	3	15	7	9	1
Relative freq.	**0**	**1**	**1+**	**2**	**2+**	**3**	**4**
Listening	0,026	0,079	0	0,368	0,105	0,395	0,026
Speaking	0	0,105	0,053	0,421	0,132	0,263	0,026
Reading	0,026	0,053	0,053	0,342	0,079	0,421	0,026
Writing	0,026	0,053	0,079	0,395	0,184	0,237	0,026

Fig. 8 : Différences à l'examen de STANAG

Ceci explique que des candidats à l'examen de STANAG anglais atteignent le niveau 4 alors que les résultats au STANAG français n'atteignent que le niveau 2.

Table 3: Stanag – français

Absolute freq.	**0**	**1**	**1+**	**2**
Listening	7	28	2	4
Speaking	0	35	3	3
Reading	6	27	3	5
Writing	0	34	4	3
Relative freq.	**0**	**1**	**1+**	**2**
Listening	0,171	0,683	0,049	0,098
Speaking	0	0,854	0,073	0,073
Reading	0,146	0,659	0,073	0,122
Writing	0	0,829	0,098	0,073

Fig. 9 : Dépendance entre les compétences individuelles

Dans notre étude, le coefficient de corrélation Spearman démontre la dépendance entre les compétences individuelles. Les valeurs statistiquement significatives de ces coefficients sont inscrites en rouge dans le tableau ci-après.

À l'exception des valeurs entre Speaking Fr et toutes les compétences en anglais, ces valeurs sont statistiquement significatives. Elles sont toutes positives, ce qui signifie qu' une valeur élevée de Stanag dans une compétence correspond à une valeur élevée dans une autre compétence. Exemple: Dans notre tableau, entre le *Listening Eng* et le *Speaking Eng*, la corrélation 0,88 est forte. De même, une valeur faible dans une compétence correspond a une valeur faible dans une autre compétence.

Le tableau et le graphique ci-dessous montrent qu'il existe toujours des corrélations plus fortes entre les compétences de chacune des langues. Par contre, les corrélations entre les compétences en anglais et en français ne sont plus aussi fortes.

Table 4

	Listening Eng.	Speaking Eng.	Reading Eng.	Writing Eng.	Listening Fr.	Speaking Fr.	Reading Fr.	Writing Fr.
Listening-Eng.	1	0,882	0,981	0,877	0,458	0,315	0,514	0,365
Speaking-Eng.	0,882	1	0,875	0,915	0,431	0,303	0,485	0,37
Reading-Eng.	0,981	0,875	1	0,872	0,458	0,301	0,509	0,348
Writing-Eng.	0,877	0,915	0,872	1	0,499	0,313	0,472	0,332
Listening-Fr.	0,458	0,431	0,458	0,499	1	0,746	0,898	0,712
Speaking-Fr.	0,315	0,303	0,301	0,313	0,746	1	0,694	0,926
Reading-Fr.	0,514	0,485	0,509	0,472	0,898	0,694	1	0,744
Writing-Fr.	0,365	0,37	0,348	0,332	0,712	0,926	0,744	1

Fig. 10 : Compétences de chacune des langues

Test sur la moyenne des résultats de STANAG des 4 compétences. Le coefficient de corrélation entre la moyenne de l'anglais et du français est de 0,4926391 avec une valeur de p (marge d'erreur) de 0,001951. Cette corrélation est statistiquement très importante ce qui signifie que meilleurs sont les résultats en anglais, meilleurs ils le sont aussi en français. De même, si nous appliquons le coefficient de corrélation de Spearman pour le calcul de la médiane des résultats, il est de 0,4903766 avec une valeur de p (marge d'erreur) 0,002062. Le coefficient est un peu plus faible mais reste important ce qui permet de conclure encore une fois que plus les résultats en anglais sont bons, plus ils le sont aussi en français.

Conclusion et Commentaires

Cette étude démontre donc que l'apprentissage de l'anglais influence de façon significative l'apprentissage du français et ce, de façon positive.

Pour toutes les populations de langues slaves, cette influence est positive parce que la structure générale des phrases en langue anglaise est pratiquement identique à celle de la langue française. Ce qui veut dire que lorsqu'un étudiant

tchèque, par exemple, a compris le mécanisme de construction d'une phrase en anglais (complètement différente des langues slaves où l'ordre des sujets, verbes, compléments est moins important pour la compréhension grâce aux différents cas grammaticaux), ce même étudiant n'a plus beaucoup de difficulté pour comprendre la construction des phrases en français. Ce point est acquit et il n'a plus qu'à se concentrer sur le vocabulaire et sur la grammaire française (plus compliquée qu'en anglais).

Le dernier tableau fait ressortir un coefficient de corrélation faible entre le parlé français et toutes les 4 compétences en anglais (chiffres en noir).

Pourquoi ?

Parce que la difficulté majeure entre la langue anglaise et française est la prononciation. Le Français, en général, parle mal l'anglais à cause de la prononciation et vis et versa pour l'Anglais quand il essaie de parler français. Cette difficulté est si marquée qu'une phrase anglaise sera comprise par un français quand il la lit et très souvent incomprise quand il écoute cette même phrase lue par un anglais (et encore pire quand elle est lue par un américain). Dans une conversation entre un Français et un Anglais, il arrive bien souvent que l'anglais ne comprend pas ce que dit le Français à cause de sa prononciation même si le vocabulaire utilisé est exact.

Abstract

Nowadays, the digital transformation of e-commerce businesses is fraught with several challenges. Among these challenges, there are those related to the optimization of the use of transportation and logistics infrastructure and their relationship with the e-commerce sector. A better understanding of this relationship will certainly make better use of both sectors at the same time. In fact, by a digital implementation and an optimal control of the two systems, it thus becomes possible to carry out the management of the inventories or to offer an ever more precise traceability on the order, from its exit of the inventory up to on delivery to the customer. In a quest to better understand the nature of the relationship between transportation, logistics and e-commerce, a state-of-the-art study and a summary of the main surveys and approaches addressing the issue and technology realities in this framework will be explained in this paper.

Keywords: Electronic Commerce – Distribution – Environment – Traffic Management.

Introduction

E-commerce is presently being considered as one of the most important megatrends in the global economy. A recently published report by Bain & Company revealed that these markets today stand at $8.3 billion and could grow by 3.5 times by 2022. This exponential growth is due to not only the development of Information and communications technology (ICT), but also to the improvement of transportation and logistics systems. Transportation and logistics can be defined as activities seeking to optimally move and control physical flows of an entity in order to provide and manage resources corresponding to needs. In the e-commerce context, efficient transportation management enables not only to attract new customers (diverse forms of delivery and a free or low-cost shipping), but also to keep existing customers. Therefore, transportation services can be considered as the key driver of the growth of e-commerce in the case of physically transportable goods (Allen et al. (2018); Barenji et al. (2019)). The huge fleets of vehicles that today's e-commerce giants have around the world seems to prove this. Moreover, according to the figures set out in the relevant reports (Technavio Research), transportation segments held the largest e-commerce logistics market share in 2018. These statistics could also be explained by the increasing use of different modes of transport such as road, rail, air, and water. Today, the importance of transportation is continuing to grow in the e-commerce logistics process as various large and small logistics companies are still focusing on last-mile delivery.

Conversely, there are situations where e-commerce in turn contributes to transportation and logistics (see Browne (2001)). This is essentially when suppliers, from countries where e-commerce is experiencing a dynamism, can participate in the market for transport services for e-commerce and be competitive, thus creating the opportunity for

Cite this Article as: Hana RABBOUCH, Hayet SAADAOUI and Foued SAADAOUI "Transportation Systems and E-Commerce: Understanding the Relationship" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

users to draw part of the methods of electronic commerce. E-commerce can also contribute indirectly to the transportation and logistics sector. In fact, in order to obtain transportation services, e-commerce intermediaries ensure functional relationships and a balance of powers between service providers and users, and, extend collaboration between service providers and the changes in the ownership structures of transportation companies in world trade. Therefore, it seems that a bidirectional causality between e-commerce and transportation seems evident.

Nevertheless, in recent years, the perverse effects of e-commerce in relationship with transportation have begun to become more and more known around the world (Shao et al. (2016), Hidayatno et al. (2019)). In fact, the delivery of goods usually involves parallel parking and increased congestion, hazards for road users and, of course, an increase in GHG emissions and air pollution. We can thus notice that this relation transportation-e-commerce would be as beneficial for the society on some planes but unfavourable on others. The evolution of this interaction raises all sorts of questions which, particularly in developing countries, as is the case in the Middle East and North Africa (MENA) region, have important consequences for transport providers and users in the context of e-commerce (Saidi et al. (2018)).

Opportunely, information and communication technologies, including internet-based systems, are increasingly useful in transportation services, regardless of their mode. With the development of optimization and high-precision computing techniques, which effectively contributed to the emergence of several promising concepts such as those of artificial intelligence (AI), machine learning, internet of things (IoT) and smart cities, it became possible to reimagine otherwise the relationship between transportation and e-commerce. A new relationship based on the efficient concepts of forecasting and optimal planning in production and distribution can now be established (Rabbouch et al. (2019b); Rabbouch et al. (2019c); Saâdaoui et al. (2019)). These optimal choices are therefore likely to reduce the gap between supply and demand, thus leading to a minimization of unnecessary mobility and its consequences (congestion and pollution). It would therefore be even more interesting to invest supplementary in this innovative direction while trying new optimization schemes. Such models exist in fact in various fields linking transport to other sectors of commerce and service in general, such as those of international logistics, hospital logistics, business to consumer (B2C), etc.

The purpose of this paper is therefore to review the relationship between e-commerce and transportation and logistics. Based on a selection of recent works, the effect between the two sectors is examined in both directions. The main perspectives describing the structure of this relationship are thus analysed while highlighting the impact of new intelligent technologies. On these bases, the relationship between transportation/logistics and e-commerce appears quite significant as well as dynamic. The remaining of the paper is organized as follows. Section 2 reviews the freshest corpus of literature dealing with the subject. Then, sections 3 describes how transportation and logistics support the e-commerce, followed by a section outlining inversely, the impact of e-commerce on transportation and logistics systems. Section 5 reviews the sustainable e-business models for intelligent transportation systems, and section 6 is a concluding one.

Literature Review

Several studies linking modern transportation systems with the logistics of electronic commercial services have recently been carried out. The first works date back to Visser and Lanzendorf (2004) who reviewed the literature of the relationship between mobility and accessibility effects and e-commerce. These authors were able to conclude a significant relationship, especially in the short term. Later, Weltevreden and Rotem-Mindali (2009) studied the implications of business-to-consumer and customer-to-customer e-commerce for the transportation sector. Using a nationwide sample of Dutch e-shoppers, they explored the potential impacts of both types of e-commerce on personal travel and freight transport in the Netherlands. Their results indicated that personal travel in the Netherlands has only marginally decreased as a result of e-shopping, while freight transport has slightly increased. To better harmonize the production and circulation of agricultural products, Bao et al. (2012) designed and implemented an E-commerce service platform for the supply chain management of fruits and vegetables. To assess the impact of e-commerce on the urban freight system and final delivery operations, Morganti et al. (2014) focused on the deployment of alternative options to home delivery. Their work proposed a comparison between Germany and France, which, with the United Kingdom, have Europe's leading ecommerce industries.

In a somewhat special context involving geographic systems, Gessner and Snodgrass (2015) explored the potential for e-commerce transactions across the borders between Canada and the United States. Their paper examined Canada-USA bilateral programs to explore the question of whether or not participation in such programs can

actually assist small and medium sized firms in overcoming the barriers to cross-border e-commerce transactions. Xu et al. (2015) developed efficient intermodal transportation auctions that incorporate both intermodal service costs and transaction costs for the B2B e-commerce logistics problem (ELP). Their computational results showed that incorporating such costs can leads to considerable cost saving for the shipper, shipper's group and the logistics chain, as well as higher profitability for the group of third-party logistics. Shao et al. (2016) defined a new model to analyse interactions between the strategy of distribution in e-commerce firms and traffic congestion. The authors conclude that the firm's optimal distribution strategy depends on consumers' acceptance of e-commerce as well as road users' congestion costs.

Allen et al. (2018) explained the reasons behind the growth of e-commerce and the resulting effort required to meet the exacting delivery services offered by e-retailers which often lead to poor vehicle utilisation in the last-mile operation, as well as the duplication of delivery services in urban centres as competitors vie for business. Carotenuto et al. (2018) proposed a comparison of various urban distribution systems supporting e-commerce. In particular, the pros and cons of point-to-point and lockers were highlighted and the best positions to locate lockers were defined, thus allowing to efficiently reducing consumers' deviations. Janjevic et al. (2019) suggested a method for integrating collection-and-delivery points1 (CDPs) in last-mile distribution network design. The principle of their approach was based on a non-linear optimization model that includes CDP location decisions and accounts for changes in demand patterns occurring with their placement.

Also revolving around the three axes, transportation, e-commerce and geography, Lin (2019) proposed a concept framework of E-urbanism, which is applied to understand the influence of e-commerce and migration on the socio-spatial transformation of Taobao villages in China. Her work concluded that ICT infrastructure and production networks form the foundation of e-commerce development, while social networks of rural migrants are important sources of social capital in the formation of Taobao villages. Van Asch et al. (2019) investigated the cross-border e-commerce market from the airport's perspective and confirmed previous research that the competitiveness of an airport within the air cargo market mainly depends on fast delivery of e-commerce goods. By introducing the concept of average package unit, Zhao et al. (2019) developed an Average Package Difference Model to evaluate carbon dioxide (CO2) emissions to analyse and compare environmental impacts of electronic commerce and conventional retail trade in China. The study indicated that conventional retail has a higher CO2 emission than that of electronic commerce.

In a similar comparative way, Hu et al. (2019) described expected marginal revenue and reserved slots of scattered customers under the e-commerce environment and traditional environment respectively at first. According to their result, it comes to the conclusion that the e-commerce has good predicting effect, and that the total revenue of liner company under the e-commerce environment is greater than under the traditional environment. Barenji et al. (2019) proposed a dynamic scheduling and real-time control architecture based on a multi-agent technology for e-commerce logistics parks, which helped in addressing existing gaps in the current real-time scheduling and control systems. Hidayatno et al. (2019) developed a causal loop diagram as model conceptualization for analyzing the CO2 emissions generated through urban freight volume in urban freight landscape with particular emphasis on e-commerce activities such as delivery frequency, packaging volume, and their variables interdependency. In relationship with the works cited above, in particular that of Zhao et al. (2019), it is important to underline the importance of optimal management of transportation and logistics infrastructures in the e-commerce sector in order to better control emissions levels. It is under this framework that the model developed by Hidayatno et al. (2019) could have a great importance. Finally, Lafkihi et al. (2019) provided a literature review of freight transportation service procurement and investigated the opportunities and challenges regarding transportation organization and procurement mechanism design in the context of e-commerce. This work also adds significant value to the transport-e-commerce relationship, thus allowing a better understanding of the state of the art as well as outlining new perspectives in this matter.

Unlike the number of studies dealing with the topic in northern countries, the number of studies focusing on the MENA region remains very limited in terms of both quantity and quality. Pons et al. (2003) had already highlighted the lack of development of the transport sector as one of the essential factors preventing the effective implementation of intraregional trade initiatives in MENA zone. In the context of a study of investment opportunities and challenges in the field of e-commerce in the MENA region, Sanyal et al. (2016) tried to define the

[1] Collection and delivery points are a network of services points where operators pool and deliver their consignees' parcels, and consignees pay, collect and return their parcel (Yuen et al., 2018).

few main logistical factors that could be used to promote e-commerce in this area. Also in the MENA region, Roberson wondered what are the opportunities for logistics providers as the Middle East e-commerce market grows. His technical report was carried out under the aegis of Aramex company, one of the largest courier and logistics providers in the region. This company is known for its interest on e-commerce as part of its overall business strategy and is considered a leader in logistics and transportation solutions to aid in the growth of e-commerce. Alberti-Alhtaybat et al. (2019) also treated the global logistics player Aramex and how it deals with disruptive technologies, in particular, on the unique business model that the organization has adopted and that allows disruption to be managed through collaborative knowledge management. Their study has mainly focused on the B2C, as this is where we need to improve, especially as e-commerce is expected to grow significantly in our core markets, MENA and South-East Asia.

Transportation and Logistics Supporting E-Commerce

E-commerce is the monetary exchange of goods, services or information via computer networks, including the Internet. Recent studies projected that the worldwide retail e-commerce sales will touch a new high by 2021. E-commerce businesses should anticipate a 265% growth rate, from $1.3 trillion in 2014 to $4.9 trillion in 2021. This illustrates a future of steady upward trend with no signs of decline (Figure 1). In terms of regional e-commerce sales share distribution, the main development between 2017 and the forecast for 2021 is that Asia Pacific's regional share will increase to reach two-thirds of global e-commerce, while North America and Western Europe's share shall decrease accordingly. This is a continuation of the trend seen between 2010 and 2017 (Figure 2). At the same time, a monotonous growth was recorded during the same period in the global transportation and logistics sector (Figure 3). Furthermore, the share of logistics devoted to e-commerce will also know the same fate according to other statistical studies (Figure 4). While e-commerce has had a significant impact on transportation services, its expansion is increasingly dependent on the ability of transportation and logistics services to deliver goods ordered over the internet in a timely routine. Some observers believe (Li and Fan (2014)) that current services are not fully responsive to the needs of e-commerce and that this problem is likely to increase as the volume of e-commerce grows. The demand for transportation generated by e-commerce has increased very rapidly, but it has not been accompanied by a corresponding growth in the supply of transport services and supporting logistical services. Such a state of affairs has been attributed to a few factors, such as the order processing needs and logistical means of e-commerce, which differ greatly from those of the traditional trade serving industrial supply chains. Traditional trade is characterized by the movement of large quantities of goods. These are assembled in load units that can be tracked or localized. In addition, industrial supply chains typically involve a few large buyers and a limited number of suppliers; the resultant transport demand is therefore relatively predictable. On the other hand, in e-commerce, buyers' orders are often the subject of numerous and small shipments, whose origins and destinations are widely dispersed. The corresponding transport demand is quite unpredictable because it stems from orders placed by a large number of buyers. The main challenge is to manage the entire order fulfilment system to meet customer expectations while controlling inventory and transportation costs.

Moreover, retailers operating solely online are most often without the logistical infrastructure and experience to handle electronic transactions. They need to reorganize their internal procedures, structures and modes of communication according to the requirements of a digital environment. This involves the introduction of new forms of resource sharing with different partners and the establishment of information on sales to wholesalers, shippers, manufacturers, designers, and even suppliers of raw materials. Finally, warehouses and other traditional logistics facilities are not suitable for retail e-commerce. In general, e-commerce-specific distribution networks now consist of multiple, small distribution centers across the country, or an execution or shipping contractor with access to a network of centers, distribution on a continental scale. A limited quantity of products is stored in these centers, which are frequently replenished.

Fig. 4: Global e-commerce logistics market by service type

Source: Research and Markets (2017).

On the other hand, another dimension of such a relationship that deserves to be considered more widely is that relating intelligent transportation to e-commerce. Intelligent Transport Systems (ITS) corresponds to transportation systems that apply advanced information systems for strengthening transportation and logistics, presenting a paradigm shift in the transportation field. With the ability of e-commerce to perform global trading transactions over open networks and deliver products and services, in which geographical boundaries lose their meaning, is

creating a paradigm shift in commerce. Intelligent Information and Communication Technologies (IICTs) is the combining element in ITS and e-commerce. In fact, the emergence of intelligence technology has given businesses a competitive edge and is available to developers or businesses of any size or budget. According to some recent studies published by TechRepublic, more than 60 percent of businesses used AI tools in some form in 2017, a significant increase from 38 percent in 2016. Of those businesses, 77 percent say they use AI to improve their marketing and sales processes. Using intelligent transportation in e-commerce strategy can be as simple as trying out a standard AI tool that suggests products to customers and generates email recommendations through machine learning.

In fact, the utility of intelligent transportation systems in e-commerce cannot be undermined. Packing, Storing, shipping and tracking of thousands of goods from web retailers have become a successful business for express shippers, transportation companies and traditional postal departments. Shipment tracking was the first communicating internet application to find a market in freight transportation. Today, this is just one of many applications available on internet. Other applications include programs covering customs clearance, bookings, insurance claims etc. A recent study quantifying the usage for internet for business-to-business (B2B) applications revealed that for some carriers, great parts of their interactions with customers are now carried out online (see Krishnaswamy (2002)). In another survey conducted by DHL (Dalsey, Hillblom and Lynn) International GmbH, it was found that e-commerce would be the primary driver of growth in their industry.

Krishnaswamy (2002) emphasizes the relevance of ITS to e-commerce as follows: products and services ordered over the internet require more delivery trucks on the road to homes and businesses. ITS deployment streamlines the complex, large-scale freight handling and service delivery systems and increases efficiencies in transportation infrastructure maintenance. There could be important advantages from integrating ITS and e-commerce. This could apply to multi-modal transport; including rail/road interfaces, port operations, as well as line-haul operations. Similarly, integrating ITS and e-commerce could improve supply chain management by providing useful tools for real time scheduling of operations. Improving information flows over the internet about movement of goods facilitate tracking of goods on its entire route. Organisations could move towards virtual integration, where they create and compete through extended, integrated supply chains (Krishnaswamy (2002)). Furthermore, ITS could contribute to the B2B integration. B2B is known as one of the massive strategic trends in industrial sectors. In the recent decades, many organisations are moving from internal application integration towards integration between business partners. B2B provides links between an organisation's key systems and the applications of its trading partners, customers and suppliers. This allows corporations to work with their associates, outsource manufacturing, work with third-party logistics providers and link with their customers. Some analysts predict that B2B integration would give birth to the long-heralded notion of the virtual corporation (Krishnaswamy (2002)).

However, the potential benefits identified by previous research, there is a remarkable lack of a robust ITS-based e-Business cases. Although the necessary technology exists and the internet provides opportunities for more cost effective integration of systems and services, many e-commerce enterprises are not sustainable and great ideas do not develop further. Many applications are still too expensive to purchase and install, they require substantial upfront investments and the returns will take many years to materialize. This leads us to the conclusion that much greater efforts should be made, both theoretically (research and studies) and professionally (investments) in order to take advantage of the two technologies, that of ITS as well as that of e-commerce. In the near future, it would be interesting to better integrate modern optimization strategies (Rabbouch et al. (2018); Rabbouch et al. (2019a)) within these intelligent systems connecting ITS to e-commerce in order to better adjust this relationship, and therefore, allow better exploration and knowledge of the opportunities of existing investments. It should also be mentioned that the development of such systems in the context of smart cities would also be of great interest (Rabbouch et al. (2019a); Rabbouch et al. (2019b); Rabbouch et al. (2019c); Saâdaoui et al. (2019)).

Impact of E-Commerce on Transportation and Logistics Systems

In this section, the impact of e-commerce on the sectors directly related to transportation infrastructure is emphasized. In fact, given the dynamic evolution of e-commerce all over the world, E-commerce is expected to have a significant and varying impact on transportation systems. On this assumption, the demand for transportation services is obviously expected to increase. In the literature, only a few works have examined the question over the two past decades. Despite this, the main analyzes in this context were rather qualitative. Without confirming his hypothesis, Stiller (2003) explained theoretically how e-commerce can lead to the growth in the average distance travelled. In one of the rare empirical works, Lenz (2003) proved only slight reductions of total shopping transportation has been caused by e-commerce consumers. Basbas (2006) attempted to identify the advantages and disadvantages of e-commerce in regards to freight transport and person trips. Mindali and Weltevreden (2013)

reviewed the main conceptual and quantitative studies on the implications of b2c e-commerce on mobility, and recently, Muralidharan (2018) attempted to analyze the impact of e-commerce on the parcel carriers in the EU and the US.

Let us focus on the following scenario, which can help understanding the impact of e-commerce on transportation and logistics systems. In this illustration, we consider the example of new, casual, non-business buyers, and far less informed than commercial shippers, leading carriers to introduce a range of online consumer-oriented supply chains characterized by higher volumes, origin and destination of goods and better adjustment capacity. Since consumers demand delivery within 24 hours, or even the same day, suppliers in the electronics industry, regardless of the size of their business, will have to keep significant quantities of goods not only in their own premises, but also in distribution centers across the country. Such a shift will reverse the trend of inventory reduction that has contributed in recent years to lowering costs for firms in industrialized countries. Companies will need to revise their distribution networks and it will be more efficient and cost-effective to deliver products to consumers than ever before, hence the need to expand infrastructure.

At another level, the supply chain comes with all kinds of activities: ordering, billing, representation, warehousing, shipping, insurance, customs clearance, distribution, wholesale and retail. The execution of these activities involves multiple interlocutors, who must exchange information and pay their respective services. Overall, these activities correspond to complex links between different companies and involve the exchange of various types of information. The ability to communicate information online allows service providers and shippers to share information and data in real-time and thereby collaborate in the planning of the activities in question. In addition, having easy access to information gives shippers, including small companies, more leverage in defining their needs and negotiating with service providers. The ability to effectively share information will be a critical factor in the survival of transportation and logistics service providers in the global marketplace.

The online services offered by these providers via the Internet will enable a shipper to enter an order into its resource planning system that will be automatically transmitted to the carrier via the carrier's transportation management system services. The system will determine and confirm the price, acknowledge receipt of the order, send the appropriate messages for the handling of the goods, notify the carrier and the consignees, acknowledge receipt of the carrier's invoice and pay for it, all automatically. By accessing a single website, the shipper will obtain a personalized overview of all goods in transit, inquire about the status of the shipment, consult exception reports, organize the pick-up of goods and inform its service of the purchase of the free real price of goods in circulation around the world.

E-commerce also helps reducing the role of freight forwarders and other traditional intermediaries. However, some of these intermediaries having adopted new operating methods (e.g. value-added logistics services), their services continue to be the subject of a request. Through the Internet, intermediaries can more easily access chargers and carriers, enabling them to provide integrated door-to-door services. In addition, it seems interesting to use intermediaries such as freight forwarders because of their experience and specialized knowledge in various fields (transport, storage, packaging, letter of credit formalities, customs issues, import licenses, etc.). Even if a particular shipper can obtain the information on the Internet, the range of services a freight forwarder can offer a value-added service that shippers remain ready to buy.

Visser and Lanzendorf (2004) was among the first works to review the literature of relationship between mobility and accessibility effects and e-commerce. The main questions they addressed was how e-commerce affects (a) individual activity patterns and travel behavior, (b) freight transport and logistic decisions of firms, and (c) the location decisions of households and firms. The review showed that the short-term mobility effects of B2C are relatively strong, and that an increase in both individual travel and freight transport can be expected. The long-term changes for physical accessibility and mobility, in contrast, was less clear and harder to deal with, due to the complex relationships, data problems, time lags and methodological attribution problems. A summary diagram (Figure 5) was proposed by Visser and Lanzendorf (2004) on the effects of B2C e-commerce for various aspects of freight transportation, particularly size, composition, duration, frequency, modality and spatial patterns, taking into account a variety of mechanisms:

- Size and quality of consumer demand
- Distribution systems
- Responses in the logistic and transport sector
- Location behaviour of firms in this sector.

In the diagram, the signs (+ and -) above arteries mean the nature of the relationship (contribution of e-commerce) be it positive or negative, respectively.

Fig. 5: Effects of B2C e-commerce on freight transportation.

Source: Visser and Lanzendorf (2004).

We finish this section with a reasonable evaluation of the future of transportation sector in relation with e-commerce. The recently presented analysis by Prince (1998) concluded that the long-term prospect of developing a transportation stock market remains intriguing and we may see further attempts towards this direction in the future. Nevertheless, a number of regulatory issues must be resolved for this development to take a serious turn. Information is known as to be an essential part of the supply chain and will continue to drive change in the transportation and logistics markets. According to the same author, e-commerce will be a major element in this transition. Due to e-commerce, an expected market shake awaits the transportation industry. The number of transportation and logistics e-commerce products is increasing daily. Despite their success in attracting venture capital, most will succumb to the handful of survivors who, in turn, will be absorbed by mergers and acquisitions. And while many B2B sites claim to eliminate the need for intermediaries, many become fully-fledged intermediaries.

Sustainable e-Business Models for ITS

The principal challenge for an intelligent transportation and logistics company is to beneficiate from the opportunities offered by new digital technologies. According to a 2016 study conducted by startup Freightos, 86% of logistics decision makers acknowledge that technology is the best way to increase efficiency and keep costs under control. Although the ITS technology has known an important evolution the last years, several other examples of products and services in the ITS industry could be integrated with, or make use of digital technologies. Despite all that, the opportunities offered by IICTs have remained little exploited. In the following, we present according to Giannoutakis et al. (2011) few examples of ITS technologies, where the internet could create further business opportunities.

Advanced Traveler Information Systems (ATIS): These systems provide personalized information to the user, such as traffic state, route selection, options of public transport, destination and warning messages for potential dangers (Rabbouch et al. (2017), Singh and Kumar (2010), Yang and Huang (2004)). Many of them are geographically based and operate online. They offer an tremendous opportunity for e-Business model development, through for instance, offering information on products of third parties, or even operating as platforms for added services, such as reporting defects on the road and updating online information about routes (Giannoutakis (2011)). They could also include tourist guide information for popular sites, such as suggestions for car rental and online hotel booking.

Public Transportation Service (PTS): This service represents one of the domains where intelligent transportation systems have already largely progressed and are today revolutionizing classical transportation services (Vanajakshi et al. (2009) and Velastin et al. (2004)). Extensively used examples of ITS are passenger information systems at train stations and bus stops, embedded surveillance cameras, online bookings and robotic payment systems. Further developments can be anticipated in the near future, for example, implementing other internet-based technologies on public transportation, such as improvements in the integration of traveler information with mobile technology and enforcement of Wi-Fi networks, which could create new business opportunities for third parties.

Electronic Payment Systems (EPS). EPS (also known as Electronic Toll Collection) is a promising and growing field where e-commerce can eventually dominate. (Chen et al. (2007), Odeck and Welde (2010)). This equipment allows assessing jamming automatically, by recognizing vehicles' registration numbers. Neither have the drivers to stop at toll courts, nor are officials required to collect the tolls. Private companies or public authorities could enable, via internet, prepayment of tolls, or even discounts, for frequently used route sections, by letting road users to create accounts through their websites. EPS could also be used as helpful mechanism for tracking down vehicles linked to prohibited activities and assist law application.

Electric Vehicles (EV): The increasing ecological concerns recent years has led to the growing interest on hybrid and electric automobiles (Yang (2010)). Numerical intelligent technologies are expected to contribute to the formation of online business for this category of vehicles, for example by providing online information about charging poles, or, by selling online credit for vehicle charging on a pay-as-you-go basis with a registered smartcard.

Conclusion

E-commerce is nowadays one of the most important and fastest-growing aspects of today's retail landscape. Within this rising sector, cost and efficiency management revolves mainly around how well the transportation and logistics industry manages the same factors. Indeed, an extensive logistics network is critical for ensuring smooth delivery of the goods in the e-commerce industry for order fulfilment. The transportation and logistics sector represents a leg of this process, which several companies choose to complete with their in-house logistics and transportation facilities. Accordingly, the aspect of transportation and logistics is an indispensable column of the e-commerce ecosystem especially in the ones that involve tangible goods. This fact is reviewed throughout this paper in both directions, that is, how transportation and logistics influence e-commerce, and vice versa. We also focus on the incorporation of new smart object technologies on the quality of e-commercial service in relation with smart transportation. In this area, the practices of the major players, such as Amazon or FedEx, are linked to the expectations of consumers who are increasingly large. For example, you want to be able to receive your order the same day or you can benefit from greater flexibility in returning goods. The intelligent logistics aspect of e-commerce therefore already plays a key role, which will undoubtedly become even more important in the future. Furthermore, the paper not only emphasizes the positive effects on the society, but also detrimental ones, in particular on the environment. The role of intelligent technologies is also highlighted in this context by showing, referring to a set of recent works, the potential impact of integrating these techniques on the reduction of the damaging effects of e-commerce in relation to transportation and logistics. Nevertheless, all that has been highlighted above about the relationship between transportation systems and e-commerce is expected to evolve over time, especially with the occurrence of many global crises, such as the case of the current health situation. Therefore, it would be interesting in the near future to deeply study this change in the current context of the COVID-19 pandemic. Noteworthy that the availability of considerable amounts of data may be necessary for allowing a robust statistical modeling.

Acknowledgment

We would like to thank the anonymous reviewers for their insightful and constructive comments that greatly contributed to improving the paper. Our many thanks go also to the editorial staff for their generous support and assistance during the review process.

disclosed. The research is aimed at assessing the impact of the elements of the process of purchases on the buyer fatigue at urban retailers. An experimental designed method to estimate the effect of the shopping environment on energy fatigue consumed in purchase process is presented. The result can improve the quality of shopping services on decreasing average fatigue level (energy cost) in store

Keywords: Energy, Buyer, Total Energy Expenditure, behavior, marketing.

Introduction

Market relations in Ukraine are constantly evolving, which greatly contributes to the development of trade services (Galkin, Dolia, Davidich, 2017). On the other hand, competition between trade organizations and supply systems is growing. The sharp increase in the number of retail outlets with different quality of service and price ranking means that supply systems must adapt to changing demand conditions (Ibrahim, McGoldrick, 2017). In such conditions, the analysis of the consumer market and the identification of the service area of the trading company is one of the forms of improving the efficiency of trade organizations.

The problem of distribution of demand between retail has been considered by many scholars from different points of view. The growing competition between logistics systems and technologies for the promotion of goods forces to look for new opportunities to improve their operation, taking into consideration buyers (Halkin, 2018). Consideration of the functioning of the system at the stage "Shop" - "Household" allows you to take into attention factors that have not been considered in the current models and methods.

The problem of the quality of shopping services constantly worries buyers and sellers because of quite natural causes (Birkin, Clarke, Clarke, 2017). The growth of material well-being of people causes the raise of their cultural level, which leads to the desire to buy quality products at a high level of service. Many factors influence buyer in the shopping process (socio-cultural, personal, psychological factors, situational influence, marketing influence), each of which may have a decisive influence on the magnitude and timing of fatigue (Kotler, Dubois, (2009) and as a result the buyer will make a purchase or not. Consumer studies attempt to understand the decision-making processes (Scott, 2017), etc. But those methods provide not full information on consumer's fatigue (Lemon, Verhoef, 2016). Consumer in the process of purchases requires new system approaches to measure fatigue. Neuromarketing is an innovative direction to improve the effectiveness of the company's marketing communications (primarily merchandising and advertising), by influencing the behaviour of a person as a potential buyer, taking into account the neurophysiological features of the process of making a purchase decision (Galkin et al, 2020). The study of buyer fatigue by examination energy consumed in the monitoring purchase process and the development of recommendations for improving the activities of retailer to reducing the fatigue on their basis is an actual topic of research that is not fully disclosed.

Purpose of the article: The aim of the research is to developed method to assess the fatigue of the buyer visiting any retailer according calories spend in purchase process.

Methods of Research

Methods for determining the number of calories consumed

The number of calories a person spends in different activities is a function that depends on the sex of the person, his age, weight and type of activity performed by the person (Lincoln, 1972).The process of consuming the goods is closely linked to the concept of the process of consumption. The cost of actions in the process of consumption of goods:

$$E^{cn} = \sum_{p=1}^{P} E_p = E_{\omega}^{prep} + E'^{movm}_{\omega j} + E_j^{TS} + E''^{movm}_{j\omega} + E_{\omega}^{aftsell}, \quad (1)$$

where E_{ω}^{prep} – the value of energy consumption of the end-consumer at the preparatory stage of consumption, preceding the purchase, kJ (kcal); $E'^{movm}_{\omega j}$ – the value of energy consumption of the end-consumer when travelling from the zone ω to the retailer *j*, kJ (kcal); E_j^{TS} – the value of energy consumption of the consumer during the shopping service in the *j*-th retailer, kJ (kcal); $E''^{movm}_{j\omega}$ – the value of energy costs in the delivery of the goods from

the *j*-th retailer to zones ω destination, kJ (kcal); $E_{\omega}^{aftsell}$ – the value of energy consumption of the end-consumer at the after-sales consumption, kJ (kcal).

The preliminary stage of consumption, which precedes the purchase itself, includes the following elements: awareness of product needs, information seeking and alternative valuation. In practice, this stage is related to the list of goods and their quantity, possible places of purchase, possible ways of purchase (store, Internet, etc.). The choice of product depends on the amount of time spent on the purchase. Choosing a purchase method determines the following elements of the process of consumption of material flow. So, when choosing shopping through a store, the consumer in the first stage needs to go or get to him. The consumer chooses a way of moving: on public or individual, if it is available, of transport. Depending on the type of transport chosen, the consumer determines the routes, the parameters of which affect the time of movement from the sending area to the store. The authors of the study made it clear that the age of consumers and their individual characteristics, which are determined by the type of the nervous system, are strongly influenced by the choice of the mode of transport and the route of the route. After arriving at the store, the consumer spends some time in a store, which is spent on the choice and purchase of goods (trade service). After that, the end-consumer needs to return to his destination (home, work, etc.) and deliver his goods. When choosing an online shopping method, such items are missing. The final stage is after-sales consumption, which may include the assessment of the results of the purchase, direct use or consumption (eg, cooking) and deprivation of the used goods.

To estimate consumption of end users, it is advisable to use experimental methods based on the collection of real-time information. These include the use of electronic watch Smart (Galkin et al., 2018), which calculates the number of meters travelled, time spent, and calories at different stages of the purchase process. This will make it possible to more accurately assess these parameters, comparing them with theoretical methods.

Estimation of the monetary costs of end-consumer fatigue

Estimation of fatigue is carried out on the indicator of energy cost of movement. This value characterizes the direction of the energy regulation channels in the human body (Drewnowski, 2011). For any consumer activity, energy is consumed (Kidwell, Hardesty, Childers, 2008). The amount of energy expended depends on the amount of effort spent on one or another element of the consumption process. Estimation of the amount of energy expended is carried out in various ways, among which one can distinguish: cost of action (Keytel, et. al., 2005), pulse based on built-in sensors (Baevskii, 2002), etc.

Determining the cost estimate of the energy costs of the human body in the purchasing process is based on the analysis of the required amount of calories for human existence (Postanova K. M. U., 2000). According to the normative documents, the daily consumption of calories for normal functioning is 2790.8 kcal (Monsivais, et. al., 2013). But this value may depend on gender, age, physical activity of a person. Difficulty valuation calorie value is 1 kcal different due to different levels of income, the cost structure of the budget and human households, as well as different value of the products and their usefulness to humans (Halkin, et. al, 2019).

The cost of 1 kcal is determined based on different incomes of citizens, the structure of expenditures of one person's budget and households' budget, as well as the different cost of the products themselves and their usefulness to humans. American and British scientists in medicine have achieved great success in these studies in creating diets and proper healthy eating. Their research indicates that «healthy» food costs three times more than «unhealthy» food, as a result of which the price gap between them increases. The study looked at nearly 100 popular food items, which were determined according to government criteria as healthy or not. The results indicate that 1,000 calories of «healthy» food, such as meat, salmon, yogurt and tomatoes, cost an average of £ 7.49 in 2012 (Drewnowski, Darmon, 2005). Calorie intake of less healthy foods, such as pizza, beef cutlets, and donuts, was cheaper by an average of £ 2.50. The gap between the two categories of food is £ 4.99. In 2002, this gap was £ 3.88. The average increase in the cost of «healthy» food was £ 1.84 per 1,000 calories over the decade, while the cost of «unhealthy» food increased by only 73 pennies (Monsivais, Drewnowski, 2007).

The choice of food is based on taste, cost and convenience, and, to a lesser extent, health and variety. Taste refers to the sensory appeal of products such as taste, aroma and texture. The concepts of taste and energy density are intertwined, because most high-calorie foods are usually the most delicious and vice versa. The energy density of products is defined as energy per unit mass or volume (kcal/100 g or MJ/kg) (Ainsworth, et al, 2011).

The choice of consumer products affects the cost of calories consumed by a person (Ainsworth, 2013). Existing methods for determining the required number of calories are based on diets and human consumption (Blaydes, Kayser, 2011).

Studies show that highly developed countries such as the United States and the United Kingdom have higher absolute food expenditures, but the share of household consumption spent on home-cooked food is low – less than 10%. In Kenya and other low-income countries, the share of consumer spending devoted to homemade food can be as high as 50%. Per capita calorie consumption data show an inverse relationship. In 2015, per capita calorie consumption in the United States was at a high level of 3,639 calories per day, while Kenya had only 2,189 calories (Dąbrowska, 2011).

The cost of human energy cosumed is proposed to be determined by dependence:

$$S_{KCal}^{cn} = \frac{\sum_{1}^{M}(Q_{\omega} \cdot P_{ціна})}{ALF \cdot T_{cons}}, \tag{2}$$

where Q_{ω} – an individual need for a material flow of 1 resident for a period of time living ω-th zone for the analysed period, for normal functioning of the organism, kg / inhabitant (unit / inhabitant); $P_{ціна}$ – material flow price, UAH / kg (unit / inhabitant); *ALF* – daily energy norm of the person (consumer), kcal; T_{cons} – time consumption of good, days.

Determination of the value of energy costs can be found by the formula:

$$\Theta_{3}^{ij} = E_{\omega j}^{cn} \cdot S_{KCal}^{cn}, \tag{3}$$

where $E_{\omega j}^{cn}$ – energy consumption of the consumer in the process of development of material flow, kcal; S_{KCal}^{cn} – cost of one calorie, UAH / kcal

People with different incomes and cost structure may have completely different probabilities of choosing retailer. The regularity of the impact of end-consumer flows living in different zones show differ demand at store.

Results

In order to find the initial values of the parameters of end-consumers and retailer, natural studies were conducted. The studies use a two-stage methodology for determining the relevant geographic retail market (Halkin, 2020): distance, the non-linearity factor, slope factor, etc., fig. 1.

Figure 1 – Trading area:

1,…11 – zones; A,..,O – stores.

The research was in visiting retailer via end-consumers in the service area and monitoring the selected indicator: the number of calories consumed for a one-time visit to a retailer. For all consumers, a single set of goods (consumer basket) was selected. In general, 27 people (women and men) aged 19-65 participated in the study. The received data are presented in the table 1.

Table 1: Total energy costs when walking from the store

I	3,13	4,07	4,42	4,52	1,90	2,20	2,93	0,37	2,16	2,75	3,48
J	5,62	6,05	6,04	5,57	3,96	4,08	4,44	2,53	0,81	1,79	2,87

Attractiveness of visiting retailer:

• A higher size of retailer, slope factor, none linearity factor, distance to retailer, higher income of the end-consumers causes a higher value of cost associated with purchase;

• Lower level of fatigue (calorie spend) of the end-consumers ensure small size of retailer, slope factor, none linearity factor, distance to retailer and low income of end-consumers. Therefore, if the end-consumers what to lose they should choose vice versa retailers with higher value of named parameters;

• The presence of a large number of end-consumers increase attractiveness of any retailers in this zone;

• Retailer D and G will have the highest value of probability of visiting, retailer B – the lowest, due to high generalized costs in them;

• Number and assortment of goods and prices, ultimately the choice of retailer.

This research provides further explanation of attractiveness methods of visiting retailer. The regression models that describe the time and energy of the end-consumers in and out of retailers were obtained. In contrast to the existing approach to planning and evaluating the generalize costs based on the subjective opinions, our method is based on the real purchase process calculation in particular zone. The presented factors' variation range covers typical residential zone for Ukrainian town. The proposed approach can be applied to any other town, extending the variation range.

Conclusions

The approach to estimation of the (fatigue) energy costs of end-consumers of visiting the retailers was presented for the first time. For the first the energy costs (fatigue) in monetary formed was determined in dependence of purchase process parameters. Developed model can be used for macro and micro simulation of residential zones and assessing probability of visiting retailers.

The calculated and experimental value of energy costs can be found to any retailer. According to it level of fatigue can be assumed and compare to the competitors in trading zone. Existing retailer selection methods rarely explore online monitoring of fatigue in purchase process and have never used energy consumption as a rating criterion. The Huff model (1963) underlies this study. The ability to use the inverse level of emotional shift, as a utility, presents new opportunities to apply Huff models. The proposed method can stand like additional factor in Scott, (2017); Oruc, Tihi, (2012); Nakaya, T., et al, (2007). and other models as one of the variables. The buyer compensates for the low value of one factor (attribute) by a higher value of another. Using real-time monitoring of buyer energy consumed in the purchase process provides greater opportunities for assessing the level of quality of shopping services and more accurate results.

The result can improve the quality of trade services by creating conditions conducive to a more favourable environment for shopping, planning sales areas, retailer, sales analysis, advertising and analysis customer behaviour. A method can estimate the level of fatigue of the buyer during its visit to any retailer. Also, the average fatigue level of retailer can be found. The improved model leaves quite a lot of freedom to describe utility. The scheme does not prohibit the use fatigue as an average estimate, or its total value for all residents of the zone. Often, the utility refers to the distribution of visits or distribution of retail outlets by the criterion of maximum importance for the consumer.

Abstract

One of the main functions of the state is the purchase of goods, works and services to meet public needs. More than 30 thousand tender organizers are undertaking procurement activities in Ukraine in the public sector of the economy. The annual volume of public procurements in 2018 amounts to more than 300 billion UAH (8.5% of Ukraine's GDP). The aim of the study is to identify the factors that affect real budgetary savings of public procurements. Using the method of economic and statistical analysis, the influence of intensity of competition and expected procurement value on the amount of budgetary savings has been investigated and the factors that reduce public procurements efficiency have been identified. The hypothesis of the study is that the value of budgetary savings in public procurements cannot be determined as the difference between the expected and the actual value of the purchase in the absence of a common methodology for determining the expected value of the purchase. It is proved that the lack of automatic price monitoring in the electronic system ProZorro, low level of competition in the tenders, significant losses due to the violation of the law by the customer and the improper performance of the economic and legal relations by the entities of the procurement contract are negative factors that influence the efficiency of public procurements. In the age of digital transformation, the determination of fair purchase value is determined automatically, which prevents the buyers from purchasing products at inflated prices and hereby report on achieving economy.

Keywords: Public Procurements, Public Tenders, Intensity of Competition, Budgetary Savings.

Introduction

The deficit of the state budget requires the government to take measures to improve the efficiency and effectiveness of the use of the budget funds. Public administration bodies are consumers of goods, works and services thereby affect the private sector through the public procurements mechanism. The public procurements mechanism stipulates that spending units and recipients of budgeting funds use taxpayers' money publicly to implement government programs within the framework of the state's economic policy. The development or restriction of competition depends on the budget performance. Intense competition of suppliers for government contracts leads to cutting of purchase prices and budgetary savinthegs. Inefficiency of public procurements lead to overspending of public funds, which means disrespect of taxpayers and cost overruns. excessive expence.

The main task of public procurements is to create favorable conditions for competition of market relations participants in the field of production, supply, provision of services and construction.

Literature Review

Procurements in the public sector are considered as the part of aggregate government expenditures that affect aggregate demand and economic growth. Public procurements are the components of the economic reform and government development program and they are aimed at reducing of public spending by achieving efficiency and cost-cutting of public finances as evidenced by the experience of the EU (Tkachenko, 2016), (Tkachenko et al, 2020), (Baranovsky et al, 2020) and other countries.

Significant budgetary savings can be achieved through public spending reform at «more at less cost» principle, notes Piontkivska (2016), and states that the greatest economy can be achieved through increased transparency of public procurements in the ProZorro electronic system.

Kindzerskyi (2015, p. 7) considers that the regulatory influence of public procurements to solve social and economic problems in Ukraine is destructive and disincentive.

The positive influence of public procurements on the development of the national economy can be achieved by giving preference to domestic producers, which will stimulate national production and employment through receiving state order and increase the efficiency of public procurements (Huzhva, 2018), (Halasiuk, 2018), (Mustafina, 2018).

The active position of the Ministry of Economic Development and Trade of Ukraine, Public Organization Transparency International Ukraine, the Center for Excellence in Procurement is to prevent discrimination on a national feature in public procurements, as preferences for domestic producers are violation of international agreements, a corruption factor in confirmation of goods localization and they don't provide competition of production in the domestic market and there are no incentives to compete for price and quality (Romaniuk, 2017).

The EU project «Harmonization of the Public Procurement System in Ukraine with EU Standards» (The EU…, 2013) states that electronic auctions in the EU are not aimed at solving corruption problems and significant reducing of the procurement price, but they are a significant factor of higher transparency, reduction of operating costs of customers and suppliers, easier management of the procurement process through their automatization.

We agree with the conclusions of scientists (Shapoval et al., 2017) that intense competition in tenders leads to lower prices. But according to the ProZorro electronic system, intensity of competition in competitive procurements is only 2.7 participants, by contrast to 5.4 in the EU (Costantino et al., 2012).

According to Stepaniuk (2017), the overestimated purchase value does not increase competition, but has negative consequences. Thus, public procurement depends on the presence of stimulus factors (positive impact) and deterrent factors (negative impact) (Khovrak et al., 2015).

In today's scientific environment, an understanding of the importance of transparent and efficient public procurement has emerged as it is capable of providing economic growth (Kaigorodova et al., 2018), development of social responsibility (Kaigorodova et al, 2017; Khoma et. al., 2018; Koziuk et. al., 2019; Trynchuk et. al., 2019; Trunina & Khovrak, 2019; Glonti et. al., 2020) and reduce the risks (Pyrkova et al., 2018).

The conditions for achieving budgetary savings in public procurements are the use of analytical tools to determine the expected fair value of the procurements, the high intensity of competition, the reduction of financial loss risks due to violation of legislation by the customer.

Aims and Methods

The purpose of the study is to identify the factors that affect the real budgetary savings of public procurements. A method of economic and statistical analysis was applied to achieve this goal, which made it possible to compare the amount of budgetary savings depending on the expected value of the purchase, the level of competition at the tenders and the execution of procurement contracts. According to the ProZorro electronic system, the structure of budgetary savings in public procurements has been analyzed, depending on the intensity of competition, the expected value of the procurement and procurement methods. The correlation dependence of the amount of budgetary savings on the influencing factors has been investigated.

Data Analysis and Results

According to the data of the ProZorro electronic system, budgetary savings in public procurements in 2019 amount to UAH 34,85 billion, which make up 3,35% of the expected value of the procurement. Depending on the intensity of competition, relative budgetary savings increase from 0.1 to 10,9% (Fig. 1).

Figure 1: Value of the relative budgetary savings, depending on the intensity of competition
Source: calculated according to the data of analytics module (Competition, 2020)

The highest level of competition for completed competitive procurements is observed in the open public tenders with publication in English (2.82), although the level of competition and the share of completed procurements are quite low (Table 1).

Table 1: Relative budgetary savings in public procurements in 2019, depending on the competitive procurement method, the share of completed procurements and the level of competition

Competitive methods of procurements	Relative economy of completed procurements, %	Share of completed procurements of value, %	Level of competition
Public tenders	8,3	59,1	2,74
Public tenders with publication in English	8,6	43,9	2,93
Below-threshold procurements	11,4	63,3	2,12
Negotiating procedure for defence needs	4,4	65,2	2,40

Source: calculated according to the data of analytics module (Competition, 2020)

The data in Table 1 indicate that the high level of budgetary savings (more than 5%) was achieved not because of the high intensity of competition, but because of the high expected cost of procurement. The hypothesis was checked on the example of the procurement of gasoline A-92 (Table. 2).

The results of the study confirmed that the high level of intensity of competition produces different result of the economy. In addition, the amount of budgetary savings, which is defined as the difference between the actual and the expected purchase value, does not reflect the real economy. Thus, the inflated price for gasoline (UAH 28.63 per liter) is characterized by a high 20% rate of budgetary savings. Four procurements at lower prices showed lower budgetary savings in the amount of 3-9%. The excessive expected procurement value has led to overpricing of the actual purchase price in comparison to the prices of other purchases. Thus, the hypothesis that budgetary savings in public procurements do not reflect real economy is confirmed.

Table 2: Results of the tender for the procurement of gasoline A-92 in 2019

Tender identifier	Intensity of competition	Actual price per litre, UAH	Relative economy
UA-2019-09-06-000759-b	3	24,58	29
UA-2019-08-28-000186-c	3	27,59	3
UA-2019-08-23-000080-a	2	24,80	6
UA-2019-09-04-000381-a	2	25,66	3
UA-2019-09-06-002098-b	4	25,41	9
UA-2019-08-19-000405-b	4	28,63	20

Table 3 presents the structure of budgetary savings in competitive public procurements during 2018.

Table 3: Structure of the budgetary savings in public procurements in 2019

% of economy	Share of competitive procurement procedures, %
from 0 to 1	44,6
1-5	15,1
6-10	5,1
11-20	5,2
21-30	2,6
31-50	1,9
51 and more	0,6
Total budgetary savings in competitive procurement procedures	75,1

Source: calculated according to the data of professional analytics module (Bi.prozorro, 2020)

The data in Table 3 indicate that 45% of public procurements are carried out without budgetary savings.

We suppose this is due to the low level of competition and the significant share of non-competitive procurements by customers.

66% of procurements are characterized by low level of competition (1-2 tenderers), which are presented in Fig. 2.

Figure 2: Structure of the level of competition in completed competitive procurements in 2019, %
Source: calculated according to the data of analytics module (Competition, 2020)

The analysis of the budgetary savings structure in the process of public procurements according to the ProZorro electronic system has showed that budgetary savings are achieved in four stages of procurements:

1) consideration of a proposal;
2) intention to conclude a contract;
3) suspension of a procurement by appeal;
4) completion of a procurement (signing of the contract).

The structure of budgetary savings at different stages of the procurement process in 2019 is presented in Fig. 3.

Figure 3: Structure of the budgetary savings at different stages of the procurement process in 2019, %
Source: calculated according to the data of analytics module (Bi.prozorro, 2020)

89% of the budgetary savings in 2019 are achieved at the stage of completion of the procurement, when the contract was concluded and published, the other 11% budgetary savings are reached at the stage of proposals consideration and suspened by appeal. The factors of reducing the value of the budgetary savings at different stages of public procurements are reviewed in Table 4. In our opinion, the value of the budgetary savings cannot be determined at the stages of consideration of the proposal, acceptance and appeal, since these stages are characterized by the incompleteness of the procurement. Procurements stopped by appeal are losses and are not cost-effective.

Table 4: Factors of reducing the size of budgetary savings at different stages of public procurements

№	Stages of public procurement	Stage description	Factors that distort economy value
1	Completed procurement	As a result of a tender, a contract was concluded and published between a customer and a winner participant.	1. Expected value of a procurement is excessive and, as a consequence, an actual procurement value is overestimated at a low competition rate. 2. Non-compliance with the terms of a contract or conclusion of additional agreements with price increase.
2	Consideration of a proposal	Documentary confirmation of a tenderer's compliance with the requirements specified in the tender documentation are verified.	A participant with an economically advantageous price may be disqualified for formal reasons.
3	Acceptance	A customer declares the information about the intention to conclude the contract.	1. The decision of a customer to accept an offer may be appealed in a benefit for other participants. 2. Refusal of a winner participant to conclude the contract.
4	Procurement stopped by an appeal	The Appellate Body has found a violation and a procurement is stopped until the customer takes measures to remove violations.	Losses due to a violation of the legislation by the customer that cannot be identified as budgetary savings.

Source: compiled by the authors

According to the ProZorro electronic system during 2019 1.1 million contracts were concluded in the value of UAH 1759 billion, 7% of contracts were broken (in 2018 - 12%); in 19% of contracts value changes were made (in 2018 - 21%) (Table 5). The largest number of canceled contracts are on the results of the procurement:

- of real estate services (71%);
- of additional and support transport services (38%);
- of education and training services (23%).

According to the data in Table 5, the level of competition on tenders is 2.3 participants per tender, including disqualification (1.4), the level of competition is reduced to 0.9 participants per tender.

Table 5: Indicators of the factors of reducing budgetary savings at the stages of public procurements in 2019

№	Factors of reducing budgetary savings	Indicator
1	Low intensity of competition in tenders	2,3
2	Share of unsuccessful procurements for cost, %	34
3	Share of contracts with changes for value, %	19,0
4	Share of canceled contracts, %	7,0

Source: calculated according to the data of analytics module (Bi.prozorro, 2020) and (Competition, 2020)

According to the study results of fuel procurements made by the Center for Excellence in Procurement of the Kyiv School of Economics, it was discovered that the share of additional agreements with price increase was higher, where there was the greatest economy and competition. Every sixth above threshold competitive procurement procedure changes the contract value. The study concludes that budgetary savings would be insignificant (excluding the corruption factor) in holding a new tender instead of signing an additional agreement (Hrybanovskyi & Memetova, 2017).

During the study we have come to the conclusion that when performing below-threshold purchases of standard products, it is more cost-effective to purchase via electronic catalogs with a description of goods on condition that the level of competition is high, instead of a tender with 1-2 participants. Procurement via electronic catalogs is widely used in the EU as a simplified way of purchasing.

Thus, the hypothesis is confirmed that the budgetary savings in public procurements do not reflect real economy, the economy indicator is false due to the overestimation of the expected value of the purchase and, as a consequence, the actual value of the purchase, the low level of competition in the tenders, the neglect of changes in the contract value. In fact, the difference between the expected and actual purchase price does not show the economy but the level of disbursement.

The results of our research have led us to conclude that the main factors influencing budgetary savings value are the level of intensity of competition and the expected cost of purchase (Table 6, Fig. 4). Real budgetary savings are achieved through highly competitive tenders and through centralization (consolidation) of procurements due to their economies of scale.

Table 6: The calculated coefficient of correlation between factor Xi and budgetary savings

№	Factor Xi	Correlation coefficient	Characteristics of strength and direction of relationship *
1	Intensity of competition	0,91	very strong direct relationship
2	Expected procurement price	0,71	strong direct relationship

**- characteristics of strength of relationship are made according to the Chaddock scale*
Source: own calculations

Figure 4: Dependence of the budgetary savings on the number of participants
Source: own calculations

In our opinion the methodology for determining the budgetary savings should be based on the automatic estimation of the average price on the results of completed competitive tenders. The automatic estimated purchase value can be determined by the following methods: the average price of at least three suppliers over the past period in a given region with account of the inflation index.

Conclusion

One of the important issues in the development of public procurements is ensuring of the efficient and effective use of the public funds in procurement. The urgency of the problem is confirmed by the statutory requirement of procurement on the principle of maximum economy and efficiency. The main indicators of public procurements efficiency are the budgetary savings as a result of competition, the level of the intensity competition, the share of completed procurements and the share of concluded contracts. Provoding maximum budgetary savings as the principle of public procurement is possible under conditions of high competition, centralization of the purchase of simple goods and fulfillment of the contract conditions.

The main factors of reducing budgetary savings in public procurements are the over-estimated purchase value and, as a consequence, the over-actual cost of procurement at low competition; failure to comply with the terms of the contract or the conclusion of additional agreements with price increases; disqualification of a participant with cost-

effective price for formal reasons; appeal of the procurement procedure; refusal of a winner participant to conclude the contract; losses due to violation of the legislation by the customer that cannot be identified as budgetary savings.

It is necessary to introduce an automatic price monitoring of the results of completed competitive procurements to determine the value of real budgetary savings in public procurements.

Investigation of High Potential Staff in the Small Business Company

Elena LYSENKO

Ural Federal University named after the first President of Russia B.N.Yeltsin, Yekaterinburg, Russian Federation, e.v.lysenko@urfu.ru

Maria Guadalupe PEREZ LOPEZ

UPAEP, Puebla, Mexico, garachaj@yandex.ru

Abstract

Nowadays being of High Potential employees is the extremely important need in the modern organization of different areas of activity, size and form of ownership. Article is devoted to analyses of relation to phenomenon of "Hi-Po personnel" in the small metal trade company, Russian Federation. Methodology of research, provided by the order of top-manager/owner of company cover qualitative methods – two author's sociological survey, in which managers and key employees took part. The main evaluated parameters from both sides of stakeholders were availability and readiness to become a high potential employee (1); availability of a HiPo assessment system (2); need for HiPo development management (3). Findings of comparative analyses showed differentiation of opinions between staff and leaders in the almost criteria. Novelty of research consists in aspiration to discover opportunity to share talent-management technology on the company of small business, which usually is complicated because of little scale of activity.

Keywords: Human Resources Management, High Potential Staff, Talent-Management, Well-Being on Working Place

Introduction

The need for high-potential personnel is growing every day. Today, the organization wins in the competition most often due to high-quality human resources with high development potential. High-potential personnel retention activities cover organizations regardless of ownership, size, and scope of activity. Despite the fact that most often large companies are engaged in building systems for evaluating and developing the potential of employees, a number of questions arise:

- Do small businesses need employees with high potential?
- Is small business interested in developing the potential of employees to strengthen its market position and attractiveness?
- What should be the system for evaluating and developing potential and how specific is it for small companies?

Our research is devoted to the answers to these questions.

HiPo as a Conception and an organizational strategy

Theoretical frameworks of research are based on some important ideas:

1) Burke L. (1997)*:* HiPo as a leaders who contribute in the company more than other employees.
2) Waal A.D. (2010); Adams, D. (2011)**:** there are a number of universal HiPo competencies, such as ability to adapt to changes; a long-term orientation; constantly improving capabilities; high Intelligence; leadership ability ; good interpersonal skills etc.
3) Derr, C., Jones, C. & Toomey, E.L. (1988)*:* the company can count on their stamina and their willingness to make the necessary personal sacrifices to continue in their fast-paced career paths.
4) Aon Hewitt (2013)*:* investing in a high potential program provides greater benefits and profits to the company.
5) Fedorova, A. (2020): toxic leadership is a significant obstacle to the development of employees ' potential.

We can conclude: HiPo conception is the organizational strategy.

HiPo Models

Modeling of HiPo conception as organizational strategy is crucially important because models help companies to know how to develop high potential employees as organizational resource. There are some interesting and productive Models of High Potential, describing different characteristics of it.

1) ***Burke L. (1007)*** *proposes 3-steps model.* This is a complex model based on clear imagine about expected results of HiPo development.

Figure 1: HiPo Model by L.Burke (1997)

PDI Ninth House (2013): The High Potential Integrated Road Map Model.

The High Potential Integrated Road Model it's a cycle framework which integrate the systems that comprise an effective high potential talent. It contains four elements that make to ensure the organization with leadership and talent. (Fig. 2)

Figure 2: PDI Ninth House (2013): The High Potential Integrated Road Map Model

According to this approach, it is proposed HiPo Model, where two extremely important processes: organizational management and human resources management are combined, that should be provided across key HRM-elements, such as staff planning, staff attractive, staff keeping, staff evaluation and staff developing. (Fig. 3)

Figure 3: PDI Ninth House HiPo Model

Church A. (2016): Leadership Potential Blueprint

This HiPo Model was developed by the Dr. Allan Church, PepsiCo´s Senior Vice President. Model identifies and develops HiPo in organizations. This outlines three blocks, the first one it is the "Foundational" which involve inherit characteristics of a person like personality and cognitive abilities. "Growth" dimension it´s about the capability which an employee has to learn and motivate itself and their peers; finally, the "Career" dimension that form the basis of how employees developed their leadership capability throughout their careers. Performance and Cultural fit also play important roles in employees with long term career trajectories. (Fig. 4)

Figure 4: Church A. (2016): Leadership Potential Model

Methodology

Base of Research

A small trade company E-l Ltd., located and operated on the market of Yekaterinburg, Russian Federation, was chosen as the base of the research.

Initially the company specialized in the sales of ferrous and stainless metal, and also provided services of cutting and delivery; now Ltd. E-l - is dynamically developing company (in 2010) in the metal and engineering market. According to the value and the role of the International division of labor, it is categorized as a "Small business".
E-l Ltd. specializes in two directions:

- Main activity: Shipping black, stainless steel and non-ferrous metal, a variety of special steels and alloys that is in stock in a warehouse in Yekaterinburg, as well as to order from manufacturers;
- A wide range of metal products is always in stock: metal (armature, circle, square, angles, channels, beams, hexagon, wire rod, wire, strip, channel bent), plates (hot rolled, cold rolled, low-alloyed, expanded metal, corrugated, steel sheet, galvanized, stainless steel), pipe (profile, electric welding, hot-rolled, cold-rolled) and

other types of steel. Organizational structure is presented on the Fig. 5.

Figure 5: Organogram of Company (Source: own research, 2019)

Respondents

Respondents of research were managers and key employees on the Job position "saler-manager", because their activity is the main source of profitability of company.

Table 1: Demographic data of respondents (Source: own research, 2019

Age	Sex	Status	Study grade	Antiquity, years
26	Female	Single	Preparatory	2
-	Female	Married	University	5
-	Female	Single	University	7.5
29	Female	Married	University	5
27	Female	Married	College	6
34	Male	Single	University	1
39	Male	Married	University	4
33	Female	Married	University	3
23	Female	Married	College	0.1
31	Female	Married	University	1
24	Male	Single	University	2.5
27	Female	Married	College	5
-	Female	Single	College	1.5
31	Female	Single	University	4.2

Describing of research

Study was provided in 2019 by the order of top-manager/owner of the small metal trade company, operated in the Ural Federal district, Russian Federation.

General purpose - to analyze of relation to phenomenon of "Hi-Po personnel" and to observe being in demand the HiPo assessment system in the Company.

Methodology of research – Qualitative methods. ***Instruments*** – two author's sociological survey.
The main evaluated parameters from both sides of stakeholders:

1) Availability and readiness to become a High Potential employee;
2) Availability of a HiPo assessment system;
3) Need for HiPo development management.

Findings: Comparative Analyses

In the course of the study, a comparative analysis of the opinions of managers and employees according to the criteria identified in the Toolkit was carried out.

Availability and readiness to become a High Potential employee

Despite the fact that the company has a large number of HiPo-level personnel, the level of realization of this potential is very low. (See p. 1.2. in the Table 2)

Table 2: Availability and readiness to become a High Potential employee

N	Comparison Parameters	Employees, %	Managers, %
1 Availability and readiness to become a High Potential employee			
1.1	HiPo staff presence in the Company	87.5	100
1.2	**Level of HiPo realization**	**25**	**33**
1.3	Readiness to become a High Potential employee	87.5	66

(Source: own research, 2019)

Availability of a HiPo Assessment System

While managers claim that there is a HiPo rating system in the company, employees deny that there is One. (Table 3)

Table 3: Availability of a HiPo assessment system

N	Comparison Parameters	Employees, %	Managers, %
2 Availability of a HiPo assessment system			
2.1	The importance of identifying High Potential	100	66
2.2	**Availability of a HiPo assessment system**	**0**	**66**
2.3	**Clarity of applied HiPo assessment criteria**	**25**	**66**
2.4	**Relationship of HiPo assessment with indicators of the competence model**	**25**	**100**
2.5	Using HR metrics to assess High Potential	50	66
2.6	**Adequacy of HiPo assessment**	**25**	**100**

(Source: own research, 2019)

Need for HiPo Development Management

Employees need to design a Hippo rating system more than managers do. (Table 4)

Table 4: Need for HiPo development management (Source: own research, 2019)

N	Comparison Parameters	Employees, %	Managers, %
3 Need for HiPo development management			
3.1	Need for company support in HiPo development	**62.5**	**66**
3.2	Need for a special HiPo development program	**87.5**	**66**
3.3	Benefits of evaluating the HiPo for improving employee well being in the workplace	**87.5**	**66**
3.4	Impact of HiPo assessment on the organizational environment and effectiveness of the organization	**75**	**100**

Discussion and Conclusion

Findings of comparative analyses showed:

a) differentiation of opinions between staff and leaders in the almost criteria;
b) lack of a unified system for evaluating the potential of employees;
c) there is a higher demand for potential assessment among staff than among managers, and a desire to implement it in the company.

The cornerstone to an organization´s growth it's the implementation of a high potential strategy, this step allows the company to be competitive and prepare for various situations that arise in the future. Each organization should create its own concept of working with high-potential personnel, which should correspond to the mission and values, goals and objectives etc. Process of constructing of HiPo assessment system should be complex and concern all stakeholders of company: employees and managers/employers. Another of the advantages of having a high potential program in the company is that it can increase the perception of fairness and impartiality within organization, this help to reduce the turnover and the drop out.

Abstract

The combination of the strategies of Human Resources and Marketing have originated a new tendency called Employer Branding or HR-branding, which has enhanced the image of many companies around the world as good employers, allowing them to attract and retain the talented personnel that each one of these companies needs to reach its objectives. The aim of this research was to evaluate of HR-brand and to define factors which influence on the expectations of the internal customers and the future workforce helping to attract and save talented employees as human resources in the international company operated on regional (the Ural) market of Russia. Methodology of investigation included author's quantitative methods, applying to key groups of potential and real staff, among them there are employees of all Departments (150 persons) and senior students of federal university (70 persons). During research it is discovered that company has established basic employer branding strategies, however, findings on the base of comparative analyses of respondent's opinions showed a differentiation in preferable advantages of HR-brand between potential and real staff. As the main recommendation special HR-branding campaign was proposed for developing of brand of employer. Employer branding should be part of the organizational philosophy to achieve three main objectives: reduce turnover, increase attractiveness of company and improve engagement levels/staff well-being.

Keywords: human resources management, HR-branding/Employer branding, international company

Introduction

Theoretical Frameworks

The combination of the strategies of Human Resources and Marketing have originated a new tendency called Employer Branding or HR-branding, which has enhanced the image of many companies around the world as good employers, allowing them to attract and retain the talented personnel that each one of these companies needs to reach their objectives.

Theoretical frameworks of this research are based on 2 main blocks of ideologemes.

Block 1: HR-branding as a strategy of competitiveness

1) *Jenner&Taylor (2005)*: organizations' efforts to communicate to internal and external audiences what makes it both desirable and different as an employer.
2) *Lievens&Slaughter (2016)*: an employer image is made up of specific attributes that an individual associates with the organization as a place to work. There are 2 attributes of this: functional as objective and material and symbolic as subjective and non-material.

[1] Previous version of this research was presented at SIBR 2020 (Seoul) Conference on Interdisciplinary Business and Economics Research, 5th - 6th June 2020, Seoul, Korea

Cite this Article as: Elena LYSENKO and Laura TELLEZ GANYA " HR-Brand Development: Case of International Company Operated on the Local Market in Russian Federation " Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

3) *University of Alicante:* the establishment of the employer branding strategy meets two very clear objectives:
1st - Position brand as a good employer;
2nd - Attract talent to the organization and retain loyalty to employees.
4) *Acebedo (IEBS Business School, 2015)* about consequences of using HR-branding as a strategy: agile of recruitment, reduction in costs, increase in productivity.

Block 2: EVP and algorithm of HR-branding

1) *Goncer (2014)*: importance of Employee Value Proposition (EVP) as a key element of HR-branding, because EVP accumulate mission, vision and values of company and all organizational processes, including team-management, mode of work etc.
2) *Fedorova et al. (2016. 2017, 2018):* changing of expectations of new generations in consumption, work, and business become the basis of a psychological contract between an employee and an employer and are an intangible asset of the HR-brand.
3) *Peyron (2016) (Employer Branding Academy*): algorithm of HR-branding – 9 steps: Understand the business needs, define the target, understand the target, optimize the EVP, establish objectives and indicators, develop the creative strategy, choose optimum communication channels, design an annual plan, execute the strategy and follow up.

Research of HR-Brand of International Company

Base of Research

***Base of research*:** International Company operated on local market – Leroy Merlin.

Region: The Ural Federal District, Russian Federation

***Background of the Company*:** The Company is an organization of French origin that belongs to the home construction and decoration sector. With almost 100 years of history, the company has presence in 12 countries and almost 400 stores. In 2007 the company joined Grupo Adeo is currently conformed by 24 companies in 12 countries with a total of 62,000 employees, becoming the first French group and the second European in the international market for construction and decoration. The beginning of activities in Russian territory was in 2004. In just 13 years the company has opened 60 stores in 25 regions of the country and according to its strategy of development in the next 5 years the number of stores will be more than double, since they are planning to open 140 new stores.

Describing of Research

Study was provided in 2019.

General purpose - to observe Leroy Merlin Company's HR-Brand and to design HR-branding program, focused on the peculiarity of local staff needs to attract new leaders and talents.

Methodology of research – desk and field with mix of qualitative and qualitative tools.

Program of research is presented in the Table 1.

Table 1: Program of research (Source: own research, 2019)

Stage	Aim	Type	Tools	Sources/Respondents
1st	HR-brand evaluation in social media	Desk study	Content-analysis	Web site of company Social media used by Company
2nd	Evaluation of HR-brand of Company in external and internal environment	Field study	Questionnaire for potential employees	Senior students of University as external clients (70 persons)
			Questionnaire for employees of Leroy Merlin company	Employees on different job positions as internal clients (150 persons)

Findings

HR-brand evaluation in social media

Comparative characteristics of social media used by Leroy Merlin Company are presented in the table 2.

Table 2: Evaluation of social media where Leroy Merlin Company is presented

Employment web site	YouTube	Other
Good practices		
• exclusive website for potential customers • application form to vacancies directly in the employment website • story telling about success of some executives • information about factors, identified as EVP: professional development and training	• location of corporate culture's videos and social development	• using photographs of employees rather than models • publication of internal marketing strategies and vacancies • specific Instagram account for the store in Yekaterinburg
Practices to improve		
• vacancy publications are not standardized • there is no section to upload professional information, so they are not generating portfolio • it is not possible to identify the profile of the desired employee	• in the videos, leaders are not presented as brand ambassadors • there are the sections such as construction of country houses, electrician with your own hands, among others, but no section dedicated to organizational development and career growth	• the Instagram account does not have a defined strategy

(Source: own research, 2019)

The results show that the company is not sufficiently active in social media, which are currently the most preferred sources of job search and employment.

Evaluation of HR-brand by potential employees (external clients)

A) Ranking of preferable aspects for the choice any organization as employer is presented on the Fig. 1.

Fig. 1: Preferable aspects for the choice any organization as employer

(Source: own research, 2019)

B) Recognition of the Leroy Merlin Company as a regional employer is terrific high. (Fig. 2)

Fig. 2: The company's popularity in the labor market (Source: own research, 2019)

C) Meanwhile, almost potential employees do not consider Leroy Merlin Company as a place for work in future (Fig. 3)

Fig. 3. (Source: own research, 2019)

Results of evaluation of Leroy Merlin Company's HR-brand by potential employees' show that despite the wide popularity of the company in the local market and a positive assessment of its brand, potential employees do not seek to choose it as an employer.

Evaluation of HR-brand by employees (internal clients)

A) Stability, salary and professional development is the main reasons of choice for staff of Leroy Merlin Company for working. (Fig. 4)

Fig. 4: The main reasons of choice for staff Leroy Merlin Company for working.
(Source: own research, 2019)

B) A significant preponderance of the employer's strengths and weaknesses indicates a strong internal Leroy Merlin Company's HR-brand (Fig. 5)

Fig. 5: The major advantages and disadvantages of Company

(Source: own research, 2019)

C) The company is interested in developing involvement and uses various ways to develop. (Fig. 6)

Fig. 6: The company's interest in developing of engagement and its methods

(Source: own research, 2019)

D) As result almost employees are committed to company and consider company as a the best place to work (Fig. 7)

Fig. 7: Staff engagement and evaluation Company as the best place to work.
(Source: own research, 2019)

E) Comparison of student's and employees' opinion concerning of choice of working place shows that the features that the students identify in a company that distinguishes itself as a great employer, coincide with the strengths of the analyzed enterprise. (Table 3)

Table 3: Comparison of student's and employees' opinion concerning of choice of working place

Senior students		Employees	
What aspects do you consider that make a company an excellent place to work?		In three words or short phrases, what do you consider to be the three major strengths of the company?	
Offers of competitive salary	3.90	Stability	69%
Motivates and values its employees	3.80	Development / Career growth	31%
Offers professional development	3.64	Social Package / Benefits	22%
Offers job stability	3.59	Good salary/Official salary/High salary	18%

(Source: own research, 2019)

The difference is that students believe that a good employer motivates and values their employees, but this feature was not mentioned by employees as strength of the company. Instead of this variable, they chose the benefit package as one of its strengths.

Conclusion

The opinion of students as the future workforce and external clients and the employees' feedback as the real work force and internal clients is the most valuable and important information to develop Leroy Merlin Company's HR-brand. The discoveries opened in this research are the basis for the establishment of activities and strategies that will help to position this store located in Yekaterinburg as a major employer in the region. So we propose to design the special employer branding campaign to help Leroy Merlin Company to win in the competitive struggle by improving of external and internal brand of employer. Algorithm of HR-brand campaign is presented in the table 4.

Table 4: Algorithm of HR-brand campaign

Steps	Title	Content
1	Setting	***Defining of Strategy of changing:*** Goal setting Focus on external and internal labor markets EPV Key Performance Indicators (KPI)
2	Design	***Strategy of Involvement:*** Recruiting 2.0 Adaptation Benefits Professional development Training Motivation
3	Implementing	***Strategy of Realization:*** Digital Marketing Brand ambassadors Referrals

(Source: own research, 2019)

Employer branding is a strategy with start date but without a final date. Since over time, employer branding should be part of the organizational philosophy to achieve three main objectives: reduce turnover, increase attractiveness of company and improve engagement levels/staff well-being.

E-mail: sergej.vojtovic@tnuni.sk

Abstract

The trend of physicians moving abroad for more favorable conditions of employment is significantly increasing. These physicians constitute a group of highly qualified emigrants, motivated by dissatisfaction with working conditions, the state of healthcare in Slovakia, relatively low salaries, and other push factors. Facilities in the country's healthcare system suffer from their shortage, which is reflected in the negative development of several indicators assessing healthcare and the health status of the population. The main aim of the study is to determine the effects of the departure of physicians from Slovakia on the sustainability of the healthcare system in the country. The analysis of the labor market in the sector of healthcare and social assistance, specifically physicians, has been conducted using mathematical-statistical analysis of data obtained from national and international statistical databases. The analysis of the labor market has been carried out using time series. Regression and correlation analyses with statistical significance testing were used to determine the parameters of the regression function. The trend shows a negative development in regards to the state and sustainability of staffing of Slovak healthcare system. The falling number of physicians of productive age is accompanied by the growing number of physician visits, due to the negative demographic development and the stagnating indicator of healthy life expectancy. This increases the demand for healthcare services; the demand which cannot be met in the conditions of the declining number of healthcare professionals due to their emigrating abroad for work.

Keywords: Physicians, Working Conditions, Emigration, Sustainability.

Introduction

The functioning of the healthcare system in the country is dependent on the adequacy of its staffing, its financial, material, technical and technological equipment, and also on the degree of institutionalization, access to innovations, scientific infrastructure and other factors. Healthcare is a sector in which value added is created mainly by workers, which is a result of the sector's low capital intensity and the high share of wages in GDP (Statistical Yearbook, 2018). Therefore, the state of healthcare in countries as well as the state of health of their population is largely dependent on both the quality and the required number of medical staff. This study looks into and evaluates the adequacy of staffing levels – specifically when it comes to the physicians - in medical facilities in the Slovak Republic. The current global shortage of health workers is adversely affecting healthcare systems in almost every country in the world. The efforts of the International Council of Nurses (ICN) in 2006 resulted in an extensive analysis and informing the professional and lay public about the shortage of health workers in the world labor market and the possibilities of how to deal with the situation (Judith, 2006).

Labor market demand for physicians in high-income countries (Rosling, et al., 2020) against the backdrop of positive economic, political and social changes has forced EU countries to accept immigration from both EU candidate countries and non-EU countries (Ognyanova, et al., 2014). Therefore, steps are being taken to attract needed professionals from abroad (Conclusions ..., 2011; Buchan, 2015). Despite transitional measures in the liberalization of labor markets in the member states of the European Union (Favell, 2014, Bradby, 2014; Buchan, at all, 2014;

Cite this Article as: Magdalena TUPA and Sergej VOJTOVIC " Physician Staffing of Slovakia`s Healthcare system in the Context of Physicians' Emigration" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Srovnalikova, Ditkus, 2016; Kordos, Krajnakova, 2018), the entry of physicians into the labor markets of all countries was administratively simplified (Drinkwater, et al., 2009). "Marketing" activities, the so called push factors of the labor market of developed countries (Kroezen, et al, 2015), attracted the attention of physicians from Central and Eastern Europe, as well as from other developing countries in Asia and Africa (labor market entry was more administratively demanding for physicians from these countries when compared with EU candidate countries). Emigrating to work as a physician abroad has become so attractive to potential migrants that they have been willing to invest time and money in their retraining (1st and 2nd attestations) in order to enter the labor market in the destination country and increase the benefits of their migration (Clark et al., 2002; Bahna, 2011). The aim of creating a single European platform for education and recognition of qualifications was to ensure greater flexibility in the labor market, liberalize services, labor mobility and facilitate administrative procedures (Directive, 2005).

It follows that the current and projected shortage of health workers in EU countries, global competition for physicians and current economic pressures are important reasons why it is necessary to analyze the migration of all health workers and examine its effects on the healthcare systems of individual EU countries (Glinos, 2012). In the Slovak Republic, this issue has become a focus of increased attention only in recent years. Available assessments of the current situation are presented by representatives of political and public authorities, but as such they cannot be viewed as a qualified analysis with results. The adopted solutions are non-systemic and barely follow examples of measures adopted in neighboring countries; measures that often failed to have positive results. While the latest findings published by the Slovak Medical Chamber are processed more thoroughly, they only evaluate the state of the healthcare system in the Slovak Republic and process data on the migration of healthcare workers from available sources. Their research faces serious limitations because there are no databases of migrant health workers. Emigrants in general, including emigrating health workers, are not obliged to report their leaving abroad for work. The only source that at least partially reflects the emigration of physicians is the number of applications for recognition of qualifications, however, even this has become irrelevant as a result of measures to approximate the EU's recognition systems in education that have been in effect since 2013. Analyses in this area are also carried out by some of the Think-tank institutions, but their analyses also focus only on the evaluation of the current situation.

Goal

The main goal of the study was to determine what is the impact of the departure of physicians from Slovakia on the sustainability of the healthcare system in the country. Based on this, a number of research tasks were identified, which, in our opinion, should contribute to the realization of the set goal:

- to determine the current state of staffing of healthcare system facilities in the SR by physicians;
- to evaluate pull and push factors that influence the motives and decisions of physicians to move abroad for work;
- to determine trends in the emigration for work of employees of Slovak healthcare and social assistance system;
- to prepare a forecast of changes in the number of physicians in healthcare facilities in SR;
- to define the current need of Slovak healthcare facilities for medical staff.

Current state of staffing of healthcare institutions in the Slovak Republic by physicians

In 2018, 19 178 nurses worked in healthcare facilities, which was a decrease of 1.6% when compared with 2000 (Table 1). Compared with the base year 2000, we can observe a decrease in the number of employees in each of the analyzed years. The most significant decrease occurred in 2003, 2004 and 2005.

Table 1 : Development of staffing of Slovak healthcare facilities by physicians (2000 – 2018)

	Number of physicians	chain index	base index	Physicians of productive age		Physicians of post-productive age	
				number	%	number	%

Source: authors' own calculations according to data NCZI: Medical yearbook 2000 - 2017

According to the latest available OECD data, all V4 countries have significantly lower numbers of physicians per 1000 inhabitants than the original EU member countries (Table 2). The development of the number of physicians in the V4 countries is relatively stable. The events before and after the Slovak Republic joined the EU caused a slight oscillation. The most significant decrease was recorded in 2009.

A more detailed analysis of the age structure (Table 3) found that almost 27% of physicians were of retirement age. If they stopped practicing medicine, then the Slovak Republic would have 2.58 physicians per 1000 inhabitants, which would be the lowest number among EU countries. We see a slight increase in the number of physicians in 2018, but this number still did not reach the level of the base year 2000. Population growth in the country by almost 1%, population aging, stagnation of the healthy life expectancy increase demand for health services provided by physicians, whose numbers remain insufficient, as they were decreasing until 2018.

Table 3: Development of physician staffing levels in healthcare facilities in the period 2000 – 2018, according to age categories

Source: NCZI: Medical yearbook 2000 – 2017

We cannot look for the reasons for this condition in the decline in interest in studying medicine, because more than 1,000 medical students complete their studies every year. However, graduates often emigrate abroad to work, as evidenced by surveys of medical faculties. According to the dean of the Faculty of Medicine, 8 out of 10 graduates are considering leaving Slovakia and working as a physician abroad. This is evidenced by short-term emigration statistics according to the results of the labor force sample survey in individual quarters (Table 4), broken down by sector (Health and social work) and more precisely national statistics in the target countries (especially Austria, Germany, Switzerland and the United Kingdom).

Based on the above information, we have created a prognosis of the development of the number of physicians of post-productive age working in healthcare facilities in the Slovak Republic until 2022 (Fig. 1). The prognosis suggests that in 2022, there will be 6,469 physicians of retiring age working in the country, with a lower confidence limit of 5,389 and an upper confidence limit of 7,550 people.

Fig. 1: Prognosis of the development of the number of physicians in the post-productive age in Slovakia until 2022

Source: Authors' own calculations

Based on the current setup of the healthcare system, we can assume a negative development with a prediction at the upper limit. This is indicated by the development of employment in this profession in recent years by age, the financing of healthcare system, and the demographic development of the population and its health status.

Mothodology and Data

We have determined the current state of staffing of healthcare facilities in the Slovak Republic by physicians by analyzing time series in the period 2000 to 2018 in the form of basic and growth indices, and comparing the indicator of the number of nurses per 1000 inhabitants in selected countries. The source of information about the subjective motives for the emigration of physicians was authors' own empirical research. We contacted 218 physicians who have worked or worked abroad for at least one year. Respondents filled out the questionnaire online and were contacted via social networks in the period from January 2018 to May 2018. The aim of the questionnaire was to determine the reasons and motives of physicians for going abroad to work, as well as their plans for the future, i.e. permanent migration, re-emigration or return migration. For the purposes of this study, information on the motives for the emigration of physicians to work abroad was selected from the questionnaire. The relationship between the number of physicians working in healthcare facilities in Slovakia and the short-term emigration of health and social care workers was determined using correlation and regression analysis (regression, correlation coefficient, coefficient of determination, ANOVA) at the significance level $\alpha = 0.05$. Based on these analyses, a forecast of the development of the number of physicians for 5 years was prepared, which was based on the time series of the development of this indicator in the period 2000 - 2018. A certain problem in measuring the intensity and the extent of migration of health professionals was the absence of available statistical data (Dussault et al, 2009; Hardy, J. et al. 2016).

The Slovak Republic lacks reliable data on the number of health workers who have gone abroad to work and on their work activity abroad. It is possible to use data from the Ministry of Health of the Slovak Republic, which records applications for the issuance of a certificate of equivalence of education for the purpose of practicing the medical profession abroad, but only until 2013. Since 2013, based on the so-called system of automatic recognition of education between EU Member States, we can no longer consider these data to be relevant. We obtained further information on the number of physicians and the conditions of their work abroad from the data of the National Center for Health Information, the Slovak Medical Chamber and the Slovak Chamber of Nurses and Midwives. A general overview of the migration of health professionals was provided by OECD statistics, namely the topic of health and subsequently Health Statistics for the relevant years, as well as the WHO. However, detailed information is published with a time delay of two to three years. The reports published by the Institute for Economic and Social Reforms (INEKO) of Slovakia and by the Slovak Medical Chamber also provided a general view of the issue.

Empirical Analysis

Causes and motives behind the emigration of physicians for work abroad

According to migration theories (Massey, et al. 1994; Ravenstein, 1889, Palát, 2015), generally motivating factors are low wages, unsatisfactory working conditions (legislative working hours, workload, insufficient equipment, etc.),

geographical proximity of countries with significant pull factors, providing opportunities to acquire skills in the exercise of the profession and more.

The assumption of low wages, healthcare expenditures as a share of GDP, workload (number of physician visits and the number of people in post-productive age) is verified using selected statistical data listed in Table 4. We determine the dependence of individual indicators through correlation analysis in the period 2000 – 2018, whose results are presented in the correlation matrix in Table 5.

Table 4 : Development of selected indicators of the state of healthcare in the Slovak Republic

Year	Short-term emigration in thousands		Number of people of post-productive age in thousands	Healthcare expenditures as a share of GDP (%)	Number of physician visits per year	Number of physicians in persons	Average salary of physicians in €
	Total	Healthcare and social work					
2009	131.7	13.3	665.1	7.9	11.5	17798	1506
2010	124.7	13.5	672.7	7.7	11.5	18110	1569
2011	114.6	16.6	690.7	7.4	10.9	17849	1583
2012	123	16.5	710.2	7.6	11.1	18193	1897
2013	134.2	22.7	733.1	7.5	11.0	18355	2003
2014	136.2	27.1	756.9	6.9	11.2	18574	2135
2015	160.6	35.8	783.9	6.8	11.3	18719	2316
2016	153.5	37.1	814.7	7.0	11.4	18864	2438
2017	149.8	35.3	844.9	6.8	10.9	18608	2514
2018	137.7	25.6	874.3	6.7	10.9	19178	2650

Source: ŠÚ SR: The results of the labor force sample survey in 4. quarter 2009 – 2018.

The correlation matrix shows high dependence between the development of the number of physicians, the level of wages and short-term emigration in the health and social care sector. The indicators of the number of people of post-productive age, short-term emigration in the healthcare sector, the number of physicians, the level of physicians ' wages and healthcare expenditures show a weak correlation. This means that the more people of post-productive age, the smaller share of GDP goes to healthcare. Despite the growth of absolute indicators of healthcare financing, the number of physicians is decreasing.

Another interesting result is the high degree of dependence between the average salary of physicians and short-term emigration. Despite wage growth, the number of emigrants in the health and social assistance sector is continuously increasing. This can be explained by the development of the average wage in the national economy, which more or less copies the development of the average wage of physicians. At the same time, more demanding working conditions (confirmed by empirical research), a high number of physician visits, insufficiently equipped hospitals, night shifts and working on weekends, bureaucracy, etc., are other push factors that encourage physicians to work abroad. As their shortage is also an acute problem in other countries of the European Union, the level of wages of physicians in the target countries, the equipment of medical facilities, and more are also important factors for emigration.

Table 5: Correlation matrix of selected indicators of the state of healthcare in the SR

	Short-term migration		People of post-productive age	Healthcare expenditures as a share of GDP	Number of physician visits	Number of physicians	Salaries
	Total	Healthcare					
Short-term migration total	x						
Short-term migration – Health and social care	0.904605	x					
People of post-productive age	0.685005	0.812460	x				
Healthcare expenditures as a share of GDP	-0.679575	-0.850661	-0.906292	x			
Number of physician visits	0.153431	-0.150001	-0.443088	0.41351	x

Trends in the migration of Slovak physicians to work abroad

Regression analysis was used to determine the relationship between the number of physicians in healthcare facilities and the short-term migration of health professionals in the period 2009 – 2018. The number of physicians is an independent variable X and the number of short-term emigrants is a dependent variable Y due to the fact that the number of physicians working in Slovakia impacts the number of emigrated health workers. With the increase in workload and deteriorating working conditions, physicians' dissatisfaction and tendency to emigrate are growing.

Table 6: Regression analysis of the number of physicians in the SR and short-term emigrants

	Coefficients	Standard Error	t Stat	P-value	Lower 95%	Upper 95%
Intercept	372.88898	84.46941	4.41449	0.00310	173.15058	572.62739
X Variable 1	-0.01105	0.00268	-4.12891	0.00441	-0.01737	-0.00472

Source: Authors' own calculations

The regression function has the form y = 372.889 - 0.01105x. The regression function shows that if the number of physicians entering the healthcare sector were zero, the departure of healthcare professionals for work abroad would increase by almost 373 persons per year (Intercept value - b0). As the number of physicians increases by one, the number of emigrated healthcare workers decreases by 0.01105 (X variable value 1). P-values express the significance of the locating constant and the regression coefficient. The P-value for the locating constant is 0.0031 <0.05, and for the regression coefficient it is 0.00441 <0.05, which confirms the statistical significance of the coefficient and the locating constant. The values of the 95% confidence interval for b0 and b1 express that if one physician is added to the health and social care system in Slovakia, the number of emigrated health workers will decrease with a 95% probability from 0.01737 to 0.00472.

Table 7: Correlation factor and determination factor - indicators of dependence between the number of physicians and short-term emigrants

Regression Statistics	
Multiple R	0.775573
R Square	0.601514
Adjusted R Square	0.551703
Standard Error	6.260777
Observations	10

Source: Authors' own calculations

Multiple R (correlation coefficient) is 0.776, which indicates a weak correlation between the number of physicians working in healthcare facilities in the Slovak Republic and the short-term migration of health professionals. The coefficient of determination (R Square) shows that we have explained 60.15% of the dependent variable of short-term emigration of workers in the examined sector, the other part represents unexplained variation.

Table 8: Statistical significance of dependence between the number of physicians in the healthcare sector and those working abroad short-time

ANOVA					
	df	*SS*	*MS*	*F*	*Significance F*
Regression	1	473.3464	473.3464	12.07599	0.00838
Residual	8	313.5786	39.19733		
Total	9	786.925			

Source: Authors' own calculations

Table 8 shows the explained (regression), the unexplained (residual) and the total variation. SS is the sum of squares, df - the degree of freedom and MS - mean squares. The F test was used to evaluate the analysis of variance. Since the significance of F is less than the level of significance α (0.00838 <0.05), this means that the greater the number of physicians in healthcare facilities in Slovakia, the more of them decide to emigrate to work abroad. The model is also statistically significant based on the F test and was chosen correctly.

Discussion of Results and Conclusion

Based on the conducted analysis in the period 2000 – 2018, we determined that medical facilities in the Slovak Republic are severely understaffed. The trends in the development of the number of physicians by age in the healthcare system show that the situation will only continue to deteriorate as a result of their retirement. The entry of newly qualified physicians into healthcare system would be sufficient only in case, if all graduates of medical universities and faculties in Slovakia would find employment there as well. However, the situation is worsening due to the emigration of Slovak graduates to work abroad and also due to a relatively high share of foreign students who study medicine at Slovak universities and who subsequently go back to their home countries. The situation is exacerbated by the emigration of physicians immediately after graduation, as evidenced by the intentions to emigrate expressed by the students. The results point out strengthening push factors that drive them out of the Slovak healthcare labor market. These push factors are accompanied by pull factors, which have been set by the target countries as part of their migration policies to attract qualified health personnel, a shortage of which has been evident in Western European countries for several decades (Pichlhöfer, Maier, 2015; Kovacheva, Grewe, 2015; Skills, 2017).

Multiple studies suggest that the shortage of healthcare professionals is a global problem (Oulton, 2006; Kingma, 2008). Through correlation analysis in the period 2009 – 2018, we confirmed the assumptions about the negative development of the number of physicians in Slovakia, which impacts the health of the population. There is a strong correlation dependence between indicators of the number of practicing physicians in Slovakia and short-term workers abroad. The regression analysis confirmed that the more people of post-productive age living in Slovakia, the fewer physicians are practicing medicine in Slovakia. Therefore, the departure of physicians to work abroad may jeopardize the very safety of the national health system (Watson, 2011). The share of GDP allocated to healthcare expenditures also has a high impact on the studied indicators. Countries with underfunded healthcare systems and low wages experience the negative impact of healthcare worker migration on the state of their healthcare (Dussault, Franceschini,

2006). In relation to the escalating tensions on the labor market in the healthcare sector (Health, 2016) and deteriorating working conditions of physicians, we can expect a negative development of physician staffing in healthcare facilities in Slovakia, especially in case of physicians of post-productive age, with the expected development leaning towards the upper – more negative – limit of the presented prognosis.

Conclusion

The shortage of workers in the healthcare sector has far-reaching consequences, as witnessed on a daily basis by people seeking treatment in GP and outpatient clinics, hospitals and other facilities that provide healthcare. In addition, the negative impact of such shortage is felt by the physicians themselves, who must perform an exceedingly demanding work in the conditions of a poorly set system. Work in outpatient clinics, twelve-hour shifts and night shifts in hospitals, overtime, working over weekends, growing number of patients in hospitals contribute to the fact that the job of a practicing physician is physically and mentally demanding, with a high degree of responsibility, often accompanied by stress, burnout and other negative phenomena.

Systematic quantitative and qualitative research of this topic would help us to understand not only the consequences but also the causes and motives behind the emigration of physicians leaving the Slovak Republic to work abroad, and thus to some extent influence the migration process of healthcare professionals according to the needs of the labor market in this sector and sustainability of healthcare system staffing. Building upon the analysis of the number of physicians by the age categories, we used mathematical recalculations to determine the actual state of staffing of medical facilities by physicians and defined their current shortage.

Abstract

Changing the general requirements for the level of training of specialists in higher education establishments requires the introduction of the new methods of work and improvement of traditional ones. The main goal of the study was determined by the need to motivate students while teaching a language, taking into account the principle of individualization of learning, and, most importantly, the need to co-organize work in an interdisciplinary space of requirements for the future non-language specialists to reach the level of professional communicative competence. The concept of "professionally oriented communication" in practice was reduced to the ability to compose a monologue statement and conduct a dialogue within the framework of the topics defined in the curriculum of a foreign language for professional purposes course. Purposeful work on the form of organization of communication, which is always a characteristic feature of professional communication of a specialist, was not singled out as a separate educational goal and was not subject to formation during training speciality language. Among the forms and methods of work, the most significant were those that allow you to create an actual motivation for professional communication and develop the mental and cognitive abilities of students, for example, problem solving tasks. Based on the analysis of the methodological literature, and also, based on the identified shortcomings in the level of proficiency of future specialists in professional communication skills and abilities, we put forward a hypothesis that the targeted training of professional communication skills can be included in the curriculum of a course of English for specific purposes (ESP).

Keywords: non-language specialist, English for specific purposes (ESP), professionally oriented communication, communicative competence.

Introduction

Today the current state is determined not only by the specifics of institutions of higher education, but also by modern requirements for specialist training, which involves reviewing methods and techniques of training, shifting the emphasis to practical training and the ability to be well-versed in professional activities under changing

Cite this Article as: Oleh LAZARIEV, Yuliia FERNOS, Svitlana KARYCHKOVSKA, Vasyl KARYCHKOVSKYI, Svitlana MASLOVATA and Halyna OSIPCHUK“ Methods of Forming Professional Communicative Competence of Future Non-Language Specialists” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

conditions. Enhancing the level of professionalism of future specialists involves the appropriate organization of classes within a multidisciplinary approach. As indicated by an analysis of specialized pedagogical and methodological literature professional communication skills are the essence of the professional activities of future specialists and can be included in the goals and objectives of the language training program. As studies have shown, positive results in implementing the tasks of the interdisciplinary space can be achieved when the professional communication skills and abilities are allocated as the main unit of content in the course program.

Professional communicative competence is the basis of a specialist activity. The specificity of professional-oriented communication is that it is strictly regulated and is always achieved in a problematic situation. In addition, speech interaction communicators are not free to choose the means: the positions occupied by the participants of speech interaction are defined by a fixed procedure and involve the use of clearly defined patterns of speech actions and methods of verbal expression. The analysis of the special literature allowed allocating the complex of the competences that are the essence of professional communicative competence.

This general didactic problem has been studied by the scientists for many years (Abulkhanova-Slavskaya, 1989; Kudryavtsev, 1986; Lerner, 1973; Makhmutov, 1975; Maksimova, 1981; Matyushkin, 1972; Okon, 1968; Passov, 1983; Rakitin, 1973; Safonova, 1980; Skatkin, 1971; Tsvetkova, 1971; Vaysburg, 1973; Vysotskaya, 1974).

Results of the Research

Today the advantages of competence and problem-based approaches are obvious, they have been experimentally reasoned for many times in numerous studies that have shown that the competence approach in learning promotes the development of intellectual, speech and thinking, as well as creative self-realization of students. The scientist Z. M. Tsvietkova notes that "in order to ensure the proper development of thinking in the language institutions, it is necessary to make the process of language learning more independent and more problematic" (Tsvetkova, 1971: 339). It is obvious that the specificity of language as a subject requires appropriate adaptation of the general didactic method, the essence of which is to find ways to solve problems of various degrees of complexity based on previously acquired experience.

In the methodological literature, the concepts of "problem task" and "problem situation" are considered as fundamentally different terms, because they denote different psychological realities. A. N. Leontiev (Leontev, 1959: 232) defined the task as "a goal defined in certain conditions", the problem in didactics is defined as an arisen or posed to the subject question, the answer to which no one knows and requires a creative search. As a rule the problem contains contradictions, the overcoming of which is, on the one hand, connected with difficulties of its decision, mobilization of cognitive activity and mental processes, inclusion of elements of creative, search, mental and speech activity, and on the other hand, with mastering of new knowledge and methods of obtaining them (Eiger & Rappoport, 1992).

It is important to note that the problem task is the type of task that assumes that the student must find the optimal single correct answer. In this case, the student relies on theoretical and practical knowledge that has been obtained previously. Therefore, the use of problem tasks in the methodology of language teaching allows developing the mental abilities of students and updating the previously learned theoretical and practical material.

Unlike a problem task, a problem situation presupposes the presence of several possible ways to solve it, as well as the active involvement of the student in the process of finding an answer to the question posed in the problem task. The use of competency-based and problem-based approaches is a reorientation of the learning process from teaching to learning. Thus, A. E. Melnyk (1976) characterizes the specifics of the problem situation as follows: "In order to create a problematic situation, the student must be faced with the need to complete a task (theoretical, practical) in which the knowledge to be learned will take the place of the unknown. The unknown is always characterized by a certain degree of generalization. The problem situation is characterized by the degree of complexity of the unknown to be learned. The main indicator of the degree of complexity is the level of generalization of the revealed unknown, and the degree of generalization that the student must achieve in the process of identifying new knowledge in a problem situation. The indicator of generalization thus becomes an indicator of the problem situation, i.e. an indicator that characterizes the student capabilities (creative abilities and the level of knowledge, skills and abilities achieved by him) ... (Melnyk, 1976: 37).

However, the statement of problem tasks does not provide or lead to the emergence of problem situations. Psychologists emphasize that the problem situation is always included in the conditions of theoretical or practical activities and arises only in the process of solving the problem by the students themselves.

Modern training programs provide, as a rule, a selection of typical problematic situations. The use of typical situations in learning has become so widespread that it was separated out into the approach called "the method of concrete situations". The essence of this situation is that in contrast to the problem, which involves finding a solution based on the described initial conditions and in accordance with a certain method of finding the correct answer, in this situation, questions can be asked and solutions can be given. But “the most important thing is that each student seeks his own answer to the posed questions, and each decision set out in the situation may have different assessment and can be differently interpreted by the students involved in the discussion of the situation. A specific situation is not an example of the right or wrong decision or behavior. It is a concrete example for discussion. Therefore, a specific situation does not live by itself without a group discussion process. Even if the text of a specific situation or additional information hidden from students, but known to the teacher, contains an answer that shows how life has solved the problem, the discussion that took place in the process and conclusions which students will do for themselves as a result of the discussion will be the answer to a specific situation in the learning process” (Vikhanskiy, 1997: 21).

