Abstract

Globalization currently affects every person and every sphere of his life. For this reason, we have financial, social, cultural, political, ecological, economic and even globalization, as shown by recent global events related to COVID19, perhaps even globalization of illness. Globalization is not new but is changing fast. Global interaction is centuries old, reflecting a human instinct to find new opportunities, discover new people and places, and exchange ideas and goods. The article deals with the topic of general globalization, combining Economic Globalization, Social Globalization, and Political Globalization. The study was based on data provided by the Swiss Economic Institute. The aim of the article is to familiarize readers with this phenomenon, analysis of the development trend of general globalization and analysis of similarities in development with other countries. The aim of the article is to familiarize readers with the phenomenon of globalization, presentation of the genesis of globalization and detailed characteristics of individual types of globalization. Moreover, the aim of the study is to analyze the development tendency of general globalization and to analyze similarities in development with other countries. The article classifies countries into groups that are most similar to each other in terms of the development of globalization. Grouping was made according to different types of globalization. The aim of the article is to analyze globalization in the context of the intensity of this phenomenon in individual countries.

Keywords: Globalization, Integration, Political Globalization, Wavelets.

Introduction

Globalization is a multidimensional and multifaceted process defined in many ways, which has developed with varying intensity since the end of the 19th century and has gained particular importance in the last decades of the 20th century. Globalization creates both opportunities and threats for its participants. One of the increasing trends in the world for at least a quarter of a century is the progressing socio-economic diversification and cracking the world into two separate blocks - the world of poverty and the world of wealth (see: Cheba, 2015; Hadaś-Dyduch, 2016, 2016a, 2016b, 2016c, 2017, 2019, 2019a, 2019b, 2019c, 2020; Pietrzak & Ziemkiewicz, 2018b, 2019). The social structure is changing (see: Horáková, 2015; Jankiewicz, 2018a, 2018b, 2018c, Jankiewicz & Pietrzak, 2020). The distances between individual market segments and those remaining outside this market are growing. The benefits of economic growth are not evenly distributed. The richest are quickly escaping and at the same time the area of relative poverty of both the unemployed and some of the employed is growing, even in the conditions of favorable macroeconomic indicators and good economic condition of companies (see Dresher, 2006; Goryakin & Yevgeniy, 2015; Potrafke, 2015; Kuc, 2017a, 2017b; Pietrzak et al., 2017b; Hadaś-Dyduch, 2015, 2015a, 2015c, 2018a, 2018b; Kuc-Czarnecka et al., 2020).

Globalization currently affects every person and every sphere of his life. For this reason, we have financial, social, cultural, political, economic globalization, and even as recent world events related to the coronary virus may be disease globalization. The article focuses on general globalization. The study was based on an index constructed by the Swiss Economic Institute. "The Globalization Index is calculated on a yearly basis from 1970. However, not all data are available for all countries and all years. Missing values within a series are imputed using linear interpolation. Missing values at the beginning or the end of a series are substituted by the closest observation available. Specifically, this implies that we carry the last value backward in the case of missing data at the beginning of a series and forward in the case of missing data at the end of a series" (Swiss Economic Institute). The study in this article are based on data from the Swiss Economic Institute.

Phases of Globalization Development

Global interaction is centuries old, reflecting a human instinct to find new opportunities, discover new people and places, and exchange ideas and goods. The core drivers of globalization used to be trade in goods and capital flows. Today, spurred on by rapid technological change, it is increasingly knowledge driven.

According to the European Commission and World Bank, the following events had a key impact on the development of globalization:

- 1914 – Openinig the Panam Canal;
- 1923 – First transcontinental non-sto flight;
- 1944 – Bretton Woods Conference;
- 1947 – General Agreement on Tariffs and Tarde;
- 1950 – First home TV set;
- 1951 – First contalner ship;
- 1961 – First industrial robot used in car manufacturing;
- 1961 – Organization for Economic Cooperation and Development (OECD);
- 1967 – Association of Southeast Asian Nations;
- 1973 – Organization of Arab Petroleum Exporting Countries oil embargo;
- 1974 – First personal computer;
- 1988 – Launch of first fair trade label;
- 1991 – World Wide Web;
- 1992 – First mobile text message sent;
- 1994 – North American Free Trade Association;
- 1995 – World Trade Organization (WTO);
- 1999 – Seattle WTO protests;
- 2000 – Millennial development goals;
- 2001 – China joins the WTO;
- 2006 – Wikileaks Twitter;
- 2007 – First smartphone;
- 2009 – Bitcoin;
- 2015 – First commercial delivery using a drone
- 2015 Sustainable development goals.

The above-mentioned events are often equated with phases of globalization. Globalization is still developing. Because „(…) a more connected world has brought with it new opportunities. People now travel, work, learn and live in different countries. They interact with each other on the web, sharing their ideas, cultures and experiences. Students have online access to courses run by leading universities across the world. Countries can produce more for less by specialising in what they do best and exploiting economies of scale in global markets. International competition, global climate action, scientific cooperation and exchange of ideas have stimulated creativity and accelerated innovation. Companies active in international markets remain competitive because they learn and adapt faster" ((European Commission).

Detailed Empirical Analysis

The empirical analysis is based on the globalization index, which may be composed of various components. The detailed components of the index used in the study are given below.

Components of the Globalization Index

The globalization index is a component of three globalizations: economic globalization, political globalization, social globalization.

The study was based on data provided by the Swiss Economic Institute, then economic globalisation is composed of trade globalisation and financial globalisation, of which each gets a weight of 50 percent. Social globalisation consists of personal contact, information flows and cultural proximity where each contributes one third. Economic, social and political globalisation are aggregated to the Globalisation Index using again equal weights (Gygli et al., 2019; Dresher, 2006).

Economic globalization (see more in: Gygli, Haelg, Potrafke & Sturm, 2016; Potrafke, 2015; Sánchez-López, Aceytuno, & De Paz-Bañez, 2019) characterized as long distance flows of goods, capital and services as well as information and perceptions that accompany market exchanges. Political globalization, characterized by a diffusion of government policies; and social globalization, expressed as the spread of ideas, information, images and people. See information about the European Union, the Visegrad Group, among others, in (Balcerzak, 2015, 2016, 2017, 2020; Balcerzak & Pietrzak, 2017; Cheba & Szopik-Depczyńska, 2017; Dmytrów & Bieszk-Stolorz, 2019; Simionescu et al., 2017; Gavurova et al., 2017; Hadaś-Dyduch et al., 2017). More about in trade in (Hadaś-Dyduch, 2018a, 2018b, 2019a, 2019b)

Classification of general globalization

The classification of globalization can be made in various ways. The globalization index, the components of which are given above, varies from country to country. Research shows that according to data from 2019 from the Swiss Economic Institute, the rate of general globalization is the highest in Switzerland and the lowest in Eritrea. However, due to the lack of data, the survey does not include countries such as: French Polynesia, Greenland, Guam, Korea, Dem. Rep., New Caledonia, Virgin Islands (U.S.).

The calculations show that the general globalization index, defined in the previous chapter for 209, has a maximum value of 91.91 and a minimum value of 31.15.The general globalization index, as defined in the previous chapter, currently assumes (we understand as 2019) a maximum value of 91.91 and a minimum value of 31.15. Depending on the value of this indicator, we can classify countries into eight groups due to the development of general globalization. The first group is the countries with the lowest level of globalization index, they are countries for which the index of general globalization takes the value ⟨30; 40). There were 7 countries in this group. The last group brings together countries with the highest rate of general globalization. The globalization index (GO) for this group is ⟨90; 100). This group includes 3 countries, i.e. Belgium, Netherlands, Switzerland.
Other groups:

- Group II - $GO \in \langle 40;\ 50)$. The group contains 38 countries.
- Group III - $GO \in \langle 50;\ 60)$. The group contains 51 countries.
- Group IV - $GO \in \langle 60;\ 70)$. The group contains 40 countries.
- Group V - $GO \in \langle 70;\ 80)$. The group contains 29 countries.
- Group VI - $GO \in \langle 80;\ 90)$. The group contains 29 countries.

Fig. 1: Classification of countries, by general globalization index.

Classification of countries according to economic globalization

In this section, we will analyze countries according to their development in the context of economic globalization, i.e. we will group them according to the intensity of economic globalization in individual countries. Economic globalization - what is it ?? Eonomic globalization, characterized as long distance flows of goods, capital and services as well as information and perceptions that accompany market exchanges. Economic globalisation is composed of trade globalisation (see more in: Łapinska, 2016; Miłek, 2018; Simionescu et al., 2018; Pietrzak & Jankiewicz 2019; Pietrzak & Łapińska, 2015; Pietrzak & Ziemkiewicz, 2018a;), financial globalisation and capital market development (see more in Meluzín et al., 2017, 2018a, 2018b, 2018c; Pietrzak et al., 2017a; Rollnik-Sadowska & Dąbrowska 2018;

Hadaś-Dyduch et al., 2019; Shkolnyk et al., 2019; Skalická et al., 2019a, 2019b), of which each gets a weight of 50 percent.

According to data from 2019 from the Swiss Economic Institute, the rate of economic globalization is the highest in Singapore and the lowest in Iran, Islamic Rep. Due to the lack of data, the study did not include such countries as: Andorra, Cayman Islands, Cuba, Faeroe Islands, French Polynesia, Greenland, Guam, Korea, Dem. Rep., Liechtenstein, Monaco, New Caledonia, Puerto Rico, San Marino, Virgin Islands (U.S.).

The economic globalization index, defined as above, currently assumes (we understand as 2019) a maximum value of 94 and a minimum value of 23.59. Depending on the value of this indicator, we can classify countries into eight groups due to the development of general globalization. The first group are countries with the lowest level of globalization index, they are countries for which the index of economic globalization (GE) takes the value ⟨20, 30). This group includes: Venezuela, RB; Chad; Bangladesh; Burundi; Comoros; Afghanistan; Ethiopia; Iran, Islamic Rep. The last group in the ranking brings together countries with the highest rate of economic globalization. The globalization index (GE) for this group is ⟨90; 100). This group includes 1 country - Singapore.

Others group:

- Group II - $GP \in \langle 30;\ 40)$. The group contains 21 countries.
- Group III - $GP \in \langle 40;\ 50)$. The group contains 33 countries.
- Group IV - $GP \in \langle 50;\ 60)$. The group contains 33 countries.
- Group V - $GP \in \langle 60;\ 70)$. The group contains 46 countries.

- Group VI - $GP \in \langle 70;\ 80)$. The group contains 24 countries.
- Group VII - $GP \in \langle 80;\ 90)$. The group contains 24 countries.

GROUP 4

GROUP 5

GROUP 6

GROUP 7

GROUP 8

Fig. 2: Classification of countries, according to the index of economic globalization.

It should be noted that the group of countries with the highest rates of both general globalization and economic globalization included such countries as:

- Australia (G0=81,98999786, GE=82,86000061)
- Belgium (G0=90,58999634, GE=88,54000092)
- Czech Republic (G0=85,59999847, GE=84,04000092)
- Denmark (G0=88,26000214, GE=84,45999908)
- Estonia (G0=83,76999664, GE=86,26999664)
- Finland (G0=87,69999695, GE=82,97000122)
- Germany (G0=88,59999847, GE=80,48999786)
- Hungary (G0=84,98000336, GE=82,69000244)
- Ireland (G0=84,47000122, GE=87,97000122)
- Latvia (G0=80,56999969, GE=82,08000183)
- Luxembourg (G0=83,59999847, GE=88,30000305)
- Netherlands (G0=90,70999908, GE=88,66000366)
- Portugal (G0=84,72000122, GE=80,16999817)

- Singapore (G0=83,62000275, GE=94)
- Slovak Republic (G0=83,72000122, GE=83,06999969)
- Sweden (G0=89,93000031, GE=83,34999847)
- Switzerland (G0=91,19000244, GE=86,79000092)
- United Kingdom (G0=89,83999634, GE=81,47000122)

It can be said that the above-mentioned countries are conducting the most globalized economic strategy.

Classification of countries according to political globalization

Political globalization refers to the growth of the worldwide political system, both in size and complexity. That system includes national governments, their governmental and intergovernmental organizations as well as government-independent elements of global civil society such as international non-governmental organizations and social movement organizations. One of the key aspects of the political globalization is the declining importance of the nation-state and the rise of other actors on the political scene. The creation and existence of the United Nations is called one of the classic examples of political globalization (Ougaard, 2004).

Fig. 3: Political Globalisation

According to data from 2019 from the Swiss Economic Institute, the rate of political globalization is the highest in Italy and the lowest in Greenland. The political globalization index, as defined above, currently adopts (we understand as 2019) a maximum value of 98.26 and a minimum value of 2.65. Depending on the value of this indicator, we can classify countries into ten groups due to the development of general globalization. The first group is the countries with the lowest level of political globalization index, the countries for which the index of political globalization takes the value ⟨0;10). This group included 9 countries: Greenland, New Caledonia, Virgin Islands (U.S.), Faeroe Islands, French Polynesia, Aruba, Cayman Islands, Bermuda, West Bank and Gaza.

The last group, i.e. the tenth group, brings together countries with the highest overall globalization rate. The globalization index (GP) for this group is ⟨90; 100). As many as 29 countries were classified in this group, i.e.Czech Republic, Australia, Norway, China, Romania, Korea, Rep., Poland, Argentina, Egypt, Arab Rep., Hungary, Greece, Canada, Turkey, India, Russian Federation, United States, Denmark, Finland, Portugal, Austria, Belgium, Switzerland, Sweden, Netherlands, Spain, United Kingdom, Germany, France, Italy.

Others group:

- **Group II** - $GP \in \langle 10;\ 20)$. The group contains 7 countries.:
  Palau, Puerto Rico, Marshall Islands, Micronesia, Fed. Sts., Macao, China, Kiribati, Andorra.

- **Group III** - $GP \in \langle 20;\ 30)$. The group contains 8 countries:
  St. Kitts and Nevis, Maldives, Sao Tome and Principe, Liechtenstein, Tonga, Monaco, Eritrea, Bhutan.
- **Group IV** - $GP \in \langle 30;\ 40)$. The group contains 20 countries:
  Hong Kong, China, Vanuatu, Solomon Islands, St. Vincent and the Grenadines, Bahamas, The Korea, Dem. Rep., Somalia, San Marino, Grenada, Equatorial, Guinea, Dominica, Samoa, Comoros, Antigua and Barbuda, Timor Leste, Suriname, St. Lucia, Seychelles, Swaziland, Turkmenistan.

- **Group V** - $GP \in \langle 40;\ 50)$. The group contains 11 countries:
  Lesotho, Lao PDR, Belize, Botswana, Barbados, Guyana, Afghanistan, Cape Verde, Haiti, Guinea Bissau, Tajikistan.

- **Group VI** - $GP \in \langle 50;\ 60)$. The group contains 21 countries:
  Brunei Darussalam, Oman, Central African Republic, Angola, Uzbekistan, Bahrain, Fiji, Iraq, Myanmar, Djibouti, Mauritius, Liberia, Papua New Guinea, Trinidad and Tobago, Sierra Leone, Burundi, Gambia, The Syrian Arab Republic, Chad, Sudan, Nicaragua.

- **Group VII** - $GP \in \langle 60;\ 70)$. The group contains 35 countries:
  Cambodia, Montenegro, Malawi, Iceland, Libya, Congo, Rep., Malta, Madagascar, Namibia, Kyrgyz Republic, Mauritania, United Arab Emirates, Albania, Niger, Gabon, Azerbaijan, Togo, Rwanda, Jamaica, Mozambique, Yemen, Rep., Kuwait, Panama, Cyprus, Nepal, Saudi Arabia, Lebanon, Congo, Dem. Rep., Guinea, Singapore, Zimbabwe, Mali, Honduras, Georgia, Qatar.

- **Group VIII** - $GP \in \langle 70;\ 80)$. The group contains 37 countries:
  Mongolia, Armenia, Benin, Luxembourg, Moldova, Zambia, Uganda, Kazakhstan, Macedonia, FYR Venezuela, RB Burkina Faso, Dominican Republic, Bolivia, Cameroon, Cote d'Ivoire, Vietnam, Israel, Costa Rica, Paraguay, Bangladesh, Belarus, El Salvador, Bosnia and Herzegovina, Ireland, Ecuador, Tanzania, New Zealand, Sri Lanka, Ethiopia, Latvia, Guatemala, Brazil, Lithuania, Cuba, Iran, Islamic Rep., Kenya, Colombia.

- **Group IX** - $GP \in \langle 80;\ 90)$. The group contains 25 countries.
  Estonia, Algeria, Ghana, Jordan, Thailand, Uruguay, Philippines, Senegal, Slovenia, Tunisia, Pakistan, Slovak Republic, Malaysia, Croatia, Nigeria, Peru, Bulgaria, Serbia, Morocco, Indonesia, South Africa, Chile, Mexico, Japan, Ukraine.

It should be noted that the group of countries with the highest rates of both political globalization and economic globalization included such countries as:

- Austria (GE = 82,86, GP = 95,96);
- Belgium (GE = 88,54000092, GP =96,27);
- Denmark (GE = 84,45999908, GP =93,77);
- Finland (GE = 82,97000122, GP =93,82);
- Hungary (GE = 82,69000244, GP =91,85);
- Netherlands (GE = 88,66000366, GP =97,33);
- Sweden (GE = 83,34999847, GP =97,26);
- Switzerland (GE = 86,79000092, GP =96,37).

Switzerland is a country in which the indicators of economic, political and general globalization are at a very high level. The index of general globalization and political globalization in Switzerland has been increasing by 0.51% on average annually since 1970, while the index of economic globalization by 0.66% (see more in Hadaś-Dyduch, 206, 2017).

Fig. 4 : Political and economy globalisation in Switzerland.

Fig. 5: The increments political and economy globalization in Switzerland compared to the previous year.

Conclusion

The globalization process is not guided by the so-called public charity, there is no place for selflessness. The tactics of action boils down to a certain exchange, transaction according to the principle of "something for something." Globalization tempts, attracts, makes alluring proposals, and in this way countries voluntarily submit to its tyranny and enslave. However, it is not without its risks and disadvantages. Threats include the creation of one local market, which is characterized by a tendency to harmonize, which may, as a consequence, threaten the national identity and cultural separateness of individual societies. Another threat to globalization is the decline in the role of national governments in favor of large corporations, lack of control over online content, etc. Globalization offers a new faith in achievement, success, progress and matter. However, it has a price.

Five-Dimensional Approach to Complex Wellbeing Evaluation

Frantisek KONECNY

Faculty of Economics, VSB Technical University of Ostrava,
Czech Republic,
Email: KON0214@vsb.cz

Abstract

Current literature offers a large number of studies exploring the link between human resources practices and their influence on organizational outcome. Even though individual and organizational (financial) performance is commonly in the centre of managers attention, new approaches to HRM are on the rise. With a changing understanding of effective HRM, there is also a different perspective on the importance of stakeholders. Especially, implementing HRM practices that have a positive link with wellbeing of employees is a significant step in this multi-stakeholder approach. Although wellbeing is a popular keyword in literature in modern human resources management, evaluation of wellbeing usually differs. In this study, five-dimensional approach to wellbeing evaluation is identified and the results are used to find a difference between the managers and employees' perception of wellbeing in the workplace.

Keywords: Wellbeing, Social Wellbeing, Human Resources Management,

Introduction

With an increasing number of companies incorporating the stakeholder approach, we can see that releasing complex sustainability reports is the new norm for many organizations (Dhaliwal et al., 2012). As a result, specific stakeholder groups are getting more attention due to this approach. It is especially important to note the shift in the managers' approach to human resources. As many organizations nowadays claim their actions sustainable, the approach to the human resources management (HRM) is also often referred to as a sustainable HRM (Aust et al., 2020). Even though this multi-stakeholder approach may be in the centre of decision-making process of HR managers approach to the specific HRM practices may differ. Large number of HRM practices were researched extensively, such as training and development, employment security, selectivity in recruiting, high wages and incentive pay, participation and empowerment to name a few (Kalleberg a Moody, 1994; Guest, 2002; Pfeffer, 2005). Although, many studies are focused on the HRM practices and their organizational outcomes (Jiang, 2012), for example the effect of HRM practices on turnover and productivity (Husselid, 1995), service performance (Liao, 2010) or overall performance (MacDuffie, 1995, Gong et al., 2009), Currently, there is a need for research in the link between specific HRM practices and their effect on societal wellbeing, so that the practising managers could contribute to the upcoming business transformation (Beer et al., 2015).

Disclosing various, mostly qualitative metrics about employees' wellbeing, such as working conditions, work-life balance, overall health, personal and professional development and others important factors are a common part of sustainability reports, mainly due to the employer's recognition of the wellbeing policies benefits (Tehrani et al., 2007). Even though analysing the metrics, their trends and annual changes may be beneficial to the said stakeholder group, there is always a risk of presenting more flattering results of employee's satisfaction and wellbeing, especially due to the nature of sustainability reports (e.g. qualitative nature od data), thus common rhetoric may differ from reality (Keenoy, 1990). To understand difference in the perception of wellbeing from the managers and employee's perspective, five-dimensional approach to the well-being is identified and further used for a survey in the organizational environment.

Defining HRM and wellbeing

Human resources management (HRM) is often used as an "umbrella term" including a wide variety of practices common in the workplace. It is possible to define HRM as a central strategic management task, that is derived from personnel management (Keenoy, 1990). There is not a single set of practices, however, we can use a commonly accepted "two way" approach to the HRM (Boxall and Purcell, 2008; Guest, 2012). Using the common "two way"

Cite this Article as: Frantisek KONECNY "Five-Dimensional Approach to Complex Wellbeing Evaluation" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

approach to human resource management, we can define a "soft" and a "hard" approach. (Milkman, 1997). A significant difference is in the strategic human resources management, which takes employees primarily as a unit from which it is possible to get the most out of or in the second case, when employees are seen as a key element of the organization, which needs to be developed through motivation, communication and personal development. (Pagán-Castaño, 2020). In the case of the "soft" approach, we can describe this option as "mutual benefit", this optimistic approach is based on the assumption that the application of specific human resource management practices that have a positive impact on employee wellbeing also ultimately have positive results for overall performance of the organization. On the other hand, the pessimistic variant of “hard” human resource management uses increased organizational performance by controlling employees over the achievement of individual and organizational goals (Van der Voorde et al., 2012, Dorenbosch, 2009).

Wellbeing is in literature also considered as a broad term, typically described with different models, as wellbeing could be approached from various perspectives. Theories could be divided into three categories; thus, wellbeing consists of hedonic, eudaimonic and social wellbeing (Gallagher a Lopez, 2009).

Firstly, hedonic category reflects subjective experience from person’s daily life. The effect of wellbeing is possible to describe as an experience of high level of pleasant emotions and low levels of negative emotions (Diener, 1984, Gould-Williams, 2003). Secondly, eudaimonic category of wellbeing is formed by the level of autonomy, personal growth, positive relationships, and self-acceptance. This approach makes wellbeing an outcome of person’s individual goals pursuits (Ryan et al., 2006). Lastly, social wellbeing is closely linked to an individual ability to overcome social challenges and live well in a social world (Robitschek and Keyes, 1998). According to Pagán-Castaño et al. (2020) it is also significant to distinguish several categories of wellbeing, as an HRM could have different effects (even contradictory) to selected category of wellbeing with specific practices. Furthermore, there are also recognized three main dimensions: subjective wellbeing and social wellbeing, both reflecting previous model, third dimension considers wellbeing as a physical and mental health issue, which is backed by other scholars (Ramsay et al., 2000).

In this work three basic categories of wellbeing are recognized according to the previously mentioned literature. To evaluate closely specific categories of wellbeing, there are also added two other categories, that in the result reflect five essential elements from Rath (2010). Five-dimensional model of wellbeing include career, social, financial, physical and community wellbeing. This model does not contradict commonly accepted three dimensions, some areas are expanded or divided into more practical categories. These categories reflect HR practices that are usually associated with wellbeing.

To understand how specific HR practices, influence wellbeing, we can look at various studies from HR management. Positive correlation between specific HR practices and overall wellbeing was found in a *competitive salary* (Staw a Bersade, 1993), which is reflected in the financial wellbeing section. Another example is *work-life balance*, that leads also to lower turnover and job satisfaction (McNall et al., 2010). This is also supported by Ramsay et al. (2002), with the relationship between longer work hours and more responsibilities as an important factor in workers satisfaction, and eventually wellbeing Work-life balance is included in the social wellbeing section. There is also a link between wellbeing and *performance appraisal practices*. According to scholars, performance appraisal eventually leads to wellbeing through employees’ better understanding of their needs and goals (Kooji et al., 2013). There is not explicitly a question about specific approach to performance appraisal, there are however included strength/goals/leadership perception in the career wellbeing section in this research. Aforementioned section also implicitly includes aspects of *sustainable careers*, which play an important part in the performance and wellbeing of workers (Tordera et al, 2020). Some HR practices are associated with negative link to wellbeing. Specifically, *job insecurity* could be detrimental to health and wellbeing (De Witte et al., 2015). Employees’ perception of their physical and mental health is included in the physical wellbeing part of the research. Even though community wellbeing lacks comprehensive framework or specific HR practices with proven link to wellbeing, there was some research about community wellbeing from theoretical perspective. Larson et al (2015) created a three-pillars framework, which divide community wellbeing in the social, individual and ecological parts. Although this specific framework was not used in this paper, questionnaire was constructed in a way, that the overall community wellbeing is represented by these parts.

Methodology

Data collection procedure and research sample

Research was conducted in cooperation with a specific company in Czech Republic. Data were collected through structured questionnaire from a 7-man management team and 24 employees. Questionnaire was divided into the five sections reflecting respective wellbeing categories. Questionnaire contained several identification questions,

followed by a set of questions regarding career, social, financial, physical and community wellbeing. To evaluate perception from a manager's and employees' point of view, both groups were scoring chosen statements in all categories on a classic 5-degree likert scale. Collected data were subjected to the analysis in IBM SPSS with application of Mann-Whitney U test. Mann-Whitney U test is a basic statistical nonparametric test, useful with ordinal data and two observations from groups, that are independent of each other. Both conditions were met in this research. Null hypothesis is set as H_0 = distributions of both groups is equal (in this case managers and employees) and alternative hypothesis H_1= distributions are not equal (again groups of managers and employees). Threshold for statistical significance is traditional p-value of 0,5. Several questions did not meet requirements of the test and are not included in the outcomes. This concerns questions with free text answer, which were not used for this part of the research.

Outcomes

To closely analyse a link between managers' and employees' perception of wellbeing in the workplace, this survey covered several aspects of wellbeing. Firstly, career wellbeing (in the Figure 1) consists of questions focusing on daily work life, sense of purpose in work, fulfilment, and work satisfaction. Secondly, social wellbeing (Figure 2) is considered with various equations regarding mostly employees' work/life balance and personal and professional relationships. Financial wellbeing (Figure 3) is reserved for questions regarding employees' financial standard of living. Physical wellbeing (Figure 4) figure answers mostly problems to health issues of responding employees. Lastly, community wellbeing (Figure 5) contains questions about belonging and involvement in the communities and areas, where questioned people live in.

Figures below offers a closer look at the specific questions asked, as well as a median of the answers. Statements were evaluated on a 5-point Likert scale (1 – Strongly disagree, 2 – disagree, 3- Neither agree nor disagree 4 – Agree, 5 – Strongly agree). To statistically confirm significant difference, answers were subjected to statistical Mann-Whitney U test and the P-values of the collected answers are also in the table.

Figure 1 : Career wellbeing

Evaluated statement*	***Median***		***P-value***
	Manager	***Employee***	
Your employees/You are encouraged to use their strength every day.	4	4	,370
Your employees/You have available all the resources the need for their job.	4	3	,651
Your employees/You feel strong leadership presence.	3	3	,498
Your employees/You have an opportunity to learn something new every day.	2	3	,063
Your employees/You are comfortable in their/your everyday life, they/you rarely take things for granted.	4	3	,026**
Your employees/Your everyday work is purposeful.	4	3,5	,092
In the last 12 months, employees'/your work experience was satisfying	3	3	,240
In the last 12 months, employees/you were getting closer to their/your goals	3	3	,116
In the last 30 days, your employees/You have managed to do many things better than ever before.	3	3	,370

**Statements were evaluated on a 5-point Likert scale (1 – Strongly disagree, 2 – disagree, 3- Neither agree nor disagree 4 – Agree, 5 – Strongly agree)*
*** P-value < 0,05*

The results in the Figure 1 indicate agreement on most of the aspects of career wellbeing. Medians for 4 questions in this area are the same value, which shows, that managers are very well informed about employees' strengths, their goals and overall work satisfactions. There was only one case of statistical difference of career wellbeing perception (p-value<0,026) and that was the question about employees' comfort in everyday life, where managers' median of answers resulted in 4 and employees' median with value 3.

Figure 2: Social wellbeing

*Evaluated statement**	*Median*		*P-value*
	Manager	*Employee*	
Your employees/You will always make time for regular trips or vacations with friends and families.	4	3	,041**
Your employees/You have groups (social, work), where they/you belong, where they/you are accepted.	4	4	,725
The relationships in the lives of Your employees/Yours are as strong as they can be.	4	4	,198
There is someone in the life of Your employees/Yours who supports their/your development.	3	4	,104
There is someone in the life of Your employees/Your who always motivates them to be healthy.	3	4	,031**
Every day, my employees are/I am treated with respect.	4	3	,263
Your employees'/Your relationships with their/your wives, partners or closest friends are stronger than ever.	4	3	,006**
Your employees'/Your personal relationships give them/you positive energy for every day.	3	3	,179

**Statements were evaluated on a 5-point Likert scale (1 – Strongly disagree, 2 – disagree, 3- Neither agree nor disagree 4 – Agree, 5 – Strongly agree)*
*** P-value < 0,05*

Social wellbeing (in the Figure 2) is a complex area, as many factors influence wellbeing. These factors could be personal relationships, sense of belonging, respect, and other aspects, used in the survey. Managers and employees disagreed on several occasions. Statistically significant difference was found in a very first case, where managers mostly agreed, that employees' have sufficient time for regular family vacations with median value 4, whereas employees median was only at the value 3, resulted p-value was found to be less than 0,05. Managers also overvalued personal relationships of employees, which resulted in two answers with statistically significant difference in answers (p values 0,31 and 0,06).

Figure 3: Financial wellbeing

*Evaluated statement**	*Median*		*P-value*
	Manager	*Employee*	
Your employees/You have more than enough money to do what they/you want.	3	2	,001**
Compared to the people Your employees/You spend time with, they/you are happy with their standard of living.	4	4	,978
Your employees/You have created a financial reserve that could maintain their/your lifestyle if they leave today	4	3	,001**
I believe that in the future My employees/I will have enough money.	4	3	,000**
Your employees'/Your money are well managed.	3	1,5	,001**
In the last week, your employees/You have been worried about money.	3	3	,893

**Statements were evaluated on a 5-point Likert scale (1 – Strongly disagree, 2 – disagree, 3- Neither agree nor disagree 4 – Agree, 5 – Strongly agree)*
*** P-value < 0,05*

In Figure 3 it is possible to see results of the financial wellbeing answers. Results in the financial wellbeing are the most varied, as the managers responses scored higher than employees, thus disagreement between two groups was found in several responses. Employees mostly did not agree with managers on their reward satisfaction for present and future, especially considering any financial reserves. 4 questions out of 6 in financial wellbeing were significantly different (p-value less than 0,05). This confirms that financial aspect of employee's job is perceived very differently from the managers point of view.

Figure 4: Physical wellbeing

*Evaluated statement**	*Median*		*P-value*
	Manager	*Employee*	
Your employees'/Your physical health is almost perfect.	4	3	,048**
Your employees/You are always satisfied with their/your physical appearance.	3	3	,116
Your employees/You often feel sad or depressed.	2	3	,009**
The doctor would say that Your employees/You do the best for their health.	3	3	,314
Your employees/You have too much stress in their lives.	3	4	,026**
Most days, your employees/You experience a lot of pain (mental or physical, or both).	3	2	,002**
Your employees/You exercise regularly to improve their/your health.	3	3	,685
Your employees/You eat a very healthy diet.	5	3	,022**
In the last week, your employees/You have had a lot of energy every day.	4	3	,263

*Statements were evaluated on a 5-point Likert scale (1 – Strongly disagree, 2 – disagree, 3- Neither agree nor disagree 4 – Agree, 5 – Strongly agree)
** P-value < 0,05

Figure 4 contains results from the survey, specifically results from physical wellbeing section of the questionnaire. Answers median differs in most of the questions in this part. Employees evaluated their physical, mental health and their diet with lower numbers than their managers. Significant difference was found in five cases, which can show, that the perception of physical/mental wellbeing is very different in both groups.

Figure 5 Community wellbeing

Evaluated statement	*Median*		*P-value*
	Manager	*Employee*	
Your employees/You cannot imagine living in a better community or area than the one in which they/you live today.	3	3	,570
The communities or areas where Your employees/You live are the perfect places for them/you.	3	3	,607
The houses or apartments in which Your employees/You live are ideal for them/you and their/your families.	4	4	,431
Your employees/You consider the water and air in the area where your live to be safe.	4	3,5	,533
Your employees/You are proud of their/your community (or the areas where I live).	3	3	,607
In the community (or area where Your employees/You live), they/you always feel safe.	4	3,5	,081
In the last twelve months, your employees/You have received recognition for helping their/your community (the areas where they/you live).	3	3	,685

**Statements were evaluated on a 5-point Likert scale (1 – Strongly disagree, 2 – disagree, 3- Neither agree nor disagree 4 – Agree, 5 – Strongly agree)*
*** P-value < 0,05*

Lastly, we can find community wellbeing results in the Figure 5. From the obtained results, it is possible to state, that no significant difference was found in the perception of community wellbeing from both groups. Employees consider their community and areas where they live as an ideal, safe, and optimal places, where they belong. Median from the answers of managers does not differ in most answers.

Conclusion

To conclude overall wellbeing level from different perspectives, several areas of wellbeing were explored. Career, social, physical, financial and community wellbeing served as a framework for finding answers in specific sections of workers wellbeing. However, the main goal was to find, whether there is a significant difference in the wellbeing perception from the managers' and employees' side. As important as a high level of wellbeing is, reported data about workers wellbeing are subjected to overvaluation by the organization (managers), considering subjective and qualitative information. For exact evaluation in all five categories, managers and employees evaluated given statements on a 5-point Likert scale (1 – Strongly disagree, 2 – disagree, 3- Neither agree nor disagree 4 – Agree, 5 – Strongly agree). Median of the managers and employees answers as well as p-value from the Mann-Whitney U test were used to find a statistical difference in the answers.

Firstly, career wellbeing was analysed, where only 2 of the 8 statements were significantly different in the chosen categories. Furthermore, more than half of the statements in this section resulted in the same median, thus career wellbeing is perceived very similarly (or insignificantly differently) by managers and employees. Social wellbeing proved three statements to be statistically different (p-value<0,05). It is important to note, that the differences were in the statements involving work-life balance (time for after work activities) and personal relationships. Medians for managers in these answers were one point higher than from the employees' answers. Biggest gap in the perception of wellbeing was found in the financial section of wellbeing. From 6 statements, only 2 were perceived in the same way, which is possible to see with the same median of the answers score. Another four answers were significantly different. Thus, financially related statements were very different, and managers overvalued their employee's perception. Physical wellbeing, consisting of mostly health related statements. Employees used lower scores on the scale than managers in statements about their diet, mental and physical discomfort, and overall physical health. Statistical difference was found in 4 of the 9 questions asked. Lastly, community wellbeing was evaluated. In this area, no significant difference in perception was found. This could be due to the fact, that managers are well informed about their employee's areas of living.

Given the structure of the research and the chosen method, it is also necessary to mention certain limitations arising from this article. For a deeper understanding of the relationship between the perception of wellbeing according to its dimensions, it would be appropriate to engage in research with a larger sample of respondents, beneficial would also be cross-industry comparison, or comparison with international focus (e.g. with other regions, other countries). Interesting overview of organizational health, concerning wellbeing offers Cotton and Hart (2003) with focus on organizational outcomes (performance). Furthermore, Hungerford and Cleary (2020) offer deeper understanding of trust in the workplace. This could be also a significant factor in management and employees' different perspective on their wellbeing, however, further research is needed in this area. Lastly, Böckerman et al. (2012) conclude that higher involvement of management is usually positively associated with several aspects of employee wellbeing. This is vital with connection to our research, as managers who are not involved with their employees might not only consider their employees' wellbeing different (higher) but could have direct negative influence on their employees' wellbeing.

Abstract

Fish can be called as an indispensable animal-source of food in human diet, due to the content of essential nutrients, in fish meat, with high bioavailability that are found in limited quantities in the diet. So, the present study aims to characterize the recent state of the art related to the use of phytobiotics in aquaculture and in fish processing industry. This aim targets to draw future research directions in the area of phytobiotics use for improving the profitability of fish-based sectors (fish production and processing). The effects of phytobiotic administration in fish diet during the period of preservation of fish meat freshness, from the moment of its slaughter, throughout the processing cycle, is a promising research direction. It can be also concluded that the idea of using phytobiotics in aquaculture, having the effect of preserving the freshness of fish meat for a longer period of time, is still an innovative scientific element, fully applicable to industrial fish production.

Keywords: Aquaculture, Phytobiotics, Fish Processing.

Background, Purpose and Value of Present Research

Fish and shellfish have been widely accepted as a good source of animal protein and other elements for the maintenance of body healthy. Fish can be called as an indispensable animal-source of food in human diet, due to the content of essential nutrients, in fish meat, with high bioavailability that are found in limited quantities in the diet. These nutrients consist in proteins, essential fats, vitamins and minerals.

Cite this Article as: Alina MOGODAN, Stefan M. PETREA, Ira A. SIMIONOV, Aurelia NICA, Dragos S. CRISTEA and Victor CRISTEA "The Use of Phytobiotics In Aquaculture and In Fish Processing Industry: An Overview" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

In recent years, in order to meet the growing demand for fish for human consumption, the activities have been undertaken to ensure the continuous development of aquaculture worldwide, thus improving the productive performance of aquaculture production systems, while diversifying fish species, bred in a controlled regime. A key part in the activities undertaken in the aquaculture industry is to maximize the production of fish within a relatively short time, which is designed mainly due to the feed administration for fish biomass, such as pelleted feeds, with an appropriate nutritional formula separately for each fish species.

As a result, it becomes necessary to incorporate in fish feed some natural substances with stimulating effect in order to improve the feed conversion efficiency of the food administered to the fish biomass, respectively for optimizing the growth performance indicators and also to improving the immunity. Phytobiotics are represented by a wide range of medicinal plants, aromatic plants from which some component parts can be used, namely seeds, flowers, leaves, stem or root in powder form, or extracts of them can be used, made with the help of solvents organic, containing bioactive compounds.

Therefore, the present study aims to characterize the recent state of the art related to the use of phytobiotics in aquaculture and in fish processing industry. This aim targets to draw future research directions in the area of phytobiotics use for improving the profitability of fish-based sectors (fish production and processing).

The novelty of this study is related to its wide-range analysis which includes both the advantages of using pytobiotics throughout the entire fish traceability chain, from the production sector, to processing sector, with possible future impact on selling and storing conditions, before reaching to the final consumer.

Study Retrieval and Selection Methodology

The information presented in this present research were collected from the scientific literature. Strategies for scientific study retrieval and selection were performed according to a specific methodology (Simionov et al., 2019), targeting therefore to obtain as many as possible information related to phytobiotics research and applications in fish-based industry, while considering especially the studies published in significant key journals, with high visibility and that were not commonly used in other overviews related to present research subject. As limiting factors in the process of scientific paper selection, it can be considered that the extent of searching is determined by the research question and resources available to the research team.

Findings of Present Research

The present paper findings section is structured based on three main advantages identified, after the scientific literature was studied, applicable both for aquaculture (improving fish immunity and contributing to better fish growth performance) and, future more, for fish processing industry.

Improving Immunity

In recirculating aquaculture systems, the requirement to monitor the health of biological material is determined by the intensity degree of the technological process, and the extent to which this may be achieved, in relation with the technical complexity of the system. These production systems usually involve the practice of high stocking densities and the reuse of a percentage, as high as possible, of technological water, aspects that can be considered as the main risk factors for the diseases occurrence.

Because the aquaculture closed systems involve high capital and operating expenses, much more rigorous disease control is needed, compared to open production systems. The most serious diseases that can affect the biomass culture in a closed system are caused by microorganisms (viruses, bacteria, fungi, unicellular organisms) (Cristea et al., 2002). Thus, in order to increase the immunity of the biological material, the administration of some natural substances, with immunostimulatory role, in fish feed, can be a solution.

Whereas the phytobiotics have a lot of immunostimulatory properties, they become extremely used in aquaculture, especially in recirculating aquaculture systems, as they play an important role in diseases prevention, but also in the treatment of certain diseases which can cause the loss of biological material, in a significant percentage. It is well known that once the disease has occurred at the level of a breeding unit, there is a danger that the entire production of fish will be compromised if appropriate measures are not taken to eradicate the pathogens. The

immunostimulatory properties of phytobiotics, which lead to increased resistance to disease by improving non-specific and specific defence mechanisms of the body, respectively the native and adaptive immune system, are mainly due to the bioactive compounds which they contain. On the other hand, bioactive compounds from plants are able to inhibit the generation of reactive oxygen species (ROS) and the formation of the free radicals, which leads to a reduction in oxidative stress in the fish organism. At the same time, it can be appreciated that phytobiotics are a potential source of replacement for allopathic pharmaceuticals, especially antibiotics, which can create dependence and even resistance to certain types of diseases encountered in aquaculture. In contrast to antibiotics, they are biodegradable and their impact on the aquatic environment is minimized (Antache et al., 2014a).

Research has shown that certain phytobiotics such as: *Allium sativum* (Shalaby et al., 2006), *Allium cepa* (Akrami et al., 2015), *Zingiber officinale* (Nya and Austin, 2009), *Camellia sinensis* (Ebrahimi et al., 2017), *Trigonella foenum-graecum* (Bahi et al., 2017), *Mentha piperita* (Adel et al., 2016), *Aloe vera* (Sharif Rohani et al., 2017), *Rosa canina* (Dadras et al., 2016), *Lycium barbarum* (Mo et al., 2016), *Ocimum basilicum* (Mohamad and Abasali, 2010), *Rosmarinus officinalis* (Antache et al., 2014a), *Thymus vulgaris* (Antache et al., 2014b), *Hippophae rhamnoides* (Csep et al., 2010b; Antache et al., 2014a), may improve the immune system of fish (*Oreochomis niloticus*, *Oncorhynchus mykiss*, *Labeo rohita*, *Sparus aurata*, *Paralichthys olivaceus*, *Huso huso*, *Acipenser baeri*, *Acipenser ruthenus*, *Cyprinus carpio*, etc.) by enhancing respiratory activity, phagocytic activity, bacterial activity which leads to increase the lysozyme, myeloperoxidase, immunoglobulins, cytokines. At the same time, after a specific period of phytobiotic administration, there was observed an increase in the resistance of fish to *Aeromonas hydrophyla* (Park and Choi, 2012), a widespread bacterium in aquaculture, as well as other bacteria (*Yersinia ruckeri*, *Vibrio vulnificus*, etc.).

Lee (2013) reported an improvement in the nonspecific immune response (increased respiratory activity, phagocytic activity, lysozyme and myeloperoxidase) in *P. olivaceus* in terms of dietary supplementation with a brown seaweed (*Eklonia cava*), most likely due to very high levels of antioxidants and polyphenols in this algae. At the same time, Park and Choi (2012) registered an increase in respiratory activity at Nile tilapia, phagocytic activity, lysozyme and alternative complement under the conditions of dietary administration of the phytobiotic Viscum album coloratum for 80 days. After this period, the fish were tested for *Aeromonas hydrophila* and in the case of fish in which the diet has been supplemented with phytobiotic was observed a higher survival rate with 42% than the control group.

Improving Growth Performance

Following the use of phytobiotics in aquaculture, there was observed an increase in appetite, stimulation of bile secretions and enzymatic activity. These properties are due to bioactive compounds, namely: polyphenols, flavonoids, alkaloids, polysaccharides and proteoglycans which play a major role in the prevention and control of microbial infections (Antache, 2014c). The table 1 presents main phytobiotics used in aquaculture as growth promoters.

Table 1: Phytobiotics used as growth promoters in aquaculture.

Some researchers, following the administration of phytobiotics in fish feed, have noticed an improvement in technological growth indicators, which was determined by the stimulation of appetite, which led to higher food consumption, followed by an efficient use of it in the body and the stimulation of digestive secretions.

It was found that the replacement of corn meal with black-eyed bean powder (*Vigna unguiculata*), in a percentage of 50% to 100%, led to a higher growth performance in the species *Clarias gariepinus* (Falaye et al., 2012). Also, a significant increase in growth rate and in specific growth rate were obtained at *Huso huso* species in the case of garlic administration in fish feed (Gholipour et al., 2014).

Sweet potato peel extract (*Ipomoea batatas*) administered in a concentration of 15% in fish food led to improved growth performance and better food utilization efficiency in Nile tilapia. The desideratum of the research consists in the fact that the extract from the sweet potato peel can be incorporated in the feed of the Nile tilapia in order to reduce the cost associated with fish production (Omoregie et al., 2009).

A series of studies were made on some phytobiotics such as fenugreek, neem, thyme, sea buckthorn, rosemary, ginger, white onion, black pepper, hot red pepper, basil and Goji berries administrated in Nile tilapia (*Oreochromis niloticus*) diets, while in the case of different sturgeon species, the phytobiotics used included sea buckthorn, thyme and the mix between sea buckthorn and thyme, for testing the synergistic effect (Antache, 2014c). Researches were carried out over a longer period of time, in the order of months, and the results led to an improvement in the technological performance of biomass culture and the fish welfare, especially in the case of sea buckthorn, thyme, ginger, hot red pepper and the mix between sea buckthorn and thyme administration in fish feed (Antache, 2014c).

In terms of welfare status, the authors (Antache, 2014c) identified that almost all variants of phytobiotics lead to a better results of hematological and biochemical indices of the blood, leukocyte reaction, lysozyme - that plays a special role in the body's immune system, cortisol, as well as reducing oxidative stress. Administration of sea buckthorn, thyme, hot red pepper and onion led to a reduction in lipid peroxidation and an increase in total antioxidant capacity in muscle tissue and blood plasma, which resulted in an oxidative stress reduction (Antache, 2014c).

The effect of phytobiotics on fish products and their use as natural additives in fish diet

Phytobiotics generate a wide range of effects such as the antioxidant, antimicrobial, analgesic, antiparasitic, anticoccidial, hepatoprotective and growth stimulating effects.

The antioxidants found in plants, sometimes even in low concentrations, have the role of inhibiting the oxidation process of lipids, which is a real use in order to preserve the freshness of the meat. In medicinal, aromatics plants and fruits, antioxidants are mainly represented by polyphenols and flavonoids, which play a significant role in eradicating free radicals that lead to oxidative stress.

It has been found that the use of natural preservatives leads to increased shelf life of fish, due to the antioxidant and antimicrobial properties of phytobiotics. This is a promising step in improving fish processing technology.

At the same time, consumers of meat products prefer that they contain natural antioxidants in the detriment of synthetic antioxidants, both in order to maintain freshness by reducing lipid peroxidation, and also for more flavour. This view is supported by both researchers and processors.

By comparing the antioxidants extracted from various phytobiotics (especially herbs) used during the meat processing flow, it was mainly observed that the addition of rosemary, thyme, oregano, as well as other spices, led to the inhibition of lipid peroxidation with 60% (Tanabe et al., 2002).

For example, rosemary extract showed a superior antioxidant activity, because it has been shown to reduce the process of lipid oxidation in anchovies stored at 4°C for 28 days (Turhan et al., 2009). At the same time, rosemary extract in 0.4% concentration and 0.8%, respectively, has been shown to be more effective in reduction of bacterial growth and led to obtaining a satisfactory biochemical indicators in the case of Atlantic mackerel burgers, packaged in vacuum and refrigerated (Ucak et al., 2011). In 2014, Gao et al. showed the appearance of the synergistic effect of rosemary extract in combination with nisin (peptide produced by the probiotic *Lactococcus lactis*), in the case of pompano fillet (*Trachinotus ovatus*), during storage at 4°C, by inhibiting protein breakdown, lipid peroxidation, nucleotide destruction and microbial development. The extract of turmeric (*Curcuma longa*) and onion (*Allium cepa*), in 1.5% concentration for each phytobiotic, proved to have an excellent antibacterial property, for a period of 20 days, on rainbow trout (*Oncorhynchus mykiss*) vacuumed and refrigerated (Pezeshk et al., 2011). Selmi and Sadok (2008) observed that the application of thyme (*Thymus vulgaris*), in 0.1% concentration, on tuna meat (*Thunnus thynnus*), which was vacuumed and then stored at 0°C, minimized the lipid peroxidation, proven by a low concentration of malondialdehyde (MDA) and a high concentration of polyunsaturated fatty acids (PUFA), compared to the control variant (tuna meat that was not sprayed with thyme).

On the other hand, fruits, especially berries or those with a darker color, contain a higher concentration of antioxidants, anthocyanins and ascorbic acid, with a role in reducing lipid peroxidation. For example, polyphenols extracted from grapes prevent the oxidation of lipids in the muscles of fish meat. Other researchers have used an extract of orange peel and pomegranate peel in combination with nanoparticles of chitosan in order to prolong the shelf life of silver carp fillets (H. molitrix). However, the mix between pomegranate peel extract and chitosan nanoparticles has been shown to be more effective in delaying of the lipid peroxidation process (Zaeri et al., 2015). Also, it was observed that the silver carp fillets treated with a clove extract and a grape seed extract, inhibit the lipid peroxidation and protein destruction during the refrigeration (Shi et al., 2014). In 2015, Viji et al. presented the positive effect of mint and citrus extracts on slowing down the biochemical and microbiological changes in the case of the Indian mackerel which was been refrigerated.

In recent years, a specific technology was been applied to preserve the freshness of fish meat by introducing plant extracts into the ice layer, which has led to inhibition of microbial development and slowing of lipid peroxidation process of fresh fish meat (Viji and colab., 2017). Also, the addition to ice glaze of an aqueous extract of thyme (*Thymus serpyllum*) extended the storage time of some cyprinids (*Capoeta capoeta*), from 15 to 20 days (Oral et al., 2008).

The use of extract of rosemary (*Rosmarinus officinalis*) in 1% concentration in the ice glaze has contributed to the improvement of chemical and sensorial parameters and extends with 3 days the storage time of sardines, compared to the traditional ice storage methods (Ozyurt et al., 2012). This new strategy has proved to be quite useful for improving the quality of fish meat stored on board fishing vessels for long periods of time during fishing operations.

Another source of natural antioxidants is represented by medicinal plants, due to the catechins found in the leaves. For example, catechins extracted from green tea have as affect the reducing the lipids oxidation at the level of fish meat (Tang et al., 2001). At the same time, it has been shown that the use of green tea powder has slowed down the reduction of lipid oxidation in the case of frozen mackerel (Alghazeer et al., 2008).

The application of plant extracts or a mixture of plant extracts has been shown to extend the validity of foods, including fish and fish products. With their application, there was highlighted a delay in the appearance of lipid oxidation, an inhibition in microbial development and an improvement in textural properties. There are also a number of researches which showing the protective effect against the destruction of proteins and the inhibition of enzymes, where the use of plant extracts in the technology of fish preservation and fish meat.

The results presented above confirm the potential of plant extracts to replace synthetic additives in order to prevent oxidation and deterioration of food quality, especially fish and fish products. Therefore, plant extracts extend the scope of multifunctional natural food ingredients, which serve many useful activities in the fish processing sector.

However, recent research has also shown the importance of phytobiotics administering, in various forms, in the diet of fish cultured in recirculating aquaculture systems, due to immunostimulatory properties, as well as the ability to increase productivity, by improving technological indicators of growth performance, associated with biological material.

Research Limitations and Recommendations for Future Studies

Similar to most studies, the design of the current study is subject to limitations. Thus, this overview does not consider the economic impact of using phytobiotics both on aquaculture and fish processing industry. Therefore, it is recommended for future studies related to this research area to associate the technological performance of using phytobiotics with a cost-effectiveness analysis since both aquaculture and fish processing economic activities targets the profit maximization. Also, solutions for integrating fish with plant biomass production within multi-trophic systems can be considered in order to close the production loop and to improve the economic sustainability of aquaculture.

Conclusions

The effects of phytobiotic administration in fish diet during the period of preservation of fish meat freshness, from the moment of its slaughter, throughout the processing cycle, is a promising research direction. It can be also concluded that the idea of using phytobiotics in aquaculture, having the effect of preserving the freshness of fish meat for a longer period of time, is still an innovative scientific element, fully applicable to industrial fish production, that recommends future investigations.

Abstract

Family-oriented companies are a predominant type of company in the context of the Portuguese private business fabric. At the heart of this business typology, two structural aspects of the life of individuals coexist: work (company) and family, with multiple challenges experienced by those who create, manage and coordinate them: their entrepreneurs. Recent studies reveal that 50% of family businesses do not reach the second generation and only 20% reach the third generation (AEP, 2011). Business succession planning represents one of the main management challenges experienced in this segment of companies. This communication presents a reflection on family entrepreneurship in Portugal, offering a portrait of the family businesses in the North Region of Portugal and focusing on main management challenges, such as business succession and management professionalization. For this purpose, the main results from the research project "Roadmap for Portuguese family businesses" (2016-2018), financed by NORTE 2020 / FEDER will be presented. The aims of this project were to contribute to a better knowledge and institutional visibility of this segment of companies, as well as to assess the impact of companies Northern Region in the local, national and international economy. The data presented is the result of an eclectic methodological design that has combined a quantitative-extensive approach, based on the construction of a database with all family companies formally registered in the North of Portugal and posteriorly the application of an online survey (LimeSurvey platform) to the family entities collected in previous step, in order to better characterise the profiles of family companies, and also a qualitative-intensive approach based on the conduction of a set of 23 in-depth interviews to family managers/ owners, bearing in mind the diversity of this business typology, namely in terms of basic variables such as the sector of activity, size, year of foundation, founder's gender.

Keywords : Portugal, Family Entrepreneurship, Management Challenges, Entrepreneurs.

Introduction

Holding a long-term entrepreneurial vision, entrepreneurs /owners of family businesses make a significant contribution to the GDP and employment, to innovation and the development of local communities. In fact, family businesses (FB) constitute the prevailing corporate form[1], their success and long stability being fundamental both to the economy and to society. Actually, it is estimated that their weight in the national economy (between 70% and 80% of the Small and Medium Enterprises), also including the large quoted companies) positions them in a place of honour as agents in the creation of wealth, employment and territorial and social cohesion. Nevertheless, a significant unawareness of the business configurations of family businesses still persists, although it is consensual to recognise its internal heterogeneity (in terms of dimension, industry sector, seniority, degree of professionalisation, etc.). Similarly, family businesses maintain an emotional bond with the place where they were born, the place where their activity originated, and they tend to contribute to local development, not only directly by creating new job posts, but also through the creation of initiatives dedicated to regional promotion. Due to the influence of their founders' values, the importance of family reputation and concern in maintaining family leadership, family businesses, equally, tend to evince a greater predisposition to social responsibility which is translated in a sense of duty the family has to serve society.

Cite this Article as: Ana Paula MARQUES and Ana Isabel COUTO "Overlaps Between the Family and The Business: Key Insights and Challenges of Family Entrepreneurship in Portugal" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Furthering the knowledge on family businesses appears to be more relevant in the current framework of growing internationalisation of the Portuguese economy and impacts of Revolution 4.0 [Revolução 4.0], particularly digital economy and the dematerialisation of the productive processes. It is mainly specific challenges that are geared towards topics such as: the least attention regarding strategic planning matters; succession and transmission of the founder's legacy, maintaining the entrepreneurial "spirit"; the challenge of professionalisation of the business, maintaining the balance between family, property and business; the difficulties in engaging and maintaining qualified workforce (talent)/ professionalisation of careers. Simultaneously with these challenges, we should equally mention the relative *invisibility* of this corporate typology highlighted in recent literature (Marques, 2018a, Marques, 2018b), either in setting the definition of a family business and resulting operationalisation for the purpose of producing official statistics, (EU, 2009), or in the least attention of the political decision-makers given to the specificities of the family businesses and their social and economic contribution[2]. For all intents and purposes, it is assumed that a family business is that whose control is held by the family, in terms of appointing the management, and it is where some of its members participate and work[3].

In view of the extent and complexity of this topic, the current paper is based on the main results of the research project "Roadmap for Portuguese family businesses" (2016-2018), financed by NORTE 2020 / FEDER – and presents the following structure: firstly, a review of literature will be undertaken, focusing on the key challenges faced by this specific typology of enterprises, with particular emphasis on the challenge related to the importance of business succession planning; secondly, we will describe the methodological design of the research that supports the current paper; thirdly, the section dedicated to the presentation and discussion of outcomes, the adopted alignment will focus on three fundamental topics: 1) brief radiography of the family businesses; 2) key insights and challenges of family entrepreneurship in Portugal: professionalisation and preparation of succession of the family businesses; 3) overlaps between the family and the business - owners' view. The data presented is the result of an eclectic methodological design that has combined a quantitative-extensive approach, based on the construction of a database with all family companies formally registered in the North of Portugal and posteriorly the application of an online survey to the family entities collected in previous step, in order to better characterise the profiles of family companies, and also a qualitative-intensive approach based on the conduction of a set of 23 in-depth interviews to family managers/ owners, bearing in mind the diversity of this business typology, namely in terms of basic variables such as the sector of activity, size, year of foundation, founder's gender.

Literature Review

The entrepreneurial dimension, the risk and daring of the founder at the start and maintenance of the family business, as well as the importance of succession of the family business have been highlighted in the existing literature in the last decades. Several authors focused their analyses on the process of intergenerational succession management, treating it as one of the most challenging and simultaneously most critical stages in the life of a family business (Costa e Rio, 2011; AEP, 2011; Zahar, 2005; Chrisman et al., 2005; Miller, Steier e Le Breton-Miller, 2003). Also according to the European Family Business Barometer (KPMG, 2017), in the next five years we will witness one of the greatest intergenerational power and wealth transfers in this type of companies on a European scale, exposing the family businesses to the challenges of digital economy (KMG, 2017; UE, 2009).

Such transfer of businesses will take place in contexts of greater global competitiveness and in the framework of an accelerated transformation of the processes, products/services towards digital economy. The advances in automation and robotics, the internet of "things" and virtual reality, artificial intelligence and *big data*, among other manifestations, represent a huge challenge for the economy, due to its acceleration, complexity and unpredictability. For Schwab (2018), nothing and nobody will be completely immune to the changes of the increasingly shorter life cycles of constant innovation in the processes and products. The implications for the business organisation, work and the profile of qualifications and skills are countless, making the "digital" become a mobilising resource in the competitive dynamics.

Existing literature emphasises the urgency in the preparation and qualification of the successor (Costa, 2017; Costa e Rio, 2011; Lansberg, 1999; Gersick et al. 1997; Morris, Williams, Nel, 1996; Seymour, 1993) and in the professionalisation of the family businesses by hiring non-family managers and qualifying human resources. Nonetheless, the least preparation or lack of preparation of the successor remains a common feature to the majority of the family businesses, being residual the number of those that prepare for the transfer of leadership/ownership of the business. In turn, while it is the founders' strategic vision, resilience and the capacity to take risks that best characterise the entrepreneurial "spirit", the inability to disconnect from the family business constitutes one of the biggest obstacles to succession (Marques, 2018a; Jayantilal, 2016; Gallo, 1995; Sharma, Chrisman, Pablo, Chua, 2001). In effect, in many situations, succession is not explained as a strategic medium and long-term decision; it is

indefinitely postponed and devalued due to the strong connection between the founder and the business (Bachkaniwala, Wright, Ram, 2001), as well as the resistance to the arrival of non-family members to the company's management/structures of governance. Furthermore, many founders confuse the company's management and control, fearing the non-continuity of the business due to the fact that the executive power is in the hands of non-family professionals.

It is also crucial to understand that the importance assigned to the business by the founder goes beyond mere financial outcomes, comprising intangible aspects like *status*, its image and power. Often they associate it with strategies of transmission of the family *ethos*, its traditions and values, beside the upkeep of the "secret" of the family business and the privileged connection to the surrounding community, among other aspects. Thus, in the path of a family business, and in articulation with its generations, factors such as knowledge, reputation, enterprising "spirit", trust and communication between the family members, but also the process of socialisation, professionalisation and flexibilisation in the management of (new) members of business families, with the commitment and the transparency in the relationships that are established between business and family. These aspects enable the assessment of the "family culture" in the sense of *familiness* (Habbershon, Williams, 1999), through the resources that the family business has available in the interaction with the family as a whole.

Data and Methodology

As previously mentioned, the current paper is based on the main results of the research project "Roadmap for Portuguese family businesses" (2016-2018), financed by NORTE 2020 / FEDER" (NORTE-02-0853-FEDER-000018)[4].

This project pursued a dual strategic goal: (1) to map the family businesses of the North region, either small, medium or large; (2) to assess their impact on the local, national and international economy, taking into account the dynamics of job creation, internationalisation and innovation of investment, on the one hand, and on the other hand, the professionalisation of management and governance of the family businesses. This constitutes a pioneer and innovative study in Portugal since, up to now, we are unfamiliar with similar analyses that have combined the component of the mapping of family businesses in the North region with their characterisation and further development alongside a very robust sample which focuses on this business reality.

In order to improve its operationalisation, this project was developed from a research design crossing different techniques for data collection and data processing[5]. Delimited to the North region Portugal, an (online/ on-site) survey was applied to a database which was previously selected from a systematised collection of businesses that corresponded to the profile of a family business. From a universe of more than 41 thousand businesses included in the database (Roadmapef Database)[6], we proceeded to a sampling plan which was based on the representativeness of the distribution of the family businesses among the eight N.U.T. III that integrated the North region, and on the dimension of the business defined by the number of workers. In order to simplify the collection process, only three groups of businesses were considered according to the number of workers: businesses of smaller dimensions (up to 10 workers), medium-size businesses (from 10 to 49 workers) and larger businesses (50 or more workers). Bearing in mind our study goals, it was possible to ensure the constitution of a sample of 1148 family businesses, which is considered robust in terms of the representativeness of the target-universe, guaranteeing a level of trust of 95%, with a maximum permissible error of 3%.

To administer the survey, platform *LimeSurvey* was used (June and July 2017) and an on-site stage of application of the surveys to the family businesses (October 2017 to February 2018). In a complementary manner with this stage, 23 in-depth interviews were undertaken to entrepreneurs who owned family businesses, ensuring the diverse economic sectors by the North region N.U.T. III, and belonging to different generations. This activity enabled the reconstruction of the "history" and "culture" of the family business, and kinship networks, the trajectories of the founders, the main critical turning points/ readaptation/ transformation of the business, as well as, issues related with the current situation and the challenges for the future.

Findings and Discussion

Portrait of the Portuguese family businesses

The survey which was developed and applied within the scope of the project stemmed from the previous mapping of the family businesses of the North region (*Roadmapef Database)* and enabled the possibility of making a portrait of the North region family businesses as well as the profile of the entrepreneur(s) (cf. Table 1; Figure 1).

Table 1: Main features of participating Portuguese Family Businesses

NUTS III	No.	%
Alto Minho	67	5,8
Cávado	189	16,5
Ave	138	12,0
Área Metropolitana do Porto	543	47,3
Alto Tâmega	21	1,8
Tâmega and Sousa	110	9,6
Douro	53	4,6
Terras de Trás-os-Montes	27	2,4
Total	**1148**	
Enterprise seniority	**No.**	**%**
< 5 years	138	13,6
5 to 19 years	410	40,4
20 to 49 years	398	39,2
50 to 100 years	67	6,5
> 100 years	3	0,3
Total	**1022**	
Legal Form	**No.**	**%**
Limited Company	815	71,0
Sole proprietorship	121	10,5
Public Limited Company	120	10,5
Single-member Limited Company	87	7,6
Other	5	0,4
Total	**1148**	
Firm size (number of workers)	**No.**	**%**
≤ 3 workers	326	28,4%
4 - 9 workers	340	29,6%
10 - 49 workers	327	28,5%
50 - 99 workers	82	7,1%
≥ 100 workers	73	6,4%
Total	**1148**	

Source: Roadmap online survey to Family Businesses (N = 1.148)

Taking into account the findings obtained from the questionnaire by survey applied within the framework of the project, FB (Family Businesses) are overwhelmingly micro businesses (up to 9 workers), located in the N.T.U. III of the Metropolitan Area of Porto – a noticeable trend for the concentration of urbanisation along the coastline -, with a more substantial proportion of female labour in the larger businesses, whose presence is meaningful in the economic sectors of the services, in the manufacturing industry, consultancy activities, accommodation and construction. As far as seniority is concerned, these are FBs with less than 20 years, and it is predictable to see the coexistence, where applicable, of the first and second generations (Marques, 2018c).

The entrepreneur of the FB is mostly male (65%, which contrasts with only 35% of female entrepreneurs/owners of the FB) and only 38% of these hold a university degree. As for women entrepreneurs, even if under-represented, they can offer a higher level of education, and most than half of them (60%) hold a level of schooling which is equal or greater than higher education (degree).

Key insights and challenges of family entrepreneurship in Portugal

The managerial challenges experienced in the context of family businesses are manifold. The traditional demands arising in any family business or entrepreneurial activity, such as – the need for constant innovation to remain in the lead, to deal with competition in the sector of economic activity where they operate, to ensure a good relationship with both with clients and suppliers, to manage their human resources in an efficient way, to invest in prospection and guarantee, on the whole, a healthy financial health of the business – are also followed by, in case of family businesses, specific internal challenges specifically related to its family nature. Among these challenges, the following may be highlighted: inheritance tax, donations, access to funding without loss of control of the business, but also the preparation of succession of the business, namely through the definition of family protocols, the preparation of the successor(s), of the management of potential conflicts, the professionalization of management, among others (Marques e Couto, 2019, 2017).

Business succession planning and key challenges in Family Management

The survey findings revealed that the businesses that declared to have claims to introduce changes in management, namely concerning the succession of leadership, in the short-term, that is, from 3 to 5 years, wished the youngest generation would be part of the management of the business (74%). This positioning contrasts significantly with a change that implied admission of managers that are external to the family, which gathered only 16% of the answers (Fig. 2).

Fig. 2: Main short-term management changes (leadership succession)

Source: Roadmap online survey to Family Businesses (N = 1.148)

Identical findings concerning the maintenance of the family nature of the business, namely in structuring dimensions of its activity, such as the shareholder structure of the business, were equally identified in the *Roadmap* survey question related to projections of change in the shareholder structure (property succession). Regardless of key-variables like seniority or the dimension of the family business, the findings highlight that if changes are to be introduced in property succession, they will involve the transfer of property between family members (65,8%) and not changes that are indicative of an openness (*versus* preservation/ closing) of the family property, such as selling the business (which gathered 19,2% of the answers) or opening it to share capital of non- family members (which, in turn, gathered 13,3% of the answers).

Effectively, the findings of the survey by questionnaire applied to a broad range of family businesses of the North region of Portugal are very significant concerning the preservation of the family essence of this sector of businesses, especially when we address issues like the future of the business and succession prospects, either in terms of leadership, or in terms of property (Marques e Couto, 2019).

In line with these results, we can equally find the very significant positioning of all the businessmen surveyed with regard to the "niche" concerning the search for the successor of the business: 74,3% of the total of the FB business respondents indicated that the search for a successor should take place within the family context (Fig. 3). In other words, the choice of successor is clearly restricted to the family.

On the assumption that the leadership successor may be sought outside the family, opinions subdivide, with subtle differences, between outside the company's staff (10,2%) and inside the company's staff (8,9%).

Fig. 3: Search for the successor of leadership

Source: Roadmap online survey to Family Businesses (N = 1.148)

The accomplished survey by questionnaire also ensured that entrepreneurs of FBs were given a voice, namely concerning the aspects they consider essential for the success of their businesses. (Figure 3). The findings obtained indicate that the factors which are perceived as being the most important are, therefore: (i) preparation and training of the successor prior to the actual start of her/his role (78.1%); (ii) the existence of a strategic programming (medium and long term) (76.1%); (iii) the separation between the family's interests and the business ones (75.1%); (iv) the prevalence of professional criteria in decision-making about property, governance and management of the business (73.1%).

This means that the FB entrepreneurs are worried about the continuity of their companies and trades, in particular from a medium and long-term perspective and that that concern may go through facing the challenges of professionalisation and succession, but always bearing in mind the avoidance of solutions and answers to these challenges, that may imply opening up the business to the exterior, that is, to *non-family solutions*.

