- socio-political threats,
- technogenic threats,
- natural threats,
- foreign economic and foreign policy threats.

Economic and managerial are the key threats at the present stage of economic and energy development. Among them are the following main threats (Dudin et al., 2017; Lakhno, 2015; Lisin et al., 2015; Lisin et al., 2018c):

- Investment deficiency that can lead to uncompensated disposal of production facilities and energy complex,
- low innovative activity in the energy sector, which leads to a decrease in the technical level of energy complex facilities due to insufficient R&D funding,
- complication of the energy complex management system and the growth of uncertainty in the results of its operation caused by the processes of globalization and the energy sector liberalization,
- structural changes in the economy that lead to an increase in the unevenness of energy products demand due to an increase in the share in energy consumption of the population and the non-production sphere,
- slowdown in the diversification of the energy balance and the dominance of natural gas in the European regions of the country.

According to the Federal State Statistics Service of Russia, the depreciation of the main production assets of the electric power industry is about 40%. At the same time, the assets of the backbone grid complex are the least worn out, followed by the generation segment, and the closing one is the distribution grid complex with wear up to 70%. It should be noted that more than 90% of the capacities of existing power plants, 70% of boiler houses, 70% of electric and 66% of heating networks were put into operation before 1990. This suggests that the main strategy to combat the wear and tear of energy enterprises is to extend the service life of production assets through capital repairs (Lisin et al., 2017; Lisin et al., 2016a).

Fuel efficiency at thermal power plants has been decreasing over the past decades and is about 54%. This is caused by a decrease in the heat load of power plants due to the transition to heat supply mainly from boiler houses, which is caused by the low competitiveness of CHPs when operating in the energy market, and an incorrect pricing policy on the heat market (in particular, cross-subsidization), which led to a number of large heat consumers leaving of a from district heating systems. In general, the average efficiency of Russian power plants is 36.6% (38% - coal-fired, 41% - gas) (for comparison, in the world - 39-41.5%). At the same time, the International Energy Agency recommends the efficiency indicators of coal-fired stations at 43% and gas-fired stations at 55% as the lower technological limit of efficiency (Lisin et al., 2017; Lisin et al., 2016a; Lisin et al., 2016b). The discrepancy between efficiency indicators suggests low innovation activity and technological lag in the country's energy sector.

The level of energy efficiency in the country and its regions is characterized by the energy intensity indicator of the gross domestic product. Russia takes the last place in the world ranking of 44 countries in terms of energy consumption per unit of GDP, its energy intensity index is 5 times higher than the world's best values. High energy intensity is due to climate conditions (75% of energy consumed by the population is heat), low efficiency of energy and energy-intensive industries, as well as insufficient attention to energy conservation problems at the territorial level (Lisin et al., 2018a; Lisin et al., 2018b; Lisin et al., 2017). In the regions of the country there is a shortage of heat capacity, estimated at 20% of the total heat demand, which leads to fuel overconsumption due to the use of other energy sources by 2-2.5 times (when replacing heat with electricity - by 3.5-4 times). For comparison, the energy intensity of the GDP of Canada with a similar climate and developed industry is 1.8 times lower than that of Russia.

The gradual transition to a post-industrial economy leads to a reduction in the share of energy-intensive industrial production and an increase in the share of household consumers in the structure of energy consumption. This is due to the growth of urban population and an increase in energy consumption per capita due to an increase in the number of household appliances that consume electricity. This circumstance has a strong impact on the production efficiency of the power system.

In turn, the slowdown in the diversification of the country's energy balance is caused by the existing difference in the cost of coal and gas, which does not correspond to their differences in the quality of energy sources. Today, the ratio of gas and coal prices is 1.3 and does not even reach the world indicator of 1.5 (Lisin et al., 2016b; Takaishvili et al., 2019). At the same time, coal is a competitive fuel in comparison with gas with a price ratio of at least 1.6 at the present stage of energy conversion technologies development.

Energy Security Indicators

The Energy Strategy of Russia until 2035 contains the energy security indicators shown in Table 1. According to the developers of the Strategy, failure to implement them will lead to a threat to energy security (Alekseev et al., 2019; Bogoviz et al., 2018; Akhmetshin et al., 2018; Takaishvili et al., 2019).

Table 1: Values of energy security indicators by 2035

Indicator	Value
The ratio of the annual increase in the balance reserves of energy resources to their production volume	Not less than 1
Dynamics of domestic prices for energy resources and electricity	Not higher than the inflation rate
Reduction of average depreciation of fixed assets in the energy sector	Not less than 5%
Eliminating the deficit and maintaining the reserve capacity of power plants	At 17%
Share of energy exports in the total value of exports	Not more than 45%
Share of oil refining and petrochemical products in the total value of energy exports	Not less than 40%
Share of Asia-Pacific countries in total energy exports	Not less than 31%

As shown by the analysis, at the moment there are no prerequisites for the implementation of a number of the energy security indicators.

If the required ratio of the annual increase in the balance reserves of energy resources to the volume of their production can be achieved and even exceeded, subject to the development of deposits with a high cost of fuel extraction and the introduction of technologies that increase the profitability of its extraction, then domestic prices for electricity and gas for industrial consumers in the country have already reached and surpassed the US level. In particular, it was necessary to adjust the rise in electricity prices for the population. According to the forecasts of the Ministry of Economic Development for the coming years, with an inflation rate of 4%, an increase in electricity tariffs for a household consumer will be 5%.

Reduction in the average depreciation of fixed assets of electric power industry is also unlikely to provide. At the moment, it has stabilized and, most likely, it will not be less than 45% by the specified period.

The capacity reserves of the unified energy system are 38.6 GW, in other words, 16.3% of the installed capacity of the energy system. With an observed annual increase in production capacity of 1.8% and a slow growth in electricity demand (1.5%), the set indicator of 17% should be achieved.

The share of energy exports in the total value of exports is stable and has fluctuated around 70% over the past 5 years. The only decrease in the volume of exports in monetary terms was recorded in 2015 due to the devaluation of the ruble. This drop was offset by an increase in fuel supplies in physical terms to foreign markets, which contributed to a decrease in its price. Thus, the stated indicator value of 45% is hardly achievable. At the same time,

the share of the countries of the Asia-Pacific region in the total volume of energy exports is growing and at the moment is already more than 30% (more only with the EU - 45%).

Oil refining and petrochemicals are promising developing industries. At the same time, the share of high-tech products in the export of the petrochemical industry does not exceed 10% and is mainly represented by products of low and medium-depth processing of raw materials. The analysis of foreign trade of petrochemical products shows that the share of export sales is 52.8% of turnover, while the import is 47.2%. It can be concluded that the primary task in this area for the coming decades will be the implementation of the import substitution program and increasing competition in the domestic market, which will require the development of deep oil refining technologies (for comparison, the refining depth in Russia is 75%, in the EU - 85%, in the USA - 96%). It is clear that the export share of high-tech refined products of 40% is unattainable.

Full or partial realization of threats to the energy security of the country and its regions can lead to a disruption in the stability of regional energy systems, which will aggravate the problem of ensuring reliable energy supply to consumers and slow down the pace of economic development. Preventing and overcoming threats to energy security should be a key task for authorities at various territorial levels, which cannot be solved in market conditions without cooperation with the basic territorial energy enterprises.

Methods

Formation of a criterion for assessing the level of energy security

According to the clarification of the conceptual apparatus of energy security, we will characterize it as the state of protection of the country's region from threats to reliable fuel and energy supply, achieved by ensuring the functioning of its energy system in market conditions in accordance with the principles of consumer availability of energy products and economic profitability of its production.

Thus, energy security, on the one hand, is determined by the economic profitability of energy production, on the other by its availability to the consumer. In general, an assessment of the energy security level can be obtained from the analysis of the energy products cost for the consumer and its structure:

$$\begin{cases} P = PC + MP \le LP \\ MP \ge PC \cdot RR \end{cases} \tag{1}$$

where P is the price of energy products, PC - production costs, MP - marginal profit, LP - limit price, RR-the required rate of profit.

The price of energy products should not exceed the limit price, which guarantees the state economic availability of products for the final consumer in accordance with the level of socio-economic development of the region. In turn, the marginal profit of energy enterprises should correspond to the profitability that allows the enterprise to attract investments in order to reproduce fixed assets, improve the quality and ensure the competitiveness of products.

It can be said that the interests of the state and the energy business are contradictory. If a particular criterion of the state is the fulfillment of the condition of consumer availability of energy products, then for energy enterprises it is the production profitability.

This contradiction is overcome by coordinating the economic criteria of the state and business through the compilation of a generalized efficiency criterion that includes particular criteria. Finding the extreme value of the generalized criterion function makes it possible to determine the cost of energy products, at which a balance of interests is achieved. The higher the value of the generalized criterion, the higher the level of energy security. Thus, we assume that an economically justified level of energy security will be achieved at the cost of energy products that maximizes the function of the generalized criterion.

We represent the generalized criterion, which reflects the level of energy security as a multiplicative function of two particular criteria:

$$J_{ES}(P) = J_G(P) \cdot J_B(P) = (LP - P) \cdot (MP - PC \cdot RR) = \\ (LP - P) \cdot (P - PC - PC \cdot RR) \tag{2}$$

where J_G is a private criterion of the state characterizing the remoteness of the energy products cost from the limit value; J_B is a particular criterion for the energy business, characterizing the excess of the marginal profit over the required level of profitability from the energy products sales.

The economically justified level of energy security will be determined by the cost of energy products, at which, taking into account the restrictions, the generalized criterion will take the highest value:

$$J_{ES}^{0}(P^{0}) = \max_{P}\left\{J_{ES}^{0}(P)\right\} \tag{3}$$

$$\begin{cases} P \le LP \\ P \ge PC(1 + RR) \\ PC > 0,\ 0 < RR < 1 \end{cases} \tag{4}$$

Development of an energy security assessment model

To analyze the relationships between the economic parameters of energy security and their impact on the cost of energy products for the consumer, a model of relationships between the parameters was developed, presented in Fig. 1.

Fig.1: Model of relations of economic parameters of energy security

The cost of energy products for the *P* in market conditions is determined by the marginal profit *MP* and production costs *PC* of the generating enterprise, the transport tariff *T*, the established price limit *LP*, operating within the borders of the region. In turn, in the case of market pricing, the marginal profit *MP* depends on the established equilibrium market price P_0, which, under conditions of prevailing demand, is determined by the production costs of the generating company *PC* and its profit rate. Production costs are divide into direct production costs *DPC* (determined by the cost of fuel *FC* and the cost of converting it to energy products *CC*) and general production costs *IPC* (includes depreciation *AC* and RC reliability maintenance costs).The transport tariff *T* largely depends on the actual costs of transmission *TC* (determined by the material costs *MTC* and the cost of losses *WTC*) and tax deductions *D* from the profits of generating enterprises, which compensate for part of these costs.

The compiled diagram of connections allowed to develop an algorithm for analyzing the level of energy security of the region, shown in Fig. 2.

Fig. 2: Algorithm for assessing the level of region energy security

Results and Discussion

Selecting the research object for testing the model

The Far Eastern economic region was selected as the region for testing the proposed energy security assessment model. It unites 9 territorially related subjects of the country by economic relations. It includes: the Republic of Sakha, Primorsky, Khabarovsk and Kamchatka regions, Amur, Magadan and Sakhalin regions, Jewish Autonomous Region, Chukotka Autonomous Region. The territory of the Far Eastern economic region is 36% of the country's territory. At the same time, the population is only 6.2 million people (4.2% of the total population of the country), which is decreasing by about 0.3% per year) (Lisin et al., 2018a; Prokapalo et al., 2020).

The industrial specializations of the region are non-ferrous metallurgy, mining and food industries. main production of the region is concentrated in the Khabarovsk and Primorsky regions, Yakutia and the Sakhalin Region, where about 80% of the gross regional product is produced. The power system of the Far Eastern economic region is represented by a fuel supply system and production systems of heat and power supply.

The fuel supply system is focused on the use of local fuels (primarily coals). At the same time, the export of natural gas and oil products from Western Siberia is also carried out. The structure of consumption of primary fuel and energy resources in comparison with the structure of consumption in the country is shown in Fig. 3.

Fig. 3: Comparison of the consumption of fuel and energy resources of the Far Eastern region with the national average

As can be seen, in contrast to the structure of fuel consumption in the country, in which natural gas prevails, the main energy resource of the Far East region is steam coal. At the same time, due to the development of oil and gas condensate fields, the share of gas in the energy balance of the region has increased significantly over the past ten years. In the future, a rational decrease in the share of coal and oil products towards the use of natural gas will help to increase the level of energy security of the economic region and to solve environmental problems.

Own gross production of fuel resources in the Far Eastern region is almost 3 times higher than their consumption and is excessive for each energy resource. However, due to the uneven distribution of fuel sources across regions, only the Republic of Sakha, Khabarovsk Region and Sakhalin Region are surplus for coal, and Sakhalin Region for gas (more than 90% of the region's gas is produced). The demand for natural gas in the Sakha Republic, Kamchatka Territory and Chukotka Autonomous Region is provided by its own production, while the Khabarovsk and Primorsky Regions are fully provided by external supplies.

The distribution and type of available energy resources determined the location and type of power facilities in the economic region. The Amur Region and the Republic of Sakha (South) are surplus in terms of electricity generation, the surplus of which is mainly sold in the Khabarovsk and Primorsky Regions and the Jewish Autonomous Region. The energy systems of these territorial entities form the united energy system (UES) of the East, operating in parallel with the UES of Siberia and being part of the unified energy system (UES) of the country, operating in the conditions of the wholesale electricity market. The Republic of Sakha (North), Kamchatka Territory, Sakhalin and Magadan Regions, Chukotka Autonomous Region are autonomous in terms of energy supply.

The main threats to the energy security of the region

The following main threats to the energy security of the Far Eastern economic region can be identified (Lisin et al., 2018a; Senderov et al., 2018):

- increasing moral and physical deterioration of fixed assets for the production and distribution of energy (on average 41.6% for the regions, while in a number of regions it exceeds 60%);
- a significant share of coal in the fuel balances of a number of subjects of the economic region (especially in Yakutia and the Primorsky Region), which significantly affects the environment, production and technological efficiency of the industry and energy security;
- rather low indicators of the efficiency of energy resources use by the subjects of the economic region in comparison with the national average (despite the availability of their own energy resources, significant supplies of oil and gas are carried out from Western Siberia);
- focal industrial development of the economic region, due to the extremely uneven distribution of fuel and energy resources, the largest of which are concentrated in remote areas;

- high tariffs for energy resources (gas, oil) and services of infrastructure companies for industrial enterprises, exceeding the national average by 2.3 and 1.5 times, respectively.

Low energy efficiency of the region's energy system (Table 2) and high depreciation of its main production assets pose a significant threat to energy security (Lisin et al., 2018a; Kalashnikov, 2011).

Table 2: Specific fuel consumption and losses in the networks of the Far East region

Indicator	Far East region	Russia
Specific fuel consumption for electricity generation at TPPs, g.c.e / kWh	392,8	334,3
Specific fuel consumption for heat generation at TPPs, kg.c.e / Gcal	159,3	152
Power losses in the networks, %	11,4	10

Poor implementation of energy efficiency programs in the region's energy systems is largely due to the lack of coordination in the management of the energy complex development at various organizational levels. The reason for this is the liberalization of economic relations in the industry in 2007 and the emergence of many local energy management entities that represent conflicting interests of the state and the energy business. These conflicting interests have a significant impact on the formation of electricity prices in the region.

Economic assessment of the region's energy security level

Table 3 presents the assessment of the energy security level according to the developed model (Fig. 2) based on the analysis of the prevailing average prices for electricity in the territorial entities of the Far Eastern region.

Table 3: Results of the analysis of the Far Eastern region territorial entities energy security level

Region territorial entities	Current price for energy, RUB / kWh	Energy price limits that ensure energy security, RUB / kWh		Optimization results	
				Energy price, RUB / kWh	Reasonable level of energy security
Amur region	2,2	3,0	3,4	3,2	1,13
Jewish Autonomous Region	2,1	3,2	3,6	3,5	1,05
Kamchatka Territory	4,9	5,7	6,2	5,8	1,14
Magadan Region	4,0	6,0	6,5	6,5	1,00
Primorsky Region	2,7	2,9	3,2	2,9	1,15
Sakha Republic	6,2	4,4	5,1	5,1	0,67
Sakhalin Region	4,2	3,0	3,3	3,3	0,62
Khabarovsk region	2,9	3,6	3,9	3,6	1,17
Chukotka Autonomous Region	10,8	7,2	7,8	7,8	0,52

The lower limit of electricity prices is determined by the production costs of generating companies. In the considered territorial entities, they are quite high due to high fuel prices, that is associated with climatic conditions, insufficient development of local deposits and the pricing model used. Also, significant production costs are explained by the high level of depreciation of generating equipment, which increases the share of fuel costs in the structure of production costs.

The upper limit of electricity prices is determined by the level of socio-economic development of the territorial entity, reflecting the economic availability of energy products for the consumer. The significant economic potential of the Far Eastern region is currently rather poorly realized, which determines the need for significant containment of electricity prices to ensure its availability for the consumer.

High values of the lower limits of electricity prices at low upper limits lead to rather narrow price corridors, within which the energy security of territorial entities is ensured without subsidizing energy enterprises and consumers from the state. In turn, the current electricity prices for end consumers of territorial entities go beyond the borders of the corridor, which is a threat to energy security. For most of the territorial entities of the economic region, they are artificially lowered for political reasons and the need to provide conditions for the advanced development of industrial zones, which leads to unprofitable energy business. In this case, a decrease in the value of the lower limit of the interval is required. This can be achieved by optimizing the production structure of generating companies in order to reduce fuel costs and intensify the development and diversification of local fuel sources. At the same time, the electricity prices in a number of territorial entities of the economic region go beyond the upper limit due to the level of socio-economic development. This situation is caused by the significant role of generation in the structure of the gross regional product and its significant influence on the formation of the territorial entity budget. In this case, a policy of regional production diversification is required.

Conclusion

The result of the study is the proposal of a model for assessing the economically justified level of energy security of the country's region. The method is based on a refined concept of energy security, according to which it is assumed to achieve the protection of a country's territorial unit from threats to reliable energy supply if the conditions for consumer availability of energy products and economic profitability of its production are met.

The fulfillment of these conditions is associated with overcoming the contradiction in the criteria for the efficiency of the energy system development on the part of the state and energy enterprises. If a particular criterion of the state is the fulfillment of the condition of consumer availability of energy products, then the economic profitability of production is important for energy enterprises.

To coordinate the private criteria of the state and business, a generalized efficiency criterion was developed, based on the multiplicative principle that combines private criteria. The investigated indicator is the cost of energy products for the consumer, at which the maximum of the generalized criterion (indicating an economically justified level of energy security) is reached.

The Far Eastern economic region of Russia, whose economic development is a national priority, was chosen as a region for testing the proposed model for assessing the energy security level. It is shown that the existing policy of equalizing prices in the territorial entities of the Far Eastern region without taking into account the state and features of the functioning of regional energy systems, and their level of socio-economic development, not only cannot purposefully contribute to increasing the level of energy security.

Abstract

The paper examines the directions of development of power systems of the Eurasian Economic Union member countries when creating a unified electric power market. This problem is due to the fact that the key technology for energy production, which forms the basis of the energy systems of the post-Soviet countries, is the joint generation of electric and thermal energy at thermal power plants. At the same time, this type of combined production is ineffective in market conditions, and the creation of a unified energy market can significantly affect the economic efficiency of regional energy supply systems. In this regard, a unified competitive business model for organizing energy supply to regional consumers and a method for determining the marginal tariff based on market principles are proposed.

Keywords: Eurasian Economic Union, unified electric power market, combined power plants, energy supply systems, district heating, business models, performance evaluation

Introduction

In order to develop foreign economic activity and increase the resource and production potential necessary to overcome the effects of the global economic crisis and create a driver for the growth of national economies, countries combine their efforts in the economic sphere and form common economic spaces, which in essence represent a common market. This common market ensures the movement of goods, capital, services and labor between the member states of the common economic space. At the same time, the economic policies of the participating States are also coordinated in relation to macroeconomics and the financial sector, transport and energy, trade and industry.

In 2012, within the framework of international agreements on Eurasian integration, a single economic space was formed between Russia, Kazakhstan and Belarus, called the Eurasian Economic Union. In 2015 Armenia and Kyrgyztan also joined the Eurasian Union. It is planned that the integration of the economies of post-Soviet countries by creating a common market will lead to the following macroeconomic effects (Mostafa et al., 2018; Andronova, 2016; Ivanov et al., 2019; Falkowski, 2017):

- reducing the price of goods by reducing transport costs for transporting raw materials and equipment;
- increased competition in the common market of the Eurasian Union by ensuring an equal level of economic development;
- increasing production capacity due to increased demand for products;
- reduction of payback periods for new technologies and products due to increased market volume and capacity;
- growth of the gross product of the Eurasian Economic Union countries by at least 25%.

The creation of a common market between the member States of the Eurasian economic Union implies the unification of national commodity markets in all areas of social production, including the organization of a unified electricity market.
The Unified Electricity Market (UEM) is a system of relations between the subjects of the internal electricity markets of the member states of the common economic space related to the sale and purchase of electricity (capacity) and related services, acting on the basis of general rules.
The integration of electricity markets will contribute to (Kolomeytseva et al., 2019; Lisin et al., 2017a; Sopilko et al., 2020a; Sopilko et al., 2020b):

- increasing the economic efficiency and reliability of the functioning of the Member States energy complexes;
- improving the model of functioning of the wholesale electricity market;
- increasing the volume of cross-border electricity trade, both inside and outside the common economic space;
- stabilization (reduction) of electricity prices and, as a result, the creation of a favorable investment climate.

The energy systems of the countries of the Eurasian economic Union were formed according to a single concept during the Soviet Union and formed a single energy system, which was artificially divided after the collapse of the USSR. This fact also contributes to the creation of a unified energy market, since we can talk about the existence of the necessary technological infrastructure (Lisin et al., 2017a; Sopilko et al., 2020a; Guliyev et al., 2017):

- the presence of high-voltage cross-border transmission networks with currently excessive capacity of the export-import section,
- the energy systems of the participating countries operate in parallel mode with the same characteristics and requirements for the quality of energy products.

At the same time, the key technology for the production of energy products, which forms the basis of the energy systems of the post-Soviet countries, is district heating, which implies centralized energy supply to consumers based on the joint generation of electricity and heat at CHPPs. In Russia, CHPP produces more than 40% of electricity, in Kazakhstan - 36%, and in Belarus - 56%. The role of CHP plants in district heating is even more significant: in Russia, CHP plants produce about 46% of heat, in Kazakhstan - 74%, Belarus - 83%. At the same time, it should be taken into account that the main consumer of the CHPP energy products is the population, which determines the significant social role of district heating (Lisin et al., 2017a; Makarov et al., 2017; Karatayev et al., 2016; Novikau et al., 2019; Kovalyov et al., 2013).

Despite the advantage of the combined production of heat and electricity in a single production cycle, expressed in fuel savings of up to 20-30%, in the conditions of the market model of the electric power industry, in particular, the wholesale energy market, this type of generation faces significant problems of maintaining competitiveness.

This phenomenon is associated with many reasons, the main of which is the low maneuverability of the CHPP. Providing heat to the population, CHP plants often cannot fulfill the System Operator command and respond to uneven power consumption, which does not allow them to participate in various competitive sectors of the electricity trade and indicates their inability to use in the wholesale energy market. Being displaced from the energy market CHP plants are essentially turning into large boiler houses. All the advantages of combined energy production and district heating are lost.

The spread of a market model for the functioning of the electric power industry in the countries of the Eurasian Economic Union and the creation of a unified energy market can aggravate the above problem and significantly affect the energy and economic efficiency and sustainability of regional heat supply systems development.

In this regard, it becomes relevant to consider possible ways of developing regional heat supply systems in the context of the integration of market mechanisms for pricing energy products in the member countries of the common economic space and identifying the risks of various business models of commercial activities in the field of heat supply.

Literature Review

The key interstate and intergovernmental documents determining the formation and development of the united electricity market of the Eurasian Economic Union (UEM EEU) are (Libman et al., 2012; Inshakova et al., 2019; Vinokurov, 2018; EEU program, 2016):

- Agreement on ensuring parallel operation of the electric power systems of the CIS member states (1998)
- Agreement on the transit of electricity and power of the CIS member states (2000)
- General principles of cross-border electricity trade in the CIS member States (2010)
- Agreement on the Eurasian economic Union (2014)
- The concept of the Eurasian economic Union formation (2015)
- The program for the formation of the EEU common electricity market (2018)

According to these documents, the functions of the EEU are:

- ensuring the balance of economic interests of producers and consumers of electricity in the member states;
- coordination and provision of joint operation of the systems for sale and purchase of electricity of the member states;
- ensuring the balance of supply and demand based on competitive pricing.

The functional structure of the UEM of the Union consists of (Lisin et al., 2017a; EEU program, 2016; Iskakova et al., 2017):

- a market for mutual trade under free bilateral agreements;
- a linked day-ahead market, which is a mechanism for ensuring the coordinated operation of the spot markets of the member states;
- balancing market that operates in real time according to uniform rules for all cross-border sections of the Union's UEM

The effective functioning of the Union's UEM is ensured if the market structures of the member states have segments of the trade market under free bilateral agreements and the spot market. Thus, during the formation of the Union's UEM, it is planned to liberalize the energy markets of the member with the aim of convergence of their structure and ensuring their functioning according to common market rules.

At the same time, most of the energy facilities of the member states were commissioned during the planned economy period and were not created to function in the competitive conditions of energy markets. The market conditions of functioning will significantly affect the efficiency of energy facilities, first of all, on heating systems that provide integrated energy supply to regional consumers.

Background

Current state and market structure of the Russian energy sector

Despite the fact that the energy systems of the countries of the Eurasian Economic Union were formed within the framework of the same concept laid down in the GOELRO plan adopted by the RSFSR in 1920, after the collapse of the Soviet Union, the countries developed different strategies for the energy economy development. The implementation of these strategies in recent decades has led to significant differences in the structure and approaches to management of the states' energy systems.

At present, the power system of Russia consists of 70 regional power systems, which form 7 integrated power systems: East, Siberia, Urals, Middle Volga, South, Center and North-West. All power systems are connected by intersystem power lines and operate in synchronous mode (in parallel) (Lisin et al., 2018a; Lisin et al., 2017b; Lisin et al., 2015).

The power systems form the unified power system of the country with an installed capacity of 246 656 MW. All stations generate about 1 trillion kWh of electricity annually. Thus there is an increase in electricity generation.

The electric grid sector of Russia is represented by 110-1150 kV transmission lines and covers an area of 12 million km2, where 143 million people live (more than 98% of the population). The rest of the country (about 29%) is supplied with energy by isolated power systems.

The Unified Energy System of Russia produces more electricity than it consumes. The electricity surplus is about 22 million kWh per year. This electricity is exported to neighboring countries (Lisin et al., 2018a; Voropai et al., 2018; Lanshina et al., 2018).

The main consumers of electricity are the oil and gas industry (mining and processing), metallurgical plants, mechanical engineering, light and food industries.

The Unified Energy System of Russia operates according to the rules of the market model of the wholesale electricity and capacity market. The natural monopoly of the state applies only to electricity transmission services.

The wholesale energy market model is a centralized auction of bids for the supply and purchase of electricity at the settlement nodes of the power system (Shindina et al., 2018; Lisin et al., 2018b). The wholesale energy market is divided into trading segments: free contracts market, day-ahead market (more than 72% of electricity is sold), balancing market, regulated contracts.

The structure of the wholesale energy market in Russia is shown in Fig. 1.

Fig.1: The structure of the wholesale energy market in Russia

Current state and market structure of the energy sector in Kazakhstan

The unified energy system of Kazakhstan covers an area of about 2 million km2 (74% of the country's territory) with a population of 16 million people (89% of the population). The country's energy system is conditionally divided into three zones: North, South and West. The Northern zone is energy surplus, it covers its own electricity demand and transfers the surplus to the Southern zone, as well as for export to Russia. The Western zone is characterized by both energy-surplus and energy-deficient areas. The existing restrictions on the permissible overflow in the cross-sections of the power grids do not allow providing the energy-deficient areas of the Western zone using its energy-surplus areas (Assembayeva et al., 2018; Sarbassov et al., 2013).

As well as the energy system of Russia, the energy system of Kazakhstan is energy surplus. Electricity generation in 2020 in Kazakhstan amounted to 106 billion kWh, and consumption was 105 billion kWh.The total installed capacity of the unified energy system of Kazakhstan is 22,936 MW.

The power grid of Kazakhstan consists of 0.4-1150 kV transmission lines. The main transmission lines of Kazakhstan are connected to the Russian power system in the north and to the unified power system of Central Asia in the south. There are large losses in the transmission and distribution of electricity - 21.5%. In the structure of electricity consumption in the country, the largest share falls on the industrial sector (over 68% of total consumption). The dynamics of electricity consumption by the industrial sector reflects the annual growth of electricity consumption by 5%, which indicates the energy intensity of the economy of Kazakhstan (Atakhanova et al., 2007; Dagoumas et al., 2020).

Market pricing mechanisms have been implemented in the rules of operation of Kazakhstan unified energy system. At the same time, the system operator of the power system is integrated with the backbone network operator (KEGOC JSC).

The electricity market is represented by a decentralized model based on bilateral contracts. More than 90% of electricity is sold under the trade segment of free bilateral contracts. The structure of the wholesale energy market in Kazakhstan is shown in Fig. 2.

Fig. 2: The structure of the wholesale energy market in Kazakhstan

Current state and market structure of the energy sector in Belarus

The United Energy System of Belarus consists of regional energy systems with a single centralized operational dispatch control. The general management of the energy complex is carried out by the Ministry of Energy. The functions of energy management in Belarus are carried out by the State Production Association of the Electric Power Industry "Belenergo" (SPA "Belenergo"), subordinated to the Ministry of Energy. The energy sector is fully under the jurisdiction of the state. There are no market mechanisms in the power industry (Lisin et al., 2017a; Novikau, 2019; Sivak et al., 2003).

RUE Belenergo" consists of six regional republican unitary enterprises of the electric power industry, RUE Oblenergo, responsible for the functioning and development of regional power systems, as well as RUE “ODU”, which carries out centralized dispatching control of the unified energy system of the country.

Regional RUEs are formed on a territorial basis and are vertically integrated companies, which include power plants, electrical and heating networks.. They cover the entire territory of the state (207 thousand km^2) and provide energy supply to the population (9.5 million people) and industrial enterprises.

The installed capacity of the unified energy system of Belarus is 10,098 MW. The power system is characterized by a high share of combined production of electricity and heat (92% of thermal power plants are CHPs).

The power grid economy is represented by a 220-330-750 kV network, Cross-border and intersystem power lines are quite well developed and allow for the import and export of electricity in a wide range.

The United Energy System of Belarus is energy deficient. The country annually imports electricity from 3 to 8 billion kWh (up to 25% of its own electricity generation). The main energy donor is Russia.

Electricity imports mainly cover the peaks and half-peaks of electricity consumption. This ensures maximum fuel efficiency of the CHP operation.

In the structure of electricity consumption, industry accounts for 56%, population - 23% (Lisin et al., 2017a; Novikau, 2019; Sivak et al., 2003).

The electric power market is a vertically integrated structure - the united (republican) power system unites six regional power systems corresponding to the administrative-territorial structure of the state. Within each of the regional power systems, regional management enterprises operate, on the balance of which there are power plants and networks that form the power system. They are responsible for the production, transmission, distribution and sales of energy in the region.

The structure of economic relations in the power industry of Belarus is shown in Fig. 3.

Fig. 3: The structure of economic relations in the electric power industry of Belarus

Methods

The scheme of heat supply systems organization

The heat supply systems of the countries of the Eurasian Economic Union are mainly built according to a centralized scheme, within the framework of which heat is supplied to many consumers from one source of heat energy (CHP or district boiler house) through a central heat point. About 63% of the housing stock in Russia is provided with heat and hot water from centralized heating systems, in Belarus and Kazakhstan at least 50% (Lisin et al., 2017a; Novikau, 2019; Stennikov et al., 2020; Kerimray et al., 2018).

The most common in the countries of the European Economic Union is an independent heat supply system, in which the piping systems of the heating network form several independent circuits, separated by an intermediate heat exchanger that transfers heat in contact with the coolant. Mains water acts as a heat carrier.

Fig. 4 shows the dynamics of heat consumption in Russia, Kazakhstan and Belarus.

Fig. 4: Dynamics of heat consumption in the countries of the Eurasian Economic Union

As can be seen from the graphs, the heat consumption of the countries of the Eurasian Economic Union is decreasing. At the same time, if we analyze the change in the heat capacity of GDP, then in general the opposite picture is visible (Fig. 5).

Fig. 5: Dynamics of the GDP heat capacity of the countries of the Eurasian Economic Union

This indicates the presence of crisis phenomena in the economies of countries, which led to a reduction in the gross product. At the same time, a decrease in heat consumption due to the modernization of heat supply systems and a decrease in heat losses does not allow to compensate for the negative growth trend in the heat capacity of GDP.

It can be said that today the schemes of heat supply systems have a complex fragmented structure due to different stages of their development. During the planned economy, heat supply systems for residential and industrial facilities sought to be implemented through centralized systems based on heating technologies – centralized heat supply in the production of electric and thermal energy in a single technological cycle at a CHP. Thus, it was possible to achieve energy savings and reduce the cost of heat energy and, ultimately, the tariff for consumers.

The production, transmission and distribution of energy in most countries of the Eurasian Economic Union ended up in different ownership, a lot of intermediaries appeared between generating facilities (heat sources) and consumers, which currently significantly affects the final cost of consumed heat.

District Heating Business Models

Based on the above systematic analysis of the organization and functioning of the energy systems of the key member countries of the Eurasian Economic Union, it can be assumed that the liberalization of economic relations in heat supply, which will be facilitated by the creation of a unified energy market, may lead to the emergence of the following business models for the development of regional heat supply systems and heat sales services:

1. A model for the development of a heat supply system based on the sale of heat energy through a wholesale reseller.
2. A model for the development of a heat supply system based on the direct provision of heat supply services using its own or leased networks.
3. A model for the development of a heat supply system based on the direct provision of heat supply services to consumers with transit through the networks of a third-party organization.

The first model describes the situation when a heat source (thermal power plant) releases heat energy from collectors in a wholesale reseller's network. In this case, the calculation of the cost of supplied energy is carried out on the basis of actually supplied volumes and tariffs set by the regional energy commission or by the "alternative boiler house" method. In this case, the wholesale reseller is also likely to be the owner or operating organization of heating networks.

The second model assumes the absence of any intermediaries between the heat source and heat consumers. To implement this model, the generating company must own, lease, or have operational management rights (a concession agreement) for both main and distribution district heating networks.

The last model is the most complex from the point of view of the regulatory system and the conflicts between the market participants potentially embedded in it.

The most likely is the implementation of the first business model of organizing heat supply systems, the introduction of which should lead to a decrease in the cost of heat for consumers and the heat capacity of GDP, provided that competition between heat suppliers develops.

Method of implementing the district heating business model

As a method of implementing the business model of the district heating system, it is proposed to form a single heat supply organization that sells heat at fixed tariffs to end users, collects payments, and has the authority to optimize capacity utilization. At the same time, it enters into unregulated contracts with heat suppliers, based on the principle of "alternative boiler house".

An alternative boiler house is understood as a set of standard technical and economic parameters for the operation of a model heat source. In accordance with this concept, an alternative boiler house is a local source of heat supply, which consumers in the region can use to replace third – party heat supply organizations. The determination of boiler house parameters is based on the premise of using the most modern and economical technologies. In the

process of modeling, based on a number of input parameters (technological and economic), in accordance with the payback period and the rate of return acceptable to the investor, the marginal level of the tariff for heat produced in the region (the required gross revenue) is calculated. This value is used to determine the marginal possible tariff for district boiler houses. The marginal tariff for heat generated by the CHPP is assumed to be equal to the tariff of the boiler house minus the cost of transporting heat through the main pipelines. The final tariff for the consumer is defined as the tariff of the boiler house with a surcharge for transportation through distribution networks:

$$Tariff_{CHP} = Tariff_{Boiler} - C_{lines}^{magistral} + C_{lines}^{distribution} \quad (1)$$

where $Tariff_{CHP}$ - marginal tariff for thermal energy generated at CHPP , $Tariff_{Boiler}$ - ideal boiler house tariff, $C_{lines}^{magistral}$ - the cost of transporting heat through the main networks to the heating point , $C_{lines}^{distribution}$ - the cost of transporting heat energy through distribution networks to the consumer.

At the same time, the "alternative boiler room" method has many disadvantages. So, model calculations show that the inclusion of capital costs of the boiler house in the calculation of the marginal price leads to a significant increase in the tariff for thermal energy in many regions. Also, the monopoly of a single heat supply company will not allow independent heat producers to develop.
To reduce the impact of these shortcomings, it is proposed to take into account the structure of heat sources operating in a single price zone when forming the tariff for heat energy (Fig. 6).

Fig. 6: Improved method of the marginal tariff for heat forming

According to the method, the key costs of heat producers are considered as a set of production and investment costs. Production costs are primarily determined by fuel costs. Investment costs are determined by the costs of modernization programs for fixed assets. The marginal tariff is determined by the closing costs of the last switched on heat source. The "ideal boiler house" model is involved in pricing.

Finding the closing costs (the last included heat source with the highest total costs when generating a volume of heat not provided by other sources) requires solving the dynamic programming problem:

$$TC(Q) = \min\left[TC_1(Q_1) + TC_2(Q_2) + \ldots + TC_n(Q_n) + TC_{IB}(Q_B)\right] \quad (2)$$

$$\begin{cases} TC_i(Q_i) = I_i + kbQ_i \\ TC_{IB}(Q_{IB}) = I_{IB} + kbQ_{IB} \\ Q_1 + Q_2 + \ldots + Q_n + Q_{IB} = Q \\ Q_i^{\min} \le Q_i \le Q_i^{\max} \\ Q_{IB}^{\min} \le Q_{IB} \le Q_{IB}^{\max} \end{cases} \quad (3)$$

where Q - the required heat capacity of the heat supply system to meet the needs of the consumer, Q_i - heat capacity of the *i*-th heat source, Q_B - heat output of an ideal boiler house, $TC_i(Q_i)$ - total costs of the *i*-th heat source, $TC_{IB}(Q_B)$ - total costs of an ideal boiler house.

Results and Discussion

Fig. 7 shows the results of calculating the marginal pricing for large cities in Russia according to the considered business model of the district heating system and the proposed method for forming the marginal heat tariff. The results are compared with the current tariff and calculations using the “alternative boiler house” method.

Fig. 7: Results of calculations of the marginal pricing according to the proposed method and the method of "alternative boiler house"

As can be seen from the above calculation results, the proposed marginal pricing method for the district heating business model based on the organization of a unified heat supply company allows to reduce the upper price limit obtained by the “alternative boiler house” method. However, the cost of heat is higher than the current tariff. To prevent tariff growth, it is necessary to improve the organizational model of the unified heat supply company by developing mechanisms to increase market competition between heat sources.

A separate issue is the identification of possible risks in the implementation of market business models for organizing district heating systems for consumers in the formation of a common energy market in the countries of the Eurasian Economic Union. These risks include:

- the emergence of a conflict of interests between the generating company and the wholesale reseller of energy;

- possible deviation of sales volumes from the planned indicators of the generating enterprise due to the high competition of heat producers for a single buyer represented by a wholesale reseller;
- when forming a tariff for a consumer based on the costs of a wholesale reseller, the latter loses incentives to reduce costs and efficiently distribute the heat load. As a consequence, the choice of a heat source can be made not on the basis of its efficiency, but on the basis of affiliation with a wholesale reseller;
- the risk of growth of generating companies receivables and an increase in wholesale reseller payables significantly increases.

The impact of these risks on the efficiency of the considered business models for the development of regional heat supply systems in the context of the Eurasian Economic Union energy markets integration requires separate studies.

Conclusion

The creation of a unified electric power market of the member countries of the Eurasian Economic Union affects the sustainable development and the rules for the functioning of regional heat supply systems, which is due to the fact that the key technology for the production of energy products, which forms the basis of the energy systems of countries, is district heating, which involves centralized energy supply to consumers on the basis of joint generation of electric and thermal energy at a CHPP.

The analysis of economic relations in the electric power industry of the countries of the Eurasian Economic Union showed that after the collapse of the Soviet Union, the countries developed different strategies for the development of the energy economy. While Russia and Kazakhstan have taken the path of liberalizing the electricity market, Belarus has maintained a planned energy economy. Market mechanisms introduced in the energy sector of Russia and Kazakhstan are aimed at increasing the volume of electricity production in order to reduce its unit cost and increase exports to energy-deficient countries. The planned development of the energy economy of Belarus involves the rational use of heating facilities and the extraction of the maximum economic and environmental effect from the combined production of electricity and heat. The implementation of these energy strategies in recent decades has led to the emergence of significant differences in the structure and management of energy systems of states.

The creation of an energy market will lead to the introduction of general market rules for the functioning of heating systems of states. At the same time, various business models for the development of regional heat supply systems and the provision of heat sales services may arise.

The most likely is the implementation of a model for the development of a heat supply system based on the sale of heat energy through a wholesale reseller. It requires the formation of a unified heat supply organization that sells heat at tariffs to consumers and concludes unregulated contracts with heat suppliers using the "alternative boiler house" method.

To eliminate the shortcomings of the “alternative boiler house” method, leading to an increase in the tariff for heat energy, an improved method of forming the marginal tariff for heat by a single heat supply organization is proposed. This method allows you to reduce the upper limit of the price by constructing a supply curve and finding the closing costs of the last heat source to be switched on. It is shown that in order to prevent tariff growth, it is necessary to improve the business model of a unified heat supply company by developing mechanisms to increase market competition between heat sources.

Abstract

Enterprises, adapting to changes in the economy, often decide to change their cooperation strategy. However, it should be noted that when looking for new business partners and establishing relationships with them, they take risks. The main goal of the research is to identify the sources of risk occurring in the early stages of inter-organizational cooperation. In order to achieve the aim of the study empirical research using the in-depth survey method and direct interview was conducted on a sample of 244 entities located in Poland.

Keywords: Inter-Organizational Cooperation, Risk Management, Cooperation Risk.

Introduction

The economy of the 21st century is an economy that is constantly changing. Many market entities, seeking to improve the efficiency of functioning in new conditions and striving to position the company on a development path adapting to changes taking place in its environment, decide to cooperate with numerous partners under various conditions. Its goal is to achieve a number of benefits, such as increasing competitiveness, improving economic performance, reducing costs, or increasing the value of an enterprise.

It is worth noting that in order to successfully achieve the assumed goals, enterprises are often forced to change their cooperation strategy. Relationships that have been assessed as ineffective or inconsistent with the current development strategy are ended. At the same time, new relationships are being established with partners who will achieve their business goals. It should be noted, however, that decisions regarding the selection of contractors and the act of building numerous relationships of different nature are associated with risk. Therefore, it can be concluded that a thorough analysis of the risk occurring in the process of inter-organizational cooperation is crucial for achieving success in the implementation of restructuring activities.

On the basis of the above considerations, the main goal of the article was determined, which is to identify the sources of risk occurring in the early stages of inter-organizational cooperation. In order to achieve this goal empirical research using the in-depth survey method and direct interview was conducted on a sample of 244 entities located in Poland.

The Essence of the Risk of Inter-Organizational Cooperation

The analysis of the complex issues of risk occurring in the early stages of inter-organizational cooperation should begin with the exact definition of key terms. Although the subject of cooperation risk management is of interest to both the scientific and business community, it is difficult to find a uniform theory in the literature explaining the basics of threats occurring in cooperation between business entities. It is therefore worth trying to clarify concepts such as cooperation and risk. The view in Polish literature is that inter-organizational cooperation should be treated as cooperation focused on achieving benefits (Jaźwiński and Kiernożycka-Sobejko, 2006, p. 609; Kaczyński, 2012,

Cite this Article as: Bartosz MARCINKOWSKI and Sebastian NAROJCZYK " Risk Sources in Early Phases of Inter-Organizational Cooperation" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

p. 166; Mazur, 2011, pp. 290–291; Nowak, 2012, pp. 15–35; Olszyński, 1989, p. 11; Strzyżewska, 2011, pp. 27–29). According to many researchers, cooperation is primarily a form of achieving competitive advantage. Through cooperation, organizations gain the opportunity to functioning on global markets, access to cheap or qualified labor, taking advantage of the benefits of the scale or taking the most advantageous position in the value chain (Achrol and Kotler, 1999, pp. 146–147; Jarillo, 1988, p. 31; Narojczyk, 2016, pp. 57–63; Olszyński, 1989, pp. 12–15; Varadarajan and Jayachandran, 1999, p. 132).

At this point it should be emphasized that there are numerous forms of inter-organizational relationships in business practice. In addition, they have a dynamic and evolutionary character - they change over time, depending on the current requirements of entities, their level of development, market situation, or the adopted operations strategy (Jaźwiński and Kiernożycka-Sobejko, 2006; Kaczmarek, 2000; Lichtarski, 1992; Rangan and Yoshino, 1996; Webster, 1992; Wściubiak, 2017, pp. 375–387).

However, enterprises which decide to cooperate do not only benefit from such activity. Cooperation with a business partner involves some risks. It is worth noting, however, that the concept of risk has changed over the years, adapted to the level of development and the state of knowledge, which results in a multitude of perspectives from which this term can be interpreted, it has many meanings, associations, synonyms that occur in everyday, as well as scientific language. A general explanation of this concept can be found in the Polish dictionary(Szymczak, 1993, pp. 155–156), which states that risk is the probability that something will go wrong, a venture whose outcome is unknown, uncertain, problematic. It requires courage to take such a risk. On the other hand, in view of the problems of enterprise cooperation, risk is most often understood in accordance with the so-called negative concept. Its essence is to understand risk as the possibility that something will go wrong, have the courage to take the risk of which the outcome is unknown or risky, and is likely to cause damage (Małkowska-Borowczyk, 2012, pp. 9–10).

It should be noted that the risk of cooperation is a significant barrier to the development of inter-organizational relationships (Chundong et al., 2012, p. 197; Nowak, 2015, pp. 47–67). However, analyzing the subject's literature, it can be seen that these issues have not been sufficiently recognized. Although researchers agree on the existence of the phenomenon of the risk of cooperation itself, by isolating its sources and assessing the significance of its individual sources, they use diverse criteria, and achieve different results (Lee and Johnson, 2010, pp. 273–276; Liu and Zhao, 2009, pp. 4510–4511; Sumei, 2010, pp. 574–577; Wang Fei and Wang Shilei, 2010, pp. 418–420).

Research Metodology

Empirical research on risk in the early stages of inter-organizational cooperation was carried out in the period from 2017-2018. 244 entities located in Poland were analyzed using a questionnaire. In addition, an observation and direct interviews were carried out in selected entities, during which the author had the opportunity to obtain more extensive information and opinions resulting from experience and practice. The study was carried out in 5 stages as shown in the figure 1:

1. On the basis of the conducted literature studies, an appropriate theoretical framework was built to analyze the sources of risk. The cooperation process was defined and divided into successive phases. This article focuses on the phases of early cooperation (establishing the requirements profile and selecting a partner; establishing cooperation).
2. On the basis of literature research, participant observations and direct interviews, the sources of risk were identified and classified to the phases of the cooperation process.
3. In the survey, the respondents were asked to evaluate the previously identified risk sources in terms of the probability and consequences of their occurrence.
4. Based on the respondents' answers, the risk of individual events was estimated.
5. Factor analysis was used to reduce a large number of variables, the importance of which is initially difficult to estimate. Mutually independent common factors were received by combining correlated variables and removing insignificant ones.

Fig. 1: research process

Sources of risk in the early stages of inter-organizational cooperation

In the risk management process, the basic and at the same time the most important activity is the correct detection of risk sources, i.e. events that are a potential threat to the enterprise. It should be emphasized that the completeness and correctness of actions at this stage determines the accuracy of further measurements and the effectiveness of the developed procedures.

The starting point for research on the sources of risk in the initial stages of cooperation was to build an appropriate theoretical framework enabling easy and clear interpretation of the results obtained. In line with the above intention, based on the approach of Kapcia (1994), Marxt and Link (2002) and Urbaniak (2008), the process of cooperation of enterprises was divided into four successive phases presented in Figure 2:

1. Establishing the requirements profile and selecting a partner. At the beginning of this phase, an analysis of key competences and resources offered by potential partners is carried out, as well as verification of common goals. To ensure optimal results, it is necessary to use a variety of methods to search for information from many different sources. Then the most suitable of the available contractors is chosen.
2. Establishing cooperation. After meeting the requirements specified in the previous phase and finding the optimal partner, cooperation with the contractor is established. Enterprises should strive to establish a cooperative relationship aimed at achieving common goals. At this stage, the partner is often tested by gradually increasing the responsibility of the given tasks.
3. Cooperation development. At this stage, intensive cooperation occurs, which manifests itself, inter alia, in the rapid circulation of money between partners, or the development of the scope of assets included in the cooperation process. There is great commitment of employees at all levels in partner enterprises. Enterprises, through the development of relationships, strive to achieve stability, maintain internal stocks and strategic resources that allow their partners to survive in emergency situations.
4. End of the relationship. In this phase cooperation between partners is finalized. The reason for the decision in this respect can be both the achievement of previously set cooperation goals, the lack of further interest in cooperation, as well as the occurrence of a conflict between contractors.

Fig. 1: Enterprise cooperation process

Source: own study based on: Kapcia, B., 1994. Fazy rozwoju współczesnej kooperacji. Przegląd Organizacji 18–20; Marxt, C., Link, P., 2002. Success factors for cooperative ventures in innovation and production systems. International Journal of Production Economics 77, 219–229; Urbaniak, M., 2008. Rola jakości w procesach budowania relacji z dostawcami na rynku B2B (cz. 1). Logistyka nr 6, 28–29.

Having in mind that companies adapting to changing market conditions, often change the strategy of cooperation, the main focus was on the sources of risk in the first two phases, i.e. determining requirements and choosing a partner, and establishing cooperation. Next, an attempt was made to classify the sources of risk in relation to the phase of the cooperation process in which they occur. According to the classification assumptions, each event could be assigned to only one group. At this point, however, it should be noted that the effects of some of the isolated events can be manifested at various stages of the cooperation process, e.g. the effects of a certain event that occurred during the selection of a partner may not appear until the relationship development phase. In such situations, the assignment of a given source of risk to a specific phase of the inter-organizational cooperation process was guided by the criterion of probability and consequences of its occurrence. Therefore, the event was classified into a phase in which the chances and effects of a given event are the highest. In the event of doubts, they were resolved primarily on the basis of literature studies carried out and the opinions of experts obtained during direct interviews and participant observation in selected entities.

Fig. 3: Sources of risk occurring at the stage of determining requirements and selecting partners
Source: own study based on empirical research.

As part of research on the sources of risk manifesting themselves at the stage of determining the requirements for cooperation and the selection of partners, a number of factors have been identified, which are presented in Figure 3. It should be emphasized that the events identified primarily concern the analysis of their own expectations of future partners and the competences of potential contractors performed by enterprises, as well as compliance of the cooperation goals. The sources of risk occurring at the first stage of the cooperation process include:

1. Treating the potential partner's own individual goals as superior to cooperative goals. It should be noted that building a long-term and stable inter-organizational relationship on such a foundation is not possible, because a partner preferring self-interest over the common one is a source of serious danger, e.g. in the event of an opportunity for above-average profit, he can shift his resources engaged in cooperation towards more profitable venture.
2. Occurrence of different goals of the partner, which in the future will prevent building a close relationship, which should be based on common, compatible goals, motivating cooperation, as well as building trust. The selection of a partner whose basic goals are inconsistent with the company's goals may result in a conflict at a later stage of cooperation, or even lead to an end of the relationship.
3. Having too high expectations of the partner, which may result in overestimation of the value of relationships and excessive involvement of both tangible and intangible resources in cooperation.
4. The partner having bad intentions, which at the early stage of building cooperation is primarily associated with concealing goals and the desire to achieve individual benefits at the expense of other participants in the value chain.
5. Choosing the wrong partner due to incorrect analysis of his abilities, competences or possibilities. The consequence of such an event may not only be the involvement of significant resources in a relationship in which it will not be possible to achieve the set goals, but even the need to look for a new partner at the least convenient time for the company.
6. The occurrence of information asymmetry, i.e. a situation in which a potential partner has more or less information on planned cooperation. As a consequence of the above, incorrect or ineffective decisions based on incomplete knowledge may occur.
7. Conducting unsuccessful negotiations, which will not result in a win-win effect. As a consequence, it is possible that all enterprises involved in the cooperation process will not benefit equally from cooperation and

jointly pursue common goals. It should be noted that the partners treated as subordinate will not be willing to engage their key competences in cooperation organized in this way.

8. Choice of a partner who is negatively affecting the environment. It should be emphasized that units caring for ecology should not only analyze their core business in the context of ecosystem protection, but also the activities of all partners. In addition, establishing cooperation with an unsuitable partner in this respect, even if it is cooperation of low strategic importance, may result in significant costs and loss of the image of not one entity, but all units of the value chain.

9. Occurrence of IT systems non-compliance. When creating long-term close cooperation, this is an element that may cause communication difficulties and unnecessary costs in the future.

Fig. 4: Sources of risk at the stage of cooperation

Source: own study based on empirical research.

The next phase of the cooperation process, during which potential partners establish cooperation, must match each other and build a future relationship, is associated with certain specific threats presented in Figure 4. At this stage, a number of differences in the approach to running a business and methods of achieving goals are revealed. It should also be emphasized that enterprises when establishing relationships are particularly susceptible to broadly understood fraud and dishonesty on the part of partners seeking to maximize their own benefits at the expense of other participants in the value chain. The following events were classified as the most significant risk factors at the stage of commencing inter-organizational cooperation:

1. Modifying the facts by the partner, which is of particular importance in the context of providing information about production and service possibilities and sharing all kinds of financial data. Modifying the facts by the contractor in this regard threatens, among others, making wrong decisions based on false information, entrusting the contractor with overly responsible tasks that may not be fulfilled, and finally even leading to the end of the relationship.

2. Hiding information by the partner, which may be motivated by the desire to establish a highly profitable relationship, or an attempt to achieve their own hidden goals. As in the case of modifying the facts, it may threaten, among others making ineffective decisions and entrusting the partner with inappropriate tasks.

3. Establishing cooperation with a dishonest partner, which may result in the loss of funds, materials, employees or know-how. It should be noted that cooperation with an unreliable co-operator is very dangerous, especially in the case of small enterprises, because it can even lead to the loss of financial liquidity and, consequently, to bankruptcy.

4. The differences in the style of communication, which are revealed at the stage of establishing cooperation, can significantly impede the flow of information between partners and even cause conflicts in the future. This problem is particularly important in the context of international activities in various cultures.

5. Discrepancies in the joint venture management vision. Partners may disagree about methods and ways of achieving goals.

6. The emergence of intercultural misunderstandings, which is gaining in importance along with the rapidly progressing globalization, internationalization of economic activity and the expansion of markets. These misunderstandings can significantly affect the flow of information between partners.
7. Problems with financing joint projects, which includes difficulties in obtaining financing sources and problems with fair distribution of liabilities between partners.
8. Manipulation of the company's behavior by a partner aimed at achieving individual, hidden goals and own benefits at the expense of the contractor.

Discussion

At the next stage of the study, the respondents were asked to determine the probability and consequences of the above-mentioned events on a five-point Likert scale. It allowed, in the course of further studies, to estimate the risk level of individual events and to detect the most important ones. At this point, it should be emphasized that the entrepreneurs participating in the study could also supplement the list of risk sources with further events concerning cooperation, which in their opinion are important, and were not included in it. However, none of the respondents decided to extend the list, considering it extensive and exhaustive.

Then, in accordance with the adopted risk definition, the probability of occurrence of individual events indicated by the respondents was multiplied by the scope of their negative consequences, thus obtaining a number of variables describing the risk of cooperation. At the last stage of the research, in the course of further analyzes, in order to reduce a large amount of information obtained, a factor analysis with Varimax rotation was used. It allowed to reduce many primary variables to several mutually independent common factors by combining correlated variables and removing insignificant ones, the importance of which is initially difficult to assess. The use of such an approach allowed for the identification of risk areas in the early stages of cooperation, of the greatest importance for entrepreneurs, due to the high chances of occurrence on the one hand and high consequences on the other. Such an analysis of the problem should make it much easier for organizations to build new or develop already existing risk management systems through a clear and legible definition of the areas of threats related to cooperation, to which special attention should be paid.

In the conducted analysis, 4 common factors were distinguished using the Kaiser criterion (according to which the factor loading of each of the common factors subject to further analysis should be greater than 1). It should be noted that the selected factors explain almost 56% of the variance of the analyzed problem. The first of the common factors, characterized by a high loading (5.6), explains over 32% of the variability of the studied phenomenon. Subsequent factors have a lower and lower loading, up to the last, borderline fourth one, which has a loading of 1.03. The last factor explained 6% of the variance of the problem studied. Detailed data on the structure of the factors, their loadings and the explained variance are presented in Table 1.

Table 11: Risk areas in the early stages of inter-organizational cooperation

Common factors	Risk loads	Factor loading	Percentage of variance explanation
Dishonesty of the partner	- Manipulation by the partner - Manipulation by the partner - Partner dishonesty - Hiding information by the partner przez partnera	5,60	32,94
Ineffective communication	- Non-conformity of IT systems - Differences in the style of communication	1,71	10,04
Differences in strategy of management	- Partner having different goals	1,17	6,88
Information asymmetry	- Information asymmetry (unequal access to information)	1,03	6,06

Legend: Factor analysis with raw Varimax rotation was conducted. Loads greater than 0.68 were used in the construction of factors.
Source: own study based on empirical research.

The main factor explaining the largest part of the variability of the analyzed phenomenon (32.94%) is a factor consisting of such loads as risk of: manipulation by the partner, modifying facts by the partner, partner dishonesty and hiding information by the partner. This factor can be described as the risk of dishonesty. This risk is particularly important at the stage of setting requirements and choosing a partner. As the research shows, establishing a relationship with an unreliable partner is both highly probable and may have the greatest consequences in the future, during the development of cooperation.

The second factor is related primarily to the way of communication. Due to the fact that it is correlated with such primary variables as: non-conformity of IT systems and differences in the style of communication, it can be described as communication risk. This factor explained 10.04% of the variability of the studied phenomenon, and it becomes particularly important at the stage of setting requirements and choosing a partner, because the mismatch between partners in this respect will affect the effectiveness of the future relationship.

Another factor identified threatens to achieve the assumed effects of cooperation. It can be defined as a strategic risk, because it is shaped by such a factor load as the risk of partner having different goals. This factor explains 6.88% of the variability of the analyzed phenomenon.

The last examined common factor, explaining 6.06% of the variance of the problem studied, can be described as the risk of information asymmetry. This risk is related to the relationship in which one of the partners decides to establish and develop cooperation having greater access to information and planning to use it to achieve greater benefits than the other parties involved in the cooperation.

It should be emphasized that enterprises striving to achieve new competitive advantages, expanding sales markets or reducing operating costs by increasing the scope and intensity of inter-organizational cooperation, should place particular emphasis on risk reduction in early stages of cooperation. This will allow to establish cooperation with the right partners and reduce the risks of future cooperation development. At this point, the importance of a properly designed and implemented risk management system should be emphasized. However, in order for this system to work efficiently and effectively, especially in the light of the very complex issues of cooperation between enterprises, a thorough assessment of cooperation risks is necessary, which includes the evaluation of both the probability and consequences of specific events, and a comprehensive analysis of the risk level.

Conclusion

To sum up, it should be said that on the basis of literature studies, empirical research, own observations and experiments, a group of 17 sources of risk was identified in the early stages of the enterprise cooperation process, i.e. when determining the profile of requirements and partner selection and establishing cooperation. It should be noted that each of the distinguished stages was characterized by certain specific types of threats. The conducted analyzes showed that in the early stages of cooperation, enterprises should pay special attention to the risk of dishonesty of the partner, ineffective communication, differences in strategy of management and information asymmetry.

The results of the above research can be used by enterprises adapting to changes in the economy by changing the cooperation strategy. Based on the prepared list of risk sources occurring at the initial stages of cooperation, it is possible to develop an effective risk management system, taking into account the complex specifics of relationships between business entities. It should be emphasized that further research on the issue of cooperation risk should focus on a more detailed analysis of the identified sources of risk.

Big Data Management Intentions in Higher Education Sector: A Perspective of Public Research Universities in Malaysia ~ A Pilot Result

[1]TASMIN, R., MUHAMMAD, R. N., ABDUL HAMID, N. A.

Department of Production and Operation Management,

Abstract

Industry 4.0 primarily focuses on 4 major domains, namely artificial intelligence, robotics, the Internet of things and big data analytics. Decision to adopt big data management is influenced by numerous factors, some of which are behaviorally interrelated. Discovery and validation of these factors are essential to be able to empirically describe their relationships and impact on one's decision to make use of the technology in the future. This paper reports the result of a pilot survey aiming to validate a questionnaire that is specifically designed to collect data on the behavioral intention factors that may likely influence higher education institutions to intend to adopt big data management. A total number of 50 sampled responses were used in the study. The Statistical Package for the Social Sciences (SPSS) version 23 was applied for the factor analysis and reliability analyses of the collected data. The result shows that the 50 responses were reliable and appropriate for the main study survey. All the factor reported loadings have fulfilled the acceptable threshold of 0.70. Both the reliabilities of the items and the scales were also within the acceptable threshold. Thus, it was concluded that the questionnaire was reliable and can subsequently be applied on the aim it was designed for.

Introduction

Competitiveness is today an exciting topic for research studies. Most organizations are engaged in a certain form of competition, either for the purpose of customers or for benefits due to scarcity of resources (Mainardes *et al.,* 2011). With globalization in organizations, there is virtually no sector in which competition has not increased significantly (Campbell-Hunt, 2000), including the higher education sector (Levy, 2006). In the current competitive business environment, organizations aim to push beyond the boundaries of table sheets and inadequate business intelligence reporting in order to achieve a more personalized and more extensive data utilization experience. Today, organizations continuously receive and send data in several formats, at various speeds and using various techniques. Hence, organizations are seen rapidly growing both internally and externally. Thus, this pushes them in seeking ways to sustain competitive advantage to improve their performance, particularly through new innovation (Tasmin & Woods, 2007). This growth forecasts an industrial revolution driven by real-time analysis, very accurate and alert actions. As a result, data are processed and transmitted instantly while the models and algorithms are stored. Therefore, the organization's potential to analyze this diverse variety of voluminous data is vital and nowadays, readiness and adoption for such analytics are at the center of attention.

In recent decades, the higher education sector has been the subject of growth due to its strategic nature to nations. In this respect, the education sector has undergone shifts emerging increase in competition among higher education institutions (HEIs) (Ahan, 2014; Tasmin et al., 2020). This competition has had consequences for all the higher education sector stakeholders. Such changes in the environment of higher education have begun to demand more

Cite this Article as: TASMIN, R., MUHAMMAD, R. N., ABDUL HAMID, N. A. "Big Data Management Intentions in Higher Education Sector: A Perspective of Public Research Universities in Malaysia ~ A Pilot Result" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

measures and management to sustain competitive advantage in order to advance (Muhammad et al., 2020). Data-driven innovation is required to improve the previous fewer developments in the sector as competency demands are needed to sustain competitive markets such as capabilities and resources; resulting that students having sufficient and appropriate job market training (Azziaty *et al.,* 2017).

To sustain on this phenomenon, especially in hostile market competition, big data technology has vast potentials to improve the teaching-learning orientation in HEIs. In order to attain this, management must revert to the identification of their competitive advantages and successive structure of strategies, which have been established in the identified benefits (Nda & Tasmin, 2019). Even though higher education institutions are very different from other business organisations, their actions must also include strategic management (Asma & Rosdi, 2017). In other words, to sustain competitive advantage, HEIs need to adopt data-driven innovative strategies such as big data management to capture, recruit and retain both students and staffs, to assure or enhance its involvement and contribution in the market. In view of that the fundamental affair of HEIs is academic education, the need and use of appropriate and formalized competitive strategies to support these institutions in the division and positioning are required in the proposed target market (Oster *et al.,* 2016). Similarly, given the essential environment of HEIs in government viewpoint, the leaders of the HEIs need to upgrade strategies to sustain competitive advantage. In this context, it is crucial to find organisational theory strategies to support educational institutions in building enhanced and forward-looking strategies.

Malaysia's Vision 2020

Paragraphs are Malaysia's education sector has undergone immense transformation and improvements. The parliament implemented National Education System after the Education Act 1966 was passed. Through a collaborative syllabus and curriculum, the government was able to use education to promote nation-building (Lestari & Armayah, 2016). The National Philosophy of Education was released in 1989 and became part of the Vision 2020 of Malaysia, which was to attain the position of a developed country by 2020 (Grapragasem *et al*., 2014). Consequently, to reinforce Vision 2020 and better to make ready the newer generation for the requirements of the 21st century. In 2012, a new National Education Blueprint (NEB) was developed and launched by the Ministry of Education (MOE) Malaysia (Grapragasem *et al*., 2014). Likewise, the government reorganized the higher education structure through MOE to allow it to take action to the need for building the nation according to challenges in the Vision 2020. In addition, the government has developed initiatives and policies to ensure that Higher Education Institutions are motivated to pursue reforms and attain excellence in the face of the global education market competition (Zain *et al*., 2017).

According to Sirat (2010), the history of Malaysian higher education has progressed through four stages, which include: Education for affirmative action, Education for privileged, Education for business and Education for global competition. The MOE introduced two blueprint plans, to reposition its higher education institutions which are: The National Higher Education Action Plan (NHEAP) 2007–2010 and the National Higher Education Strategic Plan (NHESP) beyond 2020 (Sirat, 2010). The author also mentioned that there are four steps of the strategic plan, which are: Putting the foundation (2007–2010); Establishment and enhancement (2011–1015); Excellence (2016–2020) and success and sustainability (beyond 2020).

The competitive advantage of Higher Education Institutions

Competitive advantage has been introduced as HEIs are regarded on the market as service providers (Sultan & Wong, 2014). Hence, HEIs have constantly had the ecosystem of trying to sustain competitive advantage to achieve high standards academically, to reach academic excellence, and to gain reputation and status internationally (Asma, 2017). To accomplish sustainable competitive advantage, capabilities and resources should be part of HEIs. There is a higher number of items related to sustainable development in HEIs such as corporate governance and environment, students, staff, society and companies (Rose *et al.,* 2012). It was stated by Ribeiro *et al.,* (2016) that several of the principles and resources apprehended by university staff and students are values for sustainability.

The competitive advantage of Malaysian HEIs has managerial implications, particularly for public research universities. Through practising competitive advantage in the HEIs system, as internationalization has shown, unavoidably this introduces numerous consequences to the system. Malaysian higher education has moved to

internationalization and Malaysia has subsequently proven to be an international student hub (Knight & Morshidi, 2011). Internationally, Malaysian HEIs have strategized to compete and sustain competitive advantage. The dimension of acceptance from leaders, experts, tools and techniques that can be used to manage and coordinate internationalization activities at Malaysian HEIs, would help to ensure that the quality of the process to attract and retain international students in the nation.

Therefore, there is no doubt that the Malaysian public research universities will also operate in a volatile situation that is continually changing due to political, social and economic variations within the internal and external productive environments. Such changes require a renewed focus on strategy progress, execution and transparency at all levels to make the plan operational and track its effectiveness. Consequently, sustainable competitive advantage signifies a critical factor of economic growth and a key contributing element to a prosperity of a nation in which the dean or head of faculty denotes a facilitator of the basis to sustain competitive advantage; take advantage of opportunities in the environment and uses the resources effectively to optimize profits and lessen costs. HEIs is similar with the development of civilization, with the sole of the most important avenue for understanding, saving, spreading and passing on the logical, scientific, and inventive legacy from among generations (Collini, 2013). This, in effect, will ideally strengthen academics' efforts to influence a consensus on the philosophical essence of competitive advantage of the educational institutions.

Objectives of the Study

This research aims to recognize the factors that influence the intentions of adopting big data management by public research universities in Malaysia and transformational leadership (TL) role as a moderating variable influencing such intentions. Currently, big data management is seen as one of the most important developing technologies in the digital era and likewise, it has appeared to be one of the most studied and sought information technology (IT) in information system (IS) topics. However, several prior IT/IS, social science and psychological studies have limited investigation empirically on the readiness intentions particularly in the context of education sector background but are more focused toward eventual usage or adoption by organizations such as business, healthcare and engineering sectors and gaining intention of acquiring IT/IS technologies.

Furthermore, there is also limited studies that simultaneously obtains the factors that influence readiness intentions and leadership role effect to encourage into making the decision to sustain competitive advantage. Thus, this research will integrate the effects of TL theory; whether the constructs of TL will have moderating significant effects on the Unified Theory of Acceptance and Use of Technology (UTAUT) variables. Therefore, the objectives of this research aimed at addressing the following:

1. To investigate the significant impact of the UTAUT constructs toward big data management adoption readiness among Malaysian public research universities.

2. To investigate the TL as the moderating effects on the UTAUT constructs whether TL can significantly influence the intention among Malaysian public research universities to adopt BDM.

3. To generate a new integrated big data management competency model to support the Malaysian public research universities towards empowering industry 4.0.

Methodology

Before conducting the main survey, a pilot study is carried out to collect information from respondents to accomplish the itemized objectives above. The purpose of the pilot study is to confirm the reliability and validity of the instrument developed for the research. This is done to minimize errors in the questionnaire, makes the test run smoother, make response rate easier, and make available a valuable and useful questionnaire (Muijs, 2004; Fink, 2017). Similarly, Mathers *et al.,* (2009) indicated that questionnaire pilot-testing is to ensure that all relevant matters are incorporated; in the correct order; unclear or confusing statements are acknowledged, and significant issues are not absent from the questionnaire. The data were obtained using a close-ended questionnaire. The questionnaire was formulated on the basis of a 5-point Likert scale (Vagias, 2006). After which, 1 and 5 represented

strongly disagree and strongly agree, respectively, 3 representing neutral, while 2 and 4 were disagree and agree respectively (i.e. intermediate values).

The instrument was tested on sub-sample by conducting a pilot study of the study sample. The data collected was analyzed for the pilot study by use of descriptive analysis for the variables. Cronbach's Alpha coefficient is used to assess the reliability grounded on the recommendation of Pallant (2016). In addition, normality of the data is assessed using Skewness and Kurtosis as established on the suggestion of George (2016) which stated that the Skewness and Kurtosis values should be within -/+2 of range to consider the response to be normally distributed. Likewise, outliers and the missing values are observed and appropriately treated. The data structure is also assessed by using factor analysis. The multicollinearity possibility is examined by using the Variance Inflation Factor (VIF) and Tolerance level which need to be less than 10 and 1 respectively (Pallant, 2016).

The questionnaires were distributed to the respondents from the staffs of University of Malaya (UM), Universiti Putra Malaysia (UPM), Universiti Sains Malaysia (USM), Universiti Teknologi Malaysia (UTM) and Universiti Kebangsaan Malaysia (UKM) which are the public research universities in Malaysia. The respondents chosen were staffs in charge of handling and managing institutional data of each respective university. Participants were randomly selected from the following department: The Office of the Vice-chancellor, Academic Affairs Office, Student Affairs office/Alumni office, Information Technology faculty, Strategic Management office, Legal Affairs office, Research Management Office and the Library. Accordingly, the instrument is analyzed. The result of the analysis is presented in the following sections.

Pilot Instrument Administration

Table 1 below represents how the questionnaires were distributed; the numbers returned and considered valid for analysis.

Table 1: Pilot Instrument administration

Number of:	Frequency	Per cent
Questionnaires Administered	50	100
Returned	50	100
Valid and Usable	50	100

Table 1 shows the number of questionnaires distributed to the respondents. A total of 50 questionnaires were administered to staffs of the public research universities in Malaysia, who is in charge of handling and managing institutional data of each respective university which 100 per cent were returned for the analysis due to the reason that the questionnaire was administered via email. Therefore, the response rate was excellent.

Data Descriptive, Normality, Reliability and Factorability

This subsection gives the result of the pilot study descriptive, normality, reliability and factorability according to the questionnaire constructs. These constructs are; for the independent variables are Performance Expectancy (PER), Effort Expectancy (EFF), Social Influence (SOC), Facilitating Conditions (FAC), and for the dependent variables is Behavioural Intention (BHV) with the Transformational Leadership (TL) as the moderating effect.

Independent Construct

Table 2: Pilot Result for Performance Expectancy

Code	Mean	Normality		Factor Loadings	Variance Explained	Cronbach Alpha
		Skewness	Kurtosis			
PER1	3.34	.042	-.987	.966	70.26	.877
PER2	3.68	-.948	.559	.685		
PER3	3.40	.064	-.789	.894		
PER4	3.64	-.989	.290	.611		
PER5	3.32	.030	-.928	.969		

Table 2 shows the pilot result for the Performance Expectancy construct, which produces mean values ranging from 3.32 to 3.68. The skewness and kurtosis values were all within -/+2 (George, 2016). All the variables under the construct have strong factor loadings which cumulatively explained 70.26 per cent of the variance which is considered satisfactory. The reliability of the construct was assessed using Cronbach's alpha coefficient which produced a value of 0.877 above the suggested minimum value of 0.7 (Tabachnick, 2007; George, 2016; Pallant, 2016). Therefore, this shows that the obtained result is adequate, and hence, the data is reliable and normally distributed. Thus, the instrument is considered valid for the main research survey.

Independent Construct

Table 3: Pilot Result for Effort Expectancy

Code	Mean	Normality		Factor Loadings	Variance Explained	Cronbach Alpha
		Skewness	Kurtosis			
EFF1	3.54	.340	-.268	.682	63.01	.847
EFF2	3.38	-.140	-.410	.865		
EFF3	3.50	-.244	-.893	.825		
EFF4	3.56	-.354	-.454	.681		
EFF5	3.38	.026	-.739	.890		

Table 3 depicts the pilot result for the Effort Expectancy construct, which produces mean values ranging from 3.38 to 3.56. The skewness and kurtosis values were all in the threshold of -/+2 (George, 2016). All the variables under the construct have strong factor loadings which cumulatively explained 63.01 per cent of the variance which is considered satisfactory. The reliability of the construct was measured by using Cronbach's alpha coefficient which produced a value of 0.847 above the suggested minimum threshold of 0.7 (Tabachnick, 2007; George, 2016; Pallant, 2016). Therefore, this shows that the obtained result is adequate, and hence, the data is reliable and normally distributed. Thus, the instrument is considered valid for the main research survey.

Independent Construct

Table 4: Pilot Result for Social Influence

Code	Mean	Normality		Factor Loadings	Variance Explained	Cronbach Alpha
		Skewness	Kurtosis			
SOC1	3.18	-.021	-.514	.979	68.37	.808
SOC2	3.74	-1.15	.835	.400		
SOC3	3.54	-.505	-.349	.813		
SOC4	3.20	.105	-.631	.977		

Table 4 shows the pilot result for the Social Influence construct, which produces mean values ranging from 3.18 to 3.74. The skewness and kurtosis values were all the threshold of -/+2 (George, 2016). All the variables under the construct have strong factor loadings which cumulatively explained 68.37 per cent of the variance which is considered satisfactory. The reliability of the construct was measured by using Cronbach's alpha coefficient which produced a value of 0.808 above the suggested minimum threshold of 0.7 (Tabachnick, 2007; George, 2016; Pallant, 2016). Therefore, this evinces that the obtained result is adequate, and hence, the data is reliable and normally distributed. Thus, the instrument is considered valid for the main research survey.

Independent Construct

Table 5: Pilot Result for Facilitating Conditions

Code	Mean	Normality		Factor Loadings	Variance Explained	Cronbach Alpha
		Skewness	Kurtosis			
FAC1	3.66	-1.048	.273	.682	65.33	.850
FAC2	3.92	-1.314	.768	.865		
FAC3	3.90	-1.308	.786	.825		
FAC4	2.98	-.118	-.146	.681		
FAC5	3.46	.402	-.572	.890		

Table 5 shows the pilot result for the Facilitating Condition construct, which produces mean values ranging from 3.46 to 3.92. The skewness and kurtosis values were all the threshold of -/+2 (George, 2016). All the variables under the construct have strong factor loadings which cumulatively explained 65.33 per cent of the variance which is considered satisfactory. The reliability of the construct was measured by using Cronbach's alpha coefficient which produced a value of 0.850 above the suggested minimum threshold of 0.7 (Tabachnick, 2007; George, 2016; Pallant, 2016). Therefore, this shows that the obtained result is adequate, and hence, the data is reliable and normally distributed. Thus, the instrument is considered valid for the main research survey.

Dependent Construct

Table 6: Pilot Result for Behavioral Intention

Code	Mean	Normality		Factor Loadings	Variance Explained	Cronbach Alpha
		Skewness	Kurtosis			
BHV1	3.32	.031	.114	.848	69.91	.903
BHV2	3.34	-.282	-.658	.907		
BHV3	3.40	-.196	.210	.871		
BHV4	2.56	.087	-.680	.820		
BHV5	3.84	-.983	.164	.682		
BHV6	3.72	.230	-.683	.871		

Table 6 shows the pilot result for the Behavioural Intention construct, which produces mean values ranging from 3.32 to 3.84. The skewness and kurtosis values were all the threshold of -/+2 (George, 2016). All the variables under the construct have strong factor loadings which cumulatively explained 69.91 per cent of the variance which is considered satisfactory. The reliability of the construct was measured by using Cronbach's alpha coefficient which produced a value of 0.903 above the suggested minimum threshold of 0.7 (Tabachnick, 2007; George, 2016; Pallant, 2016). Therefore, this evinces that the obtained result is adequate, and hence, the data is reliable and normally distributed. Thus, the instrument is considered valid for the main research survey.

Moderating Construct

Table 7: Pilot Result for Transformational Leadership

Code	Mean	Normality		Factor Loadings	Variance Explained	Cronbach Alpha
		Skewness	Kurtosis			
TL1	3.18	-.021	-.514	.897	83.76	.932
TL2	3.74	-1.15	.835	.964		
TL3	3.54	-.505	-.349	.818		
TL4	3.20	.105	-.631	.973		

Table 7 shows the pilot result for the Transformational Leadership construct, which produces mean values ranging from 3.18 to 3.74. The skewness and kurtosis values were all the threshold of -/+2 (George & Mallery, 2010). All the variables under the construct have strong factor loadings which cumulatively explained 83.76 per cent of the variance which is considered satisfactory. The reliability of the construct was measured by using Cronbach's alpha coefficient which produced a value of 0.932 above the suggested minimum threshold of 0.7 (Tabachnick, 2007; George, 2016; Pallant, 2016). Therefore, this shows that the obtained result is adequate, and hence, the data is reliable and normally distributed. Thus, the instrument is considered valid for the main research survey.

Descriptive of the Aggregate Constructs

Table 8: Descriptive of the Aggregate Constructs

	Mean Statistics	Standard Deviation Statistics	Skewness		Kurtosis	
			Statistics	Std. Error	Statistics	Std. Error
PER	3.47	.882	.191	.337	-.894	.662
EFF	3.47	.748	-.126	.337	-.266	.662
SOC	3.41	.815	.265	.337	-.583	.662
FAC	2.58	.975	-.885	.337	.237	.662
TL	3.61	.943	-.845	.337	.004	.662
BHV	3.53	.805	.382	.337	-.968	.662

Table 8 depicts the descriptive of all the constructs used in the questionnaire. The result produced mean values ranging from 3.41 to 3. 61 with low dispersion as indicated by standard deviation values of less than 1. The skewness and kurtosis values are all with the recommended threshold of -/+2 (George, 2016). This shows that all the constructs of the study are normally distributed. Generally, it could be concluded that the scales are reliable and could be used to measure what they were proposed to measure.

Conclusion

This research sought to investigate higher education universities readiness for big data management. Institutional readiness is a significant state of affairs, as it governs the optimal operation of technology. Results of this pilot study have indicated that the reliability analysis showed that all the scales were significantly accurate, leading to the conclusion that the questionnaire can be applied into the main survey to collect information from the larger sample of the targeted population.

Acknowledgment

The authors would like to thank the Ministry of Higher Education Malaysia for supporting this research under Fundamental Research Grant Scheme Vot No. FRGS/1/2019/SS03/UTHM/02/1 and partially sponsored by Universiti Tun Hussein Onn Malaysia.

Abstract

Today, digital transformation is one of the main drivers of economic growth. Businesses that can embrace flexible work models and adapt to change have more room for growth than ever. Russian companies have a unique chance to realize their potential in the course of the digital revolution and take their rightful place among the key players in the global market. Despite the presence of objective constraints, companies are transforming, and the state is developing new support mechanisms. The article discusses the main factors stimulating the introduction of digital technologies into the practice of Russian enterprises, as well as the barriers hindering the development of digitalization in Russia.

Keywords: Digital Technologies, Digitalization, Incentives, Barriers.

Introduction

Digitalization is the most significant innovation in a globalized economy (Rogers 2003; Schot, and Geels 2008). Most organizations believe that by 2022, on average, half of their revenues will be generated in digital channels (Kulagin, Sukharevski, and Meffert 2019). Further, according to the estimates of the World Economic Forum, by 2025 the total economic effect of digital transformation in relation to business and society will exceed 100 trillion US dollars (Zhuravlev 2019). Three waves of digital transformation – significant influence on gross value added as an opportunity and a threat for industry: a) automotive logistics; b)
mechanical & plant engineering, electrical engineering, medical technology & energy systems; c) chemicals aerospace (The Digital Transformation of Industry 2020).

In 2016, the founder and permanent chairman of the World Economic Forum, Klaus Schwab, wrote that we are on the verge of the Fourth Industrial Revolution (Industry 4.0), which will link the biological, physical, and digital worlds together, affecting all aspects of human life and activities. Now we can say that we have already entered this era: technologies that appeared several years ago are rapidly developing and becoming more complex. This includes, for example, 3D printing, blockchain, and machine learning (Schwab 2016).

Digitalization is actively penetrating all sectors of the economy, as a result, a digital regulatory environment is gradually being created (Masyuk, Bushueva, Bragina 2019). But some of the most notable changes are now taking place in industry (Skrug 2018). As a result, the term Industry 4.0 appeared (in a broad sense), which means a new level of development of automation of production and logistics networks (Digital economy: problems and consequences of modern technologies 2019). Industry 4.0 implies fully automated production, controlled by intelligent systems in real-time and in constant interaction with the external environment, not limited by the framework of one enterprise (Zemnukhova 2018).

Cite this Article as: Natalya N. MASYUK and Tatyana P. FILICHEVA " Digital Transformation of The Russian Economy: Incentives and Barriers" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

It should be noted that the introduction of digital technologies in any enterprise is almost always accompanied by conflict, the resolution of which is one of the main tasks in the implementation of digitalization (Masyuk, Bushueva, Vasyukova, and Mosolova 2018). In real life, no matter what sphere of the economy we take, the adoption of a managerial decision for the absolute resolution of conflicts is impossible, the most acceptable is the adoption of a quasi-optimal managerial decision based on local compromises (trade-offs). Examples of such solutions are given in a number of works (Bushueva, Korovin, and Masyuk 2013a, b; Masyuk, Vasyukova, Bushueva, Mosolova and Kozminykh 2016; Zhang, Stafford, Dhaliwal, Gillenson and Moeller 2014). The digital revolution entered a decisive phase in 2017 - every second inhabitant of the Earth connected to the Internet. According to the McKinsey Global Institute (MGI), in the next 20 years, up to 50% of production operations in the world can be automated, and in scale, this process will be comparable to the industrial revolution of the 18th and 19th centuries. (Hyysalo, Jensen and Oudshoorn 2016; Schwab 2016).

The Industrial Digital Agenda Initiative within the Eurasian Economic Union (EEU) was made possible by the implementation of similar initiatives in various states of the world, integration associations, in particular in the European Union, as well as in large transnational companies. Digital strategies were approved in the European Union - "Digital Europe 2020" (2010), Germany - "Industry 4.0." (2011), China - Internet Plus (2015). The autonomous non-profit organization "Institute for the Development of the Internet" (Russia), as part of the development of the "Strategy for the development of the Russian segment of the information and communication network of the Internet and related sectors of the economy" (2015) refers to 15 approved programs in the field of digital economy and development of the Internet economy in various countries (including the European Union, Germany, China, Japan, Brazil, USA, Great Britain, Estonia, Holland, Ireland, Sweden, Singapore, Philippines, Malaysia). Also the largest industrial and industrial companies in the world implement development strategies in the concept "Industry 4.0", "Internet +" (for example, Siemens, General Electric, SAP, Intel). In March 2015, international management consulting firm Roland Berger (The only leading consulting company of European origin 2018) published a report titled "Digital Transformation of Industry" 8 9, which indicated what digitalization of industry can bring Europe an additional 1.25 trillion euros in gross value added, or a loss of 605 billion euros.

In general, digital transformation is a significant restructuring of the business model of an organization using new digital technologies (Zhuravlev 2019). It leads to a fundamental rethinking of the current structure and a change in all processes, allows you to create new formats in working with partners, for example, consortia, as well as to adapt products and services to the needs of a particular client. The result should be the achievement of key results of economic efficiency by companies, optimization of business costs, and improvement of the quality of the service provided or the product produced.

Method and Methodology

The main research method was the method of a systematic review of the activities of Russian enterprises, which makes it possible to determine the factors stimulating the introduction of digital technologies, as well as to identify the barriers arising in the way of this development in the Russian economy at the regional level.

Results

Industrial companies are the foundation of the Russian economy. The rapid start of mastering modern Industry 4.0 technologies, such as the Industrial Internet of Things, 3D printing, virtual reality, touch interfaces and the widespread use of new generation robots, will allow industrial companies to take advantage of the development of these areas "from scratch" and take the lead.

The active position of the state further spurs on the digitalization of all players in the national economy. The issues of using digital technologies in public administration are discussed in their works by many authors (Scholl, 2002; Stoker, 2006; Janssen, and Joha, 2006; Bharosa et al, 2012,2013; Stegmaier, Kuhlmann, and Visser, 2014; Garnov, Topchiy, and Kosheleva 2017) and etc. It should be noted that robots are also an integral part of digital transformation (Robot density rises globally World Robotics Industrial Robot 2018).

Russia has implemented the largest projects in the field of digitalization of public services, which are among the best in the world (Garnov, Garnova 2016). Successful projects include the federal portal of the State Service,

digitalization of the Federal Tax Service, as well as projects of the Moscow Government: “My Documents”, “Parking lots”, “My Polyclinic”, and others.

In 2018, the Government of the Russian Federation launched national projects, one of which was the Digital Economy project, which includes a number of measures of state support for projects aimed at the formation and implementation of end-to-end digital technologies. Within the framework of the national project until 2024, in particular, it is planned to launch an electronic passport of the Russian Federation, a unified state cloud platform and infrastructure "Digital Profile" for the exchange of information between the state, citizens, and organizations; connect 97% of households to broadband Internet access, launch 5G communication networks, and 85% switch to domestic software in government organizations. The state plans to increase the cost of developing the digital economy in GDP by 3 times.

In Russia, it was possible to create large digital companies almost from scratch, and some of them achieved international fame. This is Tinkoff Bank - the world's largest online bank that does not have physical branches at all, digital portals and ecosystems of Yandex and Mail.ru services, the manufacturer of marine training complexes and electronic navigation systems Transas, the Avito electronic advertisement platform, the developer of digital solutions to ensure the security of "Kaspersky Lab" and many others. Digitalization also opens up great opportunities for traditional market players who are not digital companies by nature. “Severstal”, for example, being the largest player in the metallurgical sector, puts digitalization and the use of big data among its strategic priorities to achieve sustainable competitive advantage in the industry.

In developed countries, manufacturing companies have a high level of implementation of modern digital technologies, in this, they are still ahead of domestic companies. One of the reasons is the lack of a clear strategic vision of digital transformation and change management mechanisms in a number of Russian enterprises. You can also note the low level of automation of production processes and administrative functions (finance and accounting, procurement, personnel). For example, in 40% of companies, the processes are not automated.

However, this is also an incentive for a significant increase in indicators. According to an expert survey, Russian manufacturing companies are showing high interest in the topic of digital transformation. Thus, 96% of companies in the next 3-5 years plan to change the current business model as a result of the introduction of digital technologies, a third of companies have already launched organizational changes, almost 20% are already implementing pilot projects. For example, “KamAZ” has already launched a digital transformation program, which provides for a digital and continuous chain of processes, from the development stage to the after-sales service stage under life cycle contracts. This makes it possible to produce new models of premium-class trucks, which are not inferior in characteristics to products of foreign competitors.

“Sibur” implements the concept of a “digital plant”, which provides for the digitalization of production and logistics processes. The company implements advanced analytics for predictive maintenance of equipment, digital twins in railway logistics to optimize the transportation process, as well as machine vision systems and unmanned aerial vehicles for monitoring production and conducting technical inspections. Ultimately, this will allow the company to reduce costs and reduce industrial safety risks.

As part of the transition from a traditional postal operator to a postal and logistics company with IT competencies, the “Russian Post” has already launched its own digital big data analysis platform for fleet management. Moreover, the company develops an ecosystem of services in the e-commerce market: from the automation of sorting centers to financial and courier services that make life easier for customers. Other large corporations also have successful digital transformation projects, for example, “Russian Railways”, “Rosatom”, “Rosseti”, “Gazprom Neft”, etc.

The massive transition to remote work due to the spread of coronavirus infection can also become an impetus for the more active digitalization of Russian companies. The ability to maintain uninterrupted and high-quality support of key business processes in the digital environment turns into a competitive advantage. Network interactions become especially relevant in such a situation (Katz, and Shapiro 1985; Zhang, Hu, Dai, and Li 2010). The so-called mobile assistants are becoming increasingly important (Reeves 2017; Klowait 2017; Lomas 2018; Moore, and Arar 2018; Guzman 2019 etc).

Leaders of Russian companies consider the lack of technological competencies, lack of knowledge about technologies and suppliers, and lack of financial resources as the main constraints to digital transformation. Despite this, some companies are already successfully overcoming existing barriers: experimenting with new digital technologies to improve the efficiency of current business models, collecting significant amounts of data necessary for deploying digital services, initiating organizational changes, including the creation of specialized divisions within companies to raise the level of corporate technological competencies, as well as, together with specialized scientific and educational institutions, they launch practice-oriented programs for training (Berezin 2019).

The Analytical Center under the Government of the Russian Federation (hereinafter referred to as the Analytical Center) conducted a survey of the regional executive authorities (hereinafter referred to as the ROIV) of the Russian Federation. Questions were asked about the problems in the regions in the implementation of projects for the development and implementation of digital technologies and the development of the digital economy in general. The survey was conducted in August - September 2019 (Barriers to the development of the digital economy in the constituent entities of the Russian Federation 2019).

Information was requested on the following groups of barriers:

- regulatory barriers
- administrative and managerial barriers
- financial barriers,
- the level of development of information infrastructure,
- training of personnel for the digital economy,
- barriers in the development of projects in the field of "end-to-end" digital technologies,
- information barriers,
- additional barriers (other).

As part of the survey, responses were received from 70 constituent entities of the Russian Federation, of which 3 constituent entities indicated that there are no barriers to the development of the digital economy at the regional level *. The key barriers to the digitalization of the economy at the regional level of the ROEI include difficulties in training competent personnel in the digital economy (18.8% of responses about barriers out of the total number of barriers indicated by the ROEI), barriers in the field of legal regulation (17.3%) and difficulties in financial support of the regional budgets (16.9%). In addition, the ROIV indicated the presence of administrative and managerial barriers (16.0%), difficulties in the development of information infrastructure (13.9%), the presence of information asymmetry (11.1%), and barriers to the implementation of projects based on "end-to-end" digital technologies (6.0%) (Table 1).

Table 1: Key barriers to the implementation of the digital economy in Russian regions

Barrier name	%
Difficulties in training competent personnel in the digital economy	18.8%
Barriers in the field of legal regulation	17.3%
Difficulties in financial support of the regional budgets	16.9%
Administrative and managerial barriers	16.0%
Difficulties in the development of information infrastructure	13.9%
The presence of information asymmetry	11.1%
Barriers to the implementing projects based on end-to-end digital technologies	3.1%
Other	2.9%

Discussion

When introducing digital technologies, it is important to take into account high-quality planning of business needs and assess the effects of implemented solutions in the process of the digital transformation of the company, as well as ensure a high speed of project implementation, which is a determining factor in a competitive market. By the way, in foreign practice, the key factors for the success of digital transformation were the focus on changing the

business model, the creation of a competence center under the leadership of the CDTO (digital transformation manager), and the stimulation of complex transformations in key business units.

Russian manufacturing companies expect from the state, first of all, support for the implementation of technological solutions, as well as the formation of specialized educational programs and the development of an innovation ecosystem and technological entrepreneurship. Therefore, the task of the state is to create a basis for providing support in the development of digital technologies and their comprehensive implementation in the real sector of the economy.

Conclusion

Digital transformation is changing the face of the economy and is the basis for high rates of economic growth. Now Russia is noticeably lagging behind many developed countries in terms of the pace of digital transformation of the industry. At the same time, Russia has excellent opportunities to become a leader, relying on the existing technological and intellectual potential. As expected, Russian companies focus primarily on the digitalization of business processes and data-driven management, as well as customer experience management. These directions are basic for transformation and directly affect the main operating activities of the organization. Areas that remain underestimated make an important contribution in the long term in innovation potential and competitiveness companies - human capital development and competencies (digital culture) and create their own new products (R&D). Digital transformation involves the transition of an organization into a new state of permanent changes. To bring these changes to life a trained team and digital culture. In addition, many employees commented that insufficient attention to the development of competencies increases stress levels and decreases efficiency transformations. Many organizations are already planning their budgets for 2019 today, and it is high time for them to focus on funding key aspects of driving digital transformation initiatives. To move forward successfully, digital leaders must share lessons learned and actively learn from their peers. An era is opening before us, filled with gigantic opportunities and tremendous challenges, but requiring the unification of our knowledge. Hopefully, by 2025, we can significantly advance our digital change, transformation, and modernization initiatives. It can be concluded that one of the main reasons for the lag is the lack of investment resources; a regulatory framework that does not meet modern requirements; Digital divide; lack of qualified personnel, etc. We are confident that the measures implemented by the state will help increase the interest and involvement of business and society in digital transformation processes and will allow them to quickly adapt to modern requirements in the Russian and global markets.

Abstract

The Corona Pandemic 2020 is changing life conditions, industry, commerce, job market and working conditions continually and permanently. It triggered a surge in digitalization and the proportion and frequency of home office in companies. Teleworking has had positive effects for companies and workers in the last years before the Corona Pandemic. By reducing the risk of infection from viral infections, teleworking currently gains also momentum to save jobs and companies. The research question focuses in the first step on the changing scope of teleworking and its influence on job satisfaction, which is subject of this article. Further it is aimed to analyze a possible scope of teleworking, which can reduce the job satisfaction of workers and could be implemented as a guideline for HR manager. The research fundamentally bases on an extensive literature review by using various databases, Web of Science, SpringerLink, SCOPUS, Research Gate, Google Scholar, Bitkom Research, Google Search, Wiley Online Library and others. 34 studies employing quantitative, qualitative and mixed-method designs have been included in the review. The method of qualitative content analysis as outlined by Mayring has been used to analyse the literature and interpret the findings. Elaboration of theoretical basics targeted on the topic is required for achieving the goal. The growth of teleworking frequency and influence on job satisfaction is represented. Telework indicates positive effects on job satisfaction, including some negative aspects targeted social and professional isolation, and perceived threats in professional advancement. This review may be a complementary support for academics and practioners.

Keywords: Corona Pandemic, Teleworking, Job Satisfaction, Company

Introduction

Office work turned from single office into community office in the USA in 1960. Nearby work-places give workers only little privacy. Developing cubicles improved this problem in 1964. Open-plan offices established in the USA in 1970 and disseminate to Europe. A countertrend to larger offices realized in the turn of the millennium in the course of digitization while home office became popular (Segelkern, 1994). Before the Corona Pandemic the scope of home-office use was increasing steadily (Statista, 2019). Today the affinity to home office is rapidly raising because of the Corona Pandemic, which is worldwide a challenge for everyone's health and for companies' and workers' existence since the beginning of the 20th century under the Spanish Influenza Pandemic at the end of the first world war. Home-office under the Pandemic implies at least for many companies an emergency program to let companies survive. Actually, the Pandemic couldn't be foreseen and came unexpected. Companies had to react rapidly and bankruptcies could not be prevented. According Statista (2020a) a prognosis by Euler Hermes SA Paris for 2021 compared to 2019 the USA will present 57% more bankruptcies and Germany 12%. Companies ratio of teleworking continuously has raised the last years continuously and

the last months rapidly. While state required regulations have been entailed in order to dam the virus, the digitization paired with teleworking has keeping workers on job and companies on market. Home office has become an immediate integral and essential part of the working world in contrast to the last years. Three components of teleworking can be distinguished. Teleworking, called as home office, the worker's workplace is his home. Alternating teleworking is characterized as a partial time home office mixed with coordinated working time at office at the company headquarters. Mobile teleworking consists of varying workplaces, mainly utilized by representatives and account managers (Sonntag, 1997). The Federal Ministry for Agriculture, Regions and Tourism (2018) carried out that teleworking produce more work quality like attractiveness of the employer and productivity of the employee proven by better concentration, less distraction, less driving times to the office and thus time savings for getting work done. Assessments of higher efficiency of the meeting results through better coordination and cooperation, enabling more personal responsibility and optimizing the work-life balance were also cleared out. Teleworkers save climate-damaging CO_2 by reducing car traffic and contributes to environmental and climate protection. For cashiers and mechanics on the assembly line working from home is not suitable, however conception, controlling, customer care, editorial staff, personnel planning, appraisal and programming tasks, accounting, documentation is suitable to arrange as a home office work. Requirements for home office user are self-reliance, reliability, tech-savvy, equipment at home, voluntariness, being teamwork. Considering the demographic change the last five years home office adapted to companies' and workers' needs representing a possible work structure for worker who do not find an accommodation in the cities. Home office could be an emphasizing possibility to revive the rural areas. According European Parliament Brussels (2019) significant demographic contrasts can be observed between the core and the periphery in the EU and EU Member States. Population growth has been determined in eastern Ireland, the southern part of the United Kingdom, Belgium, Netherlands, Austria. Parts of western Germany, northern Italy and Scandinavia have benefited from population growth. Trends show an increasing concentration of population in certain urban areas and a depopulation of some rural areas. About 3.1 million first residence permits were issued to non-EU citizens in the EU in 2017. One out of five first residence permits were issued in Poland mainly due to migration from Ukraine, followed by Germany with 17%, the United Kingdom 16%, France 8%, Spain 7%, Italy 6% and Sweden 4%. The fastest expanding populations in 2016 were often concentrated in eastern Ireland, western Germany and southern Sweden. Most of the teleworking studies focuses on employees in general and do not differentiate between managers, employers and employees. A survey of workers conducted by the German health insurance DAK from April to May 2020 resumed the impact of home office from worker's point of view (Bodanowitz, 2020). An actual survey of the University Heinrich Heine in Düsseldorf Germany collected data from test persons who were asked to provide assessments of the work situation before Corona and to answer questions about their current situation in the home office during the Corona Pandemic and differentiate between managers and employees. Kempf (2015), scientist of Bitkom Research, particularly interviewed 1500 managing directors and HR managers from companies with 3 or more employees from all industries in 2015. The survey is representative of the overall economy in Germany. The results show significant positive effects of teleworking and give recommendations for adjustments and improvements related to teleworking structure within companies. An expansion modul of teleworking and a counterforce against overpopulation in cities is represented by co-working. Established in the USA, Silicon Valley, in 2005, a worldwide movement related to work in rented offices was initialized by freelancers and micro-enterprises in order to escape partial from latent home office, which isolated them from colleagues and chiefs. While co-working workers join a community, established companies were interested in this new form of office work. Employees of different companies are able to work in these offices. There they work for their own project, can exchange ideas and knowledge with each other and can profit from each other. In 2015 half a million users and 2017 already more than one million users are counted in co-working spaces (Weibel and Sapegina, 2018). The existing research on teleworking is extensive and detailed towards applied questionnaires. It remains to be examined if there is a scope of teleworking within long term teleworkers existent, which signalized a threshold over which an amount of teleworking has a negative influence on the job satisfaction and respectively productivity.

Relationship between teleworking and job satisfaction

Locke (1976) defined job satisfaction as "a pleasurable or positive emotional state'' resulting from the appraisal of one's job or job experiences. Various and mixed researches with conclusions are performed. Telecommuting has as well positive as well negative effects on job satisfaction (Bailey and Kurland, 2002). Some researchers found curve linear effects (Guimaraes and Dallow, 1999) and some inverted U shape linearity effects of the relationship (Golden and Veiga, 2005).

It implicates that up to a threshold of telework hours the job satisfaction decreases, which can be a guideline for managers and employees themselves. Figure 1 primarily indicates the coherences between the telecommuting intensity and individual outcomes. According to the researches of Gajendran and Harrison (2007), Charalampous et al. (2019) and Golden and Veiga (2005) an increase of telecommuting intensity in an adequate range could result in a growth of individual outcomes, like job satisfaction, performance and perceived carrier prospects. If the telecommuting intensity is not adequate, it tends to cause role stress or turnover intention. Secondarily, the quality and quantity of psychological mediators for instance perceived autonomy, relationship quality and work family conflict, better explained like work family relationship, are able to trigger the individual outcomes in an attenuated or strengthened mode. Figure 1 demonstrates the relation between telecommuting intensity, psychological mediators and individual outcomes. The theoretical relationship of sections guides as framework of the meta-analysis of Gajendran and Harrison (2007). Therefore they applied conceptual support for role of perceived autonomy, work–family conflict and relationship quality, from models developed by Allen, Shore and Griffeth (2003) and Feldman and Gainey (1997). The individual outcomes of telecommuting also derived from previous treatments of the consequences of telecommuting (Shamir and Salomon, 1985). Circles with their intersections describes figuratively that each condition enters the other, like action and reaction. The circles, respectively their contents, can affect the other in an individual way, considering employees or telecommuters with an individual constitution and environment. For instance, negative effects related to individual outcomes or psychological mediators could require a decrease in telecommuting intensity, and vice versa.

Figure 1: Telecommuting and its affection on workers' well-being

Methods

This research intends to answer the following research question: Is there a change in the quantitative scope and quality of teleworking and influence on job satisfaction under Corona Pandemic? To answer the proposed research question an extensive literature review and a qualitative literature analysis was performed. For this purpose, the following databases/library catalogues were used for literature searches: Springer Link, SCOPUS, Research Gate, Google Scholar, Google Search, Wiley Online Library, Forbes, JSTOR, Harvard Business Review. The following search terms were used as part of a targeted literature search: 'Telecommuting scope before Corona Pandemic', 'Telecommuting scope under

Corona Pandemic', 'Telecommuting and its impact on job satisfaction before Corona Pandemic', 'Telecommuting and its impact on job satisfaction under Corona Pandemic'. Quantitative and qualitative data from scientific studies with cross-sectional, meta-analysis and longitudinal character were collected and analysed. The main profession of analysing field is Human Resource Management. Data included descriptive statistics and were deductively analysed. Thereby tables, graphics and charts with nominal, ordinal and metric data of interviews and surveys are collected and analysed. All analysed research papers included in sum 699529 employees and managers from age 20 to 65 as probands. Elaboration of theoretical basics targeted on selected problems required for achieving the goals. The literature research identified in total and worldwide 17000 researches before the Corona Pandemic and 703 within the Corona Pandemic. 70 elaborated potential sources and 34 relevant sources between 1991-2020 attached as references. Researches were also searched through reference lists of existing articles. Some of those works lacked data. They were often instructional advice on setting up remote work arrangements rather than empirical data outcomes. All sources that corresponded to the generally valid scientific requirement for the level of detail and quality of the elaboration were classified as relevant. Relevant data were collected, categorized, and analysed. In the process, the literature has been coded with the MAXQDA software (Kuckartz, 2020). For this purpose, one main code, reflecting the ''Corona effect'', leads to two ''1. level subcodes'', represented by the upper terms of bankruptcies and teleworking. Five ''2. level-subcodes'' are contributed by the topic field ''telework'', from which six ''3. level-subcodes'' were defined inductively and deductively. The present literature was encoded according to the method of structured content analysis. Thereby passages were encoded in 684 codings and subsequently analyzed in relation to the research questions. Synthesizing all data, lead to the following results and conclusion. Frequent individual research reflected similar results and could lead to an inductive relation leading to possible recommendations. Figure 2 shows the sequences of the process within the structured content analysis related to the research question. The text work consisted of text review, while the categories of the topic related to the analyzing field were formed. Relevant sources were analyzed and classified into these categories by elaborating relation to each other. For an overview of the Structured Content Analysis approach, see Figure 2.

Results

The results originated by a structured synthesis of all included studies. The final sample is made up of 34 studies involving 699529 probands from single studies and included two meta-analyzes. Three of total researches analyzes teleworking and its influence only on one dimension, i.e. job satisfaction. All other investigations used more than one dimension affecting working individuals' wellbeing i.e. categorized in affective, cognitive, social, professional, and psychosomatic modi. There was an international representation of countries, like the USA, Austria, Germany, Swiss and Belgium, where studies were conducted. Considering table 1, as a cutout of tabular overview specifying researcher, topic, research field with their analytical parameters, proband-sample-size and publish date, it becomes clear that the authors use various data-pools and have analyzed various dimensions with different variables and conditions in relation to teleworking within different times, respectively years. It became clear that until the COVID-19 crisis the share of remote workers shows inconsistent results. According Statista (2020b), based on survey with 800 interviewed German HR managers conducted by the Ifo-Institute, in the second quarter of 2020, it was stated that around 40 % of the workforce in companies managed from home in their permanent home office before the Corona crisis. As a result of the Pandemic, this distribution has increased by around 20 percentage points to around 60 %. Contrasting to Ifo-Institute, results of the Fraunhofer IAO survey (Hofmann, Piele and Piele, 2020) from May 4, 2020 to May 24, 2020, with almost 500 companies from various industries and sizes includes 78 % belonged to the private sector and 22 % to the public sector. Companies with more than 1000 employees had with 50 % by far the largest share probands of total. 54 % of the respondents resumed that there were only few employees who could use the home office before the Corona crisis. 17% of them totally uses teleworking. The possible degree of use was largely 1 day per week home office or less. Before the Coronavirus Crisis, around 20 % of the workers had the opportunity to work from home for more than 10 days per month. In time of Corona Pandemic 70 % of the respondents stated that their office workers almost completely or mostly work in the home office, 21 % follows the model of a 50:50. The Mannheim Corona Study leaded by Blom et al. (2020) revealed more differentiated, that before the Coronavirus Crisis

almost 20% of employees in Germany occasionally or often worked from home. A further 35.4% of employees wanted to use home office, but could not do so, 13.5% did not want to work from home and 31.7% said that working from home is fundamentally not possible in their job. Respondents who worked at home in January 2020 had the largest proportion of home office during the Corona Pandemic, as expected. In March 2020, almost 70% of them worked from home. But in contrast, the majority of respondents who expressed a desire to work from home in January 2020 work exclusively at workplace. 57% of them work at workplace in March 2020, 61% exclusively at workplace and 17% partly at workplace and partly in the home office in June 2020. The respondents who do not want to work from home are also the group that most frequently continue to work exclusively at workplace. In July 2020, more than 70% of this group was again working exclusively at workplace and almost 10% partly at workplace and partly in the home office. The data could suggest that even during the contact restrictions due to the Corona Pandemic, it is easier to realize a preference for working at workplace than the desire to work from home. The group who fundamentally excluded home office for their work in January 2020, only around 7% still work from home during the Corona contact restrictions. This proportion decreases very significantly below 1%. At the end of March 25% of employees worked completely or predominantly in the home office, in May only 7% are now exclusively in the home office, 22% work partly at home and partly at workplace. There is strong social inequality when using home office by considering in the first few weeks at the time of the lockdown, 60% of those with high school diplomas were working from home, but only 15% of those with middle school diploma. Over 50% of the employees in Germany work at workplace at their previous place of work. 25% of employees work in the home office, including significantly more people with high educational qualifications and good earnings. Short time working and job loss particularly affect people with low incomes and jobs in the hospitality industry and in the arts and culture. The risks of the Corona Pandemic are unevenly distributed. Lower income groups are likely to be at greater risk of infection with the Coronavirus due to their work at workplace, while at the same time they are affected earlier by the negative economic effects of the Corona Pandemic. The proportion of the population who was employed in January 2020, at the end of April 1,5% are unemployed, 2,5% released without wages, 3,8% released with wages and 13,1% in short time work. Work at workplace in the previous scope measured with 58,9%, exclusively in the home office in the previous scope 5.0%, works partly at workplace and partly in the home office measured by 23.1% in June. A survey of workers conducted by the health insurance DAK compared a sample over 7000 probands from December 2019 and of this sample 6000 took part in the second survey in April 2020. 59 % of employees who regular work from home for the first time said that they work more productively than in their normal workplace. 75% of the respondents are critical because of the diminished direct contact with colleagues. 48 % miss contact to their boss and 41% miss access to files. A survey by the Federal Ministry for Agriculture, Regions and Tourism (2020) on the topic 'Work-life balance through home office carried out among employees in Austria' in July 2020, a total of 43% of respondents were of the opinion that the ability to work from home makes it easier to combine family and work. It can be stated that the Coronavirus Crisis triggered a quantitative increase of telework in the range of 20% to 50% dependent on the survey structure, like selection in numerous and type of probands and branch. Qualitative aspects were also detected and measured quantitatively. Worth mentioned are the findings of strong social inequality when using home office (Blom et al., 2020).

Home office work and job satisfaction before Corona Pandemic

Findings of Schall (2019) to the relationship between remote work and job satisfaction cleared out an existing positive correlation before the Corona Pandemic. An inverted u-shaped curvilinear relationship between the extent of telecommuting intensity and job satisfaction was not found and instead support for a positive, linear relationship. This current research signalizes that a teleworking intensity with no more than 13,7 hours per week indicates a positive relation between teleworking and job satisfaction, but not curve linear. This small sample of 185 surveyed participants did not really use teleworking more than 18 hours per week and to this conditions the author defined a positive relation of teleworking and job satisfaction. The quadratic form of teleworking intensity was entered in order to establish whether an inverted u-shaped curvilinear relationship existed between telecommuting intensity and job satisfaction. There was not found a clear threshold up to that job satisfaction decreases. The confirmation was stated by theoretical statistics and not by collecting real participant data. The major implication of the findings is that increasing remote work in the workplace may be an efficient way to increase employees' job satisfaction levels. According to Schall (2019) remote work influences employees to have higher perceived autonomy, less work-family conflict and more telecommuting intensity, which in turn influences their job satisfaction. Compared to previous measurements especially according the Gallup Study Report (Clifton, 2017), the overall trend, engagement increases between the intervals of those who do not work remotely and

those who work remotely less than 40% of the time. Golden and Veiga (2005) cleared out that 15,1 hours per week let decrease job satisfaction. Instead lower intensities increase job satisfaction.

Home office work and job satisfaction within Corona Pandemic

According researches of Beart et al. (2020) teleworking under Corona Pandemic produces many positive characteristics, like increased efficiency and better work-life balance. 65.7% of 14005 probands indicate that their overall satisfaction with their job increases with telework. 64.6% think that telework improves their work-life balance. According 48.4% of the employees' telework helps to decrease work-related stress and 47.6% of the probands assert that teleworking reduces the chance of burnout. Performance was also positively influenced. 56,3% of the participants affirm that telework improves their efficiency in performing tasks and 50,7% of participants confirmed that telework increases their work concentration. These positive effects of teleworking on job satisfaction, work-life balance, role stress, burnout and performance are in line with the findings of previous studies (Charalampous et al., 2019; Golden and Veiga, 2005). Based on the findings of the OECD report (OECD, 2020) telework can improve firm performance by raising worker satisfaction and thus worker efficiency. Better work-life balance, less commuting or fewer distractions leading to more focused work or less absenteeism. In contrast to the positive effects, worker satisfaction decreases with telework, only, due to solitude, hidden overtime and a fusing of private and work life, or an inappropriate working environment at home. In sum telework can improve or hamper firm performance, with its effects depending on two polluter principles. Companies should notice that direct affection of firm performance could cause by changing the efficiency, motivation and knowledge creation of the workforce and indirectly by facilitating cost reductions that free up resources for productivity enhancing innovation and reorganization. Table 1 gives an overview about more comprehensive researches with experimental character by using a high contingent of probands, e.g. employees. Researches related to telecommuting and its influence on job satisfaction before and after Corona Pandemic are analyzed and collected.

Discussion

Telework and its influence on workers' job satisfaction and in general well-being has been extensively analyzed and discussed. Job satisfaction has received the most empirical attention. Some conditions related to teleworking could trigger an increase or decrease of job satisfaction. The comprehensive meta-analysis of Charalampous et al. (2019) gives a detailed insight to this working field and the dependent variables. Teleworking are responsible for workers´ positive emotions, to increase their job satisfaction and organizational commitment levels and to ameliorate feelings of emotional exhaustion. As result of this working category teleworkers feel more autonomous. Exclusively social isolation could be the reason for a drawback of teleworking. According Golden and Veiga (2005) the relationship between the extent of telecommuting and job satisfaction is curvilinear and satisfaction and amount of telecommuting are positively related at lower levels of telecommuting and satisfaction plateaus resulted from higher levels of telecommuting with around 15.1 hours per week. This curvilinear relationship is moderated by several variables and the curve flattens with jobs higher in discretion and interdependence and for individuals higher in performance-outcome orientation. In terms of personality, teleworkers with a greater tendency to order and a higher need for autonomy report greater job satisfaction than do teleworkers with lower needs for order and autonomy. Considering the development of scope applying teleworking in companies, it is conspicuous that teleworking in German companies raised from 22% to 39% from 2014 to 2018 (Statista, 2019). Employees statistically have experience with telework, both in general and in its extensive form due to the COVID-19 crisis. The Ifo Institute reported 20%-increasing of teleworking scope under COVID-19. Beart et al. (2020) resumed that 65.9% of Flemish workers are completely satisfied with the increase of extended teleworking within the Corona Pandemic. 85% foresee the COVID-19 crisis as making teleworking and 81% of them foresee digital conferencing much more common in the future. Golden and Veiga (2005) revealed a special termination of teleworking to receive beneficial job satisfaction. This could use as guideline for companies and workers with view of preventing productivity of workers in times without a pandemic. Life conditions abruptly changed in 2020 and teleworking became a need preventing serious infection. The worldwide population is obliged to train and always comply to keep distance from others, called ''social distancing'' as long as the virus is not contained. Office jobs have to be new structured and teleworking is the easier way to be arranged by companies and employees. We can assume that workers' and companies' attitude towards teleworking modifies to an obligatory workplace also for the next time. The situation cannot be assessed for the future. The researches within Corona Pandemic, worth mentioned the work of Beart et al. (2020), analyzed the number of employees which are satisfied with extended teleworking within the crisis. An evaluation towards a precisely extend of telework in relation to the effects on job satisfaction and productivity in this research lacks in contrast to Golden and Veiga (2005). In case of persistent pandemic it is relevant to analyze workers' attitude towards teleworking in precise manner in order to cope with the crisis. According to Blom et al. (2020) of Mannheim University there is strong social inequality when using home office. Lower income groups are likely to be at greater risk of infection with the Coronavirus due to their work at workplace, while at the same time they are affected earlier by the negative economic effects of the Corona Pandemic. This is a disruptive factor which generally have negative influence on workers' job satisfaction and distorted the real well-being factors of employees. Companies were interested in finding new ways to create new solutions and combinations of telecommuting arrangement e.g. co-working and teleworking for the last five years. Interesting results gained from a one-year co-working experiment with 5 companies in cooperation with the Village Office Cooperative (Josef et al., 2019). It deals with the question of which specific value propositions and benefit scenarios co-working offers established companies. Further research of the subject teleworking and previous co-working to a new model by elimination the negative affecting mediators of job satisfaction within teleworking could be progressive for companies' work structure. For established companies, the question is how co-working fits into existing forms of work (corporate office, home office, mobile work) and what influence this new scenario has on the existing culture of collaboration (Weibel and Sapegina, 2018). Instead, companies actually have to accomplish and implement hygiene rules at workplace and their future focus have to arrange a new working structure. The researches of 2020 with focus of workplace in times of COVID19 and secondarily in relation to job satisfaction cannot give precise results because the new problem and companies' challenge has only existed for 7 months. The OECD report (OECD, 2020) summarized following coherences, which could help to give a guideline for companies and provide researchers with new ideas for studies:

- widespread telework may remain a permanent feature of the future working environment, catalyzed by the experiences made with teleworking during the COVID-19 crisis

- the use of telework before the crisis varied substantially across countries, sectors, occupations and firms, which suggests a large scope for policies to contribute to the spread of teleworking
- while more widespread telework in the longer-run has the potential to improve productivity and a range of other economic and social indicators (worker well-being, gender equality, regional inequalities, housing, emissions), its overall impact is ambiguous and carries risks especially for innovation and worker
- to minimize the risks of more widespread teleworking harming long-term innovation and decreasing worker well-being, policy makers should assure that teleworking remains a choice and is not 'overdone'; co-operation among social partners may be key to address concerns e.g. of 'hidden overtime'.
- to improve the gains from more widespread teleworking for productivity and innovation, policy makers can promote the diffusion of managerial best practices, self-management and ICT skills, investments in home offices, and fast and reliable broadband across the country.

These correlations, summarized by the OECD (Organisation for Economic Cooperation and Development), are worth mentioned and leads to a new research ground. Connecting previous research results with analyzed new conditions generated by the crisis of Corona Pandemic will open new niches for researchers and companies. The crisis requires new advanced methods to reach more robust and adapted conclusions. For instance, more cross sectional and longitudinal data is something that obstructs our ability to define causation and the actual direction for most of the relationships discussed in previous researches and above to the new situation. The need is to reveal mechanisms, crisis dependent dimensions and limitations. Additionally, it would be useful to conduct more diary studies which will allow us to capture a person change on levels of well-being, as opposed to a cumulative group change. An advantage of this method is that it decreases retrospective bias, which often threatens the validity of cross-sectional surveys.

Conclusions

The present study aims to give an overview of the previous literature related to the relationship of teleworking and its influence on job satisfaction with regard to the current literature with the hardship and challenge of the sudden Pandemic. In particular, it can help to understand the new experience of working from home for the first time and to know the satisfaction of this work type. Furthermore, it is given in insight to the changing conditions of experienced teleworkers within the Pandemic. A clarification of the changing extent of teleworking and job satisfaction should be given. According to previous findings of teleworking, respondents working from home will be willing to work like that, because of the condition to be protected from virus and their attraction to telework increase, if they are having good and supportive environment to work from home. Understanding the needs of employees provides employers with an opportunity to help their employees constructing a supportive and controlled work environment, which may result higher number of workers showing increased affinity to work from home. Controlling the problems e.g. of social inequality dimensions revealed of the current comprehensive study results of the Mannheim University and processes the coherence findings of the OECD (2020), researchers and practioners are able to elaborate and implement new COVID19 adequate structures into the managerial departments and workplace. This increase the probability for employees having higher job satisfaction and efficiency. The attention of a good protection from virus must not be neglected. Protection is the assurance against absenteeism maybe for a long time in fact of COVID-19, possible infections and its possible long-term consequences. The results of the present study provide a cutout of potential ways maybe for future research. It includes the differences in opinion of employees towards work from home across the states. The impact of the Pandemic affects some people more strongly, related to their age, income, academic status, personality and gender. COVID-19 makes clear how vulnerable we all are, also employees and employers. Businesses around the world have be restructured in order to have a future or disappear due to the Pandemic. Workers have to be retrained or lose their job. New ways are needed to minimize health costs and also economic costs due to these actions.

Abstract

Traditional teaching-learning process required teachers to tell everything to students which end up students passively involved during the class or tutorial sessions. As the world has globally changed, the teaching and learning process needs to incorporate the interactive elements and methodologies in order to encourage peer-to-peer-discussions as well as to develop problem-solving skills that would be needed for their future professional development. Therefore, this paper presents the design process of a board game named as Spin N Go Board Game that will be used in taxation classes, in particular for the topic of Employment Income. The development of this board game applied the Serious Game Design Assessment Framework (SGDAF) (Mitgutsch and Alvarado, 2012). It contained six domains – purpose, content, framing, mechanic, fiction/narrative and aesthetic/graphics. At this stage, the board game is not yet tested on the students. However, it is believed that by using this board game, students will gain more knowledge in this topic due to enhanced engagement and motivation in their studies because games provide fun ways to learn.

Keywords: Board game, Employment Income, Taxation, Game-Based Learning, Serious Game.

Introduction

In the past decade, the teaching and learning process has witnessed a transform to engage students to become part of the effective learning. The purpose of education nowadays not only to share the knowledge but also to promote life-long learning. Besides that, many tertiary students today are from millennials generation who were born between 1980 and 2000 (Strauss & Howe, 1991). These millennials groups are reported to be more affluent and better educated as compared to other generations (Howe & Strauss, 2000). Hence, teachers need to modify their teaching method in order to further elevate conceptual comprehension and integrate students during the class discussions (Muell et al., 2020). As cited by de Campos et al. (2020), there are many methods used to promote effective learning such as flipped classroom, team-based learning, peer instruction, collaborative testing, and constructions of educational models and experimental classes. In addition, blended learning, gaming, simulation, educational drama and/or role play as well as Moocs – massive open online courses (Khan & Pearce, 2015) are also among the strategies used to tackle the students interest during the class sessions. Out of these, board games have been widely used in education field for decades because it is believed that board games have huge social impact on young individuals (Rizov, Djokic & Tasevski, 2019).

The application of board games in addition to the lecture-based classes have been successfully used in previous researches such as Gut Game (de Campos et al., 2020) in health sciences students, Small Star Empires with Augmented Reality (AR) implementation (Rizov, Djokic & Tasevski, 2019), prototype game refers to Knowledge Management (KM) model (Taspinar, Schmidt & Schuhbauer, 2016) in management class and Logo Board Game (Khan & Pearce, 2015) which used in undergraduate business students. Nevertheless, based on available education board games in the market, it is hardly difficult to find the board game that suitable for the Accountancy students especially for the taxation class.

Moreover, Employment Income is one of the complicated topics in the Individual Taxation course. It has five applicable Sections as per Income Tax Act 1967 (ITA 1967) and a handful of items in each Section. Certain information may affect the fundamentals applied in the computation of employment income. Traditional methods of learning via lectures and tutorials may not engage undergraduates at the optimum level as this course is very technical. Therefore, this article aims to describe the design of a board game namely as Spin N Go Board Game (SNGBG) in particular to the topic of Employment Income by adopting the Serious Game Design Assessment Framework (SGDAF). The designation of this board game is one of the efforts to fill the gap that we found during the taxation class for undergraduate students in order to provide innovative ways to engage and motivate students in supplement to the traditional lecture-based class.

This article is a conceptual paper; its focus is only on the application of SGDAF in the development of Spin N Go board game. Even though SGDAF is a framework for virtual games, it is adapted to Spin N Go board game because it is also applicable. As this board game is still in the development process, some information such as students' feedback as users is not yet available. However, feedback from academicians with a solid taxation background had been obtained in order to improve features of this board game.

The remainder of this article is structured as follows: in Section 2, we look at the literature review about the previous studies on the board game, virtual game and also the background about SGDAF. This lead to the discussion on the application, implementation and designation of the board game – Spin N Go Board Game in Section 3. Finally, we conclude the ideas about the board game for the further research in Section 4.

Literature Review

Game-based learning

Education is a powerful tool that able to change the quality of life via improved critical thinking and interpersonal skills, higher level of confidence and better communication skill. Over the years, there are many studies have been performed to examine the best teaching methods and its impact on learning and student's performance (Syal & Nietfeld, 2020;

Behnamnia et al., 2020). Among these are teacher-centred approach, student-centred approach, high-tech approach and low-tech approach. Beside the traditional teaching methods, game-based learning has also been using as part of the effective tool to ensure the students are actively engaged and increase their motivation to learn (Tseng, Yang & Lu, 2019). According to Syal and Nietfeld (2020), game-based learning environment has increased significantly as it improves the academic and motivational outcomes. As the technology is growing and getting advance, the current trend of game-based learning also includes using technologies such as tablets or smartphones (Behnamnia et al., 2020). Noroozi et al., (2020) emphasized that to aligned with the 21st century education system, digital games can be used to develop scientific arguments skills. The technology can stimulate the imagination in the games such as the game-based character and narrative, increase the curiosity which can increase the joy to play.

The findings on the effectiveness of the game-based learning toward the student's performance are inconclusive. According to Behnamnia et al. (2020) and Noroozi et al. (2020), game-based learning can increase the level of student's learning as it may increase the students' creative thinking skill and problem solving skill. Additionally, the previous researches also found that game-based learning environment is less stress compared to the school environment as the students can explore the game for longer time. Similarly, Syal and Nietfeld (2020) revealed in their study that successful game-based learning is when the students are focused on the game, have a mastery approach orientation and most importantly they are interested in game itself. However, developers must exercise cautious upon designing game-based learning. Some of the game features may distract the students from the main goals of the game. This happens when students stuck in a challenging quest and become frustrated. The difficulty of the game will negatively affect the emotion and interest of students to keep playing the game (Behnamnia et al., 2020). This was in line with another study where challenges in the games such as whether things are too easy or too difficult will lead to student's boredom and frustration (Noroozi et al., 2020). The games with more audios and videos can prevent confusion but the games with too much text will confuse the students. Thus, it is important for game developers to focus on the game architecture and narrative to reach the optimal amount challenges embedded in a game so that it will increase the interest of students' in a learning engagement.

Board Game vs Virtual Game

Many people including children, teenager and adults love playing games as it can provide higher level of happiness, relaxation and can enjoy to greater creativity, thus lead to happier life. Therefore, many famous game companies such as Tencent, Xbox Game Studio, Nintendo, Electronic Arts, Activision Blizzard, Ubisoft, Konami and Rockstar Game, Capcom, Sega, and Namco Bandai have developed variety genre of games such video game, virtual reality, social game, board game, action, puzzles, mystery and many more. According to Grace (2005) the genre of games can be defined as a description of the narrative content of a game. Board game is one of the popular games that has existed for long time. In general, board game is played by moving pieces on the board according to a set of rules. Among the famous board game in the world are Monopoly, Scrabble, Chess, Risk, Uno, Battleship, Yahtzee, Evolution, Bio-sphere, Bios and many more. The traditional teaching method is associated with uninteresting and lack of experiential learning (Khan & Pearce, 2015). Moreover, different student has different learning styles that need to be taken into consideration. Thus, many studies have been done to support the effectiveness of teaching by using games.

According to Slegers et al. (2015), board games are interesting as mostly people are already exposed to this genre of games since childhood and its casual elements may act as an icebreaker. In addition, the relaxed atmosphere board games created have setting the user to be at ease and making them feel comfortable to share their thought compared to role -play method. Muell et al. (2020) supported that board games emphasized on the strategy and consequences for decision makers and thus contributed to the education's evolution. The students can use the board games to stimulate their critical thinking by identifying the concept that the games get right or wrong and omitted. Consistent with the other study, Khan and Pearce (2015) reported that students who playing board games showed higher level of flow compared to attending conventional tutorial session. Thus, it is effective to introduce a new topic by using a board game as it will increase the students' motivation, enjoyment and absorption. On the other hand, Tseng, Yang and Lu (2019) argued that it is challenging to develop a board game that include specific learning and entertainment purposes because innovation, knowledge and experience are required.

Virtual games are different from board games. Virtual games allow players to experience and influence the game environment. The effects in virtual game are also shown in real time by means of gaming devices and accessories such as hand controller, virtual reality headsets and sensor-equipped gloves. Various media can be used for virtual games such as computers, tablets and smartphones (Affadil, 2020). Due to its supreme characteristics, virtual games are widely used in many industries such as education, healthcare, entertainment, military, training and consultancy, art and industrial. In education, virtual games can be seen a lot in teaching medical and language students. For example, Verkuyl, Romaniuk and Mastrilli (2018) mention that to facilitate the transition from the classroom to clinical practice, the most effective way is by using realistic virtual simulation. According to Verkuyl et al. (2017), the main purpose of virtual games is learning than entertainment because virtual world allows students to practice scenarios on any computer, everywhere and most importantly it is also cost effective. Through virtual games, students are feeling excited and motivated to learn and thus increase the students' engagement. Additionally, virtual experience can establish good emotional connection between students and the characters as they played. Verkuyl et al. (2017) evidenced that virtual games can make the students feel confident and increase their skills. On the other hand, they also found that when the virtual games are played individually, the outcome is better than they games is played in a group. However, virtual games may also have shortcomings. One of the disadvantages is it requires a good internet connection (Verkuyl, Romaniuk & Mastrilli, 2018). One of their findings was some of the students had difficulty to refresh their screen during playing the games. As a result, the flow of the virtual game was disrupted.

The Serious Game Design Assessment Framework (SGDAF)

Serious games are designed to promote learning. It combines strategies, knowledge and structure to teach and train specific skills than to entertain. Many studies have been done to test the use of serious games to achieve specific goals. For example, Fleming et al. (2020) used Risk Assessment Simulation for Emergency Training Exercise (RAMSETE) examined the motivation behind decision made by the stakeholders while Coghlan and Carter (2020) used Design Play Experience (DPE) as a tool to attract positive emotions among the tourist regarding the threaten ecosystem. This study used the Serious Game Design Assessment Framework (SGDAF) developed by Mitgutsch and Alvarado (2012). This framework measures the effectiveness of a serious game according to six domains; they are purpose, content and information, framing, mechanic, fiction/narrative and aesthetic/graphics.

Figure 1 shows the SGDAF that applied in our board game. Firstly, every game created has its own goal or purpose that will give impact to the player. In general, the nature of the games related to education is usually designed to achieve specific target or skills than entertainment. Therefore, SGDAF emphasize that in order to design the components of the games, the explicit intention and purpose of the games need to be considered as it will influence how the player experience the game itself. The first domain in SGDAF is content and information. Content and information are referring to the data and facts provided in a game that can be seen and approachable to the players. The examples of the content are names, supplementary information and the stats of the players. In some games, the content presented to the players are not related to the games. Thus, in designing a serious game, it is important to provide information that is fact-related, valid and can be approached by the players.

Next domain is the game mechanics. Game mechanic can be defined as the rules or methods that will guide the player's moves or actions. Good game mechanic will give impact on the quality and whether or not the players are engaged and entertained enough to play the games. Games with better mechanic will provide immerse experience and fun to the players. The application of fiction and narrative in games are important to make the game stories become smooth, interesting and giving the player narrative path to follow from beginning to the end. Thus, SGDAF focuses on creating the fictional space which emphasised on the games purpose. According to Coghlan and Carter (2020), aesthetics and graphics is referring to audio-visual language that represent the overall aspects in the games such as information, fiction, framing, setting and mechanism. Game aesthetics is defined as the expression of the game such as emotion, pleasure, form giving and sociability that the player will encounter in the games. The last elements in SGDAF is framing. Framing is referring to loading the content of the game into a frame to suit the need of the game. An effective frame game should be able to adapt the objectives, characters and purpose of the games. Additionally, good framing leads the player to easily follow the games instructions and able to challenge them with the right extend which mean not too easy

or difficult, thus give them amazing playing experience. All these components must be fully interrelated in order to avoid conflicts and to have a good flow of game.

Figure 1: The Serious Game Design Assessment Framework (Mitgutsch & Alvarado, 2012).

Employment Income under Income Tax Act 1967

Under Individual Taxation syllabus in Malaysia, one of the important topics is Employment Income. Income tax on employment income is an important source of revenue to the government. It relates to an employee, a consideration paid by an employer for the services rendered. Section 13(1) of the Income Tax Act 1967 (ITA 1967) categories various types of employment income into five sub-sections (a) to (e) (Fatt, 2020) whereby these Sections will become the fundamental reference for the questions that we developed for the board game. Figure 2 describes the examples of items under Section 13 (1) of the ITA 1967.

Figure 2: Example of items under Section 13(1) of Income Tax Act 1967.

Discussion

Application of the Serious Game Design Assessment Framework in the Spin N Go Board Game

The Serious Game Design Assessment Framework (SGDAF) by Mitgutsch and Alvarado (2012) is used as a reference in the design of Spin N Go Board Game (SNGBG). However, since the SGDAF is developed for virtual games, a few components such as leader boards and badges will not be applicable. The application of the SGDAF components in the SNGBG is as follows:

Purpose

The SNGBG has several objectives. Firstly, the goal of the game is to increase student engagement in the learning of subject matter, hence improved academic performance. For this purpose, the designers embed elements of fun adapted from snake and ladder as well as UNO. Finally, as SNGBG mimics the real-life situation, it is expected that the undergraduates may obtain some rough ideas in relation to working in the industry. In this game, the setting is in a tax firm which the players start off as new employees as well as service directors and directors of controlled companies.

Content

Content refers to data, information and facts of a game. For SNGBG, only partial data of the game is available to the players. These items are the name of the employer or tax firm, points collected by the players and points provided for each question. Similarly, pawns and their pseudo names are also available to the players' knowledge. On the other hand, questions and answers are treated as confidential data. They are only accessible to the moderator of the game which his role in this game is the employer. The questions also have different levels of difficulty in order to provide challenge to the players (Hamari et al., 2016) in terms of cognitive component. The designers used Bloom's Taxonomy in the complexity of the questions (Anderson & Krathwohl, 2001). The basic verbs in the question cards are compute and decide. For easy level, the questions are at domain C2 (understand) which is to classify or identify items. For medium level, the questions are at domain C3 (application) which students are required to compute single items of employment income. The questions in the hard level are still at domain C3 (application) but consists of more items of Employment Income. Additionally, challenge is also included in the game mechanic which will be discussed later.

Framing

The selection of players as target group and their level of literacy on the subject matters are both crucial. The selection of the correct target group will support the objective of the game – to enhance students' motivation and engagement to study the subject matter. Obviously, the audience will be the students who are undertaking a course known as Individual Taxation in the current academic session which Employment Income is one of the topics covered. Students who shows low level of control, self-determination and self-regulation in their studies will be selected as the target groups (Sawyer et al., 2017). In terms of literacy, the players are expected to have a reasonable amount of knowledge and skills because this game will be provided after the lectures and tutorials are completed. This is to encourage continuous usage of the game in the future (Mitgutsch & Alvarado, 2012). Therefore, the players should be able to demonstrate the fundamentals of Employment Income according to the Income Tax Act 1967.

Game Mechanic

Game mechanic involves rules of the game, its reward system and obstacles/challenges. The maximum players at one time is four with one moderator who will be in control of the game. The moderator will read questions which will be selected by the players, check for the answers and provide points for correct answers. First of all, players will choose a pawn and determine their turn. Next, they will turn a spin which will determine the position of their pawn on the board. Next, players will choose a question card randomly and answer the question accordingly. The players will only have one chance to answer the questions in an unlimited period of time. Used questions will be taken out from the collection of question cards in order to reduce the possibility of picking up the same questions and avoid boredom.

Points will be rewarded only for correct answers. Different level of difficulty will provide different points – easy (1), moderate (3) and hard (5). In order to include challenge in the game, misfortunes are included in the board game and distraction cards. For instance, taking a prolong medical leave is an unfortunate event included in the board. Similarly, "loss a turn" and "give ten marks to the previous player" are hurdles being included in distraction cards. In order to balance the difficulty of the game, random rewards are also provided in the board game distraction cards. For examples, promotion is included in the board game and printed cards with "immune to misfortune" and "entitled for another turn".

Fiction/Narrative

Fiction/narrative offers the storyline of the game. Since SNGBG is a board game, it has a limited amount of fiction/narrative. Nevertheless, the characters of players consist of employees, service directors and directors of controlled company. They will be provided pseudo names and pawns as their identity on the board as employees. Another character is an employer being the moderator of the game whose functions are to read out the questions, check for the correct answers and records the players' points. The plot is the players need to solve a number of tax cases over time and will be rewarded only for correct answers. As they are heading towards the end of the game, they will come across a number of good luck that help them to finish up the game. Yet, hurdles are also placed on the board for the opposite effect.

Aesthetic/Graphics

The game components of SNGBG are design in visual language and not as other digital game that using audiovisual approach. The graphic design is really important because its capable to represent the game identity which drives players to determine the purpose of playing games (Mitgutsch & Alvarado, 2012). SNGBG require physical contact parallel with the objective of the game that give understanding about employment income. Visual of the games are semantically followed the target audience, setting, characteristic and theme of the game that are based learning board game for employment. Figure 3 illustrates the examples of board game such as Monopoly and Saidina that have shown the elements of business and income for the visual and characteristic of the game. In addition, the appearance has visual the symbol of money and tax that semantically shows to the players about the theme and purpose of the game.

Based on the book title 'Aesthetic and design for game based learning' by Dickey (2015), mentioned that the role of aesthetic in games involved the design of visual materials which embrace the discussion of principles of graphic design. Therefore, it involved all the visual component such as typography, layout, color and all the design element. In this games, it used modern typeface for typography that represent the characteristic of smartness and intelligent.

Figure 3: Examples of Board Games

Coherence and Cohesiveness

All these six components of the SGDAF should be interrelated in order to support the purpose of the game and to avoid conflicts among them (Mitgutsch and Alvarado, 2012). During the pre-production phase, the designers tested SNGBG a few times in order to ensure an optimum coherence and cohesiveness is achieved. As a result, a few changes in the design of the game were made. Firstly, the characters involved only employees. However, this may cause only partial of the content can be tested. For instance, the assessment of the house value provided under Section 13(1)(c) of ITA 1967 is different among employees, service directors and directors of controlled companies. Therefore, the other two characters are included in the fiction/narrative of the game. Secondly, in order to lessen the pressure during the game, the restriction of time to answer is changed to unlimited of time. The purpose is to adjust the level of difficulty of the game, hence to avoid boredom or other negative emotions against the game (Behnamnia et al., 2020 & Noroozi et al., 2020). Another aspect of game mechanic that is amended is the presentation of the questions. Initially, the questions were printed on the question cards thus, the flow of the game was simplified and not interrupted. Once the players chose a question card, the questions would be readily visible to them. However, this plan was not suitable for questions of hard level as they were lengthy and contained many information. Therefore, the designers will only print the number of questions on the question cards while the questions will be kept in a file. Thus, once a player chooses a question card, the moderator/employer will read out the specific question. The later design may impede the flow of the game to a certain degree. However, it is unavoidable because the questions are lengthy and technical causing it impossible to shorten them. Moreover, it is easier for the designers to amend the questions in the future (if necessary) because the content is subject to changes every year in accordance to Malaysian budget.

Conclusion

In conclusion, the application of SNGBG in combination with traditional classes, could be useful for both students and teachers. Students can gain a better understanding about the topic of Employment Income which in turn provoked their thoughts, creativity and ultimately increase their academic performance. At the same time, the board game will allow

students to actively discuss the content, visualize the topic in daily situations as well as solve problems in a playful and relaxing environment. This active methodology also will help students to clarify the terms or concepts used during the taxation class that they were not completely understood before. On top of these, from the teachers' side, this board game could be one of the teaching tools to help them to teach students in a better way. With the advancement of technology, the role of teachers has been shifted from just being the knowledge provider to the facilitators of learning (de Campos et al., 2020). Thus, by using this board game, it is hopefully can help teachers to develop conceptual comprehension among students about the topic of Employment Income during the tutorial session.

Nonetheless, this board game has several important limitations to be highlighted. First, when this article focuses on the presentation and designation of board game to be shared with students and teachers, it is our prospects to further evaluate the outcomes of this methodology. Hence, this board game lacks of students' feedback since it does not test yet to them. Secondly, the board game may not suit all learning styles because our focus is only for the topic of Employment Income. Thus, some students may not give full cooperation. Students who do not have basic knowledge about taxation might not be interested to play this board game. Finally, this board game cannot measure the students' academic performance as a whole which is the main criteria in assessing the students' learning achievement since this board game only cover one topic area, not the whole syllabus.

Whereas this article focuses only on the presentation of the board game to be shared it with educators, it is in our prospects to further evaluate the outcomes of this methodology. Hence, for our future research, it is recommended to test and play the board game among the tax students and educators so that we could get the feedbacks from them. Secondly, future research also could focus on the digitalization of the board game for example transforming from physical board game into the online games in order to make it more exciting and attracting more players. Finally, it is also recommended to add the value of performance measurement into the board game so that it could become one of the assessment methods in the process of teaching and learning.

Abstract

This study is motivated by the current debate on the lack of qualified directors on the corporate boards of government-linked companies (GLCs) in Malaysia, which is believed to have caused these companies to perform relatively poorly. Drawing on extant literature and anecdotal evidence, this study argues that industry knowledge is one of the most relevant acumens required for the board of directors' efficacy. Accordingly, we examine whether GLCs have significantly less board industry expertise relative to non-GLCs. Using 27 matched-pairs of GLCs and non-GLCs listed on Bursa Malaysia from 2010 through 2017, we find that GLCs have a significantly lower *proportion* of industry expert directors compared to non-GLCs. The findings of this study provide empirical support for the concern on the deficiency of qualified directors on the corporate boards of Malaysian GLCs.

Keywords: Government-Linked Companies, Malaysia, Board Expertise.

Introduction

The main purpose of Government-Linked Companies (GLCs) in Malaysia back in 1959, when they were first established by the Ministry of Finance, was to supervise the companies that were once owned by the British Colonial Government (Entebang, 2010). However, from 1971 onwards, the purpose of GLCs was to support the Malaysian New Economy Policy that was introduced in 1970 by the Malaysian Government. The policy was aimed to elevate the position of Bumiputera in the country's economic development (Kershaw, 2000). To this end, the Government-Linked Investment Companies (GLICs) were incorporated to invest on behalf of Bumiputera, and to control and influence the GLCs (Chang, Tam, Tan, & Wong, 2007). Ever since GLICs were established, GLCs play a critical role in the Malaysian economy as the backbone of the country's capital market (GLC Transformational Programme Graduation Report, 2015). In 2015, GLCs' economic profit was recorded at RM4.2 billion, or 11.1% of the total Malaysian economy output with 2.9 times growth in market capitalisation in Malaysia. GLCs made up seven out of the ten largest listed companies in Malaysia by market capitalization, and these seven have a combined market capitalization of RM474 billion (Toh, 2018). In total, the GLICs have a majority ownership of 35 public-listed companies among the top 100 companies in terms of market capitalization and control of about 42% of Bursa Malaysia (Gomez, Padmanabhan, Kamaruddin, Bhalla, & Fisal, 2018).

Despite the significance of GLCs in Malaysia, there have been claims that they performed poorly relative to their non-GLC counterparts (Boycko, Shleifer & Vishny, 1996). The public perception towards these companies has been further tainted by the continuous poor performance of large GLCs, such as Malaysia Airline System Berhad and Proton Holdings Berhad. These anecdotal evidences appear to support the theory that government intervention often leads to lower productivity and operational inefficiency (Boycko, Shleifer & Vishny, 1996). Previous literature conjectures that GLCs are inefficient because of several reasons; social and political goals may not be consistent with profit maximization, managers are chosen based on their political connections instead of their skills and expertise, greater information asymmetries and transaction costs, and greater agency costs and less monitoring (Gaio & Pinto, 2018).