Obviously, in the process of learning communication skills (reading, writing, comprehension and speaking), the goal of a teacher is to organize student speech activities in such a way as to create conditions for the implementation of the speech problem. This methodological task was formulated by A. A. Leontiev in the article "Mental processes in the foreign language learning " (Leontev, 1975: 75), in which he stressed the need to "subordinate the methodology of teaching foreign language communication" to "the system of interrelated problems, which act as a chain of tasks that gradually become more complicated ..., these tasks should permeate all aspects of learning and all used methods should be aimed at stimulating creative activity… and minimizing mechanical, meaningless operations. Ideally, the use of problem situations in the process of teaching communication skills activates not only the intellectual abilities of students in the broadest sense of the word, but also allows you to organize classrooms so that the process of communication skills is carried out taking into account student cognitive motives and modern programs of specialist training.

The specificity of language teaching limits the use of competency and problem-based approaches, forcing the use of a combination of numerous methods. That is, the adequacy of a specific method application is always determined by the focus of a particular stage of learning on the development of language, speech or communication skills. The analysis of the existing classifications of teaching methods showed that the course programs can use two types of methods: deliberately practical methods and combined ones.

Thinking plays a leading role in the process of mastering foreign language communication, so researchers emphasize the need to take into account the principle of consciousness and communication, i.e. the need to organize learning so as to create conditions for students to understand language factors and create adequate ways to apply the material.

Thus, during the course development it is necessary to take into account that it was built in a certain sequence of methods: acquisition of knowledge – theoretical and cognitive method; development of language skills and abilities – communicative method; development of professional communicative skills – problem method, formation of professional communicative competence – competence method.

During the educational process, a large place should be given to the activity of students during the acquisition of lexical and grammatical material, as conscious assimilation of language phenomena is achieved if students actively and not passively master the educational (theoretical, linguistic, speech) material and operate it in independent professionally oriented speech. Focus on solving problems and problem situations is inextricably linked with the development of cognitive abilities of students, with the activation of their speech and thinking activities, so all teaching methods and techniques are focused on stimulating mental and creative activity, using a system consistently built according to task complexity. Solving problems and situations requires the activation of previously formed knowledge and skills of students and the development of new ones. When using combined, problem-solving methods, the issue of continuity in the formation of knowledge and lexical and grammatical skills is solved. In addition, the use of special types of work in problem-based learning allows to solve the problem of

developing professional skills and abilities, which is the part of the development of communicative competence of the language studied (Slesareva, 1980: 159).

It is obvious that work with problem situations is aimed at the development of professional communication skills, it is the final stage in the algorithm of the thematic series work. Therefore, the degree of complexity and the set of possible solutions to the problems depend on how effectively the work on the development of language and speech competencies was organized.

In the methodological literature, the question of what types of tasks can be considered "already problematic" and which only preparatory, is solved ambiguously. The same diversity of opinions is observed in the proposed classifications of problem tasks and problem situations. In this regard, the list of requirements proposed by A. P. Babenko seems interesting, which must basically meet the tasks included in a series of problem situations: "tasks that determine the motivational nature of student speech; tasks that determine the purposefulness of student speech; tasks that focus students on emotional and personal speech; tasks that focus the speaker on the listener" (Babenko, 1968).

In this theoretical study, the proposed list can be taken as a basis, despite the fact that the wording of the above requirements is broadly construed and allows the widest content. The advantages of such a list are that it allows you to distribute and typologize problematic tasks and situations in accordance with the stages of work on a thematic series, ensuring the controllability of the educational process, providing it with a cognitive and searching nature, creating conditions for the active involvement of students in work in each lesson. The algorithm of work on the thematic series involves a gradual increase in the complexity of problem tasks, the complexity of professional-oriented communicative tasks.

Each thematic series contains a set of problem tasks and a set of specific typical situations, which allows to activate both professional knowledge of students and develop professional communication skills, i.e. the ability to assess their own position, the position of the interlocutor and the purpose of communication; ability to formulate and justify their own position; ability to oppose (ask questions, influence the arguments of the addressee, supplement the interlocutor's statement or object to his ideas); the ability to reach a common conclusion. Thus, based on the theoretical foundations of the study, it is possible to develop a methodological system for the formation of professional communicative competence of the future specialist in the field of agriculture.

The main characteristics of this methodology are:

1) application of the communicative method within the framework of problem and competence approaches in the process of learning a foreign language for specific purposes;
2) combination of two methodological tasks in the educational process: improving language competence and the formation of professional communicative competence;
3) formation of the actual motivation of professional communication in the process of teaching ESP;
4) activities for the purposeful formation of professional communication skills and abilities are determined as a learning objective;
5) gradual formation of professional communicative skills and abilities, which involves a gradual increase in the complexity of problem tasks and the complexity of professional communication tasks;
6) focus on practical training, which involves the use of modern forms and methods of training that ensure readiness for effective performance of professional activities.

The process of forming professional communicative competence can be divided into three stages, each of which has its own tasks, methods, process content and control of results. At the preparatory stage, it is necessary to organize activities aimed at improving language competence and at developing the ability to construct statements based on a model form. At the next stage it is necessary to organize systematic activities for the formation of the ability to evaluate and maintain their own position, the ability to evaluate the position of the interlocutor in communication, the ability to oppose. At the final stage, it is advisable to conduct targeted activities to improve the skills that are formed in the previous stages, as well as work on the formation of the ability to participate in collective cooperation and reach a common conclusion (Graboy, 2002).

The basis for the formation of professional communicative competence is made up of problematic and competence-based approaches, which makes it possible to single out the technological components of the process of forming professional communication skills, methods and techniques of intellectual work. Adequate forms of work that gradually form professional communication skills are: problem solving, analysis of specific typical situations, business game.

The developed methodology for the formation of professional communicative competence assumes: selection of content, identification of stages, determination of methods and techniques of work and criteria for assessing the formation of professional communication skills at each stage. The most important source for the development and improvement of professional communicative competence is the organization of a systematic and purposeful work on improvement of language competence and the formation of key skills: build statements according to a given pattern, evaluate and maintain one's position, evaluate and fix the position of the interlocutor, oppose, participate in collective work and reach a common conclusion.

The experimental educational study was intended to test and compare the level of professional communication skills and abilities of the students in the experimental groups with the level of the students in all other groups. The hypothesis is considered proven if the level of proficiency in professional communication skills and abilities of the students of the experimental groups meet the requirements of the experimental training program, and also if the level of language competence (mastering the lexical and grammatical material of the thematic series) is not lower than the level of students in control groups, which are assessed by the same parameter

Dynamics of the formation of professional communicative competence

Intermediate	33	34	33
Final	40	36	24

Diagnostics of the formation and improvement of professional communicative competence of students, as well as the results of educational activities of students from the experimental groups showed a number of positive changes. Thus, at the second stage, most students of the experimental groups showed the ability to record, argue and maintain their own position in the process of professionally oriented communication, the ability to formulate clear conclusions, communicate using given expression, oppose etc. Also, the analysis of the data obtained shows that the indicators of the ability to assess the position of the interlocutor or opponent in communication and the ability to oppose coincide.

Conclusion

Thus, having worked out the methods of forming professional communicative competence of students in the process of teaching ESP, one shoul focuse on the solution of an important research task, such as identifying ways to improve the process of forming professional communicative skills of students. The conditions affecting the efficiency of the process have been identified and confirmed: the use of problem and competence-based approaches in teaching, as well as purposeful activities to improve language competence; reliance on pre-formed linguistic competence; gradual formation of professional communicative skills and abilities; organization of a purposeful, controlled, systemic process of forming professional communication skills and abilities; modern approaches to the content and techniques of training and the formation of professional communicative competence of the future

specialists. In general, the study revealed positive trends in the development of students' professional communication skills in the process of learning ESP, which indicates the need for further development of the problem, both at the theoretical and practical levels. Further research is also required to develop a methodological support for the formation of professional communicative competence based on the language of the specialty in non-languageeducational establishments.

Abstract

Scientific productivity plays an essential role in the creation of innovation and it stimulates social and economic growth. This study aimed to identify the barriers to and facilitators of scientific productivity in engineering and technology field, as perceived from the perspective of academic managers. Along with quality approach, the study relied on semi-structured interviews with managing bodies, i.e. seven deans and deputy deans from four faculties representing scientific field of engineering and technology. A single case study of Polish technical university was analysed in accordance with Braun and Clark's six-step framework and coded in NVivo software. Findings fell into four themes: scientific publication, recognition, funding research, and collaboration. The results revealed more barriers than facilitators in terms of acceleration of and motivation for research productivity. Most of them related to human, financial, organisational, structural resources, and organizational culture. The novelty of our study lies in the insights into the middle management of universities in the scientific field of engineering and technology in light of the Positive Organisational Scholarship framework.

Keywords: Scientific Productivity; Job Resources; Management; Positive Organisational Scholarship.

Introduction

The core mission of universities (apart from education and building relations with business and society) is research (Cooper 2011; Scott 2006). Higher education institutions (HEIs) endeavour to enhance research productivity by ensuring a high quality of scientific research and accountability of research funding obtained (Aprile et al. 2020). For scholars, research productivity is an ongoing process that might have a positive impact on the university and individual performance (Edgar & Geare 2013). Thus, identification of the determinants that hinder and facilitate the improvement of scientific productivity is crucial for universities in terms of boosting their status and achieving recognition in the academic environment. The novelty of our study lies in the insights into the middle management of universities in the scientific field of engineering and technology.

Scientific Productivity

Scientific productivity might be defined in a narrow, quantity approach as the number of peer-reviewed scientific publications such as scholarly articles and conference proceedings per researchers (e.g. Teodorescu 2000). However, a more extended definition of scientific productivity, which combines quantity and quality approach, has also been the basis of research. Scientific productivity involves carrying out quality research, including publishing

BASINSKA and Krzysztof LEJA "Barriers to And Facilitators of Scientific Productivity: A Case Study from Polish Technical University" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

academic papers in reputable international journals and citing these papers, acquiring research grants or external funding, and collaborating in scientific teams (Kwiek 2018). Findings of the existing studies have confirmed that the most productive academic scholars belong to research-oriented groups involved in international activities (Kwiek 2015).

Polish higher education system has been developing very dynamically over recent years. One of the essential changes in the scholarly communication in Poland is a move into a more balanced combination of quantity and quality research evaluation of scientific units, carried out every four years. Recent policy reform, called 'the Constitution for Science', transformed the regulations concerning evaluation and introduced new rules for the evaluation of the quality of scientific research at the level of individual disciplines. The new system takes into account the following three groups of achievements, i.e. scientific publications and patents, economic effects of research and development works, and assessment of the impact of scientific activity on the functioning of society and economy. The new approach is similar to other international assessment systems, such as the United Kingdom's Research Excellent Framework (Korytkowski & Kulczycki 2019). Based on the evaluation results, scientific units are assigned a category that determines the rights of the University to conduct graduate and doctoral schools, award degrees and titles in individual disciplines, and specifies the number of subsidies from the government budget.

In terms of the number of publications and the impact of field-weighted citations, Polish scientific productivity is at the average European rate (Kwiek 2019). Nevertheless, the level of international collaboration (internationally co-authored articles) has the lowest rate among other European countries (Kwiek 2020). This is an important challenge for the managing bodies of HEIs in Poland whose aim is not only to motivate the top-performers to be scientifically productive, but also to encourage those who are less productive, and, for instance, accelerate them in terms of publishing (Kwiek 2018).

Barriers to and Facilitators of Scientific Productivity

Some factors facilitate while others inhibit scientific productivity. Such factors can be analysed from the perspective of institutions and countries as well as from the point of view of researchers. The results of the existing studies have demonstrated that the main institutional barriers include teaching overload and the need to obtain funds for research, while the facilitators include the size of an institution, technical orientation, unit type, geographical location, year of founding and traditions (Kwiek 2015; Wolszczak-Derlacz 2017). It means that large old universities with the appropriate *know-how* show greater scientific productivity. Still, for most HEIs, the biggest challenge is the balance between teaching and research.

Researchers with higher academic rank are more productive than junior scholars (Horodnic & Zait 2015). Advanced researchers are excellent mentors for the new generations that start their scientific journey. However, human resources in science are currently limited by the generation gap and by the loss of top professionals to commercial organisations. Horodnic and Zait (2015) emphasise that young scholars are more oriented toward material incentives rather than inner motivations. Thus, efficient contingent rewards systems are needed to attract valuable personnel (Aguinis et al. 2013; Kyvik & Aksens 2015).

Financial and organisational resources create basic conditions for scientific productivity. For example, modern scientific tools and equipment are necessary to conduct research (Gaughan et al. 2018; Tartari et al. 2018). Structural resources are helpful for collaboration and interdisciplinary research, including research conducted in partnership with business (Abramo et al. 2017; Landry et al. 1996). Moreover, flexible organizational structures facilitate research project management and also the establishment of new teams and networks (Perkmann et al. 2013). In addition, organizational climate, number of faculty members holding PhD, and uninterrupted time for conducting research activity, significantly accelerate scientific productivity (Smeby & Try 2005). Autonomy in research activities as well as decentralised management are also beneficial. Thus, countries with diffusion-oriented research systems are more supportive of internationalisation than those with centralised research systems (Graf & Kalthaus 2018).

Moreover, innovative performance is related to international knowledge networks. Previous research has shown that both national and international collaboration increases productivity (e.g. Luukkonen et al. 1992; Kwiek 2015). Still, scientific cooperation at the international level is a time-consuming and, to a wide extent, an absorbing endeavour (Bojko et al. 2020). The size and composition of scientific networks also have an impact on scientific productivity as solid and considerable networks award greater benefits (Gaughan et al. 2018) and scientific units that are managed cooperatively may contribute to increasing research productivity (Ramsden 1994). Knowledge is also strengthened as academics move towards better-endowed institutions (Tartari et al. 2018). Organizational culture makes scholars more aware of the organizational goals and allows them to contribute to and be involved.

In summary, barriers and facilitators derive from institutional and individual factors that should be both balanced and mutually reinforcing. In line with the Positive Organisational Scholarship (Cameron 2017), positive amplification is a recipe for a positive change and at the same time, the positive approach can also result from earlier problems, difficulties, challenges and loss. Taking into consideration these premises, both the barriers and facilitators related to scientific productivity need to be simultaneously recognised.

Research Objectives and Methods

This original research aimed to identify and describe barriers to and facilitators of increasing scientific productivity in a view of academic managers within HEI, including deans and deputy deans. Two research questions have been formulated:

Q1. What are the main barriers to increasing scientific productivity in the field of engineering and technology from the perspective of academic managers?
Q2. What are the main facilitators of increasing scientific productivity in the field of engineering and technology from the perspective of academic managers?

To better understand the complexities of the barriers to and facilitators of increasing scientific productivity, we used a qualitative method (Creswell 2009). We resolved to use a case study method as a detailed examination of a single subject, event, setting or depository of documents (Yin 2003). Based on the interpretation that case study could stand by itself without comparison to other references, semi-structured interviews were chosen as the qualitative component to ensure flexibility in discussing emerging issues and encourage a more detailed description of the investigated problem. The study was conducted at one of Poland's technical universities with nine faculties (six faculties represent the field of engineering and technology sciences). Managing bodies, i.e. seven deans and deputy deans from four faculties representing six leading scientific fields of engineering and technology (Table 1), were invited to the interview. Deans are regarded as middle-level executive positions and central administrators in charge of a faculty within the university. They could be described as strategists and tacticians that have responsibilities to the board on the matters of the scientific and teaching program as well as planning and implementation (Boyko & Jones 2010).

Table 1: The faculty and participant characteristics

Faculty	Main Disciplines at the Faculty*	Respondents' position	Code
1	Civil engineering / Environmental engineering	Dean and Deputy Dean	A1, A2
2	Electronic engineering / Information engineering	Dean and Deputy Dean	A5, A7
3	Electrical engineering	Deputy Dean	A6
4	Mechanical engineering	Dean and Deputy Dean	A3, A4

*Note. * Scientific disciplines in line with the Organisation for Economic Co-operation and Development (OECD) Fields of Science and Technology Classification*

Subsequently, we applied a thematic analysis which is widely used in qualitative research for analysing data (Creswell 2009). The main goal of thematic analysis is to identify the themes or patterns that are most important for the study. We our thematic analysis in a deductive way, in which we divided data and linked various aspects of data to different themes. According to Braun and Clarke (2006), the six steps for preparing thematic analysis are as follows: familiarising oneself with the data, generating initial codes, searching for the themes, involved reviewing the themes, defining and naming themes and producing a report. NViVo software for coding and analysis of data was applied. Two main categories of barriers and facilitators of scientific productivity were used as the initial codes that were later divided into four themes to present our research results: theme 1 (publications), theme 2 (recognition), theme 3 (collaborations), and theme 4 (funds).

Results

Barriers to scientific productivity

Theme 1 revolved around the number and quality of peer-reviewed publications in valuable scientific journals. Repeated rejections and failures in terms of article publishing were identified as the main barrier within the publication theme. A1 stressed: *"The repeated failure to publish articles in high-scoring journals is discouraging. Many people come back and say: it will not work; nobody takes it (…); it is a clique, and I do not have any friends there…(…); I do not want to try anymore"*. The frequency of such situations creates an important mental barrier and undermines credibility among researchers. The interviewees also highlighted that it is very hard to achieve a "breakthrough", even with very good publications. The next barrier is the "scoring system" (a specific national system of evaluation of publications), which reflects, for example, the extension of academic contracts. Researchers who fail to deliver a required number of scored publications might struggle to renew their contracts or even be transferred to teaching positions. Besides, the respondents mentioned expensive conference fees, the small number of high-impact factor journals and ineffective publishing in most influential journals. To summarise, the common factor apart from engineering and technology disciplines in terms of publication barriers was inefficiency in being published that was contingent upon mental and financial hindrances.

Theme 2 focused on reputation and recognition in professional life that can be contributed by several factors, such as the number of citations, the Hirsch index or membership in scientific committees. The main barrier to gaining recognition was the inability to publish an article in a high impact journal, especially in the case of new researchers who are only beginning to build their reputation. Some interviewees (A5 and A7) highlighted the difficulty in achieving professional recognition without a proper scientific workshop and appropriate scientific skills. Also, prestige is based on the membership in scientific committees that invite scientists with significant achievements. A6 pointed out: "*The perception of scientists is also created by an external environment. This is, for example, the selection of individual researchers to serve as members of the Polish Academy of Science"*. Another barrier was a lack of knowledge regarding scientific culture at the best universities around the world. A1 stressed: *"Researchers do not know the scientific environment at the most prestigious universities which are focused on innovations. So, in their opinion, the article is not a goal in itself…"*. Furthermore, respondents see another barrier in high fees for open access publications. In a world in which citations are the new currency, open access papers help scholars gain recognition. Thus, in terms of recognition, in the disciplines of engineering and technology, lack of knowledge of scientific culture, insufficient competencies of young researchers and financial hindrances were reported.

Theme 3 concerned collaboration among scientists which is important for scientific productivity because complex projects need teams with different competencies and resources. The barriers were centred around the methods used in the research process. Research usually takes a long time and requires proper equipment and tools that are expensive and difficult to acquire. The need to purchase appropriate equipment to conduct highly advanced research clashes against insufficient financial sources. Other obstacles were related to the inability to manage teams and the project by project managers. Some of them are overwhelmed by grant management activities and procedures. As A4 claimed, "*There is a risk that the proposed changes will not be implemented and will remain a mere theoretical framework"*. Thus, in the engineering and technology disciplines, lack of funding for technical equipment and tools, poor work organization and insufficient team management skills were considered the biggest barrier to scientific productivity with regard to scientific collaboration.

Theme 4 concerned the acquisition of funds. To strengthen scientific productivity, researchers must focus on applying for grants or, depending on the discipline, patenting inventions. The main barriers to obtaining funds were associated with an ineffective model of work organisation. For example, at the beginning of the grant application process, researchers encounter problems at the administrative level. Another problem mentioned was a scientific cycle that requires talented and highly specialised staff. Due to the generation gap and rather low salaries at Polish universities, professionals are often employed by the business sector and lack the time or opportunity to work on scientific projects. Some respondents (e.g. A4) indicated that academics had numerous difficulties in gaining funds for research because experiments are very expensive and the grants obtained are not sufficient to cover all expenditures. The next barrier is a lack of publications and citations in high impact journals, which are required for grant competitions. According to A4, "*If someone does not have an impressive bibliometric indicator, then, frankly speaking, there is no chance to get funds for research. (…) In the majority of grant contests, the scientific publication background and recognition of the leader in the basic evaluation criterion and an indicator of success"*. In the current competitive academic milieu, interviewees drew attention to the barriers posed by difficulties in getting funds from the industry. To some extent, this might be linked to scientific and business discrepancies in terms of project objectives. Business wants to focus only on profit, however, such an objective is unacceptable in

the scientific community. To conclude, in terms of acquiring funds in engineering and technology field human, organizational and financial barriers as well as cooperation with business and industry were identified as barriers.

Facilitators of Scientific Productivity

Despite numerous obstacles to increasing scientific productivity, the interviewees also identified several facilitators. Theme 1 focused on managerial practices that facilitate an increasing number of publications in the engineering and technology disciplines. Firstly, article translation and proofreading can be refunded. It is supportive for non-native English speakers. Researchers who publish in open access journals can count on additional surcharge payments to cover the article processing charges. Moreover, researchers who succeed in publishing in the most influential journals can receive monetary rewards from their faculties. As A7 claimed: "*I pay extra. When a young researcher comes to me and says that his publication is accepted but he has to pay… that's fifty-fifty. Department needs to pay half, and I will pay half as well"*. Furthermore, suitable assistance is assured in terms of patenting inventions. Thus, in the engineering and technology disciplines, support for additional services such as proofreading and monetary rewarding were the most popular facilitators for scientific publication.

Theme 2 concerned recognition by providing compelling metrics. The interviewees stressed that the most significant facilitator was financial support. Funds could be used for open access fees or the attendance at scientific events. Some respondents also introduced progressive evaluation systems based on publication points and records. Such systems help to monitor scientific achievements and support the career path planning: "*So, we simply define at what point the employee is, and after that, let's say, possible tips are prepared. We inform them, for example, that they should speed up in certain activities, and we highlight those activities to them…"* (A6). In sum, the practices related to financial resources and human resources were indicated as the most useful facilitators in terms of gaining recognition.

Theme 3 revolved around collaboration among researchers, scientific teams and institutions, that is one of the features common for all scientific disciplines. Respondents indicated that their main facilities for academics included openness to interdisciplinary collaboration and a lack of restrictions when it comes to establishing scientific teams. For example, A1 highlighted: *"We explicitly support the creation of research teams of various sizes. I am trying to convince adjuncts who recently got their PhD to treat themselves like they would be treated in the United States: like assistant professors. As an assistant professor, you are responsible for all programs you have implemented and for what you want to do in the future"*. The interviews pointed out that interdisciplinary cooperation is crucial for complicated and extensive research at the national and international level. It was supported by A3: "*Later, they build scientific teams to solve various problems, so they know that somewhere there is someone who is doing similar research, and then we can make such contact, and this has a positive impact"*. Furthermore, to succeed in this area, interviewees argued, additional financial support is necessary. Specifically, funding for the attendance in conferences, seminars or workshops was one of the facilitators of productivity. In sum, all interviewees agreed that financial resources, autonomy and openness to interdisciplinary collaboration are important.

Theme 4 alluded to several factors in our study of possible facilitators for obtaining funds. Some respondents (A1 and A2) stressed that scholars can apply for one or two years of dean's grants that could help them in their scientific career. Those grants can be spent on personal development to support the earning of research grants in the future. Other interviewees (A3 and A4) also mentioned statutory subsidies that scholars can also receive to support their research. Other respondents (A5, A6, and A7) stressed that every project that requires additional funding not covered by grants to be completed will obtain financial support. In sum, faculties' managers indicated that financial and structural resources help acquire funds. Another noticeable facilitator is an increasingly flexible administrative structure and supportive administrative units. The interviewees highlighted: *"We have set up an office to support projects. Admittedly, this is just a beginning (…), and I think, in the future, we will develop the structure and additional services offered by this office to contribute successfully, [offering] essential help during the writing process, as well as during implementations and the managing process"* (A2). In the absence of such an office, employees can use the relevant central office to acquire funds.

Discussion

In summary, the results of this study demonstrate that scientific productivity centres on four main themes that define the main academic activities: research publications, recognition, collaboration and funding. As shown on the example of the Polish technical university, the critical factors enhancing scientific productivity are human, financial, organisational, structural resources and organizational culture. From the perspective of management

bodies, the key challenges in achieving scientific productivity are scholars' attitude and capabilities to perform research as well as the organisation and provision of appropriate resources. Our findings reveal that there are more barriers than facilitators in terms of increasing scientific productivity. The identified facilitators are mainly associated with financial, organisational and structural support, while the barriers are related to human resources financial, organisational and structural hindrances that restrict scientific productivity in engineering and technology research. Thus, only coherent actions that comprehensively address publications, recognition, collaboration and funding activities may bring measurable and noticeable effects in terms of scientific productivity. The barriers to and facilitators of scientific productivity from the perspective of middle-level managers are presented in Table 2.

Table 2: Barriers to and facilitators of scientific productivity – summary of findings.

Resources	Barriers	Facilitators
Human	• Scientific skills • Gaining and maintaining talented personnel • Mental attitude to coping with defeat • Work under pressure to publish scientific findings • Individual recognition	• Support for competencies development • Monetary esteem • Openness to interdisciplinary research
Financial	• Expensive conference fee, APC in Open Access journals • Cost of conducting research	• Funding APC in Open Access journals • Internal funding: grants and additional subsidies for grants awarded
Organizational and structural	• Work organization • Leadership and team management • Teaching overload • Equipment and tools • Red tape	• Flexible organizational structure • Administrative support
Culture	• Scientific culture • Know-how and scholarly communication practices • Collaboration with business and industry	• Organizational openness to interdisciplinary research • Human resources practices

The results of our study demonstrate that human resources are important hindrances in the pursuit of research productivity. Mental barriers (e.g. coping with repeated failures due to rejection of the paper) can be reduced through training, mentoring and engaging leadership on the level of a team, unit and faculty. When dealing with scientific productivity at the individual level, it is vital to analyse psychological factors, such as the ability to set goals, emotions, and the ability to cope with failure (Araújo et al. 2017). However, due to the generation gap and competitive conditions offered by commercial organisations, it is becoming more and more difficult to attract and retain talented employees. Kyvik and Aksens (2015) highlighted that the new generation of academics is better qualified, more collaborative, better funded, supported by better research conditions and supported by contingent rewards systems. Thus, young scholars are more oriented toward material incentives rather than intrinsic motivation and the need for recognition within the scientific community (Horodnic & Zait 2015). It is, therefore, no surprise that monetary rewards or cash-peer-publication reward policies for highlighted papers published in recognised reference databases are commonly applied (Aguinis et al. 2013).

Financial barriers affect the process of scientific productivity directly and indirectly. There are proofreading costs, expensive conference fees and article processing charges for open access journals. However, financial resources support the scientific skills of scholars and their development. On the input side, some financial and organizational resources, tools and equipment are needed (Gaughan et al. 2018; Tartari et al. 2018). On the output side, universities can thrive through the circulation of ideas and learning (Bikard et al. 2015). There is a specific balance of costs and gains for both parties, scholars and academics managers.

Structural resources are important for establishing new teams and organising interdisciplinary research. Flexible structures are necessary for leaders to support and manage their teams. Managers can adapt organisational structures to involve new teams and ideas and to decide how scholars should divide time between teaching and research (Perkmann et al. 2013). Moreover, modern and efficient leadership is also needed. Engaging leaders can use enthusiasm to inspire workers to follow their plans and visions, strengthen by delegating responsibility and challenging tasks, empower by learning and sharing knowledge and, finally, connect by supporting collaboration among team members (Schaufeli 2015).

International collaboration supports the exchange of mental and technological resources; however, there are costs of coordination and allocation among individuals. International networks can enhance creative ideas and innovative knowledge, especially in better-endowed HEIs with strong scientific culture and traditions (Kwiek 2015; Wolszczak-Derlacz 2017). Thus, they contribute to an increase in scientific productivity. Individual talents and competencies are located in scientific teams and build recognition for institutions and countries, while academic managers create conditions and provide resources for innovative ideas. Thus, a reciprocal effect exists between scholars' needs and institutional resources.

Our study has some shortcomings. We conducted a qualitative study in one of the biggest technical universities in Poland. The case study is based on specific institutional and regional conditions. Around the whole university structure, we engaged four from six technical and engineering faculties.

Conclusion

As members of the academic community, scientists are obligated to perform collaborative research, apply for research grants and other funding, disseminate scientific results through publications and build their own and institutional recognition within a higher education system in which these four themes are interconnected and mutually reinforcing. Our findings indicate that there are more barriers than supportive resources to scientific productivity that both focus on human, organizational, structural and financial resources and organizational culture. In line with a message from the Positive Organisational Scholarship (Cameron 2017), academic managers need to learn how to convert barriers into strengths and treat them as challenges instead of hindrances. The agenda for future research indicates that by linking the positive and negative sides, a more complex view on scientific productivity can be achieved.

The Contemporary Dimension of Globalization and Local Security – Conclusions from The Research

Piotr MAŚLOCH

War Studies University, Warsaw, Poland
E-mail: p.masloch@akademia.mil.pl

Abstract

The article deals with the problems of the contemporary, new globalization of the 21st century and presents the results of own research on the sense of security in the local dimension. The active participation of local communities in these processes are an important element in ensuring the internal security of the state in the conditions of globalization. In this approach, localism (regionalism) is a tendency consisting in the striving of local (regional) communities to achieve a high degree of self-determination. Localism and regionalism are now becoming global phenomena, which means they are not the opposite of globalization. On the contrary – these processes are treated as a supplement and/or modification of the internationalization of the economy.

Keywords: Globalization, Economy, Security, Local Security, COVID 19

Introduction

The modern nation state seems to be well prepared for the contemporary needs of responsibility and active and effective participation in political life. Therefore, in the policy of the European Union, the state represented by the central government still remains the main entity, despite the growing importance of lower levels of public authority and private entities, including transnational corporations. On the other hand, in the modern world, localisms and regionalisms are reviving, separating moods and striving for greater autonomy are intensifying. Due to all these factors, local and regional conditions play an important role more than ever in the process of ensuring internal security. It should be borne in mind that, depending on the problem raised (identified threat), defining the local or regional level may be understood differently. Local government units and the communities living in them will play a special role in guaranteeing and maintaining an appropriate level of national security. It is their commitment, competence, awareness, ability to build broadly understood networks of mutual connections and the sense of patriotism and historically shaped national identity that will largely determine the level of citizens' security.

Subject and Scope of Research

Research on the problems described above was carried out using the interview and survey method. Surveys, like most inquiry methods, are not perfect. Information obtained in this way is not always consistent with the actual state of affairs, and is tainted with the subjectivism of respondents answering the questionnaire questions. Therefore, when interpreting the information received, moderation and common sense is recommended, consisting in inhibiting the tendency to make quick generalizations. It should be pointed out, however, that the number of surveyed enterprises, in the case of high convergence of responses, indicates their similarity in the analysed areas, which allows for the formulation of credible conclusions.

Information constituting the basis for formulating conclusions can be ranked according to their importance. The information obtained through a questionnaire survey, which allowed to determine the correctness of events in relation to actual processes carried out in the city and municipality, is of the greatest value.

Apart from showing the phenomena taking place in the regions, an attempt was made to outline what will constitute the fundamental trends in their functioning in the coming years. On the basis of the conducted research, it should be assumed that the nearest future for local communities is, above all, further strengthening of the competitiveness of regions, development of civil society and activities for local security.

Cite this Article as: Piotr MAŚLOCH " The Contemporary Dimension of Globalization and Local Security – Conclusions from The Research" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The studies were conducted in 2018 (pilot study) and in 2019 (actual studies and their modification). Therefore, it should be emphasized that the research process did not take into account the conditions and threats resulting from the COVID-19 pandemic, which means that the presented research results may constitute the basis for the preparation and carrying out further works related to the need to redefine the threats affecting the level of security at the local level.

According to the study carried out in Sulejówek, improving the safety of residents is one of the basic tasks of local government units. Local authorities undertake a number of actions, both direct and intervention. The increase in the level of safety of the inhabitants is influenced by a number of comprehensive activities of the local government, the aim of which is to limit indirect causes posing specific threats to the inhabitants of the region. Such activities include, among others, activities related to the prevention of terrorism, fire protection and flood protection, activities in the field of education, upbringing, health protection, economic development, counteracting unemployment, drug addiction, alcoholism and violence in families. All these elements, seemingly not very related to each other, create a coherent safety system for local communities. The individual levels of local self-government differ significantly from each other, especially in terms of tasks and competences in the field of security and public order protection. The voivode ship self-government was assigned only general responsibility for matters related to the performance of tasks related to public safety. The scope of activities of poviat self-governments includes public order, safety of citizens, flood protection, fire protection and prevention of other extraordinary threats to human life and health and the environment.

Research procedure and conclusions

Based on the interview, it can be concluded that the local authorities, when exercising power in the city and municipality of Sulejówek, are aware of the fact that they bear full responsibility for the proper and effective performance of the state's functions, primarily in the sphere of internal security, peace and public order, law, as well as in emergencies such as natural disasters, social disorders, internal crisis.

In the opinion of the deputy mayor, the city and the municipality are well prepared to respond to the following types of threats:

1. natural disasters (e.g. floods),
2. crises in energy supplies,
3. ensuring internal security (police effectiveness),
4. fires,
5. construction disasters.

At the same time, it was acknowledged that in the case of threats such as terrorism, bio-terrorism or large-scale epidemiological infections, they would not be able to ensure security on their own, using forces and resources at their disposal. It is also worth noting that being aware of the existence of such threats, local authorities do not think that these events could apply to their region – this applies to both terrorism and the phenomenon of illegal immigration plaguing modern Europe.

Entrepreneurs were the next group of the local community subject to research. Here, the obtained results should be considered and interpreted in two ways. The first problem raised in the research concerned the scope and methods of internationalization of the activities of enterprises deriving from contemporary globalization processes. An enterprise, wishing to internationalize its activities, must apply a specific strategy of entering foreign markets, which should include, among others, setting goals, establishing forms of internationalization and possible restrictions in their application, and making a decision on the choice of the form ensuring the highest degree of achievement of the assumed goals. The main directions of internationalization of the activities of Polish enterprises have been determined on the basis of the conducted survey, the issues of which focus on the directions of internationalization of the activities of enterprises in the region.

The process of economic globalization is a fact. Its consequences have an extremely significant impact on both the functioning of enterprises and the perception of their safety in the local environment. Progressive globalization, by creating new conditions for competition, prompts enterprises to introduce specific changes in the scope of their functioning. So that enterprises can change and adapt their activities and structure to the conditions of globalizing economies (taking into account the related dangers), they must first of all precisely determine which manifestations of globalization initiated the process of introducing changes. Based on the results of own empirical research, it can be concluded that various manifestations of globalization with varying intensity influence the taking of actions in the field of organization management and its functioning. Representatives of management staff assessed the impact of

the proposed manifestations of globalization on undertaking or not undertaking specific changes in management on the following scale:

- +2 – strong influence stimulating making changes,
- +1 – significant impact stimulating taking of changes,
- 0 – no influence.

The replies thus obtained from a sample of 104 companies are presented in table 1.

Table 1: Manifestations of globalization influencing changes in management and functioning of enterprises

factor (manifestation) of globalization	impact assessment
I	II
1. progressive concentration of capital on a global scale	**192**
2. fast, less and less limited flow of information	**184**
3. development of modern information technologies (cybertechnologies)	**182**
4. increased importance of company and brand awareness	**176**
5. growing importance of relationships with suppliers and customers	**174**
6. unification of consumption patterns and lifestyles	**174**
7. growing importance of standardized after-sales services	**172**
8. development and dissemination of new products	**172**
9. development and dissemination of modern telecommunications technologies	**170**
10. dissemination of management concepts and methods on a global scale	**170**
11. development of smart management support systems	**156**
12. development of modern manufacturing technologies and their unification	**112**
13. increasing obligatory nature of international product quality standards	**64**
14. growing importance of the use of standardized quality management procedures	**62**
15. less and less restrictions on the international movement of goods and services	**9**
16. a trend towards displacement of production	**6**
17. marginalization of nation states	**5**
18. dissemination of a market economy	**4**
19. collapse of unprofitable plants and industries	**3**
20. growing, less and less restricted flow of capital	
21. dissemination of foreign direct investment	**3**
22. government incentives for foreign investors	**3**
23. less and less restricted movement of labour	**3**
24. other (what?)	

The data presented in Table 1 suggest that in the surveyed enterprises, the impact of individual manifestations of globalization on their functioning and management process was quite clearly differentiated. On the basis of the analysis of the collected responses, it should be stated that particular attention was paid to factors related to the progressive concentration of capital on a global scale, the fast, less and less limited flow of information and the development of modern information technologies (indications above 182 points). These phenomena, with the greatest force influencing and shaping the management process in the surveyed enterprises, are also perceived as those that significantly shape the future of enterprises by forcing them to introduce changes that allow them to function in the local environment and to undertake a competitive fight on the global market.

Relatively high rated issues related to the increased importance of company and brand awareness, the growing importance of relationships with suppliers and customers, the unification of consumption patterns and lifestyles, the

growing importance of standardized after-sales services, the development and dissemination of new products, the development and dissemination of modern telecommunications technologies, dissemination of modern management concepts and methods, and developing smart management support systems (indications from 150 to 180 points). The above symptoms of globalization, although they affect the processes taking place in enterprises less strongly than those analysed earlier, significantly indicate the direction of further changes in these organizations. As can be seen from the nature of the factors listed in points 4-11 in Table 5, most of them concern issues and problems solved on a global scale, which at the same time allows us to conclude that the activity of enterprises, even local ones, will, under the conditions of globalization, aim at unifying their activities.

The next group includes those manifestations of globalization, the average readings of which are in the range of 62-148 points and seem to exert a significant influence on some behaviours of individual organizations. These include: the development of modern manufacturing technologies and their unification, the growing obligatory nature of international product quality standards and the growing importance of using standardized quality management procedures.

On the other hand, the fourth group of factors consists of those that have a negligible impact on the current activities of the surveyed enterprises (the average strength of the impact is below 10 points).

It should also be emphasized that an important phenomenon characteristic of the surveyed enterprises is, after all, the positive assessment of the impact of all the proposed manifestations of globalization on their functioning, because it is these manifestations that have become the main stimulus forcing the continuation of changes initiated earlier, resulting from the development of globalization understood in a modern way.

Using a similar method, consisting in indicating the strength of the impact of previously identified threats, their impact on the sense of security in the local dimension was examined. In the part of the study devoted to safety (the impact of factors on the sense of security), a scale analogous to the previous part of the study was used:

- +2 – strong influence of a potential threat,
- +1 – significant impact of a potential threat,
- 0 – no impact (no threat).The results of the conducted tests are presented in Table 2.

Table 2: Threats determining the sense of security of enterprises in the local dimension

the type of threat	impact assessment
I	II
1. Cybercrime	**202**
2. Sense of internal security (effectiveness of the police and services)	**194**
3. Demography (lack of qualified staff)	**188**
4. Stability of law, including cooperation with local government	**180**
5. Technical threats (use of outdated technologies, too fast development of modern technologies in the world)	**156**
6. Fires (fire protection)	**156**
7. Transnational economic crises	**152**
8. Economic threats resulting from globalization (increased importance of international competition)	**150**
9. Illegal immigration	**142**
10. Terrorism	**22**
11. Socio-cultural threats (the role of the local environment in shaping the environment closer to the enterprise)	**20**
12. Political crises	**12**
13. Crises in the supply of energy, semi-finished products, strategic supplies	**8**
14. Natural disasters	**6**
15. Geographic threats (lack of natural environmental resources)	**6**
16. Ecology (destabilization of the ecological system)	**5**
17. Construction disasters	**4**
18. Others (what?)	

The results presented in Table 2 allow to group individual areas shaping the sense of local security in enterprises depending on the strength of the impact of selected threats on their functioning. Thus, the potential threats with the highest sensitivity to security in enterprises include factors with indications above 150 points, i.e. cybercrime, sense of internal security (effectiveness of the police and services), demographic problems (lack of qualified staff), sense of legal stability, including cooperation with local government, technical threats (use of obsolete technologies, too fast development of modern technologies in the world), fires (fire protection), transnational economic crises, economic threats resulting from globalization (increasing importance of international competition) and problems resulting from illegal immigration (F. Ogigau – Neamtiu, 2016, S. McClure, J. Scambray, 2012, J. Michalczyk, 2014). Threats with indications below 22 points are on the opposite side, among others: terrorism, social and cultural threats (the role of the local environment in shaping the environment closer to the enterprise), political crises, crises in the supply of energy, semi-finished products, strategic supplies, natural disasters, geographic threats (lack of natural environmental resources), ecology (destabilization of the ecological system), construction disasters.

It should be emphasized that the surveyed organizations define the aspects related to economy, law (legal stability), security at the local level and cooperation with local government as the basic factor of their safe functioning. They very clearly emphasize the problem of the so-called illegal immigration, which does not yet affect them, but expresses specific concerns about this phenomenon. In turn, such issues as terrorism, politics or natural disasters and ecology do not seem to affect – according to the respondents – the activity of enterprises in the region. This belief can be explained by the fact that the acts of terror are happening "out there", not in the region, hence the low impact of this factor on the respondents' sense of security. The situation is similar in the case of natural disasters and matters related to ecology – the lack of direct events and their impact on enterprises results in ignoring these factors. In both cases, it is necessary to focus on education and promotion of pro-ecological attitudes – such activities should be included in the region's development strategy and should be a natural element of functioning of both the region and the enterprises operating in it.

In this part of the survey, the respondents were also asked about the assessment of the degree of security in selected risk areas by local authorities. The obtained results are presented in Table 3.

Table 3: Level of safety performance by local authorities (selected factors)

the type of threat	average rating of the respondents
I	II
1. socio-cultural threats (the role of local authorities in shaping the environment closer to the enterprise)	**4,94**
2. natural disasters - the role of local authorities in eliminating the effects of natural disasters, ecology	**3,04**
3. counteracting crises in the supply of energy, semi-finished products, strategic supplies - cooperation of local authorities with enterprises	**3,96**
4. terrorism - the level of security in the region, information policy of local authorities	**4,86**
5. illegal immigration as a social problem - information policy of local authorities	**3,94**
6. local political crises and counteracting them	**3,94**
7. sense of internal security (effectiveness of the police and services).	**4,94**
8. legal stability, including cooperation with local self-government	**4,01**
9. others (what?)	

As can be seen from the assessments in Table 3, the activities of local authorities in terms of ensuring safety are assessed at a high level. The only deviation from high ratings is the definition of the role of local authorities in preventing natural disasters. According to the information obtained from respondents, a relatively low assessment of the authorities' action in this area results from the fact that the region has not experienced any natural disaster so far, hence it is not possible to make an unambiguous assessment in this regard. The issue of terrorism and politics as factors shaping the sense of local security should be left as an open problem for further research and discussion. On the one hand, they indicate a low impact of these conditions on the sense of security, on the other hand, they rate the actions of local authorities in this respect relatively high.

When attempting to correlate the data contained in the above tables, it should be noted that one of the basic factors guaranteeing safety at the local level is – according to the respondents – the sense of internal security (effectiveness of the police and services). When answering the question about ensuring safety by local authorities, the respondents rated this issue at an average level of 4.94 (on a scale from 2 to 5). Other factors shaping local safety, indicated as important, and being the responsibility of local authorities, are assessed at a Satisfactory level (scored above 3.51), which allows us to believe that the authorities of Sulejówek are properly implementing their tasks, shaping the region's security policy in a rational and thoughtful way.

As a determinant of contemporary security problems, it is worth citing selected elements of the EU security strategy, in which the key threats are [http://ec.europa.eu/news/]:

1. terrorism in all its forms, characterized by an absolute disregard for human life and democratic values; its global reach, catastrophic effects, ability to attract adepts thanks to radicalization and Internet propaganda, and various sources of funding make it a significant and constantly evolving threat to the security of states and regions;
2. intensification of organized crime; it manifests itself in multiple forms across national borders whenever it can bring maximum financial gains with minimum risk, such as drug trafficking, economic crime, human trafficking, human smuggling, arms trafficking, sexual exploitation of minors and child pornography, aggressive crime, money laundering and document forgery; moreover, in the form of corruption, it threatens the foundations of the democratic system and the rule of law;
3. cybercrime is a global, technical, cross-border and anonymous threat to information systems;
4. uncontrolled influx of illegal immigrants;
5. cross-border crime, such as petty crime and crime against property;
6. violence, such as among young people or hooliganism at sports events, increases the damage already caused by crime and is destructive to the functioning of modern society;
7. natural and anthropogenic disasters, such as: fires, forests, earthquakes, floods, storms, droughts, energy failures and major failures of information and communication systems significantly threaten the sense of security of modern society.

It seems that the presented catalogue of threats may be a valuable source of information in the work on a similar document, but concerning the level of regions in Poland. It should also be noted that the surveyed entrepreneurs are aware of the existing global threats that seem to coincide with those presented above.

It is worth emphasizing that there are currently no comprehensive studies and research in this area. Therefore, a discussion should begin on how to shape the security policy at various levels of local authorities and how these activities should be coordinated with the broadly understood state security (both in military and other aspects, e.g. economy, ecology, cybersecurity, illegal immigration, human trafficking and others).

Conclusions

The socio-economic reality in the period of dynamic changes in the world at the turn of the 20th and 21st centuries is an interesting and still little research area of analysis and prompts for various assessments and reflections. The considerations, publications and opinions contained in this publication are subordinated to its general goal, i.e. identifying the conditions of functioning of modern organizations (enterprises), analysing the process of managing them and the sense of security at the local level as a result of the ongoing changes in the international economy and globalization. The aim of research formulated in this way refers to the most important challenge for contemporary local communities, which is quick adaptation to the conditions of the new global reality.

Particular aspects of the relationship between governance, security, transformation and globalization are presented in the study in accordance with the current state of knowledge. This does not mean, however, that all questionable issues have been resolved. The nature of the processes of dynamic changes taking place in the global economy makes these phenomena so complicated, unpredictable and multithreaded that it is not easy to clearly determine how they will develop even in the near future. It is also difficult to indicate whether and when the measures taken to adjust the functioning of enterprises to the requirements of modern globalization will be completed.

The empirical part of the study is entirely devoted to an attempt to assess how contemporary, dynamically changing processes of globalization affect the management of the organization and the adaptation activities undertaken in terms of shaping security at the local level. The results of the presented research justify the conclusion that Polish enterprises relatively quickly began to notice specific manifestations (factors) of globalization shaping the aforementioned local security, being aware of the need to adapt individual areas of their activities to the new international situation. The

obtained empirical information also proves that the surveyed organizations correctly perceive the current and future conditions of their activities resulting from globalization, and therefore they are aware of the need to continue to undertake specific adaptation measures.

The research procedure used and presented above also allowed for a positive verification of the assumption regarding the dependence of the intensity of threats and the subjective sense of security in the regions on global factors that interpenetrate and complement each other.

Both the applied research procedure and the layout of the study allowed for the presentation of views on the issues discussed, which were later verified by empirical research. The following final conclusions can be drawn from the conducted research and analyses:

1. It is very difficult nowadays, due to the multiplicity of connections with the theory of enterprise management, as well as the large number of diverse, sometimes very different concepts, to clearly present and describe the phenomenon of globalization, management and local security. In this respect, this study is an attempt to show various opinions on this subject contained in the literature on the subject.
2. The analyses carried out in the paper, supported by the results of empirical research, provide a basis for the conclusion that the problem of local security is an extremely complex issue. For this reason, it is probably impossible to present all possible conditions shaping the course of the process of building a sense of security (and actually ensuring it), due to the changeability of the global reality in which the contemporary organization functions.
3. On the basis of the obtained research results, it should be stated that in the latest period of the development of globalization processes, three basic stages can be distinguished in terms of the sense of local security. The first stage, lasting until 1995, is first of all a surprise with the new geopolitical situation and the belief that globalization will solve all the world's problems so far. It was naively thought that the end of the Cold War and the collapse of the Soviet Union would open the way to harmonious and peaceful cooperation between individual countries in the world. The second stage, lasting from 1996 to 2001 (attacks on the World Trade Centre) was a period in which theories of the harmonious development of the world were consolidates and there were no indications that they would be negatively verified. And finally, the third period, lasting from 2001 to the present – is the time when more and more democratic states are reflecting on the desired direction of democratic development, it is finally surprise with such global phenomena as terrorism or illegal immigration.
4. There is a relatively high convergence of opinions and assessments in the surveyed organizations regarding the causes of individual phenomena resulting from globalization, and having a direct impact on the way they are managed.
5. As can be seen from the theoretical considerations supported by the empirical part, it is the processes of globalization that forced (and enforce) changes both in the interior and the environment of individual organizations. Projects in this area, undergoing constant modifications, are still implemented, but today they should be treated as a result of ongoing changes in the world. However, this does not mean that the process of changes is no longer relevant for Polish organizations. This phenomenon is important as it may contribute to building security at the local level. Continuing to undertake new adaptation measures does not guarantee success, but it allows for quick changes through the skilful use of emerging opportunities, while avoiding threats in the process of building the security of the region.

This study deals with an important and, at the same time, not systematically ordered problem of analysing the impact of globalization on the management of the organization and security of the region. We still do not know if and how local governments are prepared in the event of emergencies resulting from unexpected changes in the global world, resulting from the ever-new challenges of the 21st century.

Summarizing all the presented considerations, it should be emphasized once again that due to the dynamics of changes and the development of the pandemic, the report is only the basis for further research and studies on local security in the aspect of dynamically developing globalization processes.

Abstract

Classical models for the construction of an investment portfolio do not account for fundamental values of companies considered. In our approach, we extend the portfolio choice by adding a new criterion connected with the fundamental values of companies to the classical criteria of expected return and risk. It is assumed that an investor selects stocks according to their attractiveness, measured by some indicators of economic and financial situation of companies. In this approach, portfolios are assessed according to three criteria: their expected returns, risk (measured by variance of returns) and economic situation of the companies (measured by some indicators). In this article, we consider the book value to price ratio as a measure of the fundamental value of a company. We discuss an algorithm for constructing portfolios with this fundamental value criterion based on analytical solutions for relevant optimization problems. In the optimization problem, we consider minimizing variance with constrains on expected return and attractiveness of investment. We also present empirical examples of calculating effective portfolios of stocks listed on the Warsaw Stock Exchange and compare their performance with effective portfolios built according to the classical Markowitz approach. By adding an additional criterion of the book to market value, we received portfolios with a higher average realized rate of return compared with the classical Markowitz model. Thus, it can be useful for investors in the capital market to incorporate an additional criterion connected with fundamental values of companies when preparing a model of stock returns.

Keywords: Portfolio Analysis, Multicriterial Choice, Fundamental Analysis, Book to Market Ratio.

Introduction

Classical methods for selecting an investment portfolio, developed by Markowitz (1952, 1959) and Sharpe (1963), take into account only the market performance of companies, measured with changes in their prices. In the classical model, potential portfolios of investment are evaluated according to two criteria: expected return (which describes the potential level of profitability from an investment) and risk. The first criterion is measured with the expected rate of return and the second one - with the variance or standard deviation of returns. No other criteria are considered that might give some additional information about the financial standing and prospects of a company that could influence prices of its shares.

In recent years, however, there has been a growing interest in portfolio analysis methods with alternative ways of constructing portfolios. The article by Kolm, Tütüncü and Fabozzi (2014) contains a review of major developments in the portfolio theory since it its origin, and the book by Doumpos and Zopounidis (2014) draws attention to multicriteria methods used in this field. Most innovations depend on using some criteria of risk other than variance or standard deviation of returns, for example semi-variance or conditional value at risk. The article by Fabozzi, Focardi and Jonas (2007) presents a variety of risk measures that are currently used in the practice of portfolio investments. In other approaches, some characteristics of the distribution of returns on assets are used as additional criteria for evaluating

portfolio performance. Examples of such characteristics can be skewness or kurtosis. Expanded portfolio analysis is presented by Briec, Kerstens and Jokund (2007) or Rodríguez, Luque and González (2011).

There are several studies which include criteria not based on returns on assets. There is a branch of the literature which takes into account ethical, social or environmental criteria in portfolio construction, for example the so-called socially responsible investments approach described in Steuer, Qi and Hirschberger (2007). The articles by Ballestero et al. (2012) and Bilbao-Terol et al. (2013) are a few more examples illustrating this approach.

Lo, Petrov and Wierzbicki (2003) considered liquidity of stocks as an additional criterion in the portfolio construction process. There are only a few papers which also take into consideration fundamental values of companies. Xidonas, Mavrotas and Psarras (2010) considered the sum of dividends paid by companies. Jacobs and Levy (2013) took into account the risk associated with leverage. The utility function of an investor includes the costs of margin calls, which can force borrowers to liquidate securities at adverse prices due to their illiquidity, losses exceeding the capital invested, and the possibility of bankruptcy.

In accordance with the theoretical concept and empirical research (Fama and French 1992, 2015, 2017; Lam 2002; Zaremba, Czapkiewicz 2017), fundamental factors are important in shaping returns on capital markets. Therefore, it seems rational to include them in a stock portfolio model. The current extensive research on the main financial markets of Eastern Europe has corroborated significant impact of fundamental information concerning companies on their rates of returns. This has also been found to hold true for the book to market ratio as an indicator of the financial standing of companies. The research sample included five countries: the Czech Republic, Hungary, Poland, Russia, and Turkey (Zaremba, Czapkiewicz 2017).

There have been several attempts to combine a portfolio analysis with the fundamental analysis of companies from the Polish stock markets. Tarczyński (2002) developed a synthetic measure to evaluate the economic and financial standing of a company, which he called the taxonomic measure of attractiveness of investment (TMAI), and to apply this measure as an additional criterion in the evaluation of possible portfolios. The portfolio constructed with the use of TMAI was called a fundamental portfolio. The analytical solution of this model was given by Kliber and Rutkowska- Ziarko (2018). This model has been modified in recent years, for example by substituting variance with semi-variance as a risk measure (Rutkowska-Ziarko and Garsztka 2014). In Rutkowska-Ziarko (2013), the Mahalanobis distance was used to determine the TMAI due to possible correlation between diagnostic financial variables. Another method was proposed by Pośpiech (2019) in the research on financial ratios, and market indicators were applied to guide the initial selection of companies. Afterwards, the classical Markowitz portfolio optimization was used.

In this article, we propose an approach in which the book to market ratio (BM) serves as a measure of the current pricing of companies in a portfolio by the capital market. We present a simple algorithm for constructing a fundamental portfolio with the book to market ratio as an additional criterion for evaluating portfolios. The algorithm is based on analytical solutions of optimization problems. In the empirical part, we verify this method by computing fundamental portfolios of the stocks traded on the Warsaw Stock Exchange. We evaluated both the mathematical side of the proposed model and its usefulness for investors. To this end, we constructed a large number of portfolios (using both classical approach and our propositions) and compared their realized rates of returns.

The article is organized as follows. After this introduction, we present in section 2 our proposal of extending the classical portfolio theory with an additional, fundamental criterion. Section 3 provides an analytical solution to the problems connected with computing fundamental portfolios and an algorithm for constructing such portfolios. Section 4 contains empirical examples from the Warsaw Stock Exchange, and section 5 concludes the research.

Portfolio problem with the book to market ratio criterion

In the article, we use generalization of the classical Markowitz model of portfolio optimization (cf. Markowitz 1952 and Markowitz 1959). We consider an investor who tries to determine optimal composition of his portfolio. Let us assume that there are n risky assets with random rates of returns $R_1, \ldots, R_n$. Let μ_i be an expected return of asset i: $\mu_i = E[R_i]$. By cov_{ij} we denote covariance between the asset i and j, $cov_{ij} = \mathrm{cov}(R_i, R_j)$. By x_i we denote the proportion of wealth invested in asset i. As in the classical Markowitz model, an investor evaluates a portfolio according to criteria of expected rate of return and risk. The expected return equals

$$\mu_P = \sum_{i=1}^{n} x_i \mu_i \tag{1}$$

and the risk is measured by the variance of return from the portfolio, which equals

$$\sigma_P^2 = \sum_{i=1}^{n} \sum_{j=1}^{n} x_i x_j cov_{ij} \ . \quad (2)$$

The expected return and the variance of return of the portfolio's components are estimated on the basis of historical returns of the companies' shares. Thus, the problem of portfolio selection relies entirely on the past market data. In our approach, we combine this classical approach to estimating future market performance with the fundamental analysis. It augments the Markowitz model with a third criterion, which describes financial and economic standing of companies whose shares are in the portfolio.

Market multiples are financial indicators that compare given accounting values per share with the market price of this share. It was found that a market multiple can be used to find more attractive companies for investors on the Warsaw Stock Exchange (Rutkowska–Ziarko, Gęstwicki, Williamson, 2015). On other hand, selecting underpriced companies is not enough for building an effective portfolio. Markowski and Rutkowska-Ziarko (2011) have found that a Markowiz portfolio outperforms simple diversification for Polish capital market. Thus, it is important to combine the Markowitz model with information about the current value of a market multiple. Loughran and Wellman (2011) analyzed a broad sample of non-financial firms from NYSE, AMEX, NASDAQ. They found that companies with low levels of market multiples appeared to have higher stock returns than companies with high levels of market multiples.

As for the book to market ratio (BM), the price of one ordinary share is related to the company's book value, calculated per one ordinary share. Therefore, this market multiple represents the firm's book value relative to its market value:

$$BM = \frac{book\ value\ of\ the\ company}{market\ value\ of\ the\ company} = \frac{book\ value\ per\ share}{price\ of\ the\ share}.$$

A positive relationship between the book to market ratio and average returns was described by Rosenberg, Reid and Lanstein (1985). This relationship was also proved for Japanese stocks (Chan, Hamao, and Lakonishok 1991). Based on this research, Fama and French (1992) suggested that book to market would be a significant factor describing the variability of stock returns. They proposed a three-factor model, which explains the returns on capital market with three factors: excess rate of return relative to the market portfolio, company's size and book to market ratio. This model was positively verified on a sample of US stocks.

As in the case of all market multiples, the book to market ratio is an additive measure. If we denote the book to market ratio of stock i by BM_i, then the value of this measure for the whole portfolio is given by the following formula:

$$BM_P = \sum_{i=1}^{n} x_i BM_i. \quad (3)$$

With the introduction of BM_P, we have three criteria for assessing an investment: expected return, risk and fundamental value. One of the methods for obtaining a portfolio which is efficient with respect to all three criteria is to solve a problem of minimizing the variance of a portfolio with constrains on the two other criteria. This leads to the following optimization problem:

$$minimize \sum_{i=1}^{n} \sum_{j=1}^{n} x_i x_j cov_{ij} \quad (4)$$

with respect to

$$\sum_{i=1}^{n} x_i \mu_i \geq \gamma \quad (5)$$

and

$$\sum_{i=1}^{n} x_i BM_i \geq BM_\gamma, \quad (6)$$

where γ is the target rate of return and BM_γ is the required by the investor minimal book value for one monetary unit of the total invested wealth. Of course, there is an additional condition that $\sum_{i=1}^{n} x_i = 1$.

The analytical solution of the portfolio problem

Let Σ be a covariance matrix of returns, i.e.

$$\Sigma = \begin{bmatrix} cov_{11} & \cdots & cov_{1n} \\ \vdots & \ddots & \vdots \\ cov_{1n} & \cdots & cov_{nn} \end{bmatrix}.$$

Define the following vectors: $\mu = (\mu_1, \dots, \mu_n)^T$, $z = (BM_1, \dots, BM_n)^T$ and let e be a column vector of length n: $e = (1, \dots, 1)^T$. Using the vector notation, the optimization problem (4)-(6) can be expressed as follows:

$$minimize\ \frac{1}{2} x^T \Sigma x \tag{7}$$

with respect to

$$x^T e = 1, \tag{8}$$

$$x^T \mu \geq \gamma \tag{9}$$

and

$$x^T z \geq BM_\gamma. \tag{10}$$

The Kuhn-Tucker conditions for the problem (7)-(9) are as follows

$$\Sigma x = \lambda_1 e + \lambda_2 \mu + \lambda_3 z, \tag{11}$$

where $\lambda_2, \lambda_3 \geq 0$, with the complementary conditions

$$\lambda_2 (x^T \mu - \gamma) = 0, \tag{12}$$

$$\lambda_3 \left(x^T z - EP_\gamma\right) = 0. \tag{13}$$

Assuming that the covariance matrix is nondegenerate (as it is done in practice), it follows from equation (11) that the solution has the following form:

$$x = \lambda_1 \Sigma^{-1} e + \lambda_2 \Sigma^{-1} \mu + \lambda_3 \Sigma^{-1} z. \tag{14}$$

We have to consider several cases. To simplify the notation, we define the following symbols. Let

$$g_{11} = e^T v^1, g_{12} = e^T v^2, g_{13} = e^T v^3, g_{22} = \mu^T v^2, \tag{15}$$

$$g_{23} = \mu^T v^3, g_{33} = z^T v^3,$$

where:

$$v^1 = \Sigma^{-1} e, \quad v^2 = \Sigma^{-1} \mu, \quad v^3 = \Sigma^{-1} z. \tag{16}$$

Firstly, assume that $\lambda_2 = \lambda_3 = 0$. From complimentary conditions (12) and (13) it emerges that only condition (8) must be satisfied as equality. By inserting solution (11) with $\lambda_2 = \lambda_3 = 0$ into (8), we obtain the solution

$$\tilde{x}^1 = \frac{1}{g_{11}} \Sigma^{-1} e. \tag{17}$$

The minimal variance in this case equals

$$\sigma_1^2 = \frac{1}{g_{11}^2}. \tag{18}$$

In a case when $\lambda_2 > 0$, $\lambda_3 = 0$, the optimal solution condition (8) is fulfilled and condition (9) holds as an equation, which gives a set of equations:

$$\lambda_1 g_{11} + \lambda_2 g_{12} = 1, \tag{19}$$

$$\lambda_1 g_{12} + \lambda_2 g_{22} = \gamma. \tag{20}$$

After some transformations, one can write the solution of this system as

$$\tilde{x}^{12} = (1 - \alpha_{12})\, \tilde{x}^{1} + \alpha_{12} \frac{v^2}{g_{12}}, \tag{21}$$

where

$$\alpha_{12} = \frac{g_{12}(\gamma g_{11} - g_{12})}{g_{11} g_{22} - g_{12}^2}. \tag{22}$$

The variance of the portfolio in this solution equals $\sigma_{12}^2 = \sigma_1^2 + \Delta\sigma_{12}^2$, where

$$\Delta\sigma_{12}^2 = \frac{(\gamma g_{11} - g_{12})^2}{g_{11}}. \tag{23}$$

The case $\lambda_2 = 0, \lambda_3 > 0$ is analogous to the last one. The optimal solution satisfies conditions (8) and (10) as equations. The solution can be expressed as:

$$\tilde{x}^{13} = (1 - \alpha_{13})\, \tilde{x}^{1} + \alpha_{13} \frac{v^3}{g_{13}}, \tag{24}$$

where:

$$\alpha_{13} = \frac{g_{13}(EP_\gamma g_{11} - g_{13})}{g_{11} g_{33} - g_{13}^2}. \tag{25}$$

The growth of variance when switching from $\tilde{x}^1$ to $\tilde{x}^{13}$ equals:

$$\Delta\sigma_{13}^2 = \frac{\left(EP_\gamma g_{11} - g_{13}\right)^2}{g_{11}}. \tag{26}$$

The last case is when $\lambda_2 > 0, \lambda_3 > 0$. In this case, all conditions (8)-(10) must be fulfilled as equalities, which brings us to the following set of equations:

$$\lambda G = a, \tag{27}$$

where λ is the vector of multipliers $\lambda = (\lambda_1, \lambda_2, \lambda_3)^T$, $a = \left(1, \gamma, BM_\gamma\right)^T$ and matrix G is

$$G = \begin{bmatrix} g_{11} & g_{12} & g_{13} \\ g_{12} & g_{22} & g_{23} \\ g_{13} & g_{23} & g_{33} \end{bmatrix}.$$

The optimal solution to the problem (4)-(7) with all conditions fulfilled as equation can be expressed as follows:

$$\tilde{x}^{123} = \lambda_1 v^1 + \lambda_2 v^2 + \lambda_3 v^3, \text{ where } \qquad \lambda = G^{-1} a. \tag{28}$$

These derivations lead to the following algorithm for finding the optimal solution of the problem (4)-(6):

1. Compute vector $\tilde{x}^1$ and check if it fulfills conditions (5) and (6). If so, this is the optimal solution.
2. Otherwise, calculate $\Delta\sigma_{12}^2$ and $\Delta\sigma_{13}^2$. Choose the smaller value: let it be $\Delta\sigma_{1k}^2$.

Compute vector $\tilde{x}^{1k}$ and check if it fulfills conditions (5) and (6). If so, this is the optimal solution. Otherwise the optimal solution is vector $\tilde{x}^{123}$.

Empirical Results

In order to present computations of effective portfolios according to the augmented approach, we considered portfolios of the stock of 20 largest and most liquid companies listed on the Warsaw Stock Exchange. The sample includes all WIG20 companies. The computations are based on quarterly returns calculated on daily closing prices in the period starting from the beginning of August 2013 and ending on 7 February 2020. Returns were computed as relative increases in prices according to the formula:

$$r_{it} = \frac{P_{it+s} - P_{it}}{P_{it}} \cdot 100\% \,,$$

where r_{it} is the rate of return on security i at time t, s is the length of investment horizon (in our case one month) expressed in days and P_{it} is the quoted price of security i at time t.

Financial indicators for each company were calculated based on quarterly financial reports for the years from 2012 to 2018. For each company in the sample, we computed the book to market ratio for all trading days. The expected return and standard deviations were calculated based on time series of returns.

Firstly, we considered possible effective portfolios which can be created on the last day of the considered period. It is worth noticing that we took into account about 1700 trading days in which portfolios were created. In every time unit, four types of portfolios were built, and their realized returns were calculated. The aim was to evaluate the practical usefulness of the proposed method for investors in the Polish capital market. To make these computations, we developed a specialized software application in R package, which allowed us to solve optimization problems, create several thousands of optimal portfolios, and compare their performance.

Table 1 contains information concerning estimations of the expected return, risk and book to market ratio for all companies as of 7 February 2020. It is only an example of one trading day from the 1700 days included in our research. Characteristics of rates of return (i.e. expected return and standard deviation) were estimated based on the last 400 returns. Book to market ratios were calculated on the basis of closing prices on the last trading day. To calculate book to market ratio for each day in which portfolio was created we used the latest possible information concerning book value of the company (i.e. from the latest quarterly statement), the current number of stocks in the market and the closing price of the stock in the previous trading day.

Table 1: Mean return, risk and book to market ratio (BM)

Company	Mean (%)	Standard deviation (%)	BM

Source: own calculations

The BM of the companies under research varied from 0.03 to 4.02. The lowest value, 0.03, was for company CD Project S.A. (CDR). This is a software company producing computer games with a small amount of own assets. Its book to market ratio decreased from 0.22 in 2012 to 0.03 in 2020, mainly due to an exceptional increase in its stock prices.

The book to market ratios of the companies were negatively correlated with the mean returns (correlation coefficient -0.288) and positively correlated with standard deviation of returns (correlation coefficient 0.291). There was a negative correlation between the mean return and risk measured with variance (correlation coefficient -0.360).

The problem of portfolio choice in this situation is a trade-off between risk and the two other criteria. We seek a portfolio which minimizes risk. However, low-risk portfolios tend to have lower expected return. On the other hand, if we assume higher requirements on the mean return of a portfolio, the solution will have a lower book to market ratio. Figure 1 depicts the efficient frontier for the three-criteria portfolio choice. Each point in the graph represents a solution to problem (4)-(6) for a different combination of the required expected return and required level of BM.

Source: own study

Figure 1: Effective frontier for the portfolio problem with three criteria

In order to analyze the impact of fundamental values of companies in which one is willing to invest on the trade-off between expected return and risk, we determined the shape of efficient frontiers for various values of the required BV ratio. Using the algorithm proposed in section 3, we calculated effective portfolios for BM_{γ} at the levels of 1.23, 1.90, 2.56 and 3.23. The results are depicted in Figure 2. The graph shows that higher levels of required the book to market ratio move the effective frontier upwards. The restriction connected with the BM ratio is less important for lower levels of the required BM ratio, as the required profitability of expected return grows, and it does not apply to the highest levels of the expected rate of return.

Figure 2: Effective frontiers for different values of the book to market ratio

Source: own study

In order to compare the investments according to the fundamental method (i.e. with the book to market ratio as the third criterion) with ones derived in line with the classical approach, we performed the following calculations. We calculated several portfolios using both methods. Data for portfolio calculations were estimated based on a moving frame of the length of 400 trading days. The first frame started on 2013-04-03 and the last one began on 2020-02-05. There were 1705 frames in total. For each frame, we estimated all parameters required in both investment problems. Then, we considered investments for one moth starting on the next trading day. In each case, we considered four portfolios. The first one was the solution of a classical problem with the required rate of return equal to expected rates of return of all stock. The next three were solutions of the problem including the fundamental criterion with the same required rate of return and values of the book to market ratio equal 1.28, 2.12 and 2.97, respectively. The numbers are 30%, 50% and 70% percentiles of the observed book to market values of the considered stocks. In each case, we assumed that the expected return of the portfolio should be equal to the actual mean return of the stocks in the portfolio. Then, we checked calculated realized returns for each of these portfolios.

For each kind of portfolio, we calculated the mean return, standard deviation and cumulated return from the whole period of our study. Besides, we verified the percentage of cases in which return from a specific portfolio exceed returns from the classical portfolio. The results were presented in Table 2. Portfolio P1 is the classical Markovitz portfolio with minimal variation (under the condition that the expected value is equal to the observed mean return). Portfolios P2, P3 and P4 were constructed with the additional restriction on values of the book to market ratio (1.28, 2.12 and 2.97, respectively)

It transpires from all cases that the results from the portfolios with the BM criterion had higher mean returns and lower risk. In two of them, the cumulated return values were higher.

Table 2: The results (ex post, realized returns)

Portfolio	Mean return	Std	Exceedings	Cum. return
P1	1.05	6.21	0	1.55
P2	1.35	6.71	55.52%	1.95
P3	1.19	9.55	51.58%	1.67
P4	1.11	13.49	51.04%	1.32

Source: own calculations

Conclusions

In the paper, we propose an algorithm for constructing a portfolio of assets where three criteria are considered: potential profitability of the investment (measured with expected return), risk (measured with variance of returns) and economic situation of companies in the portfolio (given by the book to market ratio). The algorithm for finding effective portfolios inclusive of all the three criteria is based on analytical solutions of optimization problems. We have demonstrated that the algorithm is effective and allows one to construct efficient portfolios with minimal computational effort.

The proposed algorithm enabled us to determine the effective frontier (i.e. the tradeoff between expected return and risk) for several levels of requirements concerning fundamental values of companies whose stocks are in a portfolio. The empirical research results for the major companies traded on the Warsaw Stock Exchange reveal that inclusion of the book to market ratio as an additional criterion in creating a portfolio can lead to better performance.

Abstract

The necessity of optimization of financial and credit support for the development of the agro-industrial sector of the economy has been substantiated. The ways of activating bank lending to agricultural enterprises by improving the mechanism for determining interest rates for loans, introducing mortgage lending in agriculture, using credit incentives for the rational use of land and insuring credit risks. The expediency of improving the mechanism of state support for agricultural producers has been determined both through budget financing of national programs and through lending from the budget. The assessment of the current state of state financial assistance to the subjects of agricultural production is carried out, measures are proposed to improve the existing mechanisms of financial and credit support and stabilize the situation in the agricultural sector of the economy.

Keywords*:* Agriculture, Agricultural Producers, Financial Support, Credit Support, Credit Relations, Mortgage Crediting, Land Bank, Credit Risk, Risk Insurance.

Introduction

A study of the financial support of agricultural enterprises shows that these enterprises operate at the expense of their own resources, which today are significant in terms of share, but insufficient for self-financing. This leads to the development of both banking and partner forms of crediting. Bank crediting does not play a significant role in the development of the agricultural sector, although currently there are positive trends in the growth of crediting volumes by domestic commercial banks, including in terms of credit on easy terms.

Analysis of recent research and publications

Issues of financial-and-credit support of agricultural producers, both theoretical and practical directions, are considered in the works of many scientists, in particular, such scholars-economists as: Yu. Ya. Luzan [3], Yu. O. Lupenko [2], O. V. Khodakivska, V.Ya. Mesel-Veseliak [2], D. O. Plekhanov [4], P. T. Sabluk, M. M. Fedorov, well-known foreign scientists and many other domestic scientists.

However, many aspects of this important problem require further in-depth researches with the aim to find ways to improve the financial-and-credit mechanism in the context of the market and the development of various forms of economic relations.

Objectives statement

The purpose of this publication is to study the prospects for the implementation of new forms of credit relations for the enterprises of the agricultural sector of the economy and to outline the main directions of their improvement in the context of modern conditions.

Presentation of basic material of the research

Summarizing the difficulties in the way of the agricultural sector, we note that this is essentially a manifestation of the following risks, which can be figuratively divided into three groups:

1. Social-and-political and structural-and-economic – incompleteness of the legal framework, cautious anti-inflationary agricultural policy, relatively small amounts of state investment in the sphere of the agro-industrial complex; imperfection of the mechanism of state regulation of the industry; low payment discipline in the relations between business entities; undercapitalization of the banking system and insufficient level of protection of creditors' rights, for example, in terms of «blurring» of the terms of circulation of recovery of the debtor's property in the legislation.
2. Risks of sectoral nature – weak justification and low budget and economic efficiency of the majority of the investment projects in the sphere of the agro-industrial complex, shortage of energy raw materials and skilled manpower, high level of competition from foreign producers, a significant (more than 60%) degree of «dependence» of the agriculture sector from the capabilities and resources of personal subsidiary husbandry.
3. Risks of financial-and-credit nature, low level of the development of the financial market, imperfect infrastructure of the credit system serving the agricultural sector, non-defined strategy of the development of credit provision of production subjects.

Mentioned negative factors are essentially interrelated. It seems that the strategic planning of the development of the agro-industrial sector, implemented on the vector «state – banking sector – agricultural producers» are interrelated with risk and motivational components of business policy of each of the participants in the support system of agro-industrial complex.

The main provisions and measures to stabilize the situation in the agricultural sector of the economy in modern conditions and change of the motivational component of the investment activity of banks in this market segment require the conducting of the following actions:

- to develop a long-term program for the development of the agricultural sector in the context of modern conditions;
- to determine the financial priorities of domestic agricultural producers;
- to ensure the quality of economic growth of all strategic industries (and agriculture is one of them) to the growth of basic economic parameters. To continue positive innovations in terms of defining national priorities in the development of the State Budget of the country;
- to develop and ensure the support of the profitability of the agricultural sector at the appropriate level. Based on this, the development and implementation of a balanced system of income insurance of agricultural producers is seen as promising;
- to determine in the tax legislation the norms that give the right to receive benefits to business entities that invest a certain amount of their income in the agricultural sector of the economy;
- to strengthen customs control over the import of foreign food raw materials;
- to estimate the probability of benefits from the reduction (minimization or differentiation of rates) of bank income tax – from income sent to crediting the enterprises of the agricultural sector of the economy;

- to ensure a practical possibility of establishing at the level of the Government of Ukraine the so-called «limits of usury» (widely used in the United States) to prevent excessive overpricing of supply rates by commercial banks;
- to develop the structure of a specialized agricultural bank on the basis of a universal credit institution (according to the type used in the western practice) of the development bank;
- to develop the following programs of credit support for agricultural producers:

a) crediting for the purchase of mineral fertilizers; fodders, purchase of fuels and lubricants, veterinary drugs, to pay for the insurance of future harvests – up to 12-15 months in the form of overdraft, one-time issuance or credit line;

b) medium-term crediting (up to 5 years) of needs in agricultural machinery, freight transport, production equipment, in order to modernize fixed assets, the creation of production for processing agricultural products;

c) credits for the purchase of breeding stock on its security, for new construction works, for the creation of production facilities of agricultural enterprises (in particular, for building of livestock complexes) on the terms of long-term financing (up to 8 years).

The development of mortgage relations in agriculture in modern conditions is of great importance because of the need to attract additional investment in the agro-industrial complex in order to revive agricultural enterprises of various forms of ownership. The low quality of mortgage security limits the access of agricultural enterprises to credit resources and increases the credit risks of banks. In this regard, the formation of the land market is, in our opinion, a priority, the solution of which will launch a mechanism of mortgage crediting in agriculture, where the agricultural land will be mortgage, which will help to attract investment credits.

The use of mortgage mechanisms allows business entities to:

- get a credit for buying a plot of land and start own business using it;
- expand the existing economy through the purchase of new real estate, including new plots of land, buildings, structures;
- renew working capital.

The current state of the development of credit relations is characterized by the process of finding new forms of credit security of the agricultural sector of the economy in relation to new economic conditions. The change in the economic environment causes a change in credit relations in the agricultural sector of the economy.

However, there is no consensus on the optimal amount of credit resources to the volume of gross agricultural output.

To do this, it is necessary to determine the minimum (although it is not significant enough) and the maximum limit of crediting, which directly affects the level of creditworthiness of enterprises. In our opinion, the amount of credits raised by agricultural enterprises should not exceed 40% of the gross agricultural output. Exceeding this limit can disrupt the cycle of the reproduction process and increase the risk of credit default.

In the process of developing market relations, it is advisable for banks to improve the mechanism for determining interest rates on credit. The size of interest rates should be related to the technological features of agricultural production performance and the period of receipt of revenue from sold products (especially crop products).

In our opinion, the introduction of a regression scale mechanism for determining the discount rate of a commercial bank for the use of credit taking into account the growth of profits is worth noticing. The essence of it is that each subsequent increase in income lowers the credit rate, which will increase the efficiency of production of the agricultural enterprises.

The size of the interest rate on credit for agricultural enterprises should be tied to the term of their providing, which is directly related to the peculiarities of agricultural production. Thus, credit rates in the I and II quarters should be lower than rates in the III and IV quarters. This will force enterprises to be more responsible to their financial resources.

In addition, it is advisable to attract a credit support mechanism in the context of developing a state food security strategy. Thus, agricultural enterprises selling their products on the domestic market should use credit benefits (for example, lower interest rates). Consequently, the country partially compensates financial losses of enterprises and stimulates the development of the domestic market.

One of the important steps towards the development of the land market is the creation of the State Joint-Stock Land (Mortgage) Bank with an appropriate system of banks in the regions, which should provide the following types of banking services to the enterprises of the agricultural sector:

- investment and credit servicing of commodity producers of the agro-industrial complex, including mortgage crediting of the agricultural commodity producers secured by plots of land and property;
- redemption of pledged property and land by insolvent debtors from commercial banks;
- trust management of property and land and funds of insolvent agricultural enterprises;
- implementation of leasing and factoring operations for agricultural producers;
- insurance of property, life and financial risks in rural areas;
- commission transactions with goods, property and land;
- provision of services for accounting, auditing and analysis of enterprise activity and development of investment plans and business projects;
- servicing of foreign economic operations of commodity producers of the agro-industrial complex;
- carrying out other banking operations;
- performance of functions of the methodical center on rendering of consulting services to the enterprises of the agro-industrial complex, credit unions and newly created cooperative banks which serve this branch.

Throughout the civilized world, land is collateral for long-term, cheap credits for the agricultural sector. The land fund of Ukraine has 33 million hectares of arable land, and its value, according to scientists, is 140-300 billion hryvnias. Thus, long-term credits for land mortgages of 100-200 billion can be attracted to the agricultural sector of the economy. Thuswise, Ukraine has all the prerequisites for the creation and effective development of land banks.

The task of the state is to develop a credit policy taking into account the interests of each business entity in accordance with their economic status, social significance and development strategy.

In recent years, Ukrainian land has been used in complete disregard of the physical law of return of nutrients, which has led to agricultural instability, reduced agricultural efficiency, especially in years when natural disasters are increasingly common. Yield loss on poorly eroded soil is 20%, moderately eroded soil – 40%, heavily eroded soil – 60%. The annual total losses of the state amount to 12.76 billion UAH, and the loss of net profit – 7.4 billion UAH [1].

The normative documents of the state should provide for the provision of credit benefits for the rational use of land. Improving the efficiency of land use of the state is the basis of its food security and the basis of a favourable competitive environment after Ukraine's accession to the WTO. However, the legislation does not provide credit benefits in terms of regulatory and legal support for economic incentives of the rational use and protection of land.

In modern conditions, the issue of production of environmentally friendly agricultural products is acute, which is also relevant in European integration processes. This requires improvement and financial-and-credit mechanism of the agricultural sector of the economy. First of all, it is necessary to revise the pricing and customs policy, tax legislation, as well as to introduce a preferential crediting regime. The essential content of the credit is manifested through its functional significance. Researchers have presented a wide range of credit functions which are the subject of scientific discussions. This is due to the fact that, there is no consensus among scientists in understanding the role of credit in modern conditions. Some understand it as the most important tasks of the credit, others present it as a specific relationship with the economic environment, which in essence does not consider the role of credit as an important factor in the economic development. In addition, the economic category of «credit» manifests itself in various forms, which is reflected in its functions.

Based on these positions, we offer to supplement the value of credit in modern conditions with the following functions.

The function of providing with financial resources. Credit in a market economy is an elastic mechanism for the transfer of capital from one sector of the economy to another to achieve certain rates of profit-earning, which allows to overcome the limitations of individual capital and to achieve a balance in the formation of financial resources. This is very important, because the lack of financial resources and loss of time to find new sources of their formation has a negative impact on the profitability of agricultural enterprises.

Information-and-analytical function of credit. The category of credit, its size, objects of crediting, terms of granting give the chance to estimate by the society of level of economic development of separate subject of business activity and the state as a whole. In addition, information about the state of credit relations is a valuable object of analytical

researches, which will help to determine the positive and negative factors of these relations and to define the strategy for their development.

Agricultural production is a risky industry, which causes the necessity of the market development of the insurance services.

The concept of financial risk is not unambiguous in the interpretation of experts and scholars. In a narrow sense, it is just credit risks

Credit risk is connected with the possibility of non-fulfillment of the financial obligations by the entity before the investor in the result of using an internal loan to finance its activity. Credit risk arises in the process of business cooperation of the enterprise with its creditors:

1) with a bank and other financial institutions;
2) with contractors – suppliers and intermediaries;
3) with shareholders.

The variety of types of credit operations determines the features and reasons of credit risk appearing:

1) bad faith of the borrower who received a credit;
2) deterioration of the competitive state of a particular entity that received a commercial or bank credit;
3) unfavourable economic situation;
4) incompetence of the company's management;
5) non-fulfillment of the obligations by the counterparties before the borrower;
6) imperfection of the regulatory framework;
7) financial-and-economic instability of the state.

Risk insurance of credit default is a delcredit form of insurance relations organization, where the banks, investors and other creditors play simultaneously the role of insurants and insured ones, and the insurance relationship is limited by the relationship between two parties – the insurer and the insured.

The liability of the insurance institution arises when the insured has not received the amount stipulated in the credit agreement within, as a rule, 20 days after the due date of payment under the credit agreement or the deadline set by the bank if the borrower fails to comply with the credit agreement. The insurance contract sets the limit of the insurer's liability. It can be in the amount from 50 to 90% of the unrecovered credit. The rest of the risk remains the responsibility of the insured. The division of risk between the insurer and the insured is established in order not to reduce the bank's liability for the credits provided by it. When insuring, the bank must carefully check the paying capacity of the borrower, his financial condition.

If individual credits are insured, the insurance contract is concluded for the period of using the credit. The amount of insurance is set in proportion to the percentage of the insurer's liability specified in the insurance contract, based on the total amount of debt (including interest on the credit usage), which is subject to repayment under the terms of the credit agreement.

The agreement is concluded on the basis of a written application of the bank in the form prescribed by the insurer, the copies of the credit agreement together with all documents submitted for pre-contractual examination.

The insurer is obliged to pay the insurance indemnity within three banking days after the end of 20 working days and after the expiration of the insurance contract.

Another common type of bank credit insurance is borrowers' liability insurance for credits nonredemption, under which the insurer is the debtor, insuring received credit in favour of his credit provider. That is, sort of fulfilling of the financial obligations given by the debtor to cover the damage caused to his credit provider is insured. This is a type of classic (mortgage) insurance.

We suggest that some credit agreements be signed by counterparties that cooperate with agricultural producers and affect the results of their activity. Agricultural enterprises may file financial claims (if justified) against their counterparties for reimbursement of interest for the credit usage and share the responsibility in case of imposition of sanctions in case of non-fulfillment of their obligations before the credit providers. This will force counterparties in the agricultural sector of economy to fulfill their obligations more responsibly and reduce the credit exposure on agricultural producers.

The state can influence the development of agricultural production through direct participation – through budget financing of national-level programs and for the account of crediting from the budget costs, thus carrying out intersectoral redistribution of financial resources and stimulating certain types of activity in accordance with the specific purpose of financial (credit) policy. Herewith, state crediting is an important regulatory tool [2].

There is a noticeable difference between budget and bank crediting. Thus, bank credits are directed mainly in the field of agricultural production, where relatively higher income is provided with a corresponding repayment period. Budget credits are usually granted on preferential conditions at terms and interest rates in order to create conditions for the development of agricultural production of the relevant territory or increase the production of certain goods. They are a means of supporting of vital economic structures in the case of financial problems, their special position in the market, the bankruptcy of which leads to a deterioration of the economic situation in the state as a whole. At the same time, budget crediting should be temporary, used to stimulate the development of production in promising areas, and not turn into a long-term policy of redistribution of the financial resources in favour of individual entities of agricultural production [3].

Budget crediting is usually actively used during the downturn of the business activity and is an important tool of countercyclical policy. The volume of government loans in the domestic market decreases when production activity returns to its normal rhythm. Budget crediting is characterized by greater flexibility and efficiency compared to direct budget financing [4]. However, the state must be financially stable for conducting of budget crediting. Specific items of budget crediting for each industry in accordance with the development strategy should be provided in the state budget. This is especially important for small and medium-sized enterprises.

The report of the Ministry of Economy on the new model of state support of the agro-industrial complex states: in 2019, agricultural producers used 4.34 billion UAH of state support. In total, 1 667 business entities and 230 025 individuals, about 10 000 farmers and 2 agricultural cooperatives received state support.

State support was provided in six separate directions:

1) cheapening of credits;
2) support for the development of farms;
3) support for the development of horticulture, berry growing, viticulture and hop growing;
4) providing credits to farms;
5) support for the development of the livestock industry;
6) cheapening of agricultural machinery and equipment.

This allowed to purchase 6262 heads of cattle, 781 heads of sheep, 5532 heads of pigs and 257900 doses of reproductive material, partially recompense the cost of 49 livestock objects and 61 facilities for storage and processing of grain, to plant 3897 hectares of fruit-and-berry plantations, 246 hectares of vineyards and 9 hectares of hop gardens, to build 5 refrigerators with controlled atmosphere (CA) with a capacity of 8.5 thousand tons, 1 facility for freezing fruit-and-berry products, to purchase 5 lines of commodity processing of fruits, 3 mechanisms for hop granulation and 1 automated line for drying fruits, etc. In addition, 9 502 agricultural producers purchased 25 065 units of equipment, 426 enterprises attracted preferential credits.

The Law on the State Budget 2020 contains fewer state programs than year. Most of the funds were allocated to support producers operating in the livestock sector, farming and to reduce the cost of credits by compensating the bank's interest rate (Table 1).

Table 1: Directions of financial support of the enterprises of the agro-industrial complex for 2020, thousand UAH

Directions of financial support of the enterprises of the agro-industrial complex	The amount of expenses	The amount of expenses %
State support for the development of animal husbandry and processing of agricultural products	1 000	10%
Financial support for the development of farms	380	3,8%
Partial compensation for the cost of agricultural machinery and equipment of domestic production	1 000	10%
Financial support for activities in the agro-industrial complex by	1 200	12%

reducing the cost of credits		
Financial support for the development of horticulture, viticulture and hop-growing	400	4%
Provision of additional financial support to family farms through the mechanism of additional payment in favour of insured persons – members/head of the family farm of a single contribution to the obligatory state social insurance	20 000	20%

Source: [5].

The Ministry for Development of Economy, Trade and Agriculture of Ukraine distributes funds under this program. It will be recalled that currently this Ministry ensures the formation and implementation of state agricultural policy.

The procedures for providing funds for each area of state support are approved, which contain a mechanism for receiving budget funds and a list of conditions under which agricultural producers can apply for state aid.

The general conditions of almost all areas are that the following agricultural producers cannot count on state aid:

- those which have arrears of taxes and fees;
- those which have been declared bankrupt or in respect of whom a bankruptcy case has been initiated;
- which are in the process of liquidation;
- in which the facts of illegal receiving and/or misuse of budget funds were previously revealed [5].

Thus, the features of the following risks while summarizing the difficulties in the way of the agricultural sector can be noted:

1. Social-and-political and structural-and-economic – incompleteness of the legal framework, cautious anti-inflationary agricultural policy, relatively small amounts of state investment in the sphere of the agro-industrial complex; imperfection of the mechanism of state regulation of the industry; low payment discipline in the relations between business entities; undercapitalization of the banking system and insufficient level of protection of creditors' rights.
2. Risks of sectoral nature – weak justification and low budget and – economic efficiency of the majority of the investment projects in the sphere of the agro-industrial complex.
3. Risks of financial-and-credit nature – low level of the development of the financial market, imperfect infrastructure of the credit system serving the agricultural sector, non-defined strategy of the development of credit provision of production subjects. The main measures on stabilization the situation in the agricultural sector of the economy in modern conditions require the conducting of the following actions:

- to develop a long-term program for the development of the agricultural sector in the context of modern conditions;
- to determine the financial priorities of domestic agricultural producers;
- to ensure the quality of economic growth of all strategic industries (and agriculture is one of them) to the growth of basic economic parameters;
- to develop and ensure the support of the profitability of the agricultural sector at the appropriate level. Based on this, the development and implementation of a balanced system of income insurance of agricultural producers is seen as promising;
- to determine in the tax legislation the norms that give the right to receive benefits to business entities that invest a certain amount of their income in the agricultural sector of the economy;
- to strengthen customs control over the import of foreign food raw materials;
- to estimate the probability of benefits from the reduction (minimization or differentiation of rates) of bank income tax – from income sent to crediting the enterprises of the agricultural sector of the economy;
- to ensure a practical possibility of establishing at the level of the Government of Ukraine the so-called «limits of usury» to prevent excessive overpricing of supply rates by commercial banks;
- to develop the structure of a specialized agricultural bank and to work out the strategy of its development in accordance with modern conditions.

Conclusions

Thus, at the present stage of the agrarian reform, the formation of the domestic system of agricultural lending, taking into account the specifics and objective conditions of the industry, is carried out with state support. The state policy on credit provision of the agricultural sector in every possible way contributes to the development of the financial market in the countryside. It is carried out through improved legislative protection and the establishment of elements of temporary financial support. The continuation of the policy in the chosen tension for the ability to assimilate the original shortcomings is a reliable guarantee of an increase in financial flows to agriculture in subsequent years.

Abstract

Properly developed relationships are one of the elements that determine development opportunities of enterprises. Familiness resulting from the specificity, characteristics and values held in family businesses affects the shape of intra-organizational relationality as well as building working atmosphere. The management of intra-organizational relations is an intangible resource of the organization of particular strategic value. Therefore, the attention should be drawn to the significance of relational capital and its impact on the ability to manage human resources as well as organizational culture in family businesses. The objective of the article is to examine the impact of the family nature of the enterprise on building intra-organizational relations. During the analysis the attention has been paid to selected aspects of the personnel policy, including organizational culture of the enterprise, working atmosphere, stabilization and professional development as well as motivation of employees hired. The research conducted on Polish workers of family businesses in the second half of 2020 allowed for responding to the formulated research question. The research results confirmed that the basis for building positive intra-organizational relations is working atmosphere. The concern of employers for positive relationships with employees often brings a range of benefits, and the values associated with the family as well as characteristics such as trust, loyalty, tradition, enhance a sense of bond and identity of hired employees.

Keywords: Intra-Organizational Relations, Personnel Policy, Management of Family Businesses, Family Company

Introduction

Family businesses belong to the group of enterprises the specificity of which allows for the isolation of particular features that are characteristic of this type of organizations. These properties may include, among others, a high level of interdependence between the family and the enterprise, different organizational culture based on loyalty and trust in relation to employees, independence and care for positive relationships with the company's stakeholders. In turn, these characteristics allow for distinguishing family businesses against the background of non-family organizations.

In the article, an attempt has been made to identify the relationships within family organizations in the context of the personnel policy by determining the factors affecting job satisfaction and working atmosphere. Changes in the labor market cause that enterprises, not only family businesses, encounter different problems, among others, recruitment, employee retention and outflow, or talent acquisition. Therefore, it becomes relevant to build and maintain positive intra-organizational relations between employees and owners or individuals responsible for managing the team in the organization. Therefore, the objective of the article is to examine the impact of the family nature of the enterprise on building intra-organizational relations. During the analysis, the attention has been drawn to selected aspects of the personnel policy, including organizational culture of the enterprise, working atmosphere, stabilization, professional development and motivation of employees hired.

The employees of the production family businesses from the Opole region took part in the study. The enterprises were selected to meet the criteria resulting from the definition of the family business. The research was carried out in the second half of 2020 on the sample of 50 employees of the production family businesses (it was a pilot study). The

study used an original questionnaire. The collected results were analyzed using descriptive statistics with the use of a 5-point Likert scale.

Intra-Organizational Relations in Family Businesses

Establishing and maintaining lasting relationships and market relations is the essence of the functioning of each organization. Relational capital is undoubtedly a unique resource which, from the point of view of the theory of organizational resources, determines competitive advantage of the enterprise (Roman, Blomqvist, 2008). It is increasingly pinpointed that intellectual capital is the factor conditioning market advantage (Bontis, 1998). Stewart (1997) defines intellectual capital as the intellectual material of the organization, thus, it is knowledge, information, intellectual property, experience, which determines the creation of its wealth. The literature review indicates that it is possible to distinguish three components of intellectual capital, namely (Mani, Lakhal, 2015; Bombiak, 2016, p. 98):

- organizational capital, including the issues enhancing the performance of employees through technologies, organizational culture, management concepts, procedures and databases,
- human capital, understood as participants in the organization and their physical characteristics, intellectual ones, predispositions, skills, which enable the development and functioning of individual units,
- relational capital, defined as interrelationships of the organization with stakeholders, consisting of customers, suppliers, agreements with trading partners, investors, banks, public institutions etc.

Initially, relational capital was identified only with the area related to customers service. Nowadays, however, this category is perceived more extensively, and it includes relationships with all internal and external stakeholders of the organization (Cucculelli, Peruzzi, Zazzaro, 2019). Thus, relational capital can be defined as a whole of relations between the enterprise and stakeholders, which are based on mutual impact, trust and interdependence (Danielak, 2012, p. 16; Daspit, Long, 2014). The basis for the creation and management of relationships is the ability to cooperate. This ability, in the opinion of Kwiecień (2018, p. 94), builds a specific intra-organizational mechanism, which enables access to external knowledge and shapes relationships with the actors of the company's environment. When considering the structure of relational capital and its internal and external division, it can be concluded that intra-organizational relations are created by stakeholders who constitute the organization, thus both employees and managers, and their quality depends on the ability to create the atmosphere of mutual trust. It should be pinpointed that, nowadays, the advantage is gained by the company in which relational capital is value added in the long term. This enables the acquisition of basic resources such as: financial, physical, information or human resources, and creates the basis for unique resources, such as intellectual capital (Kohtamäki, Vesalainen, Henneberg, Naudé, Ventresca, 2012; Bombiak, 2016, p. 99).

The market value of the enterprise and its growth are perceived in terms of the company's success. Creating the value of the organization, regardless of its type, is based on the isolation and control of factors creating value (Carey, Lawson, Krause, 2011). Nowadays, taking into account the need for constant adaptation to the environmental conditions, it becomes necessary to share functions within the enterprise. The growing needs and attitudes of customers require specific competences and relevant relationships from employees. Establishing relationships is therefore a means to achieve the objective in each area of the activity of the organization in terms of creating its value, intra-organizational cooperation, use of common potential and achievement of mutual benefits (Kwiecień, 2018, pp. 99-100). Thus, it can be concluded that internal and external relations are intangible assets of particular strategic value. They include the characteristics such as: rareness, difficulty in purchasing and selling, difficulty in replacing. The value of relations is, in turn, inextricably linked to a specific entity, place and time (Eschner, 2017, p.137; Niazi, 2017).

The specificity of intra-organizational relations affects not only the atmosphere within the company but also the quality of external relations (Okręglicka, Havierniková, Mynarzová, Lemańska-Majdzik 2017). Internal relations in family businesses reflect interpersonal relations between employees, superiors and subordinates as well as the relationships between family members managing the company (Fig. 1).

Fig. 1: Relationships within the group of stakeholders of the family business
Source: Own study

The key role in creating intra-organizational relations is played by interpersonal bonds created between participants (Hanson, Hessel, Danes, 2019). Taking into account the fact that most family businesses are companies from the SME sector with the participation of family social capital, the feature of familiness in the process of creating interpersonal bonds seems to be particularly important. It turns out that external relations of family organizations are not built by the company but the employees representing it (Eschner 2017, pp. 137-149).

The literature review indicates that the fact that employees are satisfied with their job becomes particularly important in the organization. Employees' job satisfaction affects the functioning of enterprises, their competitiveness and profitability, and a high level of employees' satisfaction may be a critical factor influencing the success of the entire organization. According to Vorina, Simonić, Vlasova (2017), only satisfied employees are able to maintain the pace dictated by the modern labor market. The awareness of this fact among organizations is growing, and the level of job satisfaction is related to individual emotional state of each employee, which is expressed in profit and has an impact on the development and performance of the company. Job satisfaction may include different points of view such as development opportunities, working conditions, remuneration, or building positive relationships within the company. Proper development of relationships between the participants of the organization provides therefore an opportunity to access intellectual resources of employees and determines the ability and efficiency of the use of other resources (Daspit, Long 2014). Properly shaped intra-organizational relations are the factors conditioning access to knowledge, its creation and exchange, which, in turn, is the basis for the functioning in the knowledge-based economy. Involvement in the creation of positive relationships is translated into long-term sustainable relationships with external stakeholders based on cooperation and trust. On the other hand, inappropriate relationships between employees, negative atmosphere, lack of cooperation may result in the loss of commitment and, consequently, the loss of relationships with customers. Owners, managers, employees are therefore the group which initiates and implements all business processes in the organization. It can be concluded that this group is the main source of the generally understood relational capital (Rajennd et al., 2015; Bombiak, 2016, p. 100). It is indicated that family businesses are a particular group of organizations, also due to the fact that they assume greater responsibility for groups of stakeholders. This responsibility is visible in striving to maintain the stability of the company in the long-time perspective, even at the expense of high profits that can be achieved in the short-term and for the sake of building internal and external relations (Eschner 2017, p. 142).

As observed by Safin (2007), the dimension and image of family businesses is created using a range of characteristics assigned to this type of organizations. International research into family businesses allowed for the implementation of the term of "familiness", which specifies the uniqueness of this group of companies, at the same time, determining specific factors distinguishing this group (Leszczewska 2015, p. 124). Habbershon, Williams and MacMillan (2003) emphasize that, in a situation when the family is involved in the company, a package of specific resources and opportunities is created, referred to as "familiness", which may possibly create competitive advantages. The otherness of family businesses (Chua, Chrisman, Sharma 1999; Więcek-Janka 2013; Hernández-Linares, Sarkar, López-Fernández 2017) results from the characteristics that are assigned exclusively to this type of organizations. In turn, Malara (2006, p. 34) pinpointed that the characteristics distinguishing family businesses from other companies, in particular, include:

- interdependence of the business and the family,
- use of financial, intellectual and personal resources of the family,
- succession and succession strategy,
- family organization culture.

The specificity of internal relations in family businesses combines traditional employee-employer relationships as well as employee-employee relationships with relationships between family members and relationships of family members with non-family employees (compare Fig. 1). This complexity makes it possible, in the context of family businesses, to talk about a different atmosphere and climate within the company, using terms such as: familiness, trust, cohesion, involvement, enthusiasm. In non-family businesses, working atmosphere is specified as formalized and business-oriented (Tab. 1) (Eschner 207, p. 144).

Table 1: Working atmosphere in family and non-family businesses

Family businesses	Non-family businesses
✓ familiness, ✓ trust, ✓ cohesion, ✓ involvement, ✓ commitment, ✓ enthusiasm, ✓ informality,	✓ business goal orientation, ✓ formality, ✓ contractual agreements, ✓ distance,

Source: Own study based on I. Eschner 2017, p. 144

The destructive impact on building intra-organizational relations, both in family and non-family businesses, is exerted by unfair decision-making by managers. Undoubtedly, this leads to conflicts. In family businesses, a sense of injustice may be additionally enhanced by too excessive impact of the family and privileged treatment of employees being family members. The family business is also particularly prone to interpersonal conflicts. They result from strong ties between family members. Negative atmosphere between family members has a destabilizing effect on the work of employees and the condition of the enterprise. Family problems become the company's problems and vice versa (Eschner 2017, p. 146).

The process of building trust among employees requires a lot of effort since it cannot be bought through an increase in wages or special social benefits. In turn, the effect of positive relationships built on trust translates into positive relationships with customers and contractors and an increase in the attractiveness of the company in the labor market. Kwiecień (2018, pp. 134-136) indicates that the level of loyalty within the organization is, among others, affected by:

- creating the common vision and the way of the company's operation by employees, which requires the adoption of common objectives, a similar system of work and acceptance of the adopted standards for evaluating and rewarding work,
- emphasizing and indicating the behavior building trust through active listening, expressing own opinion by employees, introducing the habit of joint integration meetings, at which the company's matters are discussed,
- joint meetings providing opportunities to establish a conversation, which may be a sign of kindness and support.

The employee-employer relationship becomes an essential success factor and contributes to the effective and efficient functioning of the enterprise. The closeness of relations with the personnel affects the ease of motivation and is the basis for the reliable performance of the duties assigned (Xesha, Iwu, Slabbert, Nduna 2014).

The Personnel Policy in The Organization

The personnel policy has evolved considerably in the organization's activities over the past several decades. This has been affected by, among others, changes in the economy and the environment of the organization. Knowledge, information and specialization have become the dominant values. Intellectual capital, including human capital, in the knowledge-based economy has gained great importance and has an impact on the functioning of all enterprises. The man possessing knowledge, capable of creativity and entrepreneurship, creating innovation, oriented to development and expansion of the possessed knowledge in the place of employment has become the determinant of development (Huk 2013, p. 215; Kanten, Kanten, Gurlek 2015). Undoubtedly, one of the benefits resulting from the achievement of competitive advantage based on appropriate HR management is difficulty in duplicating it by competitors. The personnel strategy and policy of the enterprise is a unique combination of standards, personalities, skills and organizational culture. It should be pinpointed that the learning process in the organization may bring some new observations for the creators of business strategies since science performed by the organization may affect and shape market needs. Greater knowledge, which results from the learning process and market knowledge undoubtedly influences the level of competitiveness of learning enterprises (Kuşcua, Yener,

Gurbuz 2015). In Figure 2, it is pinpointed that the personnel strategy is additionally conditioned by the elements such as the labor market and economic conditions, i.e. the conditions of the business environment.