This is evidenced when we analyse the least valued success factors by the entrepreneurs of family businesses surveyed, such as: (i) openness of the share capital to non-family members (8.8%); (ii) having external professional managers in the company direction (26.6%) (Fig. 4.).

Overlaps between the family and the business: owners' view

As the number of family members increases and in spite of the fact that more options become available for choosing the successor, there may be a greater number of family members who do not wish to work in the family business, even though they expect to derive benefits from it. Hence, it is vital to establish rules of conduct that define how the family interacts in management through the definition of governance structures with the purpose of promoting its continuity.

Taking this into account, owners' testimonies have stressed the postponement of the succession (Marques e Silva, 2020) accompanied by the naturalisation of the "future" successor mainly in firms from the first generation.

> "No, I didn't [think about succession]! I have two children, and they also like this space very much. Succession will obviously be theirs, it will be theirs, but let's see how it goes in two years' time, let's wait and see!" (E4_1st Generation)

> "For now they [children] are still studying and they are still young, although the eldest already helps us at the weekend. He has been out with us to do some repair work on some machines to help us out. In fact, we wanted to give him a sense of responsibility and teach him how to earn his own money, his pocket money. Getting their own remuneration is also very enticing for them." (E20_1st Generation)

In turn, the fact that social roles are assigned to the different members of the family according to gender illustrates both the persistence of cultural patterns based on sexism, and the rupture of those patterns when we project the transference of the business succession onto the daughter, due to the fact that she has higher academic qualifications and level of professionalisation. Nevertheless, either because they are owners/shareholders, or because they hold managerial positions, family businesses undergo relevant transformations, in particular because they put emphasis on female entrepreneurs, for example in traditional sectors such as metalworking. To take up high-end positions effectively performing duties has been relevant at the level of the 2nd and 3rd generation family companies. The choice of this "female" leadership may be rooted in the fact that the descendants are only women, but it may also happen due to these women's profiles. In addition, it is important to bear in mind that many managers/owners tend to hold academic qualifications which are more suited for specific areas of the business in the Portuguese family businesses under analysis in the current paper.

> "We know for a fact that women have had fewer opportunities than men! That is obvious, but I personally prefer to look at people, in other words, I prefer to know if they are good professionals, whether male or female! If they perform their duty well, his/her opportunities will become available and he/she will have his/her place (…)" (E6_4th Generation)

> "My father said: '- My dear daughter, I was wondering if you would like to work at the factory?' I just stared at him, at the factory? 'The thing is, I don't see your sisters working there! If you don't do it, I can't see any of them adapting to that reality." (E9_5th Generation)

> "It is a very positive experience! Apart from the fact that it's a woman working in the company – and I have had proposals to work outside – I am a member of some associations precisely because I am a woman in the area of business management. Somehow that opens some doors and brings some recognition. It is good to see that people acknowledge you, and also, to see how the company has evolved in just a few years." (E1_2nd Generation)

Lastly, the strategy set up to prepare succession starts in the definition of the formal instruments of power transfer and constitution of the administrative boards, though to a lesser extent in the companies analysed in Portugal. When succession happens, not exempt from conflict, its preparation is decisive, as we can observe from the testimonies below:

> "In 2001, my father and my uncle realised that in order to ensure the continuity of their business they depended on us, we had to be involved, and also the capital and they also depended on the capital invested here. If they sold the business, they would never get the value they wanted, the fair price for them! Thus, they realised that if they donated it to us or gave us the opportunity to continue managing the business, they could have a fixed income, a steady income until the they died. And that's exactly what happened. There were deals, meetings and they realised that we [my sister and I] would be the followers, the next in line. That was the decision, but it was prepared by our father, taking into account our decision. We said that we needed some safeguards, we didn't want to work in the company for 10 or 20 years and at the time of our death we would be fighting each other. Let's define dates, set up when that happens. What safeguards will you give us? (…) There is a document … part of it was donated and another part was the right of usufruct and usufruct could be claimed at any time (…). There was some conflict, as expected, and different opinions. There were moments when it seemed that this would be in vain. We went back and forth, but in the end it worked! I believe that there is merit, in this case, thanks to my father and uncle who accepted, but thanks to us as well for giving them the safeguards they wanted, ensuring they would still be connected, safe!" (E23_3rd Geração)

Final Remarks

The family business is maintained thanks to the founder who holds a unique and privileged position in the creation of the cultural identity which is the basis of the organisation, enforcing his/her values and beliefs. These are formed by his/her own personality and cultural history, and hence they mirror the founder's education, his/her childhood, life experience, family and predecessors. Such education constitutes an illustration of the entrepreneurial dimension, of the founder's willingness to take risks and of his/her boldness at the start and maintenance of the family business, merging reasons such as business opportunity and the need to create self-employment.

Two interrelated critical dimensions arise from this study. The continuity of the companies and businesses, in particular in a medium/long-term perspective, means simultaneously facing the challenges of professionalisation and succession. Besides the investment in competitiveness and professionalised management, the continuity of the FBs tends to be envisaged stemming from solutions which are internal to the family. These have depended on strategies that are based on the postponement and "naturalisation" of succession, on the preparation of the second and third generations with more qualifications, regardless of gender, and only a very limited number of the businesses studied resort to the preparation and formalisation of mechanism of corporate succession in the medium and long-term. In fact, based on the findings of the quantitative and qualitative aspects of this study, family businesses, naturally embodied in their businessmen/leaders, reveal a not very favourable stance to welcoming external members (be it regarding the possibility of participating in the share capital, or in terms of the integration in the company's management), indicating, for that reason, a certain resistance to the *defamiliarisation* of their FBs.

However, we should highlight the importance of reputation and resilience in maintaining family leadership. By guaranteeing an intangible "brand", the family businesses aim to increase the means and tangible resources for the sustainability of its economic activity, becoming competitive in markets which are increasingly globalised. Simultaneously, due to the existing strong bond with the place where they were born, the commitment and territorial cohesion make these economic agents become relevant actors for local development.

End Not

[1] Family businesses are the most ubiquitous form of business organisation in Europe. However, only recently have studies on this topic been developed. So far, most of the existing literature was developed within the North-American context (Botero, De Massias, Nordqvist, 2015).

[2] Despite the urgency in building consensus around what is understood as family business, this issue overcomes the goals of the present article, wherefore we assume here the recommendations of the Group of Experts of the European Union about which characteristics enable the definition of a family business.

[3] Specialised literature on the topic catalogues more than 90 definitions and displays the difficulty of its operability and consequent comparability, not only in national terms but also internationally.

[4] This project, which is financed by Norte 2020 and by F.E.D.E.R. [European Fund of Regional Development), and led by the Centro Interdisciplinar em Ciências Sociais [nterdisciplinary Centre in Social Sciences – Polo Universidade do Minho], in partnership with the Associação Empresarial de Portugal (A.E.P.) [Enterpreneurial Association of Portugal]. This project, which had a two-year duration (2016-2018), involved a wide plan of in-situ activities, from the organisation of a cycle of workshops promoted by the N.U.T.III of the North region, to the dissemination of its main findings on the site www.roadpamef.uminho.pt.

[5] For further development of the methodological procedures adopted see Marques (2018a).

[6] The *Roadmapef* database mapped 41.496 family businesses in the North region. Its construction involved the mobilisation of: (i) the indicator "Family Business" of accredited body; (ii) Contacts from the Associação Empresarial de Portugal (AEP) [Portugal Business Association]; (iii) *Online* survey about family businesses. The *Roadmapef* database presents two kinds of information: fixed information related to the identification of the business; variable information, updated annually (turnover, weight of exports, number of workers, etc.).

Classic Heirs and Premature Heirs. Desired Inheritances Versus Imposed Inheritances. A Motivation Analysis of Family Entrepreneurship in Portugal

Ana Isabel COUTO

School of Economics and Management of the University of Porto (FEP), Institute of Sociology of the University of Porto (IS-UP) [Instituto de Sociologia da Universidade do Porto], Centre for Organisational and Social Studies of P.Porto (CEOS.PP/ISCAP/P.PORTO) [Centro de Estudos Organizacionais e Sociais do P. Porto], Porto, Portugal, aicouto@fep.up.pt; anacouto@iscap.ipp.pt

Abstract

The current paper offers a reflection derived from the results of the qualitative research component in the author's PhD thesis on Small and Medium Enterprises (SME) and entrepreneurial dynamics in Portugal over the last thirty years (Couto, 2013). Relying on a limited, but diverse body of biographical interviews with SME business owners, a typified set of entrepreneurial pathways and contexts was identified. This paper will focus on *tendential entrepreneurship* pathways, also known as family entrepreneurship pathways. Contrary to initial expectations, the motivation analysis on entrepreneurial narratives allowed for the conclusion that the taking on of management roles is not a linear process. One could have assumed that these pathways, believed to follow a (family) trend, would be linear in their progression towards entrepreneur status. However, our interviews analysis allowed for the conclusion that even in trend-like pathways, linearity in transition, motivation and life choice are not necessarily unifying features in these specific entrepreneurship pathways.

Keywords: Small and Medium-Sized Enterprises (Smes), Family Entrepreneurship, Motivation Analysis.

Tendential (or continuity) *entrepreneurship* pathways (Couto, 2013, p.214) revealed a set of shared features: they comprise family business initiatives, among which can be found young business owners (with an average age of 33 years old) whose parents were the owners (and founding members) of the companies they are currently running. In this case, taking on the role of entrepreneur is not related to the initial establishment of the company; these are *heir entrepreneur*s who were given managerial roles at companies founded by their parents.

Contrary to initial expectations, the motivation analysis on entrepreneurial narratives allowed for the conclusion that the taking on of management roles for these subjects is not a linear process. One could have assumed that these pathways, believed to follow a trend, would be linear in their progression towards entrepreneur status. However, our interviews analysis allowed for the conclusion that even in trend-like pathways, linearity in transition, motivation and life choice are not necessarily a unifying feature. In her study on women entrepreneurs, and specifically in the modalities for access to entrepreneurship, Rodrigues emphasises: "obviously, one has to have married a business owner for the external fact of "widowhood" to have an impact on one's life, but we must mention that not every business owner's wife who becomes a widow takes on the management of the family business (1989: 104). The same rationale is applied when considering young entrepreneurs in family SMEs: certainly not all youths whose parents run and own businesses will themselves become entrepreneurs. Therefore, even if social conditions at start may influence certain life choices, there is always a framework of personal choices and concurrent socializing forces which could drive towards options and life choices that, in this light, appear to be divergent.

Some of these entrepreneurs felt the need to explicitly state that their option to become business owners was a deliberate life choice, keeping their distance from the (stereotypical) notion of linear business handover from parents to children. Ricardo Lopes, whose father's fatigue brought about the question of management continuity at Fabricil, is a clear example of this. According to his interview, accepting to manage the company was not a linear or immediate decision; it took careful pondering and discussion with a cousin, who is currently a partner and board member at the same company. This was a joint, well-matured business project in which they were not merely "entrepreneurs through inheritance", but also "entrepreneurs through action".

> *Usually, it's hard for people to believe. They tend to think it's an inheritance. If it involves family, they think it all boils down to inheritance, but it was clearly a life choice. Mostly because before I made some decisions, I had to come to an agreement with other people who were external to the company and couldn't join right*

A Motivation Analysis of Family Entrepreneurship in Portugal" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

away. And, therefore, I only took on the role once I realized that they could join the company and I would have the chance to build a slightly different structure than what was in place… there was a need to align positions. I wouldn't have taken on the company if he [cousin] hadn't joined later… Therefore, if we hadn't come to an agreement, I wouldn't have accepted this role on my own. And therefore, many times it looks like an inheritance, but it really was a life choice. In our portfolio, we already have a few companies of our making, products of our management, so we're not simply «entrepreneurs through inheritance», but already «entrepreneurs through action».” (Ricardo Lopes, 42 years old, Fabricil enterprise)

Our motivation analysis also allowed us to confirm that when it comes to young *heir entrepreneurs*, there is no homogeneity with regards to motivation for entrepreneurship, and two distinct scenarios emerged within this category: on one hand, we could identify *classic heirs* and, on the other, premature *heirs.*

In the first subcategory – *classic heirs* (Couto, 2013, p.243) - we have identified young SME entrepreneurs whose transition to company management was timely secured and planned by their predecessors, i.e., their parents. Moreover, these cases confirm, as other studies on business owners have already shown, a trend for higher levels of formal education in *heirs* when compared to *founding members* (Shaw, 1993 *apud* Lisboa, 2002: 380).

The second subcategory – *premature heirs* (Couto, 2013, p.243) – is characterised by abrupt transitions to company management, motivated by circumstances external to the subject that push him/her towards a decision; the passing of a parent/ the company founder fits these cases. This means that these are not classic examples of a linear management handover from generation to generation, but cases in which the passing down stems from reasons outside the will of the individual. The cases included in this specific subcategory are related to *turning points* - i.e., significant moments of shift or inflection in the subjects' paths whose effects caused their trajectories to be redirected (Strauss and Corbin, 1990; Denzin and Lincoln, 2000; Nico, 2011) -, underlying their decision to take on a management role at the family company.

In André Rocha's case, 25 years old, the passing of his father when he was 11 led him to become company manager at 18. His father had founded a plumbing and piping business in 1985 and his mother managed the company til her son was fit to do so. André Rocha took on the management upon completion of a professional training program (equivalent to full mandatory education) at a vocational school for construction and public works in the North of Portugal. André defined himself as an average graded student who never enjoyed studying. In his interview, he states that he "never wanted to go to college", and that his mother gradually gave him managerial responsibilities. At 18, he became full-time company manager, after turning down a job offer at a major construction firm. Becoming an entrepreneur is suggestive of a sense of purpose, of a concern with preserving the family legacy ("I had that job offer, but I chose to stay. I thought I had to keep my father's company going.").

In João Cardoso's case, the sudden passing of his father when João was 21 forced him to interrupt his course of studies. He was a third year student at the Polytechnic of Porto, seeking a degree in Chemical Engineering, but dropped out to become manager at his father's furniture company. João is the oldest of four children (he has two sisters and a younger brother) and he believes that weighed upon his decision to lead the company. The other three children all finished college degrees and work in the field for which they studied. The company João is currently managing was built upon the company his father established 20 years ago, so as to purposefully avoid additional taxation. Since this is an area of business with strong local engagement, we should mention that João's family has a tradition in the production and trade of wood and derived products, and João's uncle and aunt own a furniture shop. In fact, these relatives were relevant in welcoming João to the business and to his new responsibilities after his father passed. Besides, João won't hesitate to say that even if his father's passing hastened his embracing of business ownership, he had always been attracted by this business activity and had always voiced his wish to work at the family business in the future, since he was influenced by his father and close to the activity and development of the company since early childhood. In this case, even if the inheritance was, to a certain extent, *imposed*, it was simultaneously *desired.* In fact, João could have sold the company after the passing of his father, but chose to carry on with the family business and preserve the family "legacy", as he says. In these cases, the affective and symbolic dimensions are clearly the prevailing motivation in the general framework of motivation to entrepreneurship.

Across all featured cases of family entrepreneurship pathways, we see that these entrepreneurs point to moments in their socialization process as reasons for them to later achieve entrepreneur status. In fact, early socialization with the company, or with the area of business the company belongs to, is clearly and particularly important for these young entrepreneurs in family SMEs. For instance, many of them mentioned going to company premises with their father on school holidays; others stated that family meal time was the moment when several company issues were discussed, etc. In other words, entrepreneurial predispositions and skills, which Guerreiro has written about (1996), were, in these cases, taught from an early age and, moreover, permanently activated and renewed within the family milieu.

Vasco Veloso's case is that which better illustrates the *classic heir* subcategory, since the family company is part of his personal and professional path as a *desired inheritance* (*versus* an *imposed inheritance*, as is the case with *premature heirs*). Becoming a business owner derived from Vasco's explicit wish to preserve his father's company. The handover was previously planned and he took on management responsibilities at 24. Nevertheless, Vasco, who majored in Economics at the School of Economics and Management of the University of Porto and also holds a degree in gemmology, does state that he would have liked his first work experience to have been outside the family business, but that wasn't feasible ("My sister is the youngest and my father could use a hand, he was already getting old… and I had to come along.")

The family tradition in the jewellery business was conducive to a favourable history and development of the company ("Boavista was established in 1984… My family history in the jewellery trade goes back to the mid 19th century. My father is the fourth generation to work in this trade. So, it's deeply rooted within the family."). According to Lisboa, Portuguese business structures have a fundamental difficulty at generating what he calls "industry dynasties", that is, according to the author, established companies cannot last for over three decades, a time frame which doesn't favour the emergence of dynasties (2002:540). In the overall set of researched companies, those currently run by Vasco Veloso, established in 1985, and Ricardo Lopes, established in 1965, are among the oldest and more firmly rooted. In light of what was previously said, they constitute an exception, not the rule.

In the case of Vasco Veloso, family tradition in the jewellery sector is not the single factor explaining the company's successful development: the growing involvement of family members also plays a part.

> *"Well, in recent years we grew a lot. Initially, if there was growth, it was solely due to my parents, then they came for me, meanwhile I went for my sister (laughs). Later, I managed to bring my wife along, but we can no longer handle this. If we want to keep growing, we have to delegate."* (Vasco Veloso, 34, Boavista)

The role of the family is, therefore, crucial (beyond the moment of foundation of the company) in terms of the actual, objective participation of several family members (parents, sister, uncle and wife) in the business activity. According to this entrepreneur, the fact that they have different academic backgrounds allows family members to run different departments within the company ("My father and my mother are the managers. I am director-general. My wife is in charge of marketing, my uncle is the administrative and financial supervisor, and my sister, who's a trained architect, is in charge of the company's visual identity, and she's the creative one, she's in charge of all things creative!"). Indeed, the analysis on Vasco' social and professional trajectory, as well as on the structure and organisational model of the company he's running, suggests a strong interlacing of entrepreneurship and family bonds.

If the cases included in this pathway are taken as reference, we may indeed conclude that family, in the various roles it plays, becomes the most relevant factor, in a pool of explanatory factors, for a positive experience of entrepreneurship.

The relevance of the family in building entrepreneurship pathways may be considered bearing in mind two distinct moments: (i) the initial foundation of the company and (ii) its later development. Previous researches has shown that the family may have an influence upon the conditions involved in the establishment of a company, but also upon its growth capacity and survival (Rodrigues, 1989, 1991; Guerreiro, 1996), giving emphasis on different *types of inheritance* and asset handover: " (…) one may not inherit a company, but instead inherit the capital required to start a company and seek initial funding, as well as "name" and "reputation" when facing a market of clients and suppliers" (Rodrigues, 1989: 74). These more subjective dimensions of inheritance were, in fact, mentioned by the SME entrepreneurs included in these pathways, when asked about the major beneficial factors not to the founding of a company – all of the cases are representative of 2nd generation entrepreneurs who were not involved in the original company foundation –, but to the lived experience of entrepreneurship.

In our research, *tendential entrepreneurship* pathways are, therefore, characterised by a set of cases which are revealing of *inheritances* at various levels, that is, not only objective *inheritances* with a material element (such as the economic asset itself, i.e., the company), but also other more subjective *inheritances* with an immaterial element (such as entrepreneur predispositions and skills taught at an early age, the "good name" and sound reputation of the company in the eyes of banking partners, clients or suppliers, etc.), which, as we have shown, have a definitive influence upon the former.

Abstract

A country's digital transformation agenda should combine a robust strategy and bespoke adoption and implementation of information technology processes. The digital transformative process requires wholehearted embrace and a change mindset from both private and public entities across all sectors, such as the manufacturing, finance, transport and service industries, to healthcare, and even education. Several factors classified into technical and human factors may affect the success or failure of implementing a digital transformative agenda. The human elements, which are deemed most important include user experience, user awareness and trustworthiness, whereas the technological factors comprise the functionality and security of the systems, applications or devices. This research-in-progress explores Saudi Arabia's path to digital transformation as a key strategy towards achieving its Vision 2030 agenda. It will narrow down the digital transformation journey within the higher education sector and specifically the universities. It will seek to show the current status of this digital transformation in universities, highlight strengths and weaknesses of the implementation process and provide recommendations that can be adopted to successfully achieve digital transformation.

Keywords: Digital Transformation, University, Digitalization, Higher Education and Change and Adaptation.

Introduction

The core functions and key operations of educational institutions is to restore, maintain and advance education in a country [1]. To sustain this, such institutions need to continually deploy innovative changes, from modes of imparting learning, to examination processes, and even management style. Indeed, like the business world, the application of novel changes is an inevitable process, especially on educational systems, which are constantly experiencing dynamic teaching and learning demands, both internally and externally [1]. Incidentally, the demand for these changes has coincided with a period of rapid digital information explosion, technological discoveries, and disruptive innovations, which Big Data, Internet of Things (IoT), and Artificial Intelligence (AI) [1]. Thus, the education sector has no option but to smartly harness these disruptive technologies, coupled with the internet platform to innovate, reconstruct and successfully transform, digitally.

The process of digital transformation requires a complex strategy that not only incorporates information technology processes, but also the human aspect and their interactions with the systems [2]. It therefore requires an understanding of the bespoke organizational needs, entire processes involved, the steps to take and the full cooperation of all stakeholders [3]. Otherwise, the digital transformation process will face challenges and obstacles [4]. For instance, a myriad of organizations simply automates their existing services and label this a digital transformation – such as moving from handwritten purchase orders to computer-generated ones. In the education sector, some institutions simply shift their educational modules from the traditional classroom offerings to online and assume this is a digital transformation. However, digitization and digital transformation encompasses a wider focus and a multitude of strategies. This is what separates organizations that are merely "doing digital" and those deemed to be "digital innovators". The latter not only understand their specific holistic needs but are also able to exploit the vast technological innovations to create a competitive advantage in the marketplace [5].

Effecting innovative change to the education system can be a daunting task. For example, at the higher education level, precisely the universities, the execution of innovative change to overhaul existing systems is a challenging endeavor due to the complex organizational structures, levels, functions and operations in place [1]. Furthermore, such institutions, whether public or private have already established their unique institutional culture that combines human and technical complexities. This makes resistance to change highly probable [3]. Consequently, researchers, such as Alharbi [4], have shown that innovative change is likely to incur financial loses in wasted resources and budget allocations if the proposed change is not fully embraced and implemented. Alharbi [4], further notes that one of the reasons for resistance to change is the lack of effective evaluation of the workforce needs in relation to the change strategy. In essence, there is a mismatch between these two critical elements. From the high education perspective, this would require a synergy between the management, the teaching staff and the students. Alharbi [4] also notes that the technical aspects in a system are the easiest to modify in contrast to human factors. In some cases, the developers and systems analysts tend to minimize or overlook human factors and instead prioritize the technical dimensions of the organization. This may lead to a misalignment of the change strategy and management resulting in implementation challenges and hurdles and eventually missing the objectives and goals of the organizational change [5].

From a country perspective, a government researches, designs, implements and maintains systems across all that are not only effective, sustainable, fulfills the needs of its people, but also justify the costs it incurs. However, in instances where these irreducible minimums are not achieved, there is need for revising and modifying the system. The system life cycle principle posits that when the national economy system undergoes a stagnating and strenuous period, it needs to be upgraded. Saudi Arabia is currently facing this critical phase, where a myriad of multi-sectorial pressures (both internally and externally) are being exerted to its national economic system. For instance, the ongoing geopolitical upheavals, coupled with volatility in global oil prices has had colossal socio-economic and financial strains and stresses to the country's economic system [6]. This has had a knock-on effect on its organizational mechanism across other sectors, including education. Hence, the need for restructuring these mechanisms and services, particularly in the education sector. One way of doing this is via digital transformation.

Digital transformation represents a path of strategic planning culminating in organizational change [1]. It commences with empowering the change team with new techniques and methods that assure a highly responsive and bold culture towards novel strategic innovation. This is augmented by having the right leadership driving this change transformation into a high-performing innovative organization. Principally, an appropriate team of technologists and marketers should assist the leadership in delivering this agenda [2]. The term "Digital" is synonymous with transformative change taking place in today's world and induced by rapid adoption of disruptive technology [2]. Organizations still utilizing traditional modes of operations and functioning are increasingly under pressure as the world transforms into a digital era. For those organizations that have seized this opportunity and adopted the digital transformation, they have created sustainable competitive advantages that have spurred their growth and buttressed them as leaders in their respective fields.

Currently, the government of Saudi Arabia is taking the huge responsibility, in terms of human and financial resources, of designing, building and implementing a national model for the digital transformation of its institutions across all sectors [7]. Within the higher education sector, this is being championed by both public and private universities with the latter being nominal in comparison to the former. All these efforts are under the government's umbrella initiative entitled Vision 2030 – a national transformative master plan. Its impetus is the expansion and easing of the nation's operations and peripheral functions to encompass the private sector, thus lessen public sector dependencies and related pressures in service provision [6]. Moreover, the amendments seek to eradicate the current hurdles, flaws and bottlenecks in the system [7]. Ultimately, the new structure envisions a more service-oriented and dynamic culture in the provision of quality services.

The goal of this research-in-progress is to show the major challenges and hurdles that the universities could face in their path to successfully actualizing the digital transformation plan and in relation to their readiness for change as per the Vision 2030's national education plan.

Literature Review

Change Definition

According to Wittenstein [8] change is defined as a transformative process of revamping from the present state to a more coveted one. Similarly, Lewin [3] states that, "Change and constancy are relative concepts; group life is never without change, merely differences in the amount and type of change exist" [p. 5]. Thus, the concept of change and

adaptability to it have been identified as the most critical factors in the realms of research and policy formulation across various sectors, including education systems.

But, notwithstanding the advances in the education sector, there are still significant impediments related to the adaptability and acceptance of change, particularly in this sector where digital transformation is still at its formative stages. Repetto [9], attributes these hurdles to a lack of understanding (by individuals affected by the change) and poor execution (by the drivers of change) of the desired modes of innovation and adaptation. From a research perspective, studies done by Biersbroek et al. [10], Preston et al. [11], Alshehri and Drew [12], Cartelli et al., [13], and Kreutzer et al. [14] have suggested there are various factors that may either lead to success or failure of administrative and governance system in their quest for executing change. These can be determined via scrutinizing the adaptive competence, appraising the ramifications, and pinpointing plausible options for both knowledge on the desired change and the acclimatization process to this change [10]-[14]. In addition, these studies [10]-[14], have also shown that there are limitations in the frameworks used to systematically examine the degree for change readiness and adaptability among educational organizations.

The Technological Change Worldwide and in Saudi Arabia

The widespread, multi-sectorial application and adoption of information and communication technologies (ICTs), has revolutionized and influenced all spheres of our lives [15]. The rapid development, deployment and uptake of ICT technologies and innovations is increasingly drawing the global community into a fully-digital era [2]. For example, the internet has completely transformed how people interact, work and communicate. Technological applications, such as web-based and mobile apps, and smart devices, including smart phones, tablets, smart gadgets, among others, are making the execution of daily tasks easier and allow people to stay connected irrespective of physical or geographical barriers [2]. Most of these smart devices are progressively being ingrained into daily routine to the point of people hardly functioning without them. Some these inevitable traditional routines include: the use of online maps for navigation, the use of instant message and e-mail delivery for communication, and the use of the internet for searching, watching content and browsing social media pages [15]. The newer applications include the use of IoT devices to remotely control energy consumption in smart homes, hail a taxi, engage in e-commerce from the comfort of one's home, and conveniently and securely perform cashless financial transactions. These illustrations are indeed the hallmarks of a digital society and the growing influence digitization is having on global populace [2].

Accordingly, countries round the world, including Saudi Arabia (KSA) are recognizing that embracing digitization creates an excellent opportunity for driving socio-economic progression leading to improved and quality living among its citizens [6]. Similarly, KSA is banking on the usage of ICT and digitization to stimulate the implementation plans and programs as per the Vision 2030 blueprint. The digitization process also aims at boosting national security, hasten the practice of good governance, and stimulate economic and social progression [5]. To attain and sustain full digitization in any given economy, change is inevitable [5].

Nonetheless, introducing change and maintaining innovation in an economy could face hurdles and implementation issues, especially in today's operational environments that comprise complex structures, functions and operations [16]. According to Alharbi [16], bringing about this change both in a public or private entity, small or large, can be quite a challenging prospect to the management authorities. This is attributed to the intertwined complexities of technical and human aspects [16]. In some instances, the innovation or change plans fail to achieve the desired objectives and consequently lead to wastage of invested resources. One of the major cause is inadequate examination and understanding of the intended changes in relation to the needs and effects on both human and non-human factors [17]. The human factors are more challenging compared to the technical elements in any given system [16]. This has seen implementers of change systems, such as system analysts and developers underrate or out rightly ignore human factors when planning for change. Instead, the mostly concentrate on the feasibility of the technical dimensions on the change system. Basically, this results in a misalignment of the desired change and the actual implementation processes, leading to controversies and execution issues and eventually failure in attaining the desired goals and objectives [17].

In relation to human factors, Alotaibi et al. [18] identifies user experience, user awareness and trustworthiness as the key components that can impede the successful adoption or implementation of digital technologies. According to Newman [19], trust is a vital component that influences users' enthusiasm in accepting new technology. Also, there exists a substantial correlation between trust and the adoption of a new technology [12]. Besides, there is also a compelling positive correlation between an individuals' acceptation to use new technologies and trust [12]. Hence, trust is a critical cog in the wheels of social and economic communications and interactions. Lack of trust hinders the introduction and embrace of new technologies is a substantial barrier and challenges for the introduction of new technologies [19]. For example, Alotaibi et al. [18], recommends that for any government to motivate and encourage

its citizenry to uptake online services, it needs to build mutual trust first. This can be realized by the government concentrating first on fulfilling positive short-term outcomes, which progressively builds users' trust towards fully implementation of the plan, upon accomplishing full trust [12].

User experience defines individual involvement or exposure to a specific device, application or system, which leads to the acquisition of cumulative skills and understanding of the system, device or application [13]. User experience plays a compelling role in an individuals' acceptance and continued use of the new technology, especially if it is beneficial [18]. The real successful achievement of a new technology is its continuous usage, rather than just its initial or temporary use. Temporary or low level application of these new technologies can delay the deployment and acceptance of these initiatives, including government-led ones [14]. In situations where a country has a high rate of user experience acceptance, the uptake of new technology is also high. Alshehri and Drew [12], note that in such cases, the users are very comfortable in quickly accepting and adopting new information systems, particularly if they acquire sufficient knowledge on how to utilize the new technology.

Finally, a lack of awareness is yet another element hindering the uptake of new technologies [13]. The government in conjunction with private and academic institutions should focus on creating awareness on the execution of new technology as means of motivating and encouraging public adoption [12]. User awareness is indeed significant when introducing new technologies, systems or devices to any user environment. Alotaibi et al. [18], note that user awareness is considered a key factor in introducing new information systems in developing nations, such as KSA. Thus, the promotion of awareness programs via training and targeting top management in organizations and government agencies should be promoted. Once these top-tier stakeholders have grasped the crux of the new technology, they can then positively influence the rest of the employees' attitudes towards technology adoption [14].

Cyber Attack

Technical factors, although ostensibly minimal in affecting the implementation of digital transformation, is still a big concern for any country [4]. Bell [20], points out that one of the notable technical factors responsible for slowing down or delaying KSA's rate of digital transformation is cyber insecurities or cyberattacks. In fact, Bell [20], opines that the occurrence of cybercrimes in KSA will probably double in the next two years and will result financial costs with 2020 projected at about $ billion. Saudi Arabia's attractive market and fast-growing economy makes it a key target for cyber criminals. This is coupled with the proliferation of financially wealthy individuals making cybercriminals' engagement in the vice quite lucrative [20]. Unfortunately, the country also lacks requisite technical capabilities and supportive legal legislation and laws to effectively combat cybercrime. Likewise, there is also poor awareness among it citizenry on matters related to IT security and safe internet use [21]. Lastly, the country is an emerging economy and still at its formative stages in digitization matters in comparison to more established global economies such as Japan or the United Kingdom [22]. Concisely, cyberattacks and cybercrime create dire consequences, which extensively negate the country's economic gains and operations across all sectors – both in private and government.

While the rates of cybercrime and cyberattacks are growing exponentially worldwide, Bell [20], indicates that KSA is one of the countries with the highest growing rates of these attacks. For instance, in 2017, Bell [20], reports that the country experienced a 35% surge in cyberattack cases from 2016. This has resulted in the country incurring higher costs (approximately 6-8%) compared to its neighbors in the Middle East [20]. Surprisingly, such cyber insecurity events are yet to trigger organizations (both public and private) in enhancing their investments in appropriate cybersecurity frameworks, both in terms of technology and personnel. Bell [20], indicates that in KSA average investment by organizations on cybersecurity capabilities, training and awareness is nearly 60% lower in comparison with the financial outlay undertaken by similar entities in developed nations. Such scenarios (high rate of cyber-attacks), compel the normal technology user in KSA to deem it unsafe to use, especially if it concerns new technology adoption. The notion and fear of sharing personal information via internet platforms and digital devices has seen seemingly innovative services, such as cashless financial systems, have a slow uptake the general user in KSA. This implies that security of devices, data and information forms an essential component that greatly persuades the adoption of new technology [18].

Digital Transformation and Vision 2030

Saudi Arabia's government has identified digital transformation the key driver for realizing their Vision 2030 agenda [23]. This has seen organizations and institutions, both public and private revolutionize their internal management processes, procedures and cultural practices to align themselves with the vision program [7]. Therefore, it is imperative that all businesses operating in the country embrace digital transformation or lose their competitive advantages and eventually risk exiting the Saudi market. Al-Helayyil et al. [24], notes that the rise of the digital

economy has triggered new business models and companies that are disrupting the traditional or conventional models and creating totally new niche markets. A vivid example is the transformation of digital photography that saw the fall of household names such as Kodak; e-commerce where online companies such as Amazon and E-bay have overtaken brick-and-mortal firms such as Walmart in consumer retail; taxi hailing, where companies such as Uber have deployed apps and grabbed a substantial market share from established taxi companies without owning a single taxi; YouTube, Netflix and iTunes have totally altered the film and music industry; and finally TripAdvisor and Airbnb have completely revolutionized the tourism, travel and hospitality industry globally [15]. The entry of such global disruptive companies, who have embraced digital transformation, into the Middle East market has threatened the existence of traditional companies in the region [4].

Nonetheless, all is not lost as long as these companies have a change in organizational readiness and ensure their personnel is willing to accept change and the digital transformation [16]. Vandeweerd et al. [17], caution that the continued operation of closed systems among companies that shun changes will not operate effectively in the current digital world, rather they should be flexible and adopt an open system. In addition, for companies to embrace this readiness for digital transformation, the stakeholders need to create awareness, motivate their personnel, and provide education through employee promotions, regular training, and offering financial incentives [17]. Nowadays employees perceive most organizations as learning and career growth institutions that play a crucial role in readiness for transformative change.

In 2016, Saudi Arabia launched its Vision 2030 agenda as a path for transformative and revolutionary change geared towards a post-oil economic era [7]. The aspirations of this initiative are to expand Saudi Arabia's sources of economic income and transform its economy. It is a comprehensive project that encompasses all sectors of the country's economic structure [24]. In June 2016, the cabinet ratified the NTP as the interim project geared towards achieving the outlined objective of Vision 2030 [7]. To ensure the eventual actualization of Vision 2030 and the fulfillment of all goals set, the Saudi has outlined the following objectives: a cutback in public spending via the exertion of more effective and efficient utilization of public resources; enhancement of the nation's World Economic Forum's yearly ranking on Global Competitive Index, (from the current position (25) to within top ten) by 2030; the reduction of the unemployment rate from 11.7% to 7 % by 2030 through the creation of more and better job opportunities for the citizenry; and expand the country's sources of economic revenue and income through digitization of the economy, creation of an attractive and competitive economic environment for foreign and local investors and privatization of most of its state-owned corporations, hence reduce the country's reliance on oil [24]. All these is founded on the successive implementation of the country's digital transformation and a core strategic approach to accomplishing the Vision 2030 goals [23].

Research Question

1. What is the status of digital transformation in Saudi Arabia's educational institutions in general and the Universities in specific?
2. What areas do they need to concentrate on to successfully achieve the digital transformation goals?

Aims and Objectives

General Objective

To identify the major challenges and hurdles that the universities could face in successfully implementing the digital transformation plan and in relation to their readiness for change as outlined in the Vision 2030's national education plan.

Specific Objectives

1. To show a concise picture of the current state of digitization in Saudi Arabia's universities.
2. To identify areas where both government and private universities need to focus on to adopt and successfully actualize the digital transformation
3. To identify the weaknesses and strengths of KSA educational institutions' preparedness for digital transformation.

Methodology

The proposed methodological approach for this research study is the qualitative case study. Creswell [25], explains this methodology as "the study if an issue explored through one or more cases within a bounded system (i.e. a setting,

a context)" [p. 73]. The researcher will employ the method to scrutinize various cases and adduce exhaustive descriptions. Furthermore, the researcher will employ interviews inform of questionnaires, as the preferred data collection mode, to accomplish the objectives of the study and answer the research question. This will entail the researcher distributing the research questionnaire to 50 employees derived from both government and private universities' IT departments located in Jeddah, Riyadh and Makkah. The questionnaire will comprise two major sections. The first section, the researcher will seek to capture the participants' level of understanding of the principles of digital transformation and its related concepts. In the second section, the researcher will pose relevant questions aimed at accomplishing the objectives of the study. The researcher will employ multiple choice questions that will include the following options: strongly agree, agree, disagree, and strongly disagree.

Moreover, the researcher will collect additional data by interviewing 10 IT experts from two Saudi Universities to validate information gathered via the questionnaires. The researcher will use semi-structured questions to gather this information from the IT experts. The researcher will select these experts based on their understanding and mandate for implementing the universities' vision in and in tandem with Saudi Arabia's vision 2030. In terms of data coding, the researcher will adopt a deductive approach. For data analysis, the researcher will utilize the qualitative technique, which will incorporate case narrations, identify thematic areas in the cases and even examine possible cross-case themes. This analytical approach ensures that the researcher will have practical, exhaustive experience with a rich array of data collection techniques that are not only flexible to use, but also provide for adaptation to the case problem and scenario.

Conclusion

Concisely, digital transformation is a comprehensive process that combines ICT processes, such as disruptive technology including Big Data, IoT and AI and a robust strategy. Any entity, be it an organization or country and within the public or private sectors needs to consider both technical and human factors in effecting its digital transformation. The technical factors include the functionality and security elements of the change system, while the human factors entail user experience, awareness and trustworthiness. Any mismatch between the transformative agenda and addressing of user needs may result in failure. Additionally, digital transformation represents a change in the organizational processes and operations, which may be resisted by the targeted adopters based on the human and technological factors outline earlier. This poses a significant challenge to organizations and must devise ways to overcome them. Ideally, an organization or government needs to match its needs for digital transformation and the appropriate human and technological factors to successfully achieve its digital transformation.

Abstract

This paper aims to analyze the importance of a digital leader in the context of digital transformations and to sketch the "portrait" of an efficient digital leader as close as possible to help companies easily going through the process of digitization. To obtain relevant information, we will examine the existing literature, as well as the latest published studies on the impact of a digital leader in the implementation process. Furthermore, we will investigate in depth what are the sets of skills and essential characteristics that the digital leader should have, to find out later in this research how important the digital leader is in an IT company, including how much professional experience and technical knowledge matters to support a successful transformational process. For this purpose, a targeted questionnaire has been used to ensure that all results presented in this paper are based on real data, tested for statistical significance. We conclude the research with a set of conclusions meant to outline the importance of having a digital leader when the company goes through a process of digital transformation and also to provide a structured "portrait" of the digital leader (skills and essential characteristics).

Keywords: digital leader, digital transformation process, digital leader skills.

Introduction

Digital transformation has become an extremely important factor for the business environment in recent years. Businesses have begun to increasingly embrace the idea of transforming the way they operate, and those that have not done it yet are beginning to take it into consideration (Akhtar et al., 2018). The results of the Eurobarometer survey show that most respondents believe that digital transformation has a positive impact on the economy (75%), quality of life (67%) and society (64%) (European Commission, 2017).

Meanwhile, the International Data Corporation estimates that, by 2022, worldwide, $2 billion will be invested in technologies and services that will allow the opening to a digital transformation, the transformation in this direction of business environment being inevitable (IDC, 2018).

But what does digital transformation really mean? The process refers to the strategical adoption of digital technologies with the final purpose of improving processes and productivity, delivering better customer and employee experience, managing business risk and controlling costs (IDC, 2018).

Digital transformation is the process of rethinking the business model or business process in the light of the availability and accessibility of digital technology. This can be done by using digitalization that refers to the analog information that has been digitized and that can be integrated and then used in various software applications with good premises for automation. On the other hand, digitization is the transition from analog to digital formats or simpler said, the process of collecting all available and then accessible information in a digital format.

For many businesses today, the main motivation for digital transformation is the chance to gain competitive advantage by improving the customer's experience (Dumitrescu & Buzatu, 2020). Though, it is necessary to understand that digital transformations imply both risks (pressure for employees, lot of requirements) and opportunities (innovation, job enrichment), which requires a holistic approach focused on needs (Grab et al., 2020).

Since seeing the advance digital transformation has gained, as well as the challenge of proportions that it represents for organizations, it is inevitable to what are the critical factors that can help organizations turn the implementation of this process into a success.

First, we'd like to affirm that the biggest challenge is to innovate for the future and *not* digitize the past (Boros, Dumitrescu, & Burtica, 2018). That is why digital transformation is first and foremost a leadership challenge! A leader needs to inspire and empower teams and employees with a skill set and a digital mindset. Some authors in their paper (Scuotto et al., 2017) concluded that the digitization of businesses emergences the implementation of new business models and may also have repercussions on the relationship between the organization and its customers. This means as well that the communication between organizations and customers increased due to digitalization, meaning the exchange of data between them is easier (Papa et al., 2018). All these changes represent a challenge and have the ability to create tensions between old values and procedures, which in the end may represent an obstacle in implementing new technologies (Del Giudice, 2019). It's all about a strategic process of change that transforms an organization's business models, about how it creates value for its customers or citizens, and how it captures that value; that is, how it monetizes it. It seems that companies which are able to grasp the challenges brought by digital transformation are as well able to provide a new value proposition to their customers, for a better and reliable data management (Grab et al., 2019). For this transformation, a change in the skills, competencies and in the cultural DNA of the organization is needed. Learning and organizational culture are, in fact, critical factors of digital transformation. At the beginning of the digital revolution this was a technology topic, then it became a business topic, and today it is primarily a leadership topic (Cortellazzo, Bruni, & Zampieri, 2019).

For a deeper understanding, we would like to make a comparison between surviving in a jungle versus where we live today. The difference stands in the fact that the jungle is based on a process of *evolution*, in which you can anchor yourself to predictable landmarks. What we are experiencing today is a *revolution*, and the reason why we can call it a revolution is precisely that we lack the predictability of benchmarks, especially those that impact at a societal level as well organizational. No industry, no company, no individual is immune to the threat of being disrupted. Down to the personal level, being relevant in a digital world is the main challenge encountered.

Organizations which are facing digital transformations, and which had big expectations benefits related to business and customers have failed because they collided with the organization culture (Wokurka et al., 2017). Reorienting leadership in this world does not mean that traditional skills have been suppressed, but now they coexist within a mixture of new factors. Namely, to be a digital leader, one must become fluent in digital: developing new digital skills, experimenting and taking risks and understanding how technology transforms society and translates into impact on business (LearningPro, 2020)

What We Understand by A Digital Leader

In their article, Leonardus & Sasmoko discuss about the importance of leaders in developing innovative business models, especially in the context of digital transformation, considering them digital leaders (Leonardus & Sasmoko, 2019). Thus, the digital leader, involves a combination of the transformational leader's leadership style and the use of digital technology. Despite the fact that having a role of digital leader includes the usage of technology, the focus is still on strategy, structure and understanding the customer's needs (Briggs, J.,). Digital leadership is defined as the combination of a leader's culture and competence in optimizing the use of digital technology to create value for companies, while the key success factors for digital leaders are the visibility of the executive and supervisory committee, digital transformation being seen as the core and control (Sahin Danisman, 2015). In this context, the digital leader is assigned five essential characteristics to complete the transformational process - the leader must be *creative*, *thoughtful*, *visionary*, *inquisitive* and at the same time a *deep leader* (Zhu, 2015).

What are the steps that a digital leader should take to obtain a successful digital implementation?

In 2018, Deloitte developed a digital transformation scheme, designed to help global interpreters assess their current status in the digitization process, ask the right questions and define the steps they need to take.

Figure 1: The stages of the digital transformation process

Source: Deloitte, 2018. Survival through Digital Leadership

First of all, the company digital leaders must be aware of the changes that digital transformation will cause, they must realize the specific impact on their business model, to define what are the steps to be taken for this transformation, to allow permanent change and innovation. While the first three stages shown in the figure 1 ensure survival, the fourth stage is necessary to create a sustainable future-value for the business.

In all four stages, the organization and its people are the critical success factors for the digital transformation. Cultural change within the organization is a necessary condition for creating opportunities and making room for innovation, and these can only be guided by a dedicated digital leader. The digital leader understands and respects traditional processes and structures and has the power, knowledge and charisma to adapt them for the company's digital future (Deloitte, 2018).

Therefore, the role of a digital leader is essential in leading the decision-making process as promptly as possible, but also in order to drive change of any kind (SCMedia, 2020). And to be able to drive this change, one of the main steps a digital leader must take is to build on the resources he has, starting with the human resource (VantageCircle, 2020).

Current state of adoption of a digital leader in companies during a digital transformation process

As digital transformation currently is at its infancy for many industries, it is very important for organizations to learn from the top digital performers in their field and then change and adapt in order to succeed (Martinez-Caro et al., 2020). One of the reasons that rather few companies have a well-defined digital strategy is that at the C-level / management team there are no leaders with digital skills: 72% of the board members do not have digital skills - cf. Russell Reynolds Assoc.; they support caution and not innovation, and the impact on organizations is harsh. This effect is called 'digitally illiterate leaders' (Russell Reynolds Associates, 2019).

According to a report made by McKinsey Digital (McKinsey & Company, 2018)., digital performance and digital leaders are key elements for companies to remain competitive on the market.

Hence, it was noticed during the time that we are in the very early days of digital transformation and, as a consequence, it is normal that digital leaders "outperform their digital followers and digital laggards in the sophistication and quality of their Digital Quotient" (McKinsey & Company, 2018).

Nevertheless, the adoption of the digital leader inside any company that faces a digital transformation process is part of the management strategy. Based on recent research, team leaders are challenged to pay more attention in understanding both how technology is able to increase the process quality and how can the human resource become part of the digital implementation process, by building a good knowledge base (Fogoros et al., 2020). Paul Willmott proposes three important steps that should constitute the base of any process from any company who intent on getting involved in a

digital transformation process. First, it is the alignment between overall corporate strategy and the digital initiatives the companies are perusing. Second, is the ability of driving a fast and agile culture through the help of digital leaders. Third is getting the right organization factors in place (talent, people, processes, structure, and systems that really make a difference when it comes to performing in this new world) (McKinsey & Company, 2018).

In theory these should be the key elements for success. But because studies regarding the adoption of digital leaders (second step proposed by Paul Willmott) in digital transformation processes are very limited and that there is no evidence or enough data, it's hard to conclude that the success of digital transformation process comes from the adoption of a digital leader (with all the skills and characteristics with which it must come bundled) (Hamill, 2019).

This is the reason why this paper proposes and analyzes a series of skills and characteristics attributed to the digital leader, and also the way in which he/she is seen and placed in the transformation process by the employees of the companies directly affected (either managers or individual contributors).

Research Objectives and Methodology

Research Objectives

The paper's research objectives:

1. See how the digital transformation process is being perceived inside surveyed companies in Romania and how important it is for both organizations and employees;
2. Essential characteristics for a digital leader - the surveyed companies' opinion in Romania;
3. Outline the "portrait" of a digital leader with all the knowledge he or she should have to sustain a successful digital transformation.

Research Methodology

We start with a survey of the current literature regarding the importance of a digital leader in a digital transformation process.

Given that there is not enough data on the effects that a digital leader has on a company that goes through a process of digital transformation, and neither on the skills and main characteristics that the digital leader should have to be able to lead a process of transformation, the approach used in this paper is that of the questionnaire. The aggregation of responses to targeted questions should either provide supporting evidence regarding the digital leader and its characteristics and role in the transformation process, or, contrarily, infirm the authors' hypothesis.

The questionnaire was created on an online platform to be accessible and easy to use and includes 13 research questions. The survey was filled-in by 183 professionals (both managers and non-managers), most of them coming from companies with an IT profile in Romania, during a four-week period in August 2020.

The number of responses is sufficient to draw statistically significant conclusions. All questions were subjected, depending on their type, to appropriate statistical tests. Whenever a test fails to meet the threshold, the implications of that question (or part of question) is ignored.

183 people from different companies familiar with the concept of digital transformation and who have a technical profile (both managers and non-managers) answered the questionnaire.

The first questions establish an understanding of the respondents' positions, from both managers (55.74%) and non-managers (44.26%), all participants having higher education and ~10% of them being MBA graduates (this was not a question; the questionnaire was directly given to an MBA graduate class). The other questions are related directly to the paper's research objectives.

Study results on perception of the digital transformation process in the surveyed companies in Romania

First, we choose to understand the importance of digital transformation and the importance of the role of the digital leader in such a process.

Thus, according to the responses received in our questionnaire, over 95% of respondents feel that digital transformation is an important process (32.79% agree and 62.3% strongly agree). Only 3 persons don't have a preference and 6 persons (3.28%) strongly disagree.

Regarding the question "For a company that is going through a digital transformation process, how important do you consider the digital leader to be?", almost 97% answered it is important (27.87% important and 68.85% very important), and only 3.28% say that the leader has an average importance. Nobody considers the digital leader as unimportant. Given the number of samples, the results are statistically significant.

Therefore, the conclusion we draw from these questions is that both the process of digital transformation and the presence of a digital leader to facilitate this transition are important for a business to be successful.

Study results on essential digital leader skills in the surveyed companies in Romania

Starting from Zhu's statement (Zhu, 2015) – referred here-on as 'current literature' – that the essential characteristics of a digital leader are to be creative, thoughtful, visionary, curious and at the same time a deep leader, following the research we can conclude:

The respondents were asked to rank a number of 13 skills/characteristics by reordering them: the first row represents the most important skill to have, down to the last row which is the least important. Each time a characteristic was placed first it got 13 points, while the last one got 1 point. Figure 2 shows the weighted scores for each of the 13 skills. Please note that every respondent got a randomized placement of the skills in his questionnaire to eliminate positional bias.

Figure 2: Weighted average of skill preference. Source: Authors' own research.

Out of 13 skills / characteristics presented in the survey to the participants, the first 6 were selected by them as the most important ones (we selected the top 5 as Zhu, but the 5th and the 6th skill obtained the same weighted score, so we included both in our current analysis):

1. Transformative vision: knowledge of market and trends, business acumen, problem solver
2. Change oriented: open-minded, adaptable, innovative, creative
3. Direction: providing vision and purpose
4. Inspirational leadership: getting people to follow you
5. Understands technology: prior experience, digital literacy
6. Forward looking: clear vision, sound strategy, foresight

Before drawing any conclusions, we analyze these skills regarding statistical significance. In table 1 we summarize our findings regarding significance, obtained by applying the single sample t-test.

Table 1:Two-tailed, single sample t-test, with the population mean μ = 7, significance at p<.05. Source: Authors' own research.

t-test	t-value	p-value	Significant at p<.05?
Transformative vision	6.403271	< .00001	**Yes**
Change oriented	5.722189	< .00001	**Yes**
Direction	3.608387	.000398	**Yes**
Inspirational leadership	1.419777	.157383	No
Understands technology	0.542344	.588245	No
Forward looking	0.57823	.563824	No

Looking at the results we see that only our top 3 skills are discussible, as we have enough samples to safely affirm (>95% confidence) that these skills are representative for the entire population.

Returning to current literature, the 5 attributes chosen by the survey participants confirm some of the skills mentioned by him but also come with others that are new.

Digital leadership is classified into five characteristics:

1. Thought leader, having the capability to be tough in facing market and competition change;
2. Creative leader, having the creativity and innovation mind set to formulate the idea into reality;
3. Global visionary leader, being able to provide direction and become an orchestra in transforming the digital business transformation;
4. Inquisitive leader, having learning capability to face complex and dynamic ecosystem due to volatility, uncertainty, complexity and ambiguity (VUCA) factors;
5. Profound leader, having in-depth knowledge and comprehension to make interpretation, assumption and synthesizing of information in making decision.

The top three characteristics that a digital leader should have, identified in the current literature (Zhu, 2015) and by this study are compared in Table 2.

Table 2: Skills of a digital leader. Source: Authors' own research

Skill	Current literature	This study	Comments
1.	Thought leader, having the capability to be tough in facing market and competition change	Transformative vision: knowledge of market and trends, business acumen, problem solver	In face of a changing market you need to be resilient, meaning thinking everything very well (Zhu); having knowledge about the market and having business acumen (our study). We argue that these 2 definitions are overlapping enough, while different from the other skills/characteristics to be considered similar.
2.	Creative leader, having the creativity and innovation mind set to formulate idea into reality	Change oriented: open-minded, adaptable, innovative, creative	A digital leader needs to be creative in face of a fast-changing market, has to be innovative and adaptable. These 2 definitions are similar.
3.	Global visionary leader, being able to provide direction and become an orchestra in transforming the digital business transformation	Direction: providing vision and purpose	For both, providing direction is essential for a digital leader.

Regarding the fourth and fifth different characteristics identified after our study and the literature, we cannot compare them because our results for these positions are not statistically significant.
Another interesting way to look at the findings is by selecting the first three choices of each person. Figure 3 shows that as a first choice, Transformative Vision is by far the most selected as the top choice, with 21.32% of respondents, which is a rather expected result. However, for the second choice, Inspirational Leadership, while getting mostly voted in the second place with 18.03% of respondents, in the overall weighted score it only ranks fourth. The third choice becomes even less evident, with Direction (11.48%) that makes it in top 5 and with Innovation (11.48% as well) that does not make it.
Testing whether the 1st choice result is statistically significant, the probability that the observed proportion of 21.32% comes from a population not equal to 7.69% (which is what random chance would yield choosing one of the 13 choices) is <.00001%. The 95% Adjusted Wald Confidence Interval is (15.97%, 27.83%). The second choice obtains a 95% CI interval of (13.1%, 24.28%), so it is statistically significant; the third choice however is not: it obtains an interval of (7.56%, 16.97%), meaning that the true mean of the population, with 95% confidence, lies in this interval, including our random chance choice of 7.69%.

Figure 3: Preference proportion for each skill as being chosen 1st, 2nd or 3rd. Source: Authors' own research.

Study results on digital leader "portrait" in the surveyed companies in Romania

The final objective of this paper refers to the shaping of the "portrait" of the digital leader. Let's continue to sketch the portrait by looking at what people answer to the remaining questions in the survey. For the question of "Is technical knowledge important for a digital leader to succeed?", 73.77% answered affirmative (54.1% agree and 19.67% strongly agree); 14.75% are neutral with 11.48% saying that technical knowledge is not important (6.56% disagree and 4.92% strongly disagree).

Next, "The leader's previous experience is important in order for him to achieve a successful digital transformation," was confirmed as being important in proportion of 68.86% (9.8% strongly agree and 59.02% agree), 22.95% are neutral and 8.2% disagree.

In conclusion, both technical knowledge and previous experience (the second one a bit less important than the first one) are essential in shaping the portrait of an ideal digital leader.

This result came as a surprise for the authors of this paper because the responses were different from what we expected. Initially, from numerous discussions had with managers, people involved in digital transformation processes, reading of various specialty literature, we were most likely to believe that technical knowledge is not that important when it comes to be a digital leader. Nevertheless, according to our findings it seems that statistically this feature matters.

The same goes for the question that refers to the importance of the leader's previous experience. Our belief was that the previous experience is very important for a digital leader to have when it comes to such a big project that involves numerous changes, affects budgets, headcounts, organizational structures and so on. But results showed us that this characteristic is important to have (59.02%) and it is not very important (only 9.8%).

Going further to the next question relevant for our study, that has the purpose of determining the exact leadership style that goes hand in hand with the concept of a digital leader ("Which leadership style do you think best suits a digital leader?"), we found that 65.57% opted for a "transformational leadership" style, followed by "participatory or democratic" style with 24.59%. The results for the next four leadership styles were seen as not being important by the respondents therefore there will not be analyzed but only mentioned („Laissez-faire" leadership, transformational leadership, charismatic leadership and authoritarian or autocratic leadership).

This means that people associate the concept of digital leader with the person that can inspire employees to embrace and create change without micromanaging. It's a management style that is designed to give employees more room to be creative, look to the future and find new solutions to old problems (White, 2018).

The last step in outlining a more accurate profile of the digital leader is the question referring to the actions that a digital leader should take both in business and in relation to people in order to ensure a successful digital transformation. As such, to the question "A digital leader will more likely … (choose the option that you consider the most appropriate one)" the respondents had to choose between two options among 5 criteria. The results are as follows – a digital leader will:

- Use data driven analysis (93.44%)
- Set vision and not aspiration (83.61%)
- Develop customer or citizen-based strategy (73.77%)
- Outline coherent action (85.25%)
- Focus on outcomes (73.77)

Table 3: Choice between the first or second sentence completion. Source: Authors' own research

A digital leader will more likely …			
First option	Response percentage	Second option	Response percentage
Use data driven analysis	93.44%	Use subjective analysis	6.56%
Set vision	83.61%	Set aspiration	16.39%
Develop customer or citizen-based strategy	73.77%	Develop inside-out plans	26.23%
Outline coherent action	85.25%	Outline disjointed performance programs	14.75%
Focus on outcomes	73.77%	Focus on outputs	26.23%

Results & Discussion

By taking into account the results analyzed above, when a company would like to hire / assign a leader able to lead both a digital transformation process as well as his/her team, it is mandatory to look after the following characteristics and skills:

1. He/she must have a transformative vision. Meaning that he/she should have a great understanding of market and trends, business acumen and being a problem solver;
2. Also, this person must be change oriented. This means that skills like open-minded, adaptable, innovative, creative are desirable to have when we talk about a digital transformation leader;
3. Direction. He or she should provide vision and purpose;
4. Should have a decent amount of technical knowledge;
5. Should build upon previous experience in handling digital transformation processes.

What is important to be mentioned following this result is that if the first three characteristics are required for a digital leader to have, the last two are preferable but not mandatory.

The leadership style that is expected from him to apply is the transformational one while the actions recommended for a digital leader to embrace while going through a digital transformation process are to use data driven analysis, set vision and not aspiration, develop customer or citizen-based strategy, outline coherent action and focus on outcomes.

Conclusions

This paper aimed to analyze the importance of a digital leader in the context of digital transformation and to sketch its "portrait", meaning summarizing the key skills and characteristics needed to lead a successful digital transformation in Romania.

To compare to current literature and do so with confidence, we created a survey with targeted questions. Its results mostly confirmed our hypotheses, but some were surprising. We collected a significant number of responses (183), most of them coming from people that are working in the organizational environment both managers and non-managers. We draw the following conclusions:

C1. We have established that the digital transformation process is important not only for the company but also for its employees. We determined that the digital leader is a key piece in this process and that every company, team, business in general, that goes through a digital transformation should benefit from the support of a digital leader.

C2. According to (Zhu, 2015), a digital leader must be thought, creative, visionary, inquisitive and at the same time a profound leader.

Analyzing our survey, we were able to establish statistical significance for top 3 (of 13) skills/characteristics that a digital leader should have. These are: Transformative vision, Change oriented and Direction.

We argue that Zhu's top three characteristics have been chosen in the exact same order as by our respondents: while our definitions and Zhu's do not match word-for-word (Zhu outlines 5, we propose 13 more finer-grained ones), interestingly, the top three for each overlap well enough to be considered similar.

C3. We outlined the ideal "portrait" of the digital leader and determined the essential skills and characteristics that he/she should have.

C3.1. Digital leader's skills and characteristics:

Must-have skills

1. Transformative vision: knowledge of market and trends, business acumen, problem solver
2. Change oriented: open-minded, adaptable, innovative, creative
3. Direction: providing vision and purpose

Preferable to have skills

4. Technical knowledge, while important to have, surprisingly is not thought as critical
5. Previous experience in handling digital transformation processes

C3.2. Leadership style applied by digital leaders

Following our study, we identified that the leadership style that best suits a digital leader and that offers best results is the transformational one, followed relatively far by the participatory or democratic style.

C3.3. Going deeper, the study showed us that after establishing what are the characteristics and skills that we are looking for a digital leader to have and after making sure that the leadership style applied by him/her is transformational, it is important to also look at the actions that he/she is going to take after being in a leading position.

The data revealed that is essential for a digital leader to:

1. Use data driven analysis, rather than subjective analysis
2. Set vision and not aspiration
3. Develop customer or citizen-based strategy, rather than inside-out plans

4. Outline coherent action, rather than disjointed performance programs
5. Focus on outcomes, rather than on outputs

Abstract

The research targets to get information regarding the fish and fishery products consumption, preference and the factors that influence the decision to buy, in association with the socio-economic characteristics of the consumers and to make an assessment of how the availability of information related to the traceability of fish-based products would influence the intention to buy these products in the future. A number of 12 parameters are considered for the analysis. Also, considering the data related to fish consumption, three time series algorithms were used. The exponential smoothing forecast method registered the highest accuracy. The subgroup analyses of socio-demographic characteristics reveal the emergence of new types of consumer preferences. When the geographical availability of fisheries is considered, the gradual increase in importance of the hypermarket becomes more obvious. In this context, the high dependence on the offer of hypermarkets raises the risk of an impoverished consumer choice in the near future. Education and product diversification are determinant factors for improving Romanian yearly fish consumption rate.

Keywords: Traceability, Fish Consumption, Fishery Sector, Time Series Algorithms.

SIMIONOV, Aurelia NICA and Victor CRISTEA "Data Analysis for Gaining Insights on Customers' Awareness About Quality of The Fish and Fishery Products" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Introduction

Fish consumption is influenced by many factors such as socioeconomic background, education level (Olsen *et al.*, 2007), age (Myrland *et al.*, 2000) (Honkanen, Olsen and Verplanken, 2005), religion and cultural traditions (Devadawson, Jayasinghe and Sivakanesan, 2015), but lately, consumers are very preoccupied about the health involvement (Pieniak *et al.*, 2008), food safety and fish quality (Opara and Mazaud, 2001), being even willing to pay a higher price for quality products (Verbeke, Vermeir and Brunsø, 2007). Consumers want to have access to all the information needed (product name, provenience, etc.) in order to be informed of the buying decision about fish and fishery products, but, in most cases, this information do not exist or are too scarce. In order to reduce the perceived risk associated with food consumption, many countries have introduced the Food Traceability System, which provides all relevant information about the food process, "from the farm to the table" (Choe *et al.*, 2009) (Bailey *et al.*, 2016). Thus, any insights related to the factors that can influence the evolution of the market would be highly beneficial for the stakeholders in order to come with up with the best strategies, approaches or technological investments (Carlucci *et al.*, 2015).

The aim of this research is to get information regarding the fish and fishery products consumption, preference and the factors that influence the decision to buy, in association with the socio-economic characteristics of the consumers and to make an assessment of how the availability of information related to the traceability of fishery products would influence the intention to buy these products in the future, in Romania.

Material and Methods

Questionnaire design and data collection

The questionnaires were distributed to random respondents from Romania, after previous pretesting, with a various socio-economic and demographic backgrounds, gender and age dispersion.

The 1st part of questionnaire is related to the demographic characteristics. First question was "*Do you eat fish and fish products*?". If the answer was "*No*" the questionnaire was ended. A total of 730 valid questionnaires were used in the analysis. Preferred type of fishery product and the preferred place to purchase these products (multiple-choice) was also asked.

In the research 34 demographic parameters are included, structured according to following criteria:

- Place where the customer lives: urban, rural;
- Level of studies: college, high school, university, PhD;
- Occupational field: industry, constructions, agriculture, distribution, services, education, health, administration or some other sector;
- Age: less than 30, between 30 and 40, between 40 and 55, greater than 55;
- Preferences on the place where the customer can buy fish products: hypermarket, fishery, market, proximity store, directly from producer;
- Fish products type preferred by the customer: living fish, fresh fish, frozen fish, semi canned fish, canned fish, and seafood.

The 2nd part of questionnaire is related to the factors which can influence the decision to buy fish and fishery products and also, regarding the influence of the availability of traceability information on the intention to purchase these products. Respondents indicated their degree of agreement or disagreement using a five-point Likert scale: *1 – disagree, 2 – neither agree nor disagree, 3 – slightly agree, 4 – agree, 5 – strongly agree*. In this section, 12 parameters are considered for the analysis, structured as it follows:

- Supply chain: Transporting Conditions, Storing Conditions, Processing Conditions;
- Traceability: InfoQualityPc, InfoQualityStore, InfoQualityMobile (the quality of information provided through computers, directly in store or via mobile devices);
- Provenience: Provenience, Growing Conditions, Feeding Conditions;
- Processing conditions;
- Price;
- Freshness.

Forecast Analysis

The current research forecast analysis of the Romania's fish consumption was based on three types of time series algorithms, respectively: a) ARIMA, b) LSTM, c) Exponential Smoothing.

Statistical Methods

Analytics procedures are used in order to discover useful information or suggesting conclusions that could support decision-making processes for different fish market players. Usually, because of the ordinal nature of the Likert data, it is not advisable to use parametric techniques to analyse it (Joshi *et al.*, 2015). Therefore, in order to perform analysis of variance we will use procedures like Mann Whitney or Kruskal Wallis test. Still, a Likert scale, composed of four or more Likert-type items that represent similar questions, combined together into a single composite score, can be analysed as interval data. In this context, parametric analysis is justifiable by the Central Limit Theorem. Therefore, several techniques that we can include are t-test and ANOVA.

Results and Discussions

The present research targets to statistically identify if there are differences between the scoring tendencies of people, for all the questions and all demographic attributes. Thus, Kruskal Wallis test is applied. For this, demographic data is structured differently, see figure 1. The following R code performs the data structure change for the Employment attributes:

```
#adding Employment
fisheryData$Employment <- "Pending"
#aggregate Employment
for(i in 1:nrow(fisheryData)) {
  if ( fisheryData$Employeed[i] == "Yes") {fisheryData$Employment[i] <- "Working"}
  if ( fisheryData$Retired[i] == "Yes") {fisheryData$Employment[i] <- "Retired"}
  if ( fisheryData$Unemployed[i] == "Yes") {fisheryData$Employment[i] <- "Unemployed"}
  if ( fisheryData$Other[i] == "Yes") {fisheryData$Employment[i] <- "Other"}
}
#drop employment
#remove employment columns
drops <- c("Employeed","Retired","Unemployed", "Other")
fisheryData <- fisheryData[ , !(names(fisheryData) %in% drops)]
```

Figure 1: Aggregating employment attributes under one column/attribute

After running the above code extended for each category, a new structure, for the demographic part of the data frame that will better fit our procedures, is created – see figure 2.