Cite this Article as: Rabia Kausar MOHAMMAD ASHRAF and Seri Ayu Masuri MD DAUD "Board Industry Expertise of Government-Linked Companies in Malaysia" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The empirical findings on the performance of GLCs do not seem to fully support the above anecdotes and conjectures. While some researchers documented poorer performance of GLCs compared to non-GLCs (Van Den Berghe & Baelden, 2005; Ab Razak & Aliahmed, 2008; Najid & Rahman, 2011), several others found the contrary (Bhatt, 2016(b)). These inconsistent findings suggest the assumption that government intervention impairs firms' performance is unlikely to hold for all GLCs. Consistent with this latter conjecture, an economist and a GLC expert in Malaysia, Professor Terrence Gomez cautions against assuming that GLCs are underperformers, or run-of-the-mill firms. "What we are seeing here are dynamic firms maintaining their performance as the top companies in the country." (The Edge, July 2017). Further, Cuervo and Vilalonga (2000) provide evidence on the effects of differential organizational characteristics on privatized firm's performance. Together, this evidence suggests other determinants of GLCs' performance may be at work.

It is logical to think that the firms' productivity and operational efficiency will be subordinate to the board of directors' and executives' objective function(s) and their related strategic choices. Arguably, some level of industry expertise and experience on the board would help the board of directors to competently fulfil their responsibilities. The potentially critical role of industry expert directors is implicit in the following anecdote involving a poorly performing GLC in Malaysia, Malaysia Airlines System (MAS):

> *"Even as MAS's shares tanked, its main union, Malaysian Airlines System Employees Union (Maseu), maintained that the airline could be returned to the black within a year if helmed by someone (in-house) with* ***aviation experience****. A 20,000-strong union, Maseu wants MAS chief executive Ahmad Jauhari Yahya, whose previous experience includes media and power, to leave."* (The Business Times, May 20, 2014, emphasis added).

Hence, *ceteris paribus*, variation in the board industry expertise is a potential explanation for the performance of GLCs. More specifically, poor firm performance could be a result of ineffective monitoring or advising, hence, strategic decision-making in which the boards lack the relevant industry expertise. Accordingly, the key research question that this study seeks to address is whether, on average, GLCs have significantly less board industry expertise relative to non-GLCs.

The remainder of this paper is structured as follows. In section 2 we review the relevant literature and develop our empirical predictions. Section 3 explains our empirical design, and section 4 presents our descriptive and empirical results. Finally, section 5 concludes.

Literature Review and Hypothesis Development

One of the reasons claimed to be the cause of government-owned company's inefficiency and poor performance is the selection criteria of the firms' executives and members of the board of directors (Gaio & Pinto, 2018). Particularly, executives and directors of GLCs appear to be selected based on their political connections instead of their expertise (Gaio & Pinto, 2018). However, the board composition and control structure of government-owned firms have not been widely studied. A few empirical studies that investigated the latter issue include Megginson, Nash, and Van Randenborgh (1994), which documented significant changes in the size and composition of corporate boards of directors after privatization. Particularly, they documented a considerable change in the board composition with only 54% of the new boards composed of continuing directors on average. The size of the board also changed frequently with 34% of companies elected larger boards following privatization while 24% downsized their boards. Additionally, 14% of the companies replaced their CEO after privatization.

In Malaysia, anecdotal evidence suggests that the board of directors of GLCs exhibit some common compositional features including having many former government officers and politically connected directors. For example, two out of six (33.3%) board members of D'nonce Technology Bhd are politically connected and former government directors. UMW Holdings Bhd and Boustead Holding have six out of twenty (30%) and one out of five (20%) politically connected and former government directors, respectively.

Organizational characteristics including culture (Bishop & Thompson, 1992), objectives, business nature and location, organizational structure and management, and labor (Martin & Parker, 1997) differ across GLCs and non-GLCs. Overall, GLCs appear to receive more negative than positive perceptions with poor corporate governance, and incompetent top executives being the main area of attack (Ting & Lean, 2015). Particularly, GLCs are associated with lack of managerial capabilities and skills (Castanias & Helfat, 1991). As Barberis, Boycko, Shleifer, and Tsukanova (1996, p.764–790) have noted, 'pre-privatization (government-owned) managers might have the 'wrong' skills,

because they are good at dealing with politicians, but not at facing competitive market conditions'. Dahlan (2010) suggests GLCs have a poor recruitment system. Particularly for the board members, there has been a conjecture in the literature that directors of GLCs are often appointed based on their networking and political connections rather than skills and expertise (Hamid, 2011; Lau & Tong, 2008; Gaio & Pinto, 2018), potentially resulting in a lack of relevant expertise and qualifications on board.

Furthermore, given that directors need to get paid according to their skills and knowledge, and that there is a limited pool of directors with industry expertise, appointing industry expert directors can be sufficiently costly to the firms (Jeanjean & Stolowy, 2009; Hamid, 2011). As GLCs are associated with inadequate compensation to its directors and employees (The Edge, 2004), it is argued that GLCs have a relatively weak incentive to appoint industry expert directors on their boards. Consequently, the industry expert directors are more likely attracted to join non-GLCs, leading to non-GLCs having more industry expertise on their boards of directors.

In view of the above arguments, the following hypothesis is predicted:

H1: On average, GLCs have lower level of board industry expertise compared to non-GLCs.

Research Design

Sample Selection and Data Sources

The sample of this study are the 38 public quoted GLCs listed in the Putrajaya Committee on GLC High Performance (PCG) website (http://www.pcg.gov.my/). This study focuses on public listed GLCs because their annual reports are publicly available. Malaysia is chosen as a setting for this study given the suggestion that GLCs in Malaysia have poor corporate governance (Ab Razak, Ahmad, & Aliahmed, 2011).[1] That is, the board's decision-making including the appointment of new directors in GLCs in Malaysia is highly intervened by the government through its controlling power in the companies (Jamaludin, Sanusi, & Kamaluddin, 2015). Consequently, there are many occasions where directors of GLCs in Malaysia are appointed based on their political connections rather than their skills and qualifications (Hamid, 2011). Therefore, Malaysia is expected to provide an interesting setting with sufficient variation in the board expertise across GLCs and non-GLCs. The sample period for the study is 2010–2017.

A matched control group of non-GLCs are used as a benchmark to measure differential board expertise. The control non-GLCs are matched on industry classifications and total assets to control for industry effects, and firm size. Matching on these variables helps to rule them out as alternative explanations for any difference found in board expertise between the GLCs and non-GLCs.

After completing the matching procedure, there are 27 useable pairs left in the study. Table 1 contains a reconciliation of the 38 initial list of GLCs and the 27 final pairs used in this study. Ten of the initial 38 GLCs do not have total assets data because they merged with or acquired by another company. One GLC, that is Malayan Banking Bhd (Maybank) from the Finance sector, does not have a matched non-GLC because its total assets are too large, thus, it is dropped from the sample.[2]

[1] This perception of poor corporate governance in GLCs led the Malaysian government to order the formation of an integrity and governance unit at all GLCs effective from 5th October 2018 with a 2-year grace period. The order was widely gazetted on 21st November 2018 (see for example Free Malaysia Today, 2018; News Straits Times, 2018).

[2] For example, in 2017, Maybank's total asset stood at RM736 billions, which is nearly doubled the largest non-GLC for this sector, Public Bank Bhd. Public Bank Bhd recorded total assets of RM380 billions for 2017 and is used as a matched non-GLC for the second largest GLC in the Finance sector, which is CIMB with total assets of RM485 billions in 2017.

Table 1: ***Reconciliation of the 38-initial list of GLCs and the 27 final pairs used in this study***

Matching and sample selection process	**Number of companies**
GLCs listed in the Putrajaya Committee on GLC High Performance (PCG) in 2018	38
GLCs without total asset data	(10)
GLCs without matched non-GLCs	(1)
Total firm pairs left in the study	27

The summary statistics of firm size (measured using natural logarithm of total assets) for GLCs and non-GLCs are provided in Table 2. By design, the two groups should have mean firm size that are approximately equal. As can be seen from Table 2, the mean natural logarithm of total assets for both GLCs and non-GLCs is 22.38.

Table 2: Descriptive statistics of the sample firms' size

Variables		**Min**	**Max**	**Mean**	**SD**	**Skewness**	**Kurtosis**	**N**
Firm_Size	GLCs	17.65	26.70	22.38	2.24	-0.43	-0.47	169
	Non-GLCs	17.65	26.70	22.38	2.21	-0.23	0.60	169
	All firms	17.65	26.95	22.49	2.22	-0.33	-0.56	338

Variable definition: ***Firm_Size*** is the natural logarithm of total assets for firm i at year t.

Director industry expertise data is hand collected from the annual statutory reports filed with Securities Commission. The total asset data is obtained from the Thomson Reuters DataStream.

Board Industry Expertise Measurement

This study employs three measures of board industry expertise, which are further discussed below.

Arguably, board industry expertise is multi-dimensional covering relevant formal education and experience in the industry. That is, a director is deemed to have the industry expertise if he/she has *either* relevant formal education *or* experience in the industry. While relevant formal education engenders technical knowledge in an individual, expertise developed from industry experience builds tacit knowledge in the individual (Kor & Misangyi, 2008), hence, equips the learner with the knowledge and skills for effective application.

Formal education and training could take the form of university degrees or professional affiliations and accreditations (Christy, Matolcsy, Wright & Wyatt, 2013). Directors' relevant professional affiliation and accreditation is defined as membership of industry-specific relevant professional bodies. The relevant university degrees and professional bodies are identified by searching the industry job advertisements for the qualifications required of potential candidates. Data on directors' relevant university degrees and professional qualifications is hand-collected from the director profile section of the companies' annual reports from the year 2010 through 2017.

Similarly, the profile of each director of the sample companies is manually examined from annual reports to determine a director's industry experience. A director is classified as one with industry expertise if he/she is described to have served at least one company operating in similar industry or if he/she has been with the company/group of companies for a certain number of years at the senior manager level and above.

The directors' industry expertise is then aggregated at the board level to create the three measures of the board's relevant expertise consistent with Krishnan, Wen, and Zhao (2011):

(1) a dummy variable that equals one if the company has at least one director with relevant formal education or prior experience at senior manager level and above in a similar industry, and zero otherwise *(Ind_Expert)*
(2) number of directors with relevant formal education, or prior experience at the senior manager level and above in similar industry *(#Ind_Expert)*
(3) the proportion of the board that has relevant formal education *or* prior experience at the senior manager level and above in similar industry *(%Ind_Expert)*

Empirical Models

Hypothesis 1 predicts that GLCs have significantly lower board's industry expertise compared to non-GLCs. To test Hypothesis 1, the independent samples *t*-test is employed. This test will compare the *mean* of board industry expertise for GLCs and matched non-GLCs and report if the mean difference between the two groups is statistically significant.

Results

Descriptive Statistics

Table 3 reports the distribution of sample firm pairs (each pair consists of a GLC and a matched non-GLC) across industries and sample years. As can be seen, the distribution of sample firm pairs is fairly consistent across the sample years. However, there is some variation of the sample firm pairs across industries. The highest number of pairs belongs to financial and industrial industries with 36 and 37 firm pairs, respectively. On the other hand, utilities and technology report the lowest number of sample pairs with 8 and 7 pairs, respectively.

Table 3 : Distribution of sample GLC and non-GLC pairs across industries

	Number of firm pairs									
Year	**Industry**									
	1	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**All industries**
2010	2	2	1	1	5	4	2	1	1	19
2011	3	2	2	2	4	4	2	1	1	21
2012	3	2	2	2	5	4	2	1	1	22
2013	3	2	1	2	5	5	2	1	1	22
2014	3	2	1	2	5	5	2	1	1	22
2015	3	2	2	2	4	5	2	1	0	21
2016	3	1	2	2	4	5	2	1	1	21
2017	2	2	2	2	4	5	2	1	1	21
Total firm pairs	22	15	13	15	36	37	16	8	7	169

Industry: (1) Basic Material; (2) Consumer Cyclical; (3) Consumer Non-cyclical; (4) Energy; (5) Financial; (6) Industrial; (7) Telecommunication; (8) Utilities; and (9) Technology

Table 4 reports the minimum, maximum, mean, standard deviation, kurtosis and skewness of the three measures of board industry expertise. As shown in Table 4, it is common for GLCs and non-GLCs to have at least one industry expert directors on their board as the mean of *Ind_Expert* is nearly 1. For both *#Ind_Expert* and *%Ind_Expert,* non-GLCs report higher mean compared to GLCs. Among the nine industries, utilities show the highest mean of *#Ind_Expert* and *%Ind_Expert* of 7.44 and 61%, respectively. This statistic could be due to the highly specialized and heavily regulated nature of the utilities industry, thereby suggesting the appointment of more industry expert directors on the companies' boards.

Table 4: Descriptive statistics of board industry expertise

		Industry

	Kurtosis	2.19	-1.12	3.95	-0.73	0.25	0.73	-0.01	-1.08	-0.80	-0.25	-0.96	-0.20

Industry: (1) Basic Material; (2) Consumer Cyclical; (3) Consumer Non-cyclical; (4) Energy; (5) Financial; (6) Industrial; (7) Telecommunication; (8) Utilities; and (9) Technology

Empirical Results

The independent samples *t*-test results are presented in Table 5. The *number* of industry expert directors, *#Ind_Expert* of GLCs are lower than non-GLCs for consumer non-cyclical, industrial, utilities and technology industries. However, the *overall* mean of board industry expertise for GLCs are not statistically significant from that of the non-GLCs for the first and second measures of board industry expertise, *Ind_Expert* and *#Ind_Expert,* which is inconsistent with Hypothesis 1. This finding is not of concern given that the first measure of board industry expertise, *Ind_Expert,* is a dummy variable, which may not capture a systematic variation between GLCs and non-GLCs. *#Ind_Expert,* on the other hand, measures the absolute number of directors with industry expertise, which is not scaled by board size. Therefore, the mean of board industry expertise for the second measure is highly likely affected by the board size of the GLCs and non-GLCs. That is, firms with larger boards are expected to have more industry experts. Accordingly, a direct comparison between the level of board industry expertise of GLCs and non-GLCs using *#Ind_Expert* may be less meaningful.

The result for the third measure of board industry expertise, *%Ind_Expert,* is consistent with Hypothesis 1. As can be seen from Table 5, the overall mean of board industry expertise for non-GLCs is 0.32 while the mean expertise for GLCs is only 0.27. The mean difference between the two groups is positive and significant at 5% level suggesting

that non-GLCs have a significantly higher percentage of directors with industry expertise.[3] Further, Table 5 reports that the mean differences of board industry expertise between non-GLCs and GLCs are positive and significant for the consumer non-cyclical and industrial industries. On the other hand, the mean differences of board industry expertise between GLCs and non-GLCs are *negative* and significant for the energy and technology industries. That is, the percentage of industry expert directors is higher in GLCs relative to non-GLCs. A potential explanation for this unexpected result is that these are highly specialized industries in which technical expertise is highly critical and not easily transferred to industry outsiders. In Malaysia, these two industries are largely controlled by the government in that the GLCs such as Petronas Gas Bhd, Petronas Dagangan Bhd, and Formosa Prosonic Industries Bhd. are the giant players in the market. For the remaining industries, non-GLCs report higher but insignificantly differences in mean of board industry expertise for *%Ind_Expert* compared to GLCs.

Conclusion

GLCs play a widespread and pervasive role in the economic and social development in Malaysia, (Menon, 2017). Despite GLCs' significance in this country, there have been anecdotal evidences to suggest that they are underperforming. Notwithstanding, the empirical findings on the performance of GLCs are so far mixed. These inconsistent findings suggest other determinants of GLCs' performance may be at work. One of the reasons claimed to be the cause of GLCs inefficiency and poor performance is poor recruitment system (Dahlan, 2010; Gaio & Pinto, 2018). Particularly for the executives and directors of GLCs, there has been a conjecture in the literature that they are often appointed based on their networking and political connections rather than skills and expertise (Hamid, 2011; Lau & Tong, 2008; Gaio & Pinto, 2018), potentially resulting in a lack of relevant expertise and qualifications on board.

Consequently, we hypothesized that GLCs in Malaysia have lower level of board industry expertise compared to non-GLCs. The results are consistent with prediction. On aggregate, GLCs have lower *proportion* of directors with industry-related formal qualification or experience. As argued in Section 2, the ineffective directors' appointment in GLCs by the government that is biased towards appointing directors with government connection with them may be done at the expense of the company. That is, these politically connected directors may be appointed even when they do not have the relevant industry expertise. This finding provides empirical support for the potential ineffective and biased appointment of directors on to the boards of GLCs in Malaysia by the government.

The main limitation of this study is that it assumes that the most relevant (if not the only relevant expertise) to enhance firm performance is industry expertise. However, prior literature suggests that the board of directors should be composed of relevant 'skillset' endogenous to the firm (Christy et al., 2013). A set of relevant skills may include other types of expertise such as accounting (or financial), legal, or even networking skills. Therefore, future research may extend this study by examining the role of other potential relevant expertise on the performance of GLCs. A particularly interesting extension of this study will be to test the effect of having directors connected with the government on the performance of GLC

[3] As discussed in Chapter 4, an alternative approach to test Hypothesis 1 is using Equation (1) estimated using the ordinary least squares regression. However, both approaches should yield consistent results. Untabulated estimates for Equation (1) indicate that α_1 is not significant for the first two measures of board industry expertise. For the third measure of board industry expertise, *%Ind_Expert,* α_1 is -4.404 (significant at 5% level) suggesting that GLCs have significantly lower percentage of industry experts on board. Overall, these results are consistent with the independent samples T-test results presented in Table 4.4.

Table 5: Differences in the mean of board industry expertise between GLCs and matched non-GLCs (2010-2017)

Abstract

The adoption of electronic medical records in the e-Health sector in Morocco is intended to enhance hospital quality, to decrease the frequency of medical errors and to minimize the cost of health care. But few studies have focused on the predictive factors of physicians' intention to use an EMR system. Using the indicators in the **UTAUT model**, a theoretical model is suggested to illustrate the behavior of physicians in using an **EMR system** at the **Mohammed VI University Hospital Center in Marrakech, Morocco**.

Keywords: UTAUT model, Adoption of the Electronic Medical Records, EMR system, Mohammed VI University hospital, Marrakech (Morocco).

Introduction

The electronic medical record is the main component of any hospital information system. It overcomes the disadvantages of the paper medical record by making it more accessible and more secure. Access time is now measured in seconds instead of hours. Networked, the electronic medical record can be shared and consulted by several stakeholders at the same time. Data protection is ensured by access authorizations (Login, passwords, data encryption, etc.). The electronic medical record facilitates data sharing, communication and coordination between the different partners in the healthcare system. It is the hub of any hospital information system.

The majority of hospitals in developing countries are characterized by the predominance of the classic medical data management system, associated with problems such as the lack of an electronic medical record, duplication of medical information, difficult access to health data and loss of time (Omary Z et al., 2009). Aware of the importance of the implementation of the electronic medical record and with the objective of taking advantage of its benefits and overcoming its drawbacks paper, The Morocco, during the last ten years, has launched the deployment of hospital information systems in major public hospitals and mainly in the University Hospital Centers (UHC). However, despite the willingness of public authorities and the investments made, the process of deploying the electronic medical record faces many obstacles related mainly to the acceptance of its use by health professionals. The objective of this study is to develop, through the UTAUT model, a conceptual framework that brings together the main factors influencing the adoption of EMRs by physicians, which will be empirically tested with physicians working at the Mohammed VI UHC in Marrakech.

Cite this Article as: Oumaima Hafide, Abdelaziz Zitouni and YounessLafraxo "A Conceptual Study of the Impact of UTAUT Model on the Intention and Adoption of Electronic Medical RecordsBy physicians of Mohammed VI University Hospital Center (UHC) in Marrakech (Morocco)" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Physicians are the primary users of EMRs in hospitals. Specifically, they can easily build, consult, distribute and share patient records between physicians and other stakeholders. During EMR implementation, many physicians, however, are confronted with technical problems (system failure and poor interface design), inefficiency, data errors and system incompatibility issues (Freudenheim, MILT (2012)). As well, physicians are becoming worried about losing autonomy or changes in the power structure, Sherer, S.A. (2010). There is a critical barrier to the adoption of EMRs across the board due to a limited physician support base. To increase physicians' willingness to adopt the EMR, it is important to change their attitudes and receive ongoing support, as they are the primary users of these systems (Venkatesh, V., Sykes, TA, Zhang, X. (2011)). Many countries are currently creating a medical record; however, the limited acceptance of this technology presents a serious challenge to its successful use. As a result, this document is intended to clarify the acceptance of the EMR system, especially at Mohammed VI University Hospital Center, located in Marrakech, Morocco.

The choice of UHC Mohammed VI to test our research model is motivated by the fact that this center is the largest hospital in the region of Marrakech and is a regional medical reference. 1500 beds and contains more than 20 medical specialties and employs more than 500 doctors and 1500 nurses. In addition, as part of the "Digital Morocco" project launched by the government in 2008 to computerize all public and private institutions, the UHC Marrakech has since 2009 a Hospital Information System called HOSIX and an electronic medical record, becoming the first health institution in Morocco to engage in such a project. The EMR at the UHC Marrakech has been in operation for 11 years, but its deployment seems to be hampered by resistance and obstacles related mainly to user commitment.

For this study, the objective is to identify the most significant determinants of physicians' acceptance of EMRs in a sampling of general practitioners and specialists in the province of Marrakech. Our main efforts focused on resolving the following questions: What are the user's intention factors for the adoption of an EMR at Mohammed VI Hospital?

This study investigates the impact of performance expectation, effort expectation, social influence and perceived risk on behavioral intention and the effect of enabling conditions on the physician's perception of the situation.

We will have conducted a field survey to collect data from physicians who had experience using EMR exchange systems at UHC Mohammed VI. A questionnaire will be administered directly to a sample of 200 physicians.

To test the proposed research model, we employed structural equation modeling using the partial least squares method.

Literature Review and Theoretical Framework

UTAUT is one of the most influential frameworks for the prediction of factors that influence technology acceptance and adoption (H. San Martín et al.,2012). The model has proven that ithas good predictability. Nevertheless, its ability to predictThe adoption of electronic medical records by physicians is unclear, especially in developing countries (V. Venkatesh et al.,2011).

Consequently, many authors have used UTAUT either along side variables from other theoretical models or by examining antecedents and moderators of key determinants when used in healthcare (Seok Kim, et al.,2015) Thus, the addition of context-specific determinants should be used to improve the predictability of UTAUT when used in healthcare (Abd Rahman Ahlan et al.,2014)

a) Unified Theory of Acceptance and Use of Technology (UTAUT):

The unified theory of technology acceptance and use (UTAUT) was proposed by (V. Venkatesh, 2003) as an alternative to the TAM. UTAUT was formulated with four main determinants of information technology intent and use, namely performance expectation (EP), effort expectation (EE), social influence (SI) and enabling conditions (CF). PE, measuring the extent of an individual's feeling, believes that the system could improve its performance and that this configuration is similar to the utility concept of the TAM model. EE measures the extent to which users believe that the system is easy to use and that this configuration is similar to the ease of use construction in the TAM model. UTAUT also theorizes the moderating effect of four other influences such as gender, age, experience and voluntary use (V. Venkatesh, 2003). The actual UTAUT model is extended with additional variables (Nuq & Aubert, 2013; Oh & Yoon, 2014; Slade, Williams, & Dwivedi, 2013). Personal innovativeness in IT (PI) and resistance to change (RC) are regarded as important determinants that impact the physicians' intention to use the

eHealth services (Hoque & Sorwar, 2015).This study takes into account the behavioural factor related to computer use, which plays an important role in the adoption of EMRs by doctors at Mohammed VI Hospital in Marrakech.

b) Adoption of EMR

As noted above, previous research has attempted to identify the factors that influence physicians' adoption of EMRs in different ways (Hossain et al (2019)) (Vossebeld et al (2019)). For example (Hossain et al., 2019), based on the theory of acceptance and use of unified technology (UTAUT), to study physician adoption of EMR systems in Bangladesh (Hossain). et al. Taddei (Vossebeld et al. (2019)) studied factors such as anxiety, self-efficacy, self-confidence, inadequacy and data security indirectly had a significant influence on physicians' intentions to use the EMR.

c) Performance Expectancy (PE):

Performance expectation is considered an important construct in behavioural research and refers to the expected improvement in performance after the adoption of a new system (V. Venkatesh et al 2003). This factor is derived from the perceived utility construct proposed in the TAM. The most valuable system is one that users believe will reduce their diversity and improve their performance (A. Granic and N. Marangunic, 2015) (V. Venkatesh, 2003).
It is found that PE is the strongest factor of users' BI to use a new technology (Lean, Zailani, Ramayah, & Fernando, 2009; Liébana-Cabanillas, Marinković, & Kalinić, 2017; Oliveira, Faria, Thomas, & Popovič, 2014; Venkatesh, Morris, Davis & Davis, 2003). PE influences users' BI to adopt the neweHealth services that may facilitate the overall health information systems (Gagnon et al., 2016; Pai & Huang, 2011). PE has a positive impact on users' intention to adopt a new technology (Hoque & Sorwar, 2015; Hoque, 2016a).

d) Effort Expectancy (EE)

According to Venkatesh et al (2003), effort expectation is defined as the degree of ease of use of the system. it was created from the perceived ease of use variable proposed in TAM (FD Davis, 1989). It refers to the ease of use of a new technological system and is associated with the user's interest in understanding it (Venkatesh V et al. (2011)). EE is a necessary variable to determine user behaviour in many areas, such as online systems,[(Jewer J 2018), (Steinhilber S, 2013) ((Hoque R, 2017)]. EE significantly influences the users' intention to adopt new technologies (Alalwan, Dwivedi, & Rana, 2017; Alalwan, Dwivedi, Rana, & Algharabat, 2018; Hoque & Sorwar, 2015; Weerakkody, El-Haddadeh, Al-Sobhi, Shareef, & Dwivedi, 2013). Previous studies also propose that EE has a positive impact on the users' intention to adopt the health information system. Such as, EE is regarded as a significant determinant directly affecting users' intention to use the EHR system, M-health monitoring systems, and eHealth services (Boontarig, Chutimaskul, & Chongsuphajaisiddhi, 2012; Lian, 2015; Sun, Wang, Guo, & Peng, 2013).

e) Social Influence (SI)

Social influence is defined as the extent to which an individual believes that other important users should use a new system (V. Venkatesh et al. (2003)). Three measures of SI used in this study include (1) user perspectives, (2) attitude of the living environment, and (3) community recognition of general practitioners. The SI as a direct attitude factor towards system use and behavioural intentions is presented as a subjective norm in TAM2, (V. Venkatesh and FD Davis, (2000)). FC is an important factor of BI and use of the new technologies (Yi, Jackson, Park, & Probst, 2006). The infrastructural support has a significant role in facilitating the use of the health information systems (Bhattacherjee & Hikmet, 2008). FC has a positive impact on the BI and use of the new eHealth services (Boontarig et al., 2012).

f) Facilitating Condition (FC)

FC is about how people think there is a technical support infrastructure in place that allows them to use the technology whenever necessary (V. Venkatesh et al. 2003). FC is an important factor of BI and use of the new technologies (Yi, Jackson, Park, & Probst, 2006). The infrastructural support has a significant role in facilitating the use of the health information systems (Bhattacherjee & Hikmet, 2008). FC has a positive impact on the BI and use of the new eHealth services (Boontarig et al., 2012). FC is a key factor for people using telemedicine systems ((Hoque R, 2017)(H. Sallehudin et al (2016)).

g) Perceived Risks

Perceived risk has been defined as the combination of two components: uncertainty and negative consequences (R.A. Bauer, 1960). Similarly, the adoption and use by physicians of technologies of Healthcare information is also subject to uncertainty and the degree of negative outcomes (A.K. Yarbrough & T.B. Smith,2007). Perceived risk was based primarily on the perceived level of uncertainty in the physician's use of health care information

technology (A.K. Yarbrough & T.B. Smith,2007). Previous studies have identified facets of perceived risk. Cunningham,1967 proposed the following six dimensions of perceived risk: (a) performance risk; (b) financial risk; (c) psychological risk; (d) social risk; (e) physical risk; and (f) temporal risk. In the context of online services, the following seven dimensions of risk were identified: (a) performance risk; (b) financial risk; (c) time risk; (d) psychological risk; (e) social risk; (f) privacy risk; and (g) overall risk.

In the context of healthcare, potential security and privacy problems compromising the confidentiality of EMRs indicate the importanceof performance, psychological, and privacy risk (A. Weeger et al.,2011)
In this study, we define physicians' perceived risk based on their perception of the likelihood of losing patient data or fear of losing the confidentiality of medical and personal patient data when exchanging EMRs between physicians and between hospitals.

Therefore, in this study perceived risk is a critical research variable.

Perceived risk is one of the most important concepts (Zhao, Y., Ni, Q. and Zhou, R. (2018)). In this study, perceived risks are related to the perceptions and/or uncertainties perceived by physicians when using the EMR. previous research has attempted to explore perceived risks for the use of EMRs (J.M. O. and González, M.VR (2011)) (Hsieh, P.J. (2015)). Other studies have shown that PR plays a negative role in the adoption of EMRs (Zhao, Y., Ni, Q. and Zhou, R. (2018)).

h) Behavioral intention to use EMR system

This research's principal objective is to examine the factors that influence physicians' behavioral intent and to continue to use the EMR as a support for the SIS in the future. According to Ajzen, (1991), intention is an indicator used to examine the factors that influence utilization behavior,Ajzen, (1991). FC is an important factor of BI and use of the new technologies (Yi, Jackson, Park, & Probst, 2006). The infrastructural support has a significant role in facilitating the use of the health information systems (Bhattacherjee & Hikmet, 2008). FC has a positive impact on the BI and use of the new eHealth services (Boontarig et al., 2012).

Table 1: Previous EMR adoptions by physicians

Study	Theory	Method	Variable
Hossain and al.	Unified Theory of Acceptance and Use of Technology (UTAUT)	Survey Sample = 249 physicians	**DV[1]:** behavioral intention, and use behavior **IV[2]:** performance expectancy, effort expectancy, social influence, facilitating condition, personal innovativeness in IT, and resistance to change
Emani and al.		Survey Sample = 1,075 physicians	**DV**: satisfaction with the outpatient EHR. **IV:** physician age, gender, race, specialty (primary care, medical specialty, and surgical specialty), number of outpatients seen per week, number of outpatient hours worked per week, practice size
Venkatesh and al.	Theory of acceptance and use of technology	Survey Sample = 141 physicians (longitudinal study)	**DV:** Behavioral intention and use behavior **IV:** Performance expectancy, effort expectancy, social influence, and facilitating conditions
Egea and González	TAM	Survey Sample = 254 physicians	**DV:** Perceived risk, institutional trust, perceived usefulness, perceived ease of use, attitude towards usage, and usage intentions of electronic health care records (EHCR) **IV:** information integrity

[1]DV: dependent variable.
[2]IV: independent variable.

Sykes et al.		Survey Sample = 151 physicians/8,440 patient	**DV:** EMR system use and performance (patient satisfaction) **IV:** Characteristics of individual, technology perception, and social network centralities

Hypothesis and Research model

Based on the literature review on the extended UTAUT model in the healthcare sector, the purpose of our study is to investigate the factors that influence physicians' behaviour towards the EMR system adoption.

This model explain behavioral intention by suggesting four principal factors, namely performance expectancy (PE), effort expectancy (EE), social influence (SI), and facilitating conditions (FC). After extensive review of literature conducted using UTAUT in health technologies,we used the basic constructs of the UTAUT model (Fig. 1) and modified it based on extensive literature review .

The proposed model established in this study hypothesizes that apart from the four basic constructs (PE, EE, SI and FC), perceived risks (PR) may have significant loading on the acceptance and use of the EMR system in Morocco.

The modification on the model is to increase the prediction of the intention to use the EMR system by physicians. The following sections explain the hypotheses developed in this study for investigating the research question.

Figure. 1: Research Model (2019)

Hypothesis1: *Performance Expectancy has a significant influence on the behavioral intention to use EMR.*
Hypothesis 2*: Effort Expectancy has a significant influence on the behavioral intention to use EMR.*
Hypothesis 3: *Social Influence has a significant influence on the behavioral intention to use EMR.*
Hypothesis 4: *Facilitating Condition has a significant influence on the behavioral intention to use EMR.*
Hypothesis 5: *Physician's perceived risk has a significant influence on the behavioral intention to use EMR.*
Hypothesis 6: *behavioral intention has a significant influence on the use of EMR system.*

Conclusion

Based on the findings presented in the literature review, the UTAUT model is one of the most commonly used models in healthcare information technology adoption research. As part of the research model proposed above, additional qualitative and quantitative research would be required to determine the ability of this model to explain the end-user's intentions to use the EMR system. Our study's main objective is to validate the UTAUT model and

variables that identify physicians' intentions and behaviours that can be used in the context of e-recording and technology communication.

The construct measures shown in Fig. 1 will all adopted from previous studies and measured using a 7-point Likertscale; the anchors ranged from “strongly agree” to “stronglydisagree.” Although previous studies have validated the ques-tionnaire items, we will conducted pretests by requesting severalphysicians and information management professors to evalu-ate each item. To ensure validity and reliability, we will conducted a pilot test with a sample that was representative of the actualrespondents. We will conducted structural equa-tion modeling using partial least squares (PLS) estimations forthe data analysis because the PLS method requires a minimalsample size and has few residual distribution requirementsfor model validation . The target participants will be physi-cians who had experience using the EMR exchange in Mohammed VI University Hospital Center in Marrakech, Morocco.

EMR adoption in hospitals may be very important to improve health services. Understanding and identifying the needs and perceptions of physicians and the physicians of Mohammed VI Hospital in Marrakech is very important for the implementation of the EMR. E-Medical records will help physicians by offering them more information about the health of their patients as well as providing them with health care services in remote locations.

Abstract

Background: The Electronic Medical Record (EMR) is the backbone of today's global healthcare systems, enabling the management and computerized sharing of all patient medical information. The sharing of medical data between healthcare professionals enables the improvement of the efficiency and quality of healthcare services provided to patients. Despite the promise of EMR use, health care professionals continue to resist its adoption and successful EMR deployment remains a major challenge. **Objectives**: The objective of this study was to identify and synthesize the determinants of EMR adoption, through a systematic literature review, by healthcare professionals in developing countries. **Methods**: A systematic literature review was conducted using the PRISMA-P (Preferred reporting items for systematic reviews and meta-analyses) methodology. Articles published between January 2010 and June 2020 that studied the determinants of EMR adoption and acceptance by health professionals in developing countries were identified using five online databases: ScienceDirect, Springer Link, Scopus, Emerald and Sage journals. The selection process excluded duplicate articles and articles that did not directly address the objectives of this study. In the end, 17 articles were included. The extraction of results was done by two researchers, independently. **Results**: This study included 17 articles that examined the determinants of adoption and acceptance of EMR use by health professionals in developing countries. From these articles, 27 factors were identified and grouped into 4 classes: (1) technological factors (2) individual characteristics of healthcare professionals, (3) organizational and managerial characteristics and (4) social factors. **Conclusion**: Identifying the determinants of EMR adoption in developing countries is crucial for health system managers and policy makers. It allows them to grasp the expectations of potential users and to adjust EMR deployment strategies in order to successfully integrate the EMR into medical practices.

Keywords: EMR Adoption; EMR Adoption; Developing Countries.

Introduction

Over the past decade, worldwide, there has been a shift from paper-based documentation to electronic documentation and the way in which patient information is stored and accessed in healthcare (Aruldass, 2019). The use of electronic patient medical records (EMRs) has made it easier for healthcare professionals to access critical patient information. Organizational quality and safety teams are now able to capture and communicate data more effectively. This process helps guide practice improvement and ensure the provision of high-quality, ongoing care (BORYCKI, 2015)[1].

EMR implementation has also contributed to a reduction in unnecessary surveys and procedures and medication errors, mainly due to error-prone handwritten documents, illegible handwriting and the care of professionals using different terminology. Research has shown that the use of the EMR has improved communication between health

Cite this Article as : Oumaima Hafide, Abdelaziz Zitouni and Youness.Lafraxo " Determinants of EMR Adoption and Use by Healthcare Professionals in Developing Countries : A Systematic Review" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN : 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

care providers, patients and their families, compared with the previous paper-based documentation (BORYCKI, 2015).

Physicians are the primary users of EMRs in hospitals. Specifically, they can easily create access, distribute and share patient records among physicians and other stakeholders. During EMR implementation, however, many physicians face technical problems (system failure and poor interface design), inefficiencies, data errors and system incompatibility issues (Freudenheim, MILT (2012)). In addition, physicians are concerned about loss of autonomy or changes in the power structure, Sherer, S.A. (2010). Nurses and midwives, the largest cohort of health care staff, are important professionals affected by advances in EMR technology (ACN, 2017, Dixit and Sambasivan, 2018, University of Scranton, n.) [2].

There is a major barrier to widespread adoption of EMRs due to the limited support base of physicians. To increase physician willingness to adopt EMRs, it is important to change their attitudes and receive ongoing support, as they are the primary users of these systems (Venkatesh, V., Sykes, TA, Zhang, X. (2011)) [3]. Many countries are in the process of creating a medical record; however, the limited acceptance of this technology presents a serious challenge to its successful use. Therefore, this paper aims to clarify the acceptance of the EMR system, particularly in developing countries.

For this study, the objective is to identify the most significant determinants of EMR acceptance by health professionals in developing countries based on a systematic review of 17 articles on the topic. Our main efforts focused on addressing the following questions: What are the user-intention factors for EMR adoption in developing countries? In the form of a new integrated model.

Methods

Search Strategy

Five electronic databases (ScienceDirect, Springer Link, Scopus, Emerald and Sage journals.) were systematically searchedto identify articles published between January 2010 and June 2020 examining the factors influencing healthcare professionals' adoption and use of electronic medical record (EMR) Inhealthcare settings in the developing countries. The search string was: (adoption OR acceptance OR use) AND (electronic health record OR EHR OR electronicmedical record OR EMR OR electronic record) AND (developing countries).

Article Selection

A set of inclusion and exclusion criteria were applied to select the articles to include in our analysis. An article has been included if it meets all of the following criteria:

(1)examined the factors influencing healthcare professionals 'adoption and use of electronic medical record (EMR); (2) was conducted in one of the developing countries; (3) has been the subject of empirical research in healthcare establishment; (4) was published between January 2010 and June 2020; (5) the full text of the article was available and (6) has been published in English. Literature review articles, opinions and comments were excluded from this review. Applying the PRISMA method "Preferred Reporting Items for Systematic Reviews and Meta-Analyses" and using the online software Covidence, duplicate articles have been excluded. Then, two PhD students (ZI and HA) independently reviewed the titles and abstracts of the remaining papers to exclude papers that did not meet one of the inclusion criteria listed above. The full-text of eligible articles were then examined. The reviewers submitted their analysis to the concordance process and extracted relevant articles from among those previously selected. The above selection process was repeated until saturation; Figure 1 summarizes this process

Figure 1: Study selection process.

Key Finding:

Table 1 below summarizes the main findings of the 17 selected articles and the main factors influencing EMR adoption by health professionals in developing countries. The results of this systematic review found that acceptance of EMR use by health care professionals are influenced by a variety of factors. These include factors related to the technological characteristics of the system, health care the personal characteristics of the professionals, social factors and organizational and managerial factors.

							healthcare practices, resulting in successful adoption of EMRS.	
Azza El.Mahalli (2015) ([20])	« Adoption and Barriers to Adoption of Electronic Health Records by Nurses in Three Governmental Hospitals in Eastern Province, Saudi Arabia »	Saudi Arabia	Hospital	Quantitative	Nurses	300	Results of the study indicate that the most frequently cited barrier among all hospitals was "loss of access to medical records transiently if computer crashes or power fails" (88.6 percent). This was followed by "lack of continuous training/ support from information technology staff in hospital" (85.9 percent), "additional time required for data entry" (84.9 percent), and "system hanging up problem" (83.8 percent). Complexity of technology (81.6 percent). .	* IT support * Contnuous training *Additional time * Complexity of technology

Results and Discussion

A total of 17 papers met the criteria for adoption of the EMR, of which 8 were on individual factors (Perceived Usefulness, Perceived Ease of Use, Work Experience, Computer experience, Degrees level, Effort expectancy, Self efficacy, Professional autonomy) and 8 on Organizational & managerial factors. Some of the articles also include technological factors (Compatibility, Complexity, Security data, Accuracy data, data integrity) and social factors (Social influence, Docor-patient relationship, Interactivity perception). The articles reviewed provide a diverse international perspective on the topic of EMR adoption in developing

countries. The methodology applied in the 17 articles reviewed is summarized in Tables 1 and 2. 15 articles reported on studies using quantitative methodology with surveys and two articles used qualitative methodology.

The results of this systematic review found that acceptance of EMR use by health care professionals are influenced by a variety of factors. These include factors related to the technological characteristics of the system, health care the personal characteristics of the professionals, social factors and organizational and managerial factors, as shown in Table 2 below.

Individual determinants are the most frequently cited, with Perceived Usefulness and Perceived Ease of Use being the main explanatory factors for EMR adoption, this result is consistent with other empirical findings (S. Hong, J.Y.L. Thong and K.Y. Tam 2006; M.-C. Lee 2010; Bowling, A.2016).The influence of organizational and managerial factors is less important than that of individual factors, in this sense, the review of this study showed that management of EMR implementation and technology support promote the adoption of EMRs by health care providers, a result consistent with other empirical findings (Bowers et al. 2011; Kowitlawakul et al. 2013; Choi, Lee, Park, 2015). The influences of social and technological factors are less significant than individual and organizational/managerial factors because health care professionals have a high degree of autonomy in decision-making.

Table 2: factor frequencies

Conclusion

This study examines health care professionals' intentions regarding EMR maintenance and their adoption of the extended functions of EMR systems in their practice. In order to achieve the study's objective of identifying and synthesizing the determinants of EMR adoption by health professionals in developing countries through a systematic review of the literature.

This study includes 17 articles that examine the determinants of adoption and acceptance of EMR use by health professionals in developing countries. From these articles, 27 factors were identified and grouped into 4 classes: (1) technological factors, (2) individual characteristics of health professionals, (3) organizational and managerial characteristics, and (4) social factors.

A review of the identified articles shows the wide range of opportunities and barriers to implementing EMRs. Despite the positive effects of EMR use in hospitals, the rate of adoption of EMR systems in hospitals is still low and they face resistance from health care professionals.

The use of electronic medical records requires the presence of certain users and system attributes, the support of others, and many organizational and managerial factors and environmental enablers. In addition, difficulties in using EMRs and the non-use of specific functions result from the presence of barriers.

By considering the factors identified in this study, it should be possible to improve clinicians' ability to use EMRs easily and effectively. This, in turn, will increase the likelihood of quality and safety improvements through EMRs.

The review found that implementers can insulate the project from these by establishing strong leadership, using technical project management, standards setting, and training of their staff to ensure risks do not compromise successful implementation. Decision support tools can only be used to accelerate universal adoption of the EMR.

The findings of this study can be used as an overview of adoption drivers and barriers that professionals may potentially see in the EMR implementation process.

Abstract

The study examined the stabilization effect of fiscal policy on banking system stability in Nigeria between 1985 and 2019. The study adopted ADF, and Cointegration technique to check the stationarity and to determine the existence of long run relationship among the variables. Ordinary least square technique was used to evaluate the interaction between fiscal policy and banking system stability. The finding indicates that fiscal policy actually has strong influence on banking system stability in Nigeria. It further was discovered that among the fiscal policy variables, Public Debt has more effect on banking systems than other variables used in the study. This indicates that the more debt the government accumulates, the greater the instability in the banking system. It is thus imperative to offer policy implications for Nigeria. The study recommends that government should put appropriate checks in place to avoid borrowing that will creep into deficit since debt affects banking system stability. Finally, government should ensure that its borrowings are channelled towards productive segments of the economy to enhance Sustainable repayment of debt and the mechanisms for debt repayment must be severely adhere to.

Keywords: Stabilization, Policy, Debt; Expenditure.

Introduction

The 2007 financial crisis of United States caused so many negative effects on its economic growth and those of other economies of the world which triggered the Great Financial Crisis (GFC) of 2008 (Alqahtani and Mayes (2018), Knowles Phillips and Lidberg (2017). The banking system, being the centre of financial system experienced diverse challenges that led to the liquidation of many banks. According to Dumičić (2019) fiscal policy has some vast macro-prudential potentials because of its several link with both the real economy and the financial systems. For example, tax policies, public expenditure, public debt management, different social and structural measures and other fiscal policy measures are aimed at fuelling higher employment and sustainable economic growth. Adegoriola (2018) opined that fiscal policy is a critical part of post-crisis framework for macro-financial stability. The study revealed

further that while banking crisis cause havoc to public finances, rising fiscal risks also directly or indirectly cause deterioration to the financial system.
In Nigeria, fiscal policy became a major tool used for economic and banking system stabilisation since 1970s due mainly to; (i) the dominant role the domestic public sector played during the oil boom era in early (ii) the necessity for reconstruction of the whole economy after the civil war, (iii) the strategy of industrialization adopted at a time in Nigeria which was the militarization of governance and the import substitution industrialization policy (Agu, Okwo, Ugwunta and Idike 2015). Indisputably, fiscal policy is crucial for the existence of a sound and healthy banking system because government's control to tax and expenditure affects the general business environment and disposable income of citizens and corporations which aids banking system stability. Despite the undisputable relevance of fiscal policy for curbing instability and preserving banking system stability, there are currently, no prior researches on the coordination between fiscal policy and banking system stability in Nigeria and no study exists on fiscal policy that aims at stabilizing Nigeria banking system.

The empirical study is imprecise about whether or not any of the tools of government policy matter in decoupling the banking system stability in Nigeria. The counter-cyclical fiscal policy reaction to banking system stability is one channel that has been identified. However, in the empirical literature, lesser attention is given to its effects on banking system globally, particularly emerging countries like Nigeria that has frequent banking system crisis which are cause by both domestic and global shocks, thus making it very challenging and indeed difficult for government to adjust its fiscal expenditure in adverse periods of shocks. Consequently, not only is this sort of study timely and necessary, it is central in decoupling the banking system stability link through fiscal policy response tools. Again, the rationale for this study cannot be overstated as the banking system in Nigeria is faced with persistent and large shocks that results from global crisis, the uncertainty of oil prices and the implementation of counter-cyclical fiscal policies to boost the economy. Subsequently, the core thrust of this study is to analyse the effect of fiscal policy variables on banking system stability in Nigeria. This study adds to the existing literature in three ways. First, this study applies broad measures of fiscal policy tools on banking system stability in Nigeria. Second, the importance of the link between fiscal policy tools and banking system stability in Nigeria is analysed, and lastly, econometric model is used to examine the macro data in order to provide appropriate policy direction for the management of banks, financial regulators and the government. The study is designed in five sections. Following this section is the literature review section while sections three and four represent the methodology and empirical analysis, respectively and section five is the conclusion and recommendation. Indisputably, fiscal policy is crucial for the existence of a sound and healthy banking system because government's control to tax and expenditure affects the general business environment and disposable income of citizens and corporations which aids banking system stability.

Literature Review

Conceptual Review

Fiscal Policy

According to Ubi-abai and Bosco (2017) fiscal policy is defined as interventions tools of government via expenditure and tax system used for the achievement of macro-economic goals such as full employment, price stability and economic growth. The automatic stabilizers are a set of fiscal policy designed to offset variations in a country's economic activities through normal operations without extra approval by the policymakers or government. It is called automatic stabilizer fiscal policy because it stabilizes economic cycles and financial system and are routinely triggered without extra government action. For instance, during boom, tax receipts automatically increase while expenditure on benefits falls automatically, thereby, limiting the amount of economic growth. Automatic fiscal stabilisers differ from discretionary fiscal policy in that automatic stabilisers take place during recession when a government automatically spends extra due to additional claims for unemployment benefits. However, government may increase expenditure if it discovers that the automatic stabilisers are not sufficient to cater for the unemployment claims.

Banking System Stability

The Basel Committee on banking supervision established the initial set of guidelines- Basel I to complement banking regulations which was to improve the stability of the banking system and to fill the synchronization gap that lead to prior financial crisis. It was however discovered that Basel 1 is ineffective owing to rapid financial development

caused by innovation and risk management. A new framework called Basel II was developed in 2004 which was based on three pillars: supervisory review, market discipline and minimum capital requirement. The implementation of Basel II framework was both slow and difficult. The 2007-2010 global financial crisis had massive impact on global banking system stability. The unpredictable business environment characterized by increased financial distresses and bank failures called for immediate attention to be paid to the banking system in particular and financial institution in general. A lot of issues were raised and due to the impact they had on the economies, the desire to salvage the problems became top priority for financial experts, scholars, policy makers and researchers. This made the Basel Committee on banking and supervision to implement another novel framework for banking supervision which was established after serious re-examination of the previous banking regulatory frameworks – Basel I and II and caused formation of guidelines for Basel III framework. A huge disruption of the banking system operations will certainly affect the entire society. Thus, banking stability critical to reducing the extensive social and economic shocks that may arise from problems in the banking system (Neem 2019).

The relationship between fiscal policies and the banking system

The fiscal policies of the governments (local, state and federal) have *direct link* with the banking system when their fiscal deficits are financed and debts managed. This direct relationship eminent from government participating as a borrower or lender in the financial markets, the provision of incentives through tax and tax cuts, as well as the spending structures. Similarly, the *indirect* relationship among fiscal policy and the banking system through households and non-financial corporations are broad and highly relevant. This indirect link may likely have more relevance for banking system stability than the direct links. The fiscal policy could signify a risk to banking stability if it poses a risk for the operations of the real economy. Nevertheless, fiscal policy contributes positively to banking system stability as long as it supports the overall economic developments. Furthermore, the concept of the direct and indirect linkage between the fiscal policy and banking system stability may depend mainly on the financial capacity of the government which is in turn is influenced by the size of accepted and contingent government support already provided to the banking system (Itoro Ubi-Abai 2017; Okoye, Evbuomwan, Modebe, & Ezeji 2016).

Framework

Fig. 1: Fiscal Policy and Banking System Stability.

Sources: Author's Own compilation (2020).

Stylized Facts

According to Okoye et al (2016) fiscal policy has been defined by scholars like as a channel through which government regulates the level of its spending to monitor and impact on the economy. Fiscal policy used alongside the monetary policy the central bank influence money supply in a country. These policies are used to achieve macroeconomic goals which include; favourable balance of payment, price stability, decrease in poverty level, full employment, reduction in a country's debt, and sustainable economic growth. Government spending is a key component of the GDP and it denotes public expenditure on goods and services. It is among the fiscal policy tools which involves adjustment of taxation, setting up budget targets.

Previous study showed that there has been an increase in government spending from ₦1,077,871.98 million in the 3rd quarter of 2019 to ₦1,082,949.34 Million in the last quarter of 2019. Increase in government spending impacts positively on banks' performance which is a plus to banking system stability because more funds will pass through the banks to the end user – the consumers. Similarly, it found that there was a decrease in fiscal expenditure decreased from ₦2,074.46Billion in the third quarter of 2019 to ₦2,414.03Billion in the fourth quarter of 2019 (Trading Economics 2020).

Empirical Review

As indicated in a study by Matallah and Matallah (2017); Okoye et al (2016); Aero and Ogundipe (2016) fiscal policy involves deliberate actions of the government as it relates to expenditure and levying taxes or tax cuts for the sake of influencing the macroeconomic factors in the preferred direction. The importance of fiscal policy tools with regards to banking system stability is yet to gain prominence in Nigeria (Neem 2019). In this section, the study discussed numerous strands of previous literature. This include: Okoye et al (2016); Aero et al (2016); Agu et al (2015) which focused on fiscal policy and economic growth. Thach, Oanh and Chuong (2019); Adegoriola (2018); Ubi-abai et al (2017) analysed the nexus between fiscal policy and financial stability. Dumičić (2019) studied the linkages among fiscal policy and financial instability.

For studies that focus on fiscal policy and economic growth, Aero et al (2016) confirmed that significant negative link among fiscal deficits, economic growth and financial depth in Nigeria. Also, a 5% threshold level was established, this is said to be a conducive level for economic growth at a 1-year lag. It therefore resolved that the economy has been categorized by constant fiscal deficits which has negative influence on economic growth. Similarly, Neem (2019) focused 10 countries between the period of 2002 to 2014 and adopting a dynamic panel of ARDL technique, the result showed that fiscal policy is a basic instrument for economic growth.

Dumičić (2019) examined the relationship between fiscal policy and financial instability. The study ascertained and defined the key channels by which fiscal policy is related to financial instability. The study explored numerous features of public debt that are linked to financial stability, which includes; the funding costs of government and its effect on private sector costs of funding, exposures of financial institutions to the government and sustainability of public debt management. The study found that in the case of fiscal policy, which relates to election cycles have different time horizon for each of economic policymakers as its peculiar problem. Thus, have a negative effect on countercyclical capacity. It further revealed that in future policy work and research, the macro prudential capability of fiscal policy will attract more attention.

Moreover, Ubi-abai et al (2017) focused on the effect of fiscal policy measures on key macroeconomic goals from 1980 to 2013 in Nigeria. The result shows that fiscal policies caused increased growth in output however, the long run impact was not effective. Furthermore, Thach et al., (2019) discussed the impacts the interaction between fiscal and macro-prudential policies have on financial stability in Vietnam from 2008 to 2009. The result revealed that fiscal and macro-prudential policies have great influence on financial stability.

Agu et al (2015) analysed the influence of several tools of fiscal policy on the economy of Nigeria. The result showed that aggregate government expenditures have inclined to increasing with government revenue but revenue increased slower than expenditure. Thus, indicating poor economic growth in Nigeria. It found further that positive correlation exists among government expenditure and economic growth. Again, Alińska (2016) established that fiscal policy is a critical measure of the post-crisis macro-financial stability framework. The study confirmed that the banking

system crisis cause distraction to public finances and increased fiscal risks also lead to the decline of the financial system. The result showed that a resilient countercyclical standpoint could help to take care of the excess growth of asset prices and credit.

From the literature reviewed, it is apparent that quite a number of scholars have beamed light on the nexus between fiscal policy and economic growth (see Neem 2019; Matallah et al 2017; Aero et al 2016), with others focusing on the linkages between fiscal policy and financial stability (like Thach et al 2019; Adegoriola 2018 and Ubi-abai et al 2017). The effect of fiscal policy on banking system stability is omitted in most discussions in previous studies. Moreover, the fact that fiscal policy tools are crucial to the stabilization of banking system in developing economies like Nigeria, therefore, their effect on general banking system stability cannot be overlooked. Again, as at the time of this study, very few prior literatures existed on fiscal policy and banking system stability in Nigeria despite its relevance. This present study intends to fill this noticeable gap by adding to the few existing studies and extends the frontlines of knowledge by examining the links among fiscal policy and banking system stability. Thus, this study tests the effect of fiscal policy tools - government expenditure, external debt, government funding, public debt and consumption tax on banking system stability. Furthermore, this study includes consumption tax instead of Value added tax in the model which is omitted in most studies. The inclusion of consumption tax in the model is due to its effect on the purchasing power of the citizens. The higher the consumption tax, the lesser the amount available to purchase more goods and the lesser the savings ability. Thus, reducing the purchasing power of consumers. This current study is dearth in literature particularly in banking system in Nigeria, hence, represents our core contribution to literature.

Research Methodology

Theoretical Framework

In an effort to highlight the theoretical basis for the explicit relationship this current study seeks to explore, the study is theoretically underpinned to Keynesian economics theory developed by John Maynard Keynes in 1930. Keynes established the theory in an effort to comprehend the Great Depression. It is an economic theory that explain the effect of aggregate expenditure on inflation and output in an economy. It is a demand-side" theory that centres on economic changes over the short run period. The theory established that in order to stimulate demand and tug the world economies out of depression, the governments must increase their spending (expenditure) and reduce taxes (tax cuts). Keynesian economics theory is a concept which explicitly explained the possibility of achieving optimum economic performance while preventing economic crash by influencing total demand via economic intervention and activist stabilization policies. Thus as the economy and the financial institution are stabilized via effective implementation of appropriate fiscal policies, the banking system which is the centre point of the financial institution will also be stabilized.

Model Specification

The methodical framework adopted for this study follows basically the Keynesian framework and Chukwudi and Henry (2020). In the Keynesian framework, preferred aggregate demand link is stated in the goods market as specified in the equations below;

$$Y = C + I + G + (X - M) \quad (1)$$

Where:

Y represents aggregate output at a specific period of time C is total consumption, I indicate total investment;

G is aggregate government expenditure and (X−M) represents net exports. Output could be influenced by its own past level in time series setting. Consequently, the model can be extended in the relationship between fiscal policy and banking system stability as stated below:

$$BST_t = f(CADF_t, DRG_t, PD_t, GFD_t,, CTAX_t, EXD_t,, GCEXP_t \quad (2)$$

$$BST_t = CAR_t \quad (3)$$

$$BST_t = CAR_t = f(CADF_t, DRG_t, PD_t, GFD_t,, CTAX_t, EXD_t,, GCEXP_t \quad (4)$$

Explicitly, the econometric model is stated thus;

$$BST_t = \alpha_0 + \alpha_1 CADF_t + \alpha_2 DRG_t + \alpha_3 PD_t + a_4 GFD_t + a_5 CTAX_t + \alpha_6 EXD_t + a_7 GCEXP_t + et \quad (5)$$

Hence, model used in the analysis is stated as follows:

$$CAR_t = \alpha_0 + \alpha_1 CADF_t + \alpha_2 DRG_t + \alpha_3 PD_t + a_4 GFD_t + a_5 CTAX_t + \alpha_6 EXD_t + a_7 GCEXP_t + et \quad (6)$$

Where:

BST represents Banking System Stability; the dependent variable is proxied by bank soundness indicator (CAR). CAR represents Capital Adequacy Ratio. The independent variables include; CADF which represents Current Account Deficit, DRG is Debt growth, PD signifies Public Debt, GFD is the Government Funding, CTAX represents Consumption Tax, EXD signifies External Debt, the only control variable in the model is GCEXP which represents Government Capital Expenditure, et indicates stochastic error term and t is time period measured. α_0 represents the intercept describing banking system stability when the independent variables are equivalent to zero. α_1, α_2, α_3, α_4, α_5, α_6, α_7 are the parameters or coefficients or of the independent variables. The inclusion of the stochastic or error term (e_t) in the above model is to capture the impact of other variables that are not included in the model. In order to convert the variables to their natural logarithm formula in order to match the small values for regressions. Thus, most of the variables are logged. We now have log of profit, log of public debt, log of government funding, log of government capital expenditure, log of consumption tax, and log of external debt. The a priori expectations are stated as follows: $\alpha_1>0$; $\alpha_2>0$; $\alpha_3>0$ $\alpha_4<0$; $\alpha_5<0$; $\alpha_6<0$; $\alpha_7<0$.

Data Sources and Operationalization

The variables employed in this study are based on several extant literature and the theoretical stance of the study as discussed above. The study relied entirely on secondary data sourced from the Central Bank of Nigeria Statistical Bulletin and World Development Indicators. The study period is from 1985 to 2019. The period was chosen due to availability of data as well as to capture the effect of fiscal policy on the banking system during the various global financial crisis periods and the domestic financial reforms in Nigeria.

Data Presentation and Analysis

In this section, the ADF Unit Root Test and inferential analysis of the data were discussed.

Table 1: Summary of ADF Unit Root Test of the Model

Variables	P value I(1)	Critical Values 1% & 5%	ADF t-statistics I(1)	Status

Source: Authors Computation (2020)

Table 1 shows an ADF unit root test result. The result of the test carried out on all the variables revealed that the variables became stationary only at first difference. This means that the series are I(1) series. The table shows that the different probability values are less than 1%.

Table 2: Johansen Co-integration Test

Variables	Trace Eigen Statistics	Significance level of 0.05	P value	Maximum Eigen Statistics	Significance level of 0.05	P value
None *	256.7235	159.5297	0.0000	74.08092	52.36261	0.0001
At most 1 *	182.6426	125.6154	0.0000	60.44764	46.23142	0.0009
At most 2 *	122.1950	95.75366	0.0002	40.98569	40.07757	0.0394
At most 3 *	81.20928	69.81889	0.0047	29.89419	33.87687	0.1390
At most 4 *	51.31509	47.85613	0.0228	25.87364	27.58434	0.0814

At most 7	2.380406	3.841466	0.1229	2.380406	3.841466	0.1229

*Note: ** significant at 5% critical level* **Source: Authors Computation (2020)**

In Table 2, the trace test shows that five cointegrating vectors are present at 5% critical level while the max-eigen test confirms that three cointegrating equation exist at 5% critical level. The explanation is that we reject the non-existence of cointegration stand of the null hypothesis and accepts the alternative hypothesis proposition of existence of cointegration in the model. Thus, the study concludes that there exists long-run link between current account deficit, debt growth, public debt, government funding, consumption tax, external debt, government capital expenditure and Banking system stability in Nigeria over the period of study.

Table 3 presents the ordinary least square results which indicates that the estimates of the long run model captures the effect of Fiscal policy on Banking system stability in Nigeria during the period covered by this study. The result shows that four variables; current account deficit, consumption tax, government capital expenditure and public debt have positive relationship with Banking system stability proxied with bank soundness indicator - capital adequacy ratio. This confirms our apriori expectation for these variables. The remaining three variables; debt growth, external debt and government funding have negative association with Banking system stability in Nigeria. However only consumption tax and public debt have positive and significant relationship with capital adequacy ratio while debt growth DRG and government funding have negative but significant association with capital adequacy ratio. Again, the result showed that the coefficient of CTAX, PD, and GFD which are 0.134118, 0.031050, and -0.036672 respectively are significant at 5%. This indicates that a unit change in CTAX induces a 0.13-unit positive change in CAR, a unit change in PD induces a 0.03 units positive change in CAR while a unit change in GFD induces a -0.03 units negative change in CAR. The coefficient of DRG, has positive and significant impact on CAR although not significant at 5%. CADF and GCEXP both have coefficient that show positive and non-significant impact on CAR. On the other hand, EXD is the only variable that has a coefficient that shows negative and non-significant impact on CAR. The positive and significant effect of CTAX and PD could be as a result of the impact these policies have on bank customers and the various business sectors which have direct impact on banks operations and performance in Nigeria. The R^2 value of 0.777304 indicates that about 78% of the dependent variables jointly explained by the independent variables i.e. Capital Adequacy Ratio is explained by the explanatory variables in the model.

Table 4: Summary of Error Correction Model (ECM)

Source: Authors Computation (2020)

The table 4 shows the short-run analyse of the relationship between fiscal policy and banking system stability in Nigeria between 1985 and 2019 using error correction mechanism (ECM). The result is the short-run analysis which shows that, current account deficit, consumption tax, government capital expenditure have positive relationship with Banking system stability - capital adequacy ratio. This implies that increase in current account deficit, consumption tax and government capital expenditure has high impact on banking system stability. This is understandable because these three variables directly affect the consumption, investment and savings culture of the citizens, which also have direct impact on banks' intermediation role. Similarly, increase or decrease in the noted variables are critical to business growth in Nigeria. This have direct impact also on banks' performance, liquidity and profitability. On the other hand, debt growth, external debt, government funding, public debt and have negative association with capital adequacy ratio. This is in conformity to expectation because debt growth and external debt have little or no direct effect on domestic banks in Nigeria as the fiscal deficit and external debt are financed with external loans, thus, it will not have direct positive effect on banks as when financed with loan from domestic banks or sources. The parsimonious error correction model results in Table 4 shows an R^2 of about 73.7% and this shows better goodness

of fit, meaning that there is a strong relationship between the variables used. Thus it shows that 73.7per cent of the variation is explained by all the variables employed in the model, leaving only a 26.3% attributable to the white noise error term.

Conclusion

This sub-section draws conclusions from the summary of the regression analysis; Co-integration and Ordinary Least Square analysis, along with the Error Correction Model (ECM), the results regards to the effect of fiscal policy on banking system stability in Nigeria between 1985 and 2019 which span across the periods before the - Post, during and after-Structural Adjustment Programme (SAP) in economic eras. The results revealed that the fiscal policies of the government significantly affect banking system stability in Nigeria directly and indirectly. Indirectly through debt growth and external debt which affect capital inflow, foreign investment, foreign business partnership etc and directly through government funding, government capital expenditure, consumption tax. and other government spending. The funds are usually channelled through the domestic banks to individuals (contractors, investors), corporate bodies and other government agencies in Nigeria. Thus we reject the null hypothesis of nonexistence of association between fiscal policies and banking system stability in Nigeria and accept the alternative hypothesis that states that fiscal policy significantly impact on banking system stability in Nigeria.

Recommendations

Based on the conclusion reached, the study recommendations are as follows: (i) The government should increase its expending in the domestic economy. (ii) The management of banks should ensure that they pay close attention to fiscal policy tools which significantly impacts on banking system. (iii) Appropriate checks should be put in place by the government to avoid government borrowing that will lead to continuous deficit since debt affects banking system stability. (iv) The government should ensure that its borrowings are channelled towards productive segments of the economy to enhance sustainable repayment of debt. (v) Finally, mechanisms for debt repayment must be severely adhere to.

Abstract

The subject of the article concerns the issue of interdependence between capital markets and the problem of identifying the long-term equilibrium between these markets. The phenomenon of interdependence between markets is an element of their functioning, however, the progressive globalization of world economies significantly strengthens the system of mutual connections. The subject matter is important as the last world financial crisis of 2008 has shown that it is possible to shift shock effects from financial markets in one economy to other countries, which results in crisis situations not only in the financial sphere, but also destabilising the real economy. The main goal of the article is to establish a long-term equilibrium between the UK capital market as the main capital market in Europe and the capital markets of the Visegrad Group countries, which can be considered as the markets of local importance. The article presents a research hypothesis stating that there is present the similar long-term development of interdependencies between selected capital markets. The DCC-GARCH model with a conditional t-student distribution was used to measure the interdependence, on the basis of which the conditional correlations for the established pairs of capital markets were determined. The article presents a cointegration analysis for conditional correlations between selected capital markets, and then estimates the parameters of the VECM model were obtained. An equation has been established to define the long-term equilibrium between capital markets and the short-term equation. The obtained results allowed for the verification of the research hypothesis regarding the existence of a long-term path for the course of the interdependence between the capital markets of Great Britain, Poland, the Czech Republic and Hungary.

Keywords: Capital Market; Cointegration Analysis; DCC-GARCH Model; Conditional Variance; Conditional Correlation.

Introduction

The capital market in Hungary started operating in the 19th century. In the twentieth century, this market ceased to function during the communist period after World War II. It was only after 1989 that Hungary began building a

BALCERZAK "Identification of The Dependence of The Hungarian Capital Market on The Leading Capital Markets in Europe" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

market economy, and in June 1990 the Budapest Stock Exchange (BSE) was established. Budapest Stock Exchange obtained the status of a joint-stock company in 2002. It should be emphasized that Hungarians did not introduce any safeguards against taking over the stock exchange by institutions or investors. As a result, in 2004 BSE was taken over by the Austrian stock exchange. This acquisition did not have a positive impact on the development of the Hungarian stock exchange and as a result of many years of decline in stock exchange capitalization, the Hungarian Central Bank (MNB) took over a controlling stake in the Budapest Stock Exchange in 2015.

The economy of Hungary and its capital markets, like economies and capital markets in other countries, is subject to the processes of progressive globalization (see Edison et al., 2002; Łapińska, 2013, 2016; Hadaś-Dyduch, 2016, 2017; Cieślik, et al., 2019a; 2019b; Pieterse, 2019; Jakimowicz and Rzeczkowski, 2019a, 2019b; Jaklič & Svetličič, 2019; Sánchez-López et al., 2019; Shkolnyk et al., 2019; Zhao et al., 2020; Skalická et al., 2019a, 2019b; Uslu & Akay, 2019; Spulbar et al. 2020; Nikolic, 2020). In addition, the development of the capital market is influenced by the economic reforms introduced after 2003, which significantly improved the level of competitiveness of the economy and increased the value of investments and outlays for the growth of innovation. Institutional changes and convergence processes, which significantly improved the situation on the labour market, structure of consumption and trade relations with other countries, also influenced the competitiveness level of the real economy, which in the longer term should influence the development of the capital market (see Kuc, 2015, 2017, Gavurova et al., 2016; Cheba & Szopik-Depczyńska, 2017; Simionescu et al, 2017; Shin, 2017; Zogning. 2017; Jankiewicz, 2018; Kurowska-Pysz et al., 2018; Meluzín et al., 2018a, 2018b, 2018c; Khursheed et al., 2018; Rollnik-Sadowska & Dąbrowska, 2018; Kijek & Matras-Bolibok, 2019; Legenzova et al., 2019; Kusairi et al, 2019; Ludbrook et al., 2019; Lampropoulos et al., 2019; Čepel, 2019; Balcerzak, 2020). The mentioned re-takeover of Budapest Stock Exchange by Hungary and the significant socio-economic development of the country after 2015 contributed to the improvement of the capital market situation, which translated into an dynamic changes in the capitalization of the stock exchange.

Technically speaking, the main index of the Hungarian stock exchange BUX, which will be used in current analysis, consists of fifteen companies, but four stock exchange companies account for ninety percent of the BUX index capitalization: OTP Bank, MOL, Richter and Magyar Telekom. This factor should be always taken into consideration in the case of conclusions on the results concerning this market.

Undoubtedly, due to the globalization processes in both financial and real sphere (Booth, 2018; Grossman. 2018, Chessell, 2018; Kliestik et al., 2020, Peters et al., 2020), the Hungarian capital market is characterized by strong interdependencies with the main capital markets in Europe (see Forbes & Rigobon, 2002; Boswijk & Doornik, 2004; Corsetti et al., 2005; Pietrzak et al., 2017; Gaigaliene et al., 2018; Skare and Porada-Rochoń, 2019a, 2019b, Stavytskyy, et al., 2019). The subject of the article, related to the formation of interdependence on capital markets, is important due to the possibilities of transferring risk from financial markets to the economies of individual countries, which not only took place during the 2008 global financial crisis, but it can be also present during so called standard times (see Bekaert & Wu, 2000, Baur, 2003; Pericoli & Sbracia, 2003; Billio & Caporin, 2010, Engle 2009, Reboredo et al., 2015; Hanias et al., 2020).

The global financial crisis has shown that the financial interdependencies in a time of high degree of globalization can lead to negative consequences for functioning or even collapse of national economies. Therefore, the constant monitoring of that phenomenon can help to design policies and tools, which can be used to reduce that risk. As a result, the aim of the proposed article is to identify the strength of the dependence of Hungary's capital market on major capital markets in Europe. The analysis covers the interdependencies with the UK capital market, as the leading market in Europe and with the capital market of Germany, which due to the geographical reasons and strength of the real economy, is the most important capital market for Central and Eastern European economies. The development of interdependencies between capital markets was examined in the years 1998-2019, where the DCC-GARCH model was used to measure the interdependence.

Data and the Methodology

In line with the adopted aim of the article, the dependence of the Hungarian capital market on the capital markets of Great Britain and Germany was identified. The study used logarithmic rates of return of three stock exchange indices (BUX, FTSE 100, DAX). Data for the years 01.01.1998-30.12.2019 was obtained from the yahoo website

(http://www.finance.yahoo.com). The assessment of the strength of correlation was based on the values of the conditional correlation between the respective pairs of stock indices. The DCC-GARCH model was used to measure the conditional correlation between pairs of indices (see Engle, 2002, 2009). This model allows the simultaneous modelling of conditional variance for individual indexes as well as conditional correlations for selected pairs of indexes.

In the DCC-GARCH model, standardized residuals from the variance equation and delayed conditional correlations are used to describe the course of conditional correlation. As a result of preliminary research on the properties of index returns, the specification of the AR model (1) in the equation for the conditional mean and GARCH model specifications (1,1) in the equation for the conditional variance were adopted for each index.

The two-stage maximum likelihood method was used to estimate the parameters of the DCC-GARCH model (see Engle, 2009), where the conditional t-student distribution was assumed for the random component. The significance level of 5% was adopted to assess the significance of the DCC-GARCH model parameters.

Results

Table 1 presents the results of estimation of the DCC-GARCH model. According to the mentioned in methodological section assumed level of significance, the parameters of the AR (1) model and the parameters of the GARCH (1,1) model are statistically significant for each of the three indices. The parameters of the conditional correlation equation are also statistically significant. The obtained estimates of the parameters of the degrees of freedom of the student's t-distribution indicate the presence of fat tails for the rates of return of the analysed indices, which justifies the adoption of this distribution in the study.

Table 1: The results of the DCC-GARCH model parameters estimation

Equations for index BUX				**Equations for index DAX**

Source: Authors' study.

Then, on the basis of the obtained DCC-GARCH model estimation results, the course of the conditional correlation between the pairs of the studied indexes in 1998-2019 was determined. The determined time series of conditional correlations for the index pairs (FTSE100, BUX) and (DAX, BUX) are presented in Figure 1.

The analysis of the correlation allowed for the assessment of the strength of dependence of the Hungarian capital market on the capital markets of Great Britain and Germany. The preliminary visual analysis of the conditional correlation values shows a very high similarity in the course of the correlation between the studied pairs of capital markets (Hungary, Great Britain) and (Hungary, Germany) in the years 1998-2019.

It should be emphasized that the strength of the interdependence between the analyzed capital markets fluctuates throughout the period under examination. A relatively high level of interdependence occurred in 1999-2003, which was the market reaction to the preparation of Hungary and other Central and Eastern European countries to join the European Union. Then, after joining of the Hungary to the EU, the strength of interdependence decreased, which was influenced by significant institutional changes resulting from Hungary becoming more similar to the old EU countries. This indicated the growing role of the internal information in shaping the situation on the market.
The next increase in the interdependence between the pairs of the studied countries took place in 2008-2012, which in turn was the result of the global financial crisis.

After 2012, the situation on the global capital markets calmed down, which translated into a decline in the strength of the analyzed interdependencies.

It is worth emphasizing that in the analyzed period, the Budapest Stock Exchange (BSE) was more strongly correlated with the UK capital market than with the much closer geographically the German capital market. This factor can confirm the leading role of the UK as the financial center of Europe, which during the analytical period was not really affected by the process of Brexit.

Source: Authors' study.

Conclusions

The subject of the article concerns the analysis of the interdependencies between selected capital markets in Europe. It should be emphasized that the high level of interdependence results from the progressing globalization. This means that the phenomenon of interdependence between capital markets becomes a significant risk factor for the functioning of national economies. The growing links between markets become particularly important in crisis situations that may lead to the disruption of the functioning of a single economy or even to the collapse of the economic system. In such a situation, stabilization measures resulting from the undertaken economic policy may turn out to be ineffective. Therefore, the analysis of interrelationships between markets appears as an important research problem. The obtained empirical conclusions may be useful for political decision-makers in the context of creating effective economic policy related to the development of individual economy markets, including the functioning of the capital market.

The aim of the article was to identify the strength of dependence of the Hungarian capital market on the UK and Germany, which can be considered as the leading capital markets in Europe. The conducted research allowed to establish the interdependencies between selected pairs of capital markets in the years 1999-2019, and then to evaluate their course. As a result of the conducted research, a similarity in the development of the correlation between the analyzed pairs of capital markets was established. This means that the Hungarian capital market reacts similarly to external information from the main European markets. This indicates the risk related to the functioning of capital markets in Europe, where fundamental global shock events are spreading through the markets of Great Britain and Germany to the capital market of Hungary. The conducted research allowed for the conclusion that the Hungarian capital market should be still considered as relatively shallow developing market. It should be stressed, however, that the way the Budapest Stock Exchange (BSE) operates is becoming more similar to the functioning of mature European capital markets.

Abstract

The subject of the article concerns the issue of interdependence between capital markets and the problem of identifying the long-term equilibrium between these markets. The phenomenon of interdependence between markets is an element of their functioning, however, the progressive globalization of world economies significantly strengthens the system of mutual connections. The subject matter is important as the last world financial crisis of 2008 has shown that it is possible to shift shock effects from financial markets in one economy to other countries, which results in crisis situations not only in the financial sphere, but also destabilising the real economy. The main goal of the article is to establish a long-term equilibrium between the UK capital market as the main capital market in Europe and the capital markets of the Visegrad Group countries, which can be considered as the markets of local importance. The article presents a research hypothesis stating that there is present the similar long-term development of interdependencies between selected capital markets. The DCC-GARCH model with a conditional t-student distribution was used to measure the interdependence, on the basis of which the conditional correlations for the established pairs of capital markets were determined. The article presents a cointegration analysis for conditional correlations between selected capital markets, and then estimates the parameters of the VECM model were obtained. An equation has been established to define the long-term equilibrium between capital markets and the short-term equation. The obtained results allowed for the verification of the research hypothesis regarding the existence of a long-term path for the course of the interdependence between the capital markets of Great Britain, Poland, the Czech Republic and Hungary.

Keywords: capital market; cointegration analysis; DCC-GARCH model; conditional variance; conditional correlation.

Introduction

The dynamically progressing globalization processes contribute to the growth of connections between the countries that have been creating the expanding system of world economies since the 1990s (see Edison et al., 2002; Hadaś-Dyduch, 2016, 2017; Cieślik, et al., 2019a, 2019b; Janus, 2019; Pieterse, 2019; Sánchez-López et al., 2019; Uslu, & Akay, 2019; Ludbrook et al. 2019; Stavytskyy et al, 2019; Booth, 2018; Grossman, 2018; Chessell, 2018; Kliestik et al. 2020; Peters et al., 2020; Nikolic, 2020). This translates to the greatest extent into an increase in interdependencies between capital markets (see Bekaert & Wu, 2000; Baur, 2003; Pericoli & Sbracia, 2003; Engle 2009; Billio & Caporin, 2010; Reboredo et al., 2015; Shin, 2017; Pietrzak et al., 2017; Zogning, 2017, Legenzova et

BALCERZAK "Identification of The Long-Term Equilibrium Between the UK Capital Market and The Capital Markets of The Visegrad Group" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

al., 2019; Skare & Porada-Rochoń, 2019a, 2019b; Spulbar et al., 2020; Zhao et al., 2020). It should be emphasized, however, that globalization processes, by tightening political and economic relations between countries, also contributes to the increase of interdependence between all markets of economies, also the ones in the real sphere. For over thirty years, a systematic increase in migration, convergence processes, changes in the structure of consumption, the level of trade exchange, the flow of foreign direct investment, diffusion of innovation has been recorded for most countries (see Łapińska, 2013, 2016; Kuc, 2015, 2017; Cheba & Szopik-Depczyńska, 2017; Litavcová, Hečková, Chapčáková, 2017; Simionescu et al, 2017; Tvaronavičienė & Gatautis, 2017; Jankiewicz & Pietrzak, 2020; Khursheed et al., 2018; Kurowska -Pysz et al., 2018; Čepel, 2019; Jakimowicz & Rzeczkowski, 2019a, 2019b; Jaklič & Svetličič, 2019; Kijek & Matras-Bolibok , 2019; Lampropoulos et al., 2019; Kusairi et al, 2019).

The subject of the article concerns the identification of connections between capital markets, the analysis of their volatility over time and the identification of the long-term equilibrium between these markets. The discussed topic is important because in the reality of the mentioned dynamically developing globalization processes both in financial and real sphere, the current knowledge on the international interdependencies between the financial markets, allows to create economic policy, which takes into consideration important aspects related to the functioning of financial markets, which during the crisis can destabilise the real economy (see Forbes & Rigobon, 2002; Corsetti et al., 2005, Shkolnyk et al., 2019; Karkowska & Kravchuk, 2019; Gospodarchuk & Suchkova, 2019). The world financial crisis in the years 2008-2012 clearly showed that shocks occurring in the financial markets may spread to other markets of the economy and then lead to a disruption of the functioning of individual countries or a crisis of the entire economic system (see Gaigaliene et al., 2018).

Depending on the analyzed aspect of globalization processes, it is possible to identify the dominant centers that contribute to the greatest extent to the growth of connections between countries. In the case of capital markets, the dominant centers are the world's largest stock exchanges. The British capital market with the London Stock Exchange undoubtedly dominates in Europe. On the other hand, capital markets of local importance are the markets of the Visegrad Group countries (see Meluzín et al., 2018a, 2018b, 2018c; Skalická et al., 2019a, 2019b). Numerous studies indicate their strong dependence on the main capital markets in Europe, including the UK capital market.

The main purpose of this article is to establish the long-term equilibrium between these capital markets. The article presents a research hypothesis stating that there is a process of similar long-term development of the interdependence between the capital market of Great Britain and the capital markets of the Visegrad Group countries.

In order to verify the adopted research hypothesis, a cointegration analysis was performed for conditional correlations between selected capital markets and a VECM model (Vector Error Correction Model) was built (see Engle & Granger, 1987, Boswijk & Doornik, 2004; Lütkepohl, 2005; Engle, 2009; Pietrzak et al., 2017). The DCC-GARCH model was used to measure the interdependencies (see Engle, 2002, 2009), on the basis of which the conditional correlation for selected pairs of capital markets were determined.

Data and the Methodology

In line with the adopted objective of the article, the main indices of selected capital markets were adopted, the FTSE100 index in the UK, the PX index for the Czech Republic, the WIG index for Poland and the BUX index for Hungary. The study used logarithmic rates of return of selected stock indices for the years 01.01.1999-30.12.2019. The data was obtained from the yahoo website (http://www.finance.yahoo.com). Slovakia was not included in the analysis due to significant data gaps.

In the first step of the analysis, the parameters of the DCC-GARCH model were estimated, which allowed for the determination of conditional correlations for subsequent pairs of capital markets. The next step in the study was to perform a cointegration analysis. The analysis verified the hypothesis of long-term equilibrium between the UK capital market and the capital markets of the Visegrad Group. As a result of the conducted research, a VECM model was built, which is a VAR model for cointegrated processes (see Engle Engle & Granger, 1987). The Johansen procedure (see Johansen, 1988, 1991, 1995) was used to identify the number of cointegrating vectors, which is

iterative in nature and is used until the null hypothesis is rejected. Johansen's procedure uses the maximum eigenvalue test and the trace test (see Johansen, 1995).

Cointegration analysis was performed on the basis of conditional correlations obtained from the DCC-GARCH model. Therefore, the following long-term equation for conditional correlations was adopted:

$$q_{t,y_0} = \alpha_0 + \alpha_1 q_{t,y_1} + \cdots + \alpha_n q_{t,y_n} + \varepsilon_t \qquad (1)$$

The obtained results of the Phillips and Perron tests (see Phillips & Perron, 1988) allowed to state that all the conditional correlation series are integrated in the first degree.

Johansen's procedure was performed in the second step of the analysis. The obtained results made it possible to test the number of integrating relations. After determining the number of cointegrating vectors, the long-term equation of the VECM model was estimated. Finally, the parameters of the short-term equation were estimated, where the explanatory variables were the delayed in time first differences of conditional correlations and the term ECM_{t-1} responsible for the long-term relation.

Results

The values of the calculated test statistics are indicative of the presence of one integrating vector for the Johansen's procedure are presented in Table 1.

Table 1: Results of Johansen's procedure

Number of cointegrating vectors	**Max-Eigenvalue test**		
	Eigenvalue	**Statistic**	**p-value**
None	0.011	83.291	0.001
At most 1	0.005	38.324	0.071
At most 2	0.003	15.093	0.229
Number of cointegrating vectors	**Trace test**		
	Eigenvalue	**Statistic**	**p-value**
None	0.011	44.967	0.007
At most 1	0.005	23.218	0.175
At most 2	0.003	12.792	0.289

Source: own calculation.

After determining the number of cointegrating vectors, the following long-term equation of the VECM model was estimated, where all the parameters in the VECM equation were statistically significant:

$$q_{t,FTSE100,WIG} = -0.731 + 1.932\, q_{t,FTSE100,BUX} + 0.658\, q_{t,FTSE100,PX} + \varepsilon_t \quad (2)$$

The obtained equation indicates a long-term equilibrium between the capital market of Great Britain and the capital markets of the Visegrad Group, which confirms the hypothesis presented in the article. The process of conditional correlation between a pair of indices (FTSE100, WIG) combines a significant positive relationship with the process of conditional correlation of an index pair (FTSE100, PX) and the process of conditional correlation of an index pair (FTSE100 , BUX). This means that the UK capital market plays a dominant role in the long run and sets the long-run equilibrium in Europe, which is indicated by the cointegrating relation from equation 2. As it was given in the methodological section, in the last step, the parameters of the short-term equation were estimated, where the

explanatory variables were the delayed in time first differences of conditional correlations and the term ECM_{t-1} responsible for the long-term relation. The obtained results concerning the parameter estimates and the t-statistics for the next three equations are presented in Table 2. Most of the parameters for the delayed differences of conditional correlations are statistically insignificant in the short-term equation. This means that the delayed first differences of the conditional correlations are not able to sufficiently describe the short-term dependencies. The parameters for the variable ECM_{t-1} turned out to be statistically significant, and negative assessments of these parameters indicate the existence of the equilibrium mechanism for all researched pairs of markets.

Table 2: Vector Error Correction Model

VECM		$q_{t,FTSE100,WIG}$	$q_{t,FTSE100,BUX}$	$q_{t,FTSE100,PX}$
constant	estimate	-0.001	-0.001	0.001
	t-statistics	4.589	4.055	1.818
ECM_{t-1}	estimate	-0.005	-0.006	-0.002
	t-statistics	5.094	6.024	3.053

Conclusions

The subject of the article concerns the analysis of the interdependencies between the capital markets of selected European countries, the strength and range of which have significantly increased in the last 30 years. Undoubtedly, the main factor of this phenomenon are dynamically progressing globalization processes. The problems discussed in the article are important because the current and precise knowledge on the interdependencies may allow for the development of appropriate economic policies of individual countries and tools to improve the functioning of capital markets. The world financial crisis that occurred in 2008-2012 showed the possibility of the collapse of the entire system of financial markets and the need to future secure the proper functioning of the financial markets of individual countries.

The aim of this article was to establish a long-term equilibrium between the capital markets of Great Britain, Poland, Hungary and the Czech Republic. In the cointegration analysis carried out in the article, the number of cointegrating vectors was checked and the VECM model was estimated. As part of the study, the equation determining the long-term equilibrium between capital markets and the short-term equation were determined, where the explanatory variables were the time-delayed first differences in conditional correlations and the term ECM_{t-1} responsible for the long-term relation. Obtained negative assessments of these parameters indicated the existence of the equilibrium mechanism for all pairs of the capital market.

The research carried out on the basis of conditional correlations between selected capital markets allowed for the verification of the research hypothesis regarding the existence of a long-term path for the course of interdependence between the capital markets of Great Britain, Poland, the Czech Republic and Hungary. This confirms the existence of similar development tendencies in the formation of interdependencies between the capital market in Great Britain and the markets of the Visegrad Group countries. To sum up, the conducted research allowed for the assessment of the capital markets of the Visegrad Group countries as a group of markets with similar development trends, dominated by the capital market of Great Britain.

Magdalena Krystyna WYRWICKA
Poznan University of Technology, Poznan Poland, magdalena.wyrwicka@put.poznan.pl;

Abstract

The COVID-19 pandemic, which started in December 2019 in Wuhan, China, changed the global economy significantly. Due to its unprecedented scale - for at least 100 years - the pandemic has been the source of a macro-economic shock. Its range and impact cause changes in the functioning of organisation, the market structure, competition principles and even in the legal system. This not only affects the volume of trade and prices, but also daily activities like shopping or greeting one another. At the same time, a series of economic processes have been seen to stop, including production and distribution of many goods, along with the freezing of transactions and debt. Since Coronavirus is an external factor, once the pandemic is over from the macroeconomic perspective, the economies of individual countries should be back to "balance" in the longer run. However, the way the global economy regains its growing trend will depend on how the virus subsides. Additionally, going down to the microeconomic level, a special role of individual entrepreneurs becomes notable, since by managing economic entities they are capable of cancelling the pandemic's negative effects in order to survive in the market and, subsequently, implement growth strategies. Deloitte's research has shown that the SARS-CoV-2 epidemic has had a negative impact on the functioning of 58% of Polish enterprises (Deloitte, 2020).

This paper presents a case study of a micro-enterprise that manufactures packaging. The purposes of the article is to analyse the impact of the COVID-19 pandemic on the functioning of a Polish SME company, with particular focus on the effects on the domestic and international market, the role of IT systems in its business, the plans for the future and the state's assistance.

Keywords: Enterprise Functioning, COVID-19 Pandemic, Small and Medium Enterprises Sector, Freezing of Economy

Introduction

Facing the growing, global epidemic, the resulting economic crisis, especially the threat of dramatic decline in the job market requires, just like with the 2008 financial crisis, or perhaps to an even higher degree, the change of paradigms of thinking about the future, in the perspective of several years. Up until today, the most important common feature of globalisation was the revolution in informational technologies that introduced IT tech, the Internet, automation and robotisation to even the furthest corners of the world, despite the fact that the rate of changes and utilisation of the benefits of the technology is not distributed uniformly (Carbonero, Ernst and Weber, 2018).

Global economy is based on the free flow of goods and capital, associated with quick technological changes, although it fails to guarantee stable growth with no risk and turbulences (IMG, 2019). One of the fundamental, structural features of today's economy are short-term temporal changes of cyclical nature that is evident in the alternating phases of growth and decline of the volume of manufactured goods and offered services within a geographical location. The consequence of this phenomenon are also fluctuations of employment in the job market, just like after 2008, when the global financial crisis hit (Arpaia, Kiss, 2014).

The emergence of the SARS-CoV-2 coronavirus in China and the disease it causes, COVID-19 (full name Coronavirus Disease 2019) forced a redefinition of cognitive perspective and political priorities virtually all over

Cite this Article as: Lukasz BRZEZINSKI and Magdalena Krystyna WYRWICKA "Conditions of Functioning of SME Enterprises in Poland during COVID-19 Pandemic: A Case Study" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

the world. The COVID-19 pandemic is the first global event in 21th C. that resulted in most countries all over the world having to significantly subject the ongoing functioning of the economy to the necessity of maintaining the societies' health security. This phenomenon was referred to as "freezing the economy" (Laurent, 2020).

Description of Temporal Characteristics of the COVID-19 Pandemic

Pursuant to the data from the World Health Organisation (WHO), the global emergence of SARS-CoV2 coronavirus may be connected with the identification of the virus in Wuhan, China (Hubei province) in December 2019. The sequence of events related to the spreading of SARS-CoV-2 in the world, from December 30, 2019 to August 26, 2020, was as follows (Męcina, Potocki, 2020; WHO, 2020):

- December 30, 2019 - notification of China National Health about the emergence of several clusters of pneumonia of unknown etiology in Wuhan.
- January 01, 2020 - closing of a local Huanan seafood wholesale market in Wuhan.
- January 07, 2020 - isolation of a new coronavirus.
- January 12, 2020 - disclosure of the sequence of the new virus.
- January 13 - 19, 2020 - first coronavirus cases identified outside China (Thailand, Japan, South Korea).
- January 20, 2020 - first cases of infection among healthcare workers caring for patients who were carriers of SARS-CoV-2.
- January 24, 2020 - 835 infections identified in China.
- March 11, 2020 - World Health Organisation announces COVID-19 pandemic.
- The first official case of SARS-CoV-2 infection in Poland was publicly announced on March 04, 2020 (Mostowy, 2020).
- On March 06, 2020 the number of registered cases in the world exceeded 100,000.
- On April 02, 2020 the number of confirmed deaths in the world exceeded 50,000, with 1,000,000 registered infections.
- On May 09, 2020 the number of registered cases reached 4,000,000.
- On August 26, 2020 the number of registered cases reached 24,000,000.

It is worth noting that activities aiming to minimize the effects of pandemic in Poland were initiated with the adoption of an act, on March 02, 2020, on special solutions related to the prevention, counteraction and combating COVID-19 (Journal of Laws, 2020, Item 374). The temporal characteristics of preventative activities aiming to reduce the risk of infection that was similar to the Polish characteristics, was also present among other European Union states - preventative activities were taken when the development of epidemic was already covered publicly (Herszenhorn, Wheaton, 2020).

The source literature underscores that the issue of efficient national pandemic governance in Europe was already less than certain (Speakman, Burris and Coker, 2020). There are two fundamental ways of reducing the scale of infection within a population (Imperial ... , 2020):

- mitigation – a strategy consisting in delaying the process of proliferation of the virus within a population, aiming to reduce the burden on national healthcare and to protect individuals most vulnerable to the infection;
- suppression – the strategy's main goal is to stop and reverse the upwards trend with regard to the number of infections to a fixed, low level.

In both these strategies there are fatalities of the infected, but only the suppression strategy increases the probability of significant reduction of cases that result in the death of the infected. In fact, both strategies only serve as a help, until an effective vaccine against the infectious disease is developed or a combination of existing drugs which allow curing of the infected is established.

It should be noted here that from the global perspective, the already known strategies of alleviating the effects of the pandemic have not worked as expected. Until August 27, 2020 there were a total of 24,35 million cases and 829,899 fatalities (Table 1).

Table 1: Coronavirus in Poland and in the world - confirmed cases, recoveries and fatalities - data as of August 27, 2020 (Scope…, 2020)

Confirmed cases	
Poland	**World**
64,689	24,349,576
Recoveries	
Poland	**World**
44,097	16,885,119
Fatalities	
Poland	**World**
2,010	829,899

It is worth noting that the emergence of a pathogen on a massive scale, an example of which is COVID-19, contributed to the economic shock and negative changes in particular sectors of the world's economy. These issues are discussed in the following section.

Perception of the pandemic as a global implicator of changes

Researchers fail to agree on the scope and depth of changes that the COVID-19 pandemic may bring to the global socio-economic system. Today, some politicians, economists and commentators believe that nothing really happened and that "in a short while" the world's economy will be back on track, growing as usual. Some even think that in the wake of the pandemic today's world may cleansed and take a turn in the right direction, an example of which may be getting convinced to stop climate changes (Wyns, 2020, Sikora, Lisowski, Wójcik, 2020). Sadly, there are many evidence pointing to the contrary, with such views possibly untrue or even mere wishful thinking. Most importantly though, having little to do with reality. The opposing views, emerging at a growing rate, claim that the world is facing a metamorphosis that is has not experienced in at least 100 years (Mazzucato, 2020).

According to M. Mazzucato (2020) that world is now facing a triple crisis: health, economic (financial) of unthinkable proportions and climatic, all of which cannot be tackled by "business as usual". In the wake of it, the contemporary world economy's deficiencies will become transparent, especially drastic in terms of the labour market, increasingly more dominated by transnational corporations (Kowalczyk, 2020).

The world has been taken by surprise by the epidemic. Questions are arising about the future of the economy and seeking explanation as to why contemporary economic theories cannot provide answers to today's challenges. There is one point, however, with which the overwhelming majority seems to agree. The problem will not be solved and the pandemic overcome without radical changes in the role and meaning of the market and, most importantly, the state (Reddy, 2020). According to J.K. Galbraith (2020) however, the pandemic can be overcome with relative ease, compared to a war, provided the government steps up to the challenge. Which means providing reliable information about the course of the pandemic to the people, financing all medically necessary expenses from the budget (including efforts to develop a cure and a vaccine) and, most importantly, putting in place a special agenda that addresses the effects of the pandemic.

The signs of "panic about the future" can be observed more and more frequently. The reason behind the radical and quick revaluation of opinion on the course of growth tendencies of the global economy was, naturally, the SARS-CoV-2 pandemic and the diseases it causes, COVID-19. This gives rise to more and more fears about the future, and not just the future of the civilization's fundamentals, such as the economy, but about the future of the civilization in itself. This is a simple consequence of the fact that although the economy itself is slowly rising from the global financial crisis in the beginning of 21st C., the economic has not yet been ready to explain this phenomenon and most certainly to accurately name the basic principles of the new theory of economics. This has been overlapped by a strong need to counter the challenges of the pandemic. The challenges related to the future model of the economy, the relations between the market and the state or the intensity of international cooperation. The situation is dangerous in that the rate at which the global economy, labour market and financial stability is very quick and that is starting to threaten the national security of more and more countries (Kowalczyk, 2020).

The predictions on the future of national economies and the entire, global economy are becoming more and more pessimistic and troubling. According to J. Bullard, the head of the Federal Reserve Bank in St. Louis, one of the banks of the Federal Reserve System (FED), even 47 millions Americans may lose their jobs in the wake of the SARS-CoV-2 pandemic, brining the unemployment rate up to 32.0% (Bullard, 2020). According to the International Monetary Fund the pandemic has already pushed the world into recession (Bluedorn, Gopinathand Sandri, 2020).

Based on the data from the European Commission, all European Union states will suffer recession. In 2020, Poland's GDP will shrink by 4.3%, with an average 7.4% fall for the entire EU (Forbes, 2020).

The pandemic has already made an impact on the situation in individual sectors of the economy. First, it impacted economy sectors closely related to human traffic, namely tourism and communication, and secondly trade, which is the movement of goods. Declines are also affecting global financial markets.

Consequences of COVID-19 for enterprises in Poland

The speed of reaction of governments of individual EU states to the proliferation of the virus within populations depended on objective factors - the number of infections and fatalities, and subjective ones - how the decision makers evaluated the epidemiological risk. One of the key decision rationales was the occurrence of the first fatalities caused by COVID-19. The introduction of measures which affect the course of social and economic processes to such a high degree promptly produces negative consequences on national, regional and global scale.

Using the typology of susceptibility of economy sectors to the pandemic-induced economic crisis, as created by the analysts of the International Labour Organization (ILO), it may be estimated that 37.46% of the globally employed (1.25 billion people) work in global economy sectors that are most vulnerable to the crisis (ILO, 2020).

At the same time, the International Labour Organization claims that around 2.7 billion employees (81% of the world's workforce) are subject to partial or complete work limitation. Even 195,000,000 people could lose their jobs in Q2 2020, of which 12,000,000 in Europe along (PulsHR ..., 2020).

The program for supporting Polish economy announced by the government of the Republic of Poland initially provided for the activation of PLN 212 billion (PAP, 2020). It was acknowledge, however, that an insufficient part of the expenses was appropriated directly to protect jobs and guarantee income to employees and other groups if such income is lost. A large part of the program was more related to the support for the financial sector, to help companies maintain financial liquidity and to introduce bank guarantees to keep companies solvent (BGK, 2020). The growing social expectations, increasingly higher political postulates and the firm stance of entrepreneurs and labour union representatives convinced the government to activate additional assistance worth PLN 100 billion, dedicated to maintain employment and protect jobs, regardless of the size and type of business activity. The total value of intervention of the government of the Republic of Poland will be around PLN 300 billion (15% of Poland’s GDP) (Tarcza ..., 2020).

However, moving to the micro-economic level, of relevance for a single enterprise, mainly negative effects of the COVID-19 pandemic can be shown. Based on Devire's[i] organisations research, the problems predominantly affect sectors such as transport, forwarding, logistics, automotive, aviation, commerce, construction and manufacturing. In the territorial context, employers from the Łódzkie province exhibited the most pessimistic mindset - 86% of them declared that their businesses would be negatively impacted by coronavirus. Only 5% of employers saw a chance for them in the current situation - this group declared that it would have a positive impact on their activity. The most dramatic boom can be seen in e-commerce, because most of commerce dealings moved online. Manufacturers of sanitary goods and protective clothing are also reaping profits. Also, information technology businesses sees higher demand for hardware, services and remote working software (Devire, 2020). This research shows that entrepreneurs were expecting, to the greatest extent, reduced demand for products or services (48% of the respondents), in such sectors as: consulting, transport, forwarding, logistics and industrial manufacturing. Additionally, as many as 45% of entrepreneurs pointed to the possibility of reducing their employment (mostly in manufacturing, aviation, commerce and gastronomy) (Devire, 2020).

Although the discussed difficulties the entrepreneurs are or will be facing have been identified among a wider group of businesses, the following points will discuss the results of a case study of a micro-business[ii], with regard to the effects of the COVID-19 pandemic.

Methodology

The purposes of the article is to analyse the impact of the COVID-19 pandemic on the functioning of a Polish SME company, with particular focus on the effects on the domestic and international market, the plans for the future and the state's assistance.

The following research problems were formulated:

1. What are the effects of the COVID-19 pandemic on the analysed entity (in domestic, international and strategic view)?
2. What is the scale of the state's assistance for enterprises during the economy's lock-down?
3. What are the plans for the future and the strategy for the coming year?

The applied study methods included a case study and a documentation method. The case study, or analysis and description of a single, most usually real case, that allows drawing conclusions on the causes and results of its course and, in a broader sense, a given business model, market specifics, technical, cultural and social conditions, etc. This means drawing conclusions on the basis of a single case. It is a study method consisting in a comprehensive description of a certain group or a unit, approached without any initial hypotheses. The subject of exploration is individual in nature. The case study's most important element, looking from the perspective of credibility, is the quality of its substantial content. The quality is manifested, among else, by the accuracy of the raised problems, formulated diagnoses and the adequacy of solutions proposed for a given situation (Langley 1999). The documentation method consists in the use of factual information for examination purposes, collected, in advance, for economic practice purposes and recorded in relevant documents.

A case study of a manufacturing enterprise

Enterprise X[iii] will be analysed in this article, a business manufacturing and trading corrugated and plain cardboard packaging. The enterprise manufactures packaging from 2-, 3- and 5-ply cardboard, in various corrugation configurations (C, B, E), as well as flap boxes, otherwise known as FEFCO201, along with custom shaped packaging.

According to the Polish Classification of Activity, this is classified as Section C, Division 17.21.Z - Manufacture of corrugated paper and paperboard and of containers of paper and paperboard, SIC code: 51119902 – Printing paper, 51130304 – Corrugated and uniform box packaging (PKD, 2020).

It is worth adding that the COVID-19 pandemic forced a more widespread use of IT solution than previously. While the economy was in lock-down, the organisation fully transitioned to remote working to maintain relations with employees and business associates. Speaking of relations with clients and suppliers, remote working elements had been implemented earlier, especially with regard to daily correspondence, invoicing and bank transfers. Hence, the work's specific nature and organisation was not largely affected.

Answers to individual research issues will be provided below.

The effects of the COVID-19 pandemic on the analysed entity (in domestic, international and strategic view)

The change of the scale of activity must be identified as the main element. The analysis of the company's revenues in the months preceding the pandemic (January - March, 2020), until the months during lock-down (April - June, 2020), a 34.61% drop in sales was identified (Table 2).

Table 2: Total sales in January - June, 2020, in X enterprise (Own work)

Month	Total sales
January	PLN 134,132.89
February	PLN 175,812.73
March	PLN 227,383.71
April	PLN 104,246.55
May	PLN 126,042.50
June	PLN 121,091.59

The reduction in sales resulted from limited orders and reduced scale of operations of the company's clients. Many businesses with which enterprise X cooperates export their products and their shut-down, in turn, forced X to hold their operations.

With regard to the overheads, such as warehouse leases, leasing contracts, machinery depreciation or accounting and legal fees, which did not change during the pandemic, the reduced sales resulted in employee remuneration being paid from current revenues and the remaining overheads from the organisation's previously saved resources. Operational loss was incurred from April to June.

Employment-wise, production employees have civil law agreements, meaning that no job orders translated in no work and no remuneration. Employees with employment contracts received their remuneration as usual.

In order to minimise any additional costs, some of the tasks and subcontracted (outsourced) services were taken over by the enterprise's employees. For example, transport services were no longer outsourced (X would deliver the goods to the clients on their own) and warehouse tasks were taken over by X's production employees (preparing adequate quantities of goods for shipment, accepting deliveries, warehouse cleaning).

The scale of the state's assistance for enterprises during the economy's lock-down

The enterprise X received the state's assistance in the form contributions paid to the Social Insurance Institution (ZUS) waived for three months (April - June, 2020) and a low interest loan for micro-businesses from the Labour Fund, amounting to PLN 5,000, which may be remitted, provided the enterprise continues business activity for three years since the day of issuing the loan.

Plans for the future and the strategy for the coming year

X's most important client was a business whose main activities include offset printing, impregnating, coating and laminating clothing articles. The client uses products that are difficult to obtain or whose prices are impossible to accept in the Polish market. The growing trade relations made it possible to import these goods from Chinese vendors. From October 2019 until March 2020 around 30% of the enterprise's revenues came from the sale of goods to this particular client. Sadly, the even sector is still battling serious problems, resulting in no new orders. Therefore, a significant reduction in the sale of a specific range of items can be identified (Table 3).

Table 3: Volume of sales of individual goods for the most important client, January - June, 2020, [pcs] (Own work)

Product name	January	February	March	April	May	June
Cleaning tape for pad printing [pcs.]	1010	1190	690	138	138	621
PET heat transfer film [pcs.]	2000	4000	4000	0	0	0
Carbide ring, 2 mm [pcs.]	30	20	30	0	10	10
Squeegee rubber [pcs.]	5	5	5	0	0	5
PTFE Teflon film [pcs]	220	445	225	0	0	100

The reduced revenues and changes in the structure of clients forced the enterprise to introduce major modifications in its operation. Most importantly, the enterprise focused on seeking new, potential clients. A lot of enterprises are still dealing with the effects of the economic lock-down. Entrepreneurs were forced to stop leasing warehouses and let go production employees, all in order to survive in a market seeing dramatically reduced sales. They still, however, expect better availability of goods, the possibility of placing order at any time and short lead times.

With these facts in mind, strategic business rationales were developed for the coming year. New business partners were found, to whom solutions for particular problems were offered, e.g. storage of goods. Once these clients provided forecasts until the end of 2020, inventory stocks were agreed that would be maintained by X within a specific time, with goods delivered at the client's request. This means that the organisation is capable of handling such deliveries within a single day, or even mere hours. Many businesses find this solution very beneficial, because given their specific scale of operations, larger entities would not commence small series production, not to mention being able to offer to the smaller buyer prices that would be satisfactory for both parties.

Conclusions

It is evident that the coronavirus pandemic will have far-reaching consequences, both for global and Polish economy. The course and severity of this impact will be the outcome of numerous processes, most notably the duration of the pandemic, the scale and involvement of states in the liquidation of the inevitable results, as well as the attitude of entrepreneurs.

The recently unprecedented reduction of international economic exchange is, and will remain, the direct effect of combating the pandemic. Private consumption suffered a dramatic drop due to closed borders, shopping centres, restaurants and cultural facilities. Several sectors, such as entertainment, restaurant, and most importantly tourism and transport, suffered a major downturn.

The economies of today are interrelated via capital, both with regard to the supply chain and the value chain, in terms of operation of entities within a specific brand and from a macro-economic perspective. A single economic entity may affect numerous organisations by limiting or stopping, altogether, its operations. Most importantly, this applies to large enterprises which cooperate with a wide array of suppliers and subcontractors.

The article discusses the results of a case study of enterprise X, a manufacturer and seller of corrugated cardboard and cardboard packaging. The COVID-19 affected the enterprise's functioning to a high degree. Most importantly, a reduction in sales of around 34.61% was noted during the freezing period. Operating profits suffered a loss, despite some government assistance (waived ZUS contributions, low-interest loan). From the strategic perspective, X's business model was modified, because the enterprise's key client reduced its business activity (the client generated nearly 30% of the revenue). More focus was put on other areas of activity - such as storage services for specific range groups, maintaining their availability and keeping customer service at a high level (e.g. delivery within several hours).

Abstract

The development of small and medium-sized enterprises (SMEs) is an important subject of interest in the field of economic and social sciences. It is caused, inter alia, by the influence of the SME sector entities on the socio-economic processes taking place in the modern economy. In many countries, small and medium-sized enterprises constitute an important base of entrepreneurship and create a dynamically developing sector of the economy, but on the other hand, it is an extremely ”delicate” sphere of activity, susceptible to the influence of various factors and conditions. In this aspect, the COVID-19 pandemic – caused by the SARS-CoV2 coronavirus – can be indicated. It started as an epidemic on November 17th 2019 in Wuhan, Hubei Province, Central China, and on March 11th 2020, was declared a pandemic by the World Health Organization (WHO) (Coronavirus…, 2020).

The health crisis caused by COVID-19 and the ongoing isolation of many markets pose unprecedented challenges to people and economies around the world. According to the International Labour Organization, about 2.7 billion workers (81% of the world’s workforce) are partially or completely cut back on work. In the second quarter of 2020, up to 195 million people could lose their jobs, including 12 million people in Europe alone. To mitigate the effects of the crisis, governments of many countries are introducing various support programs for entrepreneurs and employees (PulsHRa…, 2020). In order to overcome the economic slowdown, organizations should adapt to the new reality, which on the one hand may generate barriers, but also development factors.
The article will present the results of an expert survey on barriers and factors for the development of small and medium-sized enterprises during the COVID-19 pandemic in Poland. The aim of the article is **to identify potential barriers and determinants of the development of economic entities from the SME sector in Poland during the COVID-19 pandemic**, based on the opinions of Experts.

Keywords: Enterprise Development, COVID-19 Pandemic, Sector of Small and Medium Enterprises, Determinants of Enterprise Development, Barriers of Enterprise Development.

Introduction

In order to survive, an enterprise strives for development, which often boils down to a set of activities introducing such internal changes in the system, caused by active shaping of external conditions, as a result of which the system is able to achieve a greater degree of complexity and thus a greater repertoire of diversity compared to earlier state (Hapten, 1988; Koontz & O'Donnell, 1989; Roystron& Altman, 1994; Segarra & Callejon, 2002).

The development of the enterprise means coordinated changes to the enterprise’s systems, adapting to the constantly changing environment. These adjustments are effective if they ensure that

the enterprise achieves and maintains a competitive advantage, which is a prerequisite for surviving on the market (Strotmann, 2007; Watson, 2010).

Development is primarily a qualitative phenomenon consisting in the introduction of product, process and structural innovations as well as in the field of organization and management (Pierścionek, 1998). Development is an objective phenomenon occurring in society and economy, consisting in constant changes, however, not every change should be equated with development (Piecuch, 2010).

The global COVID-19[i] pandemic has forced many changes in the approach to enterprise management, the basic dimension of which is the ability to adapt tasks and functions as well as methods of work organization and management to the radically changing conditions of their operations. On an international scale, measures have been taken to prevent the spread of disease. Travel has been reduced, quarantines and curfews have been introduced and a number of sports, religious and cultural events have been postponed or cancelled. Some countries have closed their borders or introduced restrictions on border traffic, including the arrivals of passengers, and restrictions on people crossing the border. Controls at airports and railway stations were introduced. The pandemic caused global, social and economic disruptions, including the largest worldwide recession since the Great Depression (Garcia et. al., 2020). It led to the delay or cancellation of events, widespread shortages in supplies, which were deepened by panicked purchases, which in particular changed the structure and perception of barriers and factors for the development of enterprises in the SME sector, which are extremely vulnerable to any cyclical changes.

Barriers and determinants of the development of enterprises from the SME sector

The development of the enterprise means coordinated qualitative changes in the systems in the enterprise, adapting them to the dynamic environment .These activities are effective if they ensure that the enterprise achieves and maintains a competitive advantage, which is a necessary condition to survive on the market (Urbaniak, 2016; Wyrwicka, 2003).

The essence of managing an organization and shaping its development potential, and thus determining the right strategic directions, is to deal with various kinds of tensions. The ability to identify contradictions and then reasonably integrate them, thanks to which a certain kind of complexity and uniformity of development is achieved, is a challenge for people managing enterprises in today's world (Machaczka & Machaczka, 2011, pp. 162-167).

In this context, it is worth referring to the concept of barriers to enterprise development, which may constitute the adopted solutions in terms of resources or processes and the related states and the situation in the environment. Business development barriers are divided into two categories: external and internal. The first ones include market, personnel, financial barriers resulting from the government's economic policy, legal barriers resulting from the lack of access to information. On the other hand, the second (internal) ones include: imperfections in the field of management, basic activity (e.g. production), lack of competences or an inadequate scale of activity (Strategor, 2001; Czekaj, 2010).

Among the internal barriers to the activity and development of the enterprise, there are, therefore, imperfection in the management, limitations related to the basic activity, scope of operation or lack of competences of the owners and staff of the enterprise (Table 1).

Table 1: Characteristics of individual groups of barriers to the development of enterprises from the SME sector (Matejun, 2007)

Management imperfections	
Development strategyerrors	- demonstrated mismatch between the product or services and the expectation of recipients, - bad location of the enterprise, - too low initial capital, - dependence on a specific group of recipients/suppliers
Operational management errors	-lack of funds for current operations and investments -mistakes made in planning, implementing solutions and control
Staffingproblems	- maladjustment of incentive systems or Staff competences to the

Management imperfections	
	needs of the company's operations, -mismatch between qualifications or terms of reference of the management to the needs of the organization, - permanent changes at the highest levels of management
Weaknesses of organizational structures	- communication problems within the company, - lack (or errors) of allocation of decision-making powers, - insufficient level of delegation of tasks and powers, - lack of staff preparing indications of the spectrum of possibilities in order to make the right decision
- unforeseen increase in operating costs: rents, energy, telecommunications fees, costs of raw materials, semi-finished products and others.	
- ignorance of modern management concepts, methods or techniques.	
Barriers related to the owners policy	
Inadequates kills	- in the field of scales and marketing, -in the field of business planning, - in the field of financial management,
- low tendency to learn, development innovation and creativity, - abandonment of *know-how* - chasing the novelty without taking into account the experiences of previous professional generations	
Barriers related to the basic activity	
- means of work or technologies inadequate to the needs, - processing capacity inadequate to the needs, - supply difficulties, - problems with technology transfer, difficulties in keeping up with technical progress.	
Housing barriers	
- inadequate (too small or too large) premises, - problems with choosing the right location for customer service points, - renovation costs, - no parking spaces, - remotness from main communication routes.	
Barriers related to the size of the business	
- failure to recognize market needs in the context of the product life cycle, - no risk management or deliberate provisioning, - lack of flexibility related to the size of the business, - lack of readiness to change the market offer, **-** inappropriatehumanresources policy.	

The problem of the impact of internal barriers to activities grows and accumulates with the growth of the organization (e.g. measured by the size of employment, sales) and its "aging". Larger, longer-lasting businesses face more complex challenges. An example is the need to separate management processes from the ownership sphere. The negative impact of limited housing resources may also appear to a greater extent, and the activity in a complex market with greater volatility may introduce the need to improve the qualifications and competences of the management and employees of such entities (Matejun, 2007, pp. 128).

In the processes of their functioning, enterprises may use various factors that may support their development. These factors, referred to as stimulators, determinants, or catalysts of development, are measurable components distinguished in a complex of phenomena, which are considered as the cause of development processes (Pszczołowski, 1978) and constitute their driving forces. The literature on the subject points out that they may come from within the organization, being its strengths (internal factors) or from the environment, creating opportunities for the development of a small enterprise (external factors) (Nogalski, Rutka and Wójcik-Krapacz, 2007). The selected internal and external factors (stimulants) of the development of small and medium-sized enterprises are presented in Table 2.

Table 2: Selected internal and external factors (stimulants) of the development of small and medium-sized enterprises (Matejun, 2008)

Internal factors of the development of SME	External factors of the development of SME
- the ability to manage the resources of the organization -knowledge, experience and entrepreneurship of the management -employees' competences and skills -the nature of the market the knowledge of it -ability to implement technical progress -the size of the capital -production abilities -quality of offered products and / or services -cooperative links -ability to operate flexibly -level of sales profitability	-legal conditions for starting and running a business -the country's economic growth -development of demand and supply in the market -market competition -access to external financing -customs policy -regulations of the financial and tax system -the government's policy towards SMEs -the scope of the state's financial and non-financial support -entrepreneurial culture

Enterprises always operate in a specific external environment. They operate in a specific region in conjunction with the state and other companies. The environment provides them with certain opportunities and possibilities, but at the same time imposes requirements and limitations on them. This state of affairs is of particular importance during the COVID-19 pandemic, which has had an unprecedented impact on the activities of entities from the SME sector

The impact of the COVID-19 pandemic on the development opportunities of enterprises in the SME sector

The COVID- 19 pandemic is not only the most serious global health crisis since the Great Flu in 1918 (the so-called Spanish flu), but it is, also, the most economically costly pandemic in recent history (BIS, 2020). The economic effects of "stopping" the globalized and computerized world are felt by all participants of economic processes.

According to the estimates of the European Commission, all European Union (Eu) countries will face a recession (Forbes, 2020). Despite the swift and comprehensive policy response at both EU and national level, the coronavirus pandemic will have a significant impact on the economic performance in 2020 as lifting of restrictions is slower than expected. The scale and duration of the pandemic and possible future containment measures are still largely unknown. The Eu economy is expected to contract by 8.3& in 2020 (including Poland by 4.3%), and by 5.8% in 2021. In the euro area, a decrease of 8.7% in 2020 and an increase of 6.1% in 2021, respectively (Forecast…, 2020).

Interesting is the opinion of the Bank for the International Settlements (BIS) analysts, which indicate that, on the one hand, the high losses due to global efforts to contain the COVID-19 pandemic are unprecedented. On the other hand, it is unclear if the counterfactual would be less costly – an uncontrolled pandemic like the Great Flu of 1918 caused significant and lasting damage. It is therefore necessary to better understand the COVID-19 shock transmission channels for the economy, the interactions between economic decisions and the epidemic, and political compromises. (BIS, 2020).

The pandemic has already marked its different impact on the situation of individual sectors of the economy. In the first place, it hit the areas of the economy closely related to the spatial movement of people, i.e. tourism and communication and secondly with the movement of the goods, i.e. trade. The declines are also affecting the global financial markets.

Therefore, in the face of the spread of the SARS-CoV-2 virus, it is reasonable to ask about the effects of this phenomenon on the Polish, micro, small and medium-sized enterprise sector. This is an important matter, because nearly half of the gross domestic product in Poland is produced in this sector, and almost 60% of workers are employed there. It is also the sector most exposed to any changes and turbulences in the economy.

Based on the research carried out jointly by PwC, SpotData and CBM Indicator[ii], it can be indicated that almost **90% of enterprises in Poland from the SME sector experienced disruptions in their operations resulting from social isolation and changes in customer behaviour**. From over one third of companies (35.3%), the decrease in revenues exceeds 50% compared to the same period in the previous year (PwC, 2020).

In addition to the drop in revenues, delays in payments from customers are also a very important problem. Over 50% of companies experienced difficulties with financial liquidity. One third of companies intend to cut employment in response to the economic shock. Most of such companies are among small enterprises – as much as 42.5%. On the other hand, in the group of medium-sized enterprises employing 50-249 employees, a quarter has already started or are planning layoffs. This confirms the conclusion that the smallest companies feel the shock the most, and the larger companies may be slightly more resistant to short-term shocks (PwC, 2020).

It can therefore be concluded that the scale of the negative effects of the COVID-19 pandemic for the Polish SME sector is unprecedented in the history of the Polish free market economy. In this context, it is particularly important to search for and identify both threats and market opportunities. One of the elements of these activities is the analysis of barriers and indicators of development, which was carried out in the research part of this article with the use of an expert survey and the use of network analysis to interpret the results.

Methodology

The aim of the research was to **identify potential barriers and determinants of the development of economic entities form the SME sector in Poland during the COVID-19 pandemic**, based on the opinion of Experts.
The following research problems were formulated:

1. **What are the barriers to the development of enterprises from the SME sector in Poland during the COVID-19 pandemic,** based on the opinions of Experts?
2. **What are the dominants of the development of enterprises from the SME sector in Poland during the COVID-19 pandemic,** based on the opinions of Experts?

In the process of collecting research material, two research methods were used: **a questionnaire survey (expert survey)** and **a network analysis**.

The questionnaire survey consists in obtaining data by asking questions on the basis of a specially prepared questionnaire - obtaining answers by the interviewer from respondents, selected on the basis of appropriately selected research samples. It should be noted that an expert survey is a special type as it consists in using the knowledge and creativity of people, who are specialists in a given field (Magruk, 2005, pp. 257). Most often they are carried out on a small, deliberately selected research sample. In expert surveys, questions asked to respondents concern not only facts or their attitude towards them, but also attempts to explain and predict them. Thanks to professional knowledge and "imagination embedded in reality" they can also create valuable (realistic) forecasts of the development of the situation in a given fragment of the economic and social reality (Babbie, 2004, pp. 327; Churchill, 2002, pp. 309-311).

Network analysis is a method of detecting, describing and identifying relationships among groups of people or organizations (Wassermann & Faust, 1994). It i san interdisciplinary method that uses elements of graph theory, statistics, matrix algebra, as well as sociology, social psychology or anthropology, focusing primarily on the structure of the existing relationships between social entities (people, teams, organizations, regions, etc.). Network analysis is practically used (mainly in analytical processes) in management and quality sciences, both at the supra-organizational level, including interregional (Reid, Smith & Carroll, 2008, pp. 345-352), and in relation to the broadly understood activity enterprises (Kijkuit, van den Ende, 2010, pp. 451-479).

In the research part of the article, the following network analysis indicators will be used:

- Nodes betweeness, it is the ratio of the number of the shortest paths between any two nodes passing through a given node to the total number of all the shortest paths; sometimes mediation is normalized in such a way that the maximum mediation in the network is 1, mediation indicates which nodes are the most

important, i.e. it determines the probability with which a given factor (element) is key for the total tides in the network;
- Cumulative value of a vector – it is the sum of all connections from a given network node, it parameterizes the range of influence of a given factor on the flows in the network.

Network analysis allows to evaluate network structures by analysing connections at various levels, identifying structural gaps and distinguishing subgroups connected by a particularly strong structure of relations, as well as assessing the importance of individual people in the analysed economic and social processes (Scott, 2000).

The ”Pajek” program developed by V. Batagejland A. Mrvar (Program, 2015), was used for the analysis and visualization, thanks to which it is possible to reflect the relations and interactions between departments, employees, their activities, processes, material and non-material resources, as well as the environment of the organization.

The article is a continuation of the series of experimental research on the use of the ”Pajek” program as an auxiliary tool in creating a concept of solving specific problems of enterprises based on the relational systems between employees and other resources at the disposal of the organization, as well as environmental factors and phenomena(see: Brzeziński, Wyrwicka, 2015; Brzeziński, Kliber & Wyrwicka, 2016).

The study was conducted in August-September 2020 on a sample of 34 experts related to both the business and scientific spheres (16 scientists from the disciplines of management science, economics and finance, 3 business owners and 15 managers with at least 5 years of experience in their job). An expert research form was used in which the respondents were asked about barriers and determinants of entities from the SME sector in Poland. Moreover, the impact of these factors was determined on a scale from 1 to 5 (where 1- no impact, 2- weak impact, 3- medium impact, 4 – high impact, 5- very high impact)

Indicators and barriers of the development of enterprises – analysis of own research

The study was conducted in August-September 2020 on a sample of 34 business experts and scientists. An expert questionnaire form was used to collect the research material, which consisted of two parts: concerning the assessment of the impact of barriers on the development of enterprises from the SME sector, and also concerning the assessment of the impact of determinants on the development of enterprises from the SME sector. In terms of barriers, the following categories were distinguished: administrative, tax, management, owner, policy, core business and housing. However, development was divided into internal and external factors.

In terms of analysis and interpretation, network analysis tools were used – visualizations and brokerage indicators and vector value. In response to individual research problems, a division was made into the work part related barriers to development, as well as determinants. In the case of work visualizations in the ”Pajek” program, the thickness of the lines between individual network element determines the strength of the relationship and the thicker it is, the stronger the impact.

In order to select the factors significant for the development of an enterprise in the SME sector, the authors chose two parameters for the analysis: the intermediate value and the vector value, which can be determined by the ”Pajek” program.

The value of intermediation indicates the probability with which a given factor is crucial for the formation of barriers or determinants in this case (it is calculated from all connections in the network, and the values sum up to one). The higher the mediation value, the greater the importance of a given factor can be indicated. On the other hand, the value of the vector determines the strength of the factor’s impact on the indicator, in this study it ranges from 1-5 (where 1- no impact, 2- weak impact, 3- medium impact, 4- high impact, 5- very high impact). The higher the value of the vector, the greater its impact on the indicator.

Individual opinions of experts have been complied in relations to individual barriers and determinants of enterprise development, takin into account the strength of the impact of individual factors, On this basis, it is possible to indicate the characteristics of the relationship network:

- 104 network elements, including: 34 experts, 70 factors (35 barriers of development; 35 determinants of development);
- 2238 network connections.

The summary of experts' opinions is included in the network visualization -fig. 1. Symbols:

- Black diamond – indication of individual experts;
- Red circle – categories of barriers to enterprise development;
- Red triangle – barriers to enterprise development;
- Green circle- categories of enterprise development factors;
- Green triangle – factors of the company's development.

Fig. 1: Network visualization of Experts' opinions on barriers and determinants of the development of enterprises from the SME sector in Poland in the COVID-19 period (source: own study)

Barriers of the development of enterprises from the SME sector in Poland in the COVID-19 period, based on the opinion of Experts

The value of the vector determines the strength of the factor's impact on the indicator, in this study it ranges from 1-5 (where 1- no impact, 2- weak impact, 3- medium impact, 4- high impact, 5- very high impact). The higher the value of the vector the greater its impact on the indicator. The list of the highest values of cumulative vectors of barriers to enterprise development is presented in Table 3.

Table 3: List of the highest values of cumulative vectors of barriers to the development of enterprises from the SME sector in Poland – based on experts' opinions (Own study)

136,000000	No risk management or intentional provisioning
136,000000	Development strategy errors
135,000000	Drop in revenues due to the COVID-19 pandemic
134,000000	Low propensity to learn, develop innovation and creativity
134,000000	The nature of the market and its knowledge
130,000000	Operational management errors
130,000000	Personnel problems

It should be noted that the most important barriers (based on vector values in the network) are: no risk management or intentional provisioning; development strategy errors; drop in revenues due to the COVID-19 pandemic.

The value of intermediation indicates the probability with which a given factor is crucial for the formation of barriers or determinants of development (it is calculated from all connections in the network, and the values sum up to one). The higher the mediation value, the greater the importance of a given factor can be indicated. Table 4 presents the list of the highest values of the index of intermediation of barriers to enterprise development.

Table 4: A list of the highest values of the index of intermediation of barriers to the development of enterprises from the SME sector in Poland – based on the opinion of experts (Own work)

0.000538	Duration of proceedings before a civil and administrative court
0.000538	Procedures of applying for aid funds and their settlement (also in the scope of the
0.000538	Public procurement procedures
0.000538	Number of required permits, permits, concessions, licenses
0.000538	Labor law regulations
0.000538	Duties regarding declarations submitted to administrative authorities
0.000538	Start-up procedurę̨s
0.000316	The period of waiting for the interpretation by the Minister of Finance

Among the factors with the highest value of intermediation index, we can distinguish: duration of proceedings before a civil and administrative court; procedures of applying for aid funds and their settlement; public procurement procedures; number of required permits, permits, concessions, licenses; labor law regulations; duties regarding declarations submitted to administrative authorities; Start-up procedures; the period of waiting for the interpretation by the Minister of Finance.

Determinants of the development of enterprises from the SME sector in Poland in the COVID-19 period, based on the opinion of Experts

The development factors with the highest cumulative values of vectors include: ability to manage company resources; the quality of the products and / or services offered; shaping the demand and supply in the market. The list of the highest values of cumulative vectors of barriers to enterprise development is presented in Table 5.

Table 5: A list of the highest values of cumulative vectors of determinants of development of enterprises from the SME sector in Poland – based on experts' opinions (Own study)

146,000000	Ability to manage company resources
141,000000	The quality of the products and / or services offered
136,000000	Shaping the demand and supply in the market
134,000000	The nature of the market and its knowledge
133,000000	Management knowledge, experience and entrepreneurship
133,000000	Ability to act flexibly
133,000000	Legal conditions for starting and running a business
130,000000	Employees' competences and skills
130,000000	Regulations of the financial and tax system

With regard to development determinants, the same -high – value was obtained by many factors, such as: legal conditions for starting and running a business, the rate of economic growth of the country after the COVID-19 pandemic and shaping the demand and supply in the market (Table 6).

Table 6: A list of the highest values of the intermediation index for the determinants of development of enterprises from the SME sector in Poland – based on experts' opinions (Own work)

0,000582	Legal conditions for starting and running a business
0,000582	The rate of economic growth of the country after the COVID-19 pandemic
0,000582	Shaping the demand and supply in the market
0,000582	Market competition
0,000582	Access to external financing (including the
0,000582	Customs policy
0,000582	Regulations of the financial and tax system
0,000582	Government policy towards enterprises from the SME sector
0,000582	The scope of the state's financial and non-financial support
0,000582	Entrepreneurialculture
0,000582	Freezing the economy after the lock-down period caused by the COVID-19 pandemic

It should be noted that it is interesting that both experts and scientists did not indicate any specific features that may be of particular importance during a global pandemic. First of all, entities from the SME sector are struggling with the decline in revenues, the blunders of strategies that did not take into account the epidemic. In the current situation, the implication of the development of small and medium-sized enterprises may be the modification of business models and a flexible focus on identifying market niches and creating a new range of services or expanding the functionality of products. This applies to both relationships with individual and business customers. Currently, the second wave of epidemics is taking place in Poland, therefore the experiences of entrepreneurs from the first half of this year, as well as the identified development factors, may contribute to the development of strategic premises that will help to survive on the market in this difficult period.

Conclusions

The Polish economy has not experienced such a violent shock as in response to the COVID-19 pandemic since the systemic transformation in 1989. This is a new situation for owners, managers, employees and politicians alike. The scale of the crisis and recession is significant at the macroeconomic level, and the small and medium-sized enterprise sector itself was significantly affected by the "freezing of the economy". It is estimated that as many as 90% of entities in this sector experienced business disruptions, including those related to reduced turnover, difficulties in maintaining financial liquidity, or the need to reduce employment (PwC, 2020).

Based on the conducted research based on the opinions of experts, the most important barriers to development include: no risk management or intentional provisioning, low propensity to learn, develop innovation and creativity,

problems with technology transfer, difficulties in keeping up with technical Progress, inadequate skills in sales, business planning, financial management, marketing, low propensity to learn, develop innovation and creativity as well as chasing the novelty without taking into account the experiences of previous professional generations. However, the factors of development include primarily: the quality of the products and / or services offered, ability to manage company resources, sales profitability level, legal conditions for starting and running a business, the rate of economic growth of the country after the COVID-19 pandemic, as well as shaping the demand and supply in the market.

In addition, the very circumstances surrounding the COVID-19 pandemic provide an opportunity for companies to somehow challenge the current perception of work, or even give it a new shape in the future. It is primarily about introducing new working methods – promoting flexibility in the workplace, adapting the environment in terms of maximizing commitment and productivity, and in a broader context even adapting to the lifestyle and work of individual employees (PulsHRb).

Therefore, the determinant of enterprise development may be not only the provision of appropriate equipment (breaking the technological barrier), used to perform professional duties, but also a change in the aspect of work culture – to a flexible work environment, focused on task-oriented work, or optimization of investments, the pandemic stood in the opposition to the perception of the job.

[i] By September 4th 2020, there were nearly 26.34 million cases of COVID-19 in 188 countries and territories, including over 869,000 deathsand over 17.57 million recoveries (ECDC, 2020).

[ii] The aim of the study was to analyse the first effects on companies of the fight against COVID-19 disease. The survey was conducted on March 24th – April 2nd this year, with the use of telephone interviews (the so-called CATI survey) and on-line surveys, on a sample of over 750 micro, small and medium-sized enterprises (PwC, 2020).

Understanding Success: A Constructionist Approach to Identifying Success Factors Among the Polish Entrepreneurs Using Polish Panel Survey (POLPAN), 1988-2018

Abstract

In this initial investigation we took the constructionist stance attempting to enhance the scholarly community's understanding of how Polish entrepreneurs construct own success factors and if this has changed over time, as the country transited from command to market economy. Using the data from the Polish Panel Survey, POLPAN, waves 1988-2018, we were able to identity "Social Capital", "Luck" and the "Need for achievement" as the main factors which entrepreneurs believed contributed to their success. At the same time, we were able to demonstrate that the way entrepreneurs construct own success factors has changed during Poland's transit.

Keywords: Entrepreneurship, Success, Constructionism, POLPAN, Poland

Introduction

Entrepreneurship is a specific type of activity, which, by its nature, involves creation of something new, e.g. developing a new product, starting a new company or investing in a new market, and therefore targets success. It is, thus, natural, that both scholars and practitioners have long been interested in answering the questions about effective ways to achieve entrepreneurial success. There are, however, several problems associated with this type of research. First, there is a lack of agreement on the exact criteria for entrepreneurial success. Although the financial results are often considered the main criterion for a successful company, business success understood broadly depends on the goals set by an entrepreneur, including her financial (profit, income or economic growth) and organizational (creation of a new product, team building, survival of the company in the market during crisis), as well as personal (economic well-being, lifestyle success) aims. Secondly, existing research exaggerates either endogenous (individual traits) or exogenous (socio-economic surrounding) success factors, paying little attention to the interaction of these two sets of explanators in the actual entrepreneurial performance and their change over time.

Taking the constructionist stance, in this initial exploration we complement the existing scholarship by analyzing the factors which entrepreneurs considered important for own success under the different periods of economic transition. Using the data from the Polish Panel Survey (POLPAN) panel survey, carried out in Poland during 1988 - 2018, we examined the beliefs of entrepreneurs about the factors of success. Using the factor analysis we have identified three main factors that were important prerequisites for success, namely the factors of "Social capital", "Luck " and the "Need for achievement". We demonstrate that the composition of the obtained factors differs in different waves, reflecting the general change in the entrepreneurial climate in Poland, which was transiting from command to market economy.

Theoretical Framework

The literature offers no single definition of the "entrepreneurship" or the "entrepreneur". Entrepreneurship was defined as the entry of new firms, and the creation of high-growth firms (Hoffmann, 2007); the ability of individuals to create and develop innovative organizations that generate value(Gartner, 1990); or even competitive behaviors that drive the market process (Davidsson, 2016). For the purposes of this study, we will look at entrepreneurship in terms of its occupational choice – entrepreneurs are individuals who choose to work for themselves as opposed to others (Hébert and Link, 1988). Entrepreneurs, at the same time, are "individuals who have risked or intend to risk their personal capital, personal time, and/or personal reputation in pursuit of business ventures" (Ness and Seifert, 2016, p.90).

Success is a controversial category because it depends primarily on the value obtained results for every individual entrepreneur (Rauch and Frese, 2000). At the same time, the criteria of success for an individual and an enterprise will differ significantly depending on national characteristics (Ray and Trupin, 1989), gender (Dyke and Murphy, 2006), age (Glass, 2007) or membership in a professional group (Orser and Dyke, 2012). Entrepreneurship researchers analyzing the reasons for success of the enterprise also use various criteria for its evaluation, such as creation of ventures (Shane, 2003), entrepreneurial exit (Lee and Lee, 2015), venture growth (Baum and Locke, 2004) and other different performance indicators (Fisher, Maritz and Lobo, 2014), goal achievement, economic success or lifestyle success (Rauch and Frese, 2000). The search for ways to avoid contradictions between different perceptions of factors of entrepreneurial success has led researchers to develop various multicriteria models of success (for example (Wach, Stephan and Gorgievski, 2016), which, despite their complexity, still cannot take into account all the variety of understandings of the concept of success by different individuals.

Given that success is among the key motives of entrepreneurial activity, attempts to study the factors that can lead to such success have been extensive. Existing theories that explain the reasons for success or failure of the entrepreneurs can be classified into two groups: 1) those stressing the agency behind success – so called trait model and 2) those stressing the role of the structure, various characteristics of the external environment in shaping success of the enterprise, driven by the contingency thinking (Littunen, 2000; for extensive overview see also Bouchikhi, 2016). As we demonstrate below, focus on either endogenous or exogenous factors can be limiting to the entrepreneurship research, leading to multiple calls for alternative theoretical approaches.

Supporters of the trait model try to explain the phenomenon of success or failure of the entrepreneurs using a variety of traits, which, generally, can be combined into 5 groups: 1) need for achievement, 2) locus of control, 3) problem - solving orientation, 4) interpersonal reactivity and 5) assertiveness (Caliendo and Kritikos, 2008; Rauch and Frese, 2000). Particular qualities of individuals form her or his entrepreneurial capital (Revtiuk and Malecka, 2019), which is a part of the human capital (Becker, 1964), cultural capital and social capital (Bourdieu, 2002). Human capital, including education, experience, knowledge, and skills, is among the key resources needed for the successful entrepreneur (Unger et al., 2011). At the same time, no less important is perseverance and hard work of an individual. "Entrepreneur labor refers to the entrepreneurial characteristic of hardworking, which is expected to transfer human capital to venture success" (Lee, 2019). Social capital of the entrepreneur depends on her social skills (Baron and Markman, 2000) or specific social traits (Brandstätter, 2011), and provides additional advantages in the market, usually through formation and utilization of personal relationships and social networks. At the same time, often overlooked in this type of research is the fact that the traits that lead to success in different economic systems will be different.

Theories based on the contingency thinking address this context-dependence by suggesting that the characteristics of successful entrepreneurs are not universal. This idea can be illustrated by the statement of Gartner that entrepreneurship is the ability of a person to the creation and development of innovative organizations (Gartner, 1990). Further, this degree of innovation of the same product, market or production method, may differ not only between countries but also for different regions. Successful entrepreneurs operating in different countries or cultures, have different leadership styles (Stephan and Pathak, 2016), possess different levels of human capital (Unger et al., 2011), including different levels of education (Fried and Tauer, 2009), different characteristics of cultural capital and social capital (Davidsson and Honig, 2003). However, suggesting the deterministic nature of the socio-economic structure at the expense of the agency may be equally harmful for the research on entrepreneurship.

Along with multiple attempts for multi-factor analysis, which tried to combine internal and external factors in a single model, often limiting the complex reality of entrepreneurial process to a set of variables (for critique see Bouchikhi (1993), calls for an alternative research paradigm also emerged. Social constructionist perspective, borrowed from social sciences, is seen as one of approaches which can potentially develop new and/or neglected perspectives in the field of entrepreneurship. As Lindgren and Packendorff (2009), who are among constructionism' most vocal

advocates, suggest "[constructionism] is about pluralism in entrepreneurship research; it acknowledges different meanings about entrepreneurship, provides knowledge about interaction processes and describes complexity". Constructionist stance would suppose seeking understanding of how individual entrepreneurs perceive, define, produce and reproduce entrepreneurial action across societies and time.

Guided by this logic in this initial investigation we aim to understand how entrepreneurs themselves subjectively construct their perception of success. We purposefully avoid testing any predictions, implying instead a descriptive inquiry into what factors contribute to entrepreneurs' success, from their point of view, and if these change over time within the same socio-economic system. For our exploration we have chosen Poland, a country that has undergone a successful transformation from a command socialist to a successful market economy over the past 30 years.

Background

In 1988, Poland was on the verge of market transformation. Painful but successful market reforms in 1991-93 eventually led to transition of the country: since 1996 Poland is a member of the OECD; in 2004 it become a member of the EU. The territory of Poland is 312.7 thousand sq.km., in 2017 the population amounted to 37.98 million people, GDP (current) is 526.47 billion US dollars, GDP growth (annual%) equals to 4.8% (World Bank Open Data | Data). In 2018 Poland ranked 37th in the Global Competitiveness Index and was a successful developed country and one of the leaders in Eastern Europe in terms of economic development.

Although entrepreneurial activity, unlike most other socialist countries, was initially allowed in Poland, entrepreneurs at first did not enjoy social prestige due to the lack of prospects for developing their own business (Rumiński, 2017). Rapid economic changes, however, had impacted the dominating society's views on the factors that lead to success (Janicka and Słomczyński, 2007, 2016). The beginning of economic reforms led to the revival of the entrepreneurial class in the country, which played an important role in Poland's success story (McMillan and Woodruff, 2002). For example, by the end of 1989, more than 16,000 new businesses were registered (Wilson and Adams, 1994).

Studies of entrepreneurship in the post-socialist Poland take into account different traits and their importance of entrepreneurial success in different periods, for example the impact of education and family history (Boruc, 2018), the role of social connections (Osborn and Słomczyński, 2005) or parent-son inheritance of entrepreneur status (Domański, 2000).

Methodology

This study is based on the data of the Polish Panel Survey (POLPAN), one of the longest continuously run panel studies in Central and Eastern Europe, carried out by the Institute of Philosophy and Sociology, Polish Academy of Sciences. Since it was initiated in socialist Poland in 1987-88, POLPAN reached the respondents in five-year intervals, with most recent wave fielded in 2018. This survey collects socio-demographic and socio-economic information of respondents and their families, as well as data on participants' various socio-political attitudes (Polish Panel Survey POLPAN., 2020). For this article we used the results of the all seven waves of the POLPAN (1988 to 2018). In this way the analysis covered all phases of transit of the Polish economy from late socialism to a developed market economy, which allowed to see what factors the entrepreneurs believe lead to success and if these vary depending on the external social economic environment.

For the analysis we took into account the answers of respondents, who indicated own business as the main place of work. Further, we used a set of questions about the importance of factors for success, that were asked to all respondents who participated in all waves of the POLPAN survey. Particularly, respondents were given a Likert scale from 1 to 5 (from "1=very important" to "5=not at all important") on the importance of (a) ambition, (b) of knowing the right people, (c) of hard work, (d) of political influence, (e) of coming from a rich family, (f) of a good education, (g) luck, and (h) innate ability for success in life. We assume that entrepreneurs associate success in life with their professional activity. Descriptive statistics of these variables are provided in Table 1.

Fig. 1: Average value of importance of the given factor for success in life for POLPAN, 1988-2018 (1= very important, 5= not at all important).

The analysis of the dynamics of change in the arithmetic mean of the indicators under study suggests that political influence (mean ranges from 3.05 in 1993 to 3.5 in 2008) and coming from a reach family (mean ranges from 2.94 in 2013 to 3.24 in 2018) are, according to the respondents, the least important success factors. Instead, ambition (mean ranges from 1.85 in 1988 to 2.19 in 1998), good education (mean ranges from 1.92 in 2008 to 2.56 in 1988) and innate ability (mean ranges from 1.96 in 2008 to 2.26 in 2018) are the most important. The steady increase in the importance of hard work among entrepreneurs throughout the analyzed period from 2.68 in 1988 to 2.06 in 2018 is also worth noting.

Considering that entrepreneurs are a heterogeneous stratum and will differ in types of economic activity, business size or business experience, the study used factor analysis, which allowed to identify groups of factors related to them and their weight in different waves POLPAN survey. Table 2 describes the factor groups obtained after processing the POLPAN data in SPSS using the Varimax rotation method. To verify the adequacy of the results obtained we used Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO, ranging from 0.521 to 0.773).

Findings

We grouped the results obtained in different waves of the survey depending on the obtained values of the coefficients of factor weights. As a result, we were able to identify three groups of factors including: 1) the factor of “Social Capital “(characterized by high factor weights for "Knowing the right people", "Political influence" and "Coming from a reach family”), the factor of “Luck” (characterized by high factor weights of “Luck” and “Innate ability”) and the factor of the “Need for achievement” (characterized by high factor weights of “Ambition”, “Hard work ” and, in the waves of 2003, 2008 and 2013, "Good education " and "Innate ability"). Figure 1 illustrates the obtained factors of the respective groups depending on the survey wave.

Fig. 2: The size of the coefficients of factor weights for factors of "Social Capital" (Chart 1), "Luck" (Chart 2) and the "Need for achievement" (Chart 3)

Our findings suggest that the most stable factor, according to the surveyed entrepreneurs, which leads to success, is the factor of social capital, which is found among the results of the analysis of all waves of the survey, explaining from 20.436% to 26.186% of the results. It should be noted that in the wave of 1993, the factor weight of "Knowing the right people" is the lowest (0.445), which, in our opinion, may be the result of new opportunities for entrepreneurs as a result of reforms in Poland. In other words, the rapid development of entrepreneurship has reduced the importance of knowing the right people to achieve entrepreneurial success. Saturation of markets, which occurred due to the growth of the number of enterprises, and the establishment of "rules of the game" led to the restoration of the importance of this factor for entrepreneurs in the later waves.

The "Luck" factor occurs in the early waves (1988, 1993 and 2003) and in the last wave of 2018. In our opinion, the factor of luck, according to the entrepreneurs, was important during the period of rapid economic transformation, because it was filled with "windows of opportunity", which allowed the early entrepreneurs to succeed quickly without investing significant effort and money. The success factor has returned to the agenda of entrepreneurs after the crisis years, during which small and medium-sized businesses suffered losses. Thus, the belief in the importance of luck for success was re-formed among the entrepreneurs.