Fig. 2: Determinants of the company's personnel strategy.
Source: Own study based on (Kugiel 2013, p. 76).

Personnel, as a strategic resource of the organization, is capable of learning as well as developing their potential. Hence, the personnel policy is a set of methods that the organization intends to use in HR management. The basic functions in the area of personnel management are (Lemańska-Majdzik, Sipa 2015):

- employment planning, i.e. preparation of activities and determination of future staff needs,
- organization of personnel i.e. use of the potential of employees for the efficiency of the company's performance, it is associated both with recruitment and appropriate staff selection as well as their adaptation, integration and improvement,
- employee motivation, which is directly linked to the remuneration system and social relations in the workplace,
- control of employees and their activities in order to accomplish the objective.

The enterprise, acquiring and analyzing the collected information on human capital, both inside and outside the organization, brings about that the people managing the personnel policy not only improve the quality of decisions taken but also allow stakeholders to make more accurate assessment of the long-term performance of the enterprise. An important element of shaping the appropriate personnel policy is undoubtedly organizational culture (Hanson, Hessel, Danes 2019; Lemańska-Majdzik 2019b), defined as a set of standards, values and cultural patterns, developed and widespread in the given social community (Nahapiet, Ghoshal 1998). Organizational culture in the case of family businesses affects the company's propensity to support and sustain entrepreneurship in the short-time perspective and over generations (Habbershon, Nordquist, Zellweger 2010). When analyzing literature, one may indicate the components of organizational culture of family businesses, which may include (Sułkowski 2013; Fletcher, Melin, Gimeno 2012):

- values,
- basic assumptions,
- organizational standards,
- communication methods,
- rituals and symbols,
- adopted habits and customs,
- cultural patterns and artefacts,
- sub-cultures.

It should be emphasized that the implementation of the personnel policy is becoming an inseparable element of achieving success (Munns, Bjeirmi 1996) by economic entities functioning in the realities of the economy and is closely linked to the company's strategy. This relationship can be seen in particular in companies that have achieved a high market position. It should be pinpointed that an increasing number of enterprises are aware of the need to invest in human capital, and employees with the highest qualifications and skills may be the pillar of competitive advantage (Kugiel 2013, pp. 75-76). Therefore, the overall strategy of the company should be integrated with the personnel strategy which is affected by the labor market, skills and values, economic conditions and organizational culture (compare Fig. 2).

Research Methodology

The main objective is to examine the impact of the family nature of the company on building intra-organizational relations. During the analysis, the attention has been drawn to selected aspects of the personnel policy, including the company's organizational culture, working atmosphere, stabilization and professional development and employees' motivation.

In relation to the above and on the basis of the conducted literature review, the following research questions have been formulated:

1. Does the family nature of the company shape working atmosphere?
2. Do the values associated with the family positively affect working atmosphere?
3. Does working in the family business have a positive impact on a sense of bond and identity with the organization?
4. Do conflicts between working family members influence working atmosphere?
5. Does employment in the family business have a positive impact on a sense of professional stabilization of non-family employees?
6. Does employment in the family business positively affect the professional development of non-family employees?

The employees of the production family businesses from the Opole region took part in the study. The sample selection was deliberate. The enterprises were selected to meet the criteria resulting from the definition of the family business[1]. The research was carried out in the second half of 2020 on the sample of 50 employees of the production family businesses (it was a pilot study). In order to obtain the research results, the authors' survey questionnaire was developed. The study used an original questionnaire. The research survey consisted of 13 research questions. In order to obtain reliable research results and to limit the impact of owners or managers of family businesses on the respondents, the survey was conducted anonymously. The collected results were subjected to the analysis and interpretation. During the analysis of the impact of the family nature of the company on intra-organizational relations, the 5-point Likert scale was used. The collected results were analyzed using descriptive statistics.

Research Results and Discussion

The basis and the effect of building positive internal relations in the company is appropriate working atmosphere. It consists of all the factors that determine positive relationships between employees and the company owners (Baykal 2018). The results of the research conducted on a group of family businesses have indicated that the family nature of the enterprise and the values associated with the family such as tradition, trust, loyalty and interpersonal bonds are definitely of great importance for building working atmosphere. It turns out that as much as 76% of the respondents think that the family nature of the enterprise has a positive impact on working atmosphere, including 44% of the respondents who definitely agree with that. Only 8% of the respondents declare that the family nature of the enterprise does not affect working atmosphere. Moreover, it turns out that as much as 86% of the employees under research admitted that the values characterizing family businesses have a significant impact on the aura and relations within the enterprise, and only 2% of the respondents do not agree with that. The research has shown that the respondents declare attaching great importance to creating this positive atmosphere. Various solutions favorable for building positive intra-organizational relations are used in enterprises, e.g. organizing joint integration meetings or trips. In the analyzed family businesses, 40% of the respondents have declared that organized joint activities in the company are definitely of great importance, for 24% - of rather great importance, whereas for 14% of the respondents, they are of no importance. However, 22% of the respondents are indifferent to meetings organized by business owners (Fig. 3).

[1] A family business is an enterprise defined as an economic entity in which the control of ownership or organization management remains in the hands of the family and more than one family member is involved in its operation (Marjański, Sułkowski 2009, p. 16).

Fig. 3: Working atmosphere in the family business

Source: Own study

On the basis of the conducted research, it turns out that as much as 54% of the respondents are able to give up some of the remuneration and benefits in the event of a financially difficult situation in their company. For 32% of the respondents, however, it does not really matter. As much as 80% of the employees of the family businesses in question declare that they are a part of the company, only for 10% the parent entity is not particularly important. It turns out that the vast majority, since as much as 92% of those employed in family businesses, may count on the support of the employer, in turn, 6% declare that there is no such support. It follows that a sense of bond between the employer and employees is so strong that the head of the company provides the support in difficult life moments when help is needed. As pointed out by the respondents, contacts with company owners mostly do not go beyond organizational boundaries of the enterprise (24% - rather not, 28% - definitely not), and positive relationships within the organization, as evidenced by the research results, remain irrelevant in the event of crisis situations in the company (Fig. 4).

Fig. 4: A sense of bond and identity with the family business.

Source: Own study

The family nature of the enterprise and conflicts accompanying working family members may be a source of difficulties in maintaining the appropriate atmosphere, and thus positive relationships within the organization. The respondents notice the negative impact of family conflicts on the relationships in their company. As much as 48% of the employees believe that conflicts affect working atmosphere. Frictions between family members lead to the disappearance of the previous family atmosphere both between family members and between them and hired workers. It turns out that 40% of the respondents observe the occurrence of family conflicts in the workplace, in turn, 38% of the respondents do not notice conflicts between working family members. More than half of those questioned (52%) also have noticed differences and have a sense of injustice when development decisions are made in relation to family and non-family employees (Fig. 5).

Fig. 5: The impact of conflicts on intra-organizational relations.

Source: Own study

Contemporary organizations must be aware that an effective employee motivation system determines the success of the entire company. It is worth pinpointing that managing the subordinates requires an individual approach to each of them, thus taking into account the need for a sense of value in the company. The conducted research indicates that the largest impact on job satisfaction and employee motivation is exerted by an increase in the rate of remuneration (52% of indications). An equally important factor affecting satisfaction is positive working atmosphere, indicated by 32% of those questioned. For the others, an important incentive element is development training (6% of indications) as well as additional non-wage benefits such as multisport vouchers, private medical care etc. (6% of indications). Only for 4% of the respondents, clear rules for promotion are an important motivation factor (Fig. 6).

Fig. 6: The factors affecting job satisfaction and employee motivation in family businesses

Source: Own study

Taking into account the specificity of family businesses, the approach to the issue of motivation ought to be considered while taking into account the division into company owners, family members being potential successors and non-family employees (Sundaramurthy, Kreiner 2008). Working in the family business primarily provides a sense of employment stability. It turns out that as much as 86% of the employees feel safe working in the organization with the family nature. Despite the fact that some of family businesses provide their employees with opportunities to develop and meet their professional aspirations, which has been pointed out by 48% of the respondents, 40% of employees do not have such an opportunity and 12% claim that companies approach the issue of the development of their employees on an average level. It should be emphasized that each of the parties indicated above is driven by various needs and stimuli affecting job satisfaction. For some, the actions taken may have a motivating impact, in turn, for others, on the contrary - demotivating. Unfortunately, more than half of those questioned (52% of indications) experience a sense of injustice in relation to working family members (Fig. 7).

Conclusions

Summing up, the challenges that contemporary family businesses need to face force to search for increasingly new, more effective management methods (Neckebrouck et al. 2017). The presented analysis of the impact of internal relations on the employment policy in family businesses is an integral part of the process of employee relationship management. The study was a pilot study, so the analysis shows preliminary conclusions. The empirical studies carried out on a group of employees of family businesses have been to examine the impact of the family nature of the enterprise on building intra-organizational relations. The own research conducted on a group of employees of the selected family businesses running their activities in the area of Poland has allowed for responding to the formulated research questions:

1. Yes, the family nature of the company shapes working atmosphere.
2. Yes, the values associated with the family have a positive impact on working atmosphere.
3. Yes, working in the family business positively affects a sense of bond and identity with the organization.
4. No, conflicts between working family members do not have an impact on working atmosphere.
5. Yes, employment in the family business positively affects a sense of professional stabilization of non-family employees.
6. No, in the opinion of employees, employment in the family business does not have a positive impact on the development of non-family employees.

The conducted research indicates that the employer builds relationships with employees in a conscious and planned manner and thus derives a range of specific, although not always easy to measure, benefits. The most important ones include the emotional involvement of employees, resulting in the high quality of their labor, a sense of bond, and the resulting high value of human capital translates into the value of the organization. It can be noted that the above benefits are related to familiness and specific features of family businesses. Both employees and company owners are an important link in the process of building relations within the organization and these relations affect working atmosphere thus determining the contentment and satisfaction of employees.

The research, the results of which have been presented in the article, has its constraints, which may include a low number of employees of the family businesses questioned or the lack of the use of statistical analysis. On the other hand, the considerations discussed in this article do not exhaust the subject matter. They are in fact the contribution to the extension of the research and continuation of the considerations on intra-organizational relations in the area of literature and empirical research Conducting the research on a larger population will allow for the use of appropriate statistical methods and drawing conclusions related to the whole population of employees of family businesses.

A Generative Adversarial Approach to ECG Synthesis and Denoising

Karol ANTCZAK

karol.antczak@wat.edu.pl

Abstract

Generative Adversarial Networks (GAN) are known to produce synthetic data that are difficult to discern from real ones by humans. In this paper, we present an approach to use GAN to produce realistically looking ECG signals. We utilize them to train and evaluate a denoising autoencoder that achieves state-of-the-art filtering quality for ECG signals. It is demonstrated that generated data improves the denoiser performance compared to the model trained on real data only. We also investigate an effect of transfer learning by reusing trained discriminator network for the denoising model.

Keywords: Generative Adversarial Networks, Denoising Autoencoders, ECG Signal Denoising.

Introduction

Measurement of electrical activity of the heart plays a basic role in modern diagnostics. Of multiple electrophysiological parameters of the heart, one of the most informative is the change in voltage over time caused by depolarization and repolarization of the heart muscle. A process that produces a graphical representation of it is known as electrocardiography, while the representation itself – an electrocardiogram (ECG). There are several characteristic entities that can be identified on ECG: QRS complex and P, T and U waves – each associated with specific phenomena occurring during the single cardiac cycle (see Fig. 1). Analysis of these entities associated with the knowledge of electrocardiogram scale allows, among other things, to calculate heart rate and to detect rhythm abnormalities such as atrial fibrillation, atrial flutter, cardiac arrhythmia, sinus tachycardia and sinus bradycardia. Shape analysis allows to detect another group of diseases; for example, axis deviation of QRS complex is a symptom of ventricular hypertrophy, anterior and posterior fascicular block and others.

Fig. 1: Anatomy of ECG cycle.

In order to maximize the diagnostic value of ECG, it should contain only diagnostically relevant components. However, the real ECG contains a noise caused by multiple factors (Velayudhan and Peter, 2016). The most

common are baseline wander, motion artifacts, electromyography (EMG) noise and power line interference. Furthermore, characteristic frequencies of noises often overlap with the frequency of the useful components of ECG. This makes filtering the signal a challenging task. A number of methods were developed over years, designed mostly for filtering specific kinds of noise (Joshi, Vatti and Tornekar, 2013; Velayudhan and Peter, 2016). Examples include bandpass/notch filters (used primarily to remove power line interference), wavelet transform-based methods (applied for motion artifacts and EMG removal) and empirical mode decomposition (preferred for filtering out baseline wandering noise).

In the twenty-first century, apart from classical filtering methods, techniques based on artificial neural networks also appeared. One of the first applications was presented by (Moein, 2010). It was a multi-layer perceptron trained to imitate low-pass Kalman filter. Since then, the development of deep learning and greater availability of training data (in a form of medical databases) have allowed to use more advanced models. The temporal nature of ECG signal makes it a natural candidate for processing using recurrent neural networks A 2018 research have investigated Long Short-Term Memory (LSTM) -based network for the purpose of denoising, outperforming classical filters in case of heavily noised signal (Antczak, 2019a). Single-layer LSTM networks were also explored for ECG classification (Boussaa *et al.*, 2016). Nonetheless, it seems that recurrent models have recently fallen out of favor in the area of sequence processing, being outperformed by convolution-based networks (Gehring *et al.*, 2017), (Vaswani *et al.*, 2017). More recently, a convolutional neural network has been presented for denoising of fetal ECG (Fotiadou *et al.*, 2019), reporting an increase in correlation coefficient between original and corrupted signal from 0.6 to 0.8 .

Proposed Approach

We introduce a deep model for ECG denoising, trained with the help of artificial signals generated by GAN. To achieve this, we build several auxiliary neural models. First, we use real ECG data to train 2D convolutional network that operates on time-frequency representations of signals to classify them according to the diagnostic group. This allows us to compute an equivalent of Inception score which expresses a level of data 'realism' that correlates well with human perception. Next, we train Wasserstein GAN operating in time-domain to produce artificial data that achieve possibly high Inception score. Generated artificial data are then processed using parametric model of noise. Finally, we train a denoising convolutional autoencoder that reconstructs initial, noise-free signal based on noisy input in time-domain. We evaluate it using both artificial and real data and various performance metrics. In summary, our approach for the development of the denoising model includes following steps:

1. Train the Inception network for evaluation of ECG signal quality.
2. Train the GAN for generating artificial ECG signals, using Inception score for selecting the best model.
3. Generate signal dataset with GAN and process it using the parametric noise model.
4. Train the denoising autoencoder using pairs of noised and clear signals.

Related Research

Generative Adversarial Networks (GAN) are deep learning models that produce artificial data imitating their real-life counterparts (Goodfellow *et al.*, 2014). They consist of a pair of networks, called generator and discriminator, respectively, that learn by playing a competitive minimax game. The generator produces data that is evaluated by the discriminator, along with samples of real data. The discriminator tries to determine which samples are generated and which are real, while the generator tries to fool it by producing more and more realistic samples. It has been shown that such game has (theoretically) a non-dominated solution which minimizes Jensen-Shannon divergence between generated and real data (Goodfellow *et al.*, 2014). However, "vanilla" GANs have several issues, the most vital being the mode collapse (i.e. reduction of the output data diversity) and long convergence time. Both of these problems were partially resolved by models such as Wasserstein GAN (Martin Arjovsky and Bottou, 2017) that minimizes smoother Wasserstein-1 distance rather than J-S divergence. This requires the objective function to obey 1-Lipschitz constraint, which is originally enforced by weight clipping. Guljarani et al. have shown a more efficient constraint in a form of gradient penalty, resulting in WGAN-GP model (Gulrajani *et al.*, 2017).

It should be noted the development of generative models is driven mostly by advances in visual data generation. It is due to relative ease of qualitative evaluation of such data – either by humans or by using special metrics, such as Inception score (Salimans *et al.*, 2016). A recent approach, WaveGAN, has shown that it is possible to produce realistic audio data with GAN (Donahue, McAuley and Puckette, 2019). In this case, the data is evaluated both by humans (and a cat) as well as the Inception score obtained by training the audio classification model operating on spectrograms of audio samples. Additionally, WaveGAN utilizes a specific regularization technique for

discriminator, called phase shuffle, which performs random phase perturbation of activations of 1D convolutional layers.

Generative Model

A. GAN Architecture

Proposed GAN architecture for generation of ECG signals (which we call ECG-GAN) is inspired by WaveGAN model by (Donahue, McAuley and Puckette, 2019). We train the generative model using Wasserstein GAN with Gradient Penalty variant (WGAN-GP). As real input, we use ECG signals from PTB-XL database (Wagner *et al.*, 2020). The database contains over 21k samples 10s length each, sampled at 500 Hz, available for each of 12 diagnostic leads, along with rich metadata. For generative training we use signals from aVL lead only, due to its diagnostic significance as well as to reduce dataset complexity. Signals are scaled independently to $[-1,1]$ range. Each signal consists of 5k data points. The generator network input is 1D random vector of z length with each element sampled from normal distribution. This latent vector is mapped onto dense linear layer followed by several layers of transposed convolution with leaky ReLU activation and exponentially decaying number of filters. After the last convolution, we crop the output symmetrically at both ends to 5k width and process it by the hyperbolic tangent function. Apart from the necessity of having output of specific length, cropping allows the network to generate signal before and after effective range, which minimizes signal distortions caused by padding. In all but last convolution we use batch normalization as a regularization mechanism. The critic network is made of several convolution block with ReLU activation and exponentially increasing number of filters. The last layer maps the signal into a single linear output, to produce unbounded critic score. Since batch normalization is unadvised for a critic network due to batch correlation phenomenon (Gulrajani *et al.*, 2017), we use the phase shuffle, as suggested by (Donahue, McAuley and Puckette, 2019), instead. We train networks to minimize Wasserstein distance using batches of size 64. For both networks we use Adam optimizer, with 5 critic updates per each generator update.

B. Evaluation of Generative Model

Qualitative evaluation of samples produced by generative models is preferably done by human judges, since quantitative metrics are known to be largely uncorrelated to subjective evaluation (Theis, Oord and Bethge, 2016). Qualitative analysis is associated, as one may expect, with many difficulties, both logistic and financial. There is, however, a widely used metric known as Inception score, that uses pretrained Inception neural network model (Salimans *et al.*, 2016) to provide an evaluation highly correlated to human evaluation. Given input dataset x, and model output y, it is defined as $\exp(\mathbb{E}_x \mathbf{KL}(p(y|\boldsymbol{x}) \parallel p(y))$, where **KL** is Kullback-Leibler divergence**.** Samples that represent meaningful objects should have conditional label distribution $p(y|\boldsymbol{x})$ similar to marginal distribution $p(y)$. Despite known shortcomings (Barratt and Sharma, 2018), Inception score remains a popular choice of evaluation metric for visual generative models. An analogous model was then proposed for adversarial audio synthesis (Donahue, McAuley and Puckette, 2019), using classifier trained on spectrograms of audio samples. We propose a similar model, trained on spectrograms of ECG signals. We also argue that Inception score is more suitable here than in, for example, image analysis, since human brain (especially visual and auditory cortices) has evolved to analyze "natural" data representing real objects rather than "unnatural" ones such as ECG. Therefore, it is more difficult to generate obviously fake examples that would obtain high Inception score anyway (Barratt and Sharma, 2018).

Our "Inception-like" classifier is a 2D convolutional network operating on 64x64 spectrograms. Each spectrogram is produced by performing short-time Fourier Transform on 1024 data points and mapping resulting spectrogram onto Mel scale. While Mel scale is mostly known for its application for audio data, it is also used for ECG signal preprocessing for neural networks (Boussaa *et al.*, 2016; Taherisadr *et al.*, 2018). Resulting spectra are normalized to zero mean and unit variance, clipped to 3 standard deviations and rescaled to $[-1,1]$ range. Each spectrogram has 0 to 5 output labels assigned, indicating diagnostic classes from PTB-XL. We end the classifier network with sigmoid activation and train it using binary crossentropy loss, effectively turning single multilabel classification problem into a set of binary classification tasks. The network is trained for 100 epochs with Adam optimizer and batch size 64. We validate the model after each epoch and save the one with the lowest validation loss. The final model achieves mean average precision 0.63 and mean average recall 0.41 for validation set. To obtain Inception score, we first get the output of the network for dataset $\boldsymbol{x}$ and calculate $p(y|\boldsymbol{x})$ by summing up probabilities $p(y_i|\boldsymbol{x})$ for each label and normalizing the sum to 1. Then we calculate the score using the Inception equation.

Fig. 3: Samples of ECG signal generated by ECG-GAN during various stages of training. Each column shows samples generated using the same latent vector z. Visible are first 1024 data points of each signal. Vertical axes are limited to [-1,1] range.

In addition to the Inception score, we use two additional metrics to verify whether the model result is not degenerated to one of pathological cases. The first metric, $|D|_{\text{self}}$, measures average Euclidean distance between the signal and its nearest neighbor. Low value would indicate that the model generates very similar samples, experiencing mode collapse. Another metrics $|D|_{\text{train}}$, measures average distance between signals and their closest neighbors in the training set. Low value is a symptom of model overfitting – the model learned to reproduce samples from the training set, unable to produce novel ones.

Denoising Model

Fig. 2: Random samples of spectrograms of various ECG datasets. Horizontal axes represent time, while vertical axes represent frequency (on the Mel scale). Each spectrogram represents a full-length signal (5000 data points).

A. Denoising model architecture

Proposed denoising model is a deep denoising autoencoder (DAE) (Goodfellow, Bengio and Courville, 2016) operating in time-domain. It consists of two blocks – encoder and decoder – connected together. The encoding block consists of 4 convolution layers with increasing number of filters. It is followed by the decoding block of 4 transposed convolution layers. The output is cropped to match the input signal length. Each layer has leaky ReLU activation. The baseline model uses no regularization. The detailed description of the model can be found in Table 6. Architecture of the encoder block is almost the same as the critic model (apart from the phase shuffle and the last convolutional and dense layers), allowing us to experiment with transfer learning by using pretrained critic layers as the encoder.

We train the denoising neural network in time-domain to reconstruct initial signal, given signal with added artificial noise with strength $\gamma = 1$. The baseline model is trained using a mix of real (17k samples) and synthetic (100k) signals. Models are evaluated independently on real (2k) and synthetic (100k) test datasets. We use Adam optimizer with MSE loss and hyperparameter values the same as during generative model training. Models are validated after each epoch and the one with the best validation loss is used for evaluation.

B. Noise Model

Typically, denoising autoencoders use simple noise models, like salt-an-pepper noise, additive white gaussian noise or black (masking) noise (Vincent *et al.*, 2010). They are applied to the input signal while the autoencoder learns to reconstruct the original signal by finding a certain hidden representation. This hidden representation should encapsulate useful structural features of the data. However, we argue that in case of ECG signal, the specificity and complexity of the noise should be also considered during signal reconstruction. Therefore, we propose to use a more sophisticated noise model, based on distortions present in real ECG. There are multiple known sources of noise in real ECG signal (Velayudhan and Peter, 2016), each having a specific frequency and power range. Our noise model is a parametric one that takes into account three of the most common noise sources, namely, baseline wander (a_w), motion artifacts (a_m) and power line interference (a_p), multiplied by strength parameter γ:

$$x_{noised}(t) = x(t) + \gamma(a_w(t) + a_m(t) + a_p(t))$$

Baseline wander (Kaur, Singh and Seema, 2011) is a low-frequency component, with usual frequency up to 0.6 Hz, caused mainly by respiration. We model it as a sine function with random frequency sampled uniformly from 0-0.5 Hz range and amplitude sampled randomly from 0-0.3 range (assuming that the initial signal has -1 to 1 amplitude). The motion artifact component is caused by variation of electrode capacitor due to body motion. It covers a wide range of frequencies (0.5 to 120 Hz) overlapping with the usable spectrum of ECG signal. We model it by the modulated chirp signal, i.e. sinusoidal waveform with increasing frequency and amplitude modulated by another sine wave (Serteyn *et al.*, 2013). The power line interference is produced by differences in electrode impedances as well as stray currents through the patient and the cables. It mostly has a frequency equal to that of electrical system in given country, therefore we model it as a sine waveform with 50 Hz, which is the standard frequency in most countries. The amplitude of this component is 0-0.1 of the source signal amplitude.

C. Evaluation of denoising models

When evaluating filtering methods, one should take into consideration a purpose of filtering. Therefore, we use three unrelated metrics to evaluate denoising models. The first one is mean squared error (MSE) which is the most general method and is also used as a loss function during the training of neural networks. The second metric is signal-to-noise ratio, which allows to measure a relative strength of the recovered signal to the noise. The third metric reflects the quality of the ECG signal from the diagnostic point of view. One of the most essential diagnostic activities for time-domain ECG analysis is identification of QRS complexes, which serve as a basis to determine heart rate variability. We therefore introduce δ_{HR} metric, defined as the mean absolute error of the heart rate (HR) value between noise-free and denoised signal. The heart rate is calculated as the reciprocal of average length of the cardiac cycle, which, in turn, is calculated as the distance (in seconds) between neighboring QRS peaks. For QRS detection, we use an open-source QRS detector developed by Sznajder and Łukowska (Sznajder and Łukowska, 2017) . It is based on Pan-Tompkins algorithm (Pan and Tompkins, 1985) which is one of the most common algorithms used for this purpose. Signal amplitudes were scaled to the detector operational range.

Experimental setup

In the first phase of the experiment we train and evaluate ECG -GAN model by calculating Inception score as well as $|D|_{\text{self}}$ and $|D|_{\text{train}}$ metrics. We compare the proposed model with the reference parametric model of ECG signal introduced by (McSharry *et al.*, 2003). It is a dynamical model that incorporates various morphological parameters (such as heart rate or PQRST points locations) as well as the measurement process details (like sampling frequency or measurement noise). According to authors, the quality of the model allows it to be used as a benchmark for biomedical signal processing techniques. In addition to the proposed and reference models, we calculate metrics for training and test dataset as well to obtain a reference point. The total training length of ECG-GAN is 1k epochs, which takes around 3 days on a machine with Intel Xeon E5-2640 CPU and Nvidia Tesla K20m GPU.

During the second phase, we train and evaluate denoising models. We use two reference methods, namely the bandpass filter and the wavelet filter. The bandpass filter consists of high- and low- pass filters that cut out frequencies outside of 0.05-30 Hz range. The wavelet filter uses Undecimated Wavelet Transform to decompose the signal. As a mother wavelet we use D6 wavelet from Daubechies family. Its shape is similar to QRS component, making it a viable choice for ECG signal filtering. We also perform a series of experiments by modifying the baseline denoising model. We train models with various amounts of synthetic data as well as combined synthetic + real data. This allows us to verify whether using the data from the generative model has positive effect on the denoising model. We also investigate whether the impact of synthetic data can be substituted with regularization, by training networks with phase shuffle added before each convolution in encoding block.

Fig. 4: Comparison of filtering methods. Left column contains results for synthetic signal generated with ECG-GAN, while right column – a real one.

Finally, we use the pretrained critic network as an encoder block of the denoiser to check whether the model will be able to transfer features learned during GAN training to the new task.

Results

- ***Quality of Generative Model***

Visual examples of signals generated by ECG-GAN are presented in Appendix C. Quantitative results of datasets comparison are presented in Table 1. Signals generated by ECG-GAN obtained much higher score than parametric model, while being largely unrelated to the training set, as indicated by high $|D|_{\text{train}}$ value. An informal human analysis was performed, which confirms these results. Synthetic signals had a wider frequency range compared to parametric data, which lack spectral variability, as seen in spectrograms in Fig. 2. One can also easily identify characteristic elements of ECG on generated data, such as QRS complex as well as P and T waves.

- ***Quality of denoising models***

The collected results are shown in Table 2. Proposed denoising model (ECG-GAN Denoiser) outperformed reference methods on both generated and real test sets in terms of each metric. Interestingly, networks trained

Fig. 5:Denoising model performance for various

exclusively on real or synthetic data (rows 6 and 8, respectively) performed worse than the network trained on mixed data. A more detailed analysis of impact of synthetic training dataset on test set performance can be seen

Table 2: ECG denoising results for various methods. In case of S/N, the higher value is better. For MSE and δ_{HR} – the lower, the better. The (none) row contains metrics for noisy signal without any filtering.

	Performance (generated test set)			**Performance (real test set)**		
Denoising method	MSE	S/N	δ_{HR}[Hz]	MSE	S/N	δ_{HR}[Hz]
(none)	0.139	3.243	0.911	0.127	2.332	0.912
Bandpass filter	0.141	3.185	0.846	0.122	2.532	0.789
Wavelet filter	0.141	3.183	0.850	0.123	2.516	0.805
ECG-GAN Denoiser	0.018	11.459	0.444	0.028	8.185	0.355
ECG-GAN Denoiser (phase shuffle)	0.017	11.735	0.450	0.026	8.395	0.349
ECG-GAN Denoiser (real data)	0.041	7.963	0.541	0.031	7.730	0.448
ECG-GAN Denoiser (real data + PS)	0.038	8.293	0.609	0.027	8.260	0.535
ECG-GAN Denoiser (generated data)	0.028	9.559	0.570	0.040	6.778	0.554
ECG-GAN Denoiser (pretrained)	0.038	8.587	0.727	0.047	6.100	0.627

in Fig. 5. Mixing real dataset with generated data helps to minimize drawbacks of both. Regularization in a form of phase shuffle improves performance of real data -trained network. Nevertheless, the effect of generated data is more profound than simple regularization. By combining the phase shuffle with the baseline model, we achieve the best performance for real signals. Nevertheless, we do not observe a significant beneficial effect of reusing the pretrained critic network in denoising model.

Conclusions

We have presented a deep model for ECG signal denoising, trained with the help of GAN. We have thereby demonstrated that generative adversarial models can serve as a powerful data augmentation technique that improves both the quality and the quantity of the dataset. Moreover, the effect of generated data goes beyond the simple regularization, which is the case for simple data transformations (Antczak, 2019b).

Generative model presented in this paper, despite producing "good enough" training data, is quite simple and lacks more advanced features that can be found in modern GANs for image generation. One of the most promising directions is a "style transfer" technique that provides control over stochastic variation of generated data (Karras, Laine and Aila, 2019). This would allow, for example, to generate a signal from the specific lead. We notice that our Inception network returns low scores compared to image classifiers with similar number of output labels. This is due to the fact that only a single lead (aVL) is used for the classifier training. Models that utilize data from all 12 leads available in PTB-XL database are known to achieve much higher precision and recall (Strodthoff *et al.*, 2020). A more accurate classifier would return a more credible Inception score. Similarly, it is reasonable to expect that the performance of the denoising model would benefit from data from multiple leads.

Abstract

Cloud computing (cloud) has offered cost effective business opportunities by providing flexible and on- demand IT services supply. Businesses are offered the opportunity to purchase the IT services (computing, storage, software, etc.) as required rather than retaining traditional IT assets and infrastructures. The realization of value from the opportunity has been challenging for enterprises disentangling from former IT services supply arrangements, and all businesses in gaining the necessary skill sets for optimal use. The design optimisation for cloud service use has complex new value chains and business models that require new skills and knowledge for successful performance. In this research, we asked: What are the impacts of cloud computing on the required business IT skill sets? A sample of 20 industry consultants were interviewed and the data thematically analysed in NVIVO to answer the research question. It was found that some skill sets have become irrelevant to business performance and other new ones are in demand. Skills deficits were particularly apparent in the security area where privacy and data protection are a concern. It also reflected the challenges and changing nature of cloud security that requires new knowledge and techniques.

Keywords: Cloud Opportunity, Business Skills, Disruption, Disintermediation.

Introduction

Cloud is an evolving technology that is disrupting established computing and business information services. It is replacing many supply models with an on-demand generic system that is causing radical change to the way Business Information System (BIS) services are perceived and procured. The revolution is causing disruption that impacts across every sector, from the breaking up of tradition business value chains and creating new business models, to creating new business skill sets, and changing the stakeholders' ecosystem. Studies (Youseff, Butrico, and Da Silva, 2008; Armbrust et al., 2010; Jadeja and Modi, 2012) have analyzed the benefits and limitations of cloud. In addition, many studies exist on exploring the factors affecting the adoption or resistance to cloud services in organizations (Khan and Malluhi, 2010). These studies identify the biggest challenge or limitation to adoption is security and privacy concerns. From the perspective of the business model, some studies have investigated the role of value networks in cloud computing and for cloud business models (Clohesy 2016; Frank, 2012; Hedman and Xiao, 2016; Krikos, 2010; Marston, Li, Bandyopadhyay, Zhang, and Ghalsasi, 2011). Another notable concern when adopting cloud technology is the lack of expertise for maximising the potential benefits of the technology, and for optimising the positive and negative risks associated. Cloud computing is transforming the way Information Technology (IT) services are accessed and provided for business purposes. However, the opportunity to create cloud business value has few guidelines or proven risk treatment strategies. Cloud is changing the traditional IT roles and the skills required for success. This research is specifically concerned with the business skill sets required for maximising the potential benefits from the cloud technology opportunity.

It has been argued that the advances in cloud computing is as much dependent on the organization structures and processes as it is with technology (Fellows, 2008). The adoption of cloud services involves a redefinition of existing business service skill sets by the creation of new requirements and termination of the old. There are two aspects in a technology shift (Avram, 2014, p. 533). The first is concerned with acquiring new skill sets to deploy the technology in the context of solving a business problem, and the second is how the technology will change business structures. For example, system support skills diminish in scope when cloud applications come with their own support, and the

Cite this Article as: Brian CUSACK and Adekemi ADEDOKUN "Cloud Opportunity and Business Skill Deficits" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

function changes to exclusive co-ordination and communication skill sets. Subsequently, the business restructures to discontinue internal IT hardware and software support services and concentrates on on-demand service supply to match the business processes. Consequently, the IT service supply becomes an information management task and the business design a BIS architecture. The radical redesign leaves a trust and a skills gap for business processes to adapt and to fill. One of the major challenges is finding those in the business who can and will change to meet the new challenges. A skills deficit inhibits beneficial returns on the new business opportunities. Yeboah-Boateng and Essandoh (2014, p.14) in their studies noted that the shortage of internal knowledge and expertise are rated as the biggest limitations to cloud revenue gains, especially amongst Small and Medium Enterprises (SMEs). In this paper, we briefly explore the theoretical background to cloud service transition, define a research methodology, and then report the findings to answer the research question: What are the impacts of cloud computing on the required business IT skill sets?

Theoretical Background

The concept of disruptive technology or innovation was first introduced by Clayton Christensen (Christiansen, 1997). According to Christiansen, disruptive technologies are innovations that interrupts the prevailing order of things in a particular industry. These innovations occur less frequently, and are likely to be cheap, simple and easy to use. Also, they have the tendency to alter the market dynamics and nature of competition which may result in the failure of established businesses. Christiansen further identified two criteria to define a disruptive technology (Christensen, 2002). First, a disruptive technology should enable less skilled or less-wealthy customer's access to what only the skilled or intermediary customers could do. Secondly, it should meet the demands of low-level customers who only require limited functionality of existing products in the market. This business model is expected to enable the disruptive innovator to realize attractive profits that are unattractive to the current innovators. Cloud shows the features of disruption and it proffers improvement in terms of performance, convenience, price, and flexibility to meet and exceed the market demands (Krikos, 2010, p. 23). Businesses now have access to computing resources that previously appeared impossible cost-wise (Krikos, 2010, p. 24). Moreover, the low-cost utility pricing model of cloud computing enables vendors to target those customers that were initially unable access such resources and services. Christiansen's disruptive theory is based on the idea that existing companies aim to satisfy and respond to their current customers but fail to commit to new technologies and eventually end up losing to the newcomers whose businesses are built around the new trending technology. Cloud has been referred to as a disruptive technology as it exhibits all these characteristics (Sultan, 2012, p. 167).

The cloud computing opportunity from the vendor's perspective also means disruption to revenue streams and value chains (Hedman and Xiao, 2016, p. 3990). The cloud business model removes the need for separate maintenance and licence fees, hence simplifying the complexities involved in software releases, patch management, and human maintenance service between the service provider and the business (Krikos, 2010, p. 29). However, this source of revenue normally accounts for two-thirds of a major software business income (Cusumano, 2010, p. 29). Also, the one-third of the service revenue was generated from customizing software and patch migration and this is eliminated (Cusumano, 2010, p. 29). Furthermore, the traditional software delivery model to end customers usually involved several layers of businesses, however, the mediators are eliminated as cloud provides software solutions remotely and directly as a service (Boillat and Legner, 2013, p. 49; Hedman and Xiao, 2016, p. 3991). Cloud is also changing the stakeholder ecosystem. The traditional IT service provision system consists of two stakeholders which are the consumer and the provider, however, cloud is changing these roles as well as introducing new enablers to service a provisioning ecosystem (Marston et al., 2011, p. 182). There are now three entities in the cloud ecosystem: Cloud service users (CSU), Cloud service providers (CSP), and Cloud service partners (CSN). Disintermediation and new entities eliminate the need for a middle layer for business transactions. The cloud business model is changing the structure of the software and IT service industries. Software and services are being delivered directly to the end users and disintermediating various software vendor partners such as Value-added-Resellers (VAR) who act as consultants, mediators and retailers for distribution of the products (Hedman and Xiao, 2016, p. 3991). With cloud service infusion, the need for this kind of partnership is eliminated and replaced by a triangulated flat structure. The cloud disruptive model is displacing some businesses while others are benefitting from the changes (IBM, 2010, p. 3).

Cloud introduces new threats to established business models and disrupts traditional value chains. Therefore, it is critical the skill groups are available to thoroughly analyse the cloud opportunity to meet a business need before adoption (Frank, 2012). The success or failure of a business is dependent on understanding the new ecosystem of competing risks and opportunities before purchase commitments are made. These are the new skills required for effective business delivery. In the past IT services were about the technical capability to do the business work and the cost-benefits of the solutions provided. With cloud the emphasis has shifted towards thinking out the best combination of IT service choices for the highest value business deliverables. The opportunity to explore and test business ideas has been made possible by the removing the constraints of in house IT capability and the cost efficient purchase of on-demand services. This business opportunity has removed the cost of purchasing hardware and software, its depreciation and retirement costs, and the cost of retaining expensive high-end IT skill groups. IT procurement

advisors are now required to optimise the purchase of on-demand services to match the business requirement, and compute the economic value from changing service suppliers. These are business optimisation skills for business project design, service procurement, and market thinking. Figure 1 summarises the literature analysis of the transformation in IT skills before and after cloud. The roles are changing from doing the actual technical jobs to thinking of innovative ways to maximize the available technology for optimal business benefits. The concept has shifted from an "IT support business" to "IT empowered business". The traditional skill requirements have shifted away from doing processes that are supported by IT, and toward enabling business thinking by providing seamless IT opportunity for the business plans. Cloud provides the freedom to choose quantities, qualities and the scope of services as required, but the skill and capability to do this effectively is a gap in current practice.

Fig. 1: Skills and knowledge transitioning

Research Methodology

Qualitative research is an interpretive-based method which seeks to understand the way other's conceptualized events and concepts (Kaplan and Duchon, 1988, p. 572; Creswell and Miller, 2000, p. 125). Qualitative research tends to focus on how or what questions, which enables the researcher to explore in depth a specific context and observe the situation. When textual data are quantified, the aim of understanding a context from the participant's view is lost (Kaplan and Maxwell, 1994). Hence, this makes a qualitative approach suitable for exploring opinions and perceptions of change. A two phase approach was adopted in this study. First a pilot survey of industry experts was conducted through Survey Monkey to confirm the relevancy of the questions, and then semi-structured interviews were conducted with 20 selected participants. An important consideration in qualitative research is determining the sample size. The qualitative sample size is calculated by contextual considerations and the number of participants that will be needed to attain saturation (Glaser et al., 1968, p. 61; Turner-Bowker et al., 2018, p. 842). Saturation emerges when no more data are being found or repetition is occurring. Hence, a purposeful sampling size method will be used to suit the requirements of the study.

For this study, data was collected through a purposive, semi-structured, industry-based interview method after the questions and topics of interest were confirmed relevant in the pilot study. The participants were industry experts and selected based on their expert knowledge and experience working in traditional IT service environments as well as working in the cloud environment. Selecting participants for qualitative research cannot be random, as it has to be

chosen based on the interest of the researcher (Stake, 2005). The questions for the interview were prepared ahead of time by using the pilot study feedback. The respondents were probed to elaborate on their responses further, when and where needed. The interview time varied between 30 minutes to one hour, depending on the respondent's disposition. The sample was limited to participants with background expert knowledge who have experience in IT services roles for at least five years and had at least two years' experience working in a cloud environment (see Table 1). An expert interview is concerned about the participant's knowledge and experiences as a result of their actions, roles, responsibilities, or obligations within a specific organization or institution (Littig and Vienna, 2013). Expert interview provides insights into background information, such as expert knowledge and descriptions of processes (Harrell and Bradley, 2009, p. 24). Also, expert interviews are a more efficient and concentrated way of gathering quality data than using observation and surveys (Bogner et al., 2009, p. 3). An expert in this sense is a person with insight in aggregated or specific knowledge (Van Audenhove, 2007, p. 5). Furthermore, one the strengths of Interview methods is that it gives voice to common people, which allows them to present their life situations in their own words freely, and provide personal interaction between the researcher and their subjects (Kvale, 2006, p. 481).

Table 1: Interview Participants

Interview participants	Job title	Years of experience	Years in current position	Cloud service or environment deployed	Years using cloud services?
P01	Audit Manager, Technology	10+ years	0-3years	AWS and Azure (PaaS, IaaS, SaaS)	0-3years
P02	IT Audit Manager	3-6years	0-3years	IaaS, SaaS	5+ years
P03	Internal Auditor	7-10years	0-3years	SaaS	5+ years
P04	Audit Manager	0-3years	0-3years	Microsoft Azure	0-3years
P05	Network Engineer	10+ years	0-3years	AWS	0-3years
P06	Intermediate Developer	0-3years	0-3years	AWS	0-3years
P07	AWS Specialist	3-6years	0-3years	Public Cloud	0-3years
P08	Cloud Engineer	10+ years	0-3years	Private Cloud	0-3years
P09	Information Security Analyst	0-3years	0-3years	AWS / Azure	0-3years
P10	Audit Manager	3-6years	0-3years	Sharepoint	3-5years
P11	IT manager	10+ years	7-10years	IaaS, PaaS, SaaS	3-5years
P12	Senior Systems Administrator	7-10years	0-3years	Iaas SaaS	0-3years
P13	Cloud Security Advisor	3-6years	3-6years	Hybrid	3-5years
P14	Solution Specialist - Security Architecture	0-3years	0-3years	Both Microsoft Azure and Amazon Wed Services	0-3years
P15	Chief Technology Officer	10+ years	0-3years	AWS Serverless	0-3years
P16	IT Consultant	3-6years	0-3years	Azure / AWS	0-3years
P17	Site Reliability Engineer	0-3years	0-3years	Openstack, Vcenter, Hyper-V	3-5years
P18	senior security risk analyst	7-10years	0-3years	software as a service	5+ years
P19	IT platform manager	7-10 years	0-3years	Azure / AWS	0-3years
P20	Lecturer	10+	0-3	Azure and AWS	0-3

Findings

The Pilot study provided feedback on the questions and the relevancy of the assumptions the researcher planned to explore. There was 100% agreement that cloud is causing significant changes in business IT skill requirements, confirming the researcher hunch that this is a relevant area for research. However, other questions teasing the strength

of the cloud impact divided opinion. There was split opinion but agreement that the skills requirement has changed and not all traditional skills are redundant. There was also a significant group of respondents indicating that they were not sure about the new skills requirements on account of the evolving and changing work environment. The indication is that new and old skills are required for success when taking up the cloud opportunities. Hence, the researcher was assured that the relationship between cloud changes and new skills was a problem, and part of industry consciousness but that there is divided opinion on several issues regarding the features of the required skills for cloud (see Table 2).

Table 2: Pilot Study Responses

Question	Yes	No	Not Sure
Are new skills required to cope in the cloud environment?	89%	11%	0%
Does the type of cloud determine the business skills required?	78%	12%	0%
Is cloud causing significant change in IT skill requirements?	100%	0%	0%
Are some skills now irrelevant in cloud?	33%	45%	22%
Are traditional skills still efficient in cloud?	67%	22%	11%

The 20 interviews were noded and coded, and thematically analyses using the NVIVO software. The codes were systematically reviewed, modified, and categorized into broader themes for extended meanings. The review resulted in merging, renaming, and clustering of nodes into related categories. The emerging ideas were reconstructed into a broader hierarchical themes known as tree nodes. For example, grouping skills together as essential skills required to work with cloud computing technology. A total of six descriptive themes emerged, of which four related to skills. The first theme that emerged is the important skills required to cope in the cloud environment. This theme is in line with the research question, which seeks to elucidate the important skills required by business professionals to use cloud business opportunities. The skills categorize into technical and non-technical skills (see Figure 2). The tree nodes confirm the earlier literature review that showed cloud adoption inhibitors in privacy and security concerns. The analysis shows a dominant and detailed expression of security features but lessor concern for basic IT business skills. The non-technical nodes are also populated with listed business skills for cloud value generation.

Figure 2: Codes for the Skills Theme

The first subtheme in the technical skills category is basic IT skills. Participants believe the basic IT skills are still important and fundamental in working in a cloud environment. Overall, there was an emphasis on programming skills for application building and managing in this category. The participants noted that as a rise in automation and outsourcing, where there is going to be a rise in the need for programmers in the future. Other skills included in this category are service and traffic management. For example, participant 12 and 14 noted that: "well, I still think the core skills of IT is still needed in terms of you know, in terms of scripting, patching, and all those kind of things." However, the second subtheme of security had many more entries. Security is an all-encompassing word used by the participants throughout data collection. There is a large focus on risk assessment and management risk assessment and management skills in the security category. An overarching skill requirement by most of the respondents is for skills around risk assessment and leadership in the cloud environment. Cloud technology increases the attack surface

and makes risk management a difficult task to achieve. The following excerpts illustrate some of the participant's views on the need for risk management skills. “Significantly increased the need for formal risk management training”, “You still have to have a full-stack understanding in order to assess risks exposed, maybe at not at quite the depth on physical security aspects but this still comes into play for the consumers of the cloud service and the devices that they use. The data is still held somewhere in something that has a level of risk that you need to understand.” “This is one area where most change will take place. A much larger amount of data will be travelling out of our network boundaries, mobile apps are on the increase, and people are working from a remote location. Securing our data will become increasingly more difficult.” “the most important skills you’ll have is access management is very important in this area”. Cloud services, especially data storage, are breaking the traditional geopolitical barriers of data privacy, and so skills around understanding legal requirements and compliance of data to enforce global data privacy are necessary. Other skills identified in the security category are information security governance and audit controls, virtualization security, and network and infrastructure. Network and infrastructure security skills are stated to be essential to protect and manage the organization’s cloud infrastructure.

Non-technical business skills were also critical for using cloud opportunities. Skills that emerged in this category are business analytical, innovative and critical thinking, and vendor management skills. “cloud technology is requiring new thinking patterns and is currently lacking people with critical thinking that can cover those domains.” There is a shift in IT professionals focusing on business and analytical skills. Innovative and creative thinking is necessary for professionals to view and address security in light of cloud technology. Participant P01 noted that:

> “As a general rule though for ALL staff, developing a new thinking pattern is absolutely critical. Incorporating all the key areas of thinking is important to deliver a secure product. Too often, it's a "just make it work" mentality that leads to issues in Security, gaps in risk controls, and over-provisioned environments. As an example, trying to educate teams to ensure they understand THEY own the risk for their systems and not the risk teams have been a huge challenge. It requires a shift in thinking to really take accountability for what they build”.

Also mentioned were vendor management skills where there is an emphasis on commercial and cost management, contract negotiations, controls, and project coordination/management (PO7).

> “A lot of organizations now are creating teams around managing their cost in the cloud, because most of the cloud services they charge you per hour of using the services, some even charge you per minute. There’s a high probability that some services are in use but not in use, and you just deploy them, nobody is using them, and they are incurring the cost for you. So, if you learn to manage those commercial aspects of cloud is another good skill”

Discussion

The data analysis showed that there is a clear perception that the required IT skills for successful business practice have changed as a result of the cloud impact. There was however less certainty as to the required new skills and which previous ones have become irrelevant. The strong advocacy was for a basic set of IT business skills and a demand for security skills for the cloud. There was a sense of uncertainty in the responses that reflected the unfolding nature of cloud impact and the belief that many skills could be transformed or adapted to be effective in the new cloud context. Figure 2 identified sets of technical and non-technical skills required for taking cloud business opportunities. These findings confirm previous literature reports of cloud impacts on skill requirements. The respondents also noted the deficits in different skills areas created by the cloud impact. These skills deficits were particularly apparent in the security area where privacy and data protection are a concern. It also reflected the challenges and changing nature of cloud security that requires new knowledge and techniques. There was a strong belief that current skills can be used but uncertainty as to the effect. The apparent lack of knowledge for the actual skill requirement suggests that some of the beliefs are wishful and may cover the need for a far greater acquisition of skills knowledge for effective cloud security. Current risk exposure levels in the cloud are driving demand for new skills and the requirement for more effective risk treatments.

Cloud has impacted both business and IT staff skills requirements. Cloud has introduced IT utility for all staff and can no longer be segregated into a supply department. Business professionals are expected to be competent with a sufficient technical understanding to work with cloud technology and use it as an integrated element in the business function. This has meant that IT staff have had to improve their non-technical skills and business managers their IT technical skills. Both of these transition impacts are required for employment and the successful utilization of cloud services. The IT staff need to acquire appreciative business skills of critical thinking, production and management, people management, emotional intelligence, judgment, knowledge negotiation, and cognitive flexibility. The business staff have to add systems knowledge, device management, security consciousness, techno-logics, application

management, and work systems knowledge to the daily skill set. All staff require soft or the intangible skills such as communication and interpersonal skills, project management, contractual control, and operations management. Cloud requires a new strategy to reimagine the assimilation of IT and business requirements to successfully maximize the cloud business opportunity and to achieve a competitive advantage return. The impact of disruptive technologies can be turned to success or destroy a business. Filling skills deficits is crucial for transition into successful business outcomes.

The skill requirements for BIS participants in the Cloud environment are often portrayed as a reduction of IT skill and an increase in business management skills. This research shows that respondents see the impact of cloud as being a two way effect. There is a reduction in IT skill requirements in terms of volume and scope, but equally there is a demand for business managers to increase their IT skills uptake and understanding of technical thinking. The former sharp segregation between IT and business skill sets is diminished by the cloud impact, and cross domain skills and competences are required. Cloud is displacing many of the traditional skills supply assumptions but also giving new and evolving opportunity for innovation. Cloud provides cost-efficient opportunities for businesses by offering a variety of dynamic, scalable, and shared services. To maximise the business benefits, skill groups are required that represent strength in either domain but more strongly assimilate IT and business requirements. Demand for business-related skills, organizational skills, service-related skills, communication skills, and security skills are required by all staff. This means that previous areas of specialisation have to be shared and fairly distributed as generic skill sets. Security skills and service-related skills are ranked as the core of a business skill set required in the cloud.

Conclusion

Cloud is a pervasive technology that has the capability to supply all BIS services. In this paper, a survey and interviews with experts were used to identify industry perceptions of cloud impacts and the impact on the required new business skill sets. The data showed uncertainty as to the precise skill sets required for successful business practice but there was agreement that cloud has changed the requirements. The ambiguous state reflects the current state of flux where there are degrees of cloud use from little to 100%, and knowledge gaps in current business adoption. The skills deficits were particularly apparent in the security area where privacy and data protection are of concern. It also reflected the challenges and changing nature of cloud security that requires new knowledge and techniques. The skills impact is often portrayed as an IT loss and a business gain. This research shows that there are impacts from cloud in both technical and non-technical skill sets that affect the whole business. Further research is required into the strategies for maximising Cloud benefits and minimising the drag factors that erode trust.

Abstract

The current paper looks at threats, risks and vulnerabilities from outer space and aims at establishing the interdependencies of space critical infrastructures to other critical systems, technologies and services. It first defines what security from and of space means, and it continues by bringing into discussion the threats associated to the concept of 'space situational awareness', i.e. solar weather, near-Earth objects and space debris. The paper continues with presenting the risks and vulnerabilities, as well as interdependencies by other sectors of critical infrastructure. Finally, the paper draws conclusions highlighting the areas that need to be addressed differently, highlighting the importance of approaching critical infrastructure protection from the above.

Keywords: Security of Space, Space Situational Awareness, Threats, Critical Infrastructure Protection, System of Systems

Introduction

The current paper looks at threats, risks and vulnerabilities from outer space and aims at establishing the interdependencies of space critical infrastructures to other critical systems, technologies and services. With growing interests for owning and operating assets in space, the international space context is changing fast — global competition is increasing with new entrants bringing new ambitions in space. Space activities are evolving to rather commercial with increased involvement of the private sector. In addition to market forces, major technological shifts, such as digitalisation, miniaturisation, artificial intelligence or reusable launchers, are changing the traditional business models in the space sector. Thus, the cost of accessing and using space is decreasing and access to space technologies and services becomes commonplace.

However, despite of growing business opportunities stemming from the above mentioned changes, the outer space infrastructures and services cannot act as any other ground-based infrastructural sector. The outer space environment changes the rules of protection and this article therefore attempts to compare and contrast these differences, in order to create a better understanding and consequently, a better way of approaching the protection of space critical infrastructures.

Space is no more than 100 km away from every point or person on Earth. Moreover, space technology greatly improves many aspects of our lives and we are starting to rely on it more and more each day. More than 1,000 active satellites currently provide a whole host of services that improve our world in many ways – from the navigational tools in our cars to the daily weather forecast. At the same time, they represent our collective vulnerability in case of intentional or natural disruption.

Simultaneously, the world's urban population is now growing by 60 million persons per year. By 2030, nearly 5 billion (61%) of the world's 8.1 billion people will live in cities. (UNESCO, 2020) Thus cities are increasingly

populated and always in motion, complexifying the existing networks of utilities that support modern lifestyle. The nexus between urbanization, rising living standards and technological progress raises critical questions on the extent of possible protection of population, forcing researchers and decision-makers to innovate at a much faster pace.

Critical space infrastructures represent the complex interlinkage between space and ground-based technologies that help vital services such as telecommunication or positioning, navigation and timing to function. Based on their location, space infrastructures can be divided into two segments: space and ground segments. The latter includes launch facilities, mission control centres and transmission and reception stations. The uplink sector covers activities that lead to the development of space infrastructure, such as R&D, production of satellites and launchers as well as the deployment of such infrastructure. The downstream sector primarily relates to the commercial activities based on the use of data provided by space infrastructure, such as broadcasting, communication, navigation and Earth Observation. (European Investment Bank, 2019)

Having said these, the paper first looks at the meaning of 'security of space' and continues by bringing into discussion the threats associated to the concept of 'space situational awareness', i.e. solar weather, near-Earth objects and space debris. It then, separate specific threats, risks and vulnerabilities that space critical infrastructures face. Finally, the paper draws conclusions highlighting the areas that need to be addressed differently, highlighting the importance of approaching critical infrastructure protection from the above.

Security from space vs. Security of space

Space-based assets and systems are critical to ensuring security on Earth (security from space). At the same time, these assets need to be protected in the difficult environment of outer space (security of space). (EC, 2020) This section quickly presents the distinction between these two approaches when discussing the topic of space and security.

In Europe, space-based systems are making an increasingly important contribution to security and to the EU's Common Security and Defense Policy (European External Action Service, 2020). We constantly face evolving security threats that are less visible, and less predictable than before. To deal with them, it needs the best affordable capabilities for autonomous political assessment, sound decision-making, prevention policies, and effective action. Space assets provide a significant contribution to confronting these threats through their global monitoring, communication, and positioning capabilities.

This is why space-based products and services that rely on satellites, must be monitored and protected against threats to ensure a safe and uninterrupted service. At the same time, people on Earth must be also be protected against space hazards such as asteroid strikes ('security of space'). Being informed about the situation in space is referred to as Space Situational Awareness (SSA). It covers three main themes: Space debris (SST), Space weather phenomena, and Near-Earth Objects (NEOs).

Risks, vulnerabilities and interdependencies of critical space infrastructures

This section attempts to explain, with reference to other critical sectors, the pivotal importance of critical space infrastructures for the functioning of society by highlighting the complex interdependencies between these systems and the other sectors of critical infrastructures. The section defines dependency as a linkage or connection between two infrastructures, through which the state of one infrastructure influences or is correlated to the state of the other. Furthermore, interdependency represents a bidirectional relationship between two infrastructures, through which the state of each infrastructure influences or is correlated to the state of the other infrastructure. More generally, two infrastructures are interdependent when each is dependent on the other. (Bucovetchi, O & Simion, CP, 2015)

With regards to areas of interdependencies between space critical infrastructures and terrestrial critical infrastructures, the following section looks at how dependent are vital functions to space technologies and services. (Coman, M., & Badea, D., 2019)

Firstly, the energy infrastructure (electricity, petroleum and natural gas) represents one of the most important sectors in our society, on which we depend for our current lifestyle. Without a stable energy supply, many other vital sectors are threatened, such as healthcare, finances, transportation and food supply, among others.

Energy infrastructure is increasingly reliant on space technologies such as GNSS for the monitoring of activities, as well as for the surveillance of smart grids. Intelligent electricity distribution is a complex technology requiring advanced interoperability mechanisms and precise environmental monitoring, to be provided through GNSS. Furthermore, GNSS can be used in hydropower generation for the monitoring of water reservoirs and water flows, as well as to estimate characteristics of particular resources of energy, e.g. the winds. Remote sensing and weather

satellites can be used for monitoring environmental conditions of a particular urban area, e.g. 2003 power blackout along the US East coast.

In the case of chemical and nuclear industry, space critical infrastructures are indirectly connected to these critical areas. In case of failure therefore, it indirectly affects interconnected to other critical sectors, such as energy supply, health services, transport of radioactive materials, ICT, defence, public order and national security, as well as food and water supply.

In terms of agriculture, space-based technology constitutes and enables of "precision agriculture" or "smart farming", allowing producers to improve economic, environmental and societal challenges of food production. (Gebbers & Adamchuk, 2010)

One important dimension of 'precision agriculture' is GNSS-based automatic guidance of agricultural machinery. Furthermore, telemetry has improved livestock management and specialty crop production systems. The Earth Observation satellites provide radar, optical and thermal imagery, which can offer considerable data in a repeatable manner of crops. These include useful information on crop growing conditions (water, carbon and nitrogen cycles), in addition to serving as crop inventory and watershed level planning. Thus, data from several satellite platforms can be collected and analysed with the aim of improving soil productivity.

The finance sector is a vital component of any nation-state, thus any natural or man-made disaster makes not only this sector vulnerable, but also society at large. With regards to the connection between the finance infrastructure and critical space infrastructures, it is important to mark a direct and an indirect dependency. The former refers to physically connected databases and processes in which an interruption of services due to power supply failures leads to parts of the system becoming inoperable. Furthermore, failures in communication satellites may also lead to errors in the financial system. Similarly, a disabled global navigation system may impede the global synchronization system, causing delays on the financial markets and severe losses in terms of operational capacity of the financial infrastructure.

Indirect impact might be produced by space-based services that are not used directly by the constellation of finance systems, such as the data collected by Earth observation satellites that might be used for making financial decisions by insurance companies. Furthermore, the finance sector as a vital sector for society, takes into account early warning signs offered by critical space infrastructures. (EC, 2014)

The impact of interrupted space critical infrastructure on both the central administration and on defence and national security infrastructures account for a variety of buildings, many of which are of public use, as well as for a wide range of activities, including business, commercial transactions, administrative or recreational. In addition, the public administration infrastructure contains electronic elements of identification, databases, access control systems and CCTVs, as well as services such as the Postal Services. Satellites provide tracking of services, imagery of various fields of operational processes, but also information on a country's strategic logistics: transport vehicles, strategic sites, information and telecommunication networks, information on the population regarding their identifications, personal data and many more. Thus in case of central administration infrastructure, space critical infrastructure is pivotal.

Remote sensing makes it possible to collect data on dangerous and inaccessible areas, as well as on border areas the defence and national security systems. Satellites are fundamental for border control, but also services like GNSS for tracking vehicles and suspects, or for rescue operations.

The transport infrastructure is critical to the mobility of resources and people in a connected world. Transport infrastructures are increasingly complex and integrated with applications that attempt to solve problems of flow, coordination and control, space technologies are pivotal in providing a basis for competitive transportation. The main space applications used in this sector are navigation and positioning infrastructures, as well as weather monitoring and telecommunication.

GNSS service is vital to aviation, maritime, railways and road transportation that offers coordination and efficiency of logistics (e.g. distribution of containers in port). Furthermore, in the air industry, GNSS services are important for congestion in air traffic or passenger and luggage related operations. In case of maritime transportation, the GNSS offers the fastest and the most accurate path for navigation, thus increasing the efficiency of transport and the safety of the trip. For busy seaports, space infrastructures are helpful in coordinating large vessels in narrow spaces, as well as automated container placement, pick-up and the transfer of goods. In the case of road transportation, GNSS is useful for highway surveillance, as well as for the location of vehicles and in emergency operations. Equally

important, railway transportation use GNSS to track movement of locomotives but also in controlling delays and for reducing operating costs by automatically adjusting train speed and re-route traffic.

Finally, it is important to mention the complex interdependencies between space technologies and transport infrastructures, which are directly or indirectly affecting and affected by other critical sectors. This includes the role of telecommunication infrastructures, the close relationship between transportation and energy sector, as well as food and health, particularly in disease outbreaks and their spreading across geographical space. (Georgescu, A & Bucovetchi, O, 2017)

The communication satellites become indispensable for economic, social and cultural development, and for the safety and security of communities. For the transmission of a complex universe of services of telecommunication and internet, there is another complex interconnected constellation of satellites, wireless and wired service providers that depend on each other's services and technologies. Bringing TV and radio content closer to communities that are otherwise disconnected from landlines and other terrestrial networks represent another aspect of spatial technologies.

For communication applications, synchronization is pivotal, for instance, mobile telephony and data networks use GNSS to keep in a synchronized state, while digital broadband radio uses GPS to ensure that the bits from all radio stations arrive coordinated at receivers and with a minimum of delay.

The water supply sector is very vulnerable to events ranging from contamination with deadly agents to cyber-attacks, which may cause many human illnesses or losses. It is also a pivotal sector, especially for energy critical infrastructures and the nuclear industry, not to mention the security of citizens.

With regards to space critical infrastructure, communication satellites might be used for communications. Additionally, EO satellites might be used for water supply, flood control reservoirs, flood predictions, as well as reserves for drinking water. Indirectly, it affects the food supply sector by providing information that is vital to the survival of a nation.

In the food supply sector, space infrastructures are vital mostly for the production phase, i.e. precision agriculture. Due to GNSS farmers can monitor their crops, or monitor animals or aquaculture crops. Work can be done even in adverse conditions like rain, dust, or fog, when visibility is low, due to GPS. Precision agriculture means also a rational and needs-oriented distribution of fertilizers, pesticides and a better control of the dispersion of these substances. Space technologies can provide accurate maps of areas – with precise information on crops, road infrastructure, and irrigation systems. Moreover, it can provide data on dangers to animals, like outbreaks of diseases caused by particular viruses.

The field of healthcare is critical for the wellbeing of a society through its role in infectious disease outbreaks and in case of natural disasters. While individual assets are managed locally, the networks of health facilities is highly dependent on other infrastructures such as ICT, administrative infrastructures, defence and national security, energy, food supply, water and transportation.

As a consequence, there are interactions between these critical sectors and space critical infrastructures. These relate to the role of GNSS and GIS for disaster management, as well as for detecting pollution in air, water or soil. Furthermore, space technologies are pivotal in monitoring disease propagation, in case of outbreaks. In case of disasters, correlated data between police, fire and medical teams can help save lives by using localisation provided by GPS and thus ensuring a quick response.

Telemedicine enabled by communication satellites and GIS provides new ways to improve human health. Two-way communications technology, multimedia and computer networks enables healthcare to be delivered remotely in low-resources environments. Thus, the expertise, as opposed to people, is being transferred – medical staff can perform tele-consultations, tele-diagnostics and can provide remote training to share their medical expertise.

Hand-held devices such as ultrasound smartphones can be used to provide real-time imaging from battlefields to trauma surgeons halfway around the world. People in remote areas can be tested for HIV and their results synchronized with central healthcare records (Anon., n.d.) Finally, with the help of these technologies, non-transportable patients can be monitored from a distance, providing their doctor with virtual access to their health records and vital signs.

Space products aid integration of medical data with environmental factors, thus helping the early warning of outbreaks of diseases. Integration of hospital admission records and police reports that generate multi-variable interactive GIS maps are helpful to both healthcare professionals and policy-makers to better understand the distribution of health

and disease. Technologies and materials that were initially developed for space applications have been transferred into medical practice. These include programmable pacemakers, micro-transmitters to monitor the foetus inside the womb, laser angioplasty, fiber-optic catheters and light-emitting diodes to be used in brain surgery. Technologies from the Hubble Space Telescope have been applied to digital mammography biopsy techniques.

Another important area in the field of healthcare is represented by tele-epidemiology – the science of studying the propagation of human and animal diseases, based on space technologies. Tele-epidemiology combines data sets from multidisciplinary areas (physical factors such as temperature or humidity, biological readings, health data, socioeconomic data, etc.) with satellite observation data (climatological, environ- mental, land use, etc.). This allows us to analyze the mechanisms of emergence, propagation and transmission of infectious diseases, first, by investigating the "climate - environment - health" relationships, and second, by updating the links that exist between infectious diseases and the environment in which they develop, all with the help of space technology. The ultimate objective is to provide public health stakeholders with tools, risk maps for instance, allowing them to monitor and anticipate epidemics. Space-based applications of tele-epidemiology extend to health surveillance and health emergency response.

Space-based technology has been successfully used to increase access to education in remote, rural and poor communities with limited infrastructure development. Among these important initiatives are the development of distance learning platforms that provide access to courses and materials, in addition to facilitating communication among peers who otherwise cannot meet in person. In the Democratic Republic of Congo, radio stations in rural areas broadcast educational programs to farmers in their local language. Likewise, in rural Australia, satellite services are used to bring learning opportunities to remote communities.

Conclusions

This article reviewed the concept of 'security of space' exemplifying the difficult environment of outer space and its importance for the resilience of critical space infrastructures. It then attempted to highlight various areas of interdependency between space and other critical infrastructural sectors, such as energy, water and food, telecommunications, and others.

The society takes many times technological developments as granted, such as the case of PNT or GNSS services. However, failure of such services highlights enormous societal failures in terms of critical services such as healthcare or governmental communications. In case of a collapse in the realm of space critical infrastructures, operations will be reduced in efficiency, "airlines would have to revert to legacy systems and procedures that waste expensive jet fuel on inefficient routes. Cargo vessels entering harbors would slow to a crawl to ensure safety or they might not be allowed dock at all. Container cranes at ports would revert to cumbersome manual operations. Logistical supply-chain management systems would lose or degrade their ability to track the flow of parts to their factories and products from warehouses. Construction and mining projects would become delayed as expensive manual labor replaced systems used to auto- mate surveying, re-grading, earth moving and asset tracking. Farmers would lose the ability to operate twenty-four hours a day using automated machinery and as a result, they may not be able to harvest all their crops before they spoil in the field". (George Marshall Institute for Security Studies, 2012)

Moreover, losing access to remote sensing satellites for one day might be vital for border controls and for news media reporting in case of a major event like an earthquake, tsunami, forest fire or other natural disaster occurring in that particular day. The ability to provide imagery of that major event and thus to assess the damage would be impeded and the relief efforts would be severely hampered.

In conclusion, when discussing the importance and the resilience of critical infrastructures, it is important to note that some threats cannot be tackled in a traditional manner. Due to complex interconnections, events such as solar weather or asteroids attracted to gravitational field could affect and interrupt the critical services provided.

Legal and Financial Analysis of The Consequences of Using Special Drawing Rights as Administrative Monetary Penalties Levied in Connection to Marine Pollution Prevention from Ships

Wojciech BOZEK

University of Szczecin, Szczecin, Poland
wojciech.bozek@usz.edu.pl

Abstract

There are many barriers to using the Special Drawing Rights (SDR) as the leading means of settling international accounts within the global currency system. Despite that, SDRs are a universal and flexible accounting unit used in many areas of international and national legal order, including the law of the sea. The author's research focuses on the application of the SDR of the International Monetary Fund (IMF) when to value of administrative penalties for the violation of international and national law. In the author's opinion, the role of SDR in the area of maritime law is not marginal. The conducted legal analysis of the normative material reveals that monetary penalties should, first and foremost, have a preventive, repressive and educational role. Furthermore, from the point of view of the participants of administrative proceedings, some of the legal solutions have not been clearly and exhaustively defined by the legislator. However, analysis of statistical data proves that the fluctuations of foreign currencies on the global market will affect the severity monetary penalty imposed on the perpetrator of administrative tort, and thus affect the extent of repressive, preventive and education effect on the penalized party. Moreover, this will also affect the government revenue and the fulfillment of the fiscal function through these sanctions. Consequently, this leads to a conclusion that monetary penalties of the same amounts, but imposed at a different time may in fact have different impact, both in terms of the penalty's basic and accessory roles. Such a situation will be caused by objective factors, regardless of the authority imposing monetary sanctions, as well specific circumstances of the case (type, extent of infringement, factual reasons concerning the fined party). The paper relies on statistical research method and analysis of legal acts and case law, and the method of interpretation of applicable law. The methods were used to evaluate the foreign and Polish legal order and opinions expressed in reference books and case law, and to analyze statistical data. Therefore, the conclusions reached have theoretical and practical implications.

Keywords: Special Drawing Rights, Maritime Law, Administrative Monetary Penalties.

Introduction

Monetary penalties are a universal instrument used in different legal orders to discipline entities which have violated applicable laws (Pache 1994, p. 214, Weigend 1994, p. 105, Genevois 1987, p. 671, Andrijauskaitė 2019, https://wp.me/p7wtYD-dw). Financial sanctions discussed herein are different from criminal sanctions. They serve different purposes, their primary function being retributive punishment of the perpetrator by an administrative body. Such sanctions should not only deter the perpetrator from perpetrating the same offence in the future, but also have a preventive and educational effect on other entities (cf. Teitgen-Colly 2017, p. 7, Huteau 2015, p. 230). Because of the financial nature of these sanctions, they may also contribute to public income, although this is not their major role.

The paper focuses on monetary penalties constituting revenue of state budget and determined in SDR. To ensure that the paper has both theoretical and practical significance, the author focused on the monetary penalties defined in the Act of 16 March 1995 on prevention of maritime pollution form ships (consolidated text: Journal of Laws 2017 item 2000 as amended, further: Act of 16 March 1995) and applicable over the 2014-2019 (November) period. Such approach was feasible thanks to the data provided by the Maritime Office in Gdynia on the basis of the right of access to public information.

Special Drawing Rights and their significance

Pursuant to the Agreement of the International Monetary Fund of 22 July 1944 (M.P. 2010, No 36, item 501, as amended) the unit of account in the form of the Special Drawing Rights (SDR) was created as an international reserve asset in order to supplement other reserve assets of member states of the International Monetary Fund (IMF), should

Cite this Article as: Wojciech BOZEK " Legal and Financial Analysis of The Consequences of Using Special Drawing Rights as Administrative Monetary Penalties Levied in Connection to Marine Pollution Prevention from Ships" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

such need arise. This solution is quite significant as means to ensure international liquidity and prevent crises in the international currency system (Clark, Polak 2002, p 17–23, Alessandrini, Fratianni 2009, p. 15-19). SDRs are units of accounts of the IMF used to settle transactions with the IMF, but they also function as reserve assets which may be used by a member state to purchase freely usable currencies (Gąsiorowski, Grotte, Frankiewicz, Życieńska, Walasik 2013, p. 47-48). Since SDR is the main unit of account in the IMF, it is used as the basis for calculating the size of loans, loan fees and interest rates, but it is also used in operations and transactions between IMF and member states, and monetary institutions prescribed by the IMF (such as the European Central Bank, International Bank for Reconstruction and Development, or the International Settlement Bank). SDRs also play a significant role in the drawing of the IMF's budget and the member country's share in IMF quotas (Dudziński, Nakonieczna-Kisiel 2006, p. 133). The value of SDR is based on a basket comprising five currencies, i.e. the US dollar, euro, Chinese renminbi (from 1 October 2016), Japanese yen and pound sterling, and so the basket includes only the currencies which are used for payments for international transactions, which is meant to increase the global liquidity of international finance. It must be noted that the inclusion of Chinese renminbi proves that SDR is being adjusted to current market circumstances and the need to increase global financial security (cf. Angeloni, Bénassy-Quéré, Carton, Darvas, Destais, Pisani-Ferry, Sapir, Vallée 2011, p. 36-37, 84). However, this does not alter the fact that not many transactions on the international market are conducted in SDRs (Prasad 2016, p. A11).

An important advantage of SDR is its flexibility, brought about by the fact that the SDR basket is reviewed every five years (or sooner). It is a sensible and desired practice, but it also increases the adequacy of SDR which in turn ensures its long-term value in international law. SDR should reflect the relative importance of currencies in commercial and financial systems. Actual weights of currencies included in the SDR basket change as Exchange rates between basket-member currencies fluctuate, and thus the SDR's value is calculated daily on the basis of exchange rates quoted on a given day. And so, it is dynamic. The importance of SDR is also reflected in the fact that the SDR interest rate (SDRi) provides the basis for calculating the interest rate charged to borrowing members for non-concessional loans and interest rate paid to IMF members for the use of their resources for non-concessional IMF loans (IMF 2009, Special Drawing Rights (SDRs)).

At the same time, we should note that in practice, there are factors that limit the role of SDR and affect its application as an international currency. They may be of internal and external nature. Internal limiting factors include, i.a., limited possibility of using it in the sphere of private law (there have been some ineffective attempts at making SDRs basic reserve assets in the international currency system and using them in private markets) and in the sphere of public law, and the limitation of SDR creation. Important external factors include, i.a., development trends of the international monetary system (Skopiec 2015, p. 90-91; Gąsiorowski, Frankiewicz, Grotte, Życieńska 2012, p. 37).

It might be concluded that from the international perspective, the future potential of the SDR depends on specific measures that would need to be taken to give the IMF the power to use the SDR much more flexibly and as needed by global economy. Only then the SDR would become a real alternative to internationally used currencies (Singh 2016, https://www.brookings.edu/blog/future-development/2016/04/19/reforming-the-international-monetary-system/).

The use of SDR in the prevention of marine pollution by ships

In the Polish legal order, SDR is a commonly used unit of account. These are the units used to, i.a., determine monetary penalties for violation of the provisions of administrative law in place. The Polish legislator used SDR in several legal acts, including the broadly understood maritime law (admiralty law). Besides the Act of 16 March 1995 (art. 36-36c), the maritime law encompasses the following acts, i.a: the Maritime Code of 18 September 2001 (art. 280, consolidated text: Journal of Laws 2018, item 2175, as amended); the Act of 21 March 1991 on marine areas of the Republic of Poland and maritime administration (art. 37-37c and art. 55-55c, consolidated text: Journal of Laws 2019, item 2169, as amended.), and the Act of 18 August 2011 on marine safety (art. 126-art. 128 consolidated text: Journal of Laws 2020, item 680, as amended). The above regulations which make reference to the SDR are only exemplary, as the SDR is used in many other legal acts concerning, e.g. nuclear law (Nuclear law of 29 November 2000 (consolidated text: Journal of Laws 2019, item 1792, as amended) and aviation law (Aviation law of 3 July 2002, consolidated text: Journal of Laws 2019, item 1580)).

SDRs are much more than just units of account in which monetary penalties are calculated. The solutions adopted by the Act of 16 march 1995 prove that SDR is used in many ways, not only to govern liabilities, but also to regulate legal relationships in maritime law in its broad sense. SDR is used to calculate tariff units for the issuing of port security documents. The PLN value of a tariff unit is the equivalent of 0.2 SDR, and in the Polish legal order it is calculated according to the previous week's average exchange rate quoted by the National Bank of Poland. This conversion rate is used to determine the fees for, i.a., issuing of documents, diplomas, certificates, deep diver logbooks

(Act of 17 October 2017 on underwater works, consolidated text: Journal of Laws 2020, item 397, as amended). The globally universal nature of SDRs stems from the fact that in maritime legislation they have become the standard unit of account for setting limits liability. For ships with a gross tonnage below 300, the liability limit is 200,000 SDR for claims arising out of personal injury, disturbance of health or death. For other claims the limit is 100,000 SDR. This is how Polish regulations are adjusted to international standards and legislation, i.a., the Convention on limitation of liability for maritime claims concluded in London on 19 November 1976 (Journal of Laws 1986, No 35, item 175, as amended).

As it comes to Polish economy in recent years, it can be said that the value of SDR shows relatively small variance even at times when global markets were very volatile (www.imf.org/external/np/fin/data/param_rms_mth.aspx (access: 24.08.2020) and www.money.pl/pieniadze/nbparch/srednie/?symbol=XDR (access: 24.08.2020).

To systematize the issues analyzed in the further part of this paper, administrative torts which are the basis for calculating monetary penalties in SDRs have been presented synthetically in Table 1. The analysis of the normative material leads to a conclusion that the primary function of penalties is their preventive (disciplinary) and repressive functions, educational, informative, motivational and also fiscal functions (Przybysz 2011, p. 170-172). Some of these functions are primary (fundamental), as e.g. the preventive and repressive functions, and some are supplementary (auxiliary), e.g. the fiscal function. Monetary penalty should be proportional and adequate to the irregularities identified, i.e. effective and having a deterrent effect, therefore the limits of sanctions set by the law are important, and so is the measure of penalty used in a given case (cf. judgment of the Supreme Administrative Court of 01.12.2016., II GSK 1249/15, Legalis No 1577541). The adopted method for calculating monetary fines with reference to SDR requires a disclosure of data necessary to determine the SDR to PLN conversion rate. For obvious reasons, the latter initiates the need to stipulate how the penalty will be calculated in a strictly mathematical sense. It should be underlined here that in the case law of Polish administrative courts there is no comprehensive explanation of the mathematical equations used for these calculations, which often is voiced as an objection of the party challenging the ruling and its substantiation. However, the fact that the method of conversion of SDR to PLN is not stated in the law is not treated as circumstances affecting the ruling and does not constitute grounds for revoking the administrative court's decision or to dismiss the case (cf. judgment of the Provincial Administrative Court of 04.03.2015., VII SA/Wa 1741/14).

Table 1: Application of the SDR in the Act of 16 March 1995 on prevention of pollution from ships

Sectioning level of the legal act	Tort perpetrator	Size of monetary penalty	Example of administrative tort
art. 36 para. 1	shipowner	**equivalent of up to SDR 1,000,000**	sea pollution of the Polish marine area of the Baltic Sea caused by the ship's day to day shipping operations or dumping of waste or other substances
art. 36 para. 2	shipowner affiliated to Poland	**equivalent of up to SDR 1,000,000**	sea pollution outsider the Polish Marine area of the Baltic Sea caused by the ship's day to day shipping operations or dumping of waste or other substances without a required permit or against the terms stipulated therein
art. 36a	shipowner who does not perform obligations set by the law or who violates bans imposed by the law	**up to SDR 50,000**	carriage of dangerous or polluting goods without due information about the type of cargo, intended route and time of passage, and the safety conditions of the ship; use of installations or devices that contain controlled substances in a way that does not prevent emission of controlled substances to the environment; shipping operations that cause the emission of ozone-depleting substances, nitric oxide, greenhouse gases with fluorine

art. 36aa para. 1-2, 3a, 4	shipowner	**up to SDR 600,000**	the use of fuel exceeding sulphur limits; carriage of fuel oil, in breach of the MARPOL Convention, for combustion purposes for propulsion or operation on board a ship that does not meet the sulphur content limits of fuel oil; operating a ship without a valid Inventory or heading towards recycling facilities which are not included in the European List of ship recycling facilities
art. 36aa para. 3	shipowner	**up to SDR 100,000**	failure to provide the results of tests of emission reduction methods in accordance with the Act
art. 36aa para. 5, 6, 36c,	shipowner	**up to SDR 50,000**	failure to monitor CO2 emissions using the method prescribed in art.8 Regulation (EU) 2015/757 of the European Parliament and of the Council of 29 April 2015 on the monitoring, reporting and verification of carbon dioxide emissions from maritime transport, and amending Directive 2009/16/EC (OJ L 123, 19.5.2015, p. 55, hereinafter: Regulation 2015/757), failure to fulfill the obligations concerning collection and reporting of ship fuel oil consumption data in accordance with regulation 22A Annex VI MARPOL; failure to provide information on dangerous or polluting goods loaded onto the ship for transport
art. 36b	shipper	**up to SDR 50,000**	failure to meet the obligation with regard to making dangerous or polluting goods ready for loading and transport by the ship without notifying the captain and presenting him with a Dangerous Goods Declaration
art. 36c	supplier	**up to SDR 50,000**	failure to notify prior to the first delivery (the head of the maritime office competent for the place of delivery) about fuel supply operations in Polish marine areas
art. 37a	everyone	**up to SDR 50,000**	failure to comply with provisions of the Regulation (EC) No 783/2003 of the European Parliament and of the Council on the prohibition of organotin compounds on ships and Commission Regulation (EC) No 536/2008 of 13 June 2008 giving effect to Art. 6(3) and article 7 of Regulation (EC) No 536/2003 of the European Parliament and of the Council on the prohibition of organotin compounds on ships and amending that Regulation
art. 37b	shipowner or ship's captain	**up to SDR 200,000**	failure to comply with the terms and conditions of the permit granted to the ship moving between specified ports or places or a ship that is operated only between specified port or places
art. 37c	port or marina administrator, or an entity conducting operations and using the quay within the area of the port or marina	**up to SDR 50,000**	failure to comply with the obligations to draw new or update existing pollution prevention plans and pollution emergency plans regarding port waters

Source: Author's own study based on the Act of 16 March 1995.

The purpose of monetary penalties referred to in Fable 1 is to eliminate the negative effects for human life and health, and for the environment caused by operations of ships at sea and harmonize the Polish legal order with the provisions of international law, including:

1) Commission Implementing Decision (EU) 2015/253 of 16 February 2015 laying down the rules concerning the sampling and reporting under Council Directive 1999/32/EC as regards the sulphur content of marine fuels *(*OJ L 41, 17.2.2015),
2) Resolution 380(94) of 21 November 2014 amending Regulation 2, Chapter VI of the International Convention for the Safety of Life at Sea concluded in London on 1 November 1974 (Journal of Laws 1984, item 320 and 321, and 1986, item 177),
3) Directive 2014/89/EU of the European Parliament and of the Council of 23 July 2014 establishing a framework for maritime spatial planning *(*OJ L 257, 28.8.2014, p. 135).
The regulatory solutions adopted in the Act of 16 March 1995 were also affected by: the Regulation (EU) 1257/2013 of the European Parliament and of the Council on ship recycling, and amending the Regulation (EC) No 1013/2006 and the Directive 2009/16/EC (OJL 330, 10.12.2013, p.1) and the Regulation (EU) 2015/757 of the European Parliament and of the Council of 29 April 2015 on the monitoring, reporting and verification of carbon dioxide emissions from maritime transport, and amending Directive 2009/16/EC *(*OJ L 123, 19.5.2015, p. 55, as amended).

Analysis of the effect of monetary penalties imposed pursuant to the Act of 16 March 1995

As already established, the application of the SDR in determining the size of a monetary penalty has impact on the financial situation of the entity fined, as well as on the government budget. Therefore, it is essential to strive to ensure that the substantive proceedings are objective and independent.

Throughout the analyzed period, annual government revenue collected from the total monetary penalties imposed by the Director of the Maritime Office in Gdynia was PLN 158,600 (in 2016), whereas maximum sanction imposed in any individual case was SDR 25,000, which is ca. PLN 136,600.

Thus, in the cases discussed, the exchange rate of PLN to SDR has relative significance and impacts the degree of the sanction's repressiveness experienced by the entity fined.

Table 2 implies that the application of a monetary penalty of SDR 2,000 in each of the aforementioned instances would generate a difference of ca. PLN 1,630 between the highest and lowest amount of the sanction. However, the provisions of the subject Act do not specify which exchange rate date should be used for the conversion, i.e. should it be the date of violation, date of decision or the date when the decision became final, or some other date. From the perspective of the entity fined, the varying economic burden of the penalty imposed at different times may raise reasonable doubts. For example, if one is to consider the highest penalty ruled in 2014-2019 (SDR 25,000 in 2016), the difference between the lowest and highest exchange rate of SDR to PLN (Table 2) would be over PLN 20,360.

To recapitulate, the above points to the conclusion that the severity of a monetary penalty in the above cases was dependent on non-statutory assumptions. Monetary penalties should be weighted according to the severity of the violation, the repeatability of violations and also revenue gains. However, the actual severity of the said sanction may be more than intended in result of the fluctuating SDR to PLN exchange rates. It is obvious that administrative bodies have no impact on the factors affecting foreign exchange rates, including the foreign currency to PLN rate. Nevertheless, a normative regulation of the principle which – considering the repressive nature of monetary penalties as regulatory enforcement tools – would determine the one, objective way of setting the SDR to PLN exchange rate is necessary. In the author's opinion, it would be reasonable to consider the date of violation as the reference point for the conversion, rather than referring to the date of decision or another date. Such a solution would ensure objectivity since the date of the decision actually depends on the administrative body (director of maritime office), who will try to maximize the government revenue.

Table 2: Monetary penalties levied on the basis of the Act of 16 March 1995, including SDR and PLN, and the sum total of monetary penalties levied in a given year

The Act of 16 March 1995					
Inspectorate of Marine Environment Protection, Maritime Office in Gdynia					
Year	Sum total of monetary penalties levied	Legal basis	SDR	PLN	Average conversion rate PLN to SDR
2014	11,105.12	art. 36aa para. 1	2,200.00	10,359.90	4.7090
		art. 36(1)	150.00	745.22	4.9681
2016	158,455.30	art. 36aa para. 1	2,000.00	10,815.60	5.4078
		art. 36aa para. 1	2,000.00	11,047.20	5.5236
		art. 36aa para. 1	25,000.00	136,592.50	5.4637
2017	123,044.72	art. 36aa para. 1	1,200.00	6,465.12	5.3876
		art. 36aa para. 1	2,000.00	10,271.00	5.1355
		art. 36aa para. 1	5,000.00	25,419.00	5.0838

Conclusion

The solutions adopted in Polish maritime law make many references to the SDR. As units of account, SDR should be appreciated for meeting the criteria of neutrality (lower vulnerability to macroeconomic fluctuations) and flexibility which is manifested in the fact that i.a., it is based on transparent, comprehensible and appropriate valuation methodology based on a basket of major freely usable currencies. This is also important from the perspective of monetary penalties discussed in this paper, as they can be imposed on both domestic and foreign entities (natural persons, legal persons and non-corporate entities).

In practice, the method and formula used for calculating the SDR conversion rate makes it a commonly recognized and relatively stable unit of account, which is why it is used for setting limits on liability in many international agreements (Ntovas 2010, p.9), and in administrative procedure followed in the subject sanctions. The equivalence of a monetary penalty expressed in the SDR can be freely conversed into PLN, which, however, does not mean that its value is not subject to fluctuations. Differences in exchange rates at different times affect the financial situation of the entity fined with an administrative monetary penalty, and also, affect the government revenue.

The primary function of monetary penalties analyzed in this paper is to act as preventive and disciplinary measures, while they are not enormously important in fiscal terms for the state budget. In contrast, from the point of view of an entity fined, the date selected to be the SDR to PLN exchange date may have a significant impact on the entity's financial situation. To resolve doubts that arise in this context, it is necessary to initiate law-making actions which will ensure that the amount of monetary penalty is beyond the control of the administrative body. Only then the objectivity of decisions on monetary penalties issued in administrative proceedings will be guaranteed.

Stimulating the Economy's Innovative Potential by Means of EU Funds

Ewa MILCZAREK

University of Szczecin, Institute of Legal Studies, Szczecin, Poland
ewa.milczarek@usz.edu.pl
ORCID 0000-0003-0726-0959

Abstract

Global competition forces a pursuit to increase the economy's innovative potential in order to compete on the market increasingly determined by new technologies. The EU economy also needs to meet these challenges. EU funds are one of the tools adopted by the European Union to achieve this goal.
The paper's research goal is to analyse the EU's impact on the economy by means of EU funds in terms of stimulating innovation. Since law and economy meet in the analysis of the discussed issues, methodological eclecticism has been applied by anchoring the research in the economic analysis of law. The paper discusses the legal framework of development of innovation and economic tools that implement the assumptions of the company's innovation enhancing policy.
The study's outcome involves a conclusion on whether the tools (aid funds) effectively contribute to boosting innovation of the EU economy. The analysis allows a statement that the EU policy has a positive impact on innovation of the economy, which is confirmed by comparative research of other economic areas. The said funds have led to increased performance in countries with a developed R+D sector and also in countries with a primary low share of innovation in the economy.

Keywords: European funds; innovative economy; research and development; knowledge-based economy

Introduction

Innovative activity is a key tool in states' economic development. Investment in the R+D sphere creates a basis for long-term development and also builds the economy's competitive position. The European Union, wanting to face the growing competition, supports the development of innovation by means of aid funds.

The paper's research goal is to analyse the EU's impact on the economy by means of EU funds with regard to stimulating innovation. The result of the study is a conclusion on whether this tool effectively contributes to boosting innovation of EU economy.

Innovation in The Economy

The term "innovation" was coined in the 1930s by J. A. Schumpeter [Schumpeter 1939, p. 84] who identified by these five cases where innovation occurs [Wiśniewska p.10]:

- Creating a new product,
- Applying a new methodology, production method,
- Creating a new market,
- Obtaining previously unknown raw materials,
- Reorganizing a specific branch of economy.

In the 1990s, the paradigm of the knowledge-based economy was put forth to draw attention to the characteristics of the modern economy, increasingly benefiting from knowledge capital, and such knowledge being the source of all novelties in the market [Lemanowicz 2015, p. 61]. The theory of endogenous economic growth is its expression, which emphasizes the significance of technological changes and knowledge as sources of competitive advantage of

companies, regions and national economies [Romer; Lucas]. One of the theory's elements is knowledge-based economy, in which knowledge and learning are key production factors [Lundvall]. A knowledge society, as a new social model, is determined in this approach by innovative activity, the sector of highly-technological companies, scientific progress and creative human capital [Kleiber, p. 8].

In developed economies, the driving force of development involves innovation based on three pillars: research and development (R+D), knowledge and education. Many OECD reports and publications emphasize that in the situation of a world crisis, innovation is a key economic and social factor of development of states [Przyborowska, p. 90].

European Union's Innovation Policy

The innovation policy is one of the elements of economic policy. The legal basis of EU's general industrial policy is Article 173 of the Treaty on the Functioning of the European Union (TFEU), according to which "The Union and the Member States shall ensure that the conditions necessary for the competitiveness of the Union's industry exist". The legal basis of the EU policy in terms of research and technological progress is provided in Articles 179-190 TFEU. The innovation policy strives to create an effective system of combining science, business, administration and market, that is such which will ensure quick implementation of innovations that enhance the economy's competitiveness and improved quality of community life. Its aim is to support innovative activity on various levels of economy, thus aiding the process of introduction of new products, services, technological processes or management techniques and of capturing new markets, as well as to help ensure access to sources of innovation [Okoń-Horodyńska, p. 239].

Activities intended to enhance the level of innovation have been carried out since the second half of the 1990s [EC, 1995]. The innovation policy is linked with other fields of EU activity, including most of all those concerning employment, competitiveness, environment, industry and energy. The pursuit of the innovation policy is to transform research results into new better services and products in order to maintain competitiveness of the EU on the world market and to improve the quality of life of European citizens.

The axis for the development of innovation in the EU is the "Innovation Union" - one of seven flagship initiatives provided for under the Europe 2020 strategy [EC, 2010] for creating smart, sustainable and inclusive economy. The aim of the Innovation Union is to create a single European Union innovation market which will attract innovative companies. For this purpose, introduction of various measures in terms of patent protection, standardization, public procurement and smart regulation was proposed. The Innovation Union also assumes striving to stimulate investment in the private sector and i.a. increasing European venture capital investment. The axis for the activities involves:

- transforming Europe into a world-class research centre;
- removing barriers on the path to innovation, such as costly patent procedures, market dispersion, sluggish development of norms and shortage of qualified staff, which at the moment make it impossible to introduce ideas into the market quickly;
- revolutionizing methods of cooperation of the public and private sector, especially by implementing innovation partnerships between EU institutions, national and regional authorities and companies.

These activities will be continued and developed in the further 2030 perspective [EC, 2019].

The EU innovation policy is implemented at the pan-national, national and regional level. The actors that have significant influence over the development of innovation belong to the sector of private companies. Admittedly, companies can indeed obtain funding from market instruments [Zembura], but the short grace period, credit costs and the need to secure the credit impede the use of this possibility by small and medium-sized enterprises. Entrepreneurs' hindered access to external funding is one of the most important problems of development of innovation of economies. The solutions that may facilitate the actors' conduct of R+D works involve public aid, thus support provided by the state or coming from state funds [Jabłońska]. Activities that aim to improve the conditions of financing research and innovation and access to them, in order to facilitate the transposition of innovative ideas onto real products and services, are carried out by means of various aid funds.

The EU law lacks a legal definition of the concept of aid funds. It needs to be noted that the funds constitute financial instruments, brought to life permanently or temporarily, by means of which direct financing and implementation of the aim set out in Article 174 TFEU "to promote the Union's overall harmonious development" by "actions leading to the strengthening of its economic, social and territorial cohesion" takes place in collaboration with the EC and the Member States [Świstak, p. 213].

There are many kinds of innovation. EU funds support four main areas of innovation [Żukowska, Pindelski, p.7]:

1. product innovation - the term accommodates all changes involving improvement of a product already manufactured by the company or at the start of production of another innovative product;
2. process (technological) innovation - involves a change in the methods of service delivery or production applied by a company,
3. organisational innovation - involves implementation of a new organisational method in the firm's business practices,
4. marketing innovation - involves the implementation of a new promotion method involving significant changes in product design, its packaging, advertising or business model.

The three most important groups of recipients of innovation measures include: entrepreneurs (often in collaboration with other actors), research institutions and individual researchers.

Globalization has resulted in the possibility to observe a change in the directions of approaches to innovation policy. It has become a rule to cease direct support to those phases of development of technology which are close to the commercialisation phase. Greater importance is attributed to financing basic research, often in the context of cooperation between entrepreneurs and research and academic institutions [Smith, p. 99-109]

Individual EU countries and regions are strongly differentiated in terms of economic development [Campo, Monteiro, Soares]. The EU policy must be adequate to the specific nature of given regions by selecting its tools, such as EU funds, appropriately. Financing programmes are thus available at various levels of fund size and purpose, allowing access for stakeholders of a different developmental potential. EU's biggest programme for scholarly research and innovation is Horizon 2020 [Regulation (EU) No 1291/2013]. In 2014-2020 the layouts came to EUR 77 billion. The funds are also available at the national level (in Poland, the Smart Growth Operational Programme) and at the regional level (Regional Operational Programmes). The EU has also prepared an offer of earmarked funds, for example the Innovation Fund was established in Article 10a(8) of the Directive 2003/87/EC1 in order to support innovation in low-emission technologies in all Member States.

Funds' Impact on Stimulating Innovation

The development of innovation in companies leads to enhanced profitability of their activity and to profit multiplication. Therefore, is encouragement to take up such activities really necessary? The problem in implementing innovative solutions involves high costs of developing and introducing them. This results from the very specific nature of this sector, which is based on cooperation with research units and specialists and new solutions. First profits from the R+D activity appear on average 2.57 years after the implementation of results, where majority of respondents pointed out that the maximum time they are ready to accept for the return on investment in R+D is 3 years [Tylman, p. 6]. Given the above, large enterprises have the greatest possibilities to tackle the financial requirements of such projects. Creating financial opportunities for small and medium-sized enterprises as well as star-ups is necessary for them to able to undertake such activities.

The analysis of the greatest motivators for entrepreneurs to develop R+D activity shows that they include the possibility of obtaining subsidies or tax reliefs on account of conducting R+D works and greater flexibility and dynamics of operation of academic and research centres. Entrepreneurs, when deciding to implement an R+D project, mostly take into account the likelihood of success and project costs [Tylman 2015, p.7]. The problem of accelerating processes that increase innovation and competitiveness of the economy will not be solved by a market mechanism alone. The EU and its Member States must be active not only by co-financing but also conducting research, especially in the area of basic research which might prove too risky for private actors.

Therefore, the UE policy for stimulating an innovative market by funds is right and corresponds to the real needs of the market. The effects of the EU's current activity, including definitely the impact of aid funds, is reflected in the 2020 European Innovation Scoreboard [Hollanders, Es-Sadki, Merkelbach, Khalilov]. The EU's result in this field has improved every year for five years now. Once again European innovations surpassed the achievements of the United States. However, the EU still stays behind Japan and South Korea in this respect, while China is catching up quickly. Since 2012, the EU's innovation-related performance has risen by 8.9% on average. Since 2011 innovation-related performance has improved in 25 EU Member States. The greatest increase was noted in Lithuania, Malta, Latvia, Portugal and Greece. The most important identifier of investigating the national research and development activity is the so-called GERD indicator which shows national gross expenditure on R+D. The example of Poland clearly demonstrates the trend of the GERD indicator rising in the last decade [Kwiecień p.145]. Development is based both of R+D and SME, that is two areas which most affect the level of competitiveness of the economy and the creation of long-term economic growth. Reports clearly show that the development of innovation centres is also

advancing in countries with weaker economies. EU cohesion policy funds are the main driving force of innovation and sustainable development.

In order to improve the pace of increase of R+D expenditure changes in legislation are necessary, which will make it easier for companies to obtain funds, since the not very attractive tax incentives available in recent years were rarely used (enterprises were uncertain as to what expenses qualify under them), while universities are still learning to cooperate with the enterprises sector [Marciniak].

Summary

The EU's policy on innovation is complex and multifaceted. Implementing and steering it requires clear specification of goals and preparation of a number of instruments that serve its implementation in complex institutional surroundings. Global competition forces a pursuit to increase the EU economy's innovation capacity in order to compete on the market that is increasingly determined by new technologies. Already today, thanks to the EU policy, innovations have an increasing share in the economy. They bring benefits to all citizens, consumers and employees alike. They are key to the creation of better work places, development of an ecological society and improved quality of life as well as to the preservation of the EU's competitiveness on the global market. The innovation policy is a link between a policy on research and technological progress and an industrial policy, and it allows the creation of conditions that encourage the introduction of ideas to the market.

At the moment, Europe, home to as little as 7% of the world population, generates 20% of world investment in scientific research and development, publishes one third of all high class scholarly publications and takes a dominant position in the world in the following industry sectors: pharmaceutics, chemicals, mechanical engineering and fashion [Report no. 40/2018, p. 4]. Such a high level of innovation in the economy was achieved thanks to the EU policy and relevant allocation of EU funds. Thus, EU funds productively affect the increase of innovation of the EU economy. The next, 2021-2027, perspective assumes continuation of the existing innovation policy and increasing resources for innovative activity. Even Horizon Europe (continuator of Horizon 2020), the next EU programme in terms of scientific research and innovation, will be supplied with a EUR 100 billion budget.

Therefore, one needs to remember that the EU must respond flexibly to the changing nature of market trends so that the successfully conducted policy keeps up its high level of efficiency. A correct structure of mechanisms of support that takes into account market needs, should still positively affect the increase of involvement of private operators in financing R+D works and should translate into implementation of the outlined outcomes.

Impact of Television Health Programmes: Women Resident at The Bells Community, Ota In Focus

Bukola OLOWOLADE, Dr. Olusola OYERO and Tayo ADIGBOLUJA
Covenant University, Ota, Ogun State, Nigeria.
E-mail: bukolaolowolade@gmail.com

Abstract

Health is of utmost importance to the development of individuals, community, state and any nation at large. The study explored the impact of Television Health Programmes on women resident at The Bells Community, Ota, Ogun State, focusing on health programmes on AIT. This is an empirical study and the essence of this study is to be able to generate information or statistics that would be useful for areas or sectors in Nigerian that deals with health. In gathering these information or statistics, questionnaire was used. 60 copies of questionnaires were used to gather information from women who are resident in The Bells Community. The study found that only a few women in that community actually watch television programmes. It concluded the health programmes on AIT should be made more interesting and fascinating for women who would invariably call other women's attention to the programmes.

Keywords: Impact, Television Health programmes, Women.

Introduction

In spite of the leading and expansive role played by the internet in today's world, several reports on mass media still aver that television is the most popular source of health information (Burzyńska, Binkowska-Bury, & Januszewicz, 2015). For every individual, and society at large, health is a major concern (Meti, 2014). In order for an individual, society or nation to achieve its targeted goal, health is a necessity (Meti, 2014). There have been several records of ill health and even deaths of men, women and children over the years in Nigeria. And while some of these are due to lack of facilities in our health care centers, some are actually due to lack of knowledge on how to keep a sustainable health and many other reasons. Therefore, there is the need for people to be enlightened through reachable means.

Regardless of the obvious physical, social and biological differences that exist between men and women, the entirety of women health is different from that of their male counterparts (Basdevant, Craplet, & Guy-Grand, 1993). Recent health care studies about women seek to promote an understanding of both biological and psychosocial factors that affect women health initiatives. This is inclusive of training of health care providers. More importantly, a vital role is played by the media through the social responsibility angle. It can be logically argued that the television is the most all-encompassing mass medium as it possesses the ability to combine sound and pictures. In addition, no skills are required to watch television (Meti, 2014).

However, the main crux of this study is to examine the extent to which the media is influencing women resident at The Bells Community, Ota, Ogun State. As far as the health awareness is concerned, everybody needs proper education and concern for their personal health status. Though educating facilities and various media, which are the tools of awareness, health institutions in the both the Government and public sector have grown considerably, but general public is not much accustomed to utilize them for their cause.

Sango-Ota area of Ogun state is under Ifo local government area of the state and one of the most populous areas in the local government area, with The Bells community being one of the busiest communities present therein, owing to the presence of The Bells University in that locale. The researcher chose to study and analyzed the television viewing habits

Cite this Article as: Bukola OLOWOLADE, Olusola OYERO and Tayo ADIGBOLUJA "Impact of Television Health Programmes: Women Resident at The Bells Community, Ota In Focus" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

of health programmes on AIT by women in the Bells Community. This study focuses on the impact television health programmes have on women, including pregnant women in The Bells Community, Ota, Ogun State. For this study, the television station being examined is African Independent Television- AIT. AIT was selected for this study based on its popularity and accessibility within the locale which the study focuses on. Once the name of the station is mentioned, lots of persons are familiar with it and would be able to provide their own opinions about the topic. Also, the television station has a fair number of health programmes broadcasted over its network, which was considered adequate for this study.

Research Questions

1. To what extent do The Bells Community women watch health programmes on AIT?
2. Do the health programmes on AIT meet the needs of the women in The Bells Community?