ResidenceType	Studies	Employment	WorkDomain	Age	FishType	Distribution
Urban	Highschool	Working	Services	40_55	CannedFish	DirectProducer
Urban	University	Working	Services	30_40	CannedFish	Market
Urban	University	Working	OtherSector	30_40	CannedFish	DirectProducer
Urban	University	Working	Services	30_40	LivingFish	Fishery
Urban	University	Working	OtherSector	Under30	Seafood	Hipermarket

Figure 2: R data frame structure for demographic attributes

The new structure is constructed around seven components that include all the demographic parameters taken from the questionnaire data. From the analytics/programming perspective it is good to have available both type of structures. One that has a column for each demographic parameter with values of "yes"/"no" or 0-1 and one that combines the parameters into their categories (figure 2). This was due to data analytics procedures, like clustering techniques, which are working best with numerical values because of the distance concept, while for classification or regression techniques there are methods that can deal both type of data. Usually, most of the data analysis starts with the data visualization. Thus R library called "Likert" is used, which was specifically designed to display Likert

specific data (Bryer and Speerschneider, 2016). This library provides plenty of visualization profiles from which we choose one that allowed grouping the responses for each demographic category.

```
library(plyr)
if(!require(devtools)) install.packages("devtools")
devtools::install_github('jbryer/likert')
require(likert)
#splitting the dataframe for better visualization
items_first <- fisheryData[, c(38:43)]
items_second <- fisheryData[, c(44:49)]
AgeLikert_Set1 <- likert(items_first, grouping = fisheryData$Age)
AgeLikert_Set2 <- likert(items_second, grouping = fisheryData$Age)
FishTypeLikert_Set1 <- likert(items_first, grouping = fisheryData$FishType)
FishTypeLikert_Set2 <- likert(items_second, grouping = fisheryData$FishType)
plot(AgeLikert_Set1,type = "density", centered = FALSE)
plot(AgeLikert_Set2,type = "density", centered = FALSE)
plot(FishTypeLikert_Set1,type = "density", centered = FALSE)
plot(FishTypeLikert_Set2,type = "density", centered = FALSE)
```

Figure 3: R code that uses Likert package for data visualization

The visualization, presented in figure 4, proves one weakness of likert scale questionaires: based on the overall culture and context they lived in, the respondents tend to favour more the upper part of the scale. Still, for the presented case there are also several cases that displays more variation in data, which probably will favour the results of some classification algorithms presented later on. Still, from the first look over the data, we would assume that there will be not to much success when applying classification procedures. Probably, the classifiers will predict well on 4 and 5 classes and quite poor on 1, 2,3 classes. Even so, it will be possible to compare and observe which algorithms will predict most acurately. Until than, it is possible to extract useful information based on the context where rates like 3,4 and 5 are favored most.

a. Data distribution based on distribution chanels

b. Data distribution based on employment

c. Data distribution based on fish type

d. Data distribution based on residence type

e. Data distribution based on studies

f. Data distribution based on work domain

g. Data distribution based on age

Figure 4: Data visualization of the responses based on: a. distribution chanels (direct producer, market, fishery, hipermarket, proximity store, pending); b. employment (working, other, retired,unemployed); c. fish type (canned fish, living fish, seafood, frozen fish, fresh fish, semicanned fish, pending); d. residence type (urban, rural); e. studies (highschool, university, college, phd); f. work domain (services, othersector, health, agriculture, education,administration,constructions, industry, distributions); g. age (40-55, 30-40, under 30, above 55).

One way is to use non-parametric methods, like Kruskal Wallis test, used to compare two or more independent samples of equal or different sample sizes (Dalgaard, 2008). The null hypothesis of Kruskal test is that the medians of all groups are equal, and the alternative hypothesis is that at least one population median of one group is different from the population median of at least one other group. For this, we will programmatically define a loop that will take every demographic attribute within each group and perform a Kruskal Wallis test with every Likert item. Afterwards, we will select only those cases where the p-value of the test was below 0.05 (figure 5), which would mean statistically significant and draw also the bar plots for each case, as it is easier to observe scoring differences.

For respondents with PhD and University degree the price seems to be more important than for the ones that has college/high school degrees. Makes sense if we consider that respondents with higher education will have higher salaries and access to a larger diversity of fish products, with a larger scale of prices that must be considered (figure 5a).

For unemployed respondents, price is an important factor, not necessarily in the higher part of the scale but also in the lower part. For the lower – medium part, respondents probable use well known sources and clear products with known prices and high stability (figure 5b).

From the work domain perspective, price seems to be most important for respondents working in the industry and distribution sectors and least important for the people working in agriculture domain (figure 5c).

In terms of age, price factor is the most important for people between 30 and 40 years. This interval is when people discover the most in terms of recipes and gastronomy – especially fish gastronomy that involves more knowledge. However, it is also the interval where people tend to establish some kind of financial stability, so the price of the products is important (figure 5d).

Expire date factor is important mostly for the market buyer respondents. Hypermarkets offers a lot more trust on expire dates as everything is controlled, but in a normal market, many people are checking expire dates for most of the products that they buy (figure 5e). Also, for PhD and University respondents, provenience seems to be also an important factor (figure 5f).

Provenience factor is mostly important for respondents working in Industry and Education (figure 5g). The 30-40 age interval respondents seem also to value the provenience of the fish products, considering it a valuable factor (figure 5h).

Respondents that buys semi canned, canned fish and living fish products are the most interested in knowing the provenience of what they are buying (figure 5i). Probably, that is why many hypermarkets that are selling fresh fish presents also details about where the fish was brought. From the distribution perspective, respondents most interested in the provenience of the fish products are the ones that favours markets and direct producers (figure 5j). Related to growing conditions, respondents most interested are those with university and PhD degree (figure 5k), industry, education and distribution sectors (figure 5l), as well as market and direct producers (figure 5m). The information related to feeding conditions have high impact on industry, education and distribution sectors (figure 5n), as well as market and direct producers (figure 5o). Transporting conditions are considered one of the important factors related to fish and fish products for university and PhD degree respondents (figure 5p), industry and education sectors (figure 5g), respondents with age between 30 – 55 years (figure 5r) as well as market and direct producers (figure 5s).

Rural respondents are clearly the ones for which storing conditions represent an important factor (figure 5t). This is because most of the urban people trust that selling places must apply some agricultural rules, while in the rural environment the situation is completely different.

Storing conditions are important for university and PhD degree respondents (figure 5u), industry and education sectors (figure 5v). Storing conditions factor is important for respondents that buys semi-canned fish, canned fish and living fish (figure 5w). For canned fish this is a quite unusual situation, as that type of fish products is most protected against poor storing conditions so basically it should count less. Respondents buying from market, direct producers and fisheries are the most interested about the storing conditions of the fish products they are buying (figure 5x). This is normal and the providers should consider offering details on the storing conditions or directly displaying good storing technologies.

Process conditions are important for university and PhD degree respondents (figure 5y) as well as for respondents that buys canned and semi-canned fish (figure 5z) and for those from Market sector (figure 5a'). Related to traceability (InfoQualityPc, InfoQualityStore, InfoQualityMobile), respondents with university and PhD degree seem to be most important (figure 5b', figure 5g', figure 5j' figure 5m'). Traceability information are appreciated by the respondents which buy semi-canned and canned process fish and fish products (figure 5d', figure 5h', figure 5o'), from education, industry and distribution sectors (figure 5c', figure 5k', figure 5n') and for those with connections to Market sector (figure 5i', figure 5l', figure 5p').

Figure 5: Kruskal-Wallis test results for p < 0.05

If we consider our study case situation, it is possible to aggregate several Likert items into three categories: *Supply chain* based on Transporting Conditions, Storing Conditions and Processing Conditions, *Traceability* based on InfoQualityPc, InfoQualityStore, and InfoQualityMobile, *Provenience* formed on Provenience, Growing Conditions and Feeding Conditions.

For each of these categories we will sum up respondent values for each attribute obtaining a single composite score. This way it will be possible to perform parametric analysis on our data that can be treated as interval data, where the mean is the best measure of central tendency. The following R code creates the aggregated columns (figure 6):

```
fisheryData$SupplyChainAgg <- as.numeric(fisheryData$TransportingConditions) +
as.numeric(fisheryData$StoringConditions) +
as.numeric(fisheryData$ProcessingConditions)
fisheryData$TraceabilityAgg <- as.numeric(fisheryData$InfoQualityPc) +
as.numeric(fisheryData$InfoQualityStore) +
as.numeric(fisheryData$InfoQualityMobile)
fisheryData$ProvenienceAgg <- as.numeric(fisheryData$Provenience) +
as.numeric(fisheryData$GrowingConditions) +
as.numeric(fisheryData$FeedingConditions)
```

```
anova (lm(SupplyChainAgg~Age+Studies+FishType+Distribution, data=fisheryData))
anova (lm(TraceabilityAgg~Age+Studies+FishType+Distribution, data=fisheryData))
anova (lm(ProvenienceAgg~Age+Studies+FishType+Distribution, data=fisheryData))
```

Figure 6: Columns aggregation and ANOVA analysis

As it can be notice in table 1, for all three cases, the two-way ANOVA output indicates significant difference of average scores. In addition, it seems that all demographic parameters involved are significant for these differences so further investigation is necessary. A good way to proceed is by using Tukey's range test (Bland and Altman, 1995), also Tukey's HSD (honest significant difference) test, or the Tukey–Kramer method.

Figure 7: ANOVA and Tukey test implementation in R code

Thus, Figure 7 and appendix 1 presents the R code that fits an analysis of variance model by a call to lm for each stratum, the call for Tukey algorithm and respectively the results of the Tukey tests.

By analysing Tukey results presented in appendix 1, it is possible to observe where the biggest mean differences are found between demographic parameters:

- For *SupplyChainAgg*: Above the age of 55 and 30-40 interval, Above 55 and 40-55 interval, High school – College, PhD-College, University-College, Phd-Highschool, University-High school, LivingFish – CannedFish, Semicanned fish – Living fish, Semicannedfish – Seafood, Proximity Store – Direct Producer, Proximity Store – Fishery, Proximity Store – Hypermarket, Proximity Store – Market;
- For *TraceabilityAgg*: Under the age of 30 and 40-55, PhD-College, University-College, University-High school, Fresh fish – CannedFish, Seafood-CannedFish, Fishery-Direct producer, Proximity Store – Direct producer, Proximity store – Fishery, Proximity Store – Hypermarket, Proximity Store – Market;

- For *ProvenienceAgg*: Above the age of 55 and 30-40, Above the age of 55 and 40-55, High school – College, PhD – College, University – College, PhD – High school, University – High school, Seafood – Canned fish, Proximity Store – Direct Producer, ProximityStore – Fishery, Proximity store – Market.

From the practical perspective, the pairs presented above defines the most significant differences related to Provenience, Traceability and Supply chain aggregated indicators found among demographic data. For example, if we consider Supply chain indicator, we can notice significant differences between respondents that buys living fish vs canned fish.

This makes sense, as the two kinds of products are very different from each other, therefore also the different importance rate for an indicator as traceability. Another good example is for Provenience indicator where respondents that go for proximity stores value differently than the ones that are buying from direct producers.

Thus, respondents that work in the services or industry are very interested in traceability, opposed to the ones working in construction or distribution. Respondents working in education scores highest when it comes to provenience opposed to the ones working in distribution.

Provenience indicator is very appreciated by the respondents which consumes frozen fish or semi-canned fish. Considering the data related to fish consumption, three time series algorithms were used, as follows: ARIMA, LSTM and exponential smoothing.

Therefore, figure 8 presents the fish consumption forecast till the year 2030, in Romania. It can be observed that, if solution for encouraging fish consumption will not be adopted, this indicator will register even a decreasing trend, fact which reveals the possible treats that fish-based sectors could be facing in near future.

Data presented in table 2 revealed that exponential smoothing forecast method registered the highest accuracy, fact that emphasizes that estimated forecast model is close to the real value.

Although LSTM based forecast indicates a decrease trend (figure 8) in fish consumption, its accuracy is the lowest – RMSE 1.23, compared to the other two forecast methods (ARIMA – RMSE 0.84 and exponential smoothing – RMSE 0.81).

Figure 8: Fish consumption forecast (kg/year)

The present study is based on traceability chain analysis in order to better understand the consumers need and preferences and to react according to these variables, ensuring a better economic sustainability of the fish-based sectors.

Similar to most studies, the design of the current study is subject to limitations. Therefore, in order to have a more complex analysis of the fish-based sectors, cost-effectiveness analysis must be elaborated, for most of the technologies used in both fish rearing and processing. Therefore, in Romania, most of the aquaculture sector is based on pond aquaculture systems which ensure a low economic sustainability.

High production costs may be a cause which determines high prices for fish and fish products, in relation to the consumers income. Also, consumers preferences for fish species must be analysed, since in Romania, ciprinides species are among most popular fish species, being included also in a various of traditional dishes.

However, those species are not suitable to be reared in modern aquaculture recirculating systems since this production systems will generate high operational costs that cannot be cover by low economic value fish species, as ciprinides. Thus, future research on improving fish rearing and processing technologies in order to ensure better economic sustainability can be also a future research direction which will encourage fish consumption through ensuring fish and fish products affordable prices.

Conclusion

The subgroup analyses of socio-demographic characteristics reveal the emergence of new types of consumer preferences (e.g. sea food). Although the consumers increase the range of fish and fish products they consume, the market channels used for purchasing these products decreases in variability. When the geographical availability of fisheries is considered, the gradual increase in importance of the hypermarket becomes more obvious. In this context, the high dependence on the offer of hypermarkets raises the risk of an impoverished consumer choice in the near future. Also, information related to distribution chain of fish and fishery products be crucial for better production valorisation among various consumers types. Also, it is recommended to share information related to quality of the fish products (in stores, on internet or by using special mobile applications), since the present study reveals the interest of Romanian fish consumer for traceability. Thus, a fish products traceability system can improve fish consumption in Romania and, therefore, contribute to the development of fishery sector. Also, education and product diversification are determinant factors for improving Romanian yearly fish consumption rate.

Future studies must be conducted also in rural versus urban region and also, different regions from Romania must be compared in terms of consumers preferences and habits, in order to elaborate national strategies and policies which can be applied in order to rise fish consumption and develop fishery and aquaculture sector.

Turkey and Russia in the Global Order. Implications for the Central and Eastern Europe

Karol Kujawa

WSB University, Dabrowa Gornicza, Poland
karol.kujawa@gmail.com

Abstract

In the past, Russia and Turkey considered each other as enemies. The breakthrough in Turkish-Russian relations took place after the Islamic Justice and Development Party (AKP) came to power in Turkey in 2002. In recent years we have witnessed a rapid revival in Turkish-Russian relations. Both countries are developing their economic and military cooperation and supporting each other internationally. However, this direction of Turkey's foreign policy concerns Western allies. They fear that the country will be completely dependent on Russia and thus become more unpredictable. Therefore, the main aim of this article is to examine the factors that have influenced the rapprochement of economic and military relations between these countries, especially between 2004 and 2019. The article will also debate the outlook for bilateral relations and the consequences of this new alliance for the security in Central and Eastern Europe.

Keywords: Turkey, Russia, security, Middle East, Central and Eastern Europe, Syria

Introduction

In recent years we have witnessed a rapid revival in Turkish-Russian relations. Both countries are developing their economic and military cooperation and supporting each other internationally. However, this direction of Turkey's foreign policy concerns Western allies. They fear that the country will be completely dependent on Russia and thus become more unpredictable. Therefore, the main aim of this article is to examine the factors that have influenced the rapprochement of economic and military relations between these countries, especially between 2002 and 2019. I wonder what consequences this new alliance has for international security. And most importantly, will Turkey remain a member of NATO? Will Turkey completely limit its cooperation with Western partners, become more unpredictable and dependent on Russia? The authors start with, in section one, a historical background of the Russian-Turkish relations as a point of historical reference for the subsequent sections of this chapter. The second section deals with the development of the Turkish-Russian relations under the AKP rule. Next chapter will concentrate on the Turkish-Russian relations after the coup attempt. Also, I will investigate how the Russian-Turkish cooperation affect the energy and military security of Central and Eastern European countries. Finally, I will describe perspectives of the bilateral relations.

From a methodological point of view author used analytical, descriptive, and comparative methods. Moreover, article include interviews conducted with several specialists from Turkey and Russia. The discussion on the future prospects for mutual relations between Russia and Turkey is largely hypothetical. This analysis contributes to the discussion on the prospects for cooperation between Russia and Turkey. Besides shedding new light on foreign policy, the author wonders whether leaders in Turkey and Russia might contribute to building long-term peaceful relations between the states and contribute to conflict resolution, or whether tension and violence between them will increase.

The results of these studies may prove very useful in the context of the ongoing academic debates surrounding the role of Turkey in the region and what is its dynamics and the interest toward the Central and Eastern Europe. Project may indicate what policies should be adopted by the Europearn countries in relation to Turkey. Besides, it is unlikely that future developments in the Middle East will lead to the end of the war in the region, and therefore this analytical work will remain important for many readers, including scholars, who want to broaden their knowledge and understand the role of Turkey in international relations. The results of this work may help fill the gap.

Historical Background

In the past, both the Ottoman Empire and Tsarist Russia saw each other as enemies. Both countries had imperial ambitions and wanted to play a key role in the Black Sea region. From the 17th to the 19th century, bilateral relations were dominated by armed conflicts. Even after the creation of the Turkish Republic, relations between the two

Cite this Article as: Karol Kujawa " Turkey and Russia in the Global Order. Implications for the Central and Eastern Europe" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

countries did not develop properly. During Stalin's reign, the Soviets raised territorial claims against Turkey, which led to the country's rapprochement with the West. After World War II, Ankara began to see the USSR as a real threat to its own security. However, after Stalin's death and Turkey's accession to NATO, a change occurred. The Soviet Union adopted a more moderate stance towards the country: it stopped having territorial claims and officially recognized the new government in Turkey. After the end of the 1950s, the two states established economic cooperation. At the same time, Turkish President, Adnan Menderes, paid official visits to Moscow. However, all attempts to intensify cooperation between the two countries were interrupted by the Turkish army, which carried out a military coup and overthrew the democratically elected president.

After the collapse of the Soviet Union, a new era in Turkish-Russian relations began. Russia continued to treat the post-Soviet area as its sphere of influence, while Turkey became a close ally of the USA and a rival of Russia in the Caucasus and Central Asia. It supported Azerbaijan and Turkish-language nations living in former Soviet republics. During the war in Nagorno-Karabakh the Russians supported Armenians and the Turks Azerbaijan. Also, during the Chechen wars, both countries stood on opposite sides. Russia accused the Turkish government of tolerating the activities of Chechen organizations and not responding to the creation of a safe haven for Caucasian fighters on Turkish territory. On the other hand, the Russian side supported the Kurdistan Workers' Party, which the Turkish authorities have fought against for years (Kortunov 2005).

The warming in Turkish-Russian relations took place under the rule of the secular CHP party in the late 1990s. The Turkish authorities adopted a much more moderate stance towards Russia. As early as 1999, Turkey was the first NATO member to purchase weapons, helicopters and armored transporters from Russia. Also, Moscow fundamentally changed its perception of Turkey as a rival in the Caucasus and Central Asia. It began to treat Turkey as a partner. It stopped supporting the Kurdistan Workers' Party. Besides, in November 1999, Turkish Prime Minister Bülent Ecevit visited Moscow, and in October 2000, Russian Prime Minister Mikhail Kasyanov visited Turkey. As a result of these meetings, in 1999 Russia and Turkey signed a declaration on combating terrorism. In 2000 a joint committee for cooperation in the armaments industry was established, and in 2002 agreements on military cooperation and regular joint maneuvers in the Black Sea were concluded (Bieleń 2008).

AKP And Russia

The breakthrough in bilateral relations took place after the Islamic Justice and Development Party (AKP) came to power in Turkey in 2002. Since then, Turkey has changed its foreign policy vectors. It has sought to increase its role in the region and develop cooperation with all its neighbors. Russia has played a particular role in this process. The Turkish authorities were well aware that without cooperation with Russia, it would be very difficult for them to achieve their goals. A new stage in relations between these countries began with the visit to Ankara of Russian President Vladimir Putin on 5-6 December 2004. Since then, regular meetings have been held between representatives of these countries. The Blue Stream pipeline, which was put into operation in 2005, was to become the foundation of cooperation between the countries. At the same time, Turkey did not want to limit its cooperation with Russia. Ankara began developing economic cooperation with Georgia and Azerbaijan. As a result, the Baku-Tbilisi-Ceyhan pipeline was commissioned in 2005 to supply oil from Azerbaijan to Turkish ports. At the same time, the construction of the Nabucco gas pipeline, backed by several European Union member states and by the United States, began. This project was to transport 31 billion cubic meters of gas annually from deposits in the Caspian Sea in Azerbaijan and Turkmenistan to an energy center in Austria. Moreover, in 2007, the Baku-Tbilisi-Erzurum gas pipeline was built to transport natural gas from the Shah Deniz gas field in Azerbaijan (Yıldırım 2013).

To sum up, in the first years of the AKP rule, Russia became a strategic partner in trade. However, Turkey did not want to limit its cooperation only with this country. Ankara's goal was to diversify its energy resources. To this end, Turkey had cooperated with other countries in the region and the European Union (Kanbur & Bernat 2013). Thanks to these projects, Turkey tightened its economic cooperation with Georgia and Azerbaijan, which tried to pursue a policy independent of Moscow.

Second stage: 2010-2014

The intensification of cooperation between Russia and Turkey took place in 2010-2014. One of the main architects of this policy was the Turkish Foreign Minister, Ahmet Davutoğlu. Initially, he was the chief advisor to the Prime Minister of Turkey, Recep Tayyip Erdoğan, and in 2009 he became the Foreign Minister of Turkey. Since the beginning of his diplomatic career, he has supported the policy of "no problems with our neighbors". He presented the main principles of this concept in his book entitled "Strategic depth" (Stratejik Derinlik). The book argues that:

1. Turkey's relations with its neighbors should be based on peace and security;
2. any obstacles that hinder the economic and cultural integration of the region should be removed;
3. Turkey has the task of becoming a regional superpower. Turkey has deep historical contacts with the Arabs, the Kurds, the Persians and geographical proximity to Central Asia, the Balkans and the Caucasus.

In his doctrine, however, Davutoğlu did not put Russia at first place. He claimed that good neighborhood policy with Russia is not an alternative to relations with the EU. Nor is the model partnership with the United States a rival partnership against Russia (Davutoğlu 2010).

The policy of the new minister led in a short time to the development of economic cooperation between Russia and Turkey. On 12 May 2010, during the official visit of Russian President Dmitry Medvedev to Turkey, an agreement on the introduction of visa-free travel between the two countries was signed. Both countries waived the visa requirement to enter the other country for a period of less than 30 days. Since then, the Turkish coast has been very popular with Russians. Every year several million tourists go to Turkey from Russia. In 2014, 4.5 million Russians visited Turkey. A new record was set four years later when nearly 6 million Russian tourists went to Turkey. In addition, it is estimated that there are currently over 300,000 mixed Russian-Turkish marriages in Turkey. In the seaside resorts you can easily buy Russian newspapers and watch Russian TV (Pinar 2019; Nemtsova 2019).

At the same time, Russia was becoming one of Turkey's most important trading partners. It imported mainly textiles, machinery, food and household appliances from Turkey and exported energy resources (see figure 1). Moreover, Turkey became Gazprom's second largest customer after Germany (23.4 billion cubic metres; 34.5 billion cubic metres, respectively) (Axmith 2015, p. 121). In 2011, Russian gas exports to Turkey were record-breaking at 25.8 bcm (Natural Gas... 2019). In addition, Russia implemented a number of strategic projects in Turkey. The construction of the first nuclear power plant in Turkey, in which the Russian corporation "Rosatom" is involved, is planned to be completed in 2023. The Russian side will remain the owner of the power plant, but has announced its willingness to surrender 49% of shares to Turkish or foreign investors (Schneider 2019, p. 62).

Years	Turkish exports to Russia (milion $)	Turkish imports from Russia (million $)
2002	1168	3891
2003	1367	5451
2004	1859	9033
2005	2377	12905
2006	3237	17806
2007	4726	23508
2008	6481	31364
2009	3202	19718
2010	4631	21599
2011	5992	23952
2012	6682	26625
2013	6964	25064
2014	5945	25293
2015	3589	20399
2016	1733	15162
2017	2735	19514
2018	3401	22 300
2019	3400	21150

Figure 1: Level of trade and growth between Turkey and Russia in 2004-2016

Source: TUİK 2019;
https://www.statista.com/statistics/1001013/value-turkish-goods-exports-to-russia/, 2019;
https://wits.worldbank.org/CountryProfile/en/Country/TUR/Year/2018/TradeFlow/EXPIMP/Partner/by-country, 2019.

Besides, after lengthy negotiations in 2012, the Turkish authorities agreed to the South Stream pipeline being laid through Turkish territorial waters. The project would allow Russians to transport 63 bcm of gas from the Caspian Sea

to countries in Central and Eastern Europe, Austria, Italy and Greece, bypassing traditional routes through Ukraine, Poland and Belarus (Turowski 2019). The largest shareholders in this project are Russian energy giant Gazprom (50 per cent) and Italian Eni (20 per cent), while the French company EDF and German Wintershall each have a 15 per cent stake. The construction of the South Stream pipeline has been in conflict with the Nabucco pipeline project, supported by the European Union, which aims to reduce Europe's energy dependency on energy from Russia by transporting gas from the Caspian Sea to Europe via Turkey. The Nabucco project, supported by both the European Union and the United States, was to transport 31 billion cubic meters of gas annually from deposits in the Caspian Sea in Azerbaijan and Turkmenistan to an energy center in Austria. However, its construction never took place due to the financial crisis in the EU and the lack of political will of Western European countries.

Figure 2: South Stream and Nabucco gas pipelines

Source: https://www.researchgate.net/publication/280539019... 2019.

Despite the fact that the two countries were seeking to intensify their economic cooperation, their interests in the region continued to differ. Their main dispute has been their policy towards Syria. The Kremlin was not as loyal an ally of Damascus as Tehran, and the survival of the Syrian government was still his priority. Russia wants to keep Assad in power because he is his most important ally in the Arab world. However, after the outbreak of the so-called Arab Spring in 2010, Prime Minister Recep Tayyip Erdoğan initially adopted a rather moderate course towards the Syrian president. At the same time, he tried to persuade Assad to carry out democratic reforms. Before the parliamentary elections in Turkey on 12 June 2011, in which the AKP party won, the Turkish Prime Minister became more critical of the regime. He called on the Syrian President to end his brutal actions against anti-government demonstrators. However, the bloody repression of demonstrations by security forces in Hama in the first days of August 2011 led Erdoğan to increase pressure on Syria. He announced that Assad could lose the support of Turkey if he did not stop the bloodshed and carry out reforms. However, the Turkish prime minister's requests were not answered (Kujawa 2011).

Third stage – crisis and recovery. Turkish-Russian relations after the coup attempt

The growing crisis in the Middle East has put Turkish-Russian relations at a crossroads. In 2015, a Russian Su-24 plane was shot down by Turkish fighters over the Turkish-Syrian border. Moscow responded with sanctions. It banned the export of certain agricultural products, revoked visa-free travel for Turkish citizens, and imposed restrictions on Turkish businessmen. Sanctions did not cover the energy sector. In the face of the crisis, Turkey decided to apologize for the incident and restore economic relations as soon as possible. The blame for the shooting down was placed on the Gulen movement. In order to remedy the damage caused by the aviation incident, both countries signed a joint declaration to lift all trade restrictions between the two countries. As a result, the losses slowly recovered. In 2017, the level of bilateral trade increased from 16.9 billion USD in 2016 to 22.3 billion USD (We aim to… 2019).

Turkey has not only taken quick steps to restore good relations with Russia. It has also changed its policy towards Syria. Since then, Turkey has begun to relax its position towards the Assad regime: it has increasingly become more

rare to demanded the departure of Assad. The adoption of these foreign policy vectors by Turkey was welcomed by the Kremlin. Since then, Russia has begun to take an active part in the work for the stabilization of the Middle East. However, the crisis with Russia made the Turkish political elite aware of the threat posed by dependence on Russian energy resources. Since then, the Turkish authorities have made efforts to diversify their energy sources: in order to reduce Russia's monopoly on gas supplies, the construction of the Trans-Anatolian TANAP pipeline was launched in 2015, which will enable gas exports from the giant Shah Deniz fields in Azerbaijan to Europe. The project was inaugurated in 2018. The ceremony was attended by the President of Turkey, the President of Azerbaijan, Ilham Aliyev, the President of Ukraine, Petro Poroshenko, the President of Serbia, Aleksandar Vučić, and the Prime Minister of Bulgaria, Boyko Borisov. In the same year, the Trans-Atlantic Pipeline (TANAP) and the Trans-Adriatic Pipeline (TAP) along the banks of the Marica River on the Turkish-Greek border were joined. As a result of the connection of these two pipelines, natural gas from Azerbaijan can be transported to Italy (TANAP project… 2019).

Figure 3: TANAP project vital for Turkey, Azerbaijan

Source: https://www.worldbulletin.net... 2019.

Paradoxically, the internal situation in Turkey had the greatest impact on strengthening cooperation between these countries. In 2017, a military coup d'état failed. As a result, thousands of people connected with the Gülen movement were arrested. The vast majority of Western European countries expressed their protest against the brutality of the Turkish authorities. Russia, in contrast, expressed its solidity and support for the President of Turkey. For years, the Russian authorities have regarded the Gülen movement as a threat to their internal security. It treated its supporters as an American 5th column. As early as in 2000, the Russian Federal Security Service (FSB) launched an investigation into Gülen-related institutions and educational centers. Three years later, some of Gülen's schools were closed down due to a "threat to national security" and school teachers were deported. In 2007, the Russian prosecutor ruled that the group's ideology was dangerous, and the sale of Gülen's books was banned. Eventually, in 2011, the Russian authorities closed all of Gülen's institutions on the territory of their country (*Russia: The Fethullah…* 2015).

This attitude of Putin towards the Gülen movement led Erdoğan to see him as an ally. From then on, the Turkish president began to recognize Russia as a guarantor of his interests. Russia has become not only a strategic economic ally for Turkey, but above all a military ally. Despite opposition from the United States, Turkey decided to purchase the Russian S 400 system. In mid-2019, the Turkish authorities announced that they intended to accept deliveries of the S-400 system from Russia. The Turkish president stated that he would not withdraw from purchasing Russian weapons. As a result, Russia started to supply S-400 systems, and the training of Turkish soldiers in handling Russian weapons has already been completed.

Moreover, in order to avoid misunderstandings, Russia, Turkey and Iran very often started organizing meetings within the framework of the so-called “Astana Three”, during which they consulted each other on the most important decisions concerning the future of the Middle East. One of the most important of these was the issue of Syria. However, the interests of these countries were not always consistent. The Turkish authorities do not want at all costs to allow the emergence of a Kurdish quasi state in northern Syria through which a pipeline connecting the region with oil and gas-rich northern Iraq could be built in the future. They are striving to create a so-called 'safety zone' in the region, to which some 3 million Syrian refugees are to be resettled. To achieve this goal, the Turkish authorities

carried out a military operation, "Source of Peace", in October 2019. They wanted to create a 30 km-wide strip for a so-called "safety zone" in northern Syria, and to force the Kurds living there associated with the General Protection Units (YPG) to leave the area. The Russian authorities reacted critically to these actions, claiming that they violated the territorial integrity of the country.

Figure 4: Ethnic divisions in Northern Syria

Source: http://static3.businessinsider.com.... 2019.

However, the dispute between the allies was quickly resolved. Russia agreed to Turkish conditions. This happened during a meeting between the Russian and Turkish presidents in Sochi. A 32-kilometre-wide buffer zone will be set up in Syria, joint patrols of Turkish and Russian soldiers have been launched in the area, and Kurdish fighters will be removed as a result. In this way, the northern part of Syria, hitherto controlled by the Kurds, will be under the rule of the Turks, Russians and the Syrian government army. In place of the Kurds, Turkey is to resettle the more than 3.5 million Syrian refugees it has hosted so far.

The Sochi agreement has proved extremely beneficial for Turkey. The main threat to Turkey—the prospect of a Kurdish state in the northern part of Syria—has been removed. Moreover, the problem of refugees from Syria, who are a growing problem for Turkey, is to be resolved. Their growing number is affecting the popularity of the Turkish president. The first sign of this was felt during the recent local elections, in which the ruling AKP party lost two million of supporters.

The cooperation between the two countries was not only limited to solving common problems in the region. They also took steps towards reducing dollar dominance in the global trade. The first attempt to trade with domestic currencies took President Erdoğan in late 2016. He had suggested to Russia and Iran to “trade using national money” and proposed that “the importer pays in the currency of the exporter”. According to this proposal; Turkey would pay for Russian imports in rubles. Also, Erdoğan emphasized that a financial market infrastructure in accordance with the agreement would be created, and currencies of both countries would become more attractive for commercial institutions.

Despite the fact that Turkey wants to intensify cooperation with Russia, it still does not want to limit its ambitions in the region. Its goal is energy independence. Certain hopes for achieving this goal appeared in the middle of 2020. At that time a Turkish drilling vessel discovered deposits in the western part of the Black Sea containing about 320 billion cubic metres of gas. According to President Erdoğan, further discoveries will allow Turkey to become completely independent energetically and even export gas outside the country. However, his announcements seem to be too optimistic. It is estimated that they will allow Turkey to satisfy the gas needs of the country for two decades. Other estimates say even for several years. Nevertheless, it means that the energy pressure on Turkey will decrease. It will also allow Turkey to negotiate favorable prices during the conversation with Gazprom, which expired in 2020 and has still not been established.

Implications for Central and Eastern Europe

Turkey's growing dependence on Russia makes it an increasingly unpredictable NATO member. This has a direct impact on the security of Central European countries. This shows the position of Turkey at the end of 2019. The country blocked NATO's plan to defend Poland and the Baltic States in case of an invasion from the East. It makes its consent dependent on the political help of its allies in the fight against the Kurds in Syria. Turkey demanded political support in the fight against the Kurdish militia in northern Syria (YPG). One of the conditions is formal recognition by member states that YPG members are terrorists. A disagreement by one of the countries would mean that the North Atlantic Treaty would have a problem with the smooth expansion of defensive forces in these countries. Ultimately, under pressure from the allies, Turkey changed its mind and agreed to sign the document.

Furthermore, Russia, thanks to its strong position in Syria and Turkey, has a real impact on the security of the region. It can trigger the migration of refugees not only to this country, but to Central and Eastern Europe. Turkey, which has already received almost 4 million Syrian refugees, is slowly losing patience and threatening Europe with opening its borders. This was shown, among others, by the Syrian-Russian offensive in Idlib, during which Turkey could cause an influx of 1.5 million refugees into Europe. In this way, Russia is trying to have a real influence on the migration process and wants to become a partner for the EU or a guarantor of stability in the Middle East and North Africa.

Close cooperation between Russia and Turkey weakens, above all, the energy security of Central and Eastern European countries. Apart from the Blue Stream pipeline, both countries have also started opening the new TurkStream gas pipeline which will bypass Ukraine. In this way Russia wants to give Gazprom a monopoly in South-Central Europe and thus may reduce political pressure on the countries of this region

Conclusions

The fact is that the European Union and the United States are slowly losing their close ally in the Middle East which plays a key role in Europe's energy and military security. Turkey has become increasingly economically and politically dependent on Russia. Thus, it has limited possibilities to influence the situation in the Middle East. However, this is not the end of President Putin's ambitions. Russia's goal is to exclude Turkey from the structures of the North Atlantic Alliance, close NATO bases and withdraw American soldiers from the country. But will it achieve this? On the one hand, it seems unlikely. The vast majority of Turks still express the need to remain in NATO. Besides, Turkey's exit from NATO would greatly reduce the country's defense capabilities. Without modern technology it will be very difficult for Turkey to conduct operations against the PKK and other terrorist organizations in Iraq and Syria. However, it seems that under Erdoğan's rule there will be no major changes in the country's foreign policy. He will strive at all costs to maintain close relations with Putin, who supports his position in the country and does not interfere in internal affairs. It is only after the departure from power of the Turkish president that a reset in relations with the West may occur. Moreover, he has been in power since 2002. The AKP is increasingly dissatisfied with Erdoğan's policy to date. There are still many Westernizers in the AKP who are increasingly boldly criticizing Turkish foreign policy vectors. The opposition, which aims to democratize Turkey and bring it closer to the European Union, is also growing in strength. Their chances of taking over power in the coming years are slim, but in the long run their position will systematically grow. The recent local elections have shown that Erdoğan is systematically losing supporters (around two million). The economic crisis has made more and more Turks express their disillusionment with the president's policy and want him to leave. However, it is possible that Turkey may be expelled from NATO by then. Such voices are increasingly frequent in the US Congress. In this situation, Turkey would become unpredictable and even more dependent on Russian influence. Therefore, despite these difficulties and problems, it is in the interests of both the European Union and the United States to keep Turkey within the Alliance.

An extremely important element of cooperation, which will undoubtedly affect the future of Russian-Turkish relations, is the energy sector. Turkey is highly dependent on gas imports from Russia. Recently, however, the Turkish authorities have become increasingly aware of the threat of dependence on gas supplies from Russia, and are making efforts to diversify their energy resources. One solution is the construction of the TANAP pipeline to transport gas from Azerbaijan to Turkey and further to Europe. This multi-sectorial policy may contribute to increasing Turkey's energy security. However, this does not mean that the country will be fully independent from Russian gas supplies. It will take many years before Turkey improves its energy independence. However, this will require greater cooperation with the European Union and the United States. Russia, on the other hand, will take all measures that distance Turkey from projects implemented with its western allies.

Perspectives

As a result, the main beneficiary of cooperation between these countries seems to be Russia, which has managed to make Turkey dependent on energy resources and limit the U.S.'s influence in the country. In the future, however, Turkey's dependence on Russia may increase. Several factors had an unmistakable impact on this process:

a) Firstly, the Russian president does not interfere in Turkey's internal affairs. He does not condemn the President of Turkey for the purges that were carried out in the power apparatus after the failed coup of 2017. On this matter, Russia has expressed solidarity and support for Erdoğan. Unlike many Western European countries and the US, Gülen's movement is to blamed for the failed coup.

c) Another factor that will undoubtedly determine Turkish-Russian cooperation is the Kurdish issue. Here too the Russian President gives Turkey his support. However, he does not want to increase Turkey's position in Syria and allow it access to the oil-producing areas in that country.

d) The building of mutual relations may also be supported by Putin's moderate stance towards Muslims living in Russia. For several years now he has been trying to support the activities of Russian Muslims. Among other things, the initiative to build the largest mosque in Russia was to serve this purpose. The opening ceremony of the Great Mosque in Moscow, which is able to accommodate 10 thousand people, was attended by, among others, the President of Palestine and the President of Turkey (Baczynska 2019).

Understanding Airline Passenger Satisfaction Level Using Machine Learning

Abstract

Air travel has come a long way from the crowded and noisy experience in the 1940s, through the glamorous experience in the 1970s and 1980s to the diversity of services provided today. The markets of the traditional airlines are more and more intertwined with the market of low-cost carriers (LCCs), the latter penetrating the upper class market by providing different paid services, such as cargo luggage, lunch, selection of seats and others. The future passengers' decision of which airline to choose becomes more difficult, as the airlines offer similar services, therefore the interest of the airlines to attract new passengers and to make them satisfied is more and more pronounced. This paper proposes a new approach to find out what exactly could be a crucial factor in improving the passengers' satisfaction by applying a machine learning algorithm on a large database with more than 100,000 passengers and more than 20 data points on each of them. The results could be used in the business decision making process, by focusing on providing the services which improve the most the passengers' satisfaction, therefore ensuring a sustainable development for an airline.

Keywords: Passenger satisfaction, Airline, Machine Learning, Decision Tree

Introduction

It is considered that the American brothers Wilbur and Orville Wright are the pioneers in aviation, one of the most powerful industries in the world today, when, in the cold morning of December 17th, 1903, they succeeded the first powered, sustained and controlled flight of a power-driven, heavier than air plane for 59 seconds, at 852 feet (History.com, 2019). As the air transport industry evolved, the world became more and more interconnected, allowing all kinds of businesses to flourish. From air travel to business meetings across the globe, it is estimated that around 82% of US citizens have flown at least one time during their life (Negroni, 2016). For comparison, 88% of US citizens reported that they own a car (Misra, 2015). With these numbers in mind, we can say that it is as approximately as common to fly with an airplane as it is to own a car.

However, this is the situation right now, in 2020. About one century ago, air travel was only for the wealthy and accomplished. In the 1930s, a round trip from the west coast to the east coast was priced around $260 – but the value of money was completely different. This represented about half the price of a new car and more than half of a yearly wage of a factory worker. (PBS LearningMedia, n.d.)

Passenger air travel changed dramatically over the years, with the development of new technologies, airplanes getting bigger, faster, more reliable and more capable of providing quality travelling.

In the beginning of passenger air travel era, in the 1920s, the airplanes were small, crowded (held fewer than 20 passengers), unpressurized (which meant that they had to fly at low altitudes, where significant meteorological phenomena was common) and very loud. The aircraft engineers estimated the engine noise of the airplanes during take-off to be around 120db. For comparison, the front rows at a rock concert sustain about 110db, while a military jet take-off caps at around 140db (ThinkWorth, 2016).

The next decade, between 1930 and 1940, showed a tremendous increase in the number of airline passengers, from 6,000 to 1.2 million by 1938 (ThinkWorth, 2016). In this period, stewards became in charge with more than just aiding to passengers' health and started to supply them with complementary beverages and food. By the end of 1930s, the airplanes became more comfortable, being soundproofed and heated. The first pressurized commercial aircraft was introduced in 1938.

In the golden age of aviation, between 1940 and 1960, air travel became more luxurious and flamboyant. The flights got longer and the passengers got more comfortable during the flight. It is worth pointing out the fact that during this period, people dressed up for this event – flying was extremely glamorous.

In 1970s, with the introduction of the Boeing 747, flying became more affordable and common as the airlines had more tickets to sell per flight, making the price more reasonable. Nevertheless, first class remained exquisite.

In the 1990s, a new era of in-flight entertainment began with the introduction of big, cathode-ray tube TVs, placed above the isle – enabling the passengers to deal with the long, 10h flights. As a new addition, all passengers of age, including the ones from economy class, could benefit from complementary liquor on domestic and international flights.

Coming into the third millennium, the in-flight entertainment became even better, with each passenger having his own small LCD display embedded in the seat in front of him. The menus for food and beverages became less and less complex for the economy class, while the higher priced tickets still benefit from on-demand cuisine on long flights.

The major step that was made probably resides in the first class compartment, where several airlines refurbished the interiors. Right now, it is possible to book for over $20,000 per flight an entire suite on-board, complete with 8 minutes of running hot water for a quick shower before landing, a full size bed, huge 32-inch (80 cm in diagonal) TVs, a mini bar of soft and alcoholic drinks and many more.

From the passenger's point of view, one has an incredible amount of choices when deciding an airline for the next flight. One airline has better departure/arrival times, but no included luggage, another one comes with included check-in luggage, but with a higher price and so on.

The low-cost and ultra-low-cost tactics proved to be very successful; people are finding out that they do not need in-flight Wi-Fi for a two hour flight; it is more important that the tickets are cheaper. Two good examples of successful low-cost carriers (LCCs) are Ryanair and WizzAir, both of which hold a big percent of the market, above legacy airlines, such as Turkish Airlines or Lufthansa. (CAPA, 2015)

One another interesting aspect is that the market of low-costs and ultra-low-costs can intersect with the legacy, traditional airlines. By adding the costs of a low-cost ticket, a 23kg standard hold luggage, 2 course meal, one soft drink, one alcoholic drink and the ability to choose a seat, a person will find out that he will be paying more than the equivalent services at a traditional airline.

This intersection provides a serious extra revenue for the low-cost airlines – they reach the market of upper class travelers by being able to offer them only the services they need (maybe one does not need an extra 23 kg cargo hold luggage, for example – so he will be paying extra at the traditional airline for a service he will not use).

Nevertheless, it is important to mention that for WizzAir and Ryanair, the ancillary revenue (the revenue that comes from "extras", such as the ability to choose a seat, priority boarding and so on) represents a large part of the company's revenue. In the financial year 2015, 35% of WizzAir's revenue was from ancillary activities, while for Ryan Air the percentage was around 25% (CAPA, 2015).

Continuing this trend, in 2019, LCCs in Europe had 33.1% of the total seat capacity in the region. Ryanair transported 152.4 million passengers in that year, being considered the biggest airline group in Europe, followed by Wizz Air (Mazareanu, 2020). The latter has a progressive development strategy to capture larger market share across Europe, by entering new markets which were less explored by other European LCCs (e.g. Eastern Europe). Although LCCs market share in Europe increased by 10% in 2019 compared to 2009 (Mazareanu, 2020), the traditional airlines responded with new solutions to keep their market position.

However, it is of great importance for any airline to know exactly what makes the passengers satisfied – this way, the possibility of flying them again increases. Perhaps some services increase so much the level of satisfaction for passengers, that it would be more profitable to give that service for free to all passengers (this way, more passengers will come back to the same company and will use their services; more passengers translates into more revenue which obviously means more profit) as opposed to charging extra individually for that particular service/commodity.

Objective

This paper has the purpose to find, using machine learning algorithms, what exactly is changing the perception of passengers about the quality of the airline service as a whole. A supervised machine learning algorithm (decision tree) was applied on an open-source dataset which contains the satisfaction level of more than 100,000 passengers alongside more than 20 individual data points on each passenger, such as the type of traveler, distance travelled, seat class and many others. The programming language of choice was Python, while the used libraries were Sklearn, Pandas and Numpy.

The purpose was to gain new insights about what exactly is changing the perception of passengers about the quality of the airline service as a whole. The results could be used in order to provide a background for the sustainable development of an airline, with respect to its customers' wishes, in order to maximize their satisfaction while minimizing the costs associated.

As a research limitation, it is worth mentioning the fact that the dataset used has no clear origin (i.e. if the data comes from US travelers, EU travelers, world-wide travelers etc.) and it may have been subjected to social, economic and/or political conjunctures of regional, national or international scenarios.

Theoretical aspects of the decision tree classifier

The chosen algorithm for the analysis of the dataset is the decision tree classifier. This algorithm belongs to the supervised class of machine learning algorithms. This means that the machine sees the inputs and the desired outputs of the training data set when trying to discover some "rules" that the data entries follow, in order to predict the variable of interest (in this case is the level of satisfaction of the passenger).

This algorithm can be perceived as a supervised segmentation – basically it splits the training population into groups that differ from one another with respect to some value of interest.

The segmentation of the data takes the form of a tree, in such a way that the tree's root is at the top and it branches as it goes downward. This tree is made up of nodes – interior nodes and terminal nodes, which are also called leafs. The branches are emanating from the interior nodes.

Figure 1: Basic structure of a decision tree

Each interior node in this tree represents a test of an attribute, a question related to that attribute. The dataset that will be processed has a large number of attributes: Gender, Customer Type, Age, Type of Travel, Class, Flight distance, Inflight Wi-Fi service, Departure/Arrival time convenient, Ease of Online booking, Gate location, Food and drink, Online boarding, Seat comfort, Inflight entertainment, On-board service, Leg room service, Baggage handling, Check-in service, Inflight service, Cleanliness, Departure Delay in Minutes, Arrival Delay in Minutes and the target variable, Satisfaction. From this interior node, each branch represents a different answer to that question – a certain value of the attribute, for example Age < 50.

Each data point from the data set will follow one and only one path through these branches, ending up in a terminal node (leaf). In other words, each leaf corresponds to a segment of the initial dataset and the path from the root node to the leaf gives the characteristics of that segment.

Since in this case we are interested in a supervised segmentation, each leaf contains a value for the target variable (as the algorithm sees the output values).

Decision trees or classification trees are used as predictive models. When trying to predict a target value for a new data point (predicting the satisfaction for a new customer, for example) we can predict its classification by finding the corresponding segment (going down the tree, answering the questions from each interior node – which can also be called decision nodes for that reason). In a tree, no nodes share the same descendants, as always the branches point downwards and there are no cycles.

The decision tree algorithm will split each node into more nodes, until all terminal nodes become pure (all of the instances in that node have the same value for the target variable). This will lead the decision tree to overfit. Overfitting means in simple terms that the algorithm memorizes the training dataset. It performs the splits until all of the leaf nodes are pure (have the same target variable, in our dataset that is "satisfied" or "unsatisfied"). If a classification tree is allowed to grow until all leaf nodes are pure, the prediction that the tree makes will be close to 100% accurate (because each leaf will most probably have only one member). This way, the algorithm will fail to properly generalize the information that is given through the training dataset.

In decision trees there are several ways that avoid overfitting: setting a limit on the amount of splits, setting a lower limit on the amount of members in a leaf and many others. However, if the phenomena of overfitting is avoided "too much", the decision tree will not be able to properly generalize on the data. There must be a certain level of complexity of the tree at which the model is performing the best on the testing (holdout) data – the data that the algorithm has not seen. This level of complexity can be found with something called fitting graph.

Figure 2 : Fitting graph; Reproduced from (Provost & Fawcett, 2013)

In ***Error! Reference source not found.*** a typical fitting graph is shown. It is important to notice that the tree complexity, in this case the tree size in nodes, is plotted on a logarithmical scale.

Beginning at the left, the tree is very small and has poor performance. As it is allowed more and more nodes it improves rapidly, and both training set accuracy and holdout (testing) set accuracy improve. The training set accuracy always is at least a little better than holdout set accuracy, since the algorithm did get a look at the training data when building the model. But at some point the tree starts to overfit: it acquires details of the training set that are not characteristic of the population in general, as represented by the holdout set. In this example overfitting starts to happen at around x = 100 nodes, denoted the "sweet spot" in the graph. As the trees are allowed to get larger, the training set accuracy continues to increase—in fact, it is capable of memorizing the entire training set if it is not controlled (via setting a maximum number of leafs etc.), leading to an accuracy of 1 (not shown). But the holdout accuracy declines as the tree grows past its "sweet spot"; the data subsets at the leaves get smaller and smaller, and the model generalizes from fewer and fewer data. This is an exact exemplification of the overfitting phenomena.

The fitting graph represents exactly the best trade-off between the extreme possibilities of not splitting the data as much as needed in order to generalize and building a complete tree until all the leaves are pure.

It is important to mention that the decision tree algorithm can only process numerical data, therefore the columns that have categorical values need to be pre-processed, as it will be shown further in this paper. An example of a categorical column is Gender, which has the values Male and Female.

Several decision trees were trained on the available data and, in order to easily compare their performances, for each of them a confusion matrix was generated. Generally, for a problem involving n classes, the confusion matrix is a $n \times n$ matrix, with the columns labelled with the predicted classes and the rows labelled with actual classes. Each instance in a test set has an actual class label (in this dataset, "satisfied" or "unsatisfied") as well as the predicted class by the classifier. In this case, because the dataset has only two classes, the confusion matrix will be a 2×2 matrix.

Table 1: Confusion Matrix

		Predicted condition	
		Predicted condition negative	Predicted condition positive
Actual condition / class label	Condition negative	**True negative**	**False Positive**
	Condition positive	**False Negative**	**True Positive**

This matrix gives birth to many important indicators that show the performance of the algorithm's predictions. This is important as it allows a more detailed analysis than just the simple accuracy of the model.

Accuracy, as a performance indicator, may show misleading results if the data set is unbalanced – for example, in the current dataset, if there were 99,000 satisfied customers and only 1,000 unsatisfied passengers. Continuing this example, if the tree classifier would predict that every customer is satisfied, it would have an overall accuracy of 99%, which it is exceptional.

In this context, accuracy is defined as the ratio between the correct predictions and the total number of cases analyzed: $\frac{\sum true\ positive + \sum true\ negative}{\sum total\ population}$.

At a closer look, the classifier would have a 100% recognition rate of the satisfied customers, known as sensitivity or true positive rate (TPR) which is equal to $\frac{\sum true\ positive}{\sum condition\ positive} = \frac{\sum true\ positive}{\sum true\ positive + \sum false\ negative}$, that is the proportion of the actual positives (in our case, actual satisfied customers) that are correctly identified as positives (predicted satisfied customers) – because all satisfied customers are predicted as satisfied. In this case, true positive represents the satisfied customers identified as satisfied, while false negative are the satisfied customers labelled as unsatisfied.

On the other hand, it would have a 0% recognition rate for the unsatisfied customers, which is called specificity or true negative rate (TNR) which is equal to $\frac{\sum true\ negative}{\sum condition\ negative} = \frac{\sum true\ negative}{\sum false\ positive + \sum true\ negative}$ - this represents the actual unsatisfied customers which are correctly labelled as unsatisfied.

It is obvious that is very important to choose the appropriate measure of performance for each application, as it heavily depends on what is desired. As an extreme example, if a classifier algorithm predicts whether a patient has cancer or not, obviously it would be of interest to correctly identify as many patients who actually have cancer. But then, one must ask himself: what is less desirable – to tell a healthy patient that he has cancer or to tell a patient that actually has cancer that he is healthy. It ultimately depends, as mentioned before, on the application of the algorithm.

Applying the Decision Tree Algorithm

After loading the dataset, it is necessary to process it before applying the decision tree algorithm. Firstly, we need to find if there are any missing values (which are labeled as NaN). This is easily done by using the built-in method isna().sum():

```
Gender                                0
Customer Type                         0
Age                                   0
Type of Travel                        0
Class                                 0
Flight Distance                       0
Inflight wifi service                 0
Departure/Arrival time convenient     0
Ease of Online booking                0
Gate location                         0
Food and drink                        0
Online boarding                       0
Seat comfort                          0
Inflight entertainment                0
On-board service                      0
Leg room service                      0
Baggage handling                      0
Checkin service                       0
Inflight service                      0
Cleanliness                           0
Departure Delay in Minutes            0
```

```
Arrival Delay in Minutes            310
satisfaction                          0
dtype: int64
```

The 310 missing values might not mean much of over 100,000 passengers, but nevertheless, if we replace them, we might improve the performance of our model. We considered three methods of replacing (called imputing) the missing values: with the mean value of the column, the median value of the column or the mode value of the column.

However, before replacing these values, the dataset was divided into training data and testing data by a ratio of 4/1. It was necessary to divide the dataset before imputing because otherwise, the training data would have had an "insight" of the testing data – making the input biased for the classifier. For example, these are the mean values:

```
Mean value for x_train is 15.250950203313344
Mean value for x_test is 14.889559299126322
Mean value for the dataset is 15.178678301832152
```

The comparison between the performances of the decision tree when trained using only the numerical columns (i.e. ignoring the columns with had categorical values as previously explained) with respect to the three imputing methods is presented below, in *Table 2*.

Table 2: Imputing with mean vs mode vs median (rounded values)

	Imputing method		
Performance index	Mean	Mode	Median
Accuracy	0.9233	0.9236	0.9236
Sensitivity	0.91558	0.9151	0.9151
Specificity	0.92936	0.93022	0.93022

The reason for which imputing with mode and imputing with median result in the same values is that, for this dataset, the mode is equal to the mean (both are zero).The next step in training the model is the use of the categorical columns. The sklearn library provides two approaches to this issue: label encoder and one-hot encoder.

First of all, the columns that have categorical values have been separated into a dataframe called xcat. The possible values of the attributes of these columns can be easily found out:

```
In[6]: for col in xcat.columns:
    print('column {} has {} values: {}'.format(col, len(xcat[col].value_counts()),
xcat[col].unique()))

Out[6]: column Gender has 2 values: ['Male' 'Female']
        column Customer Type has 2 values: ['Loyal Customer' 'disloyal Customer']
        column Type of Travel has 2 values: ['Personal Travel' 'Business travel']
        column Class has 3 values: ['Eco Plus' 'Business' 'Eco']
```

These columns may have important information, that could help the decision tree to classify better our passengers – as, for example, 'type of travel' and 'class' should have a significant impact on the passenger's satisfaction.

By applying label encoding, each column in xcat will be transformed. If we take the example of column 'Gender', the values 'Male' and 'Female' will be replaced with 0 and 1, in order for the decision tree to take advantage of the information from this column. This works quite well if the respective column has two possible values, like in the example above. However, if we take the example of the column class with the three values 'Eco Plus', 'Business' and 'Eco', after applying label encoding, the values of the class column will be 0, 1 and 2. This may influence the decision tree algorithm, as 2 is two times bigger than one.

This problem is solved using the one-hot encoder, which transforms each possible value of a categorical column into a column of its own, with binary values. Continuing on the example of the column class, this column will be replaced by three columns, 'Eco Plus', 'Business' and 'Eco', each of those having two possible values, 0 and 1. For example, a business class passenger will have the following values, with respect to these three columns:

```
'Eco plus' = 0
'Business' = 1
'Eco' = 0
```

The comparison between the performances of the decision tree when using label encoder versus using one-hot encoder is presented below, in *Table 3*.

Table 3: Label Encoder versus One-Hot Encoder

	Method	
Performance index	Label Encoder	One-Hot Encoder
Accuracy	0.9451	0.9460
Sensitivity	0.9415	0.9432
Specificity	0.9480	0.9482

As one-hot encoder provides better performance, the next step is to compare the performance of the decision tree applied on the dataset with one-hot encoder and imputing with mean versus one-hot encoder combined with imputing with mode. This can be seen below, in *Table 4*.

Table 4: Comparing One-Hot encoder with mean versus mode

	One-Hot Encoder	
Performance index	Imputing with mean	Imputing with mode
Accuracy	0.9460	0.9454
Sensitivity	0.9432	0.9428
Specificity	0.9482	0.9474

As we can see, imputing with mean yields better results, even if when the three replacing methods were compared, imputing with mode provided the best results.

The next step is to plot the fitting graph in order to find the maximum complexity of the model in order to avoid overfitting. The fitting graph was a plot of the accuracies on the training dataset and the testing dataset as a function of the complexity of the model. In this case, the measurement of the complexity will be the max depth that we allow the tree to grow up to.

Figure 3: Decision Tree Fitting Graph

We can see that even if the downwards slope for the testing accuracy is not as prominent as the slope present in the theoretical fitting graph we can identify a sweet spot around the point Max_Depth= 15.

The exact value can be found using the block of code below:

```
results_test = results.loc[results['subset'] == 'test']
results_test.drop(['subset'], axis = 1, inplace = True)
max_acc_test = results_test['accuracy'].max()
depth_max_acc_test = results_test.loc[results_test['accuracy'] ==
                                max_acc_test, 'Max_Depth']
depth_max_acc_test = depth_max_acc_test.iloc[0]
Out[139]: 14
```

The final step is to pass the maximum depth obtained from above into the parameters of the decision tree model.

Conclusions

The performance of the final decision tree can be described looking at the confusion matrix associated and at the metrics that were previously used for comparison:

Table 5: Performance of the final decision tree

	Performance score
Accuracy	0.95318
Sensitivity	0.9250
Specificity	0.97534

Table 6: Confusion matrix for the final decision tree

		Predicted condition	
		Predicted condition negative	Predicted condition positive
Actual condition / class label	Condition negative	**11349**	**287**
	Condition positive	**686**	**8459**

In order to read and interpret the results obtained by applying the decision tree algorithm on the dataset, we plotted the feature importance. A feature is an attribute, one of more than twenty characteristics that are available for each of the passengers. The feature importance plot shows which of the features (attributes) separates the best the satisfied passengers from the unsatisfied ones.

Figure 4: Feature Importance for maximum depth = 14

The decision tree obtained looks as follows:

Figure 5: The decision tree with the best performance, plotted until the fourth split

The value that we need to take a look at in *Figure 5* is the entropy, which is a measurement of the impurity of the node. When entropy is equal to one, it means that the samples in that node are balanced, half are satisfied, half are dissatisfied. On the contrary, the closer the entropy is to zero, the purer that node is; i.e. the split performed above was good (at least on one of the children nodes) and it helped to separate the passengers with respect to the target variable.

The last row (value = [x,y]) shows the values of the samples' target variable that belong to a certain node. For example, if we take a look on the branching on the right hand side of the tree we can observe that from all the passengers that were business travelers (Type of travel_Business Travel = 1*)* and rated the online boarding experience with five out of five, from a total of 13,672 passengers, 13,471 declared themselves satisfied, while only 202 were not satisfied with the airline services as a whole.

This means from a business perspective that if the airline is able to provide an excellent online boarding experience for the business travelers, most likely they will be satisfied customers.

Some more interesting aspects that can be read from the decision tree in *Figure 5*:

- Looking on the left side of the decision tree, even if the online boarding was at most average (grades from zero to three) and the inflight Wi-Fi service was terrible or not existent (received a grade of zero out of five), 1403 passengers out of 1411 declared themselves satisfied. This means that some other service was very good (most probably) and in the end, we cannot correlate the non-existence of the inflight Wi-Fi service with a dissatisfied passenger;
- Following the first split on the left and then coming down on the right, we are at the opposite pole: if the inflight Wi-Fi service was excellent (received a grade of five out of five), again, most of the passengers (1164 out of 1188) declared themselves satisfied – we are able to correlate the excellent inflight Wi-Fi service with a satisfied customer, disregarding the values for the other attributes.

By looking at the features importance there are some interesting things that we can learn:

- The most informative attribute is *'Online Boarding'* – which probably refers to the quality of the online check-in service;
- The second most informative attribute was *'Inflight Wi-Fi service';*
- The third attribute was *'Type of Travel_Business Travel'* – this shows that if the passenger is a business traveler, it is a lot easier to predict his level of satisfaction;
- Certain aspects which usually are used by airlines in order to attract customers are not so important in determining the level of passenger satisfaction (in comparison with the ones above), such as:

    - 'Legroom service';
    - 'Food and drink';
    - 'Arrival delay in minutes';
    - 'Departure delay in minutes';
    - 'Departure/Arrival time convenient'.

However, this was only one of many machine learning algorithms that can be used on a dataset like this. Methods like similarity matching, clustering and profiling may help us to get valuable insights from the data. The field of machine learning algorithm is quite vast and there are a lot of algorithms to explore and to apply on the dataset.

The purpose of this research was to implement a machine learning algorithm on a new problem (airline passenger satisfaction level) in order to get valuable insight with respect to what makes a passenger satisfied. With that in mind, we consider that the current paper provides a good background for further business decisions that involve the areas of services that shall be improved, with the purpose of delivering quality services that actually matter to the passengers and successfully translate into an increase of their satisfaction level.

Abstract

This study assess enrollees' perception of Health care facility's (HCFs) physical structure and equipment quality across 9 accredited National health insurance/ Health maintenance organisation (NHIS-HMO) providing healthcare facilities within the 3 local government areas in Lagos, Nigeria.
Anchored on the phenomenology of time consciousness and the filter theory of attention, the study methodology was triangulated using survey method and in-depth interview. A total of 252 questionnaires and 5 in-depth interviews (IDIs) were used to elicit data from selected respondents using simple random and convenient sampling technique. There were differences between the survey result and the in-depth interview (IDIs) responses in terms of structural awareness in contrast with access to treatment equipments. 61.1% of the respondents agreed that the physical environment of the HCF was conducive, 61.5% agreed to the presence of standard and functional medical equipments in the HCF. With regards to the quality rating, 55.1% perceived the quality of HCFs physical structure and equipment fairly positive while 30.6% of the respondents perceived it negatively. From the group comparisons, the Chi-Square results ($P<0.01$, $\chi2$ (16) = 66.750) revealed significant correlations between quality of HCFs physical environment and equipment and enrollees perception. The Spearman's correlation was also positive at .064. These findings indicate that the tangible aspects of healthcare service are significant in health outcomes as such, it is recommended that. Enrollees should have access to testing equipments considered relevant in illness treatment and the physical ambiance should be prioritised to ensure consistency in quality health promotion.

Keywords: Perception; National Health Insurance Scheme; Health Maintenance organization; Healthcare Quality.

Introduction

The problem of quality has slowly become a big part of our lives and of culture as a whole; it is difficult to describe quality because of its subjective existence and intangible characteristics that everyone wants it to be quality can be almost anything. Although, no single universally accepted definition exists, quality has been defined as "value" by Feigenbaum (1951), "excellence" by Peter and Waterman (1982). Zeithaml and Bitner (1996) research evidence

IGBOLEKWU, Festus ASAMU, Bamidele RASAK and Ogadimma ARISUKWU "Impact of Quality Healthcare Equipment and Physical Structure on NHIS-HMO Outpatient Enrollees' Perception in Lagos Hospitals" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

indicates that the quality of service can be measured in five ways: service efficiency, service provider responsiveness, service provider assurance; consumer empathy and measurable proof of service quality. Donabedian (1980) amenities components of quality in healthcare included characteristics such as comfortable physical environment and excellent service delivery. The different views expressed in the definition of quality character are context determined and dependent on the perceived perspective of the individual authors'.

Several studies have been conducted to measure what areas of health care service are considered important and significant in building necessary cues in patient's experience. For instance, Donabedian (1980), viewed healthcare quality as applying technical and medical science in such a way as that health benefits are optimised without increasing risk. Similar to Mosadeghrad (2012b) five categories of quality healthcare which included environmental attribute, Donabedian amenities for quality check also included features such as comfort of physical surroundings and attributes of the organisation towards service provision.

While evaluating quality, literatures on NHIS-HMO have mostly focused on awareness and acceptability of the scheme, funding, and the quality of services rendered under the scheme. For example, Ibiwoye and Adeleke (2008); Awe and Sanusi (2009); Arodiogbu (2005); Okaro, Ohagwu and Njoku (2010) carried out studies in Nigeria on increasing consciousness, work and modus operandi of the National Health Insurance Scheme as well as the Health Maintenance Organisation. However, these studies did not consider the quality of healthcare facilities (HCFs) equipments and physical structure as factors influencing enrollees' perception. It, therefore, becomes necessary to assess enrollees' perception of HCFs equipment and physical structure quality across selected HCFs in Lagos, Nigeria.

Literature Review

Healthcare Facility tangible quality

Dijkstra, Pieterse, and Pruyn (2006) methodical research work regarding the effect of healthcare physical surroundings on consumers' welfare and health outcome revealed a positive correlating importance between the healthcare environment and the patients' health outcome. The Cochrane database of systematic reviews 2011 including a hundred and two works by Drautas where the investigated interventions were: 'positive distractors' which included 2 studies on aromas, 5 audiovisual studies, a study on decoration and 85 studies on music. While the multifaceted interventions had 2 studies, physical change to minimize environmental stress included interventions such as; a study each on the type of bedroom, lighting, and temperature, 3 studies on the quality of air, 2 flooring studies, and 1 study assessing furniture and furnishings..

Overall, patient-account revealed the ability of music to lessen health outcomes like apprehension; on the other hand, physiological effects, and drug use contribution had little proof. With the exception of quality of air, few researches accepted or denied the introduction of physical changes. It was discovered by the incorporated research that the physical changes in the hospital environment did not cause any damage or harm. Following the incorporated criterion incorporated to assess no studies was found on art, interventions to reduce HCFs noise, patient controls, and technologies; avenues to seek aid, accessibility to nature for example, through gardens, balcony, window space and ceilings.

Drahota (2005) clearly stated in a simple outline the significance and implications of the physical surroundings as it affects patient's wellbeing. In contemporary time, studies indicate that the potential consequences attached with healthcare facilities physical environmental cues on patients' recuperation and welfare has obtained considerable attention.

The Drahota's study laid bare the capability of environmental factors in the production of optimistic results in health consumers outcomes, an idea referred to as 'healing environments'. The surrounding physical state in healthcare facilities has the ability to affect and influence health consumer's perception. The 'healing environments' ideology makes reference to cognitive effects of the physical environment through neurophysiological processing (sensory perception). One significant study by Ulrich (1984) tracked the recovery of patients in hospitals while viewing vegetation as opposed to structures, and found that those with a view to nature recovered faster.

Theoretical Framework

Perception of HCFs physical structure and equipment quality through the lens of Edmund Husserl's Phenomenology of time consciousness

The study of "phenomena" (appearance of things, or how objects emerge in individual's experience, or in what forms individual's experience objects, thus the meanings objects have in our perception at a specific time is regarded as time conscious phenomenology.

The phenomenologist Husserl (2001) assumes that intentional consciousness is related with universal contents, this can be interpreted to mean that perception, recalling; imagining and willingness are intentional in its very existence as conscious actions of the moment, hence, time conscious phenomenology assumes that our physical awareness concerning things in our surrounding or the appearance of things in our minds eye (perception, experience, thoughts, and memory) is time-related Nijhoff (1966).

Although the intentional ideology possesses an undertone of wilful interest, it essentially showcases the connection consciousness has with surrounding objects. Our perception, according to classical Husserlian phenomenology, is geared (represents or intended) towards things through particular concepts, thoughts, ideas, and pictures temporarily. Husserl referred to the various structure of experience as "intentionality" because; the directedness of perception towards objects within the physical sphere possesses consciousness attributes.

One important implication of this theory is that it explores the composition of consciousness in the formation of perception concerning an object experienced within a particular time. The connection between this research work and the phenomenology of time-consciousness is that it seeks to account for intentionality in enrollees perception guided by experience over time.

Perception of HCFs physical structure and equipment quality through the len of Attention theory

We may better characterize our environment as an environment of stimuli. Stimuli influence all or every one of our senses. Although, not all of the sensory clues within an individual's physical environment are listened or taken in at the same time but the presence of multitude of stimuli has the ability to overpower the human sense of feeling, hearing, touching, tasting and smelling. Considering the inability of people to simultaneously uphold perceptible views to every stimulus exposed to in their physical setting, the clutter of cues observed are usually filtered after being taken in, with only a few accepted into the individual's mind.

A major proponent of the attention theory, Broadbent (1958) suggested that tangible features present in the environment at specific timing are stored in a limitless capacity sensory buffer for cues processing and selection. Such filters according to Gleitman (1996) are initially placed at the sensory filter for recording but gradually, they begin to move into the perception filter phase. Information that successfully passes through these filters is remembered, attached with meanings and kept in the memory for future use. An aspect of the attention theory (Naïve Realism) emphasizes the function of perceptual experience involving the direct consciousness of the mind to filter independent objects. This filtering ability is instantly apparent to the mind once we external objects.