Finally, perhaps the most important factor is the factor which we called "The need for achievement". The core of this factor consists of the indicators of "Ambition" and "Hard work", its weight is high in 1988, 1998, 2008, 2013 and 2018. In the wave of 2003, the factor weight of "Hard work" was quite low (0.013). Next, it should be noted that in the waves 2003, 2008 and 2013 (with the exception of 2003 wave) "Good education", "Innate ability" and "Luck" were significant for this factor. In our opinion, this is due to the reduction of economic turbulence associated with the completion of reforms and the country's accession to the EU.

Conclusion and Discussion

In this study we proposed to move beyond the mainstream research in the field of entrepreneurial success, that, by and large, is focused on achieving economic results, and, using the ideas of constructionism, to look at success through the eyes of entrepreneurs themselves. By looking at the respondents' answers about the factors of success in life we did not initially set any quantitative or qualitative criteria for measuring success of their entrepreneurial activity, and thus avoided problems characteristic to studies comparing the performance of entrepreneurs operating in different industries or businesses of different size. The use of factor analysis allowed us to synthesize success factors from the

respondents' answers and trace their change during the 30-year history of Poland's transit from socialism to a successful market economy. Perhaps the most interesting trend is the dynamics of the "Luck" factor, which was important both during the early transformation period and regained importance in 2018, when Polish economy is considered one of the most successful among the new EU member states.

We acknowledge multiple limitations connected to this study. First and foremost, in POLPAN, the respondents, although were not specifically asked about the success of the enterprise, were still given a set of answers which would characterize their beliefs about success in life. Working with this data has pushed us into making assumptions about the relationship of constructed image of one's life and the role of professional activity within it. Thus, our results have to be interpreted accordingly. Additionally, our analysis relied on the answers of different respondents, grouped by the sole fact of performing entrepreneurial activity. This, on the one hand, allowed us to understand the general trends observed among the Polish entrepreneurs, for different survey waves. At the same time, we did not delve deeper into the data to understand how beliefs about success of specific individuals had changed from wave to wave. This additional analysis is possible thanks to the panel nature of the POLPAN data, and will become a subject for future investigation.

Abstract

Purpose: The objective of this article is to develop tools of intelligent education quality management, analyze the elements of institutional audit and its introduction into practice of school operation. **Methodology**: While doing research the following methods were used: method of expert evaluations, data analysis, method of experiments, sociological methods, observation, and survey. The paper analyses foreign experiences and Ukrainian practices concerning reforms introduction into educational and management processes of school operating. We consider institutional auditing as a conceptually new approach to external assessment of school operation in contrast to their certification which is of oversight nature and serves as a tool of school support. Recommendation on school operation improvement is also the result of institutional auditing. Its main stage includes school self-evaluation which is widely used while carrying out experimental work at schools. Based on the results of theoretical analysis and experimental research, it is supposed that scientific organization of education quality monitoring enables to make relevant management decisions and forecast educational and training situations for further academic year, intervene promptly and implement appropriate corrections to pedagogical process, plan specifically the work on relevant challenges with both teachers and pupils, create the conditions for comparison own assessment of pedagogical staff operation and independent external experts' evaluation. **Conclusions**: Institutional auditing confirms that, first and foremost, its effectiveness depends on systematical school self-evaluation at different stages of its operating and researching aspects of its operation that encourage school education quality improvement. As the results of this study testify, experimental work at school promoted improvement of pupils' performance improvement, their cognitive interests' development, as well as provides progressing of pedagogical staff's professional skills. The results of experimental work serve the example of schools preparation for institutional audit as an external assessment of education quality assurance. **Implications**: The results of experimental studies serve as an example of schools preparation for institutional audit to evaluate education quality assurance externally. The development and implementation of bilingual education model is the result of experimental studies (2008-2020). Due to the introduction of bilingualism the students gain opportunities to improve their language skills at the courses in Institute Grand Bleu (Cannes, France), Alliance Française (Strasbourg, France), to be involved into exchange programs between schools and College des Alberts (Argelès-sur-Mer, France) and Lyceum (Rethel, France) according mutual agreements, to participate in French-speaking and English-speaking sessions of European Youth Parliament which take place at schools etc.

Keywords: Institutional Audit, Educational Establishment, Quality, Monitoring.

Introduction

Ongoing transformations in education led to introduction of competence approach, practice-oriented methodology, and innovative education technologies in training required for improvement of education monitoring during a pandemic, especially concerning distant learning education. The key features of those changes are time, the scope of educational process participants' involvement, technical complications of changes.

The concept of organizational development technology includes structural dimension and human resources. Within structural approach, beneficial framework for achieving the goals of organizational development is created with the assistance of changes in organizational regulation. Human resources approach focuses on the development of staff, encouraging their commitment to accept and bring changes. The implementation of successful organizational transformations in both dimensions requires introduction of the important organizational development tool, institutional audit, which is the key point of this study.

The objective of the article is to develop tools of intelligent education quality management, analyze the elements of institutional audit as one of the tools of general secondary education management and outputs of its organization and introduction at schools. While doing research the following methods were used: method of expert evaluations, data analysis, method of experiments, sociological methods, observation, and survey.

The term 'audit' is traditionally associated with financial checks, but the scope of its application as a process of comprehensive testing goes far beyond pure accountancy. Being a powerful tool for verification of conformity of compliance with the provisions of law in any activity, audit can be applied in education. Auditing is a process of constant interaction which enables to evaluate competitiveness and improve the development strategy of any organization.

Literature Review

The problem of controlling in education, including the external one, became more common after shaping the holistic education system in the 19th century on the territory of Austrian-Hungarian Empire. Our special attention is given to the fact of establishing the first Inspectorates on the territory of Ukraine (the part which was captured by the Empire) whose duties included ensuring quality education as we understand it nowadays. However, general secondary education management was uncoordinated: inspectors of gymnasia and inspectors of real schools were engaged. Their responsibilities included following up on the implementation of Ministry orders, teachers' checking and inspecting, financial supervision of schools condition and writing annual reports on educational establishment activity. School inspectors not only checked the status of establishment work, but also develop special programs on reforming schools in compliance with legislation. These programs ensured unification of curricula, methodical assistance to the teachers through improving qualification courses establishing, provision of material assistance to support educational facilities (Penishkevich, O.I., 2002; Shevchenko Scientific Society,1949).

The First and the Second World Wars significantly complicated the development and formation of the tools aimed at ensuring education quality on the territory of Ukraine. Nevertheless, trends of increased monitoring in education started to develop in the world. It was in interwar and postwar period when the USA began to shape monitoring evaluation of education quality. To reform the system of school education in the USA monitoring was applied to keep the track of the level of graduates' training at 30 schools as well as the level of formation affected features (public position, critical thinking) in them. Since 1955 monitoring as a tool of tracking education system has spread around Europe. It is widely applied in different countries while planning and implementing education reforms in practice. In 1958 the manager of the Centre of comparative pedagogy, Chicago University, K. Anderson suggested detailed comparing national systems of school education based on empirical measurements of inputs and students' academic achievements.

1960-1970 marked in educational monitoring shaping. It featured internationalization of the studies, justification of monitoring conceptual framework and development educational indicators system. In 1959 International Association for the Evaluation of Educational Achievement (IEA) carried out international comparative monitoring research on achievements of primary and secondary school pupils in Mathematics (First International Mathematics Study – FIMS). Further international studies of academic performance level in specific subjects, information and communication as well as functional literacy of pupils were conducted by UNESCO Institute of Education, International Association for the Evaluation of Educational Achievement (IEA), the International Association for Educational Assessment (IAEA), the International Institute for Educational Planning (IIEP – UNESCO),

the International Bureau of Education (IBE-UNESCO), the Organization for Economic Co-operation and Development (OECD), United Nations Children's Fund (UNICEF), World Bank Institute of Economic Development and other organizations. At the beginning of the 1960s experimental committee on designing the assessment measures for the National Assessment of Education Progress (NAEP) was created under the leadership of Ralph Tyler. In 1969 the first national assessment of education progress was conducted under the funding of the US Government, in 1978 the Law on compulsory periodical national assessment of education progress was adopted.

In the 1980s-1990s the challenges concerning cost-effectiveness, organizing efficient resource management, assessment of ensuring educational system efficiency became of actual importance. Education quality was transformed into political category. Significant extension of the quality assessment and quality management systems in humanities, including education, contributed a lot.

Nowadays the studies on above-mentioned subject matters are grounded on powerful methodological base, statistical methods of theoretical data assessment are used, multi-level models are implemented. The creation of hierarchically streamlined information system of education quality management comes true. In international studies TIMSS, CIVICS, PISA, MONEE and others experiments aimed at developing efficient methodology of assessment and parameters of the researched objects within education system, determining unified indicators and criteria of education quality and its constituent parts are implemented.

The assessment of educational networks operation comes into view of a great number of current international studies, projects and programs. The four studies should be paid specific attention to as the ones covering the scope of our interests:

1. Program “Indicators of Education Systems” (INES) (OECD, 2012), directed at catalyzing reforms to educational policy and practice in the OECD’s 34 member countries and partner countries, highlighting successful educational outcomes and strategies. INES support countries’ understanding of their education systems by placing them in a global context, enables education systems to assess themselves in light of other countries’ educational performance by providing a rich and internationally comparable set of indicators on: the output of educational institutions and the impact of learning on economic and social outcomes; the financial and human resources invested in education; access to education, participation and progression; the learning environment and organization of schools.

2. Project “Education management in territorial communities: the experience of European Quartet countries, or V4 for Ukraine” implemented under the support of International Visegrad Fund and aimed at improving governance efficiency of education system management in territorial communities of Ukraine by dissemination of experience and best practices of European Quartet countries (Kavunets, A., 2018).

3. Program “U-LEAD with Europe” is similar to our study. Experts of Central reform office under the Ministry of development of communities and territories of Ukraine have been evaluating ‘School education network capability Index’ in united territorial communities (Creemers, B.P.M. and Reezigt, G.J., 2005). This index demonstrates to the citizens the compliance of real network with the model funded by the state. School education network capability index in united territorial communities takes into account the difference between the indicator of estimated class fill rate and the indicator of actual class fill rate. The former is obtained by the formula considering such indicators as the quantity of pupils and territories peculiarities. Calculated index shows to local authorities reserves for efficient use of financial resources and ways of improving the quality of education services in general secondary education system.

4. Regarding the issue of efficient educational network, it should be comprehended that efficient school and improved general secondary education operation are of different origin. Efficiency of school operation is directed at identifying the factors that work in education and why. Improvement in school operating is the practice focused on policy and directed at desirable changes. But being oriented on final results, internal data, process and context in education, they have much in common. Project ‘Effective School Improvement’ (ESI) (Creemers, B.P.M. and Reezigt, G.J., 1997) merges two traditions. In its theoretical part different orientations in a model of effective school improvement were analyzed and united. Grounded on this analysis, framework of evaluation to review case studies of school improvement projects in member countries was developed. Theoretical model and results of case studies review were united under the project of effective school improvement.

Vanda Mendes Ribeiro and Joanna Borges de Guzman (Ribeiro, V. M. and Borges, G.J., 2010) represent their studies of quality indicators application in education – Indique – a tool of self-evaluation for schools. Indique offers indicators grouped as a set of measurements and interpreted as 'fundamental elements which school should take into account while improving its quality'. The parameters include educational environment, pedagogic practice and assessment, teaching of reading and writing, democratic school management, training and working conditions of teachers at school, physical condition of the school building, pupils' access to school and their staying inside. Offered indicators regarded as quality signs are evaluated by stakeholders at brainstorming sessions which is rather appropriate. We fully agree to the main assumption of this article which states that assessment may have positive, negative and mixed consequences for the policy of municipal schools, lives of teachers and pupils. The role of evaluation varies depending on the fact how locals assimilate, adopt or oppose state policy.

Conceptual Approaches to Institutional School Auditing

Based on provisions established in management and stating that realization of any strategy is a process of ongoing changes of varying scale and complexity, it may be argued that organizational changes are always linked to implementation and correction of operating strategy. Assessment of school operation effectiveness within current conditions of educational environment is of actual importance concerning competitiveness and importance of framing policy of education development. Identification of appropriate indicators and indexes is a necessary tool for creating informational basis of school effectiveness monitoring. We consider that school assessment should be subordinated to the goal of its results application and include the following aspects: economic (establishment is evaluated as an entrepreneurship entity), benchmark (education quality and education services are estimated taking into account appropriate minimum state and regional requirements) and parametric (quality management system based on ISO 9000 is developed and implemented).

Capacity of schools to employ internal reserves and efficiently manage them copens up opportunities for shaping competitive benefits. The famous researchers in quality management Joseph M. Juran and Armand W. Feigenbaum were the first who paid attention to economic aspect of proper quality issue. Then the term 'value of quality' originated. Value of quality related to expenses on preventing poor quality, monitoring and control, as well as to expenses on correcting low-quality product. Joseph M. Juran and Armand W. Feigenbaum's approach to accounting and analysis of expenses on quality provision was widely adopted, though generating a lot of dilemmas and mistakes. In 1996 William Edwards Deming's philosophy of total quality management was studied to implement it in educational establishments (Winchip, S.M., 1996). Five key principles of the philosophy were found appropriate for educational establishments: purpose, cooperative systems, improvement, leadership and methods-processes.

It is clear that strictly defined criteria should be laid in the foundation of efficient institutional school audit. They are of two types: accreditation, promoting the procedure of state assessment of education quality, and sociological. The latter are grounded on the views of education process participants and feedback methods, or so called 'criteria of consumer monitoring'. This set of criteria is shaped by school to conduct consumer monitoring with the use of sociological studies and local surveys of specific groups of educational process participants. The most important component of assessment and guarantee of educational establishment activity quality is a monitoring of stakeholders' satisfaction with education.

In Ukraine the history of monitoring system promotion in education at national level started in 1997 when the Centre of education monitoring under Institute of content and methods of schooling of Ministry of Education of Ukraine was established. In 1999 it was transformed into the Department of monitoring of general secondary education quality under Scientific and methodological center of secondary education. It began all-Ukrainian monitoring researching in several areas: quality of basic educational literature for general education establishments (2001, 2003, 2004), quality of Physics learning (1999), quality of Maths learning by the graduates of primary, secondary and high school (2002), level of pupils' physical, moral and psychic development, as well as infrastructure of educational establishment which provides schoolchildren's health care (2005). In 1999 the first organization in the field of professional evaluation and staff selection was established in Ukraine. It was called the Centre of testing of professional competence under Ministry of Health of Ukraine. In 2005 Ukrainian center of evaluation of educational quality with its regional branches was established. It conducted monitoring of academic performance quality in primary (4th grade) and secondary (8th grade) school with the use of TIMSS technologies. The city of Kyiv, Vinnitsa, Donetsk, Lviv, Kharkiv regions and Autonomous Republic of Crimea became the units of shaping the regional systems of education quality monitoring.

The center of education monitoring which keeps the track of educational system operation in Kyiv, its effectiveness and quality was created. Its mission is to mirror the real educational processes in the city of Kyiv, shape the models of future state of Kyiv's educational system, as well as the ways of its successful development.

The adoption of a new Law of Ukraine "On Education" was one of the latest steps on the way to education improving (Verhovna Rada, 2017). In its Chapter V the main principles of education quality ensuring, particularly its internal and external systems were established. Conceptual changes in school operating started in 2018. They included among others the following: 12-year of schooling, a new structure of schools (primary (Grades 1-4, two cycles of primary education: Grades 1-2 and Grades 3-4)), basic (Grades 5-9), profile (Grades 10-12), competence approach to learning etc. According to part 2 article 41 of the Law of Ukraine "On Education" the system of education quality ensuring includes internal system of education quality ensuring and system of external education quality ensuring.

The internal system of education quality ensuring may include evaluation of education environment, pedagogical staff activity, academic performance and education management (Figure 1).

Fig. 1: Internal system of education quality ensuring

Educational reforms in Ukraine resulted in transformation from state certification of educational establishments to their institutional audit. State certification was undertaken by the local educational authorities who managed the educational establishments which made impossible to assess their operation fairly.

Institutional audit is now conducted by independent organizations (Service and its territorial branches, accredited professional public associations, other entities which can accredit educational establishment). Such situation promotes fair assessment of school activity, enforcement of state policy framework in education concerning institutional separation of control (supervision) and support for the educational establishment operation.

Institutional audit provides the application of unified tools and procedure for conducting. Moreover, it is much more efficient than state certification as it results in making conclusions on the quality of educational establishment operation and internal system of education quality ensuring.

Recommendation on school operation improvement is also the result of institution audit conducting. Self-evaluation which is undertaken directly at school is the main stage of institution audit as an external assessment of educational establishment operation. Self-evaluation as an up-to-date tool of educational policy analysis is directed at studying the topical issues of educational establishment operation. Based on this study, the solutions concerning further actions of educational organization institutional development are made. Self-evaluation process in school practice is widely employed during experimental work in educational establishments. Considering the results of experimental study and theoretical analysis, we claim that scientific organization of education quality monitoring enables to make management decisions and forecast teaching and educational situations for the next school year; intervene promptly and make appropriate changes in pedagogical process; formulate specific steps concerning the issue with teachers

and pupils; create the environment for comparison own evaluation of pedagogical staff activity and independent evaluation undertaken by external experts.

Experimental Work

One of the authors of this article, Alla Panchenko, is a scientific leader of two experiments carried out at schools within implementation of institutional audit reforms. Here is the outcome of this work:

1. The subject of experimental research: "The creation of bilingual educational establishment model" (2008-2014)

Hypothesis: implementation of bilingual education promotes improving general language skills of pupils, integration of subject knowledge in different educational fields, expansion of sociocultural communication.

The outcomes of experiment:

1. Model of bilingual educational establishment as a structural unit within the system of ongoing studying (school – Ukrainian higher educational establishment – French higher educational establishment) is reasoned, designed and tested (Figure 2).

2. The outcomes received are compared with the purposes and hypothesis set, concerning promotion bilingual education for improvement general linguistic skills of pupils. To achieve this purpose monitoring of academic performance level in bilingual subjects and subjects in Ukrainian in Grade 6-9 was conducted.The experiment reveals that motivation to study foreign language is increasing, pupils' outlook is widening due to broadening information field, pupils' general academic skills are developing (while working on retrieving the specific information from the texts and its application to solve the educational tasks), the pupils' interest in getting additional information studying the subjects in foreign language is growing, and , which is the most important, learning technologies are improving.

Fig. 2: The model of bilingual school

Full application of information technologies in teaching and educational process increases the efficiency of studying and its intensification and individualization depending on pupils' capacities, as well as increases proportion of creative independent work.

While researching the efficiency of creation of bilingual educational establishment model, pedagogical staff concluded that process of bilingual learning provides preconditions for deeper and advanced learning French by the pupils. This fact is confirmed by the results of international exams in French DELF. The trend to improve the knowledge quality in basic subjects by the pupils due to studying bilingual subjects was also kept the track of (Figure 3 and 4).

Fig. 3. Geography in French

Fig. 4. Optional course – Mathematics in French

The system of providing the opportunities for school graduates to receive the certificates of full general secondary education of Ukraine and France with the right to continue their education in higher educational establishments abroad played the significant role in experiment (Figure 5).

Fig. 5: Academic performance of pupils according to results of DELF tests at levels A1, A2, B1, B2

In appropriate manner it is stated that efficient application of all resources of bilingual studying promotes positive dynamics of pupils' knowledge quality, shapes communicative skills, expands positive motivation to learning, adapts pupils to life and activity in current pluricultural society, shapes the research skills in teachers and pupils.

The approbation of educational establishment bilingual model proved that it is a structural unit within ongoing studying (school graduates continue their studying in higher educational establishment of French-speaking countries).

According the outcomes of this experiment the decision concerning the feasibility to carry on this experimental work aimed at its further realization as a structural and component bilingual learning technology model was made with the outcomes to conduct the following experiment.

2. The subject of experimental research: "Development of bilingual educational establishment educational space within transformations in education and society" (2014-2020).

The program "Psychological and pedagogical design of personality social development among the students of comprehensive and vocational educational establishments" was implemented to realize efficiently the tasks set at school (Scientific leader: Kirichuk V. Institute of child prodigy under Academy of Pedagogical Science of Ukraine). It gives a chance for all participants of educational process to define the correctional methods based on psychological observance of all educational stakeholders accompanied personally to develop the pupils in independent manner.

The basis of diagnostic complex "Society" is consisted of three authorial methodology: "Personality vitality by the main activities"; "Grade pupils' social and communicative development- social metrics"; "Values in communication", as well as methodological projects: "Value prioritites" (S. Tyschenko); diagnostics of personal disabilities "DVOR" (Z. Karpenko); "Parents' attitude" (A. Varga and V. Stolina).

This experiment promotes prioritizing the salient values of pupils, particularly "My health and I", "My civil duties and I". The work to promote learning and working also requires increased attention.

Experiment outcomes: The proper organized bilingual learning provides a qualitative leap to cultural and intellectual pupils' development. The students accumulate cultural and linguistic experience benefitting for successful adaptation to living. All cultural, pedagogical and linguistic aspects of bilingual learning are closely linked. These schoolchildren obtain broader cultural horizons than their mates and are open up more for intercultural exchange.

Bilingual subjects learning impacts memory capacity development, attention and scope of pupils' capacity.

Fig 6: Pupils' motivation level of successful performance

Fig 7: The level of self-evaluation

Conclusion

The foreign experience analyzed in this study as well as Ukrainian practice of reforms implementation in educational and management school operation enables to state that building confidence in school education functioning and continuous improvement of education quality for sustainable development of schools are of actual importance. Institutional audit as a new conceptual approach to external evaluation of Ukrainian school operation compared with certification which had supervision and control functions is now implemented as a tool of schools' support. At the same time the state guarantees the security of institutional audit of educational and managerial processes through regular data collection, unbiased analysis and adoption of relevant decisions.

Monitoring is the main tool of school education quality; its framework enables to assess the school operation efficiently and forecast the further steps concerning its improvement.

The process of institutional auditing confirms that first and foremost its effectiveness depends on systematical self-evaluation of school operation at different stages of its aspects functioning and studying which encourage improvement of school education quality on the whole.

The results of this study confirm that experimental work at schools promoted improvement of pupils' knowledge quality, development of their cognitive interests, as well as improvement of professional skills of pedagogical staff. Implementation of bilingual model of school education is the result of experimental studies (2008-2020). Due to implementation of bilinguality the pupils gain the opportunity to improve their language skills to improve their language skills at the courses in Institute Grand Bleu (Cannes, France), Alliance Française (Strasbourg, France), to be involved into exchange programs between schools and College des Alberts (Argelès-sur-Mer, France) and Lyceum (Rethel, France) according mutual agreements, to participate in French-speaking and English-speaking sessions of European Youth Parliament which take place at schools etc.

Abstract

This study shows how the quality of low linear density polyethylene (LLDPE) foil can be optimized by controlling the outlet temperature of the extrusion head, using infrared thermography. The first part of the paper presents the material and the description of the quality testing method used in the field of polyethylene film testing. The theoretical foundations of the thermography method used is also briefly shown. The hypothesis is that the variation of the mechanical properties of the foil along the extruder cylinder is caused by temperature differences at which the process takes place. To confirm these aspects, an experimental plan was designed with the help of an infrared thermography camera to highlight the connection between local temperature and mechanical characteristics. It was found that even at 5% temperature variations, the difference in mechanical properties is very important with a sharp decrease in the case of samples taken from the ends of the cylinder. Real-time temperature measurement, at any point on the extruder generator, made it possible to observe the values that appear in the manufacturing process as well as to design and validate an automated reaction loop system that maintains the temperature at the extremities in the area of the corresponding levels from the half of the cylinder where the best product quality is obtained.

Keywords: Temperature, Mechanical Properties, Infrared Thermography, Polyethylene, LLDPE.

Introduction

The subject of the study of the mechanical characteristics of LLDPE arouses the interest of many researchers around the world. The first studies on the influence of temperature on the mechanical properties of LLDPE were published by Huizenga (1990). The increased interest for this type of material has led to an increase in the number of studies on this subject, the researchers being interested in obtaining the best possible mechanical characteristics of the LLDPE foil, Bhattacharya (1998), Fang (2005), and Bawa (2006).

Nowadays there are intense concerns, materialized through the activity of specialized research centers located in large countries producing such materials, such as: Greece - Maillis Group, Italy - Hipac Group, Poland - Strapex GmbH, Efekt Plus, Turkey - Prens Plast A.S., Poliner Plastik A.S., S.U.A. - Multiple Research Centers and Raw Material Manufacturers - Dow Chemical, Exxon Mobil, China - Hebei Orient Rubber & Plastic Co. The biunique relationship between the extruder outlet temperature and the mechanical properties of the foil has been studied and

presented in several scientific articles, starting with the year 1998. Actually, numerous studies made by Kontou (2006) and Zaghloul (2018), reveal this correspondence without any of them strictly referring to the influence of the extruder outlet temperature for foils with thicknesses between 5µm and 25µm. The interest for such a result is given by the requirement to use a small amount of material, which ensures the functional role and mechanical properties like the thicker foils, located between 50µm and 90µm.

Materials and Methods

Stretch foil is a flexible plastic layer based on polyethylene with adhesion properties, used for packaging. Due to its elasticity, the stretch foil can be stretched at normal temperature when subjected to forces. Once the resistance force ends, the foil tries to return to its original size giving stability and a good packing result. Polyethylene is a thermoplastic polymer with a variable crystalline structure and an extremely wide range of practical applications in various fields of activity. In fact, polyethylene is the largest plastic product in the world, with tens of millions of tons produced annually. It has gradually become the most successful synthetic product with various applications depending on the type of material produced. Polyethylene comes in several forms of composition, each with its precise destinations. Low density polyethylene (LDPE / PEJD) - It comes in the form of a very flexible material, a property that makes it easy to process and extremely malleable, one of the best-known applications being shopping sacks. The production process is carried out under very high pressure (1000-3000 [atm]), at moderate temperatures (420-570 [K]), from granules, according to the following chemical formula:

$$nC_2H_4 \rightarrow [-C_2H_2-C_2H_2-]_n \quad (1)$$

The industrial facility used in the study is highly productive, with an overall size of up to 5000 [mm] and a material volume of 2700 [kg/h]. Tensile strength (elongation at break) is one of the most important and common requirements of stretch foil. It represents its ability to stretch between 10% - 400%. The "Tensile test" is used to determine the breaking strength. This is a test in which a sample is placed in the testing machine and a constant load of traction is applied so that it stretches and eventually breaks. A measuring device or extensometer is used to measure the elongation. The value obtained at the highest applied force is the tension force. Typically, these tests are performed according to an internationally recognized standard procedure and by calculating the results so that the data are portable between laboratories. The loading rate can be applied as either a constant expansion rate, constant stress speed or constant loading speed, depending on the standard. Tearing strength is the stress at which a prescribed value of plastic deformation occurs (usually 0.2%). The elongation describes the value of the sample stretch before tearing. Information on the strength, rigidity and ductility of a material can be obtained through this test. Tensile strength is the stress at which a material breaks or deforms permanently. This is an intensive property and therefore does not depend on the size of the test sample. However, it is dependent on the sample preparation and the temperature of the test medium and material. Stretch testing is an important part of design, as well as quality control, to ensure the safety and integrity of products and is an essential part of consistency tests in manufacturing and construction.

Infrared thermography (IRT) is a science dedicated to the collection and processing of thermal information from non-contact measuring devices. It is based on infrared radiation, a form of electromagnetic radiation with longer wavelengths than visible light.

Infrared radiation is the energy radiated from the surface of an object whose temperature is higher than absolute zero. The emitted radiation is a function of the temperature of the material, the higher the temperature, the higher the intensity of the emitted infrared energy. There are three ways in which the radiant energy that encounters an object can be dissipated: absorption, transmission, and reflection. The portions of total radiant energy that are associated with each of these dissipation modes are called body absorption transmissibility, and reflection. Measuring temperature using infrared thermography measures the infrared radiation emitted by an object and converts the detected energy into a temperature value. However, because not all the radiation received comes from the target object, to accurately measure temperature, radiation from other sources (such as surrounding objects or the atmosphere) must be removed upon conversion to temperature. The total radiation received by the camera (W_{tot}) comes from three sources: the emission of the target object (E_{obj}), the emission of surrounding bodies reflected by the object (E_{refl}) and the atmospheric emission (E_{atm}). In summary, this situation can be expressed in Equation (2). The whole process is illustrated in figure 1.

$$W_{tot} = E_{obj} + E_{refl} + E_{atm} \quad (2)$$

Fig. 1: Infrared radiation received by the camera.

The first source is the emission from the target object. However, not all of the radiation emitted by the target object is received by the camera. Depending on the transmittance of the atmosphere (τ_{atm}), some wavelengths and some of the radiation are absorbed by the atmosphere. Thus, the emission of the target object can be expressed as in equation (3).

$$E_{obj} = \varepsilon_{obj} * \tau_{atm} * \sigma * (T_{obj})^4 \quad (3)$$

Real bodies have a reflection greater than zero and reflect the infrared radiation emitted by the surroundings. The reflection can be calculated starting from the emissivity, as shown in Equation (4). Some of this reflected radiation is also absorbed by the atmosphere. This is the second component received by the camera and can be expressed as in equation (4).

$$E_{refl} = \rho_{obj} * \tau_{atm} * \sigma * (T_{refl})^4 = (1 - \varepsilon_{obj}) * \tau_{atm} * \sigma * (T_{refl})^4 \quad (4)$$

The third component is the emission of infrared radiation from the atmosphere. This can be expressed in equation (5), where $(1 - \tau_{atm})$ is the emission power of the atmosphere.

$$E_{atm} = \varepsilon_{atm} * \sigma * (T_{atm})^4 = (1 - \tau_{atm}) * \sigma * (T_{atm})^4 \quad (5)$$

By conveniently substituting in the above equations, equation (6) is obtained, which represents the total energy received by the infrared thermography camera sensor.

$$W_{tot} = \varepsilon_{obj} * \tau_{atm} * \sigma * (T_{obj})^4 + (1 - \varepsilon_{obj}) * \tau_{atm} * \sigma * (T_{refl})^4 + (1 - \tau_{atm}) * \sigma * (T_{atm})^4 \quad (6)$$

In turn, the temperature of the object can be calculated from equation (7). Similar equations are used by different chamber manufacturers to perform temperature measurements.

$$T_{obj} = \sqrt[4]{\frac{W_{tot} - (1 - \varepsilon_{obj}) * \tau_{atm} * \sigma * (T_{refl})^4 - (1 - \tau_{atm}) * \sigma * (T_{atm})^4}{\varepsilon_{obj} * \tau_{atm} * \sigma}} \quad (7)$$

To solve equation (7), the following parameters must be found: the emissivity of the object (ε_{obj}), the reflected temperature (T_{refl}), the transmittance of the atmosphere (τ_{atm}) and the temperature of the atmosphere (T_{atm}), knowing the Stefan-Boltzmann constant $\sigma - 5{,}67 \cdot 10^{-8} [\frac{W}{m^2} \cdot K^4]$.

The infrared thermography camera used for measurements is type SC640, with microbolometer type sensor, without cooling. It has the possibility of recording on electronic media with a speed of up to 30 [frames/s] and the exposure angle can be up to 45°.

Working Approach

After determination of the technological parameters of the extrusion process, approximately 10 minutes, the input parameters of the infrared thermography camera were adjusted to correspond to the average temperature provided by the temperature sensors at the exit of the extrusion head, according to table number 1.

Table 1: Input parameters of the thermography camera

Crt.	Parameters	Values
1	Ambient temperature	22,5°C
2	Average extrusion head temperature	280°C
3	Ambient humidity	62%
4	Reflected temperature	22 °C
5	Emissivity coefficient	0.89

The experimental plan consisted of continuous recording of the process for 80 minutes, stopping filming every 10 minutes, for easier identification of the selected samples. At the end of the experiment, the samples of material necessary for the test were taken. The recorded samples and films were coded alphanumeric, to ensure correspondence between them. For filming, the code F_K was used, where K = 1÷8 and for samples PF_j, where j = 1÷8. The samples are taken from the total length of the cylinder in the areas of interest according to Figure 2.

Fig. 2:Sampling scheme

This way of working was chosen to reduce the number of measurements and because it was found that the largest temperature variations are on the ends of the cylinder. Samples were taken in turn, from P1 to P8, successively, at each stop of the recording. To determine the mechanical properties of each test roll, a sample measuring 100 × 15 [mm] shall be drawn, with the axis of symmetry at 242.5 [mm] from the left edge of the foil. Sampling for the tensile test shall be performed after 10 [m] of foil has been unwound from each spool and after variations in the parameters at the beginning of the manufacturing cycle have stabilized. The resulting samples were tested in the laboratory on a Tinius Olsen 300 ST hydraulic dynamometer.

Results and Discussions

In order to establish a possible correlation between the temperatures on the cooling cylinder and the mechanical properties of the foil, the films recorded during the experiment were interpreted using specialized infrared image processing software and their conversion into temperature at each point of the thermal scene. For each recording, three inspection lines were drawn on the cylinder. The first line (L1) was drawn at 5° to the extrusion head, the second line (L2) at 45° to L1 and the third line (L3) to 60° to L1.

Fig. 3: Thermographic film analysis scheme

On the inspection line L1, for temperature values, variations are observed between the ends of the cylinder (colder) and the central part (hotter). The resulting graph looks like a bell with a higher height in the central area. The maximum mean variation on the eight successive determinations is 12.17 [°C].

Fig. 4: Temperature evolution on the three inspection lines (average values between the eight samples)

On the inspection line L2, the allure of the bell-type curve for the variation of the temperature per cylinder is maintained and accentuated. The average temperature difference between the extremities, on all eight tests, this time is more than double, respectively 27.19 [°C]. On the inspection line L3, as the recorded nominal values decrease, the difference between the maximum and minimum values observed decreases. The average temperature variation on the eight tests is only 11.06 [°C]. The mechanical tests for the foil samples taken showed that the more accentuated cooling of the ends of the extruder cylinder causes the tensile strength of the foil to decrease. Thus, the samples taken from the central areas (Z5 and Z6, respectively samples P4 and P5) have the maximum values both for the tearing elongation (410 and 422 [%]) and for the tearing force (4.19 and 5.37 [N]).

Table 2: Tensile test results

Crt.	Average foil temperature on line L2 on the sampling area T_F (°C)	Dynamometer	
		Tearing elongation E (%)	Tearing force F_R(N)
1	62,38	282	3,32
2	68,21	318	3,84
3	72,87	359	4,15
4	78,53	410	4,19
5	79,68	422	5,37
6	71,96	360	4,19
7	68,93	355	4,15
8	64,12	317	3,8

From the representation with the help of the MATLAB program of the interpolated surface of the three vectors, respectively temperature, tearing force and tearing elongation, it results that the best values for elongation and tearing force are obtained around the average foil temperature per cylinder on the line L2 observation, 75-78 [°C], which corresponds to elongation values of 410-416 [%], for values of tearing strength of 5.12-5.15 [N]. It is also observed that small temperature variations of only a few degrees can lead to an increase in tearing elongation by more than 40 percent. The force at which the tearing takes place is also improved by about 0.3 [N].

Fig. 5: Optimizing the quality of LLDPE foil with MATLAB

Conclusions

The study showed that there is a very close correlation between the temperature of the LLDPE foil at the exit of the extruder and its mechanical properties, especially at an angle of 45° from the exit line of the extruder. The continuous inspection of the process allows to determine the temperature at each point of the image using infrared thermography. This process allowed to obtain a very large series of data, which properly analyzed provided accurate information about how it works. The correlation of the temperatures in certain areas with the values of the mechanical properties determined by tests led to the possibility to optimize the process.

Internet of Things – Digital Technology in Polish Enterprises In Context of Industry 4.0

Maciej SIEMIENIAK

Poznan University of Technology, J. Rychlewskiego 2 Str., 60-965 Poznan, Poland
maciej.siemieniak@put.poznan.pl

Abstract

The article presents the results of research conducted in one hundred Polish enterprises operating in various businesses. The research aimed to present the state of Polish enterprises in terms of preparing the enterprises to enter the world of the fourth industrial revolution. The conducted surveys on the use of modern technologies and the level of their advancement show that changes in the technological area are perceived as those that have a positive impact on functioning of the enterprise. This indicates a high level of awareness among companies regarding the need for improvement, innovation and the transition to advanced technological levels. The article focuses on one of the many elements of Industry 4.0 - the Internet of Things as one of the most important technologies of the new reality that can contribute to the improvement of processes in the enterprise and the creation of smart factories.

Keywords: Industry 4.0, Digital Technologies, Internet of Things (Iot), Research.

Introduction

A high productivity, efficient and capable machines, low manufacturing cost, high quality of products, diversity of products and flexibility of change production profile are the main goals of enterprises realized by innovative technical and technological solutions. Many of them turned out to be disruptive over the course of industrial development and they initiated revolutionary changes in industry, contributing also to economic, changes in the world.

Nowadays, customers' needs determine changes in the way of thinking in the approach to production process, management systems, logistics, work culture and ecology. The short product life span is currently one of the most important problems of the contemporary market. Such a situation requires enterprises to frequent assortment changes, even changes in the production profile, and the need to adapt quickly permanently increasing customers' demands. It can be assumed the transition of enterprises to the model consistent with the principles of Industry 4.0 will increase a value of existing and new products, services, processes, systems and business models.

Industry 4.0

The term Industry 4.0 (originally from German Industrie 4.0) comes from the strategic project of the German government, which promoted the computerization of manufacturing processes. The first time was used during the fair in Hanover in 2011 (Schwab, 2018).

The beginning of Industry 4.0, also known as the fourth industrial revolution, is considered to be 2013, when a working group was created in Germany, whose task was to define activities aimed at formulating the principles of factory automation. The result were recommendations for necessary implementations that are lead to achieve the level so-called Intelligent Industry.

The key problem in the context of Industry 4.0 is the definition of a new reality because the process of shaping it is currently in the preliminary stage. The existing definitions are descriptive and present a vision which will shape the upcoming transformation of technology and organization (Controlengineering [2], 2016).

Industry 4.0 in a very general sense of the term is the integration of machines, devices, industrial facilities, systems and processes as well as make modifications in production processes aimed at increasing production efficiency and

Cite this Article as: Maciej SIEMIENIAK " Internet of Things – Digital Technology in Polish Enterprises In Context of Industry 4.0" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

make modifications in flexible changes to the assortment. It concerns not only technology, but also new methods of work and new role of man in industry (Piątek, 2017).

The concept of Industry 4.0 means to bring to one form and to combine all elements into the one whole of the real world of production facilities with the virtual world of the Internet and information technology (IT). People, industrial facilities and IT systems exchange information automatically during production. This exchange takes place both in the area of the enterprise and in various IT systems operating for the enterprise.

New Digital Technologies

The development of Industry 4.0 will intensify activities aimed at digitization and computerization of production. Cyber-physical systems (CPS) will then be created, from which smart factories will be developed. Machines and devices, connected to the Internet of Things (IoT), will communicate and make autonomous decisions. Human participation in the production process will be limited to necessary minimum, but due to new technical and organizational solutions, will receive better support. It will be an integration of man, machine and process. Interaction in such the system will be possible between machines, machines and people, as well as between the entire stages of production, which will become interrelated. Then the supply chain will become more flexible and the manufacturing process more efficient and faster.

It is predicted that the fourth industrial revolution will start with the development and use of new technologies. One of the most important ones will be the Internet of Things (IoT), by which huge amounts of data will be sent on a state and condition of machines, devices, production in progress, inventory, etc. Therefore, advanced methods of data processing will be required, which is why techniques of Big Data analysis and Cloud Computing are being developed. The security of transmitted and processed data in the network will also be related to the development of cybersecurity. The technologies that complement the main system architecture include advanced simulations, virtual and augmented reality, additive (3D) printing and full integration of enterprise IT systems.

The key technical innovations, considered as factors enabling the fourth industrial revolution, are

(Controlengineering [2], 2016):

- a new quality of communication where the digital and real worlds are interconnected and exchange digital information;
- intelligent sensors with built-in individual identification systems;
- cloud data processing;
- analysis of big data on products and production;
- techniques for simulating real objects in virtual projections;
- direct communication between devices;
- advanced human-machine interfaces;
- cybersecurity solutions ensuring secure communication and access to systems and devices;
- a new generation of robots that interact with environment and with other robots;
- augmented reality systems supporting design and servicing;
- 3D printing technologies for prototyping.

Disruptive changes in the industry will be caused by the scale of their application, synergy, integration, as well as the dynamics of development.

Advanced IT tools that should also be mentioned are APS and SCADA systems. The APS system is an advanced tool for automatic planning and scheduling of production orders in real time. It allows you to perform complex calculations in a short time, as a result of which optimal production plans are generated, in accordance with previously set assumptions. Calculations performed with the use of algorithms make it possible to create optimal production schedules according to various criteria. APS systems are an extension and complement of ERP class programs. The system is able to simulate various production situations. Advanced production planning programs allow you not only to observe the progress of production on an ongoing basis, but also to react in real time to any adverse events, such as failures, changes in priorities or changes in the ordered quantity.

SCADA is a computer system aimed at increasing production efficiency. With the use of SCADA, it is possible to collect data from machines and measuring devices in real time, which enables supervision over the production process. A very important function of the system is the visualization of current data and historical data. The system

allows the user to control the production process, detects alarms and informs the operators about them, thanks to which it is possible to quickly react to errors and irregularities.

Internet of Things

The concept of the Internet of Things is closely related to Industry 4.0, which concerns the exchange of information between devices, systems and people.

The Internet of Things (IoT) is a concept that was first formulated in 1999 by Kevin Ashton. It relates to a system in which objects equipped with sensors (and thus clearly identifiable) communicate and exchange data with computers and other devices. This process is done using various network solutions, especially wireless (Mącik, 2016).

The Internet of Things is a dynamic global network of physical objects, systems, platforms and applications that are capable of communicating, transmitting data, and sharing intelligence among themselves, the external environment, and people (Furmanek, 2018). Thanks to the system of individual identification, IoT enables interactions and cooperation of objects to achieve common goals. In relation to the industrial environment, the term Industrial Internet of Things (IIoT) is used. There is also the concept of the Internet of Everything (IoE), which is the name for a network of people, processes, data and things connected to the Internet.

In practice, the Internet of Things network based on intelligent objects differs from the traditional concept of the Internet based on data servers connected with user access terminals. In the concept of the Internet of Things, the transfer of data between objects is important, and the interaction with humans is based on immediate needs and requests (Ożadowicz, 2014).

IoT in production process

The use of a network based on the concept of the Internet of Things can contribute to improve processes in the enterprise. Equipping production facilities with sensors increases the level of their control. Sensors allow objects to send data to a computer for collecting and analyzing the data, allowing efficient identification of the problem, deviations from the standards and make it easier to predict possible failures. This will reduce unplanned downtime of machines and devices, and this will optimize the work of the production system.

The advantages associated with the use of smart objects in a manufacturing process may include (Mącik, 2016; Smejda, 2016):

- increase in speed and quality of production processes by current data analysis,
- more effective use of production potential of industrial facilities based on current data,
- increased efficiency by automation of production tasks,
- making key business decisions thanks to data availability,
- effective waste management and reduction of environmental pollution
- increase in the production rate while maintaining the highest quality standards,
- personalization of production and short series – an easy adaptation to new tasks enables profitable production,
- predictive maintenance – a permanent monitoring of machines' work allows to optimize the work and predict breakdowns,
- modeling - it is possible to create virtual lossless production systems and test in any configuration before deployment,
- strict control of production process leads to the minimization of loss of working time, raw materials and energy.

The importance of the Internet of Things technology

The Internet of Things (IoT) technology is one of the most important technologies in the fourth industrial revolution. Digital transformation has become necessary for organizations that care about increasing production efficiency, efficient data and information flow and better process management.

The development of digitization of enterprises, advanced computerization and robotization of production systems, connecting industrial facilities into a network of cyber-physical systems that create smart factories, will contribute to create new opportunities for enterprises: algorithmic and programmable products and services related to data processing in the Cloud and the use of artificial intelligence. It will be possible to collect customer feedback that will have an impact on design of products that achieve new value for customers. It opens up the possibility of creating new businesses and strategies for the company.

The greatest advantage of the Internet of Things is participation in the Big Data analysis process. New solutions, tools, services and applications will improve the efficiency of collecting and combining data from separate IT systems. In addition to participating in analytical processes, IoT allows to monitor and detect upcoming problems in the area of maintenance and repair planning. Control of the state of use (consumption) of resources enables the timely replacement of tools and machine elements. In this way, IoT supports the concept of predictive maintenance, thus increasing the reliability of machines and devices, their availability and reducing the costs of unplanned downtime (Controlengineering [1], 2019; Pawłowicz, 2016).

The main factor influencing the development of the Internet of Things (IoT), especially the Industrial Internet of Things (IIoT), is the need to control production infrastructure by monitoring performance and maintenance costs. A big challenge for the organization, in the context of the fourth industrial revolution, is to change the way of thinking and see the benefits of using IoT solutions in industrial processes: business analytics, faster and better decision-making processes, higher efficiency and lower production costs, predictive maintenance, diagnostics and analysis of machines condition, increased safety (Controlengineering [4], 2018).

Internet of Things - digital technology in Polish enterprises

The research conducted in 2019 in one hundred enterprises, medium-sized (from 50 to 250 employees) and large (over 250 employees), operating in various business shows that changes that are currently taking place in the macro environment are perceived unfavorably by the management (Fig. 1).

Fig. 1: Structure of the assessment of changes in the macro-environment of enterprises [based on own research]

The issue of assessing changes taking place in the environment will become even more important when the level of generality in the presented structure increases. Then it turns out that the changes are perceived very negatively (highly unfavorable and unfavorable - 43%), and only some enterprises assess them positively (favorable and highly favorable - 25%).

Developing this issue by specifying the areas of changes in the macro-environment will allow to understand the reasons for such an attitude of management (Fig. 2).

Fig. 2: Areas of changes in the macro-environment by importance for the company
[based on own research]

Fig.2: a Structure of areas for a very unfavorable and unfavorable assessment of changes
[based on own research]

A very positive phenomenon is the clearly favorable impact of changes in the technological area on the functioning of the company (Fig. 2b). The beneficial and very beneficial impact of technological changes is 67% (Fig. 3), which indicates a high level of awareness of the management of the companies regarding the necessity for improvements, innovations and the transition to advanced levels of know-how. Digital transformation in industry is a time of great changes and challenges - combining technologies and creating non-standard solutions. Industry 4.0 connects the supply chain and enterprise resource planning system with the production line, providing integrated, automated and autonomous manufacturing processes that make better use of capital, raw materials and human resources.

Fig.2: b Structure of areas for favorable and very favorable assessment of changes in the macro-environment
[based on own research]

Fig. 3: The structure of the assessment of technological changes taking place in the macro-environment

[based on own research]

Competition and growing customer expectations contribute to the continuous improvement of production efficiency and capability. The third industrial revolution, due to computerization, computerization and automation of work processes, increased the efficiency of production, reducing costs and enabled the development of mass production. Currently, the problem is to manufacture short series of products, designed according to the customer's needs. The flexibility of production systems is one of the main assumed effects of the fourth industrial revolution.

In the surveyed enterprises, 68% of them declare the share of mass production in at least half of the manufactured products (Fig. 4).

Fig. 4: Share of mass production in the entire range [based on own research]

An interesting position is 19% of enterprises declaring no mass production for their product range. This applies to 79% of medium-sized enterprises surveyed in this category, employing 50-249 workers, and 21% of large enterprises employing over 250 workers. The lack of mass production in these enterprises may suggest a shift to the production of short series of products using flexible manufacturing systems, however, further research has shown that the technological level of robotization, digitization and communication of industrial facilities and the methods of managing the production system is not sufficient to enable talk about their readiness to apply the principles of Industry 4.0.

Lean Management (LM) methods, about which the surveyed companies were asked, are used to a small extent or have been implemented only partially. The lack of implementation of LM methods (total lack and implemented to a small extent - 43%) is several dozen percentage points greater than the declared implementation of them at least to a significant extent (29%) (Fig. 6). Half of the implementation (26%) means that LM methods are known in various businesses, but they are not appreciated. The situation means a short-term approach of the management to managing the enterprise due to the lack of pressure from the environment on organizational changes and innovative technological solutions. This leads to the conclusion that the management and control systems of the production process are outdated, and the road to implementing the principles of Industry 4.0 is long.

Fig. 5: Lean Management methods according to the degree of implementation
[based on own research]

Fig. 6: The structure of the implementation extent of Lean Management methods
[based on own research]

The digitization of production and the establishment of a network of industrial facilities are factors for building a smart factory that is part of Industry 4.0. It will not be possible without the use of modern machines and devices that enable the implementation of innovative manufacturing methods. Modern industry is moving towards flexible production systems that are used to easily adapt production to changes in the market. Flexible manufacturing systems increase production efficiency, minimizes costs and shortens the time of task completion. The flexibility of production systems is one of the main assumed effects of the fourth industrial revolution.

The current structure of industrial machines in the surveyed enterprises consists mainly of numerical control (NC) and computerized numerical control (CNC) machines or universal machines (Fig. 7). A slight extent of robotization is achieved by 13% of enterprises, while a technologically advanced machine park is declared by 12% of the surveyed companies. The low extent of robotization of enterprises is a serious barrier to competitiveness in the global market.

Fig. 7: Structure of industrial machines
[based on own research]

The implementation of advanced machines, devices and production systems enables development and transition to a higher technological level. A digital factory is an organizational unit where people and industrial facilities interact and share real-time information about all stages of the production process.

Almost half of the surveyed enterprises are dominated by the human work model assisted by process automation / robotization. Every fifth company speaks of the lack of robotization and almost as many declare the balance of human work with the work of automated or robotic machines. The enterprises do not show full robotization and automation of their processes, although there are those in which the level of technological advancement is so high that human work is limited to the necessary minimum (13%) (Fig. 8). The integration and interaction of human, machine and process enables interdependence and a new level of communication. Industry engineer 3.0 is a task-focused person. He can work in a group, although he does not like changes and new situations. An engineer 4.0 is a person open to changes and flexibly adapting to the new environment. Has the ability to communicate and provide detailed technical information in an optimistic way and has a conceptual approach to problem solving. The new industrial reality requires an engineer to have interdisciplinary skills, which means that only technical knowledge is not enough. The combination of soft skills with technical knowledge allows you to operate effectively in an environment of change.

Fig. 8: The share of automation / robotization in human work in the enterprises
[based on own research]

Implementing changes should start with the analysis and assessment of the current situation of the company: machinery, IT systems, competences of management and employees, and financial possibilities. Based on this analysis, it is possible to create a strategy for implementing new technologies.

More than half of the management of the surveyed enterprises is not interested in the development of the technology of the new reality and does not have specific plans (Fig. 9). Some of them have already started the process of implementing solutions (22%) of the communication technology of machines and devices, or plan to implement them within the next 2-5 years (21%). The willingness to develop in the area of robotization and communication of industrial facilities was more willingly declared by representatives of medium-sized enterprises (71%) than large enterprises (29%). Among companies that use modern technology solutions, more than half of medium-sized companies 55% and 45% of large companies have already used solutions that enable mutual communication between machines.

Fig. 9: The structure of the policy of implementing communicating machines in the enterprises
[based on own research]

Companies implement concepts, approaches, and methods to improve production management and control, collect feedback, reduce work in progress and inventory level in the entire process, reduce machine retooling time, or improve workplace management. The methods and concepts of managing the production process have evolved over all industrial revolutions. Often, efficient management and control of the process involved the use of several methods at the same time. The implementation of many methods and techniques would not be possible without the IT support offered by MRP / ERP (material requirements planning / enterprise resource planning) systems. In this way, it is possible to collect and process data from the production area and make better decisions. ERP systems are integrated, multi-module, with a central database (Controlengineering [3], 2014).

The computerization of enterprises is a very important factor determining technological development. The surveyed companies most often use MRP/ERP systems (47%) (Fig. 10). A good phenomenon is the use of Business Intelligence (BI) tools, i.e. business analytics (22%) in the process of transforming data into information, and then into the knowledge necessary for company management to make the right tactical and strategic decisions. BI is the integration of the system, application and database that enables management to conduct real-time analyzes. The use of mobile devices (19%), allowing for processing, receiving and sending information without the necessity to maintain a wired connection to the network, supports the work of company management. The growing popularity of the use of applications and mobile devices at work is, among others, the effect of increasing capability, efficiency and availability of solutions in the area of mobile technologies. The new mobile technologies are now becoming a natural work environment for many people, the basic communication tool and a source of knowledge. They allow to get closer to the phenomenon of analyzing large amounts of data, often performed online. Today Big Data Analysis is the basis of many enterprises - information improves the company's operations, supports the quality of management decision-making, allows to create effective strategies, reduce costs and enable the creation of new businesses. From this analysis uses 12% of surveyed companies.

Fig. 10: The structure of using management support methods
[based on own research]

A very positive phenomenon and undoubtedly a significant step approaching the fourth industrial revolution is the use of the latest IT technologies. The enterprise management policy includes in strategies plans for the implementation of Business Intelligence or Big Data Analysis (Fig. 11). Only 13% of companies declare the use of these technologies in their daily work, including 38% of medium-sized and 62% of large enterprises, while 11% declare their implementation in the near future (2-5 years). As many as 66% of enterprises do not have any plans regarding the use of these technologies ("no plan" and "possibly in the future").

Fig. 11: Participation in the drive to implement Big Data Analysis or Business Intelligence
[based on own research]

Technological progress creates favorable conditions for the creation of new tools for data processing and the use of Big Data. The method of data analysis and use determines their value, and the effects of effective analytics are used in the most important business decisions.

The fourth industrial revolution is a combination of modern information technologies, high-efficiency computers, cloud computing, artificial intelligence and robots. It is the latter that are to contribute to the revolution in production systems. Industry 4.0 does not aim to create enterprises in which people will be replaced by robots, but only to make them a better place for everyday work. Due to modern technology and new solutions, employees will receive better information support (Płoszczyński, 2017).

Among the surveyed enterprises, 28% agree (and strongly agree) with the opinion that the implementation of robotization is conducive to the effective use of human resources in the manufacturing process (Fig. 12). Implementing robotization into an enterprise requires emotional preparation of employees for the new role they will play in the work process (31%). It will be an integration of man, machine and production process, due to mutual cooperation and interaction in the new system. However, there is an anxiety among respondents that robotization will fully replace human work in the manufacturing process (16%). They claim that an employee, operator of machines and devices in the production process is an irreplaceable resource of the enterprise (25%). Its role will, however, evolve towards managing the activities performed by robots.

Fig. 12: The impact of robotization on the efficiency of human resources use in manufacturing processes
[based on own research]

Analyzing in details the opinions of company representatives on the impact of robotization on the work of employees, two interesting attitudes can be noticed - one that expresses a clear acceptance of the impact of modern technologies, and the second one, which indicates a clear difference of opinions of the respondents regarding the possibility of complete replacement, i.e. worker from the manufacturing process (Fig.12a). It is important to know that the role of an employee will change towards managing the activities performed by robots. New technical solutions will be associated with increasing the possibilities of employees, not removing them from the process. Competency development will be continuous and will be integrated with production processes.

Fig. 12a: The share of robotization influencing the effectiveness of human resources use in manufacturing processes

[based on own research]

Maintenance is one of the most important elements of the production process. Machine downtime due to breakdowns causes losses in work, and thus delays in production, and above all generates costs. Automation of industrial processes and the development of IT technologies contribute to the transition to a higher level of diagnostic systems, using databases where historical data is stored. Predictive maintenance replaces the outdated, but still used, reactive methods that react after a machine failure, as well as the classic preventive approach, operating in accordance with the planned schedule of machine inspections and maintenance. The prediction of industrial machinery and equipment consists in monitoring parameters, non-invasive testing, control, trend and correlation analysis, statistical data analysis. All this allows to determine the future states of machines on the basis of a set of values of the current parameters. It is then possible to work out a method of assessing the condition of machines by systematically collecting and analyzing key information. It allows to predict the moment of failure. This becomes an opportunity to invest in Industrial Internet of Things (IIoT) technologies and tools.

Figure 13 shows the structure of maintenance models applied in the surveyed companies. Most of the companies apply the model in which the pre-planned schedule of renovation works plays the main role (29%). The proactive preventive model (25%) and the least technologically advanced - reactive model (23%) were ranked next. The latest predictive method is applied by 8% of the surveyed companies.

Fig. 13: Structure of applied maintenance models in enterprises
[based on own research]

Summary

The development and wide use of new digital technologies in industry will be the beginning of changes in organization, control and management of processes in a modern factory. One of the most important technological changes will be the Internet of Things, or rather the industrial Internet of Things, through which it will be possible to send huge amounts of data on the condition of machines, devices, work in progress, inventory, etc. Therefore, advanced methods of data processing will be required, which will be associated with the development of methods and techniques for analyzing large data sets in the computing cloud. The technologies that will complete the main architecture of the IIoT system include advanced simulations, virtual and augmented reality, additive printing and full integration of enterprise IT systems. Technologies that top the main architecture of the IIoT system up include advanced simulation, virtual and augmented reality, additive printing, and full integration of enterprise IT systems. The development of the industrial Internet of Things will contribute to the emergence of a new way of communication - not only between employees of a modern factory, but above all between autonomous machines, machines and employees, and finally between the real and virtual worlds. Converting individual factories into end-to-end automated and networked production environments will contribute to the creation of smart factories, driven by a huge amount of high-quality data delivered in real time. Technologies come together in industry as a result of digital transformation. This way, new solutions will emerge that will make better use of resources. Internet of Things technology is one of the most important technologies in the fourth industrial revolution. Digital transformation becomes necessary for

organizations that care about increasing production efficiency, efficient data and information flow and better process management.

Abstract

Purpose. The main issue of this research is the hypothesis that the modern state policy of supporting entrepreneurship in Russia does not meet the needs of social entrepreneurs. The authors reveal the main directions of the Russian Federation state policy supporting social entrepreneurs and analyze practical examples of social entrepreneurship. **Design/methodology/approach.** The research was conducted using applied study, based on the results of which the analysis of the effectiveness of state policy in relation to social entrepreneurs has been concluded. The comparative analysis method and the content analysis method were also used. **Findings.** The conducted analysis made it possible to identify the problems of state policy implementation that lead to the impossibility of fully functioning social entrepreneurship in Russia. The authors conclude the prospects for social entrepreneurship development in Russia. **Research limitations/implications**. On the basis on this research, more accurate results could be obtained in a larger sample, which may be a promising direction for further scientific research. **Practical implications.** The results of the research can be used by the government to develop and implement policies supporting social entrepreneurship, as well as by social entrepreneurs to determine their interaction strategy with the government. **Originality/value.** The originality of the research is to clarify the functions of government in the framework of supporting social entrepreneurship policy in Russia.

Keywords: State Policy of Social Entrepreneurship Support, Social Projects, Social Enterprise, Social Entrepreneurship.

Introduction

According to the Sustainable Development Goals the development of a modern state requires a partnership between government and business, "partnership for sustainable development". Social entrepreneurship is particularly important for this type of interaction (Vysotskaya, 2010). Russia has joined the global community interested in implementation of sustainable development goals, and will present an overview of its achievements in this area at the UN political forum on sustainable development in 2020 for the first time.

In this light, it is important to assess the state policy supporting social entrepreneurship, as well as to analyze the practical activities of social entrepreneurship. It is important to identify factors that significantly complicate and substantially prevent social entrepreneurs from effectively carrying out their business activities, which in its turn hinders resolution of significant social issues and the state development as a whole.

The scientific and practical contributions of this article are: 1) in development of state social entrepreneurship support policy implementation in Russia; 2) in identifying weaknesses and strengths of state social entrepreneurship support

policy in Russia, both from a theoretical perspective and based on the results of an expert survey of social entrepreneurs; 3) in the improvement proposals for the state policy supporting social entrepreneurship in Russia.

The purpose of the article is to analyze and assess the degree of "maturity" of modern social entrepreneurship in Russia based on the results of theoretical and applied research, to assess the relevance of the state policy to support social entrepreneurship to the requirements of the businesses' structures themselves, and to develop proposals to improve the quality and satisfaction of social entrepreneurship with state support.

Theoretical Framework

Social entrepreneurship appears to be a relatively new area of research (Arai, 2013). A vast number of research work focuses on the different aspects of social entrepreneurship. The most significant Russian researchers are Batalina, Moskovskaya and Taradina, who consider the conceptual essence of social entrepreneurship (2008), Grishina, who reveals the legal aspect (2013) and others (Moskovskaya, Berendyaev, Moskvina, 2017).

There is a significant number of foreign scientists engaged in research in this field. First of all, we should mention Alter (2007), Omidyar (2011), Hogendoorna and Hartog (2010), Defourny and Nissan (2010) and others (Smith, et al, 2010).

Researchers Yakimets and Nikovskaya (2019), Pleten (2016) and others (Umnov, Plyukhina, Matveev, 2018; Karpenko, 2019) have studied the issues of state policy implementation in support of social entrepreneurship.

In modern society, the importance of social entrepreneurship is undoubtedly recognized. For successful implementation of actions in the field of social entrepreneurship it is necessary to have two balanced components: 1) finding and solving problems that are relevant to a society; 2) generating a profit.

Let's analyze the main provisions of a relevant regulatory framework. Thus, in July 2019, Russian legislation implemented amendments to Federal law No. 209-FZ from 26.07.2019 "On the development of small and medium-sized enterprises (SME's) in the Russian Federation".

In accordance with implemented amendments, definitions of "social entrepreneurship" and "social enterprise" were included in the text of the law as well as conditions under which state and regional governments are able to provide support to entrepreneurship as well as an exhaustive list of types of support available to social enterprise companies.

There is also a mention of social entrepreneurship in the Letter of the Ministry of economic development of the Russian Federation dated 22.12.2011 No. OG-D05-2585 «On the implementation of state support measures for small and medium-sized businesses". This refers to measures which support small and medium-sized social entrepreneurship. It mentions that "social entrepreneurship is a socially responsible business activity of medium-sized, small and microenterprises aimed at solving social problems" and followed by a list of business activity areas.

From the letter of the Ministry of economic development, it can be concluded that social entrepreneurship is very limited in the choice of its field of activity. At the same time, we note that article 24, paragraph 2 of Law No. 209-FZ provides a broader list of business activities, and also indicates the possibility for regional governments to establish additional criteria for recognizing small and medium-sized businesses as social enterprises.

At the same time, the regulatory definition of social entrepreneurship as an independent type of business activity remains unclear. In practice, entrepreneurs register their organization as socially–oriented non-for-profit organizations, as individual entrepreneurs, or as limited liability companies (Romanova, 2015). It seems that in the future, social entrepreneurs will have access to any legal form that is available to commercial enterprises. At the same time, in accordance with the criteria specified in the Federal law and the criteria approved by the members of Russian Federation, these business structures will have the status of a social enterprise.

Other important documents that reflect the establishment of a regulatory framework for the support of social entrepreneurship are the Strategy of small and medium-sized businesses development in the Russian Federation for the period up to 2030, approved by the Government Decree No. 1083-R from June 02, 2016, and the State program of economic development and innovation economies, approved by the Government Resolution No. 316 from April 15, 2014. In addition, Government Decree No. 1284-R approved a list of indicators which are used to calculate members of the Federation ratings. The rating is based on the results of implementing socially oriented non-for-profit organizations' and social entrepreneurship' support mechanisms. This rating is also based on the access level given to non-governmental organizations to provide services in the social sector and implementation of competitive methods of providing state (municipal) services.

Supporting and developing small and medium-sized businesses in the Russian Federation strategy identifies social entrepreneurship as a separate category (Chapter IV. Methods and mechanisms for achieving the Strategy's goals). The Strategy refers to the full state support for social entrepreneurs, however, the very concept of social entrepreneurship is interpreted quite narrowly, referring to the category of organizations which produce goods or provide services for socially vulnerable and disadvantaged groups of citizens or create jobs for such groups of citizens. This does not reflect another important aspect of social entrepreneurship - the economic effect of the implemented business activities.

There is a growing public and scientific interest in the topic of social entrepreneurship, which is reflected in the content of educational programs for future entrepreneurs. Thus, the Higher School of Economics has opened a professional retraining program "Master of management in social entrepreneurship "Social innovations and entrepreneurship"". Since 2013, Moscow State University has been offering a continuing professional development program called "Management in the field of social entrepreneurship". Every year a contest "Social entrepreneur" is held by "Our Future" Foundation. Thus, it is obvious that social entrepreneurship is becoming a kind of a trend that stands out from other social organizations and entrepreneurship in general.

However, it is difficult to name an exact number of organizations in Russia that could be attributed to social entrepreneurship. It is difficult to determine a proportion of social entrepreneurs in the total number of entrepreneurs in Russia, since Federal Statistics Service does not distinguish them in a separate category. It was expected that the first entry in the register of SME's for the list of social enterprises registered as of 01.04.2020 would take place on April 10, 2020. However, by the beginning of the second half of 2020 this information is not available on the Federal Statistics Service website (as of September 7, 2020).

Another difficulty in identifying and defining social entrepreneurship in Russia as a phenomenon is its similarity to other types of organizations. For example, there are non-for-profit organizations that perform social functions (they include a fairly wide range of organizations, including higher education institutions). As well as socially oriented non-for-profit organizations which are closest in their mission to social entrepreneurship, but are non-for-profit in nature.

The closest term, reflecting the essence of social entrepreneurship, can be considered the term "social enterprise", which is interpreted in Federal Law No. 209-FZ in article 3, paragraph 7, as "a small or medium-sized enterprise entity operating in the field of social entrepreneurship", where social entrepreneurship is an "entrepreneurial activity aimed at achieving socially useful goals, contributing to solving social problems of citizens and society".

The authors believe that the term "social enterprise" in this case restricts the nature of social entrepreneurship. Social entrepreneurship is initially created as an entrepreneurial structure which solves social problems in economic ways.

Thus, in theory, one can encounter a fairly broad interpretation of the content of the concept of "social entrepreneurship". At the same time, based on their practice, social investment funds have long defined characteristics of social entrepreneurship. The assessment is based on the principle of social impact, which in turn can be determined by the following parameters: 1) evaluation of the purpose and mission of the organization, as well as the target audience; 2) selection of criteria for achieving the strategic goals of the organization and compliance with the goals of the organization's mission; 3) selection of justified methods for achieving the organization's goals and their effectiveness in implementing

changes; 4) transparency of actual indicators of changes and evidence of their achievement using selected methods. Predicting results with and without changes; 5) determining the cost of the project, the ratio between costs and outcome (Stannard-Stockton, 2009).

The state uses tax incentives as support measures for socially oriented organizations or organizations that support them. In the Letter of the Ministry of Finance of the Russian Federation dated 02.06.2004 No. 03-05-06/63 «On property tax relief for organizations in the socio-cultural sector" it is stated that in accordance with the Tax code, organizations in the socio–cultural sector are exempt from property tax. To determine the type of organization, it is proposed to use the all-Russian classification of fixed assets. Federal Law No. 7-FZ from January 12, 1996 "On non-for-profit organizations" establishes that socially oriented non-for-profit organizations and organizations that provide material support to socially oriented non-for-profit organizations can benefit from tax relief, but the Tax code does not specify which types of tax relief can be applied to these organizations. In addition, the legislation generally specifies tax preferences for non-for-profit organizations (Grishina, 2012), but does not specify the type of support for socially-oriented commercial organizations, since they operate in the general tax field.

It is necessary to allocate such methods of state support as grants (tenders for granting subsidies or targeted subsidies), preferential lending, preferences for participation in public procurement, technologies for transferring budget funds to social entrepreneurs as suppliers of goods and/or services in the social sector (for example, a target certificate), property support, and other informational and organizational support.

Researchers Yakimets V.N. and Nikovskaya L.I. (2019) proposed a classification of all types of state support, divided into four classes (categories): financial, property, sales and promotion of services support, infrastructure support. For each of these categories, they evaluated state support in the Russian regions based on three criteria: respondents' awareness of support mechanisms' availability in the region; the quality of mechanisms' work; and the significance of these mechanisms in the development of social entrepreneurship.

We can conclude that the legislation regulating the activities of social entrepreneurship in Russia is not sufficiently developed. Despite this an organizational and functional structure for supporting and developing social entrepreneurship is gradually being established at the state level. A major role in the development of social entrepreneurship in Russia is played by "Our future" Foundation, which also provides organizational, informational, advisory and financial support.

However, it is difficult to assess government agencies and non-for-profit organizations' support measures for the winners of the competition. Along with the positive results of such government support, in practice there are also cases of projects' state support being cancelled, replication of the business ideas not being followed, as well as the implementation of the project itself not going ahead. It is noteworthy that participation in the competition and implementation of the project requires the competition winner to participate in financing the project. It is obvious that the larger the project (even if it belongs to SME's), the greater the amount required for its implementation. Respectively, even 30% of co-financing from the entrepreneur's budget is a large amount of funds, and the refusal from the state to further support social entrepreneur threatens them with serious debts, and in some cases even bankruptcy.

Thus, social entrepreneurship support in Russia is not systematic, there is no coherent line in the current government policy, and there is no specialized organizational structure in the government that deals with this type of support.

Study Design and Data Collection

The main objective of the study is to identify existing problems in social entrepreneurs' main business activities implementation, as well as to assess the degree of state support for social entrepreneurs based on the analysis of information obtained as a result of a social entrepreneurs' expert survey.

A so-called applied research plan was created and implemented in order to complete the study. This seems most relevant, to the existing theory on the chosen research subject — social entrepreneurship, as well as to the subject of researching issues within business actions' implementation in social entrepreneurship field and state support for this activity. It also allows us to solve the research task.

The goals of the formed applied research plan are: 1) in the social entrepreneurs' practical operations to check the presence of the issue which was identified during the study of the theory of social entrepreneurship, namely: the lack of necessary systematic support for social entrepreneurs from the government; 2) to formulate directions of social entrepreneur's state support improvements.

Note that the implementation of such applied research allows us to identify different precedents and characterize each of them in parallel with the solution of the main task.

This kind of "side" research results can be extremely useful and important for practitioners (in the case of solving the task – for the government). They can be used to adjust government policies relative to social entrepreneurs.

The study involved 24 social business structures representing various industries (Table 1) and regions in Russia (Table 2).

Within the framework of the applied study, an attempt was made to determine the scope of social entrepreneurship, to identify the degree of support for social entrepreneurs by state authorities. As well as to identify the problems and expectations of social entrepreneurs in relation to implemented state support policy. Of the 24 organizations, six are non-for-profit organizations; the remaining 18 are business entities, half of which are individual entrepreneurs; eight organizations are limited liability companies and one organization is a joint-stock company. All companies belong to microenterprises and small businesses both in terms of the number of employees (Fig. 1) and their level of income (Fig. 2). Half of the companies that took part in the study employ people with disabilities (Fig. 3).

In accordance with the task and purpose of the conducted applied research plan the main methods of research were documentation study and social entrepreneurship' management and owners survey.

In 22 companies from the total sample, materials published on "Our Future" Foundation's website were analyzed – information about participants who won grant competitions and who won interest-free loans from the Foundation.

In the course of the survey, respondents (experts) answered questions about tax relief and benefits received from the state, the degree of social entrepreneurs' state support development (subjective opinions), reasons that hinder the development of dialogue between state authorities and social entrepreneurs, and the prospects of developing a policy of state support for social entrepreneurs in Russia.

The main hypothesis of the study was: social entrepreneurs are a special category of entrepreneurs engaged in socially oriented activities, which objectively exists. But there are no special tax conditions and systematic support from government agencies, which is the main reason that hinders the development of social entrepreneurship in Russia.

Table 1: Specialization and quantity of social entrepreneurship companies

Type of company's business activity	Quantity
IT-companies	1
Companies producing and selling food products	1
Companies selling ethnic products and maintaining national traditions	1
Companies manufacturing, selling, and/or repairing equipment for people with disabilities	1

Companies providing training to people with disabilities	1
Publishing and printing companies	1
Companies providing medical services	3
Travel service companies	2
Consulting services	2
Zoo	1
Taxi companies	1
Collection and recycling of secondary raw materials companies	1
Nurseries, development centers and health centres (including swimming pools)	4
Hotel businesses	1
Social rehabilitation companies	2
Restaurants and cafes	1
Total	24

Results of the Research

Benefits and preferential treatment provided to social entrepreneurs can be divided into several types: 1) benefits provided to entrepreneurs due to the small scale of their business (simplified taxation system); 2) benefits provided for the payment of "social" taxes (medical, pension, social insurance); 3) benefits to non-for-profit organizations; 4) preferential treatment provided to SME's in the framework of public procurement; 5) benefits for people with disabilities.

The low results of evaluating the effectiveness of state policy in relation to social entrepreneurs are primarily due to the lack of tax relief (noted by 12 participants of the study) and preferential treatment (noted by 10 participants of the study). 25 % of studied participants noted that they receive benefits that are available to anyone who works as a microenterprise and a small business. 8 % of respondents receive a preferential rental rate for their business premises and 8 % participate in employment programs for people with disabilities and population employment. When asked about the effectiveness of the state policy in relation to social entrepreneurs, 54.2 % of respondents noted a complete lack of support, while the rest were not satisfied with it to varying degrees (Fig. 4).

Fig. 4: Companies ' assessment of the effectiveness of state policy regarding social entrepreneurs (0 – lack of support, 5 – high degree of support)

Social entrepreneurs note that they face serious, in their assessment, problems with their main business activities implementation: local authorities' "autocracy"; limited opportunities to participate in support programs for SME's, bureaucracy, corruption and officials' incompetence.

Based on the results of the research, the following conclusions are made. Social entrepreneurship in Russia: 1) is represented by small or medium-sized businesses; 2) may be an enterprise with different forms of ownership; 3) does not have the ability to use a special tax regime, benefits and preferential treatment, regardless of the region and area of business activity.

It is revealed that in Russia, the Government structure does not include: 1) specialized division for social entrepreneurship support; 2) all-Russian public organizations representing the social entrepreneurs' interests (there are only organizations at the regional level which are included within Russian Union of Industrialists and entrepreneurs).

It seems that in order to develop social entrepreneurship in Russia, it is necessary to implement several groups of priority actions of various types.

1) Organizational measures group of actions:

– Investment Policy and Business Development Department of the Ministry of Economic Development of the Russian Federation should implement a policy of social entrepreneurship support as a separate type of SME's in accordance with the amendments to the Federal law «On the development of small and medium-sized businesses in the Russian Federation". As well as provide continuing professional development to the Department's employees in accordance with changes coming into their employment roles and responsibilities.

- It is necessary to establish an all-Russian public organization that unites all social entrepreneurs and provides consulting and organizational services to its members.

- It seems that the body evaluating social entrepreneur's contribution into society's development and socially significant problems solving and which also determines social entrepreneur's compliance with their status should be independent. For example, it may be the Federal service for supervision in social entrepreneurship business area. It is proposed to differentiate the responsibilities of government bodies which grant benefits to social entrepreneurs and accredit their business activities. Establish business incubators for social entrepreneurs in the "scientific valleys" at universities, and expertise centers and accelerators in the regions. (In fact, social entrepreneurship expertise centers are a kind of "startup" for the gradual formation of social entrepreneurship projects accelerator).

- Create an organizational and functional model for socially oriented businesses development and social entrepreneurship by public authorities at the federal level which unite both state structures and public organizations.

2) Economic measures group of activities:

- Identify forms and types of social entrepreneurs ownership (currently, socially oriented non-for-profit organizations can't access benefits available for SME's. On the contrary small and medium-sized socially oriented businesses are deprived of preferential treatment available to socially oriented non-for-profit organizations). The introduction of social enterprise concept within the legislation only partially solves the problem.

- Create a complete and comprehensive list of social entrepreneurs business activities, correlated to the types of business activities under the all-Russian economic activity types classification.

- Amend the tax code in terms of tax reliefs and preferential treatment for social entrepreneurs and socially oriented businesses.

- Develop financial instruments for use by social entrepreneurs in support of their activities.

- Encourage large business' investment into social entrepreneurship by lowering tax rate for large businesses and developing impact investment.

- Establish preferential credit conditions for social entrepreneurship development and interest-free loans.

- Assign subsidies for rent payments and utility costs.

3) Methodological, informational and telecommunication measures group of actions:

- Develop specific, measurable and uniform criteria for performance evaluation based on social impact assessment for all socially oriented organizations.

- Develop a methodology for assessing the social impact of social entrepreneurs business activities. This can allow to minimize the human factor errors by authorized personnel for decisions making on the provision of benefits and preferential treatment.

- Develop and implement a system of measures to promote and develop social entrepreneurship.

- Create a single information database with accessible information about the system of preferential treatment, tax reliefs, grants and competitions for various categories of socially oriented businesses - a system that is open and transparent.

Conclusion

The goal of social entrepreneurship implementation and modern state policy in Russia is to achieve a new high standard of quality of life for country's citizens. As the President of Russia noted in his address to the Federal Assembly in 2019, "we need to get rid of everything that restricts the freedom and initiative of entrepreneurship". It remains to implement this principle in practice.

Russia faces many challenges. Above all social entrepreneurship companies have a desire of transforming social reality, solving existing social problems, and improving the level and quality of life. In these circumstances, the most important task of state authorities is to form new relations with businesses, to provide state support for social entrepreneurship and create partnerships with businesses to implement socially significant projects and programs.

Sensor Signal Processing Techniques for Mileage Estimation Indoors

Alexandru Marius OBRETIN

Economic Informatics Department, Bucharest University of Economic Studies, Bucharest, Romania
alexandru.obretin@csie.ase.ro

Abstract

Indoor location has recently become a growing market, as well as topic of interest for more and more academic and business enthusiasts. Initiatives that integrate novel technologies to tackle sensitive challenges are developed on a regular basis. Though, the field is still in its infancy and there is plenty of room for innovation, as most solutions have been adapted for a predefined setup and therefore, they lack scalability, not being general purpose indoor positioning systems, suitable for dynamic environments where changes occur frequently. This paper enhances an already proposed model that relies on build-in sensors in a smartphone and engages with several identified limitations. The proposed architecture follows segregation of concerns principles and displays a software equivalent for an attitude and heading reference system, capable of identifying current position within a reference building along with a navigation module that is able to determine the mileage. The implemented design provides solutions for indoor positioning corner cases that have not been considered in previous research efforts, as well as for several issues that are inherent in native mobile applications. Nevertheless, this article is introducing a software ecosystem that is open for extension and battery friendly, providing an effective and enjoyable user experience for someone interested in indoor navigation.

Keywords: Indoor Positioning System, Sensors, Signal Processing, Statistical Analysis.

Introduction

In recent years indoor positioning has evolved from a peripheral research topic to a developing industry where more and more academic and commercial initiatives try to innovate and design novel and ingenious algorithms that can tackle stringent challenges in order to capitalize and gain recognition. International events are held for stakeholders to meet and exchange ideas, special issues are dedicated to the topic in research journals and overall prospects are positive.

Although indoor positioning systems are yet expensive, complicated and sometimes inefficient, they reveal atypical use cases in indoor routing, asset tracking, real-time personnel management and monitoring, behavioural studies and emergency situations management. Over the years various proof of concept applications have been designed to approach indoor positioning challenges, the most interesting relying on neural networks to assist victims in cases of emergency - Falcon and Schulzrinne (2018), augmented reality tools for environment scanning - Rajagopal et al. (2019), Haynes et al. (2018), Cankaya et al. (2015) or image-based facility management - Baek et al. (2019), Koch et al. (2014).

Moreover, a classification initiative from Lashkari et al. (2019) categorized available indoor positioning systems into crowdsensing and crowdsourcing. While the former is characterized by mandatory implicit initiative from the user, the latter insists on explicit initiative. Concretely, crowdsourcing systems gather information directly from the users. Differently, crowdsensing systems collect data from already deployed networks of sensors. In spite of the increased attention both groups have received in the past years, the initiatives are rather sporadic, they do not have a high degree of generality and what is appropriate in one context may be inappropriate in another, because indoor location systems are often sensitive to the particularities of the environment in which they are deployed.

Related work

Another classification might categorize indoor positioning systems into hardware backed systems and software backed solutions. The first category is heavily dependent on existing information exchange protocols and technologies, such

Cite this Article as: Alexandru Marius OBRETIN "Sensor Signal Processing Techniques for Mileage Estimation Indoors" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

as Near Field Communication, Wi-Fi, Bluetooth Low Energy or magnetic field detection. One major disadvantage of this category is represented by the strong correlation between system's accuracy and the physical characteristics of the sensors networks that support the entire infrastructure, networks that are usually expensive to deploy and maintain. Nevertheless, the accuracy of these layouts tends to get affected when the reference buildings get crowded, when the batteries run out of energy or when they interfere with materials that have particular physical properties that block signal propagation. The second identified paradigm involves the use of innovative information technology solutions to compensate for the logistical and economic disadvantages of the first category. The studied initiatives belonging to this spectrum generally use common infrastructure, elements that the subjects possess in their great majority, in a modern society. In particular, the most used device in experiments in this way is the mobile phone. The prominent technological evolution of the last decades, the miniaturization of integrated circuits and hardware components, the increasing performances of the processing units, the incorporation in a mobile device of a wide variety of sensors and the development of innovative technologies such as artificial intelligence or augmented reality have facilitated new research opportunities. A number of initiatives have been successfully developed and tested in isolated contexts, either capturing video streams via the camera, which they then process using image recognition techniques and geometric analysis - Jeong et al. (2017), Zhang et al. (2016), or using artificial intelligence algorithms to estimate, based on data collected in real time, the mileage – Sui and Wang (2015), Ha et al. (2018), Huang et al. (2017).

A major disadvantage of the latter category compared to the former is the dependency on an updated building model of the reference venue. More precisely, for software solutions that rely on image processing techniques that compare video streams captured with the camera with an already known model, external changes, like advertisements, posters, lighting can prevent pattern recognition. Therefore, such applications require model maintenance and for example, in the context of large shopping centre, whenever a shop is replaced, or with every season's new collections that get displayed behind glass walls or holidays decorations, the reference images need updated to reflect the reality. A solution for this stringent issue in the realm of software based indoor positioning systems is to rely on something more static, like the floor plans.

The hereby paper will adapt, test, analyse and enhance several indoor location techniques detailed in Xu et al., where the authors proposed a software solution using smartphone capabilities to determine displacement inside venues. Although, this is not the only article of its kind, other similar initiatives that outline thought-provoking results being available in Truong et al. (2016), Zhang, Liu and Qu (2016) and Puangnak (2019), it would be the reference material for the research efforts detailed in this work, as some strategies can be adjusted and extended to a large variety of contexts, providing the prerequisites for a more general purpose indoor location application.

Theories and Methods

Since the sensors present in smartphones are capable of high frequency measurements, an architectural decision has involved the migration of processing algorithms to a stand-alone service, isolated from the source of information gathering, so as to avoid overloading the system. As such, the mobile phone remains responsible only for data acquisition and display of results, while the processing logic is migrated to a dedicated web server. This separation of responsibilities has favoured the development of individual modules, with a specific, well-defined role. In addition, during the implementation, the need for a mechanism to facilitate a phase-out and at the same time dissociated communication has been identified, because the frequency with which the information can be generated exceeds the frequency of its processing. Therefore, the entire architecture has evolved around the producer-consumer pattern, in which a number of components of the application are responsible for generating information, while others aim to process existing information and determine derived results.

The attempt to implement a software solution that integrates distinct components that communicate with each other through Apache Kafka has materialized in defining a service responsible on the one hand for aggregating and processing the values collected from the accelerometer, and on the other hand for correlating these values with angles measured by the gyroscope. The values from the accelerometer describe the acceleration exerted on the mobile phone, which is decomposed into a three-dimensional system associated with forward-backward, left-right, top-down motions, also known as roll, pitch and yaw – Fig. 1.

Fig. 1: The roll, pitch and yaw of a phone

The values obtained with the help of the gyroscope highlight the angle between the front of the phone and the magnetic North Pole. The displacement estimation service reads these values from the Kafka cluster and ensures the data integrity, verifying that the measurements made by the two sensors are recorded simultaneously and the length of the data sets corresponds. For each monitored time interval, an aggregate acceleration is determined as the difference between the root of the sum of the squares of the decomposed accelerations and the gravitational acceleration, as suggested in Xu et al. Once the aggregated acceleration has been computed, by simply graphing the values, the need for an intermediate stage of statistical processing is noticed, as the values obtained in this manner faithfully reflect the raw quiddity of the digital signals, being therefore strongly altered by digital noise. The hardware characteristics of the accelerometer, as well as the imperfect nature of the measurements that are heavily influenced by frictional forces with various surfaces and oscillations specific to human movement while the position of the phone varies simultaneously on the three components during a step, lead to the appearance of local extrema points in the graph that distort the representation and alter the result, as shown in Fig. 2.

Fig. 2: Unfiltered acceleration values measured with phone's accelerometer

In an attempt to remove the noise and smooth the graphical representation, one tested solution is filtering using a simple moving average. Starting from a numerical series and a fixed size subset of it, usually the first n elements of the series, the first value of the simple moving average is obtained by calculating the arithmetic mean of the whole subset. In general, a reasonable size of this subset is chosen, so that the resulted average is representative for the measured values. In this case, the chosen size is 10. Subsequently, the subset is altered by forward translation, which involves excluding the first element from the set and including the next, then the average of the new range is computed. The process is repeated until the complete processing of the initial series values.

Simple moving averages are generally used in time series processing to smooth short-term fluctuations and highlight long-term trends or cycles. Areas that make extensive use of such instruments include financial analysis, in particular the estimation of stock market prices and traded volumes, the examination of the gross domestic product value, the unemployment rate and other macroeconomic time series. From a mathematical point of view, a moving average is a type of convolution and can therefore be used as a low-frequency filter in the processing phase of time series that describe measured values of signals.

Through its intrinsic characteristics, the simple moving average is able to correct the presence of invalid local extrema points, the result thus obtained being much more malleable in the perspective of further processing and more accurately

reflecting the dynamics of motion. However, the simple moving average can neither completely remove the statistical noise collected by the accelerometer when stationary, nor can it flatten all the measured pseudo-peaks, as can be seen from Fig. 3.

Fig. 3: Simple moving average (red) of the measured acceleration (black)

Given the smoothing of the graph, the next step would be to determine the local extrema points and apply a threshold filter, resulting in a set of points corresponding to the footsteps that the user performed while walking. This detail is relevant in the consideration of an empirical observation that outlines the fact that between successive motion intervals, separated by rest moments, the average values of the acceleration vary. In other words, the average acceleration monitored by the phone sensor is not constant over the motion intervals and therefore the transitions from motion to rest can project local extrema points that in the prospects of future processing represent invalid points that need filtered, but which cannot be excluded with a threshold filter, without eliminating values associated with valid extrema points, as well. Fig. 4 graphically represents the values recorded by the accelerometer in the context of a rectilinear motion, where the subject is walking in two successive intervals, separated by a stationary period. It is visible how the trend decreased between the monitored intervals and the same characteristics have been noticed also for short stops required for door openings or changes in navigation direction, when the subject turns to one side to enter a room that is not collinear with the previous path.

Fig. 4: Different trend values of acceleration in successive rectilinear motions separated by a stationary period

Consequently, the use of the simple moving average has been reconsidered and a triangular moving average has been opted for, as the second choice does not react as quickly in conditions of frequent variability. In the case of accelerometer signals, pseudo-peaks generated by measurement errors and digital noise, identified by the successive presence of two peaks of similar amplitudes in very short time intervals, largely double the number of oscillations, which impacts the result of a simple moving average. The triangular moving average represents the average of the averages for a given data set. In the first stage, the simple moving averages for a conveniently chosen window are calculated, and then, based on the obtained simple averages, a secondary average is similarly determined. Visually, a triangular moving average describes a graph whose evolution is constant and slow compared to a simple moving average, that forces such representations to remain in trend for a longer period of time, providing a more accurate picture of the studied phenomenon. The differences between the two are visible in Fig. 5.

Fig. 5: Simple moving average (red) and triangular moving average (blue) of the measured acceleration

The main advantage offered by a triangular moving average is that of staying in trend for a longer period, which produces in terms of graphics processing a superior flattening of the secondary peaks, resulted from measurement errors. However, not all secondary peaks are flattened below a triangular moving average and the method also alters the amplitudes of the initial data set. Therefore, the use of a triangular moving average has been in turn reconsidered to the detriment of a Savitzky-Golay filter, described in Schafer (2011).

The algorithm proposed by Savitzky and Golay, as outlined by Ostertagová and Ostertag (2016), involves a digital filter that can be applied to a set of points in order to smooth the graph they describe, thus achieving superior accuracy, without distorting the general trend of the signal. To obtain this result, a convolution is used to try to match subsets of adjacent points with a low-grade polynomial, based on the least squares method. When the points are evenly spaced, a solution for the least squares equations can be identified as a set of convolution coefficients, which can then be applied to all other subsets, to obtain a continuous and uniform representation of the signal at all central points of each subset – Pandia et al. (2010).

However, a distortion of the initial signal following the convolution process is inevitable. From a polynomial degree higher than 3, when the values describing local extrema points are smoothed, the amplitude of the vertex will be reduced, and the median width of the graph portion will increase. Both the magnitude of the distortion and the improvement of the signal-to-noise ratio decrease with increasing polynomial degree, respectively increase with the size of the convolution function.

Although moving averages provide better digital noise reduction, they are unsuitable for smoothing functions that have curves described by point subsets. A quadratic function used as a filter is inappropriate for obtaining the derivative of a parabola with an inflection point, because a quadratic polynomial has no inflection points. The Savitzky-Golay filter can be explained in a few words as an effective interpolation in the case of univariate time series. From a graphical point of view, all variants represent techniques used for smoothing data series and it would be erroneous to assess one being better than the other, as their performance level is strongly dependent on the particularities of the data. Fig. 6 depicts a graphical representation of them in the current context.

Fig. 6: Simple moving average (red), triangular moving average (blue) and Savitzky-Golay filter (green) of the measured acceleration

Because footsteps determination is strongly correlated with the aggregate acceleration, which is computed as a square root from the sum of the squares on the three components, from which the gravitational acceleration is subtracted, the application considers redundant movements as displacement, with associated graphical highlighting. Repetitive sequences of steps to the left and right cause oscillations of acceleration on the X component, which successively record positive and negative values. As the used calculation function is based on the square value of this record, the direction of travel is ignored, the value is always positive, and the algorithm assumes that the user is moving at a constant pace in a certain direction, a chart describing this case being detailed in Fig. 7.

Fig. 7: Graphical representation of a linear left-right motion of the phone on a flat surface

Similarly, the same erroneous behaviour has been noticed for repetitive forward-backward navigation, this time the impact being on the Y coordinate. By analogy, climbing and descending the same step on a stair repeatedly will determine the distance calculation function to assume that the user is advancing to an upper floor of the building.

Following the reasoning described above, but introducing the orientation angle in the equation, it must also be considered the scenario in which the user rotates with the phone in an arc of a circle or even in a complete circle, sitting more or less in place. Such movements describe changes in the direction of travel or even turns, many of them inherent in the context of motions. However, rotating on the spot determines either positive or negative values, depending on the rotation direction, for acceleration on the X component. A correct behaviour of the displacement function should identify the moments when the user makes turns and not consider the data associated with these movements.

Experimental Results

These impediments identified in the process of concrete experiments led to transition from the aggregated approach proposed in Xu et al., in which the acceleration is perceived as a cumulation of values on the three components towards a solution that distinguishes between these values and makes informed decisions, taking into account the position of the phone and the behaviour of the user. Thus, depending on the values recorded by the accelerometer in the three-dimensional reference system, the displacement consideration is mainly assessed in relation to a single component. Specifically, if the user uses the phone perpendicular to the normal plane, the accelerations related to the Z component are the ones that determine the motion, while in the context of using the phone in a position parallel to the normal plane the Y or X component is the relevant one.

The strength of this approach consists of two distinct aspects. On the one hand, there is an isolation between the gravitational acceleration exerted on the phone naturally and the concrete acceleration the user impresses to the device

while walking. On the other hand, by eliminating the use of the squared components, an indication of the moving direction is kept during the measurements. From this point of view, not only can positive and negative values be seen at data set level that suggest depending on the position of the phone the direction of motion, but several generally valid assumptions can also be identified.

Some empirical observations during the tests:

- having the mobile phone in portrait mode, with the screen parallel to the floor and facing the ceiling and the top of the phone away from the subject, at rest, the acceleration values on the components are: X approximate 0, Y approximate -1, Z approximate -9.8
- having the mobile phone in portrait mode, with the screen parallel to the floor and facing the ceiling and with the top of the phone close to the subject, at rest, the acceleration values on the components are: X approximate 0, Y approximate 1, Z approximate -9.8
- having the mobile phone in landscape mode, with the screen parallel to the floor and facing the ceiling and the top of the phone oriented towards the right of the subject, at rest, the acceleration values on the components are: X approximate 1, Y approximate 0, Z approximate -9.8
- having the mobile phone in landscape mode, with the screen parallel to the floor and facing the ceiling and with the top of the phone oriented towards the left of the subject, at rest, the acceleration values on the components are: X approximate -1, Y approximate 0, Z approximate -9.8
- when moving in the forward direction, with the mobile phone in portrait mode, with the screen parallel to the floor, on Y component of the acceleration, before the first step there is a slight decrease in the acceleration value on this segment, followed by steep increases associated with each step, these increases exceeding in value the adjacent trend;
- when moving in the backward direction, with the mobile phone in portrait mode, with the screen parallel to the floor, on the Y component of the accelerator, before the first step there is a slight increase in the acceleration value of this segment, followed by sudden decreases associated with each step, these decreases being below the value of the adjacent trend – Fig. 8;

Fig. 8: Identified patterns in linear forward - backward motion

Identifying the aforementioned patterns in the graphical representation is a key aspect, as it helps understanding the way the information is collected from the sensor and provides a visual tool for identifying sequences of steps in either direction. Besides the positive/negative values the accelerometer collects, that are further stored in an unfiltered manner in the Kafka cluster, the graphical analysis module integrated in the solution represents an inspection mechanism that can validate the results. Currently, the proposed software solution integrates two distinct services that are accountable for interpreting raw data. On the one hand, there is a plotting module that portrays the information in convenient visual ways and on the other hand, there is the navigation module that can determine displacement.

Considering the previously mentioned data processing techniques and the strengths and weaknesses of each approach, the proposed architecture has adopted a Savitzky-Golay filter for noise reduction. Having three different streams of data, representing acceleration values on each axis, the filter eliminates the pseudo-peaks resulted from measurement errors, followed by a secondary threshold filtration that removes peaks which are located too close to a neighbour, as body mechanics brings some constraints that prevent consecutive steps in less than 0.4 seconds – Chen et al. (2015),

in a walking context. After the filtration process, the resulted data set is used to determine local extrema points corresponding to the subject's footsteps while navigating inside a building.

The developed application requires a QR code reading in the initial point of the mapping that contains details about the respective position relative to the entire building representation. Following this step, the user gives the consent for data collection and the application starts gathering information from the sensors. While navigating inside the venue, the sensors harvest data and send them in an asynchronous manner, in batches, to the server where the information is stored in predefined Kafka topics. Further, when a detailed representation of the mileage is requested from the webpage, the solution determines the original user's coordinates in the floor plan from the metadata written in the QR code, and then, incrementally, based on the identified local extrema points, calculates the displacement using the current position and the angle relative to the magnetic North Pole. This is a sequential process where the steps are determined one by one. The displacement is estimated using a linear mathematical model for estimating the length of a step depending on the height of the subject – Guest et al. (2017) and the step frequency. Precise estimation of each step is retrieved in a Cartesian system, using trigonometric functions to calculate the relative distances on the horizontal and vertical axes. Currently, the solution is capable of retrieving indoor location in a moment subsequent to the actual motion.

Fig. 9 shows the motion between two rooms located on the same level in a residential building.

Fig. 9: Screen capture from the web interface of the navigation service

Conclusions

The proposed solution addresses several challenges that other studies mentioned in the related work section have not considered, providing an effective solution for indoor location in a one-story building context. The decomposed acceleration approach provides the necessary means for correctly estimating the movement direction depending on the values sign. A comprehensive filtration step flattens the measurement prominences and outlines a continuous, smooth graphical representation that is suitable for mathematical analysis. Local extrema points correspond to actual footsteps that can be represented on a bidimensional floor plan, computing precise coordinates using basic trigonometry and relative angles between the gyroscope recordings and the magnetic North Pole. Correlated with a magnetometer, these principles emulate the behaviour inside an attitude and heading reference system capable of correctly assessing the current position of an object over time.

The architectural strategies applied to this project offer two major advantages over other projects mentioned in this paper. On the one hand, the segregation of concerns allows the complex, laborious tasks to run on a different device, saving energy and resources on users' smartphones. Compared to native applications, the proposed solution does not

require any storage space on the actual device, it does not store any temporary data, others than those of the browser when the page is loaded. On the other hand, the approach proposed in the hereby paper relies on sensors that already work in the background for monitoring device rotations or falls and collects information from them in an asynchronous manner, using web workers that run on separate threads, without interfering with the main user interface thread. Moreover, the information is collected and sent to the Kafka cluster in batches, drastically reducing the number of message exchanges between the client and the server. Therefore, the energy consumption is diminished, avoiding a battery drain that would otherwise impact the user experience.

The system has been successfully tested in two distinct reference buildings providing accuracy levels under a meter for various scenarios that include linear motion, turns over sharp, straight or obtuse angles, walking backwards or in-place rotations. Last, but not least, this infrastructure free software solution can easily be extended to different structures grace to its loosely coupled design and further improvements can include routing capabilities or real-time indoor location.

Abstract

The aim of this article is to examine the scope of instruments of competition used in industrial processing enterprises. The article presents and describes the theoretical review of the essence of competitiveness and instruments of competition. However, the empirical part was based on surveys carried out in 162 industrial processing enterprises.

Keywords: Enterprise competitiveness, instruments of competition, industrial processing enterprises.

Introduction

Competition or competitiveness are indispensable elements of modern free market economy. Competition occurs between at least two business entities and is understood as actions forced by the desire to succeed and overtake other rivals in pursuit of the same or similar goal (Maniak, 2005, p. 67). However, due to the impact of the global economy, the current competitive conditions are constantly and dynamically changing. Companies have to deal with the increase in the prices of materials and services, the specific requirements of customers, and even the shortage of unskilled or non-specialized staff (Sobolewski and Marcinkowski, 2017, p. 143). As a result, entrepreneurs must be constantly active in standing out from other rivals. Therefore, companies wishing to build or improve their competitiveness should precisely define the scope of applied competition instruments that directly affect the market. It is worth adding that this process should have been continuous due to the constantly evolving environment in which the company operates.

The purpose of this article is to examine the scope of use of classified competition instruments that are used in conducting direct competition between enterprises. The first part of this article presents only an outline of theoretical research regarding the essence of competitiveness and the concept of competition instruments, while the greater part of the article is devoted to empirical research conducted on a sample of 162 industrial processing enterprises, using the in-depth survey method.

The essence of enterprise competitiveness

Information and knowledge have become the basis for today's economy, exerting a critical impact on competitiveness, production nad productivity (Castells, 2001). As a result, the level of technological development has affected how people communicate and interact (Liberato *et al.*, 2018) and finally how people seek products, services and information (Abreu *et al.*, 2017).

Competitiveness is a key category for every enterprise, as it demonstrates the power regulating market economy mechanisms (Wolak-Tuzimek, 2017, p. 695). Ultimately, this leads to competition between others with similar businesses on the market.

When reviewing the definition of the concept, you will come across two basic approaches to enterprise competitiveness: static and dynamic (Olszewska and Piwoni-Krzeszowska, 2004, p. 508). According to static enterprise competitiveness, competitiveness is a state that illustrates the capabilities of a given enterprise relative to

its rivals. In the dynamic approach competitiveness is compared to the ability to use its own potential and external conditions, as well as to create and improve the current competitive position. However, it is worth noting that most researchers adopt the dynamic approach.

Enterprise competitiveness is a complex and multi-faceted concept. This is confirmed by the review of the literature on the definition of competitiveness presented in Table 1, which has been presented by various authors.

Table 1: Review of the definition of competitiveness of enterprises according to various authors

Author	Definition of enterprise competitiveness
J. Burnewicz (1993)	Ability to stand up to competition (Burnewicz, 1993)
G. Hamel and C.K. Prahalad (1993)	The ability to win (thanks to high quality products) first place in the opinion of customers (Hamel and Prahalad, 1993).
M. Lubiński (1995)	Ability to sustain sustainability in the long term and striving to maintain and increase market share (Lubiński, 1995).
D. Faulkner and C. Bowman (1996)	The company's ability to become a leader in the industry (Faulkner, Bowman and Albigowski, 1996).
M. Gorynia (2002)	Current or future competitive position determined by the company's ability to compete (Gorynia, 2002).
T. Wattanapruttipaisan (2002)	Ability to obtain greater efficiency in production (Wattanapruttipaisan, 2002).
L. Dwyer and Ch. Kim (2003)	The ability to constantly provide added value to the company's stakeholders (Dwyer and Kim, 2003).
M.J. Stankiewicz (2005)	Ability to efficiently (effectively), profitably and economically achieve goals on the competitive arena market (Stankiewicz, 2005).
J.E. Lombana (2006)	Maintaining a dominant market position and being "profitable" (Lombana, 2006).

Source: Based on own study.

The overview of the definitions of enterprise competitiveness presented allows to draw the conclusion that this concept should undoubtedly be treated as a developed feature of the entity. It is also worth noting that most of the cited definitions have a common aspect. They define competitiveness as the company's ability to "be" better than other market rivals (Chikán, 2008, p. 25). It's worth mentioning that this definition is also known and used by international practitioners in the field (Lee and Karpova, 2018).

Achieving competitiveness requires from the companies continuing adaptation to changing economic and social condition and norms (Markus and Rideg, 2020). Therefore, competitiveness should be treated as a concept that evaluates market participants from the point of view of the results obtained and the ability to achieve benefits in the future (Bossak and Bieńkowski, 2004, p. 19). It should also be added that competitiveness applies to all participants competing with each other on the market, both those who achieve success and those without success (Grzebyk and Kryński, 2011, p. 111).

Instruments of competing as part of the competitiveness of enterprises

The increase of interest in the competitiveness of enterprises resulted in the need to identify tools that may have a direct impact on it. These factors have been classified as instruments of competition because their proper use allows obtaining a competitive advantage and, as a result, allows to develop an appropriate market position. This concept is generally used in two areas of business operations:

1. In the sphere of resources - where they are used to acquire new resources, and then transform them into strategic resources.
2. On the target market - where they create an attractive market offer and make the buyer feel that he/she is buying a product that will fully meet their needs (Grzebyk and Kryński, 2011, p. 111).

According to Roszyk-Kowalska, instruments should be defined as tools and methods of acquiring buyers on terms that enable the company to achieve its goals (Gorzelany-Dziadkowiec, 2014, p. 33). However, Grabska emphasizes that competing instruments are significant differences for the client covering the company's offer (2006).

Stankiewicz adds that these are all conscious created funds that are used to attract customers (Stankiewicz, 2005, p. 242).

Continuing the considerations in this field, one may come to the conclusion that the discussed dimension of the company's competitiveness is a function of the nature of the company's offer itself. On the other hand, the nature of the offer is most often conditioned by the market arena, i.e. the area of the company's impact on the environment. In the literature on the subject, three market arenas in which instruments of competition can be used can be distinguished (Stankiewicz, 2005, pp. 243–251):

1. Arena "at the entrance" - refers to creating conditions that will promote the creation of new values in the context of the resources which the enterprise already owns. The company acts here as a buyer, and the purpose of using instruments in this sphere is to achieve maximum efficiency of acquired resources. On the other hand, a characteristic feature of the "at the entrance" instruments is that they only generate costs and indirectly affect the value of the enterprise.
2. The "at the exit" arena - includes activities confirming the value of the offer created by the company. The company acts here as a supplier of a product or service. The main purpose of using instruments within this sphere is to maximize sales revenue and make buyers aware of the value of the product offered.
3. The company image arena - in this sphere, the enterprise itself is a product, and its main goal is to create the most favorable image in future partners, investors and cooperators, which will allow them to "sell themselves" in the future.

A common feature of all competing instruments is the fact that they all have a similar role. Well, the main purpose of their use is primarily to inform about the product. In addition, the basic task of any competing instrument is to convince as many potential buyers as possible that the product or service is better than the one offered by the competition.

To sum up, the discussed dimension should be treated as a direct tool with which one can influence the competitiveness of the enterprise. In addition, competing instruments should contribute to the acceptance of the offer by the recipients, offering them added value. In all market arenas listed, only the instruments used "at the exit" meet the above condition. This is due to their direct contact with buyers and the impact on the amount of revenue generated. It should be emphasized, however, that the other arenas are no less important because they include activities related to acquiring resources and creating conditions for future functioning. Proper management of competition instruments is often one of the basic sources of gaining competitive advantage. In addition, the more complex the tool, the greater its importance from the perspective of obtaining the desired competitive position.

Research Method

The subjective scope of the article covered a specific group of enterprises. Based on literature sources and criteria used in business practice, it was decided that the entities that will be included in the study will be industrial processing companies that conduct production activities. It should be mentioned that these companies are a typical example of the Porter's Value Chain (Porter, 1985). Thanks to this, it is possible to analyze competition instruments according to the areas of impact proposed by Stankiewicz (2005).

Studying the instruments of competition requires determining their significance and long-term impact. Only experience that can be acquired in the course of running a business will allow entrepreneurs to form an opinion on the instruments and their impact on their functioning. Based on this assumption, entities that had been operating on the market for less than 3 years were therefore excluded from the research. It was considered that the period of 3 years is sufficient because it allows to assess which tools of competition used are more or less effective. The research was carried out in several stages and empirical research was carried out in the period from November 2017 to January 2018. The questionnaire was sent to 400 companies operating on the Polish market, with 216 sending the forms back, of which 162 were admitted for further analysis. The remaining forms were rejected as non-compliant or incomplete. The detailed characteristics of the sample are presented in Table 1.
The process of processing empirical data was controlled. The collected empirical material was verified, reduced, and then processed to alphanumeric form using specialized software. For this purpose, the statistical package Statsoft Statistica 12 and, as an auxiliary, Microsoft Excel spreadsheet were used.

Table 2: Characteristics of the enterprises according to the adopted criteria

No.	Characteristic	No. of indications N=162	Share (in %)
	Enterprises		
1.	Small	71	45.68
2.	Medium	41	25.31
3.	Big	47	29.01
	Year of foundation		
1.	Until 1990	52	32.10
2.	1991-2000	64	39.51
3.	2001-2010	27	16.67
4.	After 2010	19	11.72
	Market		
1.	Local market	19	11.72
2.	Regional market	12	7.41
3.	Domestic market	27	16.67
4.	International market	82	50.62
5.	Global market	22	13.58

Instruments of competing in industrial processing enterprises

The formulated strategy of competing is realized through the creation and application of appropriate competition instruments. These tools must be easily recognizable and quickly identified by consumers. Therefore, competition instruments affect the value of the company's offer and are consciously created means of achieving market goals contained in the adopted competition strategy.

Based on critical studies of the subject literature and opinions and comments obtained during the pilot studies, a number of competition instruments were identified. During the analysis of their cognitive load, classified variables were placed into groups according to the following areas of impact: quality, price, support/service, information. A detailed presentation is shown in Table 2.

Table 3: Instruments of competing by areas of impact

Quality	Price	Support / Service	Information
Quality of products / services offered	Terms of payment	Qualifications and experience of employees	Company image
Flexibility to adapt to customer requirements	Price	Geographical scope of activity	References
Assortment breadth	The benefits of the economy of scale	Terms and warranty period	Industry connections
Product Brand	Cost level	Efficient distribution channels	Promotion methods
Innovation		The scope of after-sales services provided	Advertisement
Having more modern technology		The scope of pre-sale services provided

Source: Based on own study: (Stankiewicz, 2005, pp. 242–249); (Juchniewicz, 2014, p. 112).

Next, during research, the respondents were asked to evaluate individual instruments of competition, taking the key rival as their main reference point[1]. Using the 5-point Likert scale, entrepreneurs could assess the tools used, giving

[1] The key rival was the company that directly competes for a common customer target group.

them the following rank: 1 meant very poor rating, 2 – poor rating, 3 – average rating, 4 – good rating and 5 - very good rating. The distribution of individual answers is presented in Figure 1.

Figure 1: Distribution of answers regarding the assessment of competition instruments of the analyzed sample

Source: own study based on the results of empirical research.

In the next stage of the study, the empirical material obtained was ranked according to the significance factor R, which was the arithmetic mean of the ratings in individual categories. This made it possible to rank the variables that determine the competition instruments of industrial processing enterprises. They were presented both in general arrangement and according to the adopted enterprise size criterion. Detailed data is presented in Table 4.

Based on the obtained results, it should be noted that for the entire population, the average scores of the specified instruments of competition fluctuated within the range of <3.07; 3.98>. However, standard deviations ranged from 0.70 to 1.14. Thus, the distribution of responses on the scale used was moderately varied, which indicates relatively unanimous responses of the respondents in this matter.

The surveyed industrial processing enterprises in Poland rated the instruments of competition related to the quality of offered products / services and the flexibility of adapting to the recipients' requirements the highest. The results of empirical research confirm that entities engaging in competition on the market focus primarily on offering products with better properties than the products of competitors, while trying to adapt them to individual buyers.

Table 4: Ranking of competing instruments for the entire population and by enterprise size criterion

The instrument of competition	Average (N=162)		Small N=74	Medium N=41	Large N=47
	R	OS	R	R	R
Quality of products / services offered	3,98	0,89	3,89	4,00	4,11
Flexibility to adapt to customer requirements	3,95	0,92	3,84	3,95	4,13
Assortment breadth	3,78	0,92	3,54	3,85	4,11
Qualifications and experience of employees	3,77	0,90	3,74	3,56	3,98

The instrument of competition	Average (N=162)		Small N=74	Medium N=41	Large N=47
	R	OS	R	R	R
Company image	3,73	0,87	3,68	3,68	3,85
Product Brand	3,69	0,90	3,53	3,73	3,91
References	3,65	0,87	3,64	3,54	3,77
Terms of payment	3,60	0,84	3,69	3,44	3,62
Geographical scope of activity	3,57	1,04	3,27	3,61	4,02
Terms and warranty period	3,47	0,90	3,30	3,44	3,77
Price	3,46	0,86	3,55	3,32	3,45
Innovation	3,43	1,00	3,15	3,46	3,85
Having more modern technology	3,43	1,00	3,18	3,44	3,83
Cost level	3,43	0,70	3,32	3,39	3,62
The benefits of economies of scale	3,39	0,84	3,16	3,46	3,68
Efficient distribution channels	3,36	0,99	3,03	3,56	3,70
Industry connections	3,36	0,79	3,24	3,39	3,51
The scope of after-sales services provided	3,27	0,85	3,19	3,12	3,53
The scope of pre-sale services provided	3,21	0,82	3,16	3,05	3,43

Legend: R - significance factor, OS - standard deviation.

Source: own study based on the results of empirical research.

The results of the conducted research clearly show that the assortment breadth is also highly rated, especially in the group of large industrial processing enterprises. The full assortment gives greater sale opportunities and reduces average transport costs for combined deliveries. In addition, it allows companies to offer buyers complete sets of products or services with full equipment. The appropriate range of products was rated lowest in small entities. This may be due to certain conditions that enterprises must meet to maintain product / service diversity, i.e. the use of different production and sales technologies, storage space, etc.

Instruments related to having experienced and qualified employees were also highly rated. Therefore, it should be concluded that an employee is becoming increasingly important not only in the process of creating competences, but is also an important tool for acquiring potential buyers. In addition, for this instrument, the scope of customer service which is connected to the competence of employees. A high range of manufactured products or services requires comprehensive service, especially maintaining its appropriate standard.

The company's image is also an important instrument of competition that was highly rated by respondents. Products and services offered by companies of good public opinion often enjoy a good reputation among consumers. Nevertheless, current image creation is a multi-faceted and extremely complex process. Enterprises are not evaluated solely from the perspective of production or service activities. Aspects such as the company's impact on the environment, charity activities and involvement in social / sports activities are also taken into account.

All in all, it is worth pointing out the factors that were the rated the lowest, i.e. methods of promotion, advertising and own scientific and research facilities. Therefore, compliance with the results presented in subsection 5.1 of this dissertation can be seen. Respondents, who rated areas of competitive potential related to R&D and marketing, also rated relatively low instruments of competition that are directly related to them.

The low rating of the scope of pre-sales and after-sales services is particularly surprising. It is emphasized that these instruments are the foundation for building customer relationships. Therefore, the low ratings of respondents are puzzling, indicating that entrepreneurs from the industrial processing sector are not trying to distinguish the scope of these competition tools. The reason for this phenomenon may be the fact that both pre-sales and after-sales services often do not generate additional profit for the company.

Turning to a detailed analysis of empirical data, taking into account the criterion of the size of the enterprise, it can be concluded that large entities usually rated the instruments of competition higher, compared to other enterprises participating in the survey. The exception to this rule are: payment terms and price, because it was the small enterprises that had the highest significance factor among the listed ones. This means that these entities mainly focus on tools which primarily allow them to offer lower prices than larger competitors. In addition, in the case of payment terms, respondents representing small enterprises, during in-depth interviews, explained their higher ratings by having a wide range of options for paying for products / services. They emphasized that they use attractive forms of credit, extend payment periods or accept many payment methods, e.g. internet, mobile, e-wallets, etc.

Conclusion

To sum up, it should be said that modern enterprises, operating in extremely dynamic market environment conditions, should place particular emphasis on the selection and scope of instruments of competition used. Undoubtedly, competition instruments understood as tools, methods or means to acquire customers are the basis by which business entities can consciously build, maintain and strengthen their competitiveness. Based on empirical research, it appears that the surveyed entities rated competition instruments, which are related to the quality of products / services offered, flexibility in adapting to the requirements of recipients and assortment breadth the highest. Therefore, industrial processing enterprises should base their strategy of direct competition on the sale of goods and services which are better in quality, however the offer should be diversified, e.g. by complementary or substitutive elements. Entrepreneurs should also take into account the possibility of adapting to the needs of customers, e.g. by giving the product / service individual features. In the respondents' opinion, competition instruments related to promotion methods, advertising and their own scientific and research facilities were rated the lowest. It is worth noting that these practices are associated with a high risk of return on investment and are characterized by the difficulty of measuring the profit that may be generated in the future. Therefore, it should be emphasized that further, in-depth research in the field of competition instruments seems necessary and that research should be published in an accessible form for readers.

Abstract

The article presents a study of preferential customs treatment within special economic zones in the Asia-Pacific. The study aims to analyze customs incentives by type of special economic zones in the Asia-Pacific. The subject of the study is special economic zones in the Asia-Pacific region. The article presents a systematization of customs incentives within special economic zones in the Asia-Pacific. The authors analyze the formats and conditions of the provision of customs incentives in each type of special economic zones in the Asia-Pacific. The results are presented of a study into the practice of the application of preferential customs treatment within special economic zones in Russia. The authors show that flexible and rapidly developing special economic zones are the perfect potential growth areas thanks to tax and customs concessions and streamlined customs clearance procedures.

Keywords: Special Economic Zones, Asia-Pacific, Preferential Customs Treatment.

Introduction

One of the key trends in the regulation of special economic zones is the introduction of trade rules that establish a system of tariffs on imports and envisage a set of non-tariff requirements and administrative procedures applicable to both imports and exports. Tenants of SEZs are often exempt completely or partially from customs duties and are entitled to benefits offered by the customs-free zone regime. The application of specific formы of preferential customs treatment depends on the objectives of the special economic zone, such as promoting foreign direct investment, boosting exports, or earning foreign currency. In retrospect, however, the performance of some zones leaves mixed impressions. This makes it necessary to examine the practice of preferential customs treatment within special economic zones, constituting a relevant research problem. The value of the study lies in the fact that of 127 countries surveyed by UNCTAD 98 have SEZ laws stipulating fiscal incentives, including elimination or reduction customs tariffs; and 94 have SEZ laws that provide for a special customs regime, which makes preferential customs treatment the most popular tool for attracting investment in special economic zones, (UNCTAD, 2019). The study aims to analyze customs incentives by type of special economic zones in the Asia-Pacific. The subject of the study is special economic zones in the Asia-Pacific region.

Methodology

The key research methods are analysis, synthesis, and comparative analysis. An analysis was performed of special economic zones specializing in foreign trade. A classification was developed of the types of preferential customs treatment within special economic zones in the Asia-Pacific and their functional focus was identified on the basis of the core qualifying features. An analysis was conducted of preferential customs treatment by type of special economic zones in the Asia-Pacific and the practice of using preferential customs treatment within special economic zones in Russia was studied. As a result of the analysis, the key components of each type of preferential customs treatment were identified. The analysis utilized data from the official websites of special economic zones based in the Asia-

Pacific and academic journals. The analysis was done by type of special economic zone and by main type of preferential customs treatment available in the zones.

Research

1. Special economic zones in the Asia-Pacific: focus on international trade. Special economic zones (SEZs) play a key role in promoting international trade and business. The concept of free ports dates back to centuries ago. Modern free trade zones that are adjacent to seaports, airports or along border corridors appeared in the 1960s. More of them popped up in the 1980s with the spread of export-oriented industrial development across the world, especially in Asia, as well as the increasing reliance of global manufacturers on offshore production. Among the countries that pioneered the establishment of special economic zones were the Chinese province of Taiwan (1966), Singapore (1969), and South Korea (1970). (Mayburov, I., Sinenko, O., 2017)

The acceleration of international production in the late 1990s and 2000s and the rapid growth of global value chains generated another wave of new SEZs, with many developing countries across all regions aiming to emulate the early success stories of SEZ projects in Asia. The global financial crisis and the resulting dip in global trade only marginally slowed the establishment of new SEZs. The current deceleration in international production and globalization is having a positive effect, as governments are responding to greater competition for mobile industrial activity with more SEZs and new types of SEZs. There are around 5,400 SEZs today, more than 1,000 of which have been established in the past five years. At least 500 more zones (approximately 10% of the current total) have been announced and are expected to open in the coming years. Most SEZs derive from the concept of free zones (also called free trade zones), the defining characteristic of which is a separate customs area. Free zones tend to be located next to seaports, airports or border corridors, their tenants mostly being firms that provide warehousing, logistics and services. Today, SEZs are used by more than 140 countries, three quarters of developing countries, and nearly all transition economies. In most developed countries, the free zone model has remained close to the original concept (Table 1).

Although free trade zones mostly providing logistics and warehousing are predominately clustered in developed countries, the majority of the existing and planned zones in developing economies are multi-activity zones that are designed to promote export and import transactions and to attract investment in diversified production projects. Such zones are often adjacent to industrial parks and provide easy access to international markets for their tenants.

Table 1: Distribution of special economic zones by region or regional group (percentage points), 2019

Region or regional group	SEZ with focus on logistics (free trade zones)	Multi-activity zones	Sector-specialized zones	SEZs with focus on innovation
Globally	**8**	**62**	**25**	**5**
Developed economies	91	8	1	0
Africa	1	89	10	0
Asia	2	65	26	7
China	*1*	*92*	*1*	*6*
Latin America and the Caribbean	9	77	13	1
Transition economies	3	35	59	5

As of 2019, over 85% of SEZs were found in the Asia-Pacific: China (2,543, including 522 national-level SEZs; 1,991 province-level ones), the Philippines (528), Latin American countries (486, including 73 in the Dominican Republic, 52 in Nicaragua, 49 in Costa Rica, 39 in Colombia, 39 in Honduras), the USA (262), the Russian Federation (130), Thailand (74), South Korea (47), Malaysia (45), Cambodia (31) etc. (UNCTAD-OECD-WTO, 2020).

2. Classification of special economic zones with the focus on international trade. Despite the wide variety of special economic zones, there is no universal classification of them in global practice. Moreover, SEZ-related terminology varies from country to country, too. The World Bank differentiates between six main types of special economic zones, including those that focus on international trade and, therefore, have special customs procedures in place (Fig. 1), for example, (Chen, X., 2019).

-*free trade zones* are zones with functions for storage, sorting and minimum processing of imported goods. Free trade zones are usually established in the vicinity of customs checkpoints, seaports and airports. Free trade zones encompass foreign-trade zones, duty free zones, offshore zones, free cities, free transit zones, free customs zones (bonded warehouses, free port) etc. Free trade zones are most common in countries whose geographic location is conducive to active foreign trade policy, e.g., the United States, China, Japan etc.

- *export-oriented manufacturing zones* are industrial estates the main objective of which is the sale of goods abroad. The category includes industrial/ duty-free export-oriented manufacturing zones, free export zones, joint venture SEZs etc. Export-oriented manufacturing zones are common in developing countries, e.g., Myanmar, Vietnam, Colombia, Brazil, etc.

- *free ports (porto franco)* are special economic zones that are adjacent to a port or a port area where duty-free import policies and a mix of tax concessions are available. The examples include the free ports of Singapore, Hong Kong, Gibraltar, Russia, and China.

Fig.1: World Bank's typology of special economic zones

China that accounts for the largest number of special economic zones both in the Asia-Pacific and globally (47.2% of all SEZs in the world) has been actively experimenting with new types of special economic zones. Five types of national-level SEZs are formally identified in China (Chen, X.,2019):

1. Economic and Technological Development Zones (ETDZ);
2. High-Tech Industrial Development Zones (HIDZ);
3. Special Customs Supervision Zones (SCSZ);
4. Border/cross-border economic cooperation zone (BECZ);
5. Other types of zones (specialized ones etc.).

Special customs supervision zones (SCSZ) are a type of economic development zone in China, which were first set up in the 1990s to attract and promote foreign trade. As of 2019, there were 135 SCSZs in China (5.9% of all SEZs in the world) that are split into six classes of special customs zones, which is a record for the Asia-Pacific (Fig. 2)

Fig.2: Special customs Supervision Zones in PRC, 2019

Source: Zoey Ye Zhang (2019)

As proposed in the Plan to Speed Up the Integration and Optimization of SCSZs Scheme issued in 2015, all existing SCSZs will be integrated into two types in the future: Bonded Zones (BZs) and Comprehensive Bonded Zones (CBZs). The transformation started in 2017, delivering 140 SCSZs and 96 CBZs by 2019. One secret of the popularity

of CBZs is that they integrate the functions of other SCSZs and offer the widest possible range of services and the most convenient customs clearance procedures. Today, China is promoting CBZs as the most advanced form of SCSZs. In Shanghai, for example, there are 10 SCSZs that have received approval from the State Council on their integration and optimization plans to become CBZs.

Special border and cross-border economic zones are a widely spread type of SEZs in the Asia-Pacific. The geographic advantage of border economic zones is their proximity to targeted foreign investment and foreign markets, especially for specialized export-processing zones. The first such zones were set up in the northern border areas of Tijuana, in Baja California and Ciudad Juarez, in Chihuahua in the 1960s. (Sinenko, O., Mayburov, I., 2019).

The US manufacturers built assembly plants in a 12-mile-wide free zone starting at the border and exported their products to the home country of their companies, which offered special incentives provided by Mexico, lower labor costs and proximity to their markets in America. Deepening regional integration has also accelerated the development of border SEZs. Regional development initiatives and cooperation programs encouraged the establishment of SEZs along regional economic corridors. For example, that was the effect of the development of the Greater Mekong Subregion corridors, a regional economic cooperation program involving Cambodia, China, the Lao People's Democratic Republic, Myanmar, Thailand, and Vietnam (Fig. 3).

Bavet - Cambodia		**Moc Bai** - Viet Nam
Chiang Kong - Thailand		**Houaysai** – Laos (Lao People's Democratic Republic)
Dong Kralor -Cambodia		**Khong Phapeng** – Laos
Koh Kong - Cambodia		**Trat/Souy Cheng** – Thailand
Lao Bao - Viet Nam		**Dansavanh** – Laos
Mohan -China		**Boten** – Laos
Myawaddy - Myanmar	⇆	**Mae Sot** – Thailand
Pak Nhai - Cambodia		**Pleiku** - Viet Nam
Poipet - Cambodia		**Aranyaprathet**- Thailand
Savan–Seno - Laos		**Mukdahan** – Thailand
Tachileik- Myanmar		**Mae Sai** – Thailand
Thadeua - Laos		**Nong Khai** – Thailand
Vang Tao - Laos		**Chong Mek** – Thailand

Fig. 3: Border zones within the Greater Mekong Subregion economic corridors, 2018.

Some of the zones are of traditional type, for example, in 2016, most firms operating in the Mae Sot SEZ in Thailand were Thai firms producing goods for the Thai market but employing day labor from Myanmarю Other zones, for instance, a SEZ on the China-Laos border, on the opposite, sought to merge two border zones into one (Mohan - China- Boten – Laos). The Mohan SEZ was established on the Chinese side in 2001 as border trade zones.

The Boten Zone on the Lao side as developed in 2003 as a tourism and trade center. The development plan of the cross-border zone was approved in 2015 by the two governments, and the construction is still under way (ASEAN Secretariat and UNCTAD, 2017).

3. Preferential customs treatment within special economic zones in the Asia-Pacific. One of the key regulatory trends in special economic zones is the introduction of trade rules that establish a system of tariffs on imports and envisage a set of non-tariff requirements and administrative procedures applicable to both imports and exports. SEZ tenants are often partially or fully exempt from customs duties and entitled to benefits offered by the customs-free regime (Fig. 4), which means facilitated simplified traded procedures, for example, accelerated customs clearance or bonded warehousing.

Fig.4: Preferential customs treatment within special economic zones

Customs clearance procedures within customs-free zones is a peculiar model of mutually beneficial cooperation between companies involved in international trade and the state. The advantages of the procedure include customs and tax incentives for businesses and investment, including foreign investment for the state. Free-zone procedures can be available in various types of special economic zones with the exception of some specialized zones, for example, tourism development zones in Russia.

Of the 127 countries surveyed by UNCTAD, 98 have SEZ laws stipulating fiscal incentives, including elimination or reduction of customs tariffs; and 94 have SEZ laws that provide for a special customs regime. This indicates that preferential customs treatment is the most popular tool for attracting investment in special economic zones (Fig. 5).

Fig.5: Investment attraction tools in SEZs (2019)

Source: UNCTAD (2019)

The application of a specific type of preferential customs treatment depends on the objectives of the special economic zone that can vary from FDI attraction, export promotion, to earning foreign currency. Table 2 presents a comparative analysis of the types of preferential customs treatment applied by various SEZs across the Asia-Pacific.

Table 2: Comparative analysis of preferential customs treatment by type of special economic zone in Asia-Pacific

SEZ	Preferential customs treatment options
Technology parks	
PRC: China-Singapore Suzhou Industrial Park (CS-SIP)	duty-free import of raw materials, equipment and components for goods intended for export
Thailand: Bang Chan Industrial Estate	Duty free import of goods
Free trade zones	
PRC: Shanghai Pilot Free Trade Zone (CSPFTZ)	Duty-free import of industrial equipment
South Korea: Jeju Investment Promotion Zones	Exemption from customs duties for 3 to 5 years
Japan: Okinawa Special Free Trade Zone (OSFTZ)	Exemption from customs duties
export-oriented manufacturing zones	
South Korea: Masan Export Processing Zone	Customs duties waved on goods imported for use in the zone.
Philippines: Bataan Export Processing Zone	duty-free import of raw materials, equipment and components
PRC: Shanghai Jinqiao Export Processing Zone (JEPS)	Customs duties on exports are waived
special economic zones (non-specialized)	
Philippines: Philippine Economic Zone Authority (PEZA)	duty-free import of raw materials, equipment, and spare parts etc; customs duties are waived on all exports .

PRC: Shenzhen Special Economic Zone	Taxes are waived on imports that are intended for producing goods for export
Thailand: Narathiwat Special Economic Zone	exemptions on import duties for equipment, machinery and inputs for the development and operation of SEZ.

Compiled by the authors using information from the official website of the special economic zones: China-Singapore Suzhou Industrial Park, Industrial Estate Authority in Thailand, Brief introduction of Shanghai Development Zones, Jeju Investment Promotion Zone, Special Free Trade Zone in Okinawa, Philippine Economic Zone Authority, Jinqiao Export Processing Zone, Incentives in Shenzhen, Guide to investment in the SEZ. Thailand.

In China, special economic zones account for over 80% of total FDI inflows. In Malaysia, nearly 90% of all funds invested in SEZs arrived from abroad. In Vietnam, SEZs account for 60 to 70% of total FDI. Eight percent of all tenants of Myanmar's Thilawa Special Economic Zone are foreign companies, and another 15% are joint ventures with foreign firms. In the other low-income countries in the region, Cambodia and the Lao People's Democratic Republic, special economic zones, too, are the main recipients of foreign investment, accounting for a significant share of total FDI (ASEAN Secretariat and UNCTAD, 2017).

Another key objective of special economic zones is the promotion of exports not only in terms of increasing export volumes, but also in terms of export diversification. Customs incentives are one of the key tools of international trade development: 87% of measures implemented by the G20 economies since 2012 had to do with the facilitation of customs treatment (Gereffi, G., S. Frederick and P. Bamber, 2019). At the same time, some special economic zones that offer preferential customs treatment put forth additional requirements to exporters. For example, in Nepal, 75% of goods and inputs manufactured within a zone must be exported; in Malaysia, goods are produced within a free industrial zone exclusively for export; to be used domestically, goods must be cleared by appropriate authorities. (Sinenko, O., Mayburov, I., Ibragimova, M., 2019)

In many countries, SEZs account for a major share of exports, especially of industrial goods: over 60% in the Philippines; over 50% in Costa Rica, the Dominical Republic and Nicaragua; 31% in Mexico; 20% in Bangladesh; 13% in Colombia. SEZs enabled the countries of the Caribbean and Central America to diversify their exports away from fruits and vegetables. Costa Rica managed to increase the share of goods exported by SEZs in total industrial exports from less than 10% in 1990 to 55% in 2003 (Mayburov, I., Sinenko, O.,2017).

Table 3 presents an assessment of the impact of special economic zones on annual trade growth, the share of foreign value-added in exports and the ratio of foreign direct investment to GDP. As special economic zones tend to grow at the same pace as national economies in the first few years of operation, the performance indicators are ranked by country – five leaders have been identified and comparative data for the Russian Federation are presented. As one can see from Table 3, having special economic zones in a country and the number of SEZs cannot be sufficient drivers of trade and export. For example, China had 2,543 SEZs in 2017, yet its FDI to GDP ration was 12.

Table 3: Effect of special economic zones on key performance indicators of Asia-Pacific countries

Trade growth			**Integration into global value chains**			**FDI**		
Country	Annual growth in sales turnover, 2007–2017	SEZs, total	Country	Foreign value-added content of exports, 2017	SEZs, total	Country	FDI to GDP, 2017	SEZs, total
Laos	18	12	Singapore	62	10	Singapore	397	10
Vietnam	16	19	S. Korea	37	47	Chile	99	4
Cambodia	13	31	Malaysia	35	45	Cambodia	94	31
Mongolia	12	3	Vietnam	32	19	Nicaragua	78	52
Bangladesh	11	39	Thailand	31	74	Vietnam	58	19
Russia	0	130	Russia	9	130	Russia	28	130

Compiled by the authors UNCTAD (2019)

4. The practice of preferential customs treatment within special economic zones in Russia. The Customs Code of the Eurasian Economic Union stipulates a customs procedure applied to the foreign goods and Union goods, under which the said goods are placed or used in the territory of the free economic zone (FEZ) or its part, without paying customs duties, taxes, and safeguard, anti-dumping, countervailing duties, provided that the terms and conditions of placement of the said goods under this customs procedure are complied with and that the said goods are used in accordance with this customs procedure.

Goods eligible for being placed under the procedure for the free economic zone are the goods that are intended to be placed and/or used by residents of the FEZ within the territory of the FEZ for the residents of the FEZ to pursue their business and other activities within the territory of the FEZ [12]
Fig.6 shows which special economic zones in Russia enable their residents to enjoy the customs procedure for the free economic zone.

The procedure for the free economic zone is applicable to residents of all special economic zones in Russia with the exception of tourism development SEZs. There are, however restrictions stipulating that residents of port SEZs must provide security for payment of customs duties and taxes. The security may not be less than:

- 30 million roubles in the case of the warehousing of any goods along with storage of, wholesale or stock-exchange trading in them, including excise goods or mineral raw material;
- 10 million roubles in the case of the warehousing of goods which are not excise goods or mineral raw material, along with storage of or wholesale stock-exchange trading in them;
- 2.5 million roubles when conducting other port-related activity (FTS, 2020).

For the purposes of applying the customs procedure for the free customs zone the Free Port of Vladivostok and the territory of advanced socio-economic development (FCS, 2020) are deemed equivalent to special economic zones.

Fig.6: Application areas for customs procedure for the free customs zone in Russia

The special customs zone regime also exempts residents from paying value added tax on goods imported into Russia. When importing goods from the Eurasian Economic Union, residents do not pay VAT if the goods are placed under the customs procedure for the free customs zone or the bonded warehouse. When importing goods from countries that are not member states of the Eurasian Economic Union, residents are exempt from VAT if:

- the goods are cleared under the procedure for release for domestic consumption after the completion of free customs zone procedure in the Kaliningrad Region SEZ;
- the imported goods are placed under customs regimes of transit, customs warehouse, re-export, duty-free shop, temporary storage, free customs zone, destruction, abandonment and the special customs procedure, as well as when declaring stores;
- the imported goods are cleared under the customs procedure of reprocessing in the customs territory. The tax is not payable if reprocessed goods are imported from the customs territory of the Customs Union within a set timeframe.

Conclusion

Special economic zones are the most common mechanism for reducing the tax costs of businesses and facilitating customs clearance procedures in international trade. Special economic zones account for more than 40% of international trade in more than 160 countries, provide jobs to over 80 million people. This is clear evidence of the role of SEZs in the structure of global value chains. The World Trade Organization posits that digital technologies could boost international trade by a third in the next 15 years, making global value chains faster, less costly and more productive. In this environment, flexible and fast-developing special economic territories are the perfect potential growth areas thanks to the tax and customs incentives and streamlined customs clearance procedures that they offer.

Abstract

The main objectives of this paper were to identify the perceived severity of COVID-19 on students' well-being and learning readiness, and to better understand how students are coping with the present crisis, both in general and in regard to their daily learning activities. Despite the difficulties experienced, the students were optimistic about their future and the university leaders' ability to manage the crisis and provide adequate support to students. Challenges faced by students include difficulty in undertaking online learning due to internet connectivity and available means to communicate. A critical success factor for students to engage in online learning during a crisis is their technological capacity to use online tools. The findings indicate that students reported an average data capacity to carry out online learning but a slightly higher level of accessibility to learn via popular social media apps. Despite the challenges of internet connectivity, students took the effort to use their data capacity to access the learning resources provided by lecturers.

Keywords: Higher Learning Institutions, student learning, learning resources, COVID-19

Introduction

At the outset of 2020, the year in which Malaysia was set to welcome fully developed nation status, the world was struck with the first major global pandemic in a century. By February, the COVID-19 crisis had worsened dramatically, affecting the health and well-being of not only individuals but also the entire higher education ecosystem. Almost overnight, new approaches to teaching and learning for students staying both on and off-campus became a pressing need, one in which Higher Learning Institutions (HLI) were ill-prepared for. To meet this challenge, HLIs require primary data combined with real-time analytics to gain insight into the well-being and learning needs of their students. HLI leaders need to know the most effective ways to innovate and adapt to best support their students and ensure continuity in providing high-quality teaching and learning experiences. HLIs' decisions on how best to continue serving their students should be based not only on the collective wisdom of HLI

leaders but also on data from the students themselves. Real-time data is critical for providing HLI leaders an accurate picture of the situation, resulting in effective responses to the crisis. Hence, the main objective of this paper is to identify the perceived severity of COVID-19 on students' well-being and learning readiness in one of the Malaysian HLIs.

Literature Review

The implementation of social distancing and movement control orders (MCO) in Malaysia and around the world, has minimized student's movements and interaction for face to face teaching and learning (Rapanta et al. (2020). Sahu (2020) pointed to five (5) challenges that HLIs are facing during the COVID-19 outbreak: (1) Shifting from Face-to-Face to Online Classes; (2) Assessment and Evaluation; (3) International Students; (4) Travel Restrictions; and (5) Mental Health. Indeed, the COVID-19 pandemic may have a serious impact on online delivery mode. Here, HLIs should be ready to invest more in effective pedagogical methods with or without the use of online technologies (Capone, Caso, Donizzetti, & Procentese, 2020; Rapanta et al., 2020).

Yang, Tu, and Dai (2020) suggested that positive thinking and resilience could reduce the negative effects of COVID-19 on mental health among college students. Likewise, greater psychological support could help to reduce the mental health consequences of the COVID-19 pandemic (González-Sanguino et al., 2020). Students feel worried that they will be exposed to COVID-19 and unable to carry out their normal activities. Here, managing psychosocial well-being during the COVID-19 pandemic with greater support from the family, community, and HLIs is very important (Ardan, Rahman, & Geroda, 2020).

Methodology

The survey was conducted in collaboration with researchers from INNOVATE Research Centre of Excellence, Universiti Putra Malaysia (UPM), and the offices of the Deputy Vice-Chancellors for Research and Innovation at Universiti Tun Hussein Onn Malaysia (UTHM) and Universiti Pendidikan Sultan Idris (UPSI) The survey was conducted to gauge students' psychological wellbeing, their online and distance learning readiness plus technological capacity at hand, and their confidence in their respective universities' support during the coronavirus (COVID 19) outbreak. The survey aimed to help HLI leaders understand the potential impact of the outbreak on students, providing greater clarity on what kinds of technology and psychosocial support are needed to address their students' needs.

Quantitative and qualitative data were collected through a set of online questionnaires distributed to students through social media, using the online platform Survey Monkey. For the purpose of this initial report, only the quantitative descriptive results are presented. Data were collected during the early stages of the COVID-19 Mandatory Control Order (MCO) period from 26th March to 3rd April 2020. The survey was conducted to capture the state of students' well-being and learning effectiveness during the COVID-19 pandemic which included 6,306 undergraduate and postgraduate students from different faculties within the University. The mean age of the sample was 22 years and the gender makeup of the sample closely followed the university as a whole, as 75.7% of respondents were female and 24.3% were male. Invitations to participate in the survey were sent out through the Student Representative Council and the offices of the Vice Chancellor and Deputy Vice Chancellor for Academic and International.

The online surveys were password coded and secured so that only one respondent was able to access the survey at a time. Data were managed by one of the research team members and kept confidential at all times. All responses were anonymous -- no identifying information was collected. The findings are presented according to percentages, to acquire a general profile of students' experiences during the crisis.

Results and Discussion

Our first concern was to gauge students' perceptions of their general well-being during the crisis. This was obtained through questions about how worried they felt about the outbreak, their perceived difficulties in completing their work, the biggest challenges they faced, how long they could see themselves working under the movement restrictions, and their sense of optimism about the future. As illustrated in Figure 1, the vast majority of students (89.2%) were either very or extremely worried about the impact of the pandemic on them personally. This indicates that the perceived severity of the situation for students was very high. It also indicates a strong awareness of the threat that the outbreak poses to different aspects of their lives.

Figure 1: Impact of Coronavirus on students' anxiety

As shown in Figure 2, just under half of the students surveyed (42%) found it at least somewhat difficult to work during the MCO period, with nearly 20.3% responding that the present work situation was 'very difficult'.

Figure 2: Perceived difficulties working these days

To further understand the particular challenges that students have faced, Figure 3 shows that communication with course mates (62.1%) and Internet connectivity (60.8%) have been the most challenging, followed by having many distractions at home (40.8%). Other significant challenges include limited access to tools or information at home (31.7%) and keeping a regular schedule (27.2%).

Figure 3: Greatest challenges working remotely

Almost one-quarter of respondents cited the challenges of general anxiety about the impact of coronavirus on their lives (24.5%) followed by social isolation (23.5%). Lastly, physical workspace was cited as major challenge by 18.0% of the students surveyed. Of note, 12.7% of respondents indicated that getting enough food to eat was a major challenge. This indicates that more than 1 in 10 students from the institution are finding it difficult to meet basic daily needs.

Probing the findings by gender, the results differed between males and females in two of the challenges. Having too many distractions at home [35.6% (M) to 42.4% (F)] was more of a challenge for female students, while social isolation [31.9% (M) to 20.7% (F)] was a greater challenge for male students. The findings could be pointing to the fact that females often have additional responsibilities at home, making it more of a challenge to find time and space to meet their academic responsibilities. Male students, on the other hand, may find the lack of daily face-to-face interaction with peers outside the home more isolating than female students.

As illustrated in Figure 4, students' perceptions on how long they can cope with the restrictions faced varied considerably. The largest percentage (30.3%) reported that they could continue to work from home for a few weeks. However, 22.8% felt that the situation was not presently sustainable. This was followed by 18.6% who said they could do it for about a month and 14.9% could do it for a week. Only 13.3% reported that if they had to, they could continue to do it for an extended period of three months or longer.

Figure 4: Length of time coping with the situation

Given the above responses, surprisingly, students remain quite optimistic about their future. As illustrated in Figure 5, more than half of the sample (62.1%) felt optimistic about the current situation, where 25.9% reported being very optimistic, and 36.2% optimistic. This finding indicates that in the early phase of the outbreak, students maintained a certain level of resilience.

Figure 5: Impact of Coronavirus on students' optimism about the future

In terms of perceived severity of COVID-19 on their well-being and learning readiness, a majority of students were significantly concerned and found it difficult to work effectively at home or at their campus hostels during the early period of the outbreak. Despite the difficulties experienced, the students were optimistic about their future and the university leaders' ability to manage the crisis and provide adequate support to students. Challenges faced by students include difficulty undertaking online learning due to internet connectivity and available means to communicate. A critical success factor for students to engage in online learning during a crisis situation is their personal technological capacity to use online tools. The findings indicate that out of five stars, students reported an average data capacity to carry out online learning but a bit higher level of accessibility to learn via popular social media apps. This means that despite the challenges of internet connectivity, the students took the effort to use their personal data capacity to access the learning resources provided by lecturers. While the institution has formulated effective policies to respond to the coronavirus (COVID 19) outbreak they can further improve on communication with students to ensure the latter are updated frequently. In light of the survey findings, recommendations are made for administrators, lecturers and students to address student well-being and continuity of learning during the coronavirus pandemic situation.

Conclusion

From the findings, we can draw the following conclusions from the survey that in terms of perceived severity of COVID-19 on their well-being and learning readiness, a majority of students participated in the survey were extremely worried about the impact of the pandemic on them personally and on their learning trajectory. More than half of the sampled respondents also found it difficult to work effectively and to communicate with their peers at home or at their campus hostels during the early period of the outbreak.

An Organizational Resilience Potential Scale within the Hospitality Industry in the face of the COVID-19 in Poland

Tomasz EWERTOWSKI

Poznan University of Technology, Faculty of Engineering Management, 2 J. Rychlewskiego Str., 60-965 Poznan, Poland, tomasz.ewertowski@put.poznan.pl

Abstract

The hotel industry turned out to be severely affected by the COVID-19. Reopening the Polish hotel industry after government restrictions, provides an opportunity to analyze the individual strategies taken by hotels to maintain their operational capabilities. Against this background, resilience as a risk measure used to assess the performance of an organization plays a very important role. The article proposes the Organizational Resilience Potential Scale for assessing the potential of resilience measures such as: redundancy, resourcefulness and rapidity. Additionally, four sub-measures related to the key resilience capabilities of the organization were identified. The survey was based on the questionnaire consisting of 22 questions to measure the potential of resilience. The results of the analyses were referred to risk matrices for individual measures to qualify them to a specific risk category, allowing managers to find out what aspects need to be taken into account to increase the resilience of the organization.

Keywords: Organizational Resilience, Hospitality Industry, Crisis Management.