Theoretical Framework

The theoretical framework used for this study is the Social Responsibility Theory. The Social Responsibility Theory originated from the United States of America in 1947 to re-examine the concept of press freedom. It argues that the press has a responsibility to the public. Onyeka Uwakwe (2003) says that the theory must at all times tell the truth and abide by media ethical measures (Uwakwe, 2003).

This theory according to Siebert et al. (1956), Kunczick (1988) and McQuail (1987) postulates six specific functions for the press. These functions are:

1. To serve the political system by making information discussion and consideration of public affairs generally accessible.
2. **To inform the public to enable it to take self-determined action.**
3. To protect the rights of the individual by acting as watchdog over the government
4. To serve the economic system: for instance, by bringing together buyers and sellers through the medium of advertising.
5. To provide “good” entertainment whatever “good” may mean in the culture at any point in time.
6. To preserve financial autonomy in order not to become dependent on special interests and influences.

The relevance of the theory to this study is hinged on the responsibility of the media to provide relevant information to the people, where necessary, which in this case is in the area of health. It is the responsibility of the media to inform the public to enable it take self-determined action. In relevance to this therefore, the media (television) is responsible for educating women on health matters or health related matters so as to enable them make informed decisions about their health.

Literature Review

A very powerful tool which can be employed in raising public awareness on issues that pertain to health and have been drawn up as a feature influencing several health behaviours are the mass media (Primack, 2004). According to Ullah, et. al (2014), television plays a critical role in our daily lives, having both positive and negative impacts. In situations where the radio is of limited impact, television has been found to be effective (Akinfeleye, 2003). In addition, at the foundational stage of television in Nigeria, the main purpose it was set to serve was education (Akinfelelye, 2003). The author however notes that in today’s world, television is being employed as a tool for national development and citizen mobilization in for developmental purposes such as family planning, primary health care, and many more.

In the Kurdish region, television, and particularly, the commercialization and Westernization of television in the Kurdistan Region has produced a new outlook for the Kurdish women which is redefining the way she looks at the world and at herself (Nazakat (2011). Today, these women view foreign mass media content, comparing their lives with what obtains

on the screens as witnessed in the films and soaps of international television productions. But this is not all. According to Bernsten & Hansen (2006), the Mass Media can help enhance capability and provide people with information they need to learn about health and where to seek services. In addition, the mass media can also serve as a vehicle through which one can overcome shame, stigma, discrimination as well as raise awareness and public and financial commitment to the issue.

Television Health Messages

This can take the form of soap operas, jingles, drama series, talk shows, campaigns, and magazine format. An example of where television has been used for health educational purposes is the largest global HIV and AIDS campaign, covering one hundred and sixty six countries- MTV's 'Staying Alive'. Since the year 2004, its campaign has been supported by UNFPA, UNAIDS, the World Bank, Family Health International and the Kaiser Family Foundation focused on girls and women (Bernstein & Hansen, 2006). In December 2009 as well, a leading social media enterprise in Nigeria known as Communicating for Change also launched three short films: ***Too Young, Too Far***, and ***Too Late***. The films were centered around maternal mortality in Nigeria, and were launched at the Silverbird Galleria Cinema in Lagos. The short film took a look at the life threatening situation of being pregnant in Nigeria (CFC, 2009). According to the CFC (2009), the Maternal Health Channel television in Ghana was established in the hopes of raising awareness and boosting maternal health across Ghana. The show comes in three parts; drama, documentary and discussion. Shirley Biagi in his book "Media Impact: an introduction to Mass Media" stated that the mass media actively influence society, they also mirror it. According to Gaziano and Horowitz (2001) this can be achieved through the media function of informing and education. Journalists should not underestimate their role in communicating health information to the public. Written materials such as fact sheets, print advertisements, and posters can be used to disseminate health information.

Methodology

The study was descriptive and women within the ages of 18- 50 in The Bells Community area of Sango Ota, Ogun State formed the population of study. The population of residents of The Bells community (excluding students of The Bells University) is estimated to be about 180 persons, with 32 per cent of the population being women within the ages of 18-50. 60 copies of questionnaire were administered that were distributed in The Bells Community, 56 copies were returned, but only 39 copies were valid. A total number of 39 copies of questionnaire were analyzed and descriptive statistics was used in the analysis. The result of the questionnaire analyzed were presented using tables, percentages and charts.

Presentation of Results

RQ 1: To what extent do The Bells Community women watch health programmes on AIT?

Table 1 below shows that business persons were the most represented with3 9% followed by students with 23%,employee with 17%, others with 13%, while the least were women who are artisans 8%. Occupation of the total respondents from The Bells Community probably affects their pattern of watching health programmes on AIT as 39% of respondents are business women and who run their own business and can decided at their own time to watch television. These sets of people have little time to watch television.

Table 1: Respondents' Occupation

Occupation	Frequency	Percent (%)
Student	9	23.0
Business Person	15	39.0
Artisan	3	8.0

Employee	7	17.0
Others	5	13.0
Total	39	100.0

Table 2 below shows that secondary school degree holders have the highest number of education, followed by OND/NCE holders, University degree holders, those with no education, others and then primary school degree holders. This implies that the highest numbers of those in business are secondary school degree holders.

Table 2: Respondents' Highest Level of Education

Occupation	Frequency	Percent (%)
None	3	8.0
Primary	1	3.0
Secondary	16	41.0
OND/NCE	9	23.0
University	7	17.0
Others	3	8.0
Total	39	100.0

Findings from this research question showed that only few of the respondents actually watch health programmes on AIT. This is in line with Daramola (2005)'s study who notes that television ranks the highest in terms of entertainment media while teaching new value system. Yahaya, Fadairo and Ogundele (2009) in their study on Attitude and the Effects of Health-based Entertainment-Education Strategies on the Knowledge and Behavior of Women in Lagos State reported that information, entertainment and education are very important to women. Therefore, health communicators should always include some elements of information, education and entertainment in their health and other development messages targeted at women in order to get their attention. Their study concluded that women in Lagos experienced a serious improvement in knowledge and a positive change in their health behavior from watching and listening to various health programmes on Entertainment, Education channels.

RQ2: Do the health programmes on AIT meet the needs of the women in The Bells Community?

Fig. 1: Do the women in The Bells Community learn from health programmes on AIT?

Fig. 2: shows from a general point of view that most of the women learn from health programmes on AIT.

Fig. 2: Extent to which health programmes increase their knowledge bank

Fig. 2 reveals that 37% of the respondents state that the health programmes on AIT increased their knowledge on health matters to a very great extent, 22% say the health programmes on AIT increased their knowledge on health matters to a great extent, 30% and 11% say that the health programmes on AIT increased their knowledge on health matters to some extent and not at all, respectively.

Fig. 3: Extent to which Health Programmes on AIT meet their health needs

Fig. 3 reveals the extent to which health programmes on AIT meets the health needs of women in The Bells Community. According to the results, 24% of the respondents agree that the health programmes on AIT meet their health needs to a very great extent, 18%, to a great extent, 50%, to some extent and 18% say that the health programmes on AIT have not met their health needs in any way.

Conclusion

This paper examined the Impact of AIT Television programmes on Women's Health in The Bells Community. The study set out to find out the extent to which existing health programmes on AIT had an impact on women's health. Based on the findings, the study concluded that AIT Television health programmes have a moderate impact on women's health in The Bells Community. This is so because the respondents were not fully aware of the health programmes on AIT. However, majority of the respondents says that their health knowledge based on the health programmes on AIT has increased.

Recommendations

This study recommends that:

- Health programmes on AIT should be integrated into other programmes, particularly programmes that have high catchment. This would help increase the level of persons that watch health programmes.
- More health programmes should be produced on AIT. The station can work this out together with the Ministry of health. By doing this there would be more programmes on air, of more quality and more lives would be saved in The Bells Community and in Nigeria as a whole.
- The government should encourage of health programmes on AIT so as to increase the knowledge levels of women in The Bells Community and other viewers of this station. This encouragement can be achieved by either the federal or the state government through sponsorship of such health programmes.

Application of A Synthetic Measure to Assess the Financial Condition of a Company – The Dynamic Approach

Ewa ZDUNEK-ROSA

Nicolaus Copernicus University in Toruń, Toruń, Poland

E-mail: ezdunek@umk.pl

Abstract

Motivation: The assessment of the company's financial condition is based on financial indicators that describe various aspects of the business entity's operations. Conclusions drawn from the analysis of individual indicators may be contradictory. Therefore, the ratio analysis should be supplemented with additional analytical tools, which will allow for a synthetic assessment of the company's financial condition. **Aim:** The aim of the article is to propose a method for a comprehensive assessment of the company's financial situation. To assess the financial condition, the ratio analysis and one of the methods of multivariate comparative analysis (MCA) were used, *i.e.,* a synthetic measure was constructed. **Results:** The results of the study are presented based on the example of a company representing the chemical industry – the AZOTY SA company. The article uses a dynamic approach, which allowed to observe the shaping of the financial situation of the economic entity over time.

Keywords: Financial Condition, Complex Phenomenon, Diagnostic Variable, Synthetic Measure (Variable), Zeroed Unitarisation Method (ZUM)

Introduction

Complex phenomena are phenomena that are described by at least two characteristics that may have different names and different ranges of variability (Kukuła, 2000, p. 7). These phenomena are the subject of research of multivariate comparative analysis (MCA), also known as statistical comparative analysis (SCA) or multivariate statistical analysis (MSA). Multidimensional methods, allowing the analysis of complex phenomena, are used in many areas, such as, for instance, macro- and microeconomics, marketing, finance and banking, ecology, education, tourism, medicine, demography, and in many others (Kukuła, 2000, pp. 22-32).

In finance and banking, the financial condition of an enterprise serves as an example of a complex phenomenon. The assessment of the financial situation of a given entity consists of the assessment of various areas of the company's activity, such as financial liquidity, operational efficiency, degree of debt, or profitability. The ratio analysis, using financial ratios calculated on the basis of financial statements, allows to evaluate each of these areas separately (Sierpińska, 2004, pp. 144-145). In practice, it often happens that financial indicators characterizing particular aspects of an economic entity's activity provide contradictory information about its financial situation. Therefore, it is advisable to look for methods that allow the assessment of the company's financial condition in a synthetic manner. In the subject literature, many different methods of assessing the company's financial situation have been proposed (Siemińska, 2002). It is also worth mentioning the methods for predicting the risk of bankruptcy of enterprises, which are based on the assessment of the financial condition of an economic entity. The application of these methods in business practice is discussed in many studies (Lee *et al.*, 1996; Hadasik, 1998; Ravi Kumar & Ravi, 2007; Swiderski *et al.*, 2012; Huterska & Zdunek-Rosa, 2016; Łapińska *et al.*, 2018; Zdunek-Rosa & Huterska, 2018, Hosaka, 2019).

The aim of the article is to present a synthetic measure to be applied in the assessment of the company's financial condition over time (*i.e.,* in dynamic terms).

The article presents a dynamic approach to the problem of assessing the financial condition of an enterprise using a multivariate comparative analysis. The dynamic approach allows to assess the direction of changes of the examined

Cite this Article as: Ewa ZDUNEK-ROSA" Application of A Synthetic Measure to Assess the Financial Condition of a Company – The Dynamic Approach" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

complex phenomenon, and thus allows to notice whether the financial condition of an economic entity improves or worsens during the period covered by the study.

Research Material and Methodology

The article uses financial ratios describing the financial situation of the AZOTY SA company in the period from Q2 2008 to Q1 2020 (48 quarterly data in total). The data are derived from the www.biznesradar.pl website.

In this study, in order to assess the financial condition of the company, an index analysis was used and one of the methods of multivariate comparative analysis (MCA) and thus a synthetic measure was constructed.

The methods of multivariate comparative analysis (MCA) are also used to analyse the dynamics of complex phenomena. The concept of a complex phenomenon is closely related to the concept of a diagnostic variable and a synthetic (aggregate) variable. Diagnostic variables are variables describing the complex phenomenon examined, while a synthetic variable is 'a variable that, based on a set of standardized diagnostic variables, determines in a quantitative manner the level (the degree of development) of the considered phenomenon in the examined objects' (Kukuła, 2000, p. 21). A synthetic measure is a unitless quantity.

The selection of diagnostic variables is based on content-related and formal criteria (Ostasiewicz, 1999, p. 116; Kukuła, 2000, p. 47; Panek & Zwierzchowski, 2013, p. 18). The basic substantive criterion is the importance of a given variable in the description of the examined complex phenomenon (*e.g.*, according to experts' opinion). The formal criteria include the degree of variability and correlation of diagnostic characteristics. Variables that qualify for the set of diagnostic variables, in addition to having a significant impact on the examined complex phenomenon, should also be characterized by a high degree of differentiation and should be weakly correlated with each other (then they do not duplicate the information conveyed by other variables).

In the next step, the diagnostic variables are identified, *i.e.,* the nature of the impact of individual variables on the complex phenomenon is determined. In practice, this means dividing the set of diagnostic variables into the following three subsets: variables-stimulants (S), variables-destimulants (D), and variables-nominants (N).

Next, the diagnostic variables are normalized. Normalization aims to bring the values of individual variables to comparability (by getting rid of the units of measure and unifying the ranges of values assumed by the diagnostic characteristics) (Walesiak, 2016, p. 17).

In the article, in order to normalize the values of individual financial ratios, the zero unitarisation method (ZUM) was used. The advantage of this method is that it meets all of the postulates for the methods of normalizing diagnostic variables (Kukuła, 2000, p. 81) - it also allows the transformation of variables taking not only positive values, but also zero or negative values. In studies of the financial situation of enterprises, profitability indicators based on various levels of financial result (*e.g.*, operating profit, gross profit, net profit, *etc.*) may assume values from the set of real numbers ($x_{ij} \in R$). Variables normalized with the use of ZUM have a fixed range of values (contained within the range [0; 1]). The zeroed unitarisation method also allows the conversion of destimulants and nominants into stimulants. It is extremely important due to the fact that among the variables describing the financial condition of companies are financial indicators that are stimulants (*e.g.*, profitability ratios), destimulants (*e.g.*, debt ratios), and also nominators (*e.g.*, liquidity ratios).

The zeroed unitarisation method is based on the following stimulant evaluation formula:

$$z_{ij} = \frac{x_{ij} - \min_i x_{ij}}{\max_i x_{ij} - \min_i x_{ij}}, \text{ for } \max_i x_{ij} \neq \min_i x_{ij}, \quad X_j \in S, \qquad [1]$$

In the case of a destimulant, the normalizing formula is given by the formula below:

$$z_{ij} = \frac{\max_i x_{ij} - x_{ij}}{\max_i x_{ij} - \min_i x_{ij}}, \quad X_j \in D, \qquad [2]$$

The formula to transform the nominant into a stimulant is as follows:

$$z_{ij} = \begin{cases} \frac{x_{ij} - \min_i x_{ij}}{c_{0j} - \min_i x_{ij}} & for\ x_{ij} \le c_{0j} \\ \frac{x_{ij} - \max_i x_{ij}}{c_{0j} - \max_i x_{ij}} & for\ x_{ij} > c_{0j} \end{cases}, \quad X_j \in N, \qquad [3]$$

where:

c_{0j} – the nominal value of the variable X_j.

In the case of nominants with a range of nominal values $[c_{1j}; c_{2j}]$, the normalizing formula is:

$$z_{ij} = \begin{cases} \frac{x_{ij} - \min_i x_{ij}}{c_{1j} - \min_i x_{ij}} & for\ x_{ij} < c_{1j} \\ 1 & for\ c_{1j} \le x_{ij} \le c_{2j}, \quad X_j \in N. \\ \frac{x_{ij} - \max_i x_{ij}}{c_{2j} - \max_i x_{ij}} & for\ x_{ij} > c_{2j} \end{cases} \qquad [4]$$

As already mentioned, when using ZUM, the normalised variable Z_j always takes a value contained in the range [0; 1], while the original variable X_j can take any value.

Subsequently, a synthetic measure was constructed describing the financial condition of the enterprise in particular quarters of the period analysed. The article uses the following formula that aggregates normalized diagnostic variables:

$$Q_i = \frac{1}{k} \sum_{j=1}^{k} z_{ij} \qquad (i = 1,2, \dots, n), \qquad [5]$$

where:

k – the number of diagnostic variables (here: financial ratios),

n – the number of objects (here: time units, *i.e.,* quarters).

The above formula is classified as additive and patternless aggregate functions (Ostasiewicz, 1999, p. 119; Kukuła, 2000, p. 72). Formula [5] does not take into account weights, *i.e.*, it assumes that all diagnostic characteristics describing the examined complex phenomenon are of equal importance. When ZUM is used to normalize diagnostic variables, the above aggregation function allows to obtain a value of a synthetic variable contained in the range [0; 1]. The enterprise's financial condition is better, when the synthetic measure takes a value closer to one.

Findings

For the purposes of the study of the economic situation of the AZOTY SA company, 15 financial ratios were considered, characterizing four basic areas of the company's operations, *i.e.*, liquidity, debt, profitability, and operational efficiency. Four liquidity ratios were selected for the study (2nd degree coverage ratio, current liquidity, quick liquidity, and cash liquidity), four debt ratios (general debt, equity debt, long-term debt, and durability of the financing structure), four profitability ratios (return on equity - ROE, return on assets - ROA, operating profit margin, and net profit margin) and three performance ratios (receivables cycle, liabilities cycle, and inventory cycle). The financial ratios indicated above were selected on the basis of substantive criteria and they constitute a set of potential diagnostic variables.

In the next step, the fulfilment of formal (statistical) criteria was checked, *i.e.,* the potential diagnostic variables were analysed in terms of the degree of differentiation and correlation between individual variables. To assess the degree of differentiation of the variables, the coefficient of variation (V_j) and the coefficient of the relative amplitude of fluctuations (W_j) were calculated (Kukuła, 2000, p. 49). The article assumes a limit value of the coefficient of variation at the level of 10% and a limit value of the coefficient of relative amplitude of fluctuations at the level of 1.3. If the following conditions are simultaneously met:

$$0 \le V_j \le 10\% \ \ (j = 1,2, \dots, p) \qquad [6]$$

and

$$1 \leq W_j \leq 1{,}3 \quad (j = 1,2,\dots,p), \qquad [7]$$

where:

p – the number of potential diagnostic variables (here: financial ratios),

the variable X_j is eliminated from the set of diagnostic variables. In this article, all of the proposed diagnostic variables turned out to be sufficiently differentiated.

Subsequently, Pearson's linear correlation coefficients between individual pairs of potential diagnostic variables were calculated. Based on the indications of the correlation matrix, seven financial ratios were eliminated.

Finally, eight diagnostic variables were used to build the synthetic measure: ROA, long-term debt, durability of the financing structure, 2nd degree coverage ratio, cash liquidity, receivables cycle, liabilities cycle, and inventory cycle. Table 1 presents a list of the diagnostic variables accepted for the study, along with the determination of their nature (*i.e.*, the impact on the company's financial situation).

Table 1: List of the diagnostic variables after taking into account substantive and formal criteria

Ratio category	Ratio	Nature of the diagnostic variable
Profitability	ROA	stimulant
Indebtedness	Long-term debt	destimulant
	Durability of the financing structure	stimulant
Liquidity	2nd degree coverage ratio	stimulant
	Cash liquidity	nominant (0.2*)
Operational efficiency	Receivables cycle	destimulant
	Liabilities cycle	stimulant
	Inventory cycle	destimulant

** denotes the nominal value of the diagnostic variable, i.e., the value of the variable for which the level of the complex phenomenon is the highest.*

Source: own study.

After determining the nature of individual diagnostic variables (see Table 1), their values were normalized using the zeroed unitarisation method (ZUM).

The last stage of the construction of the synthetic measure included the selection of an appropriate formula for aggregating the normalized variables and the calculation of the value of the synthetic variable for individual quarters of the period analysed.

Figure 1 presents the dynamics of the financial condition - described by a synthetic measure - of the AZOTY SA company in the subsequent quarters of the period analysed. The values of the synthetic variable are normalized in the interval [0; 1]. The closer the value of this measure is to one, the higher the level of the complex phenomenon is (here it means that the financial condition of the company is better).

Fig. 1: Values of the synthetic measure for the AZOTY SA company in the period from the 2nd quarter of 2008 to the 1st quarter of 2020

Source: own study.

In the period analysed, the synthetic variable took values contained in the range [0.4332; 0.6731]. The AZOTY SA company had the worst financial situation in the last period, *i.e.,* in the 1st quarter of 2020, and the best - in the 4th quarter of 2011. The average quarterly value of the synthetic measure in the examined period was 0.5603. The analysis of the formation of the synthetic variable shows that the company's condition in the period covered by the study was subject to relatively small fluctuations (the variation coefficient amounted to 9.76%).

Summary

In this study, the financial condition of the company is presented using the ratio analysis and the synthetic variable, which is a tool for multivariate comparative analysis (MCA).

The conducted analysis showed great usefulness of the presented methods for the assessment of the financial condition of the enterprise. It is worth emphasizing that the use of a synthetic measure allows the assessment of the financial condition of an economic entity over time (the dynamic approach). The next step may be to develop a model of the internal structure of the analysed process and to determine the financial condition forecast for subsequent units of time. Based on this method, it is also possible to compare the financial condition of companies representing, for instance, a specific industry.

Universal and Regional Standards for International Legal Protection of Refugees- De Lege Lata And De Lege Ferenda Evaluation

Agata SZWED

University of Szczecin, Szczecin, Poland
agata.szwed@usz.edu.pl

Abstract

The aim of the article is to analyse and evaluate international legal protection of refugees at the universal and regional level, and on this basis to provide *de lege lata* comments and *de lege ferenda* postulates within the discussed scope. The hypothesis framed at the beginning of the article is a conclusion that the current standards for international legal protection of refugees do not ensure sufficiently effective protection to them. The key concept resulting from the subject of the paper is defined, followed by basic legal acts that create the standards for refugee protection, and then their evaluation is made. The analysis allows for the formulation and justification of conclusions regarding possible future changes in the applicable legislation. Two basic methods of legal science are employed in the article: dogmatic research method and legal comparison method. It can be concluded on the grounds of the conducted research that neither universal nor regional standards of refugee protection are sufficiently effective instruments for respecting the fundamental rights and freedoms of this group of people. The main drawbacks are that the Convention Relating to the Status of Refugees has not been adapted to the current global migration situation. The limitations of acts at regional levels and their often non-binding nature make it difficult to introduce uniform international procedures. The changes suggested in the article help to strengthen the level of protection of refugees and make an attempt to alleviate any negative effects in terms of the phenomenon of displaced persons.

Keywords: Refugees, International Refugee Law, International Law.

Introduction

The current largest proportion of forcibly displaced persons since World War II, comprising 79.5 million people, including 26 million refugees (UNHCR, 2020a), dictated the need to adapt the acts hitherto in force which compose international refugee law to the changing geopolitical situation. This migration crisis takes place not only in Europe, but also all over the world, since over two thirds of refugees come from merely 5 countries: Syria, Venezuela, Afghanistan, South Sudan and Myanmar (thus it comprises: the American, Asian and African continents). The aim of the article is to analyse and evaluate international legal protection of refugees at the universal and regional level, and on this basis to provide *de lege lata* comments and *de lege ferenda* postulates within the discussed scope. The hypothesis framed at the beginning of the article is a conclusion that the current standards for international legal protection of refugees do not ensure sufficiently effective protection to them, consisting in efficacious guarantee of fundamental human rights and freedoms. The term "standards for refugee protection" is understood in this article as the model of conduct adopted by a given entity (states-parties to relevant international agreements included in international refugee law, UNHCR or UNRWA office, as well as states-parties to multi- and bilateral international agreements concerning refugees) for the legal protection of refugees, and in particular to ensure fundamental human rights and freedoms for them. Depending on whether the activity within the discussed scope takes place at the universal or regional level (usually defined territorially in relation to continents) - it is possible to speak of universal or regional standards for international legal protection of refugees.

The conducted research will allow for the formulation and justification of conclusions regarding possible future changes in the current international legislation. The method of dogmatic research (examination of applicable law; the area of dogmatic-legal analysis will be limited to international legal acts related to the subject of the article) and the method of comparative law studies (examination of the similarities and differences in the mutual influence of legal acts constituting particular branches of international law) were adopted as the research methods.

Universal standards for refugee protection

Although the phenomenon of refugeeism has been known to mankind since the dawn of history, the legal and international protection of refugees has been functioning in the international community since the interwar period. Since then, it has undergone considerable evolution, consisting primarily in the development of actions undertaken by state authorities. They are grounded on international legal acts strengthening the establishment and enforcement of fundamental human rights and freedoms in relation to refugees. The universal standard for refugee protection is based on particular acts of international law operating at the universal level and included in international refugee law - i.e. Convention Relating to the Status of Refugees of 1951 (Geneva Convention) and the Protocol relating to the Status of Refugees of 1967 (New York Protocol) which modifies its provisions, as well as the Statute of the Office of the United Nations High Commissioner for Refugees (Statute UNHCR). The universal standard for refugee protection is also complemented by the activity of the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA), which, despite offering assistance to people from a specific region, has its source in the General Assembly of the United Nations (UNGA). The evaluation of the functioning of the universal standard for refugee protection comprises the studies listed below.

Geneva Convention and New York Protocol

The entirety of the universal standard for refugee protection was created around the analysis and interpretation of the definition of the term refugee from the Geneva Convention. The need for international protection emerges when an individual is outside his country of nationality and is unable to return there owing to threats. The threats that cause the need for international protection under the Geneva Convention include persecution on account of race, religion, nationality, membership of a particular social group or political opinion, although this catalogue does not exhaust all situations that force people to leave their current place of residence. International protection replaces domestic protection as the refugee's country of origin is unable or unwilling to provide it to that person. It should be taken into account that historically, at the time the Geneva Convention was signed, the objectives of protection were to prevent forced repatriation - resulting from border changes as a result of world wars - and to facilitate repatriation when it was possible and desirable (cf. p. 2d of the UNHCR Statute of the Office). These voluntary repatriations did not turn out to be a sufficient means to fully resolve the refugee issue, and what is more - those who remained abroad did not integrate quickly and effectively through naturalisation with the host society (Skran, Daughtry 2007, p. 27). In view of the above and taking into account the fact that forced repatriations, similar to those in Europe after World War I and II, do not rather occur anymore, it has become necessary to develop and provide refugees with temporary legal protection. At present, the standards for protection concentrate on its objective, which is to ensure or restore refugees' dignity, their sense of security and fundamental human rights. The scope of protection granted to refugees under the Geneva Convention and the New York Protocol is very broad and varied. It includes the guarantee of the rights of the first, second and third generation of human rights, in a form significantly expanded in comparison with the Universal Declaration of Human Rights of 1948 adopted 3 years earlier. Making access to particular rights equal (in the same way as citizens or other foreigners), including the freedom of religious practice, the right to free access to courts, the right to care and social services, rights in the field of labour legislation and social security - betokens a high level of universal standard for protection. It is exactly this equalization of refugee rights with the catalogue of rights held by citizens or other foreigners that over the years has turned out to be one of the most problematic consequences of adopting the convention and granting refugee status. The states have elaborated a broader catalogue of forms of granting international protection, going far beyond the classification used right after World War II: refugee/asylum seeker/repatriate/foreigner. The concept of axiological legal differentiation of citizens and foreigners and the resulting differences significantly affect the method of selecting the form of protection granted to foreigners, and thus the

standard for protection of these people. The protection granted to refugees under the Geneva Convention and the New York Protocol seems to be one of the most far-reaching and imposing a wide range of positive obligations on states to provide refugees with a universal standard for protection.

A significant drawback of the provisions of the Geneva Convention is that it regulates the subject of its protection very restrictively. The threats that cause the need for international protection under this convention include persecution on account of race, religion, nationality, membership of a particular social group or political opinion, although this catalogue does not exhaust all situations that force people to leave their current place of residence (which may also include threats to life, security or freedom owing to generalized violence, external aggression, occupation, foreign domination, internal conflicts, massive violations of human rights, serious ecological disasters or other circumstances which seriously disturb public order). Therefore, the development of the refugee law at regional levels should be positively evaluated, as they have significantly broadened the definition of the term refugee and, consequently, have extended protection to a greater number of people.

The lack of a special international court to handle individual complaints related to violations of the provisions of the Geneva Convention only should be interpreted as a significant gap which needs to be bridged. The activity of such a court would contribute to the harmonisation of the interpretation and application of the Geneva Convention, as well as to the increase of efficiency and implementation of its provisions. It would also eliminate the dichotomy of the established line of judicial decisions in refugee cases noticeable at the level of regional courts. However, the establishment of a body that examines the provisions of the Geneva Convention in an impartial and independent manner would require general consent of states, but reaching a consensus on the issue of refugeeism, which triggers so many political, social and economic controversies and with a great number of international jurisdictional bodies that already operate, seems to be unlikely in the current geopolitical situation.

UNHCR

The UNHCR has been entrusted with the responsibility for the application of the provisions of both the Geneva Convention and the New York Protocol (Article 35 of the Geneva Convention and Article 2 of the New York Protocol). UNHCR was established in order to provide international protection to refugees under the auspices of the United Nations, to seek permanent solutions for their problems and to assist governments and non-governmental organizations in carrying out the voluntary repatriation and assimilation of refugees (p. 1 of the UNHCR Statute). The essence of UNHCR has been given by virtue of the provisions of the UN, so the character of its work and the protection offered should be completely non-political and humanitarian (p. 2 of the UNHCR Statute). During almost 70 years of its activity, UNHCR has granted protection to hundreds of millions of people. Over the years, it has developed its activities, most importantly - towards covering more people than just those eligible for protection under the Geneva Convention. The Office has significantly extended the circle of persons to whom it has started to provide protection - it is now doing so not only to victims of persecution, but also to people who are unable to return to the territory of their own country owing to the threats to their life, physical integrity or freedom (see UNHCR 2016). The transference of competences that coordinate the application of the two most important legal acts constituting the foundations of international refugee law to an external, independent body should be assessed positively. It was the role of UNHCR in the form of an initiator and coordinator of the international community's activity in order to deal with the problem of refugees that had a significant impact on the functioning of the entire legal scholarship of international refugee law, on the creation of provisions on the protection of refugees in internal legislations, on the practice of applying the definition of a refugee and the catalogue of his rights under the Geneva Convention by public administration bodies, and consequently on national judicial decisions concerning refugee cases (Gilbert, 2016, pp. 623-636). The informative and popularizing function of the office made it possible to create the main world discussion forum on mass resettlement of people, and thus it became a key tool for establishing intergovernmental cooperation and cooperation between non-governmental organizations. UNHCR thereby developed aid to refugees far beyond the sole monitoring of compliance with the Geneva Convention.

UNRWA

In the case of the second UN organization, UNRWA, the nature of its protection should be depoliticized and humanitarian, aimed at helping refugees as victims of the Israeli-Palestinian conflict. UNRWA is the only agency set up by the UNGA with a separate refugee protection mandate from that of UNHCR, and which focuses on providing protection to persons affected by a specific armed conflict in a territorially defined location. Today around 5.5 million Palestinians are protected by UNRWA, which operates in Syria, Lebanon, Jordan, the Gaza Strip and the West Bank (UNRWA, 2020, pp. 11-21).

Primarily, the agency's protection was granted to persons residing in Palestine from June 1, 1946 to May 15, 1948, who suffered in the 1948 war. Currently, it is provided not only to persons who have been granted refugee status through an individualized procedure, but also to the heirs of such persons, in a hereditary way. Furthermore, protection by UNRWA may also be obtained by persons who were willing to suffer a considerable loss for reasons related to the 1948 conflict in Palestine and by their family members (Sekulow, 2018). UNRWA does not consent both to the definition of the term refugee and the method of protection regulated by the Geneva Convention. UNRWA offers protection to strictly defined persons who come from a strictly defined territory, which can be perceived significant narrowing in the level of provided services in comparison with UNHCR. The high cost of financing UNRWA operations (around 1 billion dollars annually) and, in a sense, the escalation of the Israeli-Palestinian conflict meet with strong criticism. UNRWA was by definition supposed to be an agency established temporarily, but its mandate has been prolonged every few years since the mid-twentieth century on the grounds of the UNGA resolution. Despite criticism, for nearly 70 years it has been continuously providing basic services to Palestinian refugees and working to stabilise the situation of people covered by the mandate in the region.

Regional standards for refugee protection

Regional standards for the protection of refugees will be decoded from specific international texts with a regional scope - focusing primarily on the analysis and evaluation of the impact of the activities of international organizations in this area. The legal bases for regional cooperation concerning refugee protection emerged chronologically after the Geneva Convention. The Convention is therefore a starting point for these bases, which has been systematically developed at regional levels.

European Level

The European standard for the protection of refugees is concentrated on the activities of the European Union (EU). Granting the appropriate status to every third-country national standing in need of international protection in one of the Member States is moulded by the EU's asylum policy. The asylum policy of the EU is conducted within the area of freedom, security and justice, and thus lies within the shared competence between the EU and the Member States (Article 4 of the Treaty on the Functioning of the European Union (TFEU)). The legal bases for the functioning of asylum policy within the EU are founded in primary legislation in Article 67(2), Article 78 and Article 80 TFEU and Article 18 of the Charter of Fundamental Rights. The objective of this policy was to grant the appropriate status to every third-country national standing in need of international protection and to ensure compliance with the principle of non-refoulement. EU secondary legislation includes a number of directives and regulations, in particular: Directive 2011/95/EU of the European Parliament and of the Council of 13 December 2011 on standards for the qualification of third-country nationals or stateless persons as beneficiaries of international protection, for a uniform status for refugees or for persons eligible for subsidiary protection, and for the content of the protection granted (qualification directive), Regulation (EU) No 604/2013 of the European Parliament and of the Council of 26 June 2013 establishing the criteria and mechanisms for determining the Member State responsible for examining an application for international protection lodged in one of the Member States by a third-country national or a stateless person (Dublin III regulation), Directive 2013/32/EU of the European Parliament and of the Council of 26 June 2013 on common procedures for granting and withdrawing international protection. The aforementioned legal acts have set the standard of protection for refugees in the EU Member States and constitute the basis of procedures related to the admission of persons applying for EU aid. It

was reinforced by virtue of the qualification directive that the recognition of refugee status is a declaratory act, and at the same time the provisions of the Geneva Convention were confirmed (and developed). The scope of international protection guaranteed by the directive includes: protection from refoulement, access to information on rights and obligations in a language understood by a refugee, maintaining family unity, residence permit, providing travel documents, access to employment and education, access to procedures for recognition of qualifications, social welfare and healthcare, access to accommodation, freedom of movement, access to integration facilities and assistance in voluntary repatriation. The Dublin III Regulation laid down mechanisms and criteria for determining the Member State responsible for examining an application for international protection - the first Member State in which the application for international protection was lodged shall be responsible for examining it. It is evident that lodging an application for international protection only in the first safe country safeguards that those persons` stay will not be classified as illegal. The rest of legal acts contributed to determining common procedures for granting international protection and the regulation of the conditions of the stay of applicants for international protection in a given Member State pending the examination of the application. The Court of Justice of the European Union exercises judicial control over compliance with the provisions resulting from the acts forming the common asylum policy.

African Level

Africa is a continent that is a source of escape rather than a destination for persons who were forced to leave their current place of residence. Large population movements in Africa, resulting from numerous wars in colonial and post-colonial times, caused intense activity of states and institutionalisation in the area of asylum policy. At the African level, the protection of refugees is first and foremost carried into effect by the African Union through the implementation of the provisions of the 1969 Convention governing the specific aspects of refugee problems in Africa. This convention significantly broadened the definition of the term refugee resulting from the Geneva Convention, and thereby contributed to the protection of a greater number of people - i.e. not only victims of persecution, but also victims of external aggression, occupation, domination or events seriously disturbing public order in either part or the whole of the country of origin. The catalogue of rights granted to refugees is generally narrower than that granted by the Geneva Convention or the qualification directive. The protection of refugees in Africa has been strengthened by the adoption of regional international documents in the area of human rights: the African Charter on Human and Peoples' Rights of 1981, the African Charter on the Rights and Welfare of the Child of 1990 (Article 23 – Refugee Children) and the Protocol to the African Charter on Human and Peoples' Rights on the Rights of Women in Africa (Article 4(2)(k)). Adjudication on human rights on the African continent has been entrusted to the African Court on Human and Peoples' Rights, as well as to a quasi-judicial authority such as the African Commission on Human and Peoples' Rights. International judicial protection of refugees is carried into effect in a derivative manner - as in Europe - by breaching provisions established by an agreement generally included into human rights, and not by an agreement strictly regulating refugee legislation.

American Level

At the American level, not even one binding international agreement concentrating on the issue of refugeeism has been signed. Such a standard has been developed by the activity of the Organization of American States. It is grounded on the adoption of a series of non-binding resolutions, exhorting only to the signing of the Geneva Convention and the New York Protocol (without indicating the catalogue of refugee rights or obligations, or the procedures for their admission). When trying to indicate the standard of refugee protection in North and South America, one may only underline the safeguards created by the American Convention on Human Rights of 1969 - as a convention included in the branch of international human rights law - and the application of judicial control of its provisions in the form of the Inter-American Court of Human Rights. Undoubtedly, a certain standard of treatment of refugees on both American continents is set by the Cartagena Declaration on Refugees of 1984, the provisions of which were incorporated by several of its states-parties (UNHCR, 2014, p. 2). It is worth emphasizing that this declaration prompts observance of the right to asylum and the principle of non-refoulment.

Asian Level

Two factors render the protection of refugees at the Asian level difficult: Asia is the only continent in which there is no single international organisation associating all countries, and more than half of them is not a party to the Geneva Convention or the New York Protocol. The elaboration and implementation of refugee treatment standards are therefore based first and foremost on national regulations or on the regulations of bi- and multilateral international agreements. The particularism of the sources of refugee protection in Asia precludes indication of uniform regional legislation in this scope. In the case of the Asian continent, the lack of an organization which would associate all states also hinders the adoption of any regional human rights convention, the observance of which could be controlled by an international judicial authority (as is the case in Europe or even in Africa). This situation in principle also impedes precise indication of the rights and freedoms that refugees could demand. The protection of refugees therefore remains first and foremost at the level of national legislation. Diverse regulations in this area complicate cooperation of states with specialised UN agencies.

Arab level

Unfortunately, the Arab Convention on Regulating Status of Refugees in the Arab Countries of 1994 adopted by this organisation has never entered into force. Therefore, the 2004 Arab Charter of Human Rights remains the only international document in this respect. There is no international court in the Arab region that ensures proper observance of the LAS' activity or even one convention on human rights. Due to the lack of judicial control in this scope, the protection of human rights - including refugees - remains only illusory. In practice, the UNRWA mandate has become the only real form of protection in the Arab region.

Summing up the regional standards for the protection of refugees, one might say that they are based first and foremost on the adoption and promotion of the provisions of the Geneva Convention and the New York Protocol, as well as conventions and declarations in the area of generally understood international human rights law. The determinant of the standard of protection on particular continents involves the needs caused by historical mass movements of the population, and therefore the development of a standard of protection adequate to a given existing situation. As a result, there are differences between the standard of treatment of refugees in Europe (mainly grounded on binding documents, strictly related to the provisions of the Geneva Convention and the New York Protocol), in Africa (binding and non-binding documents), America and Asia (non-binding documents, high particularism of protection agreements concerning refugees) and Arab states (a binding convention, but deprived of judicial control, and thus de facto no real legal protection of refugees). The influx of refugees on particular continents is not spread evenly. According to UNHCR statistics, among the 24 million refugees, 27.3% are in Europe, 26.4% in Africa, 17.8% in North and South America, 17.4% in Asia and 11% in the Arab region (UNHCR, 2020b, p. 19). More than half of the registered refugees are therefore located in Europe and Africa, which is why the most advanced binding state cooperation in the form of refugee protection occurs in these areas. Thus, the differences in the standard of refugee protection depend on the legal character of the acts adopted in this regard, and consequently on the manner of their enforcement and establishing judicial control over them in the form of not only national but also international tribunals. States have obligations towards refugees resulting not only from documents classified as international refugee law, but also from international human rights law, international humanitarian law and the so-called general international law in the form of, above all, respecting the principle of non-refoulment, treated in the legal writings as customary law.

Conclusion

The conducted research allowed confirmation of the initial hypothesis framed at the beginning. The hitherto existing legal regulations on the international legal protection of refugees do not constitute an exhaustive and sufficient catalogue of instruments for the protection of this group of persons, as evidenced by, for example, the statistics and the scale of the problem of refugeeism in the world. States and international organisations are encouraged to cooperate closer in order to take into account all the needs of refugees, to guarantee them their status on humanitarian grounds (regardless of the reason for changing the country of their previous stay) and to effectively hold accountable the states

that contribute to the development of the refugeeism issue. The universal standard of refugee protection - founded on the Geneva Convention and the New York Protocol and the activities of UNHCR and UNRWA - undoubtedly affected the functioning of both regional and national legal bases of the protection in question. The development of regional cooperation between states and adoption of binding refugee documents, (where they are still in short supply, especially in the American, Asian and Arab regions) is turning out to be the most urgent need to secure the refugee situation. Currently, the protection of refugees focuses on safeguarding and efficient observance of human rights, but it works best when it is in line with the values approved by international law - such as peace, state security and international security, and promotion of sustainable development. If the preservation of these values took precedence over the particularistic aspirations of state authorities, it would prevent the generation of a wave of millions of refugees around the world.

Abstract

This paper examined the influence of female directors on boards on corporate social performance of listed deposit money banks (DMBs) in Nigeria. This was done to assess the attributes of the female directors (composition, expertise, independence) to determine whether they significantly contribute to decisions that relates to corporate social responsibility expenditure. The study comprises of 14 banks listed on the Nigerian Stock Exchange as at 31st December 2018. A sample size of 10 banks was selected using the Purposive Sampling Technique. Data were obtained from published annual reports of selected banks for 2010 to 2018. Descriptive statistics and Feasible Generalized Least Square regression (FGLS) were used to analyse data collected. The findings revealed that female board composition, female board expertise and female board independence had a statistically significant positive effect on corporate social responsibility expenditure. The study concludes that the presence of women is significant in a board. However, the financial as well as social and environmental expertise of the women coupled with a working environment that will promote independence of the women is also paramount. It is therefore recommended that banks should not limit its focus to female representation on the boards alone, but should ensure that the quality of women selected is considered to promote better social performance.

Keywords: Female board composition, female board expertise, female board independence, corporate social performance.

Introduction

Corporate social performance became pronounced in the academic and professional domain after the agitation for global best business practices in line with the sustainability campaign and green initiatives. The agitations were driven towards compelling companies to have a human face in their daily activities by engaging in business activities that will preserve the social state of the human and the naturalness of the environment. These arguments were centered on the sustainability theory, green accounting among others. The corporate social performance aspect of this theory centered mostly on corporate social responsibility (CSR) as well as other non- financial parameters for evaluation of company performance. The adoption of the philosophy of corporate social performance depends largely on the ideologies of the top management of each company, particularly the board. This is because all activities of a company in terms of management, policies, strategies and vision, centers around the decision taken at the board. If there is a deficiency in the board, it will flow down to the day to day activities of the company which will have a negative ripple effect on the economy. It is based on these premise that various studies were conducted to determine how various board dynamics influence corporate social responsibility of firms.

The findings of previous studies revealed that dynamics such as board attributes, ownership structure, board citizenship, among others are some of the factors that influence social performance of firms. From the analysis of the previous studies conducted on board attributes, most studies found a statistically significant relationship between

female gender and social performance of the firms (Dienes and Velte, 2016; Betz, O'connell, & Shepard, 2013; Ciocirlan & Pettersson, 2012). From the various assertions, it will be logical to opine that the presence of women on corporate board increases social welfare activity, and thereby improve on the quality of their CSR performance.

In as much as this holds true, the circumstance surrounding the women on the board will determine the extent that they will contribute to the quality of the company. Firstly, the composition of the female on the board; the activities of a board in decisions and reaching consensus dwell on numbers. The consensus is reached based on the number of votes. If the men on the board outnumbers the women there is no likelihood that they will work to benefit the company because they have been limited by the deficiency of their numbers (Konrad, Kramer & Erkut, 2008). This therefore imply that it is not enough to have women on the boards, the number of women on such board is noteworthy. The editorial board of Business day (2020) stated that according to the report of Mckinsey global institute, it was observed that the progress towards gender equality have stalled and Africa women lag behind their sisters in most other regions.

Secondly, the expertise of the female in the board is not limited to educational background, but also the CSR related managerial experience that will add value to the CSR drive of the management (Yusoff,2010). Most studies focused on the accounting and financial knowledge of the female directors as embedded in their educational background; the recent evolution in the economic environment, is an indication that much more is expected to maximize the worth of a director. Thirdly, the independence of the female on board; submissions of various studies showed that board independence significantly influences board effectiveness and control of agency cost (Patelli & Prencipe, 2007; Michelon & Parbonetti, 2012). The female gender is caught in the web of independence deficiencies because of their insecurity perspectives and high subjection to the male gender across all spheres of life. Most women in Nigeria due to financial incapabilities and political power, found seats on companies' boards with the help of their male counterparts and as such their decision are usually subjective.

Although most studies have upheld the significance of women on CSR, but based on the forgoing, it is evident that it is not enough to have women on the boards as proposed by previous studies, but there is need to x-ray the attributes of the women on the board of directors to determine whether they significantly contribute to decision making, especially as it relates to social performance. This study focusses specifically on the boards of the listed Nigerian deposit money banks because it is one of the sectors that has significant contribution to the capitalization of the Nigerian stock market.

The broad objective of this study is to examine female directors on board and corporate social performance. The study focused on three key component of female board members traits; these includes, female directors board composition, female directors' expertise, and female directors' independence.

The paper is structured into five separate headings and other subheads; these covers the introductory aspect of the study, review of literatures and hypotheses development to clarify concepts, show interactions between variables in line with previous studies. The third heading is the explanation of data and methods used in the study. The analysis and discussion of findings is explained in the fourth heading and finally, the conclusion and recommendations are outlined in the fifth heading.

Literature Review and Hypotheses Development

The definition of CSP centered mostly around the definitions in line with Wood's CSP model. Wood (1991) define CSP as "a business organization's configuration of principles of social responsibility, processes of social responsibility and policies, programs and observable outcomes as it relates to the firms' societal relationships". Jiang and Yang (2015) also stated that CSP can be evaluated by assessing the social responsiveness processes of the firm to determine how it influences their policies and action plans regarding its actualization. From the definitions it is obvious that CSP has to do with the firms developing a process that will promote their interactions with stakeholders to ensure an outcome that will be sustainable. This therefore imply that CSP cannot be discussed in isolation of corporate social responsibility (CSR) in interacting with stakeholders, the firms must ensure an outcome that will positively impact the social and environmental aspects, which depends largely on CSR activities of the firm (Odetayo, Adeyemi & Sajuyigbe, 2014). This study measured CSP as the total CSR expenditure of a company on its host communities and other philanthropic spending in a given year.

CSR activities of an organization stems from the policies and ideologies of the firm which can be driven by the philosophy of the owners of the company which is actualized by the organs of the company which comprises of the board of directors and management. This development made the activities of the board a relevant aspect in the discus of CSP and CSR. The strategic role of the board involves approving, monitoring, and reviewing strategies at one end, to a leadership role of establishing the goals, values and setting direction at the other end (Ingley & Vander Walt,

2001). This therefore imply that the value attributed to a company in terms of its business practices, depends largely on the caliber of individuals that are seated on their boards (Daily, Dalton & Cannella, 2003). This study also shares the views of previous authors in this direction, by x-raying the individual traits of the female on the boards to reveal the value they add to the company CSR practises from three focal perspectives, which are; composition, expertise and independence.

Theoretical Underpinning

This study is based on the assumptions of the agency, stakeholders and gender socialization theories. It is necessary to hinge this study on a combination of theories because of the peculiarity of the study; and the fact that the component of the study is independently and jointly related. The agency theory, as developed by Jensen (1976) assume that the relationship in a company is likened to principal and agent, where the principal is the owner (provider of capital) while the directors are likened to agents that perform duties according to the mandate of the owners. Here, the directors are expected by statue to perform their duties solely in the interest of the owners. The theory however stated that because of conflict of interest, agency problem arises when the agent pursues his personal interest at the detriment of the interest of the principal which usually leads to the owners incurring agency cost (Sundaram & Inkpen, 2004). This theory applies to this study because the board of directors are the agents that perform a strategic role that involves approving, monitoring, and reviewing strategies at one end, to a leadership role of establishing the goals, values and setting direction at the other end (Ingley, Van der Walt, 2001). This therefore imply that the value attributed to a company in terms of its business practices, and the extent of agency cost they will incur, depends largely on the caliber of individuals that are seated on their boards (Daily, Dalton & Cannella, 2003).

The stakeholder theory developed by Freeman (1984) is a theoretical perspective that argue that companies should look beyond the relationships that exists between owners and managers and consider other individuals or groups that may be affected by the activities of the firm which translates them into stakeholders (Freeman & McVea, 2001). The stakeholder theory birthed the corporate social responsibility practices of firms globally and it has become a yardstick for performance evaluation of companies despite the fact that it is regarded as a philanthropic and voluntary action. The significance of this concept in the evaluation and valuation of firms have made it become part of companies' strategic plan; which is part of the mandate of the board of directors. This study therefore predicts that the extent of corporate social performance of a firm is largely determined by the attributes of its board members. The issue of attributes made the injection of the gender socialization theory necessary. Silic-Micanovic (1997) define gender socialization as the process where human in the course of their social interactions are moulded and shaped in culturally appropriate image of femaleness and maleness. The ideologies of gender socialization emanated from the family system where a child is introduced to the world and the expectation of their gender demands (McHale, Updegraft, Helms-Erikson & Crouter, 2001). The study therefore speculates that the peculiarities of the moulding of the female gender can have a significant influence on their relationship with the principal as agents, as well as their relationship with other individuals as stakeholders.

Female board composition and Corporate social performance

Bhagat and Black (2002) describe board composition as a reflection of various levels of heterogeneity. Based on the agency theory and resource dependency theory and the corporate governance literatures, board composition is measured as the ratio of non-executive to executive board members and the number of directors on a firm's board. This study however modified the measurement by narrowing it down to the female on the board based on the objective of this study. Female board composition is therefore measured in the context of this study as the number of women on company boards in proportion to the total number of directors on the board.

Most studies conducted in developed and developing countries including Nigeria (Pucheta-Martinez, Bel-Oms & Olcina-Sempre, 2018; Cook & Glass, 2017; Deschenes, Roubacar, Prud'hommie and Ouedraogo, 2015; Garba & Abubakar, 2014); confirmed that the number of women on board significantly affect their social responsibility practices. Other studies conducted on non-financial evaluation also revealed that women as part of board of directors has significant impact on corporate philanthropy of firms (Valls, Martinez, Rambaud & Parra-Oller. 2019; Fodio & Oba, 2012). Studies conducted by Stephenson (2004) and Fernandez-feijoo *et.al* (2012) also assert that boards with more women has significant effect on CSR disclosure. Stephenson (2004) however made a clause to his findings that it was boards that had up to three women on its board that had significant effect.

There was divergent submission in the study conducted by Colakoglu, Eryilmaz and Martinez-Ferrero (2020) after enquiring into the antecedents of board diversity on corporate social responsibility using the biggest Turkish companies as focus. It was found that the ratio of female and foreign board members does not have any significant

effect on CSR performance. This finding shows a drift from the normal trend regarding female directors on board. Similarly, in a study conducted on U.S firms, Manita, Bruna, Dang & Houati (2018) they also affirmed that there is no significant relationship between gender diversity and environmental, social and governance. Kyaw, Olugbode and Petracci (2017) in a study conducted on CSR across industries and countries, found that although there is a positive effect between gender diversity and CSR across industries, but the effect is more pronounced for firms in emerging markets. The inconclusiveness of findings and scepticism that still exists on yielding to policy of increasing the number of female directors on board in developing countries, including Nigeria has further increased the uncertainties. Based on these, it is therefore hypothesized that:

H_{o1}: *Female board composition does not significantly affect corporate social performance of listed DMBs in Nigeria*

Female Director Expertise and Corporate social performance

Stakeholders are more interested in a board that comprise of members that have skills, attributes and dynamics to respond to changes in business models (Barka & Dardour, 2015). Although education has ability to drive the value system and perspectives of an individual, the degree of exposure and experiences is also required to address peculiar situations such as social and environmental concerns. Although the previous studies have measured expertise of directors on the accounting and financial knowledge of the directors (Yusoff, 2010; Dienes & Velte, 2016); this study however make a leap to incorporate the social and environmental works experience of the female on the boards. The measurement is done using dummy variable of 1 and 0. If the company board have up to 3 female directors that meet the criteria of accounting or finance experience with 8years environmental and social works experience, it is allotted 1, if not, 0.

Board expertise has been upheld in previous studies as one of the characteristics of board members that affect performance. Yusoff (2010) found in a study conducted on Malaysian board that knowledge and educational qualifications are vital components that determine the effectiveness of the boards. Harjoto, Laksmana and Yang (2019); Dienes and Velte (2016); and Yusoff and Amrstrong (2012) also supported the position in various studies conducted as stated that financial expertise is the most required skill required of board members to influence CSR performance. Jizi, Salama, Dixon and Stratling (2014) however revealed that board members financial knowhow was indifferent to CSR reporting. The submissions on the significance of educational and financial expertise on CSP from previous studies seem inconclusive. Also, the submission of Jizi *et.al* (2014) is an indication that the knowledge of the female director regarding social and environmental issues should also be considered alongside the educational and financial expertise. This assertion is based on the premise that financial expertise only is inadequate to influence CSR reporting. The hypothesis is stated thus:

H_{o2}: *Female Director Expertise does not affect corporate social performance of listed DMBs in Nigeria*

Female Director Independence and Corporate social performance

The ideology of board independence in the code of corporate governance is a call for majority of the board members to be independent from the company. It is however submitted that mere compliance with the code is not enough if the board members fail to maximize their independence effectively (Sharifah, Syahrina & Julizaerma, 2016). The female gender has lots of peculiarity when it relates to socialization and interaction with people. This peculiarity is well explained in the gender socialization theory, which is the process where individuals are taught how to socially behave in accordance with their assigned gender which is assigned at birth based on their biological sex. This psychological underpinning calls for need to examine the female directors on boards to ensure that their independence can have significant influence on company social performance. Board independence is mostly measured in terms of the proportion of non-executive directors to total directors on the board (Das, Dixon and Michael, 2015). So, in a bid to assess the level of independence of the female on board, this study measured female director independence as the percentage of female non-executive directors in the total non-executive directors sitting on a company board. Where the percentage is above 25% FDE = 1, otherwise, FDE = 0

According to previous studies, a positive relationship exists between board independence and corporate social performance (García-Sánchez & Martinez-Ferrero, 2018; Mallin, Michelon & Raggi, 2013; Jo & Harjoto, 2012). There was a clause in the study conducted by Ortas, Alvarez & Zubeltzu (2017) on the effect of firm board independence on corporate performance using the meta- analytic approach. The study revealed that there is a positive association between board independence and CSP but it is stronger in civil law countries; and the strength of the influence varies significantly in different market condition. Leung, Richardson & Jaggi (2014) studied board independence and firm performance with relation to family ownership concentration in Hong Kong. It was found that board independence does not have association with firm performance in family firms, but have positive relationship

with non-family firms. Fitriya, Fauzi & Locke (2012) showed that there was a negative and significant association between non-executive directors and firm performance. Michelon and Parbonetti (2012) also found that there is no relationship between independent directors and CSR disclosure among US and European firms. The study conducted by Ponnu & Karthigeyan (2010) in Malaysian listed firms, however found that there was no association between the variables. The inconsistencies in the submission regarding board independence is an indication that there are underlining factors that determine the independence of directors. The hypothesis is therefore stated as

H_{o3}: there is no significant association between female board independence and corporate social performance of listed DMBs in Nigeria

Data and Methods

Ex-post facto research design was applied to examine how female directors on board influence the corporate social performance of listed deposit money banks in Nigeria. The study selected a sample size of 10 out of the population of 14 listed deposit money banks as at 31st December 2018 using the Purposive Sampling Technique to purposively select banks that have not merged or discontinued operation during the period of the study. Data were obtained from published annual reports of selected DMBs for 2010 to 2018. The base year of 2010 was selected because of the visibility of the drive for gender equality, as well as social responsibility of Nigerian firms at that time (UNPD, 2010; Ifemeje & Ikpeze, 2012; Daubry, 2020). This is also the rising moments for banks in Nigeria after the global recession period. Data were analysed using descriptive statistics and panel regression analysis. The descriptive statistics shows the mean, standard deviation, minimum and maximum values including observations; tests were also conducted to determine the viability and reliability of data gathered before regression was done. The Hausman test helped to decide on the model that fits for interpretation between the fixed and random effects models.

The model of this study was specified to show the nexus between variables in line with similar studies that were carried out in the study area. This study focussed on the diversity of the female on the board only; The study modified models stated in studies conducted by Colakoglu, Eryilmaz & Martínez-Ferrero, 2020; Gennari, 2016; Fodio & Oba, 2012) to incorporating only the dynamics of female directors on board in line with agency, stakeholders and gender socialization theories. The model is stated thus;

Functional model:

CSP =*f*(FBC, FDE, FDI)
Operational Model
$CSRExp_{it} = \beta_0 + \beta_1 FBC_{it} + \beta_2 FDE_{it} + \beta_3 FDI_{it} + U_{it}$ ……*equation 1*
Where:
CSP = Corporate social performance
CSRExp = Corporate social responsibility expenditure
β_0 = Intercept
β_1- β_3 = Coefficient of the independent variables
FBC = Female board composition
FDE = Female director expertise
FDI =Female director independence
μ = Error term of firm
$_{it}$ = 'i' in period 't'
The *a priori* expectation based on literatures reviewed and theories are as follows, $\beta_1 > 0, \beta_2 > 0, \beta_3 > 0$.

Data Analysis and Discussion of findings

Descriptive Statistics

The descriptive statistics result in table 1 shows that on average, listed banks spend a total of ₦398m on CSR expenditure; with a maximum of ₦307m and a minimum of ₦774,000. The outcome of the descriptive statistics indicates that on average firms in the deposit money banks have a 17.2% of female representation on the board with a minimum of no female representation on the board and a maximum of 38% female representation on the board of directors. These statistics indicate that the female gender is still marginalized on the boards. The maximum of 38% is an indication that the female on the board cannot have a strong voting power when issues are discussed on the boards. On the average, the proportion of the female directors on board is significantly below 20%. This presentation therefore

imply that a woman cannot perform on the board in terms of voting right without the contribution of their male counterparts.

Furthermore, the descriptive statistics result shows that female directors with accounting expertise and social and environmental works experience are represented on some boards which is measured by 1 while some board have no female with such expertise on the board which is represented by 0. The mix in the observation is an indication that not all board of deposit money banks in Nigeria have female with accounting and financial knowledge coupled with social and environmental works experience. Also, the result show that some board have female independent directors who comprise of 25% of the entire board which is represented by 1 and that some board have do not female independent directors who comprise of 25% of the entire board which is represented by 0.

Table 1: Summary of Descriptive Statistics

Variables	Observations	Mean	Std.Dev.	Minimum	Maximum
CSRExp	90	3.98e+08	4.90e+07	774000	3.07e+09
FBC	90	.1723333	.057	0	.38
FDE	90	.7222222	.4504125	0	1
FDI	90	.5854444	.3991709	0	1

Source: Authors' Computation using STATA13, (2020).

Correlation

The correlation matrix shows the relationship between variables. The result also shows the relationship that exists between the independent variables and further shows symptoms of multi-collinearity if any. The result obtained shows that there exists a relationship between the dependent variable and the independent variables which signifies that the independent variables can affect the dependent variables. The independent variables are also associated with female board composition and female director expertise having a strong relationship (0.7325) which might imply issue of multi-collinearity. The symptom of multicollinearity may be because the FDE and FDI are indicator variables that represent categorical variables that have two categories. However, issue of multi-collinearity will be determined using Variance Inflation Factor (VIF). The VIF result show a mean of 1.96 and all of the individual variables have values less than the threshold of 10. This imply that it is safe to retain the variables as they cannot affect the outcome of the regression result.

Table 2: Correlation Matrix

	LogCSR	FBC	FDE	FDI
CSREXP	1.0000			
FBC	-0.1555	1.0000		
FDE	-0.2576	0.7325	1.0000	
FDI	-0.2816	0.4692	0.4772	1.00000

Results and Discussions

The Feasible Generalized Least Square regression (FGLS) was used for interpretation of tested hypotheses after conducting all relevant tests as shown in table 3. After conducting the Hausman test to determine the best model to interpret between the fixed effect and random effect model, the test result showed that the random effect is the most appropriate. However, the Breauch Pagan Langangier Multiplier (LM) Test conducted to determine the most appropriate between the random effect model and the pooled OLS, showed a significant LM test result (0.000) which signifies that the random effect model should be interpreted. However, the significant result of the Breauch Pagan Langangier Multiplier (LM) Test is an indication of the presence of heteroskedasticity which made the result invalid and as such a need to correct for heteroskedasticity. This heteroskedasticity can be corrected by running and interpreting the Generalized Least Square or the Feasible Generalized Least Square result. The Feasible Generalized Least Square result was however selected in this study because the Cross-Sectionals in the data outweighs the time series.

The model of the study is statistically significant at 5% which is indicated by a Prob >; F value of 0.016 and a Wald Chi^2 of 15.27. This clearly indicate that female directors on board jointly has a significant effect on CSR expenditure. It was revealed from the result obtained that having more female representatives on the board of directors have a positive effect on CSR expenditure and this is statistically significant at 5%. The finding of this study corroborates previous studies conducted in various countries including Nigeria (Garba & Abubakar, 2014; Deschenes, Roubacar, Prud'hommie & Ouedraogo, 2015; Gennari, 2016; Cook & Glass, 2017; Pucheta-Martinez, Bel-Oms, & Olcina-Sempre, 2018) where they all submitted that the presence of women on board has a significant effect on corporate social performance. The outcome of this study therefore implies that the presence of female on board of directors of listed deposit money banks in Nigeria can influence their corporate social performance especially their corporate social responsibility expenditures.

The analysis of the individual component of the traits of the female on board and corporate social performance using the coefficient, Z-score and P-value as a basis of judgment; it was revealed that female board composition (FBC) had co-eff of 1.25; Z-score 2.20; P=0.028<0.05. This result indicates that FBC has a positively significant effect on corporate social responsibility expenditure of listed banks. The study posit that it is not enough for women to be on board, but the number of women on the board should also be considered. This is corroborated in the findings of (Kyaw, Olugbode & Petracci, 2017; Roubacar, Prud'hommie & Ouedraogo, 2015; Gupta, Lam, Sami & Zhou, 2014; Stephenson, 2004) as stated that the positive effect between gender diversity and CSR evident in other countries and is more pronounced in firms in emerging markets. Although the descriptive statistics revealed that the percentage of women on the boards of listed banks in Nigeria on the average is about 17.2%, the regression result still indicate that they are significant. The literary explanation to that is that the women have high potential of influencing the male gender on the boards to follow their bidding on issues that relates to CSP. This result therefore indicate that the null hypothesis earlier stated that female board composition does not significantly affect corporate social performance of listed DMBs in Nigeria will be rejected

The result also shows that female director expertise (FDE) has co-eff of 5.19; Z-score 2.57; P=0.01 has a positive significant on CSR expenditure. This result point to the fact that the financial as well as social and environmental works experience significantly affect CSP. This implies that an increase in the number of female directors with more years of experience on social and environmental works in addition to the accounting and finance knowledge tend to push CSR spending high. The argument for the wings of expertise to be widened beyond accounting and finance knowledge has been further buttressed by the finding of this study in Nigerian listed DMBs. Although most studies conducted on female board expertise were limited to the accounting knowledge; and their findings showed a positive relationship (Yusoff & Amrstrong, 2012; Dienes & Velte, 2016; Harjoto, Laksmana & Yang 2019). This study however attempts to include the social and environmental works experience. The finding conforms with Jizi *et.al* (2014) as stated that the knowledge of the female director regarding social and environmental issues should also be considered alongside the educational and financial expertise. This therefore imply that the null hypothesis stated that female director expertise does not affect corporate social performance of listed DMBs in Nigeria will be rejected.

Furthermore, the result obtained regarding female director independence showed that female directors independence (FDI) (co-eff 4.35; z- score 2.49; P=0.013<0.05) have a positive significant effect on CSR expenditure. This finding further supports the previous studies as stated that the effectiveness of the board is largely dependent on their level of independence (Ortas, Alvarez & Zubeltzu, 2017; Mallin, Michelon & Raggi, 2013). It can therefore be inferred that in the case of female on board of directors, the assumption of the gender socialization theory that individuals are taught how to socially behave in accordance with their assigned gender which is assigned at birth based on their biological sex does not hold in the boards.

Although the findings of Fitriya, Fauzi and Locke (2012); Michelon and Parbonetti (2012); Ponnu and Karthigeyan (2010) contradicts the finding of this study as stated that a negative or indifferent relationship existed between female gender independence and corporate social performance This assertion does not however hold in the case of the listed DMBs in Nigeria as it is evident that the independent female directors are seen to be independent of the executive directors and act in the interest of the organization at all time while keeping stakeholders satisfied. As such, the null hypothesis which states that there is no significant association between female board independence and corporate social performance of listed DMBs in Nigeria is rejected.

Policy Implication of the findings

The findings of this study have further confirmed the significance of the female gender in the board of deposit money banks in Nigeria; as it reflected in most developed and developing countries. In the past, the female gender has suffered neglect and discrimination majorly because of the weakness attributed to the gender which has relegated them to the rare positions in administration. There have been various agitations for a gender inclusion method of governance in the private and public sector. These agitations have birthed various submissions and arguments. One of the schools of thought is the SDG-5 goals developed by the United Nations; which one of their goal is to urgently eliminate the factors that promotes discrimination of women and maximize their rights in the private and public sector (UN Women, 2020). This drive includes the change of laws and legislations that discriminate against women. Despite the position of the law, the female gender has continued to make significant positive impact in company administration. This therefore imply that the call for female inclusion is not sentimental but a wake-up gaol for owners of companies to maximize the exposed significance of the female gender.

Corporate social responsibility has become an issue of global discuss; any company that wants to be recognized and valued high must embrace the ideologies of CSR and integrate it into their strategic plan. This is because CSR activities of firms have become one of the performance evaluation criteria and yardstick for acceptability in the global market. The female gender exhibit all the traits needed to achieve impactful CSR because of the empathetic nature of the female gender; considering the philanthropic nature of CSR, the female gender is the most suitable class that can help companies achieve desired goals in this regard. It is therefore logical for companies to leverage on the laws that promotes gender equality to include more female in their companies' board of directors.

Conclusion and Recommendations

The study attempts to provide an in-depth understanding on the effect of female directors on board on corporate social performance of DMBs in Nigeria. Although previous studies have upheld the significance of female gender to firm performance and social performances when studying board diversity; there is need to x-ray the quality of the females to determine if they possess attributes that can influence the strength of corporate social performance in the boards that they occupy. The corporate social performance of DMBs is measured based on the corporate social responsibility expenditure (CSRexp). The study found that female directors on board jointly has significant effect on CSRexp.

Individually, the results revealed that female board composition, female director expertise and female director independence have positive and statistically significant effect on CSRexp. Based on these findings the study therefore concludes that the presence of female on board has significant influence on the CSR activities of a firm; however the number alone might not achieve desired result without considering the financial, social and environmental knowledge of the female director; as well as ensuring that they operate in an environment that is devoid of bias and undue pressure that can threaten independence.

The study there recommends that;

i. The proportion number of females on boards of Nigerian DMBs should be increased in line with the proposition of codes of corporate governance of some other countries. This is because if there are more women on the boards it will lead to better performance and improved connection with stakeholders

ii. Expertise of the female directors should not be limited to their accounting and financial knowledge as posited in previous studies, but the level of experience and skills acquired on social and environmental issues should also be considered alongside. This will help companies to able to harness the full potential of the women and enhance productivity.

iii. Deposit Money Banks in Nigeria still need to continue to ensure that policies are put in place to protect the female directors from social, cultural or political factors that can adversely influence the independence of the women on the board.

Abstract

The article discusses labor productivity indicators in the manufacturing industry of the Tambov Oblast. The study identifies the factors that affect labor productivity and conducts a correlation analysis. As a result of the analysis, the determining factor is defined – demographic. The forecast of labor productivity in the Tambov Oblast for the period up to 2024 is made using the method of time-series extrapolation.

Keywords: Correlation Analysis, Labor Productivity, Regional Management.

Introduction

Research on the issue of increasing labor productivity has become particularly relevant since the beginning of the implementation of national projects in the Russian Federation aimed at technological and economic growth of the country's economy. Let's consider the main indicators that characterize labor productivity in the regional context. The main statistical indicator that characterizes labor productivity is the labor productivity index for the region's economy. In general, it is calculated as the quotient of the division of the indices of the physical volume of Gross Regional Product (GRP) and changes in total labor costs. The GRP physical volume index is calculated based on the absolute values of this indicator in constant prices.

Indices of changes in total labor costs are determined on the basis of labor costs for all types of work, including additional work and production of goods for own consumption. The methodology for calculating this indicator was approved by Rosstat Order No. 274 of April 28, 2018.

Moscow	105,3	93,2	101,2	101,7	101,7	100,3	99,6	98,4	100,0	101,6	101,7

As we can see from the data in Table 1, the labor productivity index in the Tambov Oblast shows ambiguous dynamics, one of the possible reasons for this is the agricultural and industrial bias of the region's economy. In agriculture, the volume of production depends not only on the efforts of the enterprises themselves, but also on the influence of natural factors. So you can see that the dry year 2010 led to a decrease in this indicator by more than 6 points, and in 2011 there was a significant increase in it, partly due to the influence of external factors. Among the regions of the Central Federal District, the Tambov Oblast, according to data for 2018, is on the 4th place, which can not be considered a positive phenomenon in the economic system of the region.

A new indicator, taking into account the implementation of the national project “Labor Productivity and Employment Support”, is the indicator of labor productivity in the basic non-resource sectors of the economy, determined as a percentage. The index of labor productivity in the basic non-resource sectors of the economy is calculated as the quotient of the index of physical volume of output of goods and services in year t relative to year t-

1 to index of time worked in year t relative to year t-1. Basic non-resource sectors of the economy are defined as a set of products of similar types of activities that are part of the basic non-resource industries created by production units. The methodology for calculating this indicator was approved by the Decree of the Government of the Russian Federation No. 915 of July 17, 2019. The indicator for 2019 is calculated in relation to 2017.

Table 2: Labor productivity in basic non-resource sectors of the economy (2019, percentage) by regions of the Central Federal District

	The value of the indicator for the year
Central Federal District	113
Moscow Oblast	122,1
Bryansk Oblast	115,4
Kursk Oblast	114
Smolensk Oblast	113
Moscow	111,5
Kaluga Oblast	110,5
Vladimir Oblast	110,4
Oryol Oblast	109,9
Ryazan Oblast	109,9
Tambov Oblast	109
Belgorod Oblast	108,7
Ivanovo Oblast	107,7
Kostroma Oblast	106,9
Tula Oblast	106,8
Yaroslavl Oblast	106,4
Tver Oblast	106,2
Voronezh Oblast	102,2
Lipetsk Oblast	100

It should be noted that this indicator is included in the group of indicators for the performance assessment of senior officials (heads of higher executive bodies of state power) of the constituents of the Russian Federation and executive authorities of subjects of the Russian Federation. The Tambov Oblast is on the 10th place in the Central Federal District with an indicator of 109%, but the indicator is lower to the average value for the Central Federal District.

Materials and Methods

To analyze labor productivity in the Tambov Oblast, it is necessary to evaluate the main indicators that affect labor productivity. Within the framework of this study, the manufacturing industry was chosen as a model. It should be noted that statistical data in the context of basic non-resource industries are not divided by the State Statistics Service and are not placed in its structure. In this regard, the work analyzes labor productivity for the manufacturing industry in general.

The main indicators that affect the labor productivity of the Tambov Oblast in the manufacturing industry are presented in Table 3.

Table 3: The main indicators affecting labor productivity in the manufacturing industry of the Tambov Oblast in 2005-2018

	2005	2010	2011	2012	2013	2014	2015	2016	2017	2018
Volume of shipped goods of own production, works and services performed by own forces, million rubles in actual prices	23070,2	50412,8	80490	83331	89453	100852	122324,8	137364,2	134328,6	162991,2
Industrial production indices, percent of the previous year	104,0	104,6	117,3	115,5	108,0	108,9	105,4	103,5	111,2	116,5
Average number of employees, thousand people	63,6	51,2	50,5	51,0	51,9	51,2	49,9	49,5	45,5	49,6
Average monthly nominal gross payroll of employees, rubles	5297,2	12769,4	14318,3	16524,7	18638,3	21195,1	22863,3	24223,5	26797,0	27807,3
Share of domestic research and development expenditures in the gross regional product, %	No data	0,56	0,53	0,47	0,61	0,80	0,69	0,56	0,36	No data
Share of products of high-tech and knowledge-intensive industries in the gross regional product, %	No data	17,3	17,6	17,2	17,5	15,5	17,7	17,2	No data	No data

In general, labor productivity can be represented by the formula (1):

$$\frac{\text{Volume of shipped goods of own production,works and services performed by own forces}}{\text{Average number of employees}} \quad (1)$$

Based on this, we can say that in 2017 in the manufacturing industry it amounted to 2952,3 thousand rubles, and in 2018 – 3286.1 thousand rubles.

Let's determine the extent to which the following factors affect labor productivity:

- average monthly nominal gross payroll;
- the share of domestic research and development expenditures in the gross regional product, %;
- the share of products of high-tech and knowledge-intensive industries in the gross regional product, %. For the correlation analysis of these factors, we will compile a correlation matrix (Table 4).

A correlation matrix is a table where the correlation coefficient between the corresponding parameters is located at the intersection of the corresponding row and column.

For each pair of data, we calculate the correlation coefficient using the formula:

$$r = \frac{n*\sum xy - \sum x \sum y}{\sqrt{(n\sum x^2 - (\sum x)^2)*(n\sum y^2 - (\sum y)^2)}}, \text{ where}$$

y – values of the effective feature,
x – values of the factorial feature.

Table 4: Correlation analysis of labor productivity in the Tambov Oblast (correlation matrix)

	Labor productivity, thousand rubles	Average monthly nominal gross payroll of employees	Share of domestic research and development expenditures in the gross regional product, %	Share of products of high-tech and knowledge-intensive industries in the gross regional product, %
Labor productivity, thousand rubles	1			
Average monthly nominal gross payroll of employees, rubles	0,973692561	1		
Share of domestic research and development expenditures in the gross regional product, %	-0,174411579	-0,054480242	1	
Share of products of high-tech and knowledge-intensive industries in the gross regional product, %	-0,044809836	-0,232512747	-0,649605544	1

To assess the dependence of labor productivity on the amount of gross payroll, we will create a regression equation.

To calculate the parameters of the regression equation a0 and a1 we use the system of normal equations:

$$\begin{cases} na_0 + a_1 \sum x = \sum y \\ a_0 \sum x + a_1 \sum x^2 = \sum xy \end{cases}$$

Substituting the necessary values from Table 4, we get:

$$\begin{cases} 9a_0 + a_1 * 185136.9 = 19370.6 \\ a_0 * 185136.9 + a_1 * 4038589074 = 430026738.8 \end{cases}$$

Having solved the system of equations, we get the parameters for the regression equation:

a0=-668,05
a1=0,137
Let's make a linear regression equation (Y=a0+a1*X), where
Y – labor productivity,
X – gross payroll
Y= - 668,1+0,14X

Results and Discussion

The parameters of the regression equation show that other factors have a large influence (a 0=-668,1). In addition, if you increase the salary of employees by 1000 rubles, labor productivity will increase by 140 rubles.

Table 5: Calculation of labor productivity in the field of manufacturing.

	2005	2010	2011	2012	2013	2014	2015	2016	2017	2018
Volume of shipped goods of own production, works and services performed by own forces, million rubles in actual prices	23070,2	50412,8	80490,0	83331,0	89453,0	100852,0	122324,8	137364,2	134328,6	162991,2
Average number of employees, thousand people	63,6	51,2	50,5	51,0	51,9	51,2	49,9	49,5	45,5	49,6
Labour productivity	362,7	984,6	1593,9	1633,9	1723,6	1969,8	2451,4	2775,0	2952,3	3286,1

The demographic factor is chosen as the most risky factor that can influence the implementation of the national project. The population structure of the Tambov Oblast has a number of problems. Here are some statistics on the structure of employment in the Tambov Oblast according to the State Statistics Service. Data on the size of the labor force and the level of labor force participation are presented in Table 6.

Table 6: Labor force in the Tambov Oblast in 2012-2017

	2012	2013	2014	2015	2016	2017
The number of workers aged 15-72, thousand people	536,2	533,2	526,9	525,9	521,9	515,7
Labor force participation rate of the population aged 15-72, %	64,1	63,7	63,8	64,4	64,7	64,8

As can be seen from the data in Table 6, the labor force size has a clear downward trend, it has decreased by almost 4 % over 5 years. The level of labor force participation of the working-age population changes to a lesser extent. At the same time, the number of people employed in the informal sector aged 15-72 is 131 thousand, or 26,6% of the total employed population. In general, the situation does not clearly deviate from the overall picture for the Central Federal District regions, but the trend towards a reduction in the number of labor forces does not have the best effect on the efforts of regional authorities to equalize the economic situation in the region, including increasing labor productivity.

Let's make a forecast of labor productivity in the manufacturing sector, taking into account the demographic factor. To forecast labor productivity in the Tambov Oblast for the period up to 2024, we use the method of time-series extrapolation. For this purpose, a linear model was created based on a system of normal equations:

$$\begin{cases} na_0 + \sum t = \sum y \\ a_0 * \sum t + a_1 * \sum t^2 = \sum ty \end{cases}, \text{ where}$$

a0 – influence of external factors,
a1 – influence of the time factor,
y – population of the Tambov Oblast, people.
t – the time factor, t∈ [-15; 15].
Substituting data on the population of the Tambov Oblast for the last 30 years in the system, we get:
a0= -11225
a1= 1E+06 = 1000000
We get a linear equation:
y = -11325t + 1E+06R² = 0,9764
where,
y – population of the Tambov Oblast, people.
t – the time factor, t∈ [-15; 15].

The dependence shows that every year the population of the Tambov Oblast decreases by an average of 11325 people. The extrapolation of a number of population dynamics in the Tambov region is clearly shown in Figure 1.

Figure 1: Forecast of the population of the Tambov Oblast by time-series extrapolation for 2020-2024, people.

The forecast of labor productivity in the manufacturing sector, depending on the population, is shown in Figure 2.

Figure 2: Dynamics and forecast of labor productivity in the Tambov Oblast in the manufacturing industry for 2010-2024, depending on the population of the region

Taking into account the demographic factor, the impact of which on labor productivity is 97,5% (r=0,987; R^2=0,975), the forecast of labor productivity until 2024 has the following values, Table 7.

Table 7: Forecast values of labor productivity in the Tambov Oblast for the period up to 2024

Year	2020	2021	2022	2023	2024
Labor productivity in the manufacturing industry of the Tambov Oblast, thousand rubles	3126,3	3049,3	2974,2	2901,0	2829,6

The forecast is based on the value of the coefficient of determination (R^2).

R^2 is the coefficient of determination showing the proportion of variation of the effective feature 'y' under the influence of the factorial feature 'x'. In this case, productivity is an effective feature, and the population of the region is a factorial feature. The forecast is made by sequentially multiplying the values of labor productivity by the coefficient of determination (for example, 3126,3*0,975=3049,3).

Recommendations

According to the correlation analysis, the average monthly nominal gross payroll (r=0,974) has the greatest impact on labor productivity in the Tambov Oblast in the manufacturing sector. The coefficient of determination is 0,949, which shows that in 94,9% of cases, changes in labor productivity are conditioned by the changes in the amount of gross payroll.

Thus, it should be noted that the employee's salary has a high significance on the labor productivity indicator. It is necessary to take this factor into account when developing and implementing programs to increase labor productivity. As a recommendation, it can be noted that enterprises receiving certain support measures should show an increase in the average salary received by employees at the end of the period.

From the data obtained, we can conclude that with the continuing reduction of the labor force and the lack of adequate measures to equalize it in the manufacturing industry, there is a tendency of reducing labor productivity. It is becoming obvious that more and more enterprises need to be included in programs to increase labor productivity and to develop new measures to support enterprises implementing programs to increase labor productivity.

Abstract

The study is bases on a systematic approach applying the method of statistical analysis. The study exposess sharpening of negative behaviour of Russian financial and economic system resulting from the drop in interest rate: national currency devaluation, lower tax revenues, etc., bringing about the necessity to increase M2 and need for bigger volumes of devaluated rouble consumer loan raising GDP deflator. Positive behaviour of the Russian financial and economic system is attributed to the sustainability of the Russian Federation Central Bank replenishing its gold and foreign currency reserves and maintaining trade balance (trade surplus) increasing its strength under the conditions of decrease in world oil prices and Covid-19 pandemic. It has been found out that positive behaviour of Russian financial and economic system is reached due to the decrease in interest rate, rather than its invariably low level. The limit of positive behavior of the Russian financial and economic system depending on interest rate scenario is determined through volatility of crude oil and natural gas prices. Decreasing interest rate and simultaneous devaluation of the national currency the Central Bank maintains the structure of commodity economy strengthening the positions at the periphery of the world capitalism and maintaining the status of energy superpower, thus increasing its sustainability in relation to the drop in world oil prices.

Keywords: Capitalism, Behavior, Interest Rate, Financial and Economic System.

Introduction

Russian Financial and Economic System Behavior (RFESB) ought to be considered within the context of economic cycle and essence of money as a specific commodity, i.e. universal equivalent. RFESB is one motion comprising adverse motions – counter flows of income (resources, factors, of production, material values) and expenditures (funds).

The RFESB research rationale depending on interest rate scenario is attributed to the worldwide technique of economic growth maintenance applied by the Central Bank. On April 24, 2020 having lowered the key (interest) rate to5.5% for the first time since 2014 Central Bank of the Russian Federation (CBRF) passed over to the soft policy amid the expected slump in economy due to the crisis in the conditions of oil prices drop and Covid-19 pandemic by 0,5 percentage points.

TALANOVA "Russian Financial and Economic System Behavior Depending on Interest Rate Scenario" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Due to the existing financial and economic situation in Russia experts do not expect any standard decrease in the deposit and loan interest rate following the CBRF decision. Deposits are losing their attractiveness as an instrument of profit-making savings and banks will have to increase their rates.

According to CBRF, to fight Covid-19 pandemic significant restrictive measures were introduced all over the world resulting in negative impact on economic activity in Russia. It causes considerable long-lasting disinflationary influence on the prices dynamics on the part of aggregate demand that compensates for the effect of temporal pro-inflationary factors including those attributed to the drop in oil price.

CBRF forecasts about 3.1% increase in consumer prices, for the full year inflation is expected to make 3.8-4.8% and later on to remain 4%, GDP is expected to decrease by 4-6%, recovery growth is likely to make 2.8-4.8% in 2021 and 1.5-3.5% in 2022. CDRF baseline forecast is based on the average Urals oil price of 27 USD per barrel in 2020 and its further increase to 35 and 45 USD per barrel in2021 and 2022 correspondingly.

At the same time the government does not provide the population with funds like in some other countries, but acts through loan facilities and subsidies. In these conditions CBRF lightens the debt burden decreasing interest rate. Decrease in interest rate and commentaries on this motion prerequisites and grounds points to the necessity of deeper analysis of RFESB depending on CBRF interest rate scenario.

Literature Survey

The rationale of the research into adverse motions of the financial and the economic in one depending on the interest rate scenario in the new reality is attributed to stronger manifestation of the world recession signs as well as to discrepancies in opportunities of different countries to respond to negative conditions.

Modern stage of global economy development can be characterized as permanent crisis having high risks of financial instability and real sector problems caused by highly developed countries that are ”political asylums” of speculative capital. In such conditions developing nations are vulnerable since their markets are already open but mechanisms softening the impact of fundamental reasons of financial instability have not been formed yet. Wider measures are necessary to liberate Russian financial system from dependence on foreign currencies. It is appropriate to take tough measures to ensure financial security in Russia, including reduction of capital outflow, security and control of currency reserves and state assets structure through incorporation of various foreign currencies into them aiming at providing international settlements and their protection.

Policy pursued by CBRF in the medium-term perspective has made the major part of national large enterprises curtail their economic activity, and small and medium businesses have joined shadow economy (Smirnov, V., Semenov, V., Kadyshev, E., Zakharova, A., Babaeva, A., 2019). A large share of highly capitalized and effective banks (from the point of view of operating expenditures) having a broad base of funding helps smooth a negative effect from outer shocks on crediting to the real sector of the economy.

While Russian authorities are being anxious about crediting the real sector of economy and curtailing capital outflow, highly developed countries, their financial systems are gradually passing to the negative interest rate zone, Marco Del Negro, Domenico Giannone, Marc P. Giannoni, Andrea Tambalotti show that tendency in the world real interest rate on liquid and safe assets was fluctuating around 2% for over a century but has considerably dropped for the last three decades. The decrease was a common occurrence for highly developed countries since the tendencies concerning real interest rate in different countries were similar (Negro, M.D., Giannone, D., Giannoni, M.P., Tambalotti, A., 2019).

According to Robert L. Czudaj introduction of negative interest rates, firstly, considerably reduces the expectations concerning three month interest rate on the money market as well as 10-year public bond yield. Secondly, GDP growth and inflation expectations appear under significant increasing positive influence of this nontraditional tool, i.e. negative interest rate policy effectively speeds up economic growth and overcomes deflation spiral (Czudaj, R.L., 2020). In spite of the insufficient effectiveness of the new tool, banks will keep on using it combined with taking measures to reduce banking system risks.

According to Whelsy Boungou bank risk proves to be lower in the countries where negative rates are introduced. This capacity depends on banking system characteristics of a country, to be more exact on capitalization degree and the size of the country (Boungou, W., 2020). Probability of such situation approach was estimated as low due to the current state strategy of Russian financial market development, high yield on Federal loan bonds to attract foreign investments, as well as low financial literacy of the population.

George Dotsis shows that unlike commonly found negative interconnection between investments and uncertainty, the availability of interest rate lower limit results in asymmetric effect of interest rate uncertainty when taking investment decision. At low interest rate the increase in its volatility diminishes the value of anticipation and pushes up the investments, but at high interest rate the increase in its volatility pushes up the value of anticipation and cuts down on the investments (Dotsis, G., 2020).

Divya Kirti believes that banks prefer providing floating rate loans due to their restricted ability to turn their current liabilities into long-term assets. Banks having great amount of obligation with floating rate have more capital to lend with floating rate, hold more securities with floating rate and specify softer loans with floating rate (Kirti, D., 2020).

Toni Beutler, Robert Bichsel, Adrian Bruhin и Jayson Danton find out that lowering economic capital of banks, implemented risk of interest rate scenario accounts for on average about one eighth or 30 basis points of anticipated total decrease in aggregate crediting growth in a year after nominal rate push up by one percentage point. Bank lending is mainly defined by capital of banks, but not by their liquidity (Beutler, T., Bichsel, R., Bruhin, A., Danton, J., 2020).

Jens Klose points out considerable differences between real and equilibrium real interest rate going any direction. This development is observed in respect of BRICS. For China and India monetary policy tends to be too loose during many periods stimulating economic growth, but concerning Brazil the opposite is true. In Russia and South Africa the actual real rate mainly corresponds to equilibrium, thus monetary and credit policy is neither too weak nor too tough (Klose, J., 2020).

Badiea Shaukat, Qigui Zhu и M. Ijaz Khan find out multiple inverse negative relationship of real interest rate on economic growth due to national and foreign investments, human capital, trade openness, interest rate, inflation, institutional force, political instability and corruption. The interest rate is defined from the outside in the countries with transition economy where through several channels the real interest rate may not only cause damage but also restrict the economy to maintain its corresponding transition level and to achieve higher growth rate. Politically it results in necessity to set lower interest rate which is extremely needed and useful for countries with transition/developing economy to transit quicker and achieve higher growth rate (Shaukat, B., Zhu, Q., Khan, M.I., 2019).

Jun Nagayasu finds out that the difference in interest rates does not significantly influence financial flows of developed countries. On the other hand exchange rates and political integration sequentially influence investment decisions when forming financial portfolios rather than interest rates (Nagayasu, J., 2019).

Maren Baars, Henning Cordes и Hannes Mohrschladt have found out that decrease in the interest rate does not impact risk taking on the whole. Risktaking increases significantly only if interest rate drops below zero (Baars, M., Cordes, H., Mohrschladt, H., 2020). Lending risks in the banking sector are increasing today nonlinearly regarding basic characteristics of the loan, i.e. the size, the term of the loan, interest rate.

Within this context, Irina Georgescu and Jani Kinnunen introduce the concept of possible precautionary saving as a measure of the optimal deviation of savings in the transition from a certain model to a model of probabilistic interest rate risk. The first result of the work characterizes the possible preventive savings (that is, generating additional savings) by the inequality in which a relative prudence index appears, associated with the consumer utility function. The second one compares the level of optimal savings with the level of optimal savings from a possible security model (The interest rate for saving as a possibilistic risk. Physica A: Statistical Mechanics and its Applications, 5471. Article 124460. https://doi.org/10.1016/j.physa.2020.124460). Ana Isabel Sa and Jose Jorge confirm that according to the monetary policy for deposits, central banks can influence deposits and offer loans by changing the rate. But low interest rates may disable this channel (Sa, A.I., Jorge, J., 2019).

Julio Garín, Robert Lester, Eric Sims and Jonathan Wolff have found out that if interest rates are low due to the grown preference of savings, fiscal sustainability allows increasing debt during the period of low interest rates. If interest rates are low due to the drop in production growth rate, increase in spending financed due to the deficit is impossible (Garín, J., Lester, R., Sims, E., Wolff, J., 2019).

In Russia a significant part is played by interdependence of oil price change as an external factor and unemployment as an internal factor and CBRF interest rate as a response to these changes.

Baris Kocaarslan, Mehmet Ali Soytas and Ugur Soytas are of the opinion that decrease in oil prices uncertainty results in the unemployment reduction, whereas increase in oil prices uncertainty does not have any impact. In response to the decrease in the interest rate the growth of the unemployment is observed since the influence of interest rate increase is not significant. Oil prices volatility stipulated by options as a measure of oil prices uncertainty exceeds the conditional volatility of oil prices in the unemployment forecasting (Kocaarslan, B., Soytas, M.A., Soytas, U., 2020).

Te Bao and Jichuan Zong have found out that the average price deviation ("the bubble") is considerably lower in the economies pursuing interest rate policy than in the economies without such a policy. The policy preserves its effectiveness independent of the fact whether the participants are informed of the policy aims or not (Bao, T., Zong, J., 2020).

Daisuke Ida reckons that policy based on the rules is of lower weight. Under cross check of monetary and credit policy a unique equilibrium of rational expectations can be easily achieved. However, this result is the opposite when Central bank loss function contains stabilization of interest rate and inflation (Ida, D., 2020). According to Antonio Afonso and Jose Alves, SFA increase lowers long term and short term interest rates, short term interest rates experience higher reductions at that (Afonso, A., Alves, J.,2019).
Thus, the current situation in the world economy actualizes the necessity of RFESB analysis of interest rate scenario of CBRF in Russia today (Smirnov, V., Semenov, V., Kadyshev, E., Zakharova, A., Perfilova, E., 2019) to realize expedient application of this mechanism and evaluation of its effectiveness to ensure sustainable economic growth.

Method

Descriptive statistics methods including empirical data processing, systematization, pictorial presentation in the form of graphs and tables, their quantitative description through basic statistical indices are applied to estimate RFESB depending on interest rate scenario of CBRF in present-day Russia (King, A.P., Eckersley, R.J.,2019, Brownstein, N.C., Adolfsson, A., Ackerman, M., 2019). The behavior of each variable is described by means of tables, diagrams and aggregates. Tables, diagrams and graphs are plotted by means of помощью «MS Excel», «IBM SPSS Statistics Software» (Fávero, L.P., Belfiore, P., 2019). Descriptive statistics estimates data array by statistical indicators. Statistical analysis is the method of collection, study and provision of vast store of data on data characteristics (Lazar, J., Feng, J.H., Hochheiser, H., 2017) and correlations (Schofield, 1993); correlation of spatial and time series of indicators keeping to the methodology of the research.

Analysis

RFESB analysis on CBRF interest rate scenario is carried out on the results of dynamics evaluation of Crude OIL Production; Gasoline Prices; Inflation Rate ; Gold Reserves Balance of Trade; Balance of Central Bank; Consumer Credit; RUB/USD Exchange Rate; GDP Deflator; Money Supply M2; Imports; Employment Rate; Industrial Production; Manufacturing Production; Construction Output; Capacity Utilization, according to «Trading Economics during the period of 2012 to the 1st quarter of 2020.

The analysis resulted in positive RFESB from CBRF interest rate decrease - Crude Oil Production; Gasoline Prices; Inflation Rate; Gold Reserves; Balance of Trade; Balance of Central Bank. Through the decrease in interest rate CBRF maintains the structure of raw materials economy and increases its sustainability as regards drop in world oil prices.

Negative RFESB caused by decrease in interest rate are Consumer Credit; RUB/USD Exchange Rate; GDP Deflator; Money Supply M2; Imports; Employment Rate. Through lowering interest rate CBRF devaluates the national currency reducing opportunities to purchase high-tech imports making businesses work off the books (including registration of their employees as self-employed), it also increases GDP deflator enlarging M2, in that way demand for growth in devaluated Ruble Consumer Credit.

Analysis into dynamics of Industrial Production, Manufacturing Production, Construction Output, Capacity Utilization resulted in positive RFESB caused by interest rate decrease. It should be noted that positive RFESB factors are achieved by decrease in the interest rate, rather than by its stable low indicator. A reserve of 5.5% available since 2020.04.24 is lower than that of 2015 when it was 15%.

Thus, opportunities of further CBRF economy revival due to interest rate decrease are considerably restricted.

Modeling

For modeling RFESB, we use the Cobb – Douglas function as the basis, but changing it taking into account certain priorities — the extraction of crude oil and natural gas and the interest (key) rate. It should be understood that RFESB modeling is an assessment of a single movement consisting of opposing movements - trends (approximation functions) of reciprocal flows from revenues (production of crude oil and natural gas) and expenses (interest rate).

Modeling is carried out according to the formula:

where – rate of increase in crude oil and natural gas production; – CBRF interest (key) rate; = 0.4143· – 0.1 and = -0.0189· + 0.1668 – trends (approximation functions) (figure 1), constructed according to the Federal State Statistics Service for 2014-2019 (Federal State Statistics Service. *Rosstat.* © 1999-2020. Copyright Federal State Statistics Service. https://www.gks.ru) , α and β – corresponding elasticity coefficients

Figure 1. The rates of gain of crude oil and natural gas production, interest (key) rate, %.
Source: calculated using the Cobb-Douglas function «SPSS Statistics» according to Federal State Statistics Service (Rosstat). (Access: 2020/04/29).

Modeling resulted in construction of RFESB approximating functions (figure 2) which reflect a single movement in opposite movements and indicate their significant deviations.

Figure 2. Modeling of RFESB: crude oil and natural gas production and interest (key) rate.
Source: calculated using the Cobb-Douglas function «SPSS Statistics» according to Federal State Statistics Service (Rosstat). (Access: 2020/04/29).

These deviations stipulated application of polinomial approximation functions: (1) $y = -0.0043 \cdot x^5 + 0.0734 \cdot x^4 - 0.471 \cdot x^3 + 1.3906 \cdot x^2 - 1.8426 \cdot x + 0.8541$ where $\alpha = 0.75$, $\beta = 0.25$ – dominance of growth rate of crude oil and natural gas extraction; (2) $y = -0.0007 \cdot x^5 + 0.0117 \cdot x^4 - 0.0738 \cdot x^3 + 0.2148 \cdot x^2 - 0.2816 \cdot x + 0.1296$ where $\alpha = 0.25$, $\beta = 0.75$ – dominance of CBRF interest rate.

Thus, RFESB modeling revealed the dominance of change in crude oil and natural gas prices over CBRF interest (key) rate.

Results Discussion

The situation revealed as a result of the study on the dominance of change in the price of crude oil and natural gas over interest (key) rate in RFESB should be understood as a deep dependence of Russian economy on the world consumption. Located on the periphery of world capitalism Russian economy is energy superpower ensuring sustainability of the world economy growth through the increase in external and decrease in internal consumption. Energy superpower is a state possessing large proven reserves of oil, natural gas, coal, uranium, opportunities to use renewable energy and which is a largest exporter of energy supplies, at least one of them. This is manifested by the permanent devaluation of the national currency and additional currency issue.

Against this background CBRF accounting for gold reserves and maintaining trade balance (black ink) experiences favorable anticipations. Reducing interest rate CBRF maintains the structure of Russian commodity economy and increases its sustainability when world oil prices drop.

Negative RFESB factors caused by decrease in interest rate are devaluation of the national currency and as a consequence lower opportunities to purchase high-tech imports forcing businesses to work off the books and reducing tax revenues. It results in necessity to enlarge M2 and need for vast amounts of devaluated ruble consumer credit decreasing GDP deflator.

It should be noted that positive RFESB factors are achieved by decrease in the interest rate, rather than by its stable low indicator. A reserve of 5.5% available since 2020.04.24 is lower than that of 2015 when it was 15%.

To prolong the period of positive RFESB factors CBRF has to limit the rate of interest rate cut paying more attention to verbal interventions or return to the issue of the national currency denomination by one order and a "full' kopeck. 1997.08.04 Russian President Boris Yeltsin signed a Decree on the Ruble Denomination. According to the document there was a decrease in the nominal value of the currency and one new ruble became equal to one thousand old ones. On January 1, 1998, CBRF put into circulation banknotes worth 5, 10, 50, 100 and 500 rubles, as well as coins of 1, 5, 10, 50 kopecks and 1, 2, 5 rubles.

Conclusions

As a result of the study of RFESB factors depending on interest rate scenario in contemporary Russia and in the conditions of falling world oil prices and the Covid-19 pandemic, the dependence of the Russian economy on the price of crude oil and natural gas got even more deeply exposed. Russia's positions on the periphery of world capitalism have consolidated, while retaining the status of an energy superpower that ensures the sustainable growth of the world economy by increasing external and reducing domestic consumption.

Maintaining RFESB is a necessity to justify the CBRF monetary policy. Favorable sensation of interest rate reduction is observed in CBRF as a result of successful replenishment of gold and foreign exchange reserves and maintaining the trade balance. There are sharpening negative RFESB factors , i.e. devaluation of the national currency lower tax revenues and etc., resulting in necessity to enlarge M2 and need for vast amounts of devaluated ruble consumer credit decreasing GDP deflator.

Abstract

In the 21st century, companies all around the world have formed a higher expectation from the labours in the market. The recruitment needs by the employers for employment have changed drastically, and are not what the used to be in the olden days. There is certain kind of attributes searched for in an employee. These are employability skills sets. Different stakeholders have different perspectives on employability skills. Employability skills are found to have no common definitions. Different researchers or authors define employability skills differently. Employability skills are basic skill sets that are required to help in maintaining and keeping the job for a longer period, these skills are usually personal attributes, achievement skills, and more, that help the employee to be successful in their career option. In this literature review, it is studied if, the perceptions of the stakeholders towards the employability skills are meet or not, and if so, what might be the possible reasons. Articles from different authors and researchers were reviewed for writing this literature review.

Following the purpose of the study, it is taken into account, the different perceptions of employability skills by employers, higher education institutions, and employees/graduates. During the study, there were different challenges found, that were met by the employee and the employers, and its respective solutions and reasoning towards it.

Keywords: Employability skills, Stakeholders, Perception

Introduction

In the growing times, globalization has affected the organizations and business, with ever-changing technology, labour market demands, and the attributes searched- in for professionals has also changed drastically (Yet-Mee Lim et.al, 2016). As the business environment is dynamic, it becomes difficult to supply products and services that will be able to sustain and attract consumers for a long period. Hence, the firms hunt for employees that can create a market where their products or services keep the consumers interested and which helps the firms to retain their competitive advantage.

The qualities that are searched in an employee in recent times are little more than just academic abilities, these qualities include oral and written communication skills, teamwork and team-building skills, multitasking, and other dynamic business skills. These skills expected from the employers while interviewing an employee are partly based on generic skills which are highly valued by prospective employers as additional attributes (Yet-Mee Lim et.al, 2016).

The growing market underlines the value of employability in education as well, with the emphasis on improving not only skills but also practical experience (Ekpoh Uduak,2015). Therefore, countries worldwide have started to invest in education, even in the rising global socio-economic challenges, which will help in generating highly self-reliant, motivated, and skilled graduates. There is a renewed focus among the youths apart from the school system in the

advancement of practical as well as technical abilities in consideration with proficiency in the business world. Various researchers have widely discussed and defined the idea of employability. There is no definite definition for employability, different researchers defined employability differently. Employability is defined as an individual's potential for being worthy of a job; competencies, experience, and personal attributes are included as employability skills. It represents the ability of an employee to find a job, maintain a job, and switch between the job in the same business sector. (Christina Hartshorn and Leigh Sear,2005) Employability can also be termed as having organizational competency, skills relevant to work and employment, entrepreneurial skills, and communication skills relating to work (Rebecca Boden and Maria Nedeva,2010). This showcases that defining employability is dynamic and multi-dimensional, and can be hard to describe. This also means that there does not exist a centric definition for employability as it lacks measurement and consensus (Wakelin- Theron,2014).

As mentioned above that the employers expect a selected set of generic skills while hiring an employee, the stakeholders in education are apprehensive regarding young graduates and students' acquisition of skills that are work-related (ORJI and Nna Sunaday,2013). Higher education plays a key role in equipping young people for employment. It is regarded that universities act as a major role in increasing Human Capital (Ekpoh Uduak,2015). It is suggested for the Higher Education Institutions(HEI) to take initiative and responsibility to improve the education system in such a way that it exalts the employability skills in students, which will help them to get employed quicker as well as meet the demands of employers (Yet-Mee Lim et.al,2016). It should be emphasized that students who attend higher education have a variety of aspirations, perspectives, and skills that are called for a more versatile way of conveying them. Furthermore, HEIs around the world are under immense pressure to generate highly-mobile graduates with the requisite expertise, skills, and attributes to make them employable in different economic sectors of the countries (Wakelin- Theron,2014). It has been acknowledged that student employability skills can be strengthened by establishing a working relationship or interaction between schools and employers, recognizing market realities, employee and student selection, as well as adopting a modern approach to teaching and learning that emphasizes core skills and behaviors, job-seeking abilities, and a repackaged range of technical and occupational competences (ORJI and Nna Sunaday,2013). Hence, the recent trend of putting in a greater focus on a graduate with the key skillset, ensures that the Higher Education curriculum includes opportunities to improve these skills in combination to a particular subject with its specified knowledge and skills. This will create a possibility for the success of applicants in the selection process by generating 'business ready' graduates, capable of making a dynamic start and quickly adapting to change. To add on, various training programs at various universities follow different approaches, such as providing job experience, work-related training and employability skills modules, and work-related activities and even involving employers in developing and evaluation of courses. For employability skills already present in the curriculum, universities also employ a variety of programs to make them more visible to students (Sue Cranmer,2007).