Individual's perceptional experiences are made up of their mind-independent objects as well as its comprising features. At such, we are connected to those objects by our experiences and the unique quality of perception is attributed to objects that are independent of the mind's wit. In this way, when a patient enters the health care hospital, the patient sees every visible part of the health service provider (HCPs), which is an external entity. The experience is of the HCP—such a patient is conscious of the object (HCP) directly—and the sensory attributes which appears are elements of the mind-independent item.

Overall, the filter theory can be seen in the light of one of the major naïve realist defenders Martin, (2001, 2002, 2004, and 2006) who viewed experience as the relation linking persons with the object of awareness. To this end, the filter theory can be said to focus on the ability of the individual mind to take up, process and maintain certain signals from the HCF context, while others are rightly dismissed, thereby making perception a sequence involving the knowledge of mentally autonomous objects.

One implication of the filter theory is that healthcare consumers sensory cues can be distorted at first interaction making them equally distort information selectively. Martin (2002, p.378) believed experiences are products of

mind-independent objects, in which "one's experience relates one to the mind-independent world, and yet does so in a non-representational manner". Mind-independent things as well as its elements are consequently the components our experiences are made from, thus, determining the unique attribute of our perceptual experiences is traceable to the objects we are exposed to.

Often times, naïve realism is regarded as capturing individual's ability to have practical judgement concerning everyday matters, or the basic ability to perceive, understand, and judge as shared by nearly all people.

The connection between this research work and the filter theory of attention is to depict how enrollees subsequently attaches meanings to the cues and how such interpretations are attached to a stimulus exposed to during healthcare. These may involve good or bad experiences, but, such involvement depends on the force within the cue. Whatever personal understanding or meanings the enrollee makes regarding the accessed service will be kept in the memory to be recalled in the future when deciding about services to patronise in that particular HCF.

The Phenomenology of time consciousness as well as the attention theories was adopted to guide the study in investigating how perceptions are dependent on enrollees exposure to stimuli present in cues (whether good or bad) as an essential reality of the human consciousness. Enrollees perception of healthcare facility's physical structure and equipment can therefore be said to be linked to their given meanings to the objects encountered, both successional (eg, a mobile X-ray machine) or static (eg, a hospital building), this filtered cues are used in developing basic assumptions regarding the objects quality at the point of contact.

This theory builds on Archer's cultural morphology map theory, based on a model of transition found in the theory of social-ecological resilience. This overlay offers a partial response to the issue under discussion in resilience theory, community and organization. Also, it offers a context to explain what happens in the changing cultures at the cultural level. It illustrates how culture can support adaptive responses of changing communities. In two cultures, based ethnography advances the hypothesis that local cultural backgrounds play an important role in the community response to closure challenges. The theory review also provides an alternative to functionalistic approaches to research on resilience with a focus on institutional capabilities, functional engagement and social indicators. In comparison, Lyon and Parkins (2013) research provides insights into the human organization and social change, which lead to adaptation by placing culture as a dynamic structure, distinct from a social system which is static or changeable as part of social transition processes and which can remain static (resilient or adaptive). The scientists conclude that the economic upheaval alone is not a motive for concerted action. Collective action coincided with a strong pre-existing activist community and a collective immediate reaction. Instead of offering fast and simple perspectives, this interpretive approach to resilience evaluation seeks to cross various theoretical and empirically divisive theory and the empirical divisions between biophysical and social science approach for resilience studies in the society.

Methodology

The study triangulates between quantitative (questionnaires) and qualitative (In-depth interviews (IDIs) data collection method. The population comprises of NHIS and HMO enrollees' between 18 years and 65years visiting selected public and private hospitals in Eti-Osa, Ikeja and Ibeju-Lekki Local Government Areas (LGAs) within the three senatorial districts in Lagos, Nigeria. The accredited public and private HCFs included: (1) St. Mary Specialist Hospital, (2) Awoyaya hospital, (3) Blue cross hospital, (4) Unity hospital, (5) The Eko hospital, (6) General hospital Akodo, (7) Budo specialist hospital, (8) Etta Atlantic memorial hospital, and (9) St. Nicholas hospital. The selection of both public and private HCPs was to depict the two dominant healthcare facility systems in Nigeria.

Multistage sampling technique was used to select the study participants. Simple random sampling was employed at each stage to reduce selection bias. The first stage involved clustering the twenty (20) Local Governments into the three senatorial districts, selecting only one Local Government from each district through balloting. Stage two involved obtaining a list of all registered HCPs within the local governments and stratifying them into private and government administered. At this stage, convenience method was used to choose three HCFs accredited by NHIS to provide primary, secondary and or tertiary services to be sampled in the study.

Pett, Lackey, and Sullivan (2003) factor analyses of subjects-to-variables ratio, with a minimum of Garson (2008) ten (10) subjects per variable in the study instrument was utilised to choose a sample size of 240 enrollee respondents which was calculated (20 subjects per each of the 12 variables in the study instrument). The minimum

sample size of approximately 266 (240/0.9) patients was reached after adjusting for 10% non-response to the questionnaire.

A total of 252 copies of a structured questionnaire and 5 IDIs were used to elicit data from the respondents. The quantitative data collected was analysed using the nominal descriptive statistics of frequencies and simple percentages with the help of the Statistical Product and Service Solutions (SPSS) version 20. The qualitative data was analyzed using inductive content analysis. To find the relationship between the variables and test of hypotheses, the contingency Chi-Square and the Spearman's correlation analysis was performed.

The quality indicator variables were presented according to Ndiyo (2005) five (5) Likert scale position ranking. Where Strongly agree ranked highest (5), Agree ranked (4), Undecided ranked (3), Disagree ranked (2) and Strongly disagree ranked lowest (1). During hypotheses testing, these ordered categories were transformed, summated and the responses converted into five (5) categories termed as five (very good), four (good), three (undecided), two (bad) and one (very bad). The perception variables were measured using likert-type items of five ordered categories, rated from five (very high in quality) to one (very low in quality).

Ethical clearance was obtained from the Lagos State Government Health Service Commission before the study commenced with an ethical clearance code of: LSHSC/88/S.3/II/257. The management of all HCFs used in the study gave written approval for the implementation of the study. Study objectives, confidentiality of responses, benefits and the right to refuse were explained to participants of IDIs, of which written informed consent was obtained from willing participants and those without formal western education had the content translated to them in the locally spoken Yoruba language.

Results

Table 1: Socio-demographic characteristics of respondents

Variable	Frequency Distribution (N=252)	Percentages (%)
Gender		
Male	82	32.5
Female	170	67.5
Age		
18-20	22	8.7
21-30	66	26.2
31-40	93	36.9
41-50	25	9.9
51-65	46	18.3
Marital Status		
Single	70	27.8
Married	134	53.2
Others	48	19.0

Public-Private HCFs		
Public HCFs	44	17.5
Private HCFs	208	82.5

Source: Field Survey (2019)

From Socio- Demographic characteristics of respondents in Table 1, majority (67.5%) of the respondents were females. This percentage of the female respondents corresponds with the last census report. Again, a larger proportion (53.2%) of the respondents was married. The majority (36.0%) of the respondents fall within the age bracket of 31 and 40 which represents the active working population with a mean interval of 3.0278. Although more expensive, larger proportion of the respondents (81.3%) subscribed to the private HMO plan and 82.5% accessed care in private HCFs.

Table 2: Distribution of respondents' on quality of HCF's physical structure and equipment

Questionnaire Item	Responses					Total
	Strongly Agree (%)	Agree (%)	Undecided (%)	Disagree (%)	Strongly Disagree (%)	
The physical environment of the HCF is conducive	60 (23.8%)	94 (37.3%)	32 (12.7%)	36 (14.3%)	30 (11.9%)	252 (100%)
The medical equipment is standard and functional	42 (16.7%)	113 (44.8%)	29 (11.5%)	40 (15.9%)	28 (11.1%)	252 (100%)

Source: Field Survey (2019)

In Table 2, Respondents assessment of the HCF tangible aspects of service reveals majority (61.1%) from a combined weight of Strongly Agree (SA) and Agree (A) accepted the conducive state of the HCFs physical environment. Similarly, 61.5% combined weight of Strongly Agree (SA) and Agree (A) shows HCF possession of standard and functional equipment compare to the combined weight (27%) of Disagree (D) and Strongly Disagree (SD) respondents' on the HCF equipment quality.

Table 2b: Distribution of respondents' perception on quality of HCF's physical structure and equipment

Questionnaire Item	Responses					Total
	Very High perception (%)	Fairly High perception (%)	Average perception (%)	Low perception (%)	Very Low perception (%)	
Respondents' rating of HCF physical structure and equipment quality	53 (21.0%)	86 (34.1%)	36 (14.3%)	36 (14.3%)	41 (16.3%)	252 (100%)

Source: Field Survey (2019)

Table 2b reveals that majority of the respondents (55.1%) from a combined weight of very high and fairly high rated positively while 30.6% combined weight of low and very low perception rated the HCFs physical structure and equipment negatively.

Test of hypothesis

H0: There is no significant relationship between enrollees' perception and HCFs physical structure and equipment quality.

H1: There is significant relationship between enrollees' perception and HCFs physical structure and equipment quality.

Decision criterion: Reject H0 if the calculated (observed value) of chi-square ($\chi 2c$) is found to be greater than the critical (table) value of chi-square $\chi 2t$ (0.01), if not, do not reject. Data from Table 2 and 2b were cross tabulated and used in testing this hypothesis. The result is shown in Table 3.

Table 3: Cross tabulation of relationship between enrollees' perception and quality of HCFs physical structure and equipment

Variables	Very high Perception (%)	Average Perception (%)	Very low Perception (%)	Total	χ^2
Very Good	29 (48.3)	8 (13.3)	23 (38.3)	60 (100.0)	$\chi^2 = 66.750$
Good	70 (73.7)	8 (8.4)	17 (17.9)	95 (100.0)	$r = .064$
Undecided	11 (35.5)	6 (19.4)	14 (45.2)	31 (100.0)	P = .000
Bad	17 (44.8)	8 (21.1)	13 (34.3)	38 (100.0)	df = 16
Very bad	12 (42.9)	6 (12.8)	10 (35.8)	28 (100.0)	
Total	**139 (55.1)**	**36 (14.3)**	**77 (30.6)**	**252 (100.0)**	

Source: Field Survey 2019
*** Correlation is significant at the 0.01 level*

Table 3 shows the relationship between enrollees' perception and the quality of physical structure and equipment. A total of ninety-nine (99) respondents' who are very high in perception who also saw the quality of physical structure and equipment as very good and good is higher than those (29) who are very high in perception but saw the quality of physical structure and equipment as bad and very bad. Also the 99 respondents' is higher than those (23) who are very low in perception and saw the quality of physical structure and equipment as very bad and bad. As we see from these group comparisons therefore, we can see empirically that there is a relationship between perception and quality of physical structure and equipment.

Inferential statistics supports this empirical observation as shown in the calculated $\chi 2(16)=66.750$ is higher than the chi-square table ($P<0.01$). Therefore the null hypothesis is rejected and the alternate hypothesis accepted. Also, the Spearman's correlation (r)=.064 shows a positive relation between perception and quality of equipment and physical structure.

Content Analyses

Regarding structure, respondents' were interviewed regarding the tangible physical aspects of the HCFs, as observed in one of the public HCF, the windows in the female ward were all broken, with little or no greenery. A participant asserted thus:

The atmosphere continually reeks of offensive odour ranging from vomit to corpse embalmment. There is always that frightful stench. You have to use a nose mask to curtail the smell (IDI 1. Female. 44)

As observed regarding examination, the assessment of the structural quality also includes the use of standard and functional equipment in treatment and some participants recounted their ordeal:

In my entire one year of assessing care here, I have never been sent for laboratory diagnosis. Once I complained, and the doctor picked an offense (IDI 4. Female. 52)

A respondent stated thus:

Technically, only sick people come to the hospital, and if proper diagnosis is carried out, one will get better, therefore cease visiting the hospital, and every medical facility wants to make profit, so, the longer the ailment, the more frequent the patient comes in for treatment. For instance, I have been visiting for on account of malaria for 6 months yet no blood test (IDI 2. Male. 26)

Another respondent' asserted further:

I noticed that out-of-pocket paying patients were coming out from various units of the hospital that conducts tests, scan, dialysis etc, so, I am sure the equipments are standard and functional, but as an enrollee, you don't have access to such luxury as the popular song in the mouth of every personnel is "it's not covered" making me wonder what the scheme actually covers (IDI 5. Male. 30)

These responses above suggest that healthcare facilities were in possession of standard and functional equipment, which was accessed by out-of-paying patients but enrollees were deprived of such evident based means of healthcare service. It is evident that despite the fact that hospitals are supposedly the place where patients despair is abated, the physical state can affect how patients perceive the quality of services. Thus validifying the 'cleanliness is next to godliness' slogan.

Furthermore, the responses show that an enrollees insurance plan determines the quality of service accessed at hospitals and the health plans also affects the quality of service rendered, such services that involves access to equipments testing kits. This therefore raises the concern for the quality of services accessed at the HCFs by the poor and low economy enrollees'.

Conclusively, IDI statements reflected that the patients' perceptive insight builds from the cues gathered during comprehensive healthcare services experience.

Discussion of findings

The major aim of this research was to "assess enrollees' perception of quality of HCFs physical structure and equipment". The null hypothesis "quality of HCFs physical structure and equipment does not affect enrollees' perception significantly" was postulated to direct the study. The research found that intangible aspect of healthcare services were taken into cognisance by the enrollees' as a contributing factor during healthcare access. This finding validates Mosadeghrad (2013) environmental attribute of quality healthcare and Dijkstra, (2006) demonstration on the relevance of the physical healthcare environment on the health and well-being of patients.

The survey result revealed that HCFs environment were conducive, and the equipment was of functional and of standard quality, yet, IDI responses indicated an appalling physical state in the area of general cleaning, and despite the presence of functional equipments, enrollees' treatment were being conducted without thorough evidence based investigations from medical diagnostic equipment due to either enrollees health plan, NHIS coverage, or HMO and HCF tariff agreement.

This is also consistent with the attention perspective that the individual mind is capable of picking, processing and maintaining environmental cues, making perception a sequence involving mental awareness of objects.

Information presented in Tables 2 and 2b was cross tabulated to test the null hypothesis generated. The contingency chi-square test result showed a significant relationship between the variables, likewise, a positive correlation result (.101) was ascertained from the Spearman analysis as shown in Table 3, thereby leading to the rejection of the null hypothesis.

Conclusion and Recommendations

The study shows enrollees perception is affected by the quality of HCFs tangible aspects (physical structure and equipment). This explains that HCF poor management of the physical structures as well as inadequacies in functional equipments has an effect on the healthcare services offered to enrollees'.

IDI research finding concludes that, though by policy statement, there is a social health insurance scheme in Nigeria, however in reality; there might be some problems in the dispensation of treatment due to bureaucratic nature of HCFs and the NHIS-HMO coverage policy. The study therefore recommends;

1. Though the respondent agreed that medical equipment were standard and functional at the HCFs, however, evidence suggested that some HCPs deprive enrollees from evidence-based diagnoses on the pretext of coverage. To ensure the desired healthcare result is achieved, it is recommended that constructive inspectorate division be instituted to ensure accredited HCPs deliver evidence-based services such as; enrollees' ability to access testing facilities like laboratory during health diagnosis process.

2. In the light of the fact that respondents' are aware of the tangible aspect of healthcare service, the physical ambiance such as flowering, waste management, constant flowing water and scent enhancers should be given priority to ensure consistency in quality health promotion.

3. Enrollees should be allowed to access laboratory as well as other testing facilities considered relevant in their illness treatment. This will ensure an all inclusive evidence based diagnosis for CIPA and CRPS (Congenital Insensitivity to Pain with Anhydrosis; Complex Regional Pain Syndrome) patients.

Abstract

Purpose: The theoretical purpose of this article is to identify customer behaviour in a multi-channel sales environment in terms of all marketing mix components: product - stock availability, price - differentiation level, promotion - additional terms and conditions, distribution - delivery and return options. The practical purpose of the article is to provide guidelines for the recommendations of the omni-channel structure built by trading companies. **Methodology:** As part of the theoretical part, a systematic literature review based on Scopus scientific articles was used. As part of the practical part, a questionnaire study was carried out based on an original algorithm, and as part of the analysis of the results, mathematical and statistical analyses were used, e.g. hypothesis testing by means of Mood's median test. **Findings:** In the scientific literature, omnichannel in general has definitely wider connections with marketing than strictly with the marketing mix (niche subject). Empirical research shows that Internet channels are the most popular sales channels among young customers (aged under 25). The vast majority of them make purchases by collecting information about the offer from more than one sales channel. **Implications**: The research results are first and foremost important for distributors shaping their logistics customer service systems in the spirit of omnichannel. They can also prove useful for consumers making purchases in the omnichannel distribution environment. **Originality**: On the theoretical side, the article identifies the theoretical gaps between omnichannel and marketing. On the practical side, the article contains an original methodological proposal of the omnichannel marketing research.

Keywords: omni-channel, marketing mix, purchase, sales channels, customer behaviour

Introduction

Nowadays, the customer can operate in the supplier's many sales channels. This phenomenon, depending on the degree of its advancement, is called: multichannel, crosschannel, omnichannel (increasing complexity gradient). Its most advanced form - omnichannel - allows the customer to function in the supplier's two or more sales channels at the same time. Although this axiom seems unreal in practice, it is actually implemented.

The authors of this article maintain that the omnichannel studies conducted so far are mainly static in character. This statics is related to: firstly - the lack of comprehensive and detailed knowledge about the sequence of transition (performance) of a specific transaction - what specific sales channel a specific customer used at what specific stage of the purchase-sales transaction; secondly - the lack of knowledge about what a particular customer was doing at a given stage of the purchase-sales transaction - whether they checked the offer in other sales channels at the same time or not.

Breaking the sales channels as part of the transaction (its non-linear transition - using different channels), combined with the parallel presence of the customer in the supplier's two sales channels at the same time, is at the heart of omnichannel. The condition that complements the essence of omnichannel, in line with the postulates of marketing, is the lack of differences in the level of customer service between channels - both at the level of the entire transaction and its individual stage (this aspect will be the subject of the authors' next article). The level of service in each sales channel (marketing mix composition) should be the same.

Cite this Article as: Roman DOMANSKI and Michal ADAMCZAK "Omnichannel Sales in Marketing Mix Context – Research Results" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Taking into account the cited disadvantages of the static approach, the authors of the present article decided to propose a dynamic approach in the omnichannel study. It consists in the full traceability of the course of the transaction - its transparency both globally and at each given stage. It consists in the fact that a fully identifiable customer purchases a given specific product recreating their historical purchasing experience. The research is carried out from the perspective of the logistic marketing mix - the following are checked in each channel: stock availability, price differentiation, additional terms and conditions, delivery and return options.

The purpose of this article is to identify the functioning of the customer in the distributor's sales channels from the perspective of the marketing mix elements. Achieving the purpose of the article requires:

- identification of the omnichannel scale based on the results of breaking/not breaking the sales channels,
- identification of the most and least preferred sales channels in a given marketing mix element,
- identification of the most and least frequently checked elements of the marketing mix in each sales channel, compared to the channel in which the purchase took place.

In relation to the theoretical assumptions of the omnichannel concept, it should be considered in practice whether consumers should actually have a full spectrum of choice in each sales channel. Intuition tells us that consumers undoubtedly do not use certain options of choice or use them marginally. From the business point of view, maintaining such sales channels costs money, unnecessarily straining distributors' sales budgets.

The structure of the article is as follows: section 1 - introduction (research background, purpose of the article), section 2 - literature review (assumptions, quantitative and qualitative analysis); section 3 - description of the research approach (research methodology and algorithm), section 4 - analysis of research results (assumptions, mathematical and statistical analyses, results interpretation), section 5 - summary (conclusions, research limitations, directions for future research).

Theoretical background

Assumptions of the Literature Analysis

A systematic literature review was carried out in September 2020 on the basis of the Scopus database of scientific articles (selection criterion: leading database of journals in the discipline of management and quality science which is represented by the authors of the article). The analysis of the literature consisted in searching for selected characteristic words and phrases in three places: title, abstract and keywords - independently (single search) and dependently (complex search for compounds). The conducted literature search is quantitative and qualitative in nature. The aim of the quantitative analysis was to identify the number of publications in particular thematic scopes. The aim of the qualitative analysis was to identify the type of thematic threads undertaken by individual researchers. The literature review is supplemented and completed by bibliometric reports, based on the statistics offered by the Scopus database.

Quantitative and qualitative analysis of publications

In the Scopus database, a total of 711 articles on omnichannel were selected, including 349 ("omnichannel") - the first set and 362 ("omni-channel") - the second set. Within the first set, only 3 ("marketing mix") or 2 ("marketing-mix") publications have connections with the elements of the marketing mix. Due to the fact that all articles from the "marketing-mix" category are included in the "marketing mix" category, the 3-element set will be analyzed further.

These publications are from 2018 (2) - 2019 (1). From the point of view of the number of publications, there are no clearly distinguished authors, research centres or countries - single affiliations. However, from the point of view of citations, publications by Wang (5), Park and Kim (3) can be singled out. The dominant area of allocation is Business, Management and Accounting (declared in each publication). Park and Kim explore how consumers' personality trait affects their omnichannel adoption behaviour. In-depth analysis of consumer profile may enable more specific methods for marketing and managing consumers in the omnichannel context (Park & Kim, 2019). Harvey and Sanchez explore the impact of the convergence of media, strategies and technologies on the four points of the traditional marketing mix (Harvey & Sanchez, 2018). Wang analyzes the best media for mobile phone purchase methods for different groups of buyers. The proposed solution can help in the clustering results of product mix in the contex of procurement and marketing solutions (Wang, 2018).

Within the second set, the situation is similar: 4 publications ("marketing mix") and 2 publications ("marketing-mix"). Similarly, all articles from the "marketing-mix" category are included in the "marketing mix" category, so the 4-element set will be analyzed further.

These publications come from 2015-2020: 2015 (1), 2016 (1), 2019 (1), 2020 (1). From the point of view of the number of publications, there are no clearly distinguished authors - individual affiliations. However, one can observe (in terms of research centres and countries) a slight dominance of the Rennes School of Business from France. From the point of view of citations, publications by the following authors can be singled out: especially Picot-Coupey et al. (59) and Kijpokin (5). The dominant area of allocation (similarly to the first set) is Business, Management and Accounting (declared in each publication). Agarwal and Dixit analyze the case of the Myntra - in spite of touching heights in the online world in a short time span, the company is not convinced about the customer satisfaction. Myntra is planning scaling up their offline presence by opening its physical stores to boost its brands (Agarwal & Dixit, 2020). Koetz analyzes the concept of customer experience (according to marketing approach) based on case of physical stores and Sephora Flash (a mix of a physical and digital store). To provide an enhanced omni-channel shopping experience is one of the most important things (Koetz, 2019). Picot-Coupey, Huré and Piveteau present channel design to enrich customers' shopping experiences. This article investigates empirically the challenges of an e-retailer when moving towards an omni-channel strategy (Picot-Coupey et al., 2016). Kijpokin explores the roles of corporate marketing strategies and brand management in the global retail industry. It is critical for modern organizations that seek to serve suppliers and customers (Kijpokin, 2015).

Due to the small number of publications, the authors of this article decided to extend the spectrum of analysis (omnichannel) to a broad approach to marketing (without being limited only to the marketing mix), but limited by the subject of this article - purchase issues. Therefore, the searched phrase was the following composition of words: omnichannel marketing purchase (first set). A total of 13 publications were selected, including 1 conference report (omitted in further analysis), 1 publication that had already appeared earlier (Wang, 2018). These publications come from 2014-2020: 2014 (2), 2016 (1), 2017 (1), 2018 (2), 2019 (3), 2020 (3). From the point of view of the number of publications, there are no clearly distinguished authors and research centres - individual affiliations, but in the case of countries there is quite a significant US dominance - 4 publications. From the point of view of citations, publications by the following authors stand out: especially Taylor and Levin (67), also Grewal et al. (13) and Berman and Thelen (10), to a lesser extent: Shankar (7), Taufique et al. (4), Kang (3), Zaware et al. (2), Kozlova et al. (2). The dominant area of allocation, next to Business, Management and Accounting (declared in 7 publications), is Computer Science (5 publications), which is a novelty in relation to the previous cases of the literature analysis. As part of 11 new publications, their authors undertake the following research threads: multimedia advertising effectiveness (Danaher et al., 2020); omnichannel consumer buying behaviour - the purchasing pattern (Zaware et al., 2020); purchase a professional retailing technology from the technology service provider (Hu & Zhou, 2020); effect of omnichannel marketing on the online search behaviour of retail consumers (Riantini, 2019); interrelationships among lifestyle of social-local-mobile (SoLoMo) consumers and omnichannel shopping intention (Kang, 2019); parameters, habits, pre-buying and post-buying behaviour, as well as preferences and expectations of the omnichannel consumer (Kozlova et al., 2019); differences between multichannel and omnichannel marketing and transition from multichannel marketing to omnichannel marketing (Berman & Thelen, 2018); customer equity (Taufique et al., 2017); influence of retailer tactics and customer-specific factors on shopping behaviour in shopper marketing (Grewal et al., 2017); evolution of shopper marketing from 1.0 to 2.0 (Shankar, 2014); predictors of mobile app usage for purchasing and information sharing (Taylor & Levin, 2014).

In the second set of articles, the searched phrase was the word composition: omni-channel marketing purchase (another form of the omnichannel notation). A total of 11 publications were selected, including 1 publication that had already appeared in the first set (Riantini, 2019). These publications come from 2017-2020: 2017 (3), 2018 (4), 2019 (1), 2020 (3). From the point of view of the number of publications, there are no clearly distinguished authors and research centres - single affiliations, but in the case of countries there is quite a significant US dominance - also 4 publications (similarly to the first set). From the point of view of citations, the following authors stand out: Zhang et al. (43), also Rippé et al. (18), to a lesser extent: Viejo-Fernández et al. (4), Miell et al. (3), Rajan et al. (2), Niimi and Hoshino (2), Ravula et al. (1). The dominant area of allocation, next to Business, Management and Accounting (declared in 9 publications), is Computer Science (4 publications), although here it does not dominate as much as before (first set). As part of 10 new publications, their authors undertake the following research topics: usage of omni-coupons - impact of cross-effects on consumer purchase outcomes (Ravula et al., 2020); comparisons showrooming with online buying behavior - effect on the price paid online by the customer (Viejo-Fernández et al., 2020); customer journey in digital media - the impact of cross-media exposure on customers' purchase decisions (Klein et al., 2020); measuring the effects of online-to-offline marketing - how consumers adopt this commerce models (Chiang et al., 2018); impact of channel integration in omni-channel retailing - effect of consumer empowerment (Zhang et al., 2018); best practice utilisation of fit and sizing technology in online fashion retailing (Miell et al., 2018); algorithm for measuring similarity of consumer movement paths in shopping mall (Kim et al.,

2018); salesperson's role in selling to a mobile-dependent consumer who uses mobile technology to search for information during the sales meeting (Rippé et al., 2017); key drivers of purchase intent by consumers in omni-channel shopping - merging online and offline shopping practices (Rajan et al., 2017); predicting purchases with using the variety of customer behaviors (user access patterns) - analysis of the purchase history and the browsing history (Niimi & Hoshino, 2017).

Summary of the Literature Review

The conducted literature searches allow for the formulation of the following conclusions. Strict connections of omnichannel with the marketing mix constitute a niche area of interest (a small number of publications resulting from it). In a broader sense (marketing considered globally without any limitations), individual elements of the marketing mix appear in other authors' publications related to omnichannel. However, there are no articles covering all of them at the same time. The review of the publications highlighted a wide variety of thematic threads undertaken by other authors. The following publications correspond the most (in some elements) to the subject of this article: (Klein et al., 2020), (Zaware et al., 2020), (Kang, 2019), (Koetz, 2019), (Kozlova et al., 2019), (Park & Kim, 2019), (Riantini, 2019), (Zhang et al., 2018), (Grewal et al., 2017), (Niimi & Hoshino, 2017), (Rajan et al., 2017), (Picot-Coupey et al., 2016).

Summing up, the research topic proposed by the authors of this article, from the point of view of its complexity (including all elements of the marketing mix at once), is an innovative approach in the omnichannel study. Also, the approach and research framework presented in sections 1 and 3 constitute an original methodological approach, not yet encountered in the publications of other scientists. The authors of this article, after previous work in the omnichannel area - private labels (Domański & Łabenda, 2020), CRM systems (Domański & Koliński, 2020), (Domański & Wojciechowski, 2020), (Domański & Filipiak, 2019), omnichannel costs (Adamczak et al., 2018), the concept of logistic customer service (Domański & Hadaś, 2017) - with this article open their new interest in the research topic concerning the analysis of omnichannel relationships and elements of the marketing mix.

Research Framework

Research Methodology

The theoretical goal of this article is to identify customer behaviour in the multi-channel sales environment in terms of all components of the marketing mix. The research consisted in recreating by the respondents their historical, recently made purchases (course of process performance). Three product categories were selected for the study: clothing/footwear, electronics, cosmetics. These are popular products, quite commonly purchased, with which the respondents should have extensive purchasing experience. The products differ from each other (research intention), which may allow the identification of differences and similarities in their purchase by customers.

In the study, the course of a purchase transaction is considered through the prism of marketing-mix elements in sales channels: stock availability, the level of price differentiation, additional terms and conditions and delivery options (delivery and return). The essence of the research is the question of breaking sales channels by the customer and their simultaneous presence in the supplier's more than one sales channel at the same time - e.g. if the respondent was buying something in a brick-and-mortar store, did they take into account any of the marketing-mix elements, e.g. checked the price in an online store?

The survey took the form of an electronic survey made available to respondents as part of Google documents. The survey was anonymous and voluntary. It was made available to young people aged 18-25 with at least secondary level education who are active in purchasing processes (they make purchases on their own). The choice of this age group and level of education was not accidental. The authors of the study are particularly interested in how people who in the near future will be a group of customers with the greatest purchasing potential behave in purchasing processes. Researching this group allows to draw conclusions that can be used to improve purchasing processes. Assuming the population size at the level of 3 099 300 - the number of people aged 18-25 in Poland in 2016 (Statistics Poland, 2016), the significance level at $\alpha = 0.05$ and the permissible error at the level of 7.5%, the research sample size is 171 people. The questionnaire was available for one month - June 2020. 188 full responses (complete fillings) were obtained, which were further analyzed in the research results section.

Research Algorithm

At the beginning, the respondent filled in a form, providing 3 simple characteristics of themselves: gender (female, male), age (18-20, 21-25) and the level of ICT skills (on a scale from 1 - very poor to 5 - very good). Then, the

respondent selected goods that they had recently bought (clothing/footwear, electronics, cosmetics) - only one of the three categories could be selected, then (question 1) they declared the sales channel under which the purchase was made (traditional store, online store, call centre, social media, trading platform) - also it was possible to choose only one of five categories.

The further course of the study took place in terms of the marketing-mix elements. As regards the stock element, the respondent was asked (question 2) whether, before making a purchase in the channel that they declared (question 1), they had checked the availability of goods also in another sales channel of the distributor (yes, no) - binary selection. In the case of a negative answer, the respondent was immediately redirected to the price part of the survey (question 4). In the case of a positive answer, the respondent was asked (question 3) to indicate the channel in which they did so (traditional store, online store, call centre, social media, commercial platform) - the same categories as in question 1. After that, as in the case of a negative answer, a transition to the price stage of the survey took place (question 4).

As far as the price element is concerned, the logic of the algorithm was exactly the same as in the case of the stock element: if the respondent did not check the price of the goods in the alternative sales channel, then after question 4, they were immediately transferred to question 6 (additional terms and conditions stage); if they did so, in question 5 they were asked to indicate the channel in which they were doing it. This was followed by moving on to question 6.

Therefore, if the respondent did not use alternative sales channels at a given stage of the purchase transaction, they were immediately redirected to the next marketing-mix element. If, at a given stage of the purchase transaction, the respondent used alternative sales channels, they were asked to indicate them. As regards the remaining elements of the marketing-mix, the respondent was asked to indicate alternative sales channels as part of: additional terms and conditions (question 7), delivery options (question 9), return options (question 11) - as long as they checked them.

Therefore, after answering question 1, the shortest path of the algorithm is the answer to only 5 questions (case of negation), the longest answer to all 10 questions (alternative checking of every element of the marketing-mix).

Research Results

Assumptions of the survey analysis

Before analyzing the results of the research, it was determined how the situation of not breaking and breaking the sales channel in the purchasing process would be identified. The situation of not breaking the sales channel takes place when the buyer did not check the conditions of the marketing mix elements in other sales channels or when they checked them but in the same sales channel, i.e. they analyzed the offer only within one sales channel. The remaining cases in which the respondents made purchases in the indicated sales channel, checking the elements of the marketing mix in other sales channels, were defined as breaking the sales channel.

Mathematical and statistical analysis of the survey results

The analysis of the distribution of the results of not breaking and breaking the sales channel in the purchasing process showed that there was no normal distribution of these variables. The distributions of results for individual layers cannot be assigned to any of the theoretical distributions.

The analysis of the results was focused on the implementation of three specific objectives of the study, which are:
- identification of the omnichannel scale based on the results of breaking/not breaking the sales channels,
- identification of the most and least preferred sales channels in a given marketing-mix element,
- identification of the most and least frequently checked elements of the marketing-mix in each sales channel, compared to the channel in which the purchase took place.

188 respondents took part in the survey. The basic characteristics of the tested sample are presented in Table 1.

Table 1: Characteristics of respondents and goods

		n	%
gender	female	102	54.3%
	male	86	45.7%
age	up to 20	45	23.9%
	21-25	143	76.1%
ICT skills	1	0	0.0%
	2	14	7.4%
	3	88	46.8%
	4	74	39.4%
	5	12	6.4%
type of goods	electronics	49	26.1%
	cosmetics	45	23.9%
	clothing/footwear	94	50.0%

Source: own research

The gender distribution of the respondents is close to 1:1. The age distribution of the study participants also reflects the characteristics of the population. The group up to 20 consists of people aged 18, 19 and 20. The second group is made up of people aged 21 to 25. It is assumed that the number of people in each year is similar. Therefore, if the second age range is wider (5 years) than the first (3 years), it should also be more numerous in the sample. In the studied sample, no one assessed their ICT skills at a very low level.

In the study, as specified in the methodology (section 3), questions were asked about the course of the purchasing process. Table 2 presents the distribution of the sales channels in which the analyzed goods were purchased.

Table 2: Sales channels in which the analyzed goods were purchased

sales channel	n	%
call center	0	0%
trading platform	23	12%
online store	105	56%
traditional store	60	32%
social media	0	0%

Source: own research

Despite including the possibility of making a purchase through a call centre and social media channels, none of the respondents indicated such an answer. The purchasing processes carried out in online stores and traditional stores had the largest share in the results. It should be noted here that the study was conducted in the period of defrosting the Polish economy after lockdown caused by the COVID-19 pandemic. Shopping in traditional stores at that time was not as easily accessible as usual.

In the first step of the analysis, the percentage of buyers breaking the sales channel in the purchasing process was checked (goal one). The conditions for breaking and not breaking the sales channel were described in the assumptions for the analysis of the survey results. The results of this analysis are presented in Table 3.

Table 3: Analysis of breaking and not breaking the sales channel in the purchasing process

	n	%
not breaking the sales channel	51	27%
breaking the sales channel	137	73%

Source: own research

It can be concluded from the obtained results that in the vast majority of purchasing processes, buyers checked the conditions of the marketing mix elements in more than one sales channel. Treating 27% of cases where a purchase

was carried out in not breaking the sales channel as a separate sub-sample, its 81% were cases where buyers made a purchase without checking the marketing mix elements in another channel, and 19% were cases where customers checked these conditions but in the same sales channel in which they made the purchase.

The phenomenon of breaking and not breaking the sales channel requires a deeper analysis. The authors of the study checked whether there were any differences in the occurrence of this phenomenon depending on the characteristics of the respondent and the goods purchased by them. The results of the detailed analysis of breaking and not breaking the sales channel in the purchasing process are presented in Table 4.

Table 4: Analysis of breaking and not breaking the sales channel in the purchasing process divided into layers of the research sample

		not breaking the sales channel		breaking the sales channel		P-Value
		n	%	n	%	
gender	female	29	28%	73	72%	0.661
	male	22	26%	64	74%	
age	up to 20	11	24%	34	76%	0.643
	21-25	40	28%	103	72%	
ICT skills	1	0	0%	0	0%	0.998
	2	4	29%	10	71%	
	3	24	27%	64	73%	
	4	20	27%	54	73%	
	5	3	25%	9	75%	
type of goods	electronics	8	16%	41	84%	0.104
	cosmetics	12	27%	33	73%	
	clothing/foot wear	31	33%	63	67%	

Source: own research

From the results presented in Table 4, it can be seen that there are no clear differences in breaking the sales channel between the groups selected in the survey report. The percentage of people who do not break the sales channel fluctuates around 27%, as in the results analyzed for the entire sample. Slight differences are visible only in the case of the goods that were bought (here the percentage of people who do not break the sales channel ranges from 16% to 33%).

In order to statistically verify the differences in individual layers of the research sample, the hypothesis was verified by means of Mood's median test. This approach is justified by the lack of the normal distribution of the results within the population layers. Additionally, in order to perform a quantitative analysis, the text values "not breaking the sales channel" were replaced with number 1, and the "breaking the sales channel" with number 2. The test sample was divided into layers according to the criteria included in the respondent's particulars. For example, one of the criteria is the respondent's gender, and the sample layers separated according to this criterion are two: female and male. For each criterion according to which the layers were separated, several statistical hypotheses were formulated:

H0: Medians of the individual layers of the sample are the same.
H1: Medians of the individual layers of the sample are different.

The study was conducted with the assumption of the significance level $\alpha = 0.05$. P-Value indicates that it is not possible to reject H0 hypotheses. Thus, the individual layers of the sample do not show any differences in breaking or not breaking the sales channel.

Continuing the analysis of breaking and not breaking the sales channels, the authors examined the direction in which the possible breaking of the channel occurs in the case of making a purchase in a specific channel. The results of this analysis are presented in Table 3.

Table 5: Analysis of breaking and not breaking the sales channel in the purchasing process divided into the channels in which the analyzed purchase was made

	not breaking the sales channel		call center		trading platform		online store		traditional store		social media	
sales channel in which the purchase was made	**n**	**%**	**n**	**%**	**n**	**%**	**n**	**%**	**n**	**%**	**n**	**%**
call center	0	0%	0	0%	0	0%	0	0%	0	0%	0	0%
trading platform	4	17%	0	0%	3	13%	18	78%	6	26%	2	9%
online store	29	28%	1	1%	52	50%	5	5%	32	30%	15	14%
traditional store	18	30%	0	0%	8	13%	41	68%	2	3%	4	7%
social media	0	0%	0	0%	0	0%	0	0%	0	0%	0	0%

Source: own research

The results of the analysis for call center and social media channels are in grey due to insufficient number of responses. The most common dependency for the sales channel in which the purchase took place is marked in green. The headings of the lines (Table 5) show the sales channels in which the respondents made the original purchase. The columns show the channels in which the conditions within the selected elements of the marketing mix were checked. The percentage value in the individual fields of the table describes in what percentage of channel breaking in the purchasing process the buyer's attention was directed to the alternative channel, e.g. among people who made a purchase on the trading platform, 17% did not check offers in other channels, and 78% checked these conditions in an online store. In the study (explanation in section 3), the respondents could indicate several different sales channels in which they checked the conditions offered in particular elements of the marketing mix. Therefore, the percentage share of responses indicating sales channels does not add up to 100%. Totals greater than 100% show that customers checked offers in more than one sales channel.

The next stage of the analyses was the implementation of the second objective of this article - the answer to the question of what are the most and least preferred sales channels in a given marketing-mix element. The results of this analysis are presented in Table 6.

Table 6: Identification of the most and least preferred sales channels in a given marketing mix element

	call center		trading platform		online store		traditional store		social media	
marketing mix element	**n**	**%**	**n**	**%**	**n**	**%**	**n**	**%**	**n**	**%**
availability	0	0%	29	30%	48	50%	17	18%	2	2%
price	0	0%	48	42%	41	36%	21	19%	3	3%
additional terms and conditions	0	0%	18	19%	41	43%	19	20%	17	18%
delivery options	0	0%	24	38%	31	48%	7	11%	2	3%
return options	1	2%	14	27%	23	45%	13	25%	0	0%

Source: own research

As in Table 5, the results that were not included in the analysis are marked in grey this time (the number of responses for the call center channel was too small). The green colour marks the channels in which a given marketing mix element was checked the most often, and red - the one in which it was checked the least often.

The final stage of the analyses was the implementation of the third objective of the article, i.e. identification of the most and least tested elements of the marketing mix in each sales channel. The results of this analysis are presented in Table 6.

Table 7: Identification of the most and least checked elements of the marketing-mix in each sales channel

	availability		**price**		**additional terms and conditions**		**delivery options**		**return options**	
sales channel	**n**	**%**	**n**	**%**	**N**	**%**	**n**	**%**	**n**	**%**
call center	0	0%	0	0%	0	0%	0	0%	1	100%
trading platform	29	22%	48	36%	18	14%	24	18%	14	11%
online store	48	26%	41	22%	41	22%	31	17%	23	13%
tradition al store	17	22%	21	27%	19	25%	7	9%	13	17%
social media	2	8%	3	13%	17	71%	2	8%	0	0%

Source: own research

The results presented in Table 7 were supplemented with a colour illustration in accordance with the same assumptions as in Table 6. As before, also this time, data for the call center channel (too few responses) were excluded from the analysis.

Interpretation of Results

Summarizing the results of the conducted research, it should be stated that young people (aged 18-25), when purchasing clothing/footwear, cosmetics or electronics, very often check the conditions in several sales channels. As many as three quarters of respondents indicated that in the purchasing process which they analyzed they checked selected elements of the marketing mix in more than one sales channel. This transition between sales channels seems to be natural - it is a standard part of the purchasing process. There are no differences in terms of breaking the sales channel in the layers separated by gender, age, level of self-assessment of ICT skills or purchased goods. The differences in these layers are statistically insignificant. In the opinion of the authors of this study, it shows how natural and standard the element of the purchasing process of young people is to check sales conditions in various channels.

An important condition that should be indicated in the interpretation of the test results is the time in which it was conducted (June 2020). It was the time of economic defrosting after lockdown caused by the COVID-19 pandemic. This is especially important for interpreting the popularity of electronic sales channels. The sales channel most frequently indicated by respondents in which the analyzed purchase was made was the online store.

The analysis of the paths followed by buyers in the sales channels as part of the described purchasing processes allows to conclude that when making a purchase decision, the buyer most often compares the conditions of the marketing mix between online stores and purchasing platforms. In the event of making a decision to buy in a traditional store, its offer is compared with an online store. This regularity, although not statistically confirmed, is most visible in the case of the purchase of electronics, which may result from the greater value of these goods and the greater role of objectivity at the time of their purchase than in the case of more subjective decisions regarding the purchase of clothing/footwear or cosmetics. The remaining sales channels (call centre and social media) did not play a significant role (respondents mentioned them very rarely).

When analyzing the results from the perspective of selected elements of the marketing mix, it should be generalized that they are most often checked in the online store. The exception is the price, which is most often checked on purchasing platforms. The online store, due to the ease of reaching its offer (via a website or a dedicated

application), serves customers to check the offer in the broad sense of the word (comprehensive offer): price, additional terms and conditions, delivery conditions, return conditions, etc. Purchasing platforms, due to the easy possibility of comparing prices of different sellers, are an excellent tool for verifying this element of the marketing mix. The least frequently chosen sources of knowledge about the elements of the marketing mix are: call centre and social media.

When analyzing the results from the perspective of sales channels and the marketing mix elements tested in them, it should be noted that customers in electronic channels (online store, trading platform) most often check the price and additional terms and conditions. Interestingly, customers are not interested in the terms and conditions of return of goods purchased through this channel. The situation is different in the case of a traditional store, where the most frequently checked element of the marketing mix is the price. This is understandable when the purchase is made on-site. An interesting fact is that the most frequently indicated element of the marketing mix checked in the social media sales channel are additional terms and conditions. This shows the role that social media currently play in sales processes. They largely present the offer, especially those elements that can attract a potential customer. Therefore, customers expect from the offers presented in social media additional benefits related to the purchase (e.g. discount codes, bonuses, giveaways, etc.).

Conclusion, limitations and further research

Omnichannel is a young phenomenon that has been functioning for almost a decade. Classic sales and distribution channels have evolved naturally. The same is true for new forms of multichannel sales, which includes omnichannel (as their highest form of advancement). Hence, a large number of different research approaches can be observed in the omnichannel area. Which of these proposals will stand the test of time will most likely be decided by the customer's market - the handling of specific consumer requirements by the suppliers' logistics systems. Marketing creates various sales channels. The task of logistics is to conduct the flow of goods between the parties in an economical and effective way. Knowledge about the purchasing behaviour of consumers is crucial to the success of logistics goals.

As far as the theoretical part of this article is concerned, the limitation is the Scopus base of scientific articles - it is the only base considered as part of the literature review. Perhaps, in other scientific sources, the body of knowledge related to the subject of this article is broader. In terms of the practical part, the limitation is the fact that the study was performed only among people with at least secondary education residing in the territory of the Republic of Poland. It is necessary to note that also the current COVID-19 pandemic influenced the results of the study.

The directions for future research should consist in overcoming the existing limitations as well as extending the spectrum of omnichannel and marketing mix research to include new issues. A broader picture of theoretical knowledge in the subject can be obtained by conducting a literature search, e.g. in the Web of Science or Google Scholar resources. A broader picture of practical knowledge can be obtained as a result of further analyses focused on the level of customer satisfaction with the terms and conditions offered in individual sales channels and the implementation of these conditions as part of purchasing processes (assessment of the level of customer service). It would also be reasonable to extend the study to an international realm, which would allow to adapt the recommendations also to global distributors offering goods in more than one country. The survey must be necessarily repeated once the COVID-19 pandemic has ended (normal trading conditions).

According to the authors of the present article, the general conclusions of the conducted research direct the processes of building omnichannel sales channels for distributors of products of the clothing, cosmetics and electronics industries. From the point of view of young buyers, the most important sales channels are online stores, traditional stores and shopping platforms. The remaining channels are marginal solutions. The most important elements of the marketing mix which are checked in them are the price and additional terms and conditions offered by the sellers in a given channel.

Knowledge about the behaviour of young customers in sales channels is particularly important not only from the point of view of building the structure of future sales channels, but also from the point of view of directing consumers to their specific types, relationship management and shaping IT systems allowing for the collection and analysis of data on purchasing processes carried out by individual clients (CRM systems).

ABSTRACT

The environment may have a negative, neutral or positive influence on the organization. The unpredictability of the negative and neutral environment is often a source of potential threats whereas positive conditions creates opportunities to the organization. The turbulent environment of the enterprise forces on managers to take action dealing with the use of the business opportunities with limited possibility of risk verification. It is connected with short life cycle business opportunity and the dynamic nature of the risk. The paper presents meaning of the business opportunity and the risk connected with the use of the opportunity for the organizations. Based on different case studies the risk management process based on use of life cycle bossiness opportunity was created. The elaborated methodology allows evaluating of risk factors connected with the business opportunity from different sectors.

KEYWORDS: RISK, RISK MANAGEMENT, RISK MANAGEMENT PROCESS, OPPORTUNITY, LIFE CYCLE

The risk management process itself appears in the subject in literature various forms. In case of the Project Management Institute (Project Management Institute, 2009), distinguished six basic stages of risk management: risk management planning, risk identification, qualitative risk analysis, quantitative risk analysis, risk response planning, risk monitoring and control. Liderman K., (2008, p. 79); Hubbard, D., (2009, p. 30); Fraser J., Simkins B., (2010, pp. 203-4); and others present similar elements of the risk management process. According to the ISO 31000 standard, the risk management process includes six fundamental steps: communication and consultation (1), scope, context, criteria (2), risk management which include risk identification, risk analysis, risk evaluation (3), risk treatment (4), recording and reporting (5), monitoring and review (6).

The presented approach to risk management is mainly applicable in the case of large organizations, which may also have qualified organizational units. In the case of micro, small and medium-sized enterprises (SME), such an approach (narrowly specialized services dealing only with this issue) seems difficult to apply. Risk management in small and medium-sized enterprises has a less structured form, mainly based on the intuition of company managers.

In the literature on the subject, the issue of opportunities, especially risk identification and assessment, is mentioned in a few publications. The subject of risk identification and assessment concerning the life cycle opportunity is also insufficient. In addition to the lack of structuring of the theory related to opportunities and risks, one should also notice the needs of the business, especially SMEs, as regards the shaping of the risk management process dealing with the opportunities. Therefore, there is a research gap both in the area of theory and practice. This article is an attempt to fill the presented research gap. Therefore, there is a need to develop a solution that will allow reducing the risk in the event of opportunities with a short life cycle.

The research was carried out on a sample of ten small and medium-sized organizations from the SME group, which represented four basic industries: development, production, transport and services.

Literature Review

The phenomenon of opportunity is of interest to various scientific disciplines, ranging from microeconomics, strategic management cognitive science to resource theory (Hunter, 2013, pp. 58-59). Opportunities can be both subjec-

tive and objective and it is up to the company to perceive them. Hang, Garnsey and Ruan (2013, p. 6) believe that opportunities are discovered as well as created by enterprises. Alvarez and Barney (2007, pp. 11-26) argue that opportunities exist regardless of the actions and perceptions of the company. Ardichvili et al. (2003, p. 106) suggest that opportunities can be recognized to some extent, but that they are essentially developed in the course of the organization's deliberate activities and not found. The occurrence of an opportunity may be the result of deliberate actions of the enterprise or may be related to the element of surprise (Shane, 2000, pp. 448-469). Kirzner (1997, pp. 60-85) believes that opportunities can be disclosed without deliberate searches because enterprises have the necessary readiness and resources to seize opportunities. Enterprises can create a situation by acting, combining various resources, making changes without much involvement in the process of looking for opportunities (Peiris I. et al., 2013). Krupski (2008, pp. 49-50) notes that opportunities appear, last for a while, and then disappear.

The sources of opportunities may occur in a competitive environment and the macro environment of the enterprise (Bessant and Tidd,2011, pp. 430-431).

Trzcielinski (2011, p. 49) understands by opportunity a situation that favours the subject of action in achieving the intended goal or desired effect, which exists in the surroundings of this subject or is a postulated state of the features of this environment. The author of the publication believes that an opportunity constitutes a set of favourable events in the environment that can be used by the company (in order to gain benefits) thanks to the ability to configure the necessary resources.

Opportunities can be categorized taking into account management levels in the organization, especially in the perspective of the organizational hierarchy level (Królas P., Włodarkiewicz-Klimek H., 2015):

- **strategic opportunities** - are associated with a qualitative leap (product, market, technology, finance) of the enterprise;
- **tactical opportunities** – are connected with introducing a solution for improving the organization or creating a new function;
- **operational opportunities** - they concern the implementation of projects that have an impact on the current operational activity of the organization.

Due to the duration, the opportunities are limited and create a certain life cycle. From this point of view, one should distinguish between opportunities with a long and short life cycle. In the case of long life cycle opportunities, they are noticeable by many market participants. Enterprises have time to pool and prepare resources to seize the opportunity. They can also better identify and reduce the risk (Królas, Włodakiewicz-Klimek, 2015). Opportunities which creates short life cycle of opportunities are noticed by few companies. Their use depends on the ability to configure the necessary resources in a short time.

Short life cycle opportunity includes five basic phases (Trzcieliński, 2011):

- **pre-embryonic** - in this phase future events appear, often with a very long time horizon, which may be beneficial for the enterprise,
- **embryonic** - this phase concerns the occurrence of events that are the basis for the emergence of other situations considered interesting for the company,
- **birth** - occurring events cause the occurrence of a favourable situation. The situation may be complete, understood as an opportunity or incomplete being a chance for the enterprise,
- **duration** - the duration of an opportunity may be related to many factors beyond the company's control.
- **decline** - this phase may occur in the case of a lack of available resources, a change in the factor determining the opportunity.

Risk management based on life cycle opportunity

Short life cycle risk relates to a company's goal of seizing the opportunity. The enterprise may seize an opportunity or choose not to pursue this goal. Such perception of risk is related to the necessity to make a decision about taking advantage of the opportunity in a short time, without the possibility of detailed analysis of the project, with limited resources and uncertainty as to the final result of the actions taken. The possibility of taking advantage of the opportunity depends on the relationship between the company's goals, the resources owned and the situational impact (Figure 1).

Figure 1: Risk related with the use of opportunity

Source: Own study

In such approach, the risk concerns the enterprise, the possibility of configuring the necessary resources (own and / or foreign), situational impact, consistency of goals that determine the possibility of using the opportunity. Due to the short life cycle, opportunities are seen by few companies. Taking advantage of short-life opportunities is related to the availability of resources. When the enterprise has own resources, the time needed to configure them is short, but the cost of having own resources is higher. Then the risk is mainly related to the implemented project. The situation is different when the enterprise does not have or partially owns own resources. The cost of using someone else's resources is then relatively low (resources are used when they are needed), but the risk occurs at the resource configuration stage and also when taking advantage of the opportunity. When it is necessary to establish cooperation, the level of risk is influenced by the history of cooperation between the entities. If the cooperation has not taken place before, the risk is high. Adversely, the use of previous links in cooperation allows to reduce the risk. Thus, the target is more likely to be exploited.

Risk identification also takes into account factors related not only to the use of opportunities, but also those related to the pre-embryonic, embryonic, birth, duration and decline phases of opportunity short life cycle.
The risk (R) is the a product of the probability (Table 1) P and the consequences C (Table 2),
where: R = P x C:

Table 1: The likelihood of the risk

Scale	Likelihood	Effect [%]	Description
1	Rare	1-20	May occur in rare circumstances
2	Unlikely	21-40	Could occur at some time
3	Possible	41-60	Might occur at most times
4	Likely	61-80	Will probably occur at most times
5	Almost certain	81-99	Is expected to occur at most times

Source: Own study, based on Gasiński T, Pijanowski S., (2011).

The scale of likelihood based on the value from 1 (rare) to 5 (almost certain). The same situation is dealing with the consequences (Table 2).

Table 2: The Consequences of the risk

Scale	Consequences	Effect [%]	Description
1	Insignificant	1-20	Very low impact on the organization's goals
2	Minor	21-40	Low impact on the organization's goals
3	Moderate	41-60	There may occur disruptions in goal realizations of the organization
4	Major	61-80	Temporary suspension of the possibility of achieving the organization's goal
5	Catastrophe	81-99	Inability to achieve the goal of organization's

Source: Own study, based on Gasiński T, Pijanowski S., (2011).

Risk matrix (Table 3) was created based on multiplying likelihood and consequences connected with a particular risk factor.

Table 3: Risk matrix

Likelihood	Almost certain	5	10	15	20	25
	Likely	4	8	12	16	20
	Possible	3	6	9	12	15
	Unlikely	2	4	6	8	10
	Rare	1	2	3	4	5
		Insignificant	Minor	Moderate	Major	Catastrophe
	Consequences					

Source: Own study, based on Gasiński T, Pijanowski S., (2011).

Based on risk matrix three levels of risk was created:

- low risk - point value 1-4.
- moderate risk - point value 5-12,
- high (critical) risk - point value 15-25.

The last step of the risk management process is dealing with the risk treatment (Hopkins, 2010, p. 245, Pritchard, 2001,p. 41) which include:
- risk acceptance - risk exposure is tolerated by the organization. In the case of high risk, the cost of implementing risk reduction measures is disproportionate to the possible benefits.
- risk reduction– is associated with the application of measures to prevent the occurrence of risk or to reduce the risk to an acceptable level.
- risk transfer - concerns the possibility of transferring the risk to an external entity (e.g. an insurance company or other entity). This form of risk manipulation is associated with incurring a certain cost by the decision-making entity.
- avoidance of risk - is associated with the cessation of activities that involve the risk. If this option is adopted, the company loses the possibility of a risk premium.

A consequence of the presented process should be a decision about acceptance or rejection of the opportunity.

Methodology

The research was conducted on a group of ten purposefully selected SME enterprises located in three voivodeships. All enterprises had an established position on the market of provided services. The study group included: real estates, service, transport and production organizations (Table 4).

Table 4: List of activities of the surveyed enterprises[1]

Lp.	Enterprise	Industry	Size	Voivodeship
1.	Alpha	Real estates	Micro	Greater Poland
2.	Beta	Real estates	Micro	Pomeranian
3.	Gamma	Service	Small	Greater Poland
4.	Delta	Transport	Small	Greater Poland
5.	Epsilon	Production	Small	Greater Poland
6.	Dzeta	Production	Medium	Greater Poland
7.	Eta	Production	Medium	Lesser Poland
8.	Theta	Production	Medium	Greater Poland
9.	Jota	Production	Medium	Greater Poland
10.	Kappa	Production	Large	Greater Poland

Source: Own study

[1] The author of the publication was not authorized to publish the names of the companies presented in the case study. For the purposes of this article, the companies are marked with the letters of the Greek alphabet.

The basic key in the selection of enterprises was the implementation of the process approach in which the author of this study was involved as a consultant and / or auditor. The case studies were conducted over a total of three years. Observation of the effects of used opportunities lasted up to two years.

Depending on the organization, the study lasted from three months to one and a half years. Research in enterprises were conducted in a parallel manner. The basic research methods used in the case study include:

- organization audit in terms of the possibility of implementing the process approach based on pro-quality systems,
- an interview and consultation with the company's management regarding the developed process approach, including ways of identifying and using opportunities,
- direct observation involving the author's participation in the implementation of the process approach,
- a workshop on the identification and assessment of risk associated with processes and the determination of risk factors related to the possibility of taking advantage of the opportunity,
- analysis of documentation related to the use of the opportunity.

Results and Discussion

The table 5 presents the projects constituting the case studies.

Table: 5 Identification of the opportunity – case study

Alpha	Beta	Gamma	Delta	Epsilon	Dzeta	Eta	Theta	Jota	Kappa
Obtaining a building permit	Sale of shares	Public tender - submission of an offer	Diversification of activities	Purchase of a used machine	Acquisition of the enterprise	Real estate purchase	Joining an EU project	Submission of an offer in the tender procedure	Obtaining access to EU operational programs

Source: Own study

The presented case studies cover various industries:

- **Alpha case** - represents company from real estate market on Greater Poland Voivodship. The opportunity was to obtain a building permit for the construction of a multi-family building.
- **Beta case** - represents company from real estate market on Pomeranian Voivodship, with particular emphasis on the Tri-City market and the Hel Peninsula. The opportunity for this company was the found strategic investor.
- **Gamma case** - company represents a consulting company that implements pro-quality systems throughout the country. The opportunity was the submission of an offer for a tender (public procurement).
- **Delta case** - company is a company that provides transport services for passenger cars, vans and trucks, as well as provides forwarding and logistics services. The opportunity was the diversification of activities by building a vehicle inspection station.
- **Epsilon case** - company specializes in pipe fastening systems and the production of such elements as pipe holders, gutter holders, hooks. The opportunity was the purchase of a used machine.
- **Dzeta case** – company deals with the production and delivery of shut-off and control valves as well as pumps for industrial and municipal installations. The opportunity was the acquisition of a construction company.
- **Eta case** - company deals in the production of cable harnesses and induction elements. The opportunity was the purchase of real estate plot enabling the transfer of the entire plant.
- **Theta case** - company deals with the production and sale of steel and aluminium structures. The opportunity concerned joining a project financed by the EU.
- **Jota case** - company deals in the production of medical devices. The opportunity was the submission of an offer for a tender.
- **Kappa case** – company deals with the processing of thermoplastics. The opportunity was gaining access to operational programs from the EU by changing the organization into a medium one.

Figure 2: Risk management process based on short life cycle opportunity

Source: Own study

Communication and consultation (1)

- Communication and consultation is the first step in identifying opportunities with a short life cycle. Each case described in each case study involved communication at three basic levels:

- **Enterprises** - communication and consultation concerns those directly involved in identifying and seizing opportunities. In the case of micro and small entities, business managers were responsible for the opportunities. Medium-sized enterprises (over a hundred people) have dedicated departments that conduct communication and consultations with external entities, each in its scope.
- **Foreign resources** - in most cases, taking advantage of opportunities requires using someone foreign resources. Communication and consultation were dealing with the suppliers and other parties (administration) from the beginning up to the end of the project.

Analysis of the enterprise's environment (2)

The study conducted on the example of ten case studies showed that each opportunity taken is associated with other events occurring in the company's environment, which could have a positive or negative contribution to the use of the opportunity (Table 6).

Table 6: Environment of the company – case studies

Alpha	Beta	Gamma	Delta	Epsilon	Dzeta	Eta	Theta	Jota	Kappa
Changes in spatial development plans	Limited space for multi-apartment construction on the Hel Peninsula	Large competition	Limited competition (1 point providing similar services)	Strong competition on the market	Possibilities of extending the range of services	Difficulty in choosing proper a location	Requirements of Scandinavian clients to meet environmental standards	Strong competition in the market	Limited possibilities of obtaining funds from EU funds
Using the existing building conditions	No building conditions	Insufficient own resources	Possibility to diversify your business	High costs of purchasing a new machine	Taking over the liabilities of the acquired entity	High real estate prices	Enterprise expansion	Short time to proceed to the project	Limited development of R&D activities
Limited developer resources	Short investment cycle on the Hel Peninsula	Short time for acquiring subcontractors	Difficult to meet formal requirements	Low unemployment rate	Increasing the range of services offered by company	The need to secure the company's resources (people)	A large portfolio of orders for the company's products	Fulfilling formal requirements	Hierarchical structure with workers union

Source: Own study

Particular case studies presented in Table 6 could be noticed as similar to each other (Alpha - Beta and Gamma - Jota). The conditions related to the company's environment presented different problems. The decision to seize the opportunity depended on the decision-maker and the assessment performed.

Analysis of the opportunity life cycle (3)

The duration of the various phases of the short life cycle of opportunities shows Figure 3. The time could be calculated in weeks, months as well as years.

Figure: 2 : Shorty life cycle opportunity – case studies

Source: Own study, based on Trzcielinski, 2011

Based on Figure 3 it could be noticed that Beta and Kappa took steps to seize the opportunities in pre-embryonic phase. In both cases, preparations for the occurrence of a favourable situation for the entity took nearly two years. In the case of Alpha and Delta companies, the duration of the embryonic phase fluctuated within one year. Gamma made efforts to take advantage of the opportunities in the birth phase. This opportunity lasted for a couple of weeks. In the lasting phase were four companies Epsilon, Dzeta, Eta and Jota. The time for the fulfilment of the opportunity was counted in months. Theta company made efforts to use the opportunity in the decline phase. This time was counted in weeks.

Defining the parameters of the opportunity (4)

At this stage, the possibility of using the opportunity was determined:

- **Possible** - on the basis of the preliminary analysis, the decision-making entity made a decision on the legitimacy of further analysis of the situation aimed at using the opportunity. This state of affairs applied to all subjects presented in the case study.
- **Not possible** - on the basis of the preliminary analysis of the environment, there were no messages to take advantage of the opportunity. Such a situation was not presented in case studies.

Nature of the opportunity (4)

- **Strategic** - such features were associated with enterprises: Alpha, Beta, where there was a significant financial benefit. In the case of Eta, the assumption was to purchase real estate that would enable the transfer of operations to another city.
- **Tactical** - such features were associated with enterprises: Delta, Dzeta and Kappa companies were associated with this type of opportunity. In these cases, the aim was to broaden the scope (Delta, Dzeta) of services and to gain access to operational programs of EU (Kappa).
- **Operational** - this included cases: Gamma, Epsilon, Theta, Jota. In two cases: Gamma and Jota, the goal was to enter the tender. In the case of Epsilon, the goal was to buy a used machine. The objective of Theta's case was to get to the program of the EU and made an implementation of the environmental standard.

Analysis of the availability of resources (4)

The resources necessary to seize the opportunity have been divided into:

Own resources - in two cases the enterprise had sufficient resources to seize the opportunity (Theta and Kappa). The remaining companies had some of their own resources, but they were insufficient for the independent implementation of the project.

Foregin resourses - in other cases, the enterprise had to set up the necessary resources (financial, human) based on a supply chain partnership or an external credit line.

Identification and assessment of the risk (5)

Identification and assessment of the risk were done based on the presented approach:

- Probability (1 – min; – 5 max)

- Effects (1 – min; 5 - max.)
- Small risk – 1- 4 pkt.
- Medium risk – 5-14
- Critical risk – 15-25

Identification and assessment of risk in ten case studies included: the potential of the organizational, needed resources, the environment of the enterprise.

Risk measurement and defining type of risk (5)

The risk was calculated using the product of probability and effect.
The research identified two hundred and three risks associated with the use of opportunities with a short life cycle. Each of the risks has been assigned to the following categories: financial, formal and legal, operational, market and strategic.

Risk management (6)

Based on case studies, thirty of all identified risks were critical risks (Table 7).

Table: 7 Critical risk factors associated with seizing the opportunity – case studies

Alpha	Beta	Gamma	Delta	Epsilon	Dzeta	Eta	Theta	Jota	Kappa
Failure to obtain a building permit	Lack of parking space	Short period of time to prepare an offer	Reduction of financial liquidity	Long waiting period for the machine	Incorrect definition of the necessary financial resources	Losing some customers	Use of de minims found	Unfavorable criteria of selecting a bidder	Failure to meet the formal and legal requirements
Acquisition of a controlling stake in the company	Negative bank decision regarding the possibility of granting a loan	Difficult-to-meet project indicators	Difficulties in choosing technology	Long service response time to announced failures	Taking over the obligations of the acquired entity	Limitation of financial liquidity	Difficult to meet formal requirements related to the implementation	High degree of complexity of the offer	Long-term procedure of obtaining the status of a medium-sized enterprise
Unfavorable division of apartments	Low sales of apartments	Unfavorable form of payment for the invoice (at least after 3 months)	Difficulties related to failure to meet the construction completion deadline	Low machine occupancy	Payment gridlocks in relation to employees and subcontractors of the acquired entity	Losing key employees	Delegating employees for training when there is an increased demand for their work	Short execution time of the subject of the contract	Negative decision of the Supervisory Board regarding the transformation of the company

Source: Own study

Critical risks were partially eliminated by the application of risk management methods and techniques, thanks to which the obtained residual risks were acceptable. In the case when the application of risk management methods did not contribute to its reduction, the company was aware of the existence of such risk.

Monitoring and control (7)

At this stage, the risk factors identified during risk identification and assessment are monitored. The subject of monitoring and control also applies to all other stages. It should be possible to achieve the goals as well as monitor possible deviations from the adopted goal related to the use of the opportunity.

As a result of the implementation of the opportunity, an important element of monitoring and control is also updating the risks related to the current stage of advancement of the project implementation. Table 8 shows the achieved results.

Table 8: Final results – case studies

Alpha	Beta	Gamma	Delta	Epsilon	Dzeta	Eta	Theta	Jota	Kappa
Obtaining a building permit	Attracting an investor	Acquiring subcontractors	Choice of technology	Determining the conditions for the purchase of the machine	Conducting due diligence	Selected location	Fulfillment of the de minimis aid requirements	Make an offer	Positive decision of the Supervisory Board
Getting a loan and construction of flats	Obtaining formal procedure (building conditions and obtaining a building permit)	Make an offer and winning the tender	Realization of investments	Purchases and installing of machine	Established of boundary conditions	Purchase of real estate in the economic zone	Meeting formal requirements related to the implementation of the standard	Winning the order	The separation of two companies
Sales of apartments	Construction of apartments and sales of apartments	Implementation of the tender in accordance with the signed contract	Diversification of activities	Employee training and startup of the machine	Purchase of an enterprise	Transfer of the plant	Implementation of the environmental standard	Implementation of the contract in accordance with the signed contract	No obtaining the status of a medium-sized enterprise

Source: Own study

Based on the conducted research, it can be concluded that for micro-companies, the realization of the opportunity had strategic character decided about economic success (Alpha, Beta). In case of small and medium-sized enterprises taking advantage of the opportunity had a tactical and operational character which led to a competitive advantage by offering new products (Epsilon), extending the scope of services offered (Delta, Dzeta) or gaining benefits from locating the organization in the economic zone (Eta). Seizing the opportunity also made order backlog for the company's products (Gamma, Theta). In the case of Jota case, implement environmental standards made it possible to enter new markets.

The last presented case – Kappa, despite the steps taken, missed the opportunity because of the formal issues.

Conclusions

Opportunity is a situation conducive to the subject of action in achieving the intended goal. The development of both the opportunity and the way it is used in the organization depends on the sources of its creation, resources owned by the organization and the time of availability of the opportunity. The sources of possible opportunities appear both in the competitive and macro-environment. A business may seize an opportunity using its own or use foreign resources.