Introduction

COVID-19 was first identified in China (peak incidence February 13, 2020), and next it spread to neighboring countries (South Korea - peak incidence February 29). Subsequently, the disease began to spread around the world and was recognized as a pandemic by the World Health Organization (WHO) on March 11, 2020. By the end of June, 4.1 million active cases were reported, including several hundred thousand deaths. Most cases were recorded in Europe and North and South America. In Poland, the first case of the novel coronavirus was detected on March 4, 2020, while the first known death was reported on March 12, 2020. By the end of July 2020 a total of 47,469 cases was reported, of which 1,732 people died (www.worldometers.info, accessed 3 August 2020). Analyzing the intensity of the pandemic in Poland on the example of the daily number of infections and comparing with Italy's cases (as of June 30, 2020), we can be cautiously optimistic. This comparison is depicted in Fig. 1. However, we may conclude that we are probably just at the beginning of the recovery phase. Managing such an uncertain situation in hotels, when we have to reckon with the possibility of a recurrence of an increased rate of infection, is even more difficult and shows the gravity of the situation.

Figure 1: Daily new cases in Poland and Italy per 1 mln. Source: European Centre for Disease Prevention and Control, 24 July 2020

The raging pandemic and the subsequent governmental actions have mainly affected the industries vulnerable to this type of threat. One of the most affected sectors in this crisis is the tourism industry, and the hotel industry in particular (Gössling, 2020).

In Poland there are over 2.6 thousand hotels (2 635), approximately 144 thousand hotel rooms, of which 32 percent are those operating under various hotel chains. The structure of hotel guests is 79.6% domestic tourists and 20.4% foreign guests (stat.gov.pl 2020). Before the crisis caused by the pandemic, the entire industry was responsible for 12 percent of Polish GDP. Until March, the industry was stable. Then, as a result of the global pandemic and social distancing rules introduced by the government, the hotel sector recorded a sharp decline in revenues and a real prospect of bankruptcy appeared before many hotels. The situation has become dramatic for the Polish hotel industry (www.propertynews.pl, 22 May 2020). Currently, despite the still unresolved threat associated with the pandemic and the possibility of the emergence of a second wave of infection, many hotels are slowly trying to resume operations and at least partly recover lost revenues (reopen). According to Haywood (2020), if there are no solutions for going back to having a high demand scenario like in the pre-COVID era, and all businesses that serve travelers understand that they have to adjust to the social distancing norms, the business models will have to realign. In such times domestic tourism will be the only hope. Additionally, Rivera et al. (2016) state that the expansion of tourism and satisfaction are directly proportional; tourism activities should be resumed in order to bring back normalcy in society. Basing on prior experience, tourism should return to normal in one to two years once the COVID-19 pandemic is over.

Literature Review of the Hotel Industry's Organizational Resilience

The outbreak of the COVID-19 pandemic has undoubtedly caused a crisis in the hotel industry around the world. In that context it is a very interesting issue to analyze how the branch is vulnerable to that kind of event or rather how resilient it is against a crisis. Defining organizational resiliency for hotels seems to be crucial for organizations to better understand requirements for efficient crisis management and answering the question how to be better prepared in case of this type of emergency.

COVID-19 very quickly began to be compared to the phenomenon of the Black Swan, one which is theoretically impossible, however its course shows it has been an underappreciated phenomenon in terms of safety (Taleb 2007). It was equally quickly noticed that many researchers have previously warned of a global virus, and therefore the current situation should not be assessed as impossible, but only previously underestimated. On the other hand, securing oneself against many different threats is expensive and may prove ineffective for many organizations in the long run. Self-awareness of risk and the ability of an organization to manage their vulnerabilities, and be adaptive and innovative (Aldunce et al., 2014) is a much better solution. We call this ability the organization's resilience. Resilience in the hotel industry also has other contexts, most often it is a systemic, economic and environmental one (Bruneau,

Andrei 2004). The article focuses mainly on the organizational context of hotels. There are many definitions of organizational resilience. Organizational resilience considers physical properties as well as organizational structure and capacities (Cutter et al., 2008, Barroso et al., 2015). Brown et al. (2017) state that a resilient organization should detect unexpected events early and then must develop resilience capabilities to react to the negative consequences of unexpected events and to return quickly to its original state, the one before risk occurrence, or to move to a new best state after being affected by the risk, and continue business operations as efficiently as possible. The root word of resilience comes from the Latin 'to bounce back'. Kapucu, Hawkins, and Rivera (2013) created the Adaptive Resilience Framework in the context of a "community's behavior after the disaster". The model distinguishes between "bouncing back", which uses the engineering resilience approach that emphasizes reconstruction, and the adaptive resilience approach that mitigates harm or utilizes opportunities based on redevelopment. This adaptability makes an organization stronger against crises and works like a vaccination. Organizations need to integrate elements of resilience into their everyday business practices to improve response in the face of adversity (Sawalha, 2015). Organizational resilience in the literature is described through the prism of four key organizational skills (Hollnagel et al., 2011):

a) **responding**, defined as skills and knowledge of what to do and how to respond to regular or irregular disturbances and crises by either introducing previously prepared actions or by adapting normal functioning to a changing situation,
b) **monitoring**, defined as skills and knowledge of what to look for, what could be or become a threat in the near future; monitoring must include both the organization's environment and its own activities,
c) **anticipating**, defined as skills and knowledge of what to expect in terms of development, threats and opportunities in the future, e.g. potential changes, disruptions, pressure and consequences of the mentioned factors,
d) **learning**, defined as skills and knowledge derived from both positive and negative experiences.

These capabilities are illustrated in Fig. 2.

Figure 2: Key resilience assessment skills. Source: own work based on Hollnagel et al. (2011)

Schilari (2013) states that the concept of resilience has been applied in several fields, such as ecology, social and organizational science, psychology, computer science, etc. It is important that the meaning of resilience generally remains similar across applications. However, the application of resilience engineering is usually dedicated to specified industries, but the survey is useful to explain some specific definitions and components of resilience indicators. That is the reason to determine the level of resilience based on the commonly used and applied in technical systems so-called resilience triangle. One of the first examples of the triangle's use was described in a work by Bruneau and Andrei (2004). The resilience triangle presents a decrease in the functionality of the organization (system) due to the ongoing crisis and related damage. The triangle taking into account linear relationships is obviously a simplified model, because in reality we are dealing with curvilinear relationships. In Fig. 3 the curve depicts performance changing over time during a crisis situation. The y-axis refers to Performance – P (i.e. the length of stay or number of guests) and the x-axis refers to time – t from pre-event to resolution. The so-called resilience triangle is formed by vertices at [t_0, P (t_0)], [t1, P (t_1)] and [t_2, P (t_2)]. The slope of the declining section (represented for time $t_0<t<t_1$ by [P(t) – P(t_0)]/t-t_0) of the performance curve provides data about system redundancy. The slope of

the rising section (represented for time $t_1<t<t_2$ by $[P(t) – P(t_2)]/t-t_2$) of the performance curve provides data about system resourcefulness. Performance level $P(t_1)$ provides information about the robustness of the system. Section $|t_2 – t_0|$ describes the speed of overcoming the crisis (rapidity). Section $|t_2 – t_0|$ can be divided into two. The first section $|t_1 – t_0|$ symbolizes the time of crisis escalation from its occurrence to its culmination (dampen time) and often in literature, with very sudden events, it is assumed at 0 (just like the first phase of a crisis situation may not occur at all or last for a very short time). The second section $|t_2 – t_1|$ shows the time after the peak to recover back to pre-crisis level (recovery time). The $P(t_0) – P(t_1)$ value represents the amount of system performance lost or, in other words, the severity of the disruption expressed as a percentage – disruption severity. The area under the curve between time t_0 and t_2 symbolizes the organization's resilience to the crisis.

We can achieve resilience by implementing previously prepared actions or by adapting normal functioning to a changing situation. These actions will allow the organization (system) to adapt to the impact of the disruption. These adaptation options help the system to cope with and recover from a disturbing event in order to return to a predisturbance level of performance as rapidly as possible. Adaptation options can be grouped into four categories: **Redundancy** is the ability of an organization to provide uninterrupted services in the event of a disruption (e.g., having the right number of personnel to replace in the event of infection, having excess space to meet sanitary regimes); **Resourcefulness** is the utilization of materials (human resources, financial, technological and informational) to establish, prioritize, and achieve operational goals (e.g., participation in campaigns promoting stays in domestic hotels, hotel safety certifications – compliance with sanitary regimes); **Robustness** is the strength or the ability of the system to resist disturbance-induced stressors (e.g., no significant financial liabilities, diversification of income). The robustness is not a measure of its own and it is measured indirectly by redundancy; **Rapidity** is the capacity to return the system to a predisturbance level of functioning as quickly as possible (Simonovic, Arunkumar, 2016).

Figure 3: Generic presentation of system resilience. Source: own elaboration based on Simonovic and Arunkumar (2016)

The mathematical calculation of the loss of performance (ρ) can be presented as the area in Fig. 3 between the beginning of a disturbing event (t_0) and the end of the disruption recovery process (t_2). It can be obtained mathematically as:

$$\rho = \int_{t_0}^{t_2} [P(t_0) - P(\tau)] d\tau \;\; where \;\; t \in (t_0, t_2) \qquad (1)$$

where $P(\tau)$ represents the measure of system performance and $P(t_0)$ is the initial system performance level (Simonovic, Arunkumar 2016).

In contrast, the area under the curve between times t_0 and t_2 represents system resilience. Minimizing the value of ρ, i.e. loss of resilience, can be achieved in two ways: min $|P(t_0)-P(t_1)|$ – minimizing the effects of the disturbance or min $|t_2-t_1|$ – minimizing the time necessary to recover to the state before the disturbance. In the literature, reducing the area of the resilience triangle, while maintaining a constant recovery time $|t_2-t_1| \approx$ const. is known as static resilience, which is necessary to recover to the state before the disturbance. However, the reduction in the resilience triangle's area due to a decrease in time (with a constant value of the effects of interference $|P(t_0)-P(t_1)| \approx$ const.) is known as dynamic resilience (Rose 2014).

Materials and Methods

Due to the specific situation during the shutdown of the Polish hospitality industry, the survey was directed at the management of Polish hotels in order to obtain statements describing the potential of resilience to the crisis caused by the outbreak of the COVID-19 pandemic. The data collection procedure was conducted in the period between May 18, 2020 and May 28, 2020. The questionnaire consisting of 31 questions each rated on seven-point Likert-type scales (presented in Table 3) was sent to the Managers of 650 hotels indicated by the number of stars category from one to five (25% of total number of Polish star category hotels). The number of the hotels was in proportion to the number of hotels with the appropriate category in Polish hospitality industry and they were located in all regions of Poland (three-star -340, two-star – 160, four-star – 92, one-star – 44 and five-star hotels – 14). The questionnaire included a cover letter, explaining the purpose of the research. The survey was conducted online. 35 responses were received (three-star -16, two-star – 4, four-star – 12, one-star – 3 and five-star hotels – 0). The response rate was 5,4 %. During the research managers from 35 hotels were questioned, of which full and comprehensive information was obtained in 22 cases. Additionally some questions connected with structure data of the surveyed hotels were added to the questionnaire. The size of the hotel and its duration of operation were used as the study's acceptance criteria (those hotels that have not commenced operations or that have been freshly put into operation were rejected). Ultimately, the sample included 3 and 4 star hotels typical of the Polish hospitality industry. The structure of the surveyed hotels is presented in Table 1.

Table 1: Features of survey respondents

		All	* 3	4 *
Hotels		22	11	11
average years of operation		13.3	15.7	10.8
has additional sources of income from the hospitality sector (accommodation, recreation and entertainment, transportation, food and beverage, other expenditures).		21	10	11
estimated percentage decline in revenues (in the period from March 1 to May 15 compared to the same period last year)	90% -100%	16	8	8
	80% -89%	5	3	2
	70% -79%	1	-	1

The collected data has been coded and checked for correctness and randomness of the answers given. Records indicating random responses and not meeting the test criteria were removed (too short time on the market and insufficient number of employees and the facility class). The STATISTICA 13 program was used in the data analysis.

Methodology for calculating the resilience potential to risks associated with COVID-19 in the hospitality industry

The prepared survey included crisis management practices in the hotel industry, especially those which helped hotels from around the world survive crises (Kim, Chun, Lee 2005), including those affected by the SARS epidemic in 2003 (Tew et al., 2008, Shirali, Mohammadfam, Ebrahimipour 2013). In the current crisis situation in the hotel industry caused by the COVID-19 pandemic, since we are not able to clearly determine at which point we are in this situation; it is currently not possible to measure the resilience of hotels (e.g. lack of t_2). There are only a few methods that specifically focus on how to measure resilience, or rather the potential for resilience, and there is a clear gap when it comes to assessing resilience using quantitative methods (Tew et al., 2008). In this paper the results of quantitative assessment would be considered using a questionnaire. A review of literature has shown that there are three main principles (indicators) and four sub-indicators of organizational resilience, and also there are many different definitions that are accepted by different authors. This article tries to elaborate for these principles a quantitative assessment of the potential of organizational resilience.

The questionnaire consisted of 31 questions. During the analysis the number of questions was reduced (because of correlation and Cronbach's alpha criteria) thus consistency and simplification of measurement was achieved. The questions were then allocated in a selective manner to three main dimensions, i.e.: measure of the potential of system redundancy, measure of the potential of resourcefulness and measure of the potential of rapidity. The scoring of individual response results on seven-point Likert-type scales is as follows:

1. I strongly disagree - 1 point,
2. I disagree - 2 points,
3. I rather disagree - 3 points,
4. I have no opinion - 4 points,
5. I rather agree - 5 points,
6. I agree - 6 points,
7. I strongly agree - 7 points

Measures defined in this way enable us to obtain the resulting data to estimate the robustness potential, which is based on the measure of the potential of redundancy and the measure of the potential of resourcefulness which is based on the measure of itself, and to estimate the potential of total resilience, which is based on the measure of the potential of rapidity.

The questionnaire also provides four sub-measures: a measure of learning ability, a measure of responding ability, a measure of monitoring ability and a measure of anticipating ability. The specified sub-measures can be obtained from the measurement of the potential of rapidity selecting its questions into specific sub-categories (see Table 3).

Results

Table 2 presents statements describing hotel strategies to overcome the effects of a pandemic crisis and lockdown. The overall Cronbach's alpha coefficient of Resilience Potential measurement was 0.79. But the item-total correlation varied. Item-total correlations indicate that in the case of resilience we are not dealing with one single course of action, but rather with many different factors undertaken in various areas by entities from the hotel industry. The goal of our research is to build up a consistent measure of sub-resilience categories.

Table 2: Internal consistency analysis results

No.	Rated Item	Mean	SD	Item-total correlations
1	During the epidemic we minimize expenses - e.g., reduce the number of active elevators and other devices to save energy and operating costs	6.00	1.57	0.19
2	We work closely with airlines, travel agencies and other entities in the hospitality industry in the field of joint marketing and sharing key information	4.55	1.62	-0.03
3	We offer attractive discounts and voucher programs that enable our customers to obtain future services cheaper	5.64	1.43	-0.02
4	We make firm demands to support the industry through dedicated assistance programs	6.36	1.11	0.03
5	We encourage employees to take leave as an alternative to group layoffs	4.95	1.82	-0.01
6	We have limited the employment reduction to the maximum	5.55	1.37	-0.15
7	We have established a competent anti-crisis team to better manage the crisis	4.59	1.75	-0.40
8	We are actively involved in the fight against the crisis in our local community (e.g. ad hoc adaptation of hotel infrastructure and services offered for emergency services)	4.82	1.47	0.13
9	We provide employees with training programs that will help alleviate the impact of a pandemic on the hospitality industry	4.41	1.53	0.26
10	We involve employees in programs in the field of safety and health protection (e.g. disinfection program of the common part of hotel rooms)	6.09	1.44	0.68
11	People in our organization work intensively on the problem until it is resolved	6.00	0.95	0.51
12	We actively monitor the hotel industry in order to recognize emerging problems early	6.27	0.91	0.53
13	We quickly solve problems that appear in our hotel	6.59	0.49	0.56
14	We make difficult decisions quickly	6.05	0.82	0.54
15	We are able to use knowledge in an innovative way in practice	5.77	0.95	0.35

16	We've built strong relationships with others with whom we may have to work in a crisis	5.77	0.90	0.25
17	If key people were unavailable at any given time, there are always others who could replace them	5.18	1.59	0.75
18	There are few obstacles to good cooperation with other organizations	5.18	1.27	0.43
19	We selected areas for monitoring threats and defined indicators characterizing them and the limits of their tolerance	4.95	1.22	0.30
20	Our organization maintains sufficient resources to protect itself against unexpected situations	4.00	1.41	0.32
21	We have clearly defined priorities, which is important during and after the crisis	5.82	0.98	0.42
22	We focus on being able to respond to unexpected situations	5.59	0.98	0.35
23	We plan well to prepare for unexpected situations, taking into account past problems and actions taken by the organization that have contributed to their resolution.	5.32	1.10	0.29
24	We periodically test the effectiveness of our contingency plans	3.95	1.43	0.15
25	In planning, we strongly consider not only current threats, but also potential and future ones	4.73	1.39	0.51
26	In threats we see opportunity and we do not focus on threats and the risks associated with change	4.27	1.32	0.66
27	We believe that it is better to take action that most employees will benefit from and the minority will suffer rather than do nothing	5.64	1.30	0.61
28	We try new activities, tolerating the possibility of errors	5.55	0.78	0.51
29	We analyze the hotel operating context on an ongoing basis (external and internal factors relevant to achieving our goals)	5.45	1.03	0.65
30	We have a comprehensive corrective action plan in the phase of overcoming the crisis	5.14	1.22	0.38
31	We believe that we will survive the crisis and return to the original level of functioning in the foreseeable future	4.86	1.46	0.82

The list of factors presented in Table 2 was used to develop scales of individual resilience dimensions in the hotel industry. Table 3 presents the original and modified list of factors in individual resilience scales in the hotel industry. The original version took into account the dimensions of individual resilience scales identified in the literature analysis. The removed statements were only slightly or negatively correlated with the other statements. In this way a high value of internal consistency was obtained.

Table 3: Subscales of Organizational Resilience Potential

Scale	Original Items list	Reduced list of factors	Cronbach's alpha	Item-total correlations
Potential of system redundancy	1, 6, 9, 14, 17, 20, 23, 24, 31	1, 9, 17, 20, 31	0.77	0.38-0.75
Potential of system resourcefulness	2, 3, 4, 5, 7, 8, 10, 11, 12, 13, 14, 15, 16, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31	10, 11, 12, 13, 14, 15, 16, 18, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31	0.90	0.39-0.74
Potential of rapidity	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31	9, 10.11.12, 13, 14.15, 16.17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31	0.90	0.23-0.81
Subpotential of Learning ability	2, 6, 7, 8, 10, 11, 13, 15, 16, 20, 21, 22, 2324, 27, 28, 29	10, 11, 13, 15, 16, 20, 21, 22, 23, 27, 28, 29	0.83	0.37-0.67
Subpotential of Responding ability	1, 3, 4, 5, 6, 8, 9, 10, 12, 14, 15, 18, 23, 27, 28, 30	10, 12, 14, 15, 23, 27, 28, 30	0.80	0.38-0.65

Subpotential of Monitoring ability	2, 7, 9, 10, 11, 12, 13, 1417, 18, 19. 20, 25. 26. 29. 30, 31	9, 10, 11, 12, 13, 14, 17, 18, 20, 25, 26, 29, 31	0.89	0.35-0.86
Subpotential of Anticipating ability	3, 4, 5, 16, 17, 19, 21, 22, 24, 2526, 27, 31	16, 17, 19, 21, 22, 25, 26, 27, 31	0.83	0.29-0.84

Based on the results obtained, a five-stage risk matrix of resilience was developed, assigning the point results of individual measures to appropriate risk categories. The matrices are depicted in Table 4.

Table 4: Resilience risk matrix

Potentials scales / **Risk levels**	**Potential of redundancy** (max 35 points - min 5 points)	**Potential of resourcefulness** (max 133 points - min 19 points)	**Potential of rapidity** (max 154 points - min 22 points)
Very high risk (0.15-0.34)	5,00-11,99	19,00-46,99	22,00-53,99
High risk (0.35-0.54)	12,00-18,99	47,00-72,99	54,00-84,99
Considerable risk (0,55-0,69)	19,00-24,99	73,00-92,99	85,00-107,99
Moderate risk (0,7-0,84)	25,00-29,99	93,00-112,99	108,00-129,99
low risk (0,85-1,00)	30,00-35,00	113,00-133,00	130,00-154,00

The questionnaire also consisted of four sub-measures: a measure of learning ability, a measure of responding ability, a measure of monitoring ability and a measure of anticipating ability. The specified sub-measures can be obtained from the measurement of the potential of rapidity (see Table 3). The matrix of the risk of resilience for individual dimensions is presented in Table 5.

Table 5: Resilience risk matrix for individual subpotentials.

Subpotential scales / **Risk levels**	**Subpotential of Learning ability** (max 84 points - min 12 points)	**Subpotential of Responding ability** (max 56 points - min 8 points)	**Subpotential of Monitoring ability**(max 91 points - min 13 points)	**Subpotential of Anticipating ability** (max 63 points- min 9 points)
Very high risk (0.15-0.34)	12,00-28,99	8,00-19,99	13,00-31,99	9,00-21,99
High risk (0.35-0.54)	29,00-45,99	20,00-30,99	32,00-49,99	22,00-34,99
Considerable risk (0,55-0,69)	46,00-58,99	31,00-38,99	50,00-63,99	35,00-43,99
Moderate risk (0,7-0,84)	59,00-70,99	39,00-47,99	64,00-76,99	44,00-53,99
Low risk (0,85-1,00)	71,00-84,00	48,00-56,00	77,00-91,00	54,00-63,00

The results of individual potential measures can be classified according to the matrix in Table 4 as moderate risk except for the potential of redundancy which was classified as considerable risk. The complete results of the risk assessment are presented in Table 6.

Table 6: Assessed risk of organizational resilience potential

Scale	Score	Potential level [%]	Risk	Characteristic of a resilience potential
Potential of redundancy	24,45	0,69	Considerable	Static resilience
Potential of resourcefulness	104,09	0,78	Moderate	Dynamic resilience
Potential of rapidity	118.64	0,77	Moderate	Total resilience
Subpotential of Learning ability	67,59	0,80	Moderate	Subtotal resilience
Subpotential of Responding ability	45,82	0,82	Moderate	Subtotal resilience
Subpotential of Monitoring ability	69,09	0,76	Moderate	Subtotal resilience
Subpotential of Anticipating ability	48,82	0,77	Moderate	Subtotal resilience

The risk of organizational resilience potential presented in Table 6 should be assessed by managers of hotels according to the Process for Managing Risk included in ISO 31000 : 2018, thus this standard is applicable to all organizations, regardless of type, size, activities and location, and covers all types of risk.

Discussion

The Organizational Resilience Potential Scale (ORPS) has been initially verified positively through a survey of 22 hotels in Poland. However, it should be noted that the study is not a conclusive effort because of its small sample size. The findings could be incomplete and may not be generalized. For the final validation of the ORPS further studies need to be performed. But because of the dynamic crisis situation the study will provide useful suggestions in the context of resilience to the hotel management. The results of the research show that the potential of static resilience is lower than that of dynamic resilience, but generally the potential is at an average level in the examined hotels (mean scores), and the risk associated with its loss is both moderate and considerable. the results of the surveyed hotels vary and there are those that fare better or worse in the context of resilience. One should take into account the differences between resilience and its potential. An organization can have relatively good resilience potential but in the face of such a serious global crisis it can fail and lose its potential, but on the other hand thanks to its resourcefulness can use it as an advantage. This depends on how the organization recognizes threats and if it sees them also as opportunities rather than risks only. Currently we are past the peak of the crisis, in the recovery phase. During this time, dynamic resilience (represented by the potential of system resourcefulness and potential of rapidity) is very important. Polish hotels, after almost two months of not functioning due to the pandemic, including restrictions imposed by the government, are slowly trying to regain their performance through a series of comprehensive actions described in the survey questions, such as an industry-wide demand for governmental assistance for current expenses, marketing to domestic tourists with a focus on specific attributes of the location, price drop on special offers, government vouchers for tourist services for company employees and sanitary audits of hotels. These activities and the structure of hotel guests (79.6% domestic tourists and 20.4% foreign guests) show that especially in terms of resourcefulness one can be a moderate optimist. In addition, the fact that more than 95% of the surveyed hotels declare operation in at least two branches of the hospitality sector (accommodation, recreation and entertainment, transportation, food and beverage or other expenditures) speaks favorably. On the other hand, unfortunately, we still do not know at what exact stage of the pandemic we are currently at and whether there will be any possible recurrence of an increased rate of infection. How long the recovery time will last may depend on the capacity and resources of individual hotels, the strategy adopted (reactive or proactive), but also on governance assistance and many other internal and external factors. The presented tool allows executives to find out what aspects should be taken into account to increase the robustness and resilience of the organization. It is anticipated that the Organizational Resilience Potential Scale after modifications may find universal application in other industries to assess the organization's resilience potential.

Economic Sanctions as A Means of Influencing International Order as Seen in The Example of The Construction of The Nord Stream 2 Gas Pipeline

Bartosz PACHOLSKI

University of Szczecin, Szczecin, Poland
bartosz.pacholski@usz.edu.pl

Abstract

Sanctions in international law are a significant lever that serves to enforce rules of procedure which the international community perceives as desirable. They involve ensuring efficiency of application of international legal norms, as well as securing interests of actors operating under this order. In the reality of a global economy, particular significance is attributed to economic sanctions. Those who support their efficiency point to the key role of economic impact as a non-military measure, whereas opponents doubt their efficiency as an independent repressive measure and notice burdens associated with the application of economic measures for the authority that introduces them.

The US defence budget act (National Defense Authorisation Act, NDAA) for 2020 adopted at the end of 2019 introduced economic sanctions against operators involved in the construction of the Nord Stream 2 gas pipeline whose second string is to connect directly the Russian Federation with the Federal Republic of Germany. The sanctions affected stakeholders involved in the construction of the pipeline who provided highly-specialised technology necessary to lay gas pipes at the bottom of the Baltic Sea, thus making the company Allseas withdraw from the project, and in consequence halted the work.

The aim of this paper is to analyse the motifs, principles of introduction and effects of application of economic sanctions by the USA with regard to construction of the Nord Stream 2 pipeline. This purpose was implemented be means of the analytical method. The result of the study includes an assessment of the impact of measures applied by the USA on the international economic order and of compliance of decisions that were taken with international law.

Keywords: economic sanctions, international economic law, international relations, Nord Stream 2

Introduction

The decision about building the Nord Stream 2 pipeline which is supposed to be the Russian Federation's second direct gas link with the Federal Republic of Germany has risen controversy among international law actors since its very beginning. The construction of the Nord Stream 1 gas pipeline at the bottom of the Baltic Sea, launched in 2005 and finished in 2011, which bypassed natural transit countries (such as Ukraine, Poland, Belarus or the Baltic republics), was already assessed as a decision that was political in nature. The EU energy commissioner Andris Piebalgs concluded that "(w)e should never have the situation we will have with this pipeline, where one partner country decided a project that is not acceptable to others, not even discussing it" (Beunderman, 2006).

Preparations to start a new investment began in 2012. Nord Stream then informed about the outcomes of its analysis and the economic need and technical feasibility of constructing another gas pipeline at the bottom of the Baltic Sea. An agreement about financing the project was made in the second quarter of 2017. In September 2018, pipelaying operations commenced in the Baltic Sea.

The launch of the investment was responded to with wide international critique. At the beginning of 2018 the US Secretary of State R. Tillerson said that the United States sees the planned Nord Stream 2 gas pipeline between Russia and Germany as a threat to Europe's energy security (Goettig, Kelly, 2018). The critique of the decision to build the gas pipeline also came from the European Commission, Ukraine, Poland and Scandinavian countries.

Cite this Article as: Bartosz PACHOLSKI "Economic Sanctions as A Means of Influencing International Order as Seen in The Example of The Construction of The Nord Stream 2 Gas Pipeline" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

By contrast, the German chancellor Angela Merkel has tried to maintain that the construction of Nord Stream 2 pipeline is a common sense economic project, with no political consequence (Wintour, 2018). The investment's supporters also emphasize that any additional gas infrastructure can contribute to increased supply security in Europe (Goettig, Kelly, 2018). One needs to note here that proponents of the construction of the new gas pipeline see the USA's critical stand as acting in its own economic interest which is supposed to encourage European partners to buy American liquefied natural gas.

The first economic sanctions were imposed by the USA at the end of 2019. The US defence budget act for 2020 included stakeholders involved in the construction which supplied specialised technology necessary to lay gas pipes on the Baltic seabed, thus leading to the Swiss-Austrian Allseas withdrawing from the project and announcing just hours after the sanctions were signed into law that it had suspended its Nord Stream 2 pipelay activities. What is more, in mid-July 2020 the House of Representatives expanded and specified the scope of the sanctions at a rare political consensus of the Democrats and the Republicans.

The aim of this paper is to analyse the motifs, principles of introduction and effects of application of economic sanctions by the USA with regard to the construction of the Nord Stream 2 pipeline. This issue is worth analysing in detail due to the application of a rarely seen procedure of imposing sanctions on an ally. A 2015 public opinion poll showed that roughly seven-in-ten Americans see Germany as a reliable ally, and about six-in-ten Germans trust the United States (Pew Research Center survey, 2015). In light of the above, the decision to impose economic sanctions for the construction of the Nord Stream 2 gas pipeline, which the German government believes to be a strategic infrastructural investment, seems controversial. The result of the study includes an assessment of the impact of measures applied by the USA on the international economic order and of compliance of decisions that were taken with international law.

The essence of sanctions in international law

The concept of sanctions is one of the basic elements of the system of international law, understood as an appropriately ordered set of legal norms. As written by S. Wronkowska and Z. Ziembiński (1997, p. 43), if a given stakeholder is an addressee of a certain norm of conduct then the coercion concerning him involves a prediction that certain harm will be done in response to failure to meet a given norm and such harm is called a sanction for exceeding this norm. This definition, however, should not be transposed onto the ground of international law due to the specific construct of this legal order (absence of an authority or coercion apparatus) and a specific status of entities that both create international law norms and execute them. This is why Bierzanek and Symonides (2005, p. 24) define a sanction in international law as a negative response from the international community that a country which violates norms of international law meets with. The legal scholarship points to a highly differentiated classification of sanctions (Florea and Chirtoaca, 2013, pp. 268-269; Antonowicz, 2015, p. 27; Bierzanek, Symonides, 2005, p. 27). A two-level classification of sanctions according to the division characterised by Cała-Wacinkiewicz (2012, p. 6) seems the most relevant - psychological (public response), retaliation (applied by the aggrieved party, such as retorsion, reprisal, trade embargo) and organized (imposed by a relevant international organ, such as organizational, economic, political) sanctions on the one hand, and non-military (included in Article 41 of the Charter of the United Nations) and military (when the lawful state fails to be restored and the UN Security Council deems these measures insufficient) sanctions on the other. Economic sanctions must be included in the category of retaliation non-military measures. Even though they are a relatively new instrument in international relations, they have now become a common and recurring feature in political interactions between states (Caruso, 2003).

The genesis of economic sanctions must be sought in the search for a way to exercise the interests of international law actors in a less risky or controversial manner than a military intervention. At the beginning of the 20th century it was universally seen as a humanitarian alternative to war. As former US president Woodrow Wilson stated in 1919, "(a) nation that is boycotted is a nation that is in sight of surrender. Apply this economic, peaceful, silent, deadly remedy and there will be no need for force. It is a terrible remedy. It does not cost life outside the nation boycotted, but it brings a pressure upon the nation which, in my judgement, no modern nation could resist." (Hufbauer et al., 2009).

Economic sanctions can be generally defined as measures of an economic - as contrasted with diplomatic or military – character taken to express disapproval of the acts of the target or to induce that to change some policy or practices or even its governmental structure (Lowenfeld, 2002, p. 9). Through their economic impact they are to be a means of

exerting pressure by which the sanction addressee changes its behaviour and adapts to the rules of conduct in line with the intention of the actor applying such an instrument. The basic assumption of their functioning is a belief that altering the welfare of people in the targeted society - whether many with comprehensive sanctions, or few with targeted measures - will somehow generate political changes desired by the "senders" (Jones, 2015).

Economic sanctions may be applied both by an individual country and in an organized form by groups of countries or international organizations (such as the UN or the EU). The scope of their application is wide - they may address individuals, a certain group or the entire country (or countries). As M. Wiśniewska (2005, pp. 31-32) writes, generally adopted sanctions universally include:

- export and import restrictions (e.g. embargo on weapons or technology supplies);
- services-related restrictions (transport by sea or air, specialist industrial services);
- financial restrictions and restrictions concerning equity transactions (withholding transfer of cash to the penalized country).

Legal basis of the USA's application of sanctions

Imposition of sanctions by states and the right to apply retaliation measures are one of the most important possible responses to violations of norms of international law. The United States is the most active country in this respect - the authorities of this country have imposed more sanctions than all other countries in total (Andreasson, 2008, p. 17). Application of economic sanctions has been considered a basis of the concept of foreign relations of the American government at least since President Carter's term, which is motivated by treating this type of activity as in intermediate measure between violence and dialogue (Bradford, Ben-Shahar, 2012, p. 377).

The American political system prescribes that the initiative to introduce sanctions may come from the executive or the legislative. The legal basis of the activity of the president in this regard is the International Emergency Economic Powers Act which gives the president special powers to regulate commerce with regard to a specified threat for a period of one year, unless extended by the president or terminated by a joint resolution of Congress (Masters, 2019). This procedure starts most often with the president's issuing an executive order that declares a national emergency in response to an "unusual and extraordinary" foreign threat. The president may also modify sanctions by means of the executive order.

The Congress may pass acts that impose new sanctions or modify existing ones on its own initiative as part of a standard legislative procedure. Sanctions for the construction of the Nord Stream 2 gas pipeline were adopted in this way. On 20 December 2019 the US President Donald Trump singed the 2020 National Defense Authorization Act for Fiscal Year 2020, which is an annual Department of Defense policy bill aimed at covering measures unrelated to defense (Hessler, 2019). In part S. 1441 titled "Protecting Europe's Energy Security Act of 2019" a decision was taken to impose sanctions with respect to the provision of certain vessels for the construction of Russian energy export pipelines, and for other purposes. The motif for introducing this act was the particular relationship between the USA and Europe and the United States should stand against any effort designed to weaken this relationship. The most important point of the act is a provision according to which entities and persons that provided vessels that engaged in pipe-laying at depths of 100 feet or more below sea level for the construction of the Nord Stream 2 pipeline project, or any project that is a successor to either such project and foreign persons have knowingly sold, leased, or provided those vessels for the construction of such a project would be subject to U.S. sanctions in the form of their U.S. visas being denied or revoked, and their U.S. properties blocked. The bill described the pipeline as a 'tool of coercion and political leverage'.

Effects of introducing economic sanctions with respect to the construction of Nord Stream 2

Some 627 companies are involved in building Nord Stream 2 — among them only two pipelaying specialist firms — Allseas Group from Switzerland and Italy's Saipem (Hessler, 2019). Allseas has deployed the world's largest pipelaying vessel, the Pioneering Spirit, to complete the tube's final offshore stretch and it is this company that was the main addressee of the sanctions introduced by the USA. The new law brought about the expected result - the very next day after the bill was singed Allseas stated: "In anticipation of the enactment of the NDAA, Allseas has suspended its Nord Stream 2 pipelay activities. Allseas will proceed consistent with the legislation's wind down

provision and expect guidance comprising of the necessary regulatory, technical and environmental clarifications from the relevant US authority." Thus, the construction of the pipe line was halted in the moment the investment was 94% ready (Reed, Jakes, 2020).

Introduction of economic sanctions was the subject of wide critique, especially in Germany. Germany's minister of finance O. Scholz considered the introduction of sanctions as "a severe intervention in German and European internal affairs". The head of the SDP in Bundestag R. Mützenich took a firmer position seeing the USA's activities as a blackmailing attempt or proof of treating Germany as "vassals obliged to pay tribute" (Kędzierski, 2019). Whereas according to the Greens' MP J. Trittin Washington "treats Germany as a hostile country". The sanctions are also opposed by the European Union. The spokesman for the European Commission informed about on-going analyses concerning the consequences of American actions - in principle the EU opposes imposition of sanctions on EU companies conducting business lawfully and the EC's goal is to ensure transparency and supervision over the Nord Stream 2 gas pipeline according to unambiguous rules (Kędzierski, 2019).

It seems that despite significant hindering of the process of building Nord Stream 2, its construction will be continued. As soon as the day after the introduction of the sanctions, the group laying Nord Stream 2 also issued a statement. "Completing the project is essential for European supply security. We, together with the companies supporting the project, will work on finishing the pipeline as soon as possible". At the beginning of 2020 political support to the project was once again reassured: the German Chancellor Angela Merkel ensured the Nord Stream 2 will be implemented "no matter what", while President V. Putin added that "Russia is capable of completing the project on its own and that it would be finished either by the end of this year or early next year" (Harper, 2020). Experts agree that Allseas' withdrawal is a serious logistic challenge, but Gazprom has the possibility to use their own (Russian) vessels to lay the remainder of the pipeline. It became possible thanks to the consent given at the beginning of July by Denmark's Energy Agency pursuant to which Nord Stream 2 could use pipe-laying vessels with an anchor, rather than those only with advanced self-positioning technology as outlined in the original permit for the project (The Moscow Times, 2020). Finishing the remaining stretch will, however, take considerably longer because Russian vessels lay pipes at a speed that is approximately three times slower than vessels used by Allseas until the sanctions were introduced (Pallardy, 2020).

Impact of the sanctions imposed by the USA on the construction of Nord Stream 2

Introducing economic sanctions by the USA on entities involved in the construction of Nord Stream 2 was a controversial decision and received as an attack on one of US's closest European allies in Europe. Even though representatives of American authorities criticised the construction from the moment the decision about it was made, no measures other than psychological were taken. It only changed upon President Donald Trump's signing the NDAA at the end of 2019. As A. Mikulska from the Center for Energy Studies at Rice University noticed at the beginning of this year "if only the current sanctions remain in place, Russia would be able to lay the pipeline using its own vessels, though with significant delay." (Harper, 2020).

The American side does not intend to stop at the decisions taken last year. After the Danes agreed to the continuation of the construction of the gas pipeline by Russian vessels, US State Secretary Mike Pompeo announced a reversal to guidance issued by his predecessor Rex Tillerson in 2017, paving the way for further sanctions to be slapped on the pipeline (Mackinnon, 2020). Pompeo expressed a clear message to all stakeholders involved in the construction of Nord Stream 2: "Get out now, or risk the consequences". What is more, as early as in the beginning of July the House of Representatives, at a rare collaboration of the Democrats and the Republicans, passed the amendment to the NDAA. New sanctions would expand existing ones to include companies that support pipe-laying activities, as well as insurance and underwriting services (Mackinnon, 2020). On 23 July the Senate adopted the NDAA for fiscal year 2021. The bill require sanctions against persons or companies that engage in any pipe-laying activities for the construction of Nord Stream 2, that facilitate providing vessels for such activities, or that provide insurance of certain services for those vessels. Now the amendment goes to the Senate which in its proposal wants further extension of the sanctions on support vessels and companies involved in certifying the pipeline once it's complete. Germany's Foreign Ministry responded immediately saying that "it noted with regret US plans to expand sanctions on the Nord Stream 2 and that new sanctions would constitute a serious interference in European energy security and EU sovereignty".

At the same time the pressure on stakeholders involved in the construction of the gas pipeline does not subside. On 5 August 2020 three senators – T. Cruz, T. Cotton and R. Johnson warned the German company that operates the port of Mukran, a key staging post for ships involved in the pipeline's construction, that the company, its board members, corporate officers, shareholders, and employees were at imminent risk of "crushing legal and economic sanctions," including visa bans and asset freezes, if they did not cease their cooperation with the project (Mackinnon, 2020). The German Green party's J. Trittin has called the letter an "economic declaration of war", while Mecklenburg-Western Pomerania's State Premier M. Schwesig has described it as "outrageous" and an "attempt at blackmail" (von Hammerstein, 2020).

A key question remains whether new sanctions will enter into force before the project is completely finished because it is obvious that finishing the gas pipeline without access to port infrastructure will be impossible. As rightly noted by Reed and Jakes (2020), Washington could still cause more delays and raise the costs for Gazprom, but most analysts expect the pipeline to be completed because it is so close to the finish line and because Gazprom needs it to bring gas from new fields it is developing to market. Analyst J. Rangel aptly notices that "they are not going to abandon the project, because they have put so much into it". It is worth noting that despite clear support from the government German companies are also not certain about the possibility of finishing the construction. The Düsseldorf -based energy company Uniper which co-finances the construction of Nord Stream 2 admitted in a periodic report published at the beginning of August that due to the growing threat of US sanctions they see the likelihood of this project failing (Widzyk, 2020). To date Uniper has invested EUR 950 million in the construction of the gas pipeline.

Determination of both sides seems high and it is difficult to prejudge today whether the economic sanctions imposed by the USA will manage to hold back the start of operation of the new gas pipeline. As rightly noted by K. Book (Mackinnon, 2020), "The race then is between a slow pipe and a slow sanctions bill".

Conclusion

The above arrangements allow a conclusion that economic sanctions imposed by the USA against actors involved in the construction of the Nord Stream 2 gas pipeline significantly complicated the finishing of the new gas pipeline. Allseas' withdrawal led a to a few-month downtime in the works, the need to modernise Russian vessels in order to adapt them to the requirements of specialist operation of laying pipes at the seabed and postponed the final date for finishing the investment. One of geopolitical outcomes also includes a new transit agreement between Russian Gazprom and Ukrainian Naftogaz which ensures the flow of gas through Ukraine for the next five years (Jakóbik, 2019). The Ukrainian side remains one of the biggest critics of the new gas pipeline fearing significant decrease in the amount of gas transmitted through their territory after the launch of Nord Stream 2.

The assessment of legality of introducing the sanctions from the perspective of international law remains a subject of dispute. As has been mentioned earlier, the very title of the act introducing the restrictions (Protecting Europe's Energy Security Act) and the preamble specifying the allied relations between the USA and Germany is to confirm that the aim of the sanctions policy is Russia's dominant position as the main supplier of the raw material for Europe. Americans fear that in consequence this may lead to the entire European energy sector being dependent on political decisions taken in Moscow. Senator T. Cruz has even called the pipeline "a critical threat to America's national security" (Reed and Jakes, 2020). Many commentators also point to another factor which causes such great motivation of the USA to prevent the launch of the new gas pipeline - the real objective is to obtain the market for American liquefied natural gas (LNG) (Widzyk, 2020). As R. McNally says (Reed and Jakes, 2020) "We want them to buy from us, not the Russians".

There are no doubts on the German side as to the legality of economic sanctions applied by the USA. H. Mass, the German foreign minister, has stated: "with its announcements on measures that also threaten European companies with sanctions, the US Administration is disrespecting Europe's right and sovereignty to decide itself where and how we source our energy. European energy policy is decided in Europe and not in Washington. We firmly reject extraterritorial sanctions" (Maas, 2020). Moreover, Germany's Energy Ministry said in an email to the New York Times that it considered secondary sanctions a violation of international law (Eddy and Erlanger, 2020).

When assessing compliance of the economic sanctions applied by the USA with norms of international law one needs to point out that despite numerous attempts to codify international responsibility this field has not been regulated so far. Universally acknowledged principles of responsibility of international law actors have been developed over the

years by legal commentators and judicial decisions and the achievements of the International Law Commission are most important in this regard (Czapliński and Wyrozumska, 2014, p. 735). They demonstrate that sanctions applied by states are only justified where they are imposed against a country which first violated international obligations. Even though the sanctions concerning the construction of the Nord Stream 2 gas pipeline do not target Germany or Russia directly, their main recipients include European companies which conduct legal activity. This leads to a conclusion that Americans, by means of targeted economic sanctions, want to ensure implementation of its international policy, including energy policy, in Europe. Such action cannot be deemed compliant with international law, especially with regard to a close ally. As aptly noted by K. Westphal (Eddy and Erlanger, 2020), Washington is substituting sanctions for foreign policy and weaponizing interdependence.

The above allows a conclusion that economic sanctions imposed by the USA against the construction of the Nord Stream 2 gas pipeline cannot be considered actions in compliance with international law. An attempt to force the implementation of geopolitical interests by repressive measures cannot be assessed positively regardless of how the motives and outcomes of the decision to lay a new gas pipeline are assessed. In place of this it is suggested that the American side should consider introducing conditional sanctions which would be applied if concerns as to the possible manipulation by Russia of supplies of natural gas to Europe were confirmed.

E-Access to Public Information in Poland In the Context of Cyber Threats

Dominika SKOCZYLAS

University of Szczecin, Szczecin, Poland
dominika.skoczylas@usz.edu.pl

Abstract

The globalization process and the development of information society have had an indispensable impact on expanding the scope of e-access to public information. Unfortunately, information and communication systems are at risk of various types of cyber threats.
The aim of the paper is to present the concept of universal e-access to public information as part of e-government, taking into account legal regulations in force in Poland. The study will characterize the benefits and threats associated with managing e-information by administrative bodies. The paper provides answers to questions about the aspects that must be closely looked at by public administration when information and communication tools are used in order to be able to ensure transparency and accessibility of public information and security of information processing on the Internet. The research verifies the hypothesis according to which e-access to public information is a basic factor that promotes the principles of e-participation and e-democracy. However, noticing the increasing activity of cyber offenders, optimal organizational and legal solutions need to be created that will ensure cyber security of the information processed in e-repositories.
The study includes characteristics of e-government in the context of managing public information in information and communication systems. Additionally, types of cyber threats that e-access to public information is exposed to are presented on the example of Poland. In order to verify the research hypothesis, regulations concerning network security, e-services and e-government are analysed. The method of interpretation of applicable law and legal comparison methods are employed in the study.

Keywords: E-Access to Public Information in Poland, Cyber Threats, E-Government, Cyber Security.

Introduction

Advantages of e-communication have been recognized and appreciated in the sector of managing public information. Public authorities play the role of the administrator (Sasvari, 2012, p. 35). Innovative technological solutions made it possible to transform the traditional way of making information available into a new type of electronic administration (e-government). E-government also plays a regulatory role involving specification of relations between the sender (administrator-official) and the recipient, e.g. an applicant-citizen or another official. Public information may be given externally or as part of internal administration structures (Romaniuk, 2016, p. 84). Its basic advantages are that the transfer of the message is quick, simple and up-to-date.

Given the positive aspects of using means of electronic communication in public administration and the needs of information society for permanent access to public information, one cannot leave out threats associated with e-access to public information. Security of e-information may be understood in a very broad manner, i.e. as security of computer systems and software and as security of electronically processed data. Ensuring availability of information, maintaining integrity and authenticity of data is a challenge for e-government. Cyber security of e-access to public information also includes protection of critical infrastructure and information and communication resources (Ganczar, 2017, pp. 85-85) and resistance of systems in which e-information is processed to attacks of a cyber-criminal nature.

It is worth noting that in the case of specifying principles of e-access to public information, one needs to take into account technological solutions, requirements of information society and ensuring security on the web. Rules of e-participation and e-democracy cannot be fully implemented if cyberspace is insufficiently protected. Cyberspace threats may result from inadequate application of ICT (hardware failures, disruption of critical infrastructure) or they may involve cyber-attacks. In the latter, assessing whether a cyber-attack will occur is extremely difficult because, in principle, it is unexpected and anonymous.

Electronic Administration and Managing E-Access to Public Information

Producing and storing information, its processing and practical application are important to information society. Access to information encourages social development, education, implementation of principles of free market economy or friendly administration (Goban-Klas and Sienkiewicz, 1999, p. 43). Universal application of means of electronic communication has had a positive impact on access to public information, ensuring an easy and quick method of remote communication. Information and communication technologies (ICT) allow automatic gathering and processing of unlimited amounts of e-information. An adequately adapted ICT infrastructure that allows constant transmission and updating of information and software that secures data against unauthorised activity of third persons enable full implementation of principles of informatization (Żelazny, 2015, p. 10).

Ensuring universal access to public information is currently the main task of public administration. Adopting an interdisciplinary meaning of public information, it needs to be pointed out that it is "a transferable good that reduces uncertainty" (Szpor, 2016, p.104). Information is a value recognized by society, to which each citizen should have unrestricted access. Depending on regulations adopted in a given state, it may concern a diverse scope of public affairs. Access to public data may also vary and be restricted to a lesser or greater degree. Article 61 of the Constitution of the Republic of Poland of 2 April 1997 (Dz. U. (Journal of Laws) of 78 item 483 as amended, hereinafter: Polish Constitution) emphasized the principle of transparency of public information, which is applied also to electronically processed information. It involves granting citizens a practically unrestricted right to information about the activity of organs of public authority. Specification of the Polish Constitution is provided for in the provisions of the act of 6 September 2001 on access to public information (Dz. U. (Journal of Laws) of 2019 item 1429 as amended, hereinafter: API).

A report from Statistics Poland (GUS) shows that the percentage of people in Poland aged 16-74 who use services of public administration by means of the Internet rose by 4.9% compared to 2018 to amount to 40.4%. A growing trend may be observed in the question of access to broadband Internet for 2019 when 83% of households had it. When it comes to e-government services, the number of downloaded and submitted forms went up in 2019 compared to 2018: downloads - 24.6%, up by 2.5%, submissions - 31.4%, up by 6.8%. The demand for searching for information on public information websites grew slightly, 24.4% in 2018, 24.9% in 2019 (GUS, 2019, pp. 1-3).

Modernisation of public information made it possible to shape a new level of implementation of the principles of transparency, clarity and availability of public information by using ICT solutions for this purpose (Burczyński, 2011, p. 29). A positive aspect of informatization of public administration in Poland consists in the fact that by implementing IT tools it was possible to ensure, in principle, unrestricted electronic access to public information and cases examined by public authorities (Werenowska, 2018, p. 313). The applicants willingly use basic sources of making public e-information available - the Public Information Bulletin, the official information and communication gazette (Article 8(1) API) or services of the ePUAP platform - an electronic platform of public administration services.

Regulations of the EU law are not without significance in reference to legal basis of e-access to public information. Both the cyber security policy and functions of e-government are emphasized. Ensuring resistance of ICT infrastructure, implementation of the principles of a digital single market, universal and transparent provision of information, interoperability of services and counteracting digital exclusion are basic EU principles that allow full e-democracy and e-participation in public life (Banasiński, 2018, pp. 45-47). Next to principles resulting from the Digital Agenda for Europe or the Digital Single Market Strategy, the essence of the concept of universal access to public information as part of e-government may be read by using the content of EU e-government action plans. The European eGovernment Action Plan 2016-2020 clearly states the benefits of e-government. They include i.a. support for administrative processes, improving the quality of services and increasing internal public sector efficiency. It is emphasized that digitalization of the administration sector supports interactions with citizens, reduces the costs of operation of offices, and makes the procedures faster, more efficient and transparent. For the Polish legislator it primarily means that creating a relevant system of managing public e-information requires introduction of principles of e-government.

Transparency and accessibility of e-information as part of e-democracy and e-participation

The use of ICT in order to provide information gratuitously allows increased access by automation of remote transfer of information, which needs to be seen as a positive fact. Simplicity and speed of electronic communication allows

effective management of information, contributes to increased satisfaction among citizens and facilitates improvement of information and regulatory activity of public authorities. Transparency of public e-information is the main principle of e-democracy and e-participation (Fang, 2002, p.4). Benefits associated with managing e-information by administrative bodies are noticeable both for officials and citizens. For the former, they facilitate technical and organizational improvement of providing public information, reduce the time of handling matters, improve efficiency and effectiveness of the message, reduce costs of providing information, ensure automatic activities and correction of information and thus its authenticity, and reinforce the image of a friendly and open administration (Śwital, 2020, pp. 960- 961). In turn, what is essential for citizens is the aspects of universal, unrestricted and fast e-access to public information as well as the possibility to exercise rights in terms of obtaining public information or co-participation in public debate implemented by means of electronic communication (Jastrzębska, 2018, p. 53).

E-participation and e-democracy as part of e-access to public information is possible thanks to implementing relevant solutions that guarantee security of online information processing and at the same time transparency and availability of public information. Therefore, a question arises: what aspects need to be looked at closely when public administration uses ICT tools so that e-access to public information remains undisturbed? First of all, it is key to apply technically best security mechanisms and procedures thanks to which only the information administrator will have control over providing, changing or updating it. He will also ensure confidentiality and integrity of the provided data. His duties will involve protection, supervision and monitoring of access to information so as to prevent unauthorised persons from disrupting e-access. Administrators should introduce a relevant e-information security policy and institutionalized protection principles and practices (AlKalbani et al, 2017, p. 107). E-information security strategies should provide the manner of conduct in the event when cyber security of e-information is at risk of third person activity (cyber-attack) or a technological failure (software failure, system failure). It is a duty of organs of public administration responsible for adequate e-access to public information to respond to all types of threats, regardless of whether they are of a web incident nature, involve activity of cyber criminals, consist in critical infrastructure failure, prevent identification or authentication of details of the person applying for e-information or allow disclosure of confidential information or personal data.

Cyber threats to e-access to public information as seen in the example of Poland

Network disturbances resulting from inadequate use of security software or systems or inadequate operation of them might prove particularly dangerous. Naturally, they are problematic. However, attacks of cyber criminals involving unauthorised access to ICT systems managed by organs of public administration may have much more negative consequences. The effect may involve serious disruption of the operation of e-platforms or infrastructure, distortion, capture or modification of public information, reduction of freedom of access to public information or disclosing personal data or classified information (Więcaszek-Kuczyńska, 2014, pp. 213-214). An attack on confidentiality, integrity and availability of information is a serious threat in the context of cyber security of public information and personal data.

When examining the Polish case, it may be concluded that cyber-attacks did not bypass platforms managed by public administration. In 2012 cyber-attacks were made on servers that host websites of i.a. the Office of the Sejm (lower house of parliament) of the Republic of Poland, the Office of the President of Poland, Ministry of National Defence and the Chief Police Headquarters. In 2014 data from the ICT systems of the Warsaw Stock Exchange was stolen and data of employees of the National Electoral Commission. Currently, it is not only public information of organs of government administration or state institutions that are subject of attacks of cyber criminals. Local government units are becoming an attractive target because they most often have less secure ICT systems and limited possibilities to predict or resist the attacks. For example, the ICT system in a town of Kościerzyna was hacked in 2019 and files and information managed by the municipality office were encrypted. In essence this paralysed the work of the office, it was impossible even to publish public information or pay benefits (Kaczmarek, 2019). Cyber threats to ICT systems in the context of disrupting access to public information cause a violation of basic information rights, of the principle of transparency of public life and of the implementation of the principles of e-democracy, regardless of the type of a cybernetic attack (which might involve distribution of malware (viruses, Trojans or worms), breaking into ICT systems, blocking access to platforms, encrypting data, unauthorised data change, hardware damage or disrupting operation of e-access to public information) (Kesan and Hayes, 2012, p. 442).

The above examples of cyber-attacks cause numerous irregularities in e-access to public information, falsification or unauthorized change of e-data or blocking access to it. They may infringe the protection of privacy, classified information or personal information. Thus, they make it practically impossible to enjoy the possibilities of e-government's remote information services. With regard to processing information in ICT systems, technological threats, next to typical computer offences, may consist in the introduction of the so-called disinformation offensive - unlawful interference in e-data. It may result in unauthorized disclosure of data or, what is worse, manipulation of public information and in effect - serious disruption to e-access to public information (Zawieja-Żurowska, 2019, p. 134). A much more serious result of violation of e-transparency and e-access to public information will involve impossibility to use key services and digital services provided by electronic administration. To be more specific, that is when the cyber-attack concerns ICT infrastructure.

Poland, noticing the problem of disruption of e-transparency and e-access to information, adopted specific organizational-legal solutions with regard to cyber security. Detailed guidelines are listed in the act of 5 July 2018 on the national cyber security system (Dz. U. (Journal of Laws) of 2020 item 1369), which implements the NIS Directive into the Polish legal order (OJ L 194, 19.7.2016, p. 1–30). The provisions of the Cybersecurity Strategy of the Republic of Poland are also significant. The act on the national cybersecurity system in particular highlights cybersecurity of cyberspace in the aspect of resistance of ICT systems against actions which may cause violation of confidentiality, integrity, availability and authenticity of data (information) processed in the system of e-services. Lowering the quality or disrupting the implementation of a public task by a public entity - that is an incident within a public entity - may be treated in categories of a threat to e-access to public information (Banasiński and Nowak, 2018, pp. 160-161). Depending on the organization, it is also essential to introduce e-security policy that addresses the security of the entire ICT system, its development, configuration and changes and the security of processing information and making it available in an electronic form and rules of procedure in the event of a cyber-threat (Suchorzewska, 2010, p. 281). The above encourages a conclusion that an optimal solution will involve developing a security policy for e-access to public information based on the assessment of existing cyber threats and their potential effects for the functioning of e-government. Protection of e-repositories with classified information or sensitive data is a challenge. This is why Poland, noticing the problems of cyberspace, tries to introduce an optimal organizational and legal framework for the security of ICT systems. Cybersecurity of individual e-registers managed by public administration is an essential element of the national strategy (Tumkevič, 2016, p. 83).

Conclusions

The above findings demonstrate that managing access to public e-information is a basic responsibility of public authorities that stores it. Therefore, the concept of universal e-access to public information as part of e-government is worthy of approval because it is the administrative entities that, firstly, are able to ensure uninterrupted access to information and, secondly, create an organizational and legal framework of cybersecurity. In the case of using ICT tools by public administration, one must point to the aspects of ICT security that involve introduction of relevant software, hardware maintenance and appropriate information archiving, as well as to cyber threats that most often involve hacking or cyber-crimes. A positive mark must be given to activities in terms of application of technically best security mechanisms and procedures, supervision of making information available, changing or updating it, and ensuring confidentiality and integrity of e-information. As results from the above analysis, taking care about the above-mentioned elements will ensure security of processing information on the web, and at the same time transparency and availability of public information.

In an extraordinary situation where the source of the attack in not known and sudden, especially if it is of a cyber-crime nature, the public information administrator should take all necessary legal measures allowing uninterrupted access to public information. It may be noticed i.e. in Poland, where the legislator introduces at the national level detailed regulations concerning the processing of public information and the protection of the cyber space environment. Promotion of relevant models of behaviour is also praiseworthy, which is why development of appropriate policies of network security within the organization is crucial. E-access to public information is a basic factor promoting the principles of e-participation and e-democracy. However, noticing the increasing activity of cyber offenders, optimal organizational and legal solutions need to be created that will ensure cyber security of the information processed in e-repositories.

To sum up, the above-mentioned solutions demonstrate that in the time of development of new technologies and information society ensuring web security in the aspect of a service involving e-access to public information provided

for by e-government results in a need to regulate in detail the scope of protection of processing public, personal data and classified information in e-repositories. The activity of public e-information administrators in terms of creating special management policies also is approval-worthy. Therefore, as a postulate, administrative entities should pay particular attention to follow-up actions and also to the preventive aspects of controlling cyberspace in order to frustrate cyber-attacks that hinder the implementation of the principle of e-democracy and e-participation in public life.

Evolution of The Content of The Right to Be Forgotten in The Internet

Ewa MICHALKIEWICZ-KADZIELA

University of Szczecin, Szczecin, Poland
ewa.michalkiewicz@usz.edu.pl

Abstract

The right to be forgotten was first granted to citizens of the European Union by the judgement of the Court of Justice of the European Union, and then grounded by means of an EU regulation - a universal act that does not need to be implemented and is directly in force in the Member States. The aim of the paper is to show the evolution of the right to be forgotten throughout the years. Outlining the content of this right in 2014 was helpful in this respect, when the Court of Justice expressed its opinion on it. So was comparing it with the content of this right in a 2016 regulation. The analysis is supplemented by a discussion on the most important theses of a 2019 judgement of the Court of Justice which still modifies the final shape of the right to be forgotten. Therefore, the method of interpretation of applicable law is the dominant method employed in this study. As a result, it became possible to specify the full content of the right to be forgotten, the most frequent practical problems that occur when enforcing this right and specific obligations imposed on data controllers. The analysis allows a demonstration of the influence of EU regulations on how courts in Member States adjudicate currently in the cases of protection of the right to privacy. Moreover, an entirely new impact of the right to be forgotten in the aspect of creating one's own identity has been pointed out.

Keywords: Internet, right to be Forgotten, New Technologies, Human Rights.

Introduction

The right to be forgotten functioned already for some time in the legal space of European countries, though it did not have a uniform shape. In France for example it was known in the context of erasing information about the criminal past of convicts who served their sentence and successfully completed the social rehabilitation process (Rosen 2012, p. 88). With time, however, the idea of erasing data that could in various situations violate people's privacy gained significance. Particular interest was ignited by the possibility of applying this right in reference to the digital reality, in which this information is disseminated on an unprecedented scale. The European Commission (EU), by taking up this subject-matter, began works on establishing a legal framework of the right to be forgotten (de Terwange 2013). Nevertheless, before it happened in 2014, the Court of Justice of the European Union issued a breakthrough ruling in which it granted citizens of Member States the possibility of invoking this right and requesting that controllers remove links to search results which could violate their right to the protection of personal data.

The said ruling was to be breakthrough, however, in real life it only stated to whom the order of protection of personal data against its unlawful use is directed. As a result, it turned out that the addressees of this order often do not know how to act in order to implement the CJEU guidelines and instead they apply various procedures of data removal, guided by their own conscience only. All these uncertainties caused the need to introduce relevant legal regulations which would order these issues. However, along with the emergence of detailed legal regulations, the original content of the right to be forgotten, outlined in the CJEU judgement, evolved too.

This study focuses on citing the original content of the right to be forgotten and discussing the most frequent problematic issues in terms of its implementation. The primary content of this right was also compared with its new scope, supplemented by the added regulations. In turn, analyses of the CJEU rulings of 2014 and 2019 and the EU act of law - the General Data Protection Regulation - outline the background for further reflections on the contemporary essence of the right to be forgotten and its role in the national judicial decisions and in shaping its own identity.

Judgement of the Court of Justice of the European Union

The right to be forgotten on the Internet was constituted in the European system of international law by the judgement of the Court of Justice of the European Union of 13 May 2014 (Google Spain SL *v.* M. González 2014) as a derivative of the right to privacy. The case in question began when Mario Costeja González filed a complaint at the Spanish data protection agency, AEPD, against Google's Spain division. The applicant said that after typing in his personal data into the Google search engine one of the first results display information about announcements regarding the forced sale of his properties, which was supposed to be held more than 10 years earlier, though never did. Not only does this information negatively influence his reputation, but also hinder his operation of his business activity. Given the above, Mr González, invoking protection of his privacy, in particular of his personal data, requested that the said information in search results be permanently removed. The Spanish data protection agency, AEPD, approved his claims for a violation of the right to privacy and ordered that the old information be removed. However, the Spanish division of Google decided to appeal against this decision in court. In turn, the court examining the appeal issued a legal question to the CJEU (Jaaskinen 2013).

When adjudicating the case, the Court of Justice decided against the opinion of the Advocate General and also lay down new rules of interpretation of legislation, which thus far had regulated matters related to search engines and the Internet. It concluded that everyone has the right to request that the controller remove information about them, that everyone who operates data, even in the form of search results, is a controller of such data. This decision was supposed to be breakthrough as it was to guarantee everyone the right to deal freely with their personal data, even if it was made available by third parties.

The mechanism of removing personal data protected under the law was supposed to be simple. The person whose data was made available requests that it should be removed and every operator who processes such data should comply with such a request. Adoption of such a broad interpretation of the right to be forgotten resulted in the announcement of the new age of the Internet immediately after the discussed decision was issued. The said age was initiated by enabling us to independently administer any available information about us. However, with time, these hopes were verified.

Original content of the right to be forgotten

An in-depth analysis of the decision issued by the CJEU demonstrated that the entity requesting protection of his personal data, cannot, nevertheless, administer it freely. A final decision on whether the given information should be left in the digital space is taken by the processor. It is up to him if the produced content is deemed "inadequate, irrelevant or no longer relevant, or excessive" (Google Report 2019) and removed, or whether it will be left there due to a valid social interest. What is more, it turned out that the universally used term removal of personal data in fact only means the order to delist websites where the personal data under protection is placed. This means that the source data will still be left in the digital space where it was originally published or in places where this information was reproduced (Sikorski 2017, p. 55). Therefore, a consequence of the use of the right to be forgotten does not consist in complete removal of submitted personal data, but making it more difficult to find it by eliminating links that may lead to this data (de Terwangne 2013, p. 6).

The subject-matter of using the right to be forgotten afforded to everyone became much more complex than first commentators of the judgement predicted. The Court of Justice, apart from confirming that such a right is afforded to us and presenting who, in the meaning of the provisions of the EU law (Directive 95/46/EC), may be treated as a controller, did not establish any rules on the basis of which the right to be forgotten ought to function. As a result, difficulties in executing the said right have occurred in practice.

First, a problem related to the need to establish common premises appeared, where on the basis of such premises the controller will decide about removing or leaving such data. Guidelines in this respect were first drawn up only by Google and for a very long time they had an internal character. This meant that all requests submitted under the right to be forgotten were examined by internal teams of lawyers of individual divisions of Google. In the first days after issuing the judgements, individual divisions even held meetings on how to carry out the new obligations imposed on them. During such a session in the Polish division of Google, it was even discussed whether actual delisting is necessary or whether the CJEU judgement can be complied with by moving the said links to the very end of the list of search results (Słowik 2014).

Secondly, no official procedure of removing personal data was established which is why the appeal procedure in each country could be subject to different rules. This gave rise to certain claims of unequal treatment in individual Member States of the European Union. Lack of procedural unity also caused uncertainty as to whether internal rules introduced by Internet corporations will truly implement the CJEU's will.

Thirdly, the right to be forgotten was restricted with regard to persons participating in public life, thus it was deprived of the nature of an absolute right. It mostly concerns the fact that removal of certain content should not violate the right to information. Critics pointed out, however, that taking care to protect one right, we fail to notice that the mere granting of the right to be forgotten violates the essence of freedom of expression (Lee 2016, p. 544; Newman 2015, p. 507). The possibility to have any information removed will make it more difficult to express one's opinion on a given subject honestly and unrestrictedly.

Evolution of the content of the right to be forgotten

Entering the right to be forgotten in the act of given law, that is the Regulation on the protection of personal data of 27 April 2016 (EU Regulation, 2016/579 - GDPR), provides a certain solution to the discussed problematic issues. Article 17 of this act presents situations in which "the data subject shall have the right to obtain from the controller the erasure of personal data concerning him or her without undue delay and the controller shall have the obligation to erase personal data without undue delay". The catalogue of premises presented in the said article is of a closed nature, which means that only in these situations can one request that their personal data be erased. These include, for example, situations where the personal data is revealed without prior consent from the data subject, where the data subject gives their consent but then withdraws it or where the data is unlawfully processed.

Placing such regulations in an EU act of law which is directly applicable in European Union Member States and does not require implementation eliminated the problem of the lack of premises on the basis of which the controller examined requests of individual persons that their personal data be erased. At the same time, the possibility of direct application of the provisions of the regulation eliminated the lack of equality as to application of various appeal procedures in cases related to appeal against refusals to have one's personal data erased. Ultimately, Article 17(3) GDPR also established clear and precise premises concerning situations in which the right to be forgotten may be restricted or suspended, e.g. where the right of freedom of expression and information must be protected; where data processing constitutes an implementation of a legal obligation vested in the controller; where data processing is necessary to exercise or defend legal claims.

Given the above, it might seem that the right to be forgotten has gained a relevant legal shape and has become a fully enforceable right. However, one must point out that it has come across one difficulty when it comes to the issue of its application - territorial scope of its validity. Since the judgement in Google Spain SL vs. Mario Costeja González, a question about whether the European Union is entitled to demand that the right established by it be effective has been coming up.

Ultimately the doubts were only dispelled in the CJEU judgement of 24 September 2019 in the Google LLC vs. CNIL case (Google LLC *v.* CNIL,2019). This judgement sad that the territorial scope of the right to be forgotten includes the territories of the European Union Member States. In practice it means that the internet search operator is obliged to remove any personal data or to hinder access to it only in those versions of search engines which operate in the EU countries. Still, though, it will be possible to find this information in search engines which operate in other countries.

The above judgement expanded the possible behaviour of controllers with making it more difficult to access information from searches, and also outlined the area of enforceability of the right to be forgotten - it is only the territory of the European Union. The content of this judgement could not be different, of course, since it is difficult to expect internet corporations, operating e.g. on the territory of the United States, to comply with the law constituted by an international organization to which they do not even belong. Theses of this judgement only show that exercising the right to be forgotten has its limits. Despite declarations from some countries (which come from other continents too, e.g. India), which, inspired by the operation of the European Union, themselves want to introduce on their territories similar regulations that protect personal data (Abishek 2019), the scope of application of the right to be forgotten is limited. This of course results in the weakening of the protection of personal data, which was granted to each person on the basis of the generally applicable EU law.

Such a state of affairs causes doubts concerning the validity of granting EU citizens this tight that cannot be fully implemented since relevant legal tools for it are missing. However, at the same time this forces the strive to establish international cooperation between countries located not only in Europe but also on other continents. Establishing such cooperation is, however, very difficult given mostly the cultural differences between individual countries (Rosnay, Guadamuz 2017). The discussion on the introduction of the right to be forgotten to the national legal system is currently happening in the United States of America. Adoption of solutions modelled on the EU ones is, however, criticised by opponents of this idea due to the Americans' attachment to the First Amendment of the US Constitution which guarantees freedom of expression and information (Heilweil 2018).

Despite these critical comments, it is worth noting that the right to be forgotten has a great impact on the decision-giving activity of courts of Member States when adjudicating national cases for protection of privacy. In 2018, the England and Wales High Court ruled in the case of a businessman who demanded the removal of Internet links to pages with information about his conviction for a criminal conspiracy in order to falsely account for his real estate sale activities. The court dismissed the businessman's request pointing out that firstly, he is a public figure and secondly, persons who intend to cooperate with him in the future should know about his criminal past, which falls under their right to be informed (D. Heywood, 2019; NT1, NT 2 *v.* Google LLC). In the same year, the Regional Court in Amsterdam ordered Google to remove links to websites on which unofficial "black lists" of doctors operated. The court concluded that a surgeon whose personal data were placed on such a website due to a disciplinary procedure for committing a medical error has the right to request protection of his reputation. The court noticed that placing the applicant on the said lists is like a "digital pillory" which serves to defame doctors. True information about the doctor and the proceedings against him can be found without a problem on the official websites of the Dutch health service. This information, however, is not of a pejorative nature as is the case of the compiled "black lists" (D. Heywood 2019; W.C.E. baron van Lynden te Amsterdam *v.* Google LLC).

Then, it needs to be shown that the right to be forgotten was supposed to become primarily a guarantee of protection of broadly understood privacy and majority of researchers focus on this very aspect. However, in reality, it may be read in a multidimensional way - not only as a protection measure, but also as a creational tool. The possibility to remove information about oneself from generally available Internet sources may be an excellent way to shape one's identity, and at least its individual elements. M. Gonzalez's example supports this thesis and so does the said blurring of criminal sentences. This means that even information that was once legally published but is now outdated can be removed from search results (Korenhof, Ausloos, Szekely, Ambrose, Sartor, Leenes 2014).

Thus, in the case of a possibility of excising the right to be forgotten (where the catalogue of premises that substantiate refusal is closed) may to a certain degree determine what information about us will be available on the Internet and, in consequence, how we will be seen by the society. One needs to remember at that the right to be forgotten covers with its scope only this personal data which has an objective character and on the basis of which we can be identified, therefore limits of creating our identity by using this right have a restricted character. This is also backed up by the fact that each request for removal of personal data is examined individually by controllers according to the GDPR guidelines and their own subjective assessment of it. This is why many studies show that exercising the right to be forgotten should be a last resort, while first one should always think about the consequences of making their personal data available on the Internet.

Summary

The right to be forgotten has evolved significantly in the few years of its operation in the EU legal space. From a fragmentarily regulated order that controllers remove personal data on request, to a right placed in generally applicable provisions of given law. And although at the moment not only the personal scope of this right is known, but its material scope has also been regulated in detail, this right is still not fully enforceable.

Firstly, always when removing specific information or making access to them difficult, the human factor plays a significant role, that is a person who examines a submitted request. Secondly, the right to be forgotten has a specified territorial scope, thus it is valid only on the territory of the European Union. Information that will be removed in EU Member States will still be present in search engines of other countries. Finally, developing a global consensus as to the right to be forgotten seems currently impossible due to cultural differences which divide individual countries.

However, this does not mean that the right to be forgotten is an unnecessary right. In the age of digitalization of life and unrestricted dissemination of information, there must be a fuse which will allow for it to be controlled or possibly removed if it should violate certain social or legal standards. At that, one needs to note that the mere creation of legal rules which on the one hand will secure the right to privacy and on the other will protect the right to be informed and the freedom of expression was incredibly difficult. It is worth pointing out that the right to be forgotten, apart from its typically protective function, may also play a creational function, because by managing one's own data we can also create, to a certain degree, how others will see us.

Abstract

Design and development of medical applications often require a multidisciplinary approach in order to accurately identify the specific needs of customers. Due to the complexity and multiplicity of knowledge and information sources, a structured approach to product design and development of medical applications brings several advantages, specific to the research area, amongst which: standardisation and regulation of preoperative and postoperative medical care of patients, improvement in patient compliance, more accurate medical training materials and devices. The purpose of the current paper is to present in detail a methodology for management and implementation of a research internship as a project that brings together knowledge and competences acquired in medical applications design. The research internship was undertaken within an academic context and environment, based on a structured approach and it applies the basic principles of project management such as project initiation—defining the problem, determining project feasibility by research, planning-monitoring-control, execution and evaluation. This research paper summarizes the background and the purpose of the research internship, describes the process and the methods used to accomplish the tasks by defining the resources, calendar, activity plan and by evaluating the final results at the end of the process.

Keywords: Project Management, Medical Applications, Mandible, 3D Printing.

Introduction

Project management is the discipline which addresses how to initiate, plan, execute, control and conclude the individual or teamwork, in order to achieve specific objectives and key success criteria. Project management involves people able to apply knowledge, techniques, a wide range of skills and tools to meet the requirements of a project. According to Artto A.K (1999) many of the projects that were not completed on time, did not fit in the budget or were not completed to the expected quality, are due to the lack of project management strategy or a project manager able to ensure success by integrating all aspects of the project, bringing together its strengths and weaknesses. Hagan P. (2012) highlighted that the concept of project management is used in a wide array of areas, like engineering, industry, information systems, financial services, medical and health services, commerce, education and training etc.

Payne M.J. et al (2011) underlined that there is little published research and information describing the usage of project management in medical applications due to the pressure of creating an efficient project plan. This entails costs

and time savings as much as possible, but at the same time with appropriate risk management and quality assessment, to avoid affecting the patient's health and wellbeing.

It is a big challenge to bring together improvements of the healthcare system that haven't been tested before and the patients' life, but studies also show that not just once, the approach of project management in medical applications led to the identification of risks and, thus, managing to implement the project without unfortunate results.

In this case, the aim of the research internship was to design and develop an experimental model of a complete edentulous mandibular bone, using reverse engineering and 3D printing techniques. Research timeframe was set at 4 months by the specificity of the academic agreement. The role of the project manager was assumed by an engineering masters' student. Thus, a list of required abilities has been structured to facilitate the implementation of the projects' aim adapted from Hagan P. (2012), as follows:

- Adapt to and participate in change;
- Problem solve in unfamiliar situations;
- Use a system approach;
- Identify strengths and weaknesses;
- Apply appropriate technical knowledge;
- Have advanced problem-solving, analysis and synthesis skills;
- Ability for engineering design and creativity;
- Be able to think and work individually and in teams;
- Listening, influencing, motivating and communication skills;
- Need for continuous improvement.

Unlike commercial projects or curse guidelines, Lopez C. (2010) shows that the project management of an academic research internship is based on two main components: the student's ability to apply all previously acquired knowledge and the skills to understand, analyse and evaluate their own work, submitted throughout the internship. Due to the academic context of the internship implementation, the main project management challenge in terms of resources, tools and techniques used was the structuring and the automation of the process. In terms of innovation, the topic of the internship was considered as the main asset. Nevertheless, the complexity of designing an experimental model of a complete edentulous mandibular bone, together with the limited timeframe and the low medical expertise of the engineering masters' student, made this project a challenge. The current study describes the main project management stages, starting with the idea all the way until developing real medical products, by setting goals, defining key indicators, planning activities, controlling and evaluating the obtained results.

Process Specification and Methods

The research internship was undertaken by an engineering senior masters' student from University POLITEHNICA of Bucharest and it entailed a five-step process flow (Figure 1).

Figure 1: Project management structure adapted from Payne M.J. et al (2011)

The initiation phase represents the answers to few main questions that every project manager must think about such as: Why to create this project? It is feasible? and if so, what it is needed to complete it? Once the project manager got the answers to them all, the project can step forward to the second phase: Planning. The most common method as an answer to all the questions is brainstorming method.

Planning phase, the core of the project management, speaks about creating the team and represents the stage where all the member have to set the main objective of the project, the expected timeframe, budget, individual or group activities, potential risks and backup solutions etc. For the planning stage of the projects, there are several software that can be used such as Microsoft Planner, Windows Primavera etc.

The third phase of project life cycle refers to the execution of all activities defined on the planning stage. The execution is mainly based on the communication and collaboration between all members of the team and each member's sense of responsibility to accomplish the given tasks.
The next phase, monitor and control, represents the responsibility of the project manager to ensure the smoothness of the development of the process in terms of deadlines, costs and efficiency. In order to do it, the project manager can create chat groups, plan meetings or can ask activity reports to each member of the team.

During the last phase, the closure of the project life cycle, represents the simulation of the results and the review of each member's contribution. The results stage can help the project manager to define which were the strengths of the actual strategic plan in order to use them for future projects.

Project Results

Initiation

The project main goal was the design and development of a completely edentulous mandibular bone experimental model by using reverse engineering and additive manufacturing techniques. The developed prototypes aim to be used in academical environment, by the PhD students on the Department of Dentistry, Faculty of Medicine, University of Coimbra, Portugal, as preoperative patterns, in order to simulate the surgeries and so to avoid unfortune mistakes or complications.

As main partners of the project Department of Dentistry, Faculty of Medicine, University of Coimbra, Portugal together with the Faculty of Biomechanical Engineering, Polytechnic Institute of Coimbra, Portugal decided to assign the project idea as an internship stage work to a master engineer student, in the role of project manager and they defined the timeframe as being 4 months.

Once assigned the topic and the main roles, a first meeting of the entire team has been planned, in order to introduce the tools and materials that the faculty provided, the offices, laboratories and workplaces where the student together with the whole team could work during his stage.

Planning

From the very beginning, the main partners together with the project manager set the most important objectives of the project such as: MO (main objective): Design and development of a completely edentulous mandibular bone and five secondary objectives: O1. Research of at least 100 scientific papers within 4 weeks on the current state of the art, O2. Converting medical DIICOM data and developing two 3D mandibular masks (trabecular and cortical), O3. Developing two 3D mandibular molds by the end of the 3rd month of the project time, O4. 3D printing of one trabecular and one cortical mold assembly, O5. Developing at least two final prototypes by the end of the internship stage.

In order to ensure a good life cycle of the project and to reach the expected results, a list of possible risks and their contingency plan has been drawn up, forecasting the weight of each of them and it have been allocated grades from 1-3 to describe the level of importance and the impact that can have it on the project life cycle: 1- Low impact; 2- Medium; 3- High impact. The score was calculated by multiplying the contingency grade with the level and importance, the total score showing up the probability that the project to be feasible. Table 1 shows the risks' forecasting of the actual project.

Table 1: Risk analysis

Risk	Objective	Contingency plan	PI	Weight [%]	Score
1. Failure of the 3D printing equipment	O4	The labs are equipped with more than one printer	1	15	0.15
2. Inability to find suitable materials for the injecting process	O5	The Department of Biomedical Engineering provides basic materials such as foam and plastic in order to be able to test the molds and the methodology	3	15	0.45

3. Inability to provide medical data of patients	O2	Using online databases with free medical data access (eg. COCHRANE)	1	10	0.1
4. Risk of delaying the materials delivery	O5	The mold will be tested with the backup materials until the proper delivery	1	10	0.1
5. Risk of FEA simulation results to be different than the real mandibular bone	O5	It will be considered just the methodology of creating the prototypes	2	50	1
*[PI] Potential Impact: 1- Low; 2- Medium; 3- High				**100%**	**1.8**

Succeeding the qualitative analysis of the project risks and considering the maximum possible risk value being 4, it has been concluded that the risk incidence rate of the current project is low (1.8).

For a cleaner picture of the steps to follow in order to achieve the main objective, to all the secondary objectives have been allocated a list of activities and responsible members from both main partners of the project. Table 2 represents the human resources list and the distribution of the objectives for each member.

Table 2: Human resources and task distribution

Team members	Task distribution
Project Manager	Managing and organizing O1- O5 activities
Biomechanical Engineer	Ensuring support and overseeing all O1-O5 activities
Dentist	Ensuring support to the researches from O1, Approving the mandibular models from O2 and O5
Dentist Trainee	Ensuring support to the researches from O1 and testing the prototypes of O5
Design Engineer	Ensuring technical support and developing O2, O3 models
Technician	Ensuring technical requirement and support from O2, O3, O4

It is true that the cost, time and quality are predominant criteria to ensure the main scope of the projects, but for a more accurate success, the project manager defined also a list of key performance indicators for each objective such as: KPI_1: one documentation file related to state of the art in additive manufacturing, anatomy of mandibular bone and reverse engineering; KPI_2: two STL masks of mandibular bone parts (trabecular and cortical), KPI_3: two 3D models of trabecular and cortical molds; KPI_4: two 3D printed trabecular and cortical molds; KPI_5: at least two mandibular bone prototypes.

In the end of the internship stage, the project development was examined through the help of this KPI set. Table 3 represents the relations between the objectives and their allocated activities and the KPI.

Table 3: Working plan and relation between objectives and KPI

Main objective: Design and development of a completely edentulous mandibular bone
O1. Research of at least 100 scientific papers within 4 weeks on the current state of the art
KPI*: one documentation file related to state of the art in additive manufacturing, anatomy of mandibular bone and reverse engineering
A1.1. Mandibular bone anatomy
A1.2. Additive manufacturing
A1.3. Reverse engineering techniques
A1.4. Establishing necessary materials and equipment
O2. Converting medical DIICOM data and developing two 3D mandibular masks (trabecular and cortical)
KPI: two STL masks of mandibular bone parts (trabecular and cortical)
A2.1 DIICOM data processing
A2.2 Desinging two separated masks for the mandibular bone (trabecular and cortical)
A2.3 Creating the STL files of both trabecular and cortical models

O3. Developing two 3D mandibular molds by the end of the 3rd month of the project time
KPI: two 3D models of trabecular and cortical molds
A3.1 Convering and importing the STL files in CAD software
A3.2 Design and development of the trabecular mold
A3.3 Design and development of the cortical mold
A3.4 Grippers simulation
O4. 3D printing of one trabecular and one cortical mold assembly
KPI: two 3D printed trabecular and cortical molds
A4.1 Creating the G codes of the molds
A4.2 3D printing of the trabecular mold
A4.3 3D printing of the cortical mold
A4.4 Grippers acquisition
A4.5 Assembling simulation
O5. Developing at least two final prototypes by the end of the internship stage
KPI: at least two mandibular bone prototypes
A5.1 Acquisition of necessary materials and tools
A5.2 Development by using injection methods of trabecular prototypes
A5.3 Development by injection methods of cortical prototypes
A5.4 Testing the prototypes
*KPI= Key Performance Indicators

For a smoother image of the project development and in order to allocate the costs and the time of each activity, the project manager implemented the Gantt Chart method for the time efficiency and defined a list of expenses as a budget breakdown list. Table 4 represents the Budget breakdown of the project.

Table 4: Budget breakdown

No.	Category	Units	Price [euro]	Total [euro]
1	**Personnel expenses**			
1.1	Project Manager	16 weeks	10 €/h	3200
1.2	Biomedical Engineer	16 weeks	8 €/h	2560
1.3	Dentist	6 weeks	8 €/h	960
1.4	Dentist Trainee	2 weeks	5 €/h	200
1.5	Design Engineer	2 weeks	8 €/h	320
1.6	Technician	1 week	6 €/h	120
2	**Logistics expenses**			
2.1	Software license (Materialise Mimics, SolidWorks)	2	2595+1295	3890
2.2	Materials (Polyirethane Foam, Liwuid Plastic)	3	85	255
2.3	Tools (screws, syringe, threaded rod, etc.)		100	100
2.4	Consumables (paper, pens, gloves,lab coats, lab glasses,etc.)		500	500
3	**Fixed assets**			
	Electricity, water, heat, etc.		1500	1500
			TOTAL	**13605**

The project was implemented over a period of 4 months (W1 ÷ W16), without working weekends, and the activities were organized in the form of a logical and consistent sequence, assigning a time limit for each of them, as shown in Table 5 below.

Table 5: Gantt Chart

	ACTIVITY	START	DURATION [weeks]	W1	W2	W3	W4	W5	W6	W7	W8	W9	W10	W11	W12	W13	W14	W15	W16
A1	Research of at least 100 scientific papers within 4 weeks on the current state of the art			A1															
A1.1	Anatomy of mandibular bone	W1	4																
A1.2	Additive manufacturing	W2	1																
A1.3	Reverse engineering	W3	1																
A1.4	Establishing necessary materials and equipment	W3	2																
A2	Converting medical DIICOM data and developing two 3D mandibular masks (trabecular and cortical)							A2											
A2.1	DIICOM data processing	W5	1																
A2.2	Designing two separated masks (trabecular and cortical)	W5	3																
A2.3	Creating the STL models for both trabecular and cortical	W7	1																
A3	Developing two 3D mandibular molds by the end of the 3rd month of the project time									A3									
A3.1	Converting and importing the STL files	W7	1																
A3.2	Design and development of customized trabecular mold	W7	2																
A3.3	Design and development of customized cortical mold	W9	2																
A3.4	Grippers simulation	W11	1																
A4	3D printing of one trabecular and one cortical mold assembly													A4					
A4.1	Creating the G codes of the parts	W11	1																
A4.2	3D printing of trabecular mold	W11	1																
A4.3	3D printing of cortical mold	W12	1																
A4.4	Grippers acquisition	W13	1																
A4.5	Assembling simulation	W13	1																
A5	Developing at least two final prototypes by the end of the internship stage																A5		
A5.1	Acquisition of necessary materials and tools	W14	1																
A5.2	Development by injection of trabecular prototype	W14	1																
A5.3	Development by injection of cortical prototype	W15	1																
A5.4	Testing the prototypes	W16	1																

Execution

As a summary of the execution plan, the partners from the Department of Dentistry had to acquire DIICOM data from the computed tomography scan of the patient, which represents the 2D scan images of the mandibular bone of the patient and the first input of the project. Starting with it, they had to share with the master engineering student the personal medical paper of the patient, his anatomical stage and basic details of the research about the medical applications.

The PhD Dentist trainee had to present the requirements of the future mandibular product, to show the techniques and methods of how it will be used, in order to create the hypothesis of the project and to give an overview of the final product to the engineering student. Once them all have been set and the research was ready, the report has been written and the first objective was accomplished. Throughout the research on the anatomy of the mandible, the student developed medical skills and relevant knowledge about the mandibular bone, the meaning of trabecular and cortical part and most important, mechanical properties of each part of the bone, necessary for finding similar materials that can be used to create the experimental model.

Reverse engineering ended up being the most useful way to develop the mandibular model, by starting from the CT scan of the patient, turning it into a 3D model using customized medical software. In order to design the medical data, the biomechanical engineer and the master student defined as tool the medical imaging software Materialise Mimics. The main goal of the activities was to separate the bone in two different masks as trabecular and cortical part. The STL files of the masks have been created and so the second objective was done.

Figure 2: STL trabecular and cortical masks

The next step on the project plan was the development of 3D molds of each mask. The team members that assumed this task were the biomechanical engineer and the master student. Solidworks software was the main used tool for designing and simulating the assembly of the molds and once accomplished, the third objective has been reached.

Figure 3: Trabecular and cortical molds designed in Solid Works

The fourth objective speaks about the 3D printing of the molds. First step was to create the G codes of the files, a data format that can be read by the printing equipment. The 3d printer used was FlashForge Adventurer 3 and the task have been allocated to a team created by the biomechanical engineer, a design engineer and the technician.

Figure 4: 3D printed trabecular mold using FlashForge Adventurer 3 3D printer

The development of the mandibular prototypes, last objective of the project plan, meant to assembly the trabecular mold, to inject the material for the inner surface and so to create the trabecular side, followed by positioning the created part inside the cortical mold and a second injection procedure to be applied with a tougher and stronger material, in order to create the external side. Polyurethane foam and liquid plastic were the chosen materials for the last stage and the task was allocated to the master and the biomechanical engineers.

Figure 5: Mandibular prototypes: a) Polyurethane foam (density 128-240 Kg/m³); b) Liquid plastic; c) Polyurethane foam (density 1080-1230 Kg/m³);

Control and Monitor

The control and monitor part of the project management consisted mainly of meetings organized with all the members involved on the team, status reports were written for all the task of each of the team members, ensuring the closure of the project before the ending of the deadline.

Results

The project has been delivered on time, documentation was written as a final report and it has been presented as a pitch PowerPoint presentation in front of the committee composed by members of the team and one outside teacher from the Department of Biomechanics.

The final products, three models of experimental mandibular bone were created and tested using finite element analysis, in order to see which material is getting closer and responds to the tests the same or most like the mechanical properties of the real mandibular bone.

On the following table is shown the correlation of the results with the defined objectives of the project.

Table 6: Objectives and the correspondent results

Objective	Results
O1. Current state of the art.	R1. Final report and documentation speaking about the usage of additive manufacturing and reverse engineering techniques in medical approaches
O2. Design of medical data	R2. Customised STL files of two separated mandibular masks (trabecular and cortical)/ Mimics Materialise Software
O3. Computer Aided Design of the mold	R3. Two different 3D CAD models / Solidworks Software
O4. 3D printing of the molds	R4. Two separated 3D printed molds using FDM additive manufacturing technologies/ FlashForge Adventurer 3
O5. Development of the final products	R5. Three prototypes/ Polyurethane, Foam & Liquid Plastic

Conclusion

The project management plan led to a successful process, all the objectives have been accomplished without delays or added costs. Regarding the final products, the mandibular prototypes have been used by the PhD Dentistry trainee as samples for surgical simulation and the documentation obtained created a structured methodology of developing anatomical models by using additive manufacturing and reverse engineering techniques that can help both on subject global evaluation and on individual projects' evaluation. These have been adapted to a university context where some specific restrictions existed: professors and students' dedicated time, professors' workload, and diversified nature of the projects. Currently, the products and the process are being used by the dentistry trainees in collaboration with master engineers to develop a customized mandibular pattern that can help prevent unfortunate events during surgical procedures. The products may also allow the comparison between preoperative intervention and the postsurgical results and help the surgeons to receive feedback of their work.

Regarding future research, the methodology of the process to develop mandibular experimental models is open to improvements in terms of time, costs and other materials with more similar mechanical properties in comparison with the real mandibular bone.

Abstract

Based on the previous research, there are numerous studies done in order to identify the benefits of reading habits among user in the public library. The purpose of this research is to identify the ways to promote reading culture in Public Library XYZ. The significant of the research address how the reading habits of user affecting the reading culture in the Public Library XYZ. This study will give huge contribution to the library and society. As for the library, they can prepare a well plan activities and suitable materials to ensure the reading culture among users will sustain. The respondent of this study is among users from Public Library XYZ itself. The users will be determine based on their Library ID card or it call MyID that represent the membership or non-membership of the library users.

Keywords: Reading, Reading Habits, Reading Culture.

Introduction

Reading is a hobby that widely should be chosen by people nowadays. This hobby is important and priceless activities to do in leisure time. Reading activities is important to develop the habit of reading which it not just for knowledge but also for personal growth and development. It develops positive thinking and gives a better perspective in life. Reading habits significantly known as a beneficial hobby with a million of advantages to daily life. According to Lindita Skenderi & Suzana Ejupi (2017), reading habits are undoubtedly developed and learned from earlier age. Library users in 21st century have a lot of opportunity to read a book in order to do better in life. These days, by reading, people might have a great academic performance. There are many readings programmed and competition that given gifts as a prize pool. For example, storytelling competition, short video competition and others in any festival might give a huge impact to contester. Reader tend to read a reading for fun during their leisure time. The reading culture is often promoted because knowledge is seen as a form of power in contemporary times. In the era of information explosion, people need to have a knowledge to classify all the information received, which one is useful and which one is not? In order to that, people must have a knowledge. In order to gain a knowledge, people need to read and read from trustful resources.

Literature Review

According to Lindita Skenderi & Suzana Ejupi (2017), reading habits are undoubtedly developed and learned from earlier age. Reading habits significantly known as a beneficial hobby with a million of advantages to daily life. Nowadays, online book such e-books omnipresent with modern reading platforms such as smartphones, computers, console and tablet or via social networking sites. Reading habits influenced human behavior in appropriated way or vice versa. There are many positive impacts effected to the people who involve in reading world on their behavior. A reading habit is an essential life skill (Inderjit, 2014). There are several studies have

Cite this Article as: Siti Nur Aidah JOHARI, Nurhidayah HASHIM and Mohd Yusof MUSTAFFAR "Reading Habits of User Affecting Reading Culture in Public Library XYZ" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

followed the benefit of reading habits among user in Public Library XYZ, including the increased academic and career performance, improve reading skills and widen user experience and knowledge.

Increased Academic Performance

According to the previous study, it is confirmed that good reading habits enhance academic performance (Fatiloro, 2017). The author said that reading is very important to progress and expand our minds and disseminating views in order to improve performance in the areas of career or life (Saiful Farik, 2014). This means and confirmed that reading habit has influence on academic performance and there is a relationship between reading habit and academic performance. As mention by Noraien (2017), majority of students read English material purely for academic purpose and they would read specifically to seek and gain information in order to get excellent academic achievements (Bronny, 2016). Most of the user in Public Library XYZ teach their children to love reading and always visit a library to lend a book. Some of the parents agreed that by reading their kids increased their academic performance. As supported by Lindita Skenderi & Suzana Ejupi (2017), reading is not only one of the four language skills, but it is a very important element in the aspect of vocabulary enrichment, personality building and better academic performance. According to Caroline Rabaud (2017), reading has been confirmed to help in achieving a better academic performance by students. A study of this type, by Owusu-Acheaw reveals that most of the respondents claim they have seen improved academic performance after reading more books. As we can see, reading culture in Public Library XYZ can be develop. Most of the users that lend a book in Public Library XYZ would be a Chinese. This is because of the cultivating their kids to love reading. When their kid's growth up, reading habits determinate as their hobby.

Improve Reading Skills

Reading skills are important throughout our lifespan, particularly as we respond to the new demands and changes in jobs. Reading for pleasure or recreational has been found to improve reading comprehension, writing style, vocabulary, and grammatical development (Inderjit, S. 2014). According to the previous research, it has provides evidence that the act of reading itself improves reading performance (Noraien, 2017) and it define reading as a process which is active, cognitive and affective (Lindita Skenderi & Suzana Ejupi, 2017). Reading as one of the skills of literacy is the defense against solitude (Fatiloro,2017) and the findings revealed that the status of ESL students' reading habits is still bad but it can be enhanced with proper guidance and encouraging activities to motivate students' to enhance their reading skills (Noraien, 2017). Public Library XYZ as the information center that provided all kinds of the knowledge need to encourage user by doing fun activities that can cultivate their reading skill. Either less or more it can motivate user having a positive attitude about learning while reading. According to (Inderjit, 2014) reading attitude is an integral part of the development and use of lifelong reading skills.

Widen User Experience and Knowledge

Reading is important for acquiring knowledge and information. Reading is the position of the utmost character that helps to pass on knowledge and virtue through ages (Fatiloro, 2017). As mention by Inderjit (2014), through reading, we acquire new ideas and knowledge, obtain needed information, relax the minds, and improve our command of language and vocabulary. According to Mohamad Z. A. Jafre (2011) constructivism theory is a theory of knowledge or epistemology which argues that humans generate knowledge and meaning from an interaction between their experiences and ideas. Reading provides experience through which the individual may expand his horizons of knowledge, identify, extend and intensify his interest and gains deeper understanding of himself, of other human beings and of the world (Olubunmi, 2016). Believe it or not, reading habits can widen user experience and knowledge. Reading not only increases our knowledge, but it also builds maturity and character, sharpens our thinking, and widens our awareness in social, economic, political, and environmental issues (Inderjit, 2014).

The Ways to Promote Reading Culture in Public Library XYZ

According to Caroline Rabaud (2017), without the right method of reading culture, reading habits are poor and cannot be expected to progress. According to Ezaleila Mustafa (2014), encouraging children to read is seen as an essential act by many groups as an effort to open the minds as well as making them creative and innovative. The reading culture is often promoted because knowledge is seen as a form of power in contemporary times; however, not all children enjoy reading books. They will not read voluntarily, unless they enjoy the experience. There are many positive impacts effected to the people who involve in reading world on their behavior. A reading habit is an essential life skill (Inderjit, 2014). There are several studies have followed the ways to promote reading culture in Public Library XYZ, including the strategic and conducive space for reading, create programmed to excite user and improve digital reading.

Strategic and Conducive Space for Reading

There is a promising potential in making use of the library's services in a new norm. Therefore, libraries are more valued now for their spaces and the opportunities that they create for the community, such as support for education, reading culture, access to recent technologies and help user to increase reading habits. Re-designing and refreshing the library space is another way to encourage users to visit the library. The physical environment can provide cues to shape social behavior within spaces, and the spaces can be deliberately and thoughtfully assembled to encourage preferred learning behaviors (Cleveland, 2017). In Public Library XYZ, reading space was divided into three department which is children department for children who want to read, circulation department is for all age of users while reference department is meant for adult. According to Olubunmi (2016), ease of accessibility to reading materials can encourage reading. Reading corners in classrooms, theatres, villages etc. can provide easy and convenient access when needed. How the users feel about a particular space contributes to their desire to visit the space and to engage in particular learning behaviours (Chin Ee Loh, 2017).

Create a Program to Excite User

Create a program to excite community and society is important. There are a lot of initiatives created by Public Library XYZ as information centre. Previous study by Ezaleila Mustafa (2014), the library plays an important role to implement reading activities such as reading programs like "Bookstart", and "Read to Me" which involve parents in their children's reading activities. Through this programmed, it provide exposure and training to parents regarding practical strategies such as the way to read children's books, how to review children's reading abilities, and provide parents with information on how to help children read a good book, as an effort to develop and inculcate reading habits in daily life. By doing this activitiy, reading program culture will become widen and give a huge impact to the library. Replications of high impact initiatives such as enhancement of resource sharing; recontinued program; and rebranded program can rectify these issues (Bronny, 2016). The programmed that launched by National Library about Malaysia Reading slogan is an effort to stand support 'Kempen Dekad Membaca Kebangsaan' as recommended by Ministry of Education in 2019. Public Library XYZ also supported the program like 'Jom Baca 10 Minit' as it would be the routine in the library every day on 11.00am. This shows an effort of the library in order to support the program launched by National Library. Public Library XYZ also has the "Reading with Libraries" projects being organized by Kota Buku with National Library collaboration. It is an outreach service that provides reading programs for institutions such as children's centres, orphanages, and other organizations that do not have access to libraries. According to Nazeem Hardy (2016), email campaign "I'm reading…" a short-lived but very noteworthy campaign undertaken by the LIS Department was the "I am reading …, what are you reading" slogan campaign. Library staff at all levels were allowed and encouraged to add this slogan to their email signature, indicating what they were reading, and invited comment not only from inside of the department but from external correspondents.

Improve Digital Reading

As mention by Ezaleila Mustafa (2014), the objectives are to analyze the reading habits and attitude of the undergraduates toward reading, evaluate factors which influence a student to engage in independent reading, determine factors to encourage student more prefer to use digital reading given the huge impact to the revolution in the e-reading field and to explore a possible relationship between independent reading and digital reading. According to Mohamad Z. A. Jafre (2011), internet is a part of the technological and digital culture of the teenagers. Therefore, online reading would better suit teenagers compared to reading printed materials or books. An increase in digital information and time spent reading digital media has been noted which indicate the impact of the digital environment on the reading behavior (Caroline Rabaud, 2017) and with the growing amount of digital information available and the increasing amount of time that people spend reading electronic media, the digital environment has begun to affect people's reading behavior (Inderjit, 2014). The revolution of digital age affecting more to read in digital. In Public Library XYZ, there are tablet that can be used for free to find the information. According to Ezaleila Mustafa (2014), electronic platforms on which children read also can be diversions, competing for children's time and attention in mere clicks which is involving e-books, these platforms may include games, apps, websites like YouTube, social media like Instagram and other ways of watching television and movies. Kota Buku is trying to provide and publish more children's book and literature in the form of electronic and interactive books to encourage the reading culture among children.

Research Objective

The purpose of the research is to identify reading habits of user that affecting the reading culture in Public Library XYZ. The purposes that focus in the research are:

1) To identify the benefits of reading habits among user in Public Library XYZ
2) To determine the ways to promote reading culture in Public Library XYZ

Operational Variable

Operational variable means finding a measurable and valid index for the independent and dependent variables. The questionnaire is measured by using the variable in the research framework. Next, dependent variable consists of the reading habits of user affecting reading culture in Public Library XYZ and independent variable divided into two which is the benefit of reading habits among user and the ways to promote reading culture in Public Library XYZ.

Study Population

The population for this study focuses among users of library from Public Library XYZ itself. The target audience of user is based on their ID card or it call MyID that represent the membership or non-membership of Public Library XYZ users.

Sample

The sample of the study will be selected using the simple random sampling. In this study the total number of users are listed was 50 users.

Framework

This figure shows two sub frameworks in order to guide this research. First sub framework, Benefit of Reading Habits Among User in Public Library XYZ. In this study, we identified three different independent variables. Independent variables are defines based on previous discussion in Literature Review subtopic like academic performance, improve reading skills and widen user experience and knowledge.

Besides, the other sub framework to guide this research is The Ways to Promote Reading Culture in Public Library XYZ. In this research, there are three independence variables that have been allocate, and all of these have been discussed in Literature Review subtopic like strategic and conducive space for reading, create programmed to excite user and improve digital reading.

Through the discussion, the benefit and ways to promote reading culture exist when the reading habits became a hobby in life. The analysis of review also provided to make it more reliable. Then, proposed framework provided to demonstrate the continuity of the relationship between the benefit of reading habits among user and the ways to promote reading culture in Public Library XYZ.

Findings

Demographics in terms of gender, there are more males respondents compare than females. 52% are males and 48% are females. Most of the users are adults. 36% of them are in the age range of 10-19 years old. Next, the age range of 20-29 years at 28%, the age range of 30-39 years at 22%, 40-49 years are at 12% and finally, the age range of 50 years and above at below 2%.

In terms of marital status, most of the users are single, 60% of them are single, 24% are married, 4% are divorced as same as single mother and father. This is obvious since generally most of the users are teenagers. Ethically, the biggest group are the Chinese at 46%, followed by the Malays at 32%, Indian at 20% and finally, the Iban at 2%. In terms of academic achievements, a reasonable majority belongs to the UPSR (6%), PT3 are 14%, while the SPM constitutes 30% and diploma 36%, degree 14% and others 2%. This clearly shows a great majority of the library users are young students.

Absolutely, most of the library users are members of the library. Only 4% of the users are non-members of the library, while 96% are members. There is a clear indication that the library promotion towards their users is successful. The category of users are children 2%, adult 43% and family 12%. All the respondents respond that

they are enjoy going to the library because 100% of them said 'Yes'. Same goes to the question about enjoying reading in library which responded totally said that they are enjoy with it. In terms of frequency of reading, most of the users respond that they read one or more books in a week, which collect 50% from total respondent, while 34% of them read 1 book about in one month or and lastly 16% of users read 1 book more than a month.

A great majority of the users find out their reading level skill which 66% choose good, 33% very good and the last one could be poor 4%. Most of the respondents are agreed that when reading they will get experience and knowledge as like the next question the users read books of their interest influenced their academic performance which the result shown 88% answer 'yes' while 12% answer 'no'. This indicates that users regard the library as a knowledge and information hub and storehouse. As wanted to rate their reading habit, majority of respondent answer Good which 90% while 10% of the answer Very Good. By reading it can influence people surrounding which most of them answer 'yes' which collect 88% and 6% could be 'no'.

In terms of the love reading using digital devices, most users answer agree (54%), while 26% was neutral and some are answer strongly agree with 20%. Majority of users comfortable with library space which 62% answer agree, while 24% answer strongly agree and 14% answer neutral. The main reasons for liking reading environment affecting reading culture are because library take an action to have some programs at it which 56% answer agree, 28% answer strongly agree while 16% answer neutral. The reading culture can cultivate reading habit among themselves which 40% said agree, 32% said strongly agree and 14% answer neutral. Based on the question library can play role to develop reading culture which most of them answer agree 52% while 26% answer neutral lastly 22% said strongly agreed. So, if user knows the important of reading, they can understand better; because of academic requirement; they feel motivated; and because more reading materials are available.

Recommendation

Public Library XYZ can initiate a program like nurturing the reading of user from the early age stages. A campaign can be done and the librarian should play their roles to educate their users, especialy married users to understand the important of nuturing the reading from the early stage. Besides, the library can provide any activities that can attract bachelor users to come to the library because they contribute the large majority of the library visitors in Public Library XYZ. Library also can extend their opening hours because the bachelor might have benefit from it to come at night because of they are free from family commitment compare to married users.

In the other hand, to have a reading culture among users, Public Library XYZ should have an action plan that library must restructured and reconstruct all the programs that have been done before. In spite of the fact that library are led intermittently, there is a need to improve these program by upgrading and organizing them to address the issues of various unstatisfied of user about reading culture in Public Library XYZ. Library can make use the data that shows users that make a culture in reading habits have success in their academic performance and their life. Library can make a forum or a talk show by inviting the successful library users to share their experience and suggestions. As a result, a good example might build up a good trend of reading habit by other library users and it will be their culture in life.

Conclusion

This study has not covered areas of concern pertaining to the reading habit of library users in Public Library XYZ. Major area of concern is the majority of library user is male. What has made the male gender have majority in the library membership compare to women. A further study should be conduct and it will help the library to increase their membership among women. The library great initiative and activities that have been organized should be continued. Based on the success of several initiatives and programs, action plans have been identified to improve weak spots and to alleviate areas of concerned. The action plans might include online campaign, forum or talk show from the library users itself and library should create a new section like Café Conner or others that suit the need of users.

Abstract

The aim of the article is to familiarise the reader with the procedure of conducting marketing studies with the use neuroscience techniques including electroencephalography (EEG), galvanic skin response (GSR), electrocardiography (ECG), and eye tracking (ET) in order to identify those characteristics which should be present in marketing communication. In the present research we were interested in identification of factors which are taken into consideration when choosing a product on the yoghurt market. The first part of the study was constituted by an experiment with the use of the following techniques: EEG, GSR, and ECG. We recorded signals from a group of 44 healthy subjects while they were watching a documentary intermingled by a series of TV advertisements. The second part of the study was conducted with the use of two methods of gathering empirical data: eye tracking and a questionnaire. The aim of this experiment was to collect data that would enable us to identify which characteristics of yoghurt packaging are significant from the point of view of choices made by the respondents (n = 32). Data analysis shows which commercial was remembered and why. Findings also show what elements of TV advertisement evoke positive and negative emotions. When it comes to eye tracking data, the results obtained have allowed us to establish which elements placed on the yoghurt packages the participants noticed or focused on, and which were entirely ignored. In conclusion, EEG and eye tracking methodologies could be used to obtain information not obtainable with verbal interviews. We argue that the use of these methods by a company may significantly improve the management's existing knowledge about their clients and facilitate the creation of appropriate strategies in the future, e.g. product launch strategies. Further research with an extended set of subjects will be necessary to further validate the observations reported in this article.

Keywords: electroencephalography (EEG), eye tracking, perception of packaging, marketing communication

Introduction

Advertising is present in modern person's life virtually all the time. Consumers have at their disposal hundreds of TV channels, thousands of newspapers and magazines and millions of websites. And everywhere they come across various forms of advertising. Therefore, modern marketing requires from entrepreneurs something more than merely creating new products and services, giving them attractive prices and ensuring their availability. Companies must communicate with current and potential clients. In order to reach target clients successfully and influence their purchasing decisions, they creatively apply various forms of communication, including mass communication, whose primary tool is advertising.

One of the important instruments of marketing communication is product packaging (Kotler, Keller, 2012, p. 372). Packaging, as a medium of marketing communication, was taken into consideration and developed at the end of the 20th century. At the same time, first research about the influence of packaging on consumers' decisions was done. In order to influence consumers, producers nowadays are using ever more original packages, which allow to distinguish the product from its competitors. The job of packaging is to influence buyers so that they will, consciously or unconsciously, choose one particular product from the others offered by competitors. In this case, the impression made by packaging are projected onto the entire product and customers form their opinion on the quality of a product based of those impressions. External characteristics of packaging are paramount as the majority

of consumers reacts most strongly to visual stimuli. Knowing this, producers decide to study those reactions using various scientific methods.

The aim of the article is to familiarise the reader with the procedure of conducting marketing studies with the use of electroencephalography (EEG), galvanic skin response (GSR), heart rate (HR), and eye tracking (ET) in order to identify those characteristics which should be present in marketing communication. The main point of this article is to present the results of authors' experimental studies concerning the identification of factors which are taken into consideration when choosing a product on the yoghurt market. The aim of the study was also to present some advice for yoghurt producers allowing them to adapt their market offer to the needs of consumers.

Methods

Participans

The study involved a total of 76 healthy volunteers, students aged 20-24 (38 females and 38 males) from various universities in our city. The proper bioethics committee had issued permission to conduct both parts of the experiment. Out of the seventy-six volunteers, forty-four took part in the first part of the experiment and the remaining thirty-two in the second part. Each of the participants had received written information about the goal and the method of conducting the study. Additionally, the respondents were also informed about it verbally. Each of the participants had expressed their consent to taking part in the experiment in writing.

Procedure

The first part of the study. The first part of the study was constituted by an experiment with the use of the following techniques: electroencephalography (EEG), galvanic skin response (GSR) and electrocardiography (ECG). The study was conducted in a specialist laboratory located at our faculty. On the day of the experiment the participants entered the laboratory individually, in turns every 90 minutes. After a participant had been informed about the course of the experiment and after he/she had signed the consent form, the respondent would sit on a chair at a distance of 80 cm from the computer monitor. Then, with the use of specialist paste (Ten20), seven electrodes were attached to respondent's head. The electrodes were attached to the scalp in seven points, i.e.: Fp1, Fp2, F3, F4, F7, F8 and Fz (according to the international 10-20 system). Those particular points were chosen since the scientific literature has pointed to the special role of frontal and prefrontal lobes in occurrences we had wanted to study (Davidson, 2004; Werkle-Bergner, 2006). A unipolar recording of brain electrical signals was performed. The reference point was left earlap. Sampling was performed with the frequency of 256 Hz and impedances below 5 kΩ. Brain waves were recorded with the use of 19-channel electroencephalograph KT88-2400 (Digital Electric Activity Mapping) from Contec Medical Systems. Figure 1 presents a part of a sample EEG recording. Moreover, an ECG electrode was attached to the left wrist of each respondent and 3 GSR electrodes on the phalanges of fingers of the non-dominating hand. Galvanic skin response was measured by Neurobit Optima 4 equipment (Fig. 2).

The next step involved all volunteers watching a 30-minute nature documentary interrupted by three advertising blocks. Each of the advertising breaks consisted of 4 commercials, which means that 12 advertisements were presented in total. The first break contained commercials of yoghurts, the second – mineral water and the third – cars. Data was recorded both during the film and the advertisements. The aim of this part of the experiment was to establish which advertisement from a given series was remembered by the participant and which elements of the advertising message were key to its remembering. After the end of the experiment, the respondents were asked to take part in a survey in a form of a direct interview. Respondents' answers were entered by the researches into an electronic questionnaire – a specially prepared Excel spreadsheet. The first part of the interview consisted of demographic questions and four questions concerning the film. Demographic questions aimed at obtaining data concerning demographic characteristics of respondents, e.g. age and sex. The study omitted questions referring to education, profession or marital status. This resulted from the fact that all respondents were students and therefore their answers would have been identical.

Fig.1. Fragments of EEG and ECG recordings. Source: authors' own elaboration

Fig.2. EEG, GSR and ECG recordings while the respondent was watching a film with advertising breaks. Source: authors' own elaboration

The second part of the interview consisted of questions concerning advertising breaks. The first question connected with commercials aimed at detecting which of the brands and products presented had been remembered by the participant. Question 1 was worded as follows: "You have just watched a film. During the projection you were shown some commercials (12 commercials in total). Do you remember the commercials you saw? Which commercials do you remember?"). The respondents' task was to enumerate brands and products which they

remembered when they were watching the film and if a person did not remember any commercials, one should proceed directly to question 3. Then, in question 2, the researcher asked the respondents to give details about the plot of commercials they remembered, i.e. about people featured in the advertisements, places, props, scenes featured in the commercial. In the next stage the interviewer enumerated at random various brands (including brands which were not featured in the material) in order to check whether the respondent remembered the advertisement of a given brand and whether during watching it they remembered watching it earlier. Question 3 was worded as follows: "Did you see the advertisement for this brand while you were watching the film? When watching the film, did you recall seeing this advertisement before?". For both of these questions, the respondent may have answered "Yes" or "No". The entire first part of the experiment took one hour. The analysis of data gathered about the first advertising block (yoghurt advertisements) will be presented in the next parts of the article.

The second part of the study. The second part of the study was conducted with the use of two methods of gathering empirical data: eye tracking and questionnaire. The aim of this experiment was to collect data that would enable us to identify which characteristics of packaging are significant from the point of view of choices made by the respondents. The objects of the experiment were photographs of yoghurt packages, presented to the participants on the computer screen. MKo Eye Tracker produced by Hyperbeing was used to conduct this study. This is a stationary eye tracker in the form of glasses. It is equipped with only one camera sensitive to infrared light, therefore in order to use it, respondent's head needed to be immobilised with a special chin rest (Fig. 3). The chin rest had been made by the authors of this article.

Fig. 3. An example of a study with the use of MKo Eye Tracker. Source: authors' own elaboration

For the study, recording, and analysis of the data, the following software was used:

1. AOIHelper (so that areas of interest could be defined graphically),
2. ITU GazeTracker (to capture and process images from camera, to locate the pupil in the picture, and to calibrate and to determine the position coordinates of the focal point of the eye),
3. Hyperbeing software, working with Matlab R2010a with Psychtoolbox-3 module installed (to validate the calibration process, record and analyse data).

The experiment was conducted at our faculty. Similarly to the first part of the experiment, participants had been first informed on the purpose and course of the experiment (both in writing and verbally). After signing the consent form, a participant was seated as close to the desk as possible in order to rest the head on the chin rest. For safety reasons the chin rest has been screwed to the desk. The next step involved adapting the height of the chin rest and

the height of the monitor so that they fitted the participant. The next stage was the calibration of the equipment. The purpose of calibration was to determine the mapping between camera space and screen space, where calibration points were projected. The calibration was conducted in accordance with methods described in academic literature (Duchowski, 2007, p. 70). The calibration of the equipment was followed by the essential part of the experiment. The task of the participants was to look at yoghurt packages displayed on the monitor. Each photograph was shown on the screen for 6 seconds in random order each time. During the session each participant watched 5 photographs of yoghurt packages. Each experimental session lasted ca. 15 minutes. After the end of all sessions, a computer analysis of data gathered in the eye tracking study was conducted.

The questionnaire part of the experiment was focused on identifying the elements of packaging significant from the point of view of attractiveness and the evaluation of the packages done by the respondents. The participants were asked how important it is for them to read information on the packaging when choosing a yoghurt.

The analysis of data obtained in the first part of the study

Electrocardiographic signal processing. Software in the Python programming language design by the authors themselves was used to analyse data obtained in the first part of the experiment. The analysed advertising block consisted of commercials of four different yoghurts, namely: Muller Mix, Danone Activia, Danone Aksamitny and Bakoma Premium. The aim of the analysis was to compare advertisements of one category in order to create reference points and norms for this category.

The data analysis began with filtering signals with a band-pass filter, with the upper frequency limit of 2 Hz and lower frequency limit of 30 Hz. Then the recorded signal was cleared from artifacts caused by eye blinking, eye ball movements or muscle tremor. The Independent Component Analysis (ICA) method was used for this task. After clearing the signals for all participants, the signals were transformed with the use of spatial filter called CAR (Common Average Reference). Individual Alpha Frequency (IAF) was calculated for each participant, with the application of the method described in literature in order to establish selected frequency bands. In the next step, the filtered EEG signals were used to calculate Global Field Power (GEP) (Lehmann D., Skradnies W., 1980). The obtained values were then used to determine the Pleasantness Index in accordance with scientific literature (Vecchiato, Cherubino, Trettel, Babiloni, 2013, p. 81):

$$PI = GFP_{right} - GFP_{left} \quad (1)$$

where the GFPright and GFPleft stand for the GFP calculated among right (Fp2, F4) and left (Fp1, F3) electrodes, respectively.

The analysis of data obtained with the EEG was conducted observing the brain asymmetry paradigm created by professor Richard Davidson from the University of Wisconsin-Madison (Davidson R. J., Ekman P., Saron C. D., Senulis J. A., Friesen W. V. 1990; Davidson R. J., 2004). According to this paradigm, the analysis of frontal and prefrontal lobe activity of the right and left brain hemisphere and then the comparison of the results allows to interpret brain activity in motivational context. If a volunteering participant is engaged and interested in what they see on the screen, the difference between the activity of their left and right lobes will be positive (i.e. the activity of the left hemisphere will be stronger). However, when the participant is not interested in a film or advertisement, the result of subtracting the activity of the right hemisphere from the activity of the left hemisphere will be negative (Davidson R. J. 1979). In case both hemispheres are equally stimulated, we encounter neutral activity (i.e. the respondent has been neither interested or disinterested). In 90% of cases the increase of interest/involvement is accompanied by a positive emotional reaction (but not always).

Galvanic Skin Response signal processing. In the above-mentioned study, the electrodermal activity (GSR) was measured by Féré method, with the use of constant voltage of 0,5 V. In order to analyse the recording of the galvanic skin response, a band-pass filter was employed with the lower frequency limit of 0.2 Hz (in order to separate the phasic components of the electrodermal activity from the tonic components) and the higher frequency limit of 1 Hz (in order to filter out the noise and to suppress artifacts caused by Ebbecke waves; Schmidt and Walach, 2000). Both the GSR signal and other signals were registered for the entire duration of the film. Then the registered signals were divided into fragments (those recorded during the film separate from those recorded during

advertisements). The GSR signal was analysed simultaneously with the respective EEG records. Thanks to this we were able to establish what kind of emotions were induced by particular marketing communication.

Electrocardiography signal processing. The registered ECG was processed in order to extract heart rate (HR) signals. HR signals were isolated by establishing the peak-to-peak distance on the ECG record (i.e. by calculating the interbeat interval – IBI – between successive heartbeats), and then by calculating the reverse of this distance (Fig. 4). The HR record is an additional (aside from EEG and GSR) source of information on the emotions experienced by the respondents during the film and the advertisements.

Fig. 4: A fragment of ECG recording and corresponding HR recording. Source: authors' own elaboration

The analysis of data obtained in the second part of the study

To analyse data gathered with the use of the eye tracker, we used Hyperbeing software which works with Matlab R2010a with Psychtoolbox-3 module installed. As a result of the analysis we obtained:

- Scan paths and Fixation paths for each session individually and for each stimulus,
- Heat map, both for individual sessions and for all sessions together,
- Focus map, both for individual sessions and for all sessions together, like above,
- Area of Interest (AOI) with percentage description of the focus of attention, also both for individual sessions and for all sessions together.

Additionally, the results obtained were recorded as CSV text files, which were later analysed with the use of an appropriate module in the Matlab software.

Results

Creating an effective advertising message concerning food products, such as yoghurt, is relatively difficult. Yoghurt, which comprises the second largest group in the consumption of dairy products, is increasingly more valued by purchasers. Due to the high expectations of customers, producers must constantly know and adapt to the ever-changing needs and expectations of their customers, in order to effectively compete in the market, increase their sales and raise brand awareness. This causes an intensification of promotional actions which aim at creating a positive image of the company and its products and also at increasing their brand recognition, as compared to the competitors. This is why a television commercial, as a tool of mass communication, is commonly held as an effective medium of information about products. Unfortunately, yoghurt is a food product which is relatively

homogeneous (we can distinguish only natural yoghurt and flavoured yoghurt in a few basics flavours) and there is not a large difference between them, which would allow producers to distinguish their products easily from other brands. This is reflected by the large level of similarity of yoghurt commercials: they mostly inform consumers about the same characteristics of the products. Studies conducted show that many respondents had difficulty telling how many yoghurt commercials they had seen during the film. The commercials seemed to them one flow of communication. Aside from this, yoghurt advertisements tend to be described by consumers as not attractive or even boring. Yoghurt is a type of product which lends itelf easily to being the object of stereotyping and clichés. The majority of yoghurt commercials show typical family scenes connected with eating breakfast together (smiling parents and children, happy atmosphere of a picnic, spring outside the window). This is confirmed by the galvanic skin response (GSR) records of individual respondents. An example of such a recording is presented in Figure 5. When analysing the GSR recording (Fig. 5a), one can see a significant drop in interest (attention) of respondents at the moment the film stopped and the advertisements started. GSR recordings for Danone Activia, Danone Velvety and Bakoma Premium were similar. The attention increased again while the advertisement for the cherry-flavoured „Muller Mix Cherry" was shown (Fig. 5b). The rise in interest in this advertisement was confirmed by the EEG recording.

Fig. 5: A sample galvanic skin response (GSR) recording a) decrease in interest when the advertising break started, b) increase in interest in Muller Mix Cherry commercial. Source: authors' own elaboration

Yoghurt commercials usually show a person or a group of people (e.g. a family) gorging themselves on yoghurt of a particular brand. However, respondents perceived such scenes as boring. The commercial for Muller Mix Cherry was different from other advertisements in that it showed a person eating yoghurt only in the penultimate scene. Before that, a short story has been told with pictures (Fig. 6). The commercial starts with a scene where a container is being filled with milk and it forms the sign "Muller". During this, a drop of milk falls on the surface and it flows on this surface, forming a picture of a branch with cherries. Then, cherries formed from the milk fall down and make a splash, which looks like a cow. The cow is transformed into a milk cloud and milk drops falling from this cloud fall into a package of yoghurt. The next scene shows that the package contains both yoghurt and fruit which can be mixed together. It is only then when we see a young girl eating cherry yoghurt. The last scene shows the logo of the company and a sign that says "Flavour comes from the milk".

Fig. 6. Selected scenes from Muller Mix Cherry commercial. Source: authors' own elaboration

The interest of respondents in this particular commercial was confirmed by surveys conducted directly after the study. Among all yoghurt advertisements, it was this one which was best remembered due to the interest it had aroused.

When analysing EEG and GSR data one can also learn which advertisements or which particular scenes cause unpleasant feelings in respondents. It turned out that the commercial for the Activia yoghurt from Danone company was not received well by the participants. This advertisement was well remembered by almost all respondents as it featured a well-known Colombian pop singer, Shakira. However, the yoghurt was presented in the commercial as a golden ray of light, coming from the lips and going to the stomach, which caused rather unpleasant feelings in the respondents (Fig. 7). The associations were all the more so unpleasant that the stomach was portrayed as an overgrown jungle, with the ray of light traveling through it.

Fig. 7. Selected scenes from Danone Activia commercial. Source: authors' own elaboration

When it comes to eye-tracking data, the results obtained have allowed us to establish which elements placed on the yoghurt packages were well-noticed by the participants, and which were entirely ignored. On the basis on the results it has been observed that men taking part in the experiment concentrated most often on the name of the product and the brand. Women, however, paid more attention to the calorie count of the products and in general read information on the package quite carefully (especially information relating to the ingredients present in yoghurt). We have also established the order in which all areas of each package were perceived by the participants (Fig. 8). Typically the respondents started looking at the middle of a picture and they also finished by looking at the middle. Heat maps generated by the programme, both for individual sessions and for all sessions together allow us to determine which elements of the package attracted participants' attention to the greatest extent. Figure 9 shows an example of a heat map of attention areas for an individual participant as well as for the entire group of respondents.

Fig. 8. Sample paths: a) scan path, b) fixation path. Source: authors' own elaboration

Fig. 9. Heat map a) individual session, b) all sessions. Source: authors' own elaboration

The alternative to such a way of presenting data is a focus map which shows even more clearly which elements of the package attracted the attention of the volunteer taking part in the experiment (Fig. 10). Such information may also be obtained by analysing areas of interest with a percentage description of the focus of attention (AOI) (Fig. 11).

In the questionnaire part of the experiment the respondents were asked how important for them (when choosing a particular yoghurt) is information located on the packaging. The results obtained on the basis of participants' answers show that the most important ones are: a photograph or a picture of one of the ingredients and nutritional facts. The name of the product and the producer's logo are, however, of average or low importance (Fig. 12). Interestingly, the observation results of respondents' real behaviour seem to contradict that (Fig. 13 and Fig. 14). Which suggests that subconsciously customers do pay attention to the brand of the product.

Discussion

Conclusions from the first part of the study. The increasing amount of messages and the ever growing chaos in that field cause entrepreneurs to look for media, forms and contents which would reach the customer. The developments in cognitive neuroscience and in the functioning of the human brain allow us to increase our understanding of customer behaviour. The application of neurobiological knowledge in the context of marketing contributes to our comprehension of the course of such processes as emotions, attention, memory or decision-making. Undoubtedly, these are key notions for advertising and consumer behaviour. Knowing brain's reaction to various stimuli, one can increase the effectiveness and efficacy of advertising communication. Neuromarketing is capable of showing how customers react to a studied product and its accompanying marketing communication. It allows to determine whether customers pay more attention to the colour of the package or to its shape, or whether they find music or image more important in commercials. The use of EEG in neuromarketing brings a lot of new data concerning irrational choices, the significance of taste, smell and touch before making the decision to purchase, the importance of background music and the timbre of voice in commercials and their role both in positive emotional perception and in remembering an advertisement for a long time.

On the basis of experiments conducted we have determined that the effectiveness of an advertisement increases in correlation with a rise in consumer's emotional involvement. Marketing communication should therefore be more personalised, particularly in case of advertising brands well-known to consumers. We have also established that an advertisement for yoghurt:

- should not be too long
- should not be boring and ideally should tell a short story,
- should evoke emotions (preferably positive emotions),
- should clearly present company's logo in the last scene.

Questionnaires and interviews we conducted have also shown that customers rarely search for information on new products in the yoghurt market. Consumer behaviours are rather routine. Therefore, in order to increase the activity of customers, producers should apply non-standard forms of promoting their products, e.g. contests, building information-sharing portals, or creating applications whose task would be to arouse the interest of potential buyers of the product. The eye tracking study has also shown that marketing communication placed on a yoghurt package should be varied according to gender (owing to differences in perceiving some elements of the package by women and by men).

Conclusions from the second part of the study. Packaging, as an important constituent of a product, is also a significant tool for marketing. It should attract the attention of potential buyers, allow them to identify the product, incite the desire to have the product, lead to the purchase and additionally, influence consumers' satisfaction while using the product. Moreover, the product packaging creates some positive impressions as to the quality of the product inside the package and hence influences purchasers' emotions. And thanks to its ability to attract potential customers' attention, it also has a visual impact. Therefore entrepreneurs should place great importance on choosing packaging for their product.

The main advantage of eye tracking is that it allows us to study objectively the reactions of respondents to visual stimuli connected with packaging. One may learn which elements of the package are the ones really attracting customers' attention. Depending on the stage in which the study is conducted and on its purpose, various visual elements of packaging may be taken into consideration. It is worth underscoring that the process of designing packaging should not be dominated by individual tastes and preferences of marketing specialists or managers but it should be controlled by professional graphic designers. The next step is to verify the design by studying purchasers' response, including eye tracking studies. If a company applies such a mode of operation, it is almost guaranteed that the product will succeed, which means that customers will prefer the particular product offered and not a competitor's products.

Abstract

This paper aims to describe the theoretical differences in the application of marketing in the creative industries compared to traditional sectors of the economy, and identify, through statistical analysis, factors affecting the perception and opinion of the representatives of companies on the importance of promotion for the company. This paper analyses the companies from the publishing industry, which is a subsector of the creative industries. The theoretical part of the paper is based on the research of secondary sources in the form of scientific articles. The analytical part establishes the research hypotheses and analyses the primary data obtained from questionnaires. These data are analysed by using correlation analysis. Due to the ordinal nature of the data, their distribution and quantity, the Kendall correlation coefficient, was chosen to evaluate the hypotheses. Based on the established hypotheses, the following variables have been found to have an impact on the respondent's views on the importance of promotion for the company: the existence of the planning process, the number of employees, the achieved education of the respondent and the production of the tailor-made products. The age of the company does not have a demonstrable statistical correlation with the opinion on promotion in the company. The established hypotheses were evaluated in the article but considering the nature of the creative industries and their inhomogeneity, it is not possible to automatically assume that the results related to the publishing industry will automatically apply in other subsectors.

Keywords: Creative Industries, Publishing Industry, Promotion, Marketing of SMEs, Opinions on Marketing.

Introduction

A significant milestone in the development of the creative industries and, in essence, their beginning in the broader political discourse can be seen as their initial definition and the beginning of their mapping based on the activities of the British government started in 1998 through DCMS (Department for Digital, Culture, Media and Sport) (O'Connor, 2015). Since then, the creative industries have undergone significant development in many parts of the world and have received considerable recognition from academics, politicians or creative workers (Jones et al., 2016). Academic research in this area has been divided into several directions since 1998, but Business, Economics and Geography are the main areas through which the creative industries are researched (Cho et al., 2018). Nowadays, no one questions the importance and benefits of the creative industries for the artistic and cultural life of the country (Bakhshi & McVittie, 2009). Nor does anyone doubt the significance of their innovational and growth potential for the country's economy (Protogerou et al., 2016). In addition to the direct advantages, they also represent tremendous benefits in the form of spill-over effects. They create space for the cultivation of human creativity, reinforce social cohesion among the population, and they also have a significant positive impact on the companies outside the creative industries. Indeed, there is evidence that companies that are not directly part of the creative industries, but are connected to them, are more innovative than other companies that do not have such connection (Bakhshi & McVittie, 2009).

A growing number of studies of the creative industries underline that the creative industries are becoming an increasingly important component of global knowledge economies (Win, 2014). However, when researching the

Cite this Article as: Peter MIČÁK" Promotion in the Creative Industries: A Case Study of the Perspective of Micro and Small Business Owners from the Publishing Industry Subsector" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

creative industries, it is crucial to keep in mind that this is not a homogeneous group. The creative industries cover many sectors that fall under them, from the publishing industry, through film and music, to the gaming industry, just to name a few. Therefore, it is not possible to talk about a consistent organizational form of the companies or their internal processes. On the contrary, it is possible to speak of different organizational structures that arise in local conditions at different times, for different technologies and various industries (Jeffcutt & Pratt, 2002). However, despite considerable progress in creative industries research, there are still areas where there is no generally accepted consensus. One of these areas is the definition of creative industries. There are a large number of definitions, but for the purposes of this article, the definition of the Czech Ministry of Culture will be used. This definition is based on the British definition and recommendations of the European Union, but with regard to Czech cultural specifics. Creative industries in the Czech Republic are defined as follows: *"Cultural and Creative Sectors" activities are based on human creativity, skills, and talent. (…) They have the potential to create wealth and jobs, especially by exploiting the intellectual property. They include public, non-profit and market activities or products irrespective of the type and mode of financing of the entity implementing them. They add value to other economic sectors and can be a source of technological and non-technological innovation. Cultural and Creative Sectors have many other positive impacts on both society and individuals"* (Ministry of Culture of the Czech Republic, 2014).

This article aims to analyse the views and opinions of owners of small and medium-sized enterprises operating in the publishing industry in the Czech Republic, on the importance of marketing and promotion for their businesses. The article will analyse some of the factors that may influence their views and opinions. Arts promotion is fundamentally different from traditional marketing, as it is often based on a more inclusive multi-directional approach (Boorsma, 2006). Furthermore, as in any study of the creative industries, the local context, history and culture, in this case, the Czech Republic, must be taken into account. Powell and Ennis (2007) point out that the marketing of small and medium-sized enterprises faces many challenges, but this is especially true for companies operating in the creative industries.

Theoretical Framework

Since its inception in the 1980s, marketing of culture and arts has undergone rapid development and professionalization. At present, cultural and arts managers usually have an education in marketing theory and do not question the strategic importance of this kind of education for art and culture (Boorsma, 2006). Of considerable importance is the fact that the targeted education of these managers began to develop gradually in the form of academic study fields and creation of conferences (Lee & Lee, 2017). Seminars focusing on marketing training in the creative industries are on the rise. Their goal is to reflect current trends and make the artist an innovative entrepreneur. An entrepreneur/artist trained in this way is expected to fund his resources and promote his work with a higher dose of professionalism (Win, 2014).

Marketing in the creative industries, despite the adoption of modern marketing techniques, still differs significantly from the traditional sectors of the economy, it is influenced by many aspects that we do not encounter to such an extent in traditional industries. One example may be the role of art critics, who greatly influence the functioning of organizations; and in some cases, these critics could be even viewed to some extent as precursors for the restructuring of institutional logic and processes (Glynn & Lounsbury, 2005). Concepts such as opportunity identification, proactive approach, innovative approach and risk-taking should be part of the managerial way of thinking in the creative industries (Parkman et al., 2012) because although these approaches are less used in this area of the economy than in traditional sectors, they are critical for the long - term success of the company in the creative industries. Another specificity, that managers must take into account in this area, is the influence of emotions on consumer decision making. Emotions represent a significant part in customer decisions making process. Management, therefore, mostly relies on artistic quality and content. However, research shows that the quality of services or the environment also has a crucial impact on customer decisions (Hume et al., 2007).

Boorsma (2006) points out that there are many pros and cons to the traditional customer value approach, with both currents of opinions being somewhat correct. Therefore, it could be harmful and hasty to reject this approach, but it could also be hasty to adopt a marketing philosophy from a purely commercial sphere that may not be sufficiently suited to the creative industries environment. Of course, the form of marketing primarily adapts to the area or subsector of the creative industries in which the company operates. Examples are the area of galleries and museums or areas of performing arts for which it is common to build a membership base. Research of Kleinschafer et al. (2011) shows that the effort to obtain potential members by several methods has a positive impact, whether in the form of

higher patronage or, for example, greater availability of volunteers who are an essential part of internal processes in many non-profit organizations.

The research of Parkman et al. (2012) suggests that if companies in the creative industries want to identify and take advantage of market opportunities successfully, they need to align the company's management with its creative capabilities. Being successful with a new product is vital for the continuity and growth of most companies (Leenders & Wierenga, 2002). Thus, companies from the creative industries necessitate marketing, as they struggle with a large amount of alternative use of leisure time and very active competition. If cultural institutions are under pressure and have problems attracting customers, they often reach for an unconventional and creative form of advertising. These attempts to use unconventional advertising have a more positive impact on the attendance of the monitored institution than conventional equivalents of advertising (Buljubašić et al., 2016).

However, such a rapid development of management and marketing in the field of art and culture also brings negative aspects. The expansion of training and available statistics are proof that the relationship between art and business is becoming increasingly explicit and openly welcomed (Win, 2014). Many institutions had to start competing with others for customers due to the gradual professionalization in their field. One of the tools that these institutions have decided to use is branding. Consequently, it escalated to a point in which in addition to the quality of the works, the place where it was exhibited is also assessed because the brand is what can increase the impact and quality of the artwork (Lee & Lee, 2017). Marketing professionalism, together with an innovative approach, is now by default assumed, which of course causes notable challenges and difficulties for many artists. They are automatically expected to awaken their entrepreneurial spirit, and in addition to generating ideas and creating artwork, they are also expected to fundraise, promote, collaborate, network and participate in many other activities (Win, 2014).

A common disadvantage of cultural and artistic institutions in Eastern Europe is that they do not have a marketing department to perform their customer research and look for various alternative ways to connect with target groups (Buljubašić et al., 2016). Another common ailment is the lack of realization that there is no single homogeneous creative industry, as there are many subsectors, each with its own rules, networking and labour markets (Jeffcutt & Pratt, 2002).

Methodology

As the research of secondary sources in the theoretical part of this paper suggests, marketing and promotion activities in the creative industries are in no small extent different and have a significant number of specifics compared to the traditional sectors of the economy. The analytical part of the article will deal with the analysis of 77 completed online questionnaires collected during spring of 2020 from companies operating in the Czech Republic in the publishing industry subsector, which officially falls under the creative industries sector. The companies were selected based on a data from the Czech Statistical Office and Amadeus database. The relevant questions from the questionnaire consist of closed questions, which can be answered by choosing one of the offered answers in the form of Likert scale. The Results and Discussion section of this paper will present the data on which the methods of descriptive statistics will be applied. In particular, the ownership of intellectual property that is characteristic for companies operating in the creative sectors will be described, the promotion methods used will be evaluated and the data related to the evaluation of the impacts of this promotion will also be analysed. Subsequently, the research hypotheses, which this paper aims to verify, are described. Due to the ordinal nature of the analysed data, their quantity and distribution, a nonparametric Kendall correlation coefficient, namely Kendall's tau-b, will be used to evaluate the hypotheses.

Results and Discussion

The analysed data results are from 77 completed questionnaires, which were filled by micro and small companies operating in the publishing industry in the Czech Republic. According to the official definition of the creative industries in the Czech Republic, the publishing industry is considered a subsector that falls under the creative industries. Given the definition of the creative industries mentioned in the introduction section of this paper, it is crucial to focus on the intellectual property of businesses operating in the creative industries. Therefore, it is not surprising that 77 analysed companies own a substantial amount of intellectual property, primarily in the form of

copyright and trademark. As many as 71 companies (92.2%) out of the total number of analysed companies have a copyright, 26 companies (33.8%) have a trademark, three companies (3.9%) own a utility model, and one company (1.3%) own an industrial design.

Today, companies have a large number of promotion channels at their disposal, which they can use to communicate the chosen message to customers. In the case of the analysed companies from the publishing industry, it is also possible to talk about a large variety of communication channels. Forty-nine companies chose the most frequently used promotion via the Internet (63.6%), followed by a printed advertisement used by 34 companies (44.2%), followed by promotional items used by 24 companies (31.2%). Less used promotional tools are direct marketing, which is used by 17 companies (22.1%), followed by advertising on radio, which is used by 14 companies (18.2%), followed by advertising on television, which was used by nine companies (11.7%). The least used form of promotion is product placement, which is used by only seven companies (9.1%). The use of promotion and advertisement in the analysed companies can also be seen graphically depicted in the following graph.

	Product placement	TV advertising	Radio advertising	Direct marketing	Promotional items	Printed advertising	Internet advertising
Yes	7	9	14	17	24	34	49
No	70	68	63	60	53	43	28

Figure 1: Promotion tools used in the analysed companies (Source: Author's own study)

Fifty-four out of the total number of analysed 77 companies, use promotion and advertising, which amounts to over 70.1%. Conversely this means that 23 companies do not use any form of promotion. It is a surprising finding that out of 54 companies that use promotions to communicate with customers, up to 39 companies (72.2%), evaluate the quality of their communication and its impact on customers. This means that despite the fact that the creative industries are formed in the vast majority of cases by SMEs, companies are aware of the need to retrospectively evaluate the effectiveness of resources invested in promotion and advertising.

As for the composition of respondents by size, up to 63 companies (81.8%) have less than ten employees and are therefore micro-enterprises. The remaining 14 companies (18.2%) have up to 50 employees, and therefore, we can classify these companies as small companies. The respondents copy the already mentioned trend in the creative industries, in which only a tiny percentage of companies is regarded as medium and large companies. Based on the data of the documents of the official mapping of creative industries in the Czech Republic, the share of medium and large enterprises in the total number of enterprises in creative industries in the Czech Republic is 3.61% (Bednář & Kraus, 2015).

As was previously mentioned, this article aims to analyse the views and opinions of the owners of small and medium-sized enterprises operating in the publishing industry on the importance of marketing and promotion for their businesses. To this end, five research hypotheses were established, which are as follows:

Table 1: Established hypotheses (Source: Author's own study)

H1	Setting plans to achieve business goals has a positive effect on the view of the importance of promotion
H2	Having more employees has a positive effect on the view of the importance of promotion
H3	Higher achieved education of the owner / executive manager of the company has a positive effect on the view of the importance of promotion
H4	The higher age of the company has a positive effect on the view of the importance of promotion
H5	The production of a tailor-made product has a negative effect on the view of the importance of promotion

The premise for establishing the first hypothesis is that if the company sets strategies and plans, then in such a company there is a planning process and thus the company also adopts management procedures, which create a precondition for a more positive perception of the importance of promotion. This assumption can be taken for granted for bigger companies, but it is necessary to be aware of the micro and small size of the analysed companies. Given the result of the correlation analysis in the case of the first established hypothesis, it is possible to accept the null hypothesis and reject the alternative hypothesis. Hence, there is a statistically significant relationship between having plans and strategies in companies and the favourable opinion of owners or executive employees on the importance of promotion.

Table 2: Evaluation of the first hypothesis (Source: Author's own study)

H1	Setting plans to achieve business goals has a positive effect on the view of the importance of promotion		
	Kendall's tau b	Correlation Coefficient	.232*
		Sig. (2 tailed)	.028
		N	77
	* Correlation is significant at the 0.05 level (2 tailed)		

The formation of the second hypothesis is based on the assumption that larger companies require a higher level of management than micro-enterprises, for example in the form of a defined organizational structure and transparent clarification of the relationships between the company's employees. The second hypothesis is based on a similar assumption as the first one and thus that in companies with more employees, the role of promotion is also perceived more positively. Given the results of the correlation analysis, it is possible to accept the null hypothesis and reject the alternative hypothesis. The correlation is particularly significant at the 0.01 level in the second hypothesis. With the growing number of employees in the company, the opinion of the owners or executive employees on the role of promotion is also growing. Even more precisely, due to the negative correlation of analysed data, it is possible to speak of a declining negative opinion on the role of promotion in a company with an increasing number of employees.

Table 3: Evaluation of the second hypothesis (Source: Author's own study)

H2	Having more employees has a positive effect on the view of the importance of promotion		
	Kendall's tau b	Correlation Coefficient	-.303**
		Sig. (2 tailed)	.003
		N	77
	** Correlation is significant at the 0.01 level (2 tailed)		

The third hypothesis is based on the assumption that with the growing education of the owner or executive employee, a precondition arises for a better understanding of the tools and the importance of marketing for the management of the company. Given the results of the correlation analysis, it is possible to accept the null hypothesis and reject the alternative hypothesis. Thus, with higher achieved education of the owners or executive employees in the company, there is a more positive perception of the significance of promotion. More specifically, given the negative correlation of the analysed data, it is possible to speak of a declining negative opinion on the role and importance of promotion of the owner or executive employee with a higher achieved education.

Table 4: Evaluation of the third hypothesis (Source: Author's own study)

H3	Higher achieved education of the owner / executive manager of the company has a positive effect on the view of the importance of promotion		
	Kendall's tau b	Correlation Coefficient	-.249*
		Sig. (2 tailed)	.019
		N	77
	* Correlation is significant at the 0.05 level (2 tailed)		

The fourth hypothesis was established on the assumption that the representatives of the companies that were established earlier and had more experience in the market will perceive the role of promotion more positively. Given the results of the correlation analysis, it is not possible to speak of a statistically significant correlation between the observed variables. That means that we reject the null hypothesis and accept the alternative hypothesis. The reason for the absence of a statistically significant correlation between the age of the company and the perception of the importance of promotion by its representatives may be the fact that older companies that have already established themselves in the market and have their regular customers and business partners may not perceive the role of promotion as necessary for their business activities. There is also the presumption that companies that have been on the market for a longer time have been established at a time when marketing was not considered as important as it is nowadays.