Employability skills are much more important in developing countries where drop-out levels are high and opportunities for further education are slim (ORJI and Nna Sunaday,2013). The increasing unemployment rate among the graduates from the HEI is a testament to the widening gap between the university curriculum and employer needs and demands (Ekpoh Uduak,2015).

Study Objectives

This study examines the perception of employers, students, HEIs, and employees who have similar views regarding employability skills. This will help to recognize the black hole in the curriculums which can be developed and enhanced to train graduates as well as students to get and maintain their jobs in the business world. This study has been carried out on the bases of objectives:

1. To understand the different perceptions of employers, employees/graduates, and higher education institutions.
2. To identify the theories on employability skills can be practiced in real life.
3. To know how the importance of employability skills affect the practical world.

Employer Perception On Employability Skill

Though employers believe that technical expertise is important, they also require students to develop a multitude of knowledge and competencies that can be grouped into common skills and technical competencies (Yet-Mee Lim et.al, 2016).

Some employability skills are highly valued by employers such as generic skills, which are recognized by employers as well as practitioners are analytical, critical thinking, decision-making skills, interpersonal skills, oral and written communication skills, problem-solving skills, leadership skills, teamwork and teambuilding skills, and the ability to resolve conflicts and work under pressure (Ahadiat and Smith, 1994). In another research conducted by Kevin Lowden

et.al,2011, it was found that employers search for some kind of attributes, skills, and knowledge, intellectual competency that are needed for specified roles. Team working skills, problem-solving skills, self-management, knowledge of business, ICT knowledge, interpersonal and communication skills, capacity to use their own's creativity and leadership skills. In contrast to these skills, employers have emphasized the need for unique attitudes and experiences including, inspiration, perseverance, and dedication (Kevin Lowden et.al,2011). In terms of personal qualities, employers and professionals prefer students and entry-level employees, which are optimistic, responsible and competent, creative, enthusiastic, ethical, autonomous, inventive, knowledgeable, persuasive, reliable, self-confident, self-motivated, and those who showcase loyalty (Ahadiat et.al,1994). It is also found that the key attributes considered for an employee or a young graduate were trustworthiness, competency, sense for duty, optimistic behavior, and awareness of the business world for employability (Ahadiat et.al,1994). Even though employers viewed the graduates should have the ability to know when, how, and where use their theoretical knowledge in the practical world, resulting in producing higher – a level of performance (Ayiesah Ramli et.al,2010). Employers ranked more highly than technical and subject-specific skills, a range of personal qualities and core skills. It is not to disregard the importance of academic qualifications, but to underline the added value of personal attributes and core competencies (Venetia Saunders and Katherine Zuzel,2010).

In addition to this, the dynamic economic conditions and the structural global challenges faced by many employers, it has been recognized that other skills such as entrepreneurial sensitivity and cross-ethnic competency, are likely to be considered as valuable attributes for new graduate recruits. (Venetia Saunders and Katherine Zuzel,2010). Employers, as well as students, found that having work-experience, internships, and co-curricular activities as particularly helpful in improving marketable skills while at university. It was also noted in the research that though jobs required proper qualifications and degrees, these skills added to long-term employability for the young graduates (Kevin Lowden et.al,2011). Furthermore, other than generic skills, work experience, and personal attributes employers also highlighted that initiative to develop a first good impression, CV preparation, and self-presentation at job interviews are all very important. However, most students seemed to lack the ability and drive to impress during this initial process. A frequent criticism was that the graduates or early employers often do not take time and effort to design employer-oriented CV's and some employers pointed out that some candidates often showed little interest to apply to their interviews and to conduct a background search on the employer or the organization, leading to unreasonable and unrealistic expectations (Kevin Lowden et.al,2011).

To add, another perception is viewed by the employers where the HEI's could do more to introduce and address employability skills across their various courses. It was noted by the employers that the universities showed less responsiveness and participation in meeting the demands and needs of employers and the labor market (Kevin Lowden et.al,2011).

Higher Education Institution's Perception On Employability Skills

It is not just an employer's duty to bring awareness skills amongst the graduates and students. Even educators or Higher Education Institutions play an equally critical role in helping improve student employment outcomes (Song Ju et.al, 2014).

If employers are the decision-makers while recruiting, then the educators should introduce and train the graduates and students, in the field of employability skills to meet the demands of the labor market and employers. Therefore, it also necessary to know the perspective or the perception of the HEI or the educators regarding prime employability skills (Song Ju et.al, 2014). That's how education provides marketable skills and skills that are relevant to work performance, and therefore the more educated professionals, the more successful; they will be in the labor markets, both in terms of earnings and employment opportunities (Kelebogile Paadi,2014). Nevertheless, in the 21st century, education institutions need to have new educational policies and changes. Moreover, they should also search for new partnerships between the HEIs and states that will help in providing more funds and also regulate HEI. Governments have therefore called on HEIs to play a significant role in advancing the capacity to provide better support to the students and graduates, particularly from the first generation, this can be done through creative partnerships with companies, industries, and communities and to be more adaptive and versatile in consideration with the curriculum (N Wakelin- Theron,2014). Though, whether higher education institutions could or should cultivate employability skills has become a topic of debate. Researchers argued that many of the employability variables are conceptual and prescriptive; they emphasized evidence that supports current theoretical proposals on employability (N Wakelin-Theron,2014). Courses at universities are frequently academically focused and centered entirely on subject knowledge and rather than also giving attention to work-related (Ekpoh Uduak,2015). The findings done by the (Ekpoh Uduak,2015) are not particularly unexpected, since there is a general uproar of low performing students in universities. It is additionally mentioned in the study that universities do not prepare the students in the terms business environment. The university graduates are poorly prepared for the job market as there is a discrepancy between the

university opportunities and training and education regarding the demands of the business employability needs. Likewise, there is also a disparity between the skills gained by the university graduates and those needed by the labour market. It was noted that current university undergraduate programs do not provide the kind of continuous learning and basic skills to excel in their careers (Ekpoh Uduak,2015). However, the challenge remains to find the most appropriate method include employability skills in the HEIs curriculum. Even though there is a debate about whether there exists a correlation between employability skills, development, and actual employment. The survival of the higher education institutions depends on their alumni whose future employment is subjected to the procurement of certain work knowledge (N Wakelin- Theron,2014).

Universities should re-vamp their courses per the labour market as this might help the young graduates in finding and maintaining the job quicker. Having a course taught that can be applied in the practical world will also boost the confidence in the graduates for applying to work (Ekpoh Uduak,2015). Kevin Lowden et.al,2011 agreed that the growth of employability skills and attributes in HEIs must also be incorporated in the curriculum. This indicates an integrative initiative on the part of all stakeholders to develop employability skills for the students. Universities should set up career advancement or development centers to put together graduates, employers as well as alumni (Nguyen Dahn Nguyen et.al 2005). Such career- development centers function as a channel of knowledge about the real working life of workers. Such centers may host special seminars to provide employable personal attributes for students seeking jobs (Nguyen Dahn Nguyen et.al 2005). Students must be subjected to HEIs interactions that build understanding, skills, introspection, and contemplation through effective education and learning, as this improves employability. It remains a fact, that the HEIs need to invest and promote more employability development among their students. It is also noted, that there can be a notable increase in the value of higher education institutions if they are regarded as relevant to the economy and the society by being independent of the government (N Wakelin-Theron,2014). In recent times, few higher education institutions' strategies for promoting employability skills and attributes in practice include help in career decision making or search for a job, enhancement of employability skills through university programs, internships, placements, and personal developmental planning. Internships were considered helpful for the students, and due to which, placements and internships are being used by universities to give valuable work experiences to students (Kevin Lowden et.al,2011).

A research study was done by Kevin Lowden et.al,2011 found out what do the representatives from the HEIs perceive as the skills, competencies, understanding, and quality that would develop employability in graduates. There was an accord among the HEIs on the attributes and competency which supported the employability of graduates. An HEI representative highlighted the 'graduate mindset' which placed value on the 4 E's, and these are •Enterprising, •Ethical, •Engaged diligently showing interest in education and student life, •Enquiring. Another HEI representative listed qualities, credentials, and expertise for the graduate's employability, and these are • Good oral and written communication skills, • Ability to use creativity and innovativeness in their work, • Independent, • Responsible, • Potential to solve a problem with creativity, • Time Management skills, • Teamwork and Team building skills. • Aware of markets and business, • Willingness to learn, •Inspired and Enthusiastic, • Prepared to work and • Presentation skills. The educators believed that they could help the students more than just little in training and development of employability skills. It can be observed that the perceived employability skills of the educators or HEIs are alike to the employer's perception of employability.

However, the conjecture is that the graduate's chances of acquiring employment do not only depend on or concern one stakeholder but also it should involve government, HEI, industries, and even students. This is because working as a team in this will help find a viable and feasible technique and resolution to the problem if unemployment in graduates. (Ekpoh Uduak,2015).

Human capital theory suggests that education improves the efficiency of students, thereby improving work performance (Kelebogile Paadi,2014). This is because education offers, marketable skills and attributes that can be applied in the practical world hence, more highly educated graduates are, more competitive and they would be in the job market, both in terms of income and job opportunities (Yuzhuo Cai,2012).

The University of Catalonia created a learning environment in which complexities of real-world professional background in the field of communication are replicated as a virtual internship, like teamwork, problem-solving, under restricted circumstances or deadlines, customer orientation, and so on. The objective of the agency is to provide graduates, with experiences that may be faced by them in the job market in the future. TUAS Wildau in Business Informatics, holds a bachelor's degree programs, every two weeks a representative from the company provide a task to students related to present market situations, through student team meetings and evaluate the results after stipulated time given for completion of the task. Moreover, experts are invited to present a lecture or introduce new policies or practices that have entered the market (Ardiana Orrnellas.et.al,2018).

Employee/Students Perception On Employability Skills

Young graduates and early employees face a lot of problems once they enter the world of work. This is simply because they lack generic skills demanded by the employers and find it difficult to maintain their employment due to a dynamic business environment that expects the workers to adjust accordingly. Due to which, it is important to find out the differences in the importance given to employability skills by graduates and employees in regards to their perception. The literature on the importance of employability skills perceived by students is limited but also inconsistent (Alex Tymon, 2013).

Graduate employability is multidimensional and involves academic success, career management skills, and knowledge of the labour market and workplace. Despite the widespread approach in the provision of employability skills in higher education, there are still discrepancies between the graduate job performance and the employer's requirement which exists. It is noticed that the employer expectations from the graduates are been met, hence it is significant to understand and also to be aware of student's perceptions regarding the employability skills and develop them accordingly. There are several reasons why it is required to also take into account a student's as well as an employee's perception of employability. Theoretically, having effective learning involves a clear understanding regarding the importance of the content and relevant activities displayed that can be improved by having a positive order which will give an obvious outcome. In addition to this, students who place a high emphasis on what they are learning can also affect their ability to pass learned skills through various contexts, for instance from university classrooms to the workplace. Furthermore, undergraduate awareness on the significance of that prompt better use of portfolios to demonstrate skills learned in future job applications, thereby boosting job prospects. Explicit awareness of the value of employability skills, and having translucent addition in the curriculum would boost the ability of students to express their competencies to the employers. As the business environment is dynamic the students and employees need to be aware of the rising need to distinguish themselves from the rest, in the labour market (Denise Jackson,2013).

It was noted that the employees face early employment problems as they are unsuccessful to meet the appropriate employer's requirements. The reasons identified the employees failed to meet the demands required by the employers were (i) lack of ability to use theoretical knowledge in application, (ii) report writing, (iii) poor communication with others, (iv) comprehension of responsibility, (v) inability to work in a team and (vi) personal reasons. The reasons followed by the problems noted by the graduates and entry-level employee were as follows: (i) lack of cooperation between the higher education institutions and employees,(ii) disinterest in the career, (iii) choice employment,(iv) insufficient job training, (v) absence of job description, (vi) lack of proper oral and written communication skills, (vii) lack comprehension of responsibilities,(viii) temperament of the employee/graduate,(ix) job environment,(x) family background, (xi) gender discrimination and (xii) compensation. Further, it has been discussed that the graduates or students have not been properly introduced to and developed employability skills by the higher education institutions (Clarke Marilyn, 2008).

Many graduates have a powerful economic driver. They understand the importance of employability skills, and that a degree may not alone be appropriate. In recent times as there has been an increase in literacy rates all over the world, this has led to the surplus supply of graduates this makes it difficult to start for their career. This is illustrated by increasing unemployment among graduates, increased competition among the graduates, and a greater degree of uncertainty about what graduates should expect from higher education (Marie-Pierre Moreau and Carole Leathwood,2006). Due to an increase in competition between the graduates, this has also led to the change in an employer's perception and expectations in the labour market. A degree, once a perk or differentiator, is now often treated as a requirement for a career, particularly in industries that may have not have needed a degree at the entry-level in the past (Michael Tomlinson 2008). Therefore, graduates are constantly conscious of the need for specific qualifications and qualities for job progress (Alex Tymon, 2013). This can also be seen in research by Michael Tomlinson et al.,2008, where the students felt that, the degree had lost its distinguishing significance, and that there was a need to improve their employability broader. Higher education students find themselves in a competitive market, with an increasing supply of graduates joining the job force with common profiles and jobs. The difficulty confronting students is to achieve a comparative edge in a dynamic job market where workers are focus on academic qualifications.

Further, the similarity was identified between students' perceptions and literature in terms of abilities and personal qualities aligned with employability. Communication, information technology, coordination in team building and teamwork, and scheduling and organizing were the most widely mentioned abilities. The personal attributes accepted included versatility, adaptability, working hard, determination, and devotion. The personality characteristics that students considered to be important to their professions are individuality or creativity, constant learning, professionalism, self-confidence, and self-motivation (Beverley Jackling and Claude Calero,2006). In a research study, it was observed that personal abilities such as independent thinking, innovation and creativity, and versatility were

ranked as the most important skills, for development in career by the graduates and the employees (Beverley Jackling and Paul De Lange,2006). Moreover, employers suggested solutions for early employability problems faced, which were also supported by employers. This were:(i) including training as part of the curriculum, (ii) focus on written communication, (iii) development of oral and written communication, (iv) workshops and seminars for introducing problem-solving. (v) motivating in the group projects and (vi) provision of professional practical advice (Yet-Mee Lim et.al,2016). In addition to this, the graduates appeared to regard extra-curricular activity at the university and job experience rather than their degree, as adding them into their CV's is like brownie points to help in maintaining their jobs (Kevin Lowden et.al,2011).

Though there might exist a minor difference in thoughts and perception, it was gladdening to have that there appears to be a strong convergence between the employer, HEIs, and employees/graduates in their perceptions of employability skill. Furthermore, it was fortunate that the students/employee and higher education institutions are aware of the fact that there seems to be of greater importance given to employability skills in today's world.

Conclusion

Many students, graduates, employees, HEIs, and employers want higher education institutions to include employability skills in the curriculum. It can be further observed that graduates/employee reveal that workshops, seminars, job training, internships held by higher education institutions and companies helps in development in employability skills, and also benefits their job position. Many of the employees and young graduates are aware that a degree or qualification alone, may not be sufficient to maintain a job, and that with increasing competition in the labour market, it is equally important to have generic or soft skills as this will also help in better development of bio-data. Though the employees have mentioned the difficulties they face in early employability, it was also stressed by them that having enough motivation, creativity, independence, and being committed can help in maintaining the job.

Higher education institutions are seen as the middleman in helping reach a congruence that would teach the importance of employability skills that will help in increasing the opportunity for the job seeker and the job provider to match accordingly. It was emphasized that higher education institutions should update their course where the theory taught is based and used in the practical environment. Thus, this will help exalt the graduate's confidence. Universities providing internships, career development centers, etc gave positive results, as this helped to gain perception and experience on employability skills to the graduates. It was also suggested that higher education institutions should indulge themselves in partnerships, as this will help the universities to keep in touch with the labor market, and bring about changes in their curriculum accordingly.

Labour market needs are created by employers. As the business world is dynamic and there is an increase in the competition this results in to change in demands and needs by the employer. It was stated by the employers that, though having a good qualification or degree is important, the development of generic skills and the ability to apply theoretical knowledge in an application is also equally important. Employers have specified clearly on what set of employability skills do they search for in an employee, though there does not exist a common definition of employability skills. They require the employees to have technical skills as well as a broader range and concept of personal and generic attributes and skills. The literature on graduate employability discloses, that the employers and the HEIs need to work together to develop strategies that help in contributing to graduate employability.

There were also good practical practices in real-life that were identified, where it was shown how the universities have started to introduce the work environment to the students, by inviting professionals or experts and conducting virtual internships that give real-life experiences to the students and thereby, simultaneously exalting their employability skills.

This literature review has highlighted, the significance of how the employability skills in the practical world and how can be included and developed, to be introduced to the graduates. On how the universities should be able to link academic as well as employability in the curriculum. Moreover, it has identified the different perceptions of the stakeholders and, the challenges faced by the employers as well as the employee in the light of lack of employability attributes. This has also provided possible solutions to the challenges that can be overcome. All the stakeholders should work together as a team to help the future generation to support the benefits of seizing the complete skills, for personal development as well.

Abstract

The article describes and analyses the economic security of the territories of the Southern Federal District of the Russian Federation and its place in the Russian economy. State activity in the study of the subject of economic security of the region has been noted. The indicators for the study of the economic security of the territories have been grouped into four main blocks: innovation, industry, social and economic. The result is a multi-dimensional grouping of the regions of the Southern Federal District according to the parameters of the socio-economic situation of the constituent entities of the Russian Federation, broken down by these groups of economic security indicators. Interregional inequalities in the research district have been identified and a number of problems and priorities for economic development have been identified.

Keywords: economic security, gross regional product, cluster analysis, Southern Federal District (SFD), regions.

JEL Classification Codes: E7.

Introduction

In the Russian Federation, the economic security strategy is being implemented through the consolidation of efforts by federal State authorities, State authorities of the constituent entities of the Russian Federation, local government bodies, the Central Bank of the Russian Federation and civil society institutions. The functions of these institutions include ensuring economic security in order to protect national interests, implementing the strategic national priorities of the Russian Federation, monitoring and assessing the state of economic security, and formulating State policy and legal regulation in the analysis and forecasting of socio-economic development.

KHAKIMOVA "Economic Security Study of The Territories of The Southern Federal District of The Russian Federation" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Materials and Methods (materials for usage, description of the subject area, methods and techniques of research)

To assess the level of economic security, according to the Presidential Decree of May 13, 2017 № 208 "On the Strategy of Economic Security of the Russian Federation for the period until 2030", use criteria, a number of which are accumulated at the regional level. The authors have grouped the indicators by the following blocks (table 1).
The information and empirical base of the research includes legislative and regulatory documents of federal and regional significance, data of the Federal State Statistics Service for the Southern Federal District (SFD). The results of the conducted research are also based on the data obtained in the course of the authors' scientific work and conclusions (Federal State Statistics Service, 2020).

Table 1: Groups of indicators for studying the economic security of the territories of the Russian Federation

Economic block of indicators	Social block of indicators	Innovative block of indicators	Industrial block of indicators
GRP physical volume index	Unemployment rate of population aged 15-72 years by regions of the Russian Federation	Expenditures on technological innovations of organizations by type of innovation activity by regions of the Russian Federation	Production index by type of economic activity "Extraction of mineral resources" by regions of the Russian Federation
Gross regional product per capita	Number of victims of fatal industrial accidents	Advanced production technologies developed by the subjects of the Russian Federation	Index of industrial production by subjects of the Russian Federation
State debt of constituent entities of the Russian Federation and municipal debt	Level of participation in the labor force by regions of the Russian Federation	The share of products of high-tech and knowledge-intensive industries in the GRP of the constituent entity of the Russian Federation	Producer price indices for the economic activity "Production of manufactured goods" for the constituent entities of the Russian Federation as a whole in accordance with OKVED-2
GRP energy intensity	The number of people with monetary incomes is below the minimum subsistence level for Russia as a whole and for the constituent entities of the Russian Federation	Information about the use of intellectual property objects by subjects of the Russian Federation	Share of investments in fixed assets in GRP
Retail trade turnover	The share of employees of organizations with accrued wages is lower than the minimum subsistence level of the able-bodied population in Russia as a whole and in the constituent entities of the Russian Federation	Share of internal expenditures on research and development in GRP	Share of investment in machinery, equipment and vehicles in the total amount of investment in fixed capital for reconstruction and modernization, by constituent entities of the Russian Federation

The Results

A study of economic security indicators in these blocks will be carried out using the example of the Southern Federal District (UFO), which is one of the federal districts of the Russian Federation that was formed in 2000. Within the district there are 8 subjects: Republic of Adygeya, Republic of Kalmykia, Republic of Crimea, Krasnodar Krai, Astrakhan region, Volgograd region, Rostov region, Sevastopol. Before 2010 the district included

13 subjects, in January 2010 the North-Caucasian Federal District was separated from the district. Since July 2016 the Republic of Crimea and the city of federal significance Sevastopol have been included in the district. The center is Rostov-on-Don. The SFD covers an area of 447,800 square kilometers (2.61% of the RF territory). The population of the district as of January 1, 2019 is 16 454 550 people. (11.21% of the Russian Federation population).

The trends in the indicators of the economic block are presented in table 2. The volume index shows how the volume of GRP has increased (excluding the effects of price changes). In 2019, the volume of GRP of the Southern Federal District decreased by 7.8 p.p. (by 7.09%) and in 2019 it was 102.3%. In 2010, the volume of GRP of the Southern Federal District decreased by 7.8 p.p. (by 7.09%). In all subjects of the Southern Federal District, the volume index of GRP decreased in 2019 compared to 2010, except for the Astrakhan region, where the index increased by 4.2 p.p. In 2019 compared to 2018, in all subjects of the Southern Federal District, except for the Astrakhan region, the index also decreased, the highest in the Republic of Crimea (by 2.3 p.p.). In Volgograd region - the only region of the Southern Federal District - the GRP physical volume index in 2019 was less than 100%, namely, 99.2%. The gross regional product (GRP) per capita in 2019 compared to 2010 increased by 233,374.6 rubles (3.1 times) and in 2019 amounted to 347,460.4 rubles. During the period under review, the largest increase was in the Astrakhan region (4.4 times), amounting to 44,784.72 rubles, which is generally the maximum in the Southern Federal District in 2018, and to the least extent in the Republic of Crimea (since 2015 by 2.2 times) and amounted to 216 792.53 rubles. In all subjects, there is a positive trend of growth in the indicator.

Table 2: Indicators of economic security of the Southern Federal District in the context of the economic block in 2019

Russian subject	GRP per capita, rubles / person (x2)	Retail trade turnover, million rubles (x5)	GRP energy intensity, kg conv. fuel / for 10000 rubles (x4)	GRP physical volume index,% (x1)	State debt of constituent entities of the Russian Federation and municipal debt (x3)
Southern Federal District	347 460,37	3 290 219,3	174,49	101,30	426629,60
Republic of Adygea	234 548,72	95 164,4	128,62	96,20	390121,53
Republic of Kalmykia	258 607,32	21 333,1	257,33	100,35	2081220,04
Republic of Crimea	216 792,53	256 198,0	292,29	100,01	1368223,05
Krasnodar region	425 666,88	1 368 124,7	157,7	98,79	12814743,29
Astrakhan region	444 784,72	173 405,1	129,09	102,77	4939794,50
Volgograd region	323 011,58	389 565,0	165,45	101,70	9067034,12
Rostov region	340 200,11	920 765,6	275,79	101,19	20173889,58
Sevastopol	193 968,10	65 663,4	77,87	102,29	5849912,92

In 2019, compared to 2010, the volume of internal public debt of the Southern Federal District increased by 219,897,894.1 thousand rubles (19.4 times) and amounted to 231 870 832.6 thousand rubles. The volume of the external public debt of the Southern Federal District for the period under review was fully repaid, amounting to 631,064.6 thousand rubles in 2019. This is due to the fact that in 2010, the district comprised more regions, and the external debt of the Republic of North Ossetia accounted for the entire external debt of the Southern Federal District. The amount of debt owed by the municipalities of the Southern Federal District in 2019 was 29,652,170,6 thousand rubles (5.1 times) in comparison with 2010 and amounted to 36,847 753.2 thousand rubles.

GRP energy intensity is used to assess energy efficiency of national economies. In the period from 2010 to 2019, the energy intensity of all subjects of the SFD has decreased. The indicator has decreased most of all in the Republic of Crimea (by 80.69% since 2014), the lowest in the Republic of Adygeya (by 29.09% since 2014). The

highest energy intensity of GRP in 2019 is observed in Volgograd region (149.13 kg of fuel equivalent/10 thousand rubles), the lowest - in the Republic of Crimea (48.35 kg of fuel equivalent/10 thousand rubles).

Compared to 2010, retail trade turnover in 2019 increased by 2,366,220.2 million ruble (by 3.6 times). Over the reporting period, it increased most in Krasnodar Krai by 989,786.3 million ruble (3.6 times). In all subjects of the SFD, the positive trend of growth of the indicator in 2010-2019 was maintained.
Trends in the social block indicators are presented in Table 3.

Table 3: Indicators of economic security of the Southern Federal District in the context of the social block in 2019

Russian subject	Unemployment rate of population aged 15-72 years by regions of the Russian Federation (x6)	Level of participation in the labor force by regions of the Russian Federation (x8)	The number of people with monetary incomes is below the minimum subsistence level for Russia as a whole and for the constituent entities of the Russian Federation (x9)	Number of victims of fatal industrial accidents (x1)	Number of victims of fatal industrial accidents (x10)
Southern Federal District	5,50	67,00	15,17	105	6,80
Republic of Adygea	8,50	59,90	13,15	4	9,70
Republic of Kalmykia	9,40	67,30	24,94	1	9,80
Republic of Crimea	5,60	63,80	15,79	11	7,30
Krasnodar region	5,10	68,40	10,40	39	4,50
Astrakhan region	7,40	68,30	16,65	1	11,40
Volgograd region	5,50	68,00	14,17	14	6,60
Rostov region	5,00	66,80	13,49	34	9,10
Sevastopol	3,50	66,80	12,80	1	1,30

The unemployment rate of the population aged 15-72 in the Southern Federal District decreased by 1.4 percentage points between 2010 and 2019 and amounted to 5.6% in 2019. Over the period under review, the indicator decreased in all subjects of the district, the highest in the Republic of Kalmykia (by 4.8 p. p., the lowest in Volgograd region (by 0.7 p. p.). Despite this, in 2019 the highest unemployment rate was observed in the Republic of Kalmykia (9.7%), and the lowest - in Sevastopol (4.3%).

The number of fatal workplace accidents in the Southern Federal District in 2019 decreased by 132 persons compared to 2010 (55.7%) and in 2019, it was 105 persons. Six of the eight subjects from the district experienced a decline in the number of fatalities, most notably in the Rostov region and the Krasnodar region (by 23 and 22 persons, respectively, 40.4 and 36.1 %). The number of victims in Adygea increased significantly, by a factor of 4 times in 2019 compared to 2010 (by 3 persons). The highest number of victims in both 2019 and 2010 was recorded in Krasnodar Krai (39 and 67 persons, respectively). In 2010, the highest number of victims was recorded in Krasnodar Krai.

The level of labor force participation in the Southern Federal District in 2019 compared to 2010 increased by 2 p.p. and amounted to 66.8% in 2019. In all subjects, with the exception of the Republic of Adygea, the Republic of Crimea and the Sevastopol, the value of the indicator increased. In these regions, the level of labor force participation decreased by 1.7, 1.6 and 0.8 p.p., respectively. The indicator increased to the greatest extent in the Krasnodar Territory - by 4 p.p. In 2019, the lowest level of participation in the labor force strength is observed in the Republic of Adygea (60.1%), the greatest - in the Astrakhan region (68.2%).

The population with money incomes below the subsistence level in all constituent subjects of the Southern Federal District decreased in the period 2010 - 2019, with the exception of the Volgograd region, where the share of the population with money incomes below the subsistence level increased by 0.9 p.p. In 2019, the Republic of Kalmykia has the largest population with monetary incomes below the minimum subsistence level and accounts for 24.2% of the total population of the subject, while the smallest population in Krasnodar Krai accounts for 10.9% of the total population of the subject.

The share of employees with accrued wages below the minimum subsistence level of the working population in the South Federal District in 2010-2019 fell from 31.5% to 10% (by 21.5 p.p.). All regions of the district saw a decline in the indicator, with Rostov region falling the most (by 24.1 p.p.). In 2019, the Republic of Kalmykia (16.2%) recorded the highest share of workers with accrued wages below the minimum subsistence level of the able-bodied population, and Sevastopol (2.3%) - the lowest. Trends in the industrial block indicators are presented in Table 4.

Table 4: Indicators of economic security of the Southern Federal District in the context of the industrial block in 2019

Russian subject	Production index by type of economic activity "Extraction of mineral resources" by regions of the Russian Federation, (x16)	Index of industrial production by subjects of the Russian Federation, (x17)	Producer price indices for the economic activity "Production of manufactured goods" for the constituent entities of the Russian Federation as a whole in accordance with OKVED-2, (x18)	Share of investments in fixed assets in GRP, (x19)	Share of investment in machinery, equipment and vehicles in the total amount of investment in fixed capital for reconstruction and modernization, by constituent entities of the Russian Federation, (x20)
Southern Federal District	106,20	102,90	107,40	25,30	25,30
Republic of Adygea	134,10	100,50	114,40	18,55	15,00
Republic of Kalmykia	123,70	97,30	80,00	14,10	1,80
Republic of Crimea	171,10	117,40	112,10	135,28	5,80
Krasnodar region	91,00	103,20	113,70	19,76	23,50
Astrakhan region	114,30	102,60	89,50	32,66	33,50
Volgograd region	94,00	101,00	102,50	25,81	34,60
Rostov region	87,80	101,20	111,00	22,27	28,20
Sevastopol	44,70	113,40	110,80	234,13	7,70

Production index by type of economic activity "Extraction of mineral resources" increased 13.7 p.p. in the Southern Federal District in 2019 compared to 2018, and in 2011, compared to 2010, it decreased by 3.1 p.p. In 2019, the

Volgograd Region increased by 6.2 p.p. to the greatest extent compared to 2018, and decreased by 6.3 p.p. to the greatest extent in the Republic of Kalmykia.

Index of industrial production takes into account changes in the physical volume of products manufactured, as well as working hours and energy consumption. In 2019, compared to 2018, the volume of industrial production in the Southern Federal District increased by 5.7 p. p., and in 2011 compared to 2010 – by 2.5 p.p. The largest increase among entities in 2019 as compared to 2018 was in Rostov region - by 9.7 p.p., and it decreased only in the Republic of Kalmykia (by 1.3 p.p.).

Producer price index is an indicator of the average level of price changes for raw materials, materials and goods of intermediate consumption relative to the base period. In 2019, as compared to 2018, the average price level for industrial goods in the Southern Federal District increased by 10 p.p. In all subjects of the district there was a positive trend of growth of the indicator in 2019, the highest - in Sevastopol (by 20.7 p. p.).

The share of investments in fixed assets in the gross regional product of the Southern Federal Product in 2019 is 26.4%, which is 0.5 p. p. less than in 2018 and 5.6 p. p. less than in 2010. The highest share of investments in fixed assets in GRP among the subjects was recorded in the city of Sevastopol and makes 86.8%, and the lowest - in the Republic of Kalmykia and makes 14.9%.

In 2018, the share of investments in machinery, equipment, transport vehicles in the total volume of investments in fixed assets aimed at reconstruction and modernization in the Southern Federal District made 26.0%, which is 1 p.p. less than in 2017 and 3.1 p.p. less than in 2007. Among the subjects of the district the highest share of investments was recorded in the Volgograd and Astrakhan Regions (36% and 34% respectively), and the lowest - in the Republic of Kalmykia (2.2%).

Trends in the innovation block indicators are presented in Table 5.

In 2019, compared to 2010, expenditures on technological innovations of organizations in SFD increased by 28,461.7 million rubles (3.3 times) and in 2019 totaled 1,472,822.3 million rubles, up 67,837 million rubles from 2018. During the period under review, this indicator increased in all subjects of the district, the largest - in the Rostov region by 15,377.0 million rubles (by 4.7 times), the smallest - in the Republic of Kalmykia, by 9.7 million rubles. (2.1 times). In 2019, the largest and lowest expenses for companies' technological innovations were recorded in the Rostov region and the Republic of Kalmykia (19,588.4 million rubles and 11,575.5 million rubles, respectively).

The advanced production technologies developed in the period 2010 - 2019 in the Southern Federal District increased by 88 units (4.5 times) and in 2018 amounted to 113 units, which is 34 units more than in 2017. Throughout the period under review, production technologies were developed only in the Krasnodar Territory and the Rostov Region. In other subjects of the district technologies were either not developed at all (Republic of Adygeya), or were developed with variable periodicity (Astrakhan and Volgograd regions), or began to be developed in the last 2 - 3 years (Republic of Kalmykia, Republic of Crimea, Sevastopol). The largest number of developed advanced technologies in 2019 is observed in the Republic of Kalmykia (45 units), the smallest - in the Republic of Crimea (1 unit).

The share of high-tech and knowledge-intensive industries in the gross regional product in the Southern Federal District slightly increased in 2019 as compared to 2010 from 16.7% to 17.5% (by 0.8 p.p.). In 2019, the largest share of high-tech and knowledge-intensive industry products among the Southern Federal District is observed in the Republic of Crimea and Sevastopol (25.2% and 27.5%, respectively), and the smallest - in Astrakhan region and the Republic of Kalmykia (11.6% and 11.0%, respectively). These are the only regions where the share of high-tech and knowledge-intensive industry products in the gross regional product decreased over the period under review.

Intellectual property objects include inventions, utility models, industrial designs, databases, computer programs and integrated circuit typologies. In 2019, compared to 2010, the use of computer programs in the Southern Federal District increased significantly - by 152 units (5.3 times); the use of industrial designs practically did not change - it increased by 13 units. In 2019, the Southern Federal District uses inventions most (312 units), databases least of all (31 units). During the whole period under consideration, no integrated circuit typologies were used in the district.

Table 5: Indicators of economic security of the Southern Federal District in the context of the innovation block in 2019

Russian subject	Expenditures on technological innovations of organizations by type of innovation activity by regions of the Russian Federation (x11)	Advanced production technologies developed by the subjects of the Russian Federation, (x12)	The share of products of high-tech and knowledge-intensive industries in the GRP of the constituent entity of the Russian Federation (x13)	Information about the use of intellectual property objects by subjects of the Russian Federation (x14)	Share of internal expenditures on research and development in GRP (x15)
Southern Federal District	1916,03	130	16,70	998	0,45
Republic of Adygea	355,59	0	15,39	0	0,29
Republic of Kalmykia	0,00	33	11,38	0	0,08
Republic of Crimea	0,00	1	19,68	43	0,54
Krasnodar region	484,68	45	13,72	120	0,22
Astrakhan region	3,20	5	9,23	41	0,11
Volgograd region	746,94	1	17,96	281	0,43
Rostov region	325,62	20	22,21	525	0,96
Sevastopol	0,00	16	20,97	1	1,34

The share of internal expenses for research and development in the gross regional product of the Southern Federal District in 2019 is 0.46%, which is 0.01 p.p. less than in 2018 and 0.10 p.p. less than in 2010. Among the subjects of the district, the largest share of internal expenses for research and development in GRP was recorded in Sevastopol - 1.22%, and the smallest share - in the Republic of Kalmykia (0.08%). The largest share of development costs in GRP over the period under review was also observed in Rostov region - from 2010 to 2018 it was more than a percent, but in 2019 it is 0.96 percent of GRP.

For the further analysis on the considered 20 factors the matrix of pair correlation coefficients was used (the significance of coefficients was checked by the Student's criterion).

To build a regression model, the unemployment rate was chosen as a dependent variable, since from the point of view of the level of economic security of the region, the successful process of market economy formation is reflected in the employment sector. The state of the social sphere of the country is an important factor of effective economic policy. According to the matrix of paired correlation coefficients, it can be concluded that statistically significant factors affecting the unemployment rate are: number of fatalities in industrial accidents with loss of capacity to work for one working day or more, workforce participation rate, the share of population with monetary income below the minimum subsistence level, the number of intellectual property objects, production index by type of economic activity "Extraction of mineral resources" and Share of investments in fixed assets in GRP.

Test the relevance of the model parameters using the t-Student criterion. All parameters except variable x_{14} (production index by type of economic activity "Extraction of mineral resources"), are significant, since the values

of the t-statistics of these variables are greater in absolute value than the critical value $t_{кр}$= 1,890. Create a regression model based on significant indices (Table 6).

Table 6: Coefficients of parameters of the regression model

	Coefficients	t-statistics
Y- crossing	15,032	5,591
x7	-0,043	-3,955
x8	-0,120	-2,807
x9	0,152	4,261
x14	-0,005	-3,742
x19	-0,051	-10,192

The coefficient of determination is 99.32%. The quality of the regression model is good, so create a regression model based on these parameters:

$$y = 15{,}032 - 0{,}043 * x_7 - 0{,}120 * x_8 + 0{,}152 * x_9 - 0{,}005 * x_{14} - 0{,}051 * x_{19}$$

The increase in the number of victims of fatal industrial accidents with loss of capacity to work for one working day or more leads to a decrease in unemployment by 0.043 p.p. If the level of participation in labor force increases by 1 p.p., the unemployment rate decreases by 0.120 p.p. When the share of population with monetary incomes is reduced below the minimum subsistence level by 1 p.p., the unemployment rate decreases by 0.152 p.p. The growth of the number of intellectual property objects by 1 unit leads to the reduction of unemployment rate by 0.005 p.p. While increasing the share of investments in fixed capital in GRP, the unemployment rate decreases by 0.051 p.p.

To classify the regions according to the level of economic security, use the Curved Elbow method to determine the optimal number of clusters and then the Ward method to directly cluster. The elbow method revealed that the optimal number in the Southern Federal District is 2 clusters. This is largely due to the small number of subjects in the district (even taking into account the entry of the Republic of Crimea and the Sevastopol into the district in 2014) and their close proximity to each other, as well as general socio-economic and climatic trends. Thus, the regions were distributed as follows: 1 cluster - regions with high level of economic security; 2 cluster - regions with low level of economic security. The group of regions with high level of economic security included all regions of the district, except for the city. Sevastopol, which is characterized by a low level of economic security indicators (Lukovtseva A.K., 2012; Popkova, E.G., Popova, E.V., Sergi, B.S., 2018).

However, if the optimal number of 3 clusters is taken into account, it can be seen that economic security is high in the Republic of Adygeya, Republic of Kalmykia, Republic of Crimea and Astrakhan region are characterized by a high level of economic security. The average level of economic security is observed in Krasnodar Krai, Volgograd and Rostov regions. The region with a low level of economic security in 2019 is the Sevastopol (fig.1).

Fig. 1: Clustering regions of the Southern Federal District in 2019 into 3 clusters using the Ward method

Based on the analysis, it can be concluded that the Southern Federal District is characterized by a differentiation. In general, Krasnodar Krai, Astrakhan Region, take the leading positions. The differences in classifications are largely explained by the fact that the region includes the Republic of Crimea and the city of Sevastopol, and since 2010 additional indicators affecting economic security have been taken into account (Babanov E.A., 2020; Bogoviz, A.V., Sergi, B.S,. 2018; Popkova, E.G., Sergi, B.S., 2018).

The Conclusion

In general, the Southern Federal District has the largest number of grant-based entities, and all of its republics have depressed economies. The socio-economic situation is aggravated by the many problems that need to be solved within the framework of State support for the socio-economic development of the constituent entities of the Russian Federation and for the implementation of special federal programs, including the federal program «South of Russia». The most important aspect of the qualitative improvement of the productive forces is to make the most of the natural and socio-economic advantages of the district and, on this basis, it is necessary to develop those economic activities, which have no prerequisites or opportunities in other regions or whose development there is less. Special attention should be paid to the development of resort, recreation and agro-industrial complexes.

Abstract

Patent landscapes are a modern tool for analyzing and presenting the results of patent research using innovative visualization technologies. Work on patent landscapes - patent mapping (patent mapping) - includes statistical and intellectual analysis of patent documents in order to make a picture, reflecting the technical and legal status of technological developments in a given field of technology in a particular region or worldwide. The article provides information on the use of the patent landscape as a tool of state order planning in the Russian Federation.

Keywords: State, Intellectual Property, Problems, Innovation, Innovative Economy, Scientific Potential, State Regulation.

JEL Classification: O 34

Introduction

The patent landscape consists of a variety of analyses, including trends and areas of intensive patenting, areas of high technological competition, monopolization, open patent segments, and profiles of leading patent holders and authors of inventions. Patent landscapes can be developed for both a broad subject area and a narrow subject area. In this study, we will look at the patent landscape as a tool for public order planning.

Findings

In the course of the work, the data on completed and planned public procurement in 2019-2020 (Regulations on the State Patent Fund (2020) accompanied by contracts including provisions on the transfer of the results of intellectual activity (RIA) to the customer were analyzed, the results of which were concluded: That a refundable transfer of the results of intellectual activity to a State customer takes place as a consequence of:

Cite this Article as: Elena V. SIBIRSKAYA, Lyudmila V. OVESHNIKOVA, Galina Y. GAGARINA, Olga N. SIMAKHINA and Evgenia V. SIMONOVA "Patent Landscapes as A Tool for Determining Science and Technology Priorities in Government Contracts" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

– placing a State order directly for the purpose of creating intellectual property and carrying out legally significant actions against them;

– the placement of a State order for the creation of material objects, the secondary result of which is the transfer of intellectual property rights to the customer.

At the same time, the amounts of budget funds allocated for those and other purposes are economically significant and comparable for the customer and the contractor, although their specific values can vary greatly depending on the specific industry.

Depending on the planning methods of the state order and the methods of forming the documentation, it is possible more or less effective development of budget funds by each state customer, ultimately expressed in the annual national indicator of budgetary savings, illustrating the release of significant (tens and hundreds of billions of rubles) budget funds relative to the approved budget appropriations (Order of Rospatent dated July 22, 2020).

At the same time, the contractual system allows for the use of different methods of technical evaluation of products during the placing of a State order, and the relevant procedures can be carried out both at the planning stage, and in the final stages of the procurement to review the actions and their results (figure 1).

Fig. 1: Stages of government procurement

When conducting patent research for government orders, as a rule, they operate not with data on products, but with data on titles of protection based on the parameters contained only in them. WIPO's[1] Guide and Recommendations on Patent Landscapes[2] operate on «traditional» data categories, which include data from security documents, including names of authors, rights holders, dates, descriptions, formulas. Their automated analysis requires solving fundamental problems when working with information. The lack of access to the technologies for solving the mentioned problems leads to the need to maintain a staff that analyzes the values of the parameter «applicant» manually.

The development of a methodology for the use of patent landscapes in public contracting is being carried out with a view to ensuring its universality and applicability outside the sphere of public contracting without substantial modifications. Under this objective, official documentation system (ODS) provides objective, easily accessible and structured information (Order of Rospatent dated 02.07.2019 (2019); Order of Rospatent dated 10.01.2019 (2019); Order of Rospatent dated December 29, 2018 (2018); Order of Rospatent dated December 25, 2018 (2018); State standard 34.003-90 I (1990).

The Unified Information System (UIS), selected as the main ODS, and its most harmonized information part: data on actions carried out in accordance with the procedures regulated by the Law on the Contractual System, referred to in this work by the Acts are:

– a model of the economic relations that have developed in various areas in the territory of the Russian Federation, based on data on the economically sound behavior of real-world economic entities;

– an unified and publicly accessible database, published in the UIS in the public domain, accompanied by strict reporting, the violation of which entails disciplinary and administrative liability;

[1] World Intellectual Property Organization // URL: http://rosvois.ru/ (Date of referral 03.09.2020)

[2] The methodology for the development of the patent landscapes of the PHIPS Project Office // https://ww1.fips.ru/vse-zlugigi/patenty_analytics/metodologiya-razrabotki-patentnykh-patentshaftov-proektnogo--lyisafips.php (Date of referral 03.09.2020).)

– goods-oriented system: the main units of accounting in the UIS are goods and their characteristics, it is at this stage that the terms «patent landscape» and «market of public procurement» should be used. The definition of the characteristics of the goods to be procured forms the basis of control in procurement.

In order to visualize the relationships between the «patent landscape» and the «market» the geographical layer is included in the cube as a set of objective variables capable of being matched both with the place (geography) of creation of technical solutions, and with the product boundaries of the «market». The application of the patent landscape over a geographical layer in this work is used solely to demonstrate the implicit relationships of the databases already linked by the data in the objective category of geographical data, and is not an essential characteristic of the proposed methodology, meaning that all the methods presented can be performed without geographical limits.

On the other hand, it is difficult to overestimate such information as the place of origin of products and the different actions of economic systems, and the use of the geographical layer is therefore welcome.

Imagine a mechanism for comparing cubes by geographic information (Figure 2), which can be represented both as a cube face and as a column set in a database.

This illustrates the following:

– firstly, the comparison of the cubes by the «common» face, which is geographical information (geographical longitude and latitude), makes it possible to compare the other faces of the cubes with each other as basic (acts) as well as secondary legislation, including the averages described earlier, which in turn are descriptive measures;

– secondly, the diversity of different relationships can be constructed on the basis of a two-dimensional table.

Separately, the already voiced problem of ignoring the most objective data should be illustrated by the example of compiling the columns «Geographic information» (Figure 3).

When choosing parameters, the creator of the database, as well as when choosing the parameters of the RIA Database, is faced with the question of the need to store geographic information as spherical coordinates or as textual indications of state administrative divisions (for example, in the form of names of subjects of the Russian Federation).

In accordance with the principle already voiced, it is necessary to make a choice in favor of storing information in more objective data - in geographical coordinates, which, if necessary, give an idea of both the state and the element of the administrative structure of the state in which the recorded act took place, that is, it is more universal for practical application by the parameter of the Act.

It is possible to use fictions, such as storing, if accurate graphical coordinates cannot be taken into account, the geographical centers of objects, including elements of the administrative and territorial organization.

The most significant advantage is that this form of geographic data recording, even using fictions, makes it possible to calculate distances between objects without transforming them (Figure 4). This will provide quantitative data that can be used in analytical techniques, including the calculation of the average distance between factors.

On the other hand, the advantages of using objective geographic data make it possible to make an assumption about the prospects of converting the data on geographic objects contained in the ODS into more objective ones, for their comparison, for example, about the prospects of converting the data in the «customer subject» column into geographic coordinates (Figure 5).

Obtaining objective and comparable data and taking them into account in the database makes it possible to calculate statistics for the overlapping of numerous layers (creating new faces of the «Cube»), for example, if the Technological situation is superimposed on a geographical layer for solving different problems, including the assessment of the remoteness of technopolises from the factors: RIA creators and companies willing to purchase them.

Based on the results, information was obtained that industrial parks on the territory of the Novosibirsk region are concentrated in relative proximity to each other (the territory of the city of Novosibirsk, on the territory of the Novosibirsk academic town), while the consumers of the products are evenly distributed throughout the territory of the constituent entity of the subject of the Russian Federation, including those located at a considerable distance apart.

The absolute value obtained from the most distant supplier (390 km) is not in itself significant and cannot provide data to assess the Technological Situation. However, it is possible to calculate descriptive indicators, one of which is the average distance of suppliers and customers to the nearest innovation center.

After obtaining the simplest statistical indicator (trend measure) of the average distance of consumers of products from the creator of the RIA, it is possible to use it in objective (significant) economic and statistical studies and as a face of Cuba (Figure 6).

Conclusion

Patent landscapes have established themselves at the Russian and global levels as a comprehensive and multidisciplinary tool for determining scientific and technological priorities and researching the competitiveness of promising technologies, products and services intended to bring products to key markets.

The systematic and mass application of the methodology for the development of industrial and express patent landscapes presented in this article will ensure the formation of an effective infrastructure of expert and analytical support for new tools of corporate and state policy for the development of new industries and the coordination of promising technological projects, as well as the formation of fundamentally new markets and the creation of conditions for of the global technological leadership of Russia.

Review of The Infrastructure Reconstruction Process in Cambodia

Tomasz LUKASZEWSKI

University of Szczecin, Poland
tomasz.lukaszewski@usz.edu.pl

Kerry SLATTERY

National University of Management, Phnom Penh, Cambodia
kerryslattery@num.edu.kh

Abstract

For almost thirty years Cambodia has been rebuilding and expanding the infrastructure destroyed during decades of war, and striving to improve the quality of services provided by these facilities. The success of the measures taken is a prerequisite for achievement of the strategic goals including poverty alleviation and raising the citizens living standards, as well as maintaining economic growth and ensuring further development of the country.
The article presents an assessment of progress in reconstruction across various sectors of physical infrastructure such as roads, railways, telecommunication networks, water supply facilities, irrigation systems, and electricity supply facilities made in Cambodia between years 1991-2018.
The aim of the study is to evaluate the achieved level of development of the infrastructure assets in relation to its initial state, to the objectives adopted and to the expenses incurred for this purpose.

The research used descriptive method and quantitative data obtained from documents published by public entities.

Keywords: Infrastructure, Cambodia, Development, Public Investment, Private Investment.

Introduction

Thanks to combination of factors such as stable macroeconomic, preferential export access to most developed economies, liberal trade and investment policy, the country's location in the world's fastest-growing region, low labour costs and a dynamic workforce – Cambodia is currently experiencing a period of economic development. The expansion of agriculture and acceleration of industrialization driven primarily by garment production, construction, and tourism have resulted in the country's economy growing at an impressive 7% per year since the global recession in 2008, leading to a doubling of GDP per capita from $630 to $1,300 over the last ten years.

However, despite favourable prospects, to remain competitive within the Southeast Asia region and to maintain on the path of economic progress, Cambodia needs to increase investments in physical infrastructure. Such conclusion is confirmed by numerous research papers exploring the relationship between infrastructure investments and economic growth (Aschauer, 1989; Munnell 1990, Zhao and Kanamori, 2007; Straub, S., 2008; Sahoo and Dash, 2009; Estache, Serebrisky and Wren-Lewis, 2015). The authors emphasize that infrastructure investment has positive impact on employment growth, poverty reduction, increased productivity, increased efficiency and economic competitiveness, and acts as a link between resources and factories, people and jobs and products and markets (Sahoo and Dash, 2009).

The inverse relationship was also investigated. It revealed that the lack of infrastructure not only hinders the productive capacity of the country's economy and reduces its competitiveness, but also inhibits the spread of the benefits of economic growth, which makes the development process more inclusive (Sum, 2007).

Cite this Article as: Tomasz LUKASZEWSKI and Kerry SLATTERY" Review of The Infrastructure Reconstruction Process in Cambodia" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The article focuses on the effects of the infrastructure reconstruction process in Cambodia. Its aim is to review the current state of public facilities and services in Cambodia, and compare the investment achievements with the objectives and financial expenditure incurred.

When assessing the current condition of the Cambodian infrastructure, its initial state should be taken into consideration. Cambodia for centuries relied on agriculture, and failed to develop substantial infrastructure. Then under the French Protectorate a basic structure of Phnom Penh city was founded, the port facility was built, and construction of a railway linking Phnom Penh to the Thai border began. After independence, development of the infrastructure continued. During this period construction of a national road network was initiated, including completion of a route connecting Phnom Penh to Sihanoukville, a coastal city on the Gulf of Thailand. Those two cities were also linked via a rail line. Other achievements included the construction of a large-scale sea port in Sihanoukville, and development of an airport in Phnom Penh. Then the period of civil war, the Khmer Rouge rule and the subsequent years of war began. During this period, most of the existing infrastructure was destroyed.

The structure of the article has been arranged in the following way. The most economically important infrastructural subsectors were chosen and the progress made in their development over the last 30 years was characterized. Each of the structures was presented according to the following scheme: assessment of the current state and results achieved, plans for further development and financial expenses incurred and capital investment requirements. Last section contains findings and conclusions.

Transport

Between 1991 and 2015 over 7000 km of roads and several key bridges and were the built and rehabilitated (IRITWG, 2015). Despite of the external financing and relatively large public investment on the improvement of transportation infrastructure (including roads, ports, railways and civil aviation), progress is still limited. For example, the percentage of paved roads of total roads increased from 6.3% in 2005 to 10.5% in 2015 (World Bank Group, 2017).

Today road transport is the major logistics modality in Cambodia, accounting for 65% of passengers and 70% of freight in terms of total transported volume. The country's road network extends over 52000 km, covering all major regions and consisting of 5600 km of national roads, 6600 km of provincial roads, and approximately 40300 km of tertiary roads (CDC, 2013). Their standard is unsatisfactory: by 2015 only 10 percent of Cambodia's total road and highway length was paved with asphalt, approximately 50 percent of roads were made of crushed stone, gravel, or improved earth, and the remaining were unimproved earth or little more than tracks (Sum, 2007). This is the lowest ratio among all countries in the region. The conditions of major national roads have improved in recent years, but roads in the rural areas mostly remain unpaved and lack traffic lights or roadside assistance services (Hong Kong Trade Development Council, 2017). During the rainy season, certain roads in urban and rural areas are hardly accessible or totally unpassable which often leaves some sections of the country isolated and causes subsequent economic disruption (Hong Kong Trade Development Council, 2017).

In order to modernise and extend existing road network systems, the Royal Government of Cambodia has established a long-term expressway Master Plan which proposes construction of 850 km of expressways by 2020 and establishes a 2230 km expressway network by 2040.

The Cambodian railway system is underdeveloped and cannot be considered a real logistical alternative to road transport. The rail system consists of only two lines totalling around 650 km of single railway tracks, and entails a southbound track from Phnom Penh to Sihanoukville and a northbound track from Phnom Penh to Poipet on the Cambodian-Thai border. Both lines are in poor condition, with trains operating at a speed of approximately 20 km per hour (Hong Kong Trade Development Council, 2017). A rail rehabilitation project was launched in 2006 and the southern line was completed and opened to freight operations in 2013. Since then it has been used to transport fuel, coal, cement and container shipments, and in 2016 passenger services were initiated. Reparations on the northern line still have not been completed due to resettlement problems, cost overruns, flooding and construction quality issues (Open Development Cambodia, 2015).

The rehabilitation and development of a devastated Cambodian road network was conducted and financed mostly by foreign donors. According to the IRITWG report, the total value of the National Road Improvement Projects in Cambodia 1993-2015 exceeded 3.7 billion USD. Over 73% of that investment was financed by Chinese capital, with

about 11% provided by the Asian Development Bank and the World Bank, and 6% coming from Japan. The rest was covered by Korea, Thailand, Vietnam, the United States, and private investors. In terms of financial assistance, over 72% of the capital was in the form of loans, another 5.7% was grants, and the Cambodian national budget financed less than 1%. This picture may be blurred as almost 20% of funds did not have a specified proper source. Data on investment cost (in million dollars) and length of roads built (in km) in years 1993-2015 are presented in Figure 1.

Figure 1: Cost and length of road improvement projects in Cambodia 1993-2015

The further modernisation of Cambodia's transport infrastructure will require a significant amount of investment. The expressway master plan alone is estimated to cost around 35 billion USD by 2040. Total capital expenditures in the Cambodian infrastructure sector between 2013 and 2022 are calculated to be as much as 16 billion USD (According to Economic Research Institute for ASEAN and East Asia (ERIA)). This figure is largely in line with the calculations of the Council for Development of Cambodia (CDC), with total committed investment amounting to about 7 billion USD between 2012 and 2016, or some 40% of the published total (Hong Kong Trade Development Council, 2017).

In order to attract private investors and increase their participation in building transport facilities, the government adopted the 2007 Law on Concessions. The purpose of this legislation was to move forward the implementation of privately financed projects by way of introducing various mechanisms for granting infrastructure concessions, such as Build-Operate-Transfer and Build-Own-Operate arrangements. Some examples of investments in the transport sub-sector in the form of PPP include the rehabilitation of a railway funded by the Asian Development Bank, the Australian aid agency and the Cambodian government, as well as the renovation of National Road No. 4 via a BOT arrangement with private investors AZ Group.

Electricity and Energy Systems

Electricity generation in Cambodia comes from four sources: hydropower plants, coal-fired power plants, diesel power plants and biomass. Although oil has been the major source of electricity production for more than two decades, in recent years newly opened coal and hydropower plants have completely changed the picture. Up until 2011, over 90% of the electricity was produced from heavy fuel oil and diesel generators, but in 2015 this percentage shrunk to as low as 5% with most generation coming from coal (51%) and hydropower (43%). In 2015, domestic producers generated about 4.6 GWh, which can be considered a giant leap from the 1 GWh produced in 2011 (MME & ERIA, 2016).

Even in 2019 the country still lacks an overall electricity network, and electric energy is currently supplied via 24 small isolated systems. The main provider is Electricite du Cambodge (EDC), a state-run company that owns licenses for generation, distribution and transmission of electricity in Phnom Penh and the 12 provincial cities. This public

provider is supplemented by private entities, including independent power producers in provincial towns, licensees in smaller towns, and rural electricity enterprises (Open Development Cambodia, 2017).

The efficiency of the overall system is low. Twenty-four hour supply of electricity is not assured, and the quality of electricity is not reliable. In 2013, access to distributed electricity had reached no more than 35% of households1, with significant inequalities between urban and rural areas. According to data presented by the Ministry of Industry, Mines and Energy, almost 100% of households in cities are electrified and their consumption exceeds 90% of the country's produced electricity. However, in regards to rural households, only 14% have access to the grid electricity network, and some 50% have limited access to alternative off-grid electricity sources, while around 30% have no electricity access (MIME, 2013).

Relatedly, while the amount of energy generated in Cambodia has grown enormously in recent years, the demand driven by increasing industrial production, a growing population, and higher living standards has grown even faster. The total electricity production in Cambodia was reported to be 6.18 GWh in 2015. In order to keep the demand and supply balanced the country must import electricity. In 2015 Cambodia purchased 1.54 GWh of electricity, mostly from Vietnam and Thailand. This was about 25% of the country's total supply, although it should be noted that the volume of electricity purchased from overseas has been steadily decreasing in recent years. In 2016 imports fell by almost 25% compared to 2015, and in 2017 imports were expected to fall another 20%, mostly due to the increase in domestic production from coal power plants (Open Development Cambodia, 2017).

Understanding that access to electricity is fundamental for a country's socio-economic growth, sustainability, and poverty alleviation has made the Cambodian government face the following problems in the energy sector: dependence on imported electricity, low grid coverage in rural areas, electricity shortages and power outages, and high electricity prices (Open Development Cambodia, 2017). In 2014 the government officially announced all villages would be connected to the grid by 2020, and 70% of households would have power by 2030 (WWF and IES, 2016). Achieving this objective requires expanding the distribution network by developing new high-voltage lines between Cambodia and its neighbouring countries, and building transmission lines within the country. This is an expensive process. The complete electrification of Cambodia would cost close to 1 billion USD according to the EDC (Chandara, 2016), and would require external funding.

The power and electricity sub-sector received only around 18% of the total infrastructure budget, although the overall amount of investment in the energy sector has greatly increased over the last decade. This includes bi- and multilateral donor support for transmission projects, as well as private investments in hydropower and coal power stations, mostly through Build-Operate-Transfer (BOT) arrangements. The Electricity Law adopted in 2001 encourages private entities to invest in electricity generation, transmission, and distribution infrastructure, and the foreigners who utilised this opportunity the most were the Chinese who invested over 11.5 billion USD to build hydropower dams and power transmission lines in Cambodia (Grimsditch, 2016).

Irrigation, Water and Sanitation Systems

Natural conditions in Cambodia, in particular the significant difference in precipitation between the rainy season and the dry season, make irrigation systems a key element in securing stable water supply for agriculture, which in turn is an essential factor for attaining food self-sufficiency – a national socio-economic development goal of the Cambodian government. In 2005, only 16 percent of rural households had their paddy fields irrigated, while the rest relied on rainwater which often led to lower production yields and lower incomes (Sum, 2007). However, the situation has been consistently improving and according to the National Strategic Development Plan 2014-2018 Cambodia made significant progress in rehabilitating and constructing irrigation infrastructure. From 2008 to 2013, irrigated areas expanded to 1 485 670 ha, and vulnerability to flood and drought was reduced while hydrological control improved.

The water and sanitation system in Cambodia is another infrastructure subsector characterized by large inequalities related to the access disparity between municipal and rural areas. About 94% of the urban population has access to

[1] According to Council for the Development of Cambodia the access to electricity has 22,5% of households, while National Policy, Strategy And Action Plan on Energy Efficiency in Cambodia estimates this number to be 34%.

an improved water supply, and 82% to improved sanitation, while in the rural areas only 66% have access to an improved water supply and about 25% to improved sanitation (Asian Development Bank, 2014). Based on these figures, around 4.3 million people are still without access to improved water supply and 9.4 million people lack access to improved sanitation. To address this situation the government has adopted the National Strategic Plan for Rural Water Supply, Sanitation and Hygiene (RWSSH) for the years 2014-2025 which sets goals in terms of improved access for rural and urban subsectors. Necessary investments include the replacement of existing infrastructure and the development of new facilities. According to the World Bank, the plan will require annual capital spending on infrastructure to be about 211 million USD, which is around 6.2% of the 2014 national budget and 1.4% of the total 2013 GDP. Additionally, around 24 million USD per year would be needed to finance the operation and maintenance of the current and future infrastructure (World Bank Group , 2015).

The total cost of investment of irrigation systems exceeded 560 million USD (The Royal Government of Cambodia, 2014). The water and sanitation projects (WAS) were expected to consume less than 20% of the total public infrastructure budget, however an exact estimation on the amount spent is not available. Service Delivery Assessment presented report regarding public spending on WAS subsector, based on data obtained from CDC and development partners (Service Delivery Assessment, 2015). Table 1 presents report findings on the projected average annual spending of government and development partners on water supply and sanitation projects in both rural and urban areas between 2010 and 2015. It should be highlighted that the provided funds are grossly insufficient, and the sub-sector is under-funded, with current financing not even covering O&M costs.

Table 1: Public investments in capital expenditure (million US$, annual average).

Sub-sector	Domestic government	Development partners	Total
			Recent (2010-2012)
Rural water supply	0.8	7.9	8.7
Urban water supply	2.4	24.4	26.8
Rural sanitation	0.2	1.6	1.8
Urban sanitation	0.3	5.3	5.6
Total	**3.7**	**39.2**	**42.9**
			Anticipated (2013-2015)
Rural water supply	0.9	5	5.9
Urban water supply	2.2	21.5	23.7
Rural sanitation	0.4	2.5	2.9
Urban sanitation	1.6	4.3	5.9
Total	**19.50**	**32.80**	**52.3**

Additional information on the existing and projected financial gap between expenditures and financing in the WAS subs-sector are noted in the Water and Sanitation Sector Financing Strategy for Cambodia Years 2009-2028 commissioned by the Water and Sanitation Program (WSP) (Water and Sanitation Program (WSP), 2010) and cited in (Service Delivery Assessment, 2015). Table 2 quotes a baseline scenario based on the assumption that the infrastructure is extended at the same rate as the development/population, and that coverage levels remain constant with the overall service level unchanged. Under such conditions the financial gap found in year 2009 will not be reduced until 2028.

Table 2: Expenditure needs and financing available within WAS subsector (in million USD)

	2009	2015	2020	2025	2028
Expenditure need					
O&M	107.56	123.48	137.71	152.99	162.72
Re-investments	146.35	166.47	183.72	201.73	212.17
Renovation	0.53	2.4	2.4	2.4	2.4
New investments	34.62	72.76	72.76	72.76	72.76
Financing available					
Public budget	1.925	2.79	3.92	5.24	6.25

User charges	31.58	46.33	65.61	88.73	106.4
Private financing	31.28	50.21	76.52	111.38	139.54
Grants	15.567	14.56	14.56	14.56	14.56
Loans	9.358	7.66	6.55	6.55	6.55
Financing gap	-199.35	-243.56	-229.43	-203.42	-176.75

Internet and Telecommunication

Internet usage in Cambodia has soared, and quality has significantly improved over the last few years. The percentage of the population with access to the internet has increased from 3% in 2011 to 42% in 2017 (We Are Social & Hootsuite, 2017). In absolute figures, the number of internet subscribers grew from 320000 in 2010 to over 7 million in 2017. While impressive, Cambodia is still below the global internet penetration rate of 50%. In public statements government officials have predicted that by 2020 over 80% of the population will be using the internet (Open Development Cambodia, 2015). This is possible, although further internet growth is constrained by poor infrastructure such as an absence of an extensive landline network in rural areas and insufficient electricity often resulting in blackouts (Freedom House, 2017).

On a national level, Cambodia has had to rely on the infrastructure of Vietnam and Thailand for internet access up until 2017 when the country's first undersea cable was launched by Ezecom, linking provinces with slow connections to a high-speed international network and improving 4G services nationwide. The 1300 km long cable system has a capacity of 30 Tbps, and connects Cambodia to landing stations in Malaysia and Thailand (Ezecom, 2017). Another project by the Fiber Optic Cable Network (CFOCN) is underway. It is a 25-year concession agreement with the government to build a landing station in Sihanoukville and install submarine fiber-optic telecom cables to connect to the AAE-1 cable, which links Southeast Asia with Europe. The concession agreement is based on a build-own-operate-transfer model. Within the country, internet service is provided by three major operators: Telecom Cambodia, Viettel Cambodia, and Cambodia Fiber Optica Cable Network. These interconnect with smaller networks, allowing exchanges of information through Wi-Fi, LAN lines, or other means (Freedom House, 2017). In order to offer internet to the public the ISPs have to develop their own network. As an example of this, Telecom Cambodia initiated a project of installing a 467 km fibre-optic cable connection between Sihanoukville and Kampong Cham provinces in 2017 (Report Linker, 2017). After recent consolidations, the Cambodian telecommunications market is considered competitive but saturated. In 2016 six mobile service providers served over 21.2 million mobile subscribers, with a ratio of total telephone subscribers to the country's population equal to 139% (MPTC, 2015). About 96% of Cambodians claim to own a mobile phone, with 13% of citizens claiming to use more than one phone and 25% claiming more than one mobile operator, according to a survey conducted by the Open Institute (Freedom House, 2017). The number of fixed telephone lines in Cambodia is very small, declining from 2.3% in 2014 to 1.4% in 2016 (Report Linker, 2017).

A lack of information on the amount of investments actually committed in the infrastructure sector between 2006 and 2018 inhibits the understanding of the current state of sector development and its progress. It is known that the requirements for public capital expenditure in NSDP did not exceed 3.8 billion USD. However, it is not clear to what extent this was covered by government expenses, and how much came from external funding provided by development partners. There is also no proper information regarding private investment.

Conclusions

Cambodia has undoubtedly made impressive progress since 1991 in recovering and developing devastated facilities. These results have been achieved through government measures, the involvement of private parties, and foreign aid. Unfortunately lack of information on the amount of investments actually committed in the infrastructure sector between 2006 and 2018 inhibits the understanding of the current state of sector development and its progress. It is known that the requirements for public capital expenditure in the government's strategy did not exceed 3.8 billion USD. However, it is not clear to what extent this was covered by government expenses, and how much came from external funding provided by development partners. There is also no proper information regarding private investment.

Major identified problems include: the insufficient quantity and quality of facilities compared to the public needs, the high cost and limited access to public services, the low quality of those services, the uneven deployment of

infrastructure within the regions of the country, and the unequal level of access to infrastructural services whereby access is concentrated in the urban areas which comprise only about 20% of the estimated population of 14 million.

The most urgent and important infrastructure investment needs include:

- Expanding the network expressways and improving the quality of existing roads.
- Increasing the total domestic generation of electricity to reduce dependency on imports and expanding the electricity grid within the country.
- Completing the rehabilitation of railroads and restoring train operations on the northern line.
- Rehabilitating and constructing irrigation system to expand agriculture production.
- Expanding pipeline network systems to improve access to water and sanitation.
- Connecting to the global internet network and expanding internet transfer facilities within the country.

Implementation of the above-mentioned infrastructural investments will have a significant impact on further economic development of the country.

Financing of The Infrastructure Development in Cambodia

Tomasz LUKASZEWSKI

University of Szczecin, Poland
tomasz.lukaszewski@usz.edu.pl

Abstract

In the 1990s Cambodia was practically deprived of the infrastructure. The reconstruction and development of new physical facilities required substantial expenditures, exceeding the capabilities of a war-ravaged country lacking of money, industry, specialists and resources. To overcome an insufficiency of public financial and material assets, government had to encourage external capital to involvement in the provision of infrastructure projects.
The aim of the paper is to analyse the case of Cambodia to examine mechanisms of financing the infrastructure investments in developing countries.
The article addresses two issues. Firstly, reviews the political, regulatory and legal actions taken by the government to establish business climate conductive to investment and attractive to investors. Secondly, attempts to assess the effectiveness of those measures by analyse the structure and dynamics of capital expenditures on infrastructure development in Cambodia in 2006-2018.

The research used descriptive method and quantitative data obtained from documents published by public entities.

Keywords: Infrastructure, Cambodia, development, public investment, private investment

Introduction

After decades of civil war, the Khmer Rouge regime and subsequent years of economic sanctions Cambodia's infrastructure was in ruins. Reconstruction and development of new physical facilities such as roads, railways, telecommunication networks, water and electricity supply and other, was an organizational and financial challenge requiring incurring significant expenditures which were beyond the capacities of developing country like Cambodia.

To overcome an insufficiency of financial and material resources, governments had to encourage local and foreign entities to get involved in the provision of infrastructure projects on agreed upon terms. Such cooperation could be complementary to public investment, and serve as a special vehicle to move the country's infrastructure development forward. This can be done with regards to a series of factors such as the political and economic credibility, the existence of domestic capital markets, the establishment of clear and stable rules for land acquisition or competitive biddings, and more (Kumaraswamy and Zhang, 2001).

The main goal of the paper was to find an answers to the following questions: how infrastructure development in Cambodia in last 30 years was financed? from what sources those funds came, and how it were allocated to infrastructure sub-sectors?

The article has the following structure. Part one reviews the political, legal, regulatory and financial measures taken by the Cambodian authorities to create a business environment conducive to investment and attractive to private investors (both domestic and foreign), which is widely seen as a prerequisite for the implementation of public-private partnerships. Section two presents the sources of capital used to finance investments divided into public, private, domestic and foreign, as well as their changes in 2006-2018. The analysis of the structure and dynamics was based on data from documents issued by public entities and government agencies. Section three presents findings on how the capital investments were allocated among different sectors of the Cambodian economy, and how the funds within the infrastructure sector were distributed to subsectors and projects. Finally section four contains discusses findings and conclusions.

Cite this Article as: Tomasz LUKASZEWSKI " Financing of The Infrastructure Development in Cambodia" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The main difficulty of the paper was lack of complete, reliable information regarding various aspects of the investment in Cambodia. Most of documents were published by government agencies in Khmer only. The others were too general, too narrow or covers different time periods, which makes them difficult to compare. Often contained data that was contradictory, with figures varying depending on the presenting institution. In some cases even the same data presented by the same organisation is disparate in differing publications.

Review of political, legal and regulatory activities supporting private investments

The 1993 election led to the adoption of the new Constitution of the Kingdom of Cambodia, the establishment of the National Assembly, and the formation of the Royal Government of Cambodia (RGC). The new government outlined a long-term vision for rebuilding a country devastated by civil war and economic sanctions, and that vision included the establishment of macroeconomic fundamentals, the commencement of social development, and the alleviation of poverty. Based on this vision a National Program to Rehabilitate and Develop Cambodia (NPRD) was initiated in 1994 with a goal to achieve these objectives by 2000 (IRITWG, 2015). In the following decades the government formed and implemented several strategic plans focused on peace, demobilization, regional economic integration, and financial sector development, among others. At present the national political commitment to socioeconomic development is confirmed by two strategic documents: Rectangular Development Strategy for Growth, Employment, Equity and Efficiency (RDS) and National Strategic Development Plan 2014-2018. Those documents were adopted to support and coordinate all other plans, policies and strategies carrying out the country's transformation, and to ensure compliance with the objectives set forth in Cambodia Vision 2030 and the country's Industrial Development Policy 2015–2025.

The Rectangular Development Strategy for Growth, Employment, Equity and Efficiency is an agenda enacted by parliament in 2004 and implemented by the government to serve as a comprehensive policy framework. It named four strategic areas (rectangles): agriculture, physical infrastructure, private sector development, and human capacity-building, and it is accompanied by four priority areas for action (sides of rectangles). Phases I and II of the Strategy were implemented by 2014, and the third stage is operational at present. The Strategy establishes overall goals for each rectangle and sets out concrete results for the sides (some in the form of quantitative deliverables). It also contains proposed courses of action to be undertaken. The development of physical infrastructure was presented and detailed in Rectangle II. The outcomes are expected to be obtained through:

- the rehabilitation and construction of transport and urban infrastructure,
- the construction, maintenance, and management of irrigation infrastructure and clean water supply,
- the expansion of electricity supply coverage, the lowering of tariffs, and the strengthening of institutional mechanisms and management capacity,
- and the development of high quality information and communication technology.

The second policy document is the National Strategic Development Plan 2014-2018 which serves as a framework and road map for implementation and operationalization of the Rectangular Strategy. It outlines actions, programmes and projects laid out by government ministries and agencies, defines their priorities, and ensures they are aligned with the aims set out in the Strategy. The NSPD also specifies required means and resources, indicators, and timeframes for Strategy implementation, and identifies the mechanism of so-called Monitoring and Evaluation of the Result Framework (The Royal Government of Cambodia, 2014).

Besides political stability there is also the need for adoption of a legal framework which can help attract private entities and encourage them to establish long-term cooperation. This is an essential condition for companies considering infrastructure projects, as they are exposed to several investment risks such as unfair processes related to private investor selection, corruption, changes in laws and regulations, inefficient legal processes and legal barriers, and they therefore need appropriate legal protection. Private sector actors also expect guarantees against the risks that occur during the operational phase of the contract, like changes in legislation or taxation, forced termination of the agreement before the expiration date, expropriation of the private company without compensation, or many others. Those risks can be minimalized by ensuring transparency via the introduction of clear procedures related to the entire investment process including tendering, bidding, capital, and land acquisition. It is necessary to update the existing provisions and introduce new provisions and regulations for all fields related to private public partnership such as investment, transportation, land, infrastructure, finance, labour and others.

The Cambodian authorities issued or enacted a series of PPP-related laws including the Law on Public Procurement (2012), the Civil Code (2011), the Anti-Corruption Law (2010), the Land Law (2001) and the Law on Investment (1994, updated in 2003). The latter is of particular importance for investors, as it created the Council for the Development of Cambodia (CDC), which is the highest decision-making body responsible for private and public sector investment (Grimsditch, 2016). However, the most important provision is the Law on Concessions which is the legal basis for attraction and facilitation of infrastructure projects financed by the private sector. While it was promulgated in 2007 by the National Assembly, the Sub-Decree that would allow the Law on Concessions to be implemented has not yet been approved and implemented (CDC, 2013) (Asian Development Bank, 2012) (Ministry of Economy and Finance of Cambodia, 2016). The Law on Concessions establishes an institutional framework for developing, procuring, and implementing PPP projects. It specifies sectors for which concession contracts may be granted to private companies, and it enumerates the acceptable types of contracts. Further, it appoints The Council for Development of Cambodia as the centralized service institution responsible for the administrative coordination of investments in concession projects. This authority has the ability to provide information to potential investors regarding investment, approve compliance of investment incentives within the Law on Investment, and specify and obtain all required authorizations for the concession project on behalf of the concessionaire. The Law on Concessions imposes the following obligations on the contracting institution and the concessionaire: Competitors should be selected through international or national bidding procedures in accordance with procedures, the contracting institution must obtain approval for a final bid or a negotiated proposal, the chosen candidate must be informed within a certain amount of time, and the legal entity that will implement the concession project must be established and incorporated and must apply to the CDC for a registration certificate in accordance with the Law on Investment (CDC, 2013).

Sources of investment funding in Cambodia

Total capital investment required for the implementation of the all socio-development goals set out in the National Strategic Development Plans 2006–2018 was estimated to be 48.12 billion USD, out of which 14.25 billion USD was financed from public sources and 33.87 billion USD from private sources. Since this amount also included infrastructure investments, the following questions arise: How much of total capital investment was spent on infrastructure development? What were the sources of financing for those investments? On which projects and subsectors was money spent?

To find answers for the above-mentioned questions, financial data used as projections for preparation the NSDPs 2006-2018 have been summarized then divided into categories of financing sources: public, private, domestic, and foreign (Table 1).

Table 1: Capital investment requirements for NSDP 2006-2018 in billion USD

	2006-2010	2009-2013	2014-2018	Total 2006-2018
Total Investment requirements	6.46	15.13	26.59	48.12
Public Investment	2.38	4.28	7.59	14.25
Domestic Financed	0.78	1.01	1.87	3.66
Foreign Financed	1.60	3.23	5.72	10.59
Private Investment	4.02	10.85	19.00	33.87
Domestic Financed	2.76	7.49	11.46	21.71
Foreign Finance	1.26	3.35	7.56	12.16

The public sector expenses required for the implementation of NDSP's prioritized policies in years 2006-2018 was found to be to be 21.05 billion USD according to the Ministry of Economy and Finance. This amount includes 14.25 billion USD for public sector capital investments and an additional 6.78 billion USD to support the social sector. Public sector investments consist of two kinds: government expenditures, and funds provided by foreign development partners like the World Bank, Asian Development Bank, United Nations agencies, bilateral and multilateral donors, or NGOs. The Royal Government of Cambodia, between 2006 and 2018, had a reported allocation of 3.66 billion USD across all budgets for the ministries and agencies (by comparison, the total national budget for 2017 was around 5 billion USD). The remaining sum of public balance (10.59 billion USD) was financed from external partners in the form of grant-aids, concessional terms loans, resources from non-traditional sources and partners, new incomes from

the development of extractive sources, additional taxes, borrowing from domestic sources through financial instruments, and debt relief (The Royal Government of Cambodia, 2014).

Most of the financial burden for country development is borne by the private sector, which is also considered the driving force for creating employment, raising revenues, and contributing to economic growth and poverty reduction. It has accounted for over 70% of the total capital investment in Cambodia, while the public sector provides financing for less than 30%, including 7% of government expenditures. The Cambodian private sector is characterized by a large number of small and informal SMEs, and a few large enterprises (Ministry of Commerce, 2014). Studies conducted by the National Institute of Statistics in 2011 show that foreign companies operating in the local market are usually large, while domestic companies are small in terms of size. Over 97% of Cambodia's enterprises in the industrial sector are micro sized (employing 1-20 people), and only 1% is foreign-owned. On the other hand, 60% of large enterprises (over 100 staff) are responsible for the highest share of total production value and foreign-owned enterprises employ the largest number of people (Grimsditch, 2016). Regarding the mode of investment, it can be made directly or through various types of legal entities such as public and private limited companies, subsidiaries, branches, representative offices, or joint ventures.

Most of the statistics show data on investments *approved* by the CDC, not on investments actually implemented. The differences between those figures can be significant. As a report by the Ministry of Commerce showed, only 29% of approved FDI projects for years 2000–2012 were realized (Ministry of Commerce, 2014). Therefore, in order to analyse investment structures and dynamics, existing partial data must be used. According to estimates from the CDC, between 2009 and 2016, the *approved* investment amounted to 37.42 billion USD (Council for the Development of Cambodia (CDC)) (Sophea, 2014). Estimations of FDI given in NSDP covered period 2008-2016 but seems to be very conservative, while data presented by United Nations Conference on Trade and Development cover only period of 2014-2017. There are slight differences in figures quoted by WTB and UNCTAD.

Within this same period Cambodia attracted inflows of over 15.2 billion USD as reported by the World Trade Bank (The World Bank Data). Figure 1 presents a compilation of CDC data on approved private investment (separately domestic and foreign) along with FDI inflows recorded by the World Trade Bank. The gap between volumes of investment approved and implemented is particularly visible in years 2009-2012 when the dollarized Cambodian economy was recovering after the recession caused by the economic crisis.

Figure 1: FDI net inflows (USD billion)

The geographical origin of approved investment shows that over 95% of capital came from Asia, of which 56% was provided by domestic entities. Among foreign players the majority of investment is Chinese, responsible for 40% of all FDI, with the second largest provider being ASEAN countries (22%), followed by Korea (10%) and Japan (7%). Aggregated shares of investments from EU countries, the US and Australia are estimated to be 19% of all FDI according to the CDC (Figure 2).

Figure 2: Capital investment by country in years 2009-2016 by CDC (in billion USD)

The Chinese have invested a total of 14.7 billion USD in Cambodia, and have additionally disbursed more than 4 billion USD of aid in the form of grants and soft loans between 1992 and 2016 (Hong Kong Trade Development Council, 2017). Chinese state-owned enterprises operate in several sectors including industrial, physical infrastructure, energy, and agriculture. Currently 10 out of 23 companies participating in the mining industry belong to Chinese owners. Chinese companies have invested more than 7.5 billion USD in hydropower plants, and about 4 billion USD in coal power plants. About 30 Chinese investment projects related to agriculture cover over 237 000 hectares of land. At the same time, Chinese private firms are focused on investing in the garment industry, services, and tourism (Chheang Vannarith, 2017).

Regarding capital inflows from South Korea, investments tend to concentrate on four main sectors: tourism, garments, agriculture, and bio-energy. ASEAN countries follow a similar pattern: Vietnam invested 85% of approved assets in agro-industry (including plantations and the processing of rubber), Thailand invested 68% in agriculture, and Malaysia mostly focused on tourism (56%), agriculture, and the garment industry (Ministry of Commerce, 2014).

Structure and dynamics of capital expenditures on infrastructure

Public and private capital investments are distributed among different sectors of the economy. The aggregation of public investment by sector based on NSDPs data (2006 – 2018) is presented in Table 2[i]

Table 1: NSDP Allocations of total investment by sector (in billion USD)

NDSP / Sector	2006-2010		2009-2013		2014-2018		Total	
	Allocation	Share	Allocation	Share	Allocation	Share	Allocation	Share
Social	1.150	33%	2.009	32%	2.428	32%	5.587	32%
Economic	0.780	22%	1.507	24%	1.821	24%	4.108	24%
Infrastructure	**0.880**	**25%**	**1.318**	**21%**	**1.593**	**21%**	**3.791**	**22%**
Services & Cross Sectoral Programmes	0.490	14%	1.318	21%	1.593	21%	3.401	20%
Unallocated	0.200	6%	0.126	2%	0.152	2%	0.478	3%
Total	3.500	100%	6.278	100%	7.587	100%	17.365	100%

Approximately 3.8 billion USD of public money was spent on infrastructure development within the period concerned. Those funds represent 22% of total public investments and their proportion does not significantly change

over the time. The distribution of foreign investment across sectors, between 2009 and 2016, based on data provided by the CDC (Council for the Development of Cambodia, 2018) (CDC, 2013)[ii] is presented in Table 3.

Table 2: Approved FDI by sector in years 2009 – 2016 (in billion USD)

	2009	2010	2011	2012	2013	2014	2015	2016	Total	Share
Agriculture	0.590	0.554	0.725	0.56	1.13	0.26	0.48	0.48	4.78	13.40%
Industries	0.958	0.946	2.869	1.49	1.11	2.84	0.92	1.19	12.31	34.51%
Infastructure	0.410	1.059	0.658	0.23	2.62	0.35	3.13	0.54	9.00	25.24%
Tourism	3.901	0.132	2.760	0.69	0.11	0.48	0.11	1.40	9.58	26.86%

Private investment flows into a range of sectors in Cambodia, but most of the committed projects are industrial (34.5%) including garment/textiles, footwear, energy, mining, food processing and others. Infrastructure with construction (25.2%) and tourism (26.9%) follow. These sectors together account for over 86% of total investments in the given years. However, it must be again noted that data on investments approved, collected by the CDC, does not mirror the information on realized investment and there is a lack of reliable data on the latter.

The final issue of concern relates to the allocation of capital investment within the infrastructure sector and its distribution to subsectors and projects. Recognising the role of physical infrastructure development as a key pillar for pursuing Cambodia's industrialization, the government decided to spend around 3.8 billion USD of public money, and the allocation of dozens of billions of private funds through direct investments and public-private partnerships between 2006 and 2018. Additionally, Cambodia received a substantial amount of foreign aid to finance infrastructure development which is not reflected in the presented statistics. Detailed information on public fund allocation within the infrastructure subsector is provided in Table 4.

Table 3: Allocations of public investment by Infrastructure subsectors (in billion USD)

NDSP / Subsectors	2006-2010		2009-2013		2014-2018		Total	
	Allocation	Share	Allocation	Share	Allocation	Share	Allocation	Share
Transportation (Roads, Ports, Rlys., Civil Aviation)	0.550	16%	0.753	12%	0.910	12%	2.213	58%
Water and Sanitation (excluding rural)	0.150	4%	0.251	4%	0.304	4%	0.704	19%
Power & Electricity	0.120	3%	0.251	4%	0.304	4%	0.674	18%
Post & Telecommunications	0.060	2%	0.063	1%	0.076	1%	0.198	5%
Total	0.880	25%	1.318	21%	1.593	21%	3.791	100%

Conclusions

As demonstrated in this paper, between 2006 and 2018 the Cambodian government earmarked 48.12 billion USD for the development projects. However, only 3.66 billion USD, which is less than 7% of this amount, was financed by the national budget, with over 44.4 billion USD expected to come from external sources both public and private. Combining this with the fact that public and government investments have been declining recently compared to previous periods, it can be seen how strongly the government's strategy for Cambodian development depends on external sources of financing.

This leads to a conclusion that an essential condition for achieving investment goals is ensuring a favourable investment environment which will encourage public and private entities to establish long-term cooperation. In this context, surprising is lack of a legal framework applicable to public-private it leads to situation where project implementation is issued on a reactive, unsolicited, and negotiated basis, rather than through proactive government preparation and competitive tendering (Asian Development Bank, 2012).

It is a common opinion that transparency of the investment process, clear legal and financial rules, political stability and low corruption levels are risk reducing factors which are especially important in the infrastructure sector where a large portion of public and private projects are financed via various types of PPP mechanisms. However, it must be noted that a lack of the above-mentioned conditions do not stop Chinese firms from making large investments in the energy sub-sector.

Digital collaboration in Higher Education: Vulnerabilities and Challenges in E-Learning During Covid-19 pandemic

Andra Diaconescu

Politehnica University of Timisoara, Faculty of Management in Production and Transportations, 14 Remus Street, 300191 Timisoara,Romania
andra.diaconescu@upt.ro

Abstract

Digital industry influences the educational environment and encourages students to get actively involved, take part but also collaborate in this major change to overcome internal and external vulnerabilities in the learning process. Academia researchers are analyzing the vulnerabilities of this new digital revolution and trying to secure the online environment in higher education. Over the years, as innovations and investments in the digital space have grown considerably, so have opportunities for universities by allowing students to learn in their rhythm. This research seeks a detailed analysis of the most important tools that support digital collaboration among students given the current situation of online education in the COVID's context-19 pandemic. The tools that support digital collaboration among students facilitate communication in the current situation, increasing the opportunities for academia to interact with as many users as possible. Educators, students and administrators of online educational platforms need a sustainable basis for adopting a change in education. For educators, the availability of a real-time understanding is needed to increase student performance. For students, receiving information about their performance relative to their peers or their progress relative to their personal goals can be motivating and encouraging.

Keywords: Digital Collaboration, Challenges, Online, Higher Education, COVID-19

Introduction

Digital technology has achieved unprecedented growth in many industry fields. Technological drivers like machine to machine communication, blockchain, cryptocurrencies have conducted to new collaboration opportunities for parties involved. Over the last years, we see mounting pressure and acceleration on the digital transformation. (Hess, et al., 2016; Ustundag, and Cevikcan, 2017; Schweer and Sahl 2017). We stay today face to face with a new connected world, where important attention is given in the usage of Internet of Things (IoT), mobility and cloud solution. Institutions are trying to adapt their infrastructure through technological solutions so they can provide better services to clients, as storing personalized information online, order prioritization, online customer service, or transactions through mobile access.

Digital technology has also created niches for the higher education system by developing the best educational platforms. Already we are seeing free and paid digital content, digital courseware, Small Private Online Courses (SPOC), and Massive Open Online Courses (MOOC). Higher education adopted the digital approach because there is an urgent need to bridge the gaps in digital literacy of individuals, and in using digital technologies for communication between individuals and institutions. Digital higher education development in developing countries in our days represents a lever that can create economic outcomes and determine new prospects for future generations. The new wave of digitalization in the current educational environment is on the rise in Europe and beyond. European countries with the highest rate of digital skills are moving away from the approach of digital education as a separate optional or compulsory subject in schools, instead integrating it transdisciplinary in the vast majority of fields of study. Widespread digitized education disseminates through various platforms give rise to new opportunities for learning and gaining new digital skills and competencies necessary for employment, education and training, self-development, and participation in society.

Reorienting universities towards digitized education impose the necessary measures to analyze digital techniques used, respectively those that support the education and training systems. Improvement initiatives in education and

Cite this Article as: Andra Diaconescu“ Digital collaboration in Higher Education: Vulnerabilities and Challenges in E-Learning During Covid-19 pandemic” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

technological changes have certainly influenced the new directions in society, creating structures that have the ability to empower digitalization in industries (Diaconescu, et al., 2019). Technological changes reshape the material, human, and social dimensions and offer solutions when society is facing the biggest challenges caused by COVID-19 pandemic. The COVID-19 pandemic brings to light another national emergency. During the quarantine period, the educational system had to adapt to a new reality emphasizing the need to invest in technology, resources, training, so that each individual has access to education. Also was consider teacher training, increase their ability to transmit information and educate, keeping alive the interest of students to participate and learn from home. For an act of quality education, it will also be necessary to develop appropriate content for the online environment and distance learning (Diaconescu, et al., 2020).

Measures to prevent the emergence of new outbreaks have forced schools, universities, adult education centers and other educational institutions to suspend all face-to-face learning offerings. During pandemic COVID-19 higher education has reorienting his strategy and force universities towards digitized education by imposing necessary measures to analyze digital techniques used, those that support education and training systems. Consequently, all these changes had a remarkable influence on the educational environment, respectively it was a beneficial road to adapt the teaching/learning methods focusing on creative techniques and innovative technologies. More precisely exists a tacit cooperative acceptance from each university that recognizes these days the importance and advantages provided by digitized education. Now digitized education is transforming the way people work, learn, train, make sense of their world and have fun in a digitalized, networked and knowledge-based society. (Punie, 2007) The advantage brought by digitized education is that it disseminates timely information through various platforms and encourages students to experiment with new learning means, developing them new digital skills and competencies that are necessary for self-development but also good employment in market work.

Trough this paper the author explains the concept of collaboration in education and how its evolution will revolutionize the way students will explore practice workshops with the help of online tools. Beside the importance of collaboration in higher education between educators and students upon online platform it is shown how fragile is the online environment. Besides concerns for introducing all learning materials in the online curriculum, student enrollment, or student training and teachers, universities have also considered identifying the best cyber security systems to protect users' identities or prepare for cyber attacks. In this paper are highlighted some vulnerabilities in the online environment in higher education. Also, there are included collaboration challenges in the higher education and are explain some digital tools for develop students' skills based on projects. There are in questions information about how higher education is a valuable testing ground for the latest collaborative technology and how the use of digital solutions stimulates better collaboration for higher education and explore the many applications of technology in today's learning environment.

Digital collaboration in Higher Education

There was a time when technology was seen as an additional tool to traditional learning methods, but now technology is a vital component in education. While the term "educational technology" has existed for several decades, in recent years there have been changes in technology-based education systems that have brought a wave of change in higher education practices.

Innovative teaching approaches, such as virtual classrooms, online education and blended learning programs, have opened the door to unlimited opportunities for both students and educators. The digital transformation of education is accelerated by the rapid advancement of new technologies such as artificial intelligence, robotics, cloud computing and blockchain technologies. Like the major technological advances in the past, digital transformation affects how people live, interact, study and work. Grimoni, Belico dos Reis, and Tori (1998) describe the success of using multimedia for their existing electrical engineering on-campus students. Kondo and Ishijima (1999) presents a distance learning system for engineering education via the Internet, using multimedia technologies and mathematical tools for a course in control engineering (Ariadurai and Manohanthan 2008). Strenger et al., (2017) explain how digital, virtual and e-learning elements will allow students to strengthen their intercultural competences while working on real engineering and technical problems, in online courses where they can conduct experiments, analyze and interpret their results in international teams (Renzulli, 2015). Lieberman and Cheung (2007) discuss the development of remote-controlled laboratory exercises for their distance laser and fiber-optics engineering technology programmer. To address problems inherent in hands-on laboratories and teaching such laboratories at a distance, many institutions now use computer simulations as an inexpensive way to expose more students to the power of real laboratories without them having to incur the burden of costs associated with time and travel. Simulation software enables delivery of laboratory facilities to the front door of students' homes (Gorrell, 1992). Constant software upgrades have also resulted in aggregate improvements in distance education for engineering

students. Internet-based simulations can be used flexibly by students anytime, anywhere. According to Alhalabi et al., (2004), however, although simulations can serve important purposes, in some cases, such simulations are an inadequate substitute for real, hands-on laboratory experiences. Although simulation serves the purpose of initial experimentation, these authors opined that it cannot provide the same range of possibilities that manipulating physical material does. In some fields, such as electrical and mechanical engineering, actual experiences with real physical elements are necessary.

Coşkun et al., (2019) in their recent article describe an important part of the tasks in the preparation for Industry 4.0 is the adaption of the higher education to the requirements of this vision, in particular the engineering education. In the research paper they introduce a road map consisting of three pillars describing the changes/enhancements to be conducted in the areas of curriculum development, lab concept, and student club activities.

Digital collaboration in e-learning

In January 2018, an Action Plan for Digital Education was drafted and disseminated at the level of the European Union, which mainly considers education and training to be the best investments in the future of Europe, with an important role in creating a European identity, starting from common cultures and values. Attempts to imagine the future of education often highlight new technologies - omnipresent computing devices, flexible classroom models and innovative visual screens. The existential factor that shapes the future of higher education is something that people cannot touch or see: "great data and analysis." Undoubtedly, important analyzes and data have an important role to play in the future of higher education, especially collaboration through technology. Educators, students and administrators need a good collaboration to fortify the foundation and adopting change. For educators, the availability of a real-time understanding of student performance, including students at risk, can be a significant help in planning teaching activities. For students, receiving information about their performance in relation to their colleagues or about their progress in relation to their personal goals may be motivating and encouraging. (Siemens and Long, 2011)

Collaboration through technology changes the trajectory of traditional education as we know it. We have already seen how the Internet has radically changed the classical approach to learning in classrooms, introducing digital resources and providing a wealth of up-to-date knowledge that supports teachers and students. Through connectivity, we open up a new world of global learning: classrooms include students from all over the world, and collaboration between experts exposes valuable knowledge to provide new learning experiences. The captivating world of video creates opportunities for students not only to explore new areas with ease, but also to collaborate with others in engaging and fascinating ways.

Digital collaboration vulnerabilities in e-learning

According with the current situation presented above engineering graduates face multiple changing demands on their competencies. Engineering students must have good communication skills, collaboration, information networks, feedback and reception, teamwork, and even in some cases cultural understanding. Innovating engineering universities have become a necessity in a globalized world, especially for newly established universities looking for a more competitive market place.

Thereby taking into account the opinions of other researchers the intensity of the technological boom in education starts from the premise that today's students are the first generation of digital natives, who have grown up using technology since birth. They are also early adopters of the latest technological advances and demand access to the latest technology in everything they do. We are also seeing a growing demand for experienced technology professionals in the modern workplace. Adopting an active status through the use of the Internet and social networks or the use of smartphones and other mobile devices, modern students expect a more collaborative and interactive learning environment.

Starting from this premise, taking into account the requirements of the new generations of students, the educational institutions did their best to introduce new friendly and easily accessible interfaces for online learning. Although students' adaptation to the online environment has come naturally, it is also a vulnerable field that is at increased risk of cyber attacks. Universities and classrooms around the world have had to stop face-to-face meetings due to the COVID-19 pandemic. Shortly after the schools urgently started to move to distance learning, it was noticed that the parties involved were not prepared for the type of full-time digital education. Not all students or teachers had the necessary technology, laptops, stable internet connection, creating a general panic that students will be left behind with learning. Moreover, many educational institutions have not implemented adequate cybersecurity measures,

putting online classrooms at increased risk of cyber attacks. Or there have been several types of threats - phishing pages and emails related to online learning platforms and video conferencing applications, threats disguised as the same applications and distributed denial of service (DDoS) attacks affecting the education industry. DDoS attacks have affected the educational resources of the following online educational platforms:

- Coursera – represent an online learning platform that offers a wide range of open online courses, certificates and even diploma programs.
- Blackboard – provides a virtual learning environment in which educators can build fully digital courses or create additional activities to complete personal training.
- Google Meet – offer a video communication service, which can be used to host meetings and online classes
- Moodle – the most popular learning management system (LMS) in the world, used by educators to build online courses, host classes and create activities.
- Zoom – a highly popular online collaboration tool that provides free video conferencing capabilities.
- Google Classroom – a web service designed specifically for educators to host classes, generate assignments and track students' progress.
- edX – a provider of open online courses available to users worldwide.

The report of Kaspersky DDoS Intelligence System identify various threats in two platforms Moodle and Zoom. From January to June 2020, the platform most commonly used as a lure was Zoom, with 5% of the users that encountered various threats encountering them via files that contained the name Zoom. The second most common platform used as a lure was Moodle. By far the most common threats encountered in 2020 were downloaders and adware, which were encountered in 98.77% of the total registered infection attempts. Various classes of trojans followed adware.

Table 1: Vulnerabilities in online learning platforms / video conferencing applications

	Vulnerabilities	
Online learning platforms / video conferencing applications	Phishing risks	Users who reach these phishing pages are often tricked into clicking on URLs through which malicious programs are downloaded being tricked into entering their login details.
	Riskware	Various files, from browser bars and download managers to remote administration tools, which can perform various actions on your computer without your consent.
	AdWare	Users are assault with unwanted ads.
	Trojan (Backdoor)	Malicious files that allow cybercriminals to do everything from deleting and blocking data to interrupting computer performance.
	Exploit	Piece of code or even some data written by a hacker or malware writer that is designed to take advantage of a bug or vulnerability in an application.

Zoom is by far the most commonly used platform as bait, with 99.5% of users encountering various threats disguised under its name. This is not surprising, given that Zoom has become the most frequently used video conferencing platform by universities. By February 2020, the platform has added new users (2.22 million) compared to 2019 (1.99 million). Given its immense popularity, it is obvious that in the near future Zoom will be the favorite target for malicious actors. Being a tool powered in the online environment millions of users want to download the application, which inevitably at least one of them will meet with installers or fake configuration files.

Even knowing that vulnerabilities will increase in the next period because of continually usage of online education, the pandemic was a real test for all digital educational resources, none of which, public or private, was designed to cope with such an explosive increase in internet traffic. However, the variety of platforms and tools coordinated by IT developers have allowed everyone to continue their studies.

In the near future, universities will become dependent on their technological infrastructure, so that any resulting attacks and violations can have an even deeper impact on their operations. In addition, there is the potential for digital delivery technologies to be directly targeted, and we have already seen evidence of such attacks, such as vulnerability exploitation, phishing and denial of service, being targeted specifically at online learners and providers.

Digital collaboration challenges in e-learning

Passing the years, as the innovations and investments in the digital space have grown considerably, the opportunities for various universities to collaborate with each other have also increased. Some universities have enjoyed partnerships with the IT industry and allowed shared knowledge and good practice for online environment. Currently, the incentive demand for using the data and the digitization are at the helm of these new-age collaborations, in such a way that the intra-industry and universities partnerships complement each other forming a strong alliance. Given the evolution of the epidemiological situation at the international level and the adoption of legal restrictions to stop the spread of the Covid-19 virus, it has forced higher education institutions to switch to online platforms allowing safe educational activities. Thus, the teaching activities that require the physical presence of students in educational units and institutions have suspended, being configured in online format. Hundreds of digital education tools have been created with the purpose of giving autonomy to the student, improving the administration of academic processes, encouraging collaboration, and facilitating communication between teachers and learners. To embrace digital transformation must be considered several smart applications easy to implement. Smart applications allow task coordination between students and improves projects efficiency, responsiveness, and effectiveness. Coordinate homework tasks for students and synchronize information can be achieved by tools like Edmodo, Socrative, Projeqt, Thinglink, TED-Ed, cK-12, ClassDojo, eduClipper, Storybird, Animoto or Kahoot and offer an optimal modality for individuals to communicate with each other in every moment of the day using text, audio or even video. The advantages provided by smart applications have an important asset in improving students interaction, especially among for those geographically dispersed. In this sense different tools provide screen sharing and video chat for different discussions about the problems encountered in the project.

Table 2: Digital education tools

Digital education tools Facilitating communication between teachers and learners		
Engineering Unit Converter App	https://play.google.com/store/apps/details?id=mobile.unitconverter&hl=en	Allows students to easily do conversions and engineering calculations
Finger CAD	http://www.ngcybit.it/iTunesApp/fingercad/	This application gives students the opportunity to design anything they do using computerized CAD operations.
Simple Physics	https://jundroo.com/app/simplephysics/	Students complete various construction challenges using physics. For example, students build structures that should withstand different forces. Students earn points as they learn to use physics concepts to build sustainable structures.
Instructables	https://www.instructables.com/	A site that has teaching tools for engineering and includes projects and lesson plans for teaching engineering with fun and practical activities.
Wolfram Alpha	https://www.wolframalpha.com/	An online database of engineering materials where students and teachers can simply ask engineering questions, and the application will search the database for relevant materials that should answer the question.
Edmodo	https://new.edmodo.com/	It is a personalized educational tool and aligned with the opportunities brought by technology and the digital environment. Teachers and students are connected in a social network. Teachers can create online collaboration groups, manage and provide educational materials, measure student performance, and communicate with parents, among other functions.
Socrative	https://www.socrative.com/higher-ed/	It is a system that allows teachers to create educational exercises or games that students can solve using mobile devices, whether they are smartphones, laptops or tablets.
Thinglink	https://www.thinglink.com/	Allows educators to create interactive images with music, sounds, text and photos. It offers teachers the opportunity to create learning methodologies that arouse students' curiosity through interactive content that can expand their knowledge.
TED-Ed	https://ed.ted.com/	It is an educational platform that allows the creation of educational lessons in collaboration with teachers, students, generally people who want to expand knowledge and good ideas. This website allows the democratization of access to information, both for teachers and students, both parties having an active participation in the learning process of the others.

cK-12	https://www.ck12.org/student/	This platform has an open source interface that allows the creation and distribution of educational material via the internet, which can be modified and contains videos, audio and interactive exercises.
ClassDojo	https://student.classdojo.com/#/login	It is a tool for improving students' behavior: teachers give their students instant feedback, so that the friendly mood in the classroom is "rewarded" with points, and students have a more receptive attitude to the learning process.
eduClipper	https://explore.participate.com/educlipper	This platform allows teachers and students to share and explore references and educational materials. It also offers teachers the opportunity to organize a virtual class with their students and create a portfolio in which all the work done is stored.
Animoto	https://animoto.com/projects	Animoto is a digital tool that allows to create high quality videos in a short time and from any mobile device, inspiring students and helping to improve academic lessons. The Animoto interface is friendly and practical, allowing teachers to create audiovisual content that adapts to educational needs.