The company's ability to seize an opportunity is determined by the length of the opportunity life cycle. For opportunities with a long life cycle, they are open to many market competitors. Enterprises have time to pool and prepare resources to seize the opportunity. They can also better identify and reduce risk. Oppositely, short life cycle opportunities are perceived by few enterprises, and the risk related to the use must be analysed multidimensional and in relation to individual phases of the life cycle of the opportunity (Królas P., Włodarkiewicz-Klimek H., 2015).

The short life cycle risk management process covers seven basic elements: communication and consultation (1), analysis of the enterprise's environment (2), analysis of the opportunity life cycle (3), defining the parameters of the opportunity (4), identifications and assessment of the risk (5), Risk management (6), Monitoring and control (7).

On the basis of the research on the applied risk management process with a short life cycle, nine organizations took advantage of opportunities (Alpha, Beta, Gamma, Delta, Epsilon, Dzeta, Eta, Theta, Jota) and one, despite the actions taken, did not take advantage of the opportunity (Kappa).

Abstract

The issue of the organisational climate is attracting the attention of an increasingly broader group of contemporary researchers. In spite of an attempt to create a number of definitions to define the term of the "organisational climate", the term which is "an effectiveness-supporting organisational climate" remains a specific research gap. In the business practice, the latter is approached superficially, if not to say, intuitively. This article is theoretical and empirical in nature. Its main goal is to present the authors' own hypothesis of an effectiveness-supporting organisational climate model both in theory as well as from a practical point of view, considering opinions expressed by employees at different levels in the hierarchy. The key added value of the paper is identification of the organisational climate components of particular importance in the process of increasing the level of the selected parameters used to assess the organisational effectiveness of enterprises, in the opinion of blue collar workers, white collar workers without subordinate employees and managers. Using the research results, the authors succeeded in identifying the dissimilarity of respondents' preferences, taking a moderating variable they used, into account.

Keywords: Organisational Climate, Organisational Climate Model, Organisational Effectiveness, Effectiveness-Supporting Organisational Climate Model.

Introduction

While the concept of "the organisational climate" is very popular in the world of science as a research category, it seems that it is still not receiving sufficient attention from managers in enterprises and their staff. It appears that it is not sufficiently understood as a concept and, consequently, its exploration is based largely on intuition. It may be so because its operationalisation is more difficult that one may expect; however, it is important and implies certain consequences.

From the grammar point of view, the term "organisational climate" is a metaphorical adjective, whose first element is ambiguous in nature. The noun "climate" may be referred both to rooms, buildings, interpersonal relations as well as to meteorological properties. What these examples have in common is that, in each such example, a man feels the climate and the concept of the climate usually refers to people's adaptation to the existing conditions. In the literature, the term "the organisational climate" is sometimes replaced with the term "the atmosphere" which suggests that, to some extent, these terms are meteorology-related (Wudarzewski, 2013, p. 203-219). L. von Rosenstiel i F. Bögel (1992, p. 17) pointed out directly that "in the congitive sense, the organisational climate is similar to the meteorological climate since (...) we tend to describe interpersonal relations as warm, cold or that a storm is brewing". Accordingly, in spite of the meteorological roots of the term of the "organisational climate", at present, the term seems also firmly attached to the management sciences. It is of particular importance in the context of building a strong organisational culture, of which it is an element, raising the level of motivation and engagement of the staff, its creativity, openness to changes and risk propensity which, eventually, translates into increasing (or reducing) the level of effectiveness and economic and organisational efficiency of enterprises. "The rules of conduct, standards and values arising from the organisational

culture determine both the effectiveness for formulating the company's strategy, effectiveness of change management processes as well as the effectiveness of motivational systems" (Altaf, 2011, p. 161-162; also see: Hulkko-Nyman, Sarti, Hakonen, Sweins, 2014, p.24–49; Jacobs, Renard, Snelgar, 2014, p.1–13; Harrington, Voehl, 2015, p.56; Aybas, Cevat Acar, 2017, p.363–372; Yongxing, Hongfei, Baoguo, Lei, 2017, p.708–713). In the light of above, it is of utmost importance to have complete understanding of the essence and the role of the organisational climate as wel as the mechanism of its impact on the effectiveness of the staff and, consequently, of the entire organisation.

This article presents the results of the research conducted in a search for a very important question: does a type of a position occupied by an employee (white collar, blue collar without subordinate employees, a managerial position) determines the structure of the effectiveness-supporting organisational climate model?

The essence and the role of the organisational climate

In many organisations, the problem is that managers ignore or even completely conceal the importance of the organisational climate in the process of effective people management. What is more, many of them do not see the relationship or misinterpret the relationship between the organisational climate and the organisational effectiveness of the company.

The organisational climate is an ambiguous concept and its interpretation may vary. Over the years, many attempts have been made to operationalise it. The organisational climate is the dominant way of perception in the organisation and the overall emotional responses of employees to their own work environment (Aarons, Sawitzky, 2006, p.61-72), it is the atmosphere prevailing in the organisation which affects the people (Dessler, Turner, 1992, p.23), these are the features distinguishing an organisation from other organisations in terms of the behaviour of other people in the organisation, which are relatively unchanged over time (Forehand, Gilmer, 1964, p.362), is a normative structure of attitudes and standards of behaviour, which serves as the basis for interpreting the situation and taking actions that constitute a source of pressure on the direction of activity (Gregopoulos, 1965, p.115-130), is a subjectively perceived set of features of an organisation, dependent on external and internal factors, which affect the behaviour of employees inside the organisation (Łochnicka, 2016, p. 102). The organisational climate means the relationships between the employee and colleagues and line managers, in particular the feeling of a friendly atmosphere in the work group and the ability to count on the help of both colleagues and line managers (Baruk, 2014, p. 11-21), it is also the main factor shaping organisational behaviour of employees, resulting from the content of social relations including the conditions of the institution's functioning - a formal power structure, type of technology, requirements for organisations, motives - aspirations and interests of employees and teams of employees (Wudarzewski, 2016, p. 55-71). The organisational climate is a manifestation of the organisational culture (Dabic, Laznjak, Smallbone, Svarc, 2018).

The wealth of views on the organisational climate does not make it easier to understand its essence. Taking a synthetic look at the organisational climate, one may conclude that some researchers perceive it as a way of perception and all emotional reactions, some see it as a factor shaping organisational behaviour of employees, and others as a normative structure of attitudes and behaviours. A different view allows us to see in the organisational climate a set of features characterising an organisation, including its standards, organisational policy, the internal work environment, patterns of behavior, attitudes, feelings, habits, interpersonal relationships, a set of measurable properties of the work environment.

Although a precise definition of the "orgnisational climate" concept is impossible to formulate, the importance of its role in an organisation should be emphasised as the organisational climate is responsible for the quality of the work environment, for the quality of interpersonal communication and for possible conflicts or their lack. The right organisational climate can increase employee satisfaction with work and, as a result, the level of their motivation, have a positive impact on their health (both mental and possible psychosomatic ailments) and well-being, which ultimately translates into the results of the entire organisation Badura, 2016, p. 15-18).

The consequence of failing to meet the expectations of employees as to providing them with the organisational climate they desire may be a decrease in their organisational commitment, an increase in morbidity, a less enthusiastic approach to work than expected, lack of job satisfaction, which may be reflected in their critical assessment of the entire organisation , externalizsed in a more or less official way. Permanent dissatisfaction of employees is a factor that signals to the top management that there are dysfunctions in the management process and that the manager lacks sufficient managerial competences.

Extensive literature studies indicate that the structure of the organisational climate can be built by an immeasurably

wide variety of components that interact with each other. The subject was taken up by many authors (e.g. Abendroth, den Dulk, 2011, p.234-256; Avgar, Kolins-Givan, Liu, 2011, p.717-741; McDonald, Townsend, Wharton, 2013, p. 205-222; Davidson, Manning, Timo, Ryder, 2001, p. 444-461; Kundu, 2007, p. 99-108, Wudarzewski, 2013, p. 59-78; Bratnicki, Wyciślak, 1980, p. 85-103; Wajszczak, 2000, p. 13-36, etc.). The following parameters are the most frequently mentioned in the world literature, repeated in the opinion of most authors over the last 70 years:

- friendly interpersonal relations (friendliness and affection),
- relations between a manager and an employee,
- Mutual trust,
- Transparency of information,
- Efficiency of communication,
- Support from one's line manager (supportive style of management),
- Challenges (including professional challenges),
- Motiviation for work,
- Structure (complexity)
- Transparency of information,

Appreciating the many years of scientific achievements of dozens of researchers around the world, as well as using their extensive experience related to the exploration of issues related to the organisational climate and its modelling, the authors of this study have developed a proprietary model, including components of particular importance in the process of optimizing the level of organisational effectiveness:

A1. Equal treatment of employees
A2A. The level of trust in the information coming from the line manager.
A2B. The level of trust in the information coming from colleagues.
A3A. The remuneration system used in the organisation.
A3B. The remuneration system used in the department/team.
A4A. Interpersonal relations in the organisation.
A4B. Interpersonal relations in the department/team.
A5A. Efficient communication in the organisation.
A5B. Efficient communication in the department/team.
A6. Commitment to the organisation

The essence of the organisational effectiveness

The category of "effectiveness" is an equally popular and ambiguous notion as is "the organisational climate". Despite many attempts, it has not been unequivocally defined in such a way that this definition would meet with universal acceptance. As Blaik observes (2015, p. 14), sometimes onemay think that subsequent, not always in-depth, attempts to define and identify the essence of efficiency in various areas of management (economy and management), contrary to the assumed intentions, rather contribute to deepening the aforementioned ambiguity and terminological confusion, especially in the context of the already existing multitude of definitions . Pyszka (2015, p. 13-25) believes that, within the scope of the issue of effectiveness, the authors follow the footsteps of effects, i.e. the results of action, usually identified with economic effects. However, it is increasingly suggested to analyse effectiveness in a wider context. While discussing effectiveness, the above-mentioned author raises the importance and the need to attempt at answering three important questions:

In what way definition of effectiveness may affect its measurement?

Does a broader non-economic approach to efficiency enable better identification of the positive effects of an organisation's operation?

How does the change in the dynamics of effectiveness affect the assessment of the purposefulness of an action?

Skrzypek (2007, p.313-325) claims that, in management sciences, efficiency is related to such concepts as efficiency, effectiveness, efficiency, productivity, profitability, rationality, but its nature overrides them. Ziębicki (2014) emphasises that, in the literature, it in two meanings: as economic efficiency and as organisational efficiency, with the proviso that economic efficiency is presented as one of the manifestations of organisational effectiveness. As a rule,

economic efficiency is defined as the ratio of results to inputs, while organisational efficiency is defined by means of multidimensional criteria. The criteria encompass different categories of results and attributes of an organisation. This domain was researched by many scientists (e.g. Cameron, 1986; Goodman, Pennings, 1977; Lawless, 1972; Lewin, Minton, 1986; Price, 2008; Steers, 1975, etc.). Bielski (2002) emphasises that "there is no single best criterion for assessing effectiveness, and their selection is subjective and is made under the influence of the values, preferences and interests of the entity making the assessment". Similarly, Kondalkar (2010, p.8) observes some difficulties in operationalising the concept, claiming that "organisational effectiveness is a complex phenomenon and is mostly based on the adopted strategy adapted to the needs of the development of individual individuals and teams (...) this perception of efficiency is related to the personal development of employees, who thus demonstrate a high level of motivation and emotional balance". The above view allows for a relatively free interpretation and opens the possibility of creating original solutions in the selection of measures for assessing the level of organisational effectiveness, which was done by the authors of this study.

Based on the analysis of the literature on the subject, six measures of organisational effectiveness have been identified, most often indicated as the key measures according to an international group of researchers, such as:

B1A. The degree of achieving organisation's goals.
B1B. The degree of achieving employee's goals.
B2A. Personnel development level shaped by the influence exerted by the line manager and colleagues.
B2B. The level of staff development shaped by colleagues.
B3. Fast adaptability to changes (by the organisation).
B4. The degree of the employees' ability to deliver tasks in compliance with the rules (standards) of the organisation.
B5A. Individual performance (effectiveness) of employees assessed by their line manager.
B5B. Individual performance (effectiveness) of employees according to their self-assessment.
B6. Convergence of employee's values and values promoted in the organisation.

Adopting the proprietary definition of "the efficiency-supporting model of the organisational climate" reading: "the efficiency-supporting model of the organisational climate means the construction of an ideal organisational reality, constituting a set of subjectively perceived its characteristics, enabling the study of the structure of this reality, the relationship between its elements and factors affecting it, which guarantees that the organisation's performance is optimal for the investment made in the organisation and performance", and taking into account the above-identified organisational climate components (A1-A6) and measures to assess organisational effectiveness (B1-B6), an attempt was made to create a model after the pattern presented in the Fig. 1.

	A4. Interpersonal relations A. in the organisation B. in the department or a team							B4. The degree of the employees' ability to deliver tasks in compliance with the rules (standards) of the organisation		
	A5. Efficient communication A. in the organisation B. in the department or a team							B5. Effectiveness of a single employee: A. according to the line manager B. according to the employee concerned		
	A6. Commitment to the organisation							B6. Convergence of employee's values and values promoted in the organisation		

Figure 1: Effectiveness-supporting organisational climate model - theory

Source: Own analyses and studies

Research Methodology

In the research process, a proprietary questionnaire was used, its structure based on the identified variables: independent variables (A1-A6) and dependent variables (B1-B6). In the questionnaires, a 5-point Likert scale (1-5) was used, which is an estimative, dependency-displaying, one-dimensional scale while classified too a group of complex scales used to measure attitudes. The empirical research was run on a representative sample, where the type of job/position (blue collar, white collar, non-managerial without subordinate employees, managerial) was used as a moderating variable. The following assumptions were made when determining the optimal size of the sample:

- The analysis based on a regressive scheme to allow for analysing many organisational climate components (predictors) in a single statistical mode,
- The size of the sample should make it possible to run analyses for all ten organisational climate components (predictors),
- The value of the strength of the statistical reasoning was 0.80,
- A conventional threshold of 0.05 was used as the statistical significance threshold..
- a statistical model which allows for detecting even slight outcomes of 0.02 of f^2 Cohen's.

The research was conducted by using an Internet questionnaire and by direct questionnaire research among respondents. The research sample consisted of 1,348 respondents, out of which 1,266 properly filled out questionnaires were selected and eventually used in the process of the analysis. G*3.1.9.2. software was used for calculations. See Table 1 for respondents' structure by chosen criteria.

Table 1: Respondents' structure by different criteria

No.	Criterion		N	%
1	Sex	Woman	740	58%
		Men	526	42%

Source: Own analyses and studies

Dependencies between pairs of the analysed variables i.e. Each component of the organisational climate (A1-A6) and each organisational effectiveness ratio (B1-B6) were analysed with ρ Spearman rank correlation coefficient. The research results are presented in the tables 2 to 8, where p represents the statistical significance i.e. defines the probability of a random result. If the probability is lower than 0.05, the result is statistically significant. Fisher transformation values complimented the list and were used to verify the statistical significance of the differences between the values of the correlation coefficients in the compared groups. In the tables 2 - 8, the values confirming that dependences between variables, of statistical significance, are presented in red.

Research Results

The research process as a whole included:

- the respondents' assessment of selected components of the organisational climate (A1-A6), taking into account the type of job they occupy,
- the respondents' assessment of the level of selected parameters of organisational effectiveness, (B1-B6), taking into account the type of job they occupy,
- analysis of the correlation between all components of the organisational climate (A1-A6) and all criteria for the assessment of organisational effectiveness (B1-B6), taking into account the type of job position held by the respondents.

Due to the very extensive factual material that allowed the collection of the above-mentioned stages of the research process, this article presents only the results that concerned the analysis of the correlation between both groups of parameters, including the type of job position, according to the specification below.

- Table 2 - Spearman rank correlation ρ coefficients between the assessments of selected components of the organisational climate (A1-A6) and the assessments of the degree of achievement of the employee's goals (B1B),
- Table 3 - Spearman rank correlation coefficients between the assessments of selected components of the organisational climate (A1-A6) sssessing the level of human resources development shaped by the influence of colleagues (B2B),
- Table 4 - Spearman rank correlation coefficients between the assessments of selected components of the organisational climate (A1-A6) and the assessments of the organisation's capacity to adopt rapidly to changes (B3),
- Table 5 - Spearman rank correlation coefficients between the assessments of selected components of the organisational climate (A1-A6) and the assessments of the degree of achievement of the employee's goals (B4),
- Table 6 - Spearman rank correlation ρ coefficients between the assessments of selected components of the organisational climate (A1-A6) and the assessments of employee's performance by the line manager (B5A),
- Table 7 - Spearman rank correlation ρ coefficients between the assessments of selected components of the organisational climate (A1-A6) and self-assesment of employee's performance (B5B),
- Table 8 - Spearman rank correlation ρ coefficients between the assessments of selected components of the organisational climate (A1-A6) and assessments of the degree of convergence of the employee's value with the values promoted in the organisation (B6).

In the study of the correlation between the assessments of selected components of the organisational climate (A1-A6), and the assessments of the degree of achievement of the organisation's goals (B1A) and the assessments of the level of human resources development, shaped by the influence of the supervisor (B2A), no statistically significant differences between groups were found in the resultant correlation coefficients. Therefore, this article skips presentation of the results of these studies as irrelevant to the purpose of this article.

The data presented in the Table 2 indicate that a positive correlation between the assessment of the degree of achieving employee's goals (B1B (:

- and the level of trust in information coming from the line manager (A2B) was significantly statistically stronger in the group of blue collars and in the group of white collars in non-managerial positions than in the group of managers,
- and the assessment of interpersonal relations in the organisation (A4A) had a significantly statistically stronger in the group of managers than in the group of blue collar.

The data presented in the Table 3 show that a positive correlation between the assessment of the impact of the colleagues' opinion on personnel development level (B2B):

- and the level of trust in the information coming from the line manager (A2B) was significantly statistically stronger in the group of blue collars and in the group of white collars in non-managerial positions than in the group of managers,
- and the assessment of the remuneration system used in the department or a team (A3B) was statistically insignificant in the group of managers.

According to Table 6, a positive correlation between the assessment of employee's individual capacity made by their line manager (B5A):

- and the level of trust in the information coming from colleagues (A2B) was the strongest in the group of white collar workers at non-managerial positions, weaker in the group of blue collar employees, statistically insignificant in the managers' group,
- as the assessment of interpersonal relations in the department or a team (A4B) was stronger in a group of white collar workers in non-managerial positions than in the group of blue collar workers.

Source: own analysis based on research results.

Table 8 shows that the positive correlation between the assessments of the degree of convergence of the employee value with the bonus values in the organisation (B6) and the assessment of the remuneration system used in the organisation (A3A) was stronger in the group of people employed in non-manual positions without subordinate employees than in the group of employees worker positions.

Research conclusions and recommendations for practice

The aim of the research, the results of which are presented in this article, was to search for an answer to the question: does the type of job (blue collar, non-worker without subordinate employees, managerial position) determine the structure of the pro-efficiency model of the organisational climate. On the basis of the collected factual material, the following conclusions can be drawn:

1) All the components of the organisational climate specified in the model (A1-A6) influenced the criteria of organisational effectiveness (B1-B6), although not all the relationships turned out to be statistically significant (this article presents the results of the research concerning only statistically significant relationships).
2) The components of the organisational climate and the criteria of organisational effectiveness for all three groups of respondents partially overlapped. Note that:
   a) in case of the blue collar employees:
      - the level of trust in the information received from the supervisor (A2A) had a significant impact on the assessment of the degree of the organisation's ability to quickly adapt (adapt) to changes (B3),

- the level of trust in the information received from colleagues (A2B) had a significant impact on the degree of achievement of the employee's own goals (B1B) and the assessment of the degree of impact of colleagues on the level of human resources development (B2B) and the assessment of individual employee performance by the supervisor (B5A),

b) in case of employees occupying non-manual positions without subordinate employees:

- the level of trust in the information received from the supervisor (A2A) had a significant impact on the assessment of the degree of the organisation's ability to adapt quickly to changes (B3),
- the level of trust in the information received from colleagues (A2B) had a significant impact on the degree of achievement of the employee's own goals (B1B) and the assessment of the degree of impact of colleagues on the level of human resources development (B2B) and the assessment of individual employee's performance by the supervisor (B5A),
- the remuneration system used in the organisation (A3) significantly influenced the assessment of the level of convergence of the employee's values with the values awarded in the organisation (B6) and this distinguishes this group of employees from employees holding blue-collar positions

c) in case of employees holding managerial positions:

- assessment of equal treatment of employees (A1) influenced the self-assessment of individual employee performance (B5B),
- interpersonal relations in the organisation (A4) affected predominantly the degree of achievement of their own goals (B1B).

3) Employees from all three groups indicated the degree of achievement of the employee's own goals (B1B) as a significant criterion of organisational effectiveness, however, according to employees in the following positions:

a) workers and non-workers without subordinate employees - this assessment was influenced by the level of trust in the information received from co-workers (A2B),
b) employees in managerial positions - this assessment was influenced by the assessment of interpersonal relations in the organisation (A4A).

4) Employees occupying managerial positions indicated as the only group of employees the importance of such a component of the organisational climate as the assessment of equal treatment by the line manager (A1). This component influenced such a criterion of organisational effectiveness as the self-assessment of the employee's own performance (B5B), which was also important only for this group of respondents (it was not indicated in any of the other two groups).

5) For employees holding blue-collar and non-manual worker positions without subordinate employees, such organisational effectiveness criterion as:

a) self-assessment of their own performance (B5B) does not play a significant role,
b) the assessment of their performance made by their line managers (B5A) is statistically significant, and this parameter is influenced in both cases by such a component of the organisational climate as the level of trust in the information provided by colleagues (B2B), but this impact is stronger in the case of workers in non-manual positions without subordinate employees, rather than blue-collar workers.

6) Only employees occupying non-worker positions without subordinate employees indicated that the criterion of organisational effectiveness as statistically significant, such as the convergence of the employee's value with the premium values in the organisation (B6) - they are influenced by the assessment of the current level of reward used in the organisation (A3A), i.e. the climate component organisational, which was ignored by the other two groups of respondents.

The knowledge of the existence of a wide range of organisational climate components and the ability to identify those of particular importance to employees in a specific organisation is a key measure of the professionalism level of a modern manager and one of the leading challenges facing him. The aim of this article was to draw attention to the different preferences related to the modelling of the structure of the pro-effective organisational climate, taking into account the type of workstation.

For employees occupying blue-collar positions, the most important component turned out to be the level of trust in the information provided to them by:

- Their line managers - it affects the organisation's ability to quickly adapt (adapt) to changes;

- it shapes the assessment of the employee's individual performance made by his supervisor, as well as the degree of achievement of the employee's own goals and the scope of influence of colleagues on the level of development of this employee.

For employees occupying non-manual positions without subordinate employees, apart from trust, the essence of which has been discussed above, the evaluation of the reward system used in the organisation is equally important, as it affects the degree of convergence of the values professed by the employee with the values awarded in the organisation. For managers, however, the most important are completely different components of the organisational climate. The group increases the weight of such parameters as:

- equal treatment of employees by their line managers - which affects the self-assessment of their own performance,
- interpersonal relations in the organisation - which affects the degree of achievement of their own goals.

The role and responsibility of managers in emphasizing the importance of appropriate elements of the pro-efficiency model of the organisational climate is significant. They should bear in mind the fact that the psychological dimension of work may be just as important as its economic function, which identifies work as a source of income and emphasizes the achievement of a specific financial result.

Identifying the components of the organisational climate in a particular organisation and their implementation may indicate that the manager has acquired extremely valuable skills

Abstract

This study aims to conduct a systematic literature review (SLR) on the different aspects of E-Learning in education, specifically in the academic context, where E-Learning serves as a support for traditional teaching and learning methods. Important scientific contributions to this field are presented, which will serve as a guide to understand which tools and technologies are used for the creation of E-Learning modules (learning management systems, virtual campuses, virtual classrooms, etc.). In addition, the advantages of E-Learning over the traditional method of learning are presented. Data collected from 2015 to 2020 are provided to validate the observations. It is statistically demonstrated that the countries that publish more about E-Learning have the most active authors in the area. The study concludes with a comprehensive discussion on the advantages of E-Learning, as well as the tools required for its successful implementation and the factors that must be considered to ensure its maximum effectiveness.

Keywords: E-Learning at the academic level, Learning Management System, Teaching-Learning, Systematic Literature Review

Introduction

Achieving the best possible link between teaching and learning using information and communication technology (ICT) is a major challenge in the area of education, specifically at the academic level. Study centers seek to attain this link among the agents of the teaching-learning model, namely the teacher who teaches, the medium through which the course is delivered, and the student who learns [72]. A poor teaching method or medium of delivery leads to knowledge not being transmitted correctly, which in turn triggers student frustration and results in lower levels of learning. Sometimes, when too many relevant topics are handled in parallel, students may get confused and may not know what to do or where to start; the overload of information can interfere with their problem-understanding and decision-making abilities [72]. If the delivery or design of the course does not match the students' preferences, it may negatively affect their satisfaction, thus increasing the probability of students abandoning their education midway [72] [49].

The concept of online learning is growing and expanding across several sectors [28]. Online learning processes, such as E-Learning, B-learning, and M-learning, using learning management systems (LMSs), have already been implemented in most higher-level teaching-learning processes. Several universities have implemented these virtual

Cite this Article as: Alexander RODRÍGUEZ ÁNGELES, Romario FLORES-TAIPE , Javier GAMBOA-CRUZADO, Guillermo PAUCAR-CARLOS, Luis SOTO-SOTO and Augusto HIDALGO SÁNCHEZ "Academic E-Learning and Learning Management System for Teaching-Learning: Systematic Literature Review" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

and semi-virtual (B-learning) processes, and the use of LMS as a curricular support is vital in the smooth running of such virtual environments [72]. These generalized environments [55] provide a learning environment free of restrictions [2], hence providing greater flexibility in time, space, language, content, and administrative processes [16].

Online learning applications, such as social networks, virtual campuses, and LMS, allow students and teachers to meet, create, and share relevant information on the assigned courses. All platforms allow users to participate directly and share their opinions on the subject under discussion [82]. One of the main advantages of these applications is that they enable sharing of multimedia content (videos, images, documents, etc.) [12], which can be used as supporting material while conducting classes [82].

This study aims to analyze and highlight the many benefits of E-Learning, the most important of which is meaningful teaching-learning. For this purpose, different dimensions are contemplated, so that the application of E-Learning leads to efficient teaching, and consequently, optimal learning. Furthermore, different methodologies of software development necessary for these types of systems and the models that support these web platforms are discussed. This leads to a very important advancement in the field of education, as it offers new opportunities to students and teachers to improve the quality of autonomous learning and teamwork, and aids the development of new cognitive skills and knowledge.

This paper thus focuses on showing how E-Learning has been applied at the academic level to achieve a significant improvement in the teaching-learning process in the last five years. It is organized as follows: Section I presents the introduction to the research; Section II presents the corresponding background; Section III details the studies related to the research,; Section IV describes the methods and materials used in the research; Section V presents the results; Section VI discusses the study; and Section VII presents the conclusions and future possibilities.

Background

The substantial progress made in information technology over the last few years has had a major impact on every sector [5], including the field of education [51]. This has led to the proliferation of online universities and online courses [5]. Moreover, today's students are highly technologically literate and prefer to decide when, where, and at what pace to learn [19] [39]. This has forced educational institutions to adapt [39], and as a result, the traditional model has undergone a transformation into an online model that is free from the limitations of space and time, which has led to highly strategic changes in the educational and learning system [44].

E-Learning was first implemented in the UK, and has since undergone several changes. It started off as a tool to simply deliver information to students in the form of video files; however, after the emergence of the World Wide Web (www) and the increase in virtual learning environments, E-Learning has become quite complex, utilizing various systems that can be easily integrated with other technologies, such as social networks [74] [72]. These virtual environments are realized using learning management systems, which meet all requirements of developing a virtual platform in online learning, as they allow easy administration of courses (internal level) as well as the management of the learning process and performance tracking of the students taking these courses (external level). They are also considered the intermediary between the teacher and student, besides expanding the classroom spatially and temporally [6] [62]. Thus, educational institutions, teachers, and students must have practical knowledge about LMS [19].

E-Learning helps institutions project their brand image internationally and meet the growing demands of students worldwide. It also supports academic organizations in considerably saving their time and decreasing their dependency on paper-based processes, thus improving their overall efficiency [13]. To take full advantage of their potential, E-Learning implementations should focus on meeting the needs and concerns of their key stakeholders as much as possible, and LMS is at the top of the list of latest technological developments that cover all their stakeholders' requirements.

For this reason, it is necessary to undertake a comprehensive investigatation of the different dimensions of E-Learning, considering its various aspects, tools, and methodologies.

Related Work

As far as we have been able to investigate, there are no other systematic literature reviews (SLRs) on academic teaching-learning through E-Learning. However, some works have been collected that show the state of the art of this modern modality, giving us a clearer picture of the subject.

Benta et al. [13] compared a group of students taking classes in the traditional way with those using the LMS Moodle.

They focused on class attendance and homework submission, and the results showed that in traditional teaching, the percentage of students who did not submit their assignments was 56%, while the percentage that submitted was 44%. However, using Moodle, 82% of the students submitted their assignments, while only 18% did not.

The only SLR related to E-Learning was that proposed by Erhan and Jeffrey [29]. They studied the factors that considerably influence blended learning and E-Learning in relation to student satisfaction and engagement. The definitions of E-Learning, hybrid learning, and blended learning were reviewed, presented, and discussed in their study, comparing the different online teaching formats. They reviewed which factors are more prestigious than others, including the type of learning community and the identity of the student, course design, and prominent role of the teacher. In addition, the authors in [29] indicated that the digital learning environment offered by LMSs is one in which the geographical dispersion of students and eye contact are scarce. They reviewed several studies from two database sources, ERIC and ProQuest; 35 articles were read completely and 44 articles were selected for the final review. The authors concluded that the most prominent factors are the presence of the teacher in online and offline environments for on-campus activities and internships. Furthermore, they offered suggestions for an effective design of specific courses, promoting coherence between related activities among students and teachers.

Research Methods

This study applied the SLR process to efficiently compile and summarize the results obtained from the existing literature; this means that it is a reliable, controllable, and rigorous process to determine the current state of research in a particular topic, which in this case is E-Learning, at the academic level and LMS for teaching-learning.

Research Questions

The initial step toward identifying and examining relevant articles is the development and selection of appropriate research questions that will guide us through the review process. The objective is to map research on teaching-learning at the academic level through E-Learning and LMS, to find an answer to the four specific questions listed below (Table 1):

Table 1: Research Questions

Research Questions	Motivation
RQ1: What are the relevant advantages of the application of E-Learning for the improvement of teaching and learning at the academic level?	To understand the advantages of E-Learning for the improvement of teaching-learning at the academic level.
RQ2: What software development methodologies are being used for the development of E-Learning environments or platforms at the academic level to improve teaching-learning?	To identify the software development methodologies that are being used for E-Learning at the academic level to improve teaching-learning.
RQ3: What are the E-Learning modalities that are used in the process of teaching and learning at the academic level?	To discover the modalities of E-Learning in the teaching-learning process at the academic level.
RQ4: What are the technologies/tools that are being used for the deployment of E-Learning at the academic level to improve teaching-learning?	To review the technologies/tools that are being used in the deployment of E-Learning at the academic level in the improvement of teaching-learning.

A. Sources and Search Equations

A comprehensive search process was carried out, analyzing articles published between January 2015 and December 2020 using advanced search options. The search was performed on 10 search engines, listed in Table 2, and the search strings provided in the table were used for each search engine to achieve the best results.

Table 2: Search Sources

B. Selection of Studies

The chart below (Fig 1) shows the number of results found through the aforementioned search strings for each source or search engine.

Fig. 1: Consolidated Results

The study applied seven criteria to filter the results, to obtain the best and most relevant results. Table 4 shows the exclusion criteria used to filter out the large volume of results obtained in the initial search.

Table 4: Exclusion Criteria

Exclusion Criteria	
CE1	The items are not less than 5 years old.
CE2	Search results are not scientific articles.
CE3	Articles are not written in English or Spanish.
CE4	The article is not fully accessible.
CE5	The articles are not related to the topic of education.

CE6	The study was not conducted on participants involved in academics in some way.
CE7	The articles do not propose an E-Learning, virtual campus, virtual classroom, or learning management system solution.

The process of study selection is illustrated in Fig 2. The initial advanced search gave N = 476 871 results. Then, the exclusion criteria were applied, starting with EC1 and EC2, which filtered the total number of results to N = 113 596. Finally, the criteria EC6 and EC7 were applied, which left us with 86 studies.

Fig. 2: Number of Results Consolidation Chart

C. Study Qualification

The application of quality criteria (QA) was the final step used to identify the final list of documents to be included in this literature review. QA was applied to assess the quality of the research papers according to the established research questions. Six QAs were formulated, as listed in Table 5.

Table 5: Quality Criteria

Criteria for evaluating quality	
QA1:	The research is done at/for an educational institution or house of studies.
QA2:	The authors have a high level of education
QA3:	The specific subject area is clearly defined
QA4:	The objective of the research is sufficiently explained and well motivated.
QA5:	Data collection measures are adequately described
QA6:	Methods or methodology are clearly described

All 86 articles were subjected to the study qualification phase through the application of the aforementioned QAs, and their quality was assessed. On completion of this process, 83 articles were selected for a systematic review. The final selected studies were saved in the Zotero tool (Fig 3) for the management of bibliographic references.

Fig. 3: Zotero's Reports with the Classified Studies

Review of Studies

At this stage, we begin reviewing the final selected studies by answering the aforementioned research questions.

Results

After performing the literature review process of the 83 selected studies, we proceed to answer the questions posed in this research.

A. *Advantages of the application of E-Learning in teaching and learning at the academic level*

According to the results obtained from the literature review, there are 10 relevant advantages of E-Learning related to the process of teaching-learning, as listed in Table 6.

Table 6: List of Advantages

Advantages	References	Qty. (%)
Lifelong learning	[2] [6] [13] [15] [18] [20] [28] [31] [50] [55] [64] [80]	12 (5.15)
Accessibility	[2] [3] [11] [15] [22] [28] [39] [43] [44] [45] [49] [54] [57] [59] [62] [64]	16 (6.87)
Flexibility	[2] [8] [11] [13] [16] [18] [20] [24] [27] [29] [31] [36] [37] [38] [40] [42] [47] [49] [56] [57] [59] [63] [64] [65] [67] [78] [82]	27 (11.59)
Active learning	[2] [4] [12] [14] [22] [31] [45] [47] [48] [49] [51] [52] [53] [54] [59] [77] [79]	17 (7.30)
Individual learning	[1] [4] [11] [27] [53] [57] [77]	7 (3)
Self-regulated learning	[29] [53] [72]	3 (1.27)
Interaction	[1] [2] [3] [7] [8] [9] [11] [13] [14] [16] [18] [19] [20] [22] [24] [25] [26] [27] [28] [29] [31] [32] [35] [37] [38] [40] [42] [43] [45] [46] [47] [48] [50] [51] [52] [53] [55] [57] [60] [62] [63] [64] [65] [67] [68] [69] [72] [73] [77] [78] [79] [80] [81] [82]	54 (23.18)
Motivation	[2] [6] [9] [11] [12] [13] [18] [22] [23] [24] [29] [31] [32] [35] [36] [37] [41] [44] [45] [46] [47] [49] [52] [53] [55] [57] [62] [63] [64] [65] [71] [72] [73] [74] [77] [78] [80] [83]	38 (16.31)
Student performance	[1] [2] [3] [4] [5] [7] [11] [13] [14] [16] [17] [19] [21] [22] [23] [24] [26] [29] [30] [31] [32] [37] [39] [41] [42] [43] [45] [47] [48] [51] [52] [53] [56] [63] [67] [69] [73] [74] [75] [79] [82] [83]	42 (18.03)
Thinking skills	[39] [44] [48] [63] [76]	5 (2.15)

Lifelong learning is a major advantage, as online learning makes it possible for the students to study whenever and wherever they want, as part of their daily life, and eliminates the requirement to travel to a specific place for learning or to adhere to strict schedules [13]. This is why this modality is flexible in terms of time, space, language, content, and administrative processes [16], making it accessible from anywhere in the world [57]. In addition, the active learning techniques used help involve students in the learning process, improve their attention span, increase their motivation to learn, and consequently, enhance their learning outcomes [12]. Likewise, the individual learning outcomes, according to [1], are used to validate and verify whether appropriate materials are selected during the development of educational resources. In addition, according to the authors in [29], both face-to-face and online learning are necessary to enhance student performance, as currently, there are no interactive functions sufficiently capable to enhance the students' self-regulated learning process and optimize their skills. In this process, technological tools are integrated that provide the greatest interaction between teachers and students, where knowledge is conveyed and different viewpoints are discussed [57]. This implementation promotes greater motivation in learning, and consequently, greater learning achievement, as students in this environment exhibit high levels of performance in

their tasks [39]. In addition, the students' thinking skills are best developed when ICTs are integrated into traditional processes [44]. Therefore, the advantage most reflected in E-Learning is student performance, which was found in 42 (18.03%) articles.

B. *Software development methodologies for LMS*

The results of the literature study show that three methodologies are used for software development, as listed in Table 7.

Table 7: Development Methodologies

SD methodologies	References	Qty. (%)
PBL	[14] [24] [46] [70]	4 (33.33)
xPBL	[14] [24]	2 (16.67)
Scrum	[9] [10] [37] [42] [46] [53]	6 (50)

Note that very few articles were found that discuss the methodology for the development of E-Learning software. As shown in the previous table, SCRUM is used in 6 articles; PBL in 4 articles; and finally, and the least used, xPBL is found in 2 articles.

C. *E-Learning modalities*

Besides E-Learning, some other modalities have also emerged recently, which are presented in Table 8. However, there are three trends that have obviated E-Learning, which are defined below.

Table 8: Online Learning Modalities

Modalities	References	Qty. (%)
E-Learning	[1] [2] [3] [4] [5] [9] [11] [12] [13] [15] [16] [19] [20] [22] [23] [25] [26] [27] [28] [30] [31] [32] [35] [37] [38] [41] [45] [46] [47] [51] [52] [53] [55] [58] [59] [60] [61] [63] [64] [65] [66] [67] [68] [69] [72] [74] [76] [78] [79]	49 (68.06)
B-Learning	[3] [8] [16] [20] [31] [34] [38] [46] [48] [51] [55] [66] [68] [69] [71] [72] [73] [78] [82]	19 (26.39)
M-Learning	[5] [46] [55]	3 (4.17%)
S-Learning	[35]	1 (1.38)

In E-Learning, information technology plays the central role in the process, while the traditional way of using classrooms, notebooks, and books is eliminated, to provide a flexible mode of education [74]. The modality here is clearly virtual; hence, a physical presence is impossible. In contrast, B-learning, also called blended learning, refers to semi-online learning, a mixed approach that allows for the combination of electronic and traditional (face-to-face) learning strategies [46]. In blended learning, technological devices are used to support access to various academic resources [20]. In recent years, another form of learning, known as M-learning (mobile learning), has emerged, in which mobile electronic devices such as tablets and smartphones are used as learning platforms; such learning encourages effective communication and group work. Finally, and after the increasing use of social networks in traditional classrooms, S-Learning (social media learning) appears, which is a learning environment based on social

media platforms such as Facebook, YouTube, and Twitter [35]. Therefore, the modality that has maximum strength in online learning is E-Learning, with 49 (68.06%) mentions, and that with the least strength is S-Learning, with only 1 (1.38%) mention.

D. Technologies/tools for the deployment of E-Learning in teaching-learning

The number of results obtained for this question were very large. Thirteen tools (Table IX) and three technologies (Table 9) were found to be relevant in recent years.

Table 9: E-Learning Tools

Tools		References	Qty. (%)
LMS	Moodle	[6] [8] [11] [12] [13] [16] [19] [26] [29] [33] [34] [35] [36] [41] [47] [51] [55] [58] [59] [61] [64] [65] [67] [68] [69] [72] [75] [78] [80]	29 (18.13)
	Blackboard	[3] [5] [11] [16] [19] [29] [53] [54] [59] [74]	10 (6.25)
	Scorm	[11] [19] [45] [59] [61] [62] [74]	7 (4.38)
	Canvas	[11] [80]	2 (1.25)
	WebCT	[19] [29] [31] [67] [74]	5 (3.13)
Social Networks		[6] [8] [18] [20] [27] [31] [35] [36] [55] [56] [61] [63] [67] [69] [77] [78] [80] [81]	18 (11.25)
Google Drive		[12] [14] [20] [22] [50] [55] [59] [61] [68] [70] [73]	11 (6.87)
Forum		[4] [5] [7] [8] [12] [13] [15] [16] [17] [18] [19] [20] [22] [27] [33] [39] [43] [47] [51] [52] [55] [56] [57] [58] [61] [62] [63] [64] [68] [69] [72] [74] [75] [78] [79] [80]	36 (22.5)
Mahara		[36] [46] [47] [58]	4 (2.5)
Flax		[3] [5] [54] [80]	4 (2.5)
Skype		[22] [55] [58] [61] [64]	5 (3.12)
Podcasts		[27] [30] [51] [54] [56] [64] [78] [80]	8 (5)
Wiki		[8] [12] [16] [19] [27] [30] [31] [34] [40] [45] [50] [55] [56] [61] [62] [64] [67] [68] [74] [78] [81]	21 (13.12)

Table IX shows that the most used tools for E-Learning are the online discussion forums, with a score of 22.5%, as they allow you to discuss a specific topic virtually. These are followed by Wikis, with a score of 13.12%.

Learning management systems have a large share in the whole area of E-Learning, with Moodle being the most used, with a score of 18.13% in online education, followed by Blackboard with 6.25%.

Regarding the technologies used in the researched articles, semantic web seems to be at the top (53.33%), followed by cloud computing (40%), and finally, adaptive E-Learning through machine learning (6.67%), as shown in Table 10.

Table 10: E-Learning Technologies

Technologies	References	Qty. (%)
Adaptive E-Learning	[45]	1 (6.67)
Cloud Computing	[2] [31] [50] [61] [70] [81]	6 (40)
Semantic Web	[1] [28] [31] [37] [63] [74] [80] [81]	8 (53.33)

Discussion

The literature presents different articles that contribute to the area of virtual learning (E-Learning) in the teaching-learning process, where aspects, platforms (LMS), tools, and a range of characteristics of this modern process are shown. However, the best of our knowlegde, no study has been conducted in a systematic manner and that covers different aspects of E-Learning. The study results demonstrate how E-Learning has been implemented in the teaching-learning process over the last 5 years; information has been provided regarding the tools that are used in E-Learning, followed by the advantages and various aspects of online learning. In contrast, there is lesser focus on the software development methodologies used for developing educational software or LMS. The implication for the research community is that this area is large and generates multiple modalities of employing these methods, which requires further exploration. Replications are required to clarify the concepts and understand the detailed modalities in the context of E-Learning.

The results show that E-Learning is a revolutionary method for teaching-learning, comprising multiple validated tools as well as emerging modalities, and hence, the most suitable option should be chosen according to the specific needs of the institution and stakeholders. As shown by Delen and Liew [66], teaching and learning are complex processes influenced by more than just the teaching format. For this reason, the different factors that influence teaching and learning in different formats and contexts should be analyzed, which enables an easy extension of E-Learning to other fields.

Conclusion and Future Research

In this study, the SLR methodology was used to address different aspects of E-Learning at the academic level and LMS for teaching-learning. Most of the articles were obtained from free databases; a total of 476,871 articles were obtained, from which 83 relevant articles were filtered out by applying the criteria of exclusion and quality, and the requisite information was extracted from them. The research questions were formulated and answered using the articles from the years 2015–2020. The following results were obtained: 10 advantages of E-Learning were obtained when compared to the traditional way of learning, of which the following stand out: motivation, lifelong learning, flexibility in both time and space, and a greater interaction between teachers and students. The development methodologies used were PBL, xPBL, and SCRUM, with SCRUM being the most used. However, for this question, there was relatively lesser information found in the literature; in contrast, there was a greater concentration of studies regarding the tools and technologies used for the deployment of E-Learning. These studies showed 16 major tools and technologies used, with the primary ones being social networks, online forums, LMSs such as Moodle and Blackboard, semantic web, and adaptive E-Learning based on machine learning. The different modalities of online learning were also identified, namely E-Learning, B-Learning, M-Learning, and S-Learning, with E-Learning being identified as the most popular process. Finally, and most importantly, 10 main factors were identified for the effectiveness of E-Learning. For the LMS systems, these were adaptability, usability, security, and availability; for teachers, these factors were the training they must undergo in these virtual environments and the integrated tools, as well as the feedback they must provide to the students and the transparency that they need to maintain in the teaching process; for the students, these factors comprised having commitment in the virtual process and ensuring an active participation inside the virtual classroom.

This study was not exempt from its limitations, and it is propitious to mention these to aid in future research. This study covers the literature from the years 2015 to 2020; however, this time period is less advantageous when you want to view and understand the latest developments. On the other hand, this study began in early April 2020, when the COVID-19 pandemic changed the daily and traditional processes, thus promoting further studies in E-Learning. Hence, it is recommended to perform more studies that cover more recent years, to better understand the latest developments and the exponential use of E-Learning as a result of the social distancing norms of the pandemic.

Abstract

The article has researched the theoretical foundations and variants of practical employment of intercultural communication in the context of sustainable development which is seen as a global trend based on observing the human rights. Using the public administration method, the article has analyzed the notions of sustainable development and intercultural sustainability based on communication in their interconnection and interaction as the potential notions for the future research field. The analysis has been grounded on the assumptions that sustainable intercultural awareness is bound to be a pre-condition for a general and global sustainable development of societies. It has been argued that intercultural research is becoming increasingly responsible for actively examining and reflecting on this capacity. Intercultural communication is seen as an organic component of sustainable development. It has been proved that this thematic area should be included in the official discourse on the dimensions of sustainability. Based on literature review three different approaches and their interrelation between culture and sustainability have been analyzed. A possibility of building stable intercultural relations from the point of view of different actors has been argued. It is argued that nowadays, the mission of education, language and intercultural communication, especially in globalized multicultural context, is to develop socially cohesive societies, promote multi-faceted public discourse aimed at preventing conflicts and, thus, ensuring more sustainable future. The need for further research into sustainability issues and urgent actions at all levels including international organizations, governments, and local communities is substantiated.

Keywords: Sustainable Development, Cultural Sustainability, Intercultural Communication, Intercultural Education, Intercultural Competencies, Social Cohesion.

Introduction

There is a demand in the growing ethnically and culturally diverse society for intercultural education as a strategic resource for sustainable development, equality, stability and social cohesion. Intercultural education programs in this context should be designed and implemented with the objective of sustainability, supported by the governments to ensure consistency of intervention programs aimed at promoting the social inclusion of all ethnic and cultural minorities living in the country. The COVID-19 pandemic has contributed to an increase in discrimination, inequality and vulnerability of certain society strata, placing pressure on the intercultural understanding capabilities of communities at a period when unity and joint efforts are needed more than ever before. The leading world organizations and the whole international community are sending and discussing various messages which stress the need to resolve systemic injustices in order to promote a more productive and coherent response to the crisis and to recover from it.

Sustainable development is a major concern of several UN organizations which recognize the intricate link between well-being, social justice, cultural diversity and intercultural discourse, technical progress and the health of our planet. Our world is changing impetuously at a pace never seen before, so the aspirations of governments and civil society are increasingly challenged by emerging environmental, economic and socio-cultural issues, such as the

Cite this Article as: Svitlana ANDREYEVA, Mieczysław DUDEK and Agata WOZNIAK-KRAKOWIAN " The Relevance of Intercultural Communication in The Context of Sustainable Development Challenges" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

global economic crisis, climate change and human migration. Cultural diversity, intercultural communication and discussion are taking on new meanings as the international community seeks a new global order. Such concepts and the tendencies underpinning them, which give a valuable context for understanding sustainable development and building the alternative future it seeks to achieve, have been in the focus of scientific interdisciplinary discourse in the past few decades.

Recognizing and fostering cultural diversity based on respect for human rights would enhance intercultural interaction, protect the rights of marginalized groups and prevent conflicts on smaller and larger scales; promote social cohesion, thus creating favorable conditions for achieving development goals. Culture, seen in this way, is conducive to a more sustainable development. Intercultural communication has been seen as a subject for academic research that has been covered extensively in the interdisciplinary discourse over the past decades disclosing the impact of culture on interactions between individuals. However, the aspects of interconnection and interdependence of intercultural communication and sustainable development require further elaboration since they have significant theoretical and practical potential for the humanity, which substantiates the relevance of this research.

Well-known theorists and practitioners in public administration, human rights and sustainable development analyzed the most important aspects of the problematics, in particular, D. J. Fiorino (2010), D. Z. Leuenberger (2005), J. H. Spangenberg (2000), L. Winner (1986), V. Zahorskyi (2018), S. A. Zhukov (2016). Intercultural communication issues and their interconnections with sustainable development have been studied by B.K Alexander, D. Busch, W. Gudykunst, J. Oetzel, W. Messner, B. Spitzberg, L. Samovar, B. William, R.Wiseman.

The purpose of the article is to provide rational for the necessity to enhance the role and relevance of the use of a great potential of intercultural communication in achieving the sustainable development goals by developing and implementing relevant educational programs promoting intercultural competencies, fostering public multi-dimensional discourse at all levels shifting discussions from theoretical to practical plane by introducing legislative initiatives based on full respect for human rights.

Sustainable Development Based on Respecting Human Rights as A Global Trend

Sustainable development can be considered as a way to organize society so that it can thrive over the long term which means taking into account both the present and future imperatives, such as environmental and natural resource protection, or social and economic justice. Sustainability of culture is related to sustainable development as it is linked to the protection of cultural beliefs, cultural practices, conservation of heritage, and seeks to answer the question of whether or not any specific cultures will survive in the future context. Culture facilitates environmental sustainability at different levels: via the inherent ties between cultural diversity and biodiversity, as a result of its impact on patterns of consumption, and due to its contribution to sustainable practices of managing the environment. Global cultural competence is an ability which is multidimensional, since globally competent individuals will explore local, regional and intercultural problems, consider and appreciate various contexts and viewpoints, communicate with others in a positive and respectful manner and take responsible actions for sustainability and collective welfare.

Sustainable development is regarded as a global program for the protection and advancement of modern civilization that encompasses a complex of global meanings and goals that must be taken into consideration in operational and strategic management, since the concept of preserving biodiversity is relevant not only to nature but also the society and the individual. Sustainability is development that meets the needs of the present without undermining future generations' potential, maintaining a balance between economic growth, environmental protection and social welfare. As a term sustainable development first emerged in 1987 when the Brundtland Report was published, warning of the detrimental environmental aftermath of economic growth and globalization, which sought to find potential solutions to the problems created by industrialization and population growth.

As part of a new roadmap for sustainable development, the United Nations has adopted the 2030 Agenda, which includes the Sustainable Development Goals (SDG), a call for action to protect the planet and ensure people's economic well-being. Such universal goals necessitate an active involvement of the public, business companies, administrations and states all over the globe. The SDGs, also known as the Global Goals, are a plea from the UN to all countries around the world to tackle the immense challenges facing the humanity and to guarantee that all people have equal opportunities to live a better life without sacrificing our planet. One of the goals aims to ensure that all learners acquire the knowledge and skills needed to promote sustainable development, including, among others, through education for sustainable development and sustainable lifestyles, human rights, gender equality, promotion of a culture of peace and non-violence, global citizenship and appreciation of cultural diversity and of culture’s contribution to sustainable development by 2030.

We agree with Duxbury and Kangas (2017) who confirm that sustainability is “a complex set of visions for the future of humanity”. And in a similar way, Rödel (2013) adds that the semantic invention of the word "sustainability" is of global historic significance and weight. So sustainability should be seen as humanity's first true cosmopolitan term. Novak-Kalyayeva et al. (2018) notes that sustainable development allows maintaining structural integrity, functional value, interoperability, regrouping, updating and efficiency. We share the position of the authors who emphasize the role of the human rights, which along with the imperatives of sustainable development, create a basis for humanistic potential, which in its turn, causes changes in the paradigm of modern state administration in favor of increasing the level of democracy of power and self-organization of society through the implementation of democratic reforms in key areas of the functioning of society and governance. We agree with Novak-Kalyayeva et al. (2018) who note that an organic connection exists between the status of implementation of human rights and the possibility of implementing strategies for sustainable development: without entrenching in human consciousness of human rights as fundamental principles for an efficient functioning of the society (including administration), sustainable development is running the risks of becoming a loud slogan for an indefinite time, especially in countries of democratic transition. Hence, changing the paradigm of public administration based on ecological government, social justice and non-discrimination is an indispensable prerequisite for the implementation of sustainable development strategies.

From the advent of the new environmental movement in the 1960s, contradictions between ecological and economic priorities have been a core feature of environmental policy. At one side of the debate is the concern that cutting emissions and protecting wildlife and other resources impairs economic growth, productivity and development unnecessarily. Through this point of view, while some environmental safeguards are required, the general rule of public policy should be to favor development. On the other hand, there is a statement that human health and ecological limits require a carefully planned path to growth, including little or no growth, and an ecological preference over economic objectives when they clash. Environmental policy has consisted of a struggle to determine where the balance should be struck between these priorities. Economically developed and stable democratic countries in the European Union as well as the United States, Japan, etc., have been implementing sustainable development approaches and strategies which has been facilitated by the fact that they have appropriate socio-economic and institutional conditions.

However, developing countries and countries of democratic transition, like Ukraine, are in the process of identifying this need to find an environmentally sound path to growth. Zahorskyi and Andreyeva (2018) note that they should be offered a middle ground in the growth versus economy debate: poverty reduction and economic progress are a priority, but within a context which respects ecological boundaries and human rights over the long term, alongside more holistic policies.

Sustainability is one of the very few principles or values gaining universal recognition alongside with democracy and human rights. The notion of sustainability was brought to the forefront by climate change, the loss of natural resources and collapsing states. The word “sustainability” derives from the Latin “sustinere” meaning to “hold up”. It requires a holistic and coordinated approach to environmental protection, economic prosperity and social equality. Sustainability in a developmental sense refers to the apparent inconsistency between development, on the one hand, which results in nature intervention, and which depletes natural resources; and, on the other hand, sustainability, which is a mechanism or state that can be managed for an indefinite time. In this respect, it’s a government's function to balance this paradox and try to reconcile ecological and economic priorities, so as to cope with the ecological crisis without affecting established economic growth.

Since the 1970s, the possible tension between economic and ecological priorities has formed the core fault line of environmental policy in the USA and most other countries. The common opinion is that environmental conservation efforts would diminish economic development, employment and global competitiveness. Alternatively, environmental activism focuses on the need to control growth in order to prevent its more harmful consequences like ecological deterioration. In most countries, halting or reversing development is impractical, economically costly, politically challenging and is likely to hurt the very groups that need to be protected. At the same time, an unguided "development above all" policy will result in an environmental catastrophe. Due to the financial crisis and climate change, the principle of green growth - the argument that the right balance of policies, investments and technology can result in beneficial growth within ecological boundaries - has become essential to global policy and national debates. As Fiorino (2018) emphasizes, ecological priorities must be integrated into the framework of the economic and political structures to achieve green growth.

Therefore, the analysis of the positive experience of implementing sustainable development strategies is important, has considerable theoretical, scientific and practical potential, particularly for countries in democratic transition. This is particularly important in the context of the latest strategies of production and distribution in the world which have led to globalization and multiple global processes resulting in the emergence of the new model of development

and governance in the society. Amid spreading of COVID-19 epidemic and pandemic, public officials at all levels of government around the world are dealing with a massive emergency crisis that is new to most communities today. COVID-19 has created immense challenges for public health, economic, political and social structures and will have immediate implications for achieving many of the Sustainable Development Goals (SDGs).

New approaches to building the relationship of society and governance on sustainable development principles and structural stability of administration systems, as well as limiting the phenomenon under investigation to philosophical reflections focused on profound arguments in interdisciplinary debate, have become characteristic of modern theoretical concept studies and their implementation in practice. Organic relation between the principles of sustainable development and public administration were identified and argued by Leunenberger (2007). Criteria for institutional resilience of administrative institutions, developed by Leunenberger and Wakin (2007), can be used to describe a set of indexes to be taken into consideration while elaborating structural and functional workload for public administration staff and bodies, including governing ones, as well as regional and local policy.

Examining economic, biological and social systems in the context of sustainable social development, Leunenberger and Bartle (2007) noted that the goals of the economic system include efficiency, equity in the expansion and improvement of the social safety net; and the goals of the social system are citizens' participation and social justice. The scholar emphasized that the systematic approach to sustainable development allowed defining the concept of "the ecology of public administration", because it covers the idea of interdependence of human life, balance, organic system and its stabilization.

The goals of human rights and humanistic ideals of sustainable development are at the core of the paradigm of democratic governance and reflect the general principles of European identity.

Intercultural sustainability as an integral component in the sustainable development framework

Only recently has the discourse on political security begun recognizing the need to continually ensure future intercultural understanding. Accordingly, the UNESCO Educational, Cultural and Scientific Organization in 2009 pointed out that intercultural dialogue is a critical pillar for the promotion of global sustainable development. Accordingly, one of their aims is “to persuade decision makers and the various stakeholders of the importance of investing in cultural diversity as an essential dimension of intercultural dialogue, since it can renew our approaches to sustainable development, ensure the effective exercise of universally recognized human rights and freedoms, and strengthen social cohesion and democratic governance”.

Busch (2017) defines intercultural sustainability as a term that comprises any effort to design intercultural relations in ways that ensure a peaceful and a constructive coexistence of people across cultures. He points out that this notion builds a bridge between research on intercultural communication and intercultural relations on the one side and the global political discourse on sustainability on the other side. Recently, the ecologically, politically, and socially inclusive political discourse on sustainability has included the notion of cultural sustainability, referring to the supposition that strong cultural identities will contribute to social cohesion. Alternatively, intercultural sustainability refers to the idea that any other aspects of sustainability will be put at risk as long as a balanced management of people's beliefs about culture and cultural affiliations are not guaranteed.

The UN has recognized the general effect the culture has on sustainability goals: Ban Ki-moon, its Secretary-General, summed up in June 2013 that, when the UN adopted its Millennium Development Goals (MDGs) for the period 2000-2015, it had underestimated the central role of culture in achieving sustainable development goals. Rectifying the flaw, the General Assembly issued two resolutions on culture and development in 2010 and 2011. In 2013, another UN conference took place in Hangzhou on “Culture: A Key to Sustainable Development” where again, culture was understood as an add-on that may support sustainability goals in other fields. If the role of culture for general sustainable development is that decisive, a culture of sustainability therefore may be the most precise solution, say Parodi et al. (2017).

With regard to culture, intercultural communication and intercultural relationships, authors hold differing views on how these phenomena can best be managed to contribute to global peace, peaceful coexistence and overall sustainable development of the society. Intercultural sustainability as a term comprises encouraging enduring, long-lasting and viable forms of intercultural relations and intercultural communication. Since the discourse on global sustainability comprises numerous dimensions from different fields of social activity, sustainability of intercultural communication and intercultural relations here are seen as an essential dimension.

Focusing on how sustainability goals are to be met, the literature review reveals a systematic distinction between egocentric approaches that emphasizes the significance of one side of participants in intercultural communication, vs. allocentric approaches that equally considers all sides in a dialogical fashion. As opposed to the above-mentioned approaches, utilitarian understanding of cultural and intercultural sustainability sees intercultural awareness as a mechanism to promote the sustainability of other social domains.

Egocentric approaches are aiming to promote the sustainability of a single culture or organization and this is usually the society or organization, to which the writers themselves belong. Utilitarian approaches advocate for a balanced care for the culture and cultural ties in the interests of a target outside the thematic area of intercultural communication or intercultural relations. In most instances, intercultural sustainability is seen here as an instrument to promote the sustainability of a political success and economic growth of a business, a corporation, an institution or even a nation. Lastly, allocentric strategies perceive the sustainability of intercultural relations, healthy and harmonious coexistence as the most significant value to be promoted. A dialogical approach that includes all parties concerned in an equal and egalitarian manner in the intercultural interaction process is a key to this concept.

Since all cultures are viewed by allocentric notions of the sustainability paradigm as equal and equally valuable, all of them should be maintained here in order to ensure both a healthy cultural diversity and a sustainable, nonviolent intercultural co-existence. There are a number of references in the scientific literature to the value of peaceful intercultural living together for the sake of global sustainability. On the other hand, Humphrey (2013) expresses his concern saying that intercultural conflict may put sustainable development at risk. Jakubowicz (2011) determines multiculturalism as a cultural policy which attempts to reconcile egocentric and allocentric understandings of sustainability. Sustainable multicultural societies thus rely on cultural organizations and institutions that reinforce these particular cultural identities while at the same time facilitating interaction with neighboring groups. Similarly, Kubal (2013) recommends that the local law of a country should be designed in such a way that it is consistent with local migrant groups' understandings of law and justice to ensure a secure livelihood. Constructive and peaceful intercultural interactions throughout the world can be considered as a vital precondition for the sustainable development of any other social sphere. When a conflict on a global scale interferes in the peaceful development, serious regression is bound to take place in cultural, political, and ecological domains. Allocentric approaches to the sustainability paradigm recognize the need to involve all stakeholders in a mutual dialogue on what intercultural sustainability is and how to achieve it.

Busch (2017) identified a few pitfalls that emerged from reflections on intercultural sustainability and he sees one of the major concerns in the inevitable danger of essentialising of the notions of the term. The study of intercultural communication and intercultural relations has the chance to become much more transparent and productive when debating and reflecting in an open forum on its normative goals as well as its future orientations towards intercultural sustainability. Moreover, research on intercultural communication can contribute significantly and necessarily to the discourse on sustainable development and global sustainability. Australia and Canada are the countries which are particularly known for their early efforts to create sustainable local communities by introducing concepts such as multiculturalism as understanding of cultures based on boundary-making and mutual evaluations will impede the implementation of sustainable societies. Instead, a widespread promotion of non-exclusive and non-judgmental notions of culture is required.

Communities will have to deliberately devote themselves to sustainability goals, since sustainable intercultural relations will not materialize by themselves. Ambrosini and Boccagni (2015) point out that the local community level may be the most immediate entry point for ensuring intercultural sustainability. Besides these general concepts, the field of application where the ideas of sustainability play the most prominent role could be education. Many authors agree that the more deeply people internalize this goal in their worldviews, the better sustainable intercultural relations are guaranteed. Specifying this aim, Woods et al. (2011) recommend that university students should be taught to become global citizens. Similarly, Crosbie (2014) believes that sustainable democracy and peaceful social coexistence on a global level can only be achieved through global citizenship based on cosmopolitan attitudes. Concerning education as a process, Tran (2009) reminds us that learning processes are primarily based on individual and subjective constructions and re-constructions, and that concepts for sustainable intercultural relationships should be built on this. Foreign language teaching should be seen as a special domain in education that seems even more suitable for the goals of enhancing intercultural dialogue and thus, understanding.

Intercultural training is usually seen as an educational method used in companies and professional organizations in its traditional form, but its results do not automatically have to be limited to institutional benefits. Cushner (2005) notices that trainees will also benefit personally from intercultural training and will thus be better able to contribute to facilitating sustainable intercultural relations in general. Intercultural training can therefore influence the core components of the orientations of individuals and thus contribute to behaviors that support sustainable intercultural relations. It cannot be taken for granted, however, that any intercultural experience will necessarily have a lasting

effect. Therefore, intercultural training research has one central issue: how to elaborate intercultural training in such a way that it has long-lasting, sustainable effects.

Discussion: Intercultural Education for Sustainable Future

Culture is who we are, where we belong and what molds our personality and no one doubts the basic premise that without culture no progress can be sustainable. People seek to preserve cherished past cultural traditions and meanings while engaging in the creation of new meanings in a hyper-communication environment. That exercise is not easy, though. This suggests developing "intercultural competencies" to maneuver through our globalized and diverse societies in a positive way. The ultimate goal is to guarantee each emancipated person full participation in the new environment allowing them the ability to express future aspirations for all life forms.

Our world is steadily moving to the point of "no return", a whirlpool, from which it will be almost impossible to get out and the number of challenges the humanity is facing is constantly growing. Some of the major concerns nowadays are uncontrolled globalization, sweeping digitalization of the society with its encroachment on our privacy and less direct connection between people, growing human mobility resulting in a migration crisis, which, in its turn has led to the rise of populist and extreme right-wing movements in some countries. For example, according to the Federal Office for the Protection of the Constitution (BfV, Internal Counterintelligence of the Federal Republic of Germany), in 2019, there were 53 right-wing radicals "representing special danger" throughout Germany. At the end of 2016, there were only 22 people. With the availability of weapons of mass destruction becoming increasingly less expensive and easier to access, the age of terrorism is on the rise. Addressing the reasons why people want to become terrorists and achieving cooperation between potentially hostile cultures is crucial.

Intercultural education should be built around such values as equity, diversity, inclusion, democracy and human rights. It is defined by the pursuance of equality, shaping of citizens and appreciation for and positive attitude towards cultural diversity, as well as the creation of shared values through a mutual dialogue. Sales and García (1997) propose that active people participation and criticism is central to the creation of a democratic society based on equality, inclusion and solidarity. Intercultural education advocates the work in coexistence understanding universal values in difference and creating larger and richer cultures. In this vein, as Dudek et.al (2018) argue it is vital to build a more interactive society in which its culturally diverse citizens learn to live together and thus contribute to social improvement and development, particularly through the education of the young citizens. Some researchers point out that intercultural education should be directed towards a global educational programme, intercultural citizenship education that needs critical thinking, a participatory model built on common issues. Salgado-Orellana (2019) argues that intercultural education requires an inclusive educational engagement from educational institutions to the community, an education model that reacts to the need to live together and develop in an intercultural society and goes beyond the school and goes to the community in order to achieve the following goals: 1) awareness and training of citizens; 2) acceptance, recognition, and a search for common values; 3) construction of broad and shared cultures; 4) integration and social, educational and labour insertion; 5) democratic and participatory management of the centres; 6) social and educational centres involved in the community and vice versa; and 7) dialogue, meeting, coexistence, cooperation and the overcoming of conflicts.

Kalyayev et al. (2019) highlight that intercultural education is therefore a well-founded model for contributing to social and human sustainability; it assists in preserving and enhancing social cohesion, and ensures the fulfillment of cultural rights of each individual. In other words, in order to achieve sustainable development intercultural education leads to maintaining cultural diversity and intercultural miscegenation as the legacy of all humanity and seeks to overcome all forms of bigotry and racial or social inequalities bringing the equality between genders and races among the people who live in our communities. This kind of education is the key to building the society which is culturally diverse and whose future generations of residents are the children who today are learning to live and go to our schools. Furthermore, Byram's (2013) proposals on intercultural citizenship, which uphold the notion that intercultural learning is the knowledge as well as the understanding of the people with whom it interacts, that learning should include attitudes and values connected to critical cultural awareness and social justice and ultimately that learning is achieved in interaction with others, thereby emphasizing the importance of learning both in and out-of-school and community settings, respectively.

The role of language teaching and learning in this context should not be underestimated. We can only infuse divergent interests through language and cross-cultural contact. Only through reaching mutual understanding can we bind together, live together and work together in a world of divergent concepts of existence. Only then will we be able to aspire to sustainable development. Today, more than ever, the task of language and intercultural communication, especially in multicultural context, should aim at understanding that language and culture affect each group in several important ways, and account for different understanding of global issues. Beyond this development task, language and cross-cultural communication should strive to get people and communities to

understand that where principle strategies intertwine with community sustainable development goals, they support inclusive development projects with a more human and democratic resonance. This is what language and intercultural communication should target to achieve in developing countries in particular, while being mindful of adjusting the aims to the briskly changing conditions of the modern reality.

Several important areas that undermine intercultural understanding during the COVID19 pandemic caused crisis include xenophobia and ethno cultural racism to gender-based abuse. The online platforms and social media could be used as the main means of developing successful solutions by which governments, professionals and societies have managed to continue intercultural learning and exchange throughout the crisis.

Conclusion

Egocentric approaches generally hinge on ethnocentric cultural and intercultural theories as well as ideas in favor of a single entity, company, group or individual. Utilitarian applications of the concept of sustainability see culture and proficient ways to manage cultural diversity as a tool to promote the achievement of sustainability aims in other social domains, for example, cultural resilience can be considered as a critical contribution to economic and business success. We believe that all three approaches have equal significance and should be applied based on the context, historical background and traditions. Moreover, they are intertwined and potentially, utilitarian approaches can be derived from both egocentric and allocentric understandings of sustainability.