Table 5: Evaluation of the fourth hypothesis (Source: Author's own study)

H4	The higher age of the company has a positive effect on the view of the importance of promotion		
	Kendall's tau b	Correlation Coefficient	-.187***
		Sig. (2 tailed)	.057
		N	77
	*** Correlation is statistically insignificant		

The last fifth hypothesis is based on the assumption that companies in the creative industries that produce tailor-made products will probably not consider promotion as an essential tool for the company. Given the results, it is possible to accept the null hypothesis and, conversely, reject the alternative hypothesis. That means that companies that produce tailor-made products perceive promotion as less necessary for the company than in the case of companies that do not produce a tailor-made product.

Table 6: Evaluation of the fifth hypothesis (Source: Author's own study)

H5	The production of a tailor-made product has a negative effect on the view of the importance of promotion		
	Kendall's tau b	Correlation Coefficient	-.246*
		Sig. (2 tailed)	.017
		N	77
	* Correlation is significant at the 0.05 level (2 tailed)		

Conclusion

The aim of this research paper was to identify what factors influences the opinion of representatives of companies operating in the publishing industry on the importance of promotion. Five research hypotheses were established for this purpose. These hypotheses tested the influence of planning process in the company, the number of employees, the education of the respondents, the age of the company and whether the company produces tailor-made products, on the opinion of the owner or executive employee in the company regarding the importance of promotion for their businesses. Considering the theoretical part, it is possible to say unequivocally that marketing in the field of culture and art has many specifics that may not be reflected in traditional industries. In the case of research of the creative industries or their subsectors, it is always necessary to approach the analysed problem contextually. The results show that there are statistically significant correlations between planning, number of employees, education achieved by the owner or executive employee, and whether the company produces a tailor-made product, and an opinion on the importance of promotion for the company's business. In the case of the fourth hypothesis, the correlation between the age of the company and the opinion on the promotion was not statistically confirmed.

As Jeffcutt & Pratt (2002) suggests, what applies to one of the subsectors of the creative industries may not automatically apply to another subsector. Thus, one possible direction for future research could be to compare these correlations with other subsectors of the creative industries. It is also necessary to realize that the development of marketing in the creative industries is not always welcomed with open arms and many representatives of companies or artists are almost defensive about the concept of marketing and management in general because they feel they are at odds with their artistic feeling. In the creative industries, it is crucial to explore the opinions of their representatives and the factors or variables that may stimulate those opinions. This article is a modest attempt to implement such an approach. This approach could be vital for understanding the internal workings of processes in the creative industries. Despite the topicality and great present value of the creative industries, the internal processes that shape and transform the creative process in the creative economy remain mostly unclear and poorly understood (Jeffcutt & Pratt, 2002).

Abstract

The paper presents a comparative study of tourist attractivity for two cities, Brasov and Sibiu, located in Southern Transylvania, Romania. For the attractivity assessment, a combined approach was tested, using a digital, online tool (Google Trends) and a classical method (qualitative research). The results were consistent, outlining that these cities are both highly ranked by tourists, but Brasov records a constant advance. This was explained, by the subjects of the qualitative analysis, as related to differences in the natural potential (mainly climate and vegetation peculiarities). By analysing the time series of monthly Google searches (for the period January 2004- August 2020), it is clearly observable the higher interest for Brasov for almost all this period and a noteworthy exception, in 2007-2008 (in 2007, Sibiu was European Capital of Culture). Such events prove their importance in increasing tourist appeal, but the effect is limited in time, thus requiring a certain periodicity and for their optimised time planning, the Google Trends could offer very useful information.

Keywords: tourist attractivity, tourist destination, Google Trends, qualitative research, natural potential.

Introduction

Tourism represents a major economic sector worldwide and its importance is currently increasing. With this general ascending trend, that will most probably continue in the future decades (despite some possible severe drawbacks induced by social crises, like the present pandemics), the faith of particular destinations would be significantly different, in accordance with the evolution of the visitors' flux, driven by the tourist attractivity. Consequently, for sustainable tourism management, the assessment and monitoring of attractivity are of vital importance. By employing new tools, available in the present digital era, real-time information could be added to the data obtained by classical methods, potentially improving the decision-making process.

The amount of digital data generated every second in the present is astonishing. Thus, the importance of keywords is growing at a steady pace. Google Trends has been launched in 2006 to track and analyse the searching trends on Google (2017). Since its appearance, it has been a useful tool not only in keyword research but also in numerous research papers covering various topics. A comprehensive study upon articles that employed Goggle Trends is that of Jun et al. (2018).

Today, the importance of search engines is indisputable as they are an indispensable part of our daily life. The undoubtable significance of search engines in tourism and hospitality has led to a substantial literature on the subject. An extensive literature review covering the five-year-period of time 2012-2017 is that of Dinis et al.

(2019). According to them, the majority of articles which employ Google Trends are related to "forecasting/nowcasting; knowing the interest of users' searches for tourist attractions or destinations; showing the relationship between the official tourism statistics and the search volume index of Google Trends; and estimating the effect of one event on tourism demand".

The present study is aimed to analyse the correlation between the number of worldwide Google searches as provided by Google Trends and the attractivity of a destination. There were chosen two tourist destinations in Southern Transylvania with significant national importance for Romania, but less known at the international level.

Brașov is one of the most important tourist destinations in the central region of Romania. It is an area with a significant historic and cultural patrimony, in addition to its magnificent natural scenery, in the close vicinity of the mountains. Its tourist value is increased by the winter resort Poiana Brasov at the outskirts, probably the top Romanian skiing attraction, and by the nearby Dracula Castle, at Bran, with numerous visitors from all over the world.

Sibiu is also well known as a major tourist attraction in Southern Transylvania, with structural and historical similarities with Brasov, sharing a similar Saxon tradition (Kronstadt and Hermannstadt are their German names). Its tourist attractiveness has been increased by obtaining the title of European Cultural Capital (in 2007, together with Luxemburg), being the first city in Eastern Europe with this title.

Materials and Methods

The data were collected from Google Trends for the past seventeen years, from January 2004 to August 2020. The data consist of individual entries summarised as monthly values, which represent a normalized number, scaled from 0 to 100, according to Rogers (2016). The relative number of searches for the two Romanian destinations, Brașov and Sibiu, as it results from the collected data, gives an inside on the interest that is received from the online community.

In order to obtain an attractivity evaluation, as perceived by tourists, a qualitative research was conducted, using the in-depth, semi-structured interview method. As remarked by Hennink et al. (2020) "qualitative research begins with the formulation of the research questions and study objectives". Thus, the present survey was aimed to formulate a comparative attractivity index for the two cities, as well as to identify the attractions that make tourists visit a certain place, from the point of view of the tourists who have previously visited the destination.

In order to obtain a relevant sample in a qualitative research, some authors suggest that the ideal sample size should be of 12 to 26 subjects according to Luborsky & Rubinstein (1995), and "as a very general rule of thumb" to never exceed 50 subjects, as stated by Ritchie et al. (2003). Some authors consider that "recommendation for in-depth interviews is to have a sample size of 20-30" as stated by Shetty (2020).

The interview guide, comprising 18 questions, was composed of questions related to general aspects regarding the attractivity of the tourist destinations Brașov and Sibiu (questions 7, 8, 9, 10, 11 and 12), questions which aimed to identify the visitation frequency (questions 1, 2, 3 and 4) and questions regarding the correlation between attractivity of a destination and search engines (questions 13 and 14). The last questions of the survey are related to the background of the respondents.

The qualitative method used was the exploratory one. The communication technique chosen was the direct, individual one and the semi-individual, profound one. The interviews were conducted between June 2020 and August 2020, being afterwards transcribed to conduct a content analysis.

The sample for the present study consists of 23 subjects, with an age range from 21 to 80 years, who have previously visited both Brasov and Sibiu. The sex distribution of the respondents was of 60.9% women to 39.1% men. As far as education is regarded, the subjects are divided as follows: 65.2% have higher education, while an equal per cent of 17.4% have medium or postgraduate education. As far as occupational categories are concerned, 56.3% of respondents are employees (in different professional areas), 4.3% are entrepreneurs, 26.1% are students, 8.7% are retired and 4.3% have answered something else.

The study destinations are well known by the subjects, most of them having updated information, obtained through recent visits (96% visited Brasov and 59% Sibiu last year, as indicated by the answers at questions 2 and 4).

Most of the respondents (78%) have used Internet search engines when they decided to visit Brasov and Sibiu, and they stated that this influenced considerably their decision to visit the destination (75% for Sibiu and 69% for Brasov).

Results and Discussions

The differences in popularity as resulting from Google Trends are interestingly divided worldwide. Brașov has been most searched in Moldova (77% compared to 23% for Sibiu), Israel (74%), Italy (69%), UK (67%) and Greece (66%). Even though Brașov tends to be generally more popular, in terms of searches worldwide, as it can be observed in the following graphs (Fig. 1, 2 and 3), Sibiu leads in searches from the following countries: Germany (63% compared to 37% for Brașov), Austria (56%) and Switzerland (53%). This situation can be explained by the presence of the German community in the Sibiu region, which despite its consistent reduction in the last decades (especially during the communist regime and in the immediately subsequent period) is now more important than in Brasov.

The Google searches monthly averages for the study period (2004-2019), charted in Figure 1, are obviously higher for Brasov as compared to Sibiu.

Fig. 1: Annual variation of the Google searches monthly averages, for the 2004-2019 period

The monthly data of Google searches, for the analysed tourist destinations, show a generally similar shape, with an increase of the number of searches in the summertime, with a maximum in July, for both cities. The tourist interest decreases in winter and early spring, when the monthly mean minimums are recorded, in January (Sibiu) and March (Brasov). These slight differences in the searches dynamics, also observable on the chart, could be explained by the presence of the well-known ski resort Poiana Brasov, located in the Postavaru Mountains, at the southern border of Brasov city, that determines the occurrence of the minimum interest towards the end of the skiing season. The number of searches is decreasing in late autumn and early winter (with a more evident drop from November to December for Sibiu, with a lower focus of the winter sports lovers, as compared to Brasov), despite the very high number of visitors, in both destinations, during the Christmas Holliday (when attractive feasts are organised in the Central Squares, in the German style), but probably those travelling plans are drawn in the previous months.

Fig.2: Monthly Google searches, for Brasov and Sibiu, from January 2004 to August 2020

As regards the time series of monthly Google searches for Brasov and Sibiu, in the period spanning from January 2004 to August 2020, graphically represented in Figure 2, apart of the jagged aspect, determined by the seasonal variations previously analysed, it is easily observable that the number of searches for Brasov is considerably higher for almost the whole time interval. There are two exceptions, firstly the number of searches was higher for Sibiu in 2008, from April to August, and very close to Brasov in the adjacent periods, as a clear effect of the increased tourist interest for the 2007 European Cultural Capital (it is noteworthy to observe that the tourist focus on Sibiu was maximum in the summer of the following year, when people's amplified curiosity met the customary main holiday season) and secondly in the spring of 2020, when the Google searches decreased to close low values for both destinations, most probably due to the Covid-19 lockdown.

The time evolution of the difference in Google searches between Brasov and Sibiu could be more easily analysed in the following diagram (Figure 3), where the previously analysed exceptions are clearly marked as minimums, the one in July 2008 with a negative value.

Fig.3: Time series of monthly differences between Brașov and Sibiu searches

The diagram also shows that after 2007, the effect of the increased attractivity of Sibiu (European Capital of Culture in that year) was not very long-lasting, as the difference has abruptly increased, reaching in 2-3 years values comparable with those in 2005-2006. Afterwards, till 2019, the difference continues its growth at a lower but almost constant yearly rate. For the entire study period, the trendline on the chart (with its equation noted above the graph) indicates a rising tendency.

Based on the above study of the Google Trends data, one could infer a higher tourist attractivity for Brasov, with a generally increasing trend. For verifying this hypothesis and possibly consolidating these assumptions, a very useful tool is offered by the qualitative research, using the in-depth, semi-structured interview method. Much more than providing an alternative evaluation of the two destinations' attractivity, for comparison reasons, this classical approach was also designed for supplying the information necessary to identify the decisive factors for the tourist attractivity (components of the tourism potential and/or offer).

As concerns the tourist attractivity assessment for Sibiu and Brasov, which was the first objective of the qualitative research, the results are in accordance with the outcomes of the Google trends analysis (see Figure 4)

Fig.4: Qualitative research assessment of study destinations tourist attractivity

The majority of the interviewed subjects ranked the attractivity of both tourist destinations as high and very high (100% for Brașov and 78.3% for Sibiu). However, there is a noticeable difference in respondents' perception about the attractivity of these cities, in accordance with the outcomes of the Google searches analysis. The attractivity was evaluated as very high (the top category) by 56.5% of the respondents for Brasov and only 34.8% for Sibiu, resulting a per cent difference of 21.7%, well correlated with 15.5, the average difference of monthly Google searches, observable in Figure 3 (a value that could be compared with the percentual values, since these are normalized numbers, scaled from 0 to 100).

The qualitative research also offers information regarding the importance of the various factors affecting tourist attractivity. These factors were grouped into three categories (each one focused by a question in the interview guide), referring to the natural potential, the anthropic potential (attractions created by humans) and tourist infrastructure.

The natural potential was appreciated to be superior for Brașov as compared to Sibiu (with total scores of 85 and 32 respectively). Among the natural potential components, the maximum differences between the considered cities occur for climate (16 points) and vegetation (14 votes), as clearly observable in Figure 5.

Fig.5: Natural potential factors importance for tourist attractivity

The above-mentioned situation is changed for the anthropic potential, where Sibiu records a slight advance against Brașov (with a cumulated score of 87 versus 86). Despite this close overall situation, one could easily observe on the chart (see Figure 6) that the differences in favour of Sibiu are much higher for several components (monuments, museums and traditions) while Brașov was more appreciated for its churches and gastronomy.

Fig.6: Significance of anthropic potential factors for tourist attractivity

Fig.7: Tourist Infrastructure contribution to destination attractiveness

The tourist infrastructure was appreciated to be better in Brasov (with a total of 45 points and only 36 in Sibiu), but it is worth mentioning that the differences, recorded for three components, are all equal to 3 votes (see Figure 7).

By synthesising all the above-mentioned factors, contributing to the tourist attractivity, it clearly occurs that, in the opinion of the qualitative research subjects, the difference between Brasov and Sibiu is mainly related to their natural potential, with a special emphasis for climate and vegetation (forests).

At a first glance, the tourism potential of the two well-known Transylvanian cities, Brasov and Sibiu, seems very similar. Most probably this resemblance is related to their German (or more precisely Saxon) inheritance that is easily noticeable, especially in the structure and the architecture of their main squares. But even from these central positions, an important difference could be observed by any visitor. The Central Square in Brasov is in the shade of the Tampa Massif (that gave a popular alias to the city name "The Town at Bottom of Tampa"), and the nice forests draping its Western slopes (with changing colours from season to season, fresh green in the spring, gilded in the autumn sun and glittering silver in the winter frost), are creating a picturesque background to the historical buildings of the old downtown. And Tampa is not alone, on the other side the hillslopes of the Warthe Hills, are also covered by beautiful woodlands, with their green blanket stained, from place to place, by the withe limestone of the old towers and walls (like the White and The Black Towers, which are important tourist attractors). Thus, the mountains, with their piedmonts (before mentioned) inserted in the city, create a clear difference in the landscape.

Mountains are also not far from Sibiu, from several positions one could observe the Fagaras Mountains Summits (the Transylvanian Alps, as sometimes named). But these mountains and their forests are not in contact with the city.

This situation is related to the local climate of those regions. Brasov is situated in a depression area, where cold air is draining towards the bottom, especially in wintertime, creating temperature inversions with frost pockets at lower elevations and a more hospitable warmer belt at the bottom of the surrounding mountains. As a consequence, human settlements mainly avoided the lower areas and most of the towns and villages, not only Brasov, are located at the contact between the depression and the mountain range, coming in contact with the forests.

The social importance of the forests surrounding Brasov, considerably exceeding their contribution to the tourist potential of the area, is greatly recognized by the community, as documented by previous researches. In a study by Pacurar and Albu (2018), concerning the perception about the services provided by Brasov's forests, all respondents highly appreciated their role in the community life, some of them adding the following comments: "the forests help in reducing climate change, are sources of wood products, food and water, offer shelter for numerous wildlife species", "the forest is like a member of my family", "it maintains the ecological equilibrium, represents a source of food for men and animals and a source of wood "and "prevent erosion and landslides, provide oxygen and absorb carbon dioxide, reducing pollution, offer a place for relaxation and an outstanding landscape".

Conclusions

The new tools, presently available online, such as the Google Trends, used in this study, offer outstanding opportunities for applications in various domains. This synthetical information could be easily and quickly obtained and is extremely useful in assisting the decision-making process generally and particularly in tourism management.

By adding to this modern, digital approach a qualitative analysis, which could offer accurate outcomes faster than other classical methods, the results and conclusions could be consolidated and expanded.

This study sustains the usefulness of this combined approach in assessing the tourist attractivity and explaining the possible differences occurring between various destinations. This is of great importance for the sustainable management of a tourist destination. As Albu and Pacurar (2019) stated, "an accurate evaluation of the touristic potential of Brașov county, along with identification of the resources which will allow an increase in the attractivity throughout the entire year, is highly important for maintaining a constant touristic flow of visitors".

For obtaining a complete image of the attractiveness of a destination, it is important to combine the methods presented in this study. The optimal planning of the sustainable tourism development strategy for a tourist destination requires to focus all the main categories of stakeholders. For achieving better management decisions in the tourism sector, it is also advisable to apply such a combined procedure in evaluating the attractiveness of tourist destinations, involving both modern tools and classical methods. In this study, the classically acquired information about tourists' opinions were highly useful for explaining the results. Obviously, the qualitative research should be always adapted according to the typology of tourist destinations. The comparative analysis of Brasov and Sibiu attractivity, with consistent results provided by the study of Google Trends and the qualitative research, showed that these are both highly ranked by tourists, but Brasov records a constant advance. This was explained by the difference in the natural potential, mainly related to the climate and vegetation peculiarities. Obviously, these researches must be continued and deepened for confirming the results. For instance, this special focus on climate and forests decisive influence corresponds to reality, being also confirmed by experts' opinions, but the figures could be artificially inflated by the overwhelming (and not always accurate) presence of these topics (forests and climate) in the Romanian mass media. The study also brings new evidence for the efficiency of cultural events, with broad international impact (like those hosted by Sibiu, in 2007, as European Capital of Culture) in increasing the tourist attractivity, but also signals its limited duration. Consequently, new similar events need to be periodically organised, for maintaining the tourist interest, and for planning them and optimising the costs, the monitorisation of Google trends could be a simple but highly effective method.

Leadership Style, Entrepreneurial Orientation and Their Consequences: A Review Paper

Hieu Minh VU

Faculty of Business Administration, Van Lang University, Vietnam
Email: hieu.vm@vlu.edu.vn

Abstract

Effective Leadership is important for the growth and survival of every organization. Entrepreneurial orientation dimensions of risk-taking, innovativeness, and proactiveness enable an entrepreneur to spot and exploit opportunities ahead of competitors. The author uses a critical literature review method to draw insight on leadership styles, entrepreneurial orientation, and their consequences. The review highlights the important role different leadership styles play in promoting business performance, organizational effectiveness, and growth. It was observed that role of entrepreneurial orientation (EO) dimensions of risk-taking and innovativeness to organizational success is relatively unclear and inconsistent. This is due to mixed findings that were reported by scholars. The author recommends that more studies should be conducted on entrepreneurial orientation by incorporating more antecedents and consequences.

Keywords: Leadership, transformational leadership, entrepreneurship, entrepreneurial orientation (EO).

Introduction

Globalization, fast-changing technology, changing workplace, demographic changes, and Covid 19 pandemic are influencing firm performance. In this context, effective leadership is needed to cope with these forces that are shaping organizational success. Leadership is the art of influencing others to cope with the complexities of the fast-changing global environment (Nahavandi, 2002). Several scholars (e.g. Severinsson and Holm, 2012; Hotho and Dowling, 2010; Vardiman et al., 2006; Anderson et al., 2009; Amagoh, 2009) demonstrated that firms with good leadership thrive, even in difficult times. Francis (2013) notes that organizations fail due to poor leadership. Therefore, organizations need to develop leadership capacity to navigate a dynamic and uncertain business environment. Leadership style is the consistent pattern of behavior that characterizes a leader (DuBrin, 2001) that fosters an organization's effectiveness or performance (Nahavandi, 2002). Researchers have examined different approaches to leadership; contingency or situational leadership (Avolio, 2007; Haslam et al., 2011; Northouse, 2015), transformational leadership (e.g. Burns, 1978; AlimoMetcalf and Alban-Metcalf, 2005), distributed/shared (Hartley et al., 2008), transactional leadership (Burns, 1978), strategic leadership (Onu et al., 2018; Masungo et al., 2015; Kabetu and Iravo, 2018, Nwachukwu and Vu, 2020) and entrepreneurial leadership (Goossen and Stevens, 2013; Dover, Hariharan and Cummings, 2014; Renko, Tarabishy, Carsrud and Brännback, 2015). Entrepreneurial orientation is one of the entrepreneurship research domains where the body of knowledge is growing (Rauch et al., 2009). Covin and Wales (2012) acknowledge that entrepreneurial orientation is a driving force behind an organization's effort to succeed. The literature on entrepreneurial orientation is not fully established in non-US business environments (Runyan et al., 2012). Entrepreneurship behaviors foster a firm competitive edge (Vu & Nwachukwu, 2020; Kuratko, 2009), economic growth (Antoncic & Hisrich, 2004), and financial, cultural, or social values (Nwachukwu, Chládková & Zufan, 2017). Studies on entrepreneurial orientation are well documented (e.g. Lim and Envick, 2013; Jia, Wang, Zhao and Yu, 2014; Vojtovič, 2016; Hudakova, Buganova, and Dvorsky, 2015) which lend credence to the importance of EO to Small and Medium Enterprises - SMEs. The present paper examines the concepts of leadership, entrepreneurial orientation, and their consequences using a critical literature review approach. The paper adds to the leadership and entrepreneurship literature by reviewing and discussing the role of leadership styles and entrepreneurial orientation in promoting organizational outcomes. Specifically, academicians and managers will be informed of the importance of different leadership styles and EO dimensions risk-taking, proactiveness, and innovativeness in fostering organizational success. This paper is arranged as follows. In the following section, this paper presents an overview of the review of the theoretical underpinning and concepts of

leadership and leadership styles, entrepreneurship and entrepreneurial orientation, and consequences of leadership styles and entrepreneurial orientation. Next, the methodology. Finally, discussion, conclusions, limitations, and suggestions for further study.

Literature Review

In the contexts of leadership, the democratic theory focuses on getting assistance from subordinates in planning and decision making. It recognizes and appreciates the contributions of subordinates in promoting organizational success. From the resource-based view and human capital theory stance, leaders' unique insights, skills, intellectual characteristics, education, business ownership experience, and capacities influence employees and enhance productivity and performance. The dynamic capability theory has been used to explain the concept of entrepreneurial orientation (EO). Thus, value creation through entrepreneurial orientation (risk-taking, proactiveness, and innovativeness) and actions can enable firms to create and sustain value; thus, an important element in the dynamic-capability framework.

Conceptualizing leadership and leadership styles

Grint (2010) and Northouse (2015) summarise that leadership falls into one of four typologies; leadership as a position, leadership as a person, leadership as a result, and leadership as a process. Leadership as a position suggests the positional power of leaders that enables them to achieve goals within their area of responsibility or power. Leadership as a person focuses on the personal qualities and traits of the leader. Leadership, as a result, emphasizes the leaders' actions and efforts towards the attainment of agreed goals. Leadership as a process suggests that leadership is an interactive and fluid relationship between leaders and followers. Accordingly, leadership involves the process of influencing a group of individuals to achieve a common goal. Extant literature has used trait theory; behaviours, qualities, or attributes of leaders (Avolio, 2007) to explain the concept of leadership. Mann (1959) submits that the connection between leadership and traits was inconsistent. On the other hand, the behaviour theory of leadership focuses on task-oriented and people-oriented behaviours of a leader (Mendez-Morse, 1992). Tasks-oriented activities include planning, organizing, and assigning tasks and jobs in an organization among others. People-oriented behaviour focuses on using recognition of the social and emotional needs of individuals, self-esteem, and work satisfaction to promote people's performance. Contingency or situational leadership is another approach to conceptualizing leadership. This approach suggests that the situation shapes the behaviour of leaders (eg. Avolio, 2007; Haslam et al., 2011; Northouse, 2015). Transformational leadership is one of the new paradigm approaches to leadership (AlimoMetcalf and Alban-Metcalf, 2005). Transformational Leadership aims to transform people and to help them actualize their potential and enhance organizational performance (e.g. Northouse, 2015). Transactional leaders were described as those who give something in exchange for what they want. Transactional leaders direct energy, live within the organizational culture, and hold followers in a dependent position. Transactional leadership connotes the exchange or transaction between a leader and the follower (Burns, 1978). For instance, followers received rewards for their contribution to common goals. Arguably, most leadership models are transactional and common with all types of organizations. Distributed or shared leadership is another model of leadership that suggests that leadership is distributed or shared with others. As such, all members of the organization can lead when needed (Hartley et al., 2008). The concept of entrepreneurial leadership emerged from the combination of two concepts (entrepreneurship and leadership) (Yang, 2008). Ireland, Hitt and Sirmon (2003), Vecchio (2003), and Kuratko (2007) assert that entrepreneurial leadership is the ability to influence others to use resources strategically. It encompasses both the opportunity-seeking and advantage-seeking behaviours of a leader. In the words of Goossen and Stevens (2013), entrepreneurial leadership involves creating an environment that motivates followers towards spotting new opportunities and exploiting them for sustainable success and value creation.

Conceptualizing entrepreneurship and entrepreneurial orientation

Extant literature suggests that entrepreneurship plays an important role in promoting the economic growth of nations (Antoncic and Hisrich, 2004; Kuratko, 2009) and the success of Small, and Medium Enterprises (SMEs) (Nwachukwu, Chládková and Zufan, 2017). According to Kirzner and Santet (2006), entrepreneurship involves human creativity and the ability to spot profitable ideas that enable firms to leverage new and socially beneficial gains from trade. Arguably, entrepreneurship focuses on creating new economic opportunities in the market. An entrepreneur takes business and financing decisions that transform innovations to value for customers. Entrepreneurs must collaborate and cooperate with employees to develop and execute meaningful ideas (Vu and Nwachukwu, 2020). Entrepreneurial orientation involves the process, practices, and decision-making activities that facilitate new entry (Miller, 2011; Lumpkin and Dess, 1996)). Entrepreneurial orientation is a firm's strategic orientation that explains the specific aspects of entrepreneurial decision-making, methods, and practices (Wiklund and Shepherd, 2005). Dess

and Lumpkin (2005) assert that entrepreneurial orientation is 'a frame of mind' and view about entrepreneurship that is shown in a firm's processes and culture. Additionally, entrepreneurial orientation suggests strategy-making processes that enable organizations to take entrepreneurial decisions and actions (Rauch et al., 2009; Wales et al., 2011). In light of Miller (1983), entrepreneurial orientation entails a firm's propensity for risk-taking, innovativeness and proactiveness. Lumpkin and Dess (1996) expand the entrepreneurial orientation construct by adding competitive aggressiveness and autonomy. In explaining the construct, Rauch et al. (2009) describe the risk-taking dimension as the ability of a firm to deploy significant resources to ventures in uncertain environments. Risk-taking describes the uncertainty that emerges from behaving entrepreneurially and the ability of an entrepreneur to spot and deal with the risks (Ogunsiji and Kayode, 2010). Lumpkin and Dess (2001) submit that risk-taking enables a firm to calculate and plan business opportunities considering uncertainties in the marketplace. Innovativeness entails the ability to engage in creativity through the introduction of new ideas, products/services as well as technological leadership. The proactiveness dimension emphasizes "opportunity-seeking" characterized by the introduction of new products and services ahead of the competitors. Arguably, proactive firms can take advantage of market opportunities before competitors. Competitive aggressiveness explains a firm's efforts to outwit competitors. Firms use strong offensive posture or aggressive responses to neutralize competitive threats. According to Lumpkin and Dess (1996), competitive aggressiveness focuses on competitors while proactiveness is the initiative towards customers. The autonomy dimension of entrepreneurial orientation explains entrepreneurial independence when creating and implementing new ideas (Rauch et al., 2009).

Leadership styles and its consequences

Extant literature has shown effective leadership fosters strategic flexibility, performance, organizational effectiveness, and business sustainability (Ling, Simsek, Lubatkin and Veiga, 2008; Engelen et al., 2012; Yukl, 2013; Nwachukwu and Vu, 2020). Eddleston (2008) submits transformational leadership to promote positive family cultures, commitment, stewardship, and strategic flexibility. Wales et al. (2011) and Cogliser and Brigham (2004) report that leadership fosters entrepreneurial ventures' success. In the study of the public sector in the United Kingdom, Alimo-Metcalf and Alban-Metcalf (2005) find transformational leadership positively influences employee satisfaction, motivation, and productivity, and reduce levels of sickness absence and employee turnover. Empirically, Gyensare et al. (2016) conclude transformational leadership positively influence turnover intentions. Demirtas and Akdogan (2014) demonstrate ethical leadership promotes the awareness of ethical climate, as well as employees' turnover intentions. Using structural equation modeling, Azanza et al. (2015) report authentic leadership positively impacts employees' turnover intentions. Yang et al. (2019) find entrepreneurial leadership lower employee turnover intentions. Kuratko (2007) asserts entrepreneurial leadership allows firms to remain competitive and survive in the marketplace. Entrepreneurial leaders foster superior venture performance by creating strategic value (Yang et al., 2019). Rahim et al. (2015) evaluate the effect of entrepreneurial leadership on the performance of Malaysian SMEs and conclude entrepreneurial leadership positively influences organizational performance. Nwachukwu and Vu (2020) contend that strategic leadership is a firm's capability that promotes sustainable performance.

Entrepreneurial orientation and its consequences

Extant studies highlight the importance of risk-taking, innovativeness, and proactiveness to business sustainability and profitability (e.g. Lumpkin and Dess, 1996). Arguably, entrepreneurial orientation enables firms to identify new opportunities, benefit from risk-taking, develop innovative products, and proactively position themselves in the market. Previous studies suggest firms with robust entrepreneurial orientation outperform those that do not adopt entrepreneurial orientation (De Clercq et al., 2010). Karacaogl et al. (2013) submit risk-taking dimension of entrepreneurial orientation positively influences the financial performance of manufacturing firms in Turkey. Similarly, Neneh (2016) conclude risk-taking enables SMEs to survive in the marketplace. Jalali et al. (2014) find a strong positive association between risk-taking, firm performance, and growth. In the retail sector in Ghana, Anlesinya et al. (2013) report a positive and significant connection between risk-taking and profitability of micro-enterprises. Conversely, Gürbüz, and Aykol (2009) demonstrate risk-taking is negatively related to sales growth. In the same direction, Zhou and de Wit (2009) report there is no significant relationship between risk-taking and employment growth. Mirela (2008) argues that innovation promoted business survival and growth. Nwachukwu, Chládková and Fadeyi (2018) observe that innovation explains competitive heterogeneity between firms. Empirically, Calvo (2006) opines that the EO dimension of innovativeness significantly influences sales and productivity growth. He adds that the impact of innovativeness on employment growth in Spanish SMEs is insignificant. In Turkey, Karacaogl et al. (2013) report innovation has a positive effect on the financial performance of manufacturing firms. Matchaba-Hove and Vambe (2014) submit innovativeness has a significant influence on the success of small businesses in South Africa and the growth of Micro and Small Enterprises (MSEs). On the other hand, Neneh (2016)

finds there is no significant association between innovativeness and firm performance. Similarly, Anlesinya et al. (2013) demonstrate a relationship does not exist between innovativeness and profitability of microenterprise operating in the retail sector. Wiklund and Shepherd (2005) opine a proactive firm can spot and exploit new market opportunities and enhance innovative performance. Hughes and Morgan (2007) assert proactive firms can quickly respond to market signals. Proactiveness gives firms the first movers advantage in terms of profitability and market share (Lumpkin & Dess, 2001). Gürbüz and Ayko (2009) find a significant link between proactiveness, SMEs' employment, and sales growth. Similarly, Kaya and Agca (2009) report proactiveness dimension of EO significantly influences performance. Similarly, Matchaba-Hove and Vambe (2014) find that proactiveness has a significant and positive effect on the success of South African SMEs. In Ghana, Anlesinya et al. (2013) and Boohene et al. (2012) observe proactiveness is significantly related to the profitability of microenterprises in the retail and professional services sector. However, Fatoki (2014) submits microenterprises are less proactive and preferred to be followers rather than leaders.

Table 1: Theories underpinning the concept of leadership styles and entrepreneurial orientation

Variables	Theories	Literature
Leadership styles	Democratic theory,	Appadorai (1975)
	Resource-Based View (RBV)	Brush et al., (2001); Nwachukwu and Chládková (2019); Carter et al., (2003); Leitch et al., (2013).

Entrepreneurial orientation	Dynamic capability	Teece (2014); Teece, Pisano and Shuen (1997); Teece (2003); Jantunen, Puumalainen, Saarenketo and Kylaheiko (2005)

Source: Author (2020)

Methodology

The researchers use literature to support a variety of opinions. According to Transfield et al. (2003), a comprehensive review enables a researcher "to map and assess the intellectual territory" within a field of study. The author uses search strategies such as searching databases and websites to collect relevant articles used in the study. To search for these articles, the author uses the keywords; leadership, leadership styles, entrepreneurship, and entrepreneurial orientation. The search of EBSCO host, Google Scholar, Scopus, and Web of Science databases between 1959 to 2020 yielded 87 articles. A systematic literature review was done on both qualitative and quantitative studies.

Discussion

The review shows that leadership can be looked at from four perspectives: leadership as a position, leadership as a person, leadership as a result, and leadership as a process. It was observed that leadership can be operationalized based on behaviour, situation, transformation, transaction, distributed or shared, strategic leadership, and entrepreneurial leadership. The review suggests that entrepreneurial orientation is a firm's strategic orientation that supports entrepreneurial decision-making. Further, the author observes that entrepreneurial orientation encompasses five dimensions; risk-taking, innovativeness, and proactiveness (Miller, 1983) and competitive aggressiveness and autonomy (Lumpkin and Dess, 1996). The literature review suggests that entrepreneurial dimensions of risk-taking, innovativeness, and proactiveness have been widely examined. The review highlights the consequences of leadership style and entrepreneurial orientation dimensions of risk-taking, innovativeness, and proactiveness. Effective leadership influences strategic flexibility, performance, effectiveness, entrepreneurial ventures success, and business sustainability. Transformational leadership promotes positive family cultures, commitment, stewardship, and strategic flexibility, employee satisfaction, motivation, and productivity, and reduces levels of sickness absence and

employee turnover. Ethical leadership fosters the awareness of ethical climate and employees' turnover intentions. Authentic leadership influence employees' turnover intentions. Entrepreneurial leadership lower employee turnover intentions, improve competitiveness, survival, and venture performance. Strategic leadership allows firms to achieve sustainable performance. Arguably, leadership is vital for value creation and building sustainable businesses. The risk-taking dimension of entrepreneurial orientation fosters financial performance, survival and growth, profitability. Also, the review identifies the negative impact of risk-taking on sales growth and employment growth. Innovation fosters business survival, growth, sales and productivity growth, and competitive heterogeneity between firms. The review shows that innovativeness does not have an impact on employment growth, performance, and profitability. Innovative activities can allow SMEs to provide innovative products and services to customers and improve profitability (Nwachukwu and Zufan, 2017). Proactive firms can spot and exploit new market opportunities and enhance innovation performance, employment and sales growth, and profitability.

Conclusions

Effective leadership is vital to navigating a very challenging business environment. The literature review examined four areas. The first part of the review discusses the concept of leadership and leadership styles, the second area describes entrepreneurship and entrepreneurial orientation. The third part discusses leadership styles and their consequences. The fourth area focuses on entrepreneurial orientation and its consequences. Organizations with the right leaders can achieve sustainable superior performance. Extant studies on the entrepreneurial orientation dimension of risk-taking, innovativeness, and proactiveness show mixed findings. Nonetheless, entrepreneurs' risk-taking ability, innovativeness and proactiveness are important to achieve superior performance and stay ahead of competition. The study contributes to leadership and entrepreneurship literature by informing managers and entrepreneurs on how different leadership styles and entrepreneurial orientation affect the success of their organization.

The present study is exploratory and uses the review of the previous literature on leadership and entrepreneurial orientation, which somewhat limits its applicability. Further, the consequences of entrepreneurial orientation dimensions of risk-taking and innovativeness are relatively unclear and inconsistent. More empirical studies are needed on the antecedents and consequences of entrepreneurial orientation, especially risk-taking and innovativeness. This paper contributes to the ongoing debate on leadership and entrepreneurial orientation.

Abstract

Globally, there is a growing interest in female entrepreneurship. many female-owned businesses are faced with several obstacles that threaten their survival and growth. this paper focuses on literature in women entrepreneurship contexts. considering recent events, it is important to understand the enablers and the constraints female entrepreneurs experience in a developing country context. we draw insights about the subject using historical data and findings from past studies. based on our review, it was observed that gender discrimination, financial constraints, work-family conflict, lack of infrastructural support, unfavorable business and political environments, lack of entrepreneurship education, and personality-related issues hinders growth, profitability, and cause the failure of female-owned businesses. furthermore, creative education and training, leveraging team attributes and resources, digital technology, the nature of the industry, type of financing, and women entrepreneur empowerment stimulate the growth of female entrepreneurship. The authors conclude that policymakers must create a conducive environment and incentives to promote female entrepreneurship.

Keywords: Female Entrepreneurship, Feminist Theory, Institutional Theory, Enablers, Constraints

Introduction

Entrepreneurship behavior fosters the firm competitive edge (Vu and Nwachukwu, 2020a; Kuratko, 2009) and economic growth (Antoncic and Hisrich, 2004). Women entrepreneurship contributes to the economic and social development of countries. Entrepreneurial activities foster the survival and growth of business organizations (Nwachukwu, Chládková and Zufan, 2017). Female entrepreneurship is an emerging phenomenon (Jamali, 2009; Martinez and Marlow, 2017; Zahra and Wright, 2016), which positively impacts economic growth and job creation as well as the quality of life (Orhan and Scott, 2001; McMullan and Warnice, 2016). The literature on female entrepreneurship and institutions is still considered disconnected (Jennings and Brush, 2013; Giménez and Calabrò, 2018). Female entrepreneurship is a source of entrepreneurial diversity. Nonetheless, their talents and potential often remain underutilized in developing countries because of economic and socio-cultural complexities (Jamali, 2009). However, understanding the role of the institutional environment and gender is fast growing in the literature (Yunis et al., 2019) and has provided a robust theoretical foundation for studying female enterprise. The literature on the contextual environment for entrepreneurship is scanty (De Bruin et al., 2007; Dvouletý et al., 2018), which presents a limited understanding of the subject (Paul et al., 2017). Many scholars have attempted to offer a better understanding of the difficulties faced by women setting up businesses and making them grow (Link, 2017). Prior studies in Africa (e.g., Bardasi and Getahun, 2008) and elsewhere (Fairlie and Robb, 2009; Thébaud, 2015) have reported that women entrepreneurs are often hindered by limited access to finance, human capital development opportunities, discrimination, and social constraints, restrictions in making decisions, working and traveling (Terjesen and Elam,

2012), balancing work and family life, handling patriarchal societies and gender discrimination (Panda, 2018). However, extant literature suggests that women entrepreneurs are successful in developing and running small businesses (e.g., Stevenson and St-Onge 2011). Therefore, it is important to understand gender in the context of entrepreneurship, particularly to identify the constraints and drivers of the growth of female-owned businesses. The objective of this study is to propose recommendations to policy-makers based on the review of the constraints and enablers of the growth of female entrepreneurs.

Literature Reviews

Gender bias and stereotypes are more pronounced and grounded in the common belief in male-dominated contexts like entrepreneurship (Acs et al., 2011; Bardasi et al., 2011). This hinders women's advancement and women entrepreneurs' access to business and social capital. Based on role congruity theory, female entrepreneurs may face more obstacles since entrepreneurship is seen as a masculine endeavor (Jennings and Brush, 2013). Women are perceived to possess communal qualities (Rosette and Tost, 2010) such as relationship-oriented and being sympathetic to others' needs. These characteristics can assist female business owners to flourish in retail and/or other services. However, these perceptions that female entrepreneurs should engage in feminine business may put them at a disadvantage in venturing into certain male-dominated industries or seeking funding. The limited access to funding that women entrepreneurs face may be connected to gender biases among lenders and investors who perceive women entrepreneurs as being ineffective. Extant literature has used institutional theory to explain how entrepreneurs are constrained and enabled by the environment in which they live and work (Scott, 2008; Gaddefors and Anderson 2017). Rules and standards to which an individual is expected to conform with (informal institutions) encourage or discourage entrepreneurial behavior (Welter and Smallbone, 2011; Mckeever et al., 2014) and limit the entrepreneur's beliefs and actions (Amable, 2003). Arguably, informal forces influence an entrepreneur in society. On the other hand, regulatory forces (formal institutions) are compulsory rules that attract formal sanctions for non-compliance (e.g., Anderson et al., 2018). Indeed, these institutional forces constrain or enable female entrepreneurship.

Constraints to the growth of female-owned businesses

The existing literature provides evidence that female entrepreneurs in developing countries experience many challenges that arise from external and internal factors. The female entrepreneur can deal with internal constraints, whereas external factors are beyond the control of the entrepreneur. For instance, women entrepreneurs in Africa may not be hindered by internal family restrictions but are faced with external labor market challenges. External forces such as weak private sector, physically demanding jobs, and limited access to global markets posed a serious challenge for female entrepreneurs (Kuada, 2009). Muslim women experience challenges as a result of traditional family beliefs, but the external economy supports their businesses (Itani et al., 2011). Empirical studies in varying contexts have shown that insufficient support for business, lack of business knowledge, tough business climate, political instability, uncertain economy, limited access to resources, inadequate access to education and training, as well as gender biases in labor markets, work-family imbalance, and internal fears and insecurities are challenges that hinder female entrepreneurs (Danish and Smith, 2012; Ronoh et al., 2014; Maden, 2015). Based on the literature, seven key constraints that affect women entrepreneurs in developing countries are elaborated.

Gender Discrimination

Entrepreneurship is seen as a man's domain (Jennings and Brush, 2013; Panda and Dash, 2013), which make it difficult for women to establish credibility in the face of discrimination. Society gives less value to independent women (Karatas-Ozkan et al., 2010; Maden, 2015), which discourages women from pursuing entrepreneurship. Patriarchal societies and male-dominated labor markets limit women's ambitions in the entrepreneurial space (Karatas-Ozkan et al., 2010). For instance, Lebanese women experience strong resistance from their family members (Jamali, 2009). Whereas, in Saudi Arabia, women combined entrepreneurship with societal sensitivities (Danish and Smith, 2012).

Work-family conflict

Women constantly struggle to balance social expectations and their own goals. Women entrepreneurs are burden with managing their business and family (Itani et al., 2011), as well as taking care of their children (Andersson et al., 2007;

Brush et al., 2009). These social expectations reduce the time they dedicate to business-related activities such as networking and mentoring, which negatively affect their performance (Brush et al., 2009; Panda and Dash, 2015).

Financial constraints

Prior studies provide evidence on how access to finance constrains the growth of women entrepreneurs across developing countries (Halkias et al., 2011; Ramadani et al., 2015; Naguib and Jamali, 2015). Entrepreneurship is considered as a high-risk venture (Thampy, 2010), and factors such as inadequate collateral, information asymmetry, and lack of credit history limit entrepreneurs' access to loans, especially women entrepreneurs (Panda, 2012; Sandhu et al., 2012). A lack of alternatives such as private equity and microcredit and venture capital worsens the financing situation. Inconsistent work histories, lower compensation, and inadequate savings make it hard for female entrepreneurs to raise capital (Carter et al., 2001; Andersson et al., 2007). The government prefers to extend financial resources to businesses owned by men leaving little opportunity for women (Halkias et al., 2011). Sometimes, women display a risk-averse mentality and are not keen on obtaining loans to start their business (Ama et al., 2014; Maden, 2015; Naguib and Jamali, 2015). Women prefer to start with their savings in services sectors that are less expensive and easy to set up (Cosh and Hughes, 2000). This limits their ability to grow and diversify their businesses (Horrell and Krishnan, 2007).

Lack of infrastructural support

Lack of supporting infrastructure hinders the growth of female-owned businesses. Challenges such as lack of access to technology, ancillary business services, and lack of access to resources for undertaking feasibility studies and market research impede the growth of female-owned businesses. Robb and Coleman (2010) note that limited networking opportunities and consulting services also hamper female entrepreneur business performance. Gender stereotypes discourage female entrepreneurs from asking for help and support.

Unfavorable business, economic and political environments

Unfriendly business environments, economic recessions, and unstable political environments have a negative impact on entrepreneurship (Panda and Dash, 2014). For instance, armed conflict in the African region has discouraged investments, destroyed infrastructure, and hampered entrepreneurial activities (Singhand and Belwal, 2008). More so, complicated laws, bureaucratic bottlenecks, and unsupportive government policies and programs hinder the development of female entrepreneurship. Though the unfavorable business environment affects the entire entrepreneurship space, female entrepreneurs suffer more due to gender discrimination, especially in gender-segregated societies (e.g. Saudi Arabia, the UAE, Ethiopia). Therefore, women entrepreneurs find it difficult to balance the influence of the business environment with their family expectations.

Lack of entrepreneurship training and education.

Women entrepreneurs lack insights into basic business practices such as bookkeeping, engaging in marketing, and consumer-related initiatives. They come from various educational backgrounds, possess different skill sets, and lack formal business and entrepreneurship training. Empirical evidence suggests that women with university education in applied disciplines (e.g. computer science) find it hard to transfer their skill sets into their entrepreneurial ventures due to lack of opportunity, work experience, or inability to adapt to fast-changing technology (Brush et al., 2009; Adema et al., 2014).

Personality-based constraints

Sometimes, the cognition and mental attitude of women towards life limit them from achieving their full potential as entrepreneurs. They are afraid of taking risks which exposes them to loneliness and isolation in their entrepreneurial journey. Lack of self-confidence and self-doubt (Shelton, 2006) and lack of female role models (Danish and Smith, 2012) hinder the growth of female entrepreneurs.

Enablers to the growth of female-owned businesses

Research has shown that the factors fostering high growth are categorized into individual (entrepreneur and entrepreneurial team characteristics), venture (strategy, organizational structures, and systems), resources, location, and environment (Brush et al. 2004; Gilbert et al. 2006). According to Yunis et al. (2019), opportunity identification (enablers) connotes the personal characteristics of entrepreneurs, such as financial independence, resilience, self efficacy, autonomy, passion for changing women's status, and their empowerment. Characteristics and personality traits of entrepreneurs such as educational background, prior industry experience, or prior entrepreneurial experience (e.g., Baum et al. 2001), aspiration and intention (Wiklund et al. 2003; Cassar 2007), team size, heterogeneity, and capabilities influence growth (Eisenhardt and Schoonhoven, 1990). In Israel, Lerner et al. (1997) observe that the level of education significantly influences the performance of female enterprises. Devine et al. (2019) demonstrate female entrepreneurs can achieve high growth by leveraging top management team education, venture capital investment, and ownership dilution. They concluded that female-owned businesses should implement programs and policies that can enable them to optimize team attributes and resources. Digital technologies are an important source of transformation of the entrepreneurial environment (Bi et al., 2017; Giones and Brem, 2017), due to their disruptive potential as "external enablers" in the growth of new ventures (von Briel et al., 2017). Empirically, Pergelova et al. (2019) examine the impact of digital technologies on the internationalization process of women-owned businesses in Bulgaria. They found that digital technologies foster small and medium-sized enterprise internationalization through international market intelligence. It was concluded that female entrepreneurs use digital technologies to grow their businesses. Yacus, Esposito, and Yang (2019) report that women-owned businesses in "feminine industries" can achieve high growth compared to women-owned firms in "non-feminine industries." Likewise, women who used equity achieved higher rates of growth than women who used debt financing. The nature of the industry and the type of financing are enablers to the growth of female-owned businesses. Ngoasong and Kimbu (2019) shed light on the context-specific decision-making processes and practices of growth-oriented women entrepreneurs in an emerging economy. The study suggests that highly embedded women entrepreneurs have easy access to resources that result in high-growth businesses in Cameroon. Indeed, the environment drives the growth of female-owned businesses. Previous studies suggest that the empowerment of women focuses on improving women's mobility, economic security, freedom, health, and participation in decision-making processes (Afrin, 2008). Policymakers have focused on minimizing social and economic barriers to motivate and engage women in entrepreneurial activities (Kabeer, 1999; De Vita, Mari and Poggesi, 2013). Women's empowerment (self-determination, competence, and perceptions of impact) fosters entrepreneurial outcomes (Buttner and Moore, 1997; Bamiatzi et al., 2015). In India, Digan et al. (2019) find that women's entrepreneurial empowerment enhances business revenues.

Methodology

This paper relies on historical data and past studies on women entrepreneurship. We conducted a systematic search of online databases such as Google Scholar, ProQuest, and Scopus using the keywords "constraints faced by women entrepreneurs", enablers of women entrepreneurs, and "female entrepreneurship". The systematic literature review was employed to reduce bias (Tranfield et al., 2003). Only peer-reviewed articles published from 1990 to 2019 were included to improve the validity and relevance of the study. We included in our review theoretical, qualitative, and quantitative studies.

Conclusion

Entrepreneurs create, innovate, dominate, and execute new ideas to achieve superior business performance (Oboh and Nwachukwu, 2018). This paper reviews the constraints and enablers to the growth of female-owned businesses in developing countries. Our review suggests that female entrepreneurs face seven main barriers: gender discrimination, financial constraints, work-family conflict, lack of infrastructural support, unfavorable business and political environments, lack of entrepreneurship education, and personality-related barriers. These arrays of hindrances have many negative consequences for female-owned firms: smaller size and lower growth rate (Coleman, 2007), low profitability (Robb and Wolken, 2002), and increased failure rate (Minniti and Naudé, 2010). In addition, this study revealed that personal characteristics such as level of education and training drive the growth of female entrepreneurs. Creative education and training can enhance female entrepreneurs' creativity. Extant studies suggest that both human and financial resources foster superior strategic performance (Shigang and Guozhi, 2016; Neneh, 2016; Nwachukwu and Chládková, 2019; Vu and Nwachukwu, 2020b). As such, leveraging team attributes and

resources, digital technology, the nature of the industry, type of financing, and women entrepreneur empowerment are important drivers of the growth of female-owned businesses. Empowering women can enable them to overcome sociocultural issues, interpersonal constraints, and family issues (Sonwalkar and Nandedkar, 2016). In this context, policymakers can make available microfinance and resource-based initiatives to motivate female entrepreneurship. Also, they should provide access to education and training, experience-based learning opportunities, and link female entrepreneurs to networks of supporting agencies. In so doing, female entrepreneurs will enhance their knowledge of entrepreneurship and entrepreneurial activities. Likewise, policymakers must create a conducive climate to support female entrepreneurship. This study focused on the review of empirical literature which somewhat limits its applicability. Nonetheless, it informs policy-makers of the need to allocate resources in a priority area, especially female entrepreneurship. This study offers a road map for policymakers to create an enabling environment that supports the growth of female entrepreneurship. This is important due to criticisms about the effectiveness of funded entrepreneurship programs that do not prioritize women (Minniti and Naudé, 2010). Future research should examine the opportunities and constraints experienced by female social entrepreneurs, how they react and the strategies they adopt to cope with context-related opportunities and constraints within the context of a developing country. Understanding how female social entrepreneurs cope with context-related opportunities and constraints can stimulate the growth of female social entrepreneurs.

Abstract

Recently, the African tourism sector is experiencing steady growth. Nevertheless, a lot needs to be done in terms of harnessing tourism potentials in Africa. The study focuses on the contribution of tourism to Gross Domestic Products (GDP), employment, investment, and visitor exports in nine African countries; namely Botswana, Cape Verde, Ghana, Kenya, Mauritius, Namibia, Seychelles, South Africa, and Tanzania. The authors did trend analyses of the economic contribution of tourism in nine African countries. Secondary data covering 2008-2018 collected from the World Travel and Tourism Council database was used to shed light on the economic contribution of tourism in Africa. We observed that all the economic indicators (GDP, employment, visitor exports, and investment) show a positive and upward trend. South Africa, Kenya, and Tanzania are the top performers among the sampled countries. The study identified challenges and proposed some recommendations to managers and policymakers in the tourism sectors in Africa.

Keywords: GDP, Visitor Exports, Employment, African Countries, Investment.

Introduction

Globally, the tourism industry has received attention because of its capacity to stimulate consumption, promote trade and international communication (Qian, Shen and Law, 2018). Indeed, the tourism industry contributes to job creation and foster entrepreneurship. Arguably, a well-managed tourism sector has the potential to preserve the ecosystems, cultural heritage, and empower the local communities. Tourism is considered as one of the fastest-growing industry in the twenty-first century (Shahzad, Shahbaz, Ferrer, and Kumar, 2017), that can promote economic recovery and growth. Past studies had suggested that tourism is a major contributor to economic growth and development in an emerging market (Haller, 2012; Shahzad et al., 2017). Since the 1990s, tourism has increasingly contributed to Africa's Gross Domestic Product (GDP), employment, and visitor export and investment. In 2017, Tourism contribution to Africa GDP was $177.6bn (8.1% of GDP), visitor exports, $48.7bn (9.7% of total export), investment, $28.2bn (5.7% of total investment) and employment, 22.7 million (6.5% of total jobs created) (World Travel and Tourism Council, 2018).

Despite the sector's potential to develop multiple linkages with other productive sectors throughout its value chain, tourism in Africa is characterized by weak intersectoral linkages, largely due to limited domestic productive capacities across sectors. The dominance of foreign-owned airlines, tour operators, travel agencies, hotel chains, and the heavy reliance on imported inputs by tourism establishments in African countries contribute to high economic leakages in Africa's tourism sector. This study focuses on the contribution of tourism to Gross Domestic Products, employment, investment, and visitor exports in nine African countries (Botswana, Cape Verde, Ghana, Kenya, Mauritius, Namibia, Seychelles, South Africa, and Tanzania). These countries were selected using the World Bank typology of Sub Sahara Africa (SSA) destinations, which ranked the 47 SSA countries by level of tourism development. Specifically, we focused on countries categorized as emerging and consolidating. Emerging countries have robust institutions and are

Cite this Article as: Chijioke NWACHUKWU and Hieu Minh VU "Strategic Role of Tourism In Emerging and Consolidating Sub Sahara Africa (Ssa) Destinations" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

doing well in terms of quality and competitiveness. Countries classified as consolidating have relatively mature tourism sectors and the highest economic and tourism performance in SSA (Christie, Fernandes, Messerli and Twining-Ward, 2013). Tourism contribution to total GDP represents activities that deal with tourists such as hotels, travel agents, airlines, restaurants, and leisure industries. Total employment represents jobs created directly and indirectly in the travel and tourism sector. The investment includes capital investment spending directly related to travel and tourism such as new visitors' accommodation, passenger transport equipment, restaurants, and leisure facilities for tourism use (WTTC, 2018). Visitor exports refer to spending within the country by international tourists for business and leisure trips excluding spending on education.

The objective of this study is to assess and compare the economic contribution of tourism in nine African countries using 11-years data. Understanding economic contributions matter because it will inform policymakers of the importance of implementing policies that support tourism. Secondly, to propose recommendations to managers and policymakers based on the evaluation of the subject. This chapter is organized as follows: The next section presents an overview of strategic management in tourism, tourism in African, and the nature of tourism in selected African countries. Followed by the analyses of the economic contribution of tourism in sample African countries. Finally, conclusions and recommendations are presented.

Strategic Management in the Tourism sector

According to Cox et al. (2012), strategic management focuses on analyzing the internal and external environments, formulating strategies, and allocating resources to gain a competitive advantage in an industry. A systematic approach to strategic analysis allows firms to neutralize possible/potential threats and leverage opportunities to enhance business results (Nwachukwu and Chládková, 2019). Kızıloglun and Serinkan (2015) opine that strategic management involves the decisions of creating and executing effective strategies as well as monitoring of results. In the tourism context, Yasenok and Stenyushkina (2016) assert that strategic management is an effective mechanism to increase revenues and to foster sustainable tourism development. Changing the business environment and competition pose a serious challenge for managers responsible for strategy-making (Nwachukwu, Chládková, and Olatunji, 2018). Indeed, tourism development strategies require investments in tourism infrastructure (physical and social). As such a strategic approach to managing these resources is important to achieve the long-term success of the tourism organization. Strategic management enables tourism organizations to adapt to a volatile environment in the tourism destination.

Tourism destination is an important element in the tourism system and composes the essentials. Tourism destination consists of a multiplicity of actors such as tourism demand, local private tourist activities, public actors, the host community, and tourist perceptions among others (Manente, 2008). A destination is a unit providing a comprehensive experience or a product to customers (Buhalis, 2000; Murphy et al., 2000) created by an individual (Haugland et al., 2011). Mezei (2009) submitted that destination management focuses on optimizing strategic, organizational, and operational decisions and resources to promote and market tourism destination products. A well-managed tourist destination can support the ecosystems and loss of cultural integrity and identity of the destination (Charters and Saxon 2007; Rio and Nunes, 2012) and ensure tourism sustainability (Conaghan et al., 2015).

In terms of the tourism carrying capacity and tourist area life cycle (TALC), Saveriades (2000) opines that tourist carrying capacity is the maximum allowable number of tourists in a specific constrained by the ecological environment and basic facilities. According to the Canadian Arctic Resources Committee (2002), tourism carrying capacity is the ecosystem capacity that supports healthy organisms, their renewal productivity, adaptability, and capability. On the other hand, the tourism area life cycle connotes destinations and tourism products, follow a relatively consistent process of development and cycle of evolution (Butler, 1980, 2000). The TALC model suggests that the development of a destination is characterized by the number of visitors and the level of infrastructure. The model identified six phases of progression: the exploration stage of the tourism area, the involvement stage, development, consolidation, stagnation, and post-stagnation stages. The post-stagnation stage is characterized by a period of decline, rejuvenation, or stabilization. Thus, Tourism carrying capacity and tourist area life cycle (TALC) are appropriate theoretical lenses to explain the role of tourism in any economy.

Tourism in Africa

Tourism in Africa can be linked to the Roman era in Egypt. During this period people visited Thebe and Sepulchers; the Valley of the Kings, the Valley of Queens, and other places. Also, Muslim and Christian missionaries visited Sub Saharan Africa to help and to try to convert the native population to their beliefs (Manga, 2014). Africa has a robust tourism potential that can help the continent to achieve economic growth and development. However, Sub Sahara Africa's tourism industry is lagging compared to other tourist destinations (Manga, 2014). This may be as a result of the inadequate transport network, lack of common business strategies as well as the rise in manufacturing development. The fifth IPCC report of 2014 established the economic importance of tourism to Africa (Niang, 2014). The African Union (AU) Commission suggests that countries in Africa need to double tourism's contribution to the continent's Gross Domestic Product (GDP) by 2023 to support Africa's development initiatives. It has been argued that Africa's tourism sector loses a lot of revenues through economic leakages. These leakages stem from profits shifting by foreign-owned tourism businesses to their home countries rather than reinvesting them in destination countries. Figure 1 shows an upward movement in terms of the number of jobs created in the tourism sector in the last four years (2015-2018). In 2018, 9.59 million people were employed in the tourism industry in Africa.

Table 1 shows the mean and standard deviation of the contribution of tourism to GDP, employment, investment, and visitor exports of Africa for 11 years. In Africa, the average GDP is US$65.23bn, 8,938,000 million jobs were created, investment US$26.28bn and visitor exports are US$44.37bn over the entire period from 2008 to 2018.

Table 1: Descriptive statistics on the economic contribution of tourism to Africa

	GDP		Employment		Visitor exports		Investment	
	Mean	SD	Mean	SD	Mean	SD	Mean	SD
	65.23	5.15	8938	289.8	44.37	2.92	26.28	1.97

The Nature of Tourism in Selected African Countries

Tourism in Botswana

In Botswana, tourism is seen as an important driver of economic growth (Rogerson and Visser, 2011). The tourism industry has been identified as one of the sectors that could help diversify the economy beyond diamond mining (Kalikawe, 2001). Botswana enjoys a comparative advantage because of abundant wildlife and natural resources ranging from the Kalahari Desert in the south to the internationally acclaimed Okavango Delta and the Chobe-Linyanthi River to the north. These ecosystems are still relatively clean and fresh, hence attract tourists from other countries of the world (see DoT 2000; DoT 2010). For this reason, the tourism sector holds great potential for sustainable economic growth and job creation in Botswana. Improvements in infrastructure and accessibility to Botswana's wilderness areas have made tourism to become an important economic sector (Hambira, 2017). The popular tourist attractions in Bostwana are The Okavango Delta, Moremi Game Reserve, Chobe National Park, and Southern and Central Kalahari (Hambira, 2017). The Okavango Delta is the second most visited destination by leisure tourists in the country (DoT 2010, see also Mbaiwa, 2005). Tourism in the Delta is highly seasonal and offers rich aesthetic value comprising meandering palm and papyrus fringed waterways, palm-fringed islands and woodland, lush vegetation, and rich wildlife (Department of Environmental Affairs (DEA, 2008).

Tourism in Cape Verde

Cape Verde's economy depends more on income from tourism and international development aid flows. The tourism sector, account for about 90% of Foreign Direct Investments (FDI), and over 60% of exports (Monteiro and Ferro, 2017). Thus, tourism is the main driver of economic growth and employment in Cape Verde. The islands of Sal and Boa Vista are the main tourists' destinations because of the availability of sun and beach tourism (77% of the tourists

and 91% of the night stays) and foreign direct private investment (Monteiro and Ferro, 2017). In 2016, the rest of the islands (Brava, Santiago, Fogo, Maio, Nicolau, São Vicente, and São Antão) received 146,832 tourists which accounted for 23% of the total and only 9% of the night stays (Monteiro and Ferro, 2017). Despite the importance of the tourism sector to the Cape Verde economy, evidence suggests the absence of explicit strategies and connections between the tourism activities, the economic sectors, and the national development strategies (Monteiro and Ferro, 2017).

Tourism in Ghana

Ghana possesses considerable and diverse tourism assets that can be leveraged with balanced strategies and tourism support services, infrastructure, and marketing to enhance economic growth and employment. Ghana's tourism assets are usually grouped into four sectors: 1) natural attractions; 2) historical heritage; 3) cultural heritage, and 4) other attractions. In Ghana, there are opportunities for the development of ecotourism, cultural and heritage tourism, conference and business tourism, leisure tourism, and beach resort tourism (Frimpong-Bonsu, 2015). Tourism assets in Ghana include wildlife sanctuaries, national parks, resource reserves, and wetland reserves. Ghana boasts of two properties on the UNESCO World Heritage Site: forts and castles, along the coast, and Asante traditional buildings (Frimpong-Bonsu, 2015).

Tourism in Kenya

Kenya is Africa's most popular safari destination with decent tourist infrastructure and many resorts along its coastline. The government of Kenya acknowledges the importance of the tourism sector by making it one of the six priority sectors in its development initiatives. Kenya's tourism sector heavily relies on its beaches and wildlife. Masai Mara Game Reserve**,** Mount Kenya, and Lamu are notable tourists' destinations in Kenya. Kenya boast of a high level of international air connectivity, better local infrastructure, and tourist facilities. Tourism is seen as an important sector in Kenya's development aspirations. Nonetheless, the sector is faced with various internal and external challenges. (Mayaka and Prasad, 2012). Notable among the challenges is a security threat, which if not properly managed may make tourists switch to competing destinations.

Tourism in Mauritius

Tourism is a major contributor to the economic growth and development of Mauritius. Mauritius is a holiday destination for beach-resort tourists, endowed with resources, and has the potential to be a green destination. It has a wide range of natural and man-made attractions, enjoys a sub-tropical climate with clear warm sea waters, attractive beaches, tropical fauna and flora complemented by a multi-ethnic and cultural population. These tourism assets are supported by decent hotels, reliable and operational services, and infrastructures. The Aapravasi Ghat- the Immigration Depot and Le Morne Cultural Landscapes have been declared as World Heritage. Black River Gorges National Park is on the tentative list of Mauritius to be nominated by UNESCO as World Heritage Site. The government of Mauritius has identified strategies to promote leisure and entertainment, business, shopping, and Medical tourism. Efforts have been made in the area of capacity building in the tourism sector.

Tourism in Namibia

The country is among the popular destinations in Africa and is known for ecotourism which features Namibia's extensive wildlife. Every year almost one million tourists visit the country from South Africa, Germany, United Kingdom, Italy, and France. In December 2010, Lonely Planet recognized Namibia as the 5th Best Tourist Destination in the World in terms of value. The Namibian government sees tourism mainly as a trade and export commodity which is expected to generate revenue. The government of Namibia has a strong interest in generating foreign exchange from tourism and drive the country's economic growth. The tourism product consists of the principal resources that Namibia has to offer. These products include sun, sea, and sand, reefs for snorkeling and diving, wildlife for safari tourism, mountains, rivers, forests and valleys for nature, scenic and adventure tourism, cultural assets a living heritage expressed in distinctive local customs, song, dance, art, handicrafts, etc, and museums. Both the public and private sectors play an active role in the Namibian tourism industry. The private businesses are expected to drive economic growth in Namibia.

Tourism in Seychelles

Seychelles is blessed with wonderful natural tourism assets such as beautiful beaches and mountain backdrops. The success story of the tourism sector can be linked to good governance and strategic policy choices. The Seychelles tourism sector has shown sustained growth both in terms of supply and demand. The Seychelles economy heavily relies on the tourism industry, which accounts for 24.8% of its GDP (World Bank Group, 2013). Out of the few countries in the world whom their economies depend heavily on tourism (Macau and Maldives), Seychelles is more endowed to attract investors and tourists (WTTC, 2012). The country's world-class beaches, lush mountain backdrops, excellent infrastructure, friendly people, good climate, and a largely pristine environment make Seychelles a highly competitive tourist destination. The tourism sector's success is also linked to strong sector stewardship that has created a robust policy framework and sophisticated marketing apparatus (World Bank Group, 2013).

Tourism in South Africa

South Africa's tourism sector fosters inclusive economic growth and provides the necessary incentive for the government’s transformation programs (Rogerson, 2002a, Rogerson, 2002b). Tree and half million (3.5 million) tourists visited Cape Town in August 2017, which makes it an important tourist destination in Africa. South Africa's tourism industry is dominated by a small group of locally owned large tourism firms. Nonetheless, the tourism sector has many small firms operating in the industry (Rogerson, 2004b). The majority of tourism businesses in South Africa are owned by the white minority (Rogerson, 2003, 2004a). South Africa tourism products include adventure tourism (climbing, surfing, diving, hiking, horseback safaris, mountain-biking, river-rafting), cultural tourism (tourist destinations: Ukhahlamba-Drakensberg Park, Mapungubwe in Limpopo, Soweto's Heritage, and many cultural villages), fauna, flora and varied landscapes and Agri-tourism. The high crime level is a major challenge facing the South Africa tourism sector.

Tourism in Tanzania

The United Republic of Tanzania is endowed with untapped natural resources and abundant wildlife, which offer a wide range of tourism potentials. The country’s tourism industry experienced an average annual rate of 12 percent between 2000 and 2012 (World Bank, 2015). Tanzania tourism sector presents investment opportunities in the areas like accommodation development, conference tourism, leisure parks, specialized cuisine restaurants, beach tourism, historical sites, amusement parks, golf courses, air and land transport infrastructure developments, and wildlife tourism. Tanzanian tourism mainly consists of wildlife (MNRT, 2002). The country has 15 national parks that have different species of wildlife, 31 game reserves, 38 game-controlled areas, and historical and archaeological assets that form part of cultural tourism (Kazuzuru, 2014). Selous game reserve, Ngorongoro Conservation Area, Serengeti National Park, Kilimanjaro National Park, Zanzibar, the ruins of Kilwa Kisiwani, and the ruins of Songo Mnara have received world recognition as being world tourist heritages (MNRT, 2002). Tanzanians are friendly, generous, and hospitable people (MNRT, 1999). The tourism sector in Tanzania is faced with the problems of pollution of national parks due to tourist activities, such as the wastes discharged from hotels, air pollution from vehicles carrying the tourists, and land degradation (TTB, 2006; Kulindwa et al., 2001), depletion of ebony trees (Kulindwa et al., 2001), lack of empirical studies linking promotion efforts to the growth of tourism, tax policy issue, competition in the use of natural resources, financial leakage (Sandbrook, 2008), uncertainty and health issues (Kazuzuru, 2014) among others.

The Economic Contribution of Tourism in Sample African Countries

Table 2 suggests that in the last three years, tourism contribution to GDP (real prices) of Botswana, Cape Verde, Ghana, Kenya, Mauritius, Namibia, and Seychelles experienced upward movement. However, that was not the same for South Africa and Tanzania. Both countries witnessed a decline in tourism contribution to GDP (real prices) in 2017, followed by a rise in 2018. Tourism contribution to South African GDP (real prices) is more than that of other sample countries. Indeed, tourism contribution to South African GDP (real prices) in 2018 of US$10.46bn is more than the combined tourism contribution to GDP (real prices) US$9.38bn of the eight other countries.

Table 2: Tourism Contribution to GDP

Year	Botswana	Cape Verde	Ghana	Kenya	Mauritius	Namibia	Seychelles	South Africa	Tanzania
2008	0.49	0.24	0.95	2.06	0.93	0.23	0.28	8.85	1.17
2009	0.46	0.19	0.99	1.89	0.83	0.24	0.27	8.51	1.1
2010	0.52	0.22	0.89	2.36	0.81	0.25	0.26	9.27	1.13
2011	0.49	0.24	1.1	2.59	0.84	0.29	0.28	9.06	1.25
2012	0.58	0.28	1.42	2.69	0.85	0.31	0.31	9.63	1.41
2013	0.61	0.29	1.41	2.52	0.77	0.33	0.3	9.97	1.54
2014	0.63	0.27	1.38	2.54	0.81	0.35	0.31	10.42	1.67
2015	0.69	0.26	1.32	2.55	0.89	0.4	0.33	10.32	1.78

2018	0.73	0.32	1.4	2.99	0.99	0.39	0.4	10.46	2.16

Source: World Economic Forum – adapted by authors (2020)

Table 3 shows that tourism contribution to employment in Botswana experienced a decline in 2016 (25.03) and arise from (25.93) in 2017 to (27.05) in 2018. In Cape Verde, tourism contribution to employment experienced a sharp rise from 34.41 in 2016 to 38.65 in 2018. Tourism contribution to employment in Ghana economy witness steady growth from (300.23) in 2016 to (307.34) in 2017 and (311.85) in 2018. In the case of Kenya, tourism contribution to employment increased from 403.47 in 2016 to 441.53 in 2018. Mauritius experienced a steady rise in tourism contribution to employment from 40.98 in 2016 to 41.44 in 2017, followed by a marginal decline to 41.03 in 2018. Namibia witness a decline in tourism contribution to employment from 23.75 in 2016 to 22.77 in 2017, then rose to 24.26 in 2018. Seychelles witness a rise in tourism contribution to employment from 11.41 in 2016 to 12.27 in 2017, followed by a marginal fall to 11.83 in 2018. South Africa witness a downward movement in tourism contribution to employment from 741.99 in 2016 to 726.59 in 2017, then increase to 733.94 in 2018. In the last three years (2016-2018), Tanzania showed a similar trend with South Africa in terms of tourism contribution to employment. Our results suggest that in the sample countries, tourism contribution to employment is not steady and characterized by a high level of fluctuation. In the last eleven years, the South African tourism sector has created more jobs compared to other sample countries (Botswana, Cape Verde, Ghana, Kenya, Mauritius, Namibia, Seychelles, and Tanzania). Apart from Mauritius and Seychelles, all the other countries' (Botswana, Cape Verde, Ghana, Kenya, Namibia, South Africa, and Tanzania) tourism sector created more jobs in 2018.

Table 3: Tourism contribution to employment

Period	Botswana	Cape Verde	Ghana	Kenya	Mauritius	Namibia	Seychelles	South Africa	Tanzania
2008	20.97	25.83	326.57	379.02	51.18	16.59	12.65	652.32	323.22
2009	21.41	22.55	330.72	346.75	44.54	19.31	12.23	611.95	284.78
2010	24.68	25.17	303.72	413.9	42.48	20.71	10.92	621.38	286.88
2011	24.93	28.26	323.52	450.72	40.58	21.4	11.46	640.17	305.93
2012	26.51	27.85	356.29	453.79	39.75	20.89	13.17	666.07	338.77
2013	24.95	30.55	329.08	413.41	35.77	21.18	12.28	675.96	375.29
2014	26.68	32.69	324.17	407.49	34.59	21.86	11.04	696.82	393.16
2015	28.89	32.54	310.84	397.97	39.27	24.08	11.45	730.62	404.97
2016	25.03	34.41	300.23	403.47	40.98	23.75	11.41	741.99	465.85
2017	25.93	37.62	307.34	429.38	41.44	22.77	12.27	726.59	445.83
2018	27.05	38.65	311.85	441.53	41.03	24.26	11.83	733.94	477.66

Table 4 reveals that tourism contribution to investment (real prices) for Botswana grew from US$0.23bn in 2008 to US$0.48bn in 2015, declined to US$0.47bn from 2016, and US$0.44bn in 2017, and then rose to US$0.46bn in 2018. In Cape Verde, tourism contribution to investment (real prices) is characterized by fluctuation in the period under review. Tourism contribution to investment (real prices) in Ghana is not steady but stagnant in the last three years (2016 -2018). Recently it appears that the Ghana tourism sector is less attractive to investors. It may also be due to market saturation in the tourism sector. In the case of Kenya, tourism contribution to investment (real prices) declined from US$0.87bn in 2008 to US$0.69bn in 2010. From 2010 to 2014, Investment grew from US$0.8bn to US$0.91bn, followed by a decline in 2015 and 2016 and a steady rise from US$0.82bn in 2017 to US$0.88bn in 2018. In Mauritius, tourism contribution to investment (real prices) declined from US$0.27bn in 2008 to $0.12bn in 2010, followed by a marginal rise to US$0.14bn in 2011. From 2012 to 2016 there was no growth. However, in 2017 and 2018 witnessed a marginal increase of $0.12bn and US$0.13bn respectively. Investments in the tourism sector in Namibia witnessed the expansion and upward movement from 2011 to 2015. Investments in the Namibia tourism sector dropped sharply to US$0.36bn and US$0.33bn in 2016 and 2017 respectively. Seychelles witnessed a rise in investments in the tourism sector from US$0.09bn in 2008 to US$0.14bn in 2012. There was no growth from 2013 to 2015. There was a marginal increase in investment in the tourism sector from 2016 to 2018. South Africa witnessed a downward movement in tourism contribution to investments from US$6.2bn in 2008 to $4.48bn in 2010, followed by an increase from US$4.65bn in 2011 to US$5.5bn in 2014. In 2018, there was a decline in investment in the South Africa tourism sector. Investments in the Tanzania tourism sector declined from $0.68bn in 2008 to US$0.73bn in 2010, followed by heavy investments in the sector from 2011 to 2015. 2016 to 2018 saw a sharp fall in investment in the Tanzania tourism sector. There is a connection between Investment and employment in the tourism sector. We reason that as private and public sectors invest in new visitors' accommodation, restaurants, leisure facilities, and new tourism products more jobs are created. It is evident that the South Africa tourism sector has the highest investment and created more jobs compared to other countries. This is consistent with the argument that investment drives job creation and reduces unemployment.

Table 4: Tourism Contribution to Investment

Year	Botswana	Cape Verde	Ghana	Kenya	Mauritius	Namibia	Seychelles	South Africa	Tanzania
2008	0.23	0.16	0.21	0.87	0.27	0.24	0.09	6.2	0.68
2009	0.26	0.17	0.21	0.74	0.18	0.25	0.12	5.54	0.73
2010	0.27	0.16	0.12	0.69	0.12	0.24	0.12	4.48	0.73
2011	0.28	0.16	0.12	0.8	0.14	0.25	0.13	4.65	1.02
2012	0.36	0.13	0.2	0.83	0.11	0.31	0.14	4.86	0.94
2013	0.41	0.11	0.17	0.82	0.11	0.34	0.13	5.39	1.1
2014	0.41	0.11	0.21	0.91	0.11	0.47	0.13	5.5	1.16
2015	0.48	0.13	0.2	0.86	0.11	0.5	0.13	5.49	1.09
2016	0.47	0.14	0.17	0.73	0.11	0.36	0.14	5.5	0.31

Source: World Economic Forum – adapted by authors (2020)

Table 5 suggests that tourism contribution to visitor exports (real prices) in Botswana experienced a steady rise from US$0.49bn in 2011 to US$0.69bn in 2015, followed by a decline of $0.66bn in 2016. Visitor exports grew in 2017 and 2018. In Cape Verde, tourism contribution to visitor exports (real prices) declined from US$0.36bn in 2008 to US$0.29bn in 2009, increased from US$0.35bn in 2010 to US$0.41bn in 2013. There was no growth in 2014 and 2015. Visitor exports resumed upward movement from US$0.42bn in 2016 to US$0.47bn in 2018. In the case of Ghana, tourism contribution to visitor exports (real prices) declined from US$0.86bn in 2008 to US$0.63bn in 2010, followed by a steady rise from US$0.65bn in 2011 to US$0.96 in 2012, declined to US$0.79bn in 2013, followed by a sharp increase of US$1.06bn in 2014. The last three years (2016-2018) experienced a marginal increase from US$0.91bn in 2016 to US$0.93bn in 2018. In the case of Kenya, tourism contribution to visitor exports (real prices) declined from US$1.85bn in 2008 to US$1.49bn in 2009. In 2010 and 2011, visitor exports increased from US$2.15bn and US$2.48bn respectively. There was a consistent fall of visitor exports from US$2.34bn in 2012 to US$1.69bn in 2016, followed by a rise of US$1.88bn in 2017 and US$1.98bn in 2018.

In Mauritius, tourism contribution to visitor exports (real prices) dropped from US$1.75bn in 2008 to US$1.51bn in 2009, followed by a rise from US$1.64bn in 2010 to US$1.7bn in 2012. There was a fall in visitor exports in 2013. From 2014 to 2018, Mauritius has consistently increased its foreign exchange earning capacity from tourism with a steady growth of visitor exports. Spending by international tourists in Namibia shows a high level of fluctuations. This correlates with a poor level of investments in the tourism sector. In the last six years (2013 – 2018), Seychelles witnessed a steady rise in tourism contribution to visitor exports from US$0.44bn to US$0.59bn. It appears that the robust policy framework and sophisticated marketing strategies put place by the Seychelles Government is working. South Africa witnessed a decline in tourism contribution to visitor exports from US$9.51bn in 2008 to US$8.01bn in 2011, followed by an increase from US$9.08bn in 2012 to US$9.99bn in 2014. In the last eleven years, spending by international tourists in South Africa was the highest (US$10.12bn) in 2016. Spending by international tourists in Tanzania declined from US$1.39bn in 2008 to US$1.29bn in 2009, followed by a consistent growth from US$1.34 in 2010 to US$2.38 in 2018.

Table 5: Tourism Contribution to Visitors' Exports (USD bn)

Year	Botswana	Cape Verde	Ghana	Kenya	Mauritius	Namibia	Seychelles	South Africa	Tanzania

Conclusion

Africa is the second-fastest-growing tourism region after the Asia-Pacific region (WTTC 2019). The importance of tourism as a foreign exchange earner has led to growth in the sector in Africa. Yet, African countries can enjoy more economic benefits from tourism and effectively exploit its potential contribution to socio-economic development. Arguably, a well-developed tourism sector can create more economic opportunities for citizens and ensure that a larger share of the sector's revenues remains in local economies, thereby reducing poverty in rural areas. This study explored tourism contribution to GDP, employment, investment, and visitor exports from selected African countries. Providing innovative products and services to customers can foster profitability (Nwachukwu and Zufan, 2017) and growth in the tourism sector. To put the tourism sector on the path of sustainable growth, it is important to tackle these mirages of problems and challenges facing the tourism sector in Africa. The present study used secondary data and descriptive statistics to shed light on tourism contribution to Africa economies. Despite the limitation described above, the study provides insight into the tourism literature in the African context. Researchers can develop this study by empirically testing the relationship between tourism and economic indicators in more African countries. Also, scholars can carry out a comparative analysis of countries and regions in this study.

Demand for Educating Future Engineers in The Field of Social Subjects

Paulina SIEMIENIAK

Poznan University of Technology, Poznan, Poland

paulina.siemieniak@put.poznan.pl

Abstract

The aim of the article is to compile the views of future and current engineers on the need for teaching social subjects at technical universities. Based on research in the literature, the article identifies the areas of non-technical knowledge that society and employers require from engineers, in particular as regards Industry 4.0. The author compared the results of observations of other researchers with the results of the author's research carried out at the Poznań University of Technology. Conclusions from the presented case study provide arguments for the development of social competences and the integration of science in the process of educating engineers and are in line with the principles of the Bologna process. The presented results enrich knowledge that may contribute to the socio-economic development of the European region.

Keywords: Education of Engineers, Social Competences, Requirements of The Labor Market.

Introduction

Educating engineers is an extremely important process because it determines the level of a country's infrastructure (Bojanowicz, 2012). Graduates of STEM subjects are currently in high demand among employers due to their significant impact on improving the economic situation of the country. Moreover, engineers are one of the professional groups that are in least danger of being replaced by modern systems or technologies (Gorustowicz 2019). Meanwhile, the development of Industry 4.0 entails a reduction in the demand for human labor and it is forecast that this may pose a threat to over 40% of occupations in countries such as the United States or Germany (Görmüş, 2019).

Nowadays, there is a sharp distinction between the technical sciences and the humanities. A person specialized in the former appears to be interested in what is practical and concrete, whilst a humanist's area of focus seems to be rather vague and not necessarily needed by contemporary people. "In the present day, the hallmark of education has become: separation, specialization and, consequently, deepening hermetization" (Kluczyński, 2017, p. 11). As a society, we strictly separate more and more research fields and scientific disciplines, which is reflected in the offer of study programs and specializations available within them. As a consequence, we reaffirm the social belief that there is a deep gap between the humanities and technical sciences. At the same time, it becomes increasingly evident that the modern labor market requires interdisciplinary education, and graduates are expected to have comprehensive knowledge and skills. Professionals emphasize the need for holistic education of future engineers (Trbusic, 2013).

The Engineer's Profession

Technical education is related to the concept of "engineer". The word is derived from French and means a person who has specific technical knowledge. The professional title of engineer relates to the professional activities in the area of technology. Currently, in Poland, it can be obtained at technical universities, as well as agricultural and military schools (Szczepańska-Woszczyna, 2014).

In the International Standard Classification of Education (ISCED), a classification for organizing educational programs and qualifications by educational levels and fields, engineering is included in one broad category with manufacturing and construction. Narrowed down, engineering and its related professions include (http://uis.unesco.org):

Due to their education and the tasks performed, engineers are persons who are clearly connected with the world of technology. In addition, the work of an engineer is defined as: scientific, creative, mental and involving management skills. Education helps an engineer to analyze and solve technical problems in a scientific way (Kaźmierczak, 2016).

The growing demand for engineering knowledge and skills is linked to the outbreak of World War II. The country that led the way in the production of weapons and military equipment was the USA, which, by equipping Great Britain, Canada and the USSR, became the most industrialized country in the world at the end of the 20th century (Bojanowicz 2012). The increasing importance of engineers in society echoed the perception of the relationship between the effects of their work and the welfare of mankind.

As Rojter writes, the humanistic aspects of engineers' work were noticed already in the mid-nineteenth century. Among others, research carried out in the UK shows that there is a need to include more humanities content in the curricula to reflect the realities of the work of engineers (Rojter, 2004).

Social sciences in the education of engineers

In the last century, the task for which engineers were prepared was to create technology and build machines that, in terms of performance, were to be better than the previous ones. There is no doubt that modern engineers face additional, non-technical challenges of economic and social nature. Therefore, it is postulated that engineering education programs at technical universities should be modified and supplemented with the achievements and offer of non-technical sciences (Kaźmierczak, 2015; Kaźmierczak, 2016). The social roles played by active and future engineers should be presented more broadly in order to prepare graduates to fulfill their roles in the contemporary, multidisciplinary world.

Currently, engineering education in the USA is provided as part of 4-year undergraduate engineering programs and includes General Education (Gen Ed) as well as courses in social sciences and the humanities. These are compulsory classes, and students choose the subject they want to study (Bojanowicz, 2012).

In Poland, about 15% of the points obtained in the first cycle of technical studies are awarded for knowledge and skills related to non-technical aspects of engineering activities as well as non-engineering skills and other general competences (Kraśniewski, 2010). This area also includes foreign language classes (about 6% of the points obtained as part of the first cycle of higher education). Social subjects are included in the class grid of each field of study. They are often elective, which means that students themselves decide what subject will be taught.

An OECD analysis shows that engineers made up 14.6% of all graduates in Poland in 2018 (OECD, 2020). By comparison, engineers accounted for 7.8% of graduates in Australia,, and 7.2% in the United States. Poland ranks fourth in the European Union in terms of the number of science graduates (Gracel, Stoch, 2017, p. 62). However, this does not mean that it is easy to recruit engineers as highly-trained people leave the country to seek development opportunities and more attractive pay abroad.

Premises of non-technical education of engineers over the years

Engineering education prioritizes mathematics and natural sciences, and the role of the humanities and social sciences is not appreciated by students or faculty staff. The humanities include art, history and literature, whereas social sciences comprise economics, political science, sociology and psychology (Evans, 2013). A student whose knowledge is well-grounded in the humanities and social sciences is able to see the wider context of engineering problems. Since the 1940s, the humanities (and later social sciences) have been considered to enhance the creativity and social awareness of engineers thus enabling the delivery of more complete public services. The need for non-technical training has been postulated in the world in the following decades by members of various associations of engineers (see Table 1).

Table 1: Recommendations for non-technical engineering education

Year, institution/organization	Areas of education
1940 Dominion Council of Professional Engineers	- public speaking, - the use of precise English, - literature, - art, - philosophy,
1944/45 Faculty of Applied Science and Engineering of the University of Toronto,	- English, - engineering and society, - general economics, - political science, - modern world history, - modern political and economic trends, - philosophy of science, - the profession of engineering,
1950/60 Syracuse University	- scientific method, - social and philosophical implications of science and technology,
1963 Committee on Future Development of the Engineering Profession	- responsibilities to society, employers, clients and other professionals, - ethical and legal requirements of engineering practice,
1975 Canadian Accreditation Board	- require a minimum of one half year of appropriate humanities and social sciences, which should include at least a course in economics,
1970 Worcester Polytechnic Institute, Massachusetts	- engineering students completed a minor in the humanities and a community engagement project,
1988 Science, Technology and Society Studies at Lehigh University	- Humanities; the ability to teach interpretation and critical thinking, the ability to consider how the work of engineers will be used,
90's various scientific institutions and publications	- multidisciplinary courses, - the ethical, economic and social issues of engineering work, - English literature and creative writing courses, - history of science and technology, - the impact of engineering work on society,
since 2000 various scientific institutions and publications	- ethical and socially responsible engineers and leaders, - cross-disciplinary historical studies, - discussion-based courses in the area of humanities and social sciences, - creative problem solving, - teamwork.

Source: study based on Donald et. al. (2017)

Discussions on the humanistic aspects in engineering education are also present in the literature of the 1980s and 1990s (Wragge, 1987, Florman 1996). Research from this period shows that employers in Australia were concerned about the level of social skills and knowledge of human affairs among engineering graduates. It was suggested to include these issues in the curricula, even at the expense of some engineering subjects (Rojter, 2004).

It follows from the above considerations that the effect of a balanced education of engineers is primarily an understanding of the context and the ability to think critically. The education process should be based on four pillars: mathematics, natural sciences, humanities, and social sciences (Evans, et al., 2007). The American Society of Civil

Engineers with the professional boards of licensure intend to require engineers to not only complete a four-cycle education system, but also obtain a master's degree. According to this concept, the aim of the first four years of education is to teach the fundamentals of the above-mentioned areas, while the necessary technical depth is provided during second-cycle studies (Evans, et al, 2007).

The task of engineers is to respond to social and economic needs, so their education should prepare them to work in project teams whose members are specialists in various fields of knowledge. In addition, engineers should develop communication skills that allow them to share their own knowledge, learn to accept different perspectives, show responsibility and creativity, and skillfully solve problems (Tribusic, 2013).

Demand for competences on the labor market

Graduates' skills must meet the requirements of potential employers. The analysis of labor market demand leads to the conclusion that the expectations of employers exceed the level of competence displayed by candidates-graduates. This also applies to the group of specialists in technical sciences (Jelonek, 2019). Therefore, the challenge of today's universities is to prepare graduates in such a way that their qualifications and competences are adequate to the requirements of the industry (Carnevale, 2013). In one of the studies in search of the key competences of engineers entering the labor market, the expectations of employers were compared with the opinions of technical students and professionally active engineers (Tobór-Osadnik, Wyganowska, 2016). The results show that students highly value knowledge and professional skills, but are much less appreciative of aspects such as work ethics and the mission of technology in the modern world. Such an attitude may negatively impact engineering decisions taking into account the good of society and the environment.

What is most valuable in the work of engineers is having high technical qualifications combined with soft skills (Gorustowicz, 2019). An engineer entering the labor market is required to have substantive knowledge and specialist skills necessary to perform well in the profession. However, employers also expect social knowledge and skills that are universal and useful in any profession. The latter are called social (or soft) competences and are related to the psychological properties of an individual, including their ability to cope with situations involving other people. Social competences also comprise the knowledge and skills required to organise one’s work, efficient planning, forecasting, coping with stress, time management, the ability to motivate oneself, assertiveness, creativity, and emotional intelligence. In addition, the area of "soft skills" includes the knowledge and skills of teamwork, i.e. managing, motivating and inspiring others, setting goals for team members or persuading them, making unpopular decisions, and resolving conflicts (Gorustowicz, 2019).

Similar competences are mentioned in the research of the World Economic Forum. Emotional intelligence is defined as one whose growth is associated with greater employee productivity (World Economic Forum, 2016). Conclusions to this effect can be drawn from other studies too. For instance, the US Department of Labor has created a list of workplace essential skills divided into two categories: foundation and functional. The first group includes, among others, decision-making skills, problem-solving, creativity, self-management and social skills. Functional skills are specific to the functions that employees perform in their work, and include resource management, the ability to use technology, information and interpersonal skills (such as teamwork) (Draghici, et al., 2011).

In another taxonomy, employee competences are divided into four categories: technical, methodological, social and personal (Hecklau, et al., 2016). Technical competences are work-related knowledge and skills. Methodological competences relate to general problem solving and decision making. Social competences refer to collaborating and communicating with others. Finally, personal competences encompass the social values, motivations and attitudes of an individual.

The issue of competences is gaining importance in connection with the forecasts related to technological development. In Industry 4.0, the required level of knowledge and skills will be higher than it is today, and therefore the education system will also change to Education 4.0 (Benešováa, Tupaa, 2017). As Gorustowicz emphasizes, in Industry 4.0 the basis of an engineer's authority will still be the scope of his technical knowledge, and among the new "hard competences" the most desirable will be knowledge and skills in the field of: integration of IT control systems, programming of industrial robot teams, integration of analytical systems in data clouds with local systems, cybersecurity, and the use of artificial intelligence algorithms in automation systems (Gorustowicz, 2019).

The main demand will concern the IT and manufacturing professions. Apart from technical skills, employees will have to meet the following requirements: responsibility, independence, flexibility, creativity, as well as the ability and motivation to learn new things (Benešováa, Tupaa, 2017). There is consensus in the engineering community

about competences that are lacking in new graduates, such as communication, entrepreneurship, teamwork, creativity, lifelong learning and problem solving skills (Brunhaver, et al. , 2016). This is due to the lack of sufficient experience required by the industry. Providing valuable training becomes the responsibility of the university. Additional training to supplement the missing competences comes with extra costs that employers are reluctant to cover (Azmi, et al., 2018).

It is worth mentioning that social competences are considered deficient in almost every group of specialists. While this deficit is not surprising, it does draw attention to the fact that graduates assess their competences (especially social competences) very highly (Jelonek, 2019). Therefore, it can be concluded that students are not aware of the requirements of the labor market in the field of social competences and show little interest in gaining these competences due to a strong focus on professional and technical skills. In order to raise awareness, universities should introduce more apprenticeships, workshops and counseling in order to build a professional path already during studies (Azmi, et al., 2018).

Educating Future Engineers

The conducted analysis leads to the conclusion that in the process of educating engineers, social attitudes and the perception of the mission of technology in society should be made more prominent (Tobór-Osadnik, Wyganowska, 2016). The formal education of an engineer (whether working directly in industry or designing) must be very broad. It cannot focus solely on physical and vocational subjects, but should include economic, social and human sciences to meet the needs of a 21st-century enterprise. Moreover, apart from imparting knowledge, the task of a university is to shape attitudes. After all, engineers and the effects of their work have a direct impact on living conditions and safety of people. Ashby recommended that subjects related to ethics, jurisprudence, languages, social and industrial history, and the history of technology should be relevant to engineering education (Ashby 1966). As Olsson recalls, in Sweden the teaching of history (in particular the history of ideas and technology) as well as philosophy and ethics is postulated (Olsson, 1995). There, preference is given to multidisciplinary subjects that will not only facilitate the understanding of the human condition, but also promote innovative thinking. The ethical framework is considered very important to engineering career decisions.

One of the most interesting concepts of engineering education (CDIO: CONCEIVE - DESIGN - IMPLEMENT - OPERATE) assumes that the expectations of employers are best addressed by integrated studies focused on the ability to solve a problem based on many areas of knowledge, including social sciences and management. This approach should replace studying separate disciplines (Szczepańska-Woszczyna, 2014). It involves studying classic science content and shaping soft skills such as teamwork and communication, but also developing the motivation to understand technical ideas.

As suggested in the interview by Prof. A. Targowski, the principles of educating Polish engineers should include the principle of educating good and responsible representatives of this professional group (Bojanowicz 2012). A good engineer is one who can create engineering solutions in the context of ethical and sustainable development, bearing in mind their responsible application in society. A broad, humanistic and social reflection seems to be a decisive ally in achieving these goals.

Methodology and Results of Own Research

The aim of the research was to determine the motivation to study social subjects by first-year and second-year students of technical faculties at one of the best Polish engineering schools - Poznan University of Technology. The research question was related to how engineering students perceive the requirement of studying social subjects. The research sample consisted of 233 students who took part in a course of social psychology. The research tool was the proprietary auditorium survey, and the answers were provided in the period from January to February 2020. The students' fields of study are presented in Table 2. The vast majority of the respondents studied in full-time mode, 20 people are part-time students. 62.3% of first-year students and 37.3% of second-year students participated in the study. Most of the respondents were men, constituting 73% of the sample. The youngest respondents were 19 years old, and the oldest 25. The 20-year-olds were definitely the most numerous in the group (48.1%).

Table 2: Respondents' fields of study

Fields of study:	Percentage:
Full-time studies	
Chemical and Process Engineering	20.6
Environmental Protection Technologies	7.3
Power Engineering	34.8
Automatic Control and Robotics	28.8
Part-time studies	
Computing	5.2
Power Engineering	3.4

The analysis of class attendance shows that only 26% of students were present at all or almost all lectures (over 90% of the offered lectures). 41% of students participated in less than half of the classes.

Another question revealed that only slightly more than half of the students see the need to educate future engineers (including themselves) in social subjects (see Table 3). Among the respondents, students of Automatic Control and Robotics (71.6%) as well as part-time students were the most aware of the need for social education. Among students of other faculties, the number of supporters and opponents of educating future engineers in social subjects is very similar, with respondents being divided into groups of almost equal percentages.

Table 3: Students' answers to the question "Do you think it is necessary to educate future engineers (including yourself) in social subjects?"

Answers:	Percentage:
Yes	59.2
No	40.8

Source: own research.

Students who felt that social sciences are needed in engineering education were asked to substantiate their views by selecting up to three of the responses presented to them. About 30% of the respondents are aware that higher education entails the necessity to have broad, multidisciplinary knowledge, going beyond the field in which they have a diploma. A similar number of students associate the acquisition of social knowledge with an increase in personal and/or professional effectiveness, as well as are aware of the requirements of the labor market in this respect (see Table 4).

Table 4: Justification of the answer: "Yes, education of future engineers in social subjects is needed."

Answers:	Percentage:
Nowadays the knowledge of social mechanisms is valued and even required by employers	30
I can use the knowledge gained during the classes to effectively achieve my personal and/or professional goals	31.3
A person with higher education should demonstrate knowledge that goes beyond their field	31.8
I can deepen my knowledge of myself, which makes me more mature and/or more responsible	19.7
I can deepen my knowledge of other people, which may help me function in the social and/or professional world	29.2
The teaching content is simply interesting for me	18.5
I can develop the ability to think flexibly and/or tolerate ambiguity	10.7
Other	1.7

Source: own research.

Students also had the opportunity to justify their belief that there is no need to educate future engineers in the field of social subjects. For this purpose, they could choose up to three answers presented to them or add their own.

The analysis conducted in the subgroup of respondents who opposed educating future engineers in social subjects shows that almost one third of them believe that they should acquire only technical knowledge and skills during their studies. In addition, every fifth respondent justified his reluctance about social education by the necessity to invest extra time and energy. More or less every tenth respondent perceives social knowledge as useless and unnecessary at work (see Table 5). These responses show little awareness of the realities of professional life.

It is worth noting, however, that in the group opposing social education, first-year students believed that only technical knowledge should be acquired by engineers during their studies almost three times more often than second-year students. Therefore, it is to be hoped that as future engineers become more mature and gain more specific knowledge about their field, they will begin to see the importance of the human aspect. This insight is also supported by the fact that second-year students were one and a half times more likely to see the possibility of using social knowledge to effectively achieve their personal and/or professional goals, and recognized the need to acquire interdisciplinary knowledge.

Table 5: Justification of the answer: "No, educating future engineers in social subjects is not necessary"

Answers	Percentage
Knowledge of social mechanisms is not necessary in professional work	9.4
Professional development requires only a high level of technical knowledge	6.0
Knowledge of social sciences is of little use	12.4
I want to get a diploma at the lowest possible cost, and including social subjects in the study plan requires more time and energy	21.5
I believe that I should only be educated in technical competences	28.3
It is boring for me	14.2
Knowledge of social sciences is too abstract for me	7.7
Other	3.4

Source: own research.

All surveyed students were asked to choose their most preferred social subjects, i.e. those in which they would like to participate during engineering studies (see Table 6). Apart from social psychology, a course of which was just about to end, students most often indicated: management and marketing as well as small-business management. Occupational ethics was chosen least often (only 3%). This is a worrying result, as the lack of interest in work ethic may lead to engineers neglecting the moral context of their professional activity and thus failing to meet one of the requirements of the modern labor market.

Table 6: Most preferred course titles. Student opinions.

Course title:	Percentage	Course title:	Percentage
Social Psychology	32.2	The basics of entrepreneurship	14.2
Ethics	9.0	Basics of economics	17.6
Professional ethics	3.0	Economics of enterprises	6.0

Philosophy	15.9	Small-business management	20.6
Interpersonal communication	15.0	Management and Marketing	21.0
Business negotiations	14.6	Basics of economics and management	11.6
Managing a team of employees	16.3	Economics with elements of accounting	9.9
Self-presentation in business	10.7	Basics of market economy and organization	12.0
Professional data presentation	6.4

Discussion

Despite the need to expand the knowledge and social skills of engineers, as signaled by specialists and the society, the results of the presented research show that future engineers underestimate the importance of this area of knowledge. This confirms the conclusions of other studies and observations. One can get the impression that the respondents overestimate their knowledge in this area and do not associate it with effective professional functioning. Excessive and inadequate self-esteem combined with a failure to recognize the value of social knowledge may result in a situation where graduates will not be able to consciously and effectively use this knowledge in their professional activities. They may tend not to reflect on and neglect the human context of their work. This may result in professional activities carried out in an automatic and unreflective manner with no flexibility or openness to changes.

Adapting educational programs to the requirements of the modern labor market requires that universities emphasize the importance of knowledge and social skills. In order to raise the importance of education in the field of social sciences and the humanities, it may be advisable to introduce practical classes (exercises, workshops, tutorials) and to test the acquired knowledge in action through apprenticeships which consolidate not only technical but also social skills. It is also advisable to provide students with reliable feedback on their skills. The interdisciplinary approach should include the assessment of knowledge and social skills in the performance of technical tasks, and the creation and promotion of development programs.

Summary

The knowledge of a modern engineer should not be limited to technical matters, but should include economic, social and human sciences. Most of the products developed by engineers have a direct impact on the safety of people and their living conditions (Tobór-Osadnik, Wyganowska, 2016). Also in the context of staff education for Industry 4.0, it is believed that, rather than focusing only on his narrow specialization, an engineer should have the ability to understand concepts from other fields (Gorustowicz 2019).

Despite the fact that the results of the presented research are case studies, they seem to confirm the existing knowledge about the skeptical attitude of engineering students towards social education and the simultaneous demand of the society. The requirement facing modern universities is to adapt education programs to the expectations of employers by ensuring a higher level of social competences among graduates.

Abstract

Increasing demand of electricity is problematic issue nowadays and Demand Side Management programs is suggested to be the best method for reducing the demand of electricity. However, the implementation of such technologies is still problematic because the customer behaviours are different from one county to another, and the application of such technologies depends largely on the perceptions and the acceptance level of that specific country. Thus, this study has embarked to study the factors affecting the intention to accept the demand side management programs among the KAHRAMAA employees in Qatar. The study aimed at identifying the factors affecting employees' intention and to determine the impact of the independent variables (attitude, quality value, price value, environment value and the perceived behaviour control) on the dependent variable. The sample size of this study that was analysed was 294 questionnaires. The study used SPSS 22.0 for analysing the results. The findings revealed that all the factors were having high mean values. The study also highlighted three main factors which do have impact on the intention to accept demand side management programs which are quality value, environment value, and perceived behaviour control. Besides, some recommendations have been supposed for the future research and policy makers.

Keywords: Demand Response programs, Intention, KAHRAMAA.

Introduction

Since the global societies relay heavily on the energy and the energy management, enormous changes and technological advancement, like the Smart Grids, can bring many social changes (Ellabban & Abu-Rub, 2016). All the countries, including Qatar, are threatened with the risk of energy resources depletion due the increasing consumption of energy because unwise usage of the electricity and the increasing number of population around the world (Al-Marri, 2018). As a result, the future societies are going to depend on continuous innovation, creativity and transformation which is necessary to enhance the efficiency of their energy consumption (Afroz, Higgins, Urmee, & Shafiullah, 2017). Demand side management is not a new concept, but it is growing globally because it is a good opportunity for integrating the renewables

generation. The world has started to focus more on the demand side management (Alasseri, Tripathi, Joji Rao, & Sreekanth, 2017). Due to the complexity of the demand side programs, the intention toward accepting these demand side programs are much studied nowadays because they cannot be implemented without the acceptance of society individuals (Park, Hwang, Ko, & Kim, 2017).

During the previous decades, the electricity infrastructure and supply have faced much stress from the increasing demand required due to the over-consumption of electricity by people in all regions of the world (Ferreira, Rocha, & Araujo, 2018). This created the need for more reliable power supply which in turn has pushed the policy makers to the perception of smart grids. The concept of demand side management was first used by the Electric Power Research Institute in the 1980s in a form of activities that utilities go through to reduce their energy consumption. EPRI did all these activities to maximize benefit, delay of investment, and enhancement of reliability (Gellings, 2017). The implementation of demand response programs involves many issues. According to (Behrangrad, 2015), in the past the most difficult problem in implementing the DSM proliferation was the technological hurdles, however, these challenges have vanished with the technological advances in the area of smart grids.

The most influential factors that affect KAHRAMAA staff's intention to accept and use electricity demand response programs are the staff's attitude, quality value, price value, environmental value, and perceived behavior control. This intention is believed to be translated into actual actions based on many social theories and research. Staff's intention is affected in many factors. For instance, good impressions will be formed in the staff mind about the acceptance of the electricity demand response programs when they these programs believed to be having many values such as the quality and the price values. Moreover, the concern about the energy consumption and the more trend into the smart grids and technological advancement in the demand side management (Behrangrad, 2015). Thus, there is a need to examine the factors affecting the intention towards the intention to accept such programs and to identify the impact of such factors on the intention.

Per-capita consumption of electricity in Gulf counties is one among highest electricity consumption in the world because of the very high personal incomes, the need to air conditioning around the whole year, and the subsidies energy (Bayram, 2019). Petroleum reserves in the Gulf countries is about 41% of the oil in the world and 24% of the gas found the whole world. Because of the prosperous economy in the Gulf countries, the consumption of gas, water and energy is increased. The rapid growth in local need of electricity is one of the most important issues that the Gulf countries confront.

Because of the increased electricity demand during the peak time in summer-time and their experience with electricity shortage, the people focus on long-run solutions like the solar energy has been increased significantly. Qatar is one of the Gulf countries. Qatar population is predicted to increase largely as a result of the high rate growth in economy. This will increase the demand for energy, including electricity. Al-Marri, Al-Habaibeh, & Abdo (2017) stated that since the energy prices are low, it is fundamental to increase the awareness and knowledge of people in order to decrease the waste of resources and maintain sustainable energy and secured economy for Qatar. Electricity consumption per person in Qatar is one of the highest in the world. Electricity consumption is very high. Figure 1.1 shows the energy consumption per capita among many counties, including Qatar, in which the consumption is near to 200%.

Figure 1: The rise in total energy consumption per capita of Resource-Rich Countries between 1973 and 2017.
Source: (Sahin, Bayram, & Koc, 2019)

In Qatar, however, no much research or data about their domestic electricity consumption (Al-Marri *et al.,* 2017). More than half of the electricity consumption (59%) is accounted by the residential sector (Bayram, Saffouri, & Koc, 2018). The Qatari people intention should be changed to secure their future. Sahin *et al.(*2019) stated that Qatari people now do not consider the value of energy, and their electricity usage is more than they need because the electricity is provided for free to Qatari people. Regarding the demand side management in Qatar, there are only energy efficiency measures in a form of national program. This program was found in 2012 by the Qatari local utility company (Kahramaa). This program is called "Tarsheed" after the Arabic word "awareness". This program was successful to reduce water and electricity per capita consumption (by 18% and 17% respectively) in Qatar by the end of 2017 (Al-Marri *et al.,* 2017).

The study on demand side management and demand responds programs in Qatar are still limited. In this research, we tried to provide additional insights into the significance of using demand side management program such as incentive based program which this study has elaborated and highlighted the main variables that can contribute to motivate people reducing electricity usage and maintain the sustainability of the environment. This will be having a significant impact on the main stakeholders (including policy makers and energy users) involved in promoting the sustainable development of Qatar in the future, and will promote sustainable energy choices as part of the national development strategy. Two main objectives are developed for the propose of conducting this study which are stated as follows: (1) To determine the influential factors affecting the intention to accept the electricity demand side programs, (2) To examine the impact of the influential factors affecting the intention to accept the electricity demand side programs.

Literature Review

Much research has been done in many countries on the programs that can lower the electricity consumption. The studies have different reasons. Many studies indicated that these new technologies are very important to reduce the demand for the renewable energy, to protect the environment, and to reduce the electricity bill. In addition, many factors have been found having influence in affecting the customers acceptance of these technologies. Out of the many researches in the related area, some of the literature related to this study is discussed here.

Lackes, Siepermann, & Vetter (2018) conducted a study in Germany on drivers and barriers that influence the Direct load control (DLC) acceptance among the participants. This study was a quantitative study based on a survey distributed among 653 consumers. Fishbein's Theory of Technology Acceptance Model was utilized to conduct this study. This study was based on the assumption that DLC is a great opportunity to handle the issue of the energy turnover. The findings showed

that environmental impact or value, the increased comfort and the price value are the main factors or drivers that affect the respondents' attitudes to accept DLC. On the other hand, the respondents' attitudes to accepts such technology were found to be decreased because of the loss of control, unprotected usage and the technical safety. The rest of the respondents in the service provider was not found influencing the respondents' attitudes. However, trust was found having a role in affecting the participants' perceptions of the DLC advantages and disadvantages.

Milchram *et al.* (2018) conducted another study on the acceptance of smart grid technologies which focused on the moral values. The basis of this study is that smart grid technologies are the best solution to energy systems that ere more sustainable, however the implementation of these technologies is based on the social acceptance of such technologies. Thus, the study focused on the moral concerns among the literature review. The findings show that moral values work as both derivers and barriers for the acceptance of smart grids.

Another study was conducted by (Moser, 2017) in Switzerland on the perceived control and the security concerns that affect the individual acceptance of electricity load-shifting programs. The study stated that public often reject the smart metering technologies because they fell the lack of control over their appliances and the data security problems. Thus, this study embarked on studying the way these concerns influence the social acceptance of load-shifting programs. The findings show that the acceptance levels will decrease significantly when the customers feel that they have no control over their appliances. No findings were concluded regarding the factor of the data security concerns. Furthermore, the study suggested that there are serious concerns about control of their appliances. Thus, more understanding of these issues will help producing more socially accepted programs.

Reka & Ramesh (2015) conducted a survey to analyze the demand response evolving in many countries. The study was a comparative study between different countries, and it showed a portrayal for many demand responses programs in different countries with some details. The study elaborates the demand side management scenarios developed in many countries. In other words, the study focused on giving reviewing the implement DR programs and their effect in different countries. More than that the study has analyzed the impact the demand response programs have in electricity demand reduction during the peak hours and their energy efficiency.

Parrish, Heptonstall, Gross, & Sovacool (2020) defined intention as the person willingness or readiness to perform certain behavior. It is considered as the antecedent of any behavior, so it is what forms the behavior of an individual. It is the indication whether the individuals will accept and use the electricity demand side programs or not. Zhang, Xiao, & Zhou (2020) defined the intention as the individual willingness to purchase energy-saving appliances. The current study attempts to examine the KAHARMA staffs' intention to accept and use the electricity demand side programs. Thus, in this study the behavioral intention refers to the individual readiness and willingness to accept these programs. Perceive effectiveness and the perceived values were added to the TPB, so the respondents' intention towards the electricity demand side programs can be studied thoroughly. It is not always that intensions result in the actual behavior. However, the probability of conducting the behavior is increasing when the intention is stronger (Römer, Reichhart, & Picot, 2015).

Methodology

This study was conducted among the staff of the KAHRAMAA Company, Dawha, Qatar. The study followed the qualitative survey approach using online questionnaires. The population wad KAHRAMAA staff, with minimum sample size of 278. The data was collected from April to May 2020. The study followed the random sampling as the most suitable type of sampling for this current study. According to KAHRAMAA website, the total population of the KAHRAMAA staff is more than 3,000. Thus, the sample size for population more than 3,000 at the 95% confidence level are 341 respondents (Taherdoost, 2016). The data was collected by the Five-points scale questionnaire. Then the data is analyzed by using SPSS version 22.0. Some tests were used to analyze the data; pilot study, reliability test, descriptive analysis, correlation analysis, and regression analysis.

Two main methods were used in this research to collect the data. The first and main method was the hard copy questionnaires. A set of 170 hard copies were distributed at KAHRAMAA out of which 105 questionnaires were returned. The second method was the online soft copy questionnaires. A sum of 194 questionnaires were received from this method.

Only 5 questions were not considered as they show that the respondent did not answer properly. Thus, the total number of questionnaires that were analyzed are 294 in total which represents 86.21% return rate. The data and response rate is summarized in table 4.

Table 4: Questionnaire Return Rate

Population	Sample Size	Questionnaire hard copy returned	Questionnaire online returned	Total Questionnaire Returned	Return rate (%)
3000	**341**	**105**	**194**	**294**	**86.68**

Pilot study has been conducted before the real distribution of the questioner. In this pilot study, 25 respondents participate to answer the questionnaire. The respondents were given the questionnaire with an introductory paragraph on about the study, assuring the security of the respondents. The respondents were also asked to give their suggestions on how to enhance the questionnaire. The results were satisfying which shows that the questions were understandable and relevant, assuring the validity of the scales. The generally agreed upon lower limit for Cronbach's alpha is 0.70 as recommended by (Taber, 2018). Thus, the reliability of the pilot study shows satisfactory results ranging from 0.744 to 0.855.

Results and Findings

Reliability Analysis

Cronbach's alpha is used in this study to measure the internal consistency reliability. Cronbach's Coefficient Alpha is always used for the measurement of the reliability of questionnaire. Normally, it ranges between 0.0 to + 1.0. When it is higher, it reflects high degree or consistency. The results of the reliability of this study are presented in Table 6. The result of the Cronbach's Coefficient Alpha for this study was 0.611 which is considered good.

Table 6: The Reliability Test of the Actual Study

Variables	Cronbach's Alpha	N of Items
Intention to Accept Electricity Demand Response Programs.	**0.755**	**3**
Attitude Toward the Intention to Accept Electricity Demand Response Programs.	**0.624**	**4**
Quality Value	**0.833**	**4**
Price Value	**0.633**	**3**
Environmental Value	**0.854**	**4**
Perceived Behavior Control	**0.843**	**3**

Frequency Analysis of the Respondents' Demographics

Frequency analysis is every essential in all the researches which shows the frequency of the respondents answers for the questions. It is part of the descriptive analysis. In other words, it shows the how many times the respondents selected certain answers.

Gender

The gender information of the respondents is presented in Table 7 and Figure 4. Based on the chart, it can be seen that 198 of the respondents participating in this study were males whose percentage was 67.34% of the total percentage. On the other hand, the number of females participating in this study was 96 respondents whose percentage was 32.65%. Thus, it can be concluded that male respondents were more than the female respondents in this study as they were almost double the number of the females.

Table 7: Respondents' Gender

Category	Frequency	Percentage
Male	**198**	**67.34%**
Female	**96**	**32.65%**
Total	**294**	**100%**

Respondents' Age

The respondents age was divided to three categories, and the respondent were asked to choose among these categories. The first category is those whose age ranged between 18-24. The number of respondents from this category was 19 which account for only 4.46% of the total number. The second and the third category were those whose age range between 25-34 and 35-44. Their percentages were almost similar as 37.75% and 39.79% respectively. The last category was those participants whose age ranged between 54-60 whose percentage was 15.98%. Thus, it is clear that the largest number were 35-44 years old. Table 8 and Figure 5 summarize the information of the respondents' age.

Table 8: Respondents' Age

Category	Frequency	Percentage
18-24	**19**	**4.46%**
25-34	**111**	**37.75%**
35-44	**117**	**39.79%**
54-60	**47**	**15.98%**
Total	**294**	**100%**

Education Level

The respondents were having four education levels including diploma, degree, master, and PhD. The number of respondents having diploma was 59 which is 20.06% of the total percentage. Those who have degree certificates were 135 and they accounted for 45.91% of the total number. The last two categories were those who have whether master or PhD and their numbers were 64 and 36 respectively, and their percentages were 21.76% and 12.24% respectively. Table 9 and Figure 6 Summarize the information presented in this section.

Table 9: Respondents' Education Level

Category	Frequency	Percentage
Diploma	**59**	**20.06%**
Degree	**135**	**45.91%**
Master	**64**	**21.76%**
PhD	**36**	**12.24%**
Total	**294**	**100%**

Housing Condition

Housing condition refers to the respondents' condition of the house he/she lives it which can be own house, renting house or others. First the number of the respondents who live in their own house is 102 whose percentage is 34.69%. Second, the number of the participants who are renting a house was 167 which accounted for 56.50% of the total percentage. However, those who selected the other option were 25 and their percentage was8.50%. The "other option" refers to those who are not having house and are not renting houses. They could be living with their parents or other relative house. In short, the largest number of the respondents were renting a house. This is because of the fact that the employees of KAHRAMAA company comes from about 35 worldwide countries (KAHRAMAA website, 2020). Table 4.7 and figure 4.4 summarize this section.

Table 10: Respondents' Housing Condition

Category	Frequency	Percentage
Own House	**102**	**34.69%**
Renting House	**167**	**56.80%**
Other	**25**	**8.50%**
Total	**294**	**100%**

Knowledge About Electricity Demand Response Programs

A separate section in the questionnaire was used to ask the respondents if they know about the electricity demand response programs. Interestingly, almost two thirds of the respondents answered "Yes" whose number was 210 participants and with a percentage of 71.42%. This is normal results since the respondents are working in an electricity company and have great background in this sector. On the other hand, only less than on third of the respondents answered "No" whose number was 84 and their percentage was 28.57%. In short, the number of the respondents who know about the electricity DRPs programs are much more than those who do not know about such programs. The information of this section is presented in Table 11 and Figure 8.

Table 11: Respondents' Electricity DRPs Knowledge

Category	Frequency	Percentage
Yes	**210**	**71.42%**
No	**84**	**28.57%**
Total	**294**	**100%**

Descriptive Analysis

The traits and the characteristics of the phenomenon or the individuals being involved in the study are illustrated with the use of the descriptive analysis (Loeb *et al.,* 2017). In other words, descriptive analysis was used to help the researcher to present characteristics of the gathered data in a quantitative way. Thus, the data was analyzed statistically. In this statistical descriptive analysis, many measures have been conducted including the measures of the variability (deviation, Kurtosis, and Skewness) and the measures of the central tendency (such as mean an median) in order to go further and fulfill the objectives of this study.

Findings Objective 1

The first objective of this study was "To identify the influential factors affecting the intention to accept the electricity demand side programs". This objective was first accomplished in chapter two with the use of the literature review. Nevertheless, this section will emphasize and highlight more on the importance of these factors and their influential levels on the intention to accept the electricity demand side management programs which will help reduce the demand and save the electricity. Five factors were identified in this study (attitude, quality value, price value, environmental value, and perceived behavior control). To achieve the objective, mean analysis was effective to find the central tendency of the variables and establish their ranking and significance.

The variables of this study were measured by the use of the five-point Likert scale in the questionnaire. The scale starts with number one which means "Strongly Disagree" and ends with number five which means "strongly Agree". Therefore, if the mean of the variable is less than 2.32, it was considered as low. In addition, if the factor or the variable scored a mean value between 2.33 and 3.66, it was considered as average. Meanwhile, the mean score is between 3.67 and 5.00, it was highlighted as high.

The results obtained though the mean analysis are depicted in Table 13. Overall, four factors were found having high central tendency which are attitude, quality value, environmental value, and perceived behavioral control. However, price value was found having average central tendency in the analysis. More than that the standard deviations of the variables were also presented in table.

Table 13: Descriptive Statistics

	Questions	Average Mean	Std. Deviation	Total Average Mean	Mean score interpretation
Intention	**Q6**	4.12	.706	**3.77**	**High**
	Q7	4.06	.752		
	Q8	3.15	.909		
Attitude	**Q9**	3.62	.984	**3.81**	**High**
	Q10	3.77	.878		
	Q11	4.09	.747		
	Q12	3.79	.876		
Quality Value	**Q13**	4.22	.797	**3.93**	**High**
	Q14	4.13	.785		
	Q15	3.68	2.529		
	Q16	3.71	.828		
Price Value	**Q17**	3.99	.826	**3.85**	**High**
	Q18	3.25	1.076		
	Q19	4.33	2.439		
	Q20	3.83	.764		
Environmental Value	**Q21**	3.52	.881	**3.73**	**High**
	Q22	3.47	.841		
	Q23	4.20	.720		
Perceived Behavior Control	**Q24**	3.88	.759	**4.06**	**High**
	Q25	4.23	2.430		
	Q26	4.08	.714		

Based on the statistics in Table 13, it is clear that the variables or the factors score high means. A closer look can show that the mean scores of the items was ranging from 3.15 to 4.33. Meanwhile, the table also shows the standard deviation of the items which ranged from .706 to 2.529. Standard deviation scores show the dispersion of the items from their standard. A good example is the standard deviation of Q6 which is .706 which shows that most of the respondents agreed on the statement.

First is the dependent variable of the study which is the intention to accept Electricity Demand Side Management programs. Three statements were used in this variable to measure their level of intention to accept the Electricity DRPs which are; I think I am ready to accept any electricity demand response programs, I will make every effort to reduce my electricity consumption by using demand response programs, and I have a great intention to use electricity demand response programs. The total mean score of this variable was high (3.77) with standard deviation of (.789). This shows that the respondents have high intention to accept the usage of the programs at their houses.

Regarding the factors affecting the intention to accept the Electricity DRPs, perceived behavior control scored the highest mean 4.06 (Std. Dev:1.301), followed by quality value 3.93 (Std. Dev:1.248). Meanwhile, Price value and attitude came next as they obtained mean values of (3.85 and 3.81 respectively), with standard deviations (1.276 and .871 respectively).

Thus, analytical and statistical analysis have been carefully conducted to achieve the first objective of this study which is to identify the factors affecting the intention to accept the electricity DRPs among the KAHRAMAA Employees. The results showed that all the factors influential factors for the respondents' intention with change in the effect. Perceived behavior control was the most influential factors scoring a mean of 4.6. The second factor was the quality value because it scored a mean of 3.93. The third factor was the price value with a mean value of 3.85. This was followed by the attitude as it obtained a mean value of 3.81. The last factor was the environmental value which scored an average mean of 3.73 making it the last factor.

Findings Objective 2

The second objective of this study was to examine the impact and find the relationship between the intention to accept the electricity DRPs and the five factors of the study (attitude, quality vale, price value, environmental value and perceived behavior control). This objective was achieved with the use of the correlation analysis and the regression analysis. Five hypotheses are established under this objective which will be examined. Before conducting the correlation analysis and the regression analysis, the normality analysis should be conducted to examine the normality of the distribution of the questionnaire. This will help to determine which correlation analysis is effective to examine the relation between the variables.

Normality Analysis

Normality test can be performed by analyzing the skewness and kurtosis. Skewness will show the symmetry of distribution while kurtosis will show the peskedness of the data distribution. Table 14 presents the result of the normality analysis for all variables.

Table 14: Normality Test

Variables	Kolmogorove-Smironv Significant	Kurtosis
Intention	**.000**	**.000**
Attitude	**.000**	**.000**
Quality Value	**.0-00**	**.000**
Price Value	**.000**	**.000**
Environmental Value	**.000**	**.000**
Perceived Behavior Control	**.000**	**.000**

Since the sample of this research was more than 200 questionnaires, Kolmogorov Smirnov was used to test the normality of the distribution. The result indicated that the data was not distributed normally because the significant values are less than 0.05.

Correlation Analysis

This analysis showed the correlation between the variables. Table 15 shows the statistical results of the correlation analysis. Generally, the results show that all the five variables are correlated to the dependent variable at 0.05 level because all the Sig. values are less than 0.5, while at the 0.01 level, attitude and price value were not correlated to the intention to accept DRPs. The strength of the relation ranged between the one variable to another. The strongest relation was found between Quality value and the intention to accept Electricity DRPs (.418). Meanwhile, the weakest relationship was between the price value and the dependent value as the Sig. value for this factor was .128.

Table 15: The correlation results

Intention		Attitude	Quality Value	Price Value	Environment Value	Perceived Behavioral Control
	Correlation	.150*	.418**	.128*	.325**	.316**
	Sig. (2-tailed)	.010	.000	.029	.000	.000
	N	294	294	294	294	294

Table 16: depicts the Inter-Item Correlation matrix values of the variables. The values of all the matrix were positive which indicates that all assessed items measured the same underlying attribute and that there is a relation between the dependent and the independent variable.

Table 16: Inter-Item Correlation Matrix

Item	DV	IV1	IV2	IV3	IV4	IV5
DV	1					
IV1	.150	1				
IV2	.418	.164	1			
IV3	.128	.026	.186	1		
IV4	.325	.243	.349	.332	1	
IV5	.316	.207	.286	.137	.220	1

Regression Analysis

This section is devoted to conduct the regression analysis after the factor analysis and correlation analysis has been carried out. Correlation was used to test whether there is a correlation between the dependent variable and the independent variables. However, it is not enough to examine the impact of the independent variables on the dependent variable. More than that correlation analysis showed whether there is a relationship between the variables, but it did not show the magnitude (how much) and the direction (positive or negative) relationship. Thus, regression analysis was needed to examine the impact of the independent variables on the dependent variable in this study.

Figure 10: Normal P-P Plot of Standardized Residual

Table 17: Regression Analysis Model Summary

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.494[a]	.244	.236	.52223
a. Predictors: (Constant), PBC, A, PV, QV, EV				
a. Predictors: (Constant), Quality Value, Perceived Behavior Control, environment Value				

Table 17 shows the summary model of the regression analysis. Based on the data in the table, the R Square value is .244. This value means that 24% of the changes in the intention to accept the electricity DSMP. Based on the regression only three factors were included in the model as having impact on the dependent variable that are quality value, perceived behavior control and the environment value. Meanwhile, two factors were excluded which are attitude and the price value.

Table 18: Regression ANOVA

ANOVA[a]						
Model		Sum of Squares	Df	Mean Square	F	Sig.
3	Regression	25.503	3	8.501	31.170	.000[b]
	Residual	79.090	290	.273		
	Total	104.593	293			
a. Dependent Variable: Intention						
b. Predictors: (Constant), Attitude, Quality value, Price Value, Environment value, Perceived Behavior Control						

Table 18 depicts the ANOVA information of the regression analysis. The overall significance of this model is shown in this table. According to the table, the Sig. value of the model is .000 which is less than 0.05. This indicates that the model and the data represented by the model are significant. In addition, this Sig. value of .000 illustrates that a satisfactory level has been accomplished by the model in representing the variance of intention to accept the electricity DRPs toward the other five independent variables in this study. Thus, the results of this study are significant, and the study has been successful in predicting the relation and the impact of the independent variables on the intention to accept the electricity DRPs at a satisfactory level.

Table 19: Regression Coefficients

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
3	(Constant)	1.419	.250		5.685	.000
	Quality Value	.310	.058	.301	5.376	.000
	Perceived Behavior Control	.116	.033	.190	3.541	.000
	Environment value	.173	.053	.178	3.242	.001
a. Dependent Variable: Intention						

The results of the regression analysis of the relationship between the variables which shows the impact of the independent variables on the intention to accept DSMP are presented in Table 19. According to the table, the T values of the independent variables are as follows: quality value (5.376), perceived behavior control (3.541), and environment value (3.242). In addition, the results showed that the respondents intention to accept DRPs is affected only by quality value, environment value, and perceived behavior control because the Sig. value of these factors are .000 for quality value, .000 perceived behavior control, and .001 for the environment value. On the other hand, attitude and price value were found to have no impact on the intention to accept DRPs and were excluded by the model.

To illustrate more on the impact of the independent variables, a closer look is needed at the standard coefficients (B). It is clear that the percentage of the impact of the quality value has the highest positive impact on the intention to accept the $DSMP_s$ as the B value of this factor is .310. The impact of quality is positive and the value means that as the value of the quality increase by a value of 1 (every unit of change of quality, it will result in a 3.10% in the intention to accept the DRPs). Thus, when the quality value increase the intentions will increase. This was followed by environment value as its B value was .173. In addition, the B value for perceived behavior control was .116. Thus, it is clear that all the three factors selected affect the intention toward accepting the demand side management programs.

Conclusion

This study was on the factors affecting the intention of the staff at KAHRAMAA company toward the acceptance of the demand side management programs. Five factors were studied which are attitude, quality value, price value, environment value, and perceived behavior control. All the factors scored high mean values, and all the factors were correlated with the intention to accept DRPs. However, only quality value, environment value and perceived behavior control were found having impact on the intention to accept SRPs while attitude and price value were found having no impact on the intention of the respondents. In short, this study has presented great results and discussion as a reference for policy-makers which can be used for promoting the most promising DRPs in Qatar based on the factors affecting the residents' intention to accept these programs. The results can also be used by other countries with similar characteristics for forming the best policies and enhance the sustainability and development of the power operation systems in Qatar.

The first main limitation is the limit of the scope. This study was conducted among the staff of KAHRAM company. Thus, the results may not be generalized and might not be applicable to the other places in QATAR. Besides, only five factors were studied in this research. So, the study is not inclusive. The third limitation is the short time devoted to complete this study which resulted in some of the abovementioned limitations. Nevertheless, the study has followed a scientific and systematic process to conduct all the steps of the formal research starting from the study background, identifying objectives, collecting and analyzing the data and finally discussing the results and the findings.

Application of DRPs differs from one country to another country for different reasons. Based on the findings of this study, it is recommended that policy makers should focus on the quality of the technology used in the application of the DRPs

as well as raising the awareness of the residents on the benefits of the DRPs and how it will reduce the environment pollution and save the oil resources. Besides, residents should also be knowledgeable of the usage of the programs. Moreover, future research should be on a wider scope to include a bigger population size to generalize the results. In addition, more factors should be studied under this area.

Abstract

Increasing demand of electricity is a problematic issue nowadays. Two main strategies are used in the power system operation to face this issue that are reducing the electricity demand or increasing the electricity generation. However, literature review have proven Demand Side Management Programs to be the best solution for the increasing demand of electricity with the problem of level of acceptance of such programs among the nations. Thus, this review paper is aimed at reviewing the available literature on the acceptance of Demand Response Programs which special focus on the the Gulf countries. The paper has also reviewed the important factors that have an impact on the intention of people to accept such programs.

Introduction

Many countries around the world, Qatar included, have shifted their focus on producing more renewables. However, these nations are facing a big obstacle because the electricity demand of household cannot be satisfied with the renewables production (Moser 2017). Thus, electricity demand side programs are the solution for the nations to balance their household electricity demand with the renewables production ability. Milchram, van de Kaa, Doorn, & Künneke (2018) stated that the technologies of smart grid are very important as they enable the transform to energy systems that are more sustainable. Renewable energy sources are integrated into networks of electricity by integrating the rising shares of volatile. To integrate these rising shares of volatile in large scale, DRPs should be first accepted by the societies. Nevertheless, many societal concerns regarding these programs or technologies have been revealed by the related literature review. These concerns should be considered when developing these technologies to achieve the goal of developing energy systems that sustainable. This is because demand response programs are still in their early stages. Thus, this study has embarked to review the available literature on such programs and the effect of attitude, quality value, price value, environmental value, and perceived behavioral control on towards the intention to accept and use the demand response programs.

The program runs through the application of arrangements that targets the efficiency of the energy of domestic appliance usage. However, the application of the demand response programs, based on price and incentive, encounter the following issues: (1) supporting the prices of electricity, the bills of low electricity and the benefits of the employee where the bills guide to increased use of electricity; (2) the constant and heavy use of AC and water is needed in the

Cite this Article as: Samar Abdulrazzaq Mohammed AL-GHALEBI, Ahmed Saleh Ahmed Saif AL-SHAMERI, Zainon Mat SHARIF, Saba'a Saleh Ahmed SAIF and Saleh Ibrahim Mohammed AL AAMRI "Review Paper on The Demand Response Programs and The Intention to Accept Them as A Solution for Increasing Demand of Electricity" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

climate conditions; (3) high disposable annual income limits the applicability of monetary incentives capitalized by price-based DSM techniques (Alrawi *et. al,* 2019). Thus, a good solution is the electricity demand side programs or systems which will reduce the unneeded amount of electricity used. Most of the previous studies on demand side programs and smart grids suggested that the application of these technologies of sustainable energy systems must be preceded with a study on the factors affecting consumer's acceptance of these programs.

The intention of the people around the world towards the acceptance of the DSPs is improving a lot. They have recently increased the usage of renewable energy sources as their target. Their motivation is driven by mitigation of climate change and the transition to energy systems that are producing low carbon and reduce the electricity consumed. Meanwhile, the technologies of smart grid and electricity demand response programs are considered as the best solution to fulfil the aim of increasing the usage of renewable energy sources. The electricity demand response programs are allowing the electricity providers to maintain supply intermittencies and decentralization. This is achieved by the use of innovative information and communication technologies (ICT).

In Europe, people are willing to accept the demand side programs. Dane, Finck, & Zeiler (2017) conducted a survey in Denmark on 785 individuals to investigate their perception and attitudes towards the smart grid technologies. The results of this study showed that people are having high positive attitude toward such programs, and they are willing to adopt them. Another quantitative study was in United Kingdom (UK) with 2411 respondents to examine their attitudes and intention to accept demand side programs (Nicolson, Huebner, and Shipworth 2017). The study showed that respondents are having good perceptions toward the demand side management. The respondents are concerned about the climate change and environmental issues. Thus, they are having high acceptance levels.

Demand Side Management

The operation of the electricity generation systems is considered as not optimal and not sustainable in the long run because of the shortcomings and the environmental concerns. On the other hand, demand side management (DSM) is accepted as promising resource for electricity consumption reduction. DSM was introduced in 1980 by the Electric Power Research Institute as activities to be undertaken in order to reduce the electricity consumption. It was introduced because they wanted to reduce their electricity consumption, maximize their profit, and enhance their reliability. Because of the liberalization in the electricity market, this DSM was subdivided into two groups. The first one is the energy efficiency (EE) which aims at reducing the amount of electricity being consumed for the provision of products and services that require electricity. The second one is the Demand response (DR), which aims at changing the use of electricity by the consumers as a response to price incentives (Behrangrad 2015).

Demand side management (DSM) refers to the process or behavior of modifying the manner of using electricity and reducing it which enhances the efficiency and consumption in the systems of demand side energy (Gellings 2017). DSM is gaining popularity nowadays as a solution for the increasing demand of electricity and because of the smart girds technology advancement and the deregulation of the electricity market. Activities in DSM can be divided into two types: "energy efficiency (EE)" and "demand response (DR)". To ensure the sustainability of DSM, there must be a creation of business models that are sustainable. Behrangrad (2015) stated that DSM models has been affected considerably with the spread of the devices of storing energy, infrastructures of smart grids, and interrupted resources of the renewable energy.

Residential sector nowadays is contributing greatly to the energy balance of the world. However, it has been very difficult to control or make the energy demand elastic with the conditions of the power grid. Although many energy resources that are renewable have been introduced, the residents still have to participate to maintain sustainable and efficient system of electricity by following flexible patterns. Thus, the mechanisms of demand management are useful to deal with the energy resources and the demand of the customers. According to Esther & Kumar (2016), demand-side management (DSM) is a promising method which aims to make the residents energy-efficient with the continuous use of this method. Saffari et al., (2018) stated that DSM was used to refer to the load management which include many measures. These measures do many tasks like reducing the conservation, smoothing the peak load, and helps balancing the demand and the supply of the energy. Another researcher (Hsu et al. 2017) defined DSM as the technology, the programmes or the actions that are used to help reducing the energy consumption for the purpose of reducing the expenditures of the energy system and accomplishing the aims of the policy such as reducing the emissions or creating a balance between the supply and demand of the energy. Demand response is very useful for

reducing the market power and solve the problem of the higher prices introduced by the producer that are much higher than the production costs (Asadinejad and Tomsovic 2017). Besides, residents will also benefit from low bills of electricity if they follow the time-varying rates and reduce their consumption (Schneider and Sunstein 2017).

Many surveys and papers have been conducted on the DR from different point of views. Careful analysis of research in the previous decades would show that there is gap in the DSM frame because they have used many methods and terms with unclear definitions. Besides, many different methods are claimed to be different without any distinguished features, however, these different methods are very similar. According to Meyabadi & Deihimi (2017), there is a need for developing aggregated theoretical framework for the DSM branch because there is a lack of explicit definitions for the concepts and the methods. Overall, there are two different strategies in the power system operation to face the total expected load demand. These are the two main strategies includes the expanding of energy production and the use of the managerial measures which reduces the demand for electricity.

The concept of demand-side management (DSM) covers three main sub-terms; the DSM participants, the DSM objectives and the DSM category(Khalid, Amin, and Chen 2018). Xue, Tu, Yang, & Zang (2015) defined the DSM participants as the entities responsible for gathering of the small load reduction from the energy consumer and combine it as the total load reduction which will help the operator mountain the capacity market balance. The researcher explained more that these entities include local or national government, demand resource aggregators, the consumers and the utilities. More than that in the DSM category, many processes and technologies are covered such as the conservation of energy, the efficiency of energy, the incentive and price-payment based demand response, the storage and generation that are on-site. According to Celik, Roche, Suryanarayanan, Bouquain, & Miraoui (2017), the DSM objectives take many form such as to provide a reliable and secured energy by maintaining a balance between the power system while also maintaining a reduction in the energy bills and the carbon emission.

DSM provide many advantages. For instance, the power utilities can get advantage when the load is reduced because there will be no need to build more power plants and the networks for the transmission and distribution which will help save the investments. More than that DSM is helping to attain the power systems that are stable and reliable. The DSM will benefit the end user by reducing the power bill when the energy storage and the conservation actions are employed. There are also advantages for the industries in that the production cost are lees and the products are more competitive. The advantages do not stop here but go more to include the environment. There is a great improvement in the environment if the emissions are reduced with the energy conservation. Zhang, Jiao, & Chen (2017) stated that DSM help mitigating the risk of 'outages of power' during the energy crisis and reduce the carbon emissions.

Demand response programs

Demand response is defined as the development in the consumer ordinary usage patterns of electricity according to the subsequent change in the tariff changes of electricity with user and utility interaction (Alasseri, Tripathi, Rao et al., 2017). The objective of the demand response programs is to balance all the energy providers involved in the market with the aim of reducing the tariff with various programs lunched. These programs try to balance the demand and supply at the peak time. The examples of demand response can be switching off non-essential loads, switching off some elevators and turning on emergency generator. More than that one of its characteristics is the arrangement for less energy usage at the peak time.

Demand response programs can reduce the electricity usage and the electricity bills during the peak period. The customers will be able to use much electricity while paying less tariff during the off-peak periods. At the same time, the electricity providers will be able to control electricity supply and reduce the blackouts. The demand response programs will also enable the electricity providers reduce the expenses and carbon dioxide on their systems. The systems will permit more productive use of existing power era within the system limits. This decrease the need for building new generation plants. Subsequently, it is believed that electricity demand response programs will have many advantages such as bill savings, improvement of efficiency, environment benefits, reduced outages and so on. Because of the circumstances of power systems and market evolve so fast, a variety of price-based and incentive-based demand response programs are of great benefit for solving the challenges of the longstanding industry. These programs are presented in table 1.

Table 1: Electricity Demand Response Programs Currently Used

Demand Response Options	
Price-Based Options	**Incentive-Based Programs**
•Time-of-use (TOU): defined as a price with various unit rates used in diverse periods of time, commonly determined for 24 hours a day. •Real Time Pricing (RTP): known as the rate in which the electricity price hourly varies showing variations in the electricity whole sale price. •Critical Peak Pricing (CPP): Its rates are a mixture of TOU and RTP project. TOU is considered as a primary rate structure. Nevertheless, substituting a higher CPP price for the ordinary peak price is a condition under particular trigger situations. one situation is the compromise of system reliability. Another condition is the highness of the supply prices.	•Direct load control: It is a program by which the program operator ceases or cycles the operation of the electrical equipment related to the customer in a not enough time. •Interruptible service (IC): reduced options merged into retail tariffs which supply a bill credit or bill discount for the purpose of corresponding to decrease load the contingencies of the system. •Demand Bidding/Buyback Programs: based on these programs, customers provide bids in order to reduce based on market prices of wholesale electricity or equality. This is fundamentally provided to senior customers. •Emergency Demand Response Programs: these types of programs supply customers dense payments for the reduction of load during periods at the time of arising reserve shortfalls. •Capacity Market Programs: Through these programs, customers exchange traditional generations or delivery resources by providing load reductions. •Ancillary Services Market Programs: Customers show load reductions as active reserves in the markets of ISO/RTO. They pay the customers the market price to be immediately ready to help when needed if the bids they have are approved.

Source: U.S. Department of Energy (2006)

The measures of the demand-side contribute to achieve the balance between the demand for power and its supply which helps improving the efficiency of the energy and rising the power grid reliability. The conception of DSM is broad in nature. It includes actions like the installation of appliances that are energy-efficient, energy consumption reduction, the implementation of mechanisms that enable better pricing as well as changing the time of the electricity usage (Khalid, Amin, and Chen 2018). This will certainly be changing the consumer behaviors of electricity use. Thus, when the time patterns are changed and the load of the network magnitude, this would result in a change in the shapes of the load. Some of the main aims of the DSM are depicted in figure 2.1 (Illés et al. 2018). The DSM has six main aims of functions which are Load shifting, valley filling, peak clipping, strategic conservation, strategic load growth, flexible load shape.

Figure 2: DSM Techniques

World Consumer Perceptions about Demand Response Programs

The consumer perception towards the demand response programs has been discussed worldwide. This helps countries to study the possibility of implementation the new technologies and measures the acceptance level among the residents among the countries. The International Energy Agency's DSM Programme (IEA DSM Programme) has been in support for the development of DSM research globally starting from 1993. This was by means of conducting many tasks that aim to be a source for DSM information and tools for the governments and the other institutions. It is a database for the case studies of the countries globally that is growing constantly. Zhang *et al.* (2017) highlights the increasing number of governments involved in DSM as an alternative for the increasing demand of electricity. In this report, many countries were discussed. It was illustrated that North American countries were dominating the literature between the period of 1970s till 1990s while it was dominated by the European countries during 1990s–2010s. Currently, Asian countries like China, India, Thailand and South Korea are focusing more on the DSM and the DSM programmes (Urmee, 2018). The findings revealed that some projects are not successful in all countries. A successful project in one country may not be successful in another country. This indicates that countries must do the research and find out the suitable programmes for their nations according to the affecting parameters.

Uk is also among the countries focusing on the DSM and its application. A study conducted by (Whittle, Jones, and While 2020), shows the perceptions of people in UK. It was revealed that cost is an important reason that makes people take DSM measures, and those who are concerned about the cost of energy have less intention to accept the use of the DSM while it is more accepted by those who are concerned about the climate change. Moreover, a big portion of residents are willing to share their data which is important for many types of DSM.

Another situation can be mentioned is China. A report was revealed by Zhang *et al.,* (2017) show how China can benefit from the implementation of DSM. Many pilot studies have been conducted in China which show that significant power saving and environment benefits can be achieved in China. The experts of the Natural Resource Defense Council (NRDC) predicted that if the new energy-saving measures are implemented on the air-conditioning and the refrigerators in China, it will be saving an electricity quantity that is same to the quantity produced by the Three Gorges Dam. Yang, Wang, Liu, & Zhang (2018) IEA DSM revealed that reduction of electricity in China in the warm provinces would result in 38% reduction in the electricity use.

Moreover, much research has been on the acceptance of the DSM. Yan, Ozturk, Hu, & Song, (2018) stated that the literature is suggesting that price and the demand supply security are nowadays main motivations to change the energy

usage behavior and their impact is more than the impact of the environmental issues. Thus, structuring the demand response programs objectives might impact the acceptance among the residents.

Meyabadi & Deihimi (2017) discussed the perception of the demand side management and how price is an influencing factor. Based on the study, simple price structures which stay the same for longer period are more preferred by the consumers than those which are dynamic and keep changing. Saving money is a motivational factor that makes consumer change their consumption patterns and adopt the demand side management measures. Meanwhile, consumers will go back to their previous behavior if they do not feel the benefits of their change. In addition, some house consumption cannot be reduced such as cooking. Table 2.2 presents some of the DS programs in some of the rich countries.

Table 2: Various DSM programs in MENA region and some resource-rich countries.