Collaboration challenges in the higher education must be overcome through linked digital tools for develop students' skills based on projects. Projects stimulates better collaboration for higher education and explore the many applications of technology in today's learning environment. For example in educational projects, a major important element that requires creativity exposure is the design project. Most of the time, students receive this task in the final years, after having thoroughly laid the theoretical foundations. However, these projects should be from day one and spread throughout the program to develop skills and encourage active learning. In the current situation, the educational system requires a creative approach regarding digital education that response to global innovative initiatives in higher education.

Discussion and conclusions

In conclusion, the key result of distance education is an increase in digital literacy for both students and teachers. This means that the forms of the learning process should become more diverse, respond to modern needs and take advantage of new technological opportunities. The new vision approved and implemented by universities towards digital education requires the necessary measures to analyze the digital techniques used, respectively those that support education and training systems.

So far are to realize the main vulnerabilities on universities at the surface. These in the next period will try to penetrate the university environment and will increase significantly in the near future. The university has many more things essential to their ability to do business that they now need to protect. The surface of attack that universities now face is multiple scales larger than they were before. Investments in some IT and security infrastructures are needed, as a starting point to allow the transition from physical to virtual. There is much more dependence on IT infrastructure, there is much more dependence on applications. There is still the availability of using online platforms, the reliability of these platforms, all those things that are not necessarily security issues, but are IT issues.

Modern challenges and global problems that require the most attention from the new generation of students will be solved by collaborating with digital tools, developing the skills to create customized learning solutions. The growing popularity of digital services in education will also contribute to the demand for cyber security. Using distance learning as a main education tool, will speed up the importance of digital security and turned from an abstract notion into a necessity in maintaining a normal learning process. Collaboration with industry must take place immediately to introduce digital security lessons for teachers so they can pass on knowledge and skills to students.

Widely digitized education, disseminated through various platforms, gives rise to new learning opportunities and offers new practices for acquiring the digital skills needed for employment, education and training, self-development and participation in society.

Abstract

For a short period of its existence, educational ratings have become a significant factor in evaluating the activities of universities. Nowadays they are one of the main tools in the competition of higher education institutions. The purpose of the study is to improve the methodology for building a ranking of universities by professional orientation. The object of this study was Russian higher education institutions. The subject of this study is the process of rating universities. The information base of the study is normative documents, statistical data, educational, methodological, scientific, and practical materials on the topic of the study, materials of official websites of various ratings, local regulatory acts of universities, etc. This article discusses methodological approaches to the construction of various international educational ratings, their classification is carried out, the advantages and disadvantages of various methods of rating universities are identified. Conducting the study we proceeded from the working hypothesis that the current world ratings do not take into account the specifics of the national educational systems of different countries and do not fully suit the professional orientation of certain groups of higher educational institutions. The results of the study are the proposed classification of rating methods of tertiary education institutions, a generalization of the advantages and disadvantages of individual international methods for constructing educational ratings, and the developed author's methodology for rating building by professional orientation. These results have practical use not only for specific educational institutions but also for several other interested users: entrants, students, graduates, employers, etc.

Keywords: University Ranking, International Educational Rating, Global University Rating, Professional Orientation Rating.

Introduction

Recently, there has been a growing demand for transparent and objective assessment in the higher education system. The tool for this assessment is the various ratings of educational institutions. The number of such ratings has been growing steadily for the last decades. However, the scientific community is still debating on the issues of rating building: it analyzes the positive and negative consequences of applying ratings, considers various aspects of ranking the evaluated criteria, highlights the advantages and disadvantages of various rating methods, discusses methods and criteria for comparing the activities of higher education institutions, etc.

A retrospective analysis allowed us to restore the chronology of the emergence of international university rankings.

The history of university ranking dates back to the 19th century in the USA. When the Bureau of Education in the United States began to issue annual reports on educational institutions. These reports contained detailed information about universities and were aimed at classifying them according to various criteria. Later, universities began to rank based on various indicators from best to worst *(Salmi and Saroyan, n.d.)*.

The initial goal of the ratings was to determine academic performance. Such ratings were relevant for internal users (students, teachers).

Subsequently, the ranking was aimed at applicants who were going to enter a particular university.

Over time, these ratings moved beyond the national framework. Many educational ratings have gained international status and have become global. The emergence of international educational ratings is a consequence of the process of globalization and the integration of states in various fields of activity *(Daraio and Bonaccorsi, 2016)*. During this period, the participation of the institution in the ranking ceased to depend on the geographical location. A transition was made to the so-called “through” technique. It implied the search for a common denominator for different systems of university indicators and assigning them a place with the help of an integrated assessment *(Maslen, 2010)*.

It is worth noting that it was the representatives of the Asian region who were the first to publish international and world ratings, trying to unify universities around the world so that applicants and employees from anywhere in the world could choose a priority educational institution according to chosen criterion.

Based on the generalization of various international educational ratings, within the framework of this study, a classification was constructed and the advantages and disadvantages of various rating methods of higher education institutions were identified.

Classification of World Ratings

There are currently five recognized global ratings:

- “Academic Ranking of World Universities” (ARWU);
- “Times Higher Education” (THE);
- “Quacquarelli Symonds” (QS);
- "Webometrics" (WEB);
- “Performance Ranking of Scientific Papers for World Universities” (NTU Ranking).

There are also many other lesser-known ratings. Each of these is based on its unique methodology. Figure 1 shows the classification of ratings for various reasons (Fig.1).

If we consider the ratings "by type", then we can distinguish three groups. Firstly, these are ratings, where the result is the total score. For its calculation, a certain set of indicators is taken, calculated as a whole for the university. As a rule, each of these indicators is assigned its weight. Then the weighted values are calculated, which are then added up. The result is a general comprehensive assessment of a higher educational institution. This method is one of the most common.

For example, in the WEB ranking, the analysis is carried out as a whole for a higher education institution for four indicators, each of which has its weight: the number of links in the global search engines to the university's official website (25%); the number of important files posted on the official website of the university (12.5%); the number of links to the official website of the university in the Scholar search engine (12.5%); the number of unique external links to the official website and university materials in the search engines Yahoo and Exalead (50%) *(Ranking Web of Universities: Webometrics ranks 30000 institutions | Rankings updated every January and July: Universities, Webometrics, Bibliometrics, Altmetrics, 2020)*.

Fig. 1: Classification of university ratings

(Source: compiled by authors)

Secondly, ranking can be made according to individual training programs and specialities. Such ratings are more aimed at applicants. This allows them to determine the place of study, based on the chosen profile and future profession.

The advantage is that the curriculum can be ranked by academic degree: bachelor, master, graduate student, etc.
An example is the separate ARWU rating. In addition to the rating with a general final grade, it has the following estimates:

- in subjects;
- by industry;
- in subjects in the field of engineering *(http://5top100.ru, 2020)*.

Thirdly, there are combined ratings that integrate the characteristics of the above types. They also contain more complex techniques that cannot be grouped by common features into a single table.
Ratings are also divided by structural type.

Analyzing various international and national ratings you can notice that the data in them can be summarized in different ways. As a result, the summary list of leaders looks different: somewhere, each university is assigned its serial number (ordinal rating), and somewhere they are located in blocks of several educational institutions in each (cluster rating) *(Zhi-Yong, 2018)*. For example, the German Stern rating refers to cluster ratings and divides the universities under study into 3 groups: the best, medium, and worst *(Pinar, Milla and Stengos, 2018)*.

The combined structure combines the characteristics of the two previous species. Each university is assigned a serial number (as in the serial structure), but only the best educational institutions (for example, the first 50, 100, or 1000 places) are published in the final table. In this case, only a group of leading universities is visible to end-users.

Information for compiling ratings can be collected through surveys (questionnaires) of employers, university employees, students, etc. Often there is an aggregate collection of information to calculate the necessary indicators *(Arefyev, 2015)*.

Analysis of methods for developing ratings of tertiary institutions

Based on their considered classification of various ratings, we can conclude that the rating process is multifaceted and covers various areas of educational institutions.

As can be seen from a variety of ratings, there are many methods for constructing them. But any rating should answer for questions presented in Figure (Fig. 2).

In this case, the object of assessment is understood directly as the educational institution itself, which must be compared with other similar organizations using those indicators that are significant in a particular rating. Training programs are considered as the object of evaluation on the industry and subject ratings. Structural elements can be faculties, departments, and areas of activity of educational institutions.

Fig. 2: Main rating issues

(Source: compiled by authors)

The subject of the assessment is the criteria and parameters by means the university is evaluated. Most often, rating developers choose the following groups of indicators: quality of education; university reputation; scientific activity; competitiveness, etc.

Based on the subject of assessment, we can conclude that the calculation of ratings is a complex and multifaceted process since everyone can interpret the indicators in different ways. For example, the quality of education may include a different range of concepts. It may also mean student performance, student-teacher ratio, or, for example, the

proportion of foreign students. All this leads to the fact that the assessment system is extensive and multi-level *(Kehm, 2013)*.
In addition to users of the rating, there are other interested parties - those who evaluate it - the subjects of evaluation. Typically, users of the rating and subjects of evaluation are closely connected. Professors, scientists, teachers, that is, the academic community; government bodies; a group of competent experts; users of the rating (students, educational institutions, employers, graduates) can be “appraisers”.

Often, rating evaluations entail not only a social function but also a financial one. Some appraisers receive money for the work performed (for example, expert communities). Usually, universities participating in the ranking pay for consulting support. Therefore, it is necessary to control cash receipts so that there are no abuses and the assessment process is as transparent and objective as possible *(Clarke, 2007)*.

Choosing an assessment methodology it is important not only to understand how to calculate indicators and evaluate the position of higher education institutions but also how to interpret the results. Various assessment tools include questionnaires and surveys; generalized indicators; private indicators; accreditation (state or social-professional), etc.

Overview of the advantages and disadvantages of the largest world university rankings

The entire world community is still arguing about the calculation correctness of the of some indicators, the feasibility of including them in the ratings, and the information content of ratings as such. There are many nuances in building ratings that is why this process has its advantages and disadvantages. Let's look at them using the example of the three most famous world educational ratings: Academic Ranking of World Universities (ARWU), Times Higher Education (THE) and Quacquarelli Symonds (QS).

The International Ranking at Shanghai Jiao Tong University - “Academic Ranking of World Universities” (ARWU) originally aimed to determine the difference between Chinese and world universities, especially in terms of research work.

This rating is focused on scientific activity and considers those universities with Nobel Prize winners, high citation, publications in certain scientific journals *(ARWU World University Rankings 2020 | Academic Ranking of World Universities, 2020)*.

Six indicators helping to determine the place in the rating are considered here:

- Alumni (the number of Nobel or Fields Prize winners among graduates);
- Award (the number of Nobel or Fields Prize winners among staff);
- HiCi (the number of authors with a high citation index);
- N&S (the number of articles published in the journal "Nature and Science");
- PUB (number of articles indexed in international scientific databases);
- PCP (integrated indicator, which is calculated per employee).

Institutes of humanities do not calculate the N&S indicator. Hence scores are distributed among other indicators otherwise there would be an advantage in the direction of technical educational institutions, which would entail an incorrect assessment of the calculation of place in the ranking.

For each indicator, the best university is identified, which is taken as a basis - it is assigned 100 points, the rest are calculated as a percentage of this maximum value.

This technique can be called into question, since the indicators of the number of laureates are long-term, decreasing by 10% after ten years. It turns out that in 2019 the graduate or employee who received the Nobel or Fields Prize in 1930 was still included in the calculation (although this criterion will have a weight of only 10% of whatever weight it would have been, received in the 2010 year).

Nowadays It is more important for employers to hire quickly adaptable well-educated graduates than to know that in the last century one of the employees of the corresponding university received a prestigious award.

Another disadvantage of this methodology of university ranking is the country where the university has been located. This factor plays an important role in ranking procedure. For example, many universities not included in the global educational space until recently had not had the notion that it was necessary to publish in certain journals to meet international standards. Also, do not forget that no matter what the leading university in a particular country is, but if there is a negative political or economic situation at a certain time, it is unlikely that applicants will want to go there to study.

Another world-famous university ranking is the Times Higher Education (THE) ranking. Today it includes over 1250 universities around the world. THE ranking is a global table including various university performance indicators. Based on the indicators selected in it, one can receive perception about the educational organization's tasks: teaching, researching, knowledge transfers, and international perspectives. Carefully calibrated performance indicators are used to creat it. That provides the most complete and balanced comparison trusted by applicants, students, teachers, employers, and the government.

The indicators of this rating are grouped into five areas:

- Teaching (training);
- Research (research);
- Citations (citations);
- Industry income (income from production activities);
- International outlook (international interaction).

Due to some limitations, experts may not include the university in the rating process. Firstly, if the university has less than a thousand publications in its scientific base over the past 5 years. It turns out that at least 200 articles should be published in the Scopus database.

Secondly, a university can be excluded from the calculation if 80% of scientific research falls on one field of knowledge. Therefore, this restriction prevents entry into the ranking of specialized universities. This can also be considered a disadvantage of this rating.

It should be noted that it is very difficult for those countries that relatively recently joined the Bologna process to compete with those universities that have operated within the framework of a single educational space since the late 90s of the 20th century. It is difficult for “newcomers” to achieve such high rates in terms of quoting the works of their employees.

Educational institutions provide data for calculating indicators according to the rating construction method themselves. Thus, the organizers relieve themselves of the responsibility to collect data, but still, selectively check their accuracy *(Rindova, Martins, Srinivas and Chandler, 2017)*.

If for some reason the university cannot provide the initial data, it is assigned an average score between the lowest value of university`s indicator for previous years and the average value of the same indicator for other universities in the current year. Thus, the organizers try to avoid too severe penalties for failure to provide data but also do not give high marks *(Smith, 2010)*. As a result, the objectivity of the assessment as a whole is decreasing.

A comparison of individual indicators of Russian universities (Fig. 3) made it possible to verify that, for example, the methods for calculating the citation rate for QS and THE ratings are different. That is why the results are diametrically opposite.

If in 2019, in THE rating, the citation rate of Tomsk Polytechnic University (TPU) is 52.3%, then in the QS rating it is only 3.3. Although it is based on the same Scopus database. This difference is since in the QS rating the value of the citation indicator is taken to one employee and in THE rating - as a whole for the university.

Since citation has been considered over the past 6 years, a big gap in value can be, for example, in TPU between 2016 and 2018. This means that in 2011 this university had a large number of publications, and when the year was dropped out of the analysis, the indicator dropped sharply.

The last of the reviewed here international ratings is the Quacquarelli Symonds (QS) rating. He is positioned as one of the main assistants to applicants when choosing to study at world universities. The purpose of this rating is to identify the best university in the areas of research, internationalization, teaching, and employment. The surveys of employers and researchers and provided by universities quantitative data are the data resources for the rating *(Bates, 2010)*.

Fig. 3: Citation Index in «Times Higher Education»
(Source: compiled by authors on the basis of «Times Higher Education»)

Place in the ranking is calculated by six indicators:

- Academic reputation (academic reputation);
- Employer reputation (reputation among employers);
- Faculty/student (the ratio between the teaching staff and students);
- International faculty (share of the foreign teaching staff);
- International students (share of foreign students);
- Citations per faculty (number of citations per employee).

The highest weight in the ranking falls on the indicator of academic reputation, which is 40% of the total score. It is based on the expert opinions of over 80,000 scientists around the world. Researchers should point to those universities that are leaders in conducting studies. Experts are divided into international and local, and international have more weight (85%) than local (15%).

The disadvantage of this rating is that the weight of indicators related to research activities is extremely overrated. In this rating, the main share falls on the indicator of academic reputation, which is based on the scientific activities of universities. At the same time, students are not interviewed during the process of collecting data on universities. Perhaps this is done because students are less competent in matters of a professional orientation than the academic community.

However, in our opinion, for people choosing the place of their future education, it is important to know the opinion of graduates and students of the corresponding educational institution.

Thus, having analyzed the indicators of the three world ratings, it can be argued that they are more focused on research, the publication of articles, and attracting nonresident students and lecturers (teachers). After analyzing the indicators involved in calculating the ranking, it can be argued that most of the ratings are aimed at classical universities. Profile universities can never get to the top of the rankings. However, they can expect success in industry ratings.

The current ratings are showing the imperfection of the collection of information about educational institutions and their evaluation. Many criteria in the ratings are subjective because the results of the assessment often depend on the opinions of individual subjects surveyed, rather than specific quantitative objective indicators that can be double-checked.

It would seem that we are only talking about university ratings. However, the ranking process has become one of the main criteria for choosing universities in the global educational services market. Such significance of the ratings can be described by the words of the vice-president of IREG Observatory on Academic Ranking and Excellence Waldemar Sivinsky: "Your affairs do not go as you think, but as the public perceives them" *(Expert: Business Solutions, 2020).*

But it is worth to note that all the shortcomings revealed during the rating, rating developers try to eliminate through the transparency of calculation methods and greater openness of rating agencies.

In general, it can be noted that to create a more balanced and objective assessment of the university's place in the global educational community, it is better to consider its the results of the assessment in several ratings simultaneously.

Methods

The above analysis of international ratings is showing the ratings are not perfect. Often they do not take into account the characteristics of individual national education systems and do not consider universities in terms of professional criteria. While professional criteria are the basis for an objective assessment of universities by various groups of stakeholders - employers, applicants, their parents, etc. These contradictions predetermined significant practical interest in the chosen research topic.

Conducting the study, we proceeded from the working hypothesis that the current world ratings do not take into account the specifics of the national educational systems of different countries and do not fully suit the professional orientation of certain groups of higher educational institutions.

The purpose of the study is to improve the methodology for building a ranking of universities by professional orientation.

The object of this study was Russian higher education institutions. Each of these institutions has its list of goals and objectives assigned to them by the state and various groups of stakeholders.

The process of rating universities, trends in this area, as well as the advantages and disadvantages of rating methods, are the subject of this study.

The information base of the study was normative documents, statistical data, educational, methodological, scientific, and practical materials on the topic of the study, materials of official websites of various ratings, local regulatory acts of universities, etc.

It is assumed that the new methodology for building the ranking of universities should be based on the principles of public-professional accreditation.

Only those higher education institutions that have submitted the appropriate application should participate in the ranking. However, they can choose only a few specialities and educational programs that are planned to be checked. This factor is fundamental for forming a rating according to professional criteria. The advantage of this rating is that the expert commission includes both representatives of the academic and scientific community, as well as students and employers. This rating focuses on educational programs. This will help to generate complete and reliable information about a particular area of training at the university. It is assumed that such kind of information should be useful primarily to applicants and employers.

The structure of the final indicator of the proposed rating by professional criteria is presented in table 1.

The new rating is based on a generalized indicator, calculated as the sum of weighted ratings for each of the selected criteria.

As you can see, in the proposed rating, the main weight in the final score falls on the learning indicators (educational criteria). This is because, as noted earlier, the rating is designed more for applicants and employers.

The source of information for constructing the rating is quantitative objective data provided by those departments of universities that graduate according to the study program (profile) studied. In this case, the subjective assessment obtaining in other ratings during the survey is completely excluded.

Table 1: The structure of the developed rating

Indicator	Indicator Components	Weight
Training	The ratio of the number of entrants to the number of graduates of the department according to the relevant program (profile)	10,00 %
	The ratio of teacher rates to the number of students enrolled in the corresponding program (profile) of training	5,00 %
	Number of employed graduates by training profile	25,00 %
	The average grade for studying among students enrolled in the corresponding (profile) of training	25,00 %
	The income of the Department that produces specialists in the corresponding profile	5,00 %
Citation	Citation of the works of the Department's employees in scientific databases (Scopus, WoS, RSCI) that produce specialists in the corresponding program (profile) of training	15,00 %
Operating income	Income from the production activities of the Department that produces specialists of the corresponding profile	6,00 %
International engagement	Percentage of foreign students enrolled in the study program	3,00 %
	Percentage of foreign employees involved in the relevant training program	3,00 %
	The share of scientific publications of the Department's employees in collaboration with foreign scientists	3,00 %
Total		100,00 %

(Source: compiled by the authors)

The indicator of the entrant number ratio to the number of graduates of the department according to the corresponding training program (profile) is intended to reflect the level of demand for the department, which graduates specialists in the corresponding profile, and the demand for the corresponding educational program. The high value of this indicator would show the necessity to increase in the faculty and building up the material and technical base. If the value of the indicator is less than unity, then this may mean the unpopularity of the direction among entrants (employers), or the failure of students to complete their studies. In this case, the university should revise the educational program so that it becomes available to all students who wish to gain knowledge in the corresponding profile of training.

An indicator of the teacher rates ratio to the number of students studying according to the corresponding training program (profile) shows how much of the faculty per student. The higher the indicator, the more individualized will be training, which will affect its quality.

Choosing their future place of study, many entrants look at the demand for a profession in the labour market. To help in it can the indicator of the number of employed graduates according to the profile of training. The higher the indicator is, the more relevant and claimed the corresponding direction of training will be considered. If it is low, then university management should encourage establishment relationships with employers.

A high average mark for studying with students enrolled in the corresponding training program (profile) is intended to show the quality of education in this speciality.

The objectivity of these assessments can be checked during state accreditation of a higher educational institution or through a selective assessment of students' knowledge by independent expert commissions.

The income of the department graduating specialists in the relevant profile is directly related to the number of students and the cost of training.

To bring the proposed rating by professional criteria closer to international ratings and increase the level of recognition of the university in the international arena, the developed rating includes the citation rate of the department’s employees in scientific databases (Scopus, WoS, RSCI). However, the weight of this indicator in the final rating score is significantly lower than in the current global ratings. This is because, in some countries, which include Russia, higher education is aimed at students and entrants, and not at the scientific community.

The income from the production activities of the department, which graduates specialists of the corresponding profile, reflects the relationship between the department and those companies and enterprises that are ordering research work and projects from it on a contractual basis.

To be known about the university not only within the respective country but also abroad, the rating includes indicators related to international interaction: the share of foreign students, the share of foreign employees, and the share of scientific publications in collaboration with foreign scientists.

Thus, the indicators listed and described here are aimed at assessing the reputation of individual educational institutions for various communities: applicants and students, employers, the scientific community, foreign colleagues, etc.

Results

The results of the study are the proposed classification of rating methods of tertiary education institutions, a generalization of the advantages and disadvantages of individual international methods for constructing educational ratings, and the developed author's methodology for rating building by professional orientation. These results have practical use not only for specific educational institutions but also for many other interested users: entrants, students, graduates, employers, etc.

There are a large number of advantages inherent in the developed professional-oriented rating due to the proposed and above described the structure of the final indicator.

For an educational institution, they are as follows:

- Strengthening and improving the university position in the market of educational services as a result of improving the quality of separate educational programs;
- an increase in the level of trust in an educational organization among individual stakeholders, primarily among those to whom the rating is directed - entrants and employers;
- increasing the competitiveness of educational programs in the educational services market.

There are some key benefits for users such as entrants, students, and their parents, as well as for potential employers:
- obtaining complete and reliable information in the prioritized for them the direction;
- obtaining information on the chosen profession demands in the labour market;
- the opportunity for students after graduation to find a job through close connection and cooperation between employers and universities;

The developed rating is ultimately designed to improve the training quality in tertiary education.

Conclusion

The initial hypothesis of the study that the current world ratings do not take into account the specifics of the national educational systems of different countries and do not allow to fully take into account the professional orientation of certain groups of higher educational institutions has been generally confirmed.

At present, world rankings are aimed at identifying the best scientific environment in universities that will be recognized in Europe and English-speaking countries and become resources of key ideas for leading countries. Instead, first of all, being a guide for applicants when choosing a place of study, taking into account the quality of the educational process.

The developed and described author's rating is an integrated assessment of the quality of training of university graduates, calculated based on objective quantitative indicators of educational, research, international, financial and economic activities of universities.

World university rankings affect not only the educational sector but also the national policies of regions. In the future, the role of ratings will only grow. This is due to the following factors:

- with linking the amount of University funding to the rankings;
- with the transfer of national education systems to the Bologna process and standardization of the performance indicators system of educational institutions;
- with the formation of a universal global educational space and the need to increase the level of competitiveness of universities in the international arena.

Abstract

The main task of the article is to determine the criteria for giving the definition of projects from the point of view of the classic approach – PMBOK and from the point of view of the philosophy of lean production. As part of the study, the phases / stages of project implementation at enterprises were analysed separately. As a conclusion, a generalized scheme of project deployment logic was prepared, and criteria similar in terms of the two directions were defined.

Keywords: Project, Project Management, Lean Manufacturing, Project Approach, A Process Improvement, Implementation Stages, Increasing Productivity.

Introduction

Lean manufacturing is considered as one of the possible methodologies for increasing productivity by building a value stream that allows organization to reduce costs. Successful implementation of lean manufacturing requires consistent and conscious action on the part of the organization's employees, led by management and leader, as well as overcoming resistance and obstacles.

The founder of the organization of the customer-oriented approach to the organization of production is LLC Toyota Manufacturing. The corporation has successfully implemented the philosophy and principles of lean manufacturing and has shown significant growth in labour productivity.

Some companies (especially small and medium-sized enterprises) experience difficulties in implementing lean manufacturing tools, dwelling on the issues of implementing principles and tools at the initial stage. Some companies, having incorrectly decided on a project for the implementation of lean manufacturing, cease to engage in implementation and become disillusioned with this philosophy. Some companies, faced with the difficulties of selecting and implementing projects in the framework of lean manufacturing, switch to the implementation of investment projects or projects to improve individual activities.

As it was revealed during the observation of several dozen companies, the most difficult for them are the very first steps - the planning and discussion stage. This article makes an attempt to compare approaches to project

implementation depending on the requirements and capabilities of the organization, as well as stages in the implementation of projects. In this article the logic of deploying projects in enterprises is formulated.

Methodology

In this study authors have conducted research on implementation of lean production projects proposed in the framework of the national program of the Russian Federation and the classical project approach (phase model based on the principles of PMBOK and IPMA standards were chosen as the most common). The main stages / phases of project implementation within the framework of two approaches were studied, the main characteristics of each stage were determined, and the relationship between the two approaches was built and analysed.

Defining a project in terms of PMBOK perspective

PMBOK reviews best practices and includes proven and effective project management methodologies. PMBOK defines a project as a temporary application of effort made to create a unique product or service. The term "temporary" means that any project has a clear beginning and a clear end. The ending (completion of the project) occurs when the objectives of the project are achieved; or it is realized that the objectives of the project will not or cannot be achieved; or the project is no longer needed and it is terminated *(PMBOK® - A Guide to Project Management Body of Knowledge, 2020)*.

According to PMBOK, project management refers to the application of knowledge, competencies, tools, and methods in project activities to meet project requirements.

The project criteria are:

• novelty (in combination of different factors);
• changes as the main content of the project;
• a specific goal, limited in time;
• a limitation of the required resources;
• the budget related to the project.

Working on a project requires a balance between different elements in the organization. PMBOK identifies ten main areas of expertise:

● integration management;
● content management;
● time management;
● cost management;
● quality management;
● human resource management;
● communications management;
● risk management;
● procurement management;
● stakeholder management.

In the PMBOK standard, 6 main defining criteria are distinguished, on the basis of which a decision of opening and implementation is made.

Defining a lean manufacturing project in terms of the national program of the Russian Federation to increase labour productivity

The national program “Labour productivity and employment support” was initiated by the Russian government *(National projects: Russia's future, 2020)*, the main goal of this program is to ensure the growth rate of labour productivity at medium and large enterprises in the basic non-resource sectors of the economy at least 5% per year by 2024. This federal program addresses the task of creating conditions for the advanced growth of labour

productivity on the basis of the principles and tools of lean production is being solved *(Passport of the national project (program) "Labour productivity and employment support" (approved by the Presidium of the Council under the President of the Russian Federation for Strategic Development and National Projects) (Minutes of December 24, 2018 N 16), 2018)*.

Lean manufacturing can be characterized as a multi-faceted manufacturing approach that includes a continuous improvement process aimed at creating a value stream for the customer.

The methodology developed to replicate best practices states that a flow / process improvement project is a project aimed at optimizing a repetitive process and solving emerging problems using lean manufacturing tools. This methodology is not supposed to launch an investment project.

The project criteria in terms of the national program are:

- mandatory presence of a process in the project;
- the process is repetitive;
- end-to-end / cross-functional / resource-intensive process;
- no ready-made solution during the planning and implementation phase;
- the project does not require significant financial expenses.

From the point of view of the national program, one of the main criteria of projects in lean manufacturing is the lack of a ready-made solution and the mandatory presence of cross-functionality.

Phases of work on a project from the point of view of the classic project approach (PMBOK)

Within the framework of the classical design approach, there are 5 main phases, which are presented in Figure 1 *(Standards, 2020)*:

- Initiating,
- Planning,
- Execution,
- Monitoring / Controlling,
- Closing.

Fig. 1: PMBOK's Five Project Phases
(Source: A guide to the project management body of knowledge (PMBOK guide), sixth edition, 2017)

The Initiation phase focuses on identifying the problem and solving it, the project in general, assessing the economic viability of the project and preliminary costing to decide if the project is feasible. At this stage, the project charter is filled in (also project application, project passport).

The planning phase focuses on planning the implementation of the solution - creating a schema to meet the business requirements that the project is aimed at. This stage includes planning the organization of the project, specification of goals, and a detailed work plan that can guarantee the implementation of the project and obtain the expected result. At this stage, a hierarchical decomposition of work is considered and prepared. It is necessary to determine the sequence of actions, to plan required resources (finance, human resources). Moreover the stage consist of quality planning, communication planning, procurement and acquisition planning, contract planning and risk management, including risk identification, qualitative and quantitative risk analysis and risk response planning.

It is worth noting that the assignment of some of these processes to this phase has certain assumptions, for example, project risk management occurs at all phases, but in the planning phase in this area of knowledge the volume of work is greater than in other phases.

The next phase is monitoring and controlling, which focuses on coordinating resources to implement the plan, monitor and control to ensure that project objectives are achieved. At this stage, project effectiveness should be measured on a regular basis to identify major deviations from the plan that could jeopardize the project's objectives and allow corrective action and even preventive action to be taken in anticipation of potential problems.

Thus, on the one hand, execution processes are highlighted, such as the leading and project management, quality assurance, acquisition, selection and development of the project team, dissemination of information about the project, request for proposals and selection of suppliers. On the other hand, monitoring and control of processes including project work, changes, volume of work, schedule, costs, quality, project team management, and project performance reporting.

The final phase focuses on closing and looking at formal project acceptance, knowledge retention and employee reintegration.

Main phases of a Process Improvement Project

Not all organizations can, or even should, apply the same set of tools for project implementation. It is often recommended that organizations should pay attention to the following aspects:

- elimination of bottlenecks,
- competitive benchmarking,
- continuous improvement programs,
- cross-functionality of workplaces,
- reduction of cycle time,
- just-in-time production / continuous flow,
- reduction in batch size,
- optimization of maintenance processes,
- usage of the new technological equipment / technologies,
- planning strategies,
- preventive maintenance,
- pulling system,
- Kanban,
- quality management programs,
- quick changeover,
- reengineering of the production process,
- safety improvement programs,
- creation of independent working groups (cells).

It should be emphasized that these tools create a system, therefore they help to eliminate a specific type of loss, and they should be applied together.

Within the framework of the methodology, enlarged stages (roadmap) are described, the sequence of implementation of which should be followed. There are 4 main phases:

1) The preparatory phase (planning and preparation), at which the team is assembled, discussion of the pilot process, over which the changes will be made, the initial diagnostics of the state of the process is carried out. Another additional goal of this stage is to conduct basic training for team members and the head of the organization, to acquaint them with the principles, philosophy of lean production. During this phase, it is desirable to prepare information posters, brochures, allowing employees to be involved in the change process.

2) The second phase, which is the main one and assumes the maximum involvement of the team, is Diagnostics and planning phase. This phase is the basis for training specialists and trainers who will replicate successful experience to other departments and / or processes in the future. Diagnostics at this stage involves a detailed analysis, timing of operations, mapping of all operations on the selected stream. As part of planning phase, action plans (with main tasks, responsible people and deadlines) are created to minimize losses and solve existing problems.

3) The implementation of improvements is highlighted in a separate phase, which involves the active implementation of the planned activities, the creation of a project office, regulations, standards and the parallel launch of additional projects throughout the enterprise.

4) The final phase is the replication of gained experience, the creation of its own lean production system in the company.

Results

The study of the phases and stages of the two different approaches has found several points of contact, but initially it was decided to analyse the criteria for defining the project in terms of the classical approach (PMBOK) and the national program approach. The results are shown in Table 1.

Table 1: Comparison of approaches to define projects in terms of the classical school (PMBOK) and the national program

Comparative characteristics	**Classical approach (PMBOK)**	**Improvement process project (the National program)**
Availability of a ready-made solution at the time of launching the project	Yes (during initiating phase)	No
Author of the project / initiator	One person / team	Team
The duration of the project	Project has a clear beginning and the end	3-6 month, but it can be prolonged
Project planning	Different level of detail (from roadmaps to network planning)	Landmark (roadmap)
Object of the project (changes)	Any spheres and processes in the organization, one-time activity	Cyclical activity (cyclical processes)
The result of the project	Creation of a unique product or service	Improvements that affect the activities of several employees or departments in the organization (cross-functionality is required)
Implementation of	One-time activity (within the project	Continuously (creating a system of continuous

changes	frames)	improvement)
Project budget	Fixed at the initial stage (and is separated from other processes and ideas)	Determined as decisions are made
Above-projects coordinators (leader or department)	Coordinator / committee depending on the level of the project	Management / representatives of the department (service) for the development of lean production
Change / development of organizational culture	Optional (depends on the specifics of the project)	Necessarily

(Source: compiled by the authors based on practical experience)

The information obtained during the research was processed and systematized in the form of a general scheme - the logic of the project implementation.

Fig. 2: The logic of the project implementation.

(Source: compiled by the authors)

Discussion

The following conclusions were made that within the framework of the strategic goal of increasing the efficiency of the enterprise, it is worthwhile at the planning stage to agree and clearly define what type of project will be implemented: a classic project and / or a project to improve the process. Table 2 shows the possible compliance between two approaches to define projects with the criteria at the first planning phase.

Table 2: Compliance with criteria at the planning stage of the project implementation

Criteria	Classical approach (PMBOK)	The national program approach for developing processes
Availability of a ready-made solution	+	-
There is a clear understanding of the timing: start and finish of the project	+	-
Strict project planning with fixed milestones	+	-
Project implementation experience can be further replicated	+/-	+
Having an idea of the detailed final result of the project at the first phase	+	-
There is a separate (better isolated) budget for the implementation of the project	+	-
Changes will affect organizational and corporate culture	- / +	+

(Source: compiled by the authors)

The above results hypothesize that a process improvement project from the point of view of the national program is a much broader concept than a project from a classical point of view (Fig. 2).

Fig. 2: Correlation of the concepts of process improvement project with the classic project definition
(Source: compiled by the authors)

A project from the point of view of lean production includes both elements of flexible approaches to project management - that is, agile (since there are no ready-made solutions initially, only an approximate roadmap is determined and an iterative principle is used), and the classic elements of project management. Thus, within the framework of the implementation of the only one project to improve the process and increase labour productivity, several separate classical projects can be implemented (if the solutions fit the "classical" project criteria). In addition, a significant role in the implementation of lean production projects is assigned to the change management block in the organization (since we are talking about the development and change of corporate culture), that is, less rigid and mechanistic (as in classical project management), but more lasting changes.

Conclusion

In this article authors identify main criteria for defining the concept of project in terms of classical approach and from the point of view of lean manufacturing theories. The gained results allow hypothesizing that in terms of lean manufacturing the concept of project is wider and can include the classical approach of giving the definition to the project.

Abstract

The mining and metallurgical complex and metalworking are the material and technical basis of Industry 4.0. These industries have quite significant contribution to the GDP of Asian countries, while the world metal trading has a considerable negative impact on the mining and metallurgical complex of Kazakhstan. The Republic of Kazakhstan possesses technologies for the production of a whole range of rare earth metals and elements and has its own raw materials (there are prospects for the production of tellurium, cerium, europium, lanthanum, samarium, gadolinium, yttrium and other metals, especially since many of them were produced for a long time). The country is ready to introduce modern high-tech schemes for processing and obtaining high-quality metals, allowing developing new industries, such as rare metal, radio engineering, nanotechnology, etc. Almost all metals and metal products produced in Kazakhstan are exported, and domestic demand is satisfied by imports.
Analysis and review of production volumes and trade operations in the field of metallurgy in Asia and Kazakhstan revealed the most demanded metal products in the long term perspective: pipes, hollow seamless steel tubes and profiles; carbon steel rods; corners, shaped and special profiles made of carbon steel; alloy steel rods; hollow rods for drilling from alloyed or unalloyed steel.
In our opinion, the existing innovation system is not ready for the introduction of breakthrough technologies in the near future; the transfer of technologies is difficult due to the existing counterparties: foreign investments of large transnational corporations are aimed at developing the raw material base and increasing production capacities. In this regard, state policy should be aimed primarily at the complexity and rationality of the use of natural resources. The main development directions of the mining and metallurgical complex of Kazakhstan and Asian countries are the advanced development of the mineral resource base, the creation of attractive conditions for direct investment in industries with high added value, the introduction of technical regulations and the provision of energy and transport infrastructure. This represents directions for further research.

Keywords: mining and metallurgical companies, technological paradigm, waste-free technologies, rational use of mineral resources, technological policy, industry 4.0.

Introduction

The modern Kazakhstan economy is based on the total superiority of the extractive and processing industries. Apparently, it will not be able to compete with the more developed Asian states in terms of deeper integration into the world economic system due to insufficient development of high-tech industries, which could create the greatest added value. Current development trends in the world economy entail the need for the industrialization of the economy and innovative development. Nowadays Kazakhstani metallurgical companies operate in the context of global competition in the world market.

In general, more than a half of the world population live in Asian countries. They produced more than a third of world volume production in 2000. According to the Financial Times, this indicator will exceed 50% by 2020 *(The Asian century is set to begin, 2020)*. The economies of such large countries as China and India are indisputably significant, the economies of Singapore, Taiwan, Malaysia have already been recognized as developed, the Philippines, Indonesia, Thailand, and Vietnam are also have high development potential.

At the same time, metallurgy will continue to play an important role in the development of the Asian economy and will remain the "basic" industry that provides the formation of the latest technological paradigm.

A considerable increase of the high-tech metal products share is an important feature of the mining and metallurgical companies' development in terms of Industry 4.0, because the automotive, aviation, space and rocketry industries are the main consumers of metallurgical high stage conversion products *(Ivanter, 2018)*.

Currently, there is a considerable gap between the level of economic science development and the current situation in the real sector of the Kazakhstani economy. The current structure of the industrial sector does not meet the requirements of the developing technological paradigm. It is characterized by deep technological deformations. At the same time, the concept of "Industry 4.0" is actively developing in the world and Kazakhstani scientific community. According to the McKinsey Global Institute (MGI), more than a half of working operations in the world could be automated in the next 20 years, and the scale of this process will be comparable to the industrial revolution of the 18th – 19th centuries *(Getting the most out of Industry 4.0, 2020).*

Thus, there are many important issues at the present stage of Kazakhstan's metallurgy development. It is vital to determine the ways to increase and expand the production in terms of new technological paradigm conditions. The Kazakhstan's metallurgy has always been the flagship of the country's development and the foundation of its citizen's well-being. This is an industry that could bring foreign currency income to the state budget, which is comparable to the profit from oil production.

For its sustainable growth, it is necessary to pay priority attention to the restructuring of the national economy, the development of production on a new technological basis, the intensification of innovation activity, the transformation of all material production branches and the service sector on a modern scientific and technical foundation. At the same time, appropriate conditions for the flow of effective innovations and high rates of innovative activity must be created.

However, there is a range of specific features in metallurgy, which influences the whole investment process: the duration and complexity of production cycles; significant amounts of material, labour and financial costs. First of all, it is necessary to provide an economic justification for the proposed measures based on a comprehensive state mechanism to create a favourable investment and business climate in the metallurgical complex, to support domestic producers of metal products, to introduce high-tech innovative proposals of Kazakhstan's scientists in metallurgical production process. These factors determined the relevance of this scientific research.

The main purpose of the scientific work is to determine the priorities and methodological foundations of the technological development strategy for the Kazakhstan mining and metallurgical companies based on the modern trends in the Industry 4.0 development.

The main purpose of the mining and metallurgical companies' technological development is to create conditions for the innovative renewal of the mining and metallurgical industries, providing an increase in the products competitiveness in the range, quality and volume of supplies required by the economy of Kazakhstan and the world economy.

Thereby, the relevance of the mining and metallurgical companies foresight positioning is increasing in order to create a powerful scientific and technological base with the needs of new high-tech and modernized traditional industrial sectors that meet world standards of energy and resource conservation, environmental friendliness of production, labour productivity and provided with highly qualified labour resources.

Analysis of the Sources

The formation of the new industrialized countries in Southeast Asia such as Taiwan, South Korea, Singapore and Hong Kong, Japan's post-war reconstruction could be classified as phenomenal success of the national economic system modernization. This transformation was based on the "pursuit strategy", which provides for the development of cheaper products than those of competitors on the basis of the latest technologies. The process of rapid industrial development was accompanied by an increase in the living standards of the region's population *(Djelic and Quack, 2018)*.

It is important to note that the prerequisites of modern globalization, including the integration of countries into regional associations, the formation of powerful international organizations began to form as a result of the successful modernization of Germany, Japan and the countries of Southeast Asia, which contributed to their integration into the world economic community. Thus, the processes of modernization and globalization are interdependent *(Byun, Sung and Park, 2017)*.

In theory and practice, the neoliberal model of globalization prevails. It is based on the processes taking place in the world economy:

- the formation of a national innovation system, its liberalization at the national and international levels;
- regulation of the economy on a strict monetary basis;
- weakening of state regulation with the development of market mechanisms *(ElGindi, 2016)*.

The neoliberal model assumes that the results of globalization will be equally effectively used by both developed and developing countries, exporters and importers of international goods and services, technology developers and consumers adapting to them. In the financial aspect, the neoliberal model is associated with the fact that the free movement of capital provide the optimal distribution and use of savings in the world economy, stimulates economic growth and the spread of new technologies *(Liu and Dunford, 2016)*.
Structural shifts, which consist in changes in intersectoral, intrasectoral and macroeconomic proportions, are aimed at:

- decrease in the share of the raw materials sector of the economy due to an increase in the share of manufacturing industry;
- modernization of production, including equipment and technologies, increasing the competitiveness of products;
- increasing the efficient and rational use of natural resources;
- increasing the level of the republic's export potential through the production of science-intensive high-tech products;
- creating conditions for the development of innovative activities;
- assistance to further development of small and medium business *(Lenort, 2017), (Byun, Sung and Park, 2017)*.

According to UN study, modernization and technological change should affect job creation and income distribution. Ideally, the introduced technologies should create new jobs, improving the distribution of income in society *(Massa, 2015)*.

From the point of view of the technological changes specifics in the metallurgical industry, researchers pay attention to a number of influencing factors *(Gajdzik, 2019), (Park and Kim, 2019), (Wang, Zheng and Liu, 2016):*

1. Consolidation to the level of a global player. In this case, the value allows to save costs due to the volume of purchases from suppliers of raw materials and strengthen the position in negotiations with consumers of metal products. Chinese companies are considered primarily as new global players.

2. A vertical integration to the raw materials processing is taking place, since the availability of raw materials continues to be a vital factor, and a small or medium-sized company will not be able to buy raw materials on the free market at an affordable price.
3. Production of niche products with high added value: rails, stainless steel, auto sheet and other types of special steels.

A lot of attention is paid to environmentally friendly production in recent studies of technological modernization *(Jia, Foo, Tan and Li, 2017), (Dotsenko, Ezdina and Mudrova, 2019).*

Despite the long-term study of this problem, the utilization and processing of industrial waste is still not carried out at the proper level. Nowadays the large number of solutions is proposed, but the severity of the problem is determined by the increase of industrial waste formation and accumulation. The efforts of foreign countries are aimed primarily at preventing and minimizing waste generation, then at their recycling, secondary use and development of effective methods for final processing, neutralization and final disposal of only non-polluting waste. Undoubtedly, all these activities reduce negative impact of industrial waste on nature, but do not solve the problem of their progressive accumulation in the environment and, consequently, the growing danger of harmful substances entering the biosphere under the influence of man-made and natural processes. The variety of products that can be produced and consumed without waste with the modern development of science and technology is very limited and achievable only on a number of technological chains and only by highly profitable industries.

Methods

The minerals themselves and products of their primary processing (including metallurgical processing) make up about 80% of Kazakhstan's GDP. This determines the great importance of the mineral resource complex and its specific role in the formation of industrial policy. In this connection, the concept of Ecologically sustainable industrial development (ESID) became the methodological basis of this study.

In application for manufacturing processes ESID means reducing material and energy costs, eliminating toxic raw materials from the production process and reducing the amount and toxicity of all emissions and waste before they exit the production process.

In application for products ESID means reducing the negative impact throughout the entire product life cycle from the extraction of raw materials for its production to utilization when the product becomes waste. The concept of product life cycle or the "cradle-to-grave" principle was first proposed in the USA in 1960.

There are the following stages of the product life cycle:

1. Obtaining raw materials:

- extraction of raw materials (including energy consumption for the extraction of raw materials and emissions when receiving this energy);
- extraction of an energy source;
- processing of an energy source into energy;
- transportation of raw materials and energy.

2. Making of products:
- preparation of raw materials;
- manufacturing of products;
- recycling of packaging waste;
- industrial recycling (processing of our own waste);
- packaging and presentation;
- transportation of products;
- production of related products.

3. Use of products and disposal of waste associated with its exploitation.
4. Recycling of a product that has lost its consumer properties ("global recycling").

When assessing the "product life cycle" it is worth paying attention to the fact that in the four-stage cycle scheme, only one stage – "making of products" – refers to an industry problem. All other stages are cross-sectoral tasks. Thus, activities that are useful to the industry will not necessarily be beneficial to the economy as a whole.

At the same time, there are some methods of assessing production in developed countries. The technology that has not passed the examination for compliance with the criteria of "environmentally friendly production" has no prospects in the future in these countries. When licensing, experts compare the technology proposed for use in production with BAT ("Best available technology") as well as with BPT ("Best possible technology"). Unlike BPT, BAT has been implemented in practice and its performance is compared with the characteristics of the proposed technology *(Dotsenko, Ezdina and Mudrova, 2019)*.

These assessment methods allow to determine the overall economic effect of the transition to a low-waste (waste-free) technology, which is the sum of the effects:

- from prevention (reduction) of pollution emissions with industrial waste;
- from the preservation of usable lands;
- from an increase in the area of usable land by reclamation of disturbed areas.

In the process of human impact mineral resources are gradually transformed into final metal products. They sequentially pass through the stages of mining, treatment and enrichment, go to processing, which can consist of many successive technological stages, ending with the transformation of the ore mass into the final product.

Figure 1 clearly shows the transition of a part of mineral resources into losses and waste.

Their amount depends on the technical level of production, the perfection of used technologies, which make it possible to use the original natural raw materials in a complex and carry out further processing of intermediate semi-finished products with minimal waste; when creating and introducing techniques and technologies specially designed for economical use in the production process of basic materials and especially fuel (introduction of various economizers); when creating and introducing technology that processes by-products, waste and all kinds of secondary material resources.

In our opinion, the industrial policy of Russia and Kazakhstan should be implemented from these positions.

Results

The modern period of the metallurgical industry development began in 2000 and is characterized by a stable growth of steel consumption by 8% per year. The undisputed leader in the development of the metallurgical market is China, which provides about a third of world steel consumption and more than a half of its growth (Table 1).

Table 1: Volumes of steel production in the context of individual countries

Country	2019		2018	
	Rank	million tonnes	Rank	million tonnes
China	1	996.3	1	920.0
India	2	111.2	2	109.3
Japan	3	99.3	3	104.3

As the table shows, Asian countries are the main producers of steel and metal products. China and India have taken 1st and 2nd places respectively over the past few years, Russia is in the top 5 large steel producers, and Kazakhstan takes 35th place.

In addition, these countries are also the main exporters of metal products (Table 2). It should be noted that the metal products market is characterized by a strong cyclical nature both in the long term and throughout the year.

Table 2: Exports and import volumes of metal products

Country	Export		Import	
	thousand tonnes	share, %	thousand tonnes	Share, %
World	**457 583**	**100.0**	**444 350**	**100.0**

To understand the essence of the metallurgical cycle, the "producer-trader-consumer" model is usually considered. The problem of the highly cyclical nature of the metallurgical industry is primarily a consequence of the uneven dynamics of demand from consumer industries – construction, automotive sector and oil production.

The first 10 companies in the world metallurgy cover 27% of the market in terms of output, while in other industries the concentration of production is much higher (Table 3).

Table 3: Top steel-producing companies 2019

Rank	**Company**	**million tonnes**
1	ArcelorMittal	97.31
2	China Baowu Group	95.47
3	Nippon Steel Corporation	51.0

Low consolidation results in a significant market influence of suppliers and consumers on metallurgical companies. This negatively affects pricing and, ultimately, the efficiency of the metallurgical business as a whole.

One of the state's technical development indicators is the level of steel consumption. Currently, Kazakhstan lags far behind the main industrialized countries of Asia in terms of steel consumption.

In the short term, the following types of steel products are the most promising:

- alloy steel flat-rolled products;
- seamless steel pipes;
- flat-rolled products made of corrosion-resistant (stainless) steel.

All over the world, specialized high-tech enterprises are engaged in the production of stainless steel, each of which produces only a narrow segment of rolled products range. Moreover, each of these companies produces a minimum number of brands and standard sizes. This specialization combined with high-tech equipment allows to achieve the highest quality, can reduce the costs associated with stopping, reconfiguring and starting equipment and helps to increase productivity. All of these factors ensure low cost and high quality of rolled products.

The demand for the pipe industry products, as well as for the products of other basic industries, largely depends on the macroeconomic indicators of the world economy. The demand for pipes is mainly driven by three economic sectors: the oil and gas industry (which includes the transportation of oil and gas), mechanical engineering and metalworking. According to experts' forecasts, the so-called BRIC countries (Brazil, Russia, India and China) will dominate the world pipe market by 2050. The volume of world pipe production will triple by this period up to 170 million tons, 60% of which will be produced in the BRIC countries.

The main condition for the successful implementation of the industrialization policy should be an increase in the productivity of production factors and providing the competitiveness of the national economy. As mentioned earlier, the environmental friendliness of technological processes should be the main criterion for the development of new industries.

In highly developed countries, metallurgical slags, in accordance with the production and economic purpose of their use, are classified as natural resources and are fully used. At the same time, a list of production factors from the stage of liquid slags to the processing of slags in a solid state has been developed for each type of slag (blast furnace, converter, electric smelting). These factors affect their properties and determine the types of production areas where slags can be used with the greatest benefit.

Table 4 presents data from foreign full-cycle plants on the use of converter slags of traditional processing.

Table 4: Generation and use of solid waste in different countries

Solid waste type	Austria		Germany		Japan		USA		India		Kazakhstan	
	Waste generation	Use, %	Waste generation	Use, %	Waste generation	Use, %	Waste generation	Use, %	Waste generation	Use, %	Waste generation	Use, %
Blast furnace slag, kg/t of pig iron.	250-332	94-100	255	100	284-342	92-100	175-290	100	340-421	30-50	410	33.3
Dust, sludge kg/t of pig iron	6-28	80	1.5	100	9-27	100	14-17	20-40	28	0	17.4	60
Converter slag, kg/t of steel	135-187	80-100	103	96	96-155	90-100	70-170	60-100	200	25	140	3
Converter sludge, kg/t of steel	10-24	25	18	100	15-55	100	15-40	30	15	0	15.7	0

Sludge from rolling mills, kg/t of steel	3-6	50	3.5	100	2-10	100	1.1	0	12	10	12.3	100
Spent refractories, kg/t of steel	3	0	-	-	2.7	100	5-50	0	11.6	40	7.3	9.8

(Source: Worldsteel | World Steel Assoctiation, 2020)

Only about 4% of slag ends up in dumps, which confirms the high interest of related industries in it. Moreover, special technologies have been developed to involve current production slag in the work.

In addition to international cooperation and agreements, developed countries have formed a regional waste management system based on sources of waste generation, including metallurgical ones. There is the National Slag Association in the USA, the Technical Association for the study of the slag's properties, their processing and application and the Special Union for blast furnace slags in France, as well as departments and laboratories of metallurgical and construction institutes and organizations, the National Slag Association in Canada, British Slag Association in England. In 1949 a special scientific and technical society was organized in Germany for a comprehensive study of the metallurgical slags properties with the aim of their subsequent use in industry and agriculture. These studies were carried out with the participation of metallurgical representatives – producers of slag and potential consumers, but under the supervision of government.

Thus, the creation of waste-free technological processes allows to solve the problem of nature protection not only technically, but also with economically reasonable costs. When implementing this approach, the waste itself as the main sources of environmental pollution will be eliminated, while more rational use of valuable and renewable natural resources will be provided.

Discussion

The state of production in the metallurgical complex of Kazakhstan is currently characterized by the following features:

- there are practically no industrial production of science-intensive, high-tech, special materials and alloys for the development of modern industries in the country;
- the required assortment of rolled and metal products for heavy machine building, shipbuilding, oil and gas, mining and metallurgical, construction, light, food and other industries is not produced;
- there is no industrial production of materials and metal products based on the up-to-date technologies such as powder metallurgy, electrometallurgy, electroplating, new foundry and chemical technologies, etc .;
- secondary resources of metals are not used enough effectively and their export abroad is carried out uncontrollably.

The main priority directions of state policy in the field of new metallurgical industries development, taking into account the rational and comprehensive use of natural resources, are:

- the formation of economic conditions for the most efficient use of secondary raw materials, energy and material saving technologies and alternative energy sources in order to ensure the rational use of mineral resources;
- slowdown in the rate of decrease in reserves of basic minerals as well as in the volume of the main types of geological exploration;
- creation of economic conditions for improving the system of ore deposits development in order to reduce the loss of minerals in the bowels and their dilution;
- accelerating the creation of high-performance equipment and fundamentally new technologies for the enrichment of mineral raw materials, the transition to deep enrichment in order to improve the quality of concentrate, agglomerate, pellets (additional costs at this stage should pay off at subsequent stages of processing in the form of saving heat, coke, fluxes, improving quality metal, etc.);
- widespread audit testing of tailings and dumps for the content of associated valuable components in them, their reassessment and, with positive results, the implementation of geological exploration with the development of feasibility studies for re-enrichment of accumulated tailings and stored rocks;
- ensuring a fuller use of the associated overburden in the country's economy;
- excess of the volume of mineral reserves reproduction (or, at least, of the main types of mineral raw materials) over the volume of their extraction. To this purpose, it is necessary to develop a system of advanced growth of reserves in a volume not less than 1.5 times higher than the volume of annual production.

It is necessary to improve the mechanism of complex state regulation in the field of extraction, processing of raw materials, the use of products from it and waste disposal in the Republic of Kazakhstan. The main task of metallurgists, economists and ecologists is to adopt the existing developments on the problem, to continue work on improving the use of raw materials, including metallurgical ones. Therefore, it is necessary to activate the work of all organizational state structures. In order to exist, develop, improve and survive in extreme conditions a control system must have a set of certain properties.

1. Integrity and separability. The system is an integral set of elements interacting with each other. It is important to note that the elements only exist in the system. Outside the system, these are only objects that have the potential ability to form a system. System elements can be of different quality, but at the same time compatible.
2. Connections. There are significant connections between the elements of the system, which, with natural necessity, determines the integrative qualities of this system. Links can be material, informational, direct, reverse, etc. The connections between the elements must be more powerful than the connections of the individual elements with the external environment, otherwise the system cannot exist.
3. Organization. The presence of system-forming factors in the elements of the system only suggests the possibility of its creation. For the emergence of a system, it is necessary to form ordered connections, i.e. a certain structure, organization of the system. The connections between the elements of the control system are ordered in a certain way, that is, the logistics system has an organization.
4. Integrative qualities. The system has integrative qualities, i.e. qualities inherent in the system as a whole, but inherent in one of its elements separately. The material resource management system has integrative qualities that are not inherent in any of the elements separately. This is the ability to deliver the right product, at the right time, in the right place, of the required quality, with minimal costs, as well as the ability to adapt to changing environmental conditions.

The assumed organizational and economic mechanism for the development of low-waste technologies in metallurgy is shown in Figure 2. The figure shows that, first of all, scientific research must be directed to the improvement and development of regulatory support in the field of the secondary resources use.

Fig. 2: Organizational and economic mechanism for stimulating new industries in the mining and metallurgical complex

(Source: compiled by authors)

Conclusion

The solution of such a difficult task as the technological development of the mining and metallurgical complex is possible through the implementation of large-scale innovative projects using the existing scientific and technical potential of an industrial company, aimed at the development and production of new, high-tech, and therefore competitive products. Undoubtedly, modernization of the main production processes in market conditions is a task for private business; however, foreign experience indicates the need for state participation in technological development processes.

In case of creating new metallurgical enterprises and reconstructing existing production facilities, it is necessary to implement waste-free and low-waste technological processes that provide the rational economical use of ore raw materials:

- involvement of gaseous, liquid and solid waste products in the processing, reduction of emissions and discharges of harmful substances with waste gases and wastewater;
- in the extraction and processing of ferrous and non-ferrous metal ores – the widespread use of large-tonnage dump solid waste from mining and processing industries as building materials, laying the mined-out space of mines, road surfaces, wall blocks, etc. instead of specially mined mineral resources;
- full processing of all blast-furnace and ferroalloy slags, as well as a significant expansion of the scale of processing of steel-making slags and non-ferrous metallurgy slags;
- drastic reduction of fresh water consumption and reduction of waste water through further development and implementation of waterless technological processes and closed water supply systems;
- increasing the efficiency of existing and emerging processes for capturing by-components from waste gases and wastewater;
- widespread introduction of dry methods for cleaning gases from dust for all types of metallurgical industries and the search for more advanced methods of waste gases cleaning;
- development and widespread implementation of highly efficient purification equipment at metallurgical enterprises, as well as devices for monitoring various parameters of environmental pollution;
- the fastest development and implementation of new progressive low-waste and waste-free processes, bearing in mind the blast-furnace and cokeless processes of steel production, powder metallurgy, autogenous

processes in non-ferrous metallurgy and other technological processes aimed at reducing emissions into the environment;
- expanding the use of microelectronics, automated control systems in metallurgy in order to save energy and materials, as well as to control and reduce waste generation.

Abstract

The relevance of the research is due to the need to strengthen the resource potential of the information economy of the XXI century. The contradictory development of globalization processes determines the increase in the theoretical and practical significance of the category of Quality of Life. Modern regions differ significantly in terms of natural and climatic conditions, even in the era of globalization, very different opportunities for maintaining the health of the population and recreation of economic resources can be formed. The aim of the work is to improve the methodology and tools for improving the Quality of Life based on the development of the recreational potential of a region. The prospects of improving the Quality of Life based on the formation of a recreational cluster in the region, the rational use of climatic features and unique natural resources of the Southern Urals are studied. Identified opportunities to improve the Human Development Index and Better Life Index through health promotion, increase in life expectancy. The natural and climatic conditions of the natural wealth of the region and the use of natural water resources are studied. The necessity of institutional changes in the status of specially protected territories of the region, the implementation of targeted programs within the framework of the formation of a recreational cluster is justified. Methods of situational analysis, expert assessments, modelling, statistical data, field research, and publications in the open press were used. The results obtained can be used to form regional development programs.

Keywords: Quality of Life, Regional Resources, Recreational Potential, Clusterization.

Introduction

One of the main tasks of social and economic development of the society is to maintain a high Level and Quality of Life of the population. The state of the modern economy and the contradictory development of globalization processes determine the increase in the theoretical and practical significance of the categories of Level and Quality of Life. Category The Level of Life is characterized by the degree of the population's requests satisfaction, including the level of real income, the volume and features of purchased goods and services. The category of Quality of Life is based on the assessment by an individual or a separate group of various aspects in the social, physical and intellectual sphere of their activities and is characterized by the general state of economy, demographic situation, and environmental, social, political and moral aspects. Accordingly, the Quality of Life category covers not only the physical and monetary volumes of goods and services consumed, but also people's assessment of their

Cite this Article as: Viktor NEMTSEV, Igor BAEV, Elena MELNIKOVA and Pavel LIMAREV "Recreational Potential of The Southern Urals And Improving the Quality of Life" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

availability of products, goods and services, living conditions, employment, social guarantees, and education *(Lebedeva, 2018), (Stiglitz, Sen and Fitoussi, 2009)*.

According to many researchers, the Quality of Life category is more complete and more extensive than the Level of Life category. We can say that the category of Level of Life describes the economic component of the Quality of Life, complementing the characteristics of development and satisfaction of physical, spiritual and social needs of people. Based on this, the Quality of Life may differ significantly even in regions with the same Level of Life. At the same time, the environmental and geographical aspects of development become important, which predetermines the adjustment of the processes of globalization taking into account the regional development potential *(Stiglitz, Sen and Fitoussi, 2009)*, *(Eurostat. Final report of the expert group on quality of life indicators, 2017), (The transformation of our world: The agenda for sustainable development for the period up to 2030, 2015).*

Features of the economic and geographical location of a region today significantly affect the Quality of Life of the population. At first glance, territories that are part of financial and industrial clusters with large cities, large industrial facilities, and extensive transport infrastructure are in a better position. However, today certain advantages, in terms of Quality of Life, are also obtained in areas where there are no megacities, there are no enterprises that harm the environment, and there are fewer highways with increased volumes of car exhaust, which creates a healthier environment for people and a more comfortable living environment.

Modern regions have very different natural and climatic conditions of the population (in terms of the number of Sunny days, temperature, humidity, and availability of high-quality water resources). Accordingly, even in the era of globalization, there may be very different opportunities for maintaining public health and recreation of economic resources. The problems of Quality of Life are especially relevant in the era of the information economy of the XXI century, the key link of which is the person and his creative abilities, and are significantly complicated in the situation of the COVID-19 pandemic.

The development of a modern region (in terms of improving the Quality of Life of the population) should be based on increasing its recreational potential through the formation of effective clusters, taking into account the interests and uniqueness of a region, socio-economic and natural-climatic features. Accordingly, the purpose of this work is to research the methodology and develop tools for improving the Quality of Life based on the development of the recreational potential of a region.

Literature Review

As early as in 1970-80, the main approaches to the study of the Quality of Life – subjective, objective, and based on the expansion of human capabilities, began to be formed later, economic, philosophic-psychological, and socio-economic approaches were also formed. Today, within the framework of these approaches, in particular, the most famous developments are those of R.C.F. Aron, E.G. Animitsa, M. Argyle, V.F. Bezyazychny, A. Campbell, E. Diener, J. Forrester, J. Fourastie, J.K. Galbraith, R.E. Lucas, H. Noll, S. Oishi, A.I. Subetto, G.M. Zarakovskiy and many others *(Lebedeva, 2018), (Diener, Lucas and Oishi, 2018).* In 2009, as part of the Report of the Commission of Nobel prize laureates J.E. Stiglitz and A. Sen, as well as Professor J.P. Fitoussi on the measurement of economic development and social progress, a new integral approach to measuring the Quality of Life was proposed, integrating all previously designated, in the wake of thematically specialized and regionally differentiated interpretation of the concept of Quality of Life *(Stiglitz, Sen and Fitoussi, 2009)*.

The multidimensional nature of the Quality of Life category determines the existence of methodological problems and multiple approaches to its definition and measurement. Researchers prefer not to define the concept of Quality of Life, but study the system of factors that affect this category, noting the nonlinear dependence of the integral indicator of Quality of Life on these factors. For example, UN experts suggest using the Quality of Life Index, which takes into account a huge number of indicators integrated into factors of income, health, stability, security, family well-being, public relations, gender equality, political freedoms, climate, and employment *(Stiglitz, Sen and Fitoussi, 2009), (Diener, Lucas and Oishi, 2018)*, *(2019 Human Development Index Ranking | Human Development Reports, 2019)*. The lack of necessary statistical data makes it difficult to use this index for Russian regions. The organization for Economic Co-operation and Development (OECD) uses the Better Life Index, calculated on the basis of 23 indicators that form factors of Housing, Income, Jobs, Community, Education, Environment, Civic Engagement, Health, Life Satisfaction, Safety, Work-Life Balance *(OECD Better Life Index, n.d.)*. At the same

time, the attention of researchers is still insufficiently focused on the mechanisms and tools for improving the Quality of Life of the population through the use of the recreational potential of regions, which makes it possible to more fully and reasonably take into account the environmental and geographical aspects of development.

A number of developments by E.U. Alexeycheva, L.S. Arkhipova, D.D. Friedman, R.M. Kachalov, S.S. Kuznets, A.M. Lavrov, D.P. Norton, M.E. Porter, J.A. Schumpeter, U.A. Simagin, R.M. Solow have been devoted to the problems of economic development and increasing the potential of regions (at various times). These problems were also studied by representatives of the new wave of regional development theory M. Fudjita, A.O. Hirschman, P. Krugman, G. Myrdal, A. Venables and others. However, despite significant achievements, researchers have not paid enough attention to the study of regional development opportunities based on clustering of the region's recreational systems, which can increase its economic potential and contribute to improving the Quality of Life *(Krugman, 2002), (Porter, 1998)*.

Methods

In modern research, Quality of Life is often measured by the Level of Human Development, which is published annually in UN updates. The Human Development Index HDI aggregates several social indicators: the Life Expectancy Index LEI, the Education Index EI, and the Income Index II *(2019 Human Development Index Ranking | Human Development Reports, 2019)*:

$$HDI = \sqrt[3]{LEI \cdot EI \cdot II}\,; \tag{1}$$

$$LEI = \frac{LE - 20}{85 - 20}\,; \tag{2}$$

$$EI = \frac{MYSI - EYSI}{2}\,; \tag{3}$$

$$II = \frac{\ln(GNI_{pc}) - \ln(100)}{\ln(75000) - \ln(100)}, \tag{4}$$

where is LE – Life expectancy in years; MYSI – Mean years of schooling index; EYSI – Expected years of schooling index; GNI_{pc} – Gross National Income GNI per capita (purchasing power parity PPP), in $ US.

The availability of statistical information has predetermined the widespread use of this indicator by experts. However, this method has certain disadvantages; in particular, it can be attributed to the limited number of factors taken into account and the lack of assessment of the quality of the analysed spheres of life.

In our opinion, the initiative method of the OECD, which uses the Better Life Index, looks more preferable *(OECD Better Life Index, n.d.)*. In essence, it is an Internet platform for highlighting important areas of life with their weight coefficients, where the Better Life Index is presented for each country in the form of a diagram with 11 petals. Each of these petals illustrates the comfort of life (in a certain aspect) on a 10-point scale: Housing, Income, Jobs, Community, Education, Environment, Civic Engagement, Health, Life Satisfaction, Safety, and Work-Life Balance. In particular, in this platform, the "Work-Life Balance" indicator is estimated by the percentage of employees working overtime. The "Health" indicator shows Life expectancy. The indicator "Ecology" (Environment) is estimated as an indicator of the content of fine polluting particles PM 2.5 in the air (the national average value is 15.5 $\mu g/m^3$) and water quality. The "Community" indicator is characterized by the level of mutual assistance, reliability of relationships between people, and social support. The "Civic Engagement" indicator can be characterized by the participation of citizens in political life, in particular, the level of voter turnout during voting.

To study the recreational potential and water quality of the Southern Urals, the lake geosystem of the resort area of Kisegach was selected using the results of field research for the period 1994-2018. The estimation of changes in the transparency of water resources by the white disk in the central part of reservoirs over a multi-year period was performed to calculate changes in their trophic status by the transparency value based on the Carlson TSI index *(Nemtsev and Zakcharov, 2020)*.

In General, the work uses methods of analysis and synthesis, economic and mathematical modelling, system, situational and reflexive analysis, methods of expert assessments, surveys of respondents, statistical data and results of field research.

Results

According to the analysis of statistics (*2019 Human Development Index Ranking | Human Development Reports, 2019)*, the value HDI of the Russian Federation has grown to 0.824 from 0.691 (at the beginning of the 2000s), which corresponds to a very high level of development and provides it with 49th place in the ranking of all countries. However, the Russian indicator LE is at the level of 72.4 years, which is significantly lower than the level of other countries with a very high level of development (Norway 82.3 years, Switzerland 83.5 years, Australia 83.1 years, etc.). This indicates the potential for growth in Russian indicators LE and HDI is related to the fact that achievements in the field of national income are not yet being properly transformed into achievements in the field of public health and improving the Quality of Life (Table 1).

Table 1: Ranking of the Human Development Index for 2019

Rank	Country	Human Development Index HDI (value)	Life expectancy at birth (years) SDG3	Expected years of schooling (years) SDG 4/3	Mean years of schooling (years) SDG 4/6	Gross national income (GNI) per capita (PPP $ US) SDG 8.5
1	Norway	0.954	82.3	18.1	12.6	68.059
2	Switzerland	0.946	83.6	16.2	13.4	59.375
3	Ireland	0.942	82.1	18.8	12.5	55.660
4	Germany	0.939	81.2	17.1	14.1	46.946
4	Hog Kong, China (SAR)	0.939	84.7	16.5	12.0	60.221
6	Australia	0.938	83.3	22.1	12.7	44.097
6	Iceland	0.938	82.9	19.2	12.5	47.566
8	Sweden	0.937	82.7	18.8	12.4	47.955
9	Singapore	0.935	83.5	16.3	11.5	83.793
10	Netherlands	0.933	82.1	18.0	12.2	50.013
…	…	…	…	…	…	…
15	United States	0,920	78.9	16.3	13.4	56.140
16	Belgium	0.919	81.5	19.7	11.8	43.821
…	…	…	…	…	…	…
49	Russian Federation	0.824	72.4	15.5	12.0	25.036

50	Kazakhstan	0.817	73.2	15.3	11.8	22.168
52	Bulgaria	0.816	74.9	14.8	11.8	19.646
…	…	…	…	…	…	…

(Source: 2019 Human Development Index Ranking | Human Development Reports, 2019)

The Russian Federation is also characterized by a significant regional level gap: for example, in the more prosperous Moscow and St. Petersburg, it is 0.935-0.952, and in the poorest regions (the Republic of Tuva, the Jewish Autonomous Region, and the Chechen Republic) – 0.786-0.801. The regional gap is also reflected in the imbalance of Human Potential components: if the Russian Federation as a whole has a very high Education Index EI (0.910), but the Life Expectancy Index LEI is only 0.671, the Income Index II is also relatively low (0.703), in particular, the Caucasian republics of the Russian Federation have a Life Expectancy Index LEI, but a low Education Index EI *(Rating of Russian regions by quality of life, 2019)*, *(Bobylev, Tikunov and Chereshnya, 2020)*.

Calculations using the OECD method of the Better Life Index *(OECD Better Life Index, n.d.)* for the Southern Urals region were performed for consumers and specialists of sanatorium organizations that are part of the resort area of Kisegach, which includes the Elovoye, Bolshoi Kisegach and Maly Terenkul lakes (tectonic lakes located

within the Eastern foothills of the Ilmen range). We used expert assessments, official statistics and results of systematic surveys of tourists. The results of the evaluations are presented in Table 2.

Table 2: Results of the assessment for the directions of the Better Life Index in the Southern Urals

Indicators	Rating by year, point		
	2017	2018	2019
1 Housing (Housing conditions)	4.2	4.4	4.5
2 Income	2.5	2.2	2.3
3 Jobs	7.0	7.2	7.3
4 Community	6.8	7.4	7.3
5 Education	8.1	8.4	8.4
6 Environment	2.1	2.2	2.3
7 Civic Engagement	4.8	4.8	5.2
8 Health	3.3	3.2	3.3
9 Life Satisfaction	6.5	6.5	6.5
10 Safety	6.0	6.4	6.0
11 Work-Life Balance	8.0	8.2	8.5

Analysis of the results shows that the region has a fairly high assessment of the Quality of Life in the indicators "Education" (8.1-8.4) and "Work-Life Balance" (8.0-8.5), which corresponds to the national average and the level of the UK and Belgium. Other indicators are lower than the OECD average and partially correspond to the national average *(OECD Better Life Index, n.d.), (Rating of Russian regions by quality of life, 2019), (Bobylev, Tikunov and Chereshnya, 2020), (Bobylev and Grigoryev, 2018)*.

However, the indicators "Environment" (2.1-2.3) and "Health" (3.2-3.3) are noticeably lower than the national average, which can be assessed as an urgent need for the relevant system work in the region in these areas.

The results of research on the quality of water resources in the region confirm the concerns of the above respondents and experts on the "Environment" indicator and are presented in Table 3 and Fig. 1.

Table 3: Results of field research of morphometric parameters of lake geosystems of the Southern Urals

The parameters of lake	Lake geosystem of the Kisegach resort area		
	Yelovoye	Maly Terenkul	Bolshoy Kisegach
1 Absolute level mark (Baltic system of marks), m	322.5	319.0	317.0
2 Lake mirror Area, км^2	3.25	0.98	14.90
3 Maximum depth, м	13.5	18.8	33.0
4. Average depth, м	8.1	9.0	15.4
5 Volume of water mass, million m^3	26.5	8.7	230.0

(Source: author's research based on work of Nemtsev and Zakcharov, 2020)

Fig. 1: Assessment of lake water transparency in July-August on the white disk, m: Bolshoy Kisegach – red, Maly Terenkul – blue, Yelovoye – green

(Source: author's research based on work of Nemtsev and Zakcharov, 2020)

As it was found in Nemtsev and Zakcharov' work, the lake geosystem under study had accumulated environmental damage by 2020, its assimilation capacity to recreational impact was significantly underestimated, and the lakes experienced a restructuring of natural hydrobiocenoses. Due to institutional and economic reasons, the impact of the recreational complex of the Southern Urals on the studied lake geosystem in 2012-2018 decreased due to a reduction in the number of service users by almost 50%, which led to a decrease in centralized water intake from lake Bolshoy Kisegach and a decrease in the discharge of wastewater into lake Tabankul (through the channel entering lake Maly Terenkul).

In the last 10-12 years, there has been deterioration in the water quality of Lake Bolshoy Kisegach in terms of transparency and an increase in the concentration of phosphorus compounds (runoff of polluted waters of Lake Maly Terenkul and an additional summer load of unorganized vacationers). The instability of the ecosystem of lake Yelovoye is increasing, which is expressed in the increase in" blooming» of water of the 3rd degree due to the uncontrolled impact of unorganized vacationers, the use of water attractions and motor vehicles in the water area. The decrease in the recreational attractiveness of the coast and water area of lakes Bolshoy Kisegach and Yelovoye is also due to the "blooming" of blue-green algae (cyanobacteria) in the month of July and August. The observed patterns in the study of water resources in the Southern Urals form a real threat of rapid depletion of the natural and recreational potential of the region *(Nemtsev and Zakcharov, 2020).*

Deliberation and Discussion

In our opinion, the OECD Internet platform illustrates the existing structure of the concept of Quality of Life quite well, and its application is also possible for regional studies using comparative and reflexive analysis. At the same time, the OECD methodology under consideration has a significant limitation due to the use of rare statistical indicators generated within the framework of OECD-initiated programs, which determines the high cost of research and the complexity of research of individual social groups. In our opinion, for scientific purposes, the lack of statistical data, deterministic and stochastic models for calculating regional indicators can sometimes be partially compensated by expert assessments and surveys of respondents, results of meta-analysis *(Limarev, Limareva, Akulova and Khakova, 2018)*. It should also be noted that all indicators that characterize the Quality of Life trends are initially equal and are not aggregated into a single common indicator. Although this approach complicates further analysis, it is quite consistent with the level of complexity, versatility and multidirection of the concept of Quality of Life. The results of calculations of the Human Development Index and Better Life Index indicators show that there are prospects for improving the Quality of Life.

Analysis of the prospects of improving the Quality of Life through the implementation of the recreational potential of the region has identified areas of development methodology and development tools improve the Quality of Life

of the region on the basis of UN and OECD indicators *(Stiglitz, Sen and Fitoussi, 2009), (Eurostat. Final report of the expert group on quality of life indicators, 2017), (The transformation of our world: The agenda for sustainable development for the period up to 2030, 2015),* (*OECD Better Life Index, n.d.)*. The study of the current values of the Human Development Index and Better Life Index indicators, as well as the peculiarities of the formation and implementation of the recreational potential of the Southern Urals, revealed the need for systematic work of the region on Quality of Life indicators. From an economic point of view, such work can be organized on the basis of the formation of a cluster that includes health resorts, medical and wellness complexes, organizations of medical and health tourism, based on the resources of business and regional authorities. This will allow us to ensure the rational use of climate features and unique natural resources of the Southern Urals at the system level (Fig. 2).

Fig. 2: Key components of the region's recreational potential development
(Source: compiled by authors)

The cluster concept is an alternative to the traditional dissipative model of regional development based on horizontal links and relationships between direct competitors with similar activities and product lines. On the contrary, the cluster model focuses on the development of vertical relations between various actors and synergetic interactions, supplemented by the attributes of a "Knowledge-based economy" *(Krugman, 2002), (Porter, 1998), (Krugman, 1996)*. Stimulating the processes of self-development of the region on the basis of the cluster approach allows more purposefully creating conditions that contribute to increasing its recreational potential.

The use of cluster forms of interaction for the purpose of economic self-development of the region and the acquisition of additional competitive advantages of organizations is quite obvious. As a rule, it increases the

efficiency and quality of services, facilitates coordination and access to qualified labour resources, relevant information, and educational centres *(Porter, 1998), (Krugman, 1996)*.

Conclusion

A study of the prospects for realizing the recreational potential of the Southern Urals and improving the Quality of Life of the population was conducted. Actual theoretical and practical aspects of the category of Quality of Life of the population are revealed. Given that modern regions may differ significantly in natural and climatic conditions, it is advisable to creatively apply the main provisions of regional development theories to improve the methodology and develop tools for improving the Quality of Life through increasing the recreational potential of regions. Even in the era of globalization, there may be very different opportunities for maintaining public health and recreating economic resources. Identified opportunities to improve the Human Development Index and Better Life Index through health promotion, the increased Life expectancy of the population in the conditions of Southern Urals. Special attention is paid to the study of its natural and climatic conditions as the natural wealth of the region and the careful use of unique natural water resources.

A comprehensive study of the Quality of Life in the Southern Urals based on indicators of the better life index was conducted. The region has a fairly high assessment of the Quality of Life in the indicators "Education" (8.1-8.4) and "Work-Life Balance" (8.0-8.5), which corresponds to the national average and the OECD average, while the other indicators are lower than the OECD average and partially correspond to the national average. At the same time, the indicators "Environment" (2.1-2.3) and "Health" (3.2-3.3) of the Southern Urals are significantly lower than the national average, which can be assessed as an urgent need for the corresponding system work of the region in these areas.

A study of the recreational potential and quality of water resources in the Southern Urals was conducted, for this purpose, the lake geosystem of the resort area of Kisegach was selected and the results of earlier field studies were used. The dynamics of deterioration of water resources in the Southern Urals is noted, which creates a real threat of rapid depletion of the natural and recreational potential of the region.

Have been defined the prospects for improving the Quality of Life of the population based on the formation of a recreational cluster of the region, including health resorts, medical and health-improving complexes, the organization of medical and health tourism, the rational use of climatic features and unique natural resources of the Southern Urals. The necessity of institutional changes in the status of specially protected territories of the region, the implementation of targeted programs within the framework of the formation of a recreational cluster is justified.

Abstract

Relevance of the study is due to the need to improve competitiveness of coal mining enterprises operating in a global innovative economy. At the same time, the models of activity implemented by the management personnel of coal mining enterprises do not fully meet these conditions, which hinder the development of enterprises. To solve this problem, it is necessary to identify gaps in a leader activity structure and form a scientific and methodological base that allows them to be overcome. The purpose of the paper is to develop and substantiate a model for the activities of management personnel of a coal mining enterprise (CME), which ensures its competitiveness in a global innovative economy. The research methodology contains on competence-based and process-based approaches. To achieve the goal, methods of expert assessments, analysis, comparison, observation and synthesis were used. As the main object of research, middle managers of a coal mining enterprise were singled out.
The developed model of competencies includes two interrelated areas: theoretical (ideas and knowledge) and practical (skills and abilities), which, in turn, are divided into three more types: global, innovative and economic competencies. Approbation of the developed model showed that the largest gaps and, consequently, the reserves for growth of the quality of managerial work are associated with such competencies as ability and skill of planning, organization and monitoring results of functioning and improving the object of management, as well as knowledge of advanced technical and technological solutions. With a relatively high rate of development of the personnel ideas and knowledge in the field of advanced technical, technological and organizational solutions there are low rates of abilities and planning skills development, organization and control of functioning results and improvement of the object control, which is due to the lack of effective mechanisms for involving personnel in production and management processes.

Keywords: Competence Model, Innovation, Globalization, Manager, Coal Mining Enterprise, Intellectual And Innovative Potential, Competitiveness.

Introduction

The ability of enterprises to quickly and efficiently transform their strategy in the context of growing globalization of the economy has become one of the key success factors of ensuring sustainable competitive advantage and economic performance above the market average *(Kiehne, Ceausu, Arp and Schüler, 2017)*. Globalization of the economy is an integral characteristic of modern reality and it predetermines the need to consider a coal mining enterprise as a subject of the world market, integrated into a multi-level network of national economies. Maintaining and improving competitive positions in the global coal market is one of the strategic priorities of coal companies, since exports have higher profitability and opportunities to increase sales compared to domestic ones. According to the state statistics, over the past 25 years, the volume of exports of coal industry products in physical terms has grown 8.5 times, amounting to 205 million tons in 2019.

Cite this Article as: Svyatoslav ZAKHAROV, Tatyana KORKINA and Igor BAEV "Competence Model of Coal Mining Enterprise Managers" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The volume of Russian coal exports compared to iron ore and aluminium for the period 1994-2019 clearly reflects the emerging trend to strengthen the position of coal producers in the world market (Fig. 1).

Fig. 1: Dynamics of exports of coal, iron ores and aluminium in the Russian Federation for the period 1994-2019

(Source: Federal State Statistics Service)

Over the past 5 years, the Russian Federation has been one of the world leaders in the global coal industry, ranking third in terms of coal exports after Indonesia and Australia. On the international market, Russia accounts for about 15% *(Kondratev, Popov and Kedrova, 2019)*.

The on-going integration of Russian coal mining enterprises and companies into the world economic system was reflected in the decrease in the predictability of events and the parameters of their effective functioning in the future. According to the program for the coal industry development in Russia for the period up to 2035, its state is characterized as follows:

a) dependence of coal exports on instability of conjuncture of the coal markets.
In the export direction, spot prices at Vostochny and Baltic shipment ports decreased by 7.6% and 19.8%, respectively from 2010 to 2018. In 2019-2020 the emerging trend of price reduction has sharply intensified. The fall in prices is significantly affected by t consequences of the European Union's adoption of the Paris Climate Agreements, as well as the “price war” of oil producers.

b) export-oriented development of the industry is accompanied by an increase in operating costs production.
Since 2010, the total industry average cost of mining 1 ton of coal (in nominal prices) has grown 2.6 times with inflation growing 1.7 times, and the cost of transporting coal for export. The level and predictability of long-term railway and logistics tariffs are fundamental formation of investment programs of coal companies.

c) the growth of import dependence on purchases and use of foreign equipment.
The high rate of renewal of labour tools at Russian coal mining enterprises has led to the fact that in terms of their technical and technological support, they have become comparable to mines and open-pit mines in developed foreign countries. The share of imported equipment in the industry reached 79% in 2018. At the same time, the processes of updating foreign equipment and supplying spare parts in the situation of an increase in the dollar exchange rate lead to an increase in operating costs.

External factors influencing an organization require constant changes in production processes to maintain high levels of performance over time. Accordingly, when developing management decisions of both strategic and tactical nature, it is necessary to take into account the influence of external macroeconomic factors.

Today, industries and companies with high innovative activity and effectiveness of human capital are growing at a faster pace in the world, which is reflected in the level and growth rates of intangible assets. This is due to the development of an economy based on the flow of innovations, constant organizational and technological improvement and production of products with very high added value.

Over the past several decades, the economy has experienced a post-industrial era, characterized by the dominance of knowledge and services, as well as the automation of routine operations. Now comes the era of automation, in which machines develop intelligence and start making decisions *(Barro and Davenport, 2019)*. The landscape of the global economy and its working systems are being transformed by the flourishing of information technology, digitalization and advanced technology. Many organizations, trying to adapt to these changes, but lacking flexibility, are faced to disruption of their business models, low employee engagement and ultimately it leads to their death. When the need arises to make fundamental changes in organizational design in order to become agile and adapt to new technologies, many organizations try to keep up with modern technologies and business models through a series of disparate initiatives that rarely achieve their goals. These initiatives leave the dominant hierarchical form of government intact. The current pace of technological progress is exponential, while there is practically no progress in organizational design, which leads to an increasing gap between the potential of technical solutions and the ability of staff to use it (*Pasmore, Winby, Mohrman and Vanasse, 2018).*

The modern development of Russian coal companies is largely due to technological development - updating, modernizing and increasing capacity of the equipment used, mastering new technological complexes, etc. Development of advanced equipment and technologies for production, automation and digitalization of production is not ensured by a corresponding increase in the load. So with the growth of basic production assets of the industry by 2.2 times over the period 2010-2018, coal production increased 1.4 times. As studies show, further development of coal mining enterprises by upgrading equipment and increasing the volume of tangible assets is already ineffective; it does not allow overcoming the lag behind foreign competitors in labour productivity, which is 3-5 times (*Plakitkina, 2011)*. The coal industry, according to experts, is currently at the level of the fourth technological order, and to ensure sustainable competitiveness in the world market, a transition to the sixth order is required *(Kostarev, 2019)*. In turn, the development of a new technological paradigm also determines a change in requirements for the activities of management personnel, namely development of competencies that ensure acceleration and increase in the effectiveness of the innovation process. In addition, within the framework of the existing technological structure, there are significant unused opportunities for equipment and technology, which are due to the insufficiently high quality of the management personnel activities.

Without changing the approach to the selection of main drivers for the development of Russian coal companies, the industry will not be able to develop at the rates required to ensure its investment attractiveness.

The peculiarity of innovative development of coal industry enterprises is that innovations are not implemented so much in the final product but in the working processes of mining, processing and production management. In this regard, a significant number of enterprises in the industry have developed a culture of activity that inhibits the growth of innovative activity and employee productivity. This is especially true for such a category of personnel as managers of all management levels, who are responsible for setting business goals and implementing ways to achieve them by labour collectives.

The system of labour relations that exists at many enterprises of the industry continues to orient executives towards achieving volumetric, planned physical indicators of production, rather than socio-economic ones, which determine the sustainable functioning and innovative development of an employee and a coal mining enterprise.

Globalization and innovation processes taking place in the economy are transforming the conditions for functioning of coal mining enterprises and exacerbate the need for a corresponding transformation of the internal environment, and, first of all, for changing the models of activity of management personnel.

The purpose of the paper is to develop and substantiate the model of activity of management personnel of the CME, which ensures its competitiveness in the context of the global innovative economy.

Literature Review

The global economy is understood as a system of economic relations between different states, which has a multi-level structure. It is characterized by the development of foreign economic relations with significant potential for efficiency; relatively free movement of resources and benefits between states; tougher competition for all types of resources, especially for human capital, and at the same time the ability to use any resources available in the world; formation of a global system of social and labour relations; synchronization of economic cycles in different countries.

An innovative economy is based on the knowledge that forms intangible factors of production, which allow it to continuously improve and produce high added value products *(Shavina, 2017)*.

The development of an innovative economy is characterized by a number of trends, among which, in the context of this study, intellectualization of all types of labour is of greatest importance.

Based on the above interpretations, we will understand the global innovation economy as a system of economic relations, which includes economic entities of the states of the world, which stimulates the creation and use of innovations by these entities to increase the effectiveness of their activities.

In the context of innovative development, activities of managers are considered by researchers in various aspects. It is noted that the leadership style of top managers is one of the most important factors that have a decisive influence on innovation in an organization. Research by Mokhber M., Wan Ismail W. K., Vakilbashi A. confirms a direct and positive relationship between the leadership style, which has been called "transformational", and innovation in an organization. Transformational leadership has a significant and positive relationship with both empowerment and an organizational climate that supports innovation *(Mokhber, Wan Ismail and Vakilbashi, 2015), (Jung, Chow and Wu, 2003)*.

The managers who actively engage change agents, who create and discuss change with employees, can reduce resistance to change. To do this, however, organizations need to actively support the systematic development of change management capabilities among line managers *(Buick, Blackman and Johnson, 2018)*.

Study of the impact of structural changes in the economy on managerial activity in the UK showed that during a recession, due to decrease and competitive pressure from subordinate employees, additional efforts, additional roles or hard work, implementation of tactics and strategies for saving money, application of personnel work methods aimed at maximizing value at the lowest cost are required. The recession has exponentially increased the focus on cost savings through reduced labour costs. Retention of such requirements for a long period of time leads to a decrease required.in loyalty, a feeling of injustice, professional burnout, emotional exhaustion of managers *(Harris and Ogbonna, 2020)*, which is due to the absence of changes in their models of activity and the presence of gaps with the requirements of the external environment. One of the manifestations of this situation is, on the one hand, the overload of management personnel, according to their self-assessment, with current tasks, on the other hand, a lack of understanding of the structure of activity necessary to ensure the long-term development of the object of management *(Karpov et al., 2020)*.

An organization's agility is critical to successfully adapting to today's business challenges. The development of decentralized structures with shallow hierarchies and higher levels of delegation of authority is a prerequisite for organizational flexibility. In addition, giving employees greater authority and greater responsibility is key to achieving greater employee motivation and dedication. Today's managers must act as mentors who strengthen and encourage their people to be more effective, which ultimately will have an impact on the achievement of organizational goals.

Current business practice shows that a large number of companies have traditional structures and that the lack of professional managers is one of the key factors in poor business performance. A study conducted at the Banovici coal mine, a large mining company in Bosnia and Herzegovina, showed that a high level of delegation of authority positively affects the achievement of the organization's strategic and operational goals *(Delic, Alibegovic and Derzic, 2020)*.

Activities of managers to ensure labour safety at mining enterprises are one of the factors affecting their competitiveness in the global market. Decisions made by managers, based on communication and involvement of personnel, open flow and exchange of information throughout the entire work system, are critical to ensure production safety *(Donovan, Salmon, Horberry and Lenné, 2018)*. System thinking of managers and presence of vertical integration are also key factors in reducing the risk of injuries and accidents at mining enterprises *(Donovan, Salmon, Lenné and Horberry, 2017)*.

The competency model developed for middle managers of coal enterprises in China, based on the analysis of 4 components: 1) strategy, 2) internal processes, 3) operations and 4) enterprise culture, includes the following competencies: strategic vision; analysis and assessment of the situation; implementation of a plan; customer orientation; professional skills, communication (the use of various methods of communication for accurate and clear transmission of key information, feedback, overcoming any possible communication barriers); cooperation (the desire to share knowledge, information, resources, responsibilities and achievements with others, creating a cooperative relationship based on mutual trust); team management; honesty and reliability; initiative; training and innovation (active search and use of opportunities to learn and improve their abilities, as well as the application of knowledge in labour practice); standardization (understanding the important role of standardization in a coal mine, ensuring that every job is done in accordance with standards); ensuring labour safety; quality control (understanding production processes / technological steps to achieve the desired results); cost control (generating income more than costs, actively looking for ways to reduce costs), achievement orientation (striving to do a job well and flawlessly, a tendency to accept higher standards); pressure management (maintaining high standards, no matter how difficult the tasks and staff resistance are); coordination of activities (organization and distribution of human, financial, material and other resources in accordance with goals, overcoming emerging problems, timely resolution of issues of interaction in the production process) *(Xu and Wang, 2009)*.

V.B. Artemiev, A.B. Kilin, V.A. Galkin, A.M. Makarov note that functions of the head of a coal mining enterprise are the following: finalizing the strategic concept of a specific project, forming and developing a management team, guiding the building of employee functions, organizing the development of employee functionalities with the required dynamics, insuring employees against critical errors, training managers who are able to take more responsible positions, formation of reserves to ensure stability of the system, interaction with owners and the external environment, control of activities *(Artemiev, Kilin, Galkin and Makarov, 2020)*.

S.V. Samarin, considering the competence of leaders of coal mining enterprises in relation to development of innovations, highlights the competence of responsibility, understanding the goal, understanding the strategy for achieving the goal, determining the means of achieving the goal, choosing the method of control *(Samarin, 2020)*.
As we can see from the review, researchers are looking for understanding of management activities and approaches to determining the requirements for qualifications of managers to achieve success in the modern business environment. However, an effective model of the activities of the management personnel of coal mining enterprises, which takes into account the specifics of both the global and innovative economies, is still disclosed.

Methods

The research methodology contains on competence-based and process-based approaches. A broad interpretation of the concept "competence is the described requirements for a set of ideas, knowledge, skills and abilities that allow an employee to solve a certain class of professional tasks and ensure the effectiveness of his work" *(Maslennikova and Bannikov, 2019)*. To obtain the results, the methods of expert assessments, analysis, comparison, observation and synthesis were used. As the main object of the research, middle managers of a coal mining enterprise were singled out.

Results of Development and Testing Model of Management Personnel Activity of a CME in the context of the global innovation economy

As a result of the synthesis of scientific and methodological approaches, a competence model for management personnel of a coal mining enterprise has been developed. The proposed competency model includes two interrelated areas: theoretical (ideas and knowledge) and practical (skills and abilities), which, in turn, are divided into three more types: global, innovative and economic competencies (Table 1).

Table 1: Competence model of the management personnel of a CME

Competence	Global	Innovative	Economic
Representations and knowledge	Regularities of functioning of a control object as part of the world socio-economic system (K1)	Regularities of the control object transformation (K2)	Regularities of effective transformation of resources into a product (K3)
Skills and abilities	Planning, organization and control of the results of operation of the control object at a level that meets international standards for safety, productivity and efficiency (K4)	Planning, organization and control of improvements to the management object, at a rate that ensures its competitive advantages (K5)	Planning, accounting and control of the effective distribution of limited resources for the priority tasks of the development of the management object and the consumer value of the labour of each employee (K6)

(Source: compiled by the authors)

Approbation of the proposed competence model was carried out within formation of the class system for middle management of coal mining enterprises. Using the proposed model, a set of indicators was developed to assess the competencies of personnel for each category: mining foremen, mechanics, shift and section supervisors, as well as a scale of compliance of the values of these indicators with the world and Russian standards of efficiency and quality of management in the coal industry, which is presented in Table 2.

Table 2: Scale for assessing the compliance of competencies with international and Russian standards of efficiency and quality of management at coal mining enterprises

Standard	Competencies					
	K_1	K_2	K_3	K_4	K_5	K_6
World	Improves the balance of social and economic interests of the stakeholders of an enterprise	Knows and applies the world's best forms of work organization and staff motivation	Knows and rationally applies the world's best technical and technological solutions	Systematically implements measures that lead to stable implementation of the production plan and reduce the risk of negative events	Implements the latest system improvements on its own. Can confirm improvement results with quantitative qualitative indicators	Provides a consistently high level of efficiency in the use of material and human resources
Best in Russia	Maintains a balance of social and economic interests of a company's stakeholders	Knows and applies the best in Russia forms of labour organization and staff motivation	Knows and rationally applies the best technical and technological solutions in Russia	Ensures stable execution of the plan with acceptable risk	Implements individual enhancements when needed	Provides a high level of efficiency in the use of material and human resources
Average in Russia	Allows an imbalance in the socio-economic interests of a company's	Knows and does not rationally apply the best forms of labour	Knows and does not rationally apply the best technical and technological	Ensures plan execution, but is unstable and with increased risk	Implements individual improvements in case of emergency	Provides an industry level of efficiency in the use of material and

	stakeholders	organization and staff motivation in Russia	solutions in Russia			human resources
Below average in Russia	Deteriorates the balance of social and economic interests of stakeholders of an enterprise	Doesn't know advanced forms of work organization and staff motivation	Does not know and does not apply advanced technical and technological solutions	Does not provide 100% fulfilment of a production plan	Does not participate in the implementation of improvements	Does not provide the sectorial level of efficiency in the use of material and labour resources

(Source: compiled by the authors)

Assessment of the actual level of competence of management personnel of the coal mining enterprise was carried out on the basis of a written examination, interviews with a commission of top-level managers and specialists, as well as statistical reporting on the results of the operation of the management object (site, shift, and team). A total of 225 employees of enterprises that are part of the SUEK coal company, which occupies a leading position in terms of coal production in Russia and the sixth place in the world market, were evaluated.

A graphical model for assessing the actual level of competence of a coal mining enterprises management personnel, in which the world standard is quantified at 4 points, the best Russian - 3 points, the average Russian - 2 points, below the Russian average - 1 point, is shown in Figure 2a.

As a result of the assessment, it was revealed that the actual level of competence of the management personnel at the studied coal mining enterprises in 2018 was 1.6 points. The largest gaps and, therefore, growth reserves are noted in such competencies as ability and skill of planning, organizing and monitoring the results of functioning and improving the object of management, as well as in the knowledge of advanced technical and technological solutions. This is due to the lack of understanding of global competition in the field of managerial work among a significant number of executives at the surveyed enterprises.

Fig. 2: Assessment of the actual level of competence of the management personnel of a CME in (a) 2018 and (b) 2019

(Source: suggested by the authors)

The purposeful work on the formation of the required competencies among the management personnel, carried out during 2019, which included the development of their ideas, knowledge, skills and abilities, is presented in Figure 3.

Fig. 3: Scheme of a CME management personnel competencies development cycle
(Source: suggested by the authors)

The work carried out has made it possible to significantly increase the level of competence of management personnel. At the same time, the greatest development was gained by such competencies as presentation and knowledge of advanced technical, technological and organizational solutions the least ones are the skills and abilities of planning, organizing and monitoring results of functioning and improving the object of management. Such tendencies can be caused, on the one hand, by the technology for development of intellectual and innovative potential of personnel, i.e. primary formation of ideas and knowledge, and, on the other, by the lack of effective mechanisms for using increasing intellectual and innovative potential of personnel in production and management processes of a coal mining enterprise.

Formation of appropriate mechanisms for involving managerial personnel in production and management processes of an enterprise will help reduce the gap between actual and required competencies in the global innovation economy.

Discussion

The presented model differs from the existing ones by the ability to provide a more accurate correlation between competencies of management personnel and conditions for functioning of a coal mining enterprise in a global innovative economy, which expands possibilities for increasing productivity and labour efficiency. At the same time, the developed competency model partially converges with the results of similar studies by Xu H., Wang Y., namely, it includes competencies focused on improving production safety, fulfilling a production plan and reducing costs.

Conclusions

A review of scientific and methodological literature revealed the absence of description of an effective model for activities of the management personnel of coal mining enterprises, taking into account the specifics of the global innovative economy.

The developed model of competencies includes two interrelated areas: theoretical (ideas and knowledge) and practical (skills and abilities), which, in turn, are divided into three more types: global, innovative and economic competencies.

Approbation of the developed model showed that with a relatively high rate of development of personnel perceptions and knowledge in the field of advanced technical, technological and organizational solutions, low rates of development of acquired habits and planning skills, organization and control of results of functioning and improvement of the control object still exist, which is due to the lack of effective mechanisms of personnel involvement in production processes and enterprise management.

Abstract

The article analyses the use of tariff preference systems in the global economy, explores practical aspects and provides a comparative analysis of existing tariff preference systems in the EU, USA, Canada and the EAEU. The proposed methodology for assessing tariff preferences as an instrument of customs and tariff regulation and the possibility of its flexible use in order to protect national manufacturers. The methodology was tested on the example of the Russian Federation for the period from 2016 to 2019: commodity items were identified in accordance with the FEACN EAEU, for which there is a clear predominance of imports from one or more preferential countries (commodity positions: 2602, 4001, 0202, 0303). An analysis of national production made it possible to single out 0202 and 0303 commodity items of the FEACN EAEU, tariff preferences for which affect the competitive environment for national firms against the general background of the growth of the meat and fish industry in Russia. This situation proves the need for a flexible approach to the use of the system of tariff preferences. Recommendations are proposed on adjusting the current system of tariff preferences of the EAEU taking into account the interests of national producers.

Keywords: international trade, system of tariff preferences, general system of tariff preferences, commodity position, tariff preferences, customs and tariff regulation, EAEU.

Introduction

In modern conditions, foreign trade is a strategically important factor in the economic growth of any country involved in the global economic system. Therefore, issues related to the regulation of foreign trade flows of the state are significant at the moment. The authors of the article touched upon aspects of foreign trade regulation with the help of tariff preferences. When evaluating the functionality of tariff preferences, the conceptual tasks of state regulation of foreign

Cite this Article as: Evgeniy STEPANOV, Irina KILINA, Yekaterina MALININA and Ksenia POSTAUSHKINA "Transformation of The EAEU Tariff Preference System Taking into Account National Interests of The Russian Federation" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

trade based on the application of customs and tariff regulation were taken into account, namely: protectionism and protection of domestic producers (reducing dependence on the import of certain goods), fiscal direction (ensuring the revenue part of the budget, due to the payment of foreign economic activity by participants customs payments), achieving a positive foreign trade balance, increasing import substitution, inflow of investments in certain sectors of the economy, etc.

Literature Review

In the economic literature, the topic of the application of tariff preferences by countries is quite widely discussed. An analysis of the work in this area allowed all the studies to be divided into two groups. The first group included studies on the content and nature of the provision of preferences. For example: S. James (2010) considers the preferential access to markets provided to most developing countries through the Generalized System of Preferences. In his view, trade preferences distort markets and impede unilateral and multilateral trade liberalization: when beneficiary countries concentrate their efforts on maintaining their preferential access, rather than becoming competitive, efforts to liberalize multilateral trade are undermined. S. Hakobyan (2013) believes that not all importers enjoy tariff preferences in the United States. His analysis shows that the utilization rate of GSP depends on the structure of production in the beneficiary countries, taking into account local components. This coefficient increases taking into account the preferential difference, export volumes and regional concentration generally and decreases with the degree of processing of goods. J. Xie, D. Zhang (2017) emphasize that with a decrease in the ad valorem tariff, the relative demand for expensive goods increases. It depends not only on the interchange ability of expensive and cheap goods, but also on the interchange ability of weak substitutes. Thus, it can be argued that general preference systems have a positive effect on the quality of products entering the EU due to reduced tariff rates. M. Gassebner and A. Gnutzmann-Mkrtchyan (2018) consider the U.S. common system of preferences as a political tool. They conclude that the probability of termination of tariff benefits for friendly US countries is low, unlike countries with which the US has political conflicts.