Sustainable positive intercultural relations do not have a value of their own if they don't result in harnessing social cohesion and, thus, creating an environment conducive to reaching sustainable development goals. To achieve this, sustainable development goals should be institutionalized, laws should be adopted and concrete programs implemented globally. Otherwise we are running the risk of not going beyond the discussion framework and moving from words to deeds in the situation when delay is tantamount to death. Despite continuous technical progress the world stays very fragile amid growing terrorism threats, migration crisis, digitalization of the society and hence, growing cyberterrorism, overproduction on one end and poverty with lack of basic resources on the other, ongoing globalization and polarization of the society, globalization versus nationalism and post-pandemic deglobalilization, environmental collapse spiraling out of control. Combatting the virus requires social distancing and hence, builds walls between people - nations take future measures by closing borders to enhance national security. National interests are in the focus, countries such as the U.S. are moving manufactures back, and protectionism and xenophobia are on the rise. With ongoing contradictory processes of globalization and nationalism, it is unclear what the world will look like after the pandemic.

The governments and world organizations might fail the exam on dealing with the modern challenges if they don't start acting at the legislative level and put SDGs into prompt and effective coordinated actions.

Introduction

Au cours de la dernière décennie, les innovations technologiques et Internet ont de plus en plus envahi le marché de consommation à l'échelle mondiale. Les investissements dans le domaine des objets connectés s'élèvent à environ 3 milliard de dollars en 2020 selon le cabinet de conseil Américain Gartner (Novembre 2015), dont le nombre des objets connectés estimés est de 50 à 100 milliards OC en 2020 (N'Goala, 2016).

Les OC aident les utilisateurs pour atteindre les objectifs souhaités, tels que la surveillance du sommeil (les matelas ou oreillers intelligents peuvent mesurer le sommeil), l'activité sportive (les vêtements peuvent mesurer les performances sportives) ou d'autres mesures de santé, ce qui modifie les comportements et modes de vie (Yang et al., 2013). Toutefois l'acceptation de l'utilisation des OC est limitée par plusieurs variables, notamment l'utilité perçue, la facilité d'utilisation, la confidentialité et la gestion des données personnelles, ainsi que la difficulté de prise de contrôle due à la dimension matérielle et immatérielle de l'IdO. D'où l'intérêt du présent travail scientifique de mettre en contraste le besoin du consommateur connecté à renouveler ses habitudes de consommations habituelles d'une manière techniquement plus développée et les variables qui conditionnent son acceptation de ce développement en proposant un modèle conceptuel mettant en relation les caractéristiques du consommateur postmoderne et son acceptation de l'utilisation des objets connectés.

Revue de littérature

Consommation Postmoderne

De par sa nature le consommateur postmoderne est connu par ses fameux paradoxes (Alain Decrop 2008) parmi lesquels nous nous intéressons à celui de « l'ancien et le nouveau » qui explique le besoin de l'individu à retrouver son passé (l'ancien) technologiquement revisité (le nouveau). Autrement il est en recherche permanente à satisfaire ses anciens besoins d'une façon plus sophistiquée et performante.

Internet des objets (IdO)

L'IdO est une nouvelle façon d'interagir avec les objets, les environnements et les personnes. En effet, l'IdO peut connecter tout et tous, de manière dépendante ou indépendante des paramètres initiaux préétablis par les utilisateurs, selon l'intelligence artificielle incluse dans les capteurs, et peut fournir un retour d'information et des fonctionnalités personnalisées par le biais des objets intelligents (qui représentent l'aspect physique de l'IdO comme les smartphones, les tablettes, et les robots de connexion) et des applications mobiles (de base, connectées et intelligentes) (figure1). L'IdO comprend donc des objets physiques capables d'émettre des données par l'intermédiaire de capteurs, des objets virtuels connectés (c'est-à-dire des algorithmes d'intelligence artificielle et des réseaux sans fil) et des plateformes capables de collecter et de stocker, puis d'analyser et de transmettre des données.

Fondements Théoriques Et Proposition Du Modèle

Fondements Théoriques

L'IdO et les technologies intelligentes sont de plus en plus acceptées depuis quelques décennies, ce qui augmente les chances de profits pour les entreprises (Pister, 2011). Dans la littérature, on sait peu de choses sur l'acceptation et l'utilisation de l'IdO et des technologies intelligentes et sur leurs conséquences sur les perceptions et les comportements des consommateurs (Foroudi et al., 2018 ; Oh et al., 2007 ; Verhoef et al., 2017). Les technologies sont associées à la fois à des avantages et à des risques qui, à leur tour, deviennent des raisons d'adoption ou de rejet ; c'est pourquoi l'identification des meilleures conditions d'acceptation par les consommateurs est une question de recherche hautement prioritaire (Verhoef et al., 2017). La littérature contient différentes théories et modèles sur l'acceptation des technologies, tel que le modèle de l'acceptation de la technologie (TAM).

Les théories de l'action raisonnée (TRA) et du comportement planifié (TPB) ont conduit au développement de la TAM, qui prévoit que l'acceptation de la technologie par les utilisateurs est déterminée par trois facteurs : l'utilité, la facilité d'utilisation et les objectifs comportementaux (Teo, 2011). La TAM est l'une des théories les plus largement utilisées qui a été testée et critiquée dans le cadre de diverses recherches (Wu & Ke, 2016). Les études antérieures sur l'acquisition de la technologie et la diffusion de l'innovation se sont concentrées sur l'acceptation et l'utilité de l'Internet (Mortenson & Vidgen, 2016). Davis et al. (1992) ont introduit cette théorie pour prévoir l'acquisition et l'application des technologies de l'information. Cette théorie est aujourd'hui appliquée au développement d'applications sur différents systèmes d'exploitation. Le TAM est un modèle économique utilisé pour prédire l'acceptation des utilisateurs de ces technologies. Étant donné que l'environnement actuel du commerce électronique est géré par la technologie, les chercheurs utilisent ce modèle pour prédire l'acceptation et l'application des canaux en ligne (Ashraf, 2014 ; Pavlou, 2003).

Les variables de TAM, à savoir l'utilité perçue (PU) et la facilité d'utilisation perçue (PEU) semblent être des antécédents importants de l'adoption de l'IdO. Dans la littérature, ce sont les variables les plus utilisées pour expliquer l'adoption de la technologie (Hauser & Simmie, 1981) et de forts déterminants de l'utilisation de la technologie (Calantone et al., 2006 ; Davis, 1989 ; Taylor & Todd, 1995). Par conséquent, l'étude de la TAM (Davis, 1989) semble être l'approche de bon sens pour étudier l'adoption de l'IdO et des technologies intelligentes, car elle reste l'une des théories les plus influentes du comportement humain (King & He, 2006 ; Venkatesh et al., 2003). Les méta-analyses sur la TAM montrent un modèle robuste, significatif et puissant avec de fortes propriétés psychométriques qui peut être utilisé dans différents contextes technologiques (King & He, 2006 ; Lederer et al., 2000 ; Legris et al., 2003). Toutefois, le PU et le PEU sont critiqués pour leur faible pouvoir prédictif et leurs limites concernant les théories du comportement des consommateurs en matière de marketing (Bagozzi, 2007 ; Chuttur, 2009 ; Franz & Robey, 1986 ; Hu et al., 1999 ; Pikkarainen et al., 2004 ; Wu & Wang, 2005). Il semble également que le PU et le PEU soient plus importants pour les non-utilisateurs et les nouveaux utilisateurs. La littérature montre que l'influence du PU et du PEU diminue au fil du temps, mais que ces deux éléments sont des raisons d'accepter les technologies intelligentes (Venkatesh et al., 2003). Cependant, d'autres antécédents cognitifs et sociaux importants de l'adoption et de l'utilisation des nouvelles technologies devraient également être étudiés (Benbasat & Barki, 2007 ; Chuttur, 2009), tels que les avantages hédoniques (Chitturi et al., 2008 ; Sirgy, 2012) et l'influence sociale (Bagozzi, 2007 ; Venkatesh & Davis, 2000).

1. Hypothèses et Modèle conceptuel

H1 : La dualité (Ancien/Nouveau) impacte positivement l'intention de l'utilisation des objets connectés.

H2 : La relation entre la dualité (Ancien/Nouveau) et l'intention d'utilisation des IDO est médiatisée par l'utilité perçue.

H3 : la relation entre la dualité (Ancien/Nouveau) et l'intention d'utilisation des IDO est médiatisée par la facilité d'usage.

Méthodologie De La Recherche

Pour juger la pertinence de notre modèle théorique empiriquement, il nous a semblé essentiel d'aborder notre recherche selon plusieurs méthodes complémentaires afin de la cerner au mieux. Il faut tout d'abord procéder à une étude qualitative exploratoire, qui nous permettra de choisir les variables à inclure, celles qu'il faut éliminer dans notre modèle. Après cette phase qualitative, une phase quantitative sera entamée pour tester les hypothèses formulées sur une large population. L'association des méthodes aussi bien quantitatives que qualitatives doit permettre d'acquérir une vision globale du phénomène étudié.

Abstract

Analysis of the current state of socially significant services in the Ukrainian transportation area allows us to conclude that modern approaches to the formation and implementation of public policy in the social services area in the transport sector can not be called systematic, effective, and efficient given the lack of mechanisms for effective interaction of the system of providing socially significant services in the transport area, minimizing conflicts of interest of legal entities regarding the provision of such services, clear delineation of powers between public authorities and local governments, including in terms of territorial reform, stimulating the development of socially significant transport market services in the context of decentralization of power in Ukraine.

Ensuring the balance of social interests of every citizen and society as a whole, accompanied by the economic aspect of the realization of guaranteed rights and coordinated structural changes based on the achievements of the European community, will enable Ukraine to integrate its transport system into a single European space, to create foundations for the functioning of a real civil society, to ensure stable economic development of the country and to improve the provision of public transport services.

The generalization of the experience of providing socially significant transport services in the EU Member States made it possible to determine that the paradigmatic basis for reforming the system of such services in the EU countries in the growing trend of decentralization of public administration was the recognition of the importance of effective social and transport management. This development should be based on changing the vector of public policy formation, updating its institutional framework, changing the role and functions of institutions at the level of central and local authorities and local governments; development of mechanisms of market pricing for transport services and formation of new schemes of their financing and targeted payment; introduction of pilot projects of testing and evaluation of the most acceptable models for socially significant services in the transportation area; improving the regulatory framework; strengthening the responsibility of their providers; introduction of minimum quality standards for the provision of such services, the introduction of an independent system of control and guarantees of the quality of services provided.

Keywords: Conditions for Successful Deinstitutionalization.

Introduction

Ukraine, declaring the emergence and development of a socially-oriented state, a free and competitive market, including a market of transport services, having significant social obligations and taking into account the social resonance on the use of reduced fare rights, faced both the need to break the legal vacuum to provide a guaranteed quantity of socially significant transport services and the need to ensure their proper quality.

The state of affairs in the transport sector regarding the provision of socially significant services in the transportation area (or public transport services) is widely publicized. According to the official website of the Ministry of Infrastructure of Ukraine quite a lot of questions from users of transport services, as well as from carriers, public authorities, and local governments, concern the legislative regulation of the provision of social transport services and compensation for the state's obligations to provide such services at reduced rates, and also international commitments; taking control measures regarding the refusal to provide public transport services at reduced rates; refusal to cross-subsidize unprofitable passenger transportation by rail at the expense of transportation of goods by rail, etc.

The development of an inefficient state policy on the provision of public transport services causes a shortage of rolling stock, contains corruption risks, creates additional barriers to starting and running a business, and as a result — the outflow of investment capital and rising prices (transport sector in 2018 created 7.5% of value added, but only due to import-export operations and growth in consumption of transport services by households, rather than through integration processes, job creation, and investment capital infusion).

Ukrainian legislation guarantees the provision of social services free of charge to those in difficult life circumstances, and on a paid basis — to all citizens who need them, which does not deny the importance of access to public services and reflects only the form of interaction between recipient and service provider. At the same time, the modern situation indicates the need for service orientation in the formation of such a policy, based on changing vectors from paternalism (consumer-administrative model) to solidarity.

Analysis of the current state of socially significant services in the Ukrainian transportation area allows us to conclude that modern approaches to the formation and implementation of public policy in the social services area in the transport sector can not be called systematic, effective, and efficient given the lack of mechanisms for effective interaction of the system of providing socially significant services in the transport area, minimizing conflicts of interest of legal entities regarding the provision of such services, clear delineation of powers between public authorities and local governments, including in terms of territorial reform, stimulating the development of socially significant transport market services in the context of decentralization of power in Ukraine.

Ensuring the balance of social interests of every citizen and society as a whole, accompanied by the economic aspect of the realization of guaranteed rights and coordinated structural changes based on the achievements of the European community, will enable Ukraine to integrate its transport system into a single European space, to create foundations for the functioning of a real civil society, to ensure stable economic development of the country and to improve the provision of public transport services.

Literature Review

The provision of social transport services in the EU Member States and increasing their efficiency in Ukraine is actively negotiated in academia. Ukrainian scientists are discussing the interpretation of the essence of the concept of social services, their connection with public (administrative) services, public services. Such authors include: J. Belevtsova (2009); K. Gafarova (2011); V. Honcharov (2012); Yu. Horemykin (2012); K. Dubich (2013); M. Kravchenko, T. Tkach (2019); A. Novikova, T. Yashchenko, O. Novikova (2012); L. Novak-Kalyayeva, A. Kuczabski, N. Yasnyska, S. Andreyeva, I. Shapovalova (2018); O. Savchuk, V. Kushnirenko (2015); A. Siedlaczek-Szwed (2018); O. Tishchenko (2015); N. Chudyk-Bilousova (2016). In the EU, the terms "public services" and "services of general interest" are used. Given the existing approaches, we believe that it is more correct to use the concept of socially significant services in the transport sector. Ineffective state policy on the provision of social transport services in Ukraine determines the study of new approaches.

The main goal of this article is to analyze the provision of social transport services in the EU and Ukraine in order to integrate the transport system of Ukraine into a single European Area, create a foundation for real civil society, ensure stable economic development and increase the efficiency of social transport services.

Presentation of the Core Material

EU 2011 White Paper on Transport identifies transport as one of the economic and social components of the development of the single European Transport Area, recognizing that it forms 5% of EU GDP and must ensure the mobility of the population, completely denying its absence and impossibility of implementation in any of its manifestations. Such development of population mobility must be accompanied by the development of electronic service technologies and help reduce the negative impact of transport activities on the environment. Meanwhile, the European Commission identified the development of urban, suburban, and intercity transportation, its safety and quality, as the main priorities for the future.

An important aspect of European transport policy in recent years has been the reorientation from the road to rail, as the latter can better meet the criterion of mobility. Road transport becomes subsidiary, which is used exclusively for transporting passengers to railway junctions. It should be noted that in EU countries, the metro is classified as public rail transport.

It should be noted that the system of differentiation of means of transport in Ukraine is somewhat different from the means of transport in the EU since the basis of the national system of differentiation is comprised of:

type of ownership: state, communal or private, in relation to ground transportation that does not go beyond the settlement;

type of technological transportation, if it is a question of transport outside the settlement (except for the city rail in the city of Kyiv).

In contrast, the EU transport is classified depending on the technological features of its operation: rail (railway, tram, and metro), road (buses, electric transport), water (sea, river), and aviation. This classification simplifies the system of public administration and is more understandable to public authorities, service providers, and consumers.

It should be noted that the reform of the transport services sector in the EU, as well as in Ukraine, was accompanied by a number of other reforms, including decentralization reform. In turn, the process of consolidation of territorial communities was also accompanied by processes of reforming methods and means of state support, as well as the reorientation of public policy in general.

The EU transport policy is based on the principles of the unity of the transport services market, freedom of business, fair competition, transparency, safety, and environmental protection. The EU Member States have gone through a rather difficult stage in reforming the transport sector of the economy, identifying four main reform packages and overcoming the path of more than 20 years.

Today, EU Member States have a proper and transparent policy on the organization of the provision of public passenger services (services of general economic interest), as well as the obligation to compensate for the loss of revenue from the provision of such services and/or granting exclusive rights to market operators in the event of tariff regulation and reduced transport services provided to certain categories of citizens. At the same time, transparent competitive principles (tenders for public procurement of such services), the conclusion of contracts (concession agreements) for the provision of transport services are provided, and the interests of all participants in the transport services market are taken into account.

European experience in organizing and providing public transport services requires both detailed study and implementation in the Ukrainian legislative area.

Policy in the socially important transport services area began with the development of the EU acquis - White and Green EU books, Council Regulations (EC) No 1191/69 and (EEC) No 1107/70 of 26 June 1969 on action concerning the obligations inherent in the concept of public service in transport by rail, road and inland waterway. This Regulation was subsequently amended and Regulation No 1370 / 2007of the European Parliament and of the Council of 23 October 2007 on public passenger transport services by rail and by road and repealing Council Regulations (EEC) Nos 1191/69 and 1107/70 (hereinafter - Regulation 1370).

Based on the need to implement the concept of building a “service” state, EU countries adhere to the principle of building-integrated transport systems to ensure proper quality of transport services to the population of a given area, as well as maintaining the competitiveness of public transport in relation to individual transport. The ultimate criteria for the appeal of an integrated system are time, price, comfort, reliability, and safety.

It is for this purpose that the EU has developed and implemented Regulation 1370, which entered into force on December 3, 2009, and aims to create an internal market for public transport services.

It should be noted that this aim is performed by supplementing the general rules of public procurement. This Regulation also lays down the conditions under which contracts provide for compensation payments and concessions for passenger transport are considered compatible with the internal market and exempt from the prior notification to the European Commission about the state aid if the cost of vehicles purchased for public transport services does not exceed 200 thousand euros.

Thus, the basic conditions of contracts for the provision of public transport services by Regulation 1370 include:

defining the geographical area of services provided;

the parameters of public transport services based on which the compensation should be calculated, and the nature and extent of all exclusive rights granted, in order to avoid any overpayment of compensation;

means of distribution of funds related to the provision of services (personnel costs, energy, infrastructure, maintenance, etc.);

means of distribution of income from the received financial result, from ticket sales, if such public transport service is not provided on a free basis, between the carrier and the customer of such service;

the duration of the contract for the provision of public transport services is limited and should not exceed ten years for bus services and fifteen years for passenger transport by rail or other means of rail transport.

Therefore, the conclusion of an agreement on the provision of public transport services is based on the need to provide competitive tendering mechanisms for the conclusion of such agreements, which should be open to all opeartors on a fair, transparent, and non-discriminatory basis.

Regulation 1370 also provides that municipalities may provide such services either independently or assign them to an operator under their management, just as they manage their own services (the so-called “direct agreement”).

If a national, regional, or local authority, and operators enjoying exclusive rights, do not have the ability or willingness to provide public transport services independently, they must enter into such an agreement in accordance with competitive procedures as defined by Regulation 1370 and related acts, in particular Directive 2014/25 / EU for tram and bus transport, if the amounts announced before the tender procedures exceed EUR 1,000 for service contracts in the case of public or other special services.

At the same time, the EU Member States may, if they wish, organize public procurement for contracts for the provision of public transport services at a lower cost than the above-mentioned maximums set by the European Commission every 2 years to determine the need to amend them in line with the international obligations of the EU.

Contracts for public services provided by rail are also concluded in accordance with the rules laid down in Regulation 1370. Concerning the metro and tram transport, such transport is excluded from the scope of the Regulation, but the EU Member States may apply it if they deem it appropriate.

Significant attention in Regulation 1370 is paid to the quality of public transport services, and therefore the EU subsequently standardized transport services as a whole DIN EN 15140 Public passenger transport — Basic requirements and recommendations for systems that measure delivered service quality and public transport services DIN EN 13816 Public passenger transport — Service quality definition, targeting and measurement in particular.

Thus, DIN EN 13816 stipulates that operators providing public transport services must meet all the criteria specified in the contract with the municipalities, in particular, the quality of such services. The standard visualizes the quality of this type of transport services by both the consumer and the service provider, and states that the main criterion for their interaction within certain limits is measurability both in terms of reimbursement of public transport services and the quality of such services.

The EU policy on the provision of public transport services as we can see is quite strict on the one hand and quite flexible on the other hand. It is built on the principle of compromise of common and national interests. By building a general framework for the formulation of public policy on the provision of public transport services (for example by establishing uniform criteria for the quality of social transport services), the EU institutions responsible for adopting a document or policy leave the EU Member States the choice of outcome based on the need to ensure a sufficient level of mobility and competition in the common market.

It is also important to emphasize that the period of implementation of Regulation 1370 was 10 years from the date of its entry into force, which, according to scholars, is commensurate with the period of reorientation of any policy.

The EU member states have come a long way in implementing these social policy instruments. It was the most difficult for the countries of the former socialist bloc, the management of which was based on the administrative-command method. Poland, Lithuania, Latvia, and Estonia have quite successfully overcome the "social specter of the era of advanced socialism."

It is worth noting that the above-mentioned EU member states have introduced the principles of exercising the rights to a transport concession. Thus, the provision of transport concession in Poland is based on such principles as:

reimbursement for the provision of socially significant transport services from the state and local budgets is through the Ministry of Infrastructure and Development of Poland;

introduction of accurate accounting when issuing a ticket upon presentation of a document certifying the right to concession;

determining the range of persons entitled to concession at the national and regional levels (persons with disabilities, pensioners, children, military, teachers, students);

determining the maximum level of income of one family per month, at which it is possible to receive public transport service at the level of income determined by the state;

dependence on the amount of allowance on central and local authorities. Territorial communities have the right to establish an additional amount to the state-guaranteed concession at the expense of their own budgets;

decentralization of powers at the city level (discounts on city buses depend on the mayor's office);

granting concession twice a year when traveling by rail.

In Estonia, since 2018, residents of counties have been exempted from paying a fare on county bus lines.

Lithuania reimburses the provided public transport services to the operator through the Ministry of Communications of the Republic of Lithuania in full for the intended purpose from the state budget. Accounting for the provision of transport services to the citizens who receive concession is carried out during the issuance of a ticket upon presenting a document certifying the right to receive public transport services. Accounting forms for groups of categories of the population entitled to receive public transport services and routes are drawn up monthly. In total, public transport services are provided to 15 categories: people with disabilities, war veterans and their families, pensioners, children, and others. Lithuania has completely abolished professional transport concession at the state level but has retained the right to establish such concession at the local level and exclusively at the expense of the local budget. Free transport for social categories is replaced by travel with a discount — 80% and 50% depending on the category of the recipient. Transport concession in urban transport is financed exclusively by local authorities based on accounting for public transport services provided. At the same time, the state budget finances exclusively the provision of public transport services on the intercity route.

The situation is similar in Germany, where the level of discount (concession) on public transport services is 50% of the difference between the income received by the operator from public transportation of socially vulnerable groups and its costs, calculated depending on the number of person-kilometers when providing such services. In this case, the average cost of public transport services is the rate of cost per person-kilometer, which is set by land governments or bodies authorized by statutory regulations, in accordance with the average of operators that work economically and efficiently; in addition, different cost rates for rail and non-rail transport, as well as for different regions of such services can be determined according to the operational and transport characteristics of the land. The compensation payment due to the application of the discount must be reduced by 12% each subsequent year following 2006. However, the German Federal Law on Public Services stipulates that public transport services, which are provided outside Germany are also reimbursable and such reimbursement should be made only for part of the services provided in the country of transport of German residents.

Therefore, summarizing the European experience of providing public transport services, it is worth emphasizing the following:

in the EU member states, there is no notion of travel concession or provision of transport services with reduced costs, it has been replaced by a broader and more capacious concept — socially important transport services (public services of general economic interest);

concessions in the EU do not mean a complete exemption from payment for transport services provided, but the provision of an economically justified level of discount on such services;

the state establishes general conditions for the provision of public transport services, local communities set additional discounts, additional categories of persons entitled to receive discounts, the right of local communities to set discounts for using public transport;

the state has delegated the obligation to account for public transport services to territorial communities, as well as granted the right to provide additional rights to travel concessions, subject to reimbursement of such concessions from the local budget;

territorial communities are not limited in the ways and methods of collecting information on the quantity and quality of public transport services provided within the framework of agreements on the provision of public transport services concluded with operators for a specified period;

territorial communities within the framework of agreements on interterritorial cooperation have the right to grant the right of travel concessions on routes outside the territorial community, regulating the issue of financial compensation to the operator of such services (usually in such cases the obligation to account for the categories of passengers entitled to travel concession is on the operator while territorial communities provide only control over such accounting).

Thus, implementing Regulation 1370 the EU member states achieve a balance of interests of transportation services consumers who are entitled to trevel concessions, territorial communities, and the state as a whole while avoiding social conflict.

In Ukraine, the mission of reforming public policy in the public transport services area can be defined as the process of forming an effective and efficient mechanism for the functioning of transport policy as a social component of public policy in the dynamic development of Ukrainian society.

Taking into account the experience of the EU member states in the formation and implementation of public policy in the public transport services area, we should note the goals of public policy reform in Ukraine in this area:

comprehensive, holistic, balanced, and high-quality development of the transport services sector to provide vulnerable social groups with public transport services of appropriate quality and quantity;

improving the standard of living of the population by creating appropriate transport conditions;

developing the self-support of regions in all its aspects (legal, economic, social) during the realization of public transport policy;

forming stable public-private relations during the provision of public transport services;

creating conditions for the dynamic, economic and competitive development of the transport sector of the economy;

ensuring an adequate level of protection of the rights of customers, providers and consumers of such services.

We agree with Ukrainian researchers that the strategic directions for improving the mechanism of providing public transport services are:

development and approval of socially and economically justified calculation norms of transport mobility by types of transportation (urban, suburban, etc.) per person;

optimization of the enumeration of categories of recipients of travel concessions and the enumeration of conditions for obtaining the latter (adequate increase in the level of income of working persons who obtain travel concessions and the use of indirect methods of assessing the property status of applicants for the travel concessions);

study of the conditions for determining the number of budget expenditures for the provision of concession in monetary terms;

development and introduction of a mechanism and procedure for granting travel concessions agreed for all types of public passenger transport (road transport, electric transport, metro, railway transport), including in monetary terms (if necessary).

The micro-goals of the strategic directions of reforming public policy in the public transport services area include:

formation of a methodology for determining the technical condition of vehicles involved in the provision of public transport services (maximum age, condition, serviceability, etc.);

introduction of a transition period and introduction of incentive measures for decommissioning of obsolete rolling stock;

formation of the methodology of passenger costs and calculation of the amount of concessions (discounts) (bus, railway, tram, metro) on the basis of advanced accounting techniques;

settling the type of scheme of the agreement between the competent authorities and the operators on the provision of public transport services (gross expenditure contract, net contract and, probably, concessions) and the assessment of the cost of compensation;

preparation of model agreements for the provision of public transport services for road and/or rail transport, including monitoring and control by the competent authorities during the term of the agreement;

development of methods for assessing and monitoring the achievement of public policy objectives in the public transport services area;

changes in the regulatory framework for the formation and implementation of public policy in the in the public transport services area.

The fundamental postulate of reforming the modern model of providing socially significant services in the transport area in the context of decentralization of public administration in Ukraine should be the transfer of part of budget funding to provide such services, based on community needs, including interterritorial interactions of such communities.

The formation and development of a modern system of socially significant services in the transportation area, taking into account the needs of the local community will expand the range of target social groups, based on the community's capacity, and simultaneously improve the targeting and quality of services; ensure maximum availability, efficient allocation and use of human, financial, material resources through better response to the needs of citizens; strengthen the relationship between budget funds and the level of quality of services provided in the community at the expense of these funds; strengthen the social responsibility of the community.

It should be noted that, in our opinion, short-term and medium-term prospects for changing (reforming) a certain policy are not the options that will give a lasting managerial and economic effect. At the same time, in order to fully update one or another direction of public policy, it is necessary to focus on a period of 10 to 15 years, taking into account the aspect of its coherence with other areas, which will require procedural adjustment in one way or another.

Harmonization of Ukrainian law with the EU acquis is not only a tool for deepening economic cooperation with the EU but also an important means of accelerating the further development of Ukraine as a whole. To this end, the state authorities of Ukraine have approved the relevant plans for the preparation of legal acts.

It is important to amend the laws of Ukraine “On Road Transport”, “On railway transport”, “On urban electric transport”, “On local state administrations”, “On local self-government in Ukraine”, “On the basics of social protection of persons with disabilities” and other regulations, in particular, to bring the legislation on public transport in line with Regulation 1370.

Certain steps have already been taken to amend the above-mentioned legal acts. Thus, several draft laws have been registered in the Verkhovna Rada of Ukraine, which, in our opinion, are extremely unsuccessful and not aimed at resolving the issue of changing institutional approaches to the provision of public transport services, but are purely populist, as they involve increasing the discount rate, expanding the categories of citizens entitled to such social services; expansion of modes of transport where such services can be provided. Also, we consider it necessary to develop laws of Ukraine “On the administrative-territorial structure of Ukraine” and “On socially significant transport services in Ukraine or transport services of general economic interest”, which would allow taking the provision of public transport services to a functionally new level in the decentralization of power.

An important step in improving the level of public transport services is the introduction of standards for the provision of public transport services as a specific mechanism for quality control of such services according to legally defined criteria in terms of providing state support. This can be achieved both through the relevant EU standards and through the introduction of ISO 9000 and 14000 certification systems in the transport sector, without waiting for the implementation of Regulation 1370. Concomitantly, it is also necessary to ensure amendments to the basic legislative acts: Civil and the Economic Codes of Ukraine to eliminate the dual approach to imposing sanctions for non-performance of contractual obligations under state/municipal contracts and private contracts.

The experience of post-socialist countries shows that moving away from the consumer-administrative model of providing public transport services requires reforming all its components. In particular, addressing the following issues:

determination of a single body of power responsible for the formation of a policy of proper transport services, taking into account the social component and the needs of territorial communities;

clear delineation at the legislative level of the competence of central and local authorities regarding the commissioning the public transport services, based on their needs, and for territorial communities and administrative units — taking into account the issues of spatial planning and their contractual interaction;

formation of a route network:

based on the objectives of interoperability and inclusiveness of transport services;

whereas rail transport is the most widely used in the provision of public transport services and road transport should be used exclusively as an alternative to transporting passengers to rail junctions or in the absence of any service at all;

based on the real needs of municipalities and administrative units;

taking into account the need to visit educational and medical institutions, workplaces, state and municipal authorities during their work;

introduction of a contractual provision of public transport services, based on the principles inherent in public (tender) procurement, based on the actual need for such services for the municipal or central government. Such contractual regulation should be applied not only in the system "customer – provider", but also at the level of "customer of higher-level services - customer of lower-level services" in cases where the length of the route exceeds the statutory percentage. It should also be provided that municipalities and administrative units that have public operators may grant them exclusive rights to provide public transport services, but such rights are "delegated" under a contract the essential terms of which are the same for all operators;

legislative consolidation of the essential terms of the contract for the provision of public transport services, including the term of the contract, which may not be less than 10 years, and the conditions for its extension; rules of organization and provision of services within the relevant route; conditions and rules of compensation (reimbursement) of operators' expenses for quality public transport services provided following the calculated quantity; rules for monitoring compliance with the terms of the contract; determination of commensurate civil liability for compliance with the terms of the contract;

legislative regulation of providing public transport services on the terms of a concession;

introduction of the procedure of standardization of transport services and its obligatory nature as an element of observance of the licensing legislation;

determination of mechanisms and amounts of state aid to operators, if the costs associated with the provision of public transport services, such as the renewal of rolling stock, exceed EUR 200,000;

addressing the issue of eliminating obstacles to the development of competition in the provision of public transport services, for example by introducing a percentage quota of the total length of routes in the respective territorial community;

elimination of strict tariff regulation and the transition to free pricing, which is formed under the influence of free economic processes based on a fair and transparent economic basis within the contractual regulation;

determining the method of calculating compensation for services provided;

conducting the budget decentralization depending on the accounted number of services, the territory of provided services, and the terms of the contract between customers of different levels;

reduction of the list of the categories of the population having travel concessions depending on the need to receive the service (indicator here is the level of material security);

waiver of 100% travel concession and economic justification of the amount of the discount guaranteed by the state;

introduction of differentiation of the weight of the discount depending on the category and material condition of the recipient of the service (increasing the targeting of the service);

introduction/filling of the electronic register of categories of the population having travel concessions of the corresponding territory and its "coordination" with the data contained in the tax register, the register of births and deaths, changes of the social status;

introduction of periodic revision of the basis for accrual of transportation benefits depending on the material support and the number of rides;

expanding the scope of implementation of electronic services accessible to people with disabilities, including on the local level;

carrying out the procedure for allocating the railway infrastructure operator and eliminating the monopoly position of the railway operator in operating the infrastructure;

development and financing of the railway infrastructure modernization program, including through the mechanism of public-private partnership;

attracting investments by admitting private operators to rail passenger transport to create competition in the railway transport sector;

creating conditions for the establishment of joint ventures in suburban passenger transport services with the participation of local authorities;

development of high-speed railways.

It is expedient to regulate the issues of political lobbying and advocacy through parallel processes by adopting appropriate normative acts; digital gaps (Internet coverage, detection of black, gray and white areas); provision of public transport services to temporarily displaced persons, and thus clarification of the fact who is a resident of the

territorial community; simplification of land allocation procedures for the development of the transport network; development and involvement in the provision of public transport services for electric vehicles and the development of appropriate infrastructure. The issues of attracting technical and material assistance for the implementation of structural reform of public transport services also remain important; conditions for attracting foreign operators to the transportation process as additional investments in the country's economy; development of mechanisms to reduce the cost of credit for both small and medium-sized businesses.

The natural monopoly of the railway must also go through the stages of reforming and introducing the principle of competition and free access to the market of foreign operators. Of course, this can only happen with changes in legislation and the willingness of management to improve the industry. This path is not easy and requires significant financial costs.

The corresponding corruption risks cannot be ignored either.

The implementation of any changes is not possible without a powerful information campaign, which requires effective communication on vertical and horizontal levels of public authorities and local governments, as well as communication with civil society organizations and residents of local communities.

As noted, the EU countries have gone through a fairly long phase, which covered almost 20 years and was conditionally divided into 4 packages of reforms, and most countries have received financial assistance from the EU for their implementation. However, all countries have one thing in common: sustainability and gradual development, as well as the planning of the periodicity of reforms with clear indicators of implementation.

Therefore, Ukraine should focus on defining strategic priorities for the formation and implementation of transportation policy in general and its social component in particular; define their indicators and ensure consistency and gradual implementation. Experience has shown that the EU countries have gone through a transition period, so it would be appropriate for Ukraine to take into account this experience of institutional change.

At the first stage of reform (approximately 3-5 years), it is necessary to focus, in particular, on the standardization of rules for the provision of public transport services with the gradual entry into force of certain rules depending on funding; promoting administrative reform; introduction of electronic accounting of the number of transported passengers enjoying travel concessions; synchronization of data from various registers, managed by public authorities and relevant local governments; identifying places where there is no transport connection, depending on demand, as well as areas where there is no Internet coverage; analysis of the validity of transport agreements; reforming the railway by dividing it into a carrier and a railway infrastructure operator; launching a technical audit of the rolling stock and infrastructure; professionalization of drivers.

At the second stage, (approximately 5 - 7 years) it is necessary to start the process of gradual formation of the transport network and reduction of categories of passengers entitled to travel concessions, the introduction of the material basis for distribution of transport discounts, differentiation of discount weight, further reorganization of the railway by division into freight operator and passenger carrier; to work out the issue of concession of a passenger carrier; develop regulations on compensation for public transport services provided; determine requirements for the quality of transport services; introduce voluntary standardization of services in the ISO system as an additional bonus to winning the tender; gradually introduce general tender procedures to determine the operator; to determine the method of calculating the price for reduced fare transportation and the method of compensation for public transport services provided; involve civic institutions.

At the third stage, (approximately 3-5 years) it is necessary to focus on the evaluation of the results obtained in the first two stages, as well as on the practical systematic updating of these registers, monitoring compliance with the terms of contracts, the development of the route network; creating conditions for improving the investment climate; credit system reform.

Conclusions

The generalization of the experience of providing socially significant transport services in the EU Member States made it possible to determine that the paradigmatic basis for reforming the system of such services in the EU countries in the growing trend of decentralization of public administration was the recognition of the importance of effective social and transport management. This development should be based on changing the vector of public policy formation, updating its institutional framework, changing the role and functions of institutions at the level of central and local authorities and local governments; development of mechanisms of market pricing for transport services and formation of new schemes of their financing and targeted payment; introduction of pilot projects of testing and

evaluation of the most acceptable models for socially significant services in the transportation area; improving the regulatory framework; strengthening the responsibility of their providers; introduction of minimum quality standards for the provision of such services, the introduction of an independent system of control and guarantees of the quality of services provided.

It is proposed to include in the main strategic directions of public policy reform in the public transport services area: development and approval of socially and economically justified calculation norms of transport mobility by types of transportation (urban, suburban, etc.) per person; optimization of the list of categories of people entitled to travel concessions and the list of conditions for obtaining those concessions (adequate increase in the level of income of working people paying the reduced fare and the use of indirect methods of assessing the property status of applicants); study of the conditions for determining the amount of budget expenditures for the provision of benefits in monetary terms; development and introduction of a mechanism and procedure for granting benefits or reduced fare agreed for all types of public passenger transport (road transport, electric transport, metro, railway transport), including in monetary terms (if necessary).

It is established that the proposed measures for the implementation of public policy of social and transportation spheres of public relations should be accompanied by a gradual change in the systemic characteristics of functioning and institutional relations under the influence of economic, social, and political factors.

In our opinion, the proposed ways to reform socially significant services in the transport area and in general the implementation of a balanced public transportation policy in the public transport services area based on European experience:

will ensure the functioning of transport in Ukraine at a higher level of organization as well as transparent "customer-operator-passenger" financial relations;

will provide an opportunity to meet the expectations of consumers of transport services to obtain services of high European level, proper quality, and safety;

will ensure the publicity of such services;

will allow removing the unsecured financial burden both from local authorities for social measures of the state and from business entities;

will establish regional norms (standards) for the consumption of concessional travel services;

will boost tax receipts from the activities of business entities by increasing the number of taxes and by increasing the number of businesses that will become market participants;

will promote the development of the national transportation system and its integration into the single European Transport Area.

Study Regarding the Perception of The Restaurants from Craiova, Romania Regarding Food Delivery Applications

Dr. Laurențiu-Stelian MIHAI

University of Craiova, Craiova, Romania
mihai.laurentiu09@gmail.com

Abstract

In the last few years, the use of food delivery applications has increased in Romania in general and in Craiova, in particular. Food delivery applications such as Food Panda, Takeaway.com, Glovo and Uber Eats provide a simple and fast way for people to order their food online and have it delivered relatively fast. These applications quickly expanded due to aggressive marketing tactics, funded by large injections of capitol from a wide range of investors. This study aims to study how the restaurants perceive these food delivery applications. Can they be considered a business partner which offers fair terms for both parties or are they a necessary evil? In order to answer these questions, we conducted a survey on 37 restaurants, and we tried to find their opinion on several aspects, such as the biggest advantages and disadvantages of food delivery applications. Our findings have shown that restaurants tend to use food delivery application because they bring them more visibility and at the same time, there is a correlation between the age of the restaurants' and their perception of food delivery applications, meaning that younger restaurants tend to see the food delivery applications as more useful.

Keywords: Restaurants, Delivery, Food Delivery Applications, Glovo, Food Panda, Takeaway.Com,

Introduction

Nowadays, resources are becoming scarcer and more expensive, and at the same time the general public's awareness of reducing the waste of resources have grown, a new kind of economy has arisen, the sharing economy, aided by the advance in information technology. The first companies which introduced this new concept are Uber (founded in March 2009) and Airbnb (founded in August 2008). Both introduced a new business model which allowed the general public to share their resources (cars and homes, in this case) and make some money. Uber disrupted the traditional taxi industry, allowing regular people who owned cars to provide public transport, while Airbnb disrupted the hotel industry by allowing regular people to rent their homes for short periods of time. In both cases, neither company owns any of these assets: Uber doesn't own any of the cars that are working for them, while Airbnb doesn't own any of the houses or apartments which are being rented through their platform.

The sharing economy can be defined as "an economic system in which assets and services are shared between private individuals" (Lovick, 2020). It is a broad term that encompasses different applications, services or products. Atilla Marton, professor of digitalization at Copenhagen Business School divides the sharing economy into three distinct concepts (Lovick, 2020):

- The real sharing economy which is based on sharing in its simplest form (sharing food or other household objects between members of the same family or flat mates, without any monetary gain). A good example of the real sharing economy is Wikipedia, a platform where users voluntarily contribute and share knowledge (Lovick, 2020).
- Gift Giving – people share products or services (such as birthday gifts), while expecting the other to do the same in the future. A good example can be found in the early days of Information Age, where programmers would freely share bits of code (Lovick, 2020). Another good example is Napster, an early music streaming services which allowed people to share their music, while having access to other users' music.
- Pseudo-sharing economy which encapsulates today's sharing economy (Lovick, 2020). This concept implies that while people will happily share their assets, they will do it if they will get a compensation, either monetary or otherwise. The two most prominent sharing platforms—Airbnb and Uber—are very commercial and have very little to do with actual sharing in the sense of solidarity and community," insists Christoph Lutz, associate professor of communication and culture at BI Norwegian Business School (Lovick, 2020).

Food Delivery Applications

Since Uber and Airbnb were founded in the last years of the 2000s, many other companies tried to adapt their business model in other industries. The main incentive for this was on one hand, an IT proficient market who prefer to do most of their chores using a smart phone, and on the other the massive funding that companies such as Uber ($24 bn) and Airbnb ($4.8 bn) have received. One of the first companies to apply the sharing economy concepts in food ordering was Uber itself, which launched its own food delivery service, Uber Eats in 2014 (Alba, 2016).

The food delivery application works in the following way: the clients download an application on their smartphone (or visit a website) in which they find all the restaurants which deliver food to their location. Each restaurant has its menu uploaded in the application and users select the products they want to buy by adding them to the cart, just like a regular online shopping experience. After finishing the order and choosing the payment method (cash or online), the restaurant receives the order, confirms it and tells the client (through the app) how long will it take until the order is ready, the customer receiving constant updates about the status of their order ("your order is confirmed"; "your order is being prepared", "the courier is on the way"; "the courier will arrive in few moments"). At the same time, after the client finishes placing the order, the order is assigned to a courier who receives the relevant information: which restaurant to pick the order from, where to deliver it, the client's phone number and other important details.

These companies are part of the sharing economy because even though they are food delivery applications, they don't make any food (they just have partnerships with different restaurants) and they don't own any car (the drivers, just like Uber drivers, are using their own cars to deliver the orders). The business model is very simple: for each order generated through one of these applications, the restaurant pays a fee, usually ranging from 10% to 15% of the orders' total value if the restaurants are interested only in order generation, and ranging from 22% to 33% if the restaurants want both order generation and delivery (Ram, 2018).

Research Methodology

The aim of this article is to study the perception of restaurant managers from Craiova regarding food delivery applications. In order to fulfil this aim, we tried to answer the following research questions:

Research Question 1: Which is the main advantage of food delivery applications, as it is perceived by restaurant managers from Craiova?

Research Question 2: Is there a significant correlation between the age of the restaurant and its perception of food delivery applications?

Research Question 3: Which is the main reason that restaurants are leaving food delivery applications?

Research Question 4: Which is the main reason that restaurants are refusing to join food delivery applications?

Sample Description

In order to fulfil the study's aim and to answer the research questions, we conducted a quantitative research, based on empirical data, gathered through a 10-question survey which was applied on a sample of 37 restaurants from Craiova, Romania.

Fig. 1: Distribution of the restaurants' age

Source: authors' processing

As we can see from Figure 1, out of 37 restaurants, 13% (5) were opened less than 1 year ago, 24% (9) are between 1 and 3 years old, 30% (11) are between 3 and 5 years old, 14% (5) are between 5 and 10 years old and 19% (7) are more than 10 years old.

Fig. 2: Restaurants' distribution based on the type of served food

Source: authors' processing

Figure 2 is showing us that the most common food served by our respondents is pizza (35%, 13 restaurants), followed by lunch menu (16%, 6 restaurants), diversified menu with many different types of food (16%, 5 restaurants) and burgers, breakfast and desert (each category being 8% of the total number of respondents, 3 restaurants each). The least common type of food served by our respondents are Mexican (2 restaurants, 5%) and Chinese and Oriental Food (1 restaurant each, 2.5%).

Fig. 3: Presence on food delivery applications

Source: authors' processing

Out of the 37 respondents, 62% (23 restaurants) are currently present on one of the main food delivery applications which operate in Craiova (Food Panda, Glovo, Takeaway.com, Eumananc.ro, Tazz, Gustos24 or Papago), 22% (8 restaurants) are not currently present on any food delivery application but were present in the past and 16% (6 restaurants) were never present on any food delivery application.

Results and Discussion

RQ1 - Which is the main advantage of food delivery applications, as it is perceived by restaurant managers from Craiova?

Fig. 4: The main cause for the restaurants' decision to join a food delivery application

Source: authors' processing

In Fig. 4, we can see the main reason that determined the restaurants to join a food delivery application. 9 out of the 23 restaurants that are currently on a food delivery application, stated that the main advantage of these application is that it increases their visibility in the market and therefore, brings them more clients. This is especially true for new restaurants, which don't have a strong brand and are not well known in the market (Ayidin, 2019). Instead of investing a significant sum in marketing and advertisements, they sign a partnership with a food delivery application and agree to pay them a percentage of all the incomes they generate through the food delivery application, the fee being owed only if an order comes through, unlike traditional marketing where is harder to measure the efficiency of advertising (Bortolato, 2018).

Moreover, 5 out 23 restaurants state that the main reason for which they joined the food delivery application is the fact that their employees can focus on their work, instead of taking orders by phone. Answering the phone and writing down the order takes time and a small restaurant can't afford to hire a person specifically for this job. Most of the time, this job is done by another employee who already has his own tasks and responsibilities and thus, the application really eases the employees' burden and streamlines the process.

RQ2 - Is there a significant correlation between the age of the restaurant and its perception of food delivery applications?

In order to answer this research question, we need to study the next three figures which show the correlation between the restaurant's age and three other variables.

Fig. 5: The correlation between the restaurant's age and their presence on food delivery applications

Source: authors' processing

In Fig. 5, we can observe the correlation between the restaurant's age and their presence on food delivery applications. Thus, we can see that all (5) restaurants less than 1 year old are present on the food delivery applications, as well as 7 out of 9 (78%) restaurants between 1 and 3 years, 8 out of 11 (72%) of restaurants between 3 and 5 years old, 1 out of 5 (20%) restaurants between 5 and 10 years old and 2 out of 7 (28%) restaurants more than 10 years old. Thus, we can a descending trend of the restaurants' presence on food delivery applications as they age. This trend is not a surprise, taking into account the fact that younger restaurants have smaller market shares, lesser known brands and few recurring clients, thus their association with a larger brand (such as Food Panda, Takeaway.com and Glovo) is helping them increase their sales significantly. Older restaurants, especially the ones older than 5 years tend to have a large recurring client base and a strong brand (in some cases even stronger than the food delivery applications' which first started to appear in Craiova 2-3 years ago) and thus, the added value that the food delivery applications can bring them is limited.

Fig. 6: Correlation between the restaurants' age and their perception of the main advantage of food delivery applications.

Source: authors' processing

In Fig. 6 we can observe how restaurants of different age perceive the main advantage of food delivery applications. For restaurants less than 3 years old (50%, 6 out of 12), the main perceived advantage is the increased visibility which generates an increase in their sales. Young restaurants don't have enough spare resources to invest heavily in

marketing and advertisements and thus, their association with a strong brand such as Food Panda, Takeaway.com or Glovo is beneficial.
The older restaurants start to see other advantages in being present on the food delivery applications: out of 8 restaurants aged between 3 and 5 years old, 2 perceive the increased visibility as the main advantage, 2 state that the fact that their employees can focus on their work instead of taking orders is the main advantage, while another 2 claim that they are present on food delivery applications because all of their competitors are there and they need to keep up with them.

Out of 3 restaurants aged 5 or more that are present on the food delivery applications, 1 considers the visibility as the main advantage, 1 considers that cutting the marketing costs the main advantage and 1 considers that they need to join the applications in order to keep up with their competitors.

Fig. 7: Correlation between the restaurants' age and their perception of the main disadvantage of food delivery applications

Source: authors' processing

In Fig. 7, we can observe that out of 12 restaurants aged less than 3 years, 5 (42%) restaurants consider that the high fees are the biggest disadvantage of food delivery applications, while 4 (33%) consider that the online orders which generate cash flow problems are the main disadvantage they encountered while working with food delivery applications.

Out of 8 restaurants aged between 3 and 5 years old, high fees, cash flow problems generated by online paid orders and slow deliveries, each have been selected by 2 (25% each option) restaurants as the main disadvantage of food delivery applications.

Out of the 3 restaurants aged more than 5 years old which are present on food delivery applications, 1 (33%) considers that slow deliveries are the biggest disadvantage, 1 considers that the cash flow problems due to online paid orders is the biggest disadvantage, while another one (33%) considers that the inability to create its own offers and discounts is the biggest problems.

Regarding the correlation between the restaurants' age and their perception of food delivery applications we can conclude that there is a significant correlation between the two variables, which manifests as it follows:

Younger restaurants tend to be more present on food delivery applications, because they can benefit from the association with a bigger brand, while older restaurants, with stronger client bases and brands (some with brands even stronger than the food delivery applications themselves) are less likely to be found on a food delivery application;
Younger restaurants consider that the association with a larger brand brings them more visibility in the market while older restaurants tend to view the customer review system as the main advantage;
Younger restaurants who have smaller profit margins and turnover view the high fees as the biggest disadvantage of food delivery application, while older restaurants tend to consider the online paid orders which generate cash-flow problems to be the biggest disadvantage.

RQ3: Which is the main reason that restaurants are leaving food delivery applications?

Fig. 8: The main cause of restaurants' decision to leave the food delivery applications.

Source: authors' processing

In order to answer this research question, we asked our respondents to rate six statements, using a 5-point Likert scale (ranging from 1 – totally disagree to 5 – totally agree). Thus, we can see out of 8 restaurants which are currently not present on any food delivery application, but were present in the past, all of them more or less agree (75% totally agree while 25% agree) that the fees were too high. Regarding the low-quality customer service as a reason to leave the food delivery applications, the answers were more evenly distributed: 3 out of 8 restaurants (38%) totally agreed with the statement, 2 out of 8 (25%) of the respondents agreed with this statement, 2 out of 8 (25%) of the respondents neither agreed or disagreed with the statement, while 1 out of 8 (12%) restaurants disagreed with the statement. Moreover, we can see that the applications are quite good from a technical point of view, because 6 out 8 (7.5%) of the restaurants more or less disagreed (37.5% totally disagreed and 37.5% disagreed) with the statement that the applications had too many technical problems which took too long to get fixed. Furthermore, all respondents more or less disagreed (63% totally disagreed, 37% disagreed) with the statement that not many orders came through. Regarding the statement "online paid orders generated cash flow problems for my restaurant", all 8 (100%) restaurants totally agreed, while the last statement "I was disappointed by the overall quality of the service" received mixed answers: 6 out of 8 respondents either totally disagreed, disagreed or agreed with the statement (25% each option) while 2 out of 8 either totally agreed or neither agreed nor disagreed (12.5% each option).

Based on the above arguments, we concluded that the main cause of the restaurants' decision to leave the food delivery applications is the fact that the online paid orders generated cash flow problems for the restaurants. If a client orders food through an application and chooses to pay online, the application receives the whole amount, holds the fees and transfers the remaining amount to the restaurant after 30 or more days. Basically, the restaurant doesn't have access to its own cash for 30 or more days, which affects its ability to pay in time its own suppliers, employees or taxes.

RQ4: Which is the main reason that restaurants are refusing to join food delivery applications?

Fig.9: The main cause of restaurants' refusal to join food delivery applications

Source: authors' processing

In order to answer this research question, we asked the respondents to rate five statements on a Likert Scale, ranging from 1 – totally disagree to 5 – totally agree. Thus, we can see that all respondents more or less agree (83% totally agree and 17% agree) that the fees charged by the food delivery applications are too high. Moreover, all restaurants more or less agree (66% totally agree and 34% agree) that they have more than enough orders without using any food delivery application while 3 out of 6 (50%) agree (33% totally agree and 17% agree) that they don't want to share a part of their income with a third party. Furthermore, only 1 restaurant out of 6 (16%) totally agrees that the food delivery applications cannot bring an increase in their sales, while 2 out of 6 (33%) totally disagree with this statement. At the same time, 5 out of 6 restaurants more or less agree (50% totally agree and 33% agree) with the fact that the terms and conditions offered by the food delivery applications are not fair.

Thus, we can see that the main reason that restaurants refuse to join food delivery applications are the fees, which are too high. This is not surprising, considering that while the average profit margin in the restaurant industry is between 0 and 15% (Resendes, 2019), most food delivery application charge a fee between 12% and 18% for order generation and another fee between 10 and 15% for delivery services. Thus, for a restaurant to be able to make a profit in these conditions, it either has to raise its prices in order to cover the additional fees or to transfer a part of these fees to client, by adding additional fees (e.g. delivery fees, surcharge for not meeting the minimum order).

Conclusions

The results of our study have shown us that the main reason for which restaurants are joining food delivery applications is the fact that it brings them more visibility in the market, and therefore increases their sales. At the same time, we found that there is a significant correlation between the age of the restaurants and their perception of food delivery applications: younger restaurants tend to be more likely to join these kinds of applications, since they can benefit from the association with a stronger brand, despite the high fees and cash-flow problems related to online paid orders. Moreover, regarding the restaurants which were present on a food delivery application at one point in the past, the main reason for which they have left it is cash-flow problem generated by online paid orders and high fees. Furthermore, the restaurants which were never present on a food delivery application state that the high fees are not worth the small increase in sales. The problems addressed in study should be further explored with a larger sample from other cities in Romania.

Future research will have as objective the analysis of the impact that Corporate Social Responsibility has on the companies in the field of services based on the analysis made by Burlea-Schiopoiu and Mihai (Burlea-Schiopoiu & Mihai, 2019) on Romanian SMEs.

Abstract

The paper explores tax regulation of virtual currencies (cryptocurrencies) as a new class of financial assets. The relevance of the topic is due to the wide development in the world of virtual currencies operations in the absence of a unified the interpretation of virtual currencies and in the absence generally accepted of the regulation of digital financial assets. The research is aiming to identify the economic and legal interpreting of virtual currency, determine taxation of virtual currencies in foreign countries and draft recommendations on taxation of cryptocurrencies transactions in Russia. Based on the study of tax regulation of virtual currencies in Singapore, UK, USA and Japan the paper defines interpretations of cryptocurrencies and outline their tax consequences. No correlation between taxation of virtual currencies and regulation of virtual currencies in the monetary and payment systems has been found. In most studied countries virtual currencies-related incomes are taxable by corporate taxes and the burden of taxation is defined by national approach to corporate taxation. The authors conclude that in Russia implementation of best global practices shall be complemented by considerations of domestic direct and indirect taxation specifics. The paper suggests that cryptocurrencies-related incomes should be subject to corporate income tax but exempted from personal income tax. Virtual currencies-related transactions should be exempted from VAT but without necessarily recognizing cryptocurrencies as official mean of payment.

Keywords: Virtual Currencies, Cryptocurrencies, Digital Financial Assets, Tax Regulation, Virtual Currency Taxation, Cryptocurrency Taxation.

Introduction

In recent years, active introduction of new digital information technologies has led to the emergence of a new class of assets in the payment sector and in the financial markets - crypto-assets, which are commonly called digital financial assets in Russia. Among these assets are virtual currencies, stablecoins, security tokens, utility tokens, etc. Most digital financial assets do not perform standard monetary functions and, from the point the banking regulators' point of view, they are not absolutely safe to be used as an exchange medium (Bank for International Settlements, 2019). Nevertheless, digital financial assets perform a wide range of financial functions and incorporate assets of different economic and legal nature, including monetary, equity, debt, etc. In most cases, such assets are created using the *distributed ledger technology*[1] or *blockchain*[2], allowing to store all information related to the issue, trading or transfer of assets in a decentralized manner.

Despite a wide range of digital financial assets, *virtual currencies (cryptocurrencies)* which can act as a payment instrument, as well as a means of savings and investment play one of the most significant roles. *From a functional point of view* virtual currency can be defined as a digital expression of value that can be bought and sold in a digital

Cite this Article as: Dmitry KOCHERGIN, Natalia POKROVSKAIA, Victor DOSTOV, and Pavel SHUST "Tax Regulation of Virtual Currencies in Developed Countries and Russia" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

form and function as: 1) an exchange medium; and/or 2) a unit of account; and/or 3) a means of preserving value, but does not have legal status in any jurisdiction (that is, it is not a legal means of payment from a regulatory point of view in most developed and developing countries). *From an institutional point of view* virtual currency can be interpreted as a digital expression of value, which is issued not by traditional issuers of modern forms of money such as central banks, credit institutions or specialized issuers of electronic money, but it can be used to a limited extent as an alternative to generally accepted forms of money for payments being conducted in electronic networks (for more details, see Kochergin, 2016). Unlike central bank digital currencies, virtual currencies do not have a clearly identified issuer to whom monetary claims can be addressed (Kochergin et al, 2019).

Virtual currencies differ both from universally recognized national fiat money issued by state monetary authorities, and from electronic money issued by credit institutions or specialized issuers by a number of formal and essential criteria (Kochergin, 2017).

Essential features of virtual currencies are:

1) *A trust-based mechanism of value formation.* Virtual currencies are assets whose value is determined by demand and supply. The pricing of virtual currencies is similar to pricing of rare goods, such as gold. However, unlike gold, they do not have have intrinsic value. As a result, their value is based only on the belief that they can be exchanged for other goods or services, or a certain amount of national currency at some later time.

2) *Securing of a direct exchange of electronic value*. Until quite recently, only cash could be used to facilitate direct exchange of value between the parties without participation of intermediaries in payments. A key innovation in virtual currency schemes is the use of distributed ledger technology, which guarantees remote exchange of value in the absence of trust between parties and without participation of *intermediaries.*

3) An institutional mechanism in which information and financial transactions are managed without intermediaries. Most virtual currency schemes are not managed by any specific person or institution. This distinguishes them from electronic money systems that have one or more issuers of value that are responsible for the reimbursement of electronic money. A decentralized nature of most virtual currencies implies the absence of any identifiable scheme operators, which are usually credit institutions or specialized issuers in the case of electronic money (Kochergin, 2011).

A steady increase in appeal of the development of virtual currencies circulation has been observed since 2015. This appeal was dictated by payment and investment potential of virtual currencies as a new digital financial asset. As a result, during 2016-2017 exchange rates of virtual currencies has been steadily increasing. Thus, on January 7, 2018, a record cryptocurrency market capitalization was reached, amounting to $ 813.87 billion (CoinMarketCap). A subsequent deep correction of the virtual currency market, as a result of which the total cryptocurrency capitalization from January 2018 to December 2018 decreased by 80%, was associated with two factors - gaps in the regulation of virtual currencies and technological imperfection of most solutions existing on the market. The correction of leading virtual currencies in 2018 was also associated with the actions of financial regulators that weakened speculative activity in the market of operations with virtual currencies.

One of the most important problems hindering the widespread use of virtual currencies in the payment and investment spheres, not only by private payers and investors, but also by credit institutions and investment funds, is the lack of a comprehensive economic and legal framework for regulating digital financial assets. In this regard, timeliness of the introduction of regulatory mechanisms, including tax-related (which is the most important instrument of state regulation of digital financial assets) seem especially relevant because the interest in the virtual currencies on the part of financial market participants and regulatory bodies remains high.

The development of virtual currencies due to their decentralization, and the difficulty of determining the state affiliation of the operations mediated by them, on the other hand, represents significant challenge in various financial fields, including taxation. The features of virtual currencies create a potential opportunity to use them for global tax avoidance (Marian, 2013). At present, tax authorities of various countries are making attempts to tax the transactions related to virtual currencies, while the theoretical justification of such tax mechanisms usually follows practice and is likely to be widely implemented only in the near future.

Analysis of spontaneously emerging approaches to the taxation of transactions with virtual currencies in different countries, in the context of different interpretations and a lack of a unified approach to the taxation of digital financial assets both at national and international levels, is of undoubted research interest not only because of the introduction of such assets into the legal field in the framework of the modern digital economy, but also in connection with the development of a tax regulation regime for virtual currencies in the Russian Federation.

It is likely that the uncertainty associated with the taxation of virtual currencies will gradually decrease as far as their legislative regulation is introduced. International standards may be an incentive to develop such regulations. For example, in 2018, the Financial Action Task Force on Money Laundering (FATF) amended the Recommendations on combating money laundering and terrorism financing, recognizing the concept of "virtual asset" and "service providers related to virtual assets". In June 2019, clarifications were adopted to the Recommendation 15, which obliges all countries to introduce regulation regarding providers of services related to virtual assets, making them subject AML/CFT regulation (FATF, 2019).

The purpose of the article is to identify main economic and legal approaches to the interpretation and taxation of virtual currencies in foreign countries, to identify and characterize approaches to the interpretation of virtual currencies[3] in the tax sphere, as well as to formulate proposals for the taxation of operations with virtual currencies in Russia. The key objectives of the study are to determine the object of tax regulation in national laws and to analyse direct and indirect taxes imposed on transactions with this object. The study of approaches to taxation of virtual currencies is preceded by a review of previous scientific publications and a rationale for the choice of the analysed countries. Based on tax regulation of virtual currencies in Singapore, USA, Australia, the United Kingdom and Japan, possible interpretations of this financial asset and their tax consequences are summarized. Finally, the article draws conclusions about the possibility of using foreign experience in taxation of virtual currencies in relation to the tax regulation of virtual currencies in Russia.

Literature Review and Study Methodology

Despite high relevance of taxation issues related to transactions with virtual currencies, scientific research of these issues is fragmentary. As legal discussions about the economic nature of cryptocurrencies in the context of their taxation in Europe were the first chronologically and in breadth of distribution, these issues are most often presented in the studies of the European authors (Kowalski, 2015). Rather, reviews of regulatory initiatives and approaches to tax regulation of virtual currencies in different countries prevail (Likhuta et al., 2017; Global Legal Research Center, 2018). Attempts and generalizations are made of practical experience to develop theoretical directions of regulation in this sphere (Kochergin and Pokrovskaia, 2020a; Kochergin and Pokrovskaia, 2020b). In particular, A. Bal in his works of 2014-2015 (Bal, 2014; Bal, 2015) considers the issues of taxation of virtual currencies in three key aspects: a formation of a model approach to the taxation of virtual currencies, a description of tax legislation in this area in different countries, determination of areas for improving existing approaches to levying taxes in operations with virtual currencies. Of course, these aspects of taxation attract the attention of international regulators. In particular, although in the EU direct taxation of virtual currencies is carried out in accordance with the national laws of the Member States, the procedure for collecting VAT in the territory of these states since 2015 is in accordance with the decision of the European Court of Justice that purchase and sale of bitcoins[4] for fiat currencies is not subject to this tax (Vishnevsky and Chekina, 2018). Beyond that, in the report of the Organization for Economic Cooperation and Development, issued in March 2018, common approaches to determining the tax consequences of new technologies (cryptocurrencies and distributed ledger technologies) are expected by 2020 as part of the "Tax measures related to digitalization" project - BEPS events (Base Erosion and Profit Shifting) (OECD, 2018).

Although virtual currencies have an unlimited geographic scope, national approaches to regulating them vary widely both in the sphere of monetary relations and in the field of taxation. Against the background of the growing digitalization of tax administration processes (Victorova et al., 2019), tax authorities of an increasing number of states are issuing clarifications on the procedure for taxation of transactions with virtual currencies; however, the number of countries in which these clarifications have legal status remains low. To achieve this goal, we studied the tax aspects of virtual currencies functioning in countries where transactions with virtual currencies are legal, in countries pioneering in tax regulation in this area (see Table 1), as well as in countries whose financial markets are the most important from the point of view of innovative development: Singapore, UK, USA and Japan.

The study is based on comparative analysis and synthesis. For each country being analysed, approaches to determination of virtual currencies and their regulation in the monetary sphere were analysed; the structures and organizations that implement tax regulation are indicated, as well as links to relevant regulatory documents and regulatory requirements regarding the collection of taxes on virtual currencies are given. In addition, national systems of direct taxation of income of individuals and legal entities, as well as of indirect taxation, were analysed. The tax consequences of typical operations with virtual currencies for legal entities and individuals were examined, such as mining of virtual currencies; acquisition of virtual currencies; use of virtual currencies to pay for goods and services; receipt of virtual currencies as payment for goods or services; implementation of virtual currencies as part of the usual activities for the purchase/sale of virtual currencies; implementation of virtual currencies purchased for

investment purposes. Finally, approaches to the regulation of virtual currencies in Russia are described and proposals for taxing virtual currencies are formulated taking into account the experience of foreign countries.

Findings

Value of virtual currencies both in payment and financial spheres increases as far as their capitalization grows, scope and direction of their use widen, number of payment transactions increases, their costs decreases and the speed of payments increases. At the end of April 2019, more than 2140 virtual currencies were in circulation with a capitalization of more than 171.14 billion USD (CoinMarketCaP). Major and most famous virtual currencies were: Bitcoin Ethereum, XRP, Litecoin, EOS and Bitcoin Cash. At the same time, the value of transactions in the Bitcoin network in 2018 exceeded $ 3.3 trillion, which is six times more than the PayPal payment system and 16.5 times more than Western Union (Bitcoinexchangeguide, 2018). The daily trading volume of the world's largest cryptocurrency Bitcoin in March 2019 exceeded $ 11 billion, which was the most significant indicator for the 24-hour period since April 2017 (CoinMarketCap).

It should be noted that at present virtual currencies are legalized in more than 110 countries[5]. However, the degree of legalization, as well as the presence or absence of various restrictions on operations with virtual currencies, as before, varies significantly between countries. In general, countries with market economy and a high level of economic development have a more favorable regulatory regime for virtual currencies than countries with developing or emerging markets.

Table 1 presents different approaches to the interpretation of virtual currencies in order to implement monetary regulation in the G20 countries.

Source: Compiled by the authors on the basis of national regulations and / or official documents published by monetary regulators in the G20 countries.
*Note: * - According to the Act "On Digital Financial Assets and Digital Currency" effective from 01.01.2020 (State Duma of the Federation Council of the Russian Federation, 2020);*
*** - in October 2019 The chairman of the US Commodity Futures Trading Commission, Heath Tarbert, expressed the view that the largest virtual currencies such as Bitcoin and Ethereum, as well as other assets of a similar nature, should not be regarded as property, but as commodities (Yahoo Finance, 2017).*

As can be seen from Table 1, in the G20 countries, in order to implement monetary regulation, three main interpretations of virtual currencies prevail: 1) property 2) currency and 3) commodity. At the same time, as our subsequent analysis will show, the interpretation of virtual currencies for the purposes of monetary regulation and tax regulation may differ.

Direct and indirect taxation of operations with virtual currencies in Singapore

Singapore is one of the few countries in the world where favorable conditions have been created for the development of startups and attracting venture capital to innovative areas of the financial market in general and in the sphere of virtual currencies in particular.

Tax regulation of virtual currencies in Singapore is carried out by the Inland Revenue Authority of Singapore (IRAS) as part of taxation of business income (Inland Revenue Authority of Singapore, 2019b) and indirect taxation (Inland Revenue Authority of Singapore, 2019a). The basic income tax rate (excluding benefits and exemptions) is 17% in Singapore. At the same time, 75% of the first 10 thousand Singapore dollars (about 7.5 thousand US dollars) and 50% from the next 290 thousand Singapore dollars in 2019 and 190 thousand Singapore dollars from 2020 are supposed to be partially exempted from taxation (215 thousand and 140 thousand US dollars respectively). For startups, during the first three years after creation, the first 100 thousand Singapore dollars of income are excluded from taxation, and a 50% exemption of income is applied already from the next 200 thousand Singapore dollars in 2019 and 100 thousand Singapore dollars from 2020 (100 thousand and 75 thousand US dollars, respectively) (PWC, 2018, p. 2264). At this rate, all business income related to virtual currencies is taxed: from mining, from ordinary entrepreneurial activities in trading and exchange of virtual currencies. As with taxable income received from any other sources, it is assumed that they will be reduced by tax deductions (expenses from the corresponding activities provided for in tax legislation). Upon receipt of virtual currencies as payment for goods, works and services sold, their value is taken into account in Singapore dollars and then is subject to the income tax under the normal procedure. At the same time, income from growth in the value of foreign currency purchased by companies for investment purposes is not taxed. The income of individuals from mining, trading in virtual currencies or investing in them is also exempt from taxation.