Country	Plan
Australia	Direct Load Program Three Tariff Rates in Day (TOU)
Algeria	Water Efficiency Program (Shuval and Dweik, 2007)
Canada	Demand Opportunity Service, Load Reduction Program

GCC Consumers Perception Review about DSM

Hydrocarbon resources are very popular in the Gulf countries like Saudi Arabia, Oman, Kuwait, Qatar, and Bahrain. These countries are considered as the biggest countries in the world in having the oil fields (Al-marri, 2018). Moreover, Oman and Qatar are nowadays heading towards producing more and more natural gas. Besides, Qatar is focusing on implementing the sustainable energy programs. By the use of the energy resources that are renewable, they are able to reduce the energy waste which will reduce the intensity of electricity consumption. Examples of these measures are the electricity efficiency regulations, and energy labelling and certificate schemes for household devices. A good example in Qatar is the project hosting the 2022 World Cup by the government which introduced the solar power technologies for the cooling (Sofotasiou, Hughes, and Calautit, 2015).

The potential saving of energy with the use of DSM in governmental, commercial, and institutional sectors of Oman was predicted and the discounted payback was 4 and 12 years for equipment that is energy efficient and accomplish the sustainability while also advancing the renewable energy development is to manage the demand at the domestic level (Al-marri, 2018).

A recent study in Kuwait focused on four main suggested programs which are summer vacation program (SVP), monetary incentive (MI), cash refund (CRF), and nonmonetary incentive (NMIs). The study revealed that SVP was

the most preferred program. Although respondents are more influenced by the MI, they are similarly attracted by nonmonetary incentive (Alasseri, Rao, and Sreekanth, 2020).

All the Gulf countries have joined the high-level political forum based in the United Nation's program aimed at sustainable development that is based on the UN's 2030 agenda mean for the development and sustainability (United Nations Sustainable Development, 2019). These countries are taking advantage of the great oil resources they have and the economic boom, however, they are having problems with the wastage of resource's, the diversification of economic, and issues related to the environment pollution (Friedrichs & Inderwildi, 2013). Moreover, these countries are suffering from the huge consumption of energy and water for which the governments are paying high subsidies. This consumption will make the region vulnerable if they do not take sustainable measures because the consumption is even more than that in the industrialized countries (Salahuddin & Gow, 2014). Many studies have been conducted in the Gulf countries on the programs that can be used to reduce the consumption. First, a study was conducted in Kuwait which aimed at investigating the which DSM policy is fit for the country situation (Alasseri et al., 2017). Another study by Gaouda discussed the possibility of saving energy after implementing the DSM policies in the UAE (Gaouda et al., 2013). In Saudi Arabia, however, different DR programs were investigated with the study of their environmental influence (Eissa, 2011). Other researchers also conducted different studies in other Gulf countries like (Kiani, 2017), used on of the electricity consuming items “air conditioners”. The study was on both residential and commercial sectors with the aim of examining their influence on the economy of UAE with forecasting various scenarios of electricity usages. Furthermore, much research has been conducted in Qatar with the introduction of QNV 2030 program focusing on how to reduce the usage of electricity and water. Jasim et al. examined the potential influence of treated waste water effluent policy (Jasim et al., 2016), and Jraiw studied the influence of travel demand management policies on safety of roads (Jraiw, 2015). In electricity sector, Bayram et al. revealed the role of DSM on the integration of PV renewable energy for Qatar in 2017 and, in 2018, they further showed the patterns of the electricity consumption in Qatar (Saffouri, Bayram, and Koc, 2018). Thus Table 2.3 summarized some of the policies used in Gulf countries.

Table 3: Some EE policies adopted in GCC countries

Country	Plan	Implementer	Concept
UAE	Urban Master Plan Abu Dhabi 2030	Abu Dhabi Urban Planning Council (UPC)	Sustainability
	The Pearl Rating System	Estidama	Sustainable development
	Developing the DSM strategy	The Economic Affairs Unit of Abu Dhabi	Electricity and water consumption

Factors Affecting Attitude toward the intention to accept demand side management

Attitude

Attitude was defined as the psychological construct, emotional and mental entity that characterizes the individual (Zhang, Xiao, and Zhou, 2020). Attitudes are very complex, and they are acquired through experiences. It refers to the person state of mind in relation to a value, and it is interpreted by means of an expression describing a place, person, thing, or events, which in turn affect the customer's thinking and action. Attitude is connected with the experiences and situations and affects the person's response to all those situations, objects or places (Sahin, Bayram, and Koc, 2019). In simple words, is the way in which the mind tends to act based on previous experience and behaviors. According to Zhang, Xiao, and Zhou (2020), attitude is the way in which the mind tends to evaluate things whether positively or negatively. In addition, it is defined as the person feeling about performing certain action whether positive or negative.

Thus, attitude is one of the important elements to study and explore the individual motivations to accept electricity demand side programs (Römer, Reichhart, and Picot 2015). Many studies have been conducted in this area to examine the factors affecting the individuals' attitude toward the intention of accepting and using energy saving electricity demand side programs.

Quality Value

Quality value can be perceived as an important driver that make consumers chose a product (Zhang et al., 2020). It is the utility derived from the perceived quality and expected performance of the product (Al-kharsan *et al.,* 2018). The product characteristics and attributes usually form the quality value of that specific product. Individuals, in general, focus on the quality that can be derived from a particular product or service. Customers are looking for many aspects of the product to conceptualize its quality value. They pay attention to two main aspects: quality and performance. When they evaluate the quality, they would consider the fine manufacturing process of the product and its stable quality. However, performance, for the consumers, covers aspects like advanced technology used in producing the product and the working effect. A good example of the working effect is the frequent conversion technology when customers use the air conditioner. In this study, the quality value refers to the quality value of the electricity demand side programs that makes people accept these programs. Many studies have been done on the effect of quality value in adoption of new technologies. (Stenner *et al.,* 2017) conducted a study on the possible effect of the consumer perceived quality value to DSM. A positive and significant effect was found from the quality value on the acceptance of mobile data services. If the People sense a high quality value from the electricity demand side programs, they will formulate good impression about these energy saving programs. Therefore, there intention to accept electricity demand side programs is improved.

Price Value

Price value can be defined as the utility brought by individual' perception of cost reduction (Vardakas, Zorba, and Verikoukis, 2015). The energy efficiency of electricity demand side management programs is very high. With the use of the electricity demand side management programs, consumers can reduce the electricity bill. Some people may say that the installation of these programs might be expensive, however it is very effective for the long run. Thus, when the consumers perceive higher long-term cost reduction, the perceived price value will also be high. So, individuals feel that they will be saving money by using the electricity demand side management programs. Therefore, consumers will probably think that accepting the electricity demand side management programs is significant and right, which will result in improving their attitude toward acceptance of electricity demand side management programs.

Environmental Value

Environmental value refers to the protection the electricity demand side programs will provide to the environment. Traditional consumption and electricity systems are producing more harm for the environment, with much emissions being produced, much air pollution, and many other harms that result in the destruction of the environment and spread of the diseases (Quek *et al.,* 2019). Thus, environmental value is the value obtained from using the electricity demand

programs. It is the environment-friendly feature derived from these programs such as reducing the air pollution. This kind of value makes the individuals' pursuit toward the environmental ecological value satisfied as they value their environment. When the customers think about acceptance and using the electricity demand programs, consumers will consider this value which will protect the environment from the harms like the pollutant emission and the depletion of resources. Many researchers believe that if consumers are allowed to make a decision while saving energy, they will decide a reasonable ration based on a reasonable green commitment (Park *et al.,* 2017).

Perceived Behavioral Control

Based on TPB, perceived behavioral control is one of the main factors affecting the individual intention (Römer et al., 2015;Parrish et al., 2020). A modification in Theory of Technology Acceptance model states that perceived ease of use has a direct effect to the individual attitude toward the behavioral intention. Perceived behavioral control refers to the consumer perceived fitness and ability to perform certain action which will affect the person attitude toward conducting that action. The perceived behavioral control refers to the ability of the individuals to acquire the electricity demand side management programs which will increase their acceptance levels towards the programs.

Conclusion

This paper has reviewed the available literature on the demand response programs by presenting the previous studies in the global level and goes down to the Gulf level. The review has shown that demand response programs are the best solution for the increasing demand of electricity faced by the nations in the current time. Besides, it has shown how the applications of such programs differ from one country to another with the difference in the intention of people to accept such programs. It is suggested that the nations that are facing the increase in the demand for electricity should be investing more on the application of such programs. In addition, it is recommended that the intention of people to accept such programs should be examined before applying such programs because the acceptance level varies from one country to another country.

Abstract

Unemployment is an issue in most of the countries, both developing and developed. Students spend their available life, money, and efforts in education for getting a good job. However, when they finish their education, they spend much time looking for a job and sometimes stay unemployed. It is believed that one of the best solutions for this problem is to start a privet business. Thus, the objective of the study was to study the factors that affect UTHM students' entrepreneur intention and find the relationship between these factors and the intension to become entrepreneurs. Four main variables were studied in this research namely, attitude, perceived behavior control, need for achievement, and family background. The study followed the quantitative method and collected the data via online and hard questionnaires. The Sample size of the study was 375 based on Morgan table. The data was analyzed using the Statistical Package for Social Science (SPSS) version 22.0. For achieving the objectives of the study many statistical test were conducted including reliability and normality test, mean analysis, and correlation & regression analyses. The findings of this study showed that all the variables were correlated with entrepreneurial intention. Moreover, the study also showed that all factors have a significant impact on entrepreneurial intention, except for the family background which was found to have no significant impact.

Keywords*:* Entrepreneurial Intention.

Introduction

Students' Entrepreneurial Intention is crucial and fundamental aspect that Malaysian government has been recently focus on with more effort to push the entrepreneurial minds of students as a way of creating more opportunities for the university graduates. Thus, this study will fill the research gap of the factors that impact the student's intention to become entrepreneurs.

The economy plays an indispensable job in estimating the achievement or success of each nation around the world. Therefore, every country is resolved to discover various approaches to improve its economy and one of the generally realized choices and widely known is through entrepreneurship. Without a doubt, numerous countries around the globe believe that the way to economic improvement is through entrepreneurship (Mustapha & Selvaraju, 2015).

Numerous researchers and economists are also in favor of the way that entrepreneurship is a significant factor in the improvement of society (Shamsudin *et al.,* 2016). Entrepreneurship has built up its situation as the most dominant economic power in the course of the most recent decades. What's more, entrepreneurship is seen as the motor that drives the economy and thus, there is a rising interest for the advancement of education programs that promote entrepreneurship (Popescu *et al.,* 2016). Entrepreneurship is a strategic field that is continually advancing and changing with time. Entrepreneurship is viewed as the driver of the economic development of the country and assurance of the endurance of society. Entrepreneurship is one of the significant supporters of a country's economic development, advancement, and competitiveness (Hussaina, 2017).

One of the factors driving the growth of entrepreneurship in any country is the position of universities through the preservation of entrepreneurship education. The university is liable for educating and enabling its graduates and motivating them to choose entrepreneurship as their profession. University needs to implement specific entrepreneurial learning examples dependent on experimental contribution to furnish students with important information so as to encourage student motivation for entrepreneurship (Asiah *et al.,* 2018). This is because entrepreneurs are the most dynamic, creativity and innovation. They are prepared to face uncertainty through creativity and determination to succeed. This spirit has led them to see the opportunity and the confidence to seize the opportunity. Therefore, entrepreneurs need to create and venture into new fields to enhance their competitiveness by giving people more choices (Hoque, 2018). Studies have recommended that entrepreneurship can be learned or by one way or another supported through entrepreneurship education (Manik & Sidharta, 2016). In addition, entrepreneurship education can likewise be considered as the proper exchange of innovative abilities and entrepreneurial competencies, that allude to the ideas, aptitudes, and mental mindfulness that people use during the time spent starting, developing and building up their development growth-oriented ventures (Shamsudin *et al.,* 2016).

Nowadays, unemployment among graduates has been a significant issue in Malaysia (Kadir & Merican, 2017). And the issue of unemployment among graduates is not new and is a problem for the country. The genuine circumstance today is that an ever-increasing number of graduates are joining the joblessness queue. And that unemployment problem occurs every time a university releases thousands of graduates each year. Youthful and fresh graduates, specifically, experience challenges in securing their first employment (Taha *et al.,* 2017). As the quantity of graduates surpasses the market request, the joblessness pace of new graduates additionally increments. This is because of the absence of openings for work (Taha *et al.,* 2017). Consequently, the involvement of graduates in entrepreneurship can curb and reduce the problem of unemployment. Even this field offers employment opportunities to others. Therefore, graduates need to be exposed to this field from an early age (George, 2017).

Several studies reveal that most countries these days are confronting an increase in unemployment problems. Along these lines, entrepreneurial knowledge and aptitudes may assist the nations with reducing the joblessness problem (Saraih *et al.,* 2018). Restricted chances to gain work happened for the most part in competitive environments. With this statement, graduates from colleges and universities face challenges to get a job in both the public and private sectors because of the present economic environment condition (Saraih *et al.,* 2018). It has been realized that tertiary education providers produce graduates for whom there is no business market. The period among graduation and work has kept on increasing and has turned into the basis of a disappointment for Malaysian graduates (Hoque, 2018).

According to the statistics revealed by Eduadvisor (2018), about 290,000 students finish their higher education. One out of five of these students remain unemployed, most of whom are degree holders. The number of these unemployed people account for about 55% of the unemployed people in Malaysia. The Figure 1 below also shows data on the unemployed fresh graduates based on their fields of specialization.

Figure 1: Unemployed Fresh Graduates based On Fields

Source: Eduadvisor (2018)

In the present conditions, it is asserted that one of the potential choices is for these graduates to move toward becoming entrepreneurs (Hoque, 2018). However, like any other problem-solutions, there are some factors that probably affect the students to start their own businesses. These factors are attitude, perceived behavioral control, family background, and need for achievement. First, attitude plays a great rule since students probably have no idea about being entrepreneur, so this affects their intention negatively. Thus, it is important to study UTHM students' attitudes toward the entrepreneurial intention. Second, perceived behavioral control is also significant because it is the nature of humans to have no intention to do behaviors which the individuals do not have the ability to perform. Family background is also- having a considerable effect because people always inclined to follow others in life. The last factor is the need for achievement. Since the introduction of David McClelland on motivation, the need for achievement is considered as a characteristic of entrepreneurs (Dina *et al.,* 2016).

While the pace of growth of jobless graduates is increasing, entrepreneurship is viewed as one of the variables that can increase work and be a critical factor for economic growth in creating nations (Hoque, 2018). Thus, this research aims at identifying the factors that affect the students' intention to become entrepreneurs. Given that, independent work as an entrepreneur is a profession that must be given consideration as an option for graduates (Mazdan, 2015).

Literature Review

Regardless of the shifting meanings of 'entrepreneurship' and the nonattendance of one generally definition meaning of the term, all the accepted definitions rotate around the thought of start up a business or endeavoring to start up a business (Hoque, 2018). Intent can be defined as a state of mind directing an individual's consideration towards a particular item or a way so as to accomplish something (Israr & Saleem, 2018). The entrepreneurial intention, along these lines, can be defined as a person's choice to begin their very own venture later on (Hakimin *et. al,* 2015). Entrepreneurial intentions can likewise be defined as the state of mind of a person that directs the person toward the idea of venture creation (Manik & Sidharta, 2016), without intentions activity is far-fetched. The expression of entrepreneurial intention has a comparative assignment to different terms that are every now and again used, for instance, entrepreneurial mindfulness, entrepreneurial potential, trying entrepreneurs, entrepreneurial proclivity, entrepreneurial affinity, and entrepreneurial direction (Nguyen, 2018).

Entrepreneurial intention is the beginning stage of the choice to participate in any business or venture, making it an increasingly significant indicator of future entrepreneurial contrasted with characteristic and demographic models or frames of mind and outside factors that are by and large situational (Jumamil *et al.,* 2017). Being a procedure, it is a

purposeful conceptualization or change so as to make or include an incentive through the composed utilization use of resources (Jumamil *et al.,* 2017).

Entrepreneurial intention as a perspective that advances the improvement or foundation of new business. In other words, it is a mentality impacting the decision of entrepreneurship and offering basic bits of knowledge and vision into procedures including opportunity accepted, concluded that a solid entrepreneurial intention should bring about an inevitable endeavor to begin a business notwithstanding prompt changes in conditions like marriage, childbearing, graduation, work which may cause delays (Koe, 2016). It is theoretically believed that providing a person with education and entrepreneurial experience from an early age can increase one's potential to become an entrepreneur (Hussaina, 2017).

Jumamil *et. al* (2017) conducted a study on UPLB (University of the Philippines Los Baños) graduates to investigate the factors affecting entrepreneurial intention. The results showed that self-efficacy, attitude, and knowledge on the availability of entrepreneurial support were the most influential factors towards entrepreneurial intention. Other demographic factors like gender, entrepreneur parents and friends were also found affecting the entrepreneurial intention. More than that the researcher has stressed the importance of entrepreneurial intention in taking decisions to engage in business more than the demographics, attitudes or external factors. This researcher stated that entrepreneurial intention predicts future business engagement, while the others are only situational.

Saraih *et al.* (20.18) studied the effect of self-efficacy in the engineering students' intention to become entrepreneurs in one of the Malaysian universities. The study used a quantitative method and following the Bandura Social Learning Theory. The findings showed that respondents have a high interest to become entrepreneurs and a moderate level of self-efficacy. Moreover, the study revealed that there is a significant relationship between the entrepreneurial intention and the self- efficacy.

Another quantitative study was conducted by Anas Al Bakri & Ahmed Mehrez (2017) at Qatar University. This study focused on the role model, university role, and demographics as factors affecting the students' entrepreneurial intention. University's role was the most influential factor. It was also revealed that male students are more inclined to be entrepreneurs than females. The role model factor scored a mean of 6.72 which indicates that respondents think of entrepreneurial role models, and there is a positive relationship between the availability of role models and students' preferences towards entrepreneurship.

Popescu *et al.* (2016) has studied psycho-behavioral traits including the need for achievement and its effect on entrepreneurial intention. The finding revealed that the need for achievement does have a strong effect on the students to become entrepreneurs. The results were similar to the findings of Pillis and Reardon (2007), the students to start their businesses to acquire a higher state of well-being which they consider as self-achievement. The studies also showed that the respondents need to gain recognition, self-realization, prosperity and never stay without work, which can be achieved through starting new businesses.

Shirokova *et al.* (2015) studied the gap between intention and behavior. The study suggested that although the intension-behavior relationship in other fields is at a high level, the research regarding this relation in entrepreneurship is still lacking the king and scarce. Thus, the study examined the relationship between entrepreneurial intention and action among the students regarding the contextual factors and environmental characteristics. One of the main factors was the family entrepreneurial background. The findings revealed that the Entrepreneurial family background factor has a strong influence on the students' intention to become entrepreneurs.

Another study was conducted by Ambad & Damit (2016) in Kota Kinabalu, Sabah, Malaysia. This paper applied the Theory of Planned Behavior to identify the factors that affect the entrepreneurial intention among the students because most of the literature indicates that entrepreneurial intention can be determined by using this theory. The study focused on educational support the students perceived, subjective norms, perceived structural support, personal attitude, and perceived behavioral control. The findings revealed that only three factors that have an impact on the students' intention to become entrepreneurs which are personal attitude, perceived behavioral control, and perceived relational support.

Thus, this study suggests that the students will incline to be entrepreneurs if they have a positive attitude, feel the ease of starting a business and have friends and family support.

Personal Attitude

Attitudes toward any certain behavior is the good or bad evaluation a person has toward the behavior (Grandom and Mykytyn, 2004). Attitude is an essential part of producing different choice behavior and intentions. Beliefs and fillings are what form the attitude (Zanna & Rempel, 1988). Attitudes are formed and saved in mind; this makes the decision making easier and strengthen the decision quality. Xavier et al. (2009) defined the relation between attitude entrepreneurial intention as the perceived benefits the individual probably feel they can obtain from starting a new business.

Gelard Saleh (2011) stated that there is a good relation between attitude and entrepreneurial intention. This was refuted by (Skosana, 2012). Krueger (2000) conducted a survey on students and the findings supported the theory of Planned Behavior except for the perceived social norm which was found to have non-significant effect on the students' entrepreneurial.

Another study was by Franke and Luthje (2004) on entrepreneurial intention among business students at two universities in Germany and one of the leading USA academic institutions. The findings revealed the positive relation between the students' intention toward starting a business and their attitude. The results also supported by the findings of Dohse & Walter (2009) and Paço et al., (2011) which found that the attitude toward the behavior has direct and positive effect on entrepreneurial intentions.

Perceived Behavioral Control

Perceived behavioral control refers to the individuals' perception regarding their ability to control certain events or actions that influence their lives (Hussaina, 2017). The Perceived behavioral control orientation involves assuming the belief that the results of our actions are influenced by what we do (Jumamil et al., 2017). It is considered that entrepreneurs, unlike other people, can have greater control over the results of their actions (Dina et al., 2006). Perceived behavioral control is behavior based on the level of control of an individual's belief system, the Perceived behavioral control of an entrepreneur should be understood as a clear cause of the entrepreneur's ability to control the entrepreneur's belief system throughout his life (Shirokova et al., 2016).

The concept of Perceived behavioral control refers to an individual's belief in himself (the locus of internal control) or his belief that he is influenced by an external factor (locus of external control (Koe, 2016). The Perceived behavioral control over expectations to control one's environment and beliefs in order to control the level of self-control and environmental pressures and to overcome them, meanwhile, Perceived behavioral control refers to the degree to which one feels that his success or failure depends on himself (Bin Yusoff et al., 2015). This statement implies whether an individual has the power or self-confidence in the events that occur to him or her. Individuals who believe that they can influence their own lives are expected to have internal control, while individuals who think they cannot influence the environment are said to have an external locus of control (Hussaina, 2017).

Family Background

Entrepreneurial family background alludes to those individuals whose parents or family members are associated with independent work (Shirokova et al., 2016). The family, and specifically the dad or mother, assumes the most powerful role in setting up the attractive quality and believability of entrepreneurial action for an individual (Hussaina, 2017). Numerous researchers contend that the presence of an entrepreneurial parent makes a domain wherein entrepreneurial development is empowered and success is stressed. Social encounters picked up by kids, for example, observing an entrepreneur, may direct the person's quest for a career similar to those early learning experiences (Shamsudin et al., 2017). There are several pieces of proof in student entrepreneurship literature proposing that students with family

business background foundation come from a specific familial setting that may impact their future job intentions (Kadir & Merican, 2017).

Growing up in an entrepreneurial environment offers a chance to gain from independently employed parents, who fill in as good examples (Shirokova et al., 2016) making along these way positive convictions about an entrepreneurial vocation and an ideal disposition towards shared with into entrepreneurial activities, which thusly may make youngsters just want to become toward becoming entrepreneurs, Moreover, the family business background gives bits of knowledge into entrepreneurial activity and basic leadership forms and decision-making processes the being students originating from entrepreneurial families (Shirokova et al., 2016).

Need for Achievement

The need for achievement is an important determinant of an individual's entrepreneurial intentions, the construct need for achievement is regarded as a major influential element behind human action (McClelland, 1964). As a concept, the need for achievement is the satisfaction felt by an individual when he or she achieves a goal through his or her own efforts. Therefore, it is not surprising that such people are always looking for success, both of their own and of those with whom they are working (Hoque, 2018). However, in order to achieve their goals, they prefer tasks of moderate difficulty, avoiding, as much as possible, the challenges with a high degree of difficulty. At the same time, the tasks that are too easy are not interesting for them (Hussaina, 2017). The need for achievement seems to be more important in the case of small and medium businesses (Hattie, 2013), being a very good predictor for the entrepreneurial intentions of those who will begin such an activity (Popescu et al., 2016).

Methodology

This study is quantitative in nature. In this research, stratified random sampling was utilized to choose the samples. This type of sampling is very good in making sure that a large number of population is represented. The sample size of the study was determined based on Morgan table. The data was collected with the use of the questionnaire method and then analyzed by SPSS Version 22.0. There were about 375 copies of questionnaires distributed to the targeted respondents of UTHM students. The researcher managed to collect back 345 questionnaires from the respondents. This constitutes a sum of 92 % response rate. According to Fellows *et al.* (1997), the normal useable response rate is ranging from 25% to 35%. Therefore, the total response received is considered sufficient for the purpose of this research.

The questionnaires were collected from online and by hard copies. The online questionnaires returned were 71 which accounts for almost 29% of the total number, while the collected hard copies questionnaires were 274 questionnaires which accounted for 79.42% of the total questionnaires. Thus, most of the questionnaires were collected through the hard copies distributed among the students because the students seem to be not responsive to fill the questionnaire form online. More than that the university was about to close due the Corona Virus, so the researcher tried to distribute more hard questionnaires as it is more effective way to get the data. In Addition, many statistical analysis were conducted to achieve the main objectives of the study. These include reliability test, descriptive analysis of the data, correlation analysis, and the regression analysis.

Data Analysis and Discussion

Reliability Test

According to Table 4.2, the Cronbach's Alpha reliability coefficient on the analysis of the factors affecting the students' entrepreneurial intention among the collected result with a value of 0.872 that is considered to be Very Good Reliability.

Table 1: Reliability of the Study (Cronbach Alpha)

Reliability Statistics	
Cronbach's Alpha	N of Items
0.872	**31**

Demographic of Respondents

Respondent's Gender

In this study, the respondents were 345 from different faculties at University Tun Hussein Onn Malaysia (UTHM). This part is explaining the gender information of the respondents as shown in Table 4.4 and Figure 4.1. This survey provides an accurate data finding among the genders from the students male and females. This is because the data pointed that more men students participated in the survey than women students. Figure on Table 4.1, the numbers of male respondents were 220 which make 63.8% of the total number. On the other hand, the number of female respondents was 125 which accounted for 36.2%. Thus, the majority of the respondents were males.

Figure 2: Frequency of Respondent's Gender

Respondent's Age

This section presents data on the age of the respondents. The data shows that most students are between 23 and 27 years old whose percentage was (45.2%). The second biggest category was those students aged between 18-22. Their percentage was 33.9%. The third category was for those students aged between 28-32. These students accounted for almost 12.5%. The smallest number of respondents was from the last category with the average age above 32. The data analysis of the respondents' age showed that most of the respondents were Bachelor or Master Students.

Figure 3: Frequency of Respondents Age

Respondents Race

This section shows data about the respondents' race. Overall, the majority of the respondents were Malay. From the demographic information in Table 4.6 and Figure 4.3, the number of respondents whose race is Malay was 141. This number was the heist number among the other groups. It accounts for 40.9 % of the overall number. The second big number was the Arab respondents whose number was 96, and their percentage was 27.8%. In addition, the number of Chinese respondents and the number of Indian respondents were almost similar (32 and 26 respectively), and their percentage was 9.3% for the Chinese, and 7.5% for the Indians. Moreover, 50 respondents chose the category "Others" which refers to other countries like Pakistan, Somalia, and other countries. The percentage of these respondents was 14.5%.

Figure 4: Frequency of Respondents Race

Respondents Education Level

Figure 4.4 shows the educational background of the respondents. Among the survey from UTHM students, the output recorded 229 out of the demographic which 66.4% were Bachelor students. Thus, it is clear that Bachelor students were the majority of the respondents in this study. The second category was pointed as Master students with percentage 91 and that accumulate 26.4%. This is followed by the third category which is the PhD students whose number was 25 which accounted for only 7.2% out of the total respondents.

Figure 5: Frequency of Respondents Education Level

Respondents Faculties

Figure 4.5 shows data on the faculties of the respondents. The biggest number of respondents were from the FPTP whose number was 97 and their percentage was 28.1%. This figure was followed by the students from FSKTM and FKMP as their numbers were almost similar (65 and 60 respectively), and their percentage was 18.8% and 17.4% respectively. A good number of respondents was from the FKAAS as their number was 52 (15.1%). Finally, the small number of respondents came from the FKEE and FPTV as their numbers were 39 and 32, and they accounted for 11.3% and 9.3% respectively. To conclude, much number of respondents were from the FPTP.

Figure 6: Frequency of Respondents Faculties

Family Business

This section shows the data regarding the respondents' family business background. The respondents were asked whether their families have business or not. From the demographic information in table 4.9 and figure 4.6, it is clear that number of respondents were 345. From this number, 149 respondents answered "Yes". This number accounts for 43.2% of the total number. On the other hand, 196 of the respondents answered "No". The percentage of these respondents is 56.8% of the total number. Thus, the number of respondents who their families do not have business is more than the number of respondents whose family do have business.

Figure 4.6: Frequency of Respondents Family Business

Descriptive Analysis

The Findings of Objective 1

The first objective was to identify the factors that affect UTHM students' intention to become entrepreneurs. There are four main factors being examined in this study; attitude, perceived behavior control, need for achievement, and the family background. This objective was first achieved by discussing these factors in the literature review of the study in Chapter 2. To fully satisfy the first objective of the study and answer its related question, the mean analysis was selected as the best method to determine the central tendency of the factors which will specify the average mean of each variable and its level of tendency.

Table 2: Descriptive Statistics

Factors	Average Mean	Std. Deviation	Total Average mean	Interpretation
Intention	3.90	.916	3.78	**High**
	3.69	.980		
	3.72	.993		
	3.84	.966		
Attitude	3.93	.868	4.02	**High**
	4.11	.807		
	4.02	.859		
	4.04	.784		
	4.00	.886		
Perceived Behavior Control	3.29	1.038	3.44	**Average**
	3.34	1.025		
	3.42	.912		
	3.51	.915		
	3.66	.915		
Need for Achievement	3.68	.904	3.75	**High**
	3.61	.822		
	3.85	.831		
	3.79	.831		
	3.83	.879		
Family Background	3.85	.906	3.80	**High**
	3.94	.872		
	3.71	.942		
	3.81	.946		
	3.72	.938		
	3.81	.911		

The mean and the standard deviation were summarized in the previous table after they have been extracted from the SPSS Version 22.0. One main dependent variable was studied in this research which is the intention of the respondents toward the entrepreneurial intention. While the independent variables are four factors as stated in the table. The five-point Likert scale was used to measure the tendency level of the variables starting from 1 that is strongly disagree to 5 meaning strongly agree. Based on this five-point Likert scale, the results will take different forms as such 1.00 – 2.33 means that the mean level is very low, 2.34 – 3.67 means that the mean level is moderate, and 3.68 – 5.00 means that the mean is high.

The second type of data that was represented in the table is the standard deviation of the items in the study. In fact, standard deviation measures the dispersion of the items from heir mean. Actually, the standard deviation is very high for most of the items. Q7 and Q8 are the first two items in the table with the standard deviation of .916 and .980. These levels of standard deviation show that majority of the respondents agreed on the statements in the questionnaire that was distributed.

Overall, based on the data of the mean and standard deviation in Table 4.3, it is clear that the mean of the variables were high and average. The mean scores of the variables ranged from 3.44 to 4.02 while the standard deviation ranged from .784 to 1.038.

Based on the data, the highest mean value among the variables is the value of the attitude toward the entrepreneurial intention as it scored 4.02 (Std. Dev: .565). Need for achievement and family background were almost having similar mean score as they scored 3.75 and 3.80 respectively, and (Std. Dev: .629 and .661). Finally, perceived behavioral control was having the smallest mean score which was 3.44, and its standard deviation was .720.

Thus, it can be concluded that the finding of objective one of this study was that all the factors are affecting the entrepreneurial intention of the UTHM students with variation in the percentage. Attitude was found the most influential factor with the average mean of 4.02. It was followed by the family background and need for achievement. The last variable was the perceived behavior control.

The Findings of Objective 2

The second objective of this study was to determine the relationship between the factors of attitude, perceived behavioral control, family background, and need for achievement and UTHM students' intention to become entrepreneurs. Entrepreneurial intention is the dependent variable while the others are independent variables. Four main hypotheses were formulated under this objective which are tested in this section. Two main tests were conducted in this section (Correlation Analysis and Regression Analysis) that have been determined effective to achieve objective number two of the study. However, a normality analysis will be first conducted to examine the normality of distribution and to determine which type of test should be run.

Normality Test

As shown in Table 4.4, it is the results of the normality of data. Since the sample size was more than 200, the Kolmogorov-Smirnov test was used. This showed that the data are not normally distributed. In this case, the significance value is 0.000, suggesting a violation of the assumption of normality according to Pallant (2011). The analysis shows that the results are not usually distributed because the significant values are less than 0.05.

Table 3: Normality Test

Study Variables	Kolmogorove-Smironv Significant	Shapiro-Wilk Significant
Entrepreneurial Intention	.000	.000
Attitude	.000	.000
Perceived Behavior Control	.000	.000
Need For Achievement	.000	.000
Family Background	.000	.000

Since the questionnaires, were not normally distributed, Pearson correlation was selected as an effective tool to examine the relationship as shown in next section.

Correlation

Correlation analysis was selected as the first method to examine the relationship between the variables. It will show the variables are correlated to each other. The result of the correlation analysis is shown in Table 4.5. Overall, all the variables were found correlated to the dependent variable. Based on the data, is clear that the strongest relationship was found between the need for achievement and the entrepreneurial intention of the students (r=.557, p-value = 0.000). However, the weakest correlation was between the Family background and the entrepreneurial intention.

Table 4: Correlation Analysis

Entrepreneurial Intention		Attitude	Perceived Behavior Control	Need for Achievement	Family Background
	Correlation	**.465****	**.452****	**.557****	**.367****
	Sig. (2-tailed)	**.000**	**.000**	**.000**	**.000**
	N	**345**	**345**	**345**	**345**

Multiple Regression Analysis

In the previous section, correlation analysis was used to test the correlation of between the entrepreneurial intention and the indepen-dent variables. However, it is believed that correlation analysis is not enough to satisfy the findings. Thus. Regression analysis was also used in this study because it perfectly predicts the effect of the independent variables on the dependent variable. Unlike the correlation which shows the sufficient relationship between the variables, the regression shows the magnitude (how much) and the direction (positive or negative) relationship between the dependent and the independent variables.

The following table shows the ANOVA data of the regression analysis. This result shows the significance of the overall model. Based on the table the model is significant and the data are significant since the significance score was .000 which is less than .05. This also means that the model has achieved a satisfactory level in predicting the variance of entrepreneurial intention towards the other four independent variables.

Table 5: ANOVA of the Regression Analysis

ANOVA[a]						
Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	91.087	4	22.772	60.63	.000[b]
	Residual	127.629	340	.375		
	Total	218.716	344			
a. Dependent Variable: EI						
b. Predictors: (Constant), FB, PBC, A, NFA						

Table 4.7 shows the results of the regression analysis. Based on the table the standardized coefficients of the attitude is .296, perceived behavior control .189, need for achievement .347, and family background .000. More than that the results show that attitude, perceived behavior control and the need for achievement are the main variables that affect the respondents' entrepreneurial intentions because their significant value is less than .05. However, family background was

found not having significant effect on the respondents' entrepreneurial intentions because its significant value is .980 which is more than the .05 level. In other words, family background has no contribution to the entrepreneurial intention.

Table 6: Coefficients of the regression analysis

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.269	.276		-.973	.331
	Attitude	.417	.066	.296	6.304	.000
	Perceived Behavior Control	.209	.055	.189	3.775	.000
	Need for Achievement	.440	.069	.347	6.370	.000
	Family Background	.002	.060	.000	.26	.980
a. Dependent Variable: Entrepreneurial Intention						

Thus, based on the T test in the previous table, there are only one variable that is not relevant to the equation that is the family background. The hypothesis of the family background, thus, was not supported. The R value in Table 4.8. Also strengthen the results. In more clear words, the R Square score indicates that all the variables can -express 41.60% of the changes in the entrepreneurial intention.

Table 7: Regression Analysis Model Summary

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.645[a]	.416	.410	.613

a. Predictors: (Constant), FB, PBC, A, NFA

Conclusions and Recommendations

This study was on the factors affecting UTHM entrepreneurial intention. Attitude scored the highest mean. The correlation analysis also shows that all the factors are correlated with the entrepreneurial intention. However, the regression analysis shows that all the factors are having impact on the dependent variable, except for the family background which has no effect.

Some recommendations were formulated. First, it is recommended that this study should be conducted in other universities in Malaysia. The future research should also conduct the study in a bigger scope such as conducting the study in more than one university in both private and public universities which will enable the researcher to compare the results between different universities. This would be very helpful for the policy and decision makers in the government. Furthermore, future research should focus on more factors to be conclusive. Besides, the policy and decision makers in the government should take the findings of this study with other studies into consideration. Thus, the government should make the process of establishing new businesses easier. More than that they should provide some financial support and loans because perceived behavioral control is one of the main factors that were found having positive correlation and impact on the entrepreneurial intention, and finding support from government such as loans and

financial support of course contributes to the increasing of the perceived behavior control among the graduates. In addition, students should get more knowledge in the entrepreneurship while they are still at the university. They should think how they can apply this specific specialization and knowledge in the real life by developing private businesses that can generate return.

Finally, like any other research, some limitations were identified during the conducting of this study. These limitations should be taken to consideration when findings and results of this study are interpreted. The first main limitation is the limit of the scope. This study was conducted among the students of only one public university in Johor. Thus, the results may not be generalized and might not be applicable to the other states in Malaysia. The second limitation of this study is that only four entrepreneurial factors were studied in this research. So, the study is not inclusive. The framework of the study did not include all the factors found in the literature review. The third limitation is the short time devoted to complete this study which resulted in some of the abovementioned limitations. Nevertheless, the study has followed a scientific and systematic process to conduct all the steps of the formal research starting from the study background, identifying objectives, collecting and analyzing the data and finally discussing the results and the findings.

Abstract

This article aims to present arguments that justify the introduction of hybrid capital in limited partnerships' financial statements. A limited partnership is becoming an increasingly popular form of doing business. Legal regulations in the field of accounting, as well as the literature, do not devote sufficient attention to limited partnerships or other partnerships. Issues connected with, among others, the recognition gap in accounting books and the presentation of equity in the financial statement. One of the tools which can help to cover it is hybrid capital. The work was prepared with the use of literature analysis methods and Polish regulations regarding the functioning of companies. A detailed analysis of statistical data was made in the empirical part. As a result of the research, the significance of the information gap in the area of an entity's capital was identified, and thus the potential for using the hybrid capital presentation was demonstrated.

Keywords : Materiality Principle, Limited Partnership Company, Hybrid Capital, Accounting of Limited Partnership Company.

JEL Classification: M48, M41.

Introduction

The modern accounting system was created as a result of the centuries-old evolution and it transformed from a simple register of business activity into an advanced set of activities that are necessary for enterprise's effective management. As a consequence of these changes, accounting began to perform many different functions resulting from its practical nature.

In the literature, the following functions are usually identified (Jastrzebowski, 2015):

- information,
- control,
- evidence,
- reporting,
- analytical.

The information function deserves special attention, because it fully realizes the concept of accounting as an information system (Kamela-Sowińska 2006, Hońko 2008).

According to Z. Messner (2003), the essence of the information function is connected with the formation of specific sets of information, their processing and transferring them to the management of a certain entity for their adequate use in the management process. The definition that extends the above-mentioned description was presented by (among

others) K. Szymczyk-Madej (2007). She indicated that the information function is based on the creation of specific set of information for the purposes of enterprise management and sets that are useful for external recipients.

The above characteristics differ in terms of the needs of external users of the accounting system. The second of the cited definitions points out that accounting is a highly relevant enterprise system. It is useful for all types of stakeholders (internal and external). The aforementioned diversity of users forces not only the development of different areas of accounting (e.g. financial, management or tax), but also the development of methods for sharing information prepared in the accounting system. Therefore, information is a product presented to recipients in an aggregated form via financial statements of entities (IFRS, 2020).

The reporting function is strictly connected with one of the accounting subsystems – financial reporting. The reporting (itself), according to the definition proposed by W. Gabrusewicz (2007), is a set of various compilations and numerical data concerning a specific period, which are prepared with the use of determined principles and formulas. The information contained in the financial statements is the basis for evaluation of the activity of an economic entity (Remlein, 2013).

The main factor, which affects the appearance of new elements of the financial reporting's subsystem, is the separation of ownership functions from operational functions. Owners, who remain outside the enterprise and do not have any access to the entity's operating processes, look for sources of information that will allow them to assess the property and financial condition of the entity. However, the popularization of the agency model in enterprise management is not the only factor that influences the development of the reporting function. The second factor is the expansion of the scope of actions conducted by an entity – and thus an increase in the number of realized economic operations. Managers of individual levels need information about the property and financial situation of an entity in order to make rational decisions. However, the large number of transactions makes it impossible to present the company's image in a quick way. Therefore, information generated within the framework of the accounting system is aggregated and presented in the form of numerical and numerical-descriptive reports (doctorate).

In summary, through the implementation of the accounting's information function, external and internal users receive information that is necessary in the decision-making process. However, it should be noted that the technological progress and the intensification of globalization processes contribute to the increase of a pace of changes in surroundings of an economic unit. Increasing variability forces the management of the unit to optimize the decision-making process, including shortening time needed to evaluate the unit's situation and make right economic decisions. Therefore, accounting performs a reporting function, which is connected with the aggregation of information from the accounting system (presented in the form of financial statements), allowing for the shortening of the decision-making process. However, simplifications may affect the legibility of the unit's image. One of the areas subject to the risk of inappropriate presentation is company's capital presented in the balance sheet.

The aim of this article was to present arguments that justify the introduction of hybrid capital in limited partnerships' financial statements. In the final part of the study, the materiality of a potential information gap in the financial statements concerning the entity's equity was examined.

Finally, the study was divided into four main parts covering the presentation of the principle of materiality in accounting, the essence of a limited partnership and a hybrid capital, as well as its importance from the point of view of the financial statement's legibility.

The first part presents the importance of the materiality principle and methods for the determination of the materiality threshold in the accounting system.

Next to, the actual state of regulations regarding the functioning of limited partnerships was discussed – based on examples of regulations, which are in force in Poland. These companies combine freedom in shaping a financial statement reserved for partnerships with the scale of operation for typical capital companies. Particular attention was paid to the problem of relationship between the risk of conducting business activity in this form and benefits connected with this fact (mainly tax benefits). The surplus of benefits contributes to the systematic increase in the interest of entrepreneurs in this form of business activity. As a confirmation of this thesis, the research results showing an upward trend in the number of new limited partnerships was presented in the empirical part.

The third part of the article presents the hybrid capital, its characteristics and a potential impact on the entity's financial statement.

On the other hand, the empirical study focused on two elements – the analysis of using the form of a limited partnership (as a partnership) to conduct business and determination of the materiality of an information gap in the presentation of units' capitals. In purpose of this paper gap is understood as a difference between the total value of capitals and a share capital's value. As a result, it was indicated that the number of companies operated as a limited partnership has been growing continuously for many years. Furthermore, the information gap in the field of the presentation of units' capitals is significant. Consequently, it should be stated that, from the point of view of the usefulness of financial statement, limited partnerships (as partnerships with legal possibilities to apply broadly understood simplifications) should recognize the hybrid capital as an element that explains the entity's source of funding.

The article uses the method of analyzing regulations and the literature, as well as a critical analysis of the primary study data and own statistical research.

The concept of materiality in accounting

Fundamental principles of building the accounting system are not based on rigid rules, but on the principles that should be implemented by this system. Within the framework of the area of continental influences, the principles of true and reliable image as the overriding principles of accounting are defined. However, the implementation of the target concerning the presentation of an accounting image that corresponds to the reality is realized by consideration other principles, including the principle of materiality. The concept of materiality appears in both national regulations (here on the example of Polish accounting regulations), as well as in international accounting standards.

According to the provisions of the Polish Accounting Act (UoR), an entity may use simplifications as a part of the adopted accounting policy – if they do not have a significant negative impact on the reliable and clear presentation of the property and financial situation, as well as the financial result. The regulations show a whole range of simplifications that a company may apply in its financial statement – both when it is subject to the audit obligation, and when it is exempt from it. They concern, among others, failure to apply some principles, aggregation of certain items or omission of adequate documentation. In addition to the Act, in Poland, the problem of materiality was also determined in the provisions of the national auditing standards (KSRF 1 2020). According to them, one of the basic elements of the audit of financial statements by a statutory auditor is determination of the materiality, which defines limits, to which the identified deficiencies may not be corrected (without detriment to the quality of the financial statement and the correctness of accounting books constituting the basis for its preparation). Failure to make such corrections will not mislead the reader of the financial statement.

As mentioned, the materiality provisions have been presented in the international regulations. According to the conceptual assumptions (IFRS 2020), the information is material if its omission or misstatement could have an impact on decisions of users based on financial information about a specific entity. Thus, the materiality is a feature of suitability specific for a certain entity (depending on the type or size (or both) of the item, to which the information is related). Moreover, according to the standards (IAS 2020a), material omissions or misstatements occur when they could (individually or collectively) influence the economic decisions made by users on the basis of the financial statement. This rule, as in the case of the above-mentioned national regulations, may be applied in terms of aggregating financial information and its disclosure. A single item may not be so important and it can be indicated in a separate line in the statement. However, its presentation in a separate item of additional information may be important.

The target materiality level for a given enterprise should be set by its manager. In the Polish national regulations (UoR), it was clearly stated that the entity's head should make a selection in the scope of parameters determining the level of materiality in the accounting policy (principles). Taking into account parameters occurring in practice, it is not necessary to use them simultaneously. The selection of parameters and their level should be made is such a way that they match the specifics of a certain entity as reliably as possible. In practice, it can be stated that the head of the entity should adopt the materiality threshold on an estimate basis (preferably in a percentage) – taking into account such values as: balance sheet total, sales revenues, equity or gross result on business activity or net profit.

The long period of shaping the accounting system and the importance of this problem caused that standards for the levels of determining the materiality threshold for individual economic categories have been developed in the circle of accountants and users of accounting information.
According to the recommendations presented in the literature, it can be assumed that the materiality threshold can be set at the following level (GOFIN 2018, INFOR 2017):

- from 0.5% to 3% of revenues,
- from 1% to 2% of equity,
- from 0.5% to 3% of balance sheet total,
- from 3% to 7% of gross financial result.

The values within the above ranges may be considered as irrelevant from the point of view of the usefulness of the financial statement, and thus all activities taken within the framework of the accounting system.

As already mentioned, determining whether the omission or simplification of some information affected the applicability of accounting information by users of financial statements cannot be considered solely from the perspective of a single information. Simplifications and omitted data should be summed up and the aggregated values ought to be subject to the above evaluation.

Furthermore, it ought to be considered whether this rule should also be transferred to the ground of macroeconomic data allowing not only the evaluation of a single entity, but also entire groups of enterprises and sectors of the economy. The above-mentioned consideration will be developed on the basis of the problem concerning the recognition of hybrid capital in limited partnerships.

Characteristics of a modern limited partnership

The concept of a limited partnership has a long history. Originally, a limited partnership was a tool enabling the cooperation of people with various interests: people willing to put specific capital in the project, but not interested in offering their own labor and incurring risk, as well as people, who do not have their own capital (or have insufficient capital to undertake the project), but willing to engage their work in the project and bear the risk in the case of its failure. The members of the first group are referred to as limited partners, and the second group of people – general partners.

The asymmetry of business risk is the most characteristic feature of a limited partnership. However, over the centuries, the role of a limited partnership has changed. Nowadays, this form of conducting business activity is mainly popular due to the possibility of optimizing the risk of activity and the level of its taxation.

According to entrepreneurs, economic activity should be characterized by two features: low risk and low taxation. Low risk is ensured by capital companies, where the liability of shareholders is limited to the amount of invested funds. Unfortunately, capital companies are connected with the necessity of double taxation of income. On the other hand, single taxation of income is possible in partnerships. However, in the majority of cases, partners in these companies are fully responsible for the company's obligations. A hybrid of advantages of a capital company and a partnership is a limited partnership, in which a capital company is usually a general partner (most often a limited liability company). It is a general partner with assets (and thus: the level of risk) that can be limited by setting the share capital at the level accepted by the partners.

In Poland, a limited partnership is obliged to keep accounting books, regardless of the size of its turnover. The limit of 2.000.000 EUR does not apply to this company (like in the case of, among others, unlimited companies or limited liability partnerships – UoR). Pursuant to the Polish Code of Commercial Companies, a limited partnership is established upon entry in the register. When taking advantage of the option of establishing a limited partnership via electronic means, it is a shorter period of time – however, in the case of a traditional establishment of a partnership (at a notary's office) at least a few weeks pass from the moment of concluding articles of partnership to the entry in the National Court Register. There is not limited partnership in organization. Therefore, accounting books of a limited partnership are opened with the date of its entry in the register – not with the date of concluding the articles of partnership.

The limited partnership agreement specifies the amount of a limited partner's liability and amount of partner's contributions. The limited partner's liability is the limit of the material liability of limited partners for the company's obligations. It is not included in the company's accounting books, because it does not entail (at least until the insolvency of the company) real cash flows. The case of contributions to a limited partnership is different. In the partnership agreement, partners define contributions, but there is no need to pay them at the time of concluding the articles of partnership. In practice, it turns out that the payment of contributions is often deferred. Such a situation is provided by specific regulations (the Code of Commercial Companies - CCC). They determine that the profit attributable to a limited partner for a given financial year is allocated (in the first place) to supplement his contribution (actually made) up to the value of the agreed contribution. In the event of the confluence of the company's formation and the payment of contributions, contributions are accounted as a share capital in the corresponding asset. However, posting of contributions to the share capital does not result from the legal provisions (due to the lack of CCC regulations in this respect – mentioned earlier), but it rather adheres to the principle of a true and fair image: the core capital constitutes a "founding" source of asset financing.

Another specific feature of a limited partnership is the method of settling accounts with partners. The limited partnership makes a profit. It is not a taxpayer of income tax, but its partners are taxpayers. Therefore, regardless of the transfer of profits to partners, they must pay appropriate income tax on the corresponding profits of the company: tax on natural persons or legal persons. Moreover, partners, who are natural persons, are obliged to pay social and health insurance contributions as entrepreneurs. This is related to the emergence of a demand for cash enabling at least the realization of these public law obligations. Furthermore, shareholders usually expect cash flows from the company in order to ensure its day-to-day functioning. However, the Code of Commercial Companies does not exclude the possibility of making advance payments for profit – it is a discretionary issue whether the payment of the advance is an activity that goes beyond the scope of company's ordinary activities (requiring a resolution of shareholders), pursuant to Article 121 § 2 of the Code of Commercial Companies.

The favorable method for the taxation of profits and the possibility of minimizing the risk of business activity cause that (nowadays) a limited partnership is a willingly chosen form of undertaking business activity.

The concept of hybrid capital

The concept of hybrid capital (also known as mezzanine capital), which previously was outside the area of accounting interest, is important for further considerations. In Polish literature, the concept of mezzanine capital is closely connected with obtaining financing sources constituting hybrid instruments. These sources represent both characteristics of equity and liabilities, so their use enables the optimization of the financing structure. The etymology of the term "mezzanine" comes from French and it literally means an entresol or a mid-floor – i.e. something in between. Therefore, the concept of mezzanine is used in corporate finance sciences. So far, it has not been clearly defined, but (in practice) it is used to identify various hybrid forms of financing. Thus, the mezzanine capital means forms of business financing covering different financial instruments with a mixed nature between equity and external capital. Instruments eligible for the mezzanine capital include, inter alia, subordinated loans, seller loans, profit-sharing loans, silent partnership contributions, owner loans, rights to participate in profits, convertible bonds and warrant bonds (Grzywacz, 2012).

The considerations concerning the mezzanine financing found in Polish literature focus their attention on the advantages of this capital as a form of financing that combines the advantages of equity and external capital. It is emphasized that mezzanine is more convenient and more accessible than traditional financing. Furthermore, it enables the financing of enterprises with increased risk. Mezzanine instruments create a capital relationship and (at the same time) enable to use the financial leverage (Juszczyk, Nagórka 2009). Other benefits of the mezzanine capital, such as: filling the capital gap, dual character of financing, increase in creditworthiness, incurring tax costs, flexibility, risk distribution or increase in financial liquidity, as well as its disadvantages (relatively high cost, limited availability and increased scope of control) are also analyzed (Grzywacz, 2012).

However, it is worth paying attention to the mezzanine capital from the perspective of accounting. The concept of mezzanine means the introduction of another element to the structure of liabilities (including forms of financing that are clearly neither equity nor external capital). So far, authorities developing accounting standards or legal acts regulating its problems have not decided to take such a move. However, along with the development of these forms of financing, it may be necessary to ensure the reliability of the financial statement.

All instruments with characteristics that combine equity and external capital could be presented as the mezzanine capital (or hybrid capital) – in accordance with the structure of liabilities presented in Figure 1.

Assets	Equity	
	Mezzanine capital	Instruments with characteristics of equity and external capital
	Liabilities (external capital)	
	Other items of liabilities, e.g. reserves	

Fig. 1: Mezzanine capital in the structure of liabilities in the balance sheet.

Source: Own study.

Undoubtedly, the introduction of such a structure of liabilities would increase the credibility and usefulness of the financial statement – thanks to the avoidance of simplifications connected with the unambiguous assignment of hybrid instruments to equity or external capitals. It would enable to comply with the following accounting principles: materiality, reality over appearance, precautionary. On the other hand, specification of the hybrid capital requires additional work of the company's financial and accounting personnel, as well as the special attention of auditors, who examine a financial statement. Therefore, in the further part of the study, the author tries to justify the need to specify the hybrid capital based on the implementation of the principle of materiality in accounting.

Data and Methodology

As stated in the previous section, the hybrid capital is a structure enabling a more complete presentation of the specificity of capital in partnerships, including limited partnerships. Undoubtedly, the introduction of the principles of recording, estimation and disclosure of hybrid capital to the accounting policy will generate additional operating costs of the accounting system, including the preparation and evaluation of financial statements. Therefore, it is important to determine whether there are any reasons for making this effort – in other words, whether the hybrid capital is a significant source that may affect the assessment of the entity's condition?

In order to answer this question, it is necessary to examine the scale of the phenomenon of using limited partnerships. These considerations are based on macroeconomic data for the Polish market and own research carried out on a sample of 381 Polish companies conducted in the form of limited partnerships.

The purpose of the study conducted for the needs of this article is to determine the attractiveness of the legal form of a limited partnership for the purposes of conducting business activity under the conditions of the Polish legal system and the significance of potential information gaps arising as a result of applying simplifications in the preparation of a financial statement determined for partnerships. Consequently, the study was divided into two stages:

- Determination of the change in the attractiveness of this form of business among Polish entrepreneurs,
- Examination of the materiality of a potential information gap.

The following analysis is based on source data collected and prepared by the Central Statistical Office in Poland (GUS) within the framework of the primary research under the name "Structural changes in groups of entities of the national economy in the REGON register, 2018" (published in 2019), "Activities of non-financial enterprises in 2018" (published in 2020), "Groups of enterprises in Poland in 2018" (published in 2020) and own calculations.

Moreover, the study presents an analysis of national economy entities in the REGON register with specification of the number of newly registered and deleted entities (according to selected features, including legal forms, covering the years 2009-2018).

Finally, the collected data for the entire economy was confronted with the results of own research conducted on a representative group from the population of 40,850 limited partnerships conducting business activity in Poland. The size of the research sample from the entire population was determined on the basis of the assumption of a 95% confidence level and the size of the fraction of 0.5. Additionally, a maximum error of 5% was adopted. Consequently,

the sample size accepted for the study was 381 companies. Data on individual companies was obtained from the website of the Polish National Court Register. The selection of units for the sample was performed using simple random selection.

Results and Discussion

Polish entrepreneurs acquired full freedom in the field of shaping their economic projects along with the economic and social transformations in the early 1990s. During this period, the process of searching for optimal forms of company organization also began. This process continues to this day. This thesis may be confirmed by the data complied by the Polish Central Statistical Office, showing the continuous increase in the number of registered enterprises.

Fig. 2: Number of entities registered in Poland (in thousands).
Source: Own research based on (GUS, 2019).

Despite the fact that over the decade there has been no significant change in the number of entities operating within the Polish economic area, the number of entities has been systematically growing – starting from approx. 3.7 million entities (at the end of 2009) to approx. 4.3 million entities (on the last day of 2018).

Along with the growing number of enterprises in the analyzed period, the share of non-capital units operated by natural persons also increased.

Fig. 3: The share of enterprise organization forms in Poland.
Source: Own research based on (GUS, 2019).

As mentioned above, limited partnerships in the Polish nomenclature are included in the group of individuals. Therefore, the trend of doing business in this form should be examined. Further analysis of the data prepared by the statistical office indicates that this form has been gaining popularity in recent years. This trend is showed in the next chart.

Fig. 4: The share of limited partnership forms in the structure of Polish companies.
Source: Own research based on (GUS, 2019).

The total number of limited partnerships and limited joint-stock partnerships increased from approx. 6 thousand entities (at the end of 2009) to 40 thousand entities (on the last day of 2018). In other words, the attractiveness of this form of business activity in Poland is so large that the increase in this type of companies amounted to over 650% in the years 2009-2018.

In summary, it can be stated that the interest in using the form of a limited partnership to conduct business activity in Poland has systematically increased in recent years. Unfortunately, as noted in the previous part of this study, this form (as a partnership) is not subject to such strict regulations in the field of disclosure of information. Due to this fact, entities decide on numerous simplifications. Data aggregation also covers the sphere of the individual's capital and (thus) makes it impossible to reveal the real image of enterprises. At this point, the key question is whether the scope of this data is large enough to be considered as material.

The data collected by the central statistical office shows that at the end of 2018 (the last fully audited period) the total value of equity of entities keeping the accounting books amounted to 524 818,1 million PLN (with the structure presented in the diagram below).

Fig. 5: Value of equity of enterprise groups in 2018.

Source: Based on GUS 2020b.

According to the same study, the share capital of companies totaled 152 750,6 million PLN – i.e. the remaining equity capital amounted to 372 067,5 million PLN. As you can see, the value of other capitals exceeds the value of core capitals. Therefore, it should be determined whether they ought to be subject to further division, including with the use of the concept of hybrid capital. Therefore, the materiality level of the data in macroeconomic terms should be determined.

In accordance with the previously presented principles, the materiality would have values (GUS 2020a):

- from 0.5% to 3% of revenues – i.e. from 24 778,68 million PLN to 148 672,11 million PLN (with total revenues of non-financial companies amounting to 4 955 737 million PLN),
- from 1% to 2% of equity – i.e. from 5 248,18 million PLN to 10 496,36 million PLN,
- from 0.5% to 3% of the balance sheet total – i.e. from 6 064,96 million PLN to 36 389,76 million PLN (with a balance sheet total of companies amounting to 1 212 992,3 million PLN),
- from 3% to 7% of the gross financial result – i.e. from 1 611,11 million PLN to 3 759,26 million PLN (with the total gross result for entities amounting to 53 703,8 million PLN).

Taking into account the above calculations, it should be concluded that the cognitive gap in the amount of 372 067,5 million PLN ought to be considered as material, because it exceeds all limits (possible to determine).

However, it should be considered whether the same conclusions can be extrapolated to limited partnerships. For this purpose, an own study was carried out to examine the significance of the information gap in the group of limited partnerships. The analysis consisted in determining the average value of the cognitive gap based on a research sample of 381 units from the group of Polish limited partnerships amounting to 40 850 entities. The study compiled the balance sheet total, equity and share capital. Then, the absolute value of the information gap in the companies' capitals and the ratio of its size to the value of the total assets were calculated. The last stage was to determine the weighted average share for the tested sample, where the weights were the values of assets of individual companies. Finally, the information was obtained according to which the ratio of the absolute value of the information gap to the value of the balance sheet sum is 27.28%, which, in accordance with the adopted methodology, may be considered as the level exceeding the significance mark.

Therefore, limited partnerships, which are entities with an attractive legal form, should detail their financial statements in terms of equity. As indicated earlier, the hybrid capital is an element that can captures the characteristics of capitals in partnerships (including limited partnerships), so it should be a natural choice in the scope of information gap's liquidation.

Conclusion

As shown in this article, a limited partnership is becoming an increasingly popular form of doing business. Legal regulations in the field of accounting, as well as the literature, do not devote sufficient attention to limited partnerships or other partnerships. Issues connected with, among others, the recognition gap in accounting books and the presentation of equity in the financial statement, including the hybrid capital, remain unregulated.

The aim of the article was to present arguments that justify the introduction of hybrid capital in limited partnerships' financial statements. In connection with this goal, the article presents the most important areas concerning the characteristics of limited partnerships and hybrid capital (taking into account its position and materiality in the entity's balance sheet). Finally article presents numerical arguments confirming the significance of information gaps in the area of an entity's capital. Thus, the discussed hybrid capital can be effectively used to present a true and fair view of the enterprise.

Abstract

Ecological awareness of the new generations plays a major role in forming their social and business attitudes. Moreover, it has a significant role in their decision-making process, concerning the youth's business development through entrepreneurship. The characteristic features of today's generations are object of numerous studies, but they are mainly focused on the generation Y while the generation Z remains insufficiently studied. This is especially true for the post-communist countries. So far there is a lack of comparative studies on the ecological awareness and entrepreneurial attitudes of Generation Z from these countries. The aim of this research is to conduct a comparative study of the ecological awareness and entrepreneurship attitudes of Generation Z in three Middle- and Eastern-European countries (Poland, Bulgaria and Ukraine). The research finds that Generation Z representatives, in all three countries, pay attention to the pro-ecological idea, although - with varying degree of awareness. There is a strong bond between their ecological awareness and the level of their intention to establish a pro-ecological restaurant as a start-up. However, a difference could be seen among the representatives of the three countries studied. This paper could be used for further studies and comparative analyses of the pro-ecological and entrepreneurship attitudes of Generation Z representatives.

Keywords: Generation Z, Pro-Ecological Behaviour, Ecological Awareness, Entrepreneurship.

Introduction

Young people are more and more important segment of the labor market. At the same time, the question of sustainable development is a significant notion in the development of the modern society (Tzschenke, Kirk, Lynch, 2004), and it has become an important topic of analyses (Berezan, Milar, Raab, 2014). A key aspect of the modern industry is ecology and care for environment, which in many places is endangered by the excessive development of some nature polluting productions. Ecological awareness of the new generations plays a major role in forming their social and business attitudes. It is the green concept itself that is identified as one of the most crucial tasks facing the nowadays industry (Han, Kim, Kiatkawsin, 2017), and its dynamic growth inevitably means high impact on the environment (Rosa, Silva, 2017). Another important issue is to outline the role of this ecological awareness in their decision-making process, concerning the youths' future business development through entrepreneurship. According to Machnik-Slomka and Klosok-Bazan (2017), strong ecological awareness influences the system of values and forms eco-friendly attitudes and behaviors of entrepreneurs. Also, entrepreneurs with ecological awareness are not afraid of taking up ecological challenges, which has an impact on improved business competitiveness (Machnik-Slomka, Klosok-Bazan, 2017).

Some authors analyzevarious age groups which determine the demand on the global markets, as well as the ecological attitudes of these groups. One of such groups of ever increasing importance is the group of young people, born between 1995 and 2010, the so called Generation Z. The characteristic features of today's generations are object of numerous studies, but they are mainly focused on the generation Y (Buffa, 2015; Jang, Kim and Bonn,

2011) while the generation Z remains insufficiently studied. This is especially true for the post-communist countries. So far there are no comparative studies published on the environmental awareness and entrepreneurial attitudes of Generation Z representatives from these countries.

The aim of this research is to conduct a comparative study of the ecological awareness and entrepreneurship attitudes of Generation Z in three Middle- and Eastern-European countries: Poland, Bulgaria and Ukraine.

Literature Review

The Generation Z – general characteristics

It is well known that a generation is a group that shares mutual birth year, vital events and similar behavior patterns within these events. As some authors (Marshall, 1999; Delahoyde, 2009; Chen, 2010) precise, each generation consists of individuals, born in the same period and affected by the same economic, technological and political conditions, sharing similar values, behavior and lifestyles.

Most of the authors define the Generation Z as people born between 1995 and 2010 (Lazanyi, Bilan, 2017; Vallone et al., 2016; Ivanyi, Biro-Szigeti, 2019). Oblinger and Oblinger (2005), state that Generation Z is surrounded by digital technology from their birth in the digital era. Therefore, this generation is also called internet generation. They have the highest motor skills synchronization.

Since they have the opportunity of long distance communication, they can, they do, and they will probably continue to live alone. It is expected from them to be highly qualified and inventive. At the same time, the literature accentuates the need for studies concerning the behaviors of the representatives of different generations (Li, Li, Hudson, 2013). Some of the analyses point out the fact that the young people from Generation Z are independent (Desai, Lele, 2017), expect fast access to information and instant answers to their questions (Opis, Cenusa 2017). This should be seen as an important premise for the employers who are responsible for communication with the young ones. This generation is characterized as more online than offline (Hamed, 2017; Ip, Lee, Law, 2012; Rudez and Nemec, 2015). Another characteristic feature is their use of smartphones to gain access to the internet (87% of them) when compared to older generations (Ivanyi, Biro-Szegedi, 2019).

The environment and the need to protect it have been named as one of the main factors determining the behavior patterns of nowadays generations, which affects their ecological and business/entrepreneurship attitudes. Moreover, the significance of this factor is still rising (Dwyer et al., 2009). As early as in 2010, over 60% of Europeans voiced their concerns about air pollution and 50% feared the negative impact of food on health (Food-related risks, EC, 2010). It is observed that a lot of people implement often radical changes to their lifestyles in order to limit the impact on the environment (Bostrom, Klintman, 2011; Zalejski, Faszczewska, 2012). Sidali, Huber and Schamel (2017), in turn, present an analysis revealing the different attitudes to the ecological issues depending on the respondents' age. Other sociological factors such as sex, level of education or level of income do not seem to generate any significant differences. Hence, it is worthwhile focusing on specific age groups, including the Generation Z. Han et al. (2017) present results, showing that young people do care about the environment and are eager to undertake pro-ecological actions. For example, in Poland it is the young who are most committed to pro-ecological actions (Zalejski, Faszczewska 2012).

Ecological awareness of Generation Z

Nowadays youth behavior is strongly influenced by environmental or "green" values. According to Doszhanov and Ahmad (2015) and Mohd (2013) these values influence their needs and attitudes. 'Green'-oriented persons are usually defined as individuals who apply everyday practices that are viewed as environmentally-friendly (Connolly and Prothero, 2008), prefer organic food and pro-ecological restaurants.

In the widest sense the 'green'-oriented person is one, who is interested in the environment and implement green practices at home (Di Pietro et al., 2013). According to Han et al. (2011) they are mid to high income earners, female and youths (Baltescu, 2017). This trend results in a new market - with an environmental conscience and new competitive advantages for the companies. In the same time, rising environmental and health concern about the

current global industry has contributed to increasing number of young people considering the ‘‘eco-friendly’’ life as value (Mohd, 2013). Baltescu (2017) surveys 264 students in Brasov. The results show that 95% consider themselves as highly environmentally concerned, while at the same time, only 34% were aware of establishing pro-ecological restaurant as a sign of ecological awareness. To young adults, an ecofriendly restaurant attributes are: use of renewable energies, attention to the use of ingredients, avoiding of frying procedures, and the use of organic ingredients (Baltescu, 2017). Jang et al. (2011) defined a pro-ecological restaurant as one that implements green practices. According to some authors, green practices that can be widely applied in restaurant businesses include employing energy- and water-efficiency equipment, using locally-grown and organic food, offering healthy menus, forbidding disposable cups and to-go containers, training employees to adopt green practices, recycling and disposing of cooking oil, and reducing pollution (Gázquez-Abad et al., 2015; Schubert et al., 2010).

The demand for environmentally friendly practices has risen quickly over recent decades. Establishment of new environmental regulations has increased individuals’ environmental awareness. A study conducted by Harris Interactive (https://harris-interactive.co.uk/) shows that 63% of consumers would spend more for organic food or locally grown food. That’s why increasing consumer interest in eco-friendly food caused a number of changes to the restaurant industry. There are lots of studies pointing out Generation Y consumers’ behavioral intentions concerning green restaurants (Yoon et al., 2011), but studies for Generation Z are yet insufficient. That’s why, it is worthwhile to conduct more studies about the so mentioned subject.

Generation Z Entrepreneurship Attitudes

It is well known that workplace consists of a mix of multiple generations of employees whose experiences have molded them into individuals with characteristics defining their generation. These generations have different behavioral characteristics that define their expectations and preferences at the workplace. The diverse profiles of various generations demand an environment in which all the generational age cohorts will thrive in the workplace (Otieno and Nyambegera, 2019). Typical features of Generation Z are: self-confidence, proactivity, creativeness, innovativeness, leadership. They want to guarantee their future. Happiness is very important on the business area. If they cannot find this happiness on the work place, they will quite the job easily. They do not like authority and don’t have any significant relation with age groups. There is no difference for both man and woman relevant with it (Ozkan and Solmaz, 2015). Considering these features of Generation Z, it could be suggested that they will prefer to establish their own business rather being employed.

Jenkins (2019) points that some of the characteristics, behavioral traits and entrepreneurship attitudes of the post millennials (Generation Z) are:

- Working habits of Generation Z include: “do it yourself” approach, hard work and pragmatic mindset;
- Generation Z gravitates towards global communication and collaboration across virtual platforms;
- Generation Z is quick to adopt new communication channels and prefers real-time, transparent, and collaborative digital communications;
- Generation Z has developed a much higher instinctual relationship with technology and the increasingly interconnected world shifts their expectations for how work can and should be executed;
- Generation Z are self-starters, self-learners, and self-motivators seeking swift impact at work;
- Generation Z place a premium on entrepreneurship and innovation.

Since they are born in the digital age, they are not that good in communication skills (Ensari, 2017). The summarizing all these characteristics of Generation Z confirms the idea that they will be more oriented towards self-employment rather than being hired as employees.

Methodology

In order to gain more precised perspective on ecological awareness and entrepreneurship attitudes of Generation Z, for the purpose of this study a comparative analysis is carried out. The analysis includes groups of university students in three Middle- and Eastern European countries: Poland, Bulgaria and Ukraine.

Sample and Data Collection

The study took place in the period November 2019 - April 2020 and included a group of Generation Z representatives (born between 1995 and 2010) in three Middle- and Eastern European countries: Poland, Bulgaria and Ukraine. Having in mind their age, it was considered appropriate to hold it among university students. The survey is addressed to 18-26 years old respondents at University of Social Sciences - Lodz (campus Warsaw, Poland), and University of Economics - Varna, Bulgaria (Bachelor and Master degree students). 600 questionnaires were distributed, as 55 of them were incomplete or invalid. 545 questionnaires were processed (195 Poles, 204 Ukrainians and 146 Bulgarians).

Questionnaire Development

Questions to be answered by respondents were established in accordance with the social research methodology aimed at limiting the interviewer's influence (Babbie, 2008). The respondents' knowledge of the issue also allowed questions to be predicted about future behavior and motivations (Schwarz, 2007). The survey questionnaire consisted of 7 questions. All the answers were measured using a nominal scale.

Data Analysis

The statistical analysis procedures used in the research are descriptive statistics as well as factor analysis. First, descriptive statistics such as simple frequencies and average values were used. Then analyzes were made detailing socio-demographic characteristics, as well as international comparisons.

The comparative analysis used in the article is an element of the study consisting in listing objects distinguished due to a common factor and observation of other differentiating aspects. The differences in the perception of eco food and eco business revealed as a result of the study have revealed the specifics of perception of this industry in different countries.

Results and Discussion

Respondents' Profiles

According to gender criteria, out of 545 respondents, 361 are female and 184 - male. Among the different nations included in the research, the percentage between male and female respondents is as follows (table 1):

Table 1: Respondents based on gender

Gender	Ukrainians	Poles	Bulgarians
Female	70%	59%	69%
Male	30%	41%	31%

Source: own research

More women than men took part in the study. The largest percentage of women can be found in the group of Ukrainians (70%) and Bulgarians (69%). In the case of Poland, the proportion was 59% to 41%.

People between18-26 is considered as Generation Z. In according to this, and the age criteria, 156 of the respondents are 18-20 years old, 248 of them are 21-23 years old, and 141 are 24-26 years old. Table 2 shows the distribution of the respondent groups by age and nationality as follows:

Table 2: Respondents by age

Age	Ukrainians	Poles	Bulgarians
18 – 20 years old	54%	23%	1%
21 – 23 years old	38%	51%	48%
24 – 26 years old	5%	26%	51%

Attitudes towards pro-ecological actions in the everyday life

Environmental values and pro-ecological actions are suggested as a main part of planned behavior of young people (Kaiser, Wolfing and Fuhrer, 1999). Some regular everyday activities could be a measure of their ecological awareness and behavior. According to the conducted research, as much as 62% of Bulgarians believe that the ecological behavior is important and they always pay attention to the eco-friendly actions. In this case, only 22% of Ukrainians, and 12% of Poles surveyed said that they always pay attention to it. This is shown in Table 4:

Table 4: Attitude towards pro-ecological actions

Attitudes towards Pro-ecological actions	Ukrainians	Poles	Bulgarians
it is important, I always try to act in line with ecology	22%	12%	62%
I try to act according to ecology, but I do not always succeed	64%	67%	38%
I'm indifferent	7%	13%	0%
I follow the rules of ecology only as long as it is in line with my interest	5%	7%	0%
It is a waste of time	2%	1%	0%

Source: own research

The results show that young people, in all three countries, pay attention to the pro-ecological idea but with varying degree of awareness. The fact that all respondents from Bulgaria indicate the first or second answer is a sign of a naive attitude, rather than of strictly following the ecological way of life. The concept of ecological lifestyle is relatively new to the Bulgarian society and is not yet deeply adopted by the young people there. Among the Ukrainians and Poles surveyed, the largest is percentage of the respondents who try to act according to the ecological idea but do not always succeed, which is much more reliable. For Bulgarians it is approximately one third of the respondents. 13% of Poles and 7% of Ukrainians surveyed are indifferent and 1% of the Poles and 2% of the Ukrainians say that, being pro-ecologically oriented is a waste of time. It is disturbing that more than 8% of all respondents are still not aware of the importance of pro-ecologically oriented lifestyle. On the other hand, they are still young and it could be presumed that in nearest future they may become more ecologically oriented.

The answer "I follow the rules of ecology only as long as it is in line with my interest" was indicated by 7% of Poles and 5% of the Ukrainians. This position reveals selfish-oriented values. Even such a widely spread idea such as the ecological concept is not able to change their value system and behavior yet.

Some early studies (Kaiser, Wolfing and Fuhrer 1999), on environmental attitude and ecological behavior, state that individual behavior is more important and could affect the environment rather than the behavior of the whole society. Individuals' every day's actions and practices contribute towards environmental preservation.

In order to indicate what the respondents' everyday life related to environmental protection is, they were asked what activities and behaviors they perform. Table 5 presents the results referring to measures: definitely yes - 0, rather yes - 1, rather not - 2, definitely not – 3. According to the respondents' answers, the most frequently implemented action among Ukrainians is to take the empty glass bottles to recycle-collection point; to avoid plastic packaging and to use biodegradable packaging. Among Poles, sorting garbage and switching off lights are the most important things. Also they usually use own shopping bags in order to avoid disposable plastic one. It is well known that they are non-degradable and are considered as one of the biggest environmental threads. In the case of Bulgarians, the most common form of pro-ecological activities is also delivering empty glass bottles to recycle / collection point, to carry own shopping bag, and sorting of garbage.

Table 5: Everyday ecological behaviors implemented in respondents' life

Everyday behavior	Ukrainians	Poles	Bulgarians
I sort my garbage	1,58	1,14	1,92
I save water cutting down its use	1,52	1,26	2,38
I carry my own shopping bag so that I don't need to buy disposable plastic ones	1,69	1,20	1,66
I use biodegradable bags	1,12	1,31	2,82
I save electricity cutting down its use	1,68	1,36	2,58
I try to buy and eat healthier foods	1,89	1,47	2,66
I pay attention/react to unnecessarily switched-on light	2,42	1,19	2,49
I take empty glass bottles to recycle/collection point	0,52	1,93	1,65
I avoid plastic packagings	0,9	1,65	2,65

Source: own research

The results in Table 5 indicate that for the different nations the same everyday activities have different impact to their ecologically oriented lifestyle. It could be suggested that there is still no generally accepted idea for ecological behavior by the studied countries.

In 21st century, young people adopt a leading role in achieving a sustainable future. According to Valente and Atkinson (2019), they are the next group of business-thinkers and decision makers. In regard to this, a question was set in our survey: "Does the establishment of restaurants following a pro-ecological policy support the idea for ecologically oriented business?" The results are presented in Table 6:

Table 6: Does the establishment of restaurants following a pro-ecological policy support the ecologically oriented business

Possible answers	Ukrainians	Poles	Bulgarians
Definitely yes	22%	18%	95%
Rather yes	48%	52%	5%
No opinion	22%	16%	0%
Rather not	7%	12%	0%
Definitely not	1%	2%	0%

Source: own research

Less than 10% give a negative answer, while 78% are confident that implementing these practices can help for cleaner nature. Presented by nations - 70% of the Poles, 70% of the Ukrainians, and all of the Bulgarians support this idea. Our findings confirm the survey results of Bell and McMinn (2011) that Generation Z agrees that business should obtain sustainable business practices, regarding social and environmental matters.

According to Frunzaru and Cismaru (2018) the concept of entrepreneurial orientation is related to the theory of planned behavior. They state that behavior is a function of believes, relevant to the behavior. For Generation Z the psychological approach to entrepreneurship could be related to their need for reaching their own business success, high social status, or to the importance of the family tradition in business. In order to study if the ecological awareness is related to entrepreneurial intentions of Generation Z representatives, a question whether they would like to establish pro-ecological restaurant was asked. The results are presented in Table 7:

Table 7: Intentions for establishing a pro-ecological restaurant as a start-up for own business

Possible answers	Ukrainians	Poles	Bulgarians
Definitely yes	18%	9%	60%
Rather yes	43%	18%	39%
No opinion	17%	23%	1%
Rather not	16%	33%	0%
Definitely not	6%	17%	0%

Source: own research

The results show that 26.2% of all the respondents answer “definitely yes”, as in this quota prevail the answers of the Bulgarians (60% of the Bulgarian respondents). 33% of all answers are “rather yes”. In this case prevailing is the quota of the Ukrainians (43% of the Ukrainian respondents). Almost 60% of the young people belonging to Generation Z, included in the survey, have entrepreneurial intentions and would start their own business (answers “definitely yes”, and “rather yes”). The biggest is the share of the Bulgarians, followed by the Ukrainians, and the Poles. It is difficult to define the exact reason for these results. Nevertheless, it could be suggested that most of the young Bulgarians believe that through establishing their own business they could gain financial independence and self-managed professional development. 26% of the respondents are not interested in establishing their own pro-ecological restaurant, at the same time, 14.8% state that they have no opinion.

Conclusions

Summarizing the results of this study, Generation Z’s representatives (nevertheless the nationality) show a high level of ecological awareness. In their everyday life they implement pro-ecological activities. It reveals their commitment to the ecological concept and environmental protection. This attitude affects not only their way of thinking but also their intentions for establishing self-business.

The research found that Generation Z representatives, in all three countries, pay attention to the pro-ecological idea, although - with varying degree of awareness. For the young people of the three nations, presented in the study, the same everyday activities (sorting garbage, saving water, using bio-degradable bags, avoiding plastic packaging etc.) have different impact to their ecologically oriented lifestyle, but they do apply them.

Almost 75% of the respondents estimate higher the value of restaurants following a pro-ecological policy which highlights their ecological consciousness regardless of nationality, and consider it as a competitive advantage. There is a strong bond between their ecological awareness and the level of their intention to establish a pro-ecological restaurant as a start-up. However, a difference could be seen among the representatives of the three countries studied. A large number of respondents representing Generation Z believe that such restaurants could help to protect the environment. We can conclude that their entrepreneurial attitudes are strongly bound to their environmental awareness.

Limitations of the research are: all respondents are university students only; the study concerns entrepreneurial intentions but not readiness for business start-up; there is lack of prior researches on this topic in the three Middle-

and Eastern European countries (Poland, Bulgaria and Ukraine), and it makes impossible to compare our findings to previous results.

cmc.catalin02@gmail.com

Abstract

The realization of a modern and extended irrigation system to irrigate larger agricultural areas is necessary due to the conditions faced by the Romanian regions in terms of weather factors but must be done in a responsible and efficient manner that will lead to a development of the Romanian agricultural sector. Accelerate the adaptation of irrigation infrastructure to the needs of farmers to reduce the vulnerability of agricultural production to external climatic factors and develop economic viability for farms by ensuring a socio-economic balance while ensuring environmental protection. Rural development contributes to regional development and reducing interregional gaps. In Romania, agriculture is a common activity in the lives of people in rural areas, so this paper aims to highlight the importance of a well-developed irrigation system in the context of agriculture's dependence on weather conditions. Agriculture recorded a significant increase in production in the period 1997-2019 due to research, development and innovation in the field, but continues to be an activity largely dependent on nature.

Keywords: Competitiveness, Economic Growth, Irrigation Infrastructure.

Introduction

Regional development is a complex process that combines the harmonious development of all areas of a country in order to ensure a relative balance between levels of social and economic development of areas and reduce territorial disparities, all taking place in the context of environmental protection and of efficient management of natural resources. (Istudor, 2006)

In 1998, the legal framework for its development was established, by Law 151/1998 on regional development in Romania, through which the content of the regional development was outlined, the legal support for the constitution of the development regions was created. These development regions are set up based on the existing system at Community level, is the classification system of NUTS territorial units, being NUTS II level. (Bomher, 2011)

The agricultural sector plays an important role in regional economic development, showing stability in the face of the crises we face. Agriculture is a field that is greatly influenced by climate change, and any change and extreme weather phenomenon brings major damage to farms, adapting to the effects of climate change by preventing and reducing their impact being essential for the development of the agricultural sector. (Howden et al., 2007) The importance of irrigation denotes that water is a component that cannot be missing from agriculture, being a vital element for any type of agricultural production, and an efficient irrigation system contributes to the adaptation of the agricultural sector to climate change.

Water is a vital natural element for life, both for humanity and for the environment and water resources must be protected and consumed responsibly, always considering the sustainability of water resources. For the agricultural sector, water is a primary resource with an enormous influence on agricultural production and Food and Agriculture

Cite this Article as: Ioana PANAIT and Marian Catalin CUCU "Romania's Regional Development by Supporting the Agricultural Sector - Irrigation System Influencing Factor" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Organization (FAO) stating that "A reliable and adequate water supply through irrigation can lead to improvements in agricultural production and ensure the economic vitality of farmers."

The irrigation infrastructure is an important component from an agribusiness and aims to ensure the necessary water to combat the negative effects of drought, ensuring the farmer the right conditions for a good harvest and generating significant agricultural income. (Gohar et al., 2015) Through a well-developed irrigation system in terms of its length and the appropriate arrangement to cover all regions of the country, it is intended, first of all, to ensure the necessary water for plants to obtain high yields, and secondly, through irrigation it contributes to the conservation of biodiversity and the rational management of water resources. From an economic point of view, irrigation systems must be designed to maximize efficiency and minimize labour and capital requirements. (Walker,1989)

The choice of an appropriate irrigation system must consider the compatibility between the irrigation method and the irrigated culture, but also the main characteristics of the agricultural holding, such as topographical characteristics, soils, water supply, crops while the socio-economic aspects are taken into account, such as the community and the economic viability, but also the environmental aspects that must aim at the protection of natural resources.

Methodology

The methodology of the paper consists in quantitative statistical analysis based on statistical data in absolute values are from the National Institute of Statistics Romania (NIS). An index of agricultural production calculated based on the production of the current year expressed in the prices of the previous year and the value of the production of the previous year was also analyzed.

Based on the analyzed data, the results obtained contribute to the identification of the situation of the eight development regions of Romania and the evolution of the main indicators of agriculture to determine the degree of competitiveness between the Romanian regions through the contribution of agriculture and especially by the irrigation system to regional development.

Analysis of the regional development in Romania regarding the vegetal agricultural sector

Analysing the value of the total production both at the country level and at the regional level in table no 1, in the period 1997-2018 a significant increasing rhythm is found, interspersed with small oscillations of the value from year to year.

Table 1: The value of vegetable agricultural production in the regions of Romania

U.M.: Millions RON

Year	Bucharest-Ilfov	Center	West	North-West	South-East	South-Muntenia	South-West Oltenia	North-East

Source: NIS

At the country level, Romania registered a constant growth in the period 1997-2004, starting with 2005 there were small oscillations but keeping the same upward trend. Reporting the year 2018 to 1997, Romania registered an increase of the value of the vegetal agricultural production of 1239 percentage points.

Comparing in terms of value the regions between them, we find that the lowest contribution to the total value of national agricultural production has the development region Bucharest - Ilfov, which is due to the much smaller agricultural area compared to other regions. In the period 1997-2018, the largest contribution to the value of national agricultural production was made by the South-Muntenia development region with an annual average of RON 6,444 million, followed by the South-East region, the North-East region, and the North-West Region. This is due, first, to the large agricultural areas found in the regions listed above.

Following the analysis from table no 2 of the indices of vegetal agricultural production, the oscillation of each region is highlighted from year to year and at the same time the dependence of this branch of the economy on certain external factors.

Table 2 : Indices of agricultural production made by the regions of Romania

The agricultural production index shows the evolution of each year compared to the base year (previous year), and the highest index was registered in the Bucharest-Ilfov Region in 2004 (164.2%), in the Centre Region in 2001 (127 , 6%), in the North-East Region in 2008 (143.8%), in the North-West Region in 2001 (132.3%), in the South-East Region in 2013 (152.3%), in the South-Muntenia Region in 2008 (167.1%), in the South-West Oltenia Region in 2008 (177.7%) and in the West Region in 2001 (154.3%).

These record values recorded over time are largely due to unfavourable weather conditions (drought) recorded in the previous year, leading to low yields and therefore significant differences from one year to another. In addition to weather conditions, agricultural production is directly influenced by factors such as low mechanization of farms, agro-chemical use, excessive land fragmentation which has led to a large number of farms, lack of financial resources that limit investment.

Analysing the production per hectare of the most common field crops in Romania, we see in table no. 3 an upward trend in the analyzed period 1997-2019, but with oscillating values in terms of analysis of each year compared to the previous year. Reporting the year 2019 to the base year 1997 it is found:

The Bucharest-Ilfov region recorded increases in production per hectare of: 33% among corn crops, 70% for wheat crops and 125% in terms of sunflower crops. The Central Region recorded increases of 83 percentage points among maize, 44 percentage points for wheat and 131 percentage points for sunflower. The Western Region saw an increase of 112% for maize, 83% for wheat and 305% for sunflower. The North-West region increased by 100 percentage points for maize, 57 percentage points for wheat and 242 percentage points for sunflower.

Comparing the 4 regions analyzed above, we notice the fact that the highest increase in terms of production / ha for the analyzed crops is registered in the Western development region.

Following the analysis of the table no. 4 that reflects the production per hectare of the South-East, South-Muntenia, South-West Oltenia and North-East development regions in the period 1997-2019, an ascending trend of all productions is found again, interspersed with small oscillations from year to year. Reporting the year 2019 to 1997 we find:

The South-East region recorded an increase in production of 23% among maize crops, 44% among wheat crops and 123% among sunflower crops. The South Muntenia region registered an increase of 47 percentage points for maize cultivation, 60 percentage points for wheat cultivation and 129 percentage points for sunflower cultivation.

The South-West Oltenia region registered an increase in production per hectare by 26% in terms of corn cultivation, 58% for wheat cultivation and 189% for sunflower cultivation. The Northeast region saw an increase in corn cultivation of 69 percentage points, among wheat cultivation of 56 percentage points and 100 percentage points for sunflower cultivation.

All the indicators analyzed above show us the upward trend of Romanian agriculture due mainly to the development of agricultural research and innovation, but the oscillations recorded from year to year of each region show its dependence on certain factors and the most important factor the influence is represented by the meteorological conditions characteristic of each year, but also of the poorly developed irrigation infrastructure, the low degree of technical endowment, the degree of chemicalization which is an intensive one.

Improving the Irrigation System in Romania To Increase Regional Competitiveness Through Agriculture

The creation of a complex and efficient irrigation system leads to an agriculture less dependent on the meteorological conditions, therefore constant productions can be achieved, diminishing the possibility of regional gaps in the agricultural sector.

The Irrigation System

The irrigation infrastructure is a complex system that consists of pumping stations, pumping stations for lifting water on terraces and networks of canals that transport water to water supply points that are represented by farms. (Angelakıs et al, 2020)

Eurostat defines the Agri-environmental indicator – irrigation to provide plants with sufficient water to obtain optimum yields and a high-quality harvested crop. Irrigation is essential in dry climates where precipitation is not sufficient for plant growth. Reddy (2016) considers that supplemental irrigation is also vital to produce high levels of quality and yield of crops on croplands in semi-arid and sub-humid climates during dry seasonal periods and drought spells where otherwise farming would not be economically viable. Irrigation water use is a major driving force behind water abstraction globally.

Given the importance of irrigation and drainage in the production process of crops, the development of irrigation capacity and the increase of irrigated areas are essential for the development of agriculture to be able to ensure quality production and high yields.

Lack of irrigation in times of drought leads to economic losses because crop yields will decline, this being an immediate, short-term effect but in the medium and long term some natural factors are affected, such as soil and microorganisms. By the uniform application on the agricultural surface of the quantity of water in the form of irrigations, the entire necessary water for the production process of the plants is ensured, which will later influence the yield and quality of the products. (Rey et al., 2017) On the other hand, if not properly applied, irrigation can lead to over-abstraction of groundwater supplies, secondary salinization and to pollution of water by nutrients, pesticides, and other farm inputs. (EC, 2012)

For the sustainability development of agriculture, farmers by using irrigation must simultaneously develop the three pillars of sustainability, as follows:

Environmental: rational use of water resources to conserve it and to reduce the water footprint

Social: ensuring the necessary consumption through improved yields that will cover the needs of the population, without affecting the natural resources needed for future generations

Economic: the use of innovations and technologies for a precision agriculture that helps to make water use more efficient and that will lead to an improvement of crop production yields and implicitly to an increase in production that will generate higher incomes for farmers

The Water Framework Directive (WFD) since 2000 emphasized the importance of adopting a sustainable approach to water resources management with focused strategies on long term protection, especially in agriculture where consumption is high.

The traditional irrigation system that came before the 1990s needs to be modernized and replaced with a more intensive one, which will permanently cover the needs of farmers, especially in the unpredictable times when drought sets in. The irrigated agricultural area in Romania has not registered major changes in recent years, being approximately 619,916 hectares, representing 34% of the total agricultural area, but it is much below the need of farmers. (National Plan)

An integrated system of irrigation of agricultural areas must be implemented to provide intelligent solutions, from adaptation to the specifics of the farm, small farms using drip or micro-sprinkler irrigation while farms with large areas need larger equipment to provide information in real time on water needs and resource consumption.

Meteorological conditions in Romania

Depending on different factors such as the level of annual rainfall, climate and zonal microclimate, Romania divides its development regions into two categories: the West, Northwest and Central regions have a higher level of rainfall, so the need for irrigation is lower compared with the southern, south-eastern and eastern regions that have water deficiencies and the degree of irrigation needed is higher. According to studies realized by the National Meteorological Agency of Romania, it is found that Romania has agricultural areas facing drought, and the south, south-east and east regions are the driest in Romania. In addition to covering the need for water from rivers and the Danube river, which is the main source for Romania, specialists' estimates show that 75% of the water used for irrigation comes from the Danube. The European Environment Agency (EEA) presents in detail all the data about the meteorological conditions.

Graph 1: The evolution of the average temperature and of the average precipitations in Romania

Source: EEA

Graph no 1 presents the evolution of the average temperature and of the average precipitations in Romania during 1997 and 2018. In 1997, the lowest average temperature in Romania was recorded in the analysed period, respectively 13.37 degrees, while the level of precipitation was high. The constant increase of the temperature from 1997-2000 by 2.42 degrees led to a drastic decrease of the precipitation level by 285 mm, thus the year 2000 represented the year with the lowest value of precipitations, only 431 mm, from the entire analyzed interval 1997- 2008, while the temperature was above the average of the period.

From 2000 to 2005, the air temperature fluctuates, but reaches a low of 13.86 degrees in 2005 being the second lowest temperature in the entire period analyzed. The year 2005 is also marked with the highest level of precipitation, 865 mm. Recently, in 2018, the highest average temperature was registered, 16.46 degrees, while the precipitation level was at 700 mm, both values increasing compared to the previous year by 4% and 2%, respectively.

These fluctuations of precipitation have an unpredictable character that hinders the agricultures activities, so it is necessary a complex and modern irrigation system that covers much of the agricultural surface to prevent meteorological phenomena such as extreme drought, so it is necessary a complex and modern irrigation system that covers much of the agricultural surface to prevent meteorological phenomena such as extreme drought.

Statistical Analysis of Irrigated Areas in Romania

Based on the statistical data provided by NIS, we created a database that includes values of irrigated agricultural areas from 1997-2019 on the 8 development regions of Romania for which an extensive statistical analysis was performed. From the available data on land improvements made in Romania, the values for the total irrigation arrangements and

the 3 land use modalities were chosen, respectively Total irrigated area, Agricultural arranged area and value for Arable land to determine a share of irrigated areas by regions, but also the dependency ratio between the evolution of arable and irrigated area. The Arable land is the part of Total irrigated area which represent the irrigated arable land. According NIS, Land improvements is the total hydrotechnical works meant for land improvement, ensure the soil fertility or to improve the development conditions of crops on low productivity land and Irrigated area represents the total works carried out to ensure the controlled water supply to the crops in order to increase the agricultural output and guarantee its independence from weather conditions.

The Bucharest-Ilfov development region is the main region in Romania, which also includes the country's capital, being the main economic pole and the most populated region. In recent years, migration from the province to the Bucharest has increased and globalization has led to the emergence of several international companies and large factories, as well as numerous logistics warehouses in this region, while areas from Ilfov county for agriculture have been removed from the agricultural circuit and introduced in the urban area to cover the needs of housing and land for different types of economic activities that have developed in the area. Thus, the agricultural sector with agricultural areas and areas arranged with land improvements such as irrigation decreased its activity in the Bucharest Ilfov region, which is why Agricultural arranged area and Total irrigated area decreased steadily during 1997-2019.

The Centre Region is a predominantly mountainous region with low average temperatures in which agriculture is represented by extensive crops such as potatoes, being the most representative crop in Covasna, Harghita and Brasov counties, and by raising animals in mountain areas such as cattle and sheep. The urbanization of areas such as Brasov and Sibiu counties, the improvement of tourist capacities and the promotion of areas as well as the development of the local economy through new economic activities led to fluctuations of agricultural areas, finally the area for agriculture decreased and the same trend was for Agricultural arranged area and Total irrigated area.

The West region represents a region that in the analysed period registered decreases of the Agricultural surface and implicitly of the two surfaces destined for irrigation. With a high degree of urbanization above the national average, with the share of agricultural area of 12% and with relief differences between the component counties, from counties predominantly with plain areas where Timis and Arad counties register the highest values of agricultural areas in the region at counties with covered hills and mountains and with forests where subsistence agriculture predominates, there is an involution of agricultural areas.

The North West region is divided into areas with a high emphasis on agriculture especially on fruits crops but with a weak capitalization of the livestock sector, urban centres that are heading towards the modernization of economic activities and in areas for tourism, but the region's average in terms of agriculture is below the national average so the areas for irrigation have decreased, even if the area Agricultural, due to small fluctuations maintains its value.

Table 6: The evolution of regions in the most irrigated area in Romania

Source: NIS

The South-Muntenia region is the most representative region in terms of agricultural area, over 2.4 million hectares for agriculture with over 40% irrigated area, being the most important area of the country in terms of agricultural activity, both in terms of plant cultivation and animal husbandry and fish farming. The location along the Danube River gives the region an advantage in terms of irrigation, providing accessibility and sufficient water, so the short distance to a water centre has led to a faster development of the irrigation system. The favourable conditions for the practice of agriculture as well as the major investments made in agribusinesses determined that the South Muntenia region has the largest agricultural area and the most employees in the agricultural sector, ensuring the development of the local economy. Unfortunately, despite the potential of the region in terms of consolidation and development of the agricultural sector, the Agricultural arranged area and Total irrigated area decreased throughout the analysed period, but the agricultural area also decreased slightly.

The South-East region is the second region of the country after the total agricultural area, but it is on the first place in terms of irrigation in Romania and registers the most irrigated areas, in 2017 versus 1997 both agricultural and irrigated area increased. Agriculture is significant in this region, viticulture, vegetable growing and cereal crops being the most representative in the country, while the fishing sector is an activity with a tradition in the maritime area as well as in the Danube Delta. The Danube is the main source of water for irrigation in the area, so there are several important stations that cover the water needs of large agricultural areas that are primarily faced with a low rainfall and extreme weather. But despite the less favourable climatic conditions and the unpredictability of weather phenomena, the large agricultural area that is served by the irrigation system has contributed positively to the development of agriculture, especially in the field of vegetables and cereals.

The North-East region is the least developed region of the country, but it is the largest in area and the most populated, but agriculture is a basic activity in the development of the region, this is represented by cereal cultivation, areas with tradition in viticulture and orchards of fruit trees. In recent years, the agricultural area has fluctuated, and irrigated

areas have decreased, in the period 2011-2019 Agricultural arranged area being constant, and Total irrigated area remained at the same level between 2008 and 2019.

The South-West Oltenia region decreased its agricultural area annually, keeping the same trend for the Agricultural arranged area and Total irrigated area. The relief is diversified, from mountains to plateaus and plains, and the southern area where the plains predominate is characterized by dry air and a phenomenon of desertification of agricultural land. Also, the counties in the south of the region are the most representative in terms of agricultural activities, where cereals predominate, fruit crops such as grapes and melons and the Danube offers the possibility of developing fish farming. Having 3 important water sources, the Danube, Olt and Jiu that provide different counties of the region, the region can provide its water needs for irrigation more easily if it has a well-defined zonal infrastructure, especially to combat desertification leading to the loss of agricultural land.

After analysing the evolution from 1997-2019 of the 8 development regions of Romania, we conclude briefly that in 2019 versus 1997 the Bucharest-Ilfov Region registered the largest decreases of the 3 studied indicators, followed by the North-West region while the Southeast region is the only region that has progressed. Also, no region reported that all agricultural arranged area had been irrigated.

Strategic Directions to Regional Development by Improving the Irrigation System in Romania

The Minister of Agriculture and Rural Development from Romania (MARD) is the main authority in Romania that deals with the irrigation system and has established since 2016 a series of strategic initiatives for the development of irrigation according to the table below.

Table 7: Strategic initiatives of MARD for the development of irrigation in Romania

Sectoral strategic objectives	Strategic initiatives
Strategic priority - Development of an efficient irrigation system	Establish a strategy for creating a modern irrigation system adapted to current requirements Development and modernization of the primary irrigation infrastructure - Application of the provisions of OUG no. 4/2015 regarding some measures for organizing the land improvement activity, approved by Law no. 269/2015 Development and modernization of secondary irrigation infrastructure - investments from NRDP Irrigation Sector Project Strategy in Romania

Source: Strategic Plan of MARD 2016

The European Union, through the structural funds, provides financial support for investments in irrigation infrastructure, so Romania's National Rural Development Program 2014-2020 (NRDP) has a sub-measure, 4.3 Irrigation dedicated to Investments for the development, modernization or adaptation of agricultural and forestry infrastructure irrigation infrastructure that has as main objective the modernization of the irrigation infrastructure of the beneficiaries who can be both organizations and federations of water users and who receive non-reimbursable support that fully covers eligible expenses and is a maximum of 1,000,000 euros for each project related to irrigation systems of pressure stations and access to agricultural roads and a maximum of 1,500,000 euros for each project aimed at arranging irrigation systems related to pumping and pumping stations.

Important actions that can generate added value in the activity of farmers are:

- Water management for the supply of irrigation needed with optimal quantities
- Creating an irrigation development action plan to be offered to farmers with technical-economic specifications regarding the irrigation system according to the requirements of each culture and the specificities of the development region

- Providing agricultural consultancy supporting the agricultural exploitation by improving the agricultural performances, yields and the incomes
- Risk management plans to prevent and mitigate the negative effects of drought
- Water efficient technology for precision agriculture to consider the rational use of water
- Improving RDI activities to adapt Romanian farms to climate change from the point of view of the efficiency of the irrigation system regarding the provision of the necessary water at the opportune moment

The plan for the development of the irrigation system to improve both the infrastructure and the access of farmers must consider objectives with long-term impact that are economically viable and accessible to as many farmers as possible through which to increase agricultural production.

Conclusions

Agriculture has played and continues to play an important role in the development of the Romanian rural area. Following the analyses performed, there is an upward trend of the production both in value and quantity in the period 1997-2019, registering oscillations from year to year. These fluctuations in production from one year to another are due to various influencing factors, including to unfavourable weather conditions recorded in certain years, so the irrigation system requires more attention, being a factor that can revive agriculture in dry periods. In the last 23 years, all surfaces fluctuated, finally in 2019 reaching a decrease compared to the base year, 1997 as follows: agricultural arranged area decreased the most, -1.32% and total irrigated area decreased by -0.99%.

Precipitation is a rather unpredictable factor with a significant impact on agriculture, often impeding agricultural activities, therefore the development of a complex and modern irrigation system to cover as large an area of the total Romanian agricultural area can reduce the dependence of agriculture on natural factors, significantly diminishing the influence of drought on production.

It can be said that the main factors that did not allow the development of the agricultural irrigation system were: lack of investments in irrigation infrastructure for its modernization and development; high costs for farmers and reduced access to funds; lack of information to all farmers about the benefits of crop irrigation.

Actions are needed to lead to the improvement of the irrigation system and infrastructure because in addition to chemicalization, irrigation also has a decisive contribution to increasing yields, leading to the development of agricultural activities in the area and thus to the regional development of the country.

Developing and Validating the Initial Version of The Robotic Process Automation Maturity Model

Andrzej SOBCZAK

Warsaw School of Economics, Warsaw, Poland
sobczak@sgh.waw.pl

Abstract

In a narrower sense RPA (Robotic Process Automation) can be perceived as one of the categories of software for the automation of business processes. At the same time, it can be considered as a specific type of organisational and technological change. Assuming the latter sense as crucial from the perspective of the implementation of digitisation of a company, it is necessary to carry out a periodic assessment of the maturity of an organisation in terms of RPA. Thanks to such an assessment, it is possible to determine the current advancement of an organization in this regard, but also to determine the improvement activities required for the implementation. However, it is necessary to use an appropriate research tool to carry out such an assessment. The goals of this article include: (G1) presenting the understanding of the term robotic process automation, (G2) describing the building blocks of the maturity model, (G3) presenting the proprietary robotic process automation maturity model and its initial verification.

Keywords: Maturity Model, Robotic Process Automation, RPA, Robotic Process Automation Maturity Model, MORPH

Introduction

”Robot” is a relatively new term, as it was coined at the beginning of the 20th century. A Czech writer Karel Čapek used this term for the first time in a play titled Rossumovi Univerzální Roboti in 1921. That term originates from the Slavic word ”robota”, that means effort, hard work.

The terms "robot" and "robotization" are used in the article in the context of the Robotic Process Automation related research area, in a reference to the research trend that emphasizes the importance of metaphors in management sciences. According to this approach, metaphors referring to the processes taking place in the natural world have an impact on a specific understanding of reality through another part thereof, as well as on the shaping of science and its language (Morgan, 2006, pp. 10-11). The author makes an assumption that a software robot is a computer program operating based on the set algorithm, created with the use of one or more RPA (Robotic Process Automation) tools, used to automatically perform business processes or parts thereof, that usually imitates human work. From the terminology point of view, a software robot is also referred to as a digital worker in the subject matter literature.

The deployment of software robots needs to be implemented in the form of coordinated organizational and technological projects. In addition, it is important to implement mechanisms for monitoring the robots' performance and maintaining the continuity of the robots' operation. As more and more enterprises decide to widely use robotic process automation, a methodological tool that can help improve the activities performed by the robots may involve the use of the robotic process automation maturity model. An appropriately implemented maturity model allows an organization to assess its skill level, the effectiveness of the processes implemented and the methods of operation used.

The issues related to robotic process automation and robotic maturity assessment are in line with the research trends undertaken as part of several sub-disciplines of the management and quality science (Belz et al., 2019), in particular:

- Change management (sub-discipline: Strategic management) - robotic process automation is considered in the article as a specific type of an organizational change that should be managed appropriately;

Cite this Article as: Andrzej SOBCZAK“ Developing and Validating the Initial Version of The Robotic Process Automation Maturity Model” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

- Organization's maturity (sub-discipline: Process and project management) - the article presents the characteristics of issues related to the robotic process automation maturity of an enterprise, which is one of the aspects of an organization's maturity;

Management in the robotic process automation environment (sub-discipline: Production, services and technology management) – the management context in the robotic process automation environment is the main theme of the discussion presented in the article.

The goals of this article include: (G1) presenting the understanding of the term robotic process automation, (G2) describing the building blocks of the maturity model, (G3) presenting the proprietary robotic process automation maturity model and its initial verification.

A diverse set of research tools was applied to achieve each of the paper's goals. They included, accordingly: literature research, partly structured expert interviews, creative thinking techniques and the case study method.

Based on the above presented objectives of the article the following structure of the paper was adopted. Section two presents the main concepts of robotic process automation. Section three includes key concepts of the maturity models and their building blocks. Section four presents the proprietary robotic process automation maturity model, including the discussion of the results of its initial verification. Section five presents the summary of the thus-far considerations and the potential directions of further research are outlined – in particular with respect to developing the proposed model.

Understanding the term Robotic Process Automation

Currently the "robotic process automation" concept is viewed in two different ways in the subject matter literature.

According to the first view, robotic process automation (RPA) is a class of IT tools. S. Aguirre and A. Rodriguez indicate that the origins of this class of software date back to 2010 (Aguirre, Rodriguez, 2017, p. 66), while the practically exponentially rising interest in this class of tools began around 2015. The current RPA market leaders include such companies as (listed in the alphabetical order): Automation Anywhere, Blue Prism, UiPath, WorkFusion (Gartner, 2020). The solutions provided by these companies are intended to be used for robotically automating processes that are characterized by the following properties:

- high stability over time - the lower the process variability over time, the better;
- a small number of deviations and exceptions - the smaller the number of deviations and exceptions occurring during the process, the easier the implementation thereof and the lower the risk that a specific emergency situation will not be taken into account;
- high frequency of process performance - the higher the frequency of starting the given process, the better, because the return on investment in the automation thereof will then be higher;
- the need to have complete knowledge of the way the process is currently performed, expressed as a set of unequivocal business rules. In particular, this means that in the event of an emergency - i.e. unforeseen during the preparation of the software robot – the information on such an event will be forwarded to the human operator, who will take an action appropriate to the situation.

The developers of the robotic process automation solutions are currently working on the second generation of the tools. According to the compilation (Lacity, Willcocks, 2018, p. 26), the future of this class of tools is cognitive automation, i.e. one where automation is implemented thanks to the software capable of effective operation in unforeseen and uncertain situations, as such automation tool (software) has the ability to use the information held in a manner similar to human reasoning. Cognitive automation uses algorithms and technological approaches derived from artificial intelligence, such as natural language processing, text analysis and data exploration, semantic technologies and machine learning (see Marshall, Lambert, 2018, pp. 200-210). Thanks to such solutions IT tools are able to autonomously evaluate and interpret knowledge. Cognitive automation provides completely new operational capabilities (van der Aalst et al., 2018, p. 271). Firstly: software that implements this type of automation has the ability to learn to react to the appearance of new objects and new situations (Leopold, van der Aa, Reijers, 2018). Such cases have up to now been a weak point of the classical automation solutions. In the event of an unforeseen situation, the tools, at best, provided information about it, and, at worst, took nondeterministic actions. Secondly: cognitive automation software has the ability to make complex decisions or decisions that involve ambiguities or seemingly competing alternatives. Thirdly, at last: this class of software is capable of detecting and reacting to the situations where risk and consequences of an error are high.

According to the second view of the term, ”robotic process automation” can be regarded as a particular type of an organizational and technological change the inherent part of which is the deployment of specific software (including cognitive software), ultimately leading to the formation of a hybrid workforce (Fersht et al., 2019), (Lacity and Willcocks, 2018), (Willcocks et al., 2020). Such a workforce is understood as a coherent ecosystem of software robots, as well as human resources with specific skills and competences, performing specific business processes and processing specific data.

The latter, broader understanding of the robotic process automation concept has been assumed for the purpose of this article. The adoption of such an understanding of robotic process automation leads to the viewing of actions related thereto not only from the technology point of view but also from the organizational and cultural perspective.

Key concepts of the maturity models and their building blocks

The maturity concept is very broad, it may mean something "fully developed", "brought to perfection" (Cooke-Davies, 2004, p. 1234-1264). The term may also refer to enterprises and the condition they are in. In this context, one of the most frequently cited definitions of maturity models was proposed by M. Kohlegger, R. Maier and S. Thalmann in 2009. In accordance with that definition, model is defined as a model that “represents phases of increasing quantitative or qualitative capability changes of a maturing element in order to assess its advances with respect to defined focus areas. The focus area determines which indicators for maturity can be used to assess a maturing element”. Another approach to the maturity model can be found in (Axelos, 2013, pp. 6-7). According to that view, the maturity model is, simultaneously, an improvement process, as well as a development path and signpost, along with the precisely defined criteria and indicators, defining the current, as well as the desired condition based on the transparent external reference values.

The majority of the existing maturity models are based on the commonly known, developed in 1991, SW-CMM (Capability Maturity Model for Software) model that was created for the software engineering needs. It should be noted that its precursor was QMMG - Quality Management Maturity Grid, a model developed by P. Crosby already in 1979 (Albliwi et al., 2014). Starting as of 1991 this model was adapted to the needs of various disciplines, such as (Nikkhoua et al., 2015, pp. 319) (Proença and Borbinha, 2016, p. 1045-1047), (Sarmento and Seixas Costa, 2019): systems engineering (SE-CMM – Systems Engineering Capability Maturity Model), integrated product and process development (IPD-CMM – Integrated Product Development Capability Maturity Model), people management (P-CMM – People Capability Maturity Model), enterprise architecture management (EEAMM – Extended Enterprise Architecture Maturity Model, NASCIO EAMM – NASCIO Enterprise Architecture Maturity Model, ACMM - Architecture Capability Maturity Model), process management (BPMM – Business Process Maturity Model, PEMM – Process and Enterprise Maturity Model), project and project/program portfolio management (PMMM – Kerzner Project Management Maturity Model, P2MM – PRINCE2 Maturity Model, OPM3 – Organizational Project Management Maturity Model, P3M3 – Project, Program, Portfolio Management Maturity Model), business continuity and enterprise risk management (BCMM – Business Continuity Maturity Model, ERM MM – Enterprise Risk Management Maturity Model, RIMS-RMM – Risk and Insurance Management Society Maturity Model).

It is noteworthy – at least based on the number of the existing maturity models – that they have won broad recognition, both among representatives of academic community, as well practitioners. Their use is supported by simplicity and ease of applying the concept, use of coherent terminology, ease of understanding the results obtained and the ability to undertake specific actions based thereupon (Lasrado et al., 2015).

At the same time, it should be emphasized that this simplicity also constitutes one of the main criticisms raised by the critics of such an approach. They are of the opinion that complexity and volatility of organizations are so high that referring to a closed list of issues (topics) (and such one always occurs in case of this type of approach) makes it impossible to take into account the specifics of the given organization (Mettler, 2011, pp. 82).

When analyzing maturity models certain common structural elements thereof can be identified. They include (Lasrado et al., 2015), (Proença and Borbinha, 2016, p. 1044-1045):

- purpose of applying the model,
- building blocks and their hierarchy,
- approach to conducting a maturity assessment,
- approach to representing the results of a maturity assessment.

Each of the structural elements of maturity models is described below.

Purpose of Applying Maturity Models

The primary purpose of applying an organization maturity model is the ability to conduct, in a systematic manner, an assessment of the organization's operations in the selected area of its operations.

Maturity models usually perform one of four functions (de Bruin et al., 2005):

- descriptive function that helps determine what the actual level of an organization's maturity is at the given moment in the assessed area; such information is required, among others, to fulfill the reporting obligation (e.g. in international capital groups the information on the maturity of selected aspects of the organization's functioning is provided to the head office),
- prescriptive function that describes the desired target condition (state) and defines the gap that exists between the existing condition (current state) and the desired condition (state),
- function defining the scope of the transition that says what actions should be performed in order to transition from the existing condition (current state) to the desired one,
- comparative function that enables referencing the maturity level of the given organization to its direct competition or the best organizations in the given class (provided such benchmark data is available; frequently benchmark databases are created by consulting companies but they can be accessed usually for a fee).

Building Blocks of Maturity Models and Their Hierarchy

The structure of the majority of maturity models is similar. Assessment dimensions are usually defined within models (typically there are a few of them, not more than 10). In some models dimensions are decomposed to the level one notch below – namely to areas (usually there are no more than 20 such areas). Each of the assessment areas is assigned issues (topics)/practices/assessment questions. Depending on the subject area that the model is applicable to and the degree of assessment accuracy – the number of issues (topics), practices or assessment questions ranges between several dozen and even 500 items. When referring to the individual issues (topics), practices or assessment questions, the degree of implementing them in the given organization's context should be defined. Authors of a model usually define possible answers and assign weights thereto. This way an assessment can be made quickly, and the results obtained can be compared to other assessments (conducted at the same or at other organizations).

Approach to Conducting A Maturity Assessment

Authors of individual models recommend various methods of conducting a maturity assessment. One of three approaches can be selected:

1) self-assessment based on observation,
2) filling of a questionnaire by an in-house team of the organization's representatives with the support of an external methodology consultant,
3) filling of a questionnaire by an external team of experts with the support of the in-house team of the organization's representatives.

Option 1) is simplest, fastest and cheapest but can be burdened with the largest error due to the subjective approach and a lack of clear assessment criteria.

Selecting option 2) and 3) is based on a number of conditions – from the financial ones (the second approach is by far cheaper), up to the security issues (the second approach more easily gains acceptance of the assessed organization's security/compliance department).

In all three approaches the level of maturity in the individual assessment areas is assessed. Based on that, a graphical analysis, e.g. in the form of a radar chart, has been prepared. It can be the basis for assessing how the level of maturity of selected aspects of the organization's operations is changing over time (e.g. every year).

Approach to the Representation of the Maturity Assessment Results

When applying maturity models, one of two methods of representing the maturity assessment can be adopted: staged or continuous.

In case of the staged representation an organization can be classified on one of several (usually five, but models with 3 or 6 levels are also possible) maturity levels, where the first level signifies the lowest level.

In case of the staged approach, coefficient γ, presenting the organization's maturity level in a general way, can be calculated:

$$\gamma = \frac{1}{n} \sum_{k=1}^{n} P_k \quad (1)$$

where: n – the number of identified areas within which an assessment of the maturity level of selected aspects of the organization's operations is made; Pk – maturity level for the kth area of the organization's operations.

In case of the continuous approach, each of the areas is assessed separately. This assessment is also carried out using assessment questions. The outcome of applying this approach is a single column matrix containing the results of the assessment in the individual areas. This way it is possible to adapt the sequence of improvements to the organization's specifics and push areas that are considered as key to the forefront.

Developing and verification initial version of the proprietary robotic process automation maturity model

The author developed the initial version of the proprietary robotic process automation maturity model (MORPH – Model Oceny Dojrzałości Robotyzacji Procesów Biznesowych - Robotic Process Automation Maturity Model). The need to develop the proprietary maturity model stemmed from the fact that, as shown in the literature research carried out earlier by the author, there was no model for assessing the robotic maturity of an enterprise that would have been developed under the methodological regime. The existing models (HfS Research Maturity Model for RPA, Forrester Robotics Quotient Model, Mindtree's Automation Maturity Model, Federal RPA Community of Practice Maturity Model) have been developed by the consulting organizations and firms and they do not meet this condition.

Such techniques as creative thinking and literature research were used to develop the proprietary robotic process automation maturity model. In order to maintain the methodological regime the model development was based on the maturity model creation procedure presented in (Becker et al., 2009, p. 218). It is composed of a series of the following steps: Initiation, Problem definition, Comparison of existing maturity models, Determination of development strategy, Iterative model development, Conception of transfer and evaluation, Implementation of transfer media, Evaluation, Introduction of amendments to the model.

Literature research included both the articles that were published in the reviewed magazines and books prepared by the representatives of the academic community, as well as consulting companies' analyses and reports, and materials presented at industry conferences. The author was an organizer of nationwide seminars and workshops held at SGH (Warsaw School of Economics) in 2017-2019; attended by over 600 participants in total (both from the practitioners' world, as well as the representatives of the academic community) and with more than 80 papers presented[i]. Additionally, the author took part in 7 industry conferences and seminars organized by other entities within that time frame. Materials obtained this way constituted the starting point for developing the initial version of the proprietary robotic process automation maturity model.

Additionally, the author conducted semi-structured expert interviews with persons dealing professionally with robotic process automation. The information obtained during such interviews was also used as a contribution to developing the proprietary model's assumptions and formulating assessment questions[ii].

When developing the maturity model the author also used his own experiences in deploying the RPA tools as part of the projects implemented.

The developed MORPH model's structure is hierarchical. Three robotic process automation maturity assessment dimensions were defined at the highest level of generality and they included:

1. Organizational aspects of robotic process automation,
2. Technological aspects of robotic process automation,
3. Cultural, ethical and competence related aspects of robotic process automation.

Each of the robotic process automation maturity assessment dimensions was decomposed into assessment areas. The number of assessment areas for each dimension varies. There are 12 assessment areas in total, with the given assessment area assigned precisely to a single dimension.

Thanks to the introduced model hierarchy the diversity of issues (topics) related to robotic process automation was exposed – starting from the organizational, through the technological, up to the cultural, ethical and competence related ones.

The following assessment areas were defined for the ”Organizational aspects of robotic process automation” dimension:

1.1. Robotic process automation performance (efficiency) goals and metrics (indicators) and their alignment with the organization’s business strategy,
1.2. Roles and bodies related to robotic process automation and interfaces between robotic process automation and other areas of the organization’s operations,
1.3. Preparing processes for robotic automation and developing robots,
1.4. Robot maintenance and operation (performance) monitoring,
1.5. Managing risk factors during robotic automation and continuity of robotically automated processes.

The following assessment areas were defined for the ”Technological aspects of robotic process automation” dimension:

2.1. Managing the architecture of tools used for robotic process automation,
2.2. Information technologies used for robotic process automation,
2.3. Information technology tools used to support robotic process automation.

The following assessment areas were defined for the ”Cultural, ethical and competence related aspects of robotic process automation” dimension:

3.1. Communicating issues (topics) related to robotic process automation,
3.2. Developing robotic process automation competences among the organization’s workforce,
3.3. Providing retraining support for employees whose jobs are subject to robotic process automation,
3.4. Ethical aspects of robotic process automation.

Fig. 1: Framework structure of the development of the proprietary Robotic Process Automation Maturity Model

Source: own compilation.

Assessment questions were defined for each assessment area, along with the permitted answers assigned thereto. 40 assessment questions were defined in total. Such a number of assessment questions allows to precisely define the robotic process automation maturity level in the individual areas.

Each of the assessment questions can be answered with two types of answers (where the answer is the result of the subjective perception of reality by the respondent):

- Yes / No – this type of answer is applicable in a situation where only one of two results of the implementation (resolution) of the given issue is possible.
- Yes / To a large degree / To a medium degree / To a small degree / No – this type of answer is applicable in a situation where several degrees of the result of the implementation (resolution) of the given issue are possible.

Information obtained when providing answers to assessment questions is the basis for evaluating the maturity level for the given assessment area. The following answer evaluation system was adopted:

- In case of Yes / No answers - for the answer "Yes" - 5 points are obtained, for "No" - 0 - points.
- In case of a Yes / To a large degree / To a medium degree / To a small degree / No answers - 5 points are obtained for the answer "Yes", 4 points are given for the answer "To a large degree", for the answer "To a medium degree" - 3 points, for the answer "To a small degree" - 2 points, "No" - 0 - point.

The outcome of applying the described technique is the aggregate indicator presenting the organization's maturity for 12 assessment areas (Enterprise Robotic Process Automation Maturity Indicator – ERPAMI).

The ERPAMI is described by the formula:

$$\text{ERPAMI} = Round\left(\frac{1}{n}\sum_{i=1}^{n} Round\left(\frac{1}{k_i}\sum_{j=1}^{k_i} x_{ij}\right)\right) \quad (2)$$

where: n – the number of robotic process automation maturity assessment areas; xij – the value of the answer to the jth assessment question in the ith assessment area; ki – the number of assessment questions in the ith assessment area; Round - function rounding to the nearest integer.

Due to space constraints the article does not present the complete list of assessment questions, but it outlines what issues (topics) are raised in each of the 12 assessment areas and one sample question from each assessment area is cited.

As part of the first assessment area "Robotic process automation performance (efficiency) goals and metrics (indicators)", references are made to the following issues (topics):

- Whether and how was the scope of robotic process automation defined?
- Whether and how were the goals of robotic process automation defined?
- Whether and how was the way of measuring the achievement of the individual goals of robotic process automation defined?

A sample assessment question: Were the adopted goals of robotic process automation formally accepted by a representative of the organization's management team?

As part of the second assessment area "Roles and bodies related to robotic process automation and interfaces between robotic process automation and other areas of the organization's operations", references are made to the following issues (topics):

- Whether and how were the roles related to robotic process automation management defined?
- Whether and how were the roles related to robot development defined?
- Whether and how were the roles related to robot maintenance and robot operation (performance) monitoring defined?
- Whether and how were the rules of cooperation with IT, security, compliance departments established?

A sample assessment question: Is there an established change management process in IT systems on which robots are working and are consultations between the department responsible for robotic automation and the IT department a part of such a process?

As part of the third assessment area "Preparing processes for robotic automation and developing robots", references are made to the following issues (topics):

- Whether and how are processes to be robotically automated selected?
- Whether and how are processes optimized prior to their robotic automation?
- Is there a standardized procedure in place to document processes to be robotically automated?
- Is there a standardized procedure in place to develop a robot?
- Is there a standardized procedure in place to document a robot code?
- Is there a standardized procedure in place to test a robot?

A sample assessment question: Does the organization have a formally adopted and commonly applied procedure in place to document the code of the robot being developed?

As part of the fourth assessment area ”Robot maintenance and operation (performance) monitoring”, references are made to the following issues (topics):

- Whether and how is robot operational performance monitored?
- Whether and how are exceptions handled during a robot’s operation?
- Whether and how does a notification of robot operation occur?
- Whether and how is the documentation required to maintain robot operation developed?

A sample assessment question: Does the organization have formally adopted and applied non-availability times for individual robot types?

As part of the fifth assessment area ”Managing risk factors during robotic automation and continuity of robotically automated processes”, references are made to the following issues (topics):

- Whether and how does the organization manage risks related to robotic process automation?
- Does the organization have emergency plans in place in case a failure of robotically automated processes occurs?

A sample assessment question: Does the organization have a formally adopted robotic process automation exit plan in place?

As part of the sixth assessment area ”Managing the architecture of tools used for robotic process automation”, references are made to the following issues (topics):

- Whether and how does the organization manage the architecture of IT environments related to robotic process automation?
- Whether and how does the organization manage architecture standards related to robotic process automation?

A sample assessment question: Does the organization have a documented architecture of the production, test and development environments in which robots are operating?

As part of the seventh assessment area ”Information technologies used for robotic process automation”, references are made to the following issues (topics):

- Whether and how did the organization select IT tools used for robotic process automation?
- Whether and how does the organization update IT tools used for robotic process automation?

A sample assessment question: Were the IT tools used for robotic process automation selected consciously, in line with the applicable procedure?

As part of the eighth assessment area ”Information technology tools used to support robotic process automation”, references are made to the following issues (topics):

- Does the organization use IT tools to model/analyze business processes prior to their robotic automation?
- Does the organization use IT tools for robot code version control?
- Does the organization use IT tools for robot service (operation) orchestration?
- Does the organization use IT tools for robot operation (performance) monitoring?

A sample assessment question: Does the organization use IT tools that allow for creating documentation of the process to be robotically automated?

As part of the ninth assessment area" Communicating issues (topics) related to robotic process automation", references are made to the following issues (topics):

- Whether and how does the organization communicate issues (topics) related to robotic process automation to middle and higher-level management teams?
- Whether and how does the organization communicate issues (topics) related to robotic process automation to the field personnel?
- Whether and how does the organization communicate issues (topics) related to robotic process automation to social partners (e.g. trade unions)?
- Whether and how does the organization communicate issues (topics) related to robotic process automation outside the organization (e.g. media)?

A sample assessment question: Does the organization have a plan in place to communicate issues (topics) related to robotic process automation that takes into account all of its workforce groups?

As part of the tenth assessment area "Developing robotic process automation competences among the organization's workforce", references are made to the following issues (topics):

- Whether and how does the organization monitor competences related to robotic process automation among business departments' personnel?
- Whether and how does the organization develop competences related to robotic process automation among business departments' personnel?

A sample assessment question: Does the organization measure the level of competences related to robotic process automation among business departments' personnel?

As part of the eleventh assessment area "Providing retraining support for employees whose jobs are subject to robotic process automation", references are made to the following issues (topics):

- Whether and how does the organization monitor the impact of robotic process automation on its personnel, in the context of providing support for their retraining?
- Whether and how does the organization provide retraining support for employees as a result of the robotic process automation completed?

A sample assessment question: Does the organization measure the impact of robotic process automation on its personnel?

As part of the twelfth assessment area "Ethical aspects of robotic process automation", references are made to the following issues (topics):

- Whether and to what extent does the organization undertake actions aimed at raising the awareness related to ethical aspects of robotic process automation?
- Does the organization have the defined responsibilities related to ethical aspects of robotic process automation?

A sample assessment question: Is there an appointed person in the organization that coordinates issues (topics) related to ethical aspects of robotic process automation?

The author is aware of the proposed MORPH model's limitations. They entail, among others, potential difficulties with interpreting individual assessment questions. For example, in the majority of cases the organization can apply robot documentation development standards, but its initial robots do not have documentation because the standards did not exist yet when such robots were designed. At the same time, the organization does not have organizational capabilities (resource constraints) to fix the documentation gaps.

In order to ensure the correctness and usefulness of the MORPH model being developed for enterprises the author presented its successive versions during industry meetings (two presentations were made in 2019). During such events, attended by domain experts dealing with robotic process automation, both from management, as well as

technical side, the author presented individual stages of works on the MORPH model – from its very early version, up to the ever more mature one. Based on the comments submitted by experts the model developed by the author was systematically improved, for example with respect to the assessment dimension names and the assessment question formulation and completeness.

MORPH model's pilot deployment was conducted after the works on developing and improving the model had been completed. The author is aware of the limitations of such an approach – in particular, the results obtained cannot be generalized to apply to the entire population based on a single case. However, the approach adopted in the paper assumes that case studies should not be used to generalize, but primarily to revise the theory (Pizło, 2009, p. 248).

An enterprise operating in the financial industry (considered a large undertaking in the understanding of (European Commission, 2014)), with numerous competitors – both on the domestic, as well as the international market, was selected for the pilot deployment. However, versus its competitors the company is viewed as one of smaller entities in the area of its operations – in terms of headcount and market share. Like the majority of similar entities the enterprise finds itself under regulatory and cost pressures, and at the same time it must continuously increase customer service satisfaction level. Additionally, it has recently (2018-2019) been feeling very strong pressure to raise workforce wages – in particular in the back-office part, but also in the sales network.

The enterprise was selected to conduct the pilot project for the following reasons:

- the company already has experience related to robotic process automation – conducted based on two models: using an external service provider, as well as in-house resources;
- the enterprise understands benefits provided by robotic process automation and there is a consensus within the organization that the works are worth continuing;
- the enterprise has technical capabilities to deploy robotic process automation on a broader scale;
- a discussion was started within the enterprise on how to ensure the scalability of robot deployments and, at the same time, approach the maintenance of the already deployed robots.

As part of the pilot deployment the author performed the role of providing methodological support: provided the interested entity with the tool (MORPH model and the application), conducted training on the structure (design) and the principles (rules) of using the model, provided clarifications on the use of the model on an ongoing basis (in particular, explanations related to the interpretation of the individual questions). At the end of the deployment a representative of the organization presented a summary of the MORPH model's application to the author.

The representatives of the pilot organization had questions related to the individual assessment questions formulations. The clarifications were provided on an ongoing basis by the author and some of them were taken into account in the MORPH model's version that was developed after the pilot deployment had been completed. The pilot organization appreciated the completeness and comprehensiveness of the assessment questions, but also noted a relatively long time required to give an answer. Furthermore, the representatives of the pilot organization indicated that it would be extremely valuable for them to be able to compare the results they obtained with the results of other organizations (most preferably from the same industry). The author noted that creating a benchmark database could be problematic due to formal reasons, as companies (Polish firms in particular) are reluctant to grant consent for making their, even anonymized data, available for scientific research.

Based on the feedback received the final (as of this moment) version of the MORPH model was prepared.

At the same time, the completed deployment allowed to initially prove at least some of 5 design assumptions defined at the beginning of this section to be true:

- application of the model allowed for objectively assessing the actual robotic process automation maturity level for the given organization;
- model can be used at a company that does not have a lot of experience in robotic process automation yet, but during the pilot project no limitations were identified that would prevent the model's application at a higher maturity level company.
- model was applied at a large company operating in the financial industry but no limitations were identified that would prevent the model's application at a company of a different size or a different industry;
- model was applied using the organization's in-house resources;

- model is not connected to any specific robotic process automation vendor/tool (the company at which the pilot deployment was completed used one of the highest rated RPA tools on the market, but the model can be used to assess maturity at companies that use other, even niche solutions).

Summary and Directions of Further Research

As a result of very widespread use of robotic process automation tools by enterprises, an interdisciplinary research area dealing with advanced automation and robotic automation technologies from the point view of their impact on economic and organizational aspects of the operations of enterprises (in particular, companies operating in the services sector), which is defined by the term robonomics (Ivanov, 2017), is currently developing.

Robotic process automation - viewed as a special type of organizational change - may affect the modification of the components of the enterprise's business model, as well as the elements of its management system. If properly implemented, it allows for achieving a number of benefits - both financial and non-financial. If improperly implemented, it can even disrupt the continuity of the business processes. That is why conscious and mature robotic process automation management is so important. This can be helped by the systematic assessment of the company's robotic maturity.

In the first part of the article the author lays out three goals of this paper. In the second part of the article an attempt is made to accomplish the first goal: understanding the term Robotic Process Automation. In the third part of the article the structure of maturity models is discussed, and thus the second goal of the article is achieved. The proprietary model for assessing robotic process automation maturity at enterprises is discussed in the subsequent part of the article. The approach to its design is presented, as well as its initial verification method is described. This way the third goal of the article is accomplished.

The initial verification of the developed MORPH model confirmed its applicability. Therefore, the author is planning to continue research in this area. In particular, based on the experience gained the author is planning to expand the approach developed: he is intending to enrich the robotic process automation maturity model with aspects related to the intelligent (cognitive) robotic process automation. As far as possible, works on the verification of the model by international organizations will also be undertaken. Additionally – in accordance with the feedback from the pilot deployment – an attempt will be made to develop an anonymized organization self-assessment benchmark database. This is why the MORPH model developed by the author is made available free of charge – including the detailed description (along with the complete list of assessment questions) and the IT tool supporting its application. Any organization may apply the model for its internal needs, and also adapt it to the extent required thereby. The precondition for the free of charge use of the model shall be the consent of the interested entity to provide anonymized assessment results to the benchmark database.

[i] The author was an organizer of the following research events: "Robotic process automation, cognitive automation, augmented intelligence – presence and ambitions" seminar (July 4, 2018), "From simple automation to accounting and reporting robots" seminar (September 20, 2018), "Democratization of automation and robotic automation in the creation and absorption of digital innovation" seminar (July 4, 2019), "Developing advanced digital competences (robotic process automation and artificial intelligence) among business departments' personnel" seminar (December 12, 2019), "Customer management strategies in the world of business automation and robotic process automation" workshops (March 22, 2017), "Data + algorithms in customer management" workshops (April 26, 2017), "Robotic process automation from the legacy systems' perspective" workshops (May 30, 2017).

[ii] Author conducted an analysis of 18 projects completed in Poland, related to the implementation of the RPA tools in medium and large companies representing diverse industries (banking, insurance, telecommunications, financial services, BPO (Business Process Outsourcing) and SSC (Shared Service Center), e-commerce, traditional retail). However, the author is aware of the fact that an 18-interview sample is limited in size. The reason for such limited size was still a low penetration of robotic process automation. The analysis was based on semi-structured interviews conducted with persons in charge of robotic process automation deployments (middle level management personnel) or supervising such implementations (higher level management personnel). The criterion for selecting respondents was having completed at least one pilot RPA tool implementation. The interviews were carried out in the 2018-2019 time frame.

Cultivating Leadership Among Accounting Educators in Malaysian Context Using Qalb-Guided Leadership Framework

Abstract

This paper aims to discuss the concept of qalb-guided leadership and the importance of cultivating the qalb-guided leadership elements among Malaysian accounting educators. The educators are leaders that play a significant role to educate students to become intellectually, spiritually, emotionally and physically balanced as well as harmonious to their family, community and country. Leadership without qalb (heart) will lead to intellect without heart, negligence, lack of mindfulness, confusion and doubtfulness. Nowadays, there are tremendous issues in relation to integrity, corruption and unethical behavior in teaching and learning as well as in the accounting profession, which could not be ignored. Thus, using qalb-guided leadership framework components namely wisdom, justice, courage and temperance, this paper can explain how it could reinforce the commitment with drive, focus, energy and synergy of accounting education in higher institutions with consistency, resilience and perseverance among accounting educators. This discussion is expected to add value to the existing literature on leadership quality issues since the integration of qalb-guided leadership elements in education is still at the early stage. Since wisdom, justice, courage and temperance are universal concepts, they are relevant to be practiced in any higher education institutions globally.

Keywords: Qalb-Guided Leadership, Accounting Educator, Education.

Introduction

Education plays a significant role in the development of individual characters (Muhamad, Saleh, Abu Kasim and Suppiah, 2019). In transforming the education system, it is essential to consider the outcomes of the education system beyond the economic implication. Malaysian education sector is guided by National Philosophy of Education (NPE) and directives from Ministry of Education (MOE) and Ministry of Higher Education (MOHE). The NPE sets out the education blueprint which stipulates that education must be aspired to foster a person to be balanced in terms of intellectual, spiritual, emotional and physical in line with religious faith (Ministry of Education, 2008). While MOE is the government agency that oversees the pre-school, primary and post- secondary education level, MOHE is another agency that governs the Malaysian higher education. Both MOE and MOHE assist the government in cultivating and fostering students' potential in fulfilling the country's vision (Ministry of Education, 2013; Ministry of Higher Education, 2020). Thus, by focusing on a holistic education system, it is hoped that Malaysia will become a developed country that has congruent citizens with high earnings economy.

The ethical behavior of accountants is extremely significant since accountants are seen as the custodian of public trust (Muhamad et al, 2019, Salleh and Ahmad, 2010). In order to curb immoral and unethical behavior among accountants, ethical values must be inculcated in accounting education starting from the first year of the students' life. In 2006, the demonstration of students' ethical values has been incorporated as one of the learning outcomes in the Malaysian

accounting degree curriculum (Hala Tuju 2, 2007). Before accounting educators can integrate ethics into their teaching and learning activities, they must possess such values. They serve as models of desirable leadership traits to their students within the university environments and society. The educators' values will determine their emotions, behavior and accordingly the outcomes of their teaching and learning activities. Since they have integral roles in establishing holistic students in achieving balance and harmonious life, educators must portray themselves as individuals who possess such ethical manners.

Qalb-guided leadership is seen as a recommended approach in cultivating ethical behavior among accounting educators. Accounting educators are regarded to be leaders since they have the authority to influence their students' achievements within their position as educators (Jaques, 1989). Instead of motivated by incentives, sovereignty or eminence, accounting educators should be motivated by a sense of responsibilities, accountability and clarity of purpose that are determined by qalb or spiritual heart (Abdul Razak, Mohd Noor, Abdul Mutalib, Mohd Jailani and Wan Razali, 2018). Leadership with qalb will lead to intellect with heart, care, mindfulness, clarity and certainty. Consequently, a good leader should have, among other things, good intentions, be forever mindful of Allah, just, trustworthy and truthful.

By applying qalb-guided leadership, accounting educators should be able to transform their essence and strengthen their responsibilities and accountability. Having pure qalb will induce accounting educators to reconcile religiosity and their engagements including teaching and learning activities. The good values possessed by educators will be demonstrated by instilling love, kindness, mercy and graciousness in dealing with any issues that the educators encounter.

The leadership attributes that form the foundations in qalb-guided leadership are principally derived from the viewpoint of al-Ghazali. These attributes are persistent with other behaviors of leaders across various circumstances and perspectives. In accordance with al-Ghazali, four cardinal virtues of a leader are wisdom, justice, courage and temperance. Justice is argued to be the most important cardinal virtues, as it must not be separated from the other virtues (Abdul Razak et al, 2018).

Thus, this study seeks to discuss the concept of qalb-guided leadership and the importance of cultivating the qalb-guided leadership elements among accounting educators.

Problem Statement

The term 'leadership' should be discussed in a wider perspective. It includes not only the head of departments but also all individuals in the organization. Thus, leadership is not associated with the position held as individuals are deemed to be leaders in their surroundings (Abdul Razak et al, 2018). In the context of the corporate world, accountants are considered to be one of the leaders in an organization. Being entrusted to safeguard public trust, accountants should possess high integrity and act professionally and ethically in disseminating financial information to the users.

Contemporary failures in high-profile corporates such as One Malaysian Development Berhad (1MDB), Felda Global Ventures Holding Berhad (FGV), Transmile and Perwaja Steel have triggered many questions. One of the questions can be related to leadership effectiveness and consequently, the integrity of the accountants is at stake. Even though the accountants have attended leadership training as part of the education curriculum at the university level and through corporate education, they may engage in unethical conduct to pursue their personal interest at the expense of the organization. This situation demands a holistic approach in promoting ethical and professional values that lead to effective leadership practices among the accountants in Malaysia and globally. Study done by Alam, Said and Abd Aziz (2019) found that ethical leadership quality has positive influences on leaders' behavior. Thus, it is suggested the ethical values among leaders should be cultivated at lower and higher education levels.

The current trend has shifted the focus of accounting educators from teaching culture to product-driven research culture. Instead of teaching activities, the main criteria in promotion exercises to be generally considered are conference presentations, research grants, publications and consultancy (Chunmei and Chuanjun, 2015). Thus, accounting educators who actively present papers, do research and consultancy work will be highly recognized and financially rewarded. Due to practical restrictions encountered by accounting educators such as heavy workloads, limited resources, institutional and individual differences as well as unprofessional review and publication process, educators may involve in unethical and immoral conduct such as plagiarisms and academic inequities. By possessing strong and sufficient leadership virtues, educators should be able to exercise ethical and professional judgment

continuously at all education levels (Shairf, Junaid and Malik, 2019) regardless of the pressure from the top management.

The educational approach has experienced a major shift starting from March 2020 due to COVID-19 pandemic. Since face-to-face classes are not permissible to be conducted, online teaching and learning are seen as the best alternatives to the conventional approach in order to ensure academic continuity. A study done by Akdemir, Vural and Çolakoğlu (2015) indicated that the tendency to perform unethical behavior in virtual environment is greater. Due to stress and pressure, educators may act unethically to ensure their tasks are completed while juggling with challenges faced in working from home. The integrity of accounting educators may not be upheld and instead of focusing on teaching-related tasks, they take the opportunity to involve in activities for their personal interest. Thus, this situation shows the importance for accounting educators to have leadership virtues that uphold the integrity and ethical values in all circumstances.

All these ethical issues can be minimized if the educators possess appropriate leadership virtues. Literature suggests that the virtues on leadership can be explained in various ways. This study intends to elaborate on the leadership concept using a qalb-guided leadership framework. Thus, this study aims to discuss the concept of qalb-guided leadership and the importance of cultivating the qalb-guided leadership elements among accounting educators.

Education Leadership

Nowadays, there is an extensive belief of the quality of leadership makes a significant difference to the higher institution and student outcomes (Bush, 2007). All higher institutions require effective leaders and managers to provide the best possible education for their learners. The main asset is the people, which requires the development of skill and knowledge to become competent. This requires trained and committed educators, which, in turn, creates powerful leaders. Leadership is a process of inspiration built on clear values and beliefs and fosters a 'vision' for the higher institutions. The vision is expressed by leaders who strive to gain the assurance of staff and stakeholders and its learners for the institutions' benefit in the future (Bush, 2007).

Education in Malaysia is a continuous endeavor to build human capacity as a whole and to combine efforts to create people based on faith and obedience to God who are mentally, spiritually, emotionally and physically healthy and harmonious. These initiatives are aimed at developing Malaysians who are knowledgeable, virtuous, accountable and able to achieve personal well-being and contribute to the peace of their families, societies and countries. Referring to the National Education Philosophy (1966) blueprint, there are four dimensions of leadership education. The first dimension is enhancing individual potential in a comprehensive and integrated manner to be someone who is balanced and harmonious. The second dimension involves a balance encompassing intellect, spirituality, emotion and physical wellbeing, initiated with faith and compliance to God's rules. The third dimension is producing Malaysians who are knowledgeable, competent, virtuous and responsible and possess the ability to achieve personal wellbeing. The fourth dimension is the capability to develop and contribute towards the harmony of their family, community and country. Thus, all academicians play a significant role in molding students as humanistic persons, holistic and balance in their values, thinking and action.

Ensuring future quality leadership is vital for higher education and educational systems need to focus on fostering future leaders, as well as making academia an attractive profession. In systemic terms, the present challenge of leadership is not only to enhance the quality of current leaders but also to establish clear plans for future leadership and efficient leadership succession processes, particularly for educational institutions. Many educational representatives are active in governance problems, engaging with local, state or national levels of university education (Abdul Razak et al, 2018). The educational leaders at the university level usually function as university administrators, such as department chairs or academic deans.

In the context of the Malaysian higher education institutions, the Ministry of Higher Education (MOHE) has released Malaysian Education Blueprint 2013, which focusing to improve the quality of graduates especially accountancy talents produced by higher institutions (Johari. Mustaffha, and Mohd Deni, 2016). The education system's direction is to ensure that all students maintain awareness, expertise in professional and leadership, bilingual expertise, integrity, faith and foreign identity (Jalil, Haron and Muda, 2019). MOHE subsequently published the Malaysian Education Blueprint 2015-2025 (Ministry of Higher Education, 20xx) introduced elements of ethics and spirituality as one of the qualities of the graduates. It is predicted that students will be ethically and socially upright, religiously grounded, humane and loving, respect environmental growth and a balanced lifestyle (Jalil et al, 2019). The idea of qalb-guided leadership was then implemented as an additional factor needed to improve the skills of institutional

leaders. Qalb-driven leadership is used to control the conduct, thinking, behavior, feelings and emotions of leaders, according to the Malaysian Higher Education Leadership Academy or AKEPT Program Book (2018). The presence of qalb concept in the higher education system aims to offer high quality education, excellent individual and prosper the nation (Sarif, 2018). Qalb concept is based on both the Rukun Negara and the Philosophy of National Education which inspires a concept of "balanced and harmonious human being" (Johari, Mohd Shamsudin, Yahya, Tan and Zainun, 2018). This qalb-guided leadership is expected to assist the accounting educators to transform their essence and strengthen their responsibilities and accountability in producing talented accounting graduates that have a balance between knowledge and ethic. In the current education system, educators are focused on educating the mind and neglected the heart. Therefore, graduates of straight-A's often lack of soft skill, leadership skill or qualities to shape the society (Majid, Liming, Tong and Raihana, 2012).