The second group of studies includes works devoted to the effects of providing preferences both in the economy of individual countries and in the global economy generally. In this case, each study has an applied character and is carried out on the example of individual countries. In this context, studies dedicated to the analysis of the impact of tariff preferences on the economies of countries providing preferences and countries recipients of preferences are highlighted. This is due to the fact that preferences have both positive and negative effects on the economies of both developed and developing countries. The influence of the general system of preferences on developing countries was reflected in the work of Gil-Pareja, S, R Llorca-Vivero and JA Martínez-Serrano (2014). Using the latest developments in the field of econometric analysis of the equation of gravity for the period 1960–2008, it was proved that mutual preferential trade agreements and the generalized system of preferences have a positive effect on exports from developing countries. R. Olson (2014) believes that the GSP has historically successfully promoted trade with developing countries, but in recent years trade volumes have declined. GSP changes will be able to reorient this system to better fulfil its initial task of assisting developing countries. At the same time, it is necessary to focus on increasing imports of preferential goods while reducing pressure from integration associations that impede the use of GSP. Lubinga, M.H., Ogundeji, A.A., Jordaan, H., Verschoor, A.-J. (2017) consider the impact of the GSP system on the export of fruits and vegetables from Kenya, Tanzania and Uganda to the European Union. The results of the study revealed the relationship between GSP and the export of certain commodity items from developing countries. Pallavi Kishore (2017) examined the conditions for providing tariff preferences to developing countries in the World Trade Organization from the perspective of developing countries. The author focuses on discrimination in the context of the provision of tariff preferences for certain groups of goods.

The analysis of the publication devoted to the topic of the general system of tariff preferences indicates the relevance of tariff preferences as an instrument for regulating the foreign trade of individual states, both from the beneficiary countries of tariff preferences and from the countries that provide preferences. In this connection, the urgent problem is the flexible adjustment of the national system of tariff preferences in order to ensure national state interests.

Methodology

In order to conduct a comparative analysis of international experience, the systems of tariff preferences of: the USA, the European Union (EU), Canada and the Eurasian Economic Union (EAEU), of which the Russian Federation is a member, are investigated. The results of the analysis of the application of tariff preferences are presented in Table 1, in which the following criteria are highlighted: signs of determining the recipient countries of the preference, criteria for determining the goods, the frequency of the revision of the system, regulatory acts governing the provision of preferences and some additional conditions.

Table 1: Comparative analysis of the system of tariff preferences of the EU, USA, Canada and the EAEU

The criteria	EU	USA	Canada	EAEU
Criteria for assignment to beneficiary countries	Standard GSP - low and middle income countries GSP + - low and middle income countries that support 27 international conventions EBA - UN classified countries as least developed	Developing countries - low and middle income countries Least developed countries - countries classified by the UN as least developed.	Developing countries - low and middle income countries Least developed countries - countries classified by the UN as least developed.	Developing countries - countries that are not classified by the World Bank as upper middle income and high income countries Least Developed Countries UN classified as least developed
Criteria for highlighting the list of goods	«S» - sensitive products that are considered especially important for the EU. «NS» - insensitive goods that do not have such a big impact on the country's economy.	A - preferential import of goods for all beneficiary countries; A* - preferential import of goods only for certain countries prescribed in the Harmonized System; A+ - preferential importation of goods only for least developed countries	Almost all goods, with the exception of some agricultural products, textiles, clothing, shoes and steel.	The list of preferential goods contains virtually no highly processed goods. Mainly raw materials, agricultural, food products and some semi-finished products.
Additional terms	The country is excluded from the preferential lists if the condition is met: 1) for all product groups: $\frac{Im_m}{Im_g} > 57\%$ 2) in relation to vegetable products, animal or vegetable oils, fats, waxes and mineral products: $\frac{Im_m}{Im_g} > 17{,}5\%$	The product is excluded from the preferential lists if the cost Im of this product> 50% of the total import of this product or the value Im> 190 million US dollars	If the beneficiary country cannot confirm the country of origin of the goods, it can use the tariff rate of the "Most Favored Nation".	If the volume of goods imported at the subheading level exceeds 3% in value or quantity of the total amount of the same goods imported into the customs territory of the Union, while import during the year has increased by more than 50%, the use of Tariff preference system for this product is suspended.

The criteria	EU	USA	Canada	EAEU
	3) for textiles: $\frac{Im_m}{Im_g} > 47{,}2\%$			
Number of beneficiary countries	71 countries	119 countries	154 countries	152 countries
System Review Period	4 years	Annually	2 years	3 years

(Source: compiled by the authors)

The analysis of the tariff preference systems of the EU, USA, Canada and the EAEU showed that, despite the uniform principles in the basis of preferential regimes, each country (association) has its own peculiarities associated with the tasks solved in the framework of providing trade advantages. Therefore, the conditions for the provision of preferences, lists of preferential goods and countries are different. For example, in the EU, most agricultural products are not included in the preferential lists of products; in Canada, preferences are provided for practically all products, with the exception of certain agricultural products, textiles, clothing, shoes, and steel.

A comparative analysis of the Tariff preference system of developed countries with the EAEU showed that the EU, USA and Canada use a deeper differentiation of customs duties on import from beneficiary countries than in the EAEU. In the EU and the USA, there is a gradation system for certain groups of goods to protect their economy; the EAEU, in turn, does not have such a gradation. In our opinion, the creation of such a gradation of product groups as sensitive and insensitive and the introduction of a certain import threshold would help the EAEU protect its manufacturer.

Research Methods

The purpose of this study is to assess the use of tariff preferences as a tool of customs tariff regulation and the possibility of its flexible use in order to support national producers. The study uses methods of mathematical, statistical and geographical analysis. The research technique is reduced to the following algorithm, consisting of the following steps:

1) A dynamic analysis of the quantitative composition of the beneficiary countries of the EAEU tariff preferences for the period from 1995 to 2019.
2) Analysis of the dynamics of imports into the Russian Federation of goods from preferential countries for the period from 2016 to 2019 in absolute terms and relative imports in the Russian Federation in general .
3) Allocation of commodity items that are more imported from developing or least developed countries with the provision of tariff preferences
4) Analysis of the geographical structure of imports of selected goods.
5) Assessment of the specific share of importing countries of preferential goods allocated commodity positions.
6) Analysis of the dynamics of production of selected commodity positions in the domestic market.
7) Evaluation of the possible prospects for the transformation of the EAEU tariff preferences system in order to support domestic producers.

Research Results

To analyse the breadth of coverage of the foreign trade partners of the Russian Federation with the EAEU tariff preferences system, an analysis was made of the quantitative composition of the EAEU beneficiary countries of tariff preferences for the period from 1995 to 2019 (Table 2).

Table 2: Countries-users of the tariff preferences of the Russian Federation and their dynamics for the period 1995–2019

Beneficiary countries	1995	2005	2010	2017	2018	2019
Developing	105	102	103	103	104	102
Least developed	47	51	49	48	48	49

(Source: compiled by the authors according to the site https://www.trademap.org/tradestat/Country_SelProduct_TS.aspx)

The authors revealed that most of the partners of the Russian Federation are beneficiaries of tariff preferences provided within the EAEU (151 out of 193 countries in 2019, which is more than 78%), while since 1995 the number of countries has not changed.

An analysis of the dynamics of imports into the Russian Federation of goods from preferential countries for the period from 2016 to 2019 in absolute terms and relative to imports to the Russian Federation in general (table 3) showed that most of the imports of preferential goods to the Russian Federation were from developing countries. From 2016-2019 the value of imports of goods from developing countries increased by 33.3% to $ 6,198.82 million, which is 7.24% of total imports. Also, over the period, imports from least developed countries increased by 37.1% ($ 845.64 million and 0.99% of total imports).

Table 3: The volume of imports of goods in respect of which tariff preferences are applied from 2016–2019, mln Dollars, %

Year	Imports of goods from developing countries			Import of goods from least developed countries		
	Mln dollars	% by 2016	Share in import (total)	Mln dollars	% by 2016	Share in import (total)
2016	4 650.42	100.00	6.66	616.62	100.00	0.88
2017	5 517.61	118.65	6.60	522.73	84.77	0.63
2018	5 962.88	128.22	6.56	733.78	119.00	0.81
2019	6 198.82	133.30	7.24	845.64	137.14	0.99

(Source: calculated by the authors based on statistics from the FCS of Russia)

For further research, commodity items were identified that were imported to a greater extent from developing countries with the provision of tariff preferences. The results of the study showed that the largest share of imports of preferential goods imported by developing countries over the past few years are: bananas, citrus fruits, apples and pears, soybeans, coffee and tea, palm oil, cattle meat (frozen), fish (frozen), tobacco raw materials, etc. - more than $ 800 million per year.

At the next stage of the analysis, we focused on commodity positions, the import of which is mostly carried out from preferential countries:

The calculation was carried out according to the formula:

$$Sim = \frac{Im_{ct}}{Im_t},$$

Where S_i – the share of imports of a commodity position from developing countries of the total imports of this commodity position;
Im_{ci} – volume of imports of commodity items from developing countries;
Im_t – total imports of commodity position.
As a result, 4 commodity items were identified, the import of which is mostly carried out from preferential countries: ores and concentrates (commodity position 2602); natural rubber, balat, gutta-percha, guava, chikl and similar natural resins, in primary forms or in the form of plates, sheets or strips, or tapes (commodity position 4001); frozen cattle meat (commodity position 0202); frozen fish, excluding fish fillets and other fish meat, of commodity position 0304 (commodity position 0303).

So, in 2016, 99.86% of natural rubber, balat, gutta-percha (commodity position 4001) was imported from preferential countries (in 2019 - 99.91% of all imports of this product). The second place in terms of the specific share of imports from preferential countries is occupied by citrus fruits (commodity position 0805) (2016 - 97.01%, 2019 - 99.61%). Cattle meat (commodity position 0202) also occupies a large share of deliveries - in 2016 the share was 97.06%, by 2019 the share dropped to 66.04%. For the entire analysed period, there is an increase in the share of imports of ores and concentrates (commodity position 2602) from 77.28% in 2016 to 95.89% in 2019%.

A geographical analysis of the import of each commodity item made it possible to identify the main user countries of the tariff preference system and determine their share in the volume of supply.

The main share of ore and concentrates imports is in the Republic of South Africa; in 2016 all imports were from this country, by 2019, 3 more countries were added to suppliers: Gabon, Turkey and China, while maintaining the clear dominance of South Africa. In 2019, 98% of imports came from the Republic of South Africa, followed by Gabon with a value of 1.94%, Turkey (0.02%) and China (0.01%) in third and fourth places (table 4).

Table 4: The Share of the beneficiary countries of tariff preferences for the importation of commodity position 2602 for 2016 and 2019

2016				2019			
№	**importing country**	**% in import**	**Mln dollars**	**№**	**importing country**	**% in import**	**Mln dollars**

% of total imports		77.28		% of total imports		95.89	

(Source: calculated by the authors based on statistics from the FCS of Russia)

In 2016 and 2019, the main country for the supply of natural rubber, balat, gutta-percha is Indonesia (69.07% and 38.16%, respectively). By 2019, the cost of deliveries increased by 20.7%, but the share of imports decreased due to an increase in deliveries from Malaysia. The second place in 2016 was taken by Vietnam 15.84%, in 2019 it fell to third place, while the value growth of imports was revealed, but the share is reduced. Malaysia took the third place - 6.48% ($ 2.97 million), by 2019, the supply of natural rubber from this country increased and amounted to $ 32.41 million, which allowed it to rise to second place (table 5) .

Table 5: The Share of the beneficiary countries of tariff preferences for the importation of heading 4001 for 2016 and 2019

(Source: based on statistics from the Federal Customs Service of Russia)

According to the data in Table 6, it can be seen that Brazil in 2016 was in first place in imports of frozen cattle meat, its share was 63.49% ($ 282 million), by 2019 its share decreased and it fell to last place. Paraguay strengthened its position and in 2019 already took first place, its share increased, although the value of imports decreased by 19.9%. In 2016 and 2019, Colombia maintained its position, but its value of imports also fell by 42.8%.

Table 6: Percentage of beneficiary countries of tariff preferences for the import of commodity position 0202 for 2016 and 2019

2016				**2019**			
№	**importing country**	**% in import**	**Mln dollars**	**№**	**importing country**	**% in import**	**Mln dollars**

	total	100	444.23		total	100	181.06
% of total imports		97.06		% of total imports		66.04	

(Source: calculated by the authors based on statistics from the FCS of Russia)

In 2016 and 2019, Chile accounted for the largest share of frozen fish imports. By 2019, imports of this commodity item from the beneficiary countries increased by 7 times, and Chile increased its share to 56.14% (124 million dollars) (table 7). In 2016, the share of deliveries from Peru amounted to 13.67% (4.30 million dollars). By 2019, the value of imports increased and amounted to 14.23 million dollars, but the share decreased while - 6.41%. Turkey, on the contrary, strengthened its position and in 2019 took second place with a value of 25.42 million dollars. (11.45%). In general, the number of importing countries decreased in 2019.

Table 7: Share of beneficiary countries of tariff preferences when importing commodity item 0303 for 2016 and 2019

2016				2019			
№	**importing country**	**% in import**	**Mln dollars**	**№**	**importing country**	**% in import**	**Mln dollars**
1	Chile	39.95	12.58	1	Chile	56.14	124.68
2	Peru	13.67	4.30	2	Turkey	11.45	25.42

% of total imports		57.02		% of total imports		92.27	

(Source: calculated by the authors based on statistics from the FCS of Russia)

Thus, we can conclude that the share of imports of goods from developing countries in the total volume of imports of these goods to Russia from 2016-2019 of certain commodity items is quite high, and sometimes reaches 90%, which can create non-competitive conditions for domestic manufacturers and requires a detailed analysis of the state of the development trend of national industries.

In the framework of this study, in order to identify prospects for adjusting the EAEU tariff preferences system, the state and dynamics of the development of domestic production of meat and fish industries were studied - the two commodity positions considered were: meat of cattle, frozen (commodity position 0202); frozen fish, excluding fish fillets and other fish meat of commodity position 0304 (commodity position 0303).

It was determined that the livestock industry, along with other agricultural sectors of the Russian Federation, shows a positive trend. At the same time, there is an increase in the production of poultry, pork and beef. In 2019, total production amounted to 10.81 million tons. The main share is poultry meat - 5.05 million tons, and pork - 3.85 million tons in percentage terms, the meat market structure is as follows (Figure 1).

Figure 1: Dynamics of meat production in Russia for the period 2016 – 2019

(Source: calculated by the authors based on Unified interdepartmental information and statistical system data)

The authors also analysed the fish and seafood market. It was revealed that the production of fish products for the analysed period shows a positive trend (Figure 2).

Over the past 4 years, the volume of production of fish products increased by 6.9%. Positive dynamics indicate the development of this sector of agriculture. In 2019, the volume of production reached 4 310 thousand tons.

According to Rosstat, in 2019, exports of fish and crustaceans from the Russian Federation increased by 4.3% and reached $ 5.4 billion, but the volume of supplies decreased by 6.2% to 2.1 million tons.

Figure 2: Dynamics of fish production in Russia for the period 2016 – 2019
(Source: calculated by the authors based on Unified interdepartmental information and statistical system data)

Thus, in connection with the positive dynamics of the production of preferential goods in the Russian Federation, the question arises of the advisability of providing tariff preferences to countries that supply more than half of the total imports of preferential countries. In this connection, a possible adjustment of the EAEU tariff preferences system was proposed with the aim of supporting the domestic producer on the basis of the gradation mechanism of the EU tariff preferences system.

Discussion

The analysis showed that for a number of commodity items there is a clear dominance of supplies from one or more countries, which may contradict the principles of fair competition. In our opinion, the experience of the EAEU tariff preference system is interesting, which provides for a more flexible adjustment of the preferential lists of goods and beneficiary countries, based on the calculation of the specific share of imports of goods from specific countries.

Based on the study of international experience in applying the system of tariff preferences and the study, the authors proposed recommendations for transforming the system of tariff preferences of the EAEU.

Firstly, it was proposed to amend the list of developing beneficiary countries. That is, to exclude countries, which, when using the GNI per capita indicator, are several times higher than that of all EAEU member countries. Of course, it is worth considering the consequences of such editing of the list of developing countries, it is possible to change the indicators of foreign trade with these countries, including political threats.

Secondly, it is necessary to amend the list of preferential goods. Creation of a system of discounts for preferential goods or exclusion from this list of sensitive goods. This system will help protect domestic producers (there will be no decrease in the competitiveness of their products) and the economy of the EAEU member states.

Thirdly, introduce a grading system for product positions for developing countries using the EAEU tariff preference system.

Monitoring on this system should be carried out annually. A country that exceeds these thresholds will be derived from the system of tariff preferences.

Our proposed gradation mechanism will allow us to track the flow of goods to the domestic market, increase payments to the federal budget from foreign trade, and pursue a more effective protectionist policy.

Our study showed that the Russian Federation is characterized by a trend towards an increase in trade with preferential countries, which generally differs from the global trend identified by R. Olson (2014). However, as in the study of Lubinga, M. H., Ogundeji, A. A., Jordaan, H., Verschoor, A.-J. (2017). In addition, we found that the system of tariff preferences promotes the import of only certain commodity items. And, in general, we agree with the opinion of S. James (2010) that preferential regimes impede the development of free trade and create additional benefits for beneficiary countries, which, in our opinion, confirm the need for flexible adjustment of the system of tariff preferences for each country in individually, taking into account the specifics of the domestic market of goods.

Conclusions

In the framework of this study, a methodology was proposed for assessing the use of tariff preferences as an instrument of customs and tariff regulation and the possibility of its flexible use in order to support national producers. The methodology was tested on the example of the current EAEU tariff preferences system, as a result of which recommendations were proposed for transforming the existing EAEU tariff preferences system. It was revealed that for a number of commodity items imported to the territory of the Russian Federation by preferences, there is a clear prevalence of suppliers from one or several countries, which creates additional competitive barriers for domestic producers (in the presence of domestic developing production), namely, meat and fish products. Recommendations on improving the EAEU tariff preferences system are aimed at changing the list of beneficiary countries, the list of preferential goods, as well as the gradation of tariff rates for developing and least developed countries depending on the saturation of the domestic market and the capacities of national producers.

Abstract

Many problems cannot be solved without effective interaction between customs authorities and participants of foreign economic activity. In particular, this concerns the problems of accelerating customs operations when placing goods under customs procedures, the problems of simplifying customs operations, as well as exchanging information, optimizing and synchronizing the joint activities of customs authorities and participants of foreign economic activity. At the same time, as of today, there is no multi-purpose assessment methodology of interaction between customs authorities and participants of foreign economic activity, which would allow to assess the level of such interaction, as well as to identify the counteraction of the same interaction. The article considers the theoretical basis of interaction be-tween customs authorities and participants of foreign economic activity and reviews the theoretical and methodological aspects of the interaction between customs authorities and participants in foreign trade. The proposed assessment methodology of interaction between customs authorities and foreign trade participants is a set of indicators arranged in 4 groups: temporal indicators of interaction, indicators of the application of technology of electronic declaration, indicators of assessment of the level of risk of participants of foreign economic activity and overall indicators of interaction between customs authorities and participants of foreign economic activity. The methodology allows assessing the interaction and graphically representing the results obtained with the aim of identifying points of counteraction and the problem areas. To assess the effectiveness of interaction between a participant of foreign economic activity and customs authority, indicators can be considered separately or together. The approbation of the developed methodology on the example of the interaction between the participant of foreign economic activity and the customs authorities of Federal Customs Service of Russia at various levels has been carried out, practical recommendations have been given. The results of methodology approbation show its correctness, validity, and opportunity of practical application in the work of customs authorities and participants of foreign economic activity not only in the territory of the Russian Federation, but also in foreign countries with the possibility of its adaptation.

Keywords: customs authority, participant of foreign economic activity, assessment of interaction effectiveness.

Introduction

Russia's accession and participation in the World Customs Organization have led to the formation of new standards in terms of the time of customs operations, the level of paper and paperless document flow, the quality of customs services, etc. Therefore, only the established interaction between customs authorities and participants of foreign

Cite this Article as: Alexander SMEKALIN, Viktoria FROLOVA, Ekaterina SALIMONENKO and Alyona KARDAPOLTSEVA "Development of Assessment Methodology of Interaction Between Customs Authorities and Participants of Foreign Economic Activity" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

economic activity can provide the achievement of new indicators. A number of problems arise in the regulation of foreign trade when implementing international conventions and national concepts by the Federal Customs Service of Russia. These problems cannot be solved without effective interaction between customs authorities and participants of foreign economic activity. Interaction between customs authorities and participants of foreign economic activity takes place at various levels (customs post - participant of foreign economic activity, customs – participant of foreign economic activity, etc.) through a range of mechanisms for collaboration. Placing goods under customs procedures is one of the main areas of interaction. The implementation of this process depends on both the actions of customs authority and the actions of a participant of foreign economic activity. Changes in procedures of a customs business-process can have a critical influence on the results of customs control, efficiency and effectiveness of customs procedures. The development of analysis system and risk management, achievements in information technology and electronic data interchange, etc. create new requirements and provide opportunities for improving customs procedures. These requirements and opportunities are taken into account in customs regulation, but there is no clear approach to the assessment of interaction between customs authorities and participants of foreign economic activity in modern conditions. The efficiency level of such interaction determines the speed of customs operations when placing goods under customs procedures, as well as the effectiveness of customs control.

Literature Review

Russian scientists are actively engaged in issues related to the assessment of indicators of customs activity. A large number of works of Russian customs Academy scientists are devoted to this issue. Issues relating to interaction between customs authorities and participants of foreign economic activity have been researched by a number of Russian and foreign scientists. Russian scientists have made a huge contribution to the development of theoretical and practical problems in this area: Pogodina I. V. *(Pogodina, 2015)*, Pimenova O. V. (*Pimenova, 2019*), Makrusev V. V. *(Stoyalova and Makrusev, 2018)*, Stoyalova A. A. *(Stoyalova and Makrusev, 2018)*, Butova T. V., Dunaeva A. I., Udachin N. O. *(Butova, Dunaeva and Udachin, 2014)*, Melnikova A. I. *(Melnikova, 2020)*, Kutepova O. N. *(Smekalin and Kutepova, 2019)* and others, and foreign scientists Nebrat V., Gorin N., Didkivska L. *(Nebrat, Gorin and Didkivska, 2020),* Fedorenko R. V. *(Fedorenko, 2016)*, Gokinaeva I. A. *(Gokinaeva, 2020)*, Nenovsky N., Turcu C. *(Nenovsky and Turcu, 2012)*, Głodowska A., Pera B. *(Głodowska and Pera, 2019)*. At the same time, as of today, there is no multi-purpose assessment methodology of interaction quality between customs authorities and participants of foreign economic activity. Despite the existing publications on the subject, many aspects of interaction between customs and business are still of great interest. The vast majority of publications are devoted to the analysis of theoretical aspects of interaction between customs authorities and participants of foreign economic activity during the performance of customs control of goods transported through the customs border, usually without paying sufficient attention to practical problems. In general, the question of interaction is revealed in a fragmented way in such publications. The problem of the study is the absence of a complete, covering all aspects, methodology for interaction assessment, and inadequate methods to solve this problem in practice.

It is impossible to develop measures to improve the effectiveness of interaction between customs authorities and participants of foreign economic activity in modern conditions without analysing and assessing the positive experience of foreign countries in this regard. There are 2 main developed, tested and implemented models of interaction between business and customs, they are: the American model and the model used in the UK.

In the United States of America, the scheme of interaction between business and customs is to use the "Single window" system (the International Trade Data System in the US (ITDC)) adapted to the specific features.

Customs authority in the USA conducts customs control and makes decisions in the following way: 1) the basic level of customs control which is fully automated and centrally occurs without human intervention; 2) the auxiliary level which gives the ability to detail the basic level of control according to the recommendations of the local customs authority; the process of customs control is to conduct a thorough computer analysis of electronic information on goods imported into the United States *(Butova, Dunaeva and Udachin, 2014)*. The first selection by type of cargo is carried out using a special computer control system to sort the goods into two groups: interest-sensitive goods and less interest-sensitive goods for the state *(Nebrat, Gorin and Didkivska, 2020)*. The second selection is a repeated computer analysis of all data on imported goods, which is performed automatically at the data processing centre of the customs service of the USA.

According to most experts, the UK has the most successful experience of public-private partnership (hereinafter PPP). The decades-long struggle for the effectiveness of the public service in this country which was started by Margaret Thatcher, has led to the establishment of an effective mechanism for interaction between the State apparatus and the private sector under market conditions. Today, the United Kingdom is one of the world leaders in both the total number of projects and the number of industries where PPP is applied *(Melnikova, 2020)*. Customs regulation of foreign trade is no exception.

Methods

Today, customs and foreign trade participants interact via a telecommunications network, which is designed for information exchange within the customs service and interaction with external subscribers. The information system of Russian customs authorities is steadily developing. In the system of foreign trade regulation, relations that arise when goods and vehicles are transported across the customs border are the subjects of not only legal but also scientific research. From a scientific viewpoint, three types of relations should be emphasized: anti-interaction (counteraction), neutrality and interaction.

Improvement, development, and technical support of the customs authorities were reflected in the Comprehensive Program for the Development of the Federal Customs Service of Russia until 2020. It was established from the analysis of this Comprehensive Program in terms of the interaction between customs authorities and participants of foreign trade, that in relation to liberalization and simplification of customs procedures the following steps have been implemented: the increased use of electronic declaration, the introduction of technology of remote release, the introduction of mandatory preliminary information about the imported goods, the reduction of time of release of goods with high-degree of processing, the establishment of a minimum list of documents required for submission for customs purposes, the introduction of the institute of an authorized economic operator making it possible to release goods before submitting a customs declaration, the application of new technologies of customs payments. Therefore, the electronic declaration system is the basic mechanism for interaction between customs authorities and participants of foreign economic activity.

The system of customs payments is considered as the second mechanism of interaction. At present, the organization of customs payments collection and customs revenues generation involves a number of participants of the relations arising in the process of movement of funds from the payer to the account of the Federal Treasury. These participants are involved in the mechanism of interaction due to the operation of the Eurasian Economic Union *(Smagin, Karpushkina, Danilova and Aliukov, 2017)*. The Federal Customs Service has developed "Concept for centralizing the accounting of customs and other payments and maintaining a single personal account of a participant of foreign economic activity". This concept assumes the gradual introduction of the centralization of customs payments.

The third mechanism of interaction, in our opinion, is the organization of work on the implementation of customs policy and interaction with participants of foreign economic activity in the framework of expert advisory councils on the implementation of customs policy at regional customs offices and customs.

With the use of the electronic declaration system and the improvement of software products, a system for assessing the quality of work of customs officials has appeared *(Pogodina, 2015)*. So, today a declarant has an opportunity to assess the quality or the level of work of a customs inspector who performs customs operations relating to the release of goods declared under declaration of goods (hereinafter DG) with the help of the assessment system. The essence of this system is that a customs operations specialist, who submits a DG to a customs post, after the release of goods, is given the opportunity to assess the quality of work of the customs official who has carried out customs control and the release of goods. We believe that the results obtained through the use of this assessment system are not always objective and often one-sided. This is due to the fact that such results are brought to the attention of the evaluated customs official, which, undoubtedly, will affect the quality of interaction between this official and the declarant during subsequent customs operations in the future.

In this regard, it is possible to include a third independent "appraiser" in the specified evaluation system in order to obtain objective evaluation results and avoid conflicts of interest. For example, the Chamber of Commerce and Industry can act as such an organization. In order to achieve accurate results, the assessment could be carried out

with the division of traders into two categories: enterprises of Chamber of Commerce and Industries and others. However, at the moment this system has no practical implementation.
Customs authorities in turn use the categorization of participants of foreign economic activity, the results of which form three risk levels: low, medium and high. In this case, customs also assesses participants of foreign economic activity unilaterally.

Therefore, the current methods of assessment of interaction between customs authorities and participants of foreign economic activity do not provide fully objective results; do not allow assessing the effectiveness of interaction in a complex; they are one-sided in character.

In order to assess comprehensively interaction between customs and business, the authors have developed groups of indicators that can be used to assess the effectiveness of such interaction. The system of indicators of the effectiveness of interaction between customs authorities and participants of foreign economic activity consists of quantitative and qualitative indicators.

We will group the indicators not according to the directions (mechanisms) of interaction, but taking into account the specifics of their calculation and the nature of interaction reflection into 4 groups.

1. Time indicators of interaction. The indicators included in this group reflect the speed of customs operations and customs control and are of great interest to participants of foreign economic activity because the specified speed often determines the amount of costs of participants of foreign economic activity associated with the transportation of goods across the customs border.
2. Indicators of the use of electronic declaration technology (remote release, preliminary information, etc.). This group of indicators reflects the two-way interaction between customs authorities and participants of foreign economic activity. Such interaction takes place when declaring goods in electronic form which are located in the region of activity of the customs authority other than the place of their declaration.
3. Indicators for assessment of the risk level of a participant of foreign economic activity. The name of the group of the indicators fully explains their purpose, which is to evaluate the activity of a participant of foreign economic activity with regard to violations of the customs legislation of the Russian Federation and the law of the EAEU when interacting with customs authorities.
4. General indicators of interaction between customs authorities and participants of foreign economic activity. This group of indicators includes indicators that characterize the interaction between a participant of foreign economic activity and customs authorities at various levels (customs, regional customs authorities, the Federal Customs Service) in all other aspects.
The individual indicators included in the above-mentioned groups and their calculation formulas are presented in table 1.

To assess the effectiveness of interaction between a participant of foreign economic activity and customs authority, indicators can be considered separately to identify problematic points of contact, or indicators can be considered together.

For a comprehensive assessment of the effectiveness of interaction between a participant of foreign economic activity and customs authority, it is proposed to use an integrated indicator calculated using the formula (1).

$$I = \sum_{i=1}^{n} Wi \cdot Xi, \quad (1)$$

where *n* is the number of criteria;

Wi – importance of the indicator (the importance of the indicators of the table is estimated by expert judgment, the sum of the importance of all indicators should be equal to 100%);
Xi – the calculated value of the indicator.
If 0<I<0.3, the interaction efficiency is low.
If 0.3<I<0.6, the interaction efficiency is medium.
If 0.6<I<1, the interaction efficiency is high.

Results

The developed methodology was tested during the period from 01.01.2019 to 31.12.2019 on the example of enterprise "X", which is registered as a legal entity in the territory of the Chelyabinsk region and which carries out foreign economic activities in the area of responsibility of customs "Z". We represent the results of the practical application of the developed methodology in table 1.

Table 1: Results of the practical application of the methodology for the assessment of the interaction between customs authority «Z" and foreign economic participant "X"

N	Name of the indicator and the formula of its calculation	*Xi*, %	*Wi*, %
1. Time indicators of interaction.			
1.1.	The percentage of customs clearance time when goods are placed under the customs procedure "customs transit" (reverse indicator). $K_1 = T_1/T_{1max} \cdot 100\%$, where T_1 - the customs clearance time from the moment of registration of a DG to the moment of release of goods under a DG; T_{1max} - the maximum customs clearance time from the moment of registration of a DG to the moment of release of goods.	100.0	1.00
1.2.	The percentage of customs clearance time when finalizing the customs procedure "customs transit" (reverse indicator). $K_2 = T_2/T_{2max} \cdot 100\%$, where T_2 - the customs clearance time when finalizing the customs procedure "customs transit"; T_{2max} - the maximum customs clearance time when finalizing the customs procedure "customs transit".	97.92	1.00
…	…	…	…
1.9.	The percentage of time spent on customs clearance when placing goods under the customs procedure "export". Export customs duties are not applied to goods if types of customs control in accordance with the risk profiles are not applied (reverse indicator). $K_9 = T_9 / T_{9\,max} \cdot 100\%$, where T_9 – customs clearance time when placing goods, for which export customs duties are not applied, under the customs procedure "export"; $T_{9\,max}$ – the time limit for customs clearance when placing goods, for which export customs duties are not applied, under the customs procedure "export";	91.67	2.00
2. Indicators of application of electronic declaration technology.			
2.1.	The percentage of declarations submitted using the technology of remote release $L_1 = Q_1 / Q_{1\Sigma} \cdot 100\%$, where Q_1 - the number of declarations of goods submitted with application of technology of remote release; $Q_{1\Sigma}$ – the total number of submitted declarations of goods.	100.0	2.00
…	…	..	…
2.8.	Frequency of failures (abnormal situations) of information systems when working with customs authorities (reverse indicator) $L_8 = Q_8/T \cdot 100\%$, where Q_8 – the number of failures (abnormal situations) of information systems when working with customs authorities (reverse indicator); T – time period (a year, a quarter, a month).	50.00	2.60
3. Indicators for assessment of the risk level of a participant of foreign economic activity.			
3.1.	The percentage of offences against the customs legislation related to failures (abnormal situations) of information technology when working with customs authorities (reverse indicator). $M_1 = V_1/V_{1\Sigma} \cdot 100\%$, where V_1 – the percentage of offenses against the customs legislation related to failures (abnormal situations) of information technology when working with customs authorities;	50.00	4.00

	$V_{1\Sigma}$ – the number of failures (abnormal situations) of information systems when working with customs authorities (reverse indicator);		
…	…	…	…
3.9.	The level of achievement of the predicted value of customs payments for the quarter by a participant of foreign economic activity. $M_9 = V_{9\Sigma} / V_9 \cdot 100\%$, where $V_{9\Sigma}$ – the amount of customs payments actually paid by a participant of foreign economic activity in the reporting quarter; V_9 – the predicted value of the amount of customs payments in the reporting quarter formed by a participant of foreign economic activity and sent to customs authority.	104.0	1.00
4. General indicators of interaction between customs authorities and participants of foreign economic activity. **4.1. Interaction at the level of "customs-participant of foreign economic activity".**			
4.1.1	The level of working capital diversion (accounts receivable) to secure payment of customs duties (reverse indicator). $R_1 = S_1 / S_{1max} \cdot 100\%$, where S_1 – the working capital used to secure the payment of customs duties; S_{1max} – total working capital.	99.50	1.50
…	…	…	…
4.1.12	The percentage of working meetings and advisory councils undertaken in 1 year.	25.00	1.00
4.2. Interaction at the level of "regional customs authority - participant of foreign economic activity".			
4.2.1	The percentage of requests from a participant of foreign economic activity to regional customs authority (the Federal Customs Service) for making a preliminary decision on the classification of goods. $R_9 = S_9 / S_{9max} \cdot 100\%$, where S_9 – the number of requests from a participant of foreign economic activity to regional customs authority (the Federal Customs Service) for making a preliminary decision on the classification of goods. S_{9max} – the total number of requests from a participant of foreign economic activity to regional customs authority (the Federal Customs Service) for making a preliminary decision on the classification of goods.	3.33	2.00
…	…	…	…
4.2.5	The percentage of requests from participants of foreign economic activity (including for the purpose of removing "administrative barriers"), the result of consideration of requests. Taking into account the results of the indicator, it is possible to consider creating an electronic portal for information exchange between customs authority and a participant of foreign economic activity (reverse indicator).	100.0	2.00
4.2.6	The percentage of undertaken working meetings and advisory councils.	16.67	1.00
4.3. Interaction at the level of "Federal Customs Service -participant of foreign economic activity".			
4.3.1	The level of trust and partnership (the value of the indicator is based on the results of surveys).	51.00	1.50
4.3.2	The level of awareness of participants of foreign economic activity about opportunities in the legislation of the Eurasian Customs Union (the value of the indicator is based on the results of surveys).	60.00	2.00
4.3.3	The percentage of requests from participants of foreign economic activity (including for the purpose of removing "administrative barriers"), the result of consideration of requests. Taking into account the results of the indicator, it is possible to consider creating an electronic portal for information exchange between customs authority and a participant of foreign economic activity (reverse indicator).	100.0	2.00
4.3.4	The percentage of undertaken working meetings and advisory councils.	0.00	1.00
4.3.5	The level of use of personal office features by a participant of foreign economic activity.	19.35	2.00

(Source: compiled by the authors based on data from the Federal Customs Service, customs authority "Z" and participant of foreign economic activity "X")

The importance of each indicator is identified by the expert group, which included representatives of customs "Z" and participant of foreign economic activity "X".

$$I = \sum_{i=1}^{n} Wi \cdot Xi = 1.00 \cdot 0.01 + 0.98 \cdot 0.01 + ... + 0.00 \cdot 0.01 + 0.19 \cdot 0.02 = 0.68 \quad (2)$$

Thus, the calculation of the integrated indicator produced the value 0.68, which corresponds to a high level of interaction efficiency.

To graphically display the values of indicators and make them easier to monitor, the diagrams in figures 1 and 2 are constructed. Time indicators of interaction and indicators of application of electronic declaration technology are shown in Figure 1.

Fig. 1: Graphical representation of the values of the indicators of groups 1 and 2

(Source: Compiled by the authors based on the results of testing the developed methodology)

For correct calculation and display the values of the indicators of group 1 on the diagram, indicators 1.1- 1. 9. are converted to the reverse measurement system; group 2 - indicators 2.2., 2.8; group 3- indicators 3.1.-3.8. Indicators for risk assessment of a participant of foreign economic activity and general indicators of interaction between customs authorities and participants of foreign economic activity are shown in figure 2. To correctly calculate and display the values of the indicators in group 4 on the diagram, the indicators 4.1.1., 4.1.2., 4.1.7., 4.1.8., 4.1.11., 4.2.5., 4.3.3. are converted to the reverse measurement system.

Fig. 2: Graphical representation of the values of the indicators of group 3 and 4
(Source: Compiled by the authors based on the results of testing the developed methodology)

Discussion

Only indicators 1.5. and 1.7. of group 1 reach the value "above average". These indicators reflect the speed of customs operations when placing goods under the customs procedures "release for domestic consumption" and "export" when identifying risks in accordance with the current risk profiles and applying the form of customs control "customs inspection". It is reasonable for custom "Z" to consider ways for shortening the time of actual customs inspection procedures, conducted with regards to goods declared by participant of foreign economic activity "X", taking into account the workload on customs posts of actual customs inspection procedures, as well as the results of the analysis of the time of drawing up the act of customs inspection.

Based on the values of the indicators included in group 2, we offer the following conclusions. First, there are not any interaction problems between customs "Z" and declarant "X" concerning the absence of communication between the customs authorities when using the electronic declaration system. This is a favourable factor of interaction, given the fact that other declarants who declared goods in the area of customs "Z" had such problems. Secondly, the percentage of declarations of goods that have been registered automatically, when placing goods under the customs procedure "release for domestic consumption (import)", as well as under the customs procedure "export", can be increased by analysing the reasons of non-compliance with the criteria of a declaration of goods automatic registration (illogical criteria, errors of the declarant) and bringing them to the attention of the FCS of Russia and the declarant (participant of foreign economic activity "X"). Third, the participant of foreign economic activity "X" uses all available information products to ensure uninterrupted and high-quality process of interaction with customs through electronic communication channels. Fourth, at the same time, as a result of the failure of the information system of the customs authority there was an emergency situation, which was the cause of violation of customs legislation.

In general, the values of the indicators of group 3 characterize participant of foreign economic activity "X" on the positive side. Despite the fact that the share of goods (6.66%) declared by this participant of foreign economic activity is risk goods, measures to minimize risks in various areas are mostly ineffective due to compliance with customs legislation by the participant of foreign economic activity.

General indicators of interaction between the customs authority and the participant of foreign economic activity characterize such interaction as a high-level interaction. Thus, based on the values of indicators 4.1.9 and 4.1.10, it can be concluded that the customs service promptly and fully informs about changes in customs legislation that regulate the actions of declarants. At the same time, administrative barriers do not appear in the interaction between participant of foreign economic activity "X" and customs "Z". The participant of foreign economic activity actively

participates in the discussion of problematic issues within the framework of advisory councils undertaken by customs.

Thus, based on the results of the calculation of each indicator, both the customs authority and the participant of foreign economic activity can draw appropriate conclusions and apply measures to improve the effectiveness of interaction, eliminating the risk of negative consequences. In other words, they should focus their efforts on problem areas and strengthen the values of troubling indicators. At the same time, the overall level of interaction efficiency (0.68) indicates the high quality of work of the customs authority and the law-abiding nature of the participant of foreign economic activity.

The results of the approbation of the developed methodology imply its correctness, validity, and the possibility of its practical application in the work of customs authorities and participants of foreign economic activity.

Conclusions

Therefore, the practical application of the methodology helps to improve the efficiency of interaction between customs and business, taking into account the following:

1) monitoring of the level of interaction between a participant of foreign economic activity and other customs authorities of the Russian Federation in the event of the appearance of a "new" participant of foreign economic activity in the customs area of responsibility.
2) graphical representation of the dynamics of indicators is convenient for monitoring;
3) indicators allow monitoring their current status in real time;
4) groups of indicators help to improve the effectiveness of organizational methods for managing conflicts between customs authorities and participants foreign economic activity, creating an opportunity for constructive dialogue;
5) indicators can be used to create a software product that can provide automatic or automated monitoring of the state of interaction between customs and participants of foreign economic activity.

At the same time, the methodology allows to focus on the most problematic and promising areas of interaction on time. Using the proposed methodology, it is possible to comprehensively assess the effectiveness of both customs authorities and the level of openness and reliability of enterprises engaged in foreign economic activity. The results of the methodology application will also allow the customs authorities to identify critical moments in the management of re-sources and assess the activities of certain customs authorities.

As a result of the conducted research, it can be concluded that the interaction between a customs authority and a participant of foreign economic activity needs a comprehensive assessment and regular monitoring in order to increase the level of such interaction. The developed and approved methodology can be applied to implement such work. The increase in the level of interaction efficiency can be achieved only by the joint efforts of a customs authority and a participant of foreign economic activity, which will provide resource, time, and material benefits to both subjects of interaction.

Acknowledgement

«The work was supported by Act 211 Government of the Russian Federation, contract № 02.A03.21.0011».

The authors express their gratitude to the Federal Customs Service of Russia and Yaroslav V. Afanasiev, Deputy Head of the Department of foreign trade of JSC "Chelyabinsk Electrometallurgical Integrated Plant (CHMK)", for the information provided for the calculations by the developed methodology. We express our gratitude to Darya Kalmykova for her assistance in the translation of the scientific work. Special thanks to the Deputy Director for Scientific Work of the School of Economics and Management, Professor of the Department "Economic theory, regional economics, state and municipal management", Doctor of economic sciences Irina V. Danilova for valuable advice when planning the study.

Abstract

The development of the world economy is the basis and premise for the steady growth of international shipping demand. The world economy is the foundation of international shipping, because international shipping can be said to be a service industry, which serves for international trade, and international trade is an important standard to measure the world economy (Frankel, 1989). From a quantitative point of view, this paper studies the influence and interaction between international shipping and the world economy through grey correlation analysis, and the influence of the world economy on international shipping is much greater than that of international shipping on the world economy. The demand for trade promotes the demand for transportation, and shipping, as a cheap and high-volume mode of transportation, is also needed. As for the original demand of trade demand, international shipping demand is a kind of derivative demand. Therefore, the rise and fall of international trade directly determines the rise and fall of shipping industry. As one of the important industries in the development of national economy, shipping industry has guaranteed and promoted the development of international trade activities, and made global integration possible In order to promote the transformation of shipping industry, adapt to the market economy environment as soon as possible, allocate shipping resources through the market, and help the more economic and more effective operation of shipping industry, a set of economic theoretical system and a new way of thinking should be established to adapt to the characteristics of shipping industry.

Keywords: International Shipping; World Economy; Grey Relational Analysis, International Trade, Logistics, Supply Chain; Transportation.

Introduction

Global economic integration makes the world economy highly correlated with international shipping. International shipping is basically at the end of the world economy (in each node of the supply chain, enterprises only make production or supply decisions based on the demand information from their neighbouring lower-level enterprises, the unreality of demand information will increase step by step along the supply chain counter-current), and according to the bullwhip effect.

Cite this Article as: Mavlit AKHTYAMOV, Natalia ZAVYALOVA, Valery LIKHOLETOV and Ksenia AIKHEL "The Analysis of Relationship Between International Shipping and World Economy" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The extreme recession of the world economy will magnify and transmit to international shipping by about ten times, reflecting the phenomena as follows: the price of freight has fallen sharply (the BDI has fallen 94% in six months *(Baltic Exchange Dry Index | 1985-2020 Data | 2021-2022 Forecast | Price | Quote, 2020)*), the demand for excess capacity has decreased, and competition has intensified the decline of profits. Before the financial crisis, the prospects of the world economy were promising, and various industries expanded excessively, including shipping industry, which also laid a huge hidden danger for the future international shipping recession.

The development situation of international shipping can be summarized as the following aspects in terms of history and the law of shipping industry itself:

First, the rise and fall of international shipping, the most important impact comes from or depends on the situation of the world economy and international trade. Secondly, it depends on the relationship between the volume of freight in the shipping market, the existing capacity and the output of new ships and the retirement of old ships. Third, it is influenced by global and regional sudden political and economic events. Of course, as an international shipping fleet, it is also subject to changes in the pattern of its own economy.

Shipping is a typical cyclical industry, which is closely related to the development of the world economy. Relevant data show that for every percentage point of global economic growth, international shipping volume will rise by 1.6%. In a sense, the rise and fall of the economy determines the growth and decline of shipping *(Michail, 2020)*. Therefore, the world economy and trade are the primary factors affecting international shipping.

Therefore, the study of international shipping and world economy, especially the linkage between them, is of great significance.

Literature Review

Grey System Theory, the full name of Grey System Theory, was proposed by Professor Deng Julong of Huazhong University of Technology in 1982. In just a few years, it has rapidly penetrated into many fields, such as economy, meteorology, ecology, water conservancy, biology, military, medicine, education, hydroelectric energy, geological exploration, transportation, process control, environmental protection and so on *(Jun and Hao, 2009)*. Its theoretical research and application research have made great progress.

Grey Relational Analysis is an important research method in the project of grey theory research. It is a systematic analysis method to measure the degree of correlation between factors according to the similarity or difference of development situation between factors. It is based on the microscopic or macroscopic geometric approximation of the sequence of behavioral factors to analyze and determine the degree of influence between factors or the contribution of factors to the main behavior. The magnitude of correlation degree is only the external expression of interaction and interaction among factors. The ranking of correlation degree can reflect the relative influence of many factors on reference factors.

Research Methods

In the past, the basic methods of factor analysis were mainly statistical methods, such as regression analysis. Although it is a more general method, most of them are only used for a few factors and are linear. For multi-factor, non-linear is difficult to deal with.

Considering the shortcomings of regression analysis method, grey system theory adopts the method of correlation analysis to make system analysis. As a system of development and change, correlation analysis is in fact a quantitative analysis of dynamic process development situation.

From a quantitative point of view, this paper will use the existing evaluation index system and the research status of correlation degree to study the interaction between international shipping and world economy by using grey correlation analysis method.

So the main research method is grey relevance degree method due to the several reasons:

Reason 1: Because there are many and complex factors reflecting international shipping and world economy, we can only analyze the main indicators with limited representation first *(Kuo, Yang and Huang, 2008)*.
Reason 2: Statistical data used for various indicators are limited, and the existing data are of large gray scale, and most of the data do not have typical probability distribution.

Therefore, the relationship between international shipping and world economy is a grey system, which can be operated by grey relational analysis.

Calculating Method

The specific calculation methods are as follows:

Selection of reference sequence $x_0(k)$.

Comparing Sequences $x_i(k)$, t = 1, 2, 3,…, n, t = 1, 2, 3,…, n (n is Number of time series).

For raw data, no quantification is performed: $x_i^{'}(k) = x_i(k) / x_1(k)$.

Seeking Reference Sequence $x_0(k)$ And comparison sequence $x_i(k)$.

Absolute difference and two-stage minimum difference and maximum difference:

$$\Delta_i(k) = \left| x_0(k) - x_i(k) \right| \quad \text{i = 1, 2, …, N} \tag{1}$$

1) Finding the Grey Relevance Coefficient $\xi_i(k) = \dfrac{\min\limits_i(\Delta_i(\min)) + \rho \max\limits_i(\Delta_i(\max))}{\Delta_i(k) + \rho \max\limits_i(\Delta_i(\max))}$

$$\min_i(\Delta_i(\min)) = \min_i(\min_k \left| x_0(k) - x_i(k) \right|)$$

$$\max_i(\Delta_i(\max)) = \max_i(\max_k \left| x_0(k) - x_i(k) \right|)$$

ρ is the resolution coefficient, It is used to improve the difference between correlation coefficients. $\rho \in [0,1]$, Usually 0.1-0.5, usually 0.5.

2) To calculate the correlation, the average value of the grey correlation coefficient is the grey correlation degree, that is: $r_i = \dfrac{1}{n} \sum_{k=1}^{n} \xi_i(k)$

Evaluation Index System

In view of the fact that there is little information on the research of thematic relevancy between international shipping and world economy, this paper mainly refers to the evaluation index system established in the relevant papers of International Shipping Centers and International Financial Centers *(Feng, 2007)*. The principal component analysis method is used to demonstrate that the index system can effectively reflect the development level of international shipping and financial centers *(Jiawen and Youtian, 2017)*.

Because of the complexity of the economic system indicators of the two, the selection process of the evaluation index system takes into account the principle of representativeness and hierarchy, and the selection of indicators that fully show the impact of the correlation between the two *(Siqi and Siqin, 2016)*. Based on the above conclusions, this paper establishes two kinds of evaluation index systems: the main factors representing the level of international shipping development and the main factors representing the level of world economic development. (Table 1)

At the same time, with the world economic gross output and the international shipping industry gross output representing the final output, the impact degree of the factors that mainly affect the world economy on the total output of the international shipping industry and the influence degree of the factors that mainly affect the shipping

industry on the total output of the world economy are analyzed respectively, so as to evaluate the relationship between international shipping and the world economy. In addition, since the gross output value of the above two industries is related to the level of international trade development, this kind of evaluation index is introduced as a reference (Table 1 presents) *(Michail, 2020)*.

Table 1: Evaluation index system

Representing the main influencing factors of the international shipping development level	**X1 total amount of sea cargo transportation**
	X2 dry bulk shipping volume
	X3 container shipping volume
	X4 crude oil shipping volume
	X5 new ship market order volume
	X6 port cargo throughput
Representing the main influencing factors of the level of world economic development	X7 World GDP
	X8 world economic growth rate
Representing the main influencing factors of the level of international trade development	X9 global trade volume growth rate
	X10 total import and export

(Source: compiled by the authors)

Selection and calculation of data

According to the current situation of the construction of international shipping center in the past five years, the first part of the evaluation index system (representing the main factors affecting the development level of international shipping) is selected to calculate the data of the construction and development of Shanghai international shipping center in the past five years *(Study on the Relevance Degree between Zhu Hui International Shipping Center and International Financial Center, 2008)*. The second and third parts of the data are calculated with reference to the relevant economic data of the WTO in the past five years *(WTO Statistics: Trade and tariff data, 2020)* and it is presented in the Table 2.

Table 2: Selection and calculation of data

International shipping index	**X1**	**X2**	**X3**	**X4**	**X5**	**X6**
Correlation	0.82	0.77	0.75	0.75	0.89	0.87
The average gray correlation between international shipping and the world economic indicator system			0.81			
World economic indicators	X7	X8				
Correlation	0.95	0.91				
Average grey correlation between world economy and international shipping indicator system			0.93			
World trade indicator	X9	X10				
Correlation	0.84 (0.98)	0.81(0.92)				
Average grey correlation between international shipping and world trade indicator system			0.82			
The average gray correlation between the world economy and the world trade indicator system			0.95			

(Source: compiled by the authors)

Results

From the calculation results of the above grey correlation degree, the following conclusions can be drawn:

1) The impact of international shipping related indicators and world economic related indicators on international trade is basically the same. Both qualitative and quantitative perspectives show that the world economy has an impact on international shipping vehicles.
It has an important impact on the world economy, and the degree of impact is similar to that of the operation of world trade.
2) The impact of the relevant indicators of world economy and World Trade on international shipping is basically the same. Both qualitative and quantitative perspectives show that the world economy has an important impact on international shipping, and the degree of impact is similar to that of the development of world trade on international shipping.
3) The impact of the world economy on international shipping is greater than that of international shipping on the world economy.

Discussion

The demand of international shipping market is derived from the demand of international trade, and the world economy is dominated by international trade. The development of world economy has the characteristics of periodic fluctuation. Therefore, to analyze the demand of shipping market, we must first analyze the international trade.

1. As a derivative of international trade, international shipping is closely related to the world economy and international trade, and also an important part of the international market. Driven by the development of trade, it is gradually interdependent with trade. It can also be said that without trade, there will be no shipping.
2. The changes of international trade in quantity, value and commodity structure will be reflected by the demand for shipping. The total demand for shipping is subject to the changing law of the development of world economy and international trade. When the world economy is in a period of rapid growth, international trade will show a corresponding trend of substantial growth *(Hummels, Lugovskyy and Skiba, 2009)*. Therefore, the overall demand for shipping is bound to grow rapidly, and the shipping market will be active and prosperous. When the world economy is in a period of stagnation and recession, the international trade will inevitably be stagnant and shrinking. At this time, the shipping market will be depressed. The law of general demand for shipping is subject to the law of change of world economy and international trade, and has certain periodicity. However, the law of shipping demand in time lags behind.
3. The international shipping market system plays a role through various market mechanisms. There is a relationship of mutual restriction, interdependence and promotion between the basic international shipping market and the relevant markets, as well as between the professional markets in the market. Through the interaction and mutual movement of price, supply and demand, competition, service and other elements, the operation of the international shipping economy is promoted.

Conclusions

From the quantitative point of view, this paper studies the interaction between international shipping and the international world economy by using the grey correlation method. The grey relational degree analysis is based on the conclusion that there is a positive linear correlation among the indexes obtained from the previous relational analysis and is simplified appropriately. The conclusion of grey correlation analysis is the same as that of qualitative analysis, and the validity of the index system is further demonstrated.

In the analysis and research of shipping demand, in order to establish the operation of shipping enterprises on a solid basis and make the objectives of the operation of the enterprises concrete, we should comprehensively consider all kinds of influencing factors in a certain range or even a larger range, and master certain laws, so as to clearly determine the direction of the operation of the enterprises. At the same time, it is also necessary to analyze and study the individual demand factors directly related to the enterprise.

The final conclusion of this paper is that there is an interactive relationship between the world economy and international shipping. Its influence degree is basically the same as that of the development of world trade, and the

influence of the world economy on international shipping is greater than that of international shipping on the world economy.

Abstract

The article is devoted to the study of the advantages of ERP-systems implementation into the Russian industrial enterprise's activities. The relevance of this topic in the current economic conditions is increasing, as the pace of business development is accelerating, new technologies are being introduced, trends in the globalization of business and increased competition are clearly expressed. The increase in material, information and financial flows leads to the need to streamline and control business processes, which requires the use of appropriate information systems. The implementation of ERP systems involves a number of difficulties, the implementation process can be phased or simultaneous, it may require the restructuring of all business processes of the enterprise or fit organically into the activities of the enterprise, if the business is already mature and the processes are fine-tuned. In each case, you need to evaluate both the potential problems and the benefits of implementing ERP systems. The variety of systems presented on the market also forces the management of enterprises to use the advantages assessment and shortcomings of domestic and foreign ERPs, making a choice. Implementation of the ERP system is associated with significant costs, the need for integrated preparation for implementation, a high degree of uncertainty due to the complexity and scale of ERP, the need to predict the effect of implementation. All this confirms the relevance of the present study and determines its purpose. The purpose of the study is to identify the advantages of implementing ERP systems in the Russian industrial enterprises activities and evaluate the effectiveness of implementing the system using the example of a particular enterprise. During the study the market analysis of ERP-systems was carried out, key advantages of implementation were highlighted, approaches to evaluation of ERP-systems implementation efficiency were considered. On the example of the Russian industrial enterprise, the implementation of the ERP-system 1C: ERP Enterprise Management was tested, conclusions were made about the implementation results that have an economic and process effect.

Keywords: logistics, procurement and stock management, ERP-system, ERP advantages, effectiveness of implementing ERP-system.

Cite this Article as: Alena LEVINA, Yuliya YAKUNINA, Aleksandr DEMCHENKO, Yuliya BALDINA and Egor KORYAKOVTSEV "Benefits of Implementing ERP Systems Based on The Experience of Russian Enterprises" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Introduction

The concept of "ERP" - Enterprise Resource Planning - was introduced by analyst Gartner Lee Wylie in 1990. The system presents an organizational strategy for integrating production and operations, labour management, funds management and asset management. It is focused on continuous optimization of enterprise resources through a specialized integrated application software package that provides a common data and process model for all areas of activity.

Enterprise Resource Planning (ERP) is a fully functional system consisting of integrated applications designed to manage daily business activities such as accounting, finance, human resources, and manufacturing. In addition, ERP systems link multiple business processes and enable data exchange between them. According to Scrutu L.E. and Lupu V. (2016), the use of ERP systems creates a joint, effective and inclusive environment among the organization's departments; helps streamline and facilitate decision-making *(Scrutu and Lupu, 2016)*.

The relationship between ERP and logistics is the agenda to this study. J. Muscatello, D. Parente, M. Swinarski (2018) talk about the connection between the implementation of ERP systems and logistics costs. ERP systems solve the problem of disparate information in the organization and coordinate mechanisms to eliminate sub optimization of the supply chain. There are a limited number of studies on the impact of ERP implementation on logistics costs. Many firms, especially manufacturers, consider ERP unnecessary if they cannot show a reduction in logistics costs. Given the share of logistics costs in GDP, it is very important to understand the impact of ERP implementation on logistics costs *(Muscatello, Parente and Swinarski, 2018)*.

As the business grows, a growing number of companies come to the conclusion that it is necessary to implement ERP systems. Therefore, it is necessary to define the implementation goals, the advantages of a particular system, and determine the effect of the implementation.

Methods

The theory and methodology of this study is based on the work of Russian and foreign authors in the field of business process automation, logistics, and integration. During the study, we used a systemic approach to the study of the problem, statistical data analysis, theory and integrated logistics methods and evaluation of the effectiveness of implementing ERP systems.

Literature Review

Market Overview

The development dynamics of the ERP market confirms the high degree of agenda on the part of the business in the development, implementation and maintenance of ERP systems.

According to R. Rake, S. Baul (2018), the global ERP software market is valued at $35.81 billion and is projected to reach $78.40 billion by 2026 *(Rake and Baul, n.d.)*. According to another global business data platform, the global enterprise resource planning (ERP) software market will grow to about $97 billion by 2023 *(Liu, 2020)*.

IT costs for enterprise software worldwide are projected to be around $503 billion in 2020. At the same time, the corporate software market in recent years has shown high growth rates, and market revenues more than doubled over the period 2009-2019 *(Liu, 2020)*.

Implementation of ERP together with new software and hardware systems and business processes can significantly change the workflow and operation *(Boudreau and Robey, 2005)*.

The data of PAC (Pierre Audoin Consultants), given in the study "Russia - IT Market 2016-2022: Market Figures - Software & IT Services" from 2018, confirm these forecasts for the Russian market *(Russian IT Services Market: Results of the Year, Forecast for the Future, 2020)*. PAC named production as the key consumer industries of IT

services in Russia in 2018 - 25.1%, the public sector - 21.4% and the banking sector - 20.9%. According to experts, this trend will continue until 2022 (Fig. 1 and Fig. 2).

Fig. 1: Structure of the Russian IT market in industry terms according to the data of the company Pierre Audoin Consultants for 2018, %

(Source: Russian IT Services Market: Results of the Year, Forecast for the Future, 2020)

Fig. 2: Russian IT market structure in the industry section according to the data of the company Pierre Audoin Consultants forecast for 2022, %

(Source: Russian IT Services Market: Results of the Year, Forecast for the Future, 2020)

According to TAdviser, which provides statistics for the period 2005-2017 on the implementation of ERP systems, the first 5 positions are occupied by trade, engineering, construction, food and chemical industries *(Industry specificity of ERP projects in Russia, n.d.)* (Fig. 3).

Fig. 3: Implementation of ERP systems by industry for the period from 2005 to October 2017
(Source: Industry specificity of ERP projects in Russia, n.d.)

Russian industry is still lagging behind in the level of automation from banks and telecommunications, but it is already significantly narrowing the gap with leading industries, said S. Petrov, a member of the board of Galaxy Corporation. In his opinion, the market for ERP systems will receive significant development due to an increase in the level of automation of the Russian industry.

Today, the market for ERP systems, that allow you to automate processes in the enterprise, is quite wide; it has global and local players.

According to Postnikov V.M. and Chekulina M.Yu. (2020), two main types of solutions can be distinguished: "box" solutions that can be used in small enterprises with standard work logic, the second type can be considered individual solutions for medium and large enterprises with unique features and many non-standard processes. For each case, you need to consider your own criteria, in the first case you need to pay special attention to the cost of implementation and the time frame, and in the second - to flexibility, scalability and the possibility of integration with other systems *(Postnikov and Chekulina, 2020)*.

The most popular ERP systems are shown in Figure 4 *(The most popular ERP systems and vendor leaders, n.d.)*.

Fig. 4: Rating of ERP systems by the number of implementations according to TAdviser database data for the period from 2005 to October 2017
(Source: The most popular ERP systems and vendor leaders, n.d.)

According to the data, ERP solutions based on the 1C: Enterprise platform are most popular in Russia. The domestic software product accounts for 31% of the total number of solutions introduced from 2005 to October 2017. The second place in the ranking is occupied by "Galaxy ERP" (7.5%), the third - SAP ERP (6.0%). Outside the top three, there are 2 solutions from Microsoft: MS Dynamics AX (5.8%) and MS Dynamics NAV (5.2%) *(What Is ERP? Guide to Enterprise Resource Planning Software, 2020)*.

The study of Postnikov V.M. and Chekulina M.Yu. (2020), based on a comparison of ERP systems according to 9 criteria, also shows that the Russian system "1C: Enterprise Management 2" leads among the compared ERP systems according to given criteria. Among foreign systems, the MS Dynamics system has shown itself well. It should be understood that if you specify a different weight of criteria and compare by other parameters, then the results may differ significantly *(Postnikov and Chekulina, 2020)*.

According to Agafonova V.V., Nikolaeva A.A., Stakanova N.S. (2018), the advantages of 1C include adaptation to Russian legislation and the possibility of a fairly quick adjustment with the help of integrator companies, as well as an ergonomic interface. When implementing SAP developed under Western standards, additional costs are inevitable for the development of specific functionality under Russian standards *(Agafonova, Nikolaeva and Stakanova, 2018)*.

For the purposes of our research, we will compare the ERP systems of SAP Business One, Microsoft Dynamics NAV, 1C ERP Enterprise Management 2.0.

SAP Business One is a software solution focused on small and medium-sized enterprises that aim to optimize internal business processes, accelerate growth, and increase profits.

Microsoft Dynamics NAV is an integrated business management system that helps develop the company and increase the number of potential deals.

An easily adaptable enterprise resource management solution automates and integrates sales, purchases, operations, accounting, and inventory management in small and medium-sized companies.

1C ERP Enterprise Management 2.0 is a modern solution for building complex information systems for managing the activities of multidisciplinary enterprises.

Table 1 shows the comparative characteristics of these ERP systems.

Table 1: Comparative characteristics of ERP systems

Criterion of estimation	**1C ERP Enterprise Management 2.0**	**Microsoft Dynamics NAV**	**SAP Business One**
Target group	Small business, ИП, medium-sized and large enterprises	Small, medium-sized and large enterprises	Large corporative enterprises
Licence policy	Purchase product license (by number of workplaces) and subscription for updates/information materials.	Purchase a product license (depending on the number of jobs)	Licenses for modules are purchased (the cost depends on the number of jobs) and a maintenance subscription, the cost of which also depends on the number of jobs)
Program cost	From 360 000 rubles	From 500 000 rubles	From 550 000 rubles
Units	9	12	15
Implementation period	3 – 4 weeks	5 – 6 weeks	5 – 6 weeks
Localization	High	Medium	Medium
The period of training of employees	14 – 30 days	From 2 to 5 weeks	30 days

(Source: compiled by the authors)

Based on the results of the comparison of the three ERP systems for business, it can be concluded that SAP Business One is the most attractive ERP system in terms of technical capabilities and usability. But this system is the most expensive of the presented options and requires a long implementation time. The smallest implementation period and cost, extensive functionality, usability, integration with other systems, as well as a fairly wide target audience are inherent in the Russian 1C ERP Enterprise Management 2.0. It should also be noted that the priority of choosing domestic systems corresponds to the state program of the digital economy of Russia and the project for the development of the IT industry for 2019-2025 years.

Thus, the review of the ERP market demonstrates high growth rates, the presence of both domestic and foreign solutions in the market. The best option for the introduction of ERP-systems into the activities of Russian enterprises is 1C Enterprise management; however, the choice of an ERP-system is carried out on the basis of a multi-criterion approach, depending on the goals and objectives of the implementation.

Benefits of ERP Implementation

With the development of business applications such as CRM (Customer Relationship Management), MRP (Manufacturing Resource Planning) and PPM (Project Portfolio Management), patchwork automation began to be replaced by a full-fledged and long-term strategy for the development of information technology in enterprises. However, together with the growth of capabilities, functions, usability of software, the volume of tasks of business applications, the cost of such programs, the cost of their introduction into production, also increased. Project implementation times, technical and organizational complexity of implementation and operation have increased significantly.

According to P.I. Yaremko (2018), the main goal in the implementation of the ERP system is to dramatically accelerate and increase the mobility of the enterprise's response to market changes with a multiple reduction in company costs, which helps achieve the principles of implementation: maintaining a single data warehouse; automation of activities; Delivering as one; ensuring customer satisfaction *(Yaremko, 2018).*

Owusu-Mainu R., Twum A.D., Konadu A., Ohene-Amoako D. (2019) established that the implementation of the ERP system is accompanied by problems and difficulties associated with reconfiguration and configuration, acquisition cost, time and cost of training users of ERP systems. However, the direct and indirect benefits: efficient customer service, efficient and reliable sales and distribution mechanisms, deep understanding of corporate data, efficient inventory management and increased profitability, efficient business operations, etc., resulting from the implementation of ERP systems far outweigh the problems associated with the implementation of ERP systems *(Owusu-Mainu, Twum, Konadu and Ohene-Amoako, 2019).*

According to the researchers *(Owusu-Mainu, Twum, Konadu and Ohene-Amoako, 2019),(Oshchepkov and Lokhmatova, 2020)* ERP systems have a number of advantages:

- Increased efficiency due to automation of data collection;
- Growth through the management of increasingly complex business processes;
- Risk mitigation, better compliance;
- Promotes cooperation through improved data exchange and communication;
- Improved supply chain management;
- Helps to save business money in the long term by optimizing processes;
- Provides a unified system that can reduce IT, workforce and training costs
- Allows you to better see important component businesses, such as sales, working capital and inventory management;
- Facilitates reporting and planning with improved data and analytics.

Panorama Consulting, an international research company, presented the benefits of ERP implementation (Fig. 5) in a report "Market Overview of ERP 2017" based on a survey of 342 companies, which was conducted from March 2016 to February 2017 *(ERP Market Overview 2017, 2017).*

According to the results of the same study, 70% of companies rated the results of ERP implementation as successful, 26% - failure, 4% - difficult to say. 74% of respondents exceeded the amounts originally budgeted. The reasons for going beyond the budgeted budgets were unforeseen technical /organizational problems for 23% of respondents, for 22% - the need for additional technologies, for 20% - expansion of coverage.

Fig. 5: Benefits of ERP implementation based on Panorama Consulting Solutions research (2017), %
(Source: ERP Market Overview 2017, 2017)

It is worth noting that expensive software of well-known manufacturers cannot always guarantee successful implementation in any business processes. Before implementing, you must always evaluate the effectiveness of this solution. To this end, various economic models and methodologies are used.

Today, there are many approaches to measuring the effectiveness of the implementation of the ERP system, and this is explained by the relative novelty of the issue, the diversity of life situations and, most importantly, the specifics of the subject of the assessment itself, because the implementation of the ERP system cannot be considered as an independent project with separate resources, cash flows and effects, and this is a project integrated into the main business of the customer and affecting the key indicators of this business *(Enterprise Management Systems (ERP) market of Russia, 2020)*. Recently, special attention has been paid to dividing the benefits associated with ERP systems into two categories: "implementation result" and "organizational results" *(Law and Ngai, 2007), (Ram and Corkindale, 2014)*.

Other experts *(Protsenko and Laikov, 2015)* systematize the approaches as follows *(How fast are enterprise resource planning (ERP) systems moving to the cloud?, 2015)*:

1. Economic component of efficiency assessment:
   - approach based on investment management methods;
   - economic analysis.
2. "Internal" or "process" component:
   - approach based on project management methods;
   - process management elements.

The potential economic effect of implementing ERP systems from the experience of the consulting company PromInfoConsult (2018) can be divided into 4 groups (Table 2).

Table 2: Economic impact of ERP systems implementation according to PromInfoConsult

Area	Measure	Average,%	Value,%
Inventory and production	Reduction of inventory	20	4-50
	Reduction in material resources	11	2-30
	Reduced production costs	12	5-50
	Lower cost of production	8	2-30
	Increase in output	29	3-150
	Productivity growth in production	14	10-20
Working capital turnover	Increase in inventory	25	7-50
	Reduction of receivables	19	8-50
Efficiency and agility	Expedite order processing	85	20-400
	Shorter lead times	26	14-75
	Reduced operational and administrative costs	20	5-50
	Profit growth	14	4-35
Work and Reporting	Reduction of work in various departments	35	10-70
	Accelerate management reporting	in 3 times	in 1,3-11 times
	Expedite regulatory reporting	in 3,1 times	in 1,4-10 times

(Source: compiled by the authors on the basis of PromInfoConsult)

In turn, the Russian leader in the field of ERP systems - 1C estimates the average effect of implementation as follows (Figure 6).

Fig. 6: Average impact of ERP systems implementation according to ERP solutions implementation project 1C, %

(Source: compiled by the authors)

These indicators include both economic and process-specific indicators. Thus, the implementation of ERP systems has both advantages and disadvantages, but most experts believe that the potential benefits significantly outweigh the disadvantages. Among the benefits of implementation are economic and process effects.

Results

We investigate the advantages of implementing the ERP system and evaluate the results of the implementation using the example of Russian production enterprises. As the subject of the study, we will take the ERP-system 1C ERP Enterprise Management as the most popular *(Agafonova, Nikolaeva and Stakanova, 2018)*, *(What Is ERP? Guide to Enterprise Resource Planning Software, 2020), (Postnikov and Chekulina, 2020)*. This system has been implemented for more than 1 million jobs, automated transport enterprises of Zheldorremmash JSC, St. Petersburg State Unitary Enterprise Passazhiavtotrans, the largest agricultural holding Russian Grain, production enterprises of AvtoVAZ OJSC, Faberlik OJSC, the largest meat processing plant in the Russian Federation, Remit, concern NPO "Aurora", the leading enterprise of the military-industrial complex of the defence industry complex JSC NPP "Salyut", Siemens Gas Turbine Technologies LLC, PJSC Gazprom Automation, production and sale of Gulliver children's clothing and others. 1C ERP Enterprise management is versatile, focused on small, medium and large enterprises.

We will conduct an assessment of the economic and process effect on the example of "UralSpetsTrans" LLC, which is engaged in the production of special-purpose transport.

The management of the enterprise is faced by the purpose - creation of the new automated control system for purchases and stocks and also the organization of the effective activity of department of supply of LLC "UralSpetsTrans" directed to formation of stocks in economically reasonable and expedient sizes.

Implementation of this system will allow to effectively solving the following tasks:

- Identify stock items that are scarce;
- Automatically identify resource items for which excess stocks have been generated and adjust the procurement plan;
- Assess the availability and structure of stockpiles;
- Calculate the need for financial resources to ensure the necessary supply of inventory in the planning period, etc.

The system calculates the required amount of funds to be invested in inventory creation by determining the requirement quantity of the individual stock types.
In the process of determining requirements, stocks can be divided into two groups:
- Production stocks;
- Finished goods stocks.

Reducing the cost of maintaining the plant's inventory is a solution to the optimization problem during their rationing. For production stocks, this task is to calculate the optimal lot size for the purchased materials.

Determining the value of the optimal size of the batch of purchased materials, at which the cost of servicing stocks will be minimal, is carried out using the known Wilson formula, as well as its modifications.

By determining the optimal values of the materials to be ordered, it will be possible to determine which items are ordered with excess or deficit, which will optimize the purchasing system and reduce warehouse costs.

Basis the purpose, the proposed to implement automated control system for purchases and stocks, is increase in efficiency of process of management of purchases in LLC "UralSpetsTrans", ensuring control of expenditure of stocks, profit mark-up of the enterprise due to cost reduction.

Based on modern examples of ERP systems implementation in industrial enterprises *(Basok and Dublin, 2011)*, it should be noted that the modern system of procurement and inventory management proposed for implementation in this enterprise can achieve the following positive results:
Optimize the batches of purchased inventory. The procurement of the required resources for the production of products according to the optimal size of the batch, allows reducing the total costs of storing stocks and fulfilling orders by an amount of 5-10%.

Rational use of stocks by having reliable information on the exact value of stocks.

Increase of liquidity and increase of turnover of reserves by 2-3% due to possibility of reduction of excess value of reserves and maintenance of their optimal value in warehouses.

Ensure optimal inventory acquisition costs by automatically comparing order execution costs at different amounts of purchased resources and determining the best option, which can contribute to saving the cost of fulfilling orders by the amount of 5-7%.

Identify scarce parts of individual stock types and select parts for which excess stocks have been generated and automatically adjust purchase orders.

Expedite the procurement process by not having to manually track inventory balances and adjust the procurement plan.

By solving these problems, it is possible to prevent production from stopping due to lack of resources and maintain the optimal amount of inventory. All these activities, with the proper implementation of an automated procurement and inventory management system, together can reduce the enterprise's variable costs by at least 5-8% by achieving the optimal value of the total inventory storage costs and fulfilment of orders.

The solution of a task of introduction of the automated control system for purchases and stocks in LLC "UralSpetsTrans" will not demand acquisition of expensive technical means, everything will function on already available equipment.

Introduction of the automated information system 1C ERP Business management on LLC "UralSpetsTrans" considerably will accelerate process of purchases, will allow to control in real time precisely warehouse stocks, avoiding their excess accumulation, will simplify process of calculation of necessary amount of the materials demanded to purchase.

You can evaluate the effectiveness of implementing an automated procurement and inventory management system 1C ERP using the economic and process component.

Table 3 shows the initial data for calculation of cost-effectiveness of the automated procurement and inventory management system 1C ERP, hereinafter referred to as NPP.

Table 3: Input Data for Calculation of Cost Effectiveness of the Automated Procurement and Inventory Management System 1C ERP

Indicator name	Unit of Measure	Key Figure Value	
		In Base Case	In New Case
Capital investments for NPP implementation	Ruble	–	430 000
Number of specialists engaged in NPP implementation	Human	–	2
Duration of NPP development	Month	–	1
Machine time consumption during NPP development	Hour	–	80
Average monthly salary of one specialist	Ruble	30 000	30 000
Average labour consumption of IVS debugging	Human – hour	1,0	0,2
The price of one hour of work at the user's organization	Ruble	170	190
Average machine time spent debugging programs per 100 commands	Hour/100	0,09	0,06
Average user consumption per 100 commands	Ruble	15,4	7,5
Investment Efficiency Ratio	Item	0,5	0,5
IVS Equipment Picking Costs	Ruble	–	140 000
Average number of typical tasks solved per year	Aim	320	320
Scope of work for one task	100 commands	–	16,5

(Source: compiled by the authors according to the site)

For the management of the LLC "UralSpetsTrans" enterprise of a key factor of making decision on introduction of system 1C ERP, the size of the net profit which remained after realization of a system is.

The effect of the implementation of the 1C ERP system in practice will be manifested not only in optimizing the salary costs of employees of the supply department and saving materials when using the system, but also in reducing the value of logistics costs that directly affect the variable costs and cost of production.

Realization of this action for optimization of purchasing logistics of LLC "UralSpetsTrans" due to reduction of logistic expenses (costs of purchase of products, transport expenses, costs of storage of stocks) is capable to improve an indicator of net profit for 3%.

The introduction of the automated ERP system on the basis of the enterprise of LLC "UralSpetsTrans" is economically justified, a more detailed calculation of the economic effect is presented in Table 4.

Table 4: Calculation of the Economic Impact of the Implementation of the Automated Procurement and Inventory Management System 1C ERP

Indicator	Value in 2019, thousand rubles
Total costs	705,2
Including:	
Capital investments for NPP implementation	430
Capital investment in software development	135,2
IVS Equipment Picking Costs	140
Net profit through implementation of 1C ERP	93 109,81
Net profit gains through cost savings	3 682,81
Total annual current cost savings	826
Overall economic impact of ERP 1C system implementation	3 803,71
Capital Investment Efficiency Ratio	1,17

(Source: compiled by the authors)

All the costs of implementing an automated procurement and inventory management system 1C ERP, are paid off by saving the current costs of the enterprise, during the first year of use of the system.

Table 5 shows the quantitative measures of the effect of the implementation of the automated 1C ERP system.

Table 5: Calculation of Project Revenue

Income item	Value
Working capital savings, thousand rubles	992,9
Economic effect due to income growth, thousand rubles.	3 803,71
Total effect of the implementation of ACS for the first year of operation, thousand rubles.	4 796,61
ROI,%	17 %
Payback period, months	10,5

(Source: compiled by the authors)

Comparison of expenses of the LLC "UralSpetsTrans" enterprise before introduction of the automated system 1C ERP is presented in Table 6.

Table 6: Comparison of expenses of the LLC "UralSpetsTrans" enterprise before introduction of system 1C ERP

Indicators	Values before changes	Values after changes	Absolute change	Relative change,%
Variable costs, thousand rubles	2 442 866	2 431 029	11 837	- 1
Costs for the purchase of materials, thousand rubles	1 294 719	1 282 882	11 837	- 1
Fixed costs, thousand rubles	997 790	997 035	755	- 0,08
Salary of staff, thousand rubles	89 158	88 403	755	- 0,85
Inventory value, thousand rubles	925270	897 512	27 758	- 3
Total costs, thousand rubles	3 440 656	3 362 218	78 438	- 2,28
Net profit, thousand rubles	89 427	93 110	-3 683	4,12
Net profit margin, %	2,59	2,7	0	4,25
Total value of assets, thousand rubles	1 099 498	1 071 740	27 758	- 2,52
Turnover of assets, thousand rubles	4,06	4,12	0,06	1,48
Return on assets, %	8,13	8,34	- 0,21	2,58
Financial leverage, %	41,68	41,47	0,21	- 0,50
Profitability of the enterprise, %	2,59	2,7	0,11	4,25

(Source: compiled by the authors)

The main parameters to change as a result of the implementation of the ERP 1C system in Table 6 are variable and fixed costs and inventory, which affects the change in the value of the current and total assets of the enterprise in question.

Changing these parameters affects the value of net profit and turnover of assets, which in turn changes the profitability of assets and the profitability of the enterprise.

Conclusions

The review of the ERP market demonstrates its high growth rates, the presence of both domestic and foreign solutions in the market. The best option for the introduction of ERP-systems into the activities of Russian enterprises is 1C Enterprise management; however, the choice of an ERP-system is carried out on the basis of a multi-criterion approach, depending on the goals and objectives of the implementation.
The implementation of ERP systems has both advantages and disadvantages, but most experts believe that the potential benefits far outweigh the disadvantages. Among the benefits of implementation are economic and process effects.

The assessment of the economic and process effect was carried out on the example of LLC "UralSpetsTrans" engaged in the production of special-purpose transport.

As a result of the implementation of the 1C ERP system, a decrease in costs, an increase in net profit, and an increase in the profitability of the enterprise were recorded.

Realization of the automated control system for purchases and stocks 1C ERP will allow to simplify and accelerate significantly process of purchases at the LLC "UralSpetsTrans" enterprise, to reduce labour input of procurement process and inventory management.

ROI amounted to 17%; the project pays off during the year, which indicates the effectiveness of this solution.

Abstract

The article proves the necessity of carrying out an estimation of housing market development level as important condition for maintenance of economic safety of households. The authors have defined the essence of the state of economic security of households in modern living conditions. The article highlights the most important spheres of vital activity of households and describes in more details risks and threats that directly or indirectly influence a condition of their economic security. It is emphasized that the housing sphere is one of the most important areas, as on the one hand it is the habitat of households, and on the other hand it has a direct impact on the state of their economic security. A group of quantitative and qualitative indicators has been proposed, which, according to the authors, will allow for more clear assessment of the housing market development level for the purpose of ensuring the economic security of households regardless of the territory of residence. The proposed methodology is based on the calculation of integral indicator on the basis of a set of indicators, grouped into four areas: housing, housing services, government support to households in the housing market, the assessment of household welfare. It is shown that the calculation of the integral indicator for assessing the housing market development level will rank regions based on the development of this market as a condition of economic security of households in each region.
The developed method was tested on the example of territorial and administrative units within the Urals Federal District of Russia. The results of the study are of practical importance, as they provide an opportunity to rank the regions both in terms of their constituent areas and in terms of the complex integrated housing market development indicator. This will allow state and regional authorities to formulate more clearly the tasks of improving the current housing policy, which will undoubtedly allow households to increase their economic security by minimizing the relevant risks and threats to their life activities.

Keywords: Households, Economic Security of Households, Threats and Risks to The Economic Security of Households, Housing Market, Housing Services, Integral Assessment, Method of Analysis of Hierarchies, The Housing Market Development Level.

Introduction

Households, at the present stage, are important economic entities. Both the welfare of a single economic unit and the entire population of the country depend on the results of their activity. This is due to the fact that the behaviour of households significantly affects the labour, goods and services, financial, housing and other markets.

Cite this Article as: Egor GOLOVANOV, Olga RYAZANTSEVA, Anna CHEREPANOVA and Marina BAZHANOVA "Assessment of The Housing Market Development Level as A Condition for Ensuring Economic Security of Households" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

In view of the great importance of the economic subject under study, there are acute issues of ensuring its economic security. Today foreign and Russian authors analyse and evaluate economic security of households from the point of view of various spheres of their functioning *(Osberg and Sharpe, 2014), (Hacker et al., 2013), (Berloffa and Modena, 2013)*. Thus the economic security of households should be considered from the point of view of having stable, well-paid work *(Beeferman, 2002), (Torgai, 2010)*, financial and non-financial assets, as well as other resources sufficient both for making large purchases and for the possibility of surviving occasional crises and subsequently ensuring high quality of life *(Golovanov, Mikhalina and Ryazantseva, 2018)*. However, by now, in addition to the approach based on the definition of the economic security of households, there is another approach that defines the economic vulnerability of a given economic subject. The authors attribute the state of economic insecurity of households to instability on the labour market, housing market, the market of medical services, pensions, underdevelopment of the insurance market *(Hacker, 2011), (Dominitz and Manski, 1997)*. Let us agree with L. Osberg, E. Sharpe (*Osberg and Sharpe, 2014)*, that economic insecurity is a state of anxiety because of the impossibility to get protection from subjectively significant potential economic losses.

Methodology for assessing the level of housing market development

The life of a household is multifaceted and directed to different spheres of society. In an enlarged form, the most important spheres of life in which households operate are social, economic, political and spiritual. In each of these areas, households face many risks and threats that directly or indirectly affect their economic security (Table 1).

Table 1: Description of main threats to household's economic security by area of activity

Areas of household activity		External threats to household's economic security	Domestic threats to household's economic security
Economic	Production area	High unemployment	Loss of basic income (loosing job)
		Low real wages	
		Growing differentiation of the population by income	
	Consumer sector	Inflation	
		Rising prices for consumer goods, durable goods and services	
	Financial sphere	Deteriorating conditions for lending to the population, including mortgage loans	Poor financial literacy of household members, including those resulting in incorrect and irrational budget allocation
			High credit dependency
			Absence of insurance reserve (savings) that would allow stabilizing unstable financial condition of a household
	Scope of legal regulation	High level of criminalization and corruption in the economic sphere	
		Preservation of a significant share of the shadow economy	
	Housing sector	Rising housing prices	Lack of own place to live.
		Growth in property maintenance costs (housing and public utilities)	Poor housing conditions and lack of opportunity to improve them
Social	Field of Education	Commercialization of education, science	Inadequate education and professional competence of household members, resulting in inability to find a decent, well-paid job
		Reducing quality and availability of education	
	Health sector	Commercialization of the health sector	Health problems of one or more household members resulting in reduced
		Reducing the quality and availability of	

Areas of household activity		External threats to household's economic security	Domestic threats to household's economic security
		health care	working capacity
	Social security sphere	Decrease in the amount of pensions granted	Placement in the care of the household of its non-working (disabled, elderly) as well as incapacitated members
		Decrease in social benefits	
	The sphere of human capital reproduction	Decrease in living standards and life expectancy	Addiction of various kinds (alcoholism, drug addiction, gambling, etc.) of one or more household members
	Ecological sphere	Deterioration of the environmental situation in the place of residence, requiring a change of residence or investment in environmental improvements	
Political		Exacerbation of the military and political situation at the place of permanent residence, including terrorist and extremist activities, political tensions in the country	
Spiritual		Rising prices for visits to places of cultural rest and, as a result, a decrease in cognitive activity, spiritual qualities and values	Inter-personal conflicts within the household caused by a clash of opposing interests, views and aspirations, resulting in economic losses to the household and, in some cases, its collapse.

(Source: compiled by the authors)

At the same time, we believe that one of the most important things in the modern world is housing, as the habitat of households. Housing is important for a person, housing needs and forms of their satisfaction are constantly changing and improving, the requirements for housing are increasing. Problems of research of the housing market are devoted to the work of such authors as K.E. Case, J.M. Quigley, R. J. Shiller, J. Wu, E. Ferrari, R. Arundel, B. Lund, J.A. Módenes, S. Kang *(Case, Quigley and Shiller, 2005), (Ferrari, 2014)*. But so far the question of assessing the housing market development level from the standpoint of economic security of households is still not sufficiently studied. In this connection, an attempt has been made to develop a toolkit for assessing this level and to test it on the example of Russian regions that are part of the Urals Federal District.

The degree of housing market development has a direct impact on the economic security of households. Thus, an increase in housing prices, an increase in the share of damaged and dilapidated housing in the total volume of the housing stock, and a decrease in the quality of housing conditions all have a negative impact, while an increase in the volume of construction, quality of housing, housing services, and improvement, on the contrary, has a positive impact on the level of households' economic security. The housing sector is extensive and has close links with many other areas, which makes it important to study its dynamics in order to identify negative trends and patterns and to be able to forecast threats and risks in the future, both within regional markets and at the federal level.

At present, addressing the problems of economic security of households, both at the national and regional levels, involves effective and sustainable development of the housing market. The housing stock is part of the national wealth, and the housing conditions of the population are part of the welfare of households. Thus, the housing security of households is one of the important factors forming their economic security.

Today the authors of numerous scientific works are engaged in research of the role of housing in the life of certain categories of households. For example, according to the report on children's health *(Breysse et al., 2004)*, it is clear that housing conditions have a direct impact on the formation and development of personality. Since about 80 per cent of children spend time indoors, it is the quality of the latter that has an impact on their health. In addition, housing conditions in which household members live, especially at an early age, also contribute to the formation and socialisation of a healthy personality. However, limited space for living has a significant impact on constructive social interaction within the household.

Household income and expenditures are also significantly affected by the ownership status of housing. Thus, households may receive additional income when renting housing. By increasing their welfare, however, if there is no housing owned by a household, it will lead to forced increase in expenses by the amount of rent.
As the second most important thing after family health, living conditions are also very important for feeling satisfied with life. However, according to the survey data, 44% of the surveyed Russians do not have any opportunity to improve their housing conditions in the next 5 years. And only 23% of respondents when answering the Russian Public Opinion Research Centre (VTsIOM) question "Are you going to improve your housing conditions (buy a place to live) in the next 5 years?" answered positively (Fig. 1) *(Database of results of surveys of Russians, 2020)*.

Fig. 1: Results of the survey of Russians about their intention to improve their housing conditions
(Source: Golovanov and Shaidurov, 2016)

The residential market is one of the most significant and organized segments of the real estate market, along with commercial, industrial, free land plots and special purpose real estate markets. It is the segment that characterizes the housing market that is most significant in the structure of the real estate market, since it is the segment that provides households with the opportunity to meet their needs in housing, social status and other related housing benefits and services.

The housing market is the economic relations which are formed between the subjects concerning the housing objects at their purchase and sale, transfer for rent, rent, pledge and other relations arising in the housing sphere *(Selyakhina, 2011)*. This is a complex social and economic system and interrelated structure containing a complex of mechanisms for redistribution of objects of existing and newly created housing stock and created housing services subject to influence of internal and external environment factors and based on achievement of many interests of all its participants in conditions of imperfect competition *(Golovanov and Shaidurov, 2016)*.

In accordance with the housing policy being implemented in Russia, each household and its family members, based on their needs and opportunities, have an equal right to freely acquire ownership of comfortable housing. This testifies to the fact that the State, represented by federal and local authorities, is building a legal and economic mechanism aimed at forming a developed and organized housing market.

The housing sector is a special sector of the economy in which the process of creation, operation, maintenance and replacement of retired housing stock is carried out. In general, the housing market includes the market for housing construction (design, construction, modernization, reconstruction, repair and liquidation) and the market for housing services. The latter are aimed at stable functioning of the housing stock. Figure 2 shows in aggregated form the main stages of development of processes on the housing market.

Fig. 2: Stages of development of the processes occurring in the housing market
(Source: Golovanov and Shaidurov, 2016)

When considering the issues of economic security of households in terms of their environment it is clearly depends on the development of the housing market and its accompanying spheres: the sphere of housing services, the sphere of state support for households, and the socio-economic sphere. While the volume of housing construction is increasing, along with the quality of housing and its improvement - there is an increase in the level of economic security of households, with a decrease in housing prices and provision of favourable conditions for granting housing, in particular, mortgage loans - there is also an increase in the volume of housing construction. In addition, provision of benefits and state support to families in need of housing, an increase in household incomes and many other factors can directly affect the economic security of households.

In order to assess the housing market development level from the point of view of economic security of households, an appropriate methodology was developed, which allows qualitatively and quantitatively reflect the situation on the housing market of different regions. The basis of the methodology will be the calculation of an integral indicator based on a set of indicators in the analysis of the following areas:

- Housing, which is a special sector of the economy associated with the creation, operation and replacement of housing stock. This sector is particularly important in the process of ensuring the economic security of households, due to the paramount importance of housing for everyone at all ages. In the process of household functioning, housing needs are constantly changing and improving, which can have a direct impact on its economic security, both upward and downward;
- housing services related to the maintenance of the proper technical and sanitary condition of housing and all infrastructure supporting it, including the removal of solid municipal waste, electrification, heating, water supply and drainage, gasification, landscaping, street lighting, arrangement of public space, etc.;
- sphere of state support to households in the housing market, in which the state creates a legal space for the effective development of the housing market, provides support to households in need and ensures social stability in society as a whole;
- area of assessment of household well-being, which characterizes the structure of human needs and the ability to meet them in a qualitative way. It is the indicators of this sphere that allow characterizing the measure of satisfaction of basic life needs of households.

Next, let's present the set of selected indicators, classifying them into four areas. Besides, the presented indicators have a difference in influence level (max or min). The growth of some indicators contributes to the growth of the housing market as a condition of economic security of households, while the growth of others hinders its development. In selecting the composition of indicators, emphasis was placed on those that can be obtained from open sources of information and officially published statistics. Let us summarize the selected list of indicators in Table 2.

Table 2: The system of indicators for assessing the housing market development level from the position of household's economic security

Index	Symbol	Calculation	Level of influence
Housing sector			
Residential Building Input Index	$I_{1.1}$	Ratio of residential buildings put into operation to total housing stock	max
Apartment Input Index per resident of the region	$I_{1.2}$	Ratio of apartments put into operation to the total population of the region	max
New residential building index per inhabitant	$I_{1.3}$	Ratio of residential buildings put into operation to the total population of the region	max
Price index on the primary housing market	$I_{1.4}$	Ratio of average cost of 1 sq. m. on the primary market in the current period to average cost of 1 sq. m. in the previous period	min
Average housing market price index	$I_{1.5}$	Ratio of average cost of 1 sq. m. at the secondary market in the current period to average cost of 1 sq. m. in the previous period	min
Index of existing state construction organizations	$I_{1.6}$	Ratio of number of operating state construction organizations to number of construction organizations of all forms of ownership	max
Index of private construction companies in operation	$I_{1.7}$	The ratio of the number of operating private construction organizations to the number of construction organizations of all forms of ownership	max
Mortgage Index	$I_{1.8}$	Ratio of the volume of housing mortgage loans extended to individuals to the total volume of issued housing loans	min
Housing Security Index	$I_{1.9}$	Ratio of total housing stock to total population of the region	max
Housing services sector			
Index of emergency housing in total housing stock	$I_{2.1}$	The share of emergency housing in the total housing stock	min
Index of dilapidated housing in total housing stock	$I_{2.2}$	Ratio of the area of dilapidated housing stock to total housing stock	min
Housing Improvement Index	$I_{2.3}$	Ratio of the area of well-appointed housing stock to the total area of the housing stock	max
Index of household expenses on payment for housing and utility services in total expenses	$I_{2.4}$	Ratio of monthly household expenses for housing and communal services to average monthly consumer expenses	min
Housing Overhaul Index	$I_{2.5}$	Ratio of the housing stock area with renewal performed to the total housing stock area	max
The sphere of state support for households in the housing market			
Index of families registered as being in need of housing	$I_{3.1}$	Proportion of families registered as being in need of housing in the total population	min
Index of families that have received housing and improved their living conditions	$I_{3.2}$	Ratio of number of families that received housing and improved living conditions to the total population	max
Unemployment rate	$I_{3.3}$	Ratio of the number of people recognized as unemployed and registered at the labour exchange to the sum of those employed and recognized as unemployed	min
Share of expenditures on housing in total expenditures of the consolidated budget	$I_{3.4}$	Ratio of budget expenditures under "housing" to all budget expenditures	max

Index	Symbol	Calculation	Level of influence
of the region			
Percentage of citizens who enjoy social support (benefits) in paying for housing and utilities services	$I_{3.5}$	Ratio of the number of citizens who enjoy social support (benefits) in payment for housing and utilities to the total population	min
Proportion of the consolidated budget aimed at providing citizens with social support to pay for housing and communal services	$I_{3.6}$	Ratio of consolidated budget expenditures aimed at providing citizens with social support in payment for housing and utilities to all budget expenditures	max
Index of population with incomes below the subsistence minimum	$I_{4.1}$	Proportion of population with incomes below the minimum subsistence level in the total population	min
Growth rate of average per capita income of the population	$I_{4.2}$	Ratio of average per capita income of current year to previous year	max
Nominal wage growth rate	$I_{4.3}$	Ratio of nominal salary of current year to previous year	max
Natural Gain Ratio	$I_{4.4}$	Ratio of births to deaths	max
Growth rate of pensions	$I_{4.5}$	Ratio of current year's pension to previous year's pension	max
Ratio of average per capita income to minimum subsistence level	$I_{4.6}$	Ratio of average per capita income of population in the region to monthly minimum subsistence level	max
Housing Availability Index Primary	$I_{4.7}$	Ratio of the cost of a standard apartment on the primary market to the annual income of the average family	max
Housing Availability Index secondary	$I_{4.8}$	Ratio of the value of a standard apartment on the secondary market to the annual income of the average family	Max
Mortgage debt growth rate per capita	$I_{4.9}$	Mortgage loans debt ratio per capita of the current year to the previous period	min
Mortgage debt index in the total amount of individuals' debt by region	$I_{4.10}$	Mortgage loans debt ratio per capita to total individual debt in the region	min
Index of correspondence of personal income to the inflation rate	$I_{4.11}$	Ratio of nominal wage growth/decrease index to consumer price index for the period under review	max
Dynamics of the working-age population	$I_{4.12}$	Ratio of number of able-bodied population of current year to previous period	max
Consumer Price Index	$I_{4.13}$	Indicator of changes in the value of the "fixed basket" of goods and services included in the "standard basket" of the general population.	min

(Source: compiled by the authors using databases of The Russian Federal State Statistics Service (Golovanov and Shaidurov, 2016), (Saati, 1993)

In order to obtain a comprehensive assessment of the housing market development level it is necessary to calculate an integral indicator. This indicator, all else being equal, will be the main criterion for comparing housing markets by region. Since these indicators have different units, therefore, they should be brought to a comparable form, i.e. scaled in the range from 0 to 1. At the same time, the following variant of indicators transformation should be considered:

1) in the presence of an increasing dependence between the analysed indicator I and the integral indicator, the value of the corresponding normalized indicator (In) is determined by formula 1.
2)

$$I_n = \frac{I_i - I_{min}}{I_{max} - I_{min}}, \quad (1)$$

where Ii is the actual value of the analysed indicator;
Imin - minimum value of the indicator;
Imax - maximum value of the indicator;

2) if there is a decreasing dependence between the analysed indicator I and the integral indicator, the value of the normalized indicator will be determined by the formula 2.

$$I_n = 1 - \frac{I_i - I_{min}}{I_{max} - I_{min}}, \quad (2)$$

To find the minimum and maximum values of the selected statistical indicators it is necessary to refer to the three sigma rule, on the basis of which the formulas for calculation will look like this, formulas 3 - 4:

$$I_{min} = I_{i\,av} - 3 \times \sigma, \quad (3)$$

where $I_{i_{av}}$ - the average value of the selected index for the period under study;
□ - the standard deviation of the selected index.

$$I_{max} = I_{i\,av} + 3 \times \sigma, \quad (4)$$

Calculation of the standard deviation is made according to formula 5.

$$\sigma = \sqrt{\frac{\sum (I_i - I_{i\,av})^2}{n}}, \quad (5)$$

where n is the number of years in the study period.
The next step after the normalization of individual indices is the calculation of the generalizing index for each of the areas under study using the formula 6.

$$I_{sp.\,j} = \frac{\sum I_n}{m}, \quad (6)$$

where Isp. j is the generalized index of the j sphere;
m - number of normalized indexes included in the generalized index.
The obtained values of generalizing indicators for each of the four areas are the basis for calculating the resulting complex integrated indicator of assessment of the housing market development level as a condition of economic security of households, formula 7.

$$I_{int} = \sum (I_{sp.\,j} \times k_j), \quad (7)$$

where Iint is a comprehensive integrated indicator for assessing the housing market development level from the perspective of economic security of households;
k_j is the weight of the j sphere, reflecting its importance in the integral indicator.

To determine the weight of each of the analysed spheres in the integral indicator, we suggest using the method developed by the American mathematician T.L. Saati, namely, the method of hierarchy analysis (MHA). The method is based on the evaluation of the influence of lower levels in the hierarchy on the vertex factor (weight of spheres in the integral index). Thus, the upper level is the level of development of the housing market, the intermediate level is the approval criteria, and the lower level is the results obtained on the basis of calculations of generalizing indices by spheres.

The approval criteria include the following:

- criterion A - the ability to comprehensively and adequately reflect the presence of threats and risks in the field;
- criterion B - the ability of the sphere to adapt to changing conditions under the influence of external and internal factors;
- criterion B - efficiency of data collection for the formation of indicators of the sphere;
- criterion D - the breadth of the data set on which the study is based.

The results of determining the final weights of the spheres in the integral indicator of the housing market development level used in the assessment of the Urals Federal District regions are presented in Table 3.

Table 3: Totals weight of criteria

Totals weight of criteria					
Criteria	A	B	C	D	Total weight of the sphere
Weight of criteria	0.26	0.58	0.06	0.10	–
State of household wealth	0.50	0.20	0.07	0.49	0.30
Housing sector	0.31	0.63	0.15	0.34	0.49
Housing services sector	0.11	0.11	0.46	0.06	0.12
The sphere of state support of households in the housing market	0.08	0.07	0.32	0.11	0.09
Amount					1.00

(Source: compiled by the authors using materials of Saati, 1993)

Results

The evaluation will be conducted over a ten-year period (2009-2018) using the example of the Kurgan, Sverdlovsk, Tyumen, and Chelyabinsk Regions that are part of the Urals Federal District.

The results of calculation of the integral index of the housing market development level as a condition for ensuring the economic security of households on the basis of the generalizing indexes for each sphere and the weights of these spheres, obtained on the basis of the MHA method are presented in Table 4.

Table 4: Generalizing complex integral indicator of the housing market development level

Subject.	Period									
	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Kurgan region	0.504	0.462	0.433	0.514	0.513	0.559	0.511	0.489	0.499	0.470
Sverdlovsk region	0.442	0.493	0.477	0.492	0.517	0.510	0.532	0.502	0.530	0.499
Tyumen region	0.482	0.484	0.484	0.529	0.520	0.508	0.544	0.506	0.510	0.447
Chelyabinsk region	0.503	0.444	0.461	0.531	0.522	0.533	0.508	0.452	0.456	0.454

(Source: compiled by the authors)

In the Urals Federal District as a whole, the most unfavourable situation was observed in 2011; the average value of the generalized integrated indicator was 0.464, which is 2% lower than in the previous year and 11% lower than the next year. In contrast, in 2014, the Federal District recorded its highest average integrated indicator value of 0.527, with a growth rate of 102% compared to the previous year.

The values of the generalized complex integral indicator of the housing market development level as a condition for ensuring the economic security of households in the regions of the Urals Federal District obtained from the calculations are summarized in Fig. 3.

Fig. 3: Generalized integrated indicator of the housing market development level as a condition for ensuring economic security of households in the regions of the Urals Federal District

(Source: compiled by the authors)

Over the whole period of the research the level of the housing market development from the point of view of economic security of households in the regions that are part of the Urals Federal District corresponds to the average level. This may indicate that the on-going regional measures aimed at the development of the housing market do not provide sufficient efficiency for its functioning. The Sverdlovsk Region has the best position among the regions of

the Urals Federal District in terms of the housing market development level as a condition for the economic security of households. First of all, this region is the only one that has positive dynamics on the whole over the period under analysis; its growth rate is 113%. Secondly, the Sverdlovsk Region had the best performance among all regions in the three years of the period under review - in 2010, 2017 and 2018.

Conclusions

In order to improve the economic security of households, scientifically sound theoretical and practical provisions have been developed, including the following:

- A new method for assessing the housing market development level as a household habitat and a condition for its economic security has been developed.
- The developed integral assessment indicator allows a comprehensive assessment of the state of development of housing markets in the regions and identification of the weakest aspects in their management by the state authorities.
- The results of a comprehensive assessment of the level of development of housing markets in the constituent entities of the Russian Federation are the basis for the rating of regions with the most favourable housing potential, which directly affects the level of economic security of households, as well as the growth of the quality of life of the population as a whole.
- The use of the results of a comprehensive assessment of the housing markets in the regions will allow the government authorities to develop measures of point impact on the redistribution of financial resources allocated for the implementation of Russia's housing policy.

Abstract

As the ecological problems are getting worse, the consumers' thoughts about the environmental protection have led to the diversification in consumer buying approach towards a green lifestyle. Therefore, companies are taking action to develop potential ecological approaches in the green market industry. Green marketing is an evolving concept of marketing that includes issues like eco-friendly products, packaging, labelling, etc. The article focuses on factors that influence consumption of eco-friendly products. Research examines how knowledge about green products of consumers effects the consumption of them. The article analyses thoughts and attitudes of Russian consumers about different characteristics of eco-friendly products, packaging and other.