A wider scope is inherent to taxation of virtual currencies circulation. Singapore's key indirect tax is the goods and services tax (GST), which is levied at a rate of 7% of the sale of goods and services within the country. Financial services, sale and rental of housing, import and sale of precious metals in the country are exempted from this tax. A 0% rate applies to the export of goods and services. Payers of the tax on goods and services are companies with a turnover of more than 1 million Singapore dollars per year (PWC, 2018, p. 2265-2266) (more than 720 thousand dollars in the United States). The levy of tax on goods and services implies the possibility of tax deduction in connection with the acquisition of materials and fixed assets by analogy with the value added tax.

For the purposes of collecting the tax on goods and services in Singapore, virtual currencies are not considered as “money”, “currency” or “commodities”. The supply of virtual currency is regarded as a service that is not subject to tax exemption. Thus, companies that are recognized as payers of tax on goods and services calculate the tax on the sale of virtual currencies from the agent’s commission in agent relations, from the fees for transactions with virtual currencies. The use of virtual currency by companies to pay for goods or services qualifies as a barter transaction. Two stages of the transaction are distinguished: the first is the supply of goods and services, and the second is the counter supply of virtual currency. Formally, the tax on goods and services is levied at each stage if each of the parties is a taxpayer. Import of goods paid in virtual currencies is subject to the same procedure for levying a tax on goods and services as imports paid in non-virtual currencies.

Crypto-assets Taxation in the United Kingdom

Modern taxation of virtual currencies in the UK, in comparison with other countries analyzed, is more comprehensive and is an element of a general approach to taxation of crypto-assets in the country being developed.

Her Majesty’s Revenue and Customs for the first time presented its position on the taxation of cryptocurrencies back in March 2014 in Analytical Report No. 9 “Bitcoin and Other Cryptocurrencies” (HM Revenue & Customs, 2014). The report indicated that cryptocurrencies have a unique identity and cannot be directly correlated with any other form of investment activity or payment mechanism.

In 2014 HMRC pointed out that the financial results of transactions with bitcoin companies are taxed on income and capital gains in accordance with the usual rules, which were not specified. HMRC assumed that every situation will be considered on the basis of its individual facts and circumstances, and appropriate legislation and case law

will be applied to determine a correct tax regime. The basic corporate income tax rate applicable to capital gains in the UK in 2019 is 19%; it is to be reduced to 17% from 2020 (PWC, 2018, p. 2669).

In December 2018, the HMRC published the "Crypto Assets for Individuals" report (HM Revenue & Customs, 2018), which is a specification of the final report on crypto-assets CATF in relation to taxation. The regulatory scope of this document is defined as crypto-assets, which means cryptographically protected digital representations of value or contractual rights that can be transferred, stored, traded electronically. According to HMRC, most often crypto-assets are acquired by citizens for personal investment with the expectation of an increase in their value or to save funds for the purchase of certain goods. For individuals, crypto-assets entail tax consequences on income tax, capital gains tax, inheritance tax.

Income tax in 2018-2019 levied in the United Kingdom at progressive rates from 20% to 43% with exemption for the first £ 11,850 of income (HM Revenue & Customs, 2019); when calculating taxable income, various deductions and exemptions apply. Capital gains tax is levied at a rate of 10% for the income up to GBP 46,350 and 20% for income exceeding the specified value. Therewith, UK income tax prevails over capital gains tax if crypto-assets trading is the main activity of the taxpayer. At the same time, income tax is levied according to the rules applicable to securities and other financial products - with the ability to summarize losses from trading some crypto-assets with income from trading other crypto-assets. In case of obtaining crypto-assets as a result of mining, the income from it, reduced by relevant expenses, as well as commissions or fees for mining, are subject to the income tax. When receiving crypto-assets as a result of airdrops[7], the income tax will not be levied on receiving cryptocurrencies without any counter actions, outside trade or business, including mining.

In the case of the sale of crypto-assets, a capital gains tax object may arise. According to HMRC, it is investment activity, which is a priority goal of purchase and sale of crypto-assets by individuals. The object of taxation on capital gains arises at the time of sale of crypto-assets, that is, at the time of sale of crypto-assets for fiat money, exchanging one type of crypto-asset for another, using crypto-assets to pay for goods or services, transferring crypto-assets to another person, and is taxed at basic capital gains tax rates. In this case, for inheritance tax purposes, crypto-assets are considered property.

One should mention the position of HMRC in approaches to the imposition of value added tax on cryptocurrencies. Even before the 2015 decision of the European Court of Justice on the exemption of bitcoin from VAT due to the economic nature of bitcoin, which corresponds not to the product but to the currency, the HMRC adhered to similar logic in the 2014 report. In relation to bitcoins and similar cryptocurrencies, it was assumed that income received from mining, as well as operations of exchanging bitcoin for fiat money, are not taxed, since they do not fall under the scope of VAT collection; other operations related to bitcoins are exempt from taxation in accordance with Article 135 (1) (d) of the EU VAT Directive (European Union, 2006). Moreover, when supplying any goods or services in exchange for bitcoin or other similar cryptocurrency, VAT will be charged in the usual manner.

The rules of taxation of crypto-assets in the UK are innovative both in indirect taxation and in terms of detailing the conditions for levying taxes, especially for transactions with crypto-assets made by individuals. Validity of taxation based on the initial differentiation of crypto-assets, in accordance with their nature and functions should be noted as well.

US Federal Taxation of Virtual Currencies

The American financial market is one of the most developed in the world, therefore, approaches to taxation of virtual currencies in the USA play a big role in choosing the tax regulation regime in those countries that have close economic and financial relations with the USA.

The United States Internal Revenue Service (IRS) issued in 2014 a guide on levying federal taxes on transactions using virtual currencies such as bitcoins or other similar currencies (IRS) Notice 2014-21) (Internal Revenue Service, 2014). The objects of IRS attention are virtual currencies that can be used to pay for goods or services, or for investment.

According to the approach of the US Internal Revenue Service, a virtual currency that has an equivalent value in real currency or replaces real currency is called a "convertible" virtual currency. For instance, bitcoin is an example of a convertible currency, as it can be digitally traded between users, can be acquired or exchanged for other fiat or virtual currencies. In general, selling or exchanging convertible virtual currency or using it to pay for goods or services in a transaction in the real economy has tax consequences that can lead to tax liabilities (FinCEN, 2013). As for the general procedure for taxing corporate incomes - following the results of the tax reform, from 2018 the federal tax rate on corporate income was reduced from 35% to 21%; however, large number of exceptions, benefits

and exemptions (PWC, 2018, p. 2699) are provided, which make possible a lower effective tax rate. For the purposes of this tax, virtual currency is treated as property.

Companies and individuals that receive virtual currency as payment for goods, work or services, the fair market value of the virtual currency in US dollars at the date of payment is included in gross income. In mining, fair market value of virtual currency at the acquisition date is included in gross income. If virtual currency mining is a trading or commercial activity, and the miner does not act as a hired worker, then his net income arising from such activity is self-employment income and is taxed accordingly. The fair market value of virtual currency when received for services performed as an independent contractor, measured in US dollars at the date of receipt, also represents income from self-employment and is tax deductible. Payment using virtual currency is regulated in the same way as any other payment.

Corporate income tax and capital gains tax on long-term virtual currency ownership of corporations are levied at a flat rate of 21%. For individuals, increase in the value of virtual currency after its sale after owning less than one year is taxed at the base income tax rate - from 10% to 37% depending on the level of personal income and the circumstances of tax payment. When selling virtual currency that has been owned for more than one year, the upper threshold for personal income tax is limited to 15% (for married individuals who file a tax return together with a maximum taxable income of 479,000 USD and 425,800 USD - for taxpayers who are not married) and 20% - for income exceeding the specified limit (EY, 2018, p. 1557).

Indirect taxation is represented in the United States by a sales tax collected on the states level. A sales tax collecting scheme is significantly different from the value added tax. A generalization of the various approaches of the US state authorities regarding levying sales taxes on transactions with virtual currencies (despite the fact that in most states these approaches are not represented by law) is a separate study objective.

Cryptocurrency Income Tax in Japan

Japan is the most developed country in terms of the use of virtual currencies in the payment and financial sectors, as well as in terms of legislation in this area. Thus, as early as in 2014, it was assumed that incomes associated with virtual currencies would be taxed in Japan by corporate income tax, personal income tax, and sales tax. However, concretization of the taxation procedure has occurred since 2017 after clarifications from the National Tax Agency of Japan.

Currently, the income arising from the use of bitcoin and other virtual currencies is subject to the income tax by analogy with income related to foreign currency and refers to different incomes (National Tax Agency of Japan, 2018a). Japan's national corporate income tax rate is 23.4%. For corporations with a capital of not more than 100 million yen (about 1 million USD) 15% is applied to the first 8 million yen of taxable profit. Companies and individuals also pay a local income and business tax at an average rate of about 10%. As a result, the effective income tax rate (including tax on capital gains) for companies taxed at a base rate of 23.4% is approximately 34%; for medium-sized companies, the effective rate is reduced to 30% (PWC, 2018, p. 1284).

It should be noted that in 2019 national tax on personal incomes is levied in Japan at a progressive rate: from 5% on income over 1,950,000 yen (about 1,800 USD). up to 45% of income over 40,000,000 yen (about 360,000 USD) Local taxes on personal income include the prefectural tax (flat rate of 4% plus 1,000 yen) and the municipal tax (flat rate of 6% plus 3,000 yen), as well as an additional payment of 1,000 yen when paying the local residents tax (Pokrovskaia and Belov, 2020). Thus, the total rate of taxation of personal income from ordinary sources ranges from 15% to 55%. The capital gains tax levied on income from the sale of securities, currencies and similar income is 20% (including 15% of the national tax and 5% of the local taxes) (EY, 2018, p. 747-748).

In accordance with the explanations of the National Tax Agency of Japan (National Tax Agency of Japan, 2018b), personal income related to bitcoin is classified as other income (which is not subject to capital gains tax) and therefore is subject to basic tax at a progressive rate of 15% to 55%. At the same time, the first 200,000 yen (about 1800 USD) of income are exempt from tax. Taxation of the increase in the value of Bitcoin as a regular income, and not by analogy with foreign currency income or securities income, actually means that for calculating the personal income tax Bitcoin is treated not as currency, but rather as property, which somewhat contradicts the money-and-credit approach to regulation and collection of other taxes.

Indirect taxation is represented in Japan by the sales tax, which is levied at a rate of 8% (with a planned increase in the rate up to 10%). The tax model does not imply value added taxation at each stage of product sales, but applies only to end-users of goods. In general, the sales tax in Japan has much in common with that of the United States, except that in Japan the tax is set at the central level and does not imply territorial differences. Since 2014, the sale

of virtual currency has been a subject of a sales tax at a rate of 8%. However, since 2017, the relevant transactions have been exempted from sales tax, which is primarily due to the recognition of virtual currencies as an official means of payment.

Due to the status of an official means of payment, on the one hand, and the peculiarities of indirect taxation (the absence of a value added tax), on the other, bitcoin operations themselves are not taxed in Japan. However, taxes on the results of these operations since 2017 are very high. In this regard, in 2020 in Japan it is planned to simplify the taxation of virtual currencies in order to stimulate their wider use within the framework of national jurisdiction (Bitcoin.com, 2018).

Prospects for taxing operations with digital financial assets in Russia

At present, in Russia there is no legalized taxation procedure for operations with digital financial assets in general and with virtual currencies in particular. Since 2017, legislative initiatives to regulate virtual currencies in Russia have been developed in the context of their interpretation in the framework of digital financial assets (see, Kochergin et al., 2020). In parallel with the consideration of the legal status issues and legitimacy of digital financial assets, attempts are being made to clarify the taxation procedure for transactions with these types of assets and their financial results. Federal Tax Service (FTS) of Russia in 2016 (Federal Tax Service of Russia, 2016) gave the following explanations: despite the fact that the legislation of the Russian Federation does not fix such concepts as “money surrogate”, “virtual currency”, “cryptocurrency”, the legislation of the Russian Federation does not prohibit Russian citizens and organizations conducting operations using cryptocurrency.

According to the Federal Tax Service of Russia, operations related to the acquisition or sale of cryptocurrencies using currency values (foreign currency and foreign securities) or the currency of the Russian Federation are foreign currency transactions. FTS of Russia, taking into account the international practice in the field of control over cryptocurrencies (virtual currencies), considers it necessary to provide a legal basis for obtaining information on transactions with cryptocurrencies from agents and currency control authorities by the tax authorities. Thus, in 2017 (Ministry of Finance of Russia, 2017), the Ministry of Finance issued an explanation about the need to pay personal income tax when making Bitcoin purchase and sale transactions between individuals in accordance with the general procedure for taxing economic benefits in cash or in kind, since chapter 23 of the Tax Code of the Russian Federation has not established a special procedure for taxing income in transactions with bitcoins. Moreover, the taxpayer must independently declare such income. A similar logic is applied to the issue of reflecting the income of a Russian organization from operations with cryptocurrency to calculate corporate income tax (Ministry of Finance of Russia, 2018b). In 2018 (Ministry of Finance of Russia, 2018a), the procedure for calculating personal income tax on transactions with cryptocurrencies was specified: the tax base on the income of individuals on cryptocurrency purchase and sale transactions is defined in Russian roubles as the excess of the total amount of income received by the taxpayer in the tax period from the sale of the corresponding cryptocurrency over the total amount of documented expenses for its acquisition.

In fact, the Ministry of Finance of the Russian Federation and the Federal Tax Service are trying to introduce a procedure for taxing business and state revenues, implemented in countries that started to regulate this sphere in 2014, namely, to impose a corporate income tax and personal income tax on the virtual currency income. In our opinion, the application of the best foreign practices should be carried out taking into account the specifics of the direct taxation in Russia. The taxation of organizations income as a whole is consistent with foreign experience and the introduction of the elements discussed above, such as: accounting for cryptocurrencies in roubles at the date of acquisition and taxation of the financial result of transactions with cryptocurrencies at the time of their implementation, can be an important step in building an integrated system for regulating digital financial assets in the Russian Federation. However, the feasibility and the possibility of taxation of the corresponding income of individuals is in doubt[8].

A feature of the Russian model of personal income taxation is the predominant tax withholding at source of income and the less developed system of revenue administration compared to countries with progressive taxation of income. Of course, certain types of income of individuals are successfully covered by the income tax in Russia and according to the results of their independent taxpayer declaration, however, this is due to the ability to control the receipt of the corresponding income on indirect grounds (for example, for income received from the results of the prize draw at advertising companies this is the organizers’ obligation to give information on the prizes paid; for income from apartment rental this is the possibility of physical control of these operations). In these conditions, the taxation of mining revenues and the increase in the value of cryptocurrencies at a base rate of 13% is faced with the obvious difficulty of controlling the payment of this tax. A feature of cryptocurrencies is, on the one hand, their virtual form, which does not allow to levy a source tax. On the other hand, the central characteristic of most cryptocurrencies is their anonymity, which makes it difficult to establish the recipient of the corresponding income.

Because, in our opinion, at least at the beginning of the creation of a comprehensive regulatory system for digital financial assets in general, and virtual currencies in particular, it is possible to exempt individuals from taxing income from operations with virtual currency or cryptocurrency by analogy with Singapore. At the same time, when creating cryptocurrency exchanges regulated by the legislation of the Russian Federation, the issue of the appropriateness of levying taxes at the source when trading cryptocurrencies requires separate consideration.

The most pressing issue is the taxation of value added tax on operations with digital financial assets. This issue can be resolved in two planes: either within the framework of the interpretation and legislative definition of the economic nature of digital financial assets in general, and virtual currencies in particular, in Russian legislation (in which the procedure for taxing these assets with VAT will be derivative), or in the field of direct tax regulation and clarification of the procedure for levying VAT or establishing exemption from transactions with digital financial assets and virtual currencies from the value added tax. Currently, only the first option is considered often, and in order to exempt the turnover of virtual currencies or cryptocurrencies from VAT, recognition of cryptocurrencies as a means of payment is being lobbied, which faces serious resistance in the monetary sphere, especially from the Central Bank of the Russian Federation. In this matter, we consider remarkable the experience of the United Kingdom, in which the exemption of virtual currencies from indirect taxation exists against a backdrop of non-recognition of virtual currencies as a means of payment and is carried out only within the framework of the tax sphere.

Conclusions

Findings allow us to draw conclusions about the prevailing common practice and national features of tax regimes in relation to virtual currencies, as well as to identify their taxation prospects for Russia.

Firstly, in most of the studied countries there is no unified definition of terms related to the turnover of digital financial assets, not only at the national level, but also at the level of different regulators. With the exception of Great Britain and Singapore, there is also no classification of new assets according to their economic nature or function. This leads to the fact that various regulatory bodies, including tax authorities, are trying to create independent approaches and interpretations of these economic assets that do not contradict the current national taxation practice.

Secondly, the taxation of virtual currencies is carried out regardless of the approaches to the legality of the respective financial assets in the monetary sphere, as well as the interpretation of virtual currencies and transactions with their use, which differ. Moreover, the tax sphere often relies on established views on virtual currencies (as is the case, for example, in the UK), but it is not necessarily derived from them (Japan).

Thirdly, in most countries, direct taxation of the results of transactions with virtual currencies is carried out according to general rules for various types of income, as is the case in the United States and Great Britain. Special conditions for levying taxes that apply exclusively to income from virtual currencies (as is the case, for example, for income from securities), are rare.

Fourthly, in all the countries studied, incomes associated with virtual currencies are subject to corporate income taxes, and the severity of the taxation is determined by the national taxation conditions of the companies - the highest rate (up to 34%) is established in Japan, the smallest - in Singapore, which, along with the absence of the capital gains tax, makes Singapore one of the most attractive countries in the field of digital financial assets. Interpretations of virtual currencies for the purpose of collecting income (profit) tax of the business are similar in the USA, Great Britain and Singapore - they are considered as an asset (property); in Japan, the taxation procedure coincides with the taxation of foreign exchange earnings.

Fifthly, among the analysed countries, the tax on personal income from operations with virtual currencies is not levied only in Singapore. In other countries, key differences relate to the following issues: 1) whether taxable income arises from the results of mining virtual currencies (as in the USA) or only after the sale of the “extracted” currency (as in Japan); 2) whether the tax consequences of using virtual currencies for personal consumption or with investment purposes differ; 3) whether the national income tax is levied, under what conditions and at what rates.

Sixthly, in regarding the taxation of realized income after long-term (more than one year) ownership of virtual currencies, the conditions in the USA and Great Britain are very similar. Tax rates average between 10% and 20%, although progressive income varies. Against this background, a significantly higher taxation of personal income from virtual currencies in Japan is noteworthy - at a progressive rate of 15% to 55%, which also allows us to

conclude that the interpretation of virtual currency in direct taxation of personal income is different from such in other areas of tax and monetary regulation.

Seventhly, the greatest coincidence is observed in the approaches to indirect taxation. Of all the countries considered (except for the United States), transactions with virtual currencies are taxed on goods and services only in Singapore. Moreover, exemption from value added tax or sales tax is not necessarily conditioned by the interpretation of the instrument in question as a currency.

Eighthly, when developing a taxation regime for operations with virtual currencies in Russia, it is necessary to take into account the best foreign practices, but also to supplement them with measures taking into account the specifics of Russian direct and indirect taxation. We believe that when taxing, it is advisable to consider virtual currencies in Russia as a kind of property. At the same time, despite the validity of taxing the income of operations with virtual currencies with corporate income tax, we believe that they should be exempt from personal income tax. Meanwhile, it is recommended to implement exemption from VAT on transactions with virtual currencies exclusively in tax sphere, without making it dependent on the recognition of virtual currencies as an official means of payment. In general, tax regulation of virtual currencies is not necessarily derived from money-credit regulation. Tax approaches to taxing transactions with virtual currencies can complement and balance other regulatory scope.

In general, tax regulation of virtual currency circulation can reduce speculative pressure in the digital financial assets market and lead to a decrease in the volatility of virtual currency rates. Reasonable tax regulation can create favourable conditions for stimulating non-speculative operations with virtual currencies both within national jurisdictions and at the international level, stimulating their use as a means of payment and means of savings.

Notes

[1] The term “distributed ledgers” means a decentralized or distributed unified accounting system for data on financial transactions, consisting of chains of formed transaction blocks (blockchain) built according to certain rules, which are used in decentralized virtual currency schemes. Key features of distributed ledger technology are: 1) decentralized distribution of equivalent copies of data between system participants; 2) sharing and synchronization of data in the system according to the consensus algorithm; 3) absence of an administrator responsible for the generation, management and transmission of data.

[2] Blockchain is underkind of distributed ledgers, representing a database consisting of a chain of blocks, each of which has information about the previous ones. Such a database is decentralized and distributed simultaneously on all computers of the system participants.

[3] Despite the fact that, from a formal point of view, the terms “virtual currency” and “cryptocurrency” are often used synonymously in economic studies, these terms are not identical. In fact, the term virtual currencies is broader and may include virtual currencies, which are based on the creation of other emission technologies than the blockchain. The term "cryptocurrency" is usually used to denote such a virtual currency, in the scheme of which emission and accounting are based on asymmetric encryption technology and use of various cryptographic methods to protect the information integrity. In the framework of our study, we allow the synonymous use of these terms because of the need to unify the object of taxation.

[4] Bitcoin is the first and largest cryptocurrency in the world in terms of capitalization. Created in 2008 by a programmer or a group of programmers known as Satoshi Nakamoto, at the end of April 2019, its capitalization amounted to about $ 172.17 billion. (more than 50% of the global virtual currency market volume) (CoinMarketCap).

[5] The term “legalized” does not mean that operations with virtual currencies in these countries are regulated by special legal norms and are complex. Regulation may be partial in nature, affecting only certain types of activities or operations of individual institutions. Such regulation may affect only the monetary sphere or the sphere of taxation.

[6] Singapore was added to the table instead of the EU as a single economic space, as in the EU countries there is currently no unified position regarding the interpretation of virtual currencies.

[7] Airdrop - is the process of free distribution of digital tokens or digital coins, aimed at popularizing a completely new cryptocurrency, which is not yet present on the exchanges, and the preliminary sale of which has just begun.

[8] In October 2019, the Russian cryptocurrency and Blockchain Association and the Commission for the Legal Support of the Digital Economy of the Moscow branch of the Association of Lawyers of Russia proposed a way to determine the official cryptocurrency rate for tax purposes. In particular, it is proposed to request a Bitcoin exchange rate from several authorized exchanges every day for 30 days and to record the average daily rate at 23:59:40 Moscow time. After that, it is proposed to calculate the cross rate of Bitcoin to the US dollar and the rouble.

The Leadership Styles of Catalan SME Owner-Managers During The COVID-19 Pandemic

Laurențiu MIHAI, Ph.D

University of Craiova, Craiova, Romania
mihai.laurentiu09@gmail.com

Abstract

The present paper aims to identify the dominant leadership style (autocratic/transactional, democratic/transformational and laissez-faire/liberal) of SME owner-managers from Catalonia, Spain and to analyse how their distribution are influenced by several factors, such as Hofstede's cultural dimension, the company's maturity level and the respondent's gender. At the same time, the article studies the impact of the COVID-19 crisis upon the Catalan business environment. Our study is based on a quantitative, empirical research conducted on a sample of 164 small business owner-managers from Catalonia, Spain. Our findings show us that, among our sample, most of the respondents practice a democratic/transformational leadership style. At the same time, we arrived at the conclusion that the company's maturity level influences the leadership style of the owner manager in a direct and positive way, while there are no significant differences between the dominant leadership style of male and female SME owner-managers. Furthermore, our research is showing that the Catalan business environment has been greatly affected by the COVID-19 pandemic, most of our respondents reducing their operational capacity in some degree or the other.

Keywords: leadership, COVID-19 pandemic, SME, Catalonia, management.

Introduction

If leadership is a function, it must be considered an indispensable part of management, whose existence depends on a series of skills that form the leadership style of that person. Leadership is one of the concepts on which no consensus has been reached. As Stogdill (1974) states, the number of definitions of leadership is equal to the number of people who have tried to define it; however, many of these definitions take into account the "influence" factor.

Nowadays, the economic environment has become more dynamic and has led organizations to find new ways to cope with the changes they are undergoing. In such an environment, in order for organizations to be successful and survive, it is necessary for them to be concerned with flexibility, dynamism and evolution, constantly avoiding stagnation.

Van Wart (2012) mentions that researchers need to develop an integral leadership model that combines transactional and transformational elements and, at the same time, takes into account the public context and different situational variables.

Leadership experts say that this concept is one on which the success or failure of an organization depends (Bennis, 2007; Burlea-Schiopoiu and Remme, 2017). Both researchers and practitioners recognize leadership as a major element that affects organizational performance (Bass, 2008; Rowe et al., 2005). They concluded that effective leadership helps increase organizational performance and facilitates the achievement of goals (Gordon and Yukl, 2004). The negative effects of inefficient leadership on organizational performance and employee attitudes confirm the importance and significance of effective leadership.

A large number of leadership theories have been developed in the last decades of the last century, stating that many of the styles proposed by these theories are similar, with certain characteristics being encountered in several leadership styles, which can lead to confusion in among the leaders in the international business environment.

Hussain and Hassan (2016) consider that researchers need to develop an integral leadership model that combines transactional and transformational elements and, at the same time, takes into account the public context and different situational variables.

Cite this Article as: Laurențiu MIHAI "The Leadership Styles of Catalan SME Owner-Managers During The COVID-19 Pandemic" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Most recent studies regarding leadership styles analyse this concept in a large company context (Peris-Ortiz et al., 2012; Quinta et al., 2015; Alonso-Almeida et al., 2015; Tintore, 2019) or in public institutions (Ricard et al., 2017), the literature lacking consistent studies regarding the leadership styles of small and medium enterprises' owner-managers (Burlea-Schiopoiu and Idowu, 2016).

This article aims to identify the dominant leadership style of SME's owner-managers from Catalonia, Spain and to analyse how these styles are influenced by different variables, such as Hofstede's cultural dimensions, the company's level of maturity and the leaders' gender. At the same time, we could not ignore the current problems that the SME's are facing because of the COVID-19 pandemic and we tried to understand how this crisis has affected our respondents' businesses.

This research is an extension of the authors' previous doctoral research, which focused on leadership styles of SME owner-managers from Romania and the Netherlands. We have chosen Spain because, from a cultural point of view, it has both differences and similarities with Romania and the Netherlands, being somewhere between the two countries that were initially studied (Burlea-Schiopoiu and Mihai, 2019). Thus, Spain has a high distance from power, but significantly less than in Romania, with an average index of individuality, but with slight inclinations towards collectivism, a moderately feminine culture (aspect where it resembles Romania and in a more small measure with the Netherlands), with a low degree of uncertainty tolerance. Specifically, we have focused our research on Catalonia, since it is one of Spain's most economically developed regions, with a strong entrepreneurial culture and a healthy SME environment.

In order to fulfil our research objectives, we tried to answer to the following research questions:

Research question 1: Which is the dominant leadership style practiced by SME owners-managers from Catalonia, Spain?
Research question 2: Is there a significant correlation between the company's maturity and the owner-manager's leadership style
Research question 3: Is there a significant correlation between the owner-managers' gender and their leadership style?
Research question 4: How did the COVID-19 pandemic affect the respondent's business?

Literature Review

Research regarding leadership sometimes struggles with many different constructs.

The researchers are using concepts such as "leadership styles", "leadership models", "management styles" or "leadership theories" in order to study leadership from different perspectives (Quinta et al., 2015). Several researchers have studied the influence of different leadership styles on individual and organizational performance (Patiar and Mia, 2008; Burlea-Schiopoiu and Rainey, 2013; Quinta et al., 2015). The studies were based on the assumption that a manager's leadership style has a significant impact on the employees' satisfaction, behaviours and attitudes and, therefore, influences the organizational performance. Some authors stated that leadership styles influence employees' commitments to their job and may induce behavioural improvements that can positively impact the quality of their performance (Clark et al., 2009; Hartline et al., 2003)

In the following review of literature, we will focus on studies regarding three leadership styles: autocratic (transactional), democratic (transformational) and laissez-faire (liberal), which were first suggest by Bass (1990) and further developed by Judge and Piccolo (2004) and Erkutlu (2008).

Different styles of leadership can have different effects on the employees' overall job-satisfaction. Democratic (transformational) leaders motivate their followers beyond personal interests (Quinta et al., 2015) and can become strong role models for their employees (Bass, 2008). At the same time, autocratic (transactional) leadership styles focus on the exchange between leaders and followers (Ricard et al., 2017), while also offering clear direction and practicing strict control and evaluation of their employees (Van Wart, 2012). Laissez-faire (liberal) leaders tend to be more disconnected from the day to day operations of their companies, relieving themselves from operational duties and focusing on more important problems, such as strategic planning and management (Krieger, 2001; Mihai, 2015a). The autocratic (transactional) leadership theory proposes a strong top-down approach (Ricard et al., 2017). The basis of this theory is the fact that the only right way to lead is through strict direction and control, focusing at the same on a clear reward and punishment system for the employees. However, autocratic (transactional) leaders, while being presented as a supervisor, are still supposed to lead and provide guidance to their followers (Ricard et al., 2017). This leader relies mostly on rational incentives and processes in order to fulfil the organization's goals and clear hierarchy and high power distance characterize his/her relationship with subordinates. They are strongly task oriented, set and

monitor clear goals and objectives, exert control and strictly evaluate the performance of their employees (Van Wart, 2012).

Autocratic (transational) leaders tend to focus on the lower levels of Maslow's hierarchy of needs. They rely on a transaction model in which employees are rewarded for their achievements and punished for their failures (Bass, 1990). They are seen as very effective in "getting specific tasks completed by managing each portion individually" (Hargis et al., 2011, p.54)

Autocratic (transactional) leadership can be defined as a leader-subordinate relationship based on a series of exchanges and understandings between leaders and subordinates (Tintore, 2019). Those who participated in these transactional exchanges at work were formed in the quid pro quo, i.e. clearly defined roles, where the manager decides, and the subordinate executes. The exchange, or understanding, usually consists of a financial reward for the hours worked, without any personal recognition of subordinates' skills or achievements (Tintore, 2019).

Bass (2008) characterized autocratic (transactional) leaders as those who operate in existing systems or cultures. Moreover, he stated that transactional leaders are concerned with efficiency and time management, preferring to avoid risks and use processes and techniques that have proven their functionality in experiences. These leaders feel more comfortable in easy-to-predict situations where past performance could be used to indicate future success. To test his theories, since the 1980s, Bass has conducted a series of experiments that have resulted in the emergence of two transactional factors, situational reward and exception management.

The situational reward was represented by the employees 'desire to know what they need to do to receive rewards, while the exceptional management indicated the employees' desire to perform the tasks in the traditional way. Moreover, the researchers stated that the situational reward usually has a stronger correlation with the results than the management by exceptions, especially the passive one.

The democratic (transformational) leadership style is thought to be able to bring change in the organization (Ricard et al., 2017). This perspective builds on the transactional theory, which highlights the connection between leaders and followers and adds a supportive approach, which complements the directive approach of autocratic (transactional) leaders. Democratic (transformational) leaders are charismatic and they are able to change the organization from within, as well as the people in it, in order to fulfil their goals (Tintore, 2019). This means that democratic (transformational) leaders recognize the need for change and innovation and implement their vision by motivating their followers (Bass, 2008). This theory places the leader in the center of the organization (Quintana et al, 2015).

The theory of democratic (transformational) leadership is based on the research undertaken by Burns (1978) and involved both leaders and subordinates working together to increase the level of motivation related to achieving an idealistic goal. This idealistic goal was one in which the direction and aspirations of both leaders and subordinates were combined into a single vision (Askehave and Zethsen, 2014). Democratic (transformational leaders sought to energize subordinates, individually, without restricting their range of basic needs; thus, leaders sought to meet the higher needs of subordinates. Thus, they motivated their subordinates to aspire to organizational goals. In other words, if an organization views employees as individuals, they can become more loyal to the company.

Alonso-Almeida et al., (2015) stated that democratic (transformational) leaders possess strongly motivating behaviours, provide models for defining traits, values, beliefs and behaviours that should be imitated by subordinates, are visionaries in terms of articulating an ideological goal, and inspires confidence in subordinates, while providing intellectual stimulation and support.

Tintore (2019) stated that democratic (transformational) leaders connect with the needs and expectations of subordinates, motivate them, energize their mental and emotional resources, and enthusiastically involve them in the work to be done. Transformational leaders are often also called participatory or democratic leaders (Banks et al. 2016).

Democratic (transformational) leaders contribute to organizational change through their words, actions, speeches and behaviours, having a considerable influence on subordinates. This type of leadership occurs when leaders are able to develop subordinates' interest in the work they do, the organization's goals, mission, and vision, and to encourage them to think beyond individual goals (Mihai, 2018).

Democratic (transformational) leaders encourage their subordinates to look at old issues from new perspectives, work for organizational goals, and motivate them to act beyond self-interest. These leaders are able to share their vision

with their subordinates to the point where they adopt that vision as if it were their own. At the same time, transformational leaders have the ability to coordinate their subordinates, create coherence throughout the system, and direct the entire organization toward vision (Banks et al. 2016).

Contrary to the autocratic (transactional) leaders, which focus on the lower levels of Maslow Hierarchy of needs, democratic (transformational) leaders target the upper levels, such as the need for social relation, respect and self-realisation (Tintore, 2019).

The Laissez-faire (liberal) style derives from the democratic (participatory) leadership style, with the difference that the leader's involvement in the activities of his subordinates is minimal. This is one of the most controversial leadership styles, in the sense that some researchers even say that it implies the lack of any leadership behaviour (Mihai, 2015a). Employees have complete freedom to make decisions that govern their activities and have to solve problems on their own with very little guidance from leaders (Quintana et al, 2015).

Although this style of leadership may seem similar to passive management-by-exception (an element of autocratic/transactional leadership), Bass (2008) and Avolio (1999) argue that laissez-faire leadership represents a completely different leadership style, with clear differences from the autocratic (transactional) and democratic (transformational) styles.

The Laissez-Faire style is characterized by the fact that all the prerogatives of the leader are delegated to subordinates, who give them little (if any) support. If the leader is not involved in organizational activity, this lack of involvement can lead to a decrease in labour productivity, cohesion and satisfaction among subordinates (Arbaiza and Guillen, 2016).

This style, even though it may seem like a style used by lazy, irresponsible leaders, can be used, but successfully, in a company that has reached maturity. The leader can focus on administrative or strategic decisions, letting his employees organize and complete the company's operational activities, as they are sufficiently competent and experienced, and day-to-day activities have become routine and the chances as an unexpected situation to occur are quite small. This can be advantageous for them to adhere to, which can focus on the more important and complex aspects of the company.

Despite the advantages presented above, some employees cannot work efficiently without guidance, cannot manage their own time and, if given full freedom, their actions can have a negative impact on the company's performance. Moreover, given that in most cases (and especially in the case of small or medium-sized enterprises), subordinates tend to take over certain aspects of leaders 'behaviour, chances are that their non-involvement will lead to a decrease in team members' interest in the activity he has to carry out.

Mendez, Vera Munoz and Vera Munoz (2013) conducted a study that analysed the relationship between the three behavioural leadership styles presented above (autocratic/transactional, democrat/transformational and laissez-faire/liberal) and organizational efficiency among small and medium enterprises in the field construction, in Puebla, Mexico. Its results showed that 1) there is a positive and significant correlation between organizational efficiency and democratic and liberal styles (laissez-faire); 2) there is a negative correlation between organizational efficiency and autocrat style.

All of the aforementioned scholars have focused their research of leadership styles on large organisations, the literature lacking relevant studies regarding leadership styles in small and medium enterprises. Unlike larger organisations, which have multiple levels of management and where the leader exerts his influence only upon his direct subordinates, a small business has a leaner organizational structure, the leader is usually also the owner and his relationship with his employees is more direct and personal (Mihai, 2015a). Many researchers agree that a small business owner-manager’s leadership style can significantly affect the satisfaction of all his employees and therefore, the overall performance of his company (Bass, 2008; Gordon and Yukl, 2004; Peris-Ortiz et al., 2012; Mihai, 2018), the SME’s success or failure being direct effect of the leader’s attitudes and behaviours (Chaganti, Cook and Smeltz, 2002).

The present papers’ authors’ previous doctoral research focused on the study of leadership styles among Romanian (Mihai, 2015a) and Dutch (Mihai, 2015b; Mihai et al., 2017) small and medium enterprise owners, as well as on a comparison between the findings in each country (Mihai, 2016). The findings have shown that in both cases, the small and medium business owner-managers mostly tend to adopt the democratic/transactional style (Mihai, 2015a; Mihai, 2015b).

The SMEs are considered to be the backbone of every national economy (Rotaru et al., 2020) and even more so the engine of the European Union's economic development (Mihai, 2018), since they represent 99.8% of the European Union's 20 million enterprises (Moritz, 2011). Small and medium business contribute to an average of 50% of the Gross Domestic Product of developed countries (Mihai, 2015b), while employing roughly 75% of the total workforce in OECD countries (Mihai 2015b).

In Spain, according to Eurostat Data for 2018 (SBA Fact Sheet for Spain, 2019, p.2), there were around 2.79 million enterprises, out of which 2.78 (99.9%) are small and medium enterprises (less than 250 employees, an annual turnover of less than €50 million and total assets of less than €43 million). According to SBA Fact Sheet for Spain (2019, p.1) "small and medium-sized enterprises (SMEs) generate 61.3% of total value added and 71.9% of total employment in Spain. Between 2014 and 2018, SME value added rose by 19% and employment by 13.5%. The outlook for SMEs in Spain continues to be positive. SME value added is expected to grow again by 6.4% between 2018 and 2020. Over the same period, SME employment is forecast to increase by 2.8%, with an expected 249,600 new SME jobs created by 2020."

Regarding Catalonia, according to CEIC Data, in 2017 there were over 618.000 private enterprises (https://www.ceicdata.com/en/spain/number-of-companies-by-region/no-of-companies-catalonia), out of which more than 519.000 (83%) were SMEs, representing 59.6% of the total value of Catalan GDP (Catalan News, 2017.

We cannot discuss the small business environment without taking into account the impact of the COVID-19 pandemic, which has affected business from all across the world. In order to protect the population and slow the expanse of the pandemic, on the 13th of March 2020, the Catalan government adopted several measures which greatly affected the business environment, among which we should mention the closing of restaurants, bars and cafes (except those offering delivery and takeaway services), retail stores and shopping centers (except those exclusively dedicated to essential goods), theatres, cinemas, nightclubs, discotheques, pubs, dance halls, concert halls, and any other recreational establishment, as well as gambling establishments and amusement parks, theme parks and any another centre devoted to entertainment or leisure activities, including sporting facilities and sports clubs (El Nacional, 2020)These measures were in place until the end of May 2020. In October 2020, when new cases of COVID-19 infections reached new records, the Catalan government reinstated some of these measures, closing again restaurants, bars and cafes (except those who offer takeaway and delivery services), while limiting the customer capacity of physical retail units to 30% of the normal capacity (except for stores which offer essential goods and medicine, which were allowed to function with 50% of the normal customer capacity (Barcelona.cat, 2020)

As of 16th of April 2020, more than 90,000 companies (most of them SMEs) asked for temporary layoffs requests (ERTOs), affecting over 660.000 workers who remained temporarily unemployed, their work contract being suspended (Catalan News, 2020)

It is important to mention, that besides regulations which restricted the operation of business, the Catalan government also implemented a series of measures meant to aid those business affected by the pandemic. According to a Catalan government document called "Aid for productive activity and employment due to the effects of coronavirus" (Generalitat de Catalunya, 2020), these measures included but are not limited to following:

- An Emergency Employment Plan with a value of €59.29 million which benefits 1,500 companies and 4,300 workers (Generalitat de Catalunya, 2020);
- €70 million to finance the liquidity needs of Catalan SME (Generalitat de Catalunya, 2020);
- €1 billion credit line of loans for the self-employed and the business affected by the pandemic, 100% guaranteed by the Catalan government (Generalitat de Catalunya, 2020);
- An extension of tax deadlines until the end of the state of alarm decreed by the Spanish government (Generalitat de Catalunya, 2020);
- Creation of "Business Marketplace COVID-19", an online service dedicated to connecting the offer and the demand of goods and services dedicated to face the COVID-19 pandemic (Generalitat de Catalunya, 2020).

Research Methodology

This article aims to analyse the leadership styles of SME owner-managers from Catalonia, Spain and to understand how these leadership styles are influenced by different variables. The article analyse how the COVID-19 pandemic affect the Catalan small business environment and what are the respondents' perception regarding the Catalan government measures that were meant to support the business environment.

In order to fulfil our research objectives, we have conducted a quantitative research using an online questionnaire with 24 questions, which was applied to small and medium business owner-managers from Catalonia, Spain. In order to gather the relevant data, we have distributed our survey to over 450 Catalan entrepreneurs, from which we gathered almost 200 responses, 164 of them being validated as relevant for this research. We have invalidated more than 30 responses for being incomplete (the respondent did not answer all the questions) or for failing several statistical reliability tests. In 5 invalidated cases, the responses were complete as well as statistical reliable, but the respondents were not the owner-manager of the company or their company did not fit in the SME category.

The entrepreneurs, which had been given the survey, were selected in arbitrary way, mainly with the support of different professional organisations, which represent the SME environment from Catalonia, several NGOs, Facebook groups and discussion forums, as well as through the personal connections of the authors. It's important to mention that this study is based on an empirical research, since the authors could not travel to Catalonia due to the COVID-19 pandemic and at the same time, had limited time and resources which were not sufficient for conducting a more complex scientific research.

Our questionnaire was divided into three parts, the first part regarding general information about the respondent and his business, the second related to the identification of the respondents' leadership style and the last part regarding the impact of the COVID-19 pandemic. The first part included questions related to sex, age and education level of the respondents, as well as regarding his position in the company (only responses from the owner-managers of SME were included in this study), the SME category (micro, small or medium), the industry in which his business activates, as well as the age of the company.

The second part of the survey comprised 15 questions which measured (using a 5 point Likert scale, ranging from total disagreement to total agreement) respondents' attitude regarding their employees, how they make decisions and assign tasks, how they evaluate their subordinates and what degree of autonomy and responsibility are they giving them. These 15 questions were divided into 3 sets of 5 questions, each set being related to one of the three leadership styles (autocratic/transactional, democratic/transformational/ and laissez-faire/liberal). The 3 sets of questions were randomly spread across the survey, so the respondents wouldn't find the pattern and be as objective and honest as possible in their answers. The questions regarding the leadership style were adapted from two online surveys (Sagepub and NWlink). In order to identify the dominant leadership style of each respondent, we have added the score from each question in every set and considered the style with highest score as being dominant. The dominant style of each participant was used in the analysis and the discussion of the results.

The last part of the survey included two questions, one related to the operational capacity reduction of the respondents' business due to the COVID-19 pandemic and the other which included 8 Likert-scale statements, related to the impact of the COVID-19 pandemic and the respondents' perception regarding different aid measures implemented by the Catalan government.

It's important to note that this research is a continuation of the authors' previous doctoral research which studied the leadership styles of SME owner-managers from Romania and the Netherlands, as well as the correlation between these styles and several variables and thus, we have tried to keep the survey similar to the ones used in Romania and the Netherlands in order to be able to continue this research with a comparison between the three countries.

The results of this study were processed through MS Excel and IBM SPSS Statistics and the results are discussed below.

Results and Discussion

Sample Distribution

Our sample is represented by 164 owner-managers of small and medium enterprises from Catalonia, Spain where 51% (84 respondents) were female and 49% (80 respondents) were male. Considering that as of 2010, only 36.4% of Catalan businesses were owned by female entrepreneurs (Noguera, 2012), the large proportion of female respondents in our survey may imply a lower degree of the sample's representativeness (Badea, 2017).

From the 164 SMEs included in this research, 133 (81%) were micro-enterprises, 25 (15%) were small enterprises and 6 (4%) fit in the medium enterprise category.

Out of the 164 respondents, 45% (73 respondents) were managing businesses in the hospitality industry, 27% (45 respondents) were running a business in the service industry, 15% (25 respondents) were involved in retail activities,

while 13% (21 respondents) were involved in the manufacturing business. Thus, we have a distribution of 27% of the respondents running businesses in the secondary sector and 73% of the respondents running business in the tertiary sector. Considering that Catalonia's main contributor to the regional gross value added (GVA) is the tertiary sector (EU's Regional Innovation Monitor Plus, 2017), which accounted for 71.5% of the total in 2017, we can state that our sample is representative for the Catalan business environment, since the distribution of our sample is very similar to the regional distribution.

Moreover, another descriptive statistics variable that we found important for the aim of this study is the maturity of the respondents' businesses. Thus, 16% of the total sample population have been running their business for less than 3 years, 27% have a business for more than 3 years but less than 5 years, 33% have been running their business for more than 5 years but less than 10 years, while 24% have had a business for more than years.

Badea (2017) arrived at the conclusion that the female entrepreneurs of Catalonia are more receptive to participating in these kinds of studies, thus showing that they are able to understand the importance of scientific studies on the business environment are more concerned with ethics and development.

In order to answer the first research question, we have studied the distribution of the leadership styles of the sample population. The leadership styles have been identified according to the entrepreneurs' responses to the three sets of questions, as it was explained in the "Research methodology" part of this paper. Thus, as we can see from Fig. 1, 43% (71 respondents) of our respondents were identified as democratic/transformational leaders, 34% (55 respondents) of the entrepreneurs were identified as laissez-faire (liberal) leaders, while 23% (38 entrepreneurs) of the respondents were identified as autocratic/transactional leaders. Thus, most of our respondents were identified as democratic/transformational leaders, but the differences are not significant enough in order to safely say that the Catalan SME environment is dominated by one type of leadership or the other.

Source: authors' processing

In order to fully understand the causes of this result, we discuss several aspects, which may have influenced the distribution of leadership styles among our sample. First of all, we need to discuss Hofstede' cultural dimensions, which are an important determinant for the attitudes and behaviours of individuals which form a certain culture.

Nowadays, Hofstede's website (www.hofstede-insights.com/spain) measures 6 cultural dimensions (as opposed to the original 4). Thus, we have (a) Power Distance, (b) Individualism, (c) Masculinity, (d) Uncertainty Avoidance, (e) Long Term Orientation and (f) Indulgence. We will discuss each of them in particular, their values for the Spanish culture (as we did not find any relevant data regarding Catalonia in particular), as seen in Figure 2 and their implication on the distribution of leadership styles in our sample.

Fig. 1: Hofstede cultural dimensions values in Spain

Source: https://www.hofstede-insights.com/country-comparison/spain/

a) Power Distance

According to Hofstede's website, "this dimension deals with the fact that all individuals in societies are not equal – it expresses the attitude of the culture towards these inequalities amongst us. Power Distance is defined as the extent to which the less powerful members of institutions and organisations within a country expect and accept that power is distributed unequally" (Hofstede Insights, 2020)The same website sets Spain's power distance index at 57, a high score that indicates Spain is a hierarchical society, in which "people accept a hierarchical order in which everybody has a place, and which needs no further justification. Hierarchy in an organisation is seen as reflecting inherent inequalities, centralisation is popular, subordinates expect to be told what to do and the ideal boss is a benevolent autocrat" (Hofstede Insights, 2020).

In our study, only 23% of the respondents have been identified as autocratic/transactional leaders, which, at a first glance, comes in contradiction with Spain's relatively high power distance index. In our opinion, Spain's power distance index of 57, while being relatively high, is significantly lower than many other European countries (especially, Eastern-European, former communists countries such as Romania, Serbia, Bulgaria or Ukraine), in which autocratic/transactional forms of leadership dominate, and thus some of the "benevolent autocrat" leaders of Spain may have been identified in our study as democratic/transformational. Moreover, we need to take into account the fact that we have identified the leadership styles of our respondents based on their own answers to a set of questions, and thus, subjectivism and the respondents' desire to be seen in a certain way might have influenced the final results.

b) Individualism

"The fundamental issue addressed by this dimension is the degree of interdependence a society maintains among its members. It has to do with whether people´s self-image is defined in terms of "I" or "We". In Individualist societies people are supposed to look after themselves and their direct family only. In Collectivist, society's people belong to 'in groups' that take care of them in exchange for loyalty (Hofstede Insights, 2020). Spain has a score of 51 on the Individualism index, which is considered collectivist when compared to most other European countries.

This inclination for collectivism might be an explanation for the predominance of non-autocratic (democratic/transformational and liberal) in our sample. This collectivist culture translates in tightly knitted teams forming at the workplace, people emphasizing teamwork and employees tending to put effort into their work without the need of strong motivational incentives from their management, thus inciting a more democratic/transformational or liberal style of management from their superiors (Burlea-Schiopoiu, 2009).

c) Masculinity

Hofstede's website states that "A high score (Masculine) on this dimension indicates that the society will be driven by competition, achievement and success, with success being defined by the winner/best in field – a value system that starts in school and continues throughout organizational life.

A low score (Feminine) on the dimension means that the dominant values in society are caring for others and quality of life. A Feminine society is one where quality of life is the sign of success and standing out from the crowd is not admirable. The fundamental issue here is what motivates people, wanting to be the best (Masculine) or liking what you do (Feminine)" (Hofstede Insights, 2020)

As we can see from Fig. 2, this dimension has a score of 42, which is a low score that indicates a feminine society, in which most things are settled by consensus. Polarization and excessive competition are not seen very well in the Spanish society, where "children are educated in search of harmony, refusing to take sides or standing out" (Hofstede Insights, 2020). Regarding the business environment, Spanish managers are likely to involve their employees in the decision-making process, to listen to their opinions and care for their needs and expectations, in other words, having a clear democratic/transformational approach to managing their teams.

d) Uncertainty avoidance

"The dimension Uncertainty Avoidance has to do with the way that a society deals with the fact that the future can never be known: should we try to control the future or just let it happen? This ambiguity brings with it anxiety and different cultures have learnt to deal with this anxiety in different ways. The extent to which the members of a culture feel threatened by ambiguous or unknown situations and have created beliefs and institutions that try to avoid these is reflected in the score on Uncertainty Avoidance" (Hofstede Insights, 2020)A high score means a low tolerance for risk and unknown situations, while a low score implies that individuals are more likely to assume risks and have a higher tolerance for the unknown.

Of all six dimensions, uncertainty avoidance is the one that clearly defines Spain, having an extremely high score of 86, which means that Spanish people do not like taking risks, are afraid of the unknown and are resistant to change. "For example, in a very recent survey 75% of Spanish young people wanted to work in civil service (i.e. a job for life, no concerns about the future) whereas in the USA only 17% of young people would like it" (Hofstede Insights, 2020). Related to business, this high score implies that managers do not like taking risks and letting things to chance, which denotes a more autocratic/transactional approach to leadership and management, in which the manager sets a clear direction for his company, which is expected to be followed by the employees.

e) Long term orientation

According to Hofstede's website, "this dimension describes how every society has to maintain some links with its own past while dealing with the challenges of the present and future, and societies prioritise these two existential goals differently. Normative societies, which score low on this dimension, for example, prefer to maintain time-honoured traditions and norms while viewing societal change with suspicion. Those with a culture which scores high, on the other hand, take a more pragmatic approach: they encourage thrift and efforts in modern education as a way to prepare for the future" (Hofstede Insights, 2020)

In fig. 2we can see that Spain has an intermediate score of 48, which means it is a somewhat normative country. "Spanish people like to live in the moment, without a great concern about the future" (Hofstede Insights, 2020). In business, this means that the managers are rather short-term orientated, more focused on results than on people, both of which are characteristics of the autocratic/transactional leadership style

f) Indulgence

One challenge that confronts humanity, now and in the past, is the degree to which small children are socialized. Without socialization, we do not become "human". This dimension is defined as the extent to which people try to control their desires and impulses, based on the way they were raised. Relatively weak control is called "Indulgence" and relatively strong control is called "Restraint". Therefore, cultures can be described as Indulgent, if they have a high score or Restrained, if they score low on this dimension.

As we can see from Figure 2, Spain has a score of 44, which means it is a Restrained, rather than Indulgent society, with a tendency for pessimism and cynicism. Spanish people do not put much emphasis on their leisure time and tend to control their impulses and desires, because they have the perception that their actions should be restricted by social norms. A society with these characteristics is a breeding ground for autocratic/transactional leadership styles, where the manager is not concerned with the needs and desires of his employees, looking only to maximize their productivity at the workplace, in order to meet the organizational goals.

In conclusion, we can see that the higher percentage of democratic/transformational leaders in our sample (43%) can be explained by only two of the six cultural dimensions (Collectivism and Femininity). The other four imply, in a stronger or weaker measure, that the Spanish business environment should be characterized by autocratic/transactional leaders, which is contradicted by the low percentage of autocratic/transactional leaders in our sample (23%). One of the explanation for this contradiction of our results and the general cultural climate of Spain might be, the fact that Catalonia is the second most developed region of the country, with a GDP of 236.739 million euro € in 2019 (PIB de las Comunidades Autónomas, 2020), just 0,01% lower than that of Madrid, and thus, their business behaviour may be somewhat different than the Spanish average age. Moreover, Catalonia is a multicultural

society, with over 6400 foreign companies according to Invest in Spain and it has been recently awarded the Southern European region for foreign investment (2018-2019) by the Group Financial Times (European Cities and Regions of the Future 2018-2019) and thus, many different cultures are leaving their mark upon the Catalan business environment and the managers' practices might not only be in line with the average Spanish cultural identity.

Our results have shown that, while indeed having a larger proportion of democratic/transformational leaders (43%), the autocratic/transactional and laissez-faire leadership styles are also somewhat well represented in our sample (23% and 34%, respectively) and thus, while the first research question is answered, we cannot say for certain that the Catalan SMEs owner-managers are in a significant proportion democratic/transformational. A more accurate statement would be that while Catalan SME owner-managers have a slight tendency for a democratic/transformational leadership style, the Catalan business environment is well represented by all three leadership styles, a result strongly supported by the cultural evidence and arguments discussed above.

Regarding the second research question, in order to understand how the company's maturity is influencing the leadership style of the owner-manager, we used the Strategic Management Maturity Model (SMMM), developed by the Strategy Management Group (Averson et al, 2010). This model is tool aimed at managers who need to asses where their organization stands in terms of strategic management, to monitor progress in improving maturity of strategic management, and to allow benchmarking across organizations, or departments within one organization, in order to identify best practices. (Strategy Management Group, 2020). The model proposes eight dimensions of strategy (Leadership, Culture and Values, Strategic thinking and planning, Alignment, and Performance measurement, Performance Management, Process Improvement and Sustainability of Strategic Management) which are analysed across five levels of organizational maturity:

a) Level 1: Ad Hoc and Static

It is characteristic of organizations at this level that they currently do not do any strategic planning or management in a formal sense, tending to plan only on the tactical or operational level in an ad hoc and uncontrolled manner, normally by senior management behind closed doors. Leaders spend a majority of their time addressing operational issues and "putting out fires" and never address long-term strategy (Strategy Management Group, 2020).

b) Level 2: Reactive

It is characteristic of organizations at this level that some elements of effective planning and strategic performance management are being applied, only in an inconsistent fashion and often with poor results. Planning discipline is unlikely to be rigorous, and only happens in reaction to events or to temporarily please an individual leader. These organizations might measure performance or even use it to punish underperformers, but often these activities are done by individuals to meet a routine policy need and are not taken seriously. (Strategy Management Group, 2020).

c) Level 3: Structured & Proactive

It is characteristic of organizations at this level that there are formal structures and processes in place to comprehensively and proactively engage in strategic planning and management. These activities occur on a regular basis and are subject to some degree of improvement over time. Measurements are somewhat aligned with strategy and employee accountability is taken seriously. (Strategy Management Group, 2020).

d) Level 4: Management & Focused

It is characteristic of organizations at this level that strategy drives focus and decision making for the organization. Organization-wide standards and methods are broadly implemented for strategy management. Leaders formally engage employees in the process and a measurement & accountability work culture help drive strategic success for the organization (https://strategymanage.com/resources/strategic-planning-basics/strategic-management-maturity-model/).

e) Level 5: Continuous Improvement

The strategic planning and management excellence are embedded within the culture of the organization and are continuously improved in a formal sense, that it is a characteristic of organizations at this level. This means that as performance is evaluated, the organization first analyses how it is performing towards its strategic goals and then

second studies how effective the strategic planning and management processes are and adapts as necessary. Excellence in strategic management drives the organization's competitive edge or performance success. (Strategy Management Group, 2020).

The main drawback of this model is the fact that the five maturity levels are not directly linked to the age of the company, which represents the main variable with which we measure the maturity in our study. For the purpose of this study, we assumed that the first two Levels are applied to companies less than 3 years old, Level 3 is applied to companies between 3 and 5 years old, Level 4 is applied to companies between 5 and 10 years old and Level 5 is applied to companies older than 10 years.

Table 1: Leaders' behaviour across the five levels of organisational maturity

	Level 1	**Level 2**	**Level 3**	**Level 4**	**Level 5**
Leadership	Leaders dictate/command & control; otherwise disengaged	Leaders dictate but gather feedback sporadically	Leaders engage with direct reports only, but do model desired behaviours and values	Leaders empower many employees through ongoing engagement	Leaders & employees fully engage in a continuous dialog based on a team based culture

Source: Salamzadeh & Hajiseydjavadi, 2016, p.89

We have decided to look into the correlation between the company's maturity and the owner-managers leadership style in order to understand if the age of the company plays any role in the distribution of leadership styles among our sample. The findings shown in Fig. 3 are discussed below

Fig. 3: The correlation between the company's maturity and the owner-manager's leadership style
Source: authors' processing

As we can observe from Figure 3, the distribution of leadership styles varies significantly among different maturity levels. Thus, in companies less than 3 years old (Level 1 and Level 2 from SMMM), most of the leaders from our sample were autocrats (53%). The percentage of autocratic/transactional leaders lowers constantly as we look at the other three maturity levels: 29% in 3-5 years old companies (Level 3), 17% in 5-10 years old companies (Level 4) and 7% in companies older than 10 years (Level 5). The percentage of democratic/transformational leaders is more or less the same in the last three maturity levels (even though the actual number of leaders increases in the first three levels and decreases in the last), while the first being significantly lower: 30% in the first maturity level, 51% in the second maturity level, 46% in the third maturity lever and 51% in the last. As for laissez-faire leaders, their presence is scarce in the first two levels (15% in the first and 17% in the second), but their proportion increases significantly if we look at older companies (37% for companies aged 5-10 years old and 75% in companies older than 10 years).

Thus, our findings show a tendency of the SME owner-managers to lower their authority as the company ages: they tend to be more autocratic/transactional in the young companies, democratic/transformational in companies, which are in the growth and development stage and liberal in mature companies. The reason for this might be the fact that in a young company (less than 3 years old), the employees are often inexperienced and need guidance and direction from their leader, who doesn't have yet full confidence in them and their abilities to fulfil their tasks and objectives and at the same time, a young company encounters many obstacles in its day to day operations (this being the stage in which many companies fail and end up closing their operations) and thus, the leader needs to be actively involved

in solving the problems which may arise at an operational level and to have an active role in steering the company on the right path in crisis situations.

As the company matures and reaches the growth and development stage (3-10 years old), employees become more experienced, more capable to solve on their own whatever problems might appear in the company's day to day operations and the leader's confidence in them and their abilities grows. It's important to note that this stage, some SME owner-managers might employ a middle-lever manager to run the company's day to day operations, and this his or hers involvement in the operational side of the company starts to diminish so he or she can focus on the more important issues, such as strategic planning and management.

A mature company, which has been on the market for more than 10 years, has very experienced employees and multiple levels of middle management and thus does not need the direct involvement of the owner-manager in its day-to-day operations, a fact that explains the prevalence of laissez-fair leaders in Level 5 companies. An important thing to mention is the fact that laissez faire leaders are also prevalent in some SME aged between 5 and 10 years old, the reason for this being that different companies mature at different speeds and it is entirely possible for some companies to have reached the last level of maturity earlier than 10 years.

In order to further study the correlation between the company's maturity and the owner's leadership style we have analysed the Pearson correlation between two variables: (1) the company's maturity and (2) the leaders' degree of involvement in the company's day to day operations (considering autocratic/transactional leaders have the highest degree of involvement, followed by democratic/transformational leaders and laissez-faire leaders, which have the lowest degree of involvement in the day to day operations). The results are shown in Table 2

Table 2: Pearson correlation between company's maturity and leader's involvement

		Leader's Involvement	Company's maturity
Leader's Involvement	Pearson correlation	1	-.229*
	Sig (2.dim)		.001
Company's maturity	Pearson correlation	-.229*	1
	Sig (2.dim)	.001	

Source: authors' processing

Our findings show a Pearson Correlation of -0,229 between the leader's involvement in the day to day operations and the company's maturity, with a sig. value of .001, which supports our previous findings that the company's maturity is influencing in a direct and negative way the leader's involvement in the day to day operations.

We continue our study of the Catalan SME's owner-managers' leadership styles with an analysis of the correlation between the respondents' gender and their leadership style. Our findings are show in Fig. 4

Fig. 4: The distribution of leadership styles across genders

Source: authors' processing

Looking at Fig. 4, we can see that in case of both genders, the dominant leadership style is democratic/transformational, which was to be expected, considering that this leadership style's prevalence in our sample (43%) of total respondents. However, it is important to note the distribution of the leadership styles across the

two genders. Thus, in the case of male respondents, the three styles are somewhat evenly distributed: 40% identified as democratic/transformational leaders, 31% identified as autocratic/transactional leaders while 29% identified as laissez-faire leaders. In the case of female respondents, the three styles are not so evenly distributed: 46% are democratic/transformational leaders, 39% are laissez-faire leaders and only 15% are autocratic/transactional leaders. Thus, even though both genders favour the democratic/transformational style, the main difference appears regarding the autocratic/transactional style: the proportion of male autocrat leaders is significantly higher than the proportion of female autocratic/transactional leaders.

Our results are in line with other authors' findings. Garcia-Solarte, Garcia-Perez-de-Lema and Madrid-Guijarro (2018, p.529) have studied this issue in a Colombian context and their results have shown that "companies with greater gender diversity (mostly women on the board of directors and in management) develop a transformational (democratic/transformational) organizational style orientated towards organizational change through the transformation of followers", rather than a transactional (autocratic/transactional) style focused on constant control and direction, as well as based on material rewards. Moreover, Eagly and Carli (2007), distinguished researchers on gender differences in leadership styles, found that the differences between male and female leadership styles are small, but they do exist. Levy (2010) found that these small differences are statistically significant regarding how males and females practice their leadership style, as well as how they are perceived in management positions and their efficiency in these positions. Other authors, such as Andersen and Hansson (2011, p.435) found that "women adopted participative styles of leadership and were more transformational leaders than men who adopted more directive and transactional styles of leadership".

Female leaders have a tendency to employ communal behaviours, such as affiliation, nurturing, communication and cooperation, while male leaders tend to display agentic behaviours and are more goal and task oriented, independent and focused in their decision-making process (Levy, 2010; Andersen & Hansson, 2011). Gordon and Yukl (2004) and Trinidad and Normure (2005) also studied this issue and came to the conclusion that female leaders are more likely to be inclusive, sensitive and nurturing and found that women scored higher than men on several skills such as teamwork, stability, motivation, recognizing trends and acting on new ideas. Forsyth (2010, p.113) stated that "women tend connect more with their group members by exhibiting behaviours such as smiling more, maintaining eye, and are more diplomatic with their comments". Another important study on this matter was conducted by the Management Research Group (2013, p.23) which found that "out of common leadership competency areas surveyed, women were rated higher by their superiors in areas like credibility with management, future potential, insight, sensitivity, and working with diverse people. Men were ranked higher in business aptitude, financial understanding, and strategic planning, which the researchers note are seen to be critical to corporate advancement. No gender differences were found in competencies such as team performance, effective thinking, and willingness to listen and no differences were found in overall effectiveness". It's important to note that several studies regarding the employees' perception of their superiors, have found that females leaders are perceived as less dominant than their male counterparts and that they "lose authority… if they employ feminine styles of leadership in male dominated roles" (Levy, 2010, p.372)

Most of these studies have the same limitation as ours, the fact that the results are based on the respondents' self-report data, which are considered somewhat unreliable by some researchers (Hamori-Ota, 2007). These differences in leadership behaviours may not be generalizable across all teams and situations and it is very difficult to predict a person's behaviour in a leadership position.

We must note that there are several studies, which did not find any significant differences in the leadership behaviour of male and female leaders. Andersen & Hansson (2011) conducted a study on public managers regarding their leadership and decision-making styles as well as motivation profiles and found some differences only regarding decision-making, but none was considered significant. Kent & Schuele (2010) analysed a large sample of German male and female leaders and found no difference regarding transformational (democratic/transformational) leadership behaviours. Cliff (2005) studied male and female SME owner-managers (as opposed to many of the aforementioned studies which analysed managers from different levels) and found no significant difference in their leadership behaviour. Another similar study was conducted by Dobbins and Platz (1986) which found that male and female leaders exhibit equal amounts of task oriented and people-oriented behaviours and their subordinates are equally satisfied.

This being said, we can conclude that while male leaders may be somewhat more inclined to exhibit autocratic/transactional leadership behaviours, there are not any significant differences between the leadership styles of male and female SME owner-managers.

In order to analyse how the COVID-19 pandemic has affected the small and medium enterprises from Catalonia, first we asked our respondents how the crisis affected their business from an operational point of view. Thus, 10 of the

respondents' companies (6%) are fully operational (100% of normal capacity), 31 respondents (19%) are running at a capacity between 75% and 100% of normal capacity, 43 respondents (26%) are operational between 50% and 75% of normal capacity, 52 respondents (31%) have reduced their operations to more than 50% and 28 respondents (18%) stated that their business was not operational when this study was conducted. Thus, we can see that 94% of our respondents were more or less affected from an operational point of view by the current crisis. In consensus with Burlea-Schiopoiu et al. (2017).

We continue our analyses with the correlation between operational capacity reduction and the company's industry in order to understand which were the industries most affected by the pandemic. The results are shown in fig. 5

Fig. 5: The correlation between operational capacity reduction and industry

Source: authors processing

Our findings are showing us that 4% of the services companies including in our sample are not operational, 11% are operational at less than 50% of the normal capacity, 36% are operational between 50% and 75% of normal capacity, 38% are operational at more than 75% of normal capacity and 11% are fully operational. We can observe that the hospitality industry has been the most affected in our sample: 27% of the companies are not operational at the moment of the study, 41% are operational at less than 50% of normal capacity, 19% are operational between 50% and 75%, 12% are operational at more than 75% and not one company from this industry which was included in our sample is fully operational. Regarding the retail industry, 8% of the companies included in our sample are not operational, 36% are operational at less than 50% of normal capacity, 36% are operational between 50% and 75% of normal capacity, not a single company is operational at more than 75% of normal capacity and 20% are fully operational. In the manufacturing industry, we can observe that 19% of our respondents' companies are not operational, 38% are operational at less than 50% of normal capacity, 19% are operational between 50% and 75% of normal capacity and 24% are operational at more than 75% of normal capacity, but not a single manufacturing company included in our sample is fully operational.

As we can see, the hospitality companies from our sample have been the most affected by the COVID-19 pandemic. This was to be expected, considering that the Catalan government restrictions have mostly targeted restaurants, bars, cafes and to a lesser extend hotels and other accommodation units: during the initial phase of the new Coronavirus pandemic, bars and restaurants were closed (except those offering delivery and takeaway services), a measure that was reimposed on the 16th of October, when the daily number of people diagnosed with COVID-19 reached new records (Barcelona.cat, 2020) A significant part of the hospitality industry was forced to fully close: indoor bars and clubs, as well as restaurants which do not offer takeaway or delivery services, which might explain why 27% of the hospitality companies included in our study were closed at the moment the study was conducted. This finding is further supported by Barcelona's restauranteurs association claim that until the end of the year, 38% of the city's bars and restaurants will be out of the business (TheLocal.es, 2020) a main cause for this being the region's, and even more so Barcelona's dependency on tourism, which has sharply declined since the start of the pandemic.

These measures also affected (albeit in a lesser measure) the retail industry: stores and stops were forced to limit their customer capacity to 30% of the total capacity, with the exception of retail units selling basic necessities (food, groceries, medicine) which could function with their customer capacity limited to 50% of the normal capacity (Barcelona.cat, 2020)). These regulations support our finding that 44% of our respondents who own and manage a retail company either are closed or function at less than 50% of normal capacity. An interesting result is the fact that 20% of the retail companies included in our samples stated that they are functional, which means they only operate online shops and stores, with no physical location and thus, were not affected, in any measure, by the government regulation.