Ramsden (1998) gives the concept of Academic Leadership and he suggests that higher education leadership has features such as leadership in teaching, i.e. presenting new teaching concepts, bringing enthusiasm to teaching, leadership in the study, strategy vision, networking and collaboration. Educational leadership is primarily concerned with the duties and responsibilities of the leadership team in improving the management of the institution (e.g. university), as well as students' achievement (Connolly, James and Fertig, 2019). Accounting educators are collaborating with the team leader and expected to create positive change in the institution's educational policy and processes. Besides, leader should inspire people to be open and put more effort to achieve challenging objectives. The leader must provide an atmosphere of trust and support, equal and productive management, i.e. the delegation of tasks and the coordination of tasks, creation and acknowledgment of results (Siddique, Aslam, Khan and Fatima, 2011). Leaders are agents of transformation whose effectiveness is measured by how efficiently they articulate and execute the strategic vision and mission (Dess, Eisner, Lumpkin and McNamara, 2019) of the education system.

Academic leaders should also have a strong insight into values and familiarize themselves with internal and external developments in the needs of the higher institution. Today, the learning world is full of challenges. The academic leader should be experienced and professional enough to efficiently handle their duties (Jalil et al, 2019). In the contact of accounting educators, they should portray a good role model for their students. Therefore, educators are sought to constantly purify their qalb and to choose in moderation the way of life to attain the dimension of harmony, intellectuality and spirituality. The strong basis for the accounting educator's excellent leadership is to foster good value through components of qalb-guided leadership, i.e. Wisdom, Justice, Courage and Temperance (WJCT).

Qalb-guided Leadership

Leadership without qalb will lead to intellect without heart, negligence, lack of mindfulness, confusion and doubtfulness (Abdul Razak et al, 2018). It will create a blind heart with no compassion, which in turn increases the hardness of the heart and affects other human abilities, such as looking but not seeing or seeing but not perceiving, hearing but not listening or listening or not understanding. The main ingredient of good values for leadership is the qalb. Through accepting the nature of the qalb the good leadership qualities could be extracted eventually. It is crucial to understand the quality of the leadership, the nature and the function of the heart to make it transformative; otherwise, it will be less meaningful and remains as a ritual.

Qalb is a term that originated from the Arabic word which means heart (qalb), is a masterpiece of spiritual compositions of the human being. Heart (qalb) is inclusive of both the physical organ that pumps blood in humans and animals and the spiritual entity which can be portrayed as sincerity, a reflection of someone that has a heart (Abdul Razak et al, 2018). The most essential spiritual heart fosters spiritual knowledge, intelligence, intellect personality, compassion, love, affection and courage. Thus, the central of spirituality is the heart. Heart (qalb) has a close connection with the human character that could affect the human point of view of the world. It works to influence human behavior. Social and emotional learning, life skills education, critical thinking, ethical reasoning and dispute resolution are all included in the definition (Solihah, 2012). Heart (qalb) is a priceless asset because it is like mirrors which reflect the way human act or view. Human is formed in the pure heart (qalb) due to the existence of the heart (qalb). However, education and experience have some power to create paradigm fetters. Those fetters close the essence of a pure heart (qalb), the loss of a pure heart would have failed to think and remain critically (Solihah, 2012). The heart will determine a person either has faith, love anxiety, sadness, happiness, mankind or religiousness, a good or bad person (Syaefulloh, 2016).

Abdul Razak et al, (2018) introduced a Qalb-Guided Leadership framework which is formulated on the basis of al-Ghazali's Ihya' Ulum al-Din description of the Four Cardinal Virtues - Justice, Wisdom, Courage and Temperance (WJCT). Abdul Razak et al, (2018) had been discussing the relationship between qalb and leadership. They had suggested that as a leader, all humans should have a balance of all four elements (WJCT). The first element, Wisdom, demands balance and it gives rise to discretion, excellence and comprehension of the soul's implicit consequences of actions and secret weaknesses (Abdul Razak et al, 2018). When wisdom is unbalanced, cunning, swindling, deception and slyness will be the result. Further, if the unbalanced is in extreme deficiency, the vice of stupidity is generated. When they have the competent mindedness of modesty as a result of their analytical competence and still have a thorough and critical thinking ability, accounting educators should exercise the sound of wisdom. In line with education wisdom, Helskog (2019) also proposed the approach of realistic theory to imaginative and holistic dialogues as a way to promote wisdom-oriented pedagogy. Wisdom is crucial in the relationship between educators and young people, not just to make life sustainable, but also to allow it to flourish.

The second element is Justice where the condition and strength in the soul will control the expansion and contraction of anger and desire as directed by Wisdom (Abdul Razak et al, 2018). The absence of justice has no extreme of excess and defect; it has only one opposite, which is cruelty. In the course of the teaching and learning process, accounting educators are expected to show consistency and justice in their decision making. Often educators face problems in penalizing the misconduct of the students such as absenteeism, plagiarism in finishing the project or task and so on. Thus, the educators should possess good negotiating skills when dealing with a problematic student, not too much sympathy, but they should have rationale empathy. Compassion skills in handling their students according to their emotional reaction will reflect effective communication. Effective communication is a must for educators in providing the teaching and learning process. This is the principle of justice that all educators should uphold and embed in their mind set. Fabionar (2020) argued that it is necessary to incorporate program content that will inspire new educators to deliver justice that will offer students the skills they need to build and sustain justice practices in their everyday lives.

The third element is Courage, which refers to the subjection of the irascible ability to the intellect. The irascible ability, when sound and balanced is called courage. Courage gives rise to nobility, endurance, dignity and suppression of rage. Irascible ability when it loses its balance and inclines towards excess is called recklessness (Abdul Razak et al, 2018). When unbalanced and inclined towards weaknesses and insufficiency, it is termed fearfulness and laziness. Accounting educators should have the consistency of mind or spiritual courage to venture, persevere and endure any apprehension or challenge when fulfilling their duties. As a reflection of their academic abilities, they can still be self-confident, self-motivated and becoming an aspiration to their students (Payne, 2020). The accounting educators should have self-control skills when engaging with their students and the community. The analytical reasoning skills also should be embedded in the educators' skill set where they have the ability to collect and analyze the information, problem solving and decision-making. Payne, (2020) also indicates that the concepts of education leadership can be effectively extended to the framework of a higher education learning practice and provide a certain discretionary approach when developing and implementing the course. Thus, the element of courage is essential for educators, as they need to be role models and assist their students in understanding their talents and strength.

The last element namely Temperance means the disciplining of the appetite by the intellect and the law. Temperance is a quality that gives rise to kindness, modesty, patience and tolerance (Abdul Razak et al, 2018). When pushed to the point of exceeding the needs are called greed, cupidity and obscenity. The accounting educators must practice the power of self-restraint, socially upright and extremely principled, which will help form and transform the society. Education in higher institutions should encourage moral growth, shape positive qualities of character, i.e. moral values that should be formed by maturing individuals, so that they can make tough decisions and sacrifice for change (Horowski, 2020).

Based on the four fundamental virtues for leadership as explained above, it is important to cultivate and reflect all the accounting educators with these four elements namely wisdom, justice, courage and temperance. The positive value that can be derived from WJCT will enable the accounting educator to become a leader that possesses the right and clear direction to achieve the mission of education as well as to achieve the vision of the national policy of education (NPE). Besides being trustworthy, accountable and responsible, the accounting educators also are expected to have wisdom and intelligence, openness and tolerance. The accounting educators should always be transparent and keen to high integrity conduct, balance and sustainable as the accounting profession nowadays being exposed with so many

unethical issues as being highlighted in the problem statement above. Accounting educators play an extremely important role in shaping the personality and actions of an individual, soul and spirituality, as they will be leaders in the future (Liou, 2016).

Again, it is worth highlighting the needs of spirituality elements in creating a leader. Subsequently, spirituality is a path emphasizing self-awareness, human interdependence, creativity, practicality, social justice and love. Therefore, it will naturally enable transformation without denying our basic human nature. Spirituality establishes a harmonious relationship between human beings and the Creator and impart balance to both inner and outer needs of human, thus reducing all the unethical conduct. Some people become too materialistic, greedy i.e. to focus on self-achievement and individualism, resulted in an imbalance in self-career development. More than that, it is quite common that certain academician, when they are more focused on personal glorification, they would not be able to attain the true meaning of knowledge, unable to realize their true selves and failed to gain their true sense of happiness (Abdul Razak et al, 2018).

Thus, cultivating the qalb-guided leadership will enable the accounting educators to transform their inner self, embrace the right values as well as empowering responsibility and accountability. Qalb-guided leadership also can shape talent, icon and potential leaders, excellent delivery, provide solutions, reconcile religiosity on daily activities, reconcile high performance and human relationship besides nurturing love, kindness, mercy and gracious (Abdul Razak et al, 2018).

The Importance of Qalb for Accounting Educators in Accounting Education

Accounting education blends education with the accounting practice in which accounting and accountant education are necessarily related to the presence of accounting in the industry (Dellaportas, 2019). Accounting as a discipline has enjoyed a growing degree of popularity within the corporate world in the twentieth century. With a rising population of accounting graduates, accounting education has enjoyed a similar reputational development (Jalil et al, 2019). They become technically skilled when students are prepared, rather than educate, but are less well-rounded in terms of communication, interpersonal, critical-thinking, decision-making and professionalism (Nelson, 1995).

The nature of accounting education requires educators to think more carefully about the quality of accounting education and clear about what accounting education is attempting to achieve. The accounting educators face challenges in educating the accountants to become highly integrity, ethically and act professionally. Inculcating students with principles to become reflective practitioners should be the aim of contemporary accounting education so that they can behave honestly, with expertise and contribute to a life in which they forsake personal well-being for the wider community's interests (Jalil et al, 2019).

In an age of postmodernism, accounting educators still face difficulties in teaching modernist education (Read and Miley, 2019). In Industry 4.0 and Society 5.0, soul and qalb environments are important to allow for greater human communication, interaction and involvement. The most powerful force to face all the challenges in this era is to have a solid and determined heart or qalb (Sarif, 2018). As such, qalb (heart) influences beyond ranking business (Radojicic and Jeremic, 2012). According to Sarif (2017), the effects of qalb with the Tawhidic paradigm are ready to provide a holistic view on Industry 4.0 with Society 5.0 which is capable of strategic planning of higher learning institutions in Malaysia into the orientation, standardization, practices, conviction and commitment.

Another concern about the profession is ethical standards learned and ultimately exercised by the accountants. Stephenson (2017) recognized that the principles of those entering colleges did not meet the ethical criteria of the accounting profession, but noted the need for high ethical standards required by the profession and the difficulties faced by the profession in hiring individuals with high ethical standards. The reassessment report on the accounting program at public universities i.e. Hala Tuju 2006 was issued by the Malaysian National Higher Education System, which mandated that professional principles and ethics should be integrated into all accounting program courses (MOHE, 2006). While ethics has now been integrated into the curriculum of higher education, it still appears to be inadequate. There is a criticism that educators have been contributing to the raise of business news scandals by discharging low quality technical education. As a result, the role of accounting education has increased in importance as a means of inculcating good conduct among accountants to complement regulatory action (Jalil et al, 2019). The underlying philosophy of the degree of education obtained during their studies is one of the fundamental aspects of an accountant's intellectual growth. Ethics in accounting education must begin with principles, not ethical codes of

conduct and responsibilities, not laws (Jalil et al, 2019). It is therefore assumed that the cardinal virtues of qalb-guided leadership i.e. WJCT will help or complement the ethics curriculum that is embedded in the higher institution.

The main function of qalb is to shape individual personality and get a strong human character (Syaefulloh, 2016). Educating and cultivating qalb (heart) are required since it affects all human parts include physical (IQ), psychological (EQ) and spiritual dimension (SQ) (Solihah, 2012). Education does not only deliver the newest and fullest information, it also develops the deep confidence and character of the student in order to boost the strength and pursue the objective of life. The accounting educators must have a high understanding of the principals of the teaching and learning process in educating their students. Moreover, education is not only focused on teaching and learning, assessment, pass the examination and get a good job, but the most important part is to ensure that the students can decide which one is right and wrong (Solihah, 2012). Excellent in grade but not having the right attitude is futile. Thus, both should be balanced i.e. excel in academics and attitude (Syaefulloh, 2016). Therefore, it is suggested to get a clear direction by using the qalb-guided leadership, inclusive with the element of WJCT.

Subsequently, the good qalb will produce good leadership and create good quality, while the bad qalb will build the characteristics of bad personalities in a person's leadership skills (Kamaruding, Naim, Kamaruding and Ibrahim, 2019). Leadership is essential to the growth of a stable society and the survival of the region, as addressed by Lukman (2015); in the Islamic tradition, the issue of leadership receives considerable attention. This is because, in Islam, leadership is regarded as the most important tool for an ideal society's fulfilment. Leaders must be able to affect not just the accomplishment of a shared goal, but also the legal achievement of the goals (Jamaludin and Akhir, 2016). The formation of a noble personality in accounting educator as a leader is thus important, as it is the foundation for getting the students to the desired outcomes as well as encouragement along the right path. An accounting educator could become a competent leader who possesses leadership skills, knowledge, abilities and behaviors that contribute to superior performance. Subsequently, this could produce a professional accounting profession in the dynamic business environment (Johari et al, 2018).

Accounting educators have a vital role to play in human development. Integrating the qalb components, WJC, is a core component of efforts to understand the potential of human growth. The human growth process must also consider conditions that prohibit the heart from being completely formed, hence reach its fullest level of purification (Jamaludin and Akhir, 2016). Therefore, qalb-guided leadership virtues are expected to change the accounting educators' personality, values, emotion and motivational level (Abdul Razak et al, 2018). Through wisdom virtue, accounting educators will be more productive and resourceful while considering others in their conduct. Having strong courage, accounting educators will be more diligent and flexible while having self-control, analytical and intellectual skills. Accounting educators who have temperance virtue should have high self-discipline, positive orientation, tolerance and socially aware of their surroundings. Justice value cultivated in the accounting educators' life will imbue them to be better in making decisions by having appropriate skills in negotiation, communication and relationship. It is suggested that qalb-guided leadership virtues practiced by accounting educators will help them to collaborate with other stakeholders in the education sector to bring wellness and wellbeing to the nation (Sarif, 2018). Besides, Dogarawa, (2013) has argued that a person who practices hisbah (the practice of deeds and prohibition of wrongdoing) will always be persistent and diligent to create a wise, truthful, trustworthy, moral, and reasonable.

Conclusion

Renewing the education leadership concept by integrating with qalb-guided leadership which focuses on four fundamental virtues, WJCT is crucial nowadays to reduce or minimize the unethical crises among the accounting profession. Hala Tuju 2006 was published by Ministry of Higher Education which stresses professional integrity and ethics, incorporated into the curriculum, backed by acts taken by many professional accounting bodies such as the American Accounting Associations, International Federation of Accountants (IFAC), Association of Chartered Certified Accountants (ACCA) and Malaysian Institute of Accountants (MIA) to improve ethics coverage in the accounting curriculum, nevertheless the qalb-guided leadership elements is necessarily needed as it could complement the professional accounting profession even better in the future. Spirituality is so impactful since it could impart balance for both the outer and inner needs of humans (Abdul Razak et al, 2018). In educating potential accountants, the qalb-guided leadership virtues will assist accounting educators to produce not only human capital but also a human being since a holistic education system is crucially more important than science and technology subjects (Md Aroff, 2014). The practical implication on the use of qalb framework could cultivate the educators to become more impactful and sustainable leaders. The four cardinal virtue (WJCT) will enable accounting educators to have self-monitoring, self-awaken, self-consciousness, self-regulation, self-discipline, self-management and self-leadership. Besides, it could establish a harmonious relationship with the self, society and God. Therefore, it is suggested that the qalb-

guided leadership virtues should be practiced by accounting educators because it will significantly influence their students' behavior. The values that have been learned will be applied by the students in their daily life resulting in more civilized behavior and alleviation in fraud and corruption. Students that are equipped with qalb-guided leadership are expected to become impactful leaders. Wisdom, justice, courage and temperance are universal concepts, thus this theoretical framework is very impactful to practice not in Asian context only but that makes global practice relevant. The empirical analysis using this approach is suggested for future research after the adoption of this qalb-guided leadership framework as a standard in the higher education institution, so that progress can be shared and the loophole could be strengthened.

Abstract

Studies on tax compliance have evolved over the years and it is highly important to analyse on the depth of the research findings and voids that could be filled for future researches. In general, past empirical studies warrants the importance of institutional factors, attitude, social factors and enforcement factors in raising tax compliance among the taxpayers. The inadequate sample and contradicting findings are the two major voids identified from the past studies to be addressed in the upcoming tax compliance studies.

Keywords: Tax Compliance, Factors, Taxpayers

Introduction

Malaysian income tax is the greatest contributor to the country's income, which is about fifty to fifty-five per cent each year (Inland Revenue Board of Malaysia [IRBM], 2018). The highest tax figure was noted in year 2018 where individuals, the second largest direct tax contributors achieved a tax record of 26.32% or RM 36.065 billion from the total direct tax revenue of RM 137.035 billion in 2018 (theedgemarkets.com, 2019). In 2004, the major tax reform took place in Malaysia where the Self-assessment system (SAS) was introduced replacing the Official Assessment System for individual taxpayers. The ultimate objective of SAS was to attain cost effectiveness in the process of tax collection via voluntary tax compliance and the eradication of enforcement efforts (Silvani and Baer, 1997; Kasipillai and Hanefah, 2000). However, the tax reform implemented has led issues of tax compliance (Hai and See, 2011; Saad, 2009). Tax compliance issue has initiated much interest among researchers, with the main attempt of identifying the influencing factors and determining ways to increase compliance. This paper attempts to explain the key factors investigated in the previous studies relevant to tax compliance and identify significant research gaps that are left to be addressed.

Literature Review

Tax Compliance

Tax compliance has been interpreted in different manners by tax researchers. In the earlier years, Jackson and Milliron (1986) described tax compliance as declaring the taxpayers' entire revenue and tax remittance to the appropriate tax body on time in accordance with the relevant tax rules, regulations and court orders (as cited in Mas'ud et al., 2014). Cuccia (1994) explained tax compliance in terms of filing every necessary tax return in the right time and correctly declaring the tax payable in accordance to the tax legislation practicable when filing the tax return. Andreoni et al. (1998) explained tax compliance as the willingness of the taxpayers in complying with tax regulations for the purpose of attaining the nation's economic balance. James and Alley (2002, p. 32) defined compliance as "the willingness of individuals and other taxable entities to act in accordance within the spirit as well as the letter of tax law and administration without the application of enforcement activity". Later, Palil and Mustapha (2011) interpreted tax compliance as the readiness of a taxpayer to obey the tax laws, report the accurate earnings, make the right claims and settle all taxes in a timely manner. As James and Alley (2002, p. 29) reported in their study, compliance definitions are looked as a continuum of definitions, and "this ranges from the narrow law enforcement approach, through wider economic definitions and on to even more comprehensive versions relating to taxpayer decisions to conform to the wider objectives of society as reflected in tax policy". Therefore, the interpretations of tax compliance itself have evolved over the years as reported by diverse number of tax scholars and practitioners. Determinants of tax compliance could be categorised into institutional factors, personal and social factors, and enforcement factors. The following subsections deliberate on past studies based on these categories.

Institutional Factors

Institutional factors form the external pressure or motivating factors influencing tax compliance. Institutional factors refers to individuals' perceptions towards the government and the tax authorities, including perceived fairness towards government spending and tax system, as well as trust and confidence towards the government. Studies that examined institutional factors are mostly influenced by the Equity Theory. The theory postulates that individuals evaluate the fairness of a situation by assessing the inputs and outcomes. Individuals tend to lower their input or raise their outcomes when outcomes are perceived to be inequitable. In the context of tax compliance, perceived inequitable treatment (e.g. misuse of public funds, tax money was spent on projects they do not approve of, corruption), would cause taxpayers to reduce the taxes paid. Tax compliance has also been found to improve whenever taxpayers perceived fair treatment by tax authorities, trust officials and received good services (Tanzi and Zee, 2000; Torgler, 2005; Alm and Martinez-Vazquez, 2007).

In Barone and Mocetti (2011), perceived fairness was found to positively affect tax morale among Italian taxpayers. Perceived fairness was analysed based on the fair outcomes of taxes paid and government efficiency. This reflects the existence of psychological contract between the two parties, the taxpayer and the government or more precisely the fiscal authorities. Fairness in tax system and the level of enforcement have been found to influence tax morale in Yee et al. (2017). The study involved 400 Malaysian taxpayers. The study concluded that when the government is perceived as fair, respondents were more likely to comply with taxes. Nevertheless, Saad (2009) found that fairness perceptions do not significantly influence taxpayers' attitude. The study conducted involved a survey of 852 individual taxpayers in Malaysia.

Ibrahim et al. (2015) examined patriotism, democracy satisfaction, parliament confidence, and government trust in relation to tax morale. The study found that confidence and trust placed by the individuals on the parliament, provision in public spending, government transparency and governance, as well as government efforts to reduce corruption positively enhances tax morale. In contrast, patriotism and the level of contention perceived by the individuals in democracy have been found as not significant. Similarly, corruption and patriotism have been found to negatively influence tax morale in Rutkauskas (2016). Policy changes has been found to negatively impact tax compliance in Engida and Baisa (2014) although perceived government disbursements, perceived equity fairness, function of tax

authorities and tax knowledge did not. Taxpayers who were attentive to policy changes tend to affect taxpayers negatively when policy changes did not produce any anticipated favourable outcomes. Nonetheless, this study suffered from the limited sample used.

In Uganda, Nkundabanyanga et al. (2017) found tax system transparency, voice and accountability and effectiveness of government significantly influence tax compliance. The study also reported the significant influence of fairness factors, including those of public spending allocation and value, tax levels, and tax equalities on tax compliance. Similarly, in Faizal et al. (2017), perceived justice dimensions were investigated in relation to tax compliance. Using responses from 90 survey respondents, the authors concluded that tax compliance is positively influenced by individual's trust on the tax authority and procedural justice. Alasfour et al. (2016), in a survey involving 329 financial managers, certified accountants and auditors, found that tax compliance is negatively impacted by government corruption rate and tax rate. In the same study, productive government spending and perceived tax system fairness was reported to significantly affect tax compliance.

Personal and social factors

Studies on the influence of personal and social factors on tax compliance have been well supported by the Theory of Planned Behaviour (Ajzen, 1991). Past studies are more inclined towards this theory in explaining the relationship between attitude, social norms and perceived behavioural control on tax compliance. Attitude has been explained as one's emotional state related to a particular behaviour. Subjective norms is one's understanding of how the significant others perceived the specific behaviour. Perceived behavioural control is described as a one's perceived comfort or hardships of performing the behaviour (Ajzen, 1991; Ifinedo, 2012).

The influence of attitude on tax compliance has been reported in Saad (2009), Damayanti (2012), Sarrah et al. (2016), Nurwanah et al. (2018), and Sulistianingtyas et al. (2018). These studies reported that tax compliance could be associated with positive attitude towards the behaviour. The relationship is rather straight forward, which is well described by the TBP. However, Salman and Sarjono (2013) documented a different result. The authors found that attitude failed to determined tax compliance. The study used responses from 87 respondents and the limited sample size may have impacted the results considerably.

Subjective norms is significant in Wenzel (2005), Saad (2009), Damayanti (2012), Salman and Sarjono (2013), Mohdali et al. (2015), Jimenez and Iyer (2016), Sarrah et al. (2016), Nurwanah et al. (2018). Jimenez and Iyer (2016) maintained that the influence of social norms on tax compliance becomes significant when social norms are internalised as personal norms by the taxpayers. Such internalisation has a dominant influence over the individual's credence and faith in government where this trust shapes the perceived fairness and eventually tax compliance. In Nurwanah et al. (2018), the influence of social norms on tax compliance, nevertheless, is subjected to individuals' social awareness. These factors could have affected the results in Sulistianingtyas et al. (2018), whereby subjective norms was found to be negatively associated with tax compliance.

Significant influence of perceived behavioural control on tax compliance is documented in Damayanti (2012), Salman and Sarjono (2013), and Sulistianingtyas et al. (2018). However, in Saad (2009), perceived behavioural control is not significant. Sarrah et al. (2016) reported that perceived behavioural control indirectly affects tax compliance via intention. Perceived behavioural control reflects how easy or hard individual taxpayers think in performing any tax compliance behaviour. The influence of perceived behavioural control on tax compliance could have been modified by the respondents' knowledge on tax and experience in tax filing. This support for this notion could be found in Salman and Sarjono (2013), whereby the tax law complexities has been found to negatively and significantly influence tax compliance intention. The study defined complexity as "complex tax laws or failure of good legal norms regarding his actions, implementation, and about the material", (p.316). The study, however, suffered from the low sample size of 87 survey respondents. When the degree of complexity is great and comprehension of tax laws is more difficult, the intention to comply with taxes decreases. The moderating influence of tax knowledge and experience on perceived behavioural control, however, has been adequately examined in past studies on tax compliance.

Enforcement Factors

Various enforcement methods have been employed by the Inland Revenue Board in order to encourage tax compliance, including legal sanctions and penalties. The influence of these enforcement factors, nonetheless, received lesser attention from researchers and existing studies showed conflicting results – hence forming a considerable gap in the literature. In Benk et al. (2011), legal sanctions were found to influence tax compliance. The sanctions examined relates to detection risk and penalty magnitude. The probability of being audited formed the strongest determinant of tax compliance although penalties were found to be insignificant in relation to tax compliance. In Alasfour et al. (2016), tax compliance was found to increase with increased audit rates and penalty rates. In Mohdali et al. (2014), it was determined that punishment threats may have adverse impact on tax compliance. Similarly, Sulistianingtyas et al. (2018) reported that sanctions do not affect tax compliance.

Discussion and Conclusion

Based on the analysis of past literatures, several conclusions can be derived. The significant role of psychological factors to be thoroughly considered by the government in designing and implementing action plans to boost voluntary compliance among the taxpayers. For example, the government should care on how their actions are being perceived by the taxpayers since many of the former researchers have provided concrete evidences on the impact of perception on tax compliance. It is also important for the government especially the tax authorities to understand the taxpayers' attitude towards tax compliance and find ways in apprehending negative attitude among the taxpayers. For example, social medias and mass medias can be utilised to spread the message on paying taxes as a civic duty that every Malaysians must fulfil. The government should actively look out for ways in making tax paying practices as a vital responsibility that should be willingly undertaken by the citizens. It is also important to ensure tax compliance becomes a social obligation to be fulfilled and denying those responsibilities should be viewed as socially unacceptable. The awareness can be created via enforced sanctions. However, it is highly important to recognise the extent of which such enforcement could be effective in enhancing in tax compliance without backfiring.

A significant research gap or lack in the past empirical studies was the inadequate sample. The sample used by some of the researchers in their studies was not a proper representative of the target population being studied. The insufficient sample quality is due to poor quality in sample selection and inadequate sample size leading to a low response rate. For instance, Mohdali et al. (2014) research sample was made up of near 90 per cent of taxpayers who were subject to monthly tax deductions from their salary and only 10 per cent of tax payers who were subject to declare their own earnings and calculate their own tax. This sample casted a doubt on the accuracy of the findings due to the high probability the findings were dominated by the respondents whose tax compliance behaviour were determined by enforcement rather than voluntary in nature. Small sample sizes also may have restricted the research findings, such as those in Salman and Sarjono (2013) with 87 responses and Faizal et al. (2017) with 90 responses.

Another limitation of the previous researches can be seen from the presence of many conflicting findings. For example, in Engida and Baisa (2014), the perceived equity fairness was reported as not significant in determining tax compliance. However, other studies like Nkundabanyanga et al. (2017) had indicated the significant influence of perceived equity on tax compliance. Contradictory results are also apparent in studies of enforcement factors.

Future Studies

Considering the gaps in the current literature, the following factors should be considered in future studies. First, the sample selection should well represent the taxpayers. If voluntary compliance is the main focus, there should be adequate representation of self-employed taxpayers in the sample. Secondly, future studies could focus on factors that increase perceived fairness in the effort to increase tax compliance. Past studies have shown significant influence of perceived fairness on tax compliance. It is about time that perceived fairness is investigated further as to encourage tax compliance. Thirdly, tax knowledge and experience in tax filing should be incorporated in the Theory of Planned Behaviour as these variables could have impacted the relationship between perceived behavioural control and tax

compliance. Fourth, the lack of studies on enforcement factors warrants further research. Enforcement factors have been found to either encourage or discourage tax compliance. Hence, more studies are needed before concrete deductions could be made.

Abstract

It is at times perplexing that with vigorous measures in place, banks are still knowingly and unknowingly absorbing money laundering risk into their institutions. Besides various measures implemented by the banks, the regulators are also making constant attempts to protect the banking industry, but the regulatory force is far from providing a total solution. This paper attempts to discuss some of the reasons (drawn from micro and macro perspectives and looking at institution-specific and industry-specific causes) that might explain why banks are still exposed to money laundering risk despite continuous efforts to reduce the use of the banking sector as a conduit for illegal activities.

Keywords: Money Laundering, Risk, Banks, Competency, Governance.

Introduction

By looking at the modus operandi of money laundering, banks are primarily the first-level contact point with the money launderers (Idowu & Obasan, 2012). The nature of banks, in terms of the products and services offered, accessibility and convenience, lures the money launderers in a far greater proportion than with any other financial intermediaries (Mclaughlin & Pavelka, 2013; Sathye & Islam, 2011) and banks should be aware that they are at risk criminally if they are knowingly involved in accepting money laundering risk into the institutions (Simser, 2011). Money laundering impacts upon the banking sector in two main ways: the erosion of their integrity and the possible threat of financial liability in the event of any legal suit levelled against, or regulatory fines imposed upon them (Bartlett, 2002). Thus, money laundering is a risk that affects not only the banks but also the banking industry and overall financial stability.

It is inarguable that the operations of banks are about taking risks, albeit calculated ones (Al-Tamimi & Al-Mazrooei, 2007; Cebenoyan & Strahan, 2004). Nevertheless, although some money laundering risk is inherent in the very nature of banking operations, it can also be exacerbated by poor control measures and non-compliance with anti-money laundering (AML) policies (Naheem, 2015; Pramod, Li & Gao, 2012) as well as the inability of bank employees to filter the risk posed by the customers (Favarel-Garrigues, Godefroy & Lascoumes, 2007; Johnston & Abbott, 2005). These non-inherent factors could originate from the institution-specific as well as industry-specific causes.

In fighting money laundering, concerted efforts are being undertaken not only by banks but also the regulators (Araújo, 2009; Usman Kemal, 2014). The endless exposure of the banks to money laundering risk has compelled the financial regulators around the world to be more vigilant in regulating this industry. It is universally recognized that all financial transactions are under surveillance nowadays, and banks are required to operate diligently and be conscious that the regulatory authorities are overseeing how they are functioning (Favarel-Garrigues et al., 2007). At the international level, the Financial Action Task Force (FATF) is an inter-governmental body mandated to set standards and to actively promote effective implementation of legal, regulatory and operational measures for combating money laundering and other related threats to the integrity of the international financial system (FATF, 2012). The regulatory authorities in the respective countries and FATF are actively geared towards making the banks as a secure financial intermediary that is safely shielded from money laundering risk.

Nevertheless, with the persistent measures in place, banks are still being continuously exposed to money laundering risk. Over the years, a number of large and prominent banks around the world, such as Standard Chartered Bank and HSBC Bank, are being affected by money laundering risk (Mclaughlin & Pavelka, 2013; The Guardian, 2019). Hence, question arises as to why these banks are being incessantly exposed to such risk? This paper aims to presents some of the possible reasons that could have led to this predicament. Banks could have managed their money laundering risk more efficiently and effectively with a better understanding of the underlying reasons for this problem.

Nature of Money Laundering Risk in Banks

Money laundering risk in banks can be grouped under two broad categories – regulatory risk and business risk (which is sub-categorised into inherent risk and residual risk) (Sathye & Islam, 2011). Regulatory risk is associated with non-compliance with the practices of customer identification, reporting, record keeping and implementation of an AML programme. Banks have to comply with a substantial amount of legal obligations to safeguard them against money laundering risk. Business risk, on the other hand, implies uncertainty and danger of loss as well as any event that poses a risk due to unforeseen circumstances which could cause banks to fail.
Inherent risk emanates from the customers seeking banking services, the products offered to the customers, the delivery method of the products and the geographical location from which the customer comes or the location in which the offering of products and conduct of transactions take place. Residual risk, on the other hand, refers to the risk that may still exist despite the robust money laundering risk management framework to alleviate all the four types of risks mentioned above.

The most critical aspect relates to the risk originating from the bank employees' assessment of customers' risk. Both Sathye and Islam (2011) and Killick and Parody (2007) similarly explained the inherent business risk by emphasizing the description of the source of risk. The customers themselves, either individual or institutional customers, bear risk due to their source of income and wealth, their past activities and the intended nature of their activities. The customers who are deemed a risk should be assigned with a high alert on the possibility of an alleged money laundering, for example politically exposed persons (PEPs), a customer who has an unusual request for service provision and a customer whose source of funds is unexplained.

Product risk, on the other hand, is the risk posed by the products being offered to the customers and their inherent attractiveness to money launderers as a conduit for illegal activities (Sathye & Islam, 2011). Some products offered by the banks may present greater appeals to the money launderers. For example, investment products, whose returns may involve receipt of a periodical annuity and full payment on maturity, are ideal for money launderers. The way the products are delivered to the customers also poses a different level of risk to the banks. Products that are delivered face-to-face generally pose lower risks compared to those delivered online.

With the Internet, customers are offered with varieties of online transactions that do not require a direct interface with the customers (McDowell & Novis, 2001; Sathye & Islam, 2011). For banks, online transactions, for example online fund transfer, pose a greater risk as the identity of the customer is not visually verified. For jurisdiction risk, money laundering risk can be country-specific in which the economic activity which gave rise to the income or wealth was derived from, or where the activity is to take place. Among these risk elements, customer risk is the strongest link that connects all four elements of risk. Banks need to develop profiles on these risk elements to form the grounds upon which customer identification documents are determined in order to ensure a thorough assessment of the related risks.

The Magnitude of Money Laundering Involving Banks as a Conduit

In 2019, the amount of fines imposed by the regulators topped USD$7.7 billion and banks were the primary recipients of those (Compliance Notes, 2019). Those banks involved were the international banks which are large in size and whose operations span across many countries. Despite good controls being in place, given that they were some of the most established banks in the industry, money could still be laundered via these institutions. The following paragraphs outline some cases involving banks at the international front which have been fined by the regulators for their involvement in money laundering activities.

The first case is London-based HSBC Bank that has been fined by the United States regulator for USD$1.92 billion in 2012 for failing to stop Mexican drug traffickers from using its banking system to launder money (Mclaughlin & Pavelka, 2013). The sum is the largest fine ever collected by a single regulator in a money laundering case. The regulator managed to substantiate that the bank had failed to maintain an effective AML programme and failed to conduct proper customer due diligence (CDD) on some of its account holders, including Mexico's Sinaloa cartel who was infamously connected with drug trafficking activities. Despite the known risk of Mexican-originated customers, the bank put Mexico in its lowest risk category and ignored the warnings that HSBC was likely to be tempting to money launderers.

HSBC agreed to pay the fine and the executives responsible for the relevant banking deal have since left the bank. No criminal charges were initiated as it had been agreed with the prosecutors that criminal charges should be set aside in the event certain conditions were met, including the payment of substantial fines. Some criticised that the fine was too lenient (Fernholz, 2012; The Guardian, 2013) and allowed the bank to avoid pleading guilty to any wrongdoings even though the case could have had very serious implications for financial and economic stability due to the huge size of HSBC globally. This case reinforces that money laundering should be tackled at the point of initial contact with the banks, as once absorbed into the institutions, less can be done to curtail its impacts towards the economy.

The second case involves Standard Chartered Bank which was fined for USD$1.1 billion in 2019 for poor money laundering controls and breaching sanctions against high-risk countries including Iran, Cuba, Sudan and Zimbabwe (The Guardian, 2019). This was not the first money laundering case involving the bank since it was fined USD$340 million in 2012 for breaking AML laws in its handling of transactions for risky Iranian customers. The United States and its allies have increased economic sanctions against Iran for the past few years in an effort to deter the country from developing its nuclear capabilities. The bank was accused of approving more than 60,000 financial transactions totalling USD$250 billion for Iranian customers over a span of a decade. In 2014, Standard Chartered Bank had paid a further USD$422 million in civil penalties for failures to routinely check transactions for signs of money laundering. This series of incidences have dragged the bank into the regulatory spotlight and presented a reputational threat that could be damaging to the bank's market performance.

Another recent case involved Swiss BSI Bank amid the 1 Malaysia Development Berhad (1MDB) sovereign fund issue (Teichmann & Falker, 2020; The Straits Times, 2016). Three of BSI's Bank executives in a Singapore branch were charged with various wrongdoings including money laundering related offences for failing to flag out suspicious transactions that had passed through the bank. One of the executives was sentenced to two weeks in jail and a fine of SGD$10,000 for failing to report suspicious transactions and another executive is serving an 18-week jail term after pleaded guilty in for similar offence. The case has also dragged a former private banker with the bank, who was charged with a similar offence and the court ruled for him to be jailed for four and half years (Thomson Reuters, 2017). Apart from BSI Bank, another giant bank affected by 1MDB scandal is Goldman Sachs which has resulted in an erosion of close to USD$1 billion of its bottom line due to litigation provisions provided in the wake of the scandal (Financial Times, 2020). Goldman Sachs allegedly helped 1MDB in raising USD$6.5 billion in a series of bond issuances, with returns amounting to USD$600 million in fees. Goldman Sachs was criticized for its lack of compliance control and some of the bank's most senior management were also purportedly involved in soliciting the illegal money derived from 1MDB investment activities. The association of Goldman Sachs with 1MDB has led to a series of lawsuits charged by the United States and Malaysian authorities. Although the parties involved are reaching a settlement agreement with Goldman Sachs of USD$3.9 billion for the Malaysian government over the scandal, the bank's reputation has arguably been terminally tarnished.

With these scandals involving large banks, which are deemed to be supposedly equipped with robust risk management practices, it is puzzling as to why these banks are still susceptible to money laundering risk. Questions have been

asked as to whether these banks are actually voluntarily taking in this risk, as they could be abiding with the 'high risk, high return' principle. From another angle, the banks could have been involuntarily and unknowingly absorbing money laundering risk into the institutions due to reasons that require solutions beyond the generic risk management practices.

Factors Contributing Towards Continuous Exposure of Money Laundering Risk in Banks

With all the efforts that have been put together, the question remains on why banks are continuously being vulnerable to money laundering risk. In this paper, we are discussing some of the possible reasons that could contribute to such risk exposure to the banks, both at the micro and macro perspectives and in terms of institution-specific and industry-specific causes.

Bank employees lack soft competencies

Banks could have different ways of monitoring their money laundering risk, with some relying on automated risk monitoring solutions and some still depending on a manual system. There are many automated risk monitoring solutions in the market, some of which are designed for larger institutions, and some of which are adaptable to banks of multiple sizes (Cocheo, 2010). However, the automated solutions encompass limitations such as the lack of criteria for the system to assess money laundering risk. According to Cocheo (2010), in dealing with false alarms and other 'noises' generated by automated solutions, "manual" (human) expertise is needed. The risk screening system used can generate an output which sometimes can be voluminous, and the data output needs to be analysed by people. There is a need for human intervention to assess whether the cases flagged out by the system are truly bearing money laundering risk. Although the banks are exposed to choices of automated solutions in assessing money laundering risk, the human factor in assessing the risk is indispensable (Dowling & Leech, 2007). At the end of the spectrum, risk management within the banks shall not be totally depending on automated solutions. The banks could face potential liability if they fail to establish measures in the form of procedures to detect money laundering which in effect could potentially lead to the conduct of negligence by their employees (Sahamid, 2008).

It was further argued that having hard infrastructure is not quite enough in facilitating the assessment of money laundering risk. Hard infrastructure, for instance in the form of information system technology and regulatory mechanisms, would provide structural support for money laundering risk assessment, but 'soft infrastructure' in the form of human intellectualism is equally important. Information system technology would generate information, as much faster efficiency and human judgement is needed to interpret the information. As the regulators are putting much emphasis on money laundering risk management, the bank employees should have a solid behavioural perspective in looking at money laundering risk. The employees, particularly the frontliners, should act as the first line of defence by utilizing the hard infrastructure and at the same time injecting their soft competencies, in optimizing their capabilities in assessing money laundering risk. This 'soft' capability, however, is deemed to be lacking (Mat-Isa, Mohd-Sanusi, Haniff & Barnes (2015).

Financial crime from within

Employees in the banks, from frontliners to higher-level management, could be complicit in allowing money laundering risk to penetrate the banks. The employees could have used their status and position in the banks to conceal their wrongdoings, which might have led to crimes remaining undetected. These insiders who at times appear to be vulnerable for various personal and work reasons, could be exploited by money launderers who know that these employees are the easiest targets for assisting them in placing the illegal money in the bank. Among the functions that the employees can be complicitly involved in are creating counterfeit checks, co-ordinating banking transactions is a way that can avoid suspicious transaction reporting (STR) and conspiring with money launderers to accept fictitious documents without checking on their authenticity (FATF, 2018).

Bartlett (2002) advocates that money laundering is often a correlation between the crime of laundering the money and fraudulent activities by the bank employees. At higher volumes of money laundering activity, banks in developing countries are vulnerable to corruption by criminals seeking to gain further influence over their money laundering channels, which could involve corrupted employees within the banks. Additionally, he points out that customer trust

is fundamental to the growth of sound banks, and the perceived risk to depositors and investors from employee fraud and corruption is an obstacle to such trust. Hence, opportunistic money launderers would leverage on this predicament to involve the bank employees acting as the insiders to facilitate their crimes of laundering their illegal money through the banks.

Professional Money Launderers

The emergence of professional money launderers with sophisticated modus operandi has made it even more difficult for the banks to detect money laundering risk. The FATF defines professional money launderers as those individuals, organisations and networks that are involved in third-party laundering for a fee or commission (FATF, 2018). They are serving their criminal clients and are complicit partners who may act in professional capacity, such as accountants and lawyers. Professional money launderers may provide a more holistic arrangement for complex money laundering schemes or develop a unique modus operandi tailored to the specific needs of their criminal clients. (FATF, 2018, Neumann & Sartor, 2016). The FATF has revealed that many countries are not adequately investigating and prosecuting professional money launderers as efforts are being channelled to self-proclaimed money launderers i.e. the criminals themselves.

Professional money launderers have become even harder to detect as they are operating a number of different business models, such as in an individual capacity, underground organizations with network of firms, or operating on an online set-up without a clear structure of ownership. Professional money launderers are often found to network with other professional money launderers, creating a complicated web of connections that act internationally to deceive financial intermediaries all over the world. Their camouflage appearance could be deceiving to the banks as they can represent their clients in a legal capacity to disguise nature, source, location, ownership, control, origin and/or destination of the illegal funds in order to avoid detection by the banks (FATF, 2018). By deceivingly acting in their legal capacity, professional money launderers would know how to evade the banks' AML regulations and procedures, and the banks could have missed to detect this risk as much trust have been put on these professionals to act truthfully to their profession.

Silent tone of Proper Governance

At the helm of banks, boards of directors and top management play a crucial role in ensuring proper governance is in place. According to De Haan & Vlahu (2016), solid governance in banks is important because banks hold a dominant position in the financial system. Jayasuria (2009) has proven that good governance practices are positively correlated with the implementation of AML activities, of which top-down support is crucial in ensuring the implementation of the AML activities at the grassroot level. Similarly, the AML compliance programme within the banks is largely dependent on the messages passed down by the board of directors and top management. Failure in having a conducive culture of compliance initiated via a top-down approach would lead the frontliners to perceive lack of consistent efforts in fighting money laundering. This would leave the frontliners to feel that they were battling the war of money laundering with limited capability on their part to have a major influence on the banks.

Absence of good governance leads to a void in the check and balance mechanism, whereby those charged with governance could have abused their power and operate the banks in their own interests instead of the shareholders'. This is seen in the case involving Goldman Sachs and the 1MDB scandal, whereby top management was involved in deriving personal advantage at the expense of many other parties involved. The board of directors and top management should have set a proper tone of governance and shown that the fight against money laundering should be a collaborative effort between all levels in the institutions. Absence of this proper tone of governance 'from above' would undermine the roles of those charged with governance in disseminating the message that they are the gatekeeper for the whole institution.

Differentiated effect of regulatory enforcement

Apart from governance from within, banks are also forced to comply with regulatory requirements. As risk management may be subsumed within the banks' own objectives on deriving commercial advantages, effective supervision by the regulator may diminish the conflict of maintaining good risk management with optimising rate of return to the shareholders (Favarel-Garrigues et al., 2007). As such, banks should manage their regulatory risk by

being constantly alert on the requirements enforced by the regulators. This is crucial as criminals would seek to use banks that operate in lax regulatory environments, or have reputations for non-compliance with AML regulations, as their conduits to launder their dirty money (McCusker, 2000).

However, enforcement effects by the regulators may have different effects on the banks and the employees. For competent employees, strict regulatory supervision is often regarded as a culture of strong monitoring that drives them to act in the best interest of the banks. Bank employees would be compelled to abide by the prescribed AML law, rules and regulations imposed by the regulators since they are aware that any non-adherence would implicate not only the banks but also their individual culpability. In contrast, for less competent employees, they would likely perceive strict regulatory supervision as a nuisance as low-performing individuals generally do not prefer to be monitored. Once monitoring by the regulator reaches a certain limit, less competent employees would tend to reduce their efforts as they feel they would be penalised for their incompetence. Less competent employees would also tend to be ignorance on the requirements of the AML law, rules and regulations. They would be ignorant of the fact that any non-adherence with the AML law, rules and regulations would affect them individually, hence, creating less motivation for them to perform better.

Mighty force of political influence

The politically exposed persons (PEPs) could be those politicians having power over the banks' management as well as random PEPs who comes to the banks seeking banking services. The PEPs, who are commonly the individuals entrusted with prominent public functions (including their immediate family members and close associates), are deemed as those who are influential in the society, hence receiving preferential treatment in conducting their banking transactions (Choo, 2010; Cogman & Head, 2017). The FATF has classified PEPs as risky and banks are required to be more meticulous and thorough in their risk assessment given the exposure posed by the PEPs. A study by Johnson (2008), however, found that there is a lack of scrutiny by the banks in conducting CDD for PEPs. Despite the requirements by the FATF and Basel Committee on Banking Supervision for banks to conduct enhanced CDD on PEPs, Johnson found that requirements to identify PEPs and scrutinise their financial transactions are not fully implemented even by banks in FATF member countries.

Furthermore, in some banks, the political structure of the country may have called for intervention from PEPs' 'hidden hands' in dealing with the banking business. Corrupt politicians, particularly, would use the banks under their power to serve their political as well as their personal needs even if the funds involved are derived from illegal means. In the case of Malaysian 1MDB, the alleged involvement of a prominent PEP in the scandal has forced one of Malaysian domestic banks, AmBank Berhad, to get entangled and fined by the Bank Negara Malaysia for RM53.7 million (The Edge Malaysia, 2015). This kind of mighty political influence from a powerful figure has left the bank in a difficult position to say no to an unusual request for service provision. Banks are at times are forced to give in and provide leeway to the PEPs despite knowing that the sources of funds are intricately unexplained.

Conclusions

In summary, there are several main issues to explain why banks are still exposed to money laundering risk. In struggling to compete and boost banks' market share and profits, some banks may compromise their gatekeeping of money laundering transactions. Banks continue to breach compliance with AML rules to pursue more market share in competitive markets (e.g. ING, 2018). Likewise, the enforcement of money laundering regulations has imposed greater challenges for the enforcement agencies to work under complex issues. Furthermore, transparency and accountability are some of the issues that need to be addressed in tackling money laundering risk. Suspicious transaction reporting needs to be enhanced to ensure effectiveness in the reporting and investigation, including those classified as PEPs. Although the regulators impose and enforce stringent AML compliance regulations, the accountability of top management and bank officers are rather subjective (Yeoh, 2019). There could be many other issues that can pose further challenges for the banks to detect money laundering risk, such as digital banking and cryptocurrencies (Whisker, 2019). Hence, more intensive efforts and initiatives need to be taken by the regulators and banks to elevate the trust of the stakeholders.

Abstract

General Muhammudu Buhari (retd), a former military ruler became democratically elected president of Nigeria in 2015 after making several attempts. Buhari's assumption to power signaled the end of the 16 years rule of the erstwhile ruling party, the People's Democratic Party (PDP). This study is premised upon the perceptions of undergraduate students in Landmark University on the performance of President Muhammudu Buhari's administration. Well structured questionnaires were administered to students of Political Science, International Relations, Sociology and Economics departments. he feedbacks garnered from students reveal an overall pessimistic outlook on the performance of the incumbent administration as most of the responses of students fall in the negative domains in respect of issues appertaining national security, the state of the economy and the anti-corruption drive.

Keywords: Perceptions; President Muhammudu Buhari; National Security; Economy; Anti-corruption; Structured Questionnaires.

Introduction

Nigeria's incumbent president, General Muhammudu Buhari (retd) is one of the key political figures in Nigeria's political history. Buhari served as Nigeria's military head of state (1984-1985) after the military took over power from the Alhaji Shehu Shagari led civilian administration of the second republic. Buhari and his influential deputy, General Tunde Idiagbon (retd) steered the ship of Nigeria for 20 months before General Ibrahim Badamosi Babangida (retd) staged a palace coup to oust them from power.

The Buhari/Idiagbon military regime was heralded as the solution to the crippling socio-economic problems rocking Nigeria as at that time. President Shehu Shagari's government (1979-1983) became very unpopular with most Nigerians because his administration lacked the political will to checkmate widespread corruption (Olowojolu, 2017). Under Shagari, Nigeria's once buoyant economy nosedived. Additionally, there were widespread condemnations over the conduct of the 1983 general election that was characterized by gross electoral fraud (Olowojolu, 2017).

Upon assuming power on January 1, 1984, the Buhari- led military regime came up with War Against Indiscipline (WAI) in order to fight corruption and indiscipline that have engulfed the Nigerian society. Prominent politicians were arrested and jailed by the military administration of Buhari based on corruption related matters (Olowojolu, 2017).

The military government of Buhari went on to expel illegal aliens from Nigeria; change the Nigerian currency; rejected IMF economic policies, closed Nigeria's borders to neighbouring countries and got involved in a much publicized diplomatic face off with Britain over the failed abduction of Alhaji Umaru Dikko (Fawole, 2003).

Across different sections of the Nigerian society, Buhari's military government was condemned for the regime's infringement on the fundamental human rights of Nigerians and the high handedness in handling the affairs of the country. On August 27, 1985, Buhari's military government was toppled in a palace coup that was masterminded by General Ibrahim Badamosi Babangida (retd) who went on to rule Nigeria for another 8 years.

Muhammudu Buhari resurfaced in the political equation of Nigeria when he defeated the incumbent president, Dr. Goodluck Ebele Jonathan in the 2015 presidential election. Prior to Buhari's 2015 victory, he had contested for the presidency in 2003, 2007 and 2011 elections with the penchant of ending as runners up. It must be noted that Buhari is the second military ruler to become a civilian president after Olusegun Obasanjo who was military ruler (1976-1979) and president between 1999 and 2007.

As Nigeria's first opposition candidate to defeat an incumbent president in an election in Nigeria, Buhari was saddled with the responsibility of re-positioning Nigeria on the right pedestal among the comity of nations. Buhari emerged as president of Nigeria at a time when the country was faced with Boko Haram Insurgency in Northeast that has claimed over 20,000 lives and left 2 million displaced from their homes (Al Jazeera, 2017). Secessionists' threats from Independent People of Biafra in Eastern Nigeria and the Fulani herdsmen and farmers clashes in some states of the country have become issues of great concern. Rising rates of unemployment and poverty, lack of basic social amenities and the high rate of corruption are major burning issues confronting the Buhari presidency. President Buhari asserted that his government will focus on three major areas: security, economy and corruption (Vanguard, January 22, 2018). In a 2018 official document released by the federal government of Nigeria, the administration of President Buhari highlighted 57 key achievements of the government.

Upon assuming office, President Buhari swung into action by embarking on foreign trips that were considered very strategic. On June 3, 2015 President Buhari made his first foreign trip to Niger republic in order to discuss about the security threats of Boko Haram, trans border crimes and proliferation of small and light weapons within the West African sub region (As'mau and Ismail, 2017). Buhari's next diplomatic shuttle was to N'Djamena the capital of Chad for a bilateral meeting with the Chadian president, Idris Derby on 4th June 2015. According to Thurston (2015), Buhari's visit to Chad helped in operationalizing the Multi Joint Task Force (MNJTF).

Under security, the government claimed that Boko Haram has been technically defeated. The federal government has intensified efforts in fighting Boko Haram insurgency by investing millions of dollars into the establishment of Multinational Joint Task Force (MNJTF) and the Civilian Joint Task Force (CJTF). Obamamoye (2017), noted that the collaborative efforts of Nigeria and its West African neighbours have weakened the potency of the boko haram insurgents. Nigeria's fight against terrorism has been bolstered through intelligence sharing with America's security experts as well as the purchase of A-29 Super Tucano aircrafts from America in 2017 (Ibekwe, 2017). Audu (2016) noted that all the 60 local government areas under the umbrella of boko haram were recaptured by the military.

The government of Nigeria in conjunction with the International Red Cross and Swiss government were able to secure the release of 106 out of the 276 Chibok girls that were kidnapped by Boko Haram on April 14, 2014 (3rd Year Report, 2018). Similarly, the government has been successful in securing the release of over 13,000 Boko Haram hostages and 105 of the Dapchi girls abducted in Yobe in February 2018 (3rd Year Report, 2018). Additionally, Buhari's presidency claims that over a million displaced persons have returned to their local communities in the Northeast, since 2015 (3rd Year Report, 2018).

The biggest security issue during Buhari's first tenure in office was the Fulani herdsmen and farmers clashes. The major hotspot of the Fulani herdsmen and farmers is in the Middle Belt region of Nigeria that is predominantly occupied by various ethnic groups (Yonas, 2016).

Traditionally, majority of Fulani people are into animal husbandry, while indigenes of the Middle Belt region are mostly farmers (McDougal et al, 2015). The quest for pasture by the Fulani herdsmen (who are considered to be settlers) in other parts of the country has often pitched them against the hosting communities (indigenes) in Nigeria. Another school of thought is of the view that the Fulani herdsmen and farmers conflict has religious connotation. For instance, the 2016 report published by Open Doors International stated that "violence against Christians in northern Nigeria has religious, political and cattle grazing/land issues, religion is a "common denominator".

Despite the devastating effects of the Fulani herdsmen and farmers clashes, the Buhari administration has been accused of been sloppy in addressing the problem. To some analysts, the Buhari administration has given more attention to ending the insurgency in Northeast than the Fulani herdsmen and farmers clashes (Ibekwe, 2015). Some of the government decisions under Buhari coupled with the fact that the president is a Fulani Muslim have further raised suspicions from various quarters that Buhari is promoting an agenda to Islamize Nigeria (Vanguard, August 3, 2015; Vanguard, December 17, 2015).

In order to address the crippling economic woes of Nigeria, President Buhari's administration devised the Economic Recovery and Growth Plan (ERGP) that will implemented between 2017 and 2020. The key objectives of ERGP include:

• Stabilizing the macroeconomic environment;
• Achieving Agriculture and Food Security;
• Ensuring energy efficiency (especially in power and petroleum products);
• Improving transportation infrastructure; and
• Driving industrialization, primarily through SMEs.

The Buhari administration has launched other programmes such as Ease of Doing Business Reforms, Social Investment Programme, Government Enterprise and Empowerment Programme (GEEP), Home Grown School Feeding Programme and Conditional Cash Transfer in order to tackle unemployment, strengthen private sector participation, ameliorate poverty and fight widespread hunger. In addition, this administration has embarked on measures to fighting corruption in Nigeria.

The federal government launched the New Whistleblowing Policy, Presidential Initiative on Continuous Audit and the full implementation of the Treasury Single Account and the Presidential Executive Order No.6 in order to block leakages and recover stolen public funds. Just between 2015 and 2017, over $29 billion dollars stolen funds and assets were recovered by the Economic and Financial Crimes Commission (Macaulay and Michael, 2018).

In order to open the frontiers of the Nigerian economy, Buhari engaged key allies by entering into bilateral and multilateral economic agreements. During Buhari's first term in office, Nigeria deepened its economic relations with America, Saudi Arabia, China, Germany, United Arab Emirates (UAE), France, G7 and G20 countries among others (Otu et al, 2018). Buhari's state visit to China in 2016 resulted into trade agreements worth a whooping $6 billion (US dollars) (Odubajo, 2017). To buttress this assertion, Bello et al (2017) noted that:

… led to the signing of the framework to enhance infrastructural development and industrial activities in Nigeria between National Development Reform Commission of China and Ministry of Industry, Trade and investment of Nigeria; Technological and Scientific Cooperation between both countries, the visit lasted for one week. In the aftermath of the visit, a number of the loan was granted to Nigeria especially to finance the deficit of 2016 budget, infrastructure loan for trains, among others. It must be noted that massive railway projects and road construction works are ongoing in different parts of Nigeria.

Given that the opposition party (All Progressives Congress) that won the 2015 general election capitalized on the undoing of the President Goodluck Jonathan administration to design her manifesto and manner of campaign to appeal to the electorate, the predominant issues of concern to the electorate became the vocal strength of the opposition party at the detriment of the ruling People's Democratic Party (PDP). All the people wanted was a change in their political experience which they believed only had a chance of happening if the men and party at the corridor of power changes. The All Progressives Congress (APC) brought the message of "change" that captivated millions of Nigerians.

To effect the desired change, the Buhari campaign manifesto stood on a 3-point agenda - security, economy and corruption (Vanguard, January 22, 2018). Now, President Buhari is almost about completing four years in office. But

there remain some questions begging for answers: Broadly speaking, has there been a real bifurcation away from the experiences of Nigerians under the leadership of the incumbent president of Nigeria?

In specific terms, given that the current administration captured power by priding herself on the ability to utilize a 3-point agenda to better the lots of Nigerians, this current study is motivated by the need to examine the perceptions of the citizens, of the performance of the current administration. To achieve the purpose of this study, questionnaires were administered to 300 and 400 level students from selected departments from the social sciences in a private university in Nigeria – Landmark University. The departments are Political Science, International Relations, Economics and Sociology. The choice of the level and departments follow from the reasoning that the 3-point agenda of the current administration are closely linked to political and socio-economic issues, and it is expected that students in the selected levels would possess better conversancy with the on-goings in the country and understand the questions put forward in the questionnaire..In a nut shell, the key thrust of the research is to examine the perceptions of Landmark University students, of Buhari's administration from 2015 to 2019.

In what follows, the relevant theory which would serve as the theoretical underpinning of this current study, the study area and data collection, the presentation and discussion of results are carried out. The paper winds up with the conclusion.

Theoretical Underpinning

David Easton's systems theory is primarily concerned with portraying the relationship between a system and the environment in which it is located. Easton espoused our attention to boundaries between politics and other aspects of social life and postulates the existence of a close relationship between a system and the environment (Easton, 1965).

He divides the basic component of his model of political system into "inputs" "outputs" in the form of decisions connected by a feedback (Easton, 1965).

The "supports" derives from the satisfaction of the outputs of the system and from more generalized or diffused support or approval for the system itself. The latter is necessary because a system's output cannot satisfy everyone. Easton distinguished between external demands coming from the environment and the internal ones emerging from within the system. There are also three subjects of support – political community or a group that seek to settle differences or promote decisions through peaceful action in common; regime or processing of demands and the implementation of decisions and government that undertakes concrete tasks (Easton, 1965).

Answering the question on how the potentially successful conditions from the environment communicate themselves to the political system, Easton presented his input-output model. Inputs consists of all the demands and supports through which wide- ranging activities in the environment can be channeled, mirrored, summarized and brought to bear upon political life; they are the key indicators of the way in which environmental influences and conditions modify and shape the operations of the political system (Easton, 1965).

These inputs are the contributions of individuals, pressure groups, civil society, mass media, and political parties towards shaping the responses of the government in terms of programmes and policies that are designed to improve on the different aspects of the society.

On the other hand, "Outputs" are the decisions of the authorities. Thus, the decisions taken by the legislative, executive, and judicial departments may be termed "political outputs"; moreover, they are authoritative as they are taken by men in authority roles. In between the inputs and the outputs, there is a "feedback loop" the identification of which helps to explain the process through which the system may cope with stress (Easton, 1965). Through it the system may take advantage of what has been happening by trying to adjust its future behavior. The feedback loop consists of the production of inputs by the authorities, a response by the members of the society to these outputs, the communication of information about the response to authorities and finally, possibly succeeding actions by the authorities giving rise to new round of the same activities. The feedback is thus crucial in determining the capacity of the system to cope with stress (Easton, 1965).

Easton's systems theory is relevant to this study because majority of Nigerians expect Buhari's government to address numerous issues that include: Boko Haram insurgency; kidnappings; armed bandits; Fulani-Herdsmen/Farmers conflict; Niger Delta militancy; the secessionists' threat of Independent People of Biafra (IPOB); corruption; unemployment,

poverty; lack of infrastructures and many more. The demands placed on Buhari's administration represent the inputs while, the efforts, initiatives, policies and programmes of President Buhari's administration in addressing the demands represent the outputs. The responses of the respondents that participated in this study shall represent the feedbacks.

Study Area and Data Collection

This study was conducted in December 2018. Landmark University students from 300 and 400 level were the target population. The target population for the research was drawn from Political Science, International Relations, Economics and Sociology under the umbrella of College of Business and Social Sciences (CBS). A well structured questionnaire was used to assess students' perceptions about the performance of President Buhari's administration on key areas such as the economy, national security and anti-corruption crusade. In total, 142 students filled the questionnaires.

Data Analysis

Descriptive statistics were used to highlight the perceptions of students about President Buhari's administration by obtaining the mean, mode, median, frequencies and percentages using the Statistical Package for the Social Sciences (SPSS).

Figures and Tables

Results and Discussion

Demography of the Study Population

Table 1 shows the sex of respondents. The numbers of male respondents were 69 and females were 71. Table 2 shows the age distribution of respondents. The age range that had the highest number was 15 to 19 years with 50 %, followed by 20 to 24 years with 35.2 %. 25 years and above had 2.1 % while, 18 respondents (12.1 %) did not fill the age section on the questionnaire.

Table 3 shows the distribution of students according to their departments. Sociology recorded the highest number of respondents with 38 (26.8%), followed by Economics with 36 respondents (25.4 %), International Relations 25 respondents (24.6 %) and 33 respondents from Political Science representing 23.2 %.

Table 1: Sex of Respondents

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Male	69	48.6	49.3	49.3
	Female	71	50.0	50.7	100.0
	Total	140	98.6	100.0	
Missing	System	2	1.4		
Total		142	100.0		

Table 2: Age of Respondents

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	15-19 Years	71	50.0	57.3	57.3
	20-24 Years	50	35.2	40.3	97.6
	25 and above	3	2.1	2.4	100.0
	Total	124	87.3	100.0	
Missing	System	18	12.7		
Total		142	100.0		

Table 3: Department of Students

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Political Science	33	23.2	23.2	23.2
	International Relations	35	24.6	24.6	47.9
	Sociology	38	26.8	26.8	74.6
	Economics	36	25.4	25.4	100.0
	Total	142	100.0	100.0	

Responses Connected to Agenda 1: National Security

On security, respondents responded to the different sub sections as contained in the questionnaire. Table 4 captures the breakdown of the perceptions of respondents on national security matters. On Boko Haram insurgency, 4.1 % (strongly agree) and 21.8 % (agree) of the respondents perceived that the President Buhari administration have defeated Boko Haram as shown in Table 4. However, the study shows that 31.7 % (strongly disagree) and 41.5 % respondents (disagree) scored the President low in the fight against the Boko Haram sect. This means that a total of 73.2% of the responses fall in the pessimistic domain.

In Table 4, 1.4 % (strongly agree) and 18.3 % (agree) of the respondents perceived that relative peace has been restored in Northeast region. 42.3% (strongly disagree) and 37.3% (disagree) of the respondents held the view that relative peace has not been restored in the enclave of Boko Haram, the Northeastern part of the country.

On the Fulani Herdsmen/Farmers conflict, the administration of President Buhari received low ratings as 54.9 % (strongly disagree) and 30.3 % (disagree) of respondents perceived that the incumbent government has not taken adequate measures in addressing the conflict (Table 4). 2.1 % (strongly agree) and 12 % (agree) of respondents were of the view that Buhari's administration has done enough in tackling the Fulani Herdsmen/Farmers conflict.

On the effects of the Fulani Herdsmen/Farmers conflict, 51.4 % (strongly agree) and 21.4 % (agree) of the respondents believed that food security cannot be attained with the lingering crisis. 10.6 % (strongly disagree) and 12 % (disagree) of the respondents perceived that the Fulani Herdsmen/Farmers conflict will not affect the attainment of food security in Nigeria.

On Niger Delta, 7% (strongly agree) and 27.5% (agree) of respondents agreed that Buhari's administration is handling Niger Delta affairs very well. 23.2 % (strongly disagree) and 40.1% (disagree) of respondents disapproved the handling of Niger Delta affairs by the Buhari-led administration.

Table 4: How has President Muhammudu Buhari's administration fared in handling national security?

QUESTIONS	SA	A	SD	D
The war on Boko Haram insurgency has been won by the Federal Government of Nigeria	4.1	21.8	31.7	41.5
	SA	**A**	**SD**	**D**
Relative peace has been restored in the North East geo-political zone of Nigeria	1.4	18.3	42.3	37.3
	SA	**A**	**SD**	**D**
The Buhari administration has taken enough measures in addressing Fulani Herdsmen/Farmers conflict	2.1	12	54.9	30.3
QUESTIONS	**SA**	**A**	**SD**	**D**
The lingering Fulani Herdsmen/Farmers conflict is a threat to the attainment of food security in Nigeria	51.4	21.4	10.6	12
	SA	**A**	**SD**	**D**
The Buhari administration has done well in handling Niger Delta affairs	7	27.5	23.2	40.1

Table 5: Students' perceptions on the state of the Nigerian economy under President Buhari

QUESTIONS	**SA**	**A**	**SD**	**D**
Agricultural revolution is evolving under the administration of President Buhari	13.4	35.2	22.5	27.5
	SA	**A**	**SD**	**D**
Graduate unemployment and poverty rates have reduced under the administration of President Buhari	5.6	9.2	51.4	33.1
	SA	**A**	**SD**	**D**
The value of Nigeria's Exchange rate is reducing under the administration of President Buhari	23.2	29.6	21.8	22.5
	SA	A	SD	D
The standard of living of Nigerians has declined under President Buhari's administration	42.3	31.7	12.7	12.7
	SA	A	SD	D
There is steady GDP growth under President Buhari's administration	4.9	16.9	33.1	47.1

Responses Connected to Agenda 2: The State of the Nigerian Economy

For this study, the Nigerian economy was the second yardstick used in assessing students' perceptions of President Muhammudu Buhari as shown in Table 5.

13.4 % (strongly agree) and 35.2 % (agree) of the respondents applauded the initiatives taken by the Buhari administration in boosting the growth of the agricultural sector. 22.5 % (strongly disagree) and 27.5 % (disagree) of the respondents did not agree that the agricultural sector is experiencing revolution under Buhari's administration.

5.6 % (strongly agree) and 9.2 % (agree) of the respondents were of the view that graduate unemployment and poverty rates have reduced under President Buhari. However, 51.4 % (strongly disagree) and 33.1% (disagree) of the respondents did not agree that graduate unemployment and poverty rates have reduced between 2015 and 2019.

23.2 % (strongly agree) and 29.6 % (agree) of the respondents admitted that the value of the exchange rate of the Nigerian currency is reducing under Buhari's administration. 21.8% (strongly disagree) and 22.5% (disagree) of the respondents opposed the view that the value of the naira is reducing.

Table 5 shows that 42.3 % (strongly agree) and 31.7 % (agree) of the respondents perceived that the living standard of Nigerians has plummeted under President Buhari's administration (2015-2019).

It must be noted that 12.7 % (strongly disagree) and 12.7% (disagree) of respondents opposed the view that the living standards of Nigerians have reduced under President Buhari's administration.

4.9% (strongly agree) and 16.9% (agree) of respondents did agree that the gross domestic product (GDP) is experiencing steady growth under Buhari's presidency. 33.1% (strongly disagree) and 47.1% (disagree) of the respondents claimed that there is no steady growth in Nigeria's GDP. Overall, the perceptions here are in consonance with those under national security as most of the responses remain negative.

Table 6: Students' perceptions on anti-corruption crusade of President Buhari

QUESTIONS	SA	A	SD	D
The Buhari administration is more serious about fighting corruption than all the previous governments in Nigeria	23.9	42.3	14.1	16.2
	SA	A	SD	D
There is strong public awareness on the anti-corruption crusade of President Buhari	16.2	52.1	11.3	16.2
	SA	A	SD	D
The fight against corruption is targeted at the perceived enemies of Buhari's government	20.4	46.5	11.3	16.9
	SA	A	SD	D
The anti-corruption crusade of President Buhari has brought about the repatriation of some stolen funds from abroad	24.6	50.7	10.6	9.9
	SA	A	SD	D
Nigeria is enjoying international prestige as a result of the anti-corruption crusade of President Buhari	10.6	26.1	25.4	34.5

Responses Connected to Agenda 3: Anti-Corruption

The third parameter used in assessing the perceptions of Landmark University students about President Buhari's administration was on the fight against corruption. As shown in Table 6, 23.9% (strongly agree) and 42.3% (agree) of the respondents agreed that the incumbent government of President Buhari is fighting corruption more seriously than all previous governments in Nigeria. 14.1% (strongly disagree) and 16.2% (disagree) of the respondents did not agree with the submission that President Buhari is fighting corruption with more intensity than previous administrations.
16.2% (strongly agree) and 52.1% (agree) of the respondents agreed that there is strong public awareness on the anti-corruption crusade of President Muhammudu Buhari. 11.3% (strongly disagree) and 16.2% (disagree) of the respondents gave negative views about the existence of strong awareness against corruption under President Buhari's administration. Thus, the majority agree that the current administration is doing fine in respect of bringing the anti-corruption crusade to the knowledge of the masses.

20.4% (strongly agree) and 46.5% (agree) of the respondents believed that the fight against corruption is targeted against the perceived enemies of the APC-led government of President Buhari. 11.3% (strongly disagree) and 16.9% (disagree) of the respondents declined to support the notion that the anti-corruption crusade is aimed at the perceived enemies of the federal government of Nigeria. In essence, the majority are of the opinion that the anti-corruption drive is a mere fight against the opponents of the current administration.

24.6% (strongly agree) and 50.7% (agree) of the respondents agreed that the anti-corruption crusade of Buhari's government has brought about the repatriation of stolen funds back to Nigeria. On the flip side, 10.6% (strongly disagree) and 9.9% (disagree) of the respondents were of the view that the anti-corruption crusade has not helped in the repatriation of stolen funds back to Nigeria. The general view thus supports that the current administration scores well in terms of engendering the repatriation of stolen funds to Nigeria.

10.6% (strongly agree) and 26.1% (agree) of the respondents believed that Nigeria is enjoying international prestige as a result of President Buhari's anti-corruption crusade. But the majority holds a contrary view, as 25.4% (strongly disagree) and 34.5% (disagree) of the respondents objected to the notion that Nigeria is enjoying international prestige as a result of President Buhari's anti-corruption crusade.

Conclusion

The emergence of former military ruler, General Muhammudu Buhari as the elected president of Nigeria in 2015 raised the hopes and aspirations of many Nigerians. Buhari's administration emphasized on achieving three cardinal objectives which include; ensuring protection of lives and property of Nigerians; boosting the growth of the Nigerian economy and fighting corruption.

In order to the assess the performance of President Buhari's administration based on the three cardinal objectives of his government, this study sampled the perceptions of 142 students within the campus of Landmark University, Omu Aran by administering questionnaires.

The primary data collected was analyzed with the use of SPSS package. The results analyzed showed that majority of the respondents scored President Buhari's administration low in the areas of national security and the management of the Nigerian economy. From the analysis, majority of the respondents gave positive remarks about the anti-corruption crusade of President Buhari. However, a larger percentage of the respondents asserted that anti-corruption crusade of President Buhari is targeted towards the opposition and that Nigeria has not started enjoying international prestige despite the anti-corruption posture of Buhari's administration.

Despite the below average ratings accorded to President Buhari's administration in its first tenure by Landmark University undergraduate students, President Muhammudu Buhari recorded a resounding victory over his closest rival, Atiku Abubakar at the 2019 presidential election. With Buhari's re-election, he has been given the opportunity to take Nigeria to the next level of greatness.

Abstract

One of the greatest assets of today's organizations is information, and normally, where is value a malicious people is trying to use it for their benefit. Thus, data security gains an important role in the confidentiality, integrity, availability, authenticity and legality of the data. Security has become a constant concern for improvement, which brings an increase in complexity that is later reflected in the performance of the applications that use them. To study the impact of the performance of a database with and without encryption, operations were tested for both cases and the average times, as well as the space occupied, were documented. Preliminary results show that encryption has a substantial impact on the database read and write performance.

Keywords: Security, Database, Cryptography, Performance, Encryption

Introduction

To make a performance analysis for the use of encryption in a relational database, an attempt was made to find a model that would strike a good balance between performance and security. The encryption of databases can be done in different ways: the data can be encrypted at the table level; row; or column level.

For this performance study, PostgreSQL was used with the native module pgcrypto. This database was chosen because it has good results in performance tests concerning other databases (Ohlsson & Persson 2019). Also, because of its flexibility to choose the encryption method, analyze issues such as security level, study the performance of insertions and queries. Note that also the total storage space was taken into account.

We started by using PGP encryption, which is known to be secure on email systems (Kar et al. 2019) and other messaging platforms (Ilmonen 2020), but in our preliminary tests proved to be inefficient for large volumes of data, so it was discarded. The best solution found was the use of raw encryption with AES (Bhange & Mathur 2019), which, being simpler, proved to be more efficient. This type of encryption is used in several current scenarios, as is the example of smart cities (Farahat et al. 2019). This decision naturally leads to a decrease in security. Even so, there was a decrease in performance compared to tests without encryption.

The data read results, queering, show that, with encryption, the times increase as there is a need for decryption. As expected, with the same queries, the use of primary and foreign keys allowed the reduction of time, but with encryption, the same did not happen for all tested queries.

Another analysis that is important to consider is the difference in the space occupied by the data, which was found to increase in scenarios with encryption and keys.

This document is organized into four sections. In Section 2, we perform a study of different forms of database encryption. In Section 3, is explained the experimental scenario. Section 4 is where the case study results are presented. Finally, Section 5 concludes the work, and we present possible future work guidelines.

Related work

In this section, some works carried out in this area are analyzed. These help to identify alternatives and improvements to the current state-of-the-art.

Asymmetric keys

Since data security is an issue of increasing importance, in this case, study, the use of cryptography algorithms is tested. These algorithms have become a constant concern for improvement, which has led to an increase in complexity involving higher execution times that are reflected in a decrease in application performance.

Thus, we make a comparison of the execution times of three algorithms using asymmetric keys, depending on the size of the keys, used in different scenarios and database domains, Rivest-Shamir-Adleman (RSA) (Sharma et al. 2019) (Bhange & Mathur 2019), ElGamal (Li 2020) and Elliptic Curve Integrated Encryption Scheme (ECIES) (Saravanan & Venkatachalam 2019).

The results in (Boicea et al. 2017) show that the encryption time increases with the number of encrypted characters, but with special attention to RSA where the encryption time varies very little with the increase in the number of characters. It was also analyzed that the algorithms have encryption times of the same order of magnitude, considering the length of the encryption key. The decryption time is dozens of times less than the encryption time for all algorithms and increases with the size of the key, again the RSA with shorter times is highlighted.

AES to IoT

In the IoT scope, security is also a criterion to take into account, after being received, the encrypted data from the IoT sensors are saved in text format. However, suppose the integrity, validity and security of the data are to be guaranteed. In that case, these encryption and decryption operations cause overhead in the data query time, which, in turn, result in additional operational delays and increased consumption of data power in wireless IoT devices.

In (Singh et al. 2017), the encryption performance of a database that contains relational tables and tables with BJSON data fields. Since the commonly used benchmarks do not include tests of encrypted column databases, the authors created a set of Python scripts to test PostgreSQL AES-128bit encryption in CBC (Hameed et al. 2019) mode, currently used for data transmission wireless IoT devices. Analyzing this case study and the present, both use symmetric key encryption algorithms and AES (Bhange & Mathur 2019) encryption. The works differ in the type of data, in which relational and non-relational BJSON data fields are used.

As for the results in (Kokkonis et al. 2019) for data with BJSON, they showed that the average insertion time is the same for encrypted and unencrypted. However, for queries, an 8% increase in processing time has been noted for encrypted documents compared to plain text documents.

FNR encryption

FNR encryption storage preserves the length and format of the fields. For this, an encrypted database was used in CryptDB using the FNR encryption scheme. This scheme consists of the classification of the data type, which is encrypted in a text with the same size that is again converted into data with the format of the original. To this end, scenarios are tested to explore the feasibility of Format Preserving Encryption (FPE) (P´erez-Resa et al. 2020). Using SQL Aware Encryption, an encryption scheme was defined for each predefined set of SQL operations, so all data items are encrypted so that any operation is possible without the need for decryption.
In comparison to the present scenario, and in addition to all the application and technologies being different, the encryption itself is also different. This allows the preservation of the size and format of the fields in a

way that does not require decryption in a set of SQL operations, something that is considered inevitable in most forms of encryption, including those used in the context of this document.

In the experimental results (Chandrashekar et al. 2015), improvements in storage were measured, with a decrease in performance. Because, in terms of storage, they showed a decrease of approximately 50% concerning AES. Although this value always depends on the data of the chosen application, it was found that the size of the data with FNR was always equal to the size in normal text, in contrast to the AES which was always much larger. The performance, of insertion operations, of the FNR when compared to the AES-128 was about seven times higher since the FNR scheme uses several encryption steps internally.// Thus, it is concluded that encryption using FNR reduces the size of the database because the size of the data remains. Still, it leads to a decrease in performance in data insertions because it requires several steps to reach the final encrypted data.

Experimental Setup

For the experimental scenario, 10GB of data were generated with the TPC-H. The interaction with the database was carried out through Python using the SQLAlchemy module, so for insertions the Python script that reads each row of data from each table and converts it into an insertion command with 4kB of bulk.

For encryption scenarios, this command changes: for each field, the encryption function is added. In this way, the loading was tested, with and without encryption, to measure the difference in performance and space occupied by the data.

As for the consultations, five queries of different complexities of the TPC-H were chosen (Q1, Q2, Q3, Q4, Q5), where for each scenario they are executed five times, and the average is calculated discarding the maximum and the minimum. These are also executed by a Python script where, in the case of encryption, it was necessary to add decryption functions to the data so that operations could be performed on them.

In the experimental scenario, the module pgcrypto (Odongo & Bukenya 2019) was used, which provides cryptographic functions for PostgreSQL (Juba & Volkov 2019). This module provides several forms of encryption. Initially, the PGP encryption model was tested using symmetric keys. In this model, the password provided is a hash calculated from a String2Key (S2K) algorithm (Shakya & Karna 2019). The data, to be encrypted must undergo a manipulation that includes compression, conversion to UTF-8 and/or conversion of line terminations. Then the data is prefixed with a block of random bytes, a SHA1 hash of the random prefix and the data is attached and placed in a data pack. This model was discarded as soon as data was entered, and times increased exponentially, which became impractical times for large amounts of data. Therefore, raw encryption functions were used, using the AES algorithm, which only performs a cypher on the data and does not have any advanced PGP encryption feature. This model directly uses the user's key as the cypher key and does not provide any data integrity checks. Although it does not deal with text, having to be converted to bytes, this model proved to be more efficient for insertion.

Experimental Results

In this section, the results are presented in the form of charts and their analysis is carried out, so it will be divided into two sub-sections, insertions and queries. In the first, the encryption scenario using PGP, the AES encryption scenario and the

Figure 1: Chart encryption PGP

same with the use of keys is be presented. For queries, AES encryption is used, with and without keys.

Insertion Performance

The results of the insertions in scenarios with and without encryption are presented to evaluate the performance differences. In 4.1.1 the PGP encryption method is tested. In 4.1.2 and 4.1.3, the raw encryption method is tested with and without AES, and with the use of keys, respectively.

PGP encryption

Through the chart 1 the insertion times with the PGP model are shown using symmetric keys in comparison to the insertion without encryption.

As can be seen in figure 1, a high increase began to be noted with only 13.5 MB of data which worsened dramatically by 1.12 GB. These times can be explained by the numerous steps, described above, for encrypting a single row of data. Thus, it is concluded that, despite being good encryption that allows the verification of integrity, it is impractical to use this encryption for large volumes of data.

AES encryption

Since PGP encryption proved to be impractical for this volume of data, crude encryption functions were used with the use of AES. The chart 2 shows the perfor-

Figure 2: Chart encryption AES

mance of this encryption compared to the same scenario without encryption.

This encryption model (Figure 2) proved to be more efficient than the previous one, since comparing both for 1.12 GB of data, this one lasts around 11 minutes, while in the previous one lasted 8 hours. Compared to the scenario without encryption, the times remained close to 1.12 GB of data, noticing a dispersion that grew with the increase of the data volume. Concerning total times, without encryption, it took 1:18:34 h, while for this encryption it took 05:23:27 h, about five times longer.

In conclusion, this encryption mode is less secure, as it has no integrity check. On the other hand, it proved to be more efficient than the previous one, already compared to the scenario without encryption, with the increase of the data volume, the performance is degraded.

AES encryption with keys

The previous scenario was repeated, including the use of primary and foreign keys, and the times are illustrated in the chart 3.

About the scenario without encryption with keys, the conclusions are the same as in the previous one, but the increase in time concerning the increase in volume proved to be even more significant, reaching 25:13:21 h for 7.24GB. Thus, the scenario without encryption with keys took a total of 03:33:15 h, and with encryption and keys, it was 27:34:11 h, an increase of around nine times.

Figure 3: Chart encryptation AES with keys

Performance in Queries

This section is analyzed the performance of data queries with and without encryption.

In chart 4, the average execution time without keys is shown for each query. With encryption, all queries have increased execution times, being more visible in some more than others due to the amount of data required, explained by the amount of data that is accessed to perform them, as they need decryption to perform operations, or to process the join operations, as well as the amount of data to perform the final data projection.

The same query scenario was performed for encryption with primary and foreign keys, and the average execution times can be seen in the chart 5. Compared to the same scenario without encryption, the times were higher, as expected. Still, while in scenarios without encryption, the execution times decreased with the use of keys, in scenarios with encryption, the same did not always happen. There were three queries in which the times increased with the use of the keys.

Occupied storage space by the database

In Figure 6, the occupied storage space is studied. When comparing the space occupied by the databases with and without keys or indexes, there is a natural increase in the use of encryption, as this, regardless of the type of data, converts into a bit chain with sizes that are mostly larger than the original. The increase was about 3.8 times. For databases with the use of keys, the same difference was noted, with an increase of approximately four times.

Figure 4: Chart queries without keys

Figure 5: Chart queries with keys

Figure 6: Chart Database Storage

Conclusions and future work

With the security level being the most important criterion, an algorithm with fewer security breaches may involve a longer encryption and decryption time, depending on the key size. This leads to significant reductions in performance, additional consumption of resources on the server and increased storage space for encrypted data. Another important aspect is key management because if decryption can only be done

with the corresponding encryption key, there is a risk that the administration will lose data due to failure, and the entire database is compromised.

In a search for encryption that would strike a better balance between security and performance, the solution went through the use of raw encryption with the use of AES. Despite being less secure encryption, as it does not have data integrity validation, it proved to be more efficient, but still with performance losses quite accentuated as the data increases.

It is concluded that the loss of performance in data encryption is inevitable. Still, depending on the requirements of the scenario to be implemented, the best balance between the desired security and performance should be sought. In the case presented, this happened when there was a decision to change between PGP and AES encryption.

For future work, it is important to analyze this encryption mode for larger volumes of data, to continue the evaluation of the identified performance degradation with the increase in data. Additionally, it would be interesting to compare the impact of encryption in different databases.

Abstract

Job involvement among employees is vital in the organization as it works as internalizing values of goodness and importance of working among people around them. Ethical behavior needs to start with leaders within the organization. The importance of ethical leadership as the driving force for ethical practices can't be underestimated. Meanwhile, perceived organizational support is vital in an organization to maximize the involvement of employees. The objective of this paper is to examine the relationship and impact of ethical leadership and job involvement among manufacturing employees. A total of 250 self-administered questionnaires were distributed among exempt staff of a manufacturing organization in Penang, Malaysia. They are the employees who are exempted from minimum wage, overtime regulations, and other rights and protections in the organization. Data analysis such as demographic, reliability, correlations, and regression was done. The finding of the paper reveals that ethical leadership can affect job involvement among staffs in the manufacturing organization. If ethical leadership are not practiced by the organization's management, then they are likely to face issues on their employees' job involvement. Hence, the findings in this paper help the organization in finding a way of dealing with their exempt staff to make them work better in their organization.

Keywords: Ethical Leadership, Job Involvement, Manufacturing, Exempt Staff, Malaysia.

Introduction

In today's competitive business environment, keeping employees enables the organization to be successful. Employees are seen one of the most important assets for organization whereby particularly in term of products and services provided by them. The benefits provided by the organizations offer successful performance for the organizations. In the context of Malaysia, the manufacturing organization of lighting solutions for automotive, computer displays, televisions, and general lighting has been seen as one of the contributors to the nation's economy.

Job involvement among employees is vital in the organization as it works as internalizing values of goodness and importance of working among people around them. Job involvement work as a subjective condition that makes people devoted to their work (Schaufeli et al., 2002). Job involvement towards organization makes a desirable feature that makes people spend energy and do their best in their work and organizational roles (Kahn, 1990). Moreover, although, job involvement is not associated with a plethora toward the job, it causes workers to enjoy their work and reduces their fatigue whereby it does not only increase the workers' job satisfaction, organizational commitment, organizational leadership behavior, perceived organizational support, emotional attachment to the organization, voluntary actions beyond the job description, and participation in organizational decisions, but also reduces the desire to leave the job (Saks, 2006). Besides that, organizations are expected to adhere to a certain set of ethics, examples of ethical behavior need to start with leaders within the organization. The importance of ethical leadership as the driving force for ethical practices can't be underestimated. Often, these top executives set the tone for every decision made within a company, no matter how small. Those who lead ethically are considered role models who can hold

Cite this Article as: Nasina MAT DESA, Muhammad Hasmi ABU HASSAN ASAARI and Kumaran KOOTHA PERUMAL "Ethical Leadership toward Job Involvement among Manufacturing Exempt Staff in Penang" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

themselves and their employees accountable whereby they make ethical culture a part of every function in an organization, from hiring and training through performance management and mentoring programs (Walumbwa et al., 2017). Meanwhile, perceived organizational support also vital in an organization to maximize the involvement of employees. Job involvement of employees and their well-being thus could increase employees' commitments towards the organization. This will reduce employees turnover in the organization.

Moreover, this paper intended to explore the management practices on ethical leadership and perceived organizational support to increase job involvement among exempt staff in a manufacturing organization. All these impacts have been studied in numerous fields such as health care, education, service and other service industry, however, it was seldom or very little being performed in engineering manufacturing industries. Thus, this research is intended to investigate the impact of ethical leadership and perceived organizational support toward job involvement among exempt staff in a manufacturing organization of lighting solutions in Penang.

Literature Review

Job Involvement

Job involvement denotes employees' attitudes toward their jobs and is one of the most specific factors relevant to work performance (Judge et al., 2017). It is a key contributing factor to an organization's success. From an organizational viewpoint, it has been regarded as the key to unlocking employee motivation and increasing productivity. Furthermore, Kanungo (1982) stated that job involvement defines as the unswerving commitments of workers and their concerns about work and the result of personal experiences and current environment.

According to Lee et al. (2015), job involvement refers to how staffs and employees perceived their jobs in relation the environment of their organization, the work itself and on how their work and their life are integrated. Zopiatis et al. (2014) stated that the idea of ideological work involving active involvement in a job or intensive involvement of employees to meet their inherent needs. The fulfilment of these needs helps to satisfy personal satisfaction. Furthermore, Zopiatis et al. (2014) also stated that work engagement and job involvement offers the opportunity to make decisions for individuals, the foundation for strengthening their work commitment.

Moreover, Holtom (2016) suggest that an integral part of employee's self-definition is the degree to which they are involved in their job. Consequently, highly-job-involved employees are more committed to their organization, invest substantial effort to achieve organizational objectives and are thus less likely to turnover and by utilizing these constructs, and by synthesizing critically the work of past literature thus this studies intended to examine the relationship between these aspects of job involvement.

Ethical Leadership

Ethical leadership is known as the demonstration of appropriate conduct through personal actions and relationships and the promotion of such conduct to subordinates through two-way communication, reinforcement, and decision making. This definition shows that ethical leaders can set an example for others and refrains from any temptations that can happen during given duty and responsibilities. Ethical leadership is crucial and vital in providing direction that enables the organization to fulfil its mission and vision and achieve declared goals (Kanungo, 1996).

According to Kark et al. (2017), the ethical leadership process occurs in either one way of two ways, either transformational or transactional. Transformational leadership is conveying and exposing the corporate leadership to the transition leadership to develop a vision and to change the foundation for the company's strategies, policies and practices. The transformation leader uses their organization strategies and techniques empower the followers, enhance their self-efficacy, and change their values, minds and attitudes, which are in line with the leaders' vision. This is one of the ethical leadership ways.

According to Toor et al. (2009), self-centred, unreliable, power-hungry and manipulative leaders are known as pseudo transformational leaders meanwhile authentic transformational leaders refer to leaders with strong moral concerns, strong concerns for self and others and ethical values which linked with the vision of the organization. However, a transactional leader is concerned with the surveillance and direction of the work to fulfil the given task. The transactional leader affects followers, rewards, sanctions and the stability of proper authority or stimulating behavioral compatibility of the influencer. The transactional leader presumes that the employee will not do anything except for a transaction in which the payment for service is large enough to motivate the employee to perform (Schubert, 2017). In the transactional leadership style, the employee acts as a means of making money, not realizing the loyalty and selflessness of the employee system.

Walumbwa et al. (2017) define ethical leadership as a formal conducting demonstration of personal conduct and personal relationships, and the promotion of such conduct to both employees in strengthening and decision-making. The definition refers to the interpersonal relationship and promotion through two-way communication and decision making. Saini (2017) also describe an ethical leader as a person that be examples for others with the right values and the strongest person to bear the test. Ethical leaders are partners in companies trying to achieve their vision, vision and value, without compromising self-interest, thus enhancing employee jobs and organizational duties thus could increase employee job involvement.

Perceived Organization Support

Perceived organizational support refers to employees' view regarding how much the organization values their contribution and cares about their well-being (Eisenberger et al., 1989). Perceived organizational support increases employees' initiative to help the organization reach its objectives. A few factors that influence whether employees recognize organizational support are organizational rewards, job conditions, and observed fairness.

Perceived organizational support has shown that researchers are more interested in management companies (Slovic, 2016). Miring'u (2016) defined perceived organizational support as staff of global beliefs about the company's assessment of their contributions and their level of concern about their well-being. Perceived organizational support is also defined as how much the organization values employees' contributions and cares about them (Lamm et al., 2015). Moreover, perceived organizational support created because of working conditions and some human resource practices will generate positive employee mentality and behavior. Reasonable treatment, supervision support, and rewarding and favorable working conditions showed a strong commitment to employee work involvement and perceived institutional support (Eisenberger et al., 2016).

On the other hand, perceived organizational support strengthens employees' effort in the organization, resulting in greater efforts to fulfil the organization's goals (Eisenberger et al., 2016). Organizational support theory refers to the high level of support to gain in return lead to employees work harder to help their organizations to reach its goal because perceived organizational support affects job involvement (Eisenberger et al., 2016). Thus as overall, these studies intended to examine the impact of perceived organizational support on job involvement.

Relationship between Ethical Leadership and Job Involvement

Job involvement as far as knowledge is concerned, the employee can engage in work by engaging in job-related work by engaging in work. Khan et al. (2011) define job involvement as a degree in emotional or mentally in identifying the work. According to Liao and Lee (2009) explored the phenomenon of job involvement and proposed that job involvement respects the extent of the importance of work in the worth of the individual. Highly involved individuals relate performing well in their job to their self-esteem Liao and Lee (2009). Thus job involvement is the vital variable for employees with high job involvement.

Moreover, ethical leaders express a moral identity and take responsibility for their actions and encourage the company to make sure they send clear messages of ethical value. When employees show interest in their organization or leaders, they are more likely to invest in trying to achieve the organization common goals. Alshammari et al., (2015) suggested that leaders create expectations about the ethical behavior that penetrates the environment. Organizational stability is emphasized by practices and expectations affecting the effectiveness of moral ethics. Therefore ethical leadership do influence job involvement and working environment among staff and employees in an organization. According to those ethical and social learning perspectives can be proposed to encourage the ethical conduct of the employer in a company.

Moreover, people and employees who have attained ethical and social values are people with a moral person. An individual's characteristics such as ethics and honesty are moral values and ethical identities, which generate positive approaches to organization and work based on the amount of attitude that individuals are engaged in their present work. Personal qualities of the employee as the ethical leader are related to ethical leadership towards job involvement among employees. Thus, hypothesis that been generated based on this relationship as below:

H_1: Ethical leadership is positively related to job involvement.

Relationship between Perceived Organizational Support and Job Involvement

Perceived organizational support is expected to be a member of the prospect of rewarding by fulfilling the organizational goals, and as a result, these expectations will increase in job involvement in organizational

engagement. For the organization to be progressive, its employees need to be motivated and be involved all the time because an employee is the largest and most important assets for the organization. However, dedication and commitment from employees depend largely on their views supported by the organization. Supporting employees views make employees feel that organization value staff contribution and commitments.

Moreover, perceived organizational support represent a related job involvement in the work of a substantial number of employees to identify a worker with a company employee. Those who are highly involved among the employees of an organization must make an effort to maximize organizational efficiency. For highly engaged employees in their organization, their jobs are inextricably linked according to different identities, interests and life goals, and can be satisfied with their duties effectively.

Furthermore, perceived organization support theory set a common concept to assess the social-emotional needs and to assess their contributions to the employees, to assess their contributions to assess the benefits of increased work efforts. Such perceived company support increases the perceived commitment of the employees to help their organization expectations to achieve the company objectives for their commitment to the organization and the enhanced efficiency.

In an organizational context, organizations treat employees well via opportunities for reward, kind treatment, or showing commitment towards the employees. Employees who recognize this positive support then have more favorable attitudes (such as higher job satisfaction, job involvement and organizational commitment) and may reciprocate through work effort exerted towards performing well on the job or serving the organization (Tuazon, 2016). Thus, hypothesis that been generated based on this relationship as below:

H_2: Perceived organizational support is positively related to job involvement.

Theoretical Framework

Figure 1 below shows a theoretical framework for this paper. This paper examines the relationship between ethical leadership and perceived organizational support on job involvement among exempt staff.

Figure 1: Theoretical Framework

Methodology

Research Design

A quantitative research method will be used for this paper with inclusive of both the primary and secondary data. These methods are chosen to define and explain the relationship between the independent variables which are ethical leadership and perceived organizational support and the dependent variable which is job involvement.

Population & Respondents

The manufacturing employees of exempt positions are studied. The exempt employees referred to as employees who are exempted from minimum wage, overtime regulations, and other rights and protections afforded in contrast to the non-exempt employees. Employers must pay a salary rather than an hourly wage for a position for it to be exempt (Barada, 2020). Typically, only executive, supervisory, professional or outside sales positions are exempt positions. The number of employees or the number of population is 800 exempt staff obtained from the Human Resource Department statistics. Among this, 250 exempt staff that worked were randomly selected using random sampling to represent the executive, supervisory and professional.

Research Instruments & Instruments Reliability

The self-administered questionnaire was divided into four parts. Firstly, Part A, this part comprised of the respondents' demographic background which consists of gender, age, religion, marital status, education status, years of service in the organization, department serving in, duration of service in this department, corporate-grade, duration of service in this corporate grade, monthly salary and gender of your manager.

Table 1 depicts the summary of the instruments reliability. Ethical leadership consisted of 21 items which were from Khuntia et al. (2004) with a reliability of 0.96. Meanwhile, perceived organizational support had 17 items which were adopted from Eisenberger et al. (1986) with a reliability of 0.93. Finally, job involvement had 10 items which were adapted from Kanungo (1982) with a reliability of 0.80.

Table 1: Instruments Reliability

Variable	Source	No of Questions	Cronbach's Alpha
Ethical Leadership	Khuntia et al. (2004)	21	0.96
Perceived Organizational Support	Eisenberger et al. (1986)	17	0.93
Job Involvement	Kanungo (1982)	10	0.80

Data Analysis

Response Analysis

The response rate by the respondents was 92% whereby a total of 230 self-administered questionnaires were collected from 250.

Demographic Analysis

Table 2 depicts the demographic analysis of the respondents. In terms of gender, the findings show that male employees were 140 (60.9%) against female employees of 90 (39.1%). Furthermore, married employees were 217 (94.3%) and single employees were 10 (4.3%). Majority of the employees were aged 40 to 49 years old (44.8%); and followed by 30 to 39 years old were 84 (36.5%) employees, above 50 years old were 23 (10%) employees, and 20 to 29 years old were 20 (8.7%) employees.

Due to the nation's ethnicity, majority of the employees employed were Malays (n=128; 55.7%); and followed by Indian employees (n=76; 33.0%), Chinese employees (n=18 (7.8%), and other employees (n=8; 3.5%). Academically, majority of the employees had a degree (n=161; 70%) as compared to 30 employees (13.0%) had a diploma, 18 employees (7.8%) had a higher certificate, 14 employees (6.1%) had a master, and 7 employees (3.0%) had a lower certificate.

Employees were asked on their length of service with the organization. Ninety-eight employees (42.6%) had 16 to 20 years of service and followed by 78 employees (33.9%) with 6 to 10 years of service, 22 employees (9.6%) with 11 to 15 years of service, 20 employees (8.7%) had 1 to 5 years of service, and 12 employees (5.2%) had less than 1 year of service.

In detail by the department, 82 employees (35.7%) were in the Human Resource Department; and followed by 48 employees (20.9%) were in the Information Technology Department, 42 employees (18.3%) were in the Engineering Department, 32 employees (13.9%) were in the Logistics Department, 15 employees (6.5%) were in the Quality Control Department, 5 employees (2.2%) were in the unclassified departments, 3 employees (1.3%) were in the Finance Department, and 3 employees (1.3%) were in the Procurement Department.

Table 2: Demographic Analysis

Item	n	%
Gender:		
• Male	140	60.9
• Female	90	39.1
Marital Status:		
• Married	217	94.3
• Single	10	4.3
• Others	3	1.3
Age (years old):		
• 20 to 29	20	8.7
• 30 to 39	84	36.5
• 40 to 49	103	44.8
• Above 50	23	10.0
Ethnicity:		
• Malay	128	55.7
• Chinese	18	7.8
• Indian	76	33.0
• Others	8	3.5
Academic Qualification:		
• Lower Certificate	7	3.0
• Higher Certificate	18	7.8
• Diploma	30	13.0
• Degree	161	70.0
Masters	14	6.1
Service (years):		
• Below 1 year	12	5.2
• 1 to 5	20	8.7
• 6 to 10	78	33.9
• 11 to 15	22	9.6
• 16 to 20	98	42.6
Department:		
• Engineering	42	18.3
• Finance	3	1.3
• Human Resource	82	35.7
• Information Technology	48	20.9
• Logistics	32	13.9
• Procurement	3	1.3
• Quality Control	15	6.5
• Unclassified	5	2.2

Reliability Analysis

The reliability analysis was conducted in examining the level of reliability of the adopted instrument used on the employees in the manufacturing. Table 3 depicts the reliability analysis whereby ethical leadership had a Cronbach's Alpha of 0.92, perceived organizational support had a Cronbach's Alpha of 0.92, and job involvement had a Cronbach's alpha of 0.93. The value of the reliability analysis was excellent.

Table 3: Reliability Analysis

Item	No of Questions	Cronbach's Alpha
Ethical Leadership	21	0.915
Perceived Organizational Support	17	0.922
Job Involvement	10	0.929

Correlations Analysis

Table 4 depicts the correlations analysis between ethical leadership and job involvement of employees in manufacturing. The employees indicated a high relationship (r=0.89) between ethical leadership toward their job involvement. Moreover, the employees also indicated a high relationship (r=0.92) between perceived organizational support toward their job involvement.

Table 4: Correlations Analysis

Item	1	2	3
1. Ethical Leadership	1	0.947*	0.893*
2. Perceived Organizational Support		1	0.921*
3. Job Involvement			1

**. Correlation is significant at the 0.01 level (2-tailed).*

Regression Analysis

Table 5 depicts the simple regression analysis was conducted on the ethical leadership and perceived organizational support toward job involvement.

Firstly, manufacturing employees had the R^2 value showed 85.2% for the dependent variable of job involvement which was explained by the ethical leadership. This means that 14.8% of the variance for job involvement was explained by other unknown additional variables that have not been explored. The simple regression model (F=653.47, p<0.00) was proven to be a significant model due to the F ratio being significant in predicting job involvement. Overall, the F ratio result presented that the combination of ethical leadership and perceived organizational support were a good fit in predicting job involvement.

Secondly, ethical leadership (β=0.20, p<0.01) was a significant predictor for job involvement for manufacturing employees. Moreover, this explained that ethical leadership was positively related to job involvement among manufacturing employees. Therefore, hypothesis H_1 was supported in explaining manufacturing employees impact of ethical leadership on their job involvement.

Finally, perceived organizational support (β=0.73, p<0.00) was a significant predictor for job involvement for manufacturing employees. Moreover, this explained that perceived organizational support was positively related to job involvement among manufacturing employees. Therefore, hypothesis H_1 was supported in explaining manufacturing employees impact of perceived organizational support on their job involvement.

Table 5: Regression Analysis

Item	Job Involvement	
	β	Sig.
Ethical Leadership	0.203	0.011
Perceived Organizational Support	0.729	0.000
R^2	0.852	
Adjusted R^2	0.851	
F-Value	653.469	
Sig. F-Value	0.000	

In summary, the organization management portrayed their ethical leadership and perceived organizational support had an impact on their employees' job involvement. The summary of the hypothesis result is depicted in Table 6.

Table 6: Hypothesis Result

Hypothesis	Result
H_1: Ethical leadership is positively related to job involvement	Supported
H_2: Perceived organizational support is positively related to job involvement	Supported

Discussion & Conclusion

The paper shows that ethical leadership and job involvement does have a significant relationship among exempt staff in the manufacturing organization. The result was by Akbari (2016) where there was a significant coefficient between ethical leadership and job involvement.

Based on the results of this paper, the organization management needs to have ethical leadership are an attitude that should be emphasized as to satisfy their exempt staff. Moreover, the organization management should portray and let their employees felt that they had practiced ethical leadership. This situation will impact their employees' job involvement in the organization. Meanwhile, perceived organizational support has a good impact on job involvement exempt staff. This is in accord with Tuazon (2016) where there is a significant relationship between perceived organizational support and job involvement.

This paper has provided a breakthrough on how ethical leadership can affect job involvement among staffs in the manufacturing organization. If ethical leadership are not practiced by the organization's management, then they are likely to face issues on their employees' job involvement. Hence, the findings in this paper help the organization in finding a way of dealing with their exempt staff to make them work better in their organization.

Abstract

Covid-19, a viral disease was first discovered in late 2019 at Wuhan, China. The coronavirus outbreak has since metamorphosed into a global pandemic in the current year 2020. The global pandemic caught governments, institutions and the entire global community unawares. Covid-19 pandemic has caused the deaths of thousands of people while several millions have been infected. The global pandemic has had devastating effects on global economy in an unprecedented way. The central theme of this study is aimed at analyzing the impact of Covid-19 pandemic on the holy pilgrimage of Muslims to Mecca and Medina. Using human security theory, the paper justified the health safety measures implemented by Saudi authorities in checkmating the spread of coronavirus during the 2020 hajj.

Keywords: Covid-19, Coronavirus, Human security, Pandemic, Saudi Arabia.

Introduction

On December 12, 2019, the novel coronavirus (COVID-19), an acute respiratory syndrome was discovered in Wuhan, Hubei Province in China (Alandijany, Faizo and Azhar, 2020). By March 11, 2020, the World Health Organization (WHO), pronounced COVID-19 as a global pandemic (Alandijany et al, 2020).

Generally, the identified symptoms of COVID-19 include cough, fever, headache, fatigue and shortness of breath (Anjorin, 2020). Nations, scientists and pharmaceutical companies are working assiduously in discovering vaccines that can cure the highly transmittable disease.

As at August 13, 2020, COVID-19 pandemic has caused over 749,000 deaths, while over 20 million people have been infected in 188 countries (Al Jazeera, August 13, 2020). It must be noted that as at August 13, 2020, over 12 million people have recovered from the coronavirus (Al Jazeera, August 13, 2020).

Table 1.1: Countries with the highest cases of COVID-19 as at August 18, 2020

COUNTRIES	COVID-19 CASES
United States of America	5,354,013
Brazil	3,340,197
India	2,702,742
Russia	932,493
South Africa	589,886

Source: https://covid19.who.int/table

Cite this Article as: Olakunle OLOWOJOLU, Bamidele RASAK, Michael ALEYOMI and Oluwafemi FAYOMI "Management of Covid-19 Pandemic And 2020 Hajj Pilgrimage" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Table 1.1 shows the top 5 countries that recorded the highest cases of COVID-19 as at August 18, 2020. United States topped with 5,354,013 cases followed by Brazil with 3,340,197 cases; India with 2,702,742 cases; Russia with 932,493 cases and South Africa with 589,886 cases respectively (WHO, 2020).

Table 1.2: Countries with the highest fatalities as at August 18, 2020

COUNTRIES	NUMBER OF FATALITIES
United States of America	170,497
Brazil	108,536
Mexico	57,023
India	51,797
United Kingdom	41,454
Italy	35,400
France	30,434
Spain	28,646
Peru	26,281
Iran	19,804
Russia	15,707
Colombia	15,372
South Africa	11,982

Source: https://coronavirus.jhu.edu/data/mortality

Table 1.2 shows the top 10 countries with the highest COVID-19 fatalities as at August 18, 2020. The breakdown of Table 1.2 indicates that United States of America recorded 170,497 deaths; Brazil 108,536 deaths; Mexico 57,023 deaths; India 51,797 deaths; United Kingdom 41,454 deaths; Italy 35,400 deaths; France 30,434 deaths; Spain 28,646 deaths; Peru 26,281 deaths; Iran 19,804 deaths; Russia 15,707 deaths; Colombia 15,372 deaths and South Africa 11,982 deaths (John Hopkins University of Medicine Resource Center, 2020).

Impact of Covid-19 On Saudi Arabia

Saudi Arabia which is the central focus of this study has been badly hit by the coronavirus pandemic. Saudi Arabia, the world's largest producer of crude oil and home to Mecca and Medina, the two holiest sites in Islam hosts the annual Hajj and Umrah (small or lesser) pilgrimage that is attended by millions of Muslims all over the world. During the Hajj pilgrimage, Muslims perform rituals that are considered very sacred in Islam.

The major rituals include praying around Kaaba, the house of Allah (God), drinking from the Zamzam well, praying at Mount Arafat and throwing stones symbolically at Satan (Al Jazeera, November 18, 2009). In 2019, 2.5 million pilgrims participated in the Hajj, while over 19 million Muslims attended Umrah in Saudi Arabia (TRT World, June 23, 2020). The holy pilgrimage to Saudi Arabia generates $12 billion dollars which is equivalent to 7 percent of gross domestic product (GDP) and 20 percent of Saudi's non-oil GDP (TRT World, June 23, 2020).

According to the International Monetary Fund (IMF), the oil rich Saudi Arabia which boasts of the largest economy in the Middle East is expected to have a 6.8 percent reduction in GDP as a result of the COVID-19 pandemic and fall in oil prices (Al Jazeera, July 25, 2020). The COVID-19 pandemic affected wide range of businesses such as hotels, real estate/property owners, food vendors, airlines, road transporters, livestock sellers, cloth sellers and other accessories that pilgrims utilize during Hajj and Umrah in Saudi Arabia.

As at August 11, 2020, Saudi Arabia has recorded 291, 468 cases of coronavirus infections, 3,233 deaths and 255,118 recoveries (Worldometer, August 11, 2020).

Human Security and Management of Hajj During Covid-19 Pandemic

The theoretical framework of this study is premised upon human security. The concept of human security came into global limelight in 1994 when the United Nations Development Programme (UNDP) published its Human Development Report.

The UNDP (1994) stated that:

Human security is a child that did not die, a disease that did not spread, a job that was not cut, an ethnic tension that did not explode in violence, a dissident who was not silenced. Human security is not a concern with weapons –

it is a concern with human life and dignity…It is concerned with how people live and breathe in a society, how freely they exercise their many choices, how much access they have to market and social opportunities– and whether they live in conflict or in peace.

Human security is concerned about the security of individuals rather than placing emphasis on the security of nation states. According to UNDP (1994), human security covers different aspects of human life such as:

- Economic Security: an individual's enjoyment of a basic income, either through gainful employment or from a social welfare in order to have good standard of living.
- Food security: an individual's access to food supplies.
- Health security : an individual's freedom from various diseases and debilitating Illnesses and his or her access to adequate health care.
- Environmental security: concerned about the safety of land, air, and water from environmental hazards in order to preserve the existence of human beings.
- Personal security: an individual's freedom from crime and violence, especially women and children who are more vulnerable.
- Community security: cultural dignity and to inter-community peace within which Individuals live and grow.
- Political security: Protection of an individual against human rights violations.

This study will analyze how the government of Saudi Arabia employed human security in the management of the 2020 Hajj pilgrimage. Firstly, Saudi authorities scaled down the number of Hajj pilgrims to 10,000 instead of the over 2 million prospective participants (BBC, July 29, 2020).

International travels were restricted from moving in and out of Saudi Arabia. This measure was taken in order to avoid possible outbreak of coronavirus during the Hajj. Also, the Saudi authorities restricted participation in the Hajj by allowing only foreigners and citizens living in Saudi Arabia to perform the holy pilgrimage.

Secondly, all the Hajj pilgrims were made to undergo thorough medical tests in order to ensure that all pilgrims were COVID-19 free. Only those that were between ages 20 and 50 with no terminal illnesses and symptoms of COVID-19 were allowed to perform the holy pilgrimage (Time, July 29, 2020). All pilgrims were ordered to quarantine in their hotel rooms and quarantine after the completion of the Hajj. The movements of pilgrims were monitored by connecting wristbands to the phones of the participants (Time, July 29, 2020).

Thirdly, Saudi authorities ensured that social distancing was strictly followed during the Hajj pilgrimage. The usual experience of having mammoth crowd was limited to small groups of 20, while standing apart in order to limit the potential outbreak of coronavirus (Time, July 29, 2020).

Another safety measure put in place by the Saudi authorities was by providing free sanitizers, towels, soaps, umbrellas and other accessories. These materials were freely given to the pilgrims in order to ensure personal hygiene and minimize the outbreak of contagious diseases (Time, July 29, 2020).

The Saudi government prevented the International media from covering the 2020 Hajj pilgrimage. Instead, Saudi government ensured that the pilgrimage was televised live to the global audience.

In summary, COVID-19 pandemic has had devastating impact on all aspects of life. The impact of COVID-19 pandemic will definitely have short, medium and long term effects on the global community. The Hajj, which is one of the most important religious rituals in Islam with global appeal was affected by the outbreak of coronavirus. The Saudi authorities implemented safety measures that ensured the success of the 2020 Hajj despite the threats posed by the COVID-19 pandemic.

In conclusion, this study advocates that other nations can learn from Saudi Arabia in ensuring the safety of individuals and nations from the potential dangers of coronavirus outbreak and other highly contagious diseases that are capable of disrupting global peace and co-existence of human beings across the world.

Abstract

The measure of stock will decide or influence the flow of the manufacturing procedure as well as the adequacy and proficiency of an organization. The cement factory produces more than 8 million packs of cement each day. The accomplishment of the cement factory depends upon the accessibility to crude or raw materials. Along these lines, in the event that the inventory of crude materials can not address the requirement of production, at that point the production procedure will be disruption. On the account of overloading production volume will be excessive. Inventory and production optimality can be achieved by utilizing economic request quantity and production request quality model. These techniques were utilized by the means of QM software, to get an optimal request amount of 15452 and 31866 respectively and the yearly holding cost for inventory or stock is 6,711,223,000 Naira and the yearly holding cost for production is 2,768,032,000 Naira.

Keywords: Optimality, Inventory, Production Request Quantity and Economic Request Quantity.

Introduction

Inventory is the assortment of assets that has a financial related worth within any organization. It is held with the goal of future utilization, for example, manufacturing, and marketing. Inventory is the connection between manufacturing and sales. It comprises an enormous level of cost within an organization and it is one of the most significant resources within a production facilities. It represents a huge portion of the overall capital however, there are three classes of inventories, they as follows:

1. Crude materials: Inputs into the manufacturing procedure that will be adjusted or changed into completed merchandise.
2. In process products: It is partially finished meaning that the manufacturing procedure is still ongoing
3. Completed products: These are merchandise that are available to be purchased, appropriation, or kept.

A decent inventory administration is fundamental for any production facility since it spares the organization from low-quality production, the dismay of clients, and profit reduction, which in turn has an immediate impact on the firm(Adeyeye, Ogunnaike, Amaihian, Olokundun and Inelo, 2016). This is attained by guaranteeing an ideal conveyance of crude materials to the processing plant and dispersion of completed merchandise. Therefore, in-other

T ADEDUGBA, olaleke O OGUNNAIKE, Kingsley A ADEYEMOA and busola E KEHINDE "The Application of Inventory Models to Attain Optimality in A Cement Manufacturing Firm" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

to manage inventory effectively and efficiently inventory control is essential. According to Fithri, Hasan, and Asri (2019), inventory or stock control is a significant issue that decides the measure of stock that will influence the flow of manufacturing procedure just as the viability and effectiveness of the organization. Deferrals or out of stock will not just impact the procedure of production but also reduce profitability.

The sum or level of stock required by an organization is diverse for each organization, contingent upon the amount of production, the storage limit of the plant, and the procedure. The stock or inventory level in a framework has huge ramifications on its productivity since it decides under stocking, overloading, the capacity cost, as well as the holding cost (Inegbedion, Eze, Asaleye & Lawal, 2019). However, the inventory stream is a fuction stock level. In this manner, inventory contributes to the production procedure and the yields from the procedure. A significant concern, particularly in the manufacturing industry has to do with the determination of an appropriate stock or inventory. Therefore this study applied economic request quantity model and production request quantity model to determine an optimal production and inventory.

Literature Review

Keshavarzfard, Makui, and Tavakkoli (2019) stated that optimization techniques, such as economic request quantity model and economic production quantity model are utilized to determine an ideal solution for both single product and multiple products. Additionally, the accomplishment of an optimal inventory is basically a heuristic procedure proposed to acquire the near optimal outcome for multiple products. A numerical model was applied by Taufik and Dharma (2019) to acquire an optimal request amount that limits the overall cost of inventory notwithstanding, the model assumes that lead time is steady and the lead time request follows a gamma distribution. Sensitivity analysis was utilized in the model to see the effect on the optimal request quantity and absolute inventory expense.

Economic request quantity model is inferred to decide the optimal inventory which minimizes the overall inventory in both the acquired and leased outlets nonetheless, the solution technique for understanding the model is created and shown through a numerical model (Makoena & Olufemi, 2019). Samithambe (2019) asserted that an idle inventory framework shows the quantity of a product that is aimed at diminishing the absolute cost of both handling stock and request processing cost therefore, economic request quantity model is applied to reduce overall cost, request cost and handling cost. The study utilized two fundamental strategies for deciding the the economic request quantity model i.e. trial & error and mathematical methodology.

It is smarter to purchase in small quantities, in light of the fact that it is described by a one-time modification of sales costs to the outright purchase of tons of merchandise, however, the two cases were checked based on the solver apparatus, utilizing non-linear model that is an integer optimization (Paweł, 2019). The conclusive outcome of the study was to decide the optimal amounts with the least inventory expenses. The proposed outcome by Suganthi and Jayalalitha (2019) was gotten from an optimal framework arrangement through a numerical model alongside a differential matrix to obtain an optimal size for the inventory in food production. A numerical model and sensitivity analysis was engaged in the study to explain the framework.

Justification for the study

The inventory volume in the cement manufacturing firm has a huge ramification on its productivity and profitability since it decides under-stocking or overloading, production rate as well as the holding cost. The demand quantity for cement is high. In this way, the volume of inventory determines the rates at which inventory streams in and out of the manufacturing framework. The streaming out of inventory is presumed to be a ceaseless movement in which inventories such as crude materials and work in progress items are put into the production framework for processing to obtain the final product. Subsequently, the manufacturing firm is confronted with the challenge of deciding an optimal stock to avoid under-stocking or overloading.

As a result of this lacuna the manufacturing firm encounters under-stocking deficiency which will halt production. On the account of overloading, there will be over production and holding cost will increase. This situation will make the value to decrease due to over time. In this manner, the study seeks to mathematically investigate and decide an optimal inventory and production in-other to reduce holding cost.

Objective of the study

The study utilized economic request quantity model and production request quantity model which is an inventory model to obtain an optimal production and inventory quantity which in turn will reduce holding cost.

Methodology

Economic request quantity model is a numerical model utilized to decide the quantity of items that should be requested to satisfy the anticipated request at a minimal inventory cost. Economic request quantity model objectively decides the reorder point for requests. While Production request quantity model is a mathematical formula applied to determine the quantity of production based on request and available inventory. The mathematical equations beneath are generic formulas for economic request quantity and production request quantity.

EOQ (Q) : $\sqrt{\frac{2DS}{HC}}$

D = The demand yearly
S = Ordering cost
C = Unit cost
H = Holding cost

POQ: $\sqrt{\frac{2DS}{H(1-d/p)}}$

D= Demand
S= Setup/Ordering cost
H= Holding cost
d = Daily demand
p = Daily production rate

Presumptions of economic request quantity model:
a) The model resolves each item exclusively in a business.

b) Annual necessity (Demand) for items in units is known.

c) Ordering cost is consistent for every year.

d) Handling expense is known and consistent. However, if the cost of handling an item is given as the level of the cost of the item, the unit cost of the item continues as before.

e) No money or discount is permitted.

f) The arranged amount of the item is conveyed immediately.

g) Immediate renewal of requested amount is on schedule (No postponement and stock deficiency).

h) Constant lead time is just permitted (no change is allowed).

The economic request quantity and production request quantity model was engaged to obtain an optimal output via QM software.

Information Analysis and Presentation

The information for this examination was secondary assembled from the cement production firm. The information incorporates the demand, ordering cost, holding cost, unit cost, daily production rate, daily demand. The information was examined utilizing economic order quantity model and production order quantity model by the means of QM software to get an optimal size.

Table 1: Economic order quantity model initial Tableau

Parameter	Value
Demand	107014317
Setup/Ordering cost(S)	969060
Holding cost(H)	868642
Unit cost	2570

Table 2: Economic order quantity model Final Tableau

Parameter	Value
Optimal inventory quantity(Q)	15452
Maximum inventory level	15452
Average inventory	7726
Orders per period (year)	6926
Annual setup cost	6711223000
Annual holding cost	6711223000

Table 3: Production order quantity model initial tableau

Parameter	Value
Demand	91025730
Setup/Ordering cost (S)	969030
Holding cost (H)	868642
Daily production rate (p)	10000000
Daily demand rate	8000000
Unit cost	2570

Table 4: Production order quantity model final tableau

Parameter	Value
Optimal production quantity(Q)	31866
Maximum inventory level	6373
Average inventory	3187
Production runs	2857
Annual Setup	2768032000
Annual Holding	2768032000

Conclusion

In light of the study, economic request quantity model and production request quantity model was utilized to obtain, an optimal output of 15452, and 31866 respectively for a year. The yearly holding cost for inventory is 6,711,223,000 naira and the yearly holding cost for production is 2,768,032,000 naira. A mathematical methodology of economic request quantity model and production request quantity model will enable inventory and operations manager to make prescriptive decisions that will achieve optimality and reduce cost. It further clarified the logical and linear connection between economic request quantity model and production request quantity model to achieve optimality because the production output is a function of inventory. The proposed inventory or stock framework did not consider issues like decay, capacity, storeroom limit and spending imperatives. These variables are significant when buying bigger amounts on the grounds that in specific occasions, the managers may be compelled to rent additional facilities on the bases of larger resources. This will unquestionably expand costs. The model introduced in this paper can be stretched out to incorporate capacity limits, spending limits, and other economic request quantity model and production request quantity model variables.

Assessment of The Normalizing Aggregation Method in The Methodology of Multiple-Level, Multiple Criteria Evaluation of Urban Transportation Projects

Miroslaw KRUSZYNSKI

Poznan University of Technology, Faculty of Engineering Management, Logistics Institute, Poznan, Poland, miroslaw.kruszynski@put.poznan.pl

Abstract

In the paper, the author assesses an original normalizing aggregation formula, developed and applied as part of the methodology of multiple level, multiple criteria evaluation of varied transportation projects for the aggregation of rankings obtained following evaluation of urban transportation projects included in pre-defined classes into one final ranking which covers all varied urban transportation projects regardless of the class from which they originate. The aggregation of rankings from particular classes into one final ranking has been carried out using the author's original formula for normalizing aggregation, supported by 10 other formulas based on normalization methods which derive from distinct families of normalization formulas, i.e. quotient, logarithmic and zero unitarization formulas. Ultimately, employing Spearman's rank correlation coefficient and vector of similarity measure, the author conducts an assessment of the aforesaid original formula for normalizing aggregation applied at level II of the methodology of multiple level, multiple criteria evaluation of urban transportation projects for the aggregation of partial rankings into one final ranking. Having reviewed the results of both procedures to assess normalizing aggregation, it may be stated that the original formula, introduced by the author, performed very well in comparison with other normalizing aggregation methods.

Keywords: Methodology of Multiple Level, Multiple Criteria Evaluation of Varied Urban Transportation Projects; Normalizing Aggregation Formula; Spearman's Rank Correlation Coefficient; Vector of Similarity Measure.

Introduction

The author approaches the problem of evaluating varied urban transportation projects as an issue which entails multiple level, multiple criteria sorting of variants. The assessment of projects relating to public transport, private – individual transport, non-motorized transport (pedestrian, bicycle) and integration of various transportation types takes place at three levels of urban management: strategic, tactical and operational, involving research into the impact of the projects on the achievement of chief objectives: strategic goals (as part of overall policy) of a metropolitan area, tactical – sectorial goals (relating to the transportation policy of the metropolitan area) and operational – subject-oriented goals, which remain strictly linked to the specific characteristics of the projects (Kruszynski M., 2014).

One of the crucial elements in the methodology of multiple level, multiple criteria evaluation of transportation projects is aggregation of rankings generated at particular levels of analysis, i.e. subject-matter, sectorial and strategic rankings, into the final ranking. Another important component of the methodology, applicable at its level II, is aggregation of partial rankings resulting from evaluation of urban transportation projects in each class into a single subject-matter ranking of the entire range of varied urban transportation projects (Kruszynski M., 2014; Kruszyński M., 2015; Żak J., 2015).

At level II of the methodology (evaluation in respect of operational goals), projects are assessed in the first place within a specific class (transportation projects addressing similar issues) to produce subject-matter rankings of the projects. At that stage of evaluation, a different family of criteria is employed for each class, whereby the number of criteria in a given criterial family often varies, to arrive at distinct arrays (rankings) for each of the classes (the number of projects in the classes may vary as well). Consequently, the obtained results (rankings) need to be aggregated into a single subject-matter ranking of all transportation projects (spanning all classes).

Cite this Article as: Miroslaw KRUSZYNSKI " Assessment of The Normalizing Aggregation Method in The Methodology of Multiple-Level, Multiple Criteria Evaluation of Urban Transportation Projects" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

In this paper, the author discusses the assessment of an original normalizing aggregation formula used to aggregate rankings generated in the course of subject-matter evaluation of transportation projects belonging to distinct classes into one subject-matter ranking of all urban transportation projects, irrespective of their class. Detailed analysis is carried out to examine the subject-matter ranking obtained on the basis of the original formula as well as the rankings resulting from aggregation of partial rankings in accordance with 10 normalization formulas (quotient, logarithmic and zero unitarization). Finally, using two procedures to support the process of evaluating and selecting the preferable method of normalizing aggregation, a conclusive assessment is made, by virtue of which the original formula for normalizing aggregation at level II of the methodology of multiple level, multiple criteria evaluation of urban transportation projects is recommended for application.

The paper comprises 4 chapters. Preliminary considerations contained in Chapter 1 introduce the reader to the essence of the issue under discussion. Chapter 2 outlines methodological foundations of the study, providing characterization of multiple level, multiple criteria evaluation of transportation projects, ranking aggregation according to that methodology as well as multiple criteria decision aid methodology (MCDA). Also, the chapter collates normalizing aggregation formulas developed from normalization formulas which represent various families of such formulas (quotient, logarithmic and zero unitarization) as well as procedures aiding the process of assessing and selecting such an aggregation method, i.e. the procedures involving Spearman's rank correlation coefficient and vector-based measure of similarity. Chapter 3 includes a detailed characterization of ranking aggregation in the operational stage of multiple level, multiple criteria evaluation of urban transportation projects and presents the results obtained by means of the original aggregation formula and 10 normalizing aggregation formulas derived from known normalization formulas; in addition, the author discusses how the analysis proceeded and assesses the formulas applied. Chapter 4 provides the conclusions and recapitulates the paper, following which the references are supplied.

Principal Methodological Concepts Employed in the Study

Multiple level, multiple criteria evaluations of urban transportation projects

The methodology of multiple level, multiple criteria evaluation of urban transportation projects enables comprehensive assessment of varied urban transportation projects whilst taking into account their impact on the achievement of goals designated in transportation itself (subject-matter goals), in urban transportation policy (sectorial goals) and in urban development strategy (strategic goals), formulated at different tiers of urban transportation and municipal management (Kruszyński M., 2014). It allows for the multiple level, multiple criteria nature of the decision-making problem in question, the numerous technological, economic, social, environmental and political aspects, as well as the interests of various stakeholders, including residents and city users, municipal authorities, operators of public transport and its passengers (Kruszyński M., 2014).

Using this methodology, a complex decision problem can be resolved based on the methodology of multiple criteria decision aid (MCDA) with a possibility of coupling it with the methodology of Group Decision Making (GDM) (Kruszyński M., 2014; Kruszyński M., 2012). In general, the methodology consists in a five-level analysis (see Fig. 2.1). At level I, specific decision problems are resolved, i.e. a variant of urban transportation project is opted for, or projects are categorized into varied predefined classes, whereas at levels II - IV one addresses decision subproblems which have been isolated from the complex decision problem. The solution to the latter, involving a comprehensive, global evaluation of varied transportation projects is arrived at the final level V (Kruszynski M., 2014).

Fig. 2.1: Methodology of multiple level, multiple criteria evaluation of urban transportation projects (Kruszyński M., 2014)

Ultimately, the solution one obtains is a listing of varied urban transportation projects arrayed in order, from the undertaking which demonstrates the highest utility and simultaneously achieves subject-matter goals specific to various types of urban transport, urban transportation policy and with regard to city's strategic development goals, down to the undertaking with the lowest impact on the achievement of goals defined in the multiple level structure of urban transportation management (Kruszynski M., 2014). Such an approach enables effective use of public resources/means designated for the functioning and development of urban transportation, allowing for the preferences of decision makers, city residents (users) and interveners.

In the methodology of multiple level, multiple criteria evaluation of varied urban transportation projects, ranking aggregation takes place at two levels and represents its crucial component (Fig. 2.1). Rankings generated following subject-matter assessment of transportation projects are aggregated at level II, while level V involves aggregation of rankings obtained from the assessment of transportation projects at levels II, III, and IV, which pertain to subject-matter, sectorial, and strategic domains, respectively (Kruszyński M., 2014).

Multiple criteria decision aid

Multiple criteria decision aid (MCDA) serves to provide the decision maker with procedures, tools and mathematical-computer methods to solve decision problems whose analysis requires numerous, often opposing viewpoints to be taken into account. The MCDA methodology is applicable to multiple criteria decision problems that necessitate selecting, classifying, and sorting, i.e. situations in which, given a defined set of variants A (which are to be analyzed and assessed in the course of the decision-making process) and a consistent family of evaluation criteria F (which should meet the requirements of exhaustiveness of evaluation, consistency of evaluation with the principal goals of the decision maker, and non-redundancy of criteria), the decision maker aims to choose a variant or classify variants into predefined classes or to sort the variants (Morisugi H., 2000; Vincke P., 1992).

The general methodology of solving multiple criteria decision problems is staged into six phases (Żak J., 2005):

– Phase I: Identification and verbal description of the decision problem.
– Phase II: Construction of the mathematical decision model.
– Phase III: Analysis and selection of methods and algorithms by means of which the decision problem can be solved.
– Phase IV: Development of computer-based implementation of selected methods and algorithms.
–Phase V: Computer-based computational experiments.
– Phase VI: Analysis of results, review and assessment of solutions and selection of the most satisfactory

(compromise) solution.

MCDA methods which serve to solve multiple criteria decision problems may generally be divided into three groups (Roy B., 1990): multiattribute utility theory methods, methods bases on the outranking relation and interactive (dialogue) methods.

Normalization methods

Next to the original formula for normalizing aggregation, aggregation of partial rankings into a final ranking at level II of the methodology also takes advantage of 10 normalization formulas that are applicable to stimulant variables (Żabicki P., 2014; Jarocka M., 2015; Żabicki P., 2014; Walesiak M., 2016) which integrate quantity quotients of the partial ranking from which a particular variant (project) originates and of the number of analyzed and assessed variants from all partial rankings (Kruszyński M., 2014; Kruszyński M., 2015; Żak J., 2015):

– Normalizing aggregation incorporating normalization by Van Delft and Nijkamp:

$$x_{ij}^{*} = \frac{l_i}{\sum_{i=1}^{m} l_i} * \frac{x_{ij}}{\sqrt{\sum_{i=1}^{m}\sum_{j=1}^{n} x_{ij}^2}} \tag{1}$$

where:

x_{ij}^{*} – normalized value of variant j from partial ranking (class) i,
x_{ij} – value of variant j from partial ranking i,
l_i – number of variants in partial ranking (class) i
m – number of partial rankings (classes),
n – number of variants in partial ranking i.

– Normalizing aggregation incorporating Weitendorf's normalization:

$$x_{ij}^{*} = \frac{l_i}{\sum_{i=1}^{m} l_i} * \frac{x_{ij} - x_j^{-}}{x_j^{+} - x_j^{-}} \tag{2}$$

where:

x_j^{+}, x_j^{-} – highest, lowest value of variant j from all (m) partial rankings (all classes).

– Normalizing aggregation according to normalization by Peldschus:

$$x_{ij}^{*} = \frac{l_i}{\sum_{i=1}^{m} l_i} * \left(\frac{x_{ij}}{x_j^{+}}\right)^2 \tag{3}$$

– Normalizing aggregation incorporating normalization by Jüttler:

$$x_{ij}^{*} = \frac{l_i}{\sum_{i=1}^{m} l_i} * \frac{x_j^{+} - x_{ij}}{x_j^{+}} \tag{4}$$

– Normalizing aggregation incorporating normalization by Stopp:

$$x_{ij}^{*} = \frac{l_i}{\sum_{i=1}^{m} l_i} * \frac{100 * x_{ij}}{x_j^{+}} \tag{5}$$

– Normalizing aggregation incorporating sum-based normalization and Pattern's stimulant normalization:

$$x_{ij}^{*} = \frac{l_i}{\sum_{i=1}^{m} l_i} * \frac{x_{ij}}{\sum_{i=1}^{m}\sum_{j=1}^{n} x_{ij}} \tag{6}$$

– Normalizing aggregation based on linear normalization:

$$x_{ij}^{*} = \frac{l_i}{\sum_{i=1}^{m} l_i} * \frac{x_{ij}}{x_j^{+}} \tag{7}$$

– Normalizing aggregation incorporating normalization by Jüttler and Körth:

$$x_{ij}^{*} = \frac{l_i}{\sum_{i=1}^{m} l_i} * \left(1 - \left|\frac{x_j^{+} - x_{ij}}{x_j^{+}}\right|\right) \tag{8}$$

– Normalizing aggregation incorporating logarithmic normalization:

$$x_{ij}^{*} = \frac{l_i}{\sum_{i=1}^{m} l_i} * \frac{\ln(x_{ij})}{\ln\left(\prod_{i=1}^{m}\prod_{j=1}^{n} x_{ij}\right)} \tag{9}$$

– Normalizing aggregation incorporating maximum standardization:

$$x_{ij}^{*} = \frac{l_i}{\sum_{i=1}^{m} l_i} * \left(\frac{-x_{ij}}{x_j^{+}} + 1\right) \tag{10}$$

Procedures supporting the assessment of the original normalizing aggregation method

Pertinent literature provides numerous methods which may support the assessment and selection of the normalization method; ultimately, two have been chosen as the most suitable for the evaluation of ranking correlation (Spearman Ch., 1904; Kendall M., 1948; Jarocka M., 2015; Kukuła K., 2015; Walesiak M., 2017; Walesiak M., 2018).

In the first procedure, described as vector of similarity measures, the results of inter-ranking comparisons yields the assessment of applied normalizing aggregation methods that generated the rankings, by means of measure m_{pq} according to formula (11) (Kukuła K., 2015):

$$m_{pq} = 1 - \frac{2\sum_{i=1}^{n}|c_{ip} - c_{iq}|}{n^2 - z}, \quad p, q = 1, 2, \dots, r, \tag{11}$$

where:

c_{ip} – position i – of the variant in ranking p,
c_{iq} – position i – of the variant in ranking q,
$z = \begin{cases} 0, n \in P \\ 1, n \notin P \end{cases}$, a P – set ot natural even numbers,
$m_{pq} \in [0,1]$,
r – number of rankings.

Following comparisons between rankings one arrives at matrix M: a symmetric matrix with dimensions $(r \times r)$ according to formula (12) (Kukuła K., 2015):

$$M = [m_{pq}] = \begin{bmatrix} 1 & m_{12} & m_{13} & \dots & m_{1r} \\ m_{21} & 1 & m_{23} & \dots & m_{2r} \\ \dots & \dots & \dots & \dots & \dots \\ \dots & \dots & \dots & \dots & \dots \\ m_{r1} & m_{r2} & \dots & \dots & 1 \end{bmatrix} \tag{12}$$

where:
$m_{pq} = 1$, when $p = q$,
$m_{pq} = m_{pq}$, when $p \neq q$.

In order to determine the degree of similarity of a ranking obtained using p – of this normalizing aggregation method with respect to the remaining rankings one needs to calculate the sum of elements p in the line (or column) of matrix M reduced by 1 in accordance with the following formula (Kukuła K., 2015):

$$u_p = \frac{1}{r-1}\sum_{\substack{q=1 \\ P \neq q}}^{r} m_{pq}, \quad p, q = 1, 2, \dots, r, \tag{13}$$

One should choose that normalization method for which u_p assumes maximum value (Kukuła K., 2015):

$$\overline{u_p} = \max_{p} \overline{u_p} \tag{14}$$

Another mode of comparing rankings and, consequently, the applied normalizing aggregation methods is to determine Spearman's rank correlation coefficient (Jarocka M., 2015). Spearman's *rho* coefficient is computed based on the following formula (15) (Spearman Ch., 1904):

$$r_s = 1 - \frac{6\sum_{i=1}^{n} d_i^2}{n(n^2-1)} \tag{15}$$

where:

d_i^2 – square difference between ranks of corresponding values of characteristics x_i and y_i,
n – number of pairs of data.

Interpretation of Spearman's rank coefficient is as follow: below 0,2 – negligible correlation (practically no relationship); 0,2-0,4 – low correlation (discernible relationship); 0,4-0,6 – moderate correlation (relevant relationship); 0,6-0,8 – high correlation (substantial relationship); 0,8-0,9 – very high correlation (very strong relationship); 0,9-1,0 – practically perfect relationship (Spearman Ch., 1904).

Empirical Verification

Ranking aggregation at level II of the methodology of multiple level, multiple criteria evaluation of urban transportation projects

As already noted, level II of the methodology entails investigation within a particular class in the first place, so as to obtain partial rankings of urban transportation projects for each class. The number of intermediate rankings corresponds with the number of classes of transportation projects under consideration; in this paper, the number in question is 4. The following classes are taken into account in this case: private transport-oriented projects (PrT), public transport oriented projects (PuT), non-motorized mobility projects (MN) and transport integration projects (IT).

Subsequently, it becomes necessary to carry out normalizing aggregation of partial rankings of urban transportation projects with computed utilities into a final ranking. The aggregation is performed according to the following original formula (16) (Kruszyński M., 2014)

$$U_{ij}^{mer} = \frac{l_i}{\sum_{i=1}^{m} l_i} * U_{ij} \tag{16}$$

where:

U_{ij}^{mer} – utility of variant/urban transportation project *i,j* in the subject-matter ranking,
U_{ij} – utility of variant/urban transportation project j in the ranking of projects in class i,
l_i – quantity within class i, where $i = 1,2, \ldots, m$,
m – number of classes, where $m = 4$,
j – variant/urban transportation project in class i, where j= 1, 2, …, l_i.

The objective of this paper was to compare the result of normalizing aggregation at level II of the methodology of multiple level, multiple criteria evaluation of urban transportation projects using the original formula (16) advanced by this author in (Kruszyński M., 2014) with 10 normalizing aggregation methods described and listed above as formulas (1), (2), (3), (4), (5), (6), (7), (8), (9), (10), with a view to evaluating the original aggregation formula (16). The ranking generated by means of the original formula (16) is designated as R0, while rankings obtained based on the normalization formulas from (1) to (10) have been marked from R1 to R10, respectively. Tab. 1 presents the positions of the urban transportation projects under consideration in ranking R0 as well as the positions of the same projects in rankings R1, R2, R3, R4, R5, R6, R7, R8, R9 and R10.

Table 1: Positions of the assessed urban transportation projects in subject-matter rankings generated by means of normalizing aggregation methods, i.e. according to (1), (2), (3), (4), (5), (6), (7), (8), (9), (10), (16)

i	*i,j*	l_i	*Variant*	*Uij* [%]	R0	R1	R2	R3	R4	R5	R6	R7	R8	R9	R10

Assessment of the original method of normalizing aggregation of rankings

The assessment of the original method of normalizing aggregation with respect to 10 other normalizing aggregation methods enumerated in Chapter 2 was carried out using two procedures in which Spearman's rank correlation coefficient was employed, and one procedure involving the vector of similarity measure.

However, prior to the above, an analysis was carried out to estimate how a change of the normalizing aggregation method affected the sorting of projects in the global subject-matter ranking (following aggregation of 4 intermediate/partial rankings). Based on a cursory analysis of positions of particular urban transportation projects in ranking R0 in relation to the positions in rankings R1 - R10, generated in the course of computational experiments in which 10 normalizing aggregation methods were employed to normalize results of project evaluation within their classes, one readily observes that their positions have changed (see Tab. 2). In fact, no project in R0 has retained the same position in the remaining 10 rankings. The winning PrT-4 project in ranking R0 changed position in 2 rankings (least frequently of all 18 evaluated projects). Most frequent change with respect to position in R0, i.e. in all 10 rankings, was noted in the case of two projects from the class of private transport projects, namely PrT-3 and PrT-5. Two projects from the public transport projects class—PuT-3 and PuT-2—changed their R0 positions in numerous other rankings, the former in 9 and the latter in 8 rankings. In the other instances, changes occurred less often, with 4 projects shifting in 3 rankings, 5 projects in 4 rankings, and the remaining 4 projects in 5 rankings.

On the grounds of this cursory analysis alone, it may be inferred that the choice of the normalizing aggregation method for the aggregation of intermediate rankings generated following the evaluation of urban transportation projects assigned to 4 subject-specific classes into one global subject-matter ranking does affect the outcome, namely the position of a given project/variant in the final ranking.

For the purposes of a detailed analysis of the rank changes of urban transportation projects in the final subject-matter rankings (R0 and R1, R2, R3, R4, R5, R6, R7, R8, R9 i R10) depending on the adopted normalizing aggregation formula, Spearman's rank correlation coefficient was computed for the positions of each transport project across the rankings; the output values are provided in Tab. 2.

Table 2: Spearman's rank correlation coefficient values between rankings R0 and R1, R2, R3, R4, R5, R6, R7, R8, R9, and R10

	R0	R1	R2	R3	R4	R5	R6	R7	R8	R9	R10
R0	1.000	0.996	0.893	0.878	-0.647	0.996	0.996	0.996	0.996	0.238	-0.624
R1		1.000	0.893	0.878	-0.647	1.000	1.000	1.000	1.000	0.238	-0.624
R2			1.000	0.969	-0.800	0.893	0.893	0.893	0.893	-0.051	-0.781
R3				1.000	-0.868	0.878	0.878	0.878	0.878	-0.051	-0.847
R4					1.000	-0.647	-0.647	-0.647	-0.647	0.531	0.998
R5						1.000	1.000	1.000	1.000	0.238	-0.624
R6							1.000	1.000	1.000	0.238	-0.624
R7								1.000	1.000	0.238	-0.624
R8									1.000	0.238	-0.624
R9										1.000	0.556
R10											1.000

High Spearman's rank correlation coefficients, whose values fluctuate between 0.9 and 1.0, attest to perfect relationship of position results in those rankings, while those in the range from 0.8 to 0.9 indicate strong correlation of the rankings, which means strong correlation of the employed normalizing aggregation methods. Perfect relationship is thus observed between R0 and R1, R5, R6, R7, R8, i.e. with 5 rankings. Each of these rankings (R1, R5, R6, R7, R8) demonstrates full correlation with 5 other rankings as well. The remaining rankings are not correlated to the same degree, as only R2 and R3 are mutually correlated with the value of Spearman's rank correlation coefficient above 0.9; the subsequent do not display perfect relationship with any other ranking.

Ranking R0 also proves to have strong correlation (value range of Spearman's rank correlation coefficient from 0.8 to 0.9) with two rankings, i.e. R2 and R3. Furthermore, ranking R0 is weakly correlated with R9 and has negligible relationship (hardly any correlation) with rankings R4 and R10. Ranking R9 was generated through normalizing aggregation constructed on the basis of logarithmic normalization, R4 is the result of normalizing aggregation according to Jüttler's normalization, while R10 was obtained following normalizing aggregation relying on maximum standardization. The normalizing formulas which served to perform normalizing aggregation that yielded rankings characterized by strong or perfect correlation with R0 all belong to one family of normalization formulas, the so-called quotient formulas. It may be presumed that besides the original formula (16) which the author employed for normalizing aggregation at level II of the methodology of multiple level, multiple criteria evaluation of urban transportation projects, other formulas of normalizing aggregation derived from the quotient-based family of normalization formulas may also be applied, i.e. (1), (2), (3), (5), (6), (7) and (8).