Results of the survey might be used by different organizations: government structures, retailers, producers, marketing agencies and others. Using green marketing concept can help to increase products sales, attractiveness, company's income and image. For long-term and significant changes in behaviour, it is necessary to develop environmental values through education and support of green markets in the state.

Keywords: eco-friendly products, environmental marketing, green marketing, customers' behaviour.

Introduction

Green marketing is how the business satisfies their customer needs and wants without giving harm to the environment due to scarcity of resources *(Sulaiman, Jamil, Othman and Musa, 2020).*

The first definition referring to green marketing dates back to 1976, when Hennion and Kinnear emphasized that environmental marketing is associated with all marketing activities that have helped to cause environmental problems and that can serve as a means of solving environmental problems. The largest number of studies on this topic was written studies during the 1990s with a decrease since 2001. In terms of content, most of the studies are devoted to five topics: namely green communication, green consumers, recycling behaviours, macromarketing, concepts and strategies (*Dangelico and Vocalelli, 2017).*

An issue of eco-friendly marketing is close to problems of ecology, manufacturing, eco-efficiency, etc. Demand for "green" products and services helps to save the environment and satisfy the customers' needs.

Global financial crises, world economic problems that arose post-Brexit, leading to changes corporate social responsibility and managers recognize the need to operationalize green marketing throughout the organization in

ensuring sustainable development in the work of employees, products and services *(Papadas, Avlonitis and Carrigan, 2017).*
At the same time, the experience of implementing green marketing in China shows that initiatives from government establish a favourable social environment for the implementation and development of green marketing efforts *(Zhu and Sarkis, 2016).*

Nowadays, more and more modern companies are ready to accept environmental responsibility.

Last century's accelerated demographic, technological and industrial development intensified the magnitude of human activity's effects in the environment. Green marketing allows building a bridge between what the customers want and the environmental-friendly firms. Hence, firms with green marketing try to look for specific customer needs, environmental aware customer profiles and ways of incorporating these insights into its offerings *(Simão and Lisboa, 2017).*

Green marketing is related to the industrial ecology and environmental sustainability issues such as extended producer responsibility, life cycle analyses, material usage, source flow and eco-efficiency. Business entities can make themselves green through three ways: value addition process, management systems and their products *(Kirgiz, 2016).*

The focus on green marketing among consumers and businesses has been matched by renewed academic research. There is increased academic investigation in this domain, as researchers seek answers to a number of green marketing-related issues, including identifying factors that influence consumers to behave in environmentally-responsible ways *(Bailey, Mishra and Tiamiyu, 2016).*

Literature Review

Significant changes in business environment that impact not only the activity of companies but the shift of the basic values and attitudes of the society have been observed recently. The changes within the activity of companies are expressed through the increase of competition within the dynamic market and the change of needs and expectations held by consumers and other stakeholders. It has been noticed that consumers more often prefer eco-friendly, safe and "clean" products which do not pollute the environment *(Banyte, Brazioniene and Gadeikiene, 2010).*

The topic of green marketing is up-to-date in the world scientific community. In terms of the number of studies according to the Scopus database the huge contribution was made by such authors as Polonsky M.J., Chen Y.S., Zhu Q. Sarkis J., Font X., Chang C.H., D'Souza C., Han H., Jabbour C.J.C., Peattie K., Suk, N.M.

J.M. Polonsky thinks that green marketing is not achieving its potential for improving the quality of life of consumers while improving the natural ecosystem. The failure is the result of the inability of consumers, firms and governments to adopt system-thinking, in which macro-marketing perspectives are integrated into respective micro-decisions. The previous ones are the anthropocentric views of the natural world *(Polonsky, 2011).*

Korean authors found that the factor of social responsibility plays an important role as a mediator in the effect of green marketing on a product or corporate reputation. Three factors of corporate image, product image and corporate reputation have a direct effect on purchase intentions, whereas social responsibility has an indirect effect on purchase intentions in the retail setting *(Ko, Hwang and Kim, 2013).*

By its nature, green marketing seeks to address the lack of fit between current marketing practices, and the ecological and social realities of the wider marketing environment *(Papadas, Avlonitis and Carrigan, 2017).*

Green marketing might be described as a process of marketing consumption, production and consumption of products and services occurred in a way that is safe for the environment. Changing focus on green marketing might seems costly in the short term, but has advantages in the long term.

Initiatives from government establish a favourable social environment for the implementation and development of green marketing efforts.

Lack of general agreement by marketers, consumers, activists, regulators and influencers has decelerated the enlargement of green products. Despite these problems, green marketing has carried on to earn followers, especially in the situation of increasing global worry about climate change. This worry has forced more companies to promote their dedication to mitigate their climate impacts.

Methods

In this section, the authors briefly explain the research methods used in collecting data in this research. The authors used the interview method to collect data by filling out a questionnaire on a sufficiently large sample of the market. As a part of the study Chelyabinsk, Russia was chosen as the survey territory.

The choice of the research area is not accidental. Green marketing is now less popular in Russia than in other countries. However, the Chelyabinsk region belongs to the territory of Russia with a particularly difficult ecological situation. Therefore, one of the research hypotheses is a greater demand from ecologically unstable territories of developing countries in the development of green marketing.

This study intends to be a signal for domestic market companies and international corporations working with and in developing countries. In this study, we define interview as the main method and the research tool is questionnaire. We chose 600 respondents for interview. The sample was determined to take into account an error of 5%. The confidence interval is 99%. The general population of the study area was economically active.

For the research, we define objects as:

1) influencing factors;
2) different consumer characteristics: level of awareness, sources of information, etc.
Hypothetical consumers know the concept of green marketing, prefer to buy eco-friendly products and can pay the extra charge for eco-friendly products.

Table 1 shows the basic sources of information about green marketing presented as answers in the questionnaire.

Table 1: Sources of information about green marketing

What sources of information do you use?	Response, %
Online media	31
Friends and family	18
Consultants	14
Offline media	15
Other	22

(Source: compiled by the authors)

It was found that 31% of people usually get information from different online media, 18% from family and friends, 14% from different consultants, 15% from offline media and 20% from other sources.

Table 2 shows the result to the point that plastic is the major pollution.

Table 2: Opinion about plastic as a major source of pollution

Rank your opinion about plastic as a major source of pollution	Response, %
Strongly agree	44
Agree	36
Neutral	8
Disagree	10
Strongly disagree	2

(Source: compiled by the authors)

In accordance with Table 2, 44% of people strongly agree with that, 36% just agree, 8% are neutral, 10% disagree, and only 2% of respondents strongly disagree.

One of the questions was directed to the determination of the possible alternatives to plastic bags.

Table 3: A most preferred alternative to plastic bags

What is the best alternative to plastic bags?	Response, %
Paper bags	57
Other natural-based materials	12
Biodegradable polymers	11
Other	20

(Source: compiled by the authors)

According to the Table 3, it was found that 57% of people prefer paper bags, 12% voted for other natural-based materials, 11% of respondents are ready to use to biodegradable polymer and 20% voted for other.

Table 4 shows the results of the willingness to pay for green packaging.

Table 4: Willingness to pay for green packaging

How much more would you be willing to pay for Green Packaging?	Response, %
Up to 5%	42
5-10%	31
Above 10%	2
No	25

(Source: compiled by the authors)

Following Table 4, 42% of respondents are ready to pay up to 5% of the cost for green packaging, 31% ready to pay 5-10%, besides 2% ready to pay above 10% of the cost and 25% don't want to pay anything for green packaging. The main problem is who should be responsible for reducing the amount of plastic usage.

Table 5: Activities in reducing plastic usage

Who should be more proactive in reducing plastic usage?	Response, %
Government	38
Non-government organizations	9
Retailers	16
FMCG manufacturers	11
Consumers	26

(Source: compiled by the authors)

\It was found that 38% people think that government should be more proactive in reducing plastic usage, 9% prefer non-government organizations to work on reducing plastic usage, 16% of respondents want retailers to work on it, 11% think FMCG manufacturer should do that and 26% want consumers to worry about plastic pollution by themselves.

Table 6: Advantages of using eco-friendly materials

What is the biggest advantage of using eco-friendly materials?	Response, %
Reduction of cost	6
Reduced resource consumption	12
Reduced pollution	40
Increased customer satisfaction	10
Reduced use of hazardous/non-degradable materials	32

(Source: compiled by the authors)

In accordance with Table 6: reduction of cost – option for 6% of respondents, reduced resource consumption - 12%, for reduced pollution 40% voted, increased customer satisfaction was mentioned only by 10% and reduced use of hazardous/non-degradable material is 32%.

The group of authors wonder is it possible for the term of green culture to become the famous trend in the 21st century?

Table 7: "Green Culture"

Will "Green Culture" become the most important trend in the 21st century marketing initiatives?	Response, %
Strongly Agree	22
Agree	20
Neutral	17
Disagree	25
Strongly Disagree	16

(Source: compiled by the authors)

It was found that 22% people strongly agree, 20% - agree, 17% are neutral, 25% disagree, and 16% choose strongly disagree point that "Green Culture" can become the most important trend in the 21st century marketing initiatives.

Table 8 shows the results for the question “Can green packaging increase products market value?”

Table 8: Green packaging can increase products market value

Can green packaging increase products market value?	Response, %
Strongly Agree	23
Agree	16
Neutral	22
Disagree	28
Strongly Disagree	12

(Source: compiled by the authors)

As we can see - 23% of people strongly agree, 16% agree, 22% are neutral, 28% disagree and 12% strongly disagree that green packaging can increase products market value.

Table 9: Awareness about green packaging

What can help with the popularization of green packaging?	Response, %
Government regulatory requirement	45
Increased media attention	33
Consumer public demand	15
Market competition	7

(Source: compiled by the authors)

37% of respondents think that government should pay more attention on regulations, 33% vote for media attention, 15% answers goes to consumer public demand and 7% hope on market competition (results are presented in Table 9).

Table 10: Challenges of green marketing

What are the challenges in implementing the concept of green marketing?	Response, %
Costs	22
Comparable quality	14
Raw material prices	16
Compatibility with existing systems of production, retail, etc.	27
Lack of standards	21

(Source: compiled by the authors)

As we can see 27% of respondents think that compatibility with existing systems of production, retail, etc. are the challenges, 22% worried about the costs, 21% of votes are for lack of standards, 16% answers go to raw material prices, and 14% are for a comparable quality.

Conclusion

There are several main results of this survey. Russian customers use different sources of information and support the idea that plastic is one of the most dangerous materials for an environment. They would prefer paper bags and would pay more for them. Respondents want the government to work more on ecological problems and think that using eco-friendly materials could reduce harm to the environment. But at the same, almost half of the respondents (40%) disagree or strongly disagree that green packaging can increase the market value of the products. Customers want the government to be responsible for popularization ideas of green marketing and think that implementing the concept of green marketing can cause a variety of different problems.

Results of the survey might be used by different organizations: government structures, retailers, producers, marketing agencies and others.

Using green marketing concept can help to increase products sales, attractiveness, company's income and image.
As noted in a similar study (*Young, Hwang, McDonald and Oates, 2009)*, for long-term and significant changes in behaviour, it is necessary to develop environmental values through education and support of green markets in the state.

Abstract

The relevance of the problem under study is due to the fact that fixed assets have an impact on the production activities of the enterprise and, as a result, on the volume of the country's GDP. The state of fixed assets of an enterprise, the quality of its products and, as a result, the profitability of its financial and economic activities, and competitive stability depend on the reproduction of fixed assets. The problem lies in the timeliness and efficiency of reproduction of the company's fixed capital. The solution to the problem depends on the competent implementation of positively influencing factors and preventing the influence of negative factors. The systematization of the factors influencing the process of reproduction of fixed assets makes it possible to build a certain model of reproduction.

For this purpose, the concept of reproduction of fixed assets is systematized, the theoretical basis of reproduction is reflected, the foundation of which is the capital of the enterprise. The study grouped the factors of both internal and external environment of the enterprise, which are important in activating the reproduction process of fixed assets. The structures, aspects of activity, which are conductors of certain factors and conditions of the reproductive process, are shown.

The practical research site is the branch enterprises of the Ural Federal District, which show the dynamics of fixed assets, their value. The features and contradictions of reproduction of fixed assets of regional enterprises, management of this reproduction are determined. Attention is drawn to the anticipation of the wear and tear of fixed assets in comparison with renovation and modernization, which leads enterprises to competitive weakness. The methodological research tools are statistical data on fixed assets of enterprises from 2013 to 2018. Data for the Ural Federal District are compared with data for the Russian Federation.

Keywords: fixed assets, reproduction of fixed assets, influencing factors, innovative approach, investment activity.

Introduction

The level of development of enterprises determines the potential of the region, its competitiveness. The development of the region is permanently accompanied by a number of serious problems, including insufficient competitiveness of manufactured products, lack of adaptation to changes in the internal and external environment, low profitability of economic entities, and their inability to cover loan obligations. The problem also manifests itself in the loading of equipment, the high cost of downtime of which ultimately reduces the financial performance of the

enterprise. Development is constrained by the lack of innovative products and technologies, not the innovative quality of infrastructure. The depreciation of fixed assets of regional enterprises is almost 50%.

Literature Review

Reproduction of fixed assets (FA) determines the condition of fixed assets in both quantitative and qualitative terms, which reflects the investment, depreciation and tax policies of the enterprise. There are a number of factors that significantly affect the effective reproduction of FA, which require systematization, which will make it possible to create a certain reproduction model on this basis *(Lytneva et al., 2017), (Khalyapin, 2018).*

Research and solutions to the problem of reproduction of fixed assets are described in the works of I. A. Gerashchenko, B. Yagshimadova, D. V. Eremeeva, I. N. Novikova, N. M. Ligay and others *(Gerashchenko, 2018)*, *(Eremeev and Novikova, 2012), (Ligai, 2019).*

The foundation of the reproduction of fixed assets is the capital of the enterprise. As a scientific concept, it is multifaceted, diverse in essence. The classics of economic theory classify capital as a factor of production and self-increasing value, the value that brings income to the owner. At its core, capital is twofold, since it has a physical nature - if it is presented in the material form of means of production, that is, materialized - and a value one, since it reflects the value of all resources available to the enterprise. The dual nature of capital includes the objective properties of fixed assets, which are expressed in their ability to function and renew, and is determined by the laws of the circulation of capital. Thus, the process of reproduction is based on these basic properties, which are specifically manifested in their depreciation during physical wear and tear and obsolescence *(Burlakova, 2018), (Gerashchenko, 2018).*

Research Methods

The process of reproduction of fixed assets of Russian enterprises has its own scientific and methodological features, which are the subject of this study. It is expedient to develop proposals for enhancing the recovery and renewal of the FA in accordance with the current development of technology and technology.

Also, this study is aimed at identifying the directions of development of the Ural Federal District (UFD) according to the state of the state fund of enterprises in the district and at determining the factors and conditions necessary for reproduction.

Based on the purpose, the object of the study is the features and contradictions of the reproduction of the production facilities of the enterprises of the region, and the subject is the management of the process of reproduction of the production facilities and the organizational and economic relations changing at the enterprise.

Methodologically, the study is based on the provisions of the science of economic theory, on the works of domestic and foreign scientists-economists dealing with the problems of using regional fixed assets and their reproduction. Also involved are legislative documents and regulatory and methodological materials on the research topic.

Results and Discussion

The rate of reproduction of fixed capital determines the quality and volume of products, which, in turn, contributes to its competitiveness, and the latter indicates the high potential of the enterprise and the worthy position of its region in the economic community. There are certain factors that, in specific economic sectors and sectors, affect the effective reproduction of fixed assets, that is, their restoration, renewal and expansion, as well as the formation of a system for their best use. This is possible when carrying out activities for the competent management of investment resources *(Carlos and Franco, 2020)*, *(Khalyapin, 2018).*

The following factors influence the reproduction of fixed assets of the Ural Federal District enterprises:

- whether the enterprise has a need for production facilities;
- composition and structure of FA;

- methods of assessment and revaluation of FA;
- depreciation rate;
- wear of the FA;
- scientific and technological progress;
- update forms;
- inflationary rates;
- investment activity of enterprises;
- availability of funding sources;
- availability and effective functioning of the legal and regulatory framework *(Budzyńska, 2018), (Burlakova, 2018), (Sokolitsyn and Ivanov, 2020), (Ligai, 2019), (Mirolyubov, 2008).*

The profit reinvested by the enterprise, as well as borrowed funds and targeted financing, are directed to the qualitative and quantitative growth of the fixed assets of economic agents *(Mandala and Sirisetti, 2019)*. The success of the functioning of an individual enterprise, a specific industry and the economy as a whole depends on the positive dynamics of such events. In case of negative results, an analysis is required at all stages, which will make it possible to understand the reasons and in the future to eliminate the negative consequences.

With the help of the official statistical reporting *(Investments in Russia, 2018), (Regions of Russia. Socio-economic indicators, 2018)*, we will reveal the dynamics of the value of fixed assets of enterprises in the Russian Federation as a whole and in the Urals Federal District separately. So, according to table 1, the cost of the fixed assets of enterprises of the Russian Federation and the regions of the Ural Federal District for six years is traced.

Table 1: Cost of fixed assets of enterprises in a comparative assessment (at full book value at the end of the year), billion rubles

Region	2013 year	2014 year	2015 year	2016 year	2017 year	2018 year	Place occupied in RF (up to 2018)
Russian Federation	121 268.9	133 521.5	147 429.7	160 725.3	183 403.7	194 649.5

(Source: Regions of Russia. Socio-economic indicators, 2018)

The data in the table show an increase in the value of fixed assets of enterprises: over six years, from the end of 2013 to the end of 2018, the value of fixed assets in the Russian Federation increased by 73,380.6 billion rubles, in the Urals Federal District - by 13,658 billion rubles. The average annual rate of growth in the value of fixed assets was 9%. This pace contradicts the pace of development of the Russian economy as a whole. Fixed assets need to be

analyzed by considering their structure, physical condition, sources and amounts of funding. Let us present the dynamics of the real growth of fixed assets (table 2).

Table 2: Dynamics of real growth of fixed assets in the Russian Federation and the Ural Federal District, 2013-2018

Index	2013 year	2014 year	2015 year	2016 year	2017 year	2018 year
Russian Federation						
Growth over the previous year,%	112.28	110.1	110.42	109.02	114.11	106.13
Growth versus base year 2013,%	–	110.1	121.57	132.54	151.24	160.51

Growth versus base year 2013,%	–	105.78	120.1	129.63	150.93	161.26
Average annual growth rate, RUB bln	2731.6					
Average annual growth rate,%	9.05					

(Source: Investments in Russia, 2018)

The picture of the FA growth is not optimistic, it has a somewhat abrupt tendency. The reason for the low growth of fixed assets is weak investment activity, which is explained by the existing problems in the macro- and microeconomics of the Russian Federation *(Khalyapin, 2018).* Further, in Table 3, we present the structure of the FA according to the areas of activity of enterprises of the Ural Federal District.

Table 3: The presence of FA at the enterprises of the Ural Federal District, different by type of economic activity, 2013-2018

Type of industry activity of enterprises	% to the total by years					
	2013	2014	2015	2016	2017	2018
Mining	42.05	40.24	39.06	37.27	41.01	37.61
Manufacturing production	10.78	9.65	10.12	10.74	7.63	6.83
Wholesale and retail trade; repair of vehicles, motorcycles, household goods and personal items	1.21	1.15	1.29	1.32	1.23	1.13
Electricity, gas and water production, distribution	6.76	6.82	6.85	6.63	6.70	6.18
Agriculture, forestry, hunting, fishing and fish farming	1.22	1.12	1.21	1.20	1.28	1.20
Building	0.97	1.01	1.30	1.14	1.28	1.25
Transport and communication	37.01	40.01	40.17	41.70	40.87	45.80
Total	100.0	100.0	100.0	100.0	100.0	100.0

(Source: Regions of Russia. Socio-economic indicators, 2018)

Table 3 shows that FA are more equipped with mining enterprises, as well as transport and communications. Manufacturing enterprises, electricity, gas and water production have a significant share. This suggests that the growth of fixed assets at the enterprises of these industries has a positive trend. But at construction enterprises, wholesale and retail trade, repair services, as well as in agricultural organizations, the volume of fixed assets is a little more than 1% of the total number of fixed assets available for years, and this number is decreasing. Behind such a situation for the country is the threat of loss of economic security, which is strange for the Russian Federation, which exports agricultural products in large volumes *(Mirolyubov, 2008).*

Consider the formatting objects according to the intensity of their input *(Khalyapin, 2018).* Table 4 shows the percentage of the introduction of FA at the enterprises of the Ural Federal District of the already named types of economic activity.

Table 4: Commissioning of the FA at the enterprises of the Ural Federal District, structured by types of economic activity, 2013–2018

Type of industry activity of enterprises	% of total fixed assets volume, by years					
	2013	2014	2015	2016	2017	2018
Mining	62.4	55.0	57.5	50.6	54.1	53.6
Manufacturing production	12.9	13.0	12.8	15.7	14.1	14.0
Wholesale and retail trade; repair of vehicles, motorcycles, household goods and personal items	1.4	1.5	1.7	3.2	1.4	1.3
Electricity, gas and water production, distribution	8.2	10.6	9.6	9.8	9.1	8.9
Agriculture, forestry, hunting, fishing and fish farming	1.7	1.5	1.9	1.8	1.9	1.7
Building	1.0	1.2	1.3	2.1	1.5	1.6
Transport and communication	12.4	17.2	15.2	16.8	17.9	18.9
Total	100.0	100.0	100.0	100.0	100.0	100.0

(Source: Investments in Russia, 2018)

These tables show the absence of a smooth growth in the commissioning of fixed assets at enterprises, regardless of their specialization. The average percentage of FA introduction is higher (55.5) – at mining enterprises; at transport and communications enterprises, it is 16.4; at manufacturing enterprises – 13.8%; at the enterprises of production and distribution of electricity, gas and water – 9.4; at enterprises of the other three sectors of the economy, the average percentage of commissioning of fixed assets is from 1.5 to 1.8. Construction enterprises show the lowest average percentage of commissioning of fixed assets – 1.5.

Next, we will reflect the assessment of the state of the FA, which is formed by the indicators of their wear. The modern manufacturability of production facilities directly affects the quality of products and production costs, which are the main factors of the competitiveness of enterprises *(Avduevskaia, Kuporov and Chepikova, 2018)*. Indicators of the degree of depreciation of fixed assets of sectoral enterprises of the Ural Federal District are shown in Table 5.

Table 5: Depreciation of fixed assets of enterprises by industry attribution in the Ural Federal District, 2013–2018

Industry relevance	%, year					
	2013	2014	2015	2016	2017	2018
Mining	63.3	61.6	61.1	61.2	59.0	56.1
Manufacturing production	49.7	48.2	47.0	44.0	43.3	39.8
Wholesale and retail trade; repair of vehicles, motorcycles, household goods and personal items	70.2	71.7	70.6	68.4	68.5	66.6
Electricity, gas and water production, distribution	39.8	37.4	40.6	40.4	44.3	46.1
Agriculture, forestry, hunting, fishing and fish farming	36.0	36.1	33.7	33.5	34.1	35.3
Building	59.0	47.1	45.6	52.9	52.6	48.9
Transport and communication	44.9	45.2	48.6	47.3	47.6	44.4
Depreciation of fixed assets on average in the Russian Federation, total	61.7	61.8	61.3	60.4	59.3	57.5

(Source: Regions of Russia. Socio-economic indicators, 2018)

The table shows that, in aggregate, the depreciation of fixed assets in the Ural Federal District annually ranges from 48 to 52%, which is on average 10% lower than in the Russian Federation as a whole. A high degree of depreciation of the processing plant in the Urals Federal District is observed in the industry of wholesale and retail trade, repair of vehicles, etc. and in the mining industry. The depreciation rate in these industries decreased by 2018, but is nevertheless high. At the enterprises of wholesale and retail trade, repairs, it is higher than in the Russian Federation as a whole.

The high degree of depreciation of the fixed assets of enterprises of all sectoral areas is explained by the fact that the bulk of the funds was acquired in the Soviet economy, that is, before 1991. This suggests that the investment activities of enterprises, especially low-profit sectors, require the involvement of the state, otherwise the economic potential of the sectoral economy will be lost *(Budzyńska, 2018)*. The weak, pitching dynamics of the reproduction of fixed assets of industrial enterprises both in the Russian Federation and in the Ural Federal District is explained by the influence of a number of negative external factors. These include *(Avduevskaia, Kuporov and Chepikova, 2018), (Hammami, 2019)*:

a) price disparity,
b) inflationary waves,
c) a small amount of investment.

Features of reproduction of fixed assets of an enterprise are as follows:

- Reproduction of FA is stimulated by the enterprise's need for them.
- Timely and effective renewal of fixed assets is possible only if there are funding sources.
- The duration of the turnover of the enterprise's fixed assets depends on the degree of their wear.
- The decision to replace (update) FA also depends on the degree of their wear.
- The size of the reproducible potential of the enterprise depends on the form of updating the FA.
- Manufacturability, quality of refurbishment of the plant depends on the stage of scientific and technological progress, on the level of innovations introduced into production.
- The regulation of the process of reproduction of the FA should be strictly based on the regulatory and legal provisions that are relevant for the current moment.
- Inflation has a negative effect on the reproduction of fixed assets, since the growth in prices for fixed assets lags behind depreciation charges; as a result of the inflationary effect, amortization accumulations are not enough to replace the retiring fixed assets *(Burlakova, 2018), (Miyazawa and Ogawa, 2019)*.

Any modern enterprise is considered as a socio-economic and ecological system, as it fulfills social, economic and environmental tasks and at the same time is under the influence of factors of the same name. These factors affect the process of reproduction of fixed assets. It is necessary to systematize the factors and conditions on which the efficiency of the process of reproduction of fixed assets depends. A factor is a reason, a driving force of a process, which determines its features or individual details. Conditions are created by the external environment of the enterprise and facilitate the execution of the event. In order for the management of the production facility reproduction to be effective, at the zero stage it is necessary to establish the factors (conditions) on which the renewal efficiency depends *(Sokolitsyn and Ivanov, 2020), (Gerashchenko, 2018).*

Analysis of literary sources on the theory and practice of reproduction of fixed assets made it possible to determine the main conditions for the implementation of this process. Two groups of factors are formed: 1) internal, created in the structures (departments, services) of the enterprise; 2) external, created in external macrostructures (bodies, departments), which are the environment of the enterprise. In the proposed classification of factors, there are control (subjective) and controlled (object) factors, as well as direct factors - directly affecting the management of the reproduction process - and indirect factors - indirectly influencing *(Miyazawa and Ogawa, 2019)*.

Controlling (subjective) factors are associated with the control system of the production facility reproduction. In the internal environment, they are formed by the management of the enterprise, in the external environment - by state authorities. Controlled (object) factors are associated with the process of reproduction of the FA as an object of control and exist only within the enterprise.

We classify the main internal (Figure 1) and external factors (Figure 2) that affect the reproduction process of the enterprise's production facility. These classifications cover all aspects of management of reproduction of the production facility, make it possible to determine the vectors of improvement.

So, internal organizational and managerial factors are manifested in the methods of making managerial decisions, production and technological - in the states of the technological equipment of the enterprise, financial and economic - in the investment policy of the enterprise, natural and ecological - in the ecology of technological equipment, etc. In the group of external territorial and industrial factors are manifested, for example, in the specifics of the industry, infrastructural - through the logistics system, legislative and regulatory - through laws in the field of the reproduction process, political - in sanctions regimes, macroeconomic - through the level of the refinancing rate, competitive - in the behavior of competitors and consumers, etc *(Lambrinoudakis, Skiadopoulos and Gkionis, 2019), (Ligai, 2019)*.

When considering all the factors and conditions of reproduction of FA, the leading role belongs to new technologies, their availability. The latest technologies determine the composition and functionality of the required equipment. In the long term, the company develops innovative products that further acquire competitiveness and commercial value.

Fig. 1: Classification of internal factors that have the power to influence reproduction fixed assets of the enterprise

(Source: Ligai, 2019)

Fig. 2: Classification of external factors that have the power to influence reproduction fixed assets of the enterprise

(Source: Ligai, 2019)

In addition to the factors that are systemic and have a positive effect on the reproduction of FA, there are factors that negatively affect and restrain reproduction processes *(Avduevskaia, Kuporov and Chepikova, 2018)*. These include:

- Expensive bank loans.
- Unstable financial condition of the enterprise.
- The working capital of the enterprise is forced to replenish at the expense of depreciation, which in the future reduces the potential for renewal of the fixed assets.
- Domestic production does not provide enterprises with the required equipment, either quantitatively or qualitatively.
- Importation of imported equipment with high customs duties.
- High level of accounts receivable.
- The company is under pressure from a high tax burden.
- Energy resources are expensive.
- Large accumulation of unsold products in warehouses.
    - Sale prices for finished products are limited *(Hammami, 2019),*(Lambrinoudakis, Skiadopoulos and Gkionis, 2019).

Conclusions

For each enterprise, for its competitiveness, the policy in the field of reproduction of fixed assets is of great importance. The qualitative and quantitative characteristics of the FA depend on the literacy of policy making.

Reproduction (updating) of fixed assets should be a continuous process, the content of which consists in the acquisition or development of new technologies, modernization and overhaul of the used fixed assets. Reproduction of production facilities is vital for an enterprise, since modern, high-quality production facilities are a basic platform for creating competitive products, goods with growing demand.

In the article, the analysis is given to the Ural Federal District, which in the Russian Federation takes the eighth place in terms of the degree of depreciation of fixed assets of enterprises. The rate of growth of private equity enterprises is the leading factor in the growth of national welfare, but it is low in the Urals Federal District. In this regard, there is a threat of loss of the overall economic security of the region. The reason for the low growth rate of fixed assets of enterprises in the region is associated with the lack of their own investment funds and with a high risk of attracting third-party investments. It is required to work out investment mechanisms both within the state, the region, and within the private sector of the economy.

The goal of market actors is to be competitive. For this to be realized, a modern enterprise must be innovative, capable of creating and mastering innovations, and have innovative potential. Taking into account such features of the enterprise, based on the analysis of the main factors and conditions, it is subsequently necessary to build a comprehensive model for managing the reproduction of fixed assets, or fixed capital. The model should take into account the influencing innovative factors, the direct process of reproduction of the production facility and the efficiency of using the production facility in the production of products and in the sphere of circulation.

It should be noted that the quality of fixed assets depends on the speed of their renewal, contributes to the efficiency of their use. The efficiency and dynamism of the FA are determined by the degree of innovation activity of the enterprise, the level and quality of innovation implementation. Modern, innovative processing plants create a high level of technical and technological equipment of the enterprise.

Abstract

The study, the results of which are presented in the paper, is aimed at studying the practice of spreading gerontomarketing in the Russian banking market. The banking services market, along with the leisure market and the medical services market, according to the authors' hypothesis, due to their significant contribution to the implementation of the strategy of active aging, have a high potential for gerontological orientation.
The article presents the results of a study of the banking services sector from the standpoint of the practice of using gerontomarketing tools: the main trends in the development of the market are outlined, leaders in the market for working with the gerontosegment are identified, the problems of using gerontomarketing in the practice of Russian banks are systematized. The research results can be used in the development strategies for both individual banks and the banking sector as a whole.

Keywords: Gerontomarketing, Banking Services Market, Market Gerontological Orientation

Introduction

In the context of demographic aging of the population, economic development cannot ignore the ever-growing role of the elderly population. Creation of conditions for a full life in old age, which corresponds to the strategy of "Active Longevity", involves the development of market segments focused on the needs of older citizens. These tasks are relevant not only for society and the government, but also for business. Attracting a segment of older consumers opens up new opportunities for business growth and development. However, in practice, dealing with older consumers is not always smooth. Interaction with consumers of the older age group requires special marketing approaches, which are scientifically reflected in the concept of gerontomarketing. Considering different consumer markets, we can conclude that the spread of the practical aspects of gerontomarketing is uneven: the potential for gerontological focus of markets varies significantly [Eppler-Hattab, 2020; Andrew Achenbaum, W.,2015; Blanchard, 2004; Butler, 1996]. We can also talk about the specificity of the practical approaches of gerontomarketing in different markets: attracting older consumers in different segments of the consumer market requires business efforts of different intensity.

In our opinion, one of the markets with a high potential for being geriatric is the banking services market. It should be noted that the Russian banking market as a whole is not yet sufficiently responsive to changes in the age structure of consumers.

The purpose of this paper is to study the specifics and practice of using gerontomarketing tools in the Russian banking market.

Methods and the Study organization

As a methodological basis for the study, we used works on the concept of gerontomarketing, the initial provisions of which were formulated by representatives of the German scientific school of marketing [Hilbert, 2000; Pott, 2004; Kaib, 2008; Nufer, 2010], as well as studies carried out by representatives of the Russian scientific school of marketing [Bagiev, 2012; Solovyova 2013; Khobotova, 2014], who, in view of the specifics of the Russian conditions, pay more attention to the problems of market formation and the practical aspects of using various gerontomarketing tools.

Also, as a methodological basis for the study, the materials of the Central Bank of the Russian Federation were used on monitoring the availability of financial products and services. Since 2015, the Central Bank of the Russian Federation has been assessing financial accessibility, including for senior citizens. The Russian Federation has developed a strategy until 2020 to increase financial accessibility. In general, some of the tasks of government policy in this area correlate with the tasks of gerontomarketing in the banking market. According to the approach of the Central Bank of the Russian Federation, financial accessibility, in addition to physical access, which is understood as the proximity of infrastructure, also includes price, assortment and mental accessibility. The specified parameters of accessibility should be taken into account when assessing the gerontological orientation of the banking market and be reflected in the strategies of gerontomarketing of banking organizations.

This study is also based on the original authors' method of marketing assessment of the gerontological orientation of consumer markets. According to the authors' approach, the level of gerontological orientation is assessed by three criteria:

- age limits of the target audience,
- taking into account the specifics of the requirements of older consumers in the development of goods and services,
- strategic focus of the company in interaction with older consumers [Astashova, 2018].

According to the methodology, the following 4 levels of gerontological orientation of organizations can be distinguished on the market:

- 0 level (ignoring),
- 1 level (neutral),
- 2 level (intuitive),
- 3 level (conscious).

Taking into account the specifics of the banking market, this methodology needs minor modification in terms of alignment with the model of financial accessibility of the Central Bank of the Russian Federation.

The research information base was formed on the basis of secondary information: analysis of official sources of the Central Bank of the Russian Federation, official websites of banking organizations, analytical reports of independent agencies. The research applied the methods of statistical data analysis, and the nonformalized desk methods of marketing research.

Results and Discussion

In recent years, the Russian banking market has seen a downward trend in the number of banking organizations, which is due to the policy of the Bank of Russia. The process of rehabilitating the banking system was implemented mainly through the mechanism of license revocation by the regulator due to poor financial condition and violations of legal requirements. The number of valid licenses was also reduced due to bank mergers, as well as voluntary refusals of credit institutions to continue their activities.

According to the INTERFAX agency, 77 banks ceased their activities in 2018 alone. If in July 2013 there were 894 banks in Russia, then by the beginning of 2019 there were 440 of them. Almost half of the banks that left the financial market over the last five years were left without licenses in 2015 and 2016 (102 and 106, respectively).

According to experts, the process of reducing the number of market participants in the coming years will continue in a milder form - approximately 5-7% of banks a year will leave the market for one reason or another. Thus, it can be expected that by 2024 there will be approximately another 100 fewer banks operating in the Russian Federation.

From the point of view of the methodology for assessing financial accessibility, infrastructure is one of the important components, while it is characterized primarily by the ability to receive financial services through physical access points. Physical access is also very important for older consumers who find it difficult to switch to remote service systems.

It should be noted that banking organizations on the territory of the Russian Federation are located unevenly (Fig. 1).

Fig. 1: The number of operating credit institutions, separate and internal structural divisions of operating credit institutions (branches) in the territorial context, as of 01.07.2019 and 01.07.2020 (Compiled by the authors based on the official statistics of the Bank of Russia: http://www.cbr.ru/statistics/bank_sector/lic/)

Per 1 million people of the adult population, most of units of operating credit institutions are in the Far Eastern Federal District (307), the least in the North Caucasian Federal District (115), where the value of the indicator was more than two times lagging behind the national average (268). The smallest number of units of operating credit institutions per 100 thousand km2 falls on two federal districts – the Far Eastern Federal District and the Siberian Federal District (28 and 86, respectively). The highest density of units of operating credit institutions is in the Central Federal District (1274), where the average Russian value was exceeded by more than 6 times (183).

Thus, in the Russian Federation there is a problem of the availability of banking services in remote, sparsely populated or hard-to-reach areas, which is taken into account in the strategy for increasing financial accessibility until 2020. It is important to note that the development of digital products and services (remote banking, e-money transfer services), as well as the development of digital channels for customer service (such as mobile access) are identified as measures to solve this problem, which, while increasing accessibility, also contributes to reducing products and services costs. Nevertheless, taking into account the prospects for the development of digital technologies, it should be noted that when working with elderly clients, banks need to make additional efforts to educate them.

When assessing the level of gerontological orientation of banks, in particular when assessing the criterion “age limits of the target audience”, the following feature of the banking services market was revealed: when providing lending services, all market participants set the upper age limit for access to the service, which on average in the

market is set at a level of 65 to 70 years at the time of loan repayment. From the point of view of gerontomarketing, limiting clients' access to services based on age is buying ageism and indicates a zero level of gerontological focus of the company. Nevertheless, in the consumer lending market, the bank's gerontological focus is more characterized by the upper limit of age restriction. While small banks set the service access limit at 60 years, the market leaders significantly expand the opportunities for older clients (at the time of the survey, the upper limit for Sovcombank clients was set at 85 years). Thus, when assessing a bank's gerontological orientation, it is advisable to separate the gerontological orientation in the deposit market and the lending market, since the same bank can offer special conditions for pension deposits, but at the same time significantly limit the access of older clients to lending. The analysis of the criterion "taking into account the specifics of the requirements of older consumers in the development of goods and services" showed that there is a wide range of forms of gerontological orientation of banking products on the Russian banking market. From the point of view of financial accessibility, the offers of banks for elderly clients can be attributed to both price, assortment, and mental accessibility, as shown in Table 1.

Table 1: Taking into account the requirements of elder consumers in the Russian market of banking services

Components of financial accessibility according to the methodology of the Bank of the Russian Federation	Examples of products and services with high gerontological orientation in the Russian banking market
Price accessibility	Increased rate on deposits for pensioners (from 0.1 to 3.4%) Decrease in interest rates on loans (0.1%)
Assortment accessibility	Pension debit cards Special deposits for retirees Special loans for retirees Special complex programs: Free round-the-clock service "LINE OF CARE" for elderly clients (Post Bank) PRIVILEGE OF TIME program (Rosbank) Respectful program (FC Otkritie) Bonus program "Heat", Service "Good health" (Eastern Express Bank)
Mental accessibility	Financial literacy events (lectures, seminars, master classes, etc.), information and educational campaigns: the "Older Generation" project, the website Active Age (АктивныйВозраст.рф), the webinar "The budget of a modern pensioner. Financial literacy" (Sberbank) Joint target program with the Pension Fund of Russia for the training of pensioners (Post Bank)

(Source: compiled by the authors)

When assessing the strategic actions of banks in relation to interaction with older consumers, criteria such as the presence of a special section on the bank's website, the focus of advertising messages, and the presence of publications in the media were considered.

Taking into account the above, we conducted a study to assess the level of gerontological orientation of banking organizations, the results of which are presented in Fig. 2.

Fig. 2: Results of assessing the level of gerontological orientation of banks in the Russian market
(Source: compiled by the authors)

As can be seen from the data in Fig. 2, the gerontological orientation of banks in the lending services market is much lower, which, as already mentioned above, is due to the presence of age restrictions on access to services. Almost a third of banks significantly limit the age of borrowers at the level of 60-65 years at the time of loan repayment, which made it possible to assess their level of gerontological orientation as zero. This is undoubtedly a significant problem and limits the possibilities of using gerontomarketing in the market. However, it is important to note the trend towards a gradual decrease in age restrictions that market leaders are demonstrating.

Conclusions

Thus, the results of the study allow us to conclude that Russian banks in general quite actively use gerontomarketing tools, many banks have introduced measures to increase the assortment and price availability of banking services for elderly consumers, and there is a fairly high level of gerontological orientation of banks in the deposit market. Against the background of positive trends, one can single out the most acute problems limiting the effectiveness of gerontomarecking: a low level of gerontological orientation of banks in the lending services market, due to the practice of age restrictions, a limited range of measures to increase the mental accessibility of banking services, which is especially acute against the background of the development of digital banking services.

Abstract

The shocks in the economies of developing countries in recent years associated with the impact of the global crisis of 2008-2009, internal macro-economic situations, and in the Russian Federation of sanctions and anti-sanctions in 2013-2014, cause increased attention to the stability and shock resistance of the economies of countries and regions. The article presents one of the methods for assessing the known fact of memory about shocks, violations, crises, which is considered as a property of unique adaptability to force majeure situations that stimulate the aggregation of reserves of stability and resistance of the economy to destructive factors. On the example of the monospecialized regions of the Russian Federation of the same type in the main industry, depending on the world market conditions, an assessment of the presence of the hysteresis phenomenon was carried out. The differences between the two crisis periods of 2007-2008 and 2013-2014 are detailed from the standpoint of the duration and speed of phase processes (decline, recovery, and growth), the depth of the fall, the variability of parameters in terms of the "index of industrial production". The identification and assessment of hysteresis allows us to expand our understanding of the adaptability of the economy of the Russian Federation and supporting regions, to focus on the uniqueness of development paths, comparative advantages of economic efficiency and the specifics of structural reactions.

The article provides an overview of approaches to the analysis and assessment of region resilience and the peculiarities of its implementation in developing countries, to which the Russian Federation be-longs. The author's approach to the assessment is presented on the example of four regions of Russia. The study was carried out on the example of regions with similar sectoral structure as the most significant factor influencing impact resistance to crises and shocks.

Keywords: Resilience, Impact Resistance, Economic Hysteresis, Regional Economic Development, Regional Reactions to Shock.

Introduction

The problems of regional resilience ensuring are formulated by the UN as a universal course for developed and developing countries in connection with the formation of a global economic space, different shock impulses that destabilize the world economy, increasing connectedness in the financial and monetary sphere and the intercountry

Cite this Article as: Irina DANILOVA, Irina SAVELYEVA, Natalya PRAVDINA and Aleksandr REZEPIN "Regional Response to Crisis Situations: Identification of Hysteresis Processes" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

movement of factors, goods, services. In our opinion, the concept of region resilience has different shades, is often replaced by terms that are close in meaning, depending on the specific task of the researchers.

The economies of developed countries have a strong mechanism of market self-regulation and institutional security. In this context, the risk of economic destruction or serious shocks is minimal. The object of the research is the problem of increasing the economy resilience as the ability to preserve the existing development model in the long term based on strengthening the infrastructure framework, reducing the frictions of the market mechanism and neutralizing external effects induced by shocks (including in the social and environmental spheres).

Literature Review

The term resilience is imported from engineering and environmental sciences to economics *(Fröhlich and Hassink, 2018)*. The meaning of the term is concretized depending on the subject areas of analysis (ecology and urban studies; economic development and crisis management; engineering), and the approaches differ accordingly. So, R. Martin *(Martin, 2011)* identifies three fundamental characteristics of resilience: the ability of the system to return to an equilibrium state after a shock; ability to resist shock; ability to adapt after shock. In terms of the economy of regions with high heterogeneity, regional resilience is interpreted as the ability of the economic system to withstand external and internal economic shocks and mitigate their consequences *(Korobitsin, 2016)*. Resilience presupposes not only higher adaptability, but also “institutionally coordinated”, “intersectoral” and “multiscalar” adaptation, contributing to regional structural changes *(Hu and Hassink, 2017)*.

For countries with a young history and an insufficiently strong system of the market mechanism (from the standpoint of scale, socio-economic efficiency, institutional support, etc.), operating in a regime of permanent instability, the analysis of the derived characteristics of resilience is of greatest relevance - this is "shock resistance" and "elasticity". Resilience is often described as “elasticity”, “endurance”, “vitality”, as well as “stress resistance”, which, according to A. Romanova *(Romanova, 2017)*, is the ability to recover from an adverse event. In general, the shock resistance of the economy lies in the presence of properties that exclude limit significant damage and destructive consequences.

Close to resilience, the term "elasticity" is defined as the ability to return, restorability to the initial parameters when the destabilizing factor is removed, that is, in this case, attention is focused on the return process in response to a shock impulse. At the same time, if impact resistance does not necessarily imply a return to the original trend line; then elasticity is a return to the original parameters, the ability to consolidate the current situation. E. Hill *(Hill and Clair, 2011)* draws attention to the quantitative criterion of elasticity, namely: if in a year the growth rate of the economy's output differs by more than 2% compared with the average annual in the previous period, it is not elastic. The applied aspect of the analysis of the shock resistance and vulnerability of the regions of the Russian Federation is:

a) in determining the current intensity of the reaction of regions, their vulnerability,
b) in measuring and systematizing factors that affect the degree of shock resistance and elasticity,
c) in the development of a mechanism for "internalization" (mobilization) of internal forces of the economy to exclude long-term stagnation.

Note that Vulnerability is interpreted as a characteristic of potential negative consequences of a shock (economic, natural, technogenic, etc.) *(Modica, Reggiani and Nijkamp, 2018).*

The study of post-shock reactions regardless of the nuances of meaning (elasticity, receptivity, impact resistance) involves the analysis of the following problems:

1. characterization of the specifics of phase changes;
2. allocation of factors that reduce adverse effects;
3. determination of the reasons for the heterogeneous reaction for a comparative assessment of the advantages of individual territories.

1. The specificity of phase transitions is highlighted in the works of R. Martin *(Martin, Sunley and Tyler, 2015)*, as the presence of four qualitatively different stages: resistance to shock (the level of sensitivity or intensity of the

reaction of the regional economy to the recession); recovery (the speed and intensity of the recovery of the regional economy after the recession); reorientation (the degree of reorientation and adaptation of the regional economy in response to the shock); renewal (the degree of renewal of the growth path of the regional economy, return to the previous path, or a hysteresis shift to a new path).

2. Among the factors that increase resilience to shocks are the following:

1) the scale of the economy and the effectiveness of built-in stabilizers,
2) the level of trade openness and export specialization;
3) the level of industrialism, diversification, vertical and horizontal connectivity of industries;
4) investment in knowledge and human capital,
5) innovation,
6) growth rates preceding the impact (initial state);
7) the business sector and management models, the degree of urbanization;
8) institutional support.

These factors ensure the strength and speed of economic recovery and adaptation; diversification due to different synchronicity of reaction to shock, the risk of significant consequences *(Martin, Sunley and Tyler, 2015), (Cainelli, Ganau and Modica, 2018), (Hill and Clair, 2011), (Brakman, Garretsen and van Marrewijk, 2015)*.

3. Different economic systems react differently to shocks; there is an asymmetry of their influence in the territorial aspect *(Modica, Reggiani and Nijkamp, 2018)*. In this aspect, it is essential to study the processes of hysteresis of the economy and regions.

Hysteresis is a reaction to shocks, disturbances, crises, which is determined both by the initial state of the system (resources, production processes, results), and by the specifics of the previous development *(Simmie and Martin, 2010)*. This is manifested: a) in the differences in phases in the path of overcoming the crisis of homogeneous regions; b) a variety of structural shifts and patterns of trend lines for regions of the same type in response to shocks and crises, c) differences in the degree of stability and a variety of economic consequences. The practical significance of the assessment of hysteresis lies in the fact that the identification of differences in territories makes it possible to adjust adequate support of both a preventive nature and anti-crisis measures. Thus, the use of the regional hysteresis index (RHI) is used to analyse the territories in the distribution of funds in order to balance the reduction of the differentiation of socio-economic development *(Botzoris and Koudoumakis, 2013)*. The final RHI index is calculated on the basis of group indices from 71 indicators; a hysteresis index value of more than 100 corresponds to a high level, respectively, a high need for funds.

To identify the processes of hysteresis, it is important:

1) determination of indicators of its manifestations (amplitude, time period of decline, recovery, growth, rate of each stage) *(Korobitsin, 2016), (Brakman, Garretsen and van Marrewijk, 2015)*, the scale and depth of shock, the number of stages of short-term decreases over the intercrisis period;
2) determination of the availability of adaptive abilities to shocks, based on "local reactions to economic shocks between different crises" *(Martin, Sunley and Tyler, 2015);*
3) (Korobitsin, 2016) determination of the presence or absence of a break in the development trend, that is, the determination of the path by the previous development; 4) identification of factors that deter-mine territorial diversity.

The effects of hysteresis, from the point of view of the authors, are of scientific interest, since they provide information on the susceptibility of the regional economy to shocks; allow assessing the stabilization potential and risks during the period of unfavourable shocks (size of the territory, quality of human potential, transport distance, specificity of the industry structure, etc. *(Angeon and Bates, 2014)*).

Theory and Methods

Regional policy to reduce susceptibility is focused on the ability to predict economic factors resistant to shock, to adequately assess the adaptive capacity of the economy for recovery, knowledge of the degree of elasticity and threshold indicators of vulnerability.

The toolkit for assessing resilience, impact resistance is diverse:

a) the system of private indicators of changes in social, economic, environmental parameters (methodology of the UN Commission on Sustainable Development, World Bank Development Indicators and others) *(Korchagina, 2012)*;
b) an assessment of qualitative indicators such as a measure of resilience and the time it took to recover to the pre-crisis level *(Korobitsin, 2016)*;
c) calculation of the NVRI (Net Vulnerability Resilience Index) *(Angeon and Bates, 2014)*;
d) assessment of the relationship between resilience and its determining factors based on the construction and assessment of regression models *(Cainelli, Ganau and Modica, 2018), (Brakman, Garretsen and van Marrewijk, 2015).*
At the stage of preliminary analysis of the problem and determination of the presence of hysteresis processes in the regions of the Russian Federation, it is logical to assess the current situation in the past, as the accumulated result of the modern reaction to shock.
The methodological tools of the authors included the following stages:
1) determination of the stability of industrial production trends in regions and the presence of a long-term memory effect, when subsequent values are highly dependent on the previous values, which is implemented based on the application of fractal data analysis for the period 2000-2019;
2) detailing the process of reaction to shock: identifying differences in the amplitude, duration, speed, depth of decrease / recovery / growth of economic indicators during the crisis events in the Russian Federation in 2007-2008 and 2013-2014 on the example of regions of the same type (monospecialized with high export dependence). The depth of the fall was defined as the percentage of industrial production decline in comparison with the value on the eve of the decline stage, taken as 100%; under the speed of decline and the rate of rise, the average value of the decline / growth of industrial production is taken as a percentage per month compared to the value of industrial production on the eve of the stage of decline / growth, taken as 100%. The criteria for differentiation when analysing the response to crises are defined as follows: decline - negative growth, recovery - reaching the value of industrial production before the stage of decline, growth - exceeding the indicator in comparison with the pre-crisis value;
3) calculation of differences in variability and ordering of processes in the analysed regions in the context of crisis periods, as an extension of information about the processes of evolutionary adaptability to shock situations of the relative index of entropy and coefficient of variation. In our case, entropy measures the disorder of the change in parameters, indirectly testifies to the spontaneity of processes in the economy, including crisis and post-crisis adaptation. To compare regional reactions, the relative entropy index *(Fedorova, 2016)* was used:

$$E = \frac{1}{n}\sum_{i=1}^{n} \ln \frac{1}{Y_i}, \qquad (1)$$

where Yi is the seasonally adjusted industrial production index for the i-th period.

To assess the variability of the variation series of data in the context of two crisis periods, the variation coefficient was used.

Assessment of the dynamic characteristics of the system assumes the presence of a significant number of observations and a long time series of the studied indicators, which justifies the use of monthly statistics. However, most socio-economic indicators contain a pronounced seasonal component, reflecting the regular changes in its values throughout the year. To exclude the seasonal component of the time series, it is proposed to use the Hodrick-Prescott filter *(Hodrick and Prescott, 1997)*, which allows to decompose the dynamics of socio-economic indicators into a trend and deviations from it (in logarithms):

$$y_t = y_t^g + y_t^c, \qquad (2)$$

Where y_t – actual value of the indicator;
y_t^g – the trend value defined by the filter;
y_t^c – deviation from trend value.

The task of the filter is to minimize the sum of the squares of the deviations under the restriction that the sum of the squares of fluctuations in the growth rates from period to period will not be very large, i.e. the trend is quite smooth. This problem is formulated as follows:

$$\min \sum_{t=0}^{\infty}(y_t^c)^2 + \lambda \sum_{t=0}^{\infty}\left[\left(y_{t+1}^g - y_t^g\right) - \left(y_t^g - y_{t-1}^g\right)\right]^2, \quad (3)$$

where λ – equalization coefficient; the higher λ, the closer the trend is to linear.

For the initial assessment of the stability of the dynamics of regional development as a whole, the identification of the random and fractal nature of the time series of development parameters, as well as the formation of a conclusion about the presence of a long-term memory of the development of economic processes, the use of fractal analysis is justified. The Rescaled Range method (RS analysis) was first proposed by H. Hurst and developed in the works of E.E. Peters *(Peters, 2009)*, B. Mandelbrot *(Mandelbrot and Hudson, 2008)*.

The stages of RS analysis implemented in the article:

1. The logarithmic ratios of the values of the original series S_t are calculated:

$$N_t = \ln \frac{S_t}{S_{t-1}}. \quad (4)$$

2. The series *N* is divided into *A* contiguous periods of length *n*, where *n* is the smallest proper divisor of *N*, not less than 10. Let's designate each period as I_a, where $a = 1, 2, \dots, A$. Let's determine for each I_a the average value:

$$E(I_a) = \frac{1}{n}\sum_{k=1}^{n} N_{k,a}. \quad (5)$$

3. The accumulated deviations of the logarithmic ratios from the mean for each period I_a are calculated:

$$X_{k,a} = \sum_{i=1}^{k}\left(N_{i,a} - E(I_a)\right). \quad (6)$$

4. The normalized ranges within each period are determined:

$$R_{I_a} = \max\left(X_{k,a}\right) - \min\left(X_{k,a}\right). \quad (7)$$

5. Standard deviations for each period $I_a$are calculated:

$$S_{I_a} = \sqrt{\frac{1}{n}\sum_{k=1}^{n}\left(N_{k,a} - E(I_a)\right)^2}. \quad (8)$$

6. For each period, the ratio of the normalized range to the standard deviation is found and the average value for periods of length n:

$$\frac{R}{S(n)} = \frac{\sum_{a=1}^{A}\frac{R}{S(A)}}{A}. \quad (9)$$

7. Steps 2–6 are repeated for large values of *n* until $n \leq N/2$.
8. A graph of the dependence of $\log(R/S(n))$ from $\log(n)$ is plotted and using the method of least squares regression is found in the form $\log(R/S(n)) = H \cdot \log(R/S(n)) + c$, where *H* is the Hurst exponent.

Further, the results obtained are checked for significance. For this, the hypothesis that the analysed structure is normally distributed is tested. R/S are random variables, normally distributed, then we can assume that H is also normally distributed. The asymptotic limit for an independent process is the Hurst exponent equal to 0.5.

The value of the Hurst exponent can be interpreted as follows:

$0 < H < 0{,}5$ is an antipersistent time series, that is, a series in which the so-called "return to the mean" occurs: if the system grows in a certain period, then a decline should be expected in the next period. The system changes faster than random, it is characterized by frequent, but small changes. The time series is a fractal with a negative reaction.

$H = 0{,}5$ - the time series is stochastic.

$0{,}5 < H < 1$ - persistent time series, characterized by the stability of trends and the effect of long-term memory: subsequent indicators strongly depend on the previous values. Time series is a fractal with a positive reaction.
With a small number of observations N, the Hurst exponent tends to evaluate them as persistent (having trends) even on random series. A.A. Enis and E.G. Lloyd *(Anis and Lloyd, 1976)*, E.E. Peters *(Peters, 2009)* suggested using the following expected indicators R/S:

$$E(R/S) = (n \cdot \pi/2)^{-0{,}5} \times \sum_{r=1}^{n-1} \sqrt{(n-r)/r}, \quad (10)$$

where n – number of observations, r – whole numbers from 1 to $n-1$.
For $n < 20$ the following formula is used:

$$E(R/S) = (n-0{,}5)/n \times (n \cdot \pi/2)^{-0{,}5} \times \sum_{r=1}^{n-1} \sqrt{(n-r)/r}\ . \quad (11)$$

The significance of the obtained Hurst exponent is checked by assessing the number of variances by which H differs from $E(H)$. The expected variance will be as follows: $D(H) = 1/N$, where N is the number of observations in the sample. Sample statistics:

$$Z = \frac{|E(H)-H|}{D(H)}. \quad (12)$$

The result is considered significant if $Z > 2$. Otherwise, the hypothesis about the normal distribution of the system is not rejected; the structure is random and has a normal distribution law.

Results

Approbation of the proposed approaches and conclusions on the resilient development of the regions of the Russian Federation were carried out on the example of four monospecialized territorial areas (Chelyabinsk, Lipetsk and Vologda regions, Krasnoyarsk Territory), which have a similar sectoral structure with specialization in the manufacturing industry of the metallurgical profile, the same type of dependence of exports on the world market of ferrous metals. The information base of the research was made up of statistical data and reference materials of the Federal State Statistics Service, statistical collections “Regions of Russia. Socio-economic indicators” and the Unified Interdepartmental Information and Statistical System (EMISS) *(Russia regions. Social and economic indicators, n.d.), (Unified Interdepartmental Information and Statistical System (EMISS), n.d.).*

The basic indicator for assessing the trend and the manifestation of the reaction to shock is the production index (operational data) for the collective qualification group of types of economic activity "Industry" (large, medium and small organizations) during 2000-2019 due to the specifics of official statistics and the availability of regular data. The value 100 corresponds to the volume of industrial production in January 2000. To exclude the seasonal component and equalize the influence of random factors, the time series was levelled using the Hodrick-Prescott filter method (the value of the equalization coefficient $\lambda = 100$).

The dynamics of industrial production (a fragment for the example of two regions is shown in Figs. 1 and 2) allows us to see the differences in the pattern of the trend of shock and post-shock reactions in the Lipetsk and Vologda regions. Attention is drawn to the similarity of the reaction in 2007-2008 (significant decline) and a very different response to the crisis of 2013-2014: the upward growth of the Vologda region and the emergence of a kind of "plateau" in the Lipetsk region.

Fig. 1: Dynamics of industrial production in the Lipetsk region

(Source: compiled by the authors)

Fig. 2: Dynamics of industrial production in the Vologda region

(Source: compiled by the authors)

The results of a fractal analysis of the seasonally adjusted industrial production index for the period 2000–2019 are presented in Table 1. The Hurst exponent for all regions exceeds the asymptotic limit equal to 0.5 and the expected value of the indicator, determined based on the sample length, is 0.6261, which indicates the persistent nature of the time series. According to the results of the significance test, the Hurst indices for all regions are significant; the hypothesis of the normal distribution of the system is refuted.

Table 1: Results of fractal analysis of the dynamics of industrial production

Region	Hurst exponent H	Time series characteristic	The expected value of the Hurst exponent $E(R/S)$	Sample statistics Z	Significance
Russian Federation	0,8875	Persistent	0,6261	62,7	significant
Krasnoyarsk Territory	0,8952	Persistent		64,6	significant
Vologda region	0,8175	Persistent		45,9	significant
Lipetsk region	0,9309	Persistent		73,2	significant
Chelyabinsk region	0,8227	Persistent		47,2	significant

(Source: compiled by the authors)

The data show the stability of industrial production trends and the presence of the effect of long-term memory, when subsequent values are highly dependent on the previous ones. It should be borne in mind that persistent systems are able to maintain the previous state both in the case of the influence of factors that inhibit development, and in the case of the influence of accelerating factors. In the analysed sample of regions, the highest persistence value is observed in the Lipetsk region, the lowest - in the Vologda region.

At the same time, a detailed analysis of the passage of crises and post-crisis recovery showed a rather high variability of the situation in the context of the phases of the passage of shock processes. In Fig. 3 there is a diagram that allows visualizing the periods, frequency and duration of the processes of de-cline and recovery in the analysed regions.

-	- period of decline in industrial production
+	- period of recovery in industrial production
+	- period of industry production growth

Fig. 3: Comparative colour-graphic diagram of industrial production dynamics
(Source: compiled by the authors)

Obvious is a fairly synchronous entry into the crisis of 2008-2009 and absolute asynchrony and a high frequency of periods of slowdown in growth rates at the stage of the second crisis and post-crisis processes in 2013-2014. This makes us talk about the presence of its own unique background for each region, specific adaptability, and unrepeatable processes of change that provoked the first stage and influenced the absolute diversity of the pattern of the second crisis. It is noteworthy that the number of reduction stages reached a maximum of 2 in the first, and 5 in the second period in the group of analysed regions.

Depths of fall, speed of decline and ascent, as well as spread in months are shown in Fig. 4.

Fig. 4: Summary characteristics of the dynamics of industrial production

(Source: compiled by the authors)

To detail the situation, the periods are analysed separately. To determine the phase characteristics, the parameters of the duration, speed and depth of the crisis fall are highlighted (Table 2).

Table 2: Characteristics of the dynamics of industrial production in 2008–2012 (Period I)

Region	Number of decline stages	Total duration of stages, month */rank**					Period of recovery and growth	The total value of the decline in production, %	Average chronological speed, %	
		decline	rank	recovery	growth	rank			decline	recovery
Chelyabinsk region	2	18 (30%)	3	26 (43%)	16 (27%)	2	42	18,0	1,00	0,84
Lipetsk region	1	15 (25%)	2	33 (55%)	12 (20%)	4	45	24,5	1,63	1,00
Vologda region	2	19 (32%)	4	26 (43%)	15 (25%)	3	41	22,8	1,20	1,13
Krasnoyarsk territory	1	8 (13%)	1	5 (8%)	47 (78%)	1	52	4,5	0,57	1,19

(Source: compiled by the authors)
** The proportion of the period in each stage is shown in brackets.*
*** Rank 1 – the best indicators. 4 – the worst.*
Light grey shading is the best and dark grey is the worst.

Attention is drawn to the presence of two regions with the most unfavourable indicators: the Vologda region and the Lipetsk region. If we evaluate the total value of the decline in production as the main feature, then a drop by 20 to 25% is a serious test for the economy, with the highest rate of decline. At the same time, the stability of all regions forces us to pay attention to the factors of these regions, which make it possible to "take the blow" of the shock. Comparison with the period 2013–2019 allows us to see changes in the adaptation of the regional economy (Table 3).

Table 3: Characteristics of the dynamics of industrial production in 2013–2019 (Period II)

Region	Number of reduction stages	Total duration of stages, month */rank**					Period of recovery and growth	The total value of the decline in production, %	Average chronological speed, %	
		decline	rank	recovery	growth	decline			decline	recovery
Chelyabinsk region	3	26 (31%)	3	13 (15%)	43 (51%)	2	56	3,5	0,13	0,37
Lipetsk region	4	25 (30%)	2	19 (22%)	40 (48%)	3	59	12,4	0,50	0,61
Vologda region	1	6 (7%)	1	3 (4%)	75 (89%)	1	78	0,4	0,06	0,15
Krasnoyarsk territory	5	29 (35%)	4	25 (30%)	30 (35%)	4	55	5,3	0,18	0,23

(Source: compiled by the authors)

* The proportion of the period in each stage is shown in brackets.
** Rank 1 – the best indicators. 4 – the worst.
Light grey shading is the best and dark grey is the worst.

The unequal value of periods I and II is obvious, both in the duration of the recovery and growth phases, and in the depth of fall and the speed of passing the stages:

1) in all analysed regions, the rate of decline is greater in the first period, and the rate of recovery - in the second, which may be due to the fact that economists consider the first crisis to be deeper due to the scale of coverage of industries;

2) it is obvious that in each period there are regions (in I - Krasnoyarsk Territory and in II Vologda and Lipetsk regions) with a maximum period of recovery and growth, a minimum rate of decline and a maximum rate of recovery. At the same time, the Lipetsk region again has a greater depth of fall (2 times less than in the previous period), while in the Vologda region the crisis decline is close to zero, the Krasnoyarsk Territory remained practically at the same level, and the Chelyabinsk region decreased by 6 times. This makes us talk about the special stability of the region's economy to such successive crisis strikes, which is confirmed by calculations of the persistence indicator: the Lipetsk region has the highest. The depth of the fall, in the opinion of the authors, is associated either with the slowness of the formation of adaptive prerequisites in the economy, or with active transformational changes (which is confirmed by the leadership of the region in most innovative projects; it is known that reforms reduce the speed of other economic processes). As a hypothesis about the reasons for the unfavourable situation in the Krasnoyarsk Territory from the standpoint of the passage of the 2013-2014 crises it is possible to make an assumption about the presence of sectoral changes in the first period, which worsened all indicators, and in the second period. At the same time, the profound impact on the Lipetsk region in terms of the depth of the fall and the rate of dumping of production volumes, on the contrary, makes us assume the stability of processes in the economy and its structure.

3) Some regions are actively transforming, which may be evidenced by an increase in the frequency of short-term discharges, or vice versa - there is an internal adaptation of the economy. Of course, the nature of shocks is different, but since all regions are of the same profile and mono-specialization, when comparing the phase characteristics of crises, a rather similar reaction (in frequency, depth and speed) was observed. In the first crisis period, the recovery stage is longer than growth (with the exception of the Krasnoyarsk Territory), and in the second, growth is noticeably longer, again this indicates a certain adaptive function. The total value of the depth of the fall in the second stage is much less than the first, but the duration (the total amount of short-term discharges) is longer.

To understand the variability and orderliness of economic processes in the context of the analysed crisis and post-crisis stages, an assessment of the indicators of entropy and variation was carried out.

Table 4: Entropy and Variation in Industrial Production Index with Seasonality

Region	Relative index of entropy for the period 2008-2012	Relative index of entropy for the period 2013-2019	Variation coefficient for the period 2008-2012	Variation coefficient for the period 2013-2019
Chelyabinsk region	-721,08	-1045,72	7,47	11,30
Lipetsk region	-932,61	-1425,86	10,83	3,64
Vologda region	-567,38	-795,97	8,89	7,76
Krasnoyarsk territory	-740,67	-1032,29	13,50	3,47

(Source: compiled by the authors)

The entropy index in the second period of the crisis increased significantly, which hypothetically may show, other things being equal, on the one hand, the activation of internal processes to strengthen adaptive functions, the activity of innovative changes, structural restructuring and processes of diversification or strengthening of specialization. On the other hand, there is a higher disorder, which is confirmed by frequent drops in production rates. To strengthen the argumentation, Table 5 shows indicators of changes in economic efficiency for 2000 – 2019*.

Fig. 5: Coefficients of relative entropy and variation in the context of crisis periods for monospecialized regions of the Russian Federation

(Source: compiled by the authors)

Table 5: Changes in the economic parameters of mono-specialized regions in the context of crisis processes and post-crisis reactions

Parameters/ regions		Period I						Period II				
		2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017

(Source: compiled by the authors Calculated by the authors according to the data of the Federal State Statistics Service (Regions of Russia. Socio-economic indicators) - URL: https://www.gks.ru/folder/210/document/13204).*

The minimum indicators of the variation series are highlighted with dark grey.

Highlighted with dark grey shading shows the lowest values of indicators, with light grey shading - the maximum of the pre-crisis 2007, which was not achieved in a number of regions and indicators in the subsequent 2017. Many low values of indicators are localized in 2009-2010, which relate to the second and third years of the crisis. At the same time, the second period is characterized by a fairly quick reaction already in 2013 and a synchronous transition to a phase of decline: indicators of return on investment and return on assets (compared to 2012). One gets the impression that the first crisis gave impulse to innovations, which in 2013 reached their maximum indicators in all regions. Note that both the first and second crisis situations caused a sharp increase in diversification in the regions, Herfindahl-Hirschman Index reached a minimum in 2009; the subsequent increase in concentration was again interrupted by the second crisis situation.

Conclusion

Thus, the analysis made it possible to confirm the presence of hysteresis processes in the economy of open monospecialized regions, their different impact resistance to crisis processes, the presence of unique economic advantages of adaptation to shock situations and the originality of phase reactions. Resistance to shocks is manifested in: 1) speed of return; 2) the scale and depth of the socio-economic consequences of the shock; 3) the presence of factors capable of reorganization and modernization (often associated with a change in the economic efficiency of a business, including investments, assets, diversification of the industry structure, activity of innovative industries); 4) budgetary resources and program measures of regional authorities to adapt to shock

events. Analysis of regional shock resistance allows anticipating, preparing and reducing the costs of recovery, form individual development path.

Abstract

The article deals with the analytical methods for performance evaluation of regional transport and logistics systems of trucking. To evaluate the functioning of regional transport and logistics systems, 4 groups of key indicators are applied: 1. Geopolitical indicators 2. Economic indicators 3. Infrastructure indicators 4. Logistic indicators. These methods provide an integral evaluation (rating) for each group of indicators on the basis of individual indicators. The mathematical methods of the fuzzy set theory are proposed for the integral evaluation of the transport and logistics systems performance. These methods provide adequate evaluation of heterogeneous information about the condition of transport and logistics systems. The analytical methods make it possible to obtain a comparative performance evaluation of various transport and logistics systems.

Keywords: Logistics, Regional Transport and Logistics Systems, Trucking, Key Performance Indicators Groups, Performance Evaluation Methods, Fuzzy Sets Theory.

Introduction

Nowadays, generally accepted approaches to performance evaluation of regional transport and logistics systems of trucking have not been developed in logistics. There is currently no ready-made set of groups of key logistics performance indicators and their corresponding criteria (indicators) suitable for performance evaluation of regional transport and logistics systems of trucking.

As a result, no consistent conceptual approaches to performance evaluation of transport and logistics systems, including regional transport and logistics systems of trucking (RTLS) have been developed yet. The problems of performance evaluation of transport and logistics systems on the basis of integral rather than particular criteria cannot be considered solved either. The development of such methods (algorithm) can become not only a measure for performance evaluation in logistics, but also an effective tool for the development of transport systems, a guideline in choosing the directions for their improvement.

Finding of The Main Groups of Key Indicators for Performance Evaluation of Regional Transport and Logistics Systems of Trucking

Based on the analysis of previous research works the authors propose to evaluate the performance of RTLS functioning of trucking with a set of the following groups of key indicators.1. Geopolitical indicators 2. Economic indicators 3. Infrastructure indicators 4. Logistic indicators

1. Geopolitical indicators
The geopolitical indicators of the region's highways are to be estimated by the TE1 indicator, which takes into account the importance of highways and their financing conditions.

$$\mathrm{TE1} = \sum(L_{EHW} + L_{FHW})/\sum L_{THW}, \quad (1)$$

where L_{EHW} – length of European routes highways; L_{FYW} – length of federal highways; $\sum L_{THW}$ – total length of regional highways.
The category of highways is to be evaluated by the indicator TE 2. TE2 is the ratio of the length of category 1 highways (1A + 1B + 1C) to the total length of the regional highways:

$$\mathrm{TE\ 2} = \sum(L_{1\mathrm{A}} + L_{1\mathrm{B}} + L_{1C})/\sum L_{THW}, \quad (2)$$

where $L_{1\mathrm{A}}$, L_{1B}, $L_{1\mathrm{C}}$ – length of category 1A highways (motorways, 1B (express roads), 1C (the road of common type with no less than 4 lines and a median strip).
The overall geopolitical indicator (GI) for the regional roads evaluation can be found as the sum of the TE1 and TE2 indicators. To enhance the significance of the TE2 indicator in relation to the TE1 indicator, we introduce weight numbers of 0.6 and 0.4 and perform standardization to bring the value of this indicator to the range [0;1]

$$\mathrm{GI} = (0{,}4 * \mathrm{TE\ 1} + 0{,}6 * \mathrm{T}E\ 2)/(\mathrm{TE\ 1}_{max} + \mathrm{TE\ 2}_{max}) \quad (3)$$

Taking into account that the maximum values of TE1 and TE2 are equal to 1, the expression (3) acquires the form:

$$\mathrm{GI} = (0{,}4 * \mathrm{TE1} + 0{,}6 * \mathrm{TE2})/2 \quad (4)$$

2. The group of economic indicators of RTLS trucking performance

As previously noted, nowadays there is no consensus on common criteria and indicators for performance evaluation of regional transport and logistics systems of trucking. The authors consider that it is associated, first of all, with the specific character of performance evaluating of RTLS and the methods of its measurement. In addition, this evaluation is carried out within the framework of various methods (methodologies), which inevitably affects the final results.

Taking into account these circumstances, it was decided to use the indicators given in the relevant sections of the federal and regional statistics reports as the main economic indicators. Let us consider the generally accepted statistical indicators characterizing trucking:

1. The road freight turnover of all types of companies, mln.t-km
2. The volume of transported goods - total, thousands tons
3. The turnover of organizations by the type of economic activity (transportation and storage)
4. Gross value added by type of economic activity (at current basic prices, million rubles)
5. The ratio of the RTLS freight turnover dynamics to the freight turnover in the Russian Federation (or the federal district) dynamics.
The integral rating for the group of economic indicators of regional transport and logistics systems of trucking performance can be calculated according to the following algorithm:
1. We determine the values for the indicators included in the group of economic indicators of regional transport and logistics systems of trucking performance, and introduce the following designations:

I_1^{EIj} – road freight turnover of all types of companies; I_2^{EIj} – the volume of transported goods; I_3^{EIj} – the turnover of organizations by the type of economic activity (transportation and storage); I_4^{EIj} – gross value added by type of economic activity (transportation and storage) at current basic prices; I_5^{EIj} – the ratio of the RTLS freight turnover dynamics to the freight turnover in the Russian Federation (or the federal district) dynamics;
j – the reference number of region's transport and logistics system of trucking evaluated by a comparative performance analysis.
2. Individual ratings R_i^{EIj} for each I_i^{EIj} indicator are calculated as follows:

$$R_i^{EIj} = \frac{I_i^{EIj}}{I_{i\,max}^{EIm}} * d_i^{EIj}, \tag{5}$$

where $I_{i\,max}^{EIm}$ – the maximum value of the *i*-th economic indicator among the regional transport and logistics systems of trucking, evaluated by comparative analysis of performance (the designation corresponds to the transport and logistics system with the reference number *m*); d_i^{EIj} – dynamics of I_i^{EIj} indicator, which is calculated as the ratio of I_i^{EIj} indicator in the current period to the same indicator of the base period.
3. The integral rating of the group of economic indicators of the performance of the j-th regional transport and logistics system of trucking R_{EI}^j is calculated as follows:

$$R_{EI}^j = \sum_{i=1}^{n} k_i * R_i^{EIj} \tag{7}$$

where R_i^{EIj} – rating value of *i*- indicator; k_i – weight of *i*-th indicator; *n* – total number of R_i^{EIj} indicators.
The weighted values of the k_i indicators can be obtained using a matrix of paired comparisons, implying a pairwise comparison of the importance of each indicator with other indicators of this group or using another method.
3. The group of infrastructural indicators of RTLS of trucking
Keeping the approach provided in the subsection devoted to the choosing of economic indicators, we will focus on infrastructure indicators, the basis for their calculating can be found in the reports of federal and regional statistics.
1. Evaluating the level of the area transport infrastructure development is carried out with various coefficients. Engel's coefficient and its modifications, such as Goltz's, Uspensky's and Vasilevsky's coefficients are mostly used to evaluate such an element of transport infrastructure as a communication route. These indicators do not exhaust the quantitative evaluation of such a complex concept as transport infrastructure. Taking into account the availability of the initial data for the calculation of these coefficients, we will take Goltz's, Uspensky's and Vasilevsky's coefficients as indicators of the transport infrastructure of regional transport and logistics systems of trucking, *(Amirov and Amirov, 2012).*

$$\text{Goltz's coefficient: } d_G = \frac{L}{S*N}, \tag{8}$$

where *L* – total length of roads; *S* – area; *N* – number of settlements.

$$\text{Uspensky's coefficient: } d_U = \frac{L}{S*H*t}, \tag{9}$$

where *H* - population size; *t* – total weight of goods transported over the territory.

$$\text{Vasilevsky's coefficient: } d_V = \frac{L}{\sqrt[3]{S*H*Q}}, \tag{10}$$

where Q – total weight of produced goods.

The integral rating for the group of infrastructure indicators is calculated according to the algorithm used for the integral rating for the group of economic indicators.

4. The group of logistic indicators of regional transport and logistics systems of trucking
A number of indicators, mentioned in various publications directly or indirectly as logistic, are not the same according to their content. Based on the analysis of available materials and the availability of indicators or data for

their calculation, the authors believe that the category of logistic indicators of regional transport and logistics systems of trucking should include:

1. The average time of transportation of one ton of cargo, days / tons (days / thousands of tons). This indicator with a sufficient degree of conventionality can be calculated as:

$$t_{goods} = \frac{365}{Q}, \tag{11}$$

where Q – total volume of transported cargo on the RTLS territory, tons (thousands of tons).
In terms of its content, this indicator is the single cycle time of goods traffic through the RTLS and can serve as a characteristic of the traffic performance. Naturally, the shorter the single-cycle time is, the more efficiently the goods traffic is organized.

2. Motorways crossing the state border. This indicator can take only two values: 1 - if such an intersection exists on the territory of the transport and logistics system and 0 - if there is no such intersection.
In addition to these indicators, classified by specialists as logistic, the authors propose to use the following additional indicators, the calculation of which is possible on the basis of publicly available statistics.

3. Traffic burden. According to the author, "traffic burden" as an indicator from the list of characteristics of various routes of communication is attributed to logistic. As a rule, the traffic burden is the amount (mass) of goods passing through a certain section of the road per unit of time. With regard to the regional transport and logistics system of trucking, this indicator is proposed to be calculated as follows:

$$G = \frac{Q}{L}, \tag{12}$$

where L – total length of goods traffic, ths.km.
In its turn, the value of the transportation length L can be calculated on the basis of public data by dividing the freight turnover of road transport by the volume of goods transported on the territory of the RTLS. Taking this approach into account, the expression (G) is the following:

$$G = \frac{Q^2}{Q_L}, \tag{13}$$

where Q_L – road freight turnover, thousands tons*km.
4. Average length of transportation of one ton of cargo, km. This indicator can be calculated in accordance with the expression (L5):

$$l_{car} = \frac{Q_L}{Q} \tag{14}$$

5. Completeness of regional transport network usage, %

$$\alpha = \frac{l_{car}}{L_0} * 100\%, \tag{15}$$

where L_0 – total length of federal roads, km.

The integral rating for a group of logistic indicators is calculated according to the algorithm used to calculate the integral rating for groups of economic and infrastructural indicators.

Methods for Performance Evaluation of Regional Transport and Logistics Systems of Trucking Based on The Transfer of Tools of The Fuzzy Set Theory

There is such a situation in different spheres of activity and scientific research when it is necessary to make decisions in the absence of certain information. The solution of such problems became possible with the fuzzy set theory, the foundations of which were laid in 1965 *(Zadeh, 1965)*. This theory has been applied in control systems

for complex technological processes, as well as in many other areas. *(Altunin and Semukhin, 2002), (Kuchin, 1987), (Borisov, Kruglov and Fedulov, 2007), (Peeva and Kyosev, 2006) et al.*

In this situation, when evaluating the performance of the regional transport and logistics systems of trucking on the basis of the proposed system of indicators, the initial information for calculations can also be considered, to a certain extent, as fuzzy information. Fuzziness in this case is developed by not quite definite numerical values of the selected indicators, the ratio (weight) of the influence on the performance of individual groups of the selected indicators. It is the relative strength of influence on the performance of regional transport and logistics systems of geopolitical, economic, infrastructural and logistic factors that creates a certain ambiguity in performance evaluation. The region and a number of other circumstances affect the weights of the influence of various groups of indicators. They can vary within a certain range with unclear boundaries. In addition, finding of "clear" values of individual indicators is not always possible, and in such cases it is possible to use their probable values, which can also lead to ambiguity.

Fuzziness of the influence weights of individual groups of indicators and fuzzy (probabilistic) values of some indicators provide adequate use of the fuzzy set theory in the system for performance evaluation of regional transport and logistics systems of trucking. In our opinion within the framework of the developed system for performance evaluation of regional transport and logistics systems the fuzzy set theory allows to adequately take into account a variety of information characterizing the indicators of transport and logistics systems and represent it in the form of membership functions.

Let us consider the opportunities of the fuzzy set theory application stated in *(Greyz, 2015), (Ukhobotov, 2011).* 1. Calculating of the sub direct image of a fuzzy set. With regard to the tasks of this study, the problem can be presented as follows: a) there is a set of certain objects (regional transport and logistics systems of trucking) that have b) a set of certain characteristics (indicators) and to evaluate these objects c) there is a group of relevant criteria (criteria set of attributes (indicators)). The result is the identification of an object that, in terms of a set of properties, most closely matches the criteria set.

The statement and designation of the symbols of this problem will be performed similar to the problem given in *(Greyz, 2015)*, and we will obtain its solution in matrix form:

$$\left(p_1, p_{2,} \dots p_{i,} \dots, p_n\right) \blacklozenge \begin{bmatrix} r_{11} & r_{12} & \dots r_{1j} \dots & r_{1m} \\ r_{21} & r_{22} & \dots r_{2j} \dots & r_{2m} \\ \dots & \dots & \dots & \dots \\ r_{i1} & r_{i2} & \dots r_{ij} \dots & r_{im} \\ \dots & \dots & \dots & \dots \\ r_{n1} & r_{n2} & \dots r_{nj} \dots & r_{nm} \end{bmatrix} = \left(q_1, q_2, \dots, q_j, \dots q_m\right) \qquad (16)$$

where $p_1, p_{2,} \dots p_{i,} \dots, p_n$ – fuzzy values of features $x_1, x_{2,} \dots x_{i,} \dots, x_n$ in criterial set, $r_{11} \dots r_{nm}$ – elements of matrix R , which present fuzzy values of features x for elements y (economic entities) ; $q_1, q_2, \dots, q_m -$ degrees of membership of elements $y_1, y_2, \dots, y_m$ in the image of fuzzy set A, which can be interpreted as a degree of conformity of the complex of economical entities' properties with the present criterial set of values of these features; n – number of features x; m – number of elements y (economic entities).
Solutions of expression (1) in the coordinate form are the following expressions:

$$\begin{gathered} min\ ((p_1 \blacksquare r_{11});\ (p_2 \blacksquare r_{21}); \dots \left(p_i \blacksquare r_{j1}\right);\ \dots (p_n \blacksquare r_{n1})) = q_1 \\ min\ ((p_1 \blacksquare r_{1m});\ (p_2 \blacksquare r_{2m}); \dots \left(p_i \blacksquare r_{jm}\right);\ \dots (p_n \blacksquare r_{nm})) = q_m \end{gathered} \qquad (17)$$

The so-called cut-off operation (■), can be presented as follows:

$$\mathrm{p} \blacksquare \mathrm{r} = \begin{cases} 1 \text{ when } \mathrm{p} \le \mathrm{r} \\ \mathrm{r} \text{ when } \mathrm{p} > r \end{cases} \qquad (18)$$

The larger q value (potential range of values [0;1]) is, the larger the compliance of the economic entity with the present criterial set of features is.

Thus, the complex indicator of compliance of the economic entity with the criterion set q can be considered as an integral indicator of the performance of the regional transport and logistics system of trucking.

To illustrate the application of the proposed methods, let us consider a conditional example of comparing several regional transport and logistics systems of trucking. We take the following values of the criterion set of features: $\{(x_1 \mid 1{,}0);\ (x_2 \mid 1{,}0); (x_3 \mid 1{,}0); (x_4 \mid 1{,}0)\}$.

Let us find out the degree of compliance of $q_1 - q_4$ of the complex of features for economic entities $y_1 - y_5$ to a given criterial set of values of these features $p_1 - p_6$ based on the tools of the problem "finding a sub direct image of a fuzzy set" (formulae (16); (17); (18):

$$(1{,}0;\ 1{,}0;\ 1{,}0;\ 1{,}0) \blacktriangleleft \begin{array}{c} \text{Transport and logistics systems №} \\ \begin{array}{ccccc} 1 & 2 & 3 & 4 & 5 \end{array} \\ \begin{bmatrix} 0{,}96 & 0{,}34 & 0{,}66 & 0{,}45 & 0{,}44 \\ 0{,}85 & 0{,}60 & 0{,}63 & 0{,}96 & 0{,}60 \\ 0{,}64 & 0{,}50 & 0{,}52 & 0{,}69 & 0{,}50 \\ 0{,}96 & 0{,}62 & 0{,}52 & 0{,}18 & 0{,}29 \end{bmatrix} \end{array} = (0{,}64;\ 0{,}34;\ 0{,}52;\ 0{,}18;\ 0{,}29)$$

The degree of compliance with the specified criteria equals to: $q_1 = 0{,}64; q_2 = 0{,}34;\ q_3 = 0{,}52; q_4 = 0{,}18; q_5 = 0{,}29$. Interpretation of these results shows that the evaluated economic entities (regional transport and logistics systems) can be arranged in the following way (as the performance decreases): №1 → №3 → №2 → №5 → №4.

Conclusions

Thus, the proposed analytical methods give an integral quantitative performance evaluation of regional transport and logistics systems of trucking. The methods are based on the calculation of key indicators, divided into four groups: Geopolitical indicators, Economic indicators, Infrastructure indicators and Logistic indicators. A distinctive feature of the methods is that it is able to obtain an integrated evaluation of the effectiveness for each assessed regional transport and logistics system using the particular heterogeneous indicators of various groups. The mathematical apparatus of the fuzzy set theory provides such an integral evaluation. It adequately evaluates heterogeneous information about the condition of transport and logistics systems. In particular, the methods use the toolkit for applying the fuzzy set theory such as "definition of a sub direct image of a fuzzy set", which defines a transport and logistics system that, in terms of a set of properties, most closely matches the selected criterial set of features and therefore has a better performance.

Abstract

The assessment of the impact of various economic indicators on labor productivity in the conditions of the transition of systems from industrial conditions of the 1st-3rd order of the economy to the 4th and subsequent levels of development of society in the post-industrial knowledge economy. The most significant indicators were identified using multiple regression analysis. The possibility of increasing the controllability of the speed of transformations of systems in the conditions of transformation processes is determined. The tasks of implementing the methods in the strategy of highly efficient transformations and the formed control mechanism for increasing the speed of transformations are solved. The analysis of the factors considered made it possible to switch from multiple regression analysis to fuzzy modeling methods that allow making forecasts of labor productivity values for specific industrial enterprises. The main indicator of labor productivity is the output per employee. The results of the study allow us to assess the possibilities of a controlled reduction of uncertainty in the implementation of high-tech innovative transformations, increasing the efficiency and speed of system transformations.

Keywords: productivity, speed and efficiency of transformations; factors; transformation of economic structures.

Introduction

The relevance of taking into account the factors of transformation of the organizational and technological structures of the economy follows from the constant increase in their importance in the period 2000-2050. The needs of the development of society on a post-industrial basis are not met in the conditions of the 1-3rd organizational and technological structures, since evolutionary processes prevail, characterized by a relatively low speed. It is necessary to improve methods for assessing and increasing the rate of innovative transformations of systems during the transition to the 4th order, a sharp increase in labor productivity. At the same time, scaling of the achieved levels of innovativeness of transformations of the types of activity of systems and management methods is ensured. Revolutionary processes of high-speed innovative transformations of the material type (the term "high-tech" is common in world practice) are necessary in the transition to the 5th and, especially, 6th economic structures. The significance of the increase in speed is determined by the lag in the growth of innovative capabilities of low-tech equipment in comparison with the rapid development of the unique needs of society. At the same time, there are innovative technological principles that determine the emergence of new production relations, technology for the formation of social consciousness. The increasing strategic gaps of these factors-challenges with their application in practice lead to an imbalance. This determines the purpose of the study as improving methods for assessing and regulating the rate of processes of innovative transformations of objects of activity according to the factors-challenges of transformation of structures for the transition from 3-4 to 5-6 economic structures, methods of increasing labor productivity. It is advisable to use the method of combining models and technologies.

Proposals are known for assessing the degree of development of an object by factors of innovation transformation. M.G. Delyagin proposes to define it by the levels of the technological pyramid. In the period 2014-20, there was an

Cite this Article as: Sergei ALIUKOV, Anatoliy ALABUGIN and Natalia TIKHONOVA " Analysis of the Influence of Economic Factors on Labor Productivity" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

increase in the number of publications on the relationship between the rate of emergence of new business models and the sustainability of development (Reefke, et al., 2013; Alt, et al., 2014; Seelos, 2014). For many organizations, existing profit-driven business models are a major obstacle to achieving sustainability. Such models of market behavior were quite effective in the processes of evolutionary transformations. However, in the context of a relatively rapid transition to a knowledge economy, profit orientation is insufficient. W. Stubbs and C. Cocklin outlined a number of normative principles of organizational development that form the "ideal type" of a business model focused on sustainability. The choice of a method for combining high-tech, tech-hume and foresight technologies for innovative transformations necessitates assessing the relationship between spatio-temporal and speed parameters of the direction of their impact on the long-term sustainability of the development of system objects, increasing labor productivity at industrial enterprises. Improving the theory in accordance with the stated purpose of the study requires a theoretical model and methodology for managing high-tech innovations, assessing the factors affecting productivity. This is confirmed by the well-known methodological proposals of P.F. Drucker], I.K. Adizes, models of spiral dynamics by K. Graves, F. Laloux. The openness of subjects and objects to the new provides in developed countries up to 80% of its growth (Aganbegyan, 2017). Consequently, the main in these complexes should be personnel receptive to innovations, as the basis for increasing labor productivity. This corresponds to the model of the spiral dynamics of "turquoise enterprises" identified in the studies of F. Laloux and B. Robertson and technology-hume technologies. According to Acad. A.G., investments in such capital should grow at an outstripping rate of 8-10% per year. Such methods should be included in separate stages of theoretical models and methodologies of the integration-balancing type of management.

Regression Analysis

Seventeen enterprises in Chelyabinsk and the Chelyabinsk region (Russia) collected data for economic indicators. These indicators and their designations are shown in Table 1.

Table 1: initial indicators

X1	Production per employee, thousand rubles
X2	Share of workers employed at machines and mechanisms,%
X3	The share of workers employed manually outside machines and mechanisms,%
X4	Staff turnover rate
X5	Shift rate for all workers
X6	The share of profile products in the total volume of products,%
X7	Share of purchased products and semi-finished products in production costs,%
X8	Share of specialists and employees in the total number of employees,%
X9	Capital-labor ratio per worker, thousand rubles
X10	Potential electrical equipment, kW
X11	The share of machines in technological equipment

(Source: compiled by the authors)

The collected values for the selected indicators are given in Table 2.

Let's carry out multiple regression analysis. As a dependent variable, we take the output per employee, thousand rubles. High R and R-squared values (Table 3) indicate a high adequacy of the regression model.

Table 3: summary table

R	R-squared	Adjusted R-squared	Std. estimation error
0,974	0,949	9,864	5,07017

(Source: compiled by the authors)

Table 4 summarizes the results of multiple regression analysis. First of all, we are interested in standardized coefficients, since they are scaled down and can be compared. An analysis of these ratios shows that the greatest impact on performance, and a negative one, is the staff turnover rate. Further, in decreasing order of importance, there are the share of specialized products in the total volume of production (positive effect), the share of workers employed manually not with machines and mechanisms (negative effect), the shift ratio for all workers (positive effect), and so on.

Table 4: coefficients of the regression model

Factors	Unstandardized coefficients		Standardized coefficients	t	Sig.
	B	Std. error	Beta		
share of workers employed with machines and mechanisms,%	-0,049	0,604	-0,022	-0,081	0,938
share of workers employed manually outside machines and mechanisms,%	-1,158	0,635	-0,467	-1,824	0,118
staff turnover rate	-1,831	0,632	-0,680	-2,896	0,027
shift ratio for all workers	34,629	15,572	0,348	2,224	0,068
share of profile products in the total volume of products,%	2,946	0,563	0,596	5,233	0,002
share of purchased products and semi-finished products in production costs,%	0,267	0,458	0,071	0,582	0,582
share of specialists and employees in the total number of employees,%	-0,911	1,406	-0,117	-0,648	0,541
capital-labor ratio per worker, thousand rubles	0,058	0,056	0,171	1,036	0,340
potential electrical equipment, kW	0,751	0,451	0,319	1,667	0,146
share of machines in technological equipment	0,005	0,188	0,006	0,025	0,981

(Source: compiled by the authors)

The constructed regression model allows making predictions. As an example, consider an enterprise for which the independent variables have the following values: the share of workers employed in machinery and equipment,% = 20.00; the share of workers employed manually not with machines and mechanisms,% = 28.00; staff turnover rate = 13.00; shift ratio for all workers = 1.50; share of profile products in the total volume of products,% = 90.00; share of purchased products and semi-finished products in production costs,% = 5.30; the share of specialists and employees in the total number of employees,% = 15.00; capital-labor ratio per worker, thousand rubles = 150.00; potential electrical equipment, kW = 21.00; the share of machines in technological equipment = 64.00. Then the predicted value for production per employee will be 67.5 thousand rubles.

Fuzzy Modeling Method

Fuzzy modeling will be carried out on the basis of the Fuzzy TECH 5.81 d Professional software package. As the output variable Output, as in the case of regression analysis, we will take the output per employee, thousand rubles. We divide the values of this variable within (30; 100) into five gradations: very low values (low); low (low); medium (medium); high (high) and very high (very high).

As output variables, we will take the first three independent variables with the greatest influence on the dependent variable: the percentage of staff turnover (Input1) within (9; 30), the share of profile products in the total volume of production (Input2) within (79; 100) and the share of workers , occupied manually not with machines and mechanisms (Input3) within the limits (10; 40). We divide each of these variables into three grades (low, medium, high).

The block diagram of the fuzzy logic model is shown in Fig. 1.

Fig. 1: Block diagram of the fuzzy logic model

(Source: compiled by the authors)

The distribution law graph for the Output variable is shown in Fig. 2. Input variables have similar distribution laws (with only three gradations).

Fig. 2: The distribution law for the variable Output
(Source: compiled by the authors)

The relationships between the dependent and independent variables are shown in Fig.3.

#	IF in1	in2	in3	THEN out1
1	low	low	low	medium
2	low	low	medium	low
3	low	low	high	low
4	low	medium	low	high
5	low	medium	medium	medium
6	low	medium	high	medium
7	low	high	low	very_high
8	low	high	medium	high
9	low	high	high	medium
10	medium	low	low	low
11	medium	low	medium	very_low
12	medium	low	high	very_low
13	medium	medium	low	medium
14	medium	medium	medium	medium
15	medium	medium	high	low
16	medium	high	low	high
17	medium	high	medium	medium
18	medium	high	high	medium
19	high	low	low	low
20	high	low	medium	very_low
21	high	low	high	very_low
22	high	medium	low	medium
23	high	medium	medium	low
24	high	medium	high	very_low
25	high	high	low	medium
26	high	high	medium	medium
27	high	high	high	low

The created fuzzy logic model allows you to make a prediction for the performance of a particular enterprise. So for the same values of independent variables (in this case, we are limited to three variables), as in the case of multiple regression analysis, we get Output = 65 (Fig.4). Recall that the regression model gave a value of 67.5. The error of the result obtained using the fuzzy logic model does not exceed 4 percent. However, in the case of using a fuzzy logic model for forecasting, we only need to use 3 independent variables, while in the case of regression analysis, we used 10 independent variables.

Results and Discussion

As a result of the analysis, it was revealed that the staff turnover rate influences labor productivity to the greatest extent. Therefore, in order to increase productivity, it is necessary, first of all, to reduce the percentage of staff turnover. This can be done by raising wages, but not only. It is important to create a comfortable environment at the enterprise, to provide favorable conditions for career growth, good working conditions. There are other opportunities to reduce employee turnover.

The second most important factor affecting performance is the share of profile products in the total volume of products. Therefore, to increase productivity, one should concentrate on the production of specialized products, trying not to scatter assets for the production of a wide variety of other types of products.

The third significant opportunity to increase productivity is the reduction of manual labor outside of machines and mechanisms. This fact is quite obvious, but, as the results of this study have shown, this possibility is not paramount.

It should be borne in mind that the choice of the most significant factors in terms of increasing productivity was carried out from a set of initial variables. At the same time, it is possible to add some other variables to the original list.

Conclusion

In the article, based on the analysis of the initial data, two mathematical models were created that describe economic processes associated with an increase in labor productivity in industrial enterprises. The first model represents multiple regression. This model identified the most important causes affecting performance. With the help of this model, the three most important reasons were identified, which led to the creation of a second model based on fuzzy logic. Both models allow making forecasts of labor productivity values. The considered examples of the forecasts made for both models showed good convergence of the results. The calculation error did not exceed a few percent, which confirms the reliability of the results of the study.

Abstract

This study explored the relationship between eustress and academic staff performance in a tertiary institution. The physical and psychological demands of workers at the tertiary level of education make them more vulnerable to high levels of stress. However, researchers have proved eustress is capable of motivating individual employees to perform well and work with interest. Therefore, this study proposed a conceptual model showing the link between eustress and academic staff performance. As a result of the conceptual model proposed, the study suggests that being optimistic and maintaining a positive perception towards work demands will increase their chances of responding positively to stressors and experiencing eustress leading to enhanced performance among academic staff in tertiary institutions.

Keywords: Eustress, Performance, Conceptual Model, Academic Staff .

Introduction

In today's dynamic work environment, employees work for longer hours, as the increasing demand of responsibilities requires them to apply themselves vigorously to work to meet the rising expectations about work performance (Mark & Smith, 2012). Any change in the processes of workflow, daily routine, and the way we do things induces a form of stress. Akinmayowa and Kadiri, (2016) asserted that the job of a university lecturer is very important and offers a variety of activities such as; social interaction, scholarly inquiry, and they are also expected to positively shape the future of their students.

Eustress is viewed as a valid concept that facilitates the development of a positive emotional state, enhances employee ability to make more novel connections and associations between ideas and creativity thereby improving productivity (Majdi, Purwanto & Sunawan, 2019).Therefore, Musrrat (2013), Ahlam and Hassan (2012), Agbu and Olubiyi (2011) and Reda and Rania (2016) have advocated a more robust and holistic approach in exploring the negative and positive stress to gain subjective lecturers reports of stress and coping mechanisms resulting in a fuller picture on academic staff stress with future recommendations grounded in research. Much of the traditional research on academic staff stress have focused mainly on negative stress which is considered harmful to employees' overall wellbeing (Anthony, 2015; Figen & Tatjana, 2015; Akanji, 2013; Mark & Smith, 2012). It is against this backdrop,

that this study seeks to propose a conceptual model showing the link between eustress and the performance of academic staff in tertiary institutions in Nigeria.

Statement of the Research Problem

Teaching effectiveness of faculty is one of the most critical areas that need to be considered. The success of the students depends to a great extent on how well the teachers have trained them (Agsalud, 2017). Eustress as a concept has received very little treatment in the literature. As Mesler (1996) stated, there are relatively few studies, and no adequate models, proposing the concept of eustress and its associated regenerative qualities. Indoo and Ajeya (2012) as well as Pama, Dulla and De-leon (2013) conducted a study to understand the correlation between emotional intelligence and teaching effectiveness of faculty members at medical and engineering colleges of Uttar Pradesh, India. However, there is a need to establish a conceptual relationship between work routine management and the teaching effectiveness of academic staff in tertiary institutions, particularly in Nigeria.

Journal publication is regarded as a vital and indispensable activity for all academic staff and the institution. They are efforts geared at extending the frontiers of knowledge and breaking new ground and essential components of an academic career (Sarah, 2015). The core of any University's charitable mission is the creation of new knowledge and understanding for public benefit (Karpov, 2018). Hence, there is a need to determine the conceptual linkage between meeting research requirements and the research output of academic staff in tertiary institutions in the Nigerian context.

Methodology

This paper adopted conceptual analysis as a research method. Analytical method often focus on defining the concepts in order to have required and adequate conditions for the application of the concepts. The critiques of this analytic method are mostly based on a critique of definitions. However, conceptual analysis is largely considered a beneficial method of inquiry mostly when the aim is to analyse concepts into their component parts in order to gain knowledge or a better understanding of a particular logical issue in which the concepts are involved and the relationships proposed between the concepts (Boston-Kemple, 2012). Therefore, this paper analysed the concepts of eustress and the performance of academic staff in order have a better understanding and knowledge of the concepts and the proposed relationships between the concepts in Nigeria tertiary institutions.

Literature Review

Concept of Eustress

Eustress is an insufficiently explored phenomenon. As the examination of the PubMed database illustrates, very few analyses of stress attend to the concept of eustress. In some models of stress, eustress is included only as a lack of negative effects (Kupriyanov & Zhdanov, 2014). Eustress is connected to Selye's work in formulation of general adaptation syndrome and emphasised the adaptive nature of the reaction to stress (Kupriyanov & Zhdanov, 2014). Quick, Wright, Adkins, Nelson, and Quick (2013) identified eustress as a healthy, positive and constructive results of a stressful event and stress response. Thus, eustress is considered the result of the body's positive response to a stressor.

Actually, there are three kinds of stress according to Keller (2013) and they are: Eustress, Neustress, and Distress. Eustress is a good stress and it arises in any situation or circumstance that a person finds motivating or inspiring. Preparing for marriage might be an example of eustress; meeting a movie star or a professional athlete including preparing an article for publication may also be a type of eustress. Usually, situations that are classified as eustress are enjoyable and for this reason are not considered to be a threat. Neustress describes sensory stimuli that have no consequential effect; it is considered neither good nor bad. News of an earthquake in a remote corner of the world might fall into this category. The third type of stress, distress, is considered bad and often is abbreviated simply as stress. Lovallo (2015) defined distress as an aversive, negative state in which coping and adaptation processes fail to return an organism to physiological and/or psychological homeostasis. There are two kinds of distress namely

acute stress which surfaces quite intensely and disappears quickly and chronic stress which may not appear quite so intense yet seems to linger for prolonged periods of time (e.g hours, days, weeks, or months).

Work Routine Management

Work routine management implies analyzing and developing action plans capable of ensuring daily outcomes. This basically involves daily management of time and tasks. Work routine management is essential to professionals to solve the day-to-day problems and minimize the strain that results from overwork and to ensure the continuous improvement of the organization (Falconi, 2018). Work routine management is important to employees and employers. Practices such as having a to-do-list and proper management of time schedule can affect employees' ability to achieve their business goals (Lambert and Henly, 2010). Teaching makes up only a part of the tasks of an academic staff, they are usually involved in research to a substantial degree and they have management tasks as well. The daily combination of these diverse tasks is an important cause of job stress and strain (Toon, Paul & Ingrid, 2001).

Teaching Effectiveness

According to Popoola and Haliso (2009), teaching effectiveness is seen as the ability of a teacher to inculcate knowledge and skills in students, as well as change their behaviour for better living. Also, Adam (1993) and Ismaila (1999) noted that teachers' knowledge of subject matter, skill proficiency and resourcefulness could be linked to institution effectiveness, teacher effectiveness and students' academic performance. In other words, one of the requirements for teaching effectiveness is improved knowledge of subject matter acquired through research, use of library information resources and services.