In the subsequent, second procedure aiding the assessment of the original formula of normalizing aggregation used as part of the methodology of multiple level, multiple criteria evaluation of urban transportation projects with respect to 10 other formulas developed from normalizing methods for each pair of rankings (generated following those formulas) in Tab. 1, the values of measure m_{pq} were estimated according to formula (11). All computed values were recorded in matrix M, in which the number of the line (column) corresponds to the normalizing aggregation method which yielded the respective global subject-matter ranking:

$$M = \begin{bmatrix} 1{,}000 & 0{,}975 & 1{,}000 & 0{,}802 & 0{,}111 & 0{,}975 & 0{,}975 & 0{,}975 & 0{,}975 & 0{,}444 & 0{,}123 \\ & 1{,}000 & 0{,}827 & 0{,}815 & 0{,}111 & 1{,}000 & 1{,}000 & 1{,}000 & 1{,}000 & 0{,}444 & 0{,}123 \\ & & 1{,}000 & 0{,}889 & 0{,}062 & 0{,}827 & 0{,}827 & 0{,}827 & 0{,}827 & 0{,}296 & 0{,}074 \\ & & & 1{,}000 & 0{,}037 & 0{,}815 & 0{,}815 & 0{,}815 & 0{,}815 & 0{,}272 & 0{,}049 \\ & & & & 1{,}000 & 0{,}111 & 0{,}111 & 0{,}111 & 0{,}111 & 0{,}543 & 0{,}988 \\ & & & & & 1{,}000 & 1{,}000 & 1{,}000 & 1{,}000 & 0{,}444 & 0{,}123 \\ & & & & & & 1{,}000 & 1{,}000 & 1{,}000 & 0{,}444 & 0{,}123 \\ & & & & & & & 1{,}000 & 1{,}000 & 0{,}444 & 0{,}123 \\ & & & & & & & & 1{,}000 & 0{,}444 & 0{,}123 \\ & & & & & & & & & 1{,}000 & 0{,}556 \\ & & & & & & & & & & 1{,}000 \end{bmatrix}$$

Following the procedure, it may be stated that R0 displays high degree of similarity to other rankings, with values of the similarity measure approaching unity ($\overline{u_p} = 0{,}993$), at the same level of similarity measure with regard to other rankings as R1 and R5, where that measure reached the maximum value of unity ($\overline{u_p} = 1{,}000$). In the remaining cases, the values for similarity measure are significantly lower (see Tab. 3).

Table 3: Average values of inter-ranking similarity measure

	R0	**R1**	**R2**	**R3**	**R4**	**R5**	**R6**	**R7**	**R8**	**R9**	**R10**
$\overline{u_p}$	0.993	1.000	0.948	0.945	0.733	1.000	0.730	0.730	0.730	0.833	0.737

Summary and Conclusions

This paper set out to assess an original normalizing aggregation formula used for the aggregation of intermediate/partial rankings into a final subject-matter ranking at level II of the methodology of multiple level, multiple criteria evaluation of transportation projects. The assessment was performed while relying on the result of normalizing aggregation according to 10 aggregation formulas derived from 10 normalization methods (quotient, logarithmic and zero unitarization).

Based on the conducted computational experiments, it may be concluded that the choice of the normalizing aggregation method for the aggregation of intermediate rankings generated in the course of evaluation of urban transportation projects from 4 subject-specific classes into one global subject-matter ranking affects the outcome, i.e. the position of a project/variant in the final subject-matter ranking.

In view of the determined impact of the employed normalizing aggregation methods on the position of urban transportation projects in individual final subject-matter rankings, the methods in question were assessed. For this purpose two procedures applicable to normalizing aggregation methods were implemented, one of which used Spearman's rank correlation coefficient, while the other relied on vector of similarity measure.

The first procedure demonstrated that the original normalizing aggregation formula is in perfect correlation with as many as 6 out of 11 formulas, and in strong correlation with further two. In the second procedure, 5 formulas showed measure of similarity approaching unity.

Having reviewed the results of both procedures to assess normalizing aggregation, it may be stated that the original formula (16), introduced by this author in (Kruszyński M., 2014), performed very well in comparison with other normalizing aggregation methods (1), (2), (3), (4), (5), (6), (7), (8), (9), (10). In the procedure assessing normalizing aggregation formulas based on Spearman's rank correlation coefficient, ranking R0 obtained from the aggregation of intermediate rankings according to original normalizing aggregation method (16) is perfectly correlated with 5 other rankings (R1, R5, R6, R7, R8), which originate from the family of quotient normalization formulas. Also, ranking R0 remains in strong correlation with two more rankings, i.e. R2 and R3, which derive from the quotient family as well. In the procedure aiming to assess normalizing aggregation formulas using vector of similarity measure, it was shown that ranking R0 displays full similarity to ranking R1 and ranking R5, as well as to R2 and R3. Further, this procedure demonstrated that R0 generated on the formula (11) is fully similar to rankings obtained by means of the quotient formulas for normalizing aggregation ((1), (2), (3), (5)). It may be presumed that the remaining normalizing aggregation methods, originating from other families of normalization formulas—logarithmic or zero unitarization—are less useful when carrying out normalizing aggregation of partial rankings into a final ranking in the methodology of multiple level, multiple criteria evaluation of urban transportation projects.

Significant, original methodological findings of this work include:

– developing 10 formulas for normalizing aggregation based on 10 normalization formulas,
– conducting aggregation of intermediate/partial rankings of urban transportation projects in 4 classes into one final subject-matter ranking using previously developed normalizing aggregation methods,

– performing assessment of the original method of normalizing aggregation based on comparisons of the subject matter rankings obtained by means of the original aggregation method and rankings generated with 10 other normalization methods,
– formulating final recommendations.

The following may be considered to constitute significant practical outcomes of the work:

– verification of suggested procedures for the assessment of normalizing aggregation formulas involving obtained subject-matter rankings,
– demonstration of practical application of both procedures for the assessment of normalizing aggregation methods used to aggregate intermediate rankings into a final subject-matter ranking at level II of the methodology of multiple level, multiple criteria evaluation of urban transportation projects.

Computational experiments conducted as part of this study make it possible to formulate the following recommendations:

– the original formula of normalizing aggregation, presented by this author in (Kruszyński M., 2014) may be applied to aggregate intermediate ranking into single final subject-matter ranking on a par with other normalizing aggregation formulas developed on the basis of normalization formulas in the quotient family,
– in order to assess the original formula of normalizing aggregation in the process of aggregating intermediate rankings into one final ranking at level II of the methodology of multiple level, multiple criteria evaluation of urban transportation projects, as well as the normalizing aggregation formulas derived from 10 normalization formulas in the various families, i.e. quotient, logarithmic and zero unitarization formulas, employed for the same purpose, one can take advantage of both procedures to aid the assessment, namely the procedure using Spearman's rank correlation coefficient and the procedure involving vector of similarity measure,
- next to the original formula of normalizing aggregation, aggregation of intermediate rankings into one subject-matter ranking may also rely on the normalizing aggregation formulas incorporating Van Delft and Nijkamp normalization and Stopp normalization.

Abstract

The purpose of this research is to identify individual factors that influence students to participate in social entrepreneurship activity and the outcome of social entrepreneurship activity to human capital and social capital. This quantitative research has been conducted on 797 Enactus students using stratified sampling at three categories of public university in Malaysia. For this purpose, statistical analysis was done on the data obtained from 797 Enactus students using stratified sampling at 20 public university in Malaysia. Based on Partial Least Squares structural equation modelling (PLS-SEM) method, our empirical study showed that involvement in social entrepreneurship activity is influenced positively by four key factors: empathy, moral obligation, self-efficacy and social support. Data analysis also revealed that there is a significant relationship between these individual factors with their human capital and social capital. The study that highlighted the influence of individual factor on student's involvement in social entrepreneurship activity and its relationship with human capital and social capital is not well validated empirically in Malaysia. Thus, this study was contributing the new body of knowledge in social entrepreneurship development in Malaysia.

Keywords: Involvement, Social Entrepreneurship Activity, Public University.

Introduction

In Malaysia the concept of social entrepreneurship shows good development and has received a lot of attention from academics and policy makers. In May 2015, social entrepreneurship was officially introduced by the government through the Malaysian Social Entrepreneurship Blueprint (MaGIC, 2015). To further increase the involvement of individuals in social enterprises, in 2019, the Accreditation of Social Enterprises (SE. A) has been established to confirm the status of a social enterprise to help them gain access to various support and greater opportunities to grow their business (website Medac). Recently, the Malaysian government has also launched the National Entrepreneurship Policy (DKN) 2030. It is the country's long-term strategy in making Malaysia a superior entrepreneurial nation by 2030 (website Medac). Among the area that will be given attention is the field of social entrepreneurship. Therefore, this policy will act as a catalyst for Malaysia to achieve a more equitable and inclusive economic distribution, subsequently emerging as the axis of the Asian economy (website Medac). However, despite the many social entrepreneurship programs implemented by the government and organizations, the involvement and awareness of Malaysians towards social entrepreneurship to support government policy is still very low. According to the Thomson Reuters Foundation (2016), the level of knowledge of Malaysians about social entrepreneurship is still low. This low knowledge leads to the lack of involvement of Malaysians in social entrepreneurship activities. Therefore, there is a need to study the involvement of students in social entrepreneurship activities in Malaysia.

Cite this Article as: Nor Suhaida Bt AWANG, Wan Fauziah Bt WAN YUSOFF and Raudah Bt MOHD ADNAN "The Involvement of Public University Students in Social Entrepreneurship Activity: Empirical Study in Malaysia" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

So, what exactly is meant by social entrepreneurship and why it is necessary to encourage more Malaysian to engage in this activity? The first and most popular definition of social entrepreneurship is the definition introduced by Dees (1998), pioneers in the field of social entrepreneurship. According to Dees, social entrepreneurship is an activity that uses conventional business models to address social issues. It is an agent of change in the social sector such as implement the ideal of changing and improving social values, looking for opportunities to make continuous changes, always engage in the process of innovation, adaptation, learning that he faces, act regardless of limitations and have accountability in accounting the decisions he achieves to the community. Other than that, social entrepreneurship can be defined as innovative development, income-generation efforts, job creation and can be carried out by individuals, groups of individuals or organizations (Pomerantz, 2003). Social entrepreneurship is driven by financial sustainability. They also provide alternative delivery systems for public services such as health, education, housing and society (Harding, 2006). Therefore, to overcome the economic and social crisis simultaneously, one of the methods that can be used is through social entrepreneurship activities. It not only can overcome the socio-economic imbalance but also indirectly can help to reduce government budgets to solve social issues.

Literature Review

Researchers have identified several studies on student involvement in social entrepreneurship activities, factors that influence students involved in social entrepreneurship activities and the outcomes of social entrepreneurship activities on students as below.

Empathy

Barnett et al. (1981) found empathy to be a very relevant feature for social entrepreneurs. Morreale, Spitzberg and Barge (2001) define empathy as the ability to experience similar feelings toward others. In the context of this study of social entrepreneurship, the definition of empathy is one's ability to understand the feelings of disadvantage people. Students who involved in social activities as a whole have a high level of empathy (Greeno, E. J, Ting, L., and Wade, K., 2018). Empathy has a positive effect on involvement in corporate voluntary activities (Forster & Grichnik, 2013). According to Sophie bacq and Elisa Alt (2018), empathy has no direct relationship to involvement in social entrepreneurship but is moderated by other factors. Thus, the development of hypothesis for empathy is as below:

H1: Empathy has positive influence on student's involvement in social entrepreneurship activity

Moral obligation

Moral obligation is defined as an individual decision to determine whether something is wrong or wrong, ethical or unethical (Schwepker & Good, 2010). Moral obligation is the second characteristic that contributes to the formation of social entrepreneurial intentions (Mair & Noboa, 2006). Personal moral values are a key driver for corporate social entrepreneurship (Hemingway, 2005). Moreover, the decision to start a social activity is often driven by an individual's ethical and moral perceptions (Kickul & Lyons 2012). Thus, the higher the level of moral obligation is seen to positively influence a person involved in social entrepreneurship (Smith, Kistruck, & Cannatelli, 2016). Thus, the development of hypothesis for moral obligation is as below:

H2: Moral obligation has positive influence on student's involvement in social entrepreneurship activity

Self-Efficacy

The basic principle of self-efficacy theory is that individual achievement and motivation are determined by self-belief (Bandura, 1982). Students who have high level of self-efficacy have a higher desire to engage in social entrepreneurship activities (Tiwari, Bhat, & Tikoria, 2017). Thus, the development of hypothesis for self-efficacy is as below:

H3: Self-efficacy have positive influence on student's involvement in social entrepreneurship activity

Social Support

Social support in this study refers to the support from family and friends influencing a person's decision to engage in social entrepreneurship activities (Hockerts, (2015). Social entrepreneur who gets encouragement and support from their parents and friends inspires them to continue to be successful as social entrepreneurs (Omorede, 2014). Other than that, individuals are more likely to form intentions to engage in entrepreneurship when they think that the decision is supported by people close to them, when entrepreneurial activity gives positive value to society, when they see others becoming entrepreneurs and successful (Malebana, 2016). Thus, the development of hypothesis for social support is as below:

H4: Social support have positive influence on student's involvement in social entrepreneurship activity

SE Involvement and its influence on human and social capital

There are several definitions regarding the term of involvement. Cohen and Uphoff (1977) state that involvement is a process, that is, the individual can approach himself or have a relationship in the planning and implementation of a program. Apart from that, from other aspects involvement also means a person's behavior towards an activity. This is supported by Leithwood and Jantzi (1999) who stated that involvement is divided into two dimensions namely affective and behavioral. Russell, Ainley and Frydenberg (2005) state that involvement consists of three forms, namely behavioral, emotional and cognitive. According to Kamidin, Mahmood and Pin (2006), involvement is more influenced by the internal input of the individual such as motivation, background, economic situation, academics and the knowledge that is in the self will form the perception of the individual and subsequently translated into the form of involvement. Therefore, the involvement factor is greatly influenced by one's individual factors.

There are several studies shows positive outcome of involvement in activities such as social entrepreneurship. It can help improve student interpersonal skills such as the ability to solve problem, work with others in addition to being able to understand the problems faced by society and experience dealing with real issues (Astin & Sax, 1998; Rahim & Lajin, 2015).

H5: SE involvement have positive influence on human capital

According to Coleman (1990) social capital is the existing relationship in the family among the organization of a community that is useful in the cognitive and social development of an individual. According to him, there are two relationship structures in social capital, namely within the family and outside the family. Social entrepreneurship activities such as service-learning have a positive effect on social capital such as the sense of social responsibility (D'Agostino, 2010). In addition, the results of this study are also in line with the study of Tshikovhi (2013) that students involved in social entrepreneurship activities through the Enactus project also has networking skills and is able to build better professional contacts. Volunteering can strengthen relationships with each other as well as social interaction (Alias & Balakrishnan, 2017).

H6: SE involvement have positive influence on social capital

Methodology

The objective of this study was to study and examine the involvement of students in social entrepreneurship and its effects on their level human capital and social capital. The study was performed on 797 students who are participate in social entrepreneurship activity in their University. The questionnaire for collecting data has a 5-point Likert scale from 1 (complete disagreement) and 5 (complete agreement). This questionnaire was sent to the respondent via google form, walk-in, and by post to increase the return of valid survey. The process of analysis data involves the use SPSS software and Smart PLS.

Result

This study also conducted to identify the individual factor that contribute to participation of students in social entrepreneurship activity. Other than that, this study also carried out to find outcome the of participation in social

entrepreneurship activity to human capital and social capital. The analysis is conducted to look the direct relationship between participation in social entrepreneurship activity and its outcomes. This analysis is carried out using PLS-SEM starting with measurement model assessment, followed by structural assessment as discussed in the following subtopic.

Measurement model assessment is carried out using PLS algorithm and the value in report is automatically generated as in Table 4.1. Based on the measurement model, Composite reliability (CR) and Cronbach's Alpha for all construct is below the threshold value.

Table 4.1: Result of Composite reliability (CR) and Cronbach's Alpha

Construct	Composite reliability (CR)	Cronbach's Alpha	Internal consistency reliability α >0.8 and 0.60<CR<0.95
EFI	0.876	0.831	Yes
EMP	0.846	0.783	Yes
HUM	0.916	0.884	Yes
INV	0.917	0.904	Yes
MOR	0.909	0.880	Yes
SOC	0.921	0.893	Yes
SOS	0.880	0.795	Yes

(Notes: EMP=Empathy; MOR=Moral obligation; EFI=self-efficacy; SOC=social support; INV=Involvement; HUM=human capital; SOS=social capital)

Next step is the convergent validity test. There are two tests under convergent validity that is indicator reliability and the average variance extracted (AVE) of all constructs.

Result

Based on Table 4.4 below, the beta value (β) is shown in the original column of the sample while the t-value is shown in the T statistics column. Beta values (β) or path coefficients are used to see the strength of the relationship between the independent variable and the dependent variable. The standard beta (β) value is between -1 to +1, i.e. the value approaching +1 indicates there is a strong positive relationship and the value approaching -1 indicates a strong negative relationship (Hair et al., 2014). Whereas, t-value is used to identify whether the relationship of independent variables and dependent variables is significant or not. According to Hair et al., (2017), beta values should be compared with critical values. In this study the critical value used is 1.96 (two-tailed). Based on t-value, the researcher will decide whether to reject or accept the hypothesis of this study (Gotz et al., 2010).

The results of the analysis show that individual factor that is empathy (t = 22.493, β = 0.314), self-efficacy (t = 20.486, β= 0.015), moral obligation (t =31.260, β =0.015) and social support (t =15.522, β =0.012) affects the level of involvement in social entrepreneurship activity. In addition, the results of the analysis also show that student involvement in social entrepreneurship activities affects the level of human capital (t = 22.321, β =0.026) and student social capital (t = 22.138, β = 0.012) where it has a t-value exceeding 1.64. Therefore, this indicates a significant path. Thus, there is a positive relationship between individual factor and level of involvement in social entrepreneurship activity. This study also highlighted that there is a positive relationship between student involvement in social entrepreneurship activities with human capital and social capital. Therefore, these results support the hypothesis that empathy, self-efficacy, moral obligation, and social support affects the level of involvement in social entrepreneurship activity. Other than that, these results also support the hypothesis that involvement in social entrepreneurship activities affects the level of human capital and social capital of the students.

Table 4.4: The Relationship of Human Capital and Social Capital of Students Involved in Social Entrepreneurship Activities with Involvement Factors in Public Universities

Hyphotesis	Relationship	Original sample (β)	Standard deviation (STDEV)	T statistics (t-value)	Significant
H1	**EMP -> INV**	0.264	0.012	22.493	Yes
H2	**MOR -> INV**	0.471	0.015	31.260	Yes
H3	**EFI -> INV**	0.314	0.015	20.486	Yes
H4	**SOS -> INV**	0.188	0.012	15.522	Yes
H5	**INV -> HUM**	0.572	0.026	22.321	Yes
H6	**INV -> SOC**	0.560	0.025	22.138	Yes

(Notes: EMP=Empathy; MOR=Moral obligation; EFI=self-efficacy; SOS=social support; INV=Involvement; HUM=human capital; SOC=social capital)

Diagram 4.1: t-value relationship between factors of individual involvement in social entrepreneurship activities with human capital and social capital in Public University

i) Coefficient of determination (R^2)

The inner model test can be performed using Smart PLS 3.0 by looking at the R-Square value for the dependent variable construct. Table 4.5 shows the R-Square values for Public Universities as a whole produced by dependent variables namely human capital and social capital. The results of this R-Square test aim to see how much contribution is made by the involvement factors to the of level of human capital and social capital. Figure 4 shows the inner structural model with further explanation.

Table 4.5: Result of R-Square

	R Square	R Square Adjusted
INV	0.987	0.987
HUM	0.327	0.326
SOC	0.314	0.313

Firstly, the R-Square value shown in Figure 4.5 above for the variable of involvement (INV) is 0.987. This shows that factor of empathy, moral obligation, self-efficacy and social support contributes 98.7% variance to the formation of involvement while the rest is 1.3%. This is because the situation has been influenced by other variables that have not been studied by the researcher. Secondly, R-Square value for the variable of human capital (HUM) is 0.327. This shows that the involvement factor contributes 32.7% variance to the formation of human capital factors while the rest is 67.3%. This is also because the situation has been influenced by other variables that have not been studied by the researcher. Lastly, the R-Square value of the variable social capital (SOC) is 0.313% of which the involvement factor contributes 31.4% variance to the formation of social capital. According to Cohen (1988), the value of R2 is divided into three category that are strong (R2 = 0.26), moderate (R2 = 0.13) and weak (R2 = 0.19). Therefore, the value of R2 in this study exceeds 0.26 which indicates that the model has a strong predictive strength.

ii) Effect size (f^2)

Next is the effect size assessment, f2. This measurement aims to see whether independent variables have an influence on dependent variables (Bobow-Thies & Albers, 2010). The results of the analysis are shown as in the diagram below to identify the effect size of involvement factors on the human capital and social capital.

Table 4.6: Result of f^2

	HUM	INV	SOC
EFI		4.272	
EMP		2.732	
INV	0.486		0.458
MOR		7.720	
SOS		1.803	

Based on the table above, the results f^2 of involvement, human capital and social capital are obtained. According to Cohen (1988), the value of f^2 at 0.02 is small effect size, 0.15 medium effect size and 0.35 is substantial effect size. The results show that the factors of involved have a substantial effect on R2 of involvement, human capital and social capital.

iii) Predictive relevance (Q^2)

In addition to R-Square values, Q^2 values are implemented using the blindfolding process in SmartPLS 3.0 Software. This assessment was conducted to look at the model's ability to predict (Henseler et al., 2009). If the value of Q^2 exceeds zero (0), it indicates that the study model has predictive relevance for the endogenous construct. Whereas if the Q^2 value is less than zero (0), it indicates that the study model does not have good predictive relevance (Henseler et al., 2009; Ramayah et al., 2017). In this study, the value of Q^2 exceeded the values> 0, which is 0.207, 0.323 and 0.289. This shows that the study model has a strong predictive relevance level and this study model has the ability to predict the path for involvement, human capital and social capital. Moreover, Hair et al (2017) stated that the relative measure value of predictive relevance 0.02 is small, 0.15 is moderate and 0.35 is large. This means that EFI, EMP, MOR and SOS items have moderate predictive effects. The results of the blindfolding process are as in Table 4. below:

Table 4.7: Cross validated Communality (Q^2)

	Q^2
HUM	0.209
INV	0.323
SOC	0.206

Discussions

This study concludes that the involvement of students in social entrepreneurship activity increases when they have a high level of empathy, moral judgment, self-efficacy and social support. The factor of empathy, moral obligation, self-efficacy and social support contributes 98.7% variance to the formation of involvement while the rest is 1.3%. This may support previous research that argue these constructs (empathy, moral obligation, self-efficacy and social support) influence through the two mediating variables of perceived desirability and perceived feasibility that have not been studied by the researcher (Shapero & Sokol, 1982; Krueger, 1993; Mair & Noboa, 2006). In addition, the results also show that there is a positive relationship between student involvement in social entrepreneurship activities on human capital and social capital. The result show that SE activity help students become more creative, innovative, competitive, have problem-solving skills and leadership skills. The results of this study are supported by Urban (2015). The results of his study show that positive self-efficacy factors related to students' human capital are to increase sustainability, social networks and innovation. In addition, the results of this study are also in line with Humphrey (2013) which shows that a person with high empathy is more innovative and creative and has better leadership skills. On the other side, this study also shows that the involvement in SE activity can increase level of social capital. It helps students to access to many professional contacts, increase sense of social responsibility, fostering loving relationships with others, gaining extensive information from their contacts and cultivating trust in others (D'Agostino, 2010; Tshikovhi, 2013; Alias & Balakrishnan, 2017).

Studies on the relationship between involvement factors and the impact of involvement in social entrepreneurship activities are still not extensive. Therefore, previous studies to support the results of the study obtained in this study are limited. Therefore, there is a need to look at the factors of empathy, self-efficacy, moral judgment and social support on the level of human capital and social capital among students in this study. Through student's involvement in activities social entrepreneurship, they can contribute ideas and energy to make social change in society by using their interpersonal and social skills. This is because previous studies have focused on only one factor, namely empathy or self-efficacy, but the factors of moral judgment, social support, external institutions and internal institutions have not been studied. Therefore, this study is a new finding in the study of social entrepreneurship research in Malaysia.

Conclusions

The findings of this study contribute to several things in the field of social entrepreneurship. First, this study offers a theoretical approach to social entrepreneurship research. It also developed and adapted a framework based on the model of Mair and Noboa (2006) and included additional variables such as human capital and social capital. In addition, many previous research papers use qualitative methods. Given that there are very few empirical studies in Malaysia about the current involvement of students in social entrepreneurship activity. Hence, the empirical results of this study are expected to help increase knowledge in this field in Malaysia.

Abstract

Current socio-economic developments generated by the SARS-Cov2 outbreak have pushed e-learning into the spotlight more than ever before. With imminent high-performance expectations from e-learning management systems the academic society has found itself in an unprecedented situation, struggling to adapt to the swift change from face-to-face activities to online teaching. A thorough state of the art analysis on e-learning solutions led to the identification of several gaps, like: a lack in statistical control for confounding factors when calculating improvement in learning; available blended learning solutions are scarce in the industrial or mechanical engineering areas; customization of content is difficult at an individual level, particularly for large theoretical classes. To overcome these gaps, authors propose a detailed management planning procedure for the design and development of an e-learning interactive educational platform able to generate and deliver a student-centered customized curriculum for complex project development in industrial engineering-based applications. The e-learning solution aims to integrate a Curriculum Route Builder, which could allow the identification and interpretation of real individual needs of one learner and integrate them into the general goal of the designed subject curriculum. To help achieve the main objective of the research, twelve specific objectives have been defined. A comprehensive workplan was developed, made up of four work packages. Each work package has associated specific activities, estimated results, key success indicators and deliverables. Risk analysis was undertaken and with a 1.82 score it was concluded that the risk incidence rate is low. After allocation of resources, it was established that three laboratories are needed to implement the project, all within a total budget of 449996.0 lei.

Keywords: Hybrid Education, Custom Curriculum, Learning Objectives, Project Planning.

Introduction

Marope M. et al. (2017) conclude that from a socio-economic and cultural point of view, curricula must enable learners to acquire competences which allow them to properly address the requirements of a demanding labor

market, all in a complex and fast changing environment due to Industry 4.0 and Artificial Intelligence influences. According to Harward D. (2017) audience is hyper connected to personal devices and usually expects at least the same level of engagement and excitement from any form of teaching/ learning/ training activity to show interest. Several approaches have been shown to shift the learning experience from teacher-centered instruction toward innovative, student-centered teaching, like: project-based learning as stated by Jensen A.A. et al. (2019) in their work; team-based approaches, as discussed by Mal P.R., Suneel P. (2019); blended learning, as presented by several researchers like First A.I. and Ayse A. (2019), Sahni J. (2019) or Dias S.B. and Diniz J.A. (2014); and even gamification of content, as presented by Subhash S. and Cudney E.A. (2018) and Alomari I. et al. (2019). These are rapidly becoming mainstream, as Dziuban C. et al. (2018) identifies that the labor market requires more and more competences like creativity, critical thinking, complex problem solving, deductive reasoning and social intelligence. OECD (2018) forecasts that, in the future, graduates will have to apply their knowledge in unknown and evolving circumstances, needing a broad range of skills, including cognitive and meta-cognitive skills (e.g. critical thinking, creative thinking, learning to learn and self-regulation); social and emotional skills (e.g. empathy, self-efficacy and collaboration); and practical and physical skills (e.g. using new information and communication technology devices). Garrison D.R. and Kanuka H. (2004) state that more and more commonly used, hybrid or blended learning refers to a combination of face-to-face learning, including but not confined to lectures, and online learning.

From a scientific point of view, Twigg C.A. (2003) classifies blended/ hybrid learning courses in four main categories: replacement, supplemental, emporium or buffet, depending on the relationship between the face-to-face and online components of the curricula. The replacement model involves that face-to-face lectures are substituted either partially or fully by online material, and class meeting time is either reduced or repurposed. Bowen W.G. (2012) shows that the most common practice is to require students to watch videos online prior to coming to class and/or to complete some type of assignment. Repurposing of lecture time can mean: • Answer students' questions; • Provide traditional recitation sessions or optional remedial sessions; • Give students the opportunity—or require them—to participate in discussions or active learning exercises. The supplemental model analyzed by Twigg C.A. (2003) assumes that students to attend the same number of class meetings, but to access technology-based materials outside of the classroom as additional resources. In the emporium model, students work solely online but within a "learning resource center". The buffet model, as, for example, implemented by Ohio State University and recorded by Pearl D. (2003), provides students with a menu of learning activities in both face-to-face and online formats, being the most flexible of the blended learning opportunities.

As implementation of blended learning solutions within higher education institutions is becoming a more common practice, at an international level, feedback on its' impact varies across specialists like Lack K.A. (2013) noted. One major drawback identified by Zhao Y. and Breslow L. (2013) is that most studies lack a statistical control for confounding factors when calculating improvement in learning.

One of the most important limitation of the existing blended learning solutions, is that they are currently delivered with a pre-planned curriculum workflow structure. In order to be truly customizable, a curriculum should allow each learner to have an individual learning experience, while achieving the same learning objectives across the same subject.

Another significant drawback of current blended curriculum design is being less concerned with individual learning styles, leaving students confused with the amount of available information. One major downside of this approach is that students who are not responsive to this model tend to fall behind, because of decreased levels of engagement and motivation. Available blended learning curricula offer solutions only for lecture or seminar-based subjects, leaving a gap for laboratory intensive subjects, like engineering classes, where specific equipment and materials are required for the teaching experience to be effective. Out of the 42 studies reviewed by Zhao Y. and Breslow L. (2013) not one was industrial or mechanical engineering based.

Considering the abovementioned, the authors propose a detailed management planning procedure for the design and development of an e-learning interactive educational platform (HYBRID-ED) able to generate and deliver a student-centered customized curriculum for complex project development in industrial engineering-based applications. The HYBRID-ED initiative is approached as a project which tackles the above-mentioned disadvantages of current approaches, by providing a fully customizable curricula for complex project development in engineering-based applications, within an e-learning educational platform.

The challenges of the proposed approach will be to design a fully customizable Curriculum Route Builder (CRB), which will allow to identify and interpret the real individual needs of one learner and integrate them into the general goal of the designed subject curriculum. The CRB is developed using the following programming environment: LabView toolkits, CSS and PHP modules.

The importance of the proposed hybrid learning solution resides in its' applicability for a continuously evolving and more demanding target audience. Once implemented the hybrid education e-learning platform will be a cost efficient and convenient solution for higher education institutions. It will offer options for monitoring, assessing and evaluation of the following main parameters: learner progress; trainer performance; consumable material stocks; equipment performance and maintenance status. Computer aided project planning software solutions (like Primavera P6) will be used to design custom resource workflows. The project is proposed to be implemented at POLITEHNICA University of Bucharest (UPB) from Romania.

Hereafter, the main management planning tools are presented in detail for the successful implementation of the HYBRID-ED initiative.

Study background and methods

Since the Future Shock's inception written by the futurist Toffler A. (1970), in connection with the educational system, a question which does not yet have an appropriate answer, has arisen: „Why is everything massified in the system, rather than individualized in the system?". The concept of "customized learning" becomes more and more current, as, according to Toffler, „new technologies make possible customization in a way that the old system — everybody reading the same textbook at the same time — did not offer". His ideas are now made possible through the buffet model proposed by the current research, according to Twigg's C.A. (2003) classification. The new approach is that of considering each learner different and customizing the teaching activities and the contents specifically for that individual, in an „education mass customization system" able to both reduce customizations costs and offer targeted teaching for each different person. A lot of e-learning platforms are available, but they are working in the same way, letting teachers to upload courses (the same for all learners) and learners to access them. HYBRID-ED offers the solution for staying in the middle of the subject with an innovative technology-breaking suggestion: hybrid learning, containing a set of characteristics able to be offered in an education mass customization system: customized, on-line contents of courses, teaching-on-demand, multimedia and interactive teaching materials, in a word, a powerful IT platform, based on artificial intelligence algorithms, able to conceive and offer a „menu" of learning activities in both face-to-face and on-line formats. This type of teaching must be provided in special classrooms, having a state-of-the-art endowment in terms of gadgets, computers and communication facilities. This is the image of the future education, and HYBRID-ED has the resource to fulfil this image and to concretize it.

The impact in the socio-economic and cultural environment is given by the broad range of skills the system can provide, including cognitive and meta-cognitive skills; social and emotional skills; and practical and physical skills. The platform runs artificial intelligence meta-algorithms able to identify the need of the learner for a certain type of skills, according to a set of initial tests and to customize the scientific content of the courses, by combining different modules and to generate new content, learner dependent. Thus, the project could change the way the students and the faculty see and understand the teaching and learning process, in the 21st century, by offering to each learner what he/she needs for personal evolution.

The impact in scientific environment is given by the new technology the platform uses and by the novelty of the algorithms and of the working mode. This could boost the universities on the road of introducing new technologies in the teaching process. The integrated platform could open new doors in the higher educational system, by exploring new applicative directions in the field of new education methods in the Industry 4.0 era. It is an opportunity for high schools and universities to discover an open teaching-learning system connected with the nowadays technology evolution.

The current e-learning solution used at UPB is a static Moodle platform. HYBRID-ED is aimed to be integrated within the learning opportunities of the Faculty of Industrial Engineering and Robotics from UPB, thus improving efficiency, learner and trainer compliance, whilst addressing the globalized issue of education transformation.

The development of a fully functional industrial engineering product is considered, in the context of the current initiative, a complex project design task (Figure 1). There are three main systems of any industrial engineering complex project, namely: mechanical system, software system, electronical system.

Figure 1: Life cycle of project implementation – methods and instruments of investigation

The projects' main objective is to design and develop an e-learning interactive educational platform able to generate and deliver a student-centered customized curriculum for complex project development in industrial engineering-based applications. The e-platform must assess the initial state of the students, from educational requirements point of view and to generate and adapt a customized curriculum for each person, being the first generative e-learning platform in the field of industrial engineering. The innovation level, novelty and originality of the implementation is derived from the way the curriculum is customized, in a generative approach controlled by artificial intelligence meta-algorithms, by selecting available knowledge in three different fields, mechanic, electronic and software, on three different levels (beginner, intermediate and advanced) and many different types of delivering the knowledge, based on the initial level of competencies of the students, identified also automatically. Calculating improvement in learning, has been shown by previous research conducted by Zhao Y., Breslow L. (2013), to lack in statistical control for confounding factors. The currently proposed initiative integrates validated scientific instruments, methods and methodologies for quantitative and qualitative measurement of learning improvement of subjects.

To support the main objective and further demonstrate the elements originality, twelve specific objectives have been defined, as follows: SO1. Identify the educational needs for industrial engineering based higher education learners; SO2. Define accurate cognitive learning objectives, behavioral learning objectives and learning outcomes in correlation with complex project design systems: mechanical, software, electrical; SO3. Develop a Curriculum Builder software tool, that evaluates and interprets real individual needs of learners. Algorithms are be defined for automatically generating a custom route curriculum for student centered learning; SO4. Develop a Task Book (TB) for a hybrid e-learning platform. The TB contains product, process and system requirements and specifications (RS), identifying in a precise and measurable way what the hybrid e-learning platform must do and how it must perform in order to satisfy the customer needs; SO5. Design the hybrid e-learning interactive educational platform architecture and functionalities; SO6. Program and implement the generative algorithms into the hybrid platform; SO7. Develop curriculum modules for complex project design in industrial engineering applications; SO8. Design and test a Pilot course for hybrid e-learning; Pilot testing also involves the undertaking of statistical analysis for result significance and validation; SO9. Test and improve design of the hybrid e-learning interactive educational platform; SO10. Develop the customized curriculum for each learner; SO11. Design an experimental plan with multivariable regression analysis using DOE. This provides a scientifically valid instrument for the development and interpretation of Surface maps for individual learner evolution; SO12.Disseminate results through scientific research publications in ISI journal and conference proceedings.

A sustainable and realistic objective of the project is to integrate the final version of the hybrid e-learning platform within the learning opportunities of the Faculty of Industrial Engineering and Robotics from UPB.

Project Planning

The Curriculum Route Builder (CRB) is the first initiative of its' kind, which could allow the identification and interpretation of real individual needs of one learner and integrate them into the general goal of the designed subject curriculum. The CRB programming considers an extended set of the following seven initial input parameters:

learning style, instructional strategy, delivery method, assessment method, competency (knowledge, skills, abilities) level, complexity level and personal preferences. The extended set is obtained through needs analysis.

Hybrid curriculum efficiency progress evaluation implies the usage of both quantitative and qualitative assessment methods, showing both what students learned and, also, how they can apply, synthesize, evaluate, and design what they have learned. Significance of the obtained results are established using an independent t-test using SPSS software. Final evaluation of the hybrid curriculum is done with design of experiments (DOE) implemented through Design-Expert V11 Software for multivariable regression analysis. Dependent and independent variables are be based on the defined cognitive and behavioral learning objectives of the hybrid curriculum.

The development and implementation of such a bold initiative requires a thorough project planning. Hereafter, the project workplan (Table 1) and main activities are described in detail.

WP1: Curriculum requirements and specifications

The first Work Package (WP1) is comprised of three main activities (A1.1 – A1.3) and is planned to be implemented during a period of seven months (M1 – M7). Hereafter, the detailed activities, estimated results, key success indicators and deliverables are described in detail.

A1.1.(M1-M3): A needs analysis is undertaken for three main systems of a complex industrial engineering project: mechanical system, software system, electronical system. The main assessment tools are: questionnaires, interviews and focus groups. The target group of the project is 1200 undergraduate students, representing all undergraduate students, from year 1 to 4, studying in the industrial engineering domain, enrolled at UPB. The sample group for the

needs analysis is comprised of 100 students, selected randomly out of the 1200, to preserve statistical significance of the study. All materials for questionnaires, interviews and focus group are designed in accordance with the graduates' necessary competence set, which is defined by RNCIS in the diploma supplements of graduates from industrial engineering domain. The question/ item structure follows both Ulrich K. and Eppinger's S. (2015) methodology. The needs analysis considers the evaluation of 7 initial CRB input parameters. The need reports includes, for all three systems of a complex industrial engineering project, the following mandatory elements: an extended set of CRB input parameters, sets of cognitive and behavioral learning objectives, set of learning outcomes, for each domain. Learning objectives are defined using Bloom's revised taxonomy as described by Gershon M. (2018). Complexity Levels as defined by Schaffernicht M.F.G. and Groesser S.N. (2016) are also be taken into account, in the needs analysis. (LAB 1)/ A1.2. (M2-M7): Using the extended set of the input parameters, learning objectives and learning outcomes, the team members construct a CRB process design flow chart using Lucidchart software. This step allows a perspective view of the generative solution needed for CRB design and implementation, allowing data to be paired with insight, at each individual step of the flowchart. CRB involves a generative programming approach, controlled by artificial intelligence meta-algorithms. LabView, C++ and Microsoft's Intentional Programming software are used to design the CRB in accordance with the constructed flowchart. The final CRB is embedded in the in the architecture of the hybrid e-learning platform. (LAB 2)/ A1.3. (M2-M7): Requirements and specifications (RS) are defined in order to identify in a precise and measurable way what the hybrid e-learning platform must do and how it has to perform in order to satisfy the customer needs. Three categories are considered for the analysis, namely: product, process and system requirements and specifications. In order to quantify the RS a list of metrics is put together, assigning them relative importance, limit and ideal values. The instructional tools used in RS identification and construction are described in the previous work of authors Doicin C. and Ulmeanu M. (2018). Bases on external functional analysis tools the Task Book (TB) of the hybrid platform is constructed. (LAB 1, 2)

Estimated results: R1. Needs analysis report, which contains a process flow describing all used assessment tools and specific outcomes. R2. Curriculum Route Builder software application; R3. Requirements and specifications for the functional hybrid e-learning platform architecture.

Key success indicators: No. of sample group participants: 100; No. of initial CRB input variables: 6; Set no. of extended input variables: 1; Set no. of cognitive learning objectives: 3; Set no. of behavioural learning objectives: 3; Set no. of learning outcomes: 3; No. CRB flowcharts: 1; No. of designed software stand-alone applications: 1; Set no. of requirements and specifications: 1.

Deliverables: D1. Report on interpreted questionnaires used in needs analysis; D2. Report on interpreted interview data sheets; D3. Focus groups evaluation report; D4. Descriptive report on definition protocol for learning objectives and learning outcomes. D5. CRB programming protocol report; D6. Curriculum Route Builder software application; D7. Task book for hybrid e-learning platform.

WP2: Architecture and detailed design of hybrid e-learning platform

The second Work Package (WP2) has four main activities (A2.1 – A2.4) and is planned to be implemented during a period of twelve months (M8 – M19). Hereafter, the detailed activities, estimated results, key success indicators and deliverables are described in detail.

A2.1. (M8-M19): The hybrid e-learning interactive educational platform must be able to generate and deliver a student-centered customized curriculum for complex project development in engineering-based applications. The general architecture is based on the Task Book, ensuring that specific RS are reached within specified limits. Targeted software solutions integrated into the general architecture are: LabView, CSS, PHP, Talentlms. The advantages of each software solution, embedded with the developed CRB, allow metadata collection usage for generative personalized curriculum in a mass specified setting. (LAB 2)/ A2.2. (M8-M16): Design of content curriculum modules involves the compliance with several previously obtained results: extended input variables; cognitive learning objectives; behavioral learning objectives; learning outcomes; CRB and hybrid platform system parameters. A labor extensive activity, it involves the creation of a meta database with existing freeware curriculum content in the three main proposed systems (mechanical, software, electronical). Content curriculum is adapted and personalized for UPB available infrastructure. (LAB 1)/ A2.3. (M9-M16): A Pilot course is developed for testing of the main functional features of the platform. Course content must meet the same restrictions as stated in A2.2.

Testing of the course is undertaken on a randomly selected sample of 25 students (years 1 to 4) studying in industrial engineering area. Using SPSS an inferential statistics paired-samples t-Test is undertaken, to allow generalization of the results, beyond the gathered data. The paired-samples t-Test was selected for analysis, offering more statistical power, as it reduces possible variability between learners. This type of statistical test also coincides with the used assessment methods at UPB. 3-point analysis is preferred. The beginning of this activity was set in M9 (February 2021), as to coincide with the beginning of the academic semester at UPB, allowing the testing and implementation of the pilot course. (LAB 1, LAB 3)/ A2.4. (M15-M19): Result of the t-Tests are processed using SPSS and a report is developed by the team members. Significance of the results is determined by the p value of the analyzed data. A targeted value of $p \leq 0.05$ is desired. The tests evaluate the degree to which students fulfil the proposed learning objectives, through their obtained learning outcomes. The amount of difference between the two at three independent moments (3-point t-test), indicate the areas of the pilot test that need improving. Solutions for improvement are based on the previously developed RS. (LAB 1)

Estimated results: R4. Functional Architecture of Alfa version for a for hybrid e-learning platform; R5. Curriculum modules for complex project design in industrial engineering applications; R6. Pilot course for hybrid e-learning;
Key success indicators: No. protocols: 1; No of architecture flowcharts: 1; No. of curriculum modules: min. 10; No. of pilot courses: 1; No. statistical tests used and interpreted: 1;
Deliverables: D8. Functional protocol for architecture design of a hybrid e-learning platform; D9. Extensive report on curriculum content development; D10. Pilot course design report. D11. Report on testing procedure, implementation and result interpretation of pilot course.

WP3: Implementation and method demonstration

The third Work Package (WP3) has two main activities (A3.1 – A3.2) and is planned to be implemented during a period of five months (M20 – M24). Hereafter, the detailed activities, estimated results, key success indicators and deliverables are described in detail.

A3.1. (M20-M124): This activity involves the integration of the full curricula modules (developed in A2.2) in the hybrid e-learning platform environment. (LAB 1, LAB 2)/ A3.2. (M22-M124): Using DOE, a base experimental plan is developed at this stage, considering at least two independent natural variables. Functionality and repeatability tests are undertaken using focus groups. Results are statistically analyzed using Design-Expert V11 Software for multivariable regression analysis. A natural logarithmic transformation is preferred for simulation runs. Response surfaces are constructed for normalized variables in 3 dimensions: Ox – mechanical system, software system, electronical system; Oy - learning style, instructional strategy, delivery method, assessment method, competency level, complexity level and personal preferences; Oz – normalized intensity levels. Results are fed through a feedback loop into the architecture design of hybrid e-learning platform. The final concept of the platform is proposed for usage within the Faculty of Industrial Engineering and Robotics, offering a three-level customization designed for semester, year and final diploma complex project development. (LAB 1, LAB 3)

Estimated results: R7. Beta version for a hybrid e-learning platform; R8. Final hybrid e-learning platform for complex project development in industrial engineering applications.

Key success indicators: no. of experimental plans: 1; no. of focus groups: min. 3; no. of surface maps: min 15; no. of hybrid platform versions: 2.

Deliverables: D12. Report on Beta version design and implementation for a for hybrid e-learning platform; D13. Experimental plan with multivariable regression analysis; D13. Surface maps of individual learner evolution.

WP4: Project management and result dissemination

The final Work Package (WP4) deals with project management and result dissemination and has three main activities (A4.1 – A4.3). It is planned to be implemented during the entire period of the project (M1 – M24). All activities, estimated results, key success indicators and deliverables are described in detail below.

A4.1.(M1-M24). Project management is done throughout the entire duration of the project, so that each activity proposed in the project is provided with all the human, material and financial resources necessary to accomplish its

waging effectively and on time. A project management strategy is planned to be developed in the first month, so that all problems are detected early fast and effective solutions are found for any technical or financial barrier that may occur during the project implementation. Management involves: compliance with quality management strategy, establish policies for conflict solving, on-going assessment of activities, monitoring and reporting. (LAB 1)/ A4.2. (M3-M24). Publication in ISI quoted journals and conference proceedings are aimed in order to disseminate the original results of the project (LAB 1)/ A4.3. (M4-M7, M11-M13, M16-M18, M22-M24) Participation to scientific events (conferences, symposiums, webinars, seminars, workshops, etc.) and study visits are undertaken for both result dissemination and good practice . (LAB 1)/

Estimated results: R9. Management research strategy; R10. Published scientific papers and participations in international conferences

Key success indicators: No. of ISI published journal papers: 1; No. of published ISI conference papers: 3; No. of conference participations: 2; No. of study visits: 2.

Deliverables: D14. Intermediary Scientific Research Rapport. D15. Final Scientific Research Rapport.

Risk Management and Ethics

The fulfilment of the proposed objectives and the generation of the expected results depends to a large extent on the appropriate and rigorous risk management. For each identified risk, a response strategy is developed in accordance with SR ISO 31000: 2010 and SREN 31010: 2010. The qualitative analysis of the most prevalent technological, commercial, human resources and research risks are presented in Table 2, as well as the main contingency plans. Considering the total risk score of the project (1.82, compared to the maximum value 4) obtained from the qualitative risk analysis, it is concluded that the risk incidence rate is fairly low, and the project is feasible (Table 2).

Table 2: Qualitative analysis of the technological, commercial, HR and research risks for project implementation

Technological risks (TR) / (CP) Contingency plans - (SO1÷SO4)	I*	W**	Score
TR 1. Inability to provide 100 eligible participants to the sample group within the specified timeframe. **CP 1.** A status evaluation of the participants' no. will be undertaken every week during A1.1. The planning is: M1–20, M2–50, M3–30. If the reports show inaccuracies in following the plan, participants will be selected from other Universities in Bucharest and Ilfov (same recruitment procedure), within the industrial engineering domain.	3	20%	0,60
TR 2. Sporadic unavailability of main e-learning environment. **CP 2.** A back-up of all e-learning content will be made on the freely available Moodle platform of UPB.	3	15%	0,45
TR 3. Incompatibility between the programming environments for generative design algorithms. **CP 3.** The main programming environment will be LabView; For compatibility with all online systems and embedded functions the Stand-Alone Toolkit will be used; As extra precautions CSS, C++ instruments will be used.	1	10%	0,10
Commercial risks (CR) / Contingency plans (CP) - (SO5, SO6, SO10, SO11)			
CR 1. Inability to make acquisitions for laboratory consumables and software licence in time for scheduled activities. **CP 4.** A necessary list will be put together and a university financed material stock will be made available.	2	5%	0,10

Scientific research, technological development and innovation activities within the project are subject to: Law no. 206/2004 on good conduct in scientific research and its subsequent amendments; Law 64/1991 on patents, republished, as subsequently amended, of Law 129/1992 regarding the protection of industrial designs, republished in 2007; and Law 8/ 1996 on Copyright and Related Rights. Compliance with specific EU legislation is ensured. Because the project involves collecting, processing and analyzing of personal data from human subjects, national GDPR Law no. 190/2018 and EU GDPR Regulation no. 679/2016 are complied with.

Resources and budget

The project is set to be implemented at the premises of UPB, using the appropriate infrastructure presented in Table 3. Each of the presented laboratories is destined for specific systems of the complex project development. Each activity detailed above has associated one of the three laboratories.

Table 3: Available infrastructure for project implementation and correlated estimated results

Laboratory & infrastructure	Estimated results
LAB 1 (https://erris.gov.ro/TCM---UPB): **3D printing Equipment** (50 3D printers), as follows: 5 Zortrax Inkspire 3D printers which are based on a version of the Stereolithography technology; one Ultrasound cleaning unit; 3 Zortrax Dual 3D printers using Material Extrusion (MEX); 5 Zortrax M300+ 3D printers (MEX); 3 Zortrax M300 3D printers (MEX); 2 BCN SigmaX dual extruder 3D printers (MEX); 10 3D Kreator 3D printers (MEX); 20 Creality CR20-Pro 3D printers using (MEX); one Zcorp 310 3D printer using Binder Jetting technology; one Powder recycling unit for the ZCorp 310 equipment; one Projet 1500 3D printer using Digital Light Processing; Go!SCAN 3D Portable Scanner Creaform 3D; 25 web cameras; 100 desktop computers; **Software:** SolidWorks, Inventor, Catia, Cura, Simplify 3D, Meshmixer, Zprint Software; ProJet Client Software; Magics 13.0; VX Elements 2.0 SR3; Mimics Research 17.0, 3-Matic Research 11.0 **Robotics:** 16 Arduino based toolkits each with Arduino Projects Book, Arduino UNO, and Breadboard-400 Pins. **Target Complex Project Development Systems: MECHANICAL & ELECTRICAL**	**R1, R3, R5, R6, R7, R8**
LAB 2 (https://erris.gov.ro/CTANM---UPB)**:** Laboratory gear, Modelling & Simulation Software, General usage Software, Data acquisition software, Data acquisition and control systems, LabVIEW modules and toolkits: 1. Programmable power supplies; TrueRMS Multimeters; Soldering stations; Drilling machine; 3 axis CNC milling machine - GoCNC A3 Evolution. 2. Inventor, Solid Works, FlexSim, INCONTROL Enterprise Dynamics, ProPlanner. 3. Primavera P6, Adobe Photoshop, Microsoft Visual Studio, Microsoft Expression Studio 4 Ultimate, Microsoft Robotics Developer Studio R3/ LabVIEW 2011 Full Development System/ NI data acquisition equipment on USB, ISA, PCI, PCMCIA, Simulation Interface, NI SoftMotion, Robotics Module. **Target Complex Project Development Systems: SOFTWARE & ELECTRICAL**	**R2, R3, R4, R7**
LAB 3 (https://erris.gov.ro/CCMA---UPB)**:** Mechanical simulation equipment: Testing system INSTRON 8800 100 kN; Testing system WALTER-BAI LVF 50 kN; dynamic extensometer SANDNER EX A 25-5X; axial extensometer EPSILON 3542-010M-100-ST extensometer 3541-010M-100-ST for testing fracture mechanics; Testing system Z010 ZWICK / ROELL 10 kN. **Target Complex Project Development Systems: MECHANICAL**	**R6, R8**

According to the project detailed budget breakdown structure Table 4, acquisitions are planned for software licenses and consumables. Mechanical and electronic module insertion kits must be purchased for pilot testing and repeatability tests. The insertion kits are comprised of: Arduino CTC 101 Program – Full (10000 lei); Elergoo Sensor module kits compatible with Arduino (7000 lei); POXL Smart Robots for UNO programming (8000 lei) ZYLtech HyperCube Full DIY Kit - 300mm Cubic Build Volume w/ Dual Z (with Heated Bed Upgrade Premium high power 12V heated bed Frame color Aluminum Anodized) (22000lei).

Conclusion

The current research presents a detailed management planning procedure for the design and development of an e-learning interactive educational platform aimed at delivering a student-centered customized curriculum for complex project development in industrial engineering-based applications. Authors conducted a thorough literature research, identifying the main gaps, and tailoring the project structure so as, through the planned work packages, to fill in those gaps. A project plan with four work packages was designed, ready to be implemented in a 24-month time frame. The project was proposed to start together with the UPB academic year, so as to facilitate the testing of the pilot e-platform. Main resources were considered to be available within UPB's laboratories, with all the infrastructure described in the Erris platform. A Detailed Budget Breakdown was put together in order to identify the necessary financial efforts needed to implement the proposal.

Future research involves the improvement of the management planning procedure and project call application for funding of the proposal. The importance of the current research is even greater in the current socio-economic developments generated by the SARS-Cov2 outbreak.

Resumen

En el presente artículo hablaremos sobre la participación de los padres de familia en el entorno educativo y su influencia en el rendimiento académico de sus hijos, de modo que, el trabajo de los padres de familia tiene como finalidad, ayudar a mejorar el rendimiento académico de los mismos, a través de la participación activa como representantes legales de los niños y como eje fundamental de este proceso. El rendimiento académico, es sinónimo de calidad, desde este punto de vista el trabajo realizado, la metodología utilizada fue en primer momento cualitativa con ayuda de un instrumento siendo la encuesta, está dirigida a los padres de familia, proponiendo una alternativa de discernimiento del problema planteado. De la misma forma los resultados obtenidos de la investigación determinaron que: en los docentes existen criterios divididos en cuanto al nivel de compromiso de los padres de familia sobre los hijos, por lo que considera que los padres de familia que se involucran en la educación de sus hijos presentan un mejor rendimiento académico, por otra parte la mayoría de los padres de familia, a pesar de manifestar tener buena comunicación con sus hijos les resultaría de utilidad, contar con una guía de orientación que les permitan ser parte del proceso de enseñanza – aprendizaje de sus hijos, a fin de que éstos eleven su rendimiento académico. Producto de la investigación, se recomienda que las instituciones integren talleres y herramientas que refuercen los lazos parentales y charlas sobre la importancia de brindar seguridad y apoyo a sus hijos y por consiguiente; lograr elevar el nivel académico, siendo el docente el protagonista secundario del grupo de estudiantes sobre todo de aquellos que no cuentan con el apoyo de sus padres, que posiblemente por no contar con una herramienta adecuada, no se obtiene un proceso de enseñanza-aprendizaje apropiado a sus edades.

Palabras Claves: Padres De Familia, Estudiantes, Educación, Nivel Académico, Conocimiento, Enseñanza - Aprendizaje, Docentes.

Abstract

In this article we will talk about the participation of parents in the educational environment and its influence on the academic performance of their children, so that the work of parents is intended to help improve the academic

Cite this Article as: María Fernanda Constante, Yolanda Paola Defáz Gallardo , Julio Castañeda Carranza and Ricardo Gómez Arce "Participación De Los Padres En El Entorno Educativo Y Su Influencia En El Rendimiento Académico De Los Estudiantes" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

performance of the same, through the active participation as legal representatives of the children and as a fundamental axis of this process. Academic performance is synonymous with quality, from this point of view the work done, the methodology used was first qualitative with the help of an instrument, the survey being directed at parents, proposing an alternative to discern the problem raised. In the same way, the results obtained from the research determined that: there are divided criteria among teachers regarding the level of commitment of parents over children, for which reason it is considered that parents who are involved in the education of their children have a better academic performance, on the other hand, most parents, despite claiming to have good communication with their children would find it useful to have an orientation guide that allows them to be part of the teaching process - learning of their children, so that they raise their academic performance. As a result of the research, it is recommended that institutions integrate workshops and tools that reinforce parental ties and talks about the importance of providing security and support to their children and therefore; achieve higher academic level, the teacher being the secondary protagonist of the group of students, especially those who do not have the support of their parents, who, possibly due to not having an adequate tool, does not obtain an appropriate teaching-learning process at their ages.

Keywords: Parents, Students, Education, Academic Level, Knowledge, Teaching - Learning, Teachers.

Introducción

La familia es un concepto muy amplio, aún más, cuando se trata de la interacción que se tiene en el desarrollo educativo de sus hijos. Por ello, se ha demostrado que cuando los padres de familia intervienen en las actividades educativas de sus hijos ellos obtienen mejores calificaciones y tienen mayor positivismo al momento de realizar cualquier actividad.

Receto nos dice "Cuando hablamos hoy de familia, debemos entenderla desde varias vertientes; no sólo como uno de los ejes sociales y culturales fundamentales a lo que respecta a la estructura de la sociedad, sino, como el órgano esencial del proceso de civilización, puesto que es el agente protagonista en el proceso educativo de las personas" (2011, p.4). Como es de conocimiento, la educación de los niños tiene origen en el entorno familiar, siendo los padres los primeros educadores, encaminado a educar niños capaces de comprender el mundo, las personas y a ellos mismos, formando personas empáticas dispuestas a ser partícipes de su educación.

Actualmente el trabajo de los educadores ha llegado a ser más complejo y desafiante, antes era suficiente tener conocimiento del plan de estudios, y el dominio de estrategias para facilitar el proceso de enseñanza-aprendizaje de los estudiantes que se evaluará. Ahora a los educadores se les pide convertirse en expertos para lograr la participación de los padres de familia, hecho que influye mucho en el proceso de aprendizaje y desarrollo de sus hijos.

Sánchez nos manifiesta que "Si bien la familia es el primer y más importante lugar educativo, es preciso aceptar que tendencias y exigencias propias de la vida moderna —el individualismo, el trabajo exacerbado y deshumanizante, el consumo han puesto bajo presión y en cuestión la capacidad de las familias para practicar su misión educativa" (2008, p.5). De esta manera, la escuela ha tenido que asumir la responsabilidad de la educación de los niños, sin embargo, este tema no solo está en las manos de las educadoras sino también en el interés de los padres de familias o representantes legales, debido a la necesidad de sacar a su familia adelante deben tomar largas jornadas de trabajo, limitando el tiempo de los padres para ser parte de la educación de sus hijos y teniendo como consecuencia la falta de compromiso con la educación de sus hijos.

La educación es aquella herencia natural que los padres comparten y dejan a sus hijos con sacrificio, única y exclusivamente dentro del seno familiar, otorgando todo tipo de interrelaciones personales: de amor, afecto, comprensión, comunicación, ayuda y orientación, que, de tal manera, modifican los comportamientos de todos los que conforman la familia. El rol más importante en la educación de sus hijos lo cumplen los padres, convirtiéndose en los primeros educadores de vida. La educación familiar se trata del cuidado, la motivación y la interacción del padre de familia con el ámbito educativo de su hijo, permitiendo de esta manera la Inter educación entre los padres e hijos.

La educación es un proceso de formación continuo que parte desde la misma concepción hasta la muerte del individuo. De ahí que la educación es un proceso interactivo de aprendizaje, entre padres e hijos, entre amigos, entre maestro y estudiantes, etc. A pesar de corresponderles la educación formal a los maestros, el papel que los padres constituyen

en este proceso de enseñanza es muy importante, debido a que deben convertirse en entes activos del proceso educativo de sus hijos. Comprender esta interacción educativa incluye a todos, como una actividad permanente que integra a los hijos, maestros, padres y su entorno social.

La escuela y los padres de familia establecen una acción conjunta y coordinada que contribuye decisivamente en el desarrollo intelectual, social y emocional del niño. Si bien en los primeros años de vida, la familia es la principal instancia socializadora, la escuela se convierte en el contexto decisivo de su desarrollo social. La colaboración entre ambas instituciones es fundamental ya que conducirá a su estimulación, aumentando autoestima, rendimiento escolar y capacidades actitudinales también para la mejora de sus habilidades sociales, psicomotrices, creativas y cognitivas.

Sánchez (2005) El entorno familiar tiene la responsabilidad de motivar y cuidar a sus hijos Para así tener una mejor educación, proporcionando medios para que mejore su desarrollo de aprendizaje con el fin de crear una zona intermedia entre la escuela y los padres de familia que de una u otra manera inciden en el rendimiento académico de sus hijos. La familia interviene dentro del desarrollo infantil tanto que ayudan a sus hijos a llenarse de pensamientos positivos y así lograr sus objetivos llegando a enorgullecer a sus padres, hay que considerar que en estos tiempos ya no solo actúa el docente sino también padres de familia para así poder dar un mayor significado a los conocimientos de los niños.

En síntesis, los padres de familia están dentro del proceso en el cual tuvo como consecuencia inevitable el asumir funciones por parte de la escuela y la regulación por el Estado. En este caso, si la participación de los padres se considera como una palanca para promover el logro académico de sus hijos, potencializar los resultados que se tendrá al momento que sus hijos realicen sus labores educativas. Como veremos en este trabajo, la cantidad de investigación desarrollada al respecto no es deficiente. El detonante de muchos de esos estudios fue el concepto de participación de los padres como un incentivo para el desempeño académico de los alumnos, o, al menos, como un catalizador o multiplicador de otras causas relevantes.

La amplia gama de temas tratados y los matices de estos estudios nos muestran que la participación de los padres es un fenómeno multifacético y multidimensional que implica dificultades conceptuales para la investigación, y problemas organizativos para la administración y la política educativa.

La educación de los niños es muy importante para su desarrollo intelectual y para que esto se realiza de una manera fácil y continua el docente debe contar y adecuar las instalaciones donde el infante se desenvuelve junto con sus compañeros y compañeras, debe ser un lugar que genere en el niño seguridad en el que pueda socializar y al mismo tiempo aprender. Al igual que en su hogar, los padres deben buscar un ambiente seguro para su desarrollo social, cognitivo y emocional.

Consecuencias de las dificultades del aprendizaje

Las dificultades en del aprendizaje se desencadenan desde la niñez, adolescencia y adultez en donde pueden sufrir una inferencia en su vida académica, laboral, económica y social, por la influencia de su conducta, auto concepto y autoestima. Según el análisis realizado por Shessel y Reiff (1999) es el único que realiza un análisis de las consecuencias de varias DEA en personas adultas a nivel social, psicológico, emocional, educativo y laboral (pp.305-314). Este enunciado manifiesta que una vez llegado a la vida adulta las consecuencias pueden manifestarse en dificultades de acceso al empleo cualificado, menos oportunidades laborales, un inferior nivel de ingresos y en posibles situaciones de riesgo de exclusión social, además relaciones sociales, donde posteriormente da lugar a un aumento del riesgo de consumo de sustancias, fracaso, desarrollo de problemas de salud mental y problemas con la justicia.

Los niños con problemas de aprendizaje suelen tener un nivel normal de inteligencia, en donde tratan de seguir las instrucciones, concentrarse y portarse bien en la escuela y en la casa, sin embargo a presar de sus esfuerzos presentan dificultades al momento de dominar las tareas de la escuela y se atarazan. Según Fernández Guerrero (2011, pp.3-4) señala que un 29 % del fracaso escolar se debe a las DEA y un 10 % al TDAH. Martínez et al. (2009) subrayan que las DEA son la causa más frecuente de fracaso escolar (pp.182) y que los alumnos con DEA tendrán en un 80 % de los casos bajo rendimiento escolar, y un 45% repetirá al menos un curso escolar (p.181).

Los problemas de aprendizaje afectan a 1 de cada 10 niños en la edad escolar estos problemas merecen una evaluación comprensiva por un experto que pueda enjuiciar todos los diferentes factores que afectan al niño. Un siquiatra de niños y adolescentes puede ayudar a coordinar la evaluación y trabajar con profesionales de la escuela y otros para llevar a cabo la evaluación y las pruebas escolásticas y así clarificar si existe un problema de aprendizaje.

Tratamientos o actividades para mejorar las dificultades de aprendizaje

Para (Osewalt, 2014) "Los maestros saben que los estudiantes tienen gran variedad de habilidades y tratan de encontrar maneras para satisfacer las necesidades de todos los estudiantes, incluyendo aquéllos con dificultades de aprendizaje y de atención"

Instrucción diferenciada

Los docentes utilizan lo que los estudiantes necesitan aprender, cómo lo asimilan y cómo lo conciben. Cuando un estudiante tiene dificultades en un área, los docentes crean un plan que sigue instrucciones paso a paso y tareas especiales.

Andamio cognitivo

El aprendizaje se fragmenta en partes más pequeñas. Las partes siguen un orden lógico y respaldan un objetivo claro. Los docentes crean una conexión entre lo que ya saben y lo que no pueden hacer por si solos. A esta conexión se le denomina "andamios", donde se puede incluir gráficos, dibujos y tarjetas con notas.

Mnemotecnia

Los estudiantes usan frases para ayudar a recordar información. Esta estrategia también puede ayudar a ampliar el vocabulario. Por ejemplo, un niño puede aprender el nombre científico del gato, *Felis catus*, usando *feliz* como la palabra clave junto a la foto de un gato jugando.

Instrucción Multisensorial

Esto permite relacionar lo que los estudiantes ven, lo que escuchan, cómo se mueven y lo que conciben. Ya que cuando se aprende a usar los sentidos se aprende mejor. Tomando en cuenta que cada niño aprende de manera diferente.

Entonces se podría considerar importante que los niños con problemas de aprendizaje sigan los tratamientos que son proporcionados por los especialistas ya que de ello dependerá saber si el tratamiento es eficaz y permita una correcta enseñanza que fortalezca las dificultades que presente cada niño. También se debe tomar en cuenta que estos especialistas muchas veces recomiendan medicación para ciertos trastornos entonces se debe tomar en cuenta que efecto causa en el niño y saber si se beneficia de ello, porque de lo contrario sería irresponsable recetar algo que sea desfavorable.

Metodología

Enfoque de la investigación

La investigación tiene un enfoque cuantitativo debido a que manifiesta la forma de ser y pensar de los padres de familia y docentes, ya que por medio de la recolección de datos verídicos los mismos que nos ayudaron a determinar el análisis y discusión de los resultados arrojados por las encuestas aplicadas, para poder consolidar conclusiones.

Propósito de la investigación

El propósito de la investigación es conocer y analizar los problemas que surgen en el rendimiento académico de los estudiantes por la escasa participación de los padres de familia en el entorno estudiantil.

Tipo de Investigación. Investigación bibliográfica

Se realizó una investigación cualitativa debido a que se utilizó como fuentes confiables, tales como revistas, libros, ensayos y la biblioteca virtual de la Universidad Técnica de Cotopaxi.

Investigación Exploratoria

Nos permitió recoger e identificar los antecedentes generales, respecto al problema investigado, como es el caso de las redes sociales y su aplicación en la educación, para determinadas observaciones para diagnosticar el problema planteado. Por otro lado, con la aplicación de la investigación exploratoria, permitió descubrir, reconocer y reconocer una acción preliminar, mediante la cual se obtuvo una idea general del objeto investigado. Mediante este tipo de investigación, se pudieron formular las preguntas directrices de la investigación.

Metodologías de la Investigación Unidad De Estudio

Para la recolección de datos sobre la participación y su influencia en el rendimiento académico de los estudiantes, se ha tomado en cuenta el instrumento de la encuesta dirigida a 10 representantes legales de diversas escuelas.

Tabla 1: población y muestra

Población	Número
Representantes legales	10
Total	10

Métodos De Investigación

Los métodos que se utilizaron fueron los siguientes:

Método inductivo
Se utilizó este método, ya que se indago experiencias dentro del ámbito educativo entre los docentes y los padres de familia, a su vez que conozcan la importancia de involucrarse en la educación de sus hijos.

Método deductivo
A través de este método se permitió reflexionar sobre la importancia de que los padres se involucren en la educación de sus hijos, y su influencia dentro del ámbito educativo y personal del niño.

Método Analítico
Se aplicó este método, para determinar cuántos padres de familia se involucran en la educación de sus hijos y cómo estos avanzan en su nivel académico.

Técnicas e instrumentos Encuesta
En esta investigación se utilizó como instrumento una encuesta, que nos ayudó a conocer de una manera factible las dudas que se han evidenciado acerca a la participación familiar en la educación escolar de sus hijos. Así mismo se realizó 6 preguntas dirigidas hacia los padres de familias.

Análisis

En cuanto a la pregunta ¿Es importante para Ud conocer sobre el desarrollo académico de sus hijos? De los 10 padres encuestados que corresponde al 100%, nos dice 10 padres que sí es importante, con un equivalente al 100%.

Interpretación

Según los resultados obtenidos todos los padres de familia piensan que es importante conocer sobre el desarrollo académico de sus hijos, ya que así pueden involucrarse más en sus estudios y saber cuáles son las materias que se les dificulta más aprender.

Análisis

En cuanto a la pregunta ¿El programa académico, el entorno social y la estructura organizativa de la escuela satisfacen las necesidades de sus hijos? De los 10 padres encuestados que corresponde al 100%, nos dice 4 padres que sí satisfacen las necesidades de sus hijos, con un equivalente al 40%, 4 padres nos dicen que tal vez satisfacen las necesidades de sus hijos, con un equivalente al 40%, y 2 padres dicen que No satisfacen las necesidades de sus hijos, con un equivalente al 20%.

Interpretación

Según los resultados obtenidos los padres de familia piensan que el programa académico, el entorno social y la estructura organizativa de la escuela satisfacen las necesidades de sus hijos, ayudándoles así a conocer más de los temas a tratar.

Análisis

En cuanto a la pregunta ¿Conoce usted a los docentes con el cual su hijo reciba clases? De los 10 padres encuestados que corresponde al 100%, nos dice 1 padre de familia que no conoce a los docentes que le imparten clases a su hijo, con un equivalente al 10%, 9 padres de familia nos dicen que, si conocen a los docentes que le imparten clases a sus hijos, con un equivalente al 90%.

Interpretación

Según los resultados obtenidos la mayoría de los Padres de Familia conocen a los diferentes docentes que imparten clases a sus hijos, esto les permite conocer las diferentes estrategias que utiliza cada educador para enseñar de manera correcta y eficaz las diferentes temáticas que se van a impartir en las horas clases a sus hijos

Análisis

En cuanto a la pregunta ¿Considera Ud. que la función de los maestros en los diferentes aspectos de la educación de su hijo es la correcta? De los 10 padres encuestados que corresponde al 100%, nos dice 3 padres que tal vez la función

de los docentes sea la adecuada, con un equivalente al 30%, 7 padres nos dicen que, si consideran que los docentes hacen una buena función en cuanto a la educación de sus hijos, con un equivalente al 70%.

Interpretación

Según los resultados obtenidos la mayoría de los padres de familia piensan que la función que realizan los maestros como guías del aula de clase es la correcta generando así un aprendizaje significativo en cada uno de sus estudiantes.

Análisis

En cuanto a la pregunta ¿Con qué frecuencia Ud. asiste a las reuniones escolares de sus hijos? De los 10 padres encuestados que corresponde al 100%, nos dice 4 padres que frecuentemente asisten a las reuniones, con un equivalente al 40%, 3 padres nos dicen casi siempre asisten a las reuniones escolares, con un equivalente al 30%, y 3 padres dicen que siempre asisten a las reuniones escolares, con un equivalente al 30%.

Interpretación

Según los resultados obtenidos la mayoría de padres de familia asisten siempre a las reuniones convocadas por los centros educativos de sus hijos, con el fin de saber más sobre las actividades que realizan sus hijos en la escuela.

Análisis

En cuanto a la pregunta ¿Ud. como padre se siente seguro de respaldar la educación de sus hijos? De los 10 padres encuestados que corresponde al 100%, nos dice 8 padres que sí se sienten seguros al respaldar la educación de sus hijos, con un equivalente al 80%, 2 padres nos dicen que tal vez se sienten seguros al respaldar la educación de sus hijos, con un equivalente al 20%.

Interpretación

Según los resultados obtenidos la mayoría de los padres de familia sienten seguridad al respaldar la educación de sus hijos ya que evidencian en sus hijos un aprendizaje significativo.

Conclusiones

- Podemos concluir que los padres de familia cumplen un rol muy importante en el ámbito educativo de sus hijos y lo ayudan a tener un buen rendimiento académico.
- Concluimos que los docentes deben de involucrar a los representantes de cada estudiante a formar parte de su desarrollo en el entorno académico.
- Los Padres de Familia deben participar en la educación de sus hijos, actividades escolares y tomarse el tiempo de realizar actividades, tales como con la tarea, ya que esto fortalecerá los lazos afectivos, de confianza en ellos mismo y tendrán más oportunidades de sobresalir académicas, y debido a esto, debería existir un vínculo entre la familia y la escuela, logrando una inter-educacion entre padres e hijos.

Resumen

El proyecto de investigación acerca del juego como principal herramienta de aprendizaje en el desarrollo de los niños de Educación Inicial; se desarrolló bajo la premisa de diagnosticar la importancia del juego en el aprendizaje de los niños de Educación Inicial. El problema que se encontró en el desarrollo investigativo es la falta de conocimiento acerca del juego como herramienta de aprendizaje en el desarrollo de los niños y niñas de educación Inicial. Para lo cual se partió del problema, la justificación, y los objetivos del proyecto. El método aplicado durante la ejecución del proyecto de investigación se enmarco en el enfoque cuantitativo, también la investigación de campo el cual permitió profundizar la investigación. La población fue de 5 educadoras y 20 padres de familia, el cual se aplicó la técnica de la encuesta y el instrumento del cuestionario con el objetivo de conocer los beneficios que se da en los niños; que se obtiene a través del juego en el contexto familiar y educativo. Los resultados arrojados del proceso investigativo han permitido concluir que las docentes y los padres de familia tiene un alto grado de conocimiento en la utilización de juegos dentro del aula. Se concluye que debido a que el juego es un elemento de motivación que facilita el aprendizaje; y de esta manera permitiendo al niño experimentar sus emociones y expresar sus sentimientos para adquisición de nuevos conocimientos.

Palabras Clave: Juego, Herramienta De Aprendizaje, Jugar, Conocimiento, Habilidades

Abstract

The research project on play as the main learning tool in the development of Early Childhood Education children; It was developed under the premise of diagnosing the importance of play in the learning of Early Childhood Education children. The problem that was found in the research development is the lack of knowledge about the game as a learning tool in the development of children in Initial education. For which the problem, the justification, and the objectives of the project were started. The method applied during the execution of the research project was framed in the quantitative approach, also the field research which allowed to deepen the investigation.
The population consisted of 5 educators and 20 parents, who applied the survey technique and the questionnaire instrument in order to know the benefits that occur in children; that is obtained through play in the family and educational context. The results obtained from the investigative process have allowed to conclude that teachers and parents have a high degree of knowledge in the use of games in the classroom. It is concluded that because the game is a motivational element that facilitates learning; and in this way allowing the child to experience their emotions and express their feelings to acquire new knowledge.

Introducción

La investigación acerca del juego como principal herramienta de aprendizaje en el desarrollo del niño es una actividad que genera emociones, las mismas que ejercen en la educación. La cual es una función importante, pues a través del juego se adquieren roles que cada niño lo asume de forma individual.

El juego constituye una herramienta indispensable para estimular el aprendizaje del niño, siendo este el canal el que permite al docente propiciar situaciones agradables a través de las cuales buscamos guiar al niño en la conquista de objetivos para enriquecer su desarrollo integral a través del juego se desarrollan sus habilidades es así que puede comunicarse y manejar emociones o demostrar su creatividad sim embargo esto les ayudara a trabajar en equipo y explorar sus habilidades intelectuales ya que podrán resolver a una corta edad sus problemas. Ayuda a la liberación de tenciones, emociones, ya que estos pequeños momentos ayudan al desarrollo durante toda su vida al realizar estos pequeños movimientos se desarrollan sus musculo, sus extremidades, van adquiriendo coordinación, ellos van elaborando sus vivencias emocionales y practican los roles que tendrán desarrollar como adultos.

Además, en los niños se convierte en una herramienta de aprendizaje ya que el juego, es una actividad propia del ser humano y se presenta en todos los niños, no solo en la niñez, sino que es un proceso que se dará durante toda la vida. Impulsan al niño a profundizarse en el mundo del conocimiento ya que estos ayudan a tener concentración y atención, los mantiene activos atentos consiguiendo un esfuerzo más profundo para obtener grandes logros, la acción de jugar les da oportunidad a sus curiosidades del mismo modo pueden desarrollar aspectos psíquicos en áreas como la afectividad , la motricidad ,la inteligencia la creatividad, y la socialización, es así que sin darse cuenta el niño ya va adquiriendo conocimiento y a su vez aprendizajes nuevos .

No todos los juegos son iguales con el pasar del tiempo van cambiando, por lo tanto el proceso de aprendizaje también, es ahí donde el acto de jugar cumple un papel muy importante, pues a través de éste puede estimularse y adquirir mayor desarrollo en sus diferentes áreas como son psicomotriz, cognitiva y afectivo-social es decir el niño va adquiriendo más conocimiento de la vida cotidiana es de ese modo el niño enriquece su lenguaje e interpretara lo que está pasando en su entorno.

Se realiza la fundamentación teórica de algunos autores sobre la importancia del juego en el proceso de enseñanza aprendizaje en los niños, se busca la metodología más adecuada para el estudio su población y muestra se calcula a través de la muestra y se obtiene los resultados de la investigación de los cuales se concluye con el aporte a la investigación y al finalizar se ingresa las referencias bibliográficas.

Fundamentación Teórica

(Moreno, 2002)"el juego es algo esencial a la especie humana, la actividad lúdica es tan antigua como la humanidad. El ser humano ha jugado siempre, en todas las circunstancias y toda cultura, desde la niñez ha jugado más o menos tiempo y a través del juego ha ido aprendiendo por tanto a vivir". (p 11)
Por tanto, el juego es una actividad que siempre ha venido dándose en el transcurso del tiempo, lo cual esto se ha ido progresando y de esa manera ayudando a los niños a que se desarrollen por medio de los juegos en todos los contextos y además en la cultura.

(Flinchun, 1988)"el juego abastece al niño de libertad para liberar la energía que tiene reprimida, fomenta las habilidades interpersonales y le ayuda a encontrar un lugar en el mundo social".
Se dice que el juego es muy importante en el niño porque de esa manera va desarrollando todos sus conocimientos, destrezas, aptitudes que el posee y de esa manera él va a ir encontrando el medio natural en el cual se pueda desarrollar adecuadamente.

(Zapata, 1990): Afirma que: "el juego no exige esfuerzo, pero algunos pueden requerir más energía de la necesaria para realizar sus acciones cotidianas".
Sin embargo, varios de los juegos necesitan que los niños poseen un entusiasmo, alegría, tener esa energía positiva que les ayudara a poder manipular de una mejor manera el juego y puedan obtener un buen desarrollo.

(Pugmire, 1996) “el juego es tan necesario para el pleno desarrollo del cuerpo, el intelecto y la personalidad del niño como lo son, la comida, la vivienda, el vestid, el aire fresco, el ejercicio, el descanso y la prevención de enfermedades y accidentes para su existencia efectiva y prolongada como ser humano”.
Por lo tanto, el juego es muy importante en el crecimiento de los niños, porque de esa manera ellos van desarrollando todas sus habilidades, la psicomotricidad fina y gruesa, su forma de actuar ante las cosas que va a realizar en su vida diaria.

(Garvey, 1985) “el juego infantil refleja el curso de la evolución desde los homínidos prehistóricos, hasta el presente. La historia de la especie humana estaría recapitulada en todo el desarrollo infantil individual”. (p 12)

Dice que el juego es algo muy importante dentro del ser humano y se debe tomar en cuenta que ha ido cambiando desde la antigüedad, hasta la actualidad y por ende esto va ayudando al infante a ir obteniendo conocimientos nuevos.
(Bañeres, 2008) “el juego es una actividad que le procura placer, entretenimiento y alegría de vivir, que le permite expresarse libremente, encauzar sus energías positivamente y descargar sus tensiones. Es refugio frente a las dificultades que el niño se encuentra en la vida, le ayuda a reelaborar su experiencia acomodándola a sus necesidades, constituyendo así un importante factor de equilibrio psíquico y de dominio de sí mismo”. (p 18)

Se manifiesta que el juego es una diversión para el niño ya que le permite desenvolverse en libertad y de esa forma pueda expresar todas sus potencialidades y asi pueda irse desarrollándose adecuadamente y por ende también le ayuda a obtener una buena salud mental.

(Moreno, 2002) “jugar no es estudiar ni trabajar, pero jugando el niño aprende a conocer y a comprender el mundo social que le rodea”. (p 25)

Se dice que el juego es una diversión para el niño ya que por medio de eso el va aprendiendo nuevos conocimientos y de esa manera él se va desarrollando en su ámbito natural y social.

(Sarlé, 2006) “el juego provee al niño de un contexto dentro del cual puede ejercitar no solo las funciones cognitivas con las que ya cuenta, sino también crear estructuras cognitivas nuevas. La enseñanza y el juego promueven el aprendizaje infantil al implicar una expansión de la zona de desarrollo infantil del niño. El juego contextualiza a la enseñanza y facilita en los niños el aprendizaje y los contenidos que se necesitan para jugar el juego”. (p 173)
De acuerdo a lo citado el juego es algo muy indispensable dentro del ámbito educativo de los niños porque de esa forma ellos experimentan nuevas cosas, conocimientos, habilidades, destrezas, les ayuda en su psicomotricidad y es así que obtienen un buen aprendizaje y de tal manera van conociendo hasta los contextos que los juegos necesitan para ser ejecutados.

(; Bonilla-, 2017.; María del Rosario Bonilla-Sánchez1 • Yulia Solovieva1 • Ignacio Méndez-Balbuena1 • Ileana Díaz-Ramírez1, /2017.) Menciono que “La actividad de juego de roles donde se representan situaciones sociales dando la posibilidad a los niños de solucionar conflictos, de analizar opciones de solución y de criticar las acciones y actitudes propias y de los demás participantes en el juego”.

De acuerdo a lo citado por Bonilla se puede argumentar que el juego ayuda al niño favorablemente para ganar confianza e ir asumiendo roles favorables para el mismo y para la sociedad porque él va relacionándolo con su entorno, de este modo el podrá solucionar problemas por si solo las situaciones que se le presenten ya que el tendrá un concepto más claro de la idea y de ese modo podrá tener su propia visión u opinión.

(López Risco, Manuel; Saldanha Pereira, Ana E.; Guerrero Barona, Eloisa; Garcia – Baamonde, Elena; García, Psicología, Nº4, 2010.) Nos menciona “La importancia de que el fenómeno de la discapacidad sea abordado desde un enfoque holístico. Así, el ocio, la cultura, los deportes, entre otras, son actividades que permiten que las personas con discapacidad puedan participar en la vida social, a la vez que desarrollan sus inquietudes.”

Según los diferentes autores podemos decir que la discapacidad es una realidad que se vive a diario y pensando en ellos que se busca dar nuevas estrategias , de enseñanza aprendizaje para evitar que el niño este sin realizar actividades o este sin tener conocimientos previos para poder integrarlo con su entorno y las diferentes actividades recreativas que se realizan, brindando la oportunidad de relacionarse con el ambiente que los rodea , dándoles a conocer nuevos conceptos e integrándolos en la sociedad para lograr un desarrollo adecuado .

(Marco, 2008) Da a conocer que "A alargo de la historia el juego ha sido considerado como un recurso educativo explotado por el hombre desde la antigüedad"

De acuerdo a lo que nos mencionó por Marco podemos decir que la existencia de los juguetes no es algo reciente ya que desde la antigüedad han llegado para cambiar el mundo de la ecuación y dar nuevos puntos de vista, ayudando en el desarrollo del infante, logrando tener y captar nuevos aprendizajes significativos con los juegos cotidianos.

(Alejandro Tamayo Giraldo, Jaime Alberto Restrepo Soto, 2016) Hace referencia a "Las emociones que se orienten hacia el entretenimiento, la diversión, el, esparcimiento, lo que conduce a gozar, reír, gritar e inclusive llorar es una verdadera fuente generadora de emociones"

De acuerdo a lo mencionado recalcaremos que las emociones están presentes en el niño en todo momento puesto que, el aprovechar de estas oportunidades e impartir conocimiento es indispensable para obtener un logro y una expresión social adecuada a futuro.

(Tamayo Giraldo, Alejandro; Restrepo Soto, Jaime Alberto, 2016) "Se hace mención del papel que tiene el juego en el desarrollo de la moral, permitiendo lograr en el sujeto una conciencia de la norma y su práctica." aseguran que el juego tiene grandes beneficios en los niños aportan favorablemente en ciertas áreas tales como motricidad fina gruesa su desarrollo intelectual les ayuda a generar un estilo de vida más saludable más activo.

(Tamayo Giraldo, Alejandro; Restrepo Soto, Jaime Alberto, 2016) "El desarrollo del juego simbólico es similar en los niños sordos y en niños oyentes en la mayoría de las dimensiones"
Tanto en niños con capacidades especiales o no es importante desarrollar las habilidades de concentración y entendimiento es por ello que el juego simbólico es una de las mejores estrategias de aprendizaje para lograr una captación adecuada del tema tratado.

(Alejandro Tamayo Giraldo, Jaime Alberto Restrepo Soto, 2016)La acción, el juego y el trabajo fueron el primer maestro en darle importancia "al juguete" o "dones para lograr su objetivo". En consideración a Alejandro Tamayo y Jaime Restrepo Soto Nos supo manifestar, que el juego es parte del alumno desde que nacen ya que estas pequeñas acciones ayudan en el desarrollo del niño convirtiéndose en aprendizajes sin presión, divertidos, llamativos, alegres, capases de llenar las curiosidades educativas

Metodología

Enfoque de la investigación

La investigación tiene un enfoque cuantitativo por cuanto pone de manifiesto la forma de ser y pensar de los padres de familia y docentes en base al análisis obtenido; a través de la recolección de datos, de esta manera ayuda a obtener conclusiones y recomendaciones.

Proposito de la investigacion

El presente trabajo de investigacion tiene como la finalidad de dar a conocer la gran importancia del juego como herramienta de aprendizaje ; de esta manera diagnosticar los resultados que se obtien en cada niño mediante el juego. Con el objetivo de que las docentes conoscan de esta herramienta y lo apliquen en el aula de clase.

Tipo de investigación

Es una investigacion descriptiva el cual permitira recoger informacion para describir acerca de del juego como principal herramienta de aprendizaje en la educacion de los niños de educacion inicial de 0 a 4 años de edad de manera que seran interpretados según la realidad que se observa.

Es decir que esta investigacion se baso en la informacion obtenida por los padres de familia y los docentes en el centro de desarrollo infantil GARABATITOS

Metodologia de la investigacion que se aplico en la investigación

La metodología que se aplica en la presente investigación es la de campo por que se realizo un cuestionario el cual se aplico a los docentes y padres de familia de la institución educativa enmarcados en mejorar el proceso de enseñanza - aprendizaje en los estudiantes de la institución educativa.

Población y Muestra

Para la recopilacion de los datos acerca del juego como principal herraminta de aprendizaje en la educacion de los niños de educacion Inicial ; se realizo la tècnica de la encuesta y como instrumento el cuestionario que se aplico a 20 padres de familia y a 5 docentes que elaboran en el Centro de Desarrollo Infantil "GARABATITOS", en la parroquia Pastocalle barrio Santa Rita del cantón Latacunga.

Tabla 1: Poblacion y muestra

POBLACION	NUMERO
Padres de familia	20
Docentes	5
TOTAL	25

Fuente: Investigación de campo

Métodos De Investigación

A continuación, se detallará los métodos que se utilizaron para realizar la investigación y fueron los siguientes:

Método Inductivo

Este método nos permitió analizar las experiencias particulares acerca del juego como principal herramienta de aprendizaje en la educación de los niños de educación inicial para poder generalizarlo y a futuro implementar en un salón de clases, mediante una aplicación educativa de educación inicial.

Método Deductivo

Mediante este método se consiguió analizar acerca de la aplicación de los conceptos generales, para que se realice en la práctica en el Centro de Desarrollo Infantil "GARABATITOS" en la parroquia Pastocalle barrio Santa Rita del cantón Latacunga en el nivel de Educación Inicial.

Método Analítico

Se aplicó este método, para establecer el nivel de conocimiento que tienen los padres de familia y los docentes del Centro de Desarrollo Infantil "GARABATITOS", sobre el juego como principal herramienta de aprendizaje en la educación de los niños de educación inicial, cuyo fundamento sirvió para tener una idea clara sobre el tema de la presente investigación.

Método histórico lógico

A través del método histórico se pudo llegar hacia la investigación de conceptos y el estudio sobre la importancia que tiene el juego en el aprendizaje de los niños y mediante las encuestas determinar cuál es el estado de conocimiento sobre el tema y los avances que ha tenido el juego en el desarrollo de los niños en la actualidad.

Método Sintético Analítico

Este método se utilizó en el desarrollo de la introducción del proyecto puesto que tanto el análisis como la síntesis nos ayudó a entender el objeto de estudio del proyecto.

Técnicas E Instrumentos

Encuesta

Esta técnica está enfocada en un cuestionario más adaptable, la misma que nos permitió entender el conocimiento, la aplicación y la necesidad del juego como principal herramienta de aprendizaje en la educación de los niños, con el objetivo de obtener información y conocimientos previos acerca del tema planteado, la misma que estuvo dirigida a los padres de familia y docentes del CDI "GARABATITOS", y de esa manera alcanzar los objetivos planteados en la investigación.

Instrumento

Se relaciona a los cuestionarios que se realizó a base de diez preguntas en las encuestas que fueron aplicadas a los padres de familia y docentes del centro infantil en la presente investigación.

En particular en la investigación se aplicó un cuestionario para la obtención de los resultados los cuales fueron los más óptimos y se socializo con los docentes y autoridades de la institución educativa para mejorar el proceso de enseñanza – aprendizaje en los niños.

Resultados

1. **¿Usted como docente recibe capacitaciones acerca del juego como la principal herramienta de aprendizaje para los niños?**

Tabla 1: Capacitaciones acerca del juego.

Alternativa	Frecuencia	Porcentaje
Si	5	100%
No	0	0%
A veces	0	0%
TOTAL	5	100%

Fuente: Educadoras del CDI "Garabatitos"

Elaborado por: Investigadoras

Interpretación

El 100% de las docentes manifiestan que, si reciben capacitaciones acerca del juego como la principal herramienta de aprendizaje para los niños, ya que de esta manera les ayuda a obtener más conocimiento de lo importante que es

el juego en el desarrollo educativo del niño para de esa manera puedan aplicarlo en el aula de tal forma que les ayude a que desarrollen sus capacidades y la psicomotricidad fina y gruesa.

2. **¿Cree usted que es necesario tener más conocimiento acerca de los juegos que ayudan al niño?**

Tabla 2: Conocimiento acerca de los juegos que ayudan al niño

Alternativa	Frecuencia	Porcentaje
Mucho	15	75%
Medio	0	0%
Poco	0	0%
Nada	5	25%
TOTAL	20	100%

Fuente: Educadoras del CDI "Garabatitos"
Elaborado por: Investigadoras

Interpretación

El conocimiento acerca de los juegos que ayudan al niño los padres de familia dicen, mucho el 75% y nada el 5% lo cual la mayoría dice que, si es necesario tener más conocimiento de los juegos para que ayuden a los niños en su ámbito educativo, ya que por medio del juego los niños experimentan, aprenden, reflejan y transforman activamente la realidad.

3. **¿Cómo docente cree que los padres de familia tengan conocimiento sobre la importancia que tiene el juego?**

Tabla 3: La importancia que tiene el juego.

Alternativa	Frecuencia	Porcentaje
Mucho	3	60%
Más o menos	1	20%
Casi nada	1	20%
TOTAL	5	100%

Fuente: Educadoras del CDI "Garabatitos"
Elaborado por: Investigadoras

Interpretación

El conocimiento que los padres de familia deben tener sobre la importancia del juego, las docentes manifiestan mucho el 60%, más o menos y casi nada el 20%, ya que dicen que la mayoría de los padres toman énfasis en aprender más sobre el juego lo cual es una herramienta para el aprendizaje del niño.

4. ¿De qué manera ayuda el juego en el aprendizaje del niño?

Tabla 4: Ayuda el juego en el aprendizaje del niño.

Alternativa	Frecuencia	Porcentaje
Positivamente	0	0%
Negativamente	0	0%
Positivamente y negativamente	5	100%
TOTAL	5	100%

Fuente: Educadoras del CDI "Garabatitos"
Elaborado por: Investigadoras

Interpretación

El 100% de las docentes manifiestan que la manera en que el juego ayuda en el aprendizaje del niño es positivamente y negativamente, lo cual dicen que el juego es una herramienta que favorece el aprendizaje de todas las áreas del

desarrollo infantil como sensorial, motricidad, comunicación y por otro lado dicen que los niños crecen a través el juego, por eso no debe limitar al niño en esta actividad lúdica.

5. **¿Considera usted que los docentes en el CDI aplican el conocimiento acerca del juego en el aprendizaje de los niños?**

Tabla 5: Aplican el conocimiento acerca del juego

Alternativa	Frecuencia	Porcentaje
Si	12	60%
No	3	15%
Nunca	5	25%
TOTAL	20	100%

Fuente: Educadoras del CDI "Garabatitos"

Elaborado por: Investigadoras

Interpretación

La aplicación del conocimiento sobre el juego en el aprendizaje del niño en el CDI por parte de los docentes, los padres de familia manifiestan que, si es 12%, no el 3% y nunca el 5%, lo cual se da a entender que la mayoría de las docentes en los centros infantiles si aplican los conocimientos que ellas poseen sobre el juego y de esa manera ayudar a que el niño se vaya desarrollando y aprendiendo más.

6. **¿Cree usted como docentes que es importante la selección de material cuando el niño va a jugar?**

Tabla 6: Selecion de material cuando el niño va a jugar

Alternativa	Frecuencia	Porcentaje
Si	3	60 %
No	2	40 %
Nunca	0	0%
total	5	100%

Fuente: Educadoras del CDI "Garabatitos"
Elaborado por: Investigadoras

Interpretacion

La importancia de la selección de material didáctico cuando el niño va a jugar, las docentes manifiestan que, si es el 60 %, no el 40 % y nunca el 0%, lo cual se da a entender que es muy necesario seleccionar el juguete acorde a la edad del niño por ejemplo si es un bebe las botellas de la calma si es un niño de dos años los juegos de construcción y de tres años en adelante los rompecabezas para que de esa manera el niño manipule cada objeto y adquiera conocimientos.

7.- ¿Considera usted como docente si es necesario utilizar en el CDI los juegos tradicionales?

Tabla 7: Es necesario utilizar en el CDI los juegos tradicionales.

Alternativa	Frecuencia	Porcentaje
Si	3	75 %
No	1	25 %
Casi nada	1	0 %
TOTAL	5	100%

Fuente: Educadoras del CDI "Garabatitos"
Elaborado por: Investigadoras

Interpretación

Como docentes mencionan que es necesario utilizar en el CDI los juegos tradicionales el 75 mencionan que sí; el 25% dicen que no; el 0 % casi nada; en si los juegos tradicionales ayudan a los niños a estimular la sociabilidad; ya que de esta forma aprender a acatar y entender normas y reglas.

8.- ¿Utiliza material reciclable al momento de crear materiales didácticos para el aprendizaje de sus niños?

Tabla 8: Crear materiales didácticos para el aprendizaje de sus niños.

Alternativa	Frecuencia	Porcentaje
Si	3	60%
No	2	40%
Nunca	0	0
Total	5	100%

Fuente: Educadoras del CDI "Garabatitos"
Elaborado por: Investigadoras

Interpretacion

utilizar materialbbles reciclables al momento de crear materiales didacticos para los niños se descubre que el 60 % corresponde que si ; el 40% a no y el 0% a nunca; es necesario dar a conocer a los niños que hay que reciclar las botellas, tapas, cartones y de esta manera hacerles entender que hay que cuidar el planeta reciclando.

9.- ¿Usted realiza en casa actividades lúdicas con su hijo?

Tabla 9: Actividades lúdicas con su hijo.

Alternativa	Frecuencia	Porcentaje
Si	3	75 %
No	1	25 %
Aveces	1	0
TOTAL	5	100%

Fuente: Educadoras del CDI "Garabatitos"
Elaborado por: Investigadoras

Interpretacion

Manifiestan los padres de familia que realizan actividades lúdicas en casa con su hijo; el 60 % corresponden que sí; el 25% dicen no y el 0% a veces; mediante las actividades lúdicas le permite al infante a que refuerce y fortalezca su autoconfianza y autonomía y así ayudando de esta manera en el desarrollo de su personalidad; mediante actividades recreativas como: juegos, canciones, retahílas etc.

10.- ¿Cree usted que mediante el juego el niño expresa sus emociones y sentimientos?

Tabla 10: Mediante el juego el niño expresa sus emociones y sentimientos.

Alternativa	Frecuencia	Porcentaje
si	10	50
Mas omenos	5	25
Casi nada	5	25
Total	20	100%

Fuente: Educadoras del CDI "Garabatitos"
Elaborado por: Investigadoras

Interpretación

Los padres de familia responden si mediante el juego el niño expresa sus emociones y sentimientos. El 50% corresponde a que sí; el 25% a más o menos y el 25% a casi nada; mediante el juego el niño expresa sus emociones por ejemplo si un niño observa en su hogar que su padre maltrata físicamente a su madre el niño; hará lo mismo con sus juguetes y también con sus compañeritos de la clase; es por eso que los niños son como esponjitas que absorben todo lo que observan.

Discusión De Los Resultados

El objetivo de este estudio fue investigar los aportes significativos que dan el uso de los juegos en el proceso de enseñanza – aprendizaje en los niños como se muestra en cada una de las preguntas existe la predisposición para realizar estas actividades y la aplicación por parte de los docentes dentro de las aulas para tener mejores resultados en sus alumnos a través de los conocimientos aprendidos en el aula.

Conclusiones

- El juego es primordial en el desarrollo de los niños al ingresar a la educación Inicial donde se puede observar que, al practicar distintas actividades lúdicas como bailes, juegos de la gallinita ciega, el gato y ratón, juegos al aire libre, etc.; ayudan a los niños a tener una mejor coordinación y equilibrio; asimismo es muy fundamental que la docente realice juegos para mejorar su motricidad fina y gruesa el cual ayudara al niño a la escritura.
- Se pudo observar que los juegos que se realizan en el Centros de desarrollo infantil GARABATITOS ayudan a que el niño se desenvuelve en la socialización, facilita el aprendizaje, desarrolla la madurez, y la adquisición de conocimientos en cada niño.
- También se puede decir que los niños al momento de jugar lo hacen con placer y ellos mismos son quienes marcan sus reglas y sus metas; por esta razón los niños son seres humanos justos al cumplir las reglas del juego que se les solicita en la clase.
- Se llega a la conclusión que al niño también de le debe dar materiales didácticos reciclables como con botellas, tapas, cartones, entre otros el cual el docente debe realizar materiales didácticos como la caja de bastidores de vestir, manitos con diferentes texturas, rompecabezas, instrumentos musicales, etc. de esta manera indicándoles a los niños a aprenderán a cuidar el medio ambiente reciclando.

Abstract

The starting point of this article is the objective of defining the educational system. The components of the educational system are also defined: social institutions, economic institutions, socio-cultural, political, professional (occupational) groups, certain NGOs. Many management principles are presented too, specific for raising the quality of an educational system, such as: the continuity principle, the student-centered principle, the didactic inovation principle, the ensurance and development of complementarity and correlation between main subjects; partenerships development for education (I) – scientific research (CS) – production (P).

Keywords:Management; Educational Systems; Quality; Principles.

Introduction

An education system is a subsystem of a global social system. We can define the education system (which is also called the institution of education) as the total number of a society's institutions, which are involved in the education of people.

The components of the education system (institutions involved in the education of people) can be: Social institutions; economic institutions; socio-cultural; political; professional groups; specific NGOs.

The main role of an education system is to generate and ensure through its functions the development of the training process of human perosnality. The design and implementation of the functions of education are carried out through specific, formal and non-formal content and methodologies.

Cite this Article as: Daniela Alice LUTA, Adrian IOANA, Daniela TUFEANU, Dragos Florin MARCU, Bogdan FLOREA , Daniela Ionela JUGANARU and Bianca Cezarina ENE“ Research Regarding Specific Management Principles Increasing The Quality Of Educational Systems” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

In order to raise the efficiency of the activities specific to an education system, it is important to study and optimize the links between: the education system – the teaching system - the teaching process, in terms of social and pedagogical relations between them. Figure 1 shows the schematic representation of these correlations.

Fig. 1: The correlations between the educational system, teaching systeam and the teaching process

The education system can be defined and analyzed both from a narrow and a broad point of view. Therefore, in the broad sense, the education system refers to "all institutions involved in organizing school architecture, more precisely in the general evolutionof studies on cycles, directions, specializations, etc.". (Dictionnaire encyclopédique de L'éducation et de laformation, 1994, pg.956).This includes school institutions, but also some institutions specialized in non-formal training (clubs, camps, professional development training centres, television and radio broadcasts, etc.).

Principles increasing the quality of educational systems

The entire education system has to be led by the saying "**quality must prevail**". From this point of view, it is important to know and apply a number of specific principles. We present and analyze below some of them.

The continuity principle – according to it, the education must be a continuous process. Therefore, specific methods and tools must be used for each stage of development (pre-school, primary, secondary school, university, post-graduate).

The principle of the student centered – the pre-school pupil, the student, the Master Degree student, the doctoral student must be the central element of the education system. Thus, the educational materials, tools and methods specific to the education system must place in the centre the beneficiary of the educational process. Looking at a famous marketing saying, we can state „the student is our master".

The principle of teaching innovation – including a wider use of modern means of presentation and communication in teaching at all levels.

Ensuring and developing complementarity and correlation between the content of the subjects taught is another principle specific to an effective education system.

The development of partnershipsin education (I) – **Scientific research** (CS) – production (P) is another principle of an education system. Figure 2 shows the diagram of connections and correlations among these three partnerships.

Fig. 2: Connections and correlations among The development of partnershipsin education (I) – Scientific research (CS) – production(P)

I will further exemplify some of the main correlations within this triple partnership.

(1): UE→SC - University education provides specific training and knowledge to enablethe Scientific Research.

(2): SR→UE - Scientific research (both university and non-university) provides education with **increased conditions for development**. This development mainly refers to two components: the first one is connected to the material aspect (equipment, installations, apparatus); the second one is connected to the scientific aspect including the specialists (the specialization of a highly qualified human resource).

(3): SR→P - Scientific research, not only the applied one, but also the fundamental one, provides theproduction with **modern and high-performance technologies and procedures.**

(4): P→SR - The production provides **the scientific research with a conduciveenvironment, appropriate for industrial experiments, in order to quantify and validate the estimated results and efficiency**. Here we must also consider the diversification of professional relationships with production specialists.

(5): P→UE - In relation to university education, production **must be seen as the main activity environment for future graduates**. Production can also provide university education with **important primary bases of technological and economic data.**

(6): UE→P - University education has the important purpose of providing **well-trained specialists necessary for the productive sectors** (and not only).

The efficiency of applying the principles of the educational system is quantified by the efficient realization of the functions of this system, namely:

- Socializing
- Transmission of culture through the two types of knowledge: academic knowledge and institutional knowledge.
- Formation and development of the personality of the subject of the educational system.
- Selection, preparation and placement of individuals in society.
- The evolution of the subject of the educational system.

Conclusions

To render an educational system more efficient, specific scientific principles of management should be applied.

The main desideratum of any educational system must be quality assurance. From this point of view (and not only), placing the subject of the educational system in a central position plays an important role.

Along with the learning and education process, theunconventional and complementary activities ensure a major opening of the educational system, which leads to an increase in its efficiency.

Also, an important role for ensuring the increased efficiency specific to any educational system is played by the improvement of the human resource involved, as a source (transmitter) in the communication process.

Summary

In the world today, large companies handle a high volume of data, making it difficult to analyze efficient decision making. This problem has led to a large number of research into the implementation of business intelligence (BI) to improve the management decision making, achieve strategic objectives that help generate value to the organization, and position themselves in front of their competitors. This document provides a systematic review of the literature from different studies that have been carried out since 2015 using BI in different areas of businesses. This review provides a comprehensive statistical analysis of specific information extracted from 97 articles published between 2015 and 2020. The results provided in this document show interesting results about the effectiveness of BI implementation in different areas of organizations and how this tool can have a great influence on effective decision making, thus achieving a competitive advantage in organizations.

Keywords: Business Intelligence, Decision Making, Ralph Kimball, OLAP, Systematic Literature Review

Introduction

Currently, companies have great difficulty in implementing a decision-making process in different parts of the organization. In recent years, medium-sized and large-sized companies have been generating a large amount of data, which is becoming difficult to manage and leads to congestion in the delivery of information [53]. BI systems have been observed as the solution for information management and decision-making problems. However, there has been an absence of research on how this system would be adopted and implemented to help decision makers [37].

Advances in information systems and organizational technologies led to the emergence of business intelligence (BI) systems in the late 1990s [96]. The BI solutions are a very important element in companies, where they provide analytical reporting capabilities based on integration of data collected from internal and external sources. This reporting facilitates efficient decision making by managements [22]. BI systems are considered a major investment in organizations, as this tool has the capacity to break down organizational information barriers and influence decisions that have a greater impact on business strategies [22]. In many companies, BI is considered a key technology that helps in the commerce decision making. Currently, with the availability of several BI systems, BI effectively supports better decision making. In addition, companies' information can be analyzed more efficiently [55].

Therefore, the use of BI in companies can generate value in different areas of the organization by providing key information for efficient decision making. It also reduces manual reporting and generates signals that are key to

Cite this Article as: Jhudith EGOCHEAGA-OSCCO, Angelo CHAVEZ-VELI, Javier GAMBOA-CRUZADO, Alfonso ROMERO BAYLÓN, Luis SOTO-SOTO and Oscar MUJICA-RUIZ "Business Intelligence for Decision Making in the Sales Area - A Systematic Literature Review" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

optimal decision making. The BI tool is a key acquisition for organizations that want to be successful by analyzing the information in real time in an efficient manner. In this article, we review the research on the use of BI for the improvement of decision making in different areas of a company. This paper is developed as a detailed review of techniques to identify research gaps in the literature. The paper is organized as follows. Section I presents the Introduction, and Section II details the background and the works related to this investigation. Section III provides the methodology used, Section IV presents the results of the systematic review of literature, and Section V presents the discussion. Finally, Section VI presents the conclusions and future work.

Background and Related Works

In recent years, many studies have proposed different methods for the implementation of BI in different organizations and identified the steps necessary for a successful introduction of this tool.

Ain et al. [96] reveal that to achieve success of the BI solution in an organization, the quality of the data, the system, and IT infrastructure are important for the success of this tool. Organizations should also keep in mind that education, training, and management support in creating a proper organizational culture are very important for a successful implementation.

Other studies also show that the concept multidimensional is the right one to build a data warehouse, being this the key to BI success, enabling powerful data analysis based on BI [27]. They also add that, in the extraction, transformation, and loading (ETL) process performing mining of data is necessary to have potentially important data and effectiveness of BI in organizations.

Brgui et al. [6] proposed a natural language-based method for the design multidimensional DM and ETL generation. They developed a prototype software called ARVAT. This software supports the construction of ETL, specification of requirements, and generation of multidimensional DM schemes, in preparation for ETL procedures, indicating effectiveness in the implementation of BI. They also indicate that the specification of requirements is very important for a BI solution for an organization to succeed.

It can be assumed that BI can be implemented in all areas and industries that have an information database. This view is supported by the various researchers who, through the use of information, have been able to achieve the goal of streamlining processes and improving performance [51]. In this implementation of the BI storage, the ETL process was designed to incorporate data quality to filter out inconsistent data with respect to data scheme and value of the data. Therefore, this quality data process allows for correct and qualitative data in the data warehouse. In addition, verification of data quality has been incorporated, as well as the data detection rules to filter the data scheme without same and the range of data that are stored in the data warehouse for your analysis.

BI research in different organization is key to improve decision making in any area in which BI is being implemented. However, sometimes the implementation is not successful because requirements, and data storage infrastructure are not well defined. Therefore, research is necessary to determine what processes are required to achieve a successful implementation of BI.

Methodology

For the development of this research, the systematic literature review was applied. This is a technique used to separate and synthesize the evidence of a particular response-oriented topic, and it defines the research questions and classifies the articles. To do so, these steps were followed to choose and to evaluate different studies in a timely manner and to provide evidence for them. This study involves a comprehensive search of relevant databases to identify the BI literature for taking decisions in different areas of an organization. Fig 1 shows the steps that were used in this research.

Fig. 1: Diagram of the research methodology

A. Definition of Research Questions

The main purpose of this research is to answer objectively to a series of questions by reviewing articles, as presented in Table 1.

Table 1: Questions and motivation for research

Research Questions	Motivation
RQ1: Which ones are the criteria for measuring the effectiveness of business intelligence development, based on Ralph Kimball's methodology, on the improvement of decisions?	Determine the development effectiveness of business intelligence based on Ralph Kimball's methodology on improving decision making.
RQ2: How many studies were published in the last 5 years by source and type of business intelligence publication?	Determine how many studies were published in the last 5 years by source and type of publication.
RQ3: In which areas business intelligence has been applied?	Knowing in which areas business intelligence has been applied.
RQ4: What methodologies are the most used for the development of business intelligence?	To know which methodologies are the most used for the development of business intelligence.
RQ5: What technology tools support business intelligence?	Get to know the technological tools that support business intelligence.

B. Sources Search

This study process uses 11 sources of relevant database, including Science Direct, Dialnet, IEEE Xplore Springer Link, Google Scholar, DOAJ, Taylor & Francis Online, Scopus, ProQuest, EBSCOhost, and Microsoft Academic.

C. Search Equations

To perform the searches in these sources, a series of search equations according to each source, as shown in Table 2, was used to find relevant articles. For this purpose, the following terms related to the research topic were used: BI, methodology or model or method, and decision making, as shown in Table 1.

Table 2: Search equation by source of search

Source	Search Equation
Science Direct	("Method" OR "Model" OR "Methodology") AND Business Intelligence AND Decision Making AND Data Warehouse
Dialnet	(“Business Intelligence”) AND (“Decision Making”) OR ("Ralph Kimball Methodology")
IEEE Xplore	((("All Metadata”: Business Intelligence) AND "All Metadata”: Decision Making) OR "All Metadata”: Ralph Kimball)
Springer Link	'"Business intelligence" AND "Decision Making" AND (Method OR model OR Methodology)'
Google Scholar	Business Intelligence AND Decision Making AND Kiimball AND (Method OR Model OR Methodology)
DOAJ	"Business Intelligence": "AND", "Decision Making"
Taylor & Francis Online	[All: business intelligence] AND [All: ralph Kimball] AND [[All: Method] OR [All: Model] OR [All: Methodology]]
EBSCOhost	TX (Business Intelligence) AND TX Decision Making AND TX ((Ralph Kimball OR Methodology))
ProQuest	((Businesses Intelligence) AND (Decision Making)) AND (Ralph Kimball) AND (Methodology OR Method OR Model)
Scopus	(ALL (“Business Intelligence”) AND ALL (“Decision Making”) AND ALL (“Ralph Kimball” OR “Methodology or Method or Model”))
Microsoft Academic	"Business Intelligence" AND "Decision Making” AND "Ralph Kimball" AND " Method OR Model OR Methodology "

D. Consolidated number of results by source

After searching the 11 sources, according to the search equation, 29 794 articles were obtained, as shown in Fig 2.

Fig. Error! Bookmark not defined.**:Articles found through source searching**

As mentioned in the previous point, 29 794 articles from the 11 database sources were found. However, it would be too time consuming to read all these articles. Therefore, in the next step, exclusions were applied according to criteria that were formulated, to select only the most relevant articles and to locate more research related to the research topic.

E. Exclusion Criteria

To select the most important articles and to make the review more efficient, seven exclusion criteria were formulated, as presented in Table 3.

Table 3: Exclusion criteria

Id.	Criterion exclusionary
CE1	The items were not published in the recent 5 years OR
CE2	The articles are not written in English OR
CE3	Articles do not show the sample unit OR
CE4	The articles do not consider the methodology of Ralph Kimball OR
CE5	Items are not unique

F. Consolidated number of results at apply criteria

In this step, the five exclusion criteria were used to reduce the number of items obtained and to find the most important articles related to the research topic. This step resulted in the selection of 97 articles.

Fig. Error! Bookmark not defined.**: Consolidation of numbers when applying criteria**

G. Criteria for assessing the quality of studies

Quality criteria were formulated to assess whether the selected articles are relevant to the research study. The criteria are presented in Table 4.

Table 4: Criteria for quality

Id.	Quality criteria
QA1	Does the topic belong to the fields of IT, information systems, or management?
QA2	Is the article relevant?
QA3	Are the bibliographic sources of quality?
QA4	Are the authors relevant and prestigious?
QA5	Is the collection adequately described and data measurements?
QA6	Is it clear which technique(s) TM can be used to support the SLR process?

When the 97 articles were checked and evaluated against the criteria of quality, each of them meets the 6 criteria formulated; therefore, no items were removed.

H. Reports with Mendeley of the studies classified

Here, we report the management of the studies using the Mendeley tool for reading and highlighting answers located for each question. This tool helps make all changes intact, as well as the highlights and comments made to each item.

Fig. 4: Item report selected in Mendeley

I. Findings Miscellaneous

In this section, interesting and varied preliminary results obtained by the systematic review are presented.

Fig 5 shows the initial items for each source. The search results show that the source with the most articles is Google Scholar with 65.11%.

Fig. 5: Initial studies through source searching

Fig 6 shows the final studies to be reviewed for answers to each of the questions in section A of the methodology. The number of articles per source is shown as well as the percentage according to the articles selected.

Fig. 6: Final studies by source

Fig 7 shows the word cloud for the titles of the articles. The most prominent words are intelligence and business.

improved decision making	[1] [4] [7] [13] [14] [15] [16] [21] [23] [28] [31] [42] [47] [48] [49] [54] [60] [61] [65] [79] [80] [88] [89] [93] [94] [97]	26	12
time saving	[15] [19] [23] [27] [30] [31] [32] [33] [35] [36] [41] [42] [51] [54] [56] [60] [61] [74] [77] [80] [82] [83] [87] [88] [93] [97]	26	12

It is observed that the criterion for measuring the effectiveness of BI most used is improved information analysis with 78 articles, which represents 35%. It is also noted that the BI criterion least used to measure effectiveness is time saving with 26 items, representing 12%.

Leonardo and Maria [28] demonstrate the benefits derived from the development of the BI tool visualizing data for the analysis of an organization's indicators, allowing the generation of a simple and intuitive method for the user.

Idrajani and Pandy [20] indicate that data storage developed at an XYZ university is key to the effectiveness of a BI solution since it generates relevant, consistent, and accurate information, thus providing management with the analysis of data and decision making.

Aljawarneh [53] mentions that most organizations are receiving benefits due to the use of BI, concluding that this tool has become one of the main strategies to maintain a competitive advantage.

According to Adiguzel [21], the use of BI showed that there are many benefits to making a decision. This result was obtained by carrying out a complete process of data storage and processing of data well, making this a source of valuable information generating a good decision making back up.

In a study carried out by BI solutions, it was noted that in the organizations where BI was successfully implemented, the production of reports had decreased in comparison with the time prior to implementing a BI solution. This shows that by implementing BI in an organization, the time spent in the elaboration of reports can be reduced [60].

RQ2: How many studies were published in the last 5 years by source and type of business intelligence publication?

Through the systematic review, the studies conducted over the last 5 years (2015–2020) on the 11 sources of search be determined, as well as how many articles were found in each source. Fig 8 shows that Google Scholar is the source that provided the most articles (22), which represents 22.68% of articles over the last 5 years. It is also shown that the source that provided the least number of articles is ProQuest with four articles, representing 4.12%.

Fig. 8: Items by source of search

The number of articles published for each year can be determined, thus obtaining the results in Fig 9. The year 2018 was the year with the most articles published (22), which represents 22.68%. The year that provided us with the least number of items is 2019 with 13 items representing 13.4%.

Fig. 9: Items per year

Through the systematic review, we also found two types of publication where the articles were published, such as conferences and journals. Journals published 71 articles, representing 73.2%, where conferences published 26 articles, representing 26.8%, as shown in Fig 10.

Fig. 10: Items by type of publication

Fig 11 of Google Trends shows the progress of the research in terms of BI in the last 5 years.

Fig. 11: BI search frequency in the last 5 years

RQ3: In which areas business intelligence has been implemented?

To answer this question, areas are mentioned where BI has been developed within the 97 articles reviewed with the RSL methodology. Table 6 displays the areas where BI was implemented.

Table 6: Areas for business intelligence implementation

Areas of implementation	Articles	Nro.	%
Sales	[6] [7] [8] [13] [18] [21] [23] [24] [27] [30] [31] [36] [37] [38] [39] [40] [41] [42] [43] [44] [45] [47] [50] [55] [60] [61] [62] [66] [69] [71] [74] [80] [82] [83] [86] [94] [95] [97]	38	21
Marketing	[2] [4] [7] [13] [14] [23] [24] [27] [29] [36] [40] [42] [47] [53] [55] [59] [61] [64] [66] [69] [76] [78] [80] [82] [84] [88] [92] [94]	28	16
Finance	[2] [4] [5] [6] [13] [15] [18] [21] [22] [23] [31] [37] [49] [50] [55] [56] [60] [61] [63] [64] [69] [73] [78] [82] [91] [94] [96] [97]	28	16
Production	[4] [6] [7] [9] [13] [15] [16] [23] [25] [42] [44] [46] [54] [55] [59] [62] [67] [72] [75] [76] [82] [85] [91] [95] [96]	25	14
Academic	[1] [4] [5] [6] [9] [10] [11] [16] [17] [20] [34] [35] [37] [40] [44] [46] [49] [53] [61] [63] [68] [79] [90] [96]	24	13
Telecommunicatio n	[1] [2] [11] [14] [23] [24] [29] [30] [34] [36] [43] [50] [51] [54] [59] [68] [69] [71] [94] [96]	20	11
Purchase	[7] [21] [24] [29] [33] [41] [45] [55] [66] [71] [74] [76] [80] [82] [83] [86] [88]	17	9

As shown in Table 6, BI has been implemented in different organizational areas, with sales being the area with most implementations as shown by 38 articles, representing 21%. Further, the area where BI was implemented the least is purchasing, as found in 17 items, which represents 9%.

RQ4: What are the most widely used methodologies for business intelligence development?

Through the systematic review of literature, we found three methodologies for the development of BI, as shown in Table 7.

Table 7: Business intelligence methodologies

Business Intelligence Methodology	Articles	Nro.	%
Kimball	[1] [3] [4] [5] [6] [7] [8] [9] [11] [12] [13] [14] [16] [17] [20] [21] [24] [25] [26] [27] [28] [29] [31] [32] [33] [36] [38] [39] [40] [42] [44] [46] [47] [49] [50] [51] [52] [53] [55] [56] [57] [58] [59] [61] [62] [63] [66] [67] [68] [70] [76] [78] [79] [80] [81] [86] [88] [89] [90] [93] [97]	61	60
Inmon	[3] [4] [5] [7] [13] [14] [21] [24] [27] [29] [32] [33] [38] [39] [40] [41] [42] [46] [47] [49] [51] [52] [53] [55] [56] [58] [62] [63] [64] [68] [70] [86] [87] [89] [94] [95]	36	35
Data Vault	[3] [32] [38] [59] [96]	5	5

As shown in Table 7, Kimball's methodology is the most applied with 61 articles, representing 60%, and the least applied methodology is data vault with five items, which represents 5%.

Andrea and Felipe [9] in their study define Ralph Kimball's methodology as a bottom-up approach up, in which the data marts are created first. This is preferred by most organizations because it provides a more refined view of the data, as this model focuses on the ease of user access and provides high performance for the data warehouse (DW).

Delgado and Fernando [89] mention that Kimbal's methodology offers more appropriate information support and provides all the elements necessary to deliver value to business users; they also mention that this methodology is suitable for small projects because of its easy understanding for the user and rapid development.

RQ5: What technological tools support business intelligence?

There are many tools that support BI according to the 97 articles reviewed. The tools found are shown in Table 8.

Table 8: Technological tools

Most used techonological tools	Articles	Nro.	%
Oracle Business Intelligence	[5] [19] [31] [32] [40] [41] [44] [51] [54] [56] [60] [61] [63] [68] [74] [76] [80] [87] [90] [91] [93] [94]	22	19,8
SAP business intelligence	[5] [8] [20] [21] [30] [37] [42] [43] [45] [47] [55] [61] [63] [64] [67] [69] [70] [73] [74] [88] [90] [97]	22	19,8
Pentaho	[1] [11] [12] [16] [17] [20] [25] [26] [28] [33] [51] [54] [56] [57] [87]	15	13,5
Microsoft Performance Point Server	[1] [13] [18] [40] [41] [46] [52] [58] [59] [65] [68] [72] [74] [76] [96]	15	13,5
Microsoft SQL Server	[1] [13] [32] [40] [41] [46] [51] [52] [58] [59] [61] [68] [72] [74] [76]	15	13,5
QlikView	[47] [48] [79] [86] [89]	5	4,5

OpenI	[1] [42] [88] [97]	4	3,6
SPSS	[29] [30] [43] [70]	4	3,6
SAS Institute	[11] [63] [74]	3	2,7
Crystal Reports	[74] [77]	2	1,8
Office SharePoint Server	[74]	1	0,9
JasperReports	[33]	1	0,9
IBM Cognos Analytics	[94]	1	0,9
Microsoft Dynamics	[32]	1	0,9

As shown in Table 8, the tools most used are Oracle BI and SAP BI. These tools are mentioned in 22 articles, which represents 20% of the total percentage. The least used tools are Office Share Point Server, Jasper Reports, IBM Cognos Analytics, and Microsoft Dynamics, with one article each, which represents 1% of the total percentage.

Discussion

To the best of our knowledge, there are many studies on BI, which has benefits to organizations, such as improved decision making, competitive advantage, and better data analysis, which help generate value for the companies. The findings clearly indicate that there is a good deal of research that show the effectiveness of BI implementation, as observed in the studies carried out from 2015 to 2020.For these studies Google Scholar was the source of data with the most articles reported with 22.68%, followed by Spring links with 14.43%; it can be said these two sources provided the most articles for the study. Looking at the last 5 years, we see that the year with most articles published was 2018 with 22.68%, followed by 2015 and 2016 with 20.62%. The year with the lowest number of studies carried out was 2020 with 13.4%. Comparison between type of publication, Conferences and Journals, show that more studies were published in Journals with 73.2%.

For the most valued authors during years 2015–2020, the authors of article [94] received the most citations with 23%; in second place, we have the authors of the article [37] with 15%; and in third place, the authors of articles [64] and [77] with 10%. These were the three most valued authors during the last 5 years (2015–2020). In addition, Indonesia, Portugal, Ecuador, India, and Serbia were the countries that conducted the most studies from 2015 to 2020. Two articles published in the United States were the most valued with over 15 citations. With regard to the means of publication, eight articles published in journals received more than 15 citations. Hence, presumably, articles in journals are most often cited, and *Information Systems Management* and *Journals of Computer* are the most quoted media. These publications are the most valued for the subject of appropriate methodology for implementation. In these articles, many researchers mentioned that the methodology of Ralph Kimball was best suited because of the bottom-up approach, easy comprehension for users, and not too expensive to be implemented.

For researchers, the studies performed must be conducted with great care, because there are also studies that are not very clear about their methods or instruments used; hence, they did not achieve the expected results.

In particular, we agree with the study by Cohelo and Miranda [96] that the use of BI brings many benefits to an organization. Their study also helps decision makers in their daily tasks, providing them with a new perspective, and can help them make the right decisions and achieve positive impacts.

It can be assumed that the use of BI can be generalized to be used in all fields of organizations depending on the infrastructure of its database and thus achieve the objectives of the organization.

Conclusion and Future Studies

This study has succeeded in identifying and analyzing the effectiveness of BI by determining its benefits, areas where it can be implemented, methodologies more frequently applied to BI and more often used tools, and the relationship of BI and improved decision making. The findings were based on the SLR research questions submitted on articles published between 2015 and 2020 in various journal databases. Based on the search equations, we found 29,794 items that were further examined applying the exclusion criteria. This step reduced the number of articles to be reviewed to 97. The results of the review found the following benefits from a successful implementation of BI, improvements in

the decisions made, quality of information, competitive advantage, analysis of real-time information, and savings in costs and time. BI helps improve decision making and can be implemented in different areas of an organization and in different business lines that have a solid data infrastructure. The applied methodology used more frequently in the implementation of BI was that of Ralph Kimball. This methodology is easy to understand for users and allows for growth of the DW because of its bottom-up approach.

This review has some limitations that a future research can address. This is the case with the issue of BI effectiveness, which in this study was analyzed in a general way based on the benefits of BI and with a time limit for the articles that were reviewed; in other words, articles were obtained between 2015 and 2020. However, further study should be focused on BI success using more recent studies. More recent research and published works on this subject will help increase awareness among professionals and researchers in this field and will provide more value to the use of BI in organizations.

Abstract

The meteoric rise of social media news during the ongoing COVID-19 is worthy of advanced research. Freedom of speech in many parts of the world, especially the developed countries and liberty of socialization, calls for noteworthy information sharing during the panic pandemic. However, as a communication intervention during crises in the past, social media use is remarkable; the Tweets generated via Twitter during the ongoing COVID-19 is incomparable with the former records. This study examines social media news trends and compares the Tweets on COVID-19 as a corpus from Twitter. By deploying Natural Language Processing (NLP) methods on tweets, we were able to extract and quantify the similarities between some tweets over time, which means that some people say the same thing about the pandemic while other Twitter users view it differently. The tools we used are Spacy, Networkx, WordCloud, and Re. This study contributes to the social media literature by understanding the similarity and divergence of COVID-19 tweets of the public and health agencies such as the World Health Organization (WHO). The study also sheds more light on the COVID-19 sparse and densely text network and their implications for the policymakers. The study explained the limitations and proposed future studies.

Keywords: Social Media, COVID-19, Twitter, Tweets, News, Trend, Natural Language Processing

Introduction

The meteoric rise of social media news during the ongoing COVID-19 is worthy of advanced research. From the records of extant studies, Facebook and Twitter play a predominant role in social information dissemination (Olaleye, Sanusi, and Salo 2018). Freedom of speech in many parts of the world, especially the developed countries and liberty of socialization, calls for noteworthy information sharing during the panic pandemic. Twitter is a preferred social media platform for this study because its information aggregation is methodical, and its communication privilege is snappy.

There are evolving trends in social media in the past. For instance, political communication through e-electioneering has become a trend in many countries globally, and this development is promoting citizen engagement in e-democracy (Macnamara and Kenning, 2011). The current global events and news stories are the trends in China (Yu, Asur, and Huberman, 2011), while Patton, Eschmann, and Butler (2013) examined gang violence, masculinity, and hip-hop in the society through Twitter due to the Internet banging. As a public relations tool for the citizenry, social media is the trend of many local governments across the United States of America (Graham and Avery, 2013).

Though social media use as a communication intervention during crises in the past is remarkable, the Tweets generated via Twitter during the ongoing COVID-19 is incomparable with the former records. Current literature on social media in the context of COVID-19 focused on data and information management from different perspectives. Cinelli et al. (2020) combined five social media platforms and compared questionable and reliable information regarding COVID-19. The authors discovered different information spreading patterns and rumors amplification.

Cite this Article as: Sunday Adewale OLALEYE, Oluwafemi Samson BALOGUN and Bukola SALAMI "Trend of Social Media News: A Viewpoint Of COVID-19 Tweets Using Natural Language Processing" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Timely dissemination of information to the public in Vietnam is the focus of the study of La et al. (2020), and the result of their research shows how the combination of policy response, social media, and science journalism helps the Vietnamese fight the deadly Corona Virus promptly. In the same line, Huynh (2020) discussed the risk perception of COVID-19 and concluded that geographical regions and behaviors exhibited while using social media positively affect the risk perception of COVID-19 in Vietnam. Information sharing during the ongoing pandemic is with mixed feelings, and Depoux et al. (2020) argue that the virality of COVID-19 misleading information is as dangerous as the virus itself, and this proposition is in tandem with Pennycook, McPhetres, Zhang, Lu, and Rand (2020). Likewise, the Editorial of Lin (2020) believes that an increase in fear and stigma may escalate through misinformation and misperception of information.

Still, on social media misinformation, Llewellyn (2020) suggests carefulness with trust and expertise on social media, and the author used the personal experience of panic and COVID-19 misleading message saturation as an early warning for the social media users. An earlier study has focused on social media misinformation and information spreading patterns, but a study on close comparison of the public and World Health Organization (WHO) Tweets are limited.

This study intends to examine the trend of social media news and compares the Tweets on COVID-19 as a corpus from Twitter. This study answers the following research questions to explore the set objectives: 1) What is the difference between the public and WHO information spreading patterns via Tweets? 2) How to strike a balance between sparsely and densely tweets during the ongoing COVID-19? The study employed a quantitative methodology and used Natural Language Processing data analysis technique. The study results show three trendy topics and their interrelationship.

This study starts with an introduction, followed by a literature review, methodology, and data analysis. The next part discusses the result, practitioner implication, and conclusion.

Literature on Natural Language Processing (NLP)

This section focuses on literature, which deals with the application of NLP on how social media is used as a means of communication during the COVID-19 pandemic to share ideas and thoughts about the effects of the pandemic in different areas of life, with Twitter being the social media platform widely used during the pandemic.

The authors of the reviewed literature cited their ideas using different NLP methods to review people's thoughts and opinions about the pandemic and its effects on the masses. They also gave an insightful contribution to how social media used during the pandemic, and some of them gave future direction on how social media can be used to solve issues related to the pandemic. The contributions of the synthesized literature is a mixture of positive and negative contradiction. For example, out of thirteen (13) recent papers reviewed, nine (9) studies did not give future direction based on their results. See Table 1 for details.

Natural Language Processing (NLP) Literature Table 1

No	Author(s)	Year	Focus	Methodology	Contribution	Future Direction
1	Kim	2020	This research incorporates a computer-assisted content review to determine which social grooming variables are reducing Incivility of users of social media when writing or reporting on the COVID-19 situation in South Korea.	Binary logistic regression and semantic network analysis	The study indicates that the scale of the social network is a negative indicator of incivility for Twitter users who have built up broader networks and earned supportive feedback from those who are less likely to use uncivil language. The linguistic choice between users varies depending on the scale of the social network.	It suggested that for future work, Social grooming of larger and more diverse social networks is a significant indicator of a decline in civility. It suggest a hybrid study of text and Visual information or other technical research (e.g. visual knowledge) Sentiment Analysis, popularity prediction, virality prediction) as its methodology.
2	Abd-Alrazaq et al.	2020	The purpose of this study is to identify the key topics posted by users of Twitter concerning the COVID-19 pandemic	Sentiment analysis	The study established 12 subjects, which were grouped into four key themes: the origin of the virus; its source; its effects. People, countries, and the economy; and ways to reduce the risk of infection. The mean sentiment for 10 was good Subjects and negatives on two subjects (deaths caused by COVID-19 and increased racism).	-
3	Cinelli et al.	2020	This research offers an in-depth study of social trends in a time period where theories and moods in social media linked to	Text analysis (NLP) and Mathematical model (SIR model)	The study suggests that the distribution of information is influenced by the model of interactions enforced by specific social media or / or the particular patterns of interaction between groups of users interested in the subject. The authors	-

			COVID19 have risen and spread.		suggest that understanding the social dynamics behind content consumption and social media is an important topic, as it may help to develop more effective disease models for social behavior and to introduce more effective communication strategies in times of crisis.	
4	Sarker & Gonzalez	2017	The research introduces an unlabelled corpus and a collection of language models to the data science, natural language processing and public health communities.	Natural Language Processing	The authors-built language models to help the development of data mining tools and methods in this area using the data, which are rich in drug-related chatter.	-
5	Al-Garadi et al.	2020	The purpose of this paper is to explain the creation and evaluation of A natural language processing and machine learning framework using Twitter data to automatically detect Tweets containing self-reported symptoms of COVID-19-positive patients.	BERT-based classifier	The BERT-based model shows high performance in detecting tweets with non-COVID-19 symptoms, while the classifier shows strong performance in detecting tweets with COVID-19 associated symptoms.	The authors propose that current performance can be enhanced in the future by incorporating more training data with a wide variety of positive COVID-19 symptoms.

6	Chen et al.	2020	In this report, the authors examine, from a language perspective, crawled tweets (Twitter posts) with and without contentious words associated with COVID-19.	Latent Dirichlet allocation (LDA) and LIWC2015 (Linguistic Inquiry and Word Count 2015)	The study shows significant variations in the usage of controversial words such as "Chinese virus" and non-controversial words such as "COVID19" and indicates that while the word "Chinese virus" may be viewed as either neutral or derogatory, its use in social media is strongly linked to the latter.	-
7	Mackey et al.	2020	The purpose of this research was to identify and classify user-generated conversations that could be correlated with the research. COVID-19 associated signs, familiarity with access to research, and discussion of disease recovery using an unsupervised machine learning. Approach.	Biterm topic model (BTM)	The research used unsupervised machine learning to describe self-reporting of symptoms, test experience, and COVID-19-related recovery references. Some users reported symptoms that they felt were linked to COVID-19, but were unable to get tested to validate their concerns.	The authors suggest concentrating on developing feature-based supervised machine learning classifiers based on established conversational characteristics reported in this study to identify self-reported COVID-19 symptoms, testing and recovery experiences for future studies.
8	Li et al.	2020	This research focuses on the application of natural language processing (NLP) Techniques for evaluating tweets in terms of	BERT model, Correlation analysis and Emotion trend analysis	The research creates an EmoCT dataset for classifying COVID-19-related tweets into different emotions, and the authors use two approaches to measure keyword correlations to understand why the public may feel sad or afraid.	Future research is to do more in-depth studies to better understand how COVID-19 impacts mental health.

			mental wellbeing			
9	Banda et al.	2020	This work presents a large-scale curated dataset of more than 152 million tweets, that daily in relation to COVID-19 chatter produced at the time of writing from 1 January to 4 April.	Natural language processing (NLP)	The authors concluded that the open dataset would allow researchers to undertake a range of research projects related to emotional and mental responses to social distancing measures, the identification of sources of misinformation and the stratified measurement of pandemic sentiment in almost real time.	-
10	Massaad, & Cherfa	2020	The research is focused on exploring the nature of social media data correlated with Telehealth and public awareness to strategically simplify and speed up the digital health transition	NLP, Generalized linear regression and cluster analysis	The Result identified some words and the states were commonly used in tweets and the study showed a correlation between the number of telehealth-related tweets posted in a given state and the number of Covid-19 reported cases in that particular state	-
11	Guo et al.	2020	The authors present a CORD19STS dataset that contains annotated 13,710 Sentence pairs obtained from the open research dataset COVID-19 (CORD19) challenge to translate their output into a	Sen-SCI-CORD19-BERT language model	The authors suggest CORD19STS, a semantic textual similarity dataset for COVID-19, which addresses the question that previous STS datasets lack in-domain knowledge of the global pandemic outbreak	-

			domain-specific context such as COVID-19.			
12	Karisani & Karisani	2020	The focus is to find out to what extent machine learning models are able to distill data generated by the user.	Naive Bayes, Logistic Regression and Bidirectional Encoder Representations from Transformers (BERT)	Machine learning has been used to automatically identify positive feedback or even to track patients' mental well-being via social media posts may significantly enhance the efforts of the organizations concerned to track the public Health, and timely response.	-
13	Rashed et al.	2020	The authors proposed a toolbox for NLP relating to SARS-CoV-2 and COVID-19.	Natural processing language	NLP toolbox was used to extract information from scientific and news articles or to identify social media posts relating to SARS-CoV-2/ COVID-19.	-

Methodology

Collection of Twitter Data

To study similarities between tweets, we chose Twitter as our target field. Twitter has one of the world's biggest social network platforms and hosts abundant user-generated posts, closely reflecting the public's reactions towards this pandemic with low expectancy. By deploying Natural Language Processing (NLP) methods on tweets, we were able to extract and quantify the similarities between some tweets over time, which means that some people say the same thing about the pandemic while some Twitter users view it differently. The tools we used are Spacy, Networkx, WordCloud, and Re.

Twitter is a platform to post tweets, share feelings with people, and respond to others' tweets. Thus, besides likes/replies/retweets, the content of COVID-19 related tweets was mined to see how similar and meaningful some tweets are: Tweet Value.

Fig 3.1: The few rows of the content of COVID-19 related tweets

Since the first confirmed case of the virus in January 2020, #COVID-19 and other similar tags have been trending on Twitter. With thousands of COVID-19 related tweets collected, we wondered how people on Twitter reacted to such tweets over time. Firstly, we explored some engagement metrics of tweets, such as the number of likes. The figure below shows the average likes/replies/retweets per tweet each day. The tweets included COVID-19 related keyword tweets. The tweets were extracted from a large number of everyday opinions.

We used the Twitter data from an open-source, and it was collected throughout 10-weeks, commencing from January 22, 2020, to April 7, 2020. The tweet was in the English language and other languages and contained six variables: public tweets and WHO tweets. A total of 37,315 tweets were captured within the sample. The study selects WHO tweets because it is one of the leading organizations that advocate for the prevention of the COVID-19 disease, and the public information was selected to balance the opinion of people towards the pandemic.

The data was sufficiently high to conduct meaningful analysis, and because of the non-English words in them, during the study's data-cleaning phase, some tweets that did not contain the Latin alphabets were discarded. A total of 200 tweets was selected from WHO tweets and 600 tweets from public tweets posted in March and April 2020. The time of the tweets extraction was when the virus was assumed to have spread to almost all the continents.

Finally, the final dataset containing 800 tweets was extracted for analysis after cleaning and considering that the dataset was sufficiently high for a meaningful interpretation. The final variables of the data were used for machine learning analysis.

Figure 3.2: The evolution of tweets over time

Experiments and Evaluation

The final dataset of 800 tweets for both WHO and public tweets was qualitatively coded. Figure 1 shows the data preparation process from data preprocessing to data processing. The coding process tests the similarities between tweets and the relevance of a coding framework for Covid-19 tweets. These similarities had already been done in a few papers but on sentiment analysis.

First, spacy NLP analysis tools were used to explore the tweet dataset for part of speech, tokenization, and Lemmatization, as shown in Figure 3.3 below.

Fig 3.3 : Glance at the tweet document and parsed documents

Furthermore, we analyze the similarities in the tweets on a more detailed level, comparing two rows in the tweet data to find similarities. To further clean the dataset, stopwords are removed from the dataset. Stopwords are commonly and frequently used words that search engines or analysis packages are programmed to ignore when searching and retrieving results of a search query. Examples of stopwords include *elsewhere*, *against*, *on*, *and alike* (Geeks for Geeks, 2016).

We conducted further analysis by utilizing the spacy library. Spacy is a free, open-source library for Natural Language Processing in Python. It features NER, Part of Speech (POS) tagging, dependency parsing, word vectors, and many more (Spacy, 2020). Here in this analysis, we used it in combination with NetworkX to form nodes and edges linking similar words together, basically forming a graph. NetworkX library is used for studying graphs and networks.

Here is how it was generated: The first step was to prepare the spacy library dataset to analyze from, where we find similarities between two tweets. However, in similarities between two tweets, sentence embedding is constructed on spacy by averaging the word embeddings and, most importantly, meaningless words such as stopwords in ordinary sentences. We use the Word2Vec model to calculate the sentence similarity in tweets since the tweet sentences are composed of words. We created another column of parsed_doc to parse the tweets to its component parts, as shown in fig 3.3. For the second step, we introduced the NetworkX to form graphs to link similar words, as shown in Fig 4.4.

In the third step, we defined some metrics to help further comprehend the changes in our analysis. We first tokenize the tweets to separate them into smaller units, which is also included in the spacy library. After this separation, we introduced the Word Cloud package to visualize the tweet dataset. Word Cloud library in python is a data visualization technique used for representing text data in which the size of each word indicates how often it appears or its importance in a sentence or list.

Findings

After putting our model results in the timeline under the pandemic context, we summarized some interesting findings.

```

Fig 4.2: Similarity results between public tweets

As shown in the figure above, there is a similarity between the tweet in row 11 and 14. This comparison accounts for 89.57% of the Twitter dataset. Likewise, tweets 14 and 17 with a similarity value of 84.60%, and tweet 13 and 15 give a similarity value of 86.95%. The similarity values are strong and conform to the threshold of > 0.7 (Gerstman, 2008; 2014). However, even though the similarity is high between these tweets because of the messages they carry, it does not necessarily mean it valued the same; that is, the importance allocated to them because of the user's opinion, as shown in figure 4.2. We also checked the likeness between tweets 40 and 61, which gave a similarity value of 68.65%. This similarity value is moderate and conforms to the boundary of 0.7 (Gerstman, 2008; 2014). Their similarity is relatively low compared to the other public tweets' similarities (see Figure 4.1).

```
print(data['parsed_doc'][11].similarity(data['parsed_doc'][124]))
print(data['parsed_doc'][14].similarity(data['parsed_doc'][89]))
print(data['parsed_doc'][13].similarity(data['parsed_doc'][95]))
print(data['parsed_doc'][112].similarity(data['parsed_doc'][61]))
```

```
0.7462380490630407
0.7467730928883817
0.4950193718372327
0.6973556097428223
```

Fig 4.3: Similarity results between public tweets and WHO tweet

Likewise, there are similarities between public and WHO tweets, but not similar to having the tweets from the same source, as seen between public tweets. As indicated in figure 4.3, tweets 14 and 89, tweets 11 and 124, 112, and 61 give a similarity value of 74.62%, 74.68%, and 69.74%. Tweets 13 and 95 shows a similarity value of 49.50%. The first and second values conform to the threshold value > 0.7 while the third and fourth similarity values conform to moderate (see figure 4.1).

Furthermore, we linked similar words together with networkX, as mentioned earlier. To make the graph legible enough, we represented 70 tweets on the networkX graph, and we showed just a part of the graph in the figure below:

Fig 4.4: NetworkX graph showing empty nodes of both Public and WHO tweets selected random

News Topics in Tweets

With the topic modeling, we extracted some hidden topics summary from the tweet, and each topic is considered a collection of keywords in some proportion. Extracting a good quality topic depends on the text used in the analysis. We used Latent Dirichlet Allocation (LDA) from the Gensim package (a very efficient LDA implementation). After

filtering tweets by keywords, suggested by the frequency of some words and the topic trends, we modelled ten topics, as shown in fig 4.4.

Fig 4.6: Topic Modelling graphs for public tweets

The first thing we did was to get the top-30 most salient terms. Saliency is a measure of how much the term tells us about a topic, while Relevance is the weighted average of the word's probability, given the topic normalized by the probability of the topic. The bubble in the inter-topic distance map measures the importance of the topics relative to the data. The larger the bubble, the more critical the topics are. As shown in fig 4.4, specific topics clustered together, indicating a similarity between topics, and the more the topics, the more clusters form and similarities.

The same trend of news topics applies here as tweets mentioning CORONAVIRUS, and some related words to its outbreak spread from China to other parts of the world. As shown in the table and word cloud, the public paid more and more attention to government actions over time. Medical-related, economic impact, and life during COVID topics increased slowly. The game season, mask, and stay at home topics did not show much upward trend over time with the tweet from the period taken.

Table 4.1: Table showing 5 topic model for public tweet

Topic 1	Topic 1 weight	Topic 2	Topic 2 weight	Topic 3	Topic 3 weight	Topic 4	Topic 4 weight	Topic 5	Topic 5 weight
coronavirus	0.059	coronavirus	0.033	coronavirus	0.092	coronavirus	0.055	confirm	0.040
Spread	0.038	outbreak	0.031	cancel	0.044	people	0.035	coronavirus	0.035
stop	0.030	need	0.018	day	0.020	virus	0.022	break	0.032
amp	0.021	medium	0.017	response	0.019	test	0.022	online	0.018
patient	0.020	disinfect	0.013	rate	0.018	think	0.020	report	0.016
learn	0.020	space	0.013	get	0.017	know	0.019	email	0.016

believe	0.020	live	0.013	cut	0.013	tell	0.018	country	0.016
virus	0.019	pay	0.013	healthy	0.013	way	0.016	team	0.016
student	0.016	paycheck	0.013	chart	0.013	health	0.013	news	0.016
flu	0.014	penalty	0.013	credit	0.011	panic	0.012	share	0.013

When visualizing using word clouds, we can see the high importance given to the word CORONAVIRUS so many times as well as some words like a test, flu, people, break, virus, public, china, cases, spread, death, hospital, trump, response, and new cases seems to be some of the most used words in the tweets from January 22, 2020, to April 7, 2020.