Our findings have shown us, that among our respondents, those who own and manage business in the services sector (transport, distribution, IT, marketing, home delivery, telecommunications, professional services, etc.) were the least affected by the COVID-19 pandemic, a result that can be explained by the fact that the government restrictions did not target them directly. Moreover, certain types of services such as home delivery flourished during the pandemic.

Furthermore, we continue our study with the analysis of the respondents' perception regarding the COVID-19 pandemic. We have asked our participants to rate 8 statements with a 5-point Likert-scale, ranging from 1 – Extremely Disagree to 5 – Extremely disagree. The questions as well as the mean value of the respondents' ratings are presented in the Table 3.

Table 3: Respondents perception of how the COVID-19 pandemic affected their business

	Question	Mean	Standard Deviation
1	In my opinion, the government restrictions are too harsh for the business environment	2.42	.512
2	The demand for my products/services has been significantly reduced during this crisis	4.12	.576
3	I had to increase the price of my products/services in order to compensate the lack of demand	3.11	.663
4	I had to temporary layoff a significant part of my workforce	3.49	.457
5	The extension of tax deadlines offered by the government is helping my business survive the pandemic	3.62	.715
6	The government and EU-backed liquidity lines and loans for SMEs are helping my business survive the pandemic	4.23	.216
7	The "Business Marketplace COVID-19" has proven to be very useful for the survival of my business	2.52	.498
8	In my opinion, the government aid measures are too restrictive (not enough companies can benefit from them)	2.95	.501

Source: authors' processing

The first question, related to the respondents' perception regarding the harshness of the government restriction registered a mean value of 2.42 (SD=.512), situating the average answer closer to the disagreement zone than the average zone, which means that our respondents don't consider the government's restrictions to be particularly harsh. This is a very interesting finding, considering that most of our respondents' business have been affected in some way by the government restrictions (as seen in Table 3). This result leads to believe that the Catalan government managed to successfully communicate the reasons behind the restrictions and how these restrictions are helping mitigate the public safety damage that the pandemic is causing, and the SME business owners understood the necessity of these measures, despite greatly hindering their operations.

The second question registered a mean answer of 4.12 (SD=.576), which places in the interval between agreement and strong agreement, which means, on an average, the Catalan SME owner-managers have encountered a severe decline in the demand for their products and services. This could be explained through the fact that Catalonia's (and in a greater extent, the region's largest city of Barcelona) dependency on tourism, which has been the most affected sector during this pandemic. Moreover, 45% of our respondents own and manage businesses in the hospitality industry and tourists represented a significant proportion of their customers.

The next question has a mean answer of 3.11 (SD=.663), placing it in the interval between the neutral and the agreement zone. This value indicates that our respondents had been forced, in some measure, to increase their prices in order to compensate for the lack of demand. A lack of demand means lower revenues, making it harder for the SME to reach a satisfactory level of profitability, or in some cases, even the break-even point.

The mean of 3.49 (SD=.457) is one of the highest in our study, placing it in the middle of the interval between neutral and agreement. This shows us that most of our respondents had to temporarily layoff some of their employees, as a solution to having their operating capacity reduced and the demand for their products and services in the lowest point of the last years. This finding is supported by Catalan News report that over 660.000 workers from over 90.000 enterprises (most of them SMEs) submitted temporarily layoff requests.
The fifth question has a mean answer of 3.62 (SD=.715), which situates in the interval between the neutral and agreement zone, which means, that our respondents have benefited from the extension on tax deadline provided by the Catalan government and this measure has been beneficial for them.

The sixth question registered the highest mean answer of all 8 questions, 4.23 (SD=.216), which means that the various liquidity lines and government or EU-backed loans have had a significant positive impact upon our respondents' business. This is normal, since most of our respondents' business have had their operational capacity reduced and/or have seen the demand for their products/services diminish and these government aid measures provided the much-needed liquidity that they needed in order to survive.

The second to last question, had a mean answer of 2.52 (SD=.498) which places it between the disagreement and the neutral zone. This question has the lowest mean score of the four questions regarding the government aid measures, which means the "Business Marketplace COVID-19" is not seen as a very helpful measure by our respondents. This is somewhat to be expected considering our hospitality and services dominated sample, since this measure is targeted more towards healthcare and technology companies which can bring their contribution to the fight against the COVID-19 pandemic.

The last question asked our respondents about their general perception regarding the inclusiveness of the Catalan government aid measures and it registered a mean answer of 2.95 (SD=.501), which places it extremely close to the neutral zone (3). This means that our respondents' perceptions were mixed, and we cannot safely say if the Catalan government aid measures were either inclusive or not inclusive enough.

Conclusions

This study's aim was to analyse the dominant leadership styles of SME owner-managers from Catalonia, Spain, as well as how these styles are influenced by different factors, such as Hofstede's cultural dimensions, the company's maturity level and the respondents' gender and the same time, to analyse the impact of the COVID-19 upon the Catalan SME environment and the respondents' perception regarding the aid measures implemented by the Catalan government in order to support the business environment during the pandemic.

Our findings have shown that in our sample, most of our respondents practiced a democratic/transformational leadership style. This result was further examined through Hofstede cultural dimensions and was supported by two of the six dimensions (Collectivism and Femininity).

Moreover, our research has found that the SME owner-managers' leadership style is influenced (among our sample) by the maturity level of his company. Thus, younger companies tend to entice a more autocratical/transactional approach from their leaders, while companies being in the growth and development staged are led by democratic/transformational leaders and older and more mature companies can be efficiently run by laissez-faire/liberal leaders.

Regarding the influence of the respondents' gender upon his dominant leadership style, our findings have shown that in case of both male and female leaders, the dominant style is democratic/transactional, but we can see a larger proportion of male leaders who employ an autocratic/transactional approach compared to female respondents.

In the last part of our research, we have analysed how the COVID-19 pandemic affected the operational capacity of our respondents. Our results have shown us that most of our respondents had to reduce the operations of their business to some degree, 18% of them not being operational at the moment of this study. Moreover, our findings suggest that our respondents don't consider the government restrictions as being too harsh, the demand for their products and services had been significantly reduced during the pandemic, some of them had to increase the price of their products or services in order to compensate for the lack of demand and many of them had to temporarily lay off a significant part of their staff. Regarding the aid measures implemented by the Catalan government in order to support the business environment, our respondents considered the extension of tax deadlines and the liquidity lines as very useful, unlike the "Business Marketplace COVID-19" which was not seen as extremely helpful, while the overall feeling of the degree of inclusion of the aid measures was mixed.

Regarding the limitations of this study, we should mention that it was conducted in an empirical and quantitative way, the authors having neither the time nor the resources to conduct a more complex scientific research. Moreover, the research was conducted online because the authors could not travel to Spain because of the COVID-19 travel restrictions and the sample was chosen arbitrarily. At the same time, the leadership styles were identified based on the respondents' answers to several questions and thus, might be affected by their subjectivity.

As we have mentioned before, this study is a continuation of the authors' previous doctoral research on leadership styles, which was conducted on a sample of Romanian and Dutch entrepreneurs. We want to further this research

by comparing the findings from Romania, the Netherlands and studying the similarities and the differences between the results, using Hofstede's cultural dimensions.

Abstract

The current increase in the popularity of implementing a lean manufacturing concept that aims to satisfy customer requirements and ensure continuous improvement of the entire organization through the elimination of waste is now almost a necessity; not only for manufacturing companies but also for companies in other industries given the rapidly changing nature of today's world. One of the lean manufacturing tools being used to analyze, visualize, identify causes, bottlenecks and waste of a process is Value Stream Mapping (VSM): which can be applied to the entire company or its individual sections. The aim of this paper is to highlight some of the limitations of VSM in terms of quality measurement, and to present improvement possibilities for the tool by focusing on the quality of the process output as a whole, along with its individual activities.

Keywords: Quality, Lean Manufacturing, Value Steam Mapping, VSM.

Introduction

The aim of this paper is to highlight quality measurement by using value stream mapping as a tool of lean production suitable for the visualization and identification of process weak points. The first chapter defines quality from the point of view of manufacturing companies and deals with the total, and distribution of, costs associated with poor quality. A brief description of lean manufacturing will also be outlined. The second chapter focuses the current approach of value stream mapping and is followed by a third chapter describing the current possibilities of measuring quality in both individual and entire flow mapped activities, together with possible shortcomings and limitations. The final chapter describes alternative quality measurement options that can help improve problem identification. The conclusion of the article summarizes the findings and discusses the possibilities of developing a value stream mapping tool.

Quality and Lean Production

Quality by itself is defined in many ways, but focusing on its definition in terms of production, it is most commonly referred to as compliance of customer requirements or demand with the supply or technical output of the company, which meets the promised design or specific specifications described by Gravin (1984) in his article. As it follows from this determination that any deviation from the predefined output is a reduction of quality. It is therefore a matter of fulfilling specifications or design, which thus simplifies production in a certain way. Simplification is achieved through the timely elimination of deviations, both in the part of product development and production through component analysis and on the other hand, by identifying possible failure modes together with the design of increasing reliability through the quality control. The output of production methods is to emphasize quality through the reduction of deviations by preventing the occurrence of defective products through more thorough design and testing of prototypes, together with more frequent inspection of components and their subsequent removal to reduce costs associated with reprocessing, scrapping and complaints, which significantly exceeds costs. for the prevention of defects.

Quality Costs

In most of the companies, the costs associated with poor quality range from 5 to 30% of the company's turnover, but we can also find costs reaching up to 36% for manufacturing companies and 40% for service companies mentioned by Russell (2013). In book by Westcott (2006) costs are generally divided into the following four categories:

- *Internal cost* - costs that arise before the final product is delivered to the customer. These costs are caused by activities such as reprocessing, repairs, poor material or communication quality, or insufficient inventory, all of which contribute to unplanned downtime.
- *External costs* - costs incurred after delivery of the product or provision of services to the customer. Examples may be the costs associated with the warranty period, complaints, product returns, but also the need to reduce the price due to non-compliance with customer requirements.
- *Appraisal costs* - costs associated with all activities related to inspections, tests, maintenance, calibration and testing.
- *Preventive costs* - costs incurred for prevention in order to minimize the costs associated with the failure of any processes throughout the company, but also the appraisal costs associated with quality. This category includes, for example, design reviews, evaluations of company processes, as well as surveys and evaluations of suppliers and, last but not least, education, training and coaching.

Tooley (2010) declared that if we determine the ratio of these costs, it is stated that 90% of the costs associated with poor quality are hidden in internal and external costs. From an accounting point of view, this is a direct loss of profit for the company. If we look at the causes of these internal and external costs associated with poor quality, they are due to low preventive costs, wherein a poor supplier control, insufficient staff training, lack of materials and/or tools, inefficient production planning, insufficient process control or poor communication are the main causes of the above 5 to 40% of the company's turnover.

Lean Manufacturing

The goal of delivering quality products mentioned by Norhazrina et al. (2020) to meet with customer requirements whole making maximum use of resources through the elimination of waste, is also set by the methodology of lean production. A methodology that originated as part of Toyota's manufacturing system in the middle of 20th century and has since spread to various industries around the world. The pressure to reduce all types of waste and meet customer requirements is growing with increasing competition, and thanks to empirically proven capabilities, lean manufacturing methodology is gaining more and more followers and thus becoming an integral part of corporate cultures. At the same time, as Rufe (2013) describes and approves, there is currently no argument against the need to engage in continuous improvement activities if the company is to remain viable and competitive in the global marketplace.

As described in previous paragraph and also by Jackson (2015), one of the causes of poor quality is inadequate processes within the company; together with insufficient control. To eliminate waste and variations in processes within the company, there are several tools that lean manufacturing applies. These are tools such as 5S, Kaizen, Kanban, SMED, Poka-Yoke, TPM, JIT or Gemba. However, after identifying the processes that add value or output from the so-called voice of the customer from the customer's point of view, the most suitable tool is to analyze the current state of compilation of the so-called value stream map.

Value Stream Mapping

In the book by Gulati (2013) the value stream mapping tool (VSM), is most used in continuous improvement activities; both in manufacturing and service companies. The advantage provided by VSM is an easy and realistic representation of the process from the customer and back to the customer together with the representation of the flow of information and material.

And as Russell (2013) adds the output of VSM is a comprehensive description of the entire process from communication with the customer, through order processing, production to delivery of the products or services back to the customer. The benefit of VSM is the easy identification of the places in the process where value is created and where, on the contrary, waste occurs. At the same time, VSM provides certain insights into the whole process; allowing process participants to see whole flow, not just the separate part pertaining to their role. This often contributes to improved communication and understanding between the activities of the whole process, as you can see in an example from King (2009) in Figure 1.

Figure 1: Example of value flow map processing.

At first look, VSM may appear similar to a process diagram, but the emphasis on the business impact of the whole process, based on lean thinking combined with the use of standardized symbols, makes VSM an advanced traffic management tool as relates Burke & Silvestrini (2017). Carried on by King & King (2015) the symbols are divided into three main groups capturing the flow of information, the material, and the timeline of the process. The information flow demonstrates the information flows from and to the customer in terms of managing the requirements of what and when is going to be produced and delivered with information flows between business entities. The timeline captures and compares the times of individual value-added-time process activities, along with non-value-added process activities times. The timeline is thus one of the key identifiers of the consequences of waste in terms of their types, not their causes. The flow of material from the point of view of manufacturing companies shows the transformation of material through the production process from its raw form to the finished product, and focuses only on the main activities of the whole flow or of the overall process. For a more detailed description and understanding of these main activities, so-called data boxes are compiled, which illustrate, for example, capacity, tact, utilization, OEE, but also quality.

Quality in Value Stream Mapping

The quality of the individual parts of the process described in the value stream can be referred to as "*Yield*", and defined using an equation (1):

$$Yield = \frac{Output}{Input} \cdot 100. \quad (1)$$

However as Kubiak & Benbow (2017) describes, this procedure and calculation strongly overestimates the quality of the activity because it does not reflect the internal costs associated with poor quality, such as repairs, rework, etc. The cause of overestimation is that repaired and reworked products are being returned to the process with subsequent of numerator increase. This simple difference can reduce the quality of the activity by a few percentage points and can greatly impact the visibility for the need for improvement in the activity.

If we move from measuring the quality of one activity of the mapped flow to measuring the quality of the overall flow, it is necessary to consider each partial step of the process. To obtain the overall quality, as the percentage of

units passing through the whole flow, referred to as the *Rolled Throughput Yield* (RTY), it is necessary to multiply the quality of each sub-process according to equation (2):

$$RTY = \prod_{i=1}^{n} TPY_i, \tag{2}$$

where:

n = Number of subprocesses,
TPY_i = Throughput yield of the ith subprocess.

Following on by Gigy & Williams (2012) from the above calculation it can also be expected that the multiplier effect achieved by the complexity of the process will have a negative effect on the overall quality of the mapped process; even under conditions where the quality of individual sub-activities will be high. For easier understanding and to visualize how complexity of the process reduces the overall quality of the output with the same level of quality of its individual parts, see figure 2 below.

Figure 2: Decrease in the overall quality of the process at different levels of its complexity and the stable quality of individual activities.

Quality measurement options in value stream mapping

When mapping the value stream, the quality is recorded in one place, in the so-called data boxes, and as described more in detail in the previous chapter: it is not a completely unambiguous value. Therefore, this chapter is aiming introduce several options to improve the outputs associated with quality, and to possibly emphasize these outputs in the mapped activity of the whole value flow. One of these options is to focus on the percentage of defects occurring in each activity, referred to and called *Defects per Unit* (DPU), and can be determined according to equation (3):

$$DPU = \frac{Total\ defects}{Number\ of\ units\ observed}. \tag{3}$$

The benefit describe by Ruggeri et al. (2007) of DPU value is a focus on all possible defects that may appear during the activities taking place in the process or more activities. Consequently, it contributes to the visibility for the implementation of improvement activities.

A very interesting possibility for determining the quality of activities in a given process interpreted by Crossley (2008) can be the calculation of the process capability index, called the *Process Capability Index* (Cpk), which brings us to the introduction of this article and adds to the quality measurement requirements and specifications. Defined by the customer in terms of *upper specification limit* (USL), and *lower specification limit* (LSL), according to equation (4):

$$Cpk = min\left[\frac{USL-\overline{X}}{3\sigma}, \frac{\overline{X}-LSL}{3\sigma}\right], \tag{4}$$

where:

USL = upper specification limit,
LSL = lower specification limit,
σ = population standard deviation.

Once calculated, the result then gives a single value that acts as a measure of how a given activity or process produces products or services. The resulting value depends on the requirements of the customer, the industry, as well as the complexity of the process. The aim is to achieve a resulting value higher than 1.

Another option represented in the book by Stamatis (2003) is to focus on, and consider, the cause of defects. In both production processes and processes focused on services, the use of the tool *Failure Mode and Effects Analysis* (FMEA) is used quite commonly for this. FMEA provides a systematic method of examining all possible ways in which a failure can occur, while at the same time estimates for each defect its impact on the overall system, process or service, together with its severity and frequency of occurrence. A suitable and usable FMEA output is the so-called Risk priority number (RPN), see equation (5), which considers three basic components to help define the priority of a failure. They are *Occurrence* (O), which reflects the probability of failure, *Severity* (S), which determines the severity of a possible defect, and finally *Detection* (D), which describes the probability of detecting a possible defect.

$$RPN = O \cdot S \cdot D \quad ; \quad O, S, D \in [1,10] \tag{5}$$

where:

O = Occurrence,
S = Severity,
D = Detection.

There are many methods to define RPN components, but the most commonly recommended and used method is a numerical scale from 1 to 10. The disadvantage of FMEA is a lack of process chain visualization regarding defects, process control, or quality control loops. However, thanks to the use of RPN value and its subsequent implementation as another indicator in the data box of individual VSM activities, an interesting value stream indicator can be created. This allows for clear identify weaknesses and risk points in the process and then motivate the activities to implement appropriate measures with quality.

Another interesting possibility is to express the quality of either individual parts or the total flow of values using a monetary indicator. The main idea of this method for measuring quality is to use the attention of process owners to a clear and comprehensible indicator, which will almost certainly serve as a trigger for activities that will contribute to improving, if not eliminating, quality problems. The article by Haefner et al. (2014) deals with this issue which lists relevant costs related to quality preventive costs, costs associated with quality control, costs of repairing damaged products, costs associated with unsuccessful and discarded products, and finally the costs associated with product complaints by the customer using equation (6):

$$QC = PC_n + IC_i + RC_j + SC_k + CC_l \tag{6}$$

where:

PC_n = prevention costs,
IC_i = inspection costs,
RC_j = rework costs,
SC_k = scrapping costs,
CC_l = customer reclamation costs.

The next step is to insert the defined costs into the data box as another value describing the value stream or very interesting as mentioning article describes also presents a graphical visualization by adding a curve below the value flow map; which more clearly highlights both the cost of individual activities, as well as the total cost associated with the quality of the flow: as we can see in Figure (3) by Haefner et al. (2014).

Figure 3: Example of application of a cost curve associated with quality together with the total costs of value streaming.

Acknowledgment

Competition between companies supplying customers with products and services is constantly increasing due to the development of industry, along with pressure to use their resources efficiently and reduce costs. For this reason, the costs associated with poor quality in the range of 5 to 40% of the company's turnover, as mentioned in the introduction to this article, can sometimes be liquidating. This fact contributes to the fact that more and more companies are implementing the concept of lean production, which aims to satisfy the customer's requirements to a maximum and ensure continuous improvement of the entire organization through the elimination of waste.

One of the tools that lean manufacturing methodology uses to visualize and identify weaknesses in a company's processes is value stream mapping. However, as the article describes, if quality is part of VSM, any given calculation is often not entirely clear and correct. This statement can be supported by Romero & Arce study (2017) that summarizes 120 studies published in the period 1990 - 2016 describing the implementation of the VSM tool; either alone or together with other lean manufacturing tools in various companies and enterprises. The outcome of this article is that of the 120 studies mentioned, more than half described improvements in lead time and Work in Process (WIP) metrics. Unfortunately, the quality of the process or value stream is not described and is not considered in this study; and probably in most of the 120 studies considered. Therefore, the reason may be intentional overestimation, misunderstandings, but also the low quality of training in the processing of VSM. For this reason, the article showcases other possibilities for quality measurement, which can be incorporated into the data boxes of the material flow, and thus help in the identification of weak points and their subsequent improvement.

One option is the DPU value, which focuses on the percentage of defects that occur in terms of all the possibilities of a given activity, and thus helps to better approach and identify the weak points of the process. Another option described in this article was the Cpk index, which describes the process's ability to meet customer requirements and specifications, which are defined as upper and lower output limits. These customer-defined limits, often referred to as service-level agreements (SLAs), can very easily be translated into a key performance indicator (KPI) of a given process, center, or line. By giving more consideration to the causes of defects a FMEA tool was showcased as a systematic method of examining all the ways in which a failure can occur. At the same time, it provides an estimate for each defect and its impact on the overall system, process, or service; together with its severity and frequency of occurrence by using its RPN value. A further interesting possibility or option is to express the quality of either individual parts or the total flow of values by using a monetary indicator with the idea being to measure quality to use it for the attention of process owners to have a clear and comprehensible indicator, which will almost certainly serve as a trigger for activities that will contribute to improving, if not eliminating, quality problems.

In conclusion value stream mapping is a more complex tool of lean manufacturing that has been popularized in the last ten years of the last century. However, in many publications, it is often described as a pen and paper tool, with its own limitations. The increasing complexity of company processes, which is associated with the need for today's customer to meet various customer requirements, also contributes to the inadequacy of the tool. Mapping the value stream thus becomes a tool that is not comprehensive enough for the complex processes of today's industry; making it is necessary to look for ways to further develop this tool and possibly combine it with new tools and methods; creating a hybrid approach.

Abstract

In developing countries, informal waste management systems and informal waste pickers (IWP) are the most significant contributors to diverting waste from landfills. Waste management systems (WMS) are core to enabling the successful measurement, decision support, and allocation of resources to solve the challenges of waste globally, but in developing countries, the quality and volume of data to support these systems are lacking. This systematic literature review surfaces environmental concerns and poor waste data quality as one of the leading research topics on adopting WMS in the last five years. It also highlights that if our perspective on waste changes from a hazard to an artifact that provides data about post-consumer consumption, it becomes more valuable to the waste management industry. The informal waste management industry and IWP are well-positioned at the source of separation to provide and unlock the value of this data. The emergence of IoT and big data allows businesses to collect data about consumer waste at scale that was never feasible before. By seeing waste as a valuable data archive that can address the challenges of data quality and data availability in developing countries, waste data can prove valuable in driving WMS adoption and driving policy and budget decisions in the private and public sectors.

Keywords: Informal Waste Management, Data mining, Internet of Things, Big Data, Green-IS

Introduction

Green-IS is a subfield of the information systems discipline investigating how information systems can support sustainability. It is focused on systems and not siloed challenges like Green IT and can, therefore, tackle much more significant problems (Jan vom Brocke, Richard T Watson, Cathy Dwyer, Steve Elliot, & Nigel Melville, 2013; Watson, Richard, Boudreau, Chen, & Huber, 2008). Examples include systems to assist a business in transport planning for fleet management (reducing emissions), supply chain management (to make sure packaging is optimized), and consumer-driven application that allows a consumer to select the optimum product for the environment choices. Formal waste management is one of the costliest services to a city (Artuso, 2011) and consumes, on average, 4% of high-income and 19% of low-income city budgets (Kaza, Silpa, Lisa Yao 2018).

Incorporating informal waste pickers into a cities formal WMS can lead to the extension of landfills; and waste-related data information can be collected at source, improving financing, policy, and planning decisions for both business and the city. Much work has been done over the years to create well-defined and engineered WMS's in industrialized countries (Marshall and Farahbakhsh, 2013). However, these systems lack the robustness to address specific challenges that developing countries face, such as urbanization, inequality, and economic growth towards the current integrated solid waste management paradigm. Five factors historically drive the adoption of WMS in developed countries (Marshall and Farahbakhsh, 2013) (1) Resource Scarcity, (2) Public Health, (3) Public Awareness and Participation, (4) Climate Change, and (5) the environment. (Marshall and Farahbakhsh, 2013). Four additional factors (1) Urbanization,

inequality, and economic growth, (2) Culture and socio-economic aspects, (3) political landscape, and (4) international influences the adoption of WMS in developing countries (Marshall and Farahbakhsh, 2013). This paper analyses and interprets the main concepts connected to solid waste management, informal waste pickers, waste management system adoption, waste data, and economic development, presenting a high-level overview of gaps in the literature suggesting additional research areas.

Research Objective

'WMS's implementation tends to fail in developing countries because of the lack of standardized waste data that can drive management financing, policy, and planning decisions (Worldbank, 2018). This research sets out to determine, through a systematic literature review, what value data collected from the informal waste management industry has for the formalized waste management industry based on the following research questions:

1. What are the essential factors for the successful adoption of waste-management systems?
2. How can the data from the informal waste-industry add value to the waste-management system and drive adoption?

Rather than framing Informal waste pickers as reliant on WMS, this paper focuses on how Informal Waste Pickers (and the informal waste management industry) can contribute to the adoption of these drivers WMS and how IS can support it.

Literature Review

This research topic has a cross-disciplinary topic that focuses on social, environmental, and information systems. The storyline around which the central neutral narrative (Sylvester *et al.*, 2013) is structured is the factors that influence 'WMS's development and adoption over the years (Marshall and Farahbakhsh, 2013). It quantifies and links the research papers to the five main drivers for WMS in developed countries and considers the four additional driving factors identified for developing countries (Marshall and Farahbakhsh, 2013).

Methodology

This review examines this complex ecosystem by integrating the literature on information systems & Waste Management Systems & Informal Waste management industry. The informal waste management industry is represented by informal waste pickers (IWP) for the literature search context. A preliminary scan of the literature on a broad subject topic conducted through Google Scholar:" information systems & Waste Management Systems & Informal Waste Pickers" revealed minimal combined quality results on this topic. The results indicated that the subject is a cross-disciplinary search and that waste management is the connecting factor between the domain of IS and Informal Waste Pickers (Figure 2)

Figure 1: WMS is the connection concept between IS and IWP

Therefore, the literature search methodology was broken into two components, "IS and WMS"and "Informal Waste Pickers and WMS." The research areas identified was a cross-disciplinary search between environmental science, waste management journals, and information system journals. The review considered the eight top information systems journals, computer science, waste management, and environmental science journals. The Special interest group for Green IS (SIGGreen) was also used as a departure point for references and sources. The investigation started broad with a Scopus, Web of Science, ACM Digital, and Google scholar search with a timespan of 2010 -2020 using the primary constructs of "Waste Pickers & Waste Management & Global South"and "Waste Pickers & Information Systems."

All the titles from the searches were reviewed and excluded if not directly connected to Waste Management, Waste Pickers, Information Systems, and the Global South. One hundred and three articles remained that focuses specifically

on these topics. Examination of the remaining papers' abstracts and main objectives highlighted how they would fit around the drivers for Waste Management as identified by (Marshall and Farahbakhsh, 2013).

Database	Papers
Scopus	36
Web of Science	84
ACM Digital	26
Google Scholar	1190

Figure 3: Papers by Sources

Figure 4: Documents by Territory and Country

Figure 5: Documents by discipline

Structuring the papers around the central narrative of the five adoption factors for WMS reduced the combined article count to 28 (Figure 6). The initial searches revealed that research around waste management systems and Waste Pickers is more robust (higher h-index and g-index) then research found around the topic IS and Waste Pickers. A reference check was also done on the remaining papers to confirm if all subjects were covered, and two additional papers were found and added.

Figure 6: process followed in selecting Papers adapted from Gunter et al.,2017

Results

A descriptive review revealed waste management patterns and how they are potentially associated with Informal Waste Pickers (Sylvester *et al.*, 2013) in a quantifiable output. A meta-analysis (R.A Guzzo, S.E. Jackson, 1987) created a picture of the pooled data and how these answers relate to the research question. Individual articles were read in detail and based on word count, focused around the five primary drivers of WMS (Marshall and Farahbakhsh, 2013) words: “Waste Pickers,” “Health,” Environment,” “Awareness,” “climate,” “scarcity.” When reading the articles, the four drivers in developing countries were taken into consideration, namely: “urbanization inequality, economic, growth, culture, politics, international.”. This review quantifies and links the research papers to the five main drivers for WMS in developed countries and considers the four additional driving factors identified for developing countries (Marshall and Farahbakhsh, 2013).

Figure 2: 5 Drivers for WMS influenced by Waste Pickers and IS

(Adapted from Marshall and Farahbakhsh 2013)

Concern for the environment emerged as the most important topic as a driver for WMS. Scarcity itself (of resources), health, and the climate were not featured that high. Considering that the main driver from the literature seems to be people's concern for the environment for adopting WMS, the paper continues by exploring how the informal waste management industry, WMS, and IS can support the environment itself.

Figure 7: Papers mapped to 5 Drivers of WMS in developing countries

By overlaying papers with a high frequency of information system concept, Waste Pickers, WMS and where the environment is the primary concern (Table 2), we can isolate that papers 23,24,25,28,29 covers our main emerging driver, namely environmental factor and how it is connected to our three main concepts IS, Waste Pickers and WMS.

Table 2: Mapping WMS to Waste Pickers and IS

Concept	Paper
Information Systems	[23],[24],[25],[28],[29],[30]
Waste Pickers	[1],[2],[3],[5],[6],[7],[8],[9],[11],[12],[13],[14],[15],[18],[19],[20],[21],[22],[23],[24],[25],[26],[28],[29],[30]
WMS	[1-30]

Five clear concepts emerged from a word count performed on the papers (Figure 8), (1) Private Sector,(2) Data, (3) Value, (4) Separation at source, and (5) Integrated Waste Management.

Figure 8: Emerging concepts within the WMS, Waste Pickers, IS, and the environment

The literature surfaced the Integrated Sustainable Waste Management Model (ISWMM) (Guerrero, Maas and Hogland, 2013) that highlighted five factors : (1) Policy & Legal, (2) Economic and financial instruments, (3) institutional arrangement, (4) social acceptance and welfare and (5) technical and operation influence the adoption of WMS in developing countries.

A conceptualized model is presented based on these concepts (Fig.9), with the resulting findings discussed.

Figure 9: Conceptual Waste Data Model adapted from Guerrero, Maas, and Hogland (2013) and (Marshall and Farahbakhsh, 2013).

These five themes of this model are explored in further detail below.

Integrate Solid Waste Management

The current paradigm for formally managing solid waste management (SWM) called: "integrated solid waste management" (ISWM) originated in the 1990s with a policy shift away from landfill and a push to a broader understanding of the impact of waste on the environment (Marshall and Farahbakhsh, 2013). ISWM strives to balance environmental effectiveness, social acceptability, and economic affordability (Marshall and Farahbakhsh, 2013). Waste management systems that do not consider social components have a smaller chance of success (Joos *et al.*, 2000; Henry, Yongsheng and Jun, 2006). Over-complex technology and techniques that are too expensive to maintain, technical and operational issues influence WMS adoption in developing countries (Guerrero, Maas and Hogland, 2013; Marshall and Farahbakhsh, 2013). Another aspect contributing to the technical and operational issue is the lack of useful quality data in developing countries on waste generation and composition, leading to a lack of information to implement solid waste management systems (Guerrero, Maas and Hogland, 2013; Marshall and Farahbakhsh, 2013).

Reducing waste by separation at source

Separation of waste at source refers to the separation of post-consumer waste at the point of generation to prevent the waste from ever entering the formal waste management system(City of Cape Town, 2019). Separation at source potentially provides one of the most accessible and cost-effective measures to limit the amount of waste that enters a city's waste management system(Miezah *et al.*, 2015; Mian *et al.*, 2017; Nahman and Oelofse, 2018; Wehn and Almomani, 2019). Waste pickers provide an informal separation at source service, minimizing waste to landfills (Peres, 2016) as they value much of what might typically enter the waste system (Marshall and Farahbakhsh, 2013). There is a financial benefit to the formal plastic recycling industry when the source's recovery process is improved (Genc, Zeydan and Sarac, 2019). Also, there is a strong case for modifying waste management systems from developed countries for

the global South's unique requirements (Oteng-ababio, Owusu-sekyere and Amoah, 2017; Millington and Lawhon, 2019; Schröder, 2019). Recycling at the source provides crucial waste data from the generation of waste.

Informal Waste pickers

Informally dumped waste constitutes almost 90% of all waste in low-income countries (Artuso, 2011), with waste pickers playing a pivotal role in recycling this waste. In many cities across the Global South, thousands of individual waste pickers, sometimes organized as cooperatives, sustain themselves by extracting recyclable waste from street dumps and landfills, diverting these to recycling value chains (Wilson *et al.*, 2015). This way of life is, however, is under threat due to the gradual formalization of the industry globally and the exclusion of waste pickers (Schröder, 2019). Socially there are challenges and stigma between waste pickers, society, and the waste management industry (Wiego,2014), with waste pickers, sometimes forced to project a particular picture of themselves to be accepted (Peres, 2016).

The value of waste data

The literature highlights that depending on perspectives, waste is a resource, hazard, commodity, manageable object, help, and, more importantly, for our research question, an archive of knowledge (Moore, 2012). Landfills, garbage, and refuse to produce the "remainders of everyday life." By conceptualizing waste as an artifact that stores knowledge, it can provide information about contemporary consumer culture and become valuable. This analysis highlights that waste data itself, and its value within the environment and integrated WMS play an essential role in driving WMS adoption in developing countries (Genc et al. 2019; Guerrero et al. 2013; Kaza, Silpa, Lisa Yao 2018).

The Private Sector & Solid Waste Management

It is nearly impossible for countries and cities to battle the onslaught of population and pollution growth independently. It can only work with public-private partnerships, focusing on economic, social, and environmental pillars (Vitorino de Souza Melaré, Angelina, Montenegro González, Faceli, & Casadei, 2017). Business is still grappling to understand how to merge profits for its shareholders, environmental sustainability (Dao, Langella, & Carbo, 2011), and what the client wants. (Dao et al., 2011) refers to this as the new triple bottom line and argues that if companies develop an integrated sustainable framework (humans, supply chain, and IT resources), it will allow a company to achieve a sustained competitive advantage (Wu, Yang, Sun, & Zou, Dec 2018). Nobre and Tavares (Nobre & Tavares, 2017) extended this by arguing that the emergence of big data and the internet of things (IoT) would allow businesses to collect large numbers of data at a low cost to make a decision and extend their advantage instantly. The capability to share information with supply chain partners coupled with information systems that contain environmental information would allow businesses to increase their environmental performance by acting as a mediator in the supply chain (Meacham, Toms, Green, & Bhadauria, 2013) and enhance their economic development and organization transformation(Wu et al., Dec 2018).

Findings

One of the limiting factors in developing countries adopting formalized waste management systems is at a "technical and operations" level. The lack of quality data hampers decision making and planning ability for the adoption of waste management systems. Waste pickers and the informal waste industry in developing countries are well-positioned to improve the quality of the data needed to drive the WMS adoption in developing countries by generating data from recycling at source. Waste itself is an artifact with the ability to provide waste data about post-consumer behavior. It provides an affordable, high-quality waste data source that addresses one of the leading factors (technical and operational) in adopting WMS in developing countries. (Marshall and Farahbakhsh, 2013). Improving the quality, volume, and range of the collected waste data can be achieved by collecting the separation data at its source. The informal waste industry and IWP is well positioned within the waste industry to provide this data since they are responsible for recycling 90% of all waste in low-income countries. Data generated from waste can drive WMS adoption in developing countries by providing the necessary information at a sustainable cost to support "Technical and Operations" factors. For private business, the volume of data available at a low cost due to emerging technologies (IoT) could allow for rapid strategic decisions, providing an immediate strategic advantage.

Conclusion

This article set out to examine the factors influencing waste management in developing countries and how the informal waste industry can contribute to the adoption of waste management systems. The research used a descriptive review build around the five factors that drive waste management system adoption (Marshall and Farahbakhsh, 2013) in developing countries. It explored waste management systems in developing countries in the informal waste industry, focusing on waste pickers. Concern for the environment and the lack of quality data emerged as the leading factors that drive the adoption of waste management systems within developing countries. The paper has found that informal waste-pickers' data can help generate quality, affordable data to assist in adoption WMS in developing countries. The research paper proposed a conceptual model for the informal waste industry's inclusion within the formalized waste management industry to improve the quality and volume of data available to the formalized industry to drive policy and budget decisions. Future research could examine how this waste data information is leveraged in models that drive the informal industries' adoption within the formalized waste management industry.

An Exploratory Survey on Perceived Privacy and Cybersecurity Challenges Faced by Professionals When Working from Home During COVID-19 Pandemic and Best Practices for Effective Risk Mitigation.

Glorin SEBASTIAN

School of Public Policy, Georgia institute of Technology, Atlanta, GA, USA
gsebastian6@gatech.edu

Abstract

According to PwC'S COVID-19 CFO Pulse survey, 41% of the finance leaders surveyed in North America said that they struggle to strike the right balance between flexibility and security for remote work. With major portion of the workforce in every country working from Home, employers might not have accounted for this scale of load on their IT infrastructure, not to mention their cybersecurity preparedness. Cybercriminals have been working to exploit this unpreparedness of the employers with regards to their IT Infrastructure. The purpose of this study is to discuss the increased Privacy and Cybersecurity risks of work from home due to Covid-19, and includes a framework that has concise and simple but extremely effective steps to mitigate and prevent these cyber-attacks.

Keywords: Privacy Risks, Cybersecurity, Covid-19, Work from Home.

Introduction

With the Covid-19 Pandemic affecting the entire Globe with over 40 Million cases, and 1 Million deaths as of October 2020 , per data obtained from Johns Hopkins Coronavirus Resource Center, and with a large percentage of workers and students working from Home or remote, could be the beginning of what William D. Eberle, Professor of Economics in Stanford's School of Humanities and Sciences in his June 2020 article on Stanford News calls the 'Work from Home' Economy. With the Covid-19 Pandemic which started in late 2019, stretching into 2021, the Pandemic is something that the world has not seen in the past 100 years, with almost everyone working from Home except the essential and front line workers.

According to PwC'S COVID-19 CFO Pulse survey, 41% of the finance leaders surveyed in North America said that they struggle to strike the right balance between flexibility and security for remote work. With major portion of the workforce in every country working from Home, employers might not have accounted for this scale of load on their IT infrastructure, not to mention their cybersecurity preparedness. With this record numbers of employees working from Home, companies are struggling not just to cope with the need for IT infrastructure to support the increased load on their IT servers but also to cope with the increase in cyber-attacks on their IT infrastructure. Cybercriminals have been working to exploit this unpreparedness of the employers with regards to their IT Infrastructure as is clear from the increased number of Cyber-attack complaints received by the FBI and Interpol.

The FBI reported in April 2020 that the number of complaints received by its Cyber Division was up to 800% increase from the numbers pre-coronavirus. Monster Cloud, a Managed Cybersecurity Services firm in its August 2020 Blog, noted that Interpol reported an "alarming rate of cyber-attacks aimed at major corporations, governments, and critical infrastructure". There has also been corporate ransomware attacks around August 2020, on multinational companies such as Honda, Garmin and Canon.

Given these circumstances, it is extremely timely and crucial for not just Multinational companies but also healthcare providers with significant amount of Health information, PII (Personally Identifiable Information) and PHI (Protected health information) to be aware and enforce proactive controls towards mitigating this very real risk. For example, the twitter handle hack in July 2020, in which twitter employees were targeted in a phone spear phishing attack, which led to bad actors assuming control of celebrity twitter handles including that of a former US President as reported in Twitter Blog. All these point to the proliferation of cyber-attacks against corporations and its employees.

Cite this Article as: Glorin SEBASTIAN "An Exploratory Survey on Perceived Privacy and Cybersecurity Challenges Faced by Professionals When Working from Home During COVID-19 Pandemic and Best Practices for Effective Risk Mitigation." Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

There are multiple types of cyber-attacks, however the common types that could affect work from Home systems include:

1) ***Social Engineering such as Phishing:***

Social Engineering refers to cyber-attacks that is accomplished through the weakest link i.e. humans. The bad actor who performs Phishing attacks uses social engineering techniques to deceive end-users, most times relying on human error, which indicates the importance of user-focused studies to help prevent future attacks as noted in the Systematic Literature Review by Das, Sanchari. (2019). Social engineering attacks are becoming very common even on corporate networks. An advanced version of Phishing is Spear phishing, which targets a specific person or group and often includes information known to be of interest to the target, such as current events or financial documents." Like other social engineering attacks, phishing attacks take advantage of the human tendency to respond to an emergency, hence most phishing emails would include a scenario that requires immediate action from the reader.

2) ***DoS and DDoS Attacks:***

A denial-of-service (DoS) attack occurs when legitimate users are unable to access resources such as information systems, devices, or network resources due to the actions of a malicious cyber attacker. A distributed denial-of-service (DDoS) attack is similar to DoS attacks, but usually includes multiple machines that are operating together to attack one target. DDoS attackers often leverage the use of a botnet—a group of hijacked internet-connected devices to carry out large scale attacks as per Security Tip (ST04-015) (2019). These attacks are specially of increased prominence with the emergence of 5G technology and IoT (Internet of Things) since increased internet speeds and interconnected IoT devices form the perfect scenario for these attacks.

3) ***Ransomware Attacks:***

Ransomware is a malware that when infects systems, usually encrypts all the data including, critical information and is perpetrated by bad actors or attackers who often demand money in return to the organization getting back access to their data. Ransomware attacks are particularly seen to target healthcare clients to gain access to the PII (Personally identifiable Information) and PHI (Personal health information).

Given this proliferation of Cyber-attacks specially on work from home setups, we also performed a study as part of this research. The main objectives for this study are as follows:

1. To measure the awareness among everyday company employees on the proliferation of the cyber-attacks, accelerated by the work from Home due to the Covid-19 Pandemic. This awareness is essentially also a measure of the effectiveness of employee cyber awareness training that they received from their respective corporate firms.

2. To suggest effective methods that companies could use to proactively detect and mitigate these Cyber risks, so that these attacks do not obstruct the work from home environment as well as to meet the most common security objectives for remote work as defined by NIST Special Publication (SP) 800-46 which is the CIA triad:
   - Confidentiality - ensuring that remote communications and data cannot be read by unauthorized parties.
   - Integrity - detect any changes to remote access communications that occur in transit; and
   - Availability—ensure that users can access resources through remote access.

Materials and Methods

The study included a survey conducted over 2 weeks in October 2020 and surveyed 109 participant responses. The survey was conducted over Google forms and shared individually to professionals on LinkedIn. To maintain uniformity the study was conducted only on professionals who could work from home completely.

The survey included questions on topics such as:

1. Ensure all the respondents had the required IT infrastructure to work from Home.
2. Enquire if the respondent company has enabled extra security measures/ controls such as VPN, Two Factor Authentication etc. to counter this increase in spam or phishing attempts.
3. If the extra security measures enabled by company has affected the employee productivity.
4. If since start of the Covid-19 Pandemic, while working from Home, the end user has experienced an increase in fraudulent emails, Phishing attempts, or spam to his/her corporate email.

Finally, the users are also asked to share suggestions on how to mitigate these Cyber security and Privacy related concerns that they might have with working from Home or remotely. The Data collected was analyzed and expressed as percentages and proportions. Please refer Table-1 for the survey responses from the study participants.

Results

All the 109 respondents have been working from Home 75% or more for the past 6 months, and most of them had enough IT infrastructure to work from Home and also had their company enable extra security measures or controls to counter increase in spam or phishing attempts.

Over 60% of the respondents agreed that there has been an increase in fraudulent emails, Phishing attempts, and spam to corporate email, since start of Covid-19 Pandemic, while 15% of the respondents thought that extra security measures had an adverse impact on their productivity. (Table 1)

Table-1: Survey responses of the study participants

What percentage of your work have you been doing remotely for the past 6 months?	***Response***
96-100%	89%
76-95%	11%
Do you have enough IT Infrastructure e.g.: Strong Internet connection, Laptop/ Desktop with the required specifications etc. to effectively work from Home?	**Response**
Yes, I had the required IT infrastructure to effectively WFH before the Pandemic	94%
did not have it prior to the Pandemic, company helped with setup during Pandemic	6%
Has your company enabled extra security measures/ controls such as VPN, Two Factor Authentication etc. to counter this increase in spam or phishing attempts?	**Response**
Yes	66%
No	28%
Did not notice	6%
If you answered Yes for above question, have these measures, affected your productivity?	**Response**
Yes	15%
No	85%
Since start of Covid-19 Pandemic, while working from Home, have you experienced an increase in fraudulent emails, Phishing attempts, and spam to your corporate email?	**Response**
Yes, there has been an increase	**62.4%**
No, there has not been an increase	37.6%

Measures for Mitigation of Cyber security Challenges

The Information Technology Laboratory (ITL), a component of the NIST Computer Resource Center, has issued a bulletin that reiterates NIST standards for teleworking. We compiled the mitigation measures suggested by the study participants and Special Publication (SP) 800-46 Revision 2, to come up with an 8 step WFH (Work from Home) Cyber-attack mitigation plan. (Figure 1). These should be included as part of internal controls by the Risk and Controls team as noted in the review article by Sebastian, G (2020) to ensure its implementation within the firm. While coming up with this framework we focused on effective and Policy friendly techniques which would be easy for the management to understand as well.

They include both detective and preventive controls, as described below and we recommend these Remote work security controls to be included in the firms security policy. However, each organization can decide on the level of enforcement of these controls based on a Risk based approach.

Fig. 1: Explains the Cyber mitigation steps that help combat cyber-attacks in workplace

Detective Control

1) *Remote Monitoring:*
Installing network scanning techniques including firewalls that restrict network traffic, DoS protection service that detects abnormal traffic flows and filters out such traffic. Active monitoring is one of the best detective controls to prevent Cyber-attacks.

2) *Incident Management:*
Incident management is a continuation of Monitoring and includes SIEM (Security information and event management) that provides a real-time analysis of security issues generated from the IT layers including application, network, and Databases. The technologies used for this incident management often have the ability for Data aggregation, correlation and sharing the information in form of Dashboards which can be used by management to assess risks and determine mitigation methods.

Preventive Control

3) *Employee training:* Humans are the weakest links in every cyber environment and hence it is to be made sure that, they are provided with appropriate training to ensure they are aware of the various attacks that they could face in a corporate environment. It is not just sufficient to have proper Employee security training, but there needs to be put in place a cyber-aware employee culture at workplace, and this awareness should be tested periodically with mock cyber-attack simulations.

4) *Access controls:* Ensuring the users have proper access controls and making sure to maintain proper segregation of duties between two conflicting business functions is important. Also there needs to be periodic review controls to ensure that the employees are not misusing their elevated access.

5) *Backups and BIA-Recovery Plans:*
Create a disaster recovery plan which includes backups and BIA (Business impact assessment) to set precedence for effective communication, mitigation, and recovery in case of critical cyberattacks. The backup plan specially helps in the case of Data loss. Also ensure the Data is encrypted on the device built-in storage including removable media used by the device.

6) *VPN, MFA:*
Both using VPN (Virtual private network) and MFA (Multi Factor authentication), ensures the user Data is protected. Employees that access company Data while connected to a VPN ensures that the Data in motion is protected between 2 devices on the Public network, same as they are connected over a Private network. Using the VPN provides security specially when connected to unsecured networks causing attacks such as man-in-the-middle attacks (MITM), eavesdropping etc. A Microsoft security blog dated August 2019, noted

that enabling MFA reduced cyber incidents by 99.9%. VPN and MFA together are the two most important preventive controls that can thwart majority of the Cyber attacks in a Work from home environment.

7) *Vendor security controls:*
Given a lot of critical Business processes and Data are outsourced to vendors, it is critical to ensure that the controls, especially Security controls on the Vendor side are effective. This usually is ensured via contract terms, and regular SOC (System and Organization Controls) audits. SOC-2 audit reports which audits the vendor Cyber and Data protection controls in place and its effectiveness is to be reviewed periodically.

8) *Endpoint security (including Wi-Fi and Access points) and Patching:*
Endpoint Security ensures each end point that is connected to the central corporate network is compliant to the organization standards and thus protects you from malware, ransom ware and other similar cyber-attacks. It manages the user access on an ongoing basis over the corporate network. It includes not just Anti-virus which is usually based on signature based protection, but end point security also includes, regular patching at Network, Application, Operating System and even at Database level, and this can be remotely monitored by Corporate IT Admin using technologies which recently has been using even Fuzzy logic, AI (Artificial Intelligence) etc. VPN discussed in #6 could be considered as part of end point security as well, but we included it as a separate point, since VPN is critical to Data protection for working from home, especially when connected to unprotected networks eg: in coffee shops. Endpoint security also includes central authentication techniques monitored by the Corporate IT Admin.

Discussion

This study tried to understand the perceived privacy and cyber security challenges faced by professionals when working from home during COVID-19 Pandemic and best practices on effective mitigation of risks. According to a similar study, by B. Gyunka and O. Christiana Abikoye (2017), one of the reasons for increase in cybersecurity risks is because we are lacking common practice and training on security. Another study by "Malicious Insider", Science Direct, 2020 found that the major challenge in cybersecurity is people risk management, authorization, and access control. In this paper based on survey study on work from home employees, we studied the perceived privacy and cyber security challenges faced by professionals when working from home during COVID-19 Pandemic. It is a fact that there has been a proliferation of Cyber-attacks since the start of the Covid-19 Pandemic, from the study we understand that most users are aware of this, but in Cyber security most is not good enough as it takes only one mistake from anyone of the employee to give a bad actor access to the enterprise resources.

Conclusion

In addition to the uncertainty caused by the Covid-19 Pandemic to health and the Economy, it is seen that cybercriminals are using this as an opportunity to launch cyber-attacks as most of the employees have been working from home for more than 6 months. We see that the employees are aware of this cyber-attack proliferation, but it needs to be made sure that all of them are fully aware of the cyber security and privacy risks posed by working from home. We also suggest an 8 step Work from home best practice framework for effective cyber risk mitigation while working from home. These steps in the framework are extremely effective to thwart cyber attacks and have been explained in a concise and simple manner, so that it can easily be used as a checklist for companies looking to incorporate remote work best practices into their security policy.

Abstract

In paper, we consider digitalization development results for managerial support to wildfire management within Industry 4.0 period while conditions of climate change and Covid-19. In studies, we used methods of data bases constructing, web-technologies and virtual reality tools. Also, we used Foresight technologies, theory of decision making under uncertainties and risk management. As digital tools, we propose to use digital online platforms, which integrate heterogeneous hardware and software resources with the use of web-technologies in distributed networks and wide application of cloud services. As study result, we demonstrate essential stages of managerial support system functioning for some examples of wildfire. For data exchange and preliminary discussion, we used platform https://www.researchgate.net/profile/Valery_Abramov2/ while research.

Keywords: Digitalization, Wildfire Management, Climate Change, Covid-19

BOLSHAKOV, Tatiana V. VEKSHINA, and Ernest R. ESTRIN "Digitalization Wildfire Management while Climate Change and Covid-19" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Introduction

Currently, global environmental economy wildfire management (WFM) area is within Industry 4.0 period, when while climate change and Covid-19 pandemic. Now, many businesses are planning and implementing a wide range of information technologies (Lukyanov, 2019), (Drabenko, 2019), (Grobitski, 2016), (Frolova, 2019), (Trunin, 2019). Industry 4.0 leads to serious technological changes in geo-information support (GISS) for sea ports activity (SPA), including natural risks management (NRM) (Berboushi, 2014), (Ershova, 2018), (Garcia, 2018), (Isaev, 2015), (Istomin, 2018), (Shilin, 2019), which requires the development of new tools, including practical learning area (Averkiev, 2020), (Korinets, 2020), (Popov, 2019).

In paper, we describe the development results for WFM digitalization within geo-information support to SPA within geo-information management (GIM) paradigm (Burlov, 2018), (Gomazov, 2018), (Fokicheva, 2016), (Lednova, 2014), (Malakhova, 2014), (Yaily 2019), (Zavgorodniy, 2020), in large environmental projects (Mandryka, 2019), (Popov, 2014), (Popova, 2019), (Rumyantseva, 2017), (Zhigulsky, 2018) within environmental economics (Bidenko, 2019), (Golosovskaya, 2014), (Karlin, 2014), (Karlin, 2009), (Kolbina, 2020), (Popov, 2016). We paid significant attention to managerial support systems (MSS) within climate change and covid-19 pandemic context (Bournashov, 2014), (Gogoberidze, 2014), (Chestnov, 2020), (Chusov, 2012), (Sikarev, 2020), (Tatarenko, 2020), including the issues of information collection and processing (Fokicheva, 2019), (Khaimina, 2014), (Popova, 2019), (Tatarnikova, 2019), (Ya, 2019). Developed digital technologies for MSS to WFM while climate change and covid-19 pandemic, considered in this article, take these factors into account.

Methods and Data

In study, we used Foresight technologies, theory of decision making under uncertainties, risk management approach, methods of data bases constructing, web-technologies and virtual reality tools. Also, we used big data technologies (Popova, 2019), (Yaily, 2019) From the point of view of geo-information management, geo-space is structured to allocate the interconnected components of the solution space (Bidenko, 2019). While research, we used data bases and tools of geo-information digital online platforms (GIDOPs) Earth (Bolshakov, 2020), (Sanina, 2020), and EOS, including its Land Viewer (LV) product (Prostakevich, 2020), (Vekshina, 2020).

Results

Last years, WFM is a hot place in global environmental economy because of heavy lost, which estimates some billions US dollars globally. Due to climate change, annual losses due to wildfires are only growing. Due to the Covid-19 pandemic, revenues from the forest industry are falling, which significantly affects the resource availability **for** fire prevention. In these circumstances, it is necessary to combine the efforts and resources of commercial players, the civil sector and government authorities in solving the problems of WFM.We put forward a statement, that WFM in modern stage is to be carried out in the sustainable development paradigm as related set of large natural-industrial projects (NIPs) within common space area and time period.

In figure1, we present a block model of investment structure while WFM, that combines the investment objectives of such NIPs (blocks 1-5) with cost of adequate managerial support (blocks 6-8), including WFM's goals and tasks (block 7). Our analysis shows that the largest part of the cost of managerial support is the environmental monitoring (block 8), the essence of which is determined by the content of block 7. Significant part of the cost in block 8 is hardware and software, the cost of which varies significantly. Now, in Covid-19 pandemic conditions, cost of WFM can arise greatly because of general economic situation. On basement of above mentioned model, we proposed to develop the managerial support system (MSS) for WFM with combined structure for access, storage and analysis of information from open geo-spatial data sources, including archives and operative mode web tools. As a result of the research performed using foresight technologies, we suggest to use geo-information distributed online platforms (GIDOP) as the main technological solutions for MSS for WFM.

Figure 1 : Block model for investment structure while WFM: 1 – block of distribution of resources; 2 – block of formation of resources; 3 - block of formation of private income; 4 - block of formation of total income; 5 – block of formation of the investment share of resources; 6 - block of comparison with the permissible level of risk; 7-block of formation changing in time set of natural risks within WFM, including climate risks and Covid-19 pandemic risks; 8 – block of environmental monitoring for WFM while climate change, adapted to Covid-19 pandemic conditions

In our research, essential goal is block of environmental monitoring within MSS for WFM while climate change and Covid-19 pandemic. Reducing the cost of MSS is an important question for WFM while Covid-19 pandemic conditions. We propose to use GIDOP EOS eos.com, which provides efficient tools for searching, processing, and analyzing large amounts of satellite data from the Landsat-7, Landsat-8 and Sentinel-2 satellite systems. Usage of GIDOP EOS allows to find and use satellite images of forest areas with wildfires zones for training purposes, to determine the location of these fires and to assess their main spatial characteristics (linear and area dimensions), which are the main initial parameters for conducting wildfire struggle measures within WFM while climate change, adapted to Covid-19 pandemic conditions.

Let's go to example. In figures 2-6, we show the sequential operations performed for the largest wildfires in Australia in the fall of 2019 with using of GIDOP EOS and its tools. In the figures 2-6, we combine on one image the first and second mid-infrared (1566-1651 nm and 2107-2294 nm, respectively) and red (636-673 nm) channels, which allowed to identify the wildfires zones on combined space image as reddish colored areas on greening plane.

Figure 2: Space combine image with wildfire zones (reddish), 3rd September 2019, Australia

Figure 3 : Enlarge space combine image with wildfire zones, 3rd September 2019, Australia

Figure 4 : Enlarge image of wildfire area and measuring its characteristics

Figure 5 : Enlarge image of wildfire area and measuring its perimeter and area

Figure 6 : Enlarge image of another wildfire area and measuring its characteristics

Then, we obtained data for WFM from figures 2-6, using GIDOP EOS's data bases and tools, and combining on one image the first and second mid-infrared (1566-1651 nm and 2107-2294 nm, respectively) and red (636-673 nm) channels, to see wildfires zones on combined space image as reddish colored areas on greening plane. Note, discussion of those data using for WFM is not task of this article.

Discussion

Proposed above low-cost MSS for WFM can be used in educational and training purposes. The essential task of university practical learning in WFM area is to teach students the practical aspects of work with MSS for WFM tools, which requires a developed learning base within special geo-information systems (GIS) laboratory. In some cases, real practical work in special GIS laboratory can be undergoes with virtual reality (VR) technologies (Korinets, 2020), (Popov, 2019), that can reduce total cost of learning process.

Conclusion

In article, we describe digitalization results for WFM within Industry 4.0 period while conditions of climate change and Covid-19. In research, we used Foresight technologies, theory of decision making under uncertainties, risk management, methods of data bases constructing, web-technologies and virtual reality tools. As study result, we suggest to use GIDOP EOS, including its LV product, as the main technological tools within MSS for WFM. We demonstrate possibilities of MSS and show the sequential operations performed for wildfires in Australia in the fall of 2019 with using of MSS and its tools. As essential result, we propose to use developed MSS as basement for WFM, including educational and training purposes. The research results presented in this article has significant scientific novelty and can be useful for private investors, public environmental organizations of the civil sector and state environmental control bodies.

Acknowledgment

While study, Associate Professor Nikolay Popov, head of geo-information systems laboratory in Arctic and Subarctic Institute at RSHU (LGIS IAS RSHU), gave us very useful consulting. Platform https://www.researchgate.net/profile/Valery_Abramov2/ was used for preliminary discussion and data exchange while this research.

Robin.Braun@uts.edu.au

Abstract

Cyber security breaches are caused due to misuse of information systems and non-compliance with cyber security measures and requirements. For effective compliance with cyber practices and human acceptance of cyber security technology, it is crucial to identify, research and analyze the factors contributing to its compliance and implementation. This study is an amalgamation and unification of the contemporary literature on the UTAUT2 model and the relationship between technology adoption and cyber security compliance. The rationale behind this study is to heal the literature gap regarding the relationship between technology adoption and cyber security compliance in the context of the Kingdom of Saudi Arabia. Based on our research and available literature, we can preliminarily conclude that factors influencing technology adoption also affect cyber security compliance, so there is a close relationship between technology adoption and cyber security compliance. This study proves a basic level idea to organizations to formulate a fully functional and useful security compliance framework for their organizations based on factors that influence the users' or employees' intentions and behavior. Consequently, the study is an exciting endeavor to prevent significant security weaknesses and reduce the security breaches in the information security systems by explaining different factors that strengthen the users' behavior and intentions to comply with the security. This is an ongoing study, and more information will emerge as it progresses.

Keywords: UTAUT2 model, technology adoption, cyber security compliance, performance expectancy, effort expectancy, social influence, facilitating conditions, hedonic motivation, price value, habit.

Introduction

In the contemporary era, where technology is exclusively proliferating, organizations must adequately comply with cyber security measures to prevent cyber-attacks and data breaches. Cyber security compliance is exceptionally critical to be acted upon to better the companies to reap the benefits of cyber security measures and prevent cyber-attacks (Twizeyimana & Anderson, 2019; Koohang, Nowak, Paliszkiewicz & Nord, 2020). Consequently, ensuring compliance with cyber security requirements and measures are getting considerable attention in the current research industry for the establishment of adequate information security in the organizations and e-government offices (Herath & Rao 2009; Huang & Madnick 2020; Karokola et al. 2012; Vance, Siponen, & Pahnila 2012; Ronchi & Ronchi, 2019; Charlette & Osei-Bryson, 2020). The current study proposes a hypothesis to check out any potential relation between technology adoption and cyber security compliance. This study will be proving any potential relationship among the variables that influence technology adoption in light of previous research, studies, and literature.

Compliance with cyber security refers to changes in a person's behavior, conduct, and attitude due to a pre-established framework that may have been developed to view the requirement and risks to gain effective results of information security. According to the literature, compliance is not a reactive response. It needs to be viewed as ongoing organizational process. That is why cyber security investments are more critical than ever before (Haris & Martin, 2019; Shein, 2020). Cyber security and compliance go hand in hand; hence, aligning security programs with business objectives is necessary for a successful information security setup. The existing research on cyber security compliance has primarily focused on technological and behavioral factors, including developing and implementing the technical frameworks, factors like attitude, and the employees' behavior regarding compliance with cyber security (Alzahrani,

Cite this Article as: Mohammed ALQAHTANI and Robin BRAUN "Assessing UTAUT2 Model for Cyber Security Compliance: A Literature Review" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

2020). Most of the contemporary research does not primarily include factors that directly targets compliance and technological adoption in an organization.

Additionally, failure to cyber security measures has also enabled unauthorized people to misuse and abuse the information system that caused a rise in security breaches (Ronchi & Ronchi, 2019). Organizations need to establish and implement cyber security frameworks to secure the confidentiality and the privacy of their users and the data they possess. These strategies should focus on technological advancements such as Data Loss Prevention on emails of employees that help in preventing employees to send files and information outside organization that are restricted, authentication mechanism that force employees to use multiple factors, etc. On the other hand, they must also focus on the factors that directly influence employee's behavior, including technology acceptance, adoption, and cyber security compliance (AlKalbani et al., 2015; Karokola et al., 2012).

This study focuses on the UTAUT2 model of technology adoption (Venkatesh, Morris, Devis, 2003; Venkatesh, Thong, and Xu 2012). The primary focus of UTAUT is to explain the behavior and intentions of a user w.r.t adopting the technology. UTAUT2 is an extension of the UTAUT model (Venkatesh, Thong & Xu, 2012). However, the existing literature up to the knowledge, UTAUT2 model is not evidenced to be researched for cyber security compliance and to examine the relationship of the UTAUT2 model with security compliance.

Rationale & Objective

We hypothesize that cyber security compliance is related to technology adoption. The study is ongoing and at a very preliminary stage now. This hypothesis will be validated with surveys and questionnaires, especially in the context of Saudi Arabia in future work. We will mainly focus on the impact of technology use for compliance compared to behavioral change for cyber security compliance. With the advancement in technologies, now technology is also being able to enforce compliance with cyber security policies and measures.

This current study is a preliminary study for our future research, and its rationale is to study the UTAUT2 model concerning cyber security compliance in Saudi Arabia. The current paper is an addition to the existing literature in the market that can be used in future research to support and cite different findings and literature.

Literature Review

Cyber security Compliance

Compliance is the implementation of cyber security standards, and policies and these policies are then followed by the employees and organizations for adequate information security (Harris & Martin, 2019). Contemporary research indicates that many security issues arise due to the employees' non-compliance with the cyber security measures (Donalds & Osei-Bryson, 2020; Vance et al., 2012). Similarly, compliance with cyber security frameworks ensures the effectiveness of mechanism along with threat prevention and risk reduction (AlKalbani, Deng, & Kam, 2015; Chen, Chen, & Wu, 2018; Choi, Lee, & Hwang, 2018; D'Arcy & Greene, 2014; Donalds & Osei-Bryson, 2020; Karokola et al., 2012; Li et al., 2019).

For effective cyber security compliance, users are required to understand, take measures in the direction of compliance (Shappie, Dawson & Debb, 2019), and conform to the security measures (Charlette & Osei-Bryson, 2020). Choi et al. (2018) surveyed identifying the effect of the employee's behavior on cyber security compliance. The study concluded a positive relationship between user behavior and cyber security compliance, i.e. cyber security compliance influence employees' behavior.

UTAUT2 Model

Unified Theory of Acceptance and Technology 2 (UTAUT2) model is a relatively new Model that adopts conceptual and pragmatic likenesses in the previous eight models to explain and analyse the technology adoption process (Venkatesh, Thong & Xu, 2012). The primary aim of the UTAUT and UTUAT2 models is to explain user behavior and intentions for technology adoption. UTAUT has four constructs: performance expectancy, effort expectancy, social influence, and following facilitating conditions (Figure 1). The first three primarily determine the user's behavioral or usage intention, while the last one directly determines the user's behavior. Age, gender, voluntariness, and experience were posited as extraneous variables influencing the four fundamental factors corresponding to their usage intention and behavior (Benbasat & Barki, 2007; Venkatesh et al., 2003).

However, UTAUT2 is an extension of the UTAUT model. Venkatesh, Thong, and Xu (2012) anticipated UTAUT2 with new constructs; hedonic motivation, price value, and habit have been incorporated (Venkatesh, Thong & Xu,

2012). Although UTAUT2 is a relatively new Model, many research is in progress to test its validity, reliability, and suitability within diverse contexts (Venkatesh, Thong & Xu, 2012; Huang et al., 2020).

Figure 1 - UTAUT2 Model

Technology Adoption overview

Adopting technology refers to making vital decisions regarding accepting, deploying, and investing in them (Taherdoost, 2018). Technology adoption can be at the governmental level, organizational level, or individual level. The factors that affect the user's decision of technology utilization should be considered critical at every stage of technology development and deployment (Lai, 2017). On the other hand, awareness of emerging technology does not mean that the individual needs to adapt to every novel technology emerging. A company must be equipped with strong decision-making skills to choose a vital technology based on knowledge, experience, and acceptance ability.

A number of technology adoption and acceptance models have been developed to determine the relationship between the user's behavior and compliance with technology and its framework (Taherdoost, 2018). These technology adoption models highlight various factors that affect the adoption and behavior of the users. Some of these models may include Theory of Reasoned Action (TRA), Theory of Planned Behaviour (TPB), Technology Acceptance Model (TAM), Diffusion of Innovation Theory (DIT), Motivational Model (MM), Model of PC Utilization (MPU), Social Cognitive Theory (SCT), Unified Theory of Acceptance, Use of Technology (UTAUT) and other models (Taherdoost 2018).

Assessment of UTAUT2 for Cyber Security Compliance through literature

The unified theory of Acceptance and Use of Technology (UTAUT) has been a fundamental model in many studies in order to measure technology adoption and technology use (Maldonado et al., 2011; Fidani & Idrizi, 2012; Ain, Kaur & Waheed, 2015; Gharaibeh & Arshad, 2018). The literature shows that the UTAUT2 model has been used in various research in various contexts (Table 1).

In the following sections, a relationship of all constructs with cyber security compliance is stated in detail.

Table 1 - Industry-wide Application of UTAUT2

	Contexts	Reference

4	**Broad-Band Internet Adoption**	LaRose, et al, 2012
5	**E-Governance Technology**	Krishnaraju, et al, 2012; Vinodh & Mathew, 2012

Relationship between technology adoption & cyber security compliance

Cyber security compliance is a multidimensional discipline, and these disciplines are interconnected to ensure the implementation of cyber security policies and their compliance across the organization (Charlette & Osei-Bryson, 2020). The development and implementation of technical cyber security measures and the improvement of security strategies are insufficient to protect the critical data stored in an organization; the human factors that influence cyber security must be taken into account with technical controls. The absence of information security awareness; ignorance from the cyber best practices, harms, and benefits; carelessness; laziness in following cyber security practices; hatred towards security; and obstruction are the significant causes of user mistakes (Donalds and Osei-Bryson, 2020). Suppose the end-user and employees of the organization do not consider the importance of these policies and do not practice and follow these policies. In that case, the security of the organization cannot be ensured. Due to this, the individual or personal behaviour aspect of cyber security is essential. Several studies are carried out on the impact of cyber security behavior (Donalds and Osei-Bryson, 2020; Harris and Martin 2019). Many cyber security incidents have been occurred due to the negligence of cyber security policies (Herath and Rao 2009; Harris and Martin 2019; Li et al. 2019).

Cyber security compliance, in a broader sense, is the adoption and acceptance of new technologies. We are hypothesizing that cyber security compliance is influenced by technology adoption, which is our primary hypothesis. This is ongoing research and at a very preliminary stage. The hypothesis will be validated through surveys and questionnaires in later stages, especially in the context of Saudi Arabia. Our future study is focused on the impact of technology usage for compliance compared to behavioral change for cyber security compliance. Technology can be used to enforce compliance with cyber security policies and measures. However, is this worthy to implement in organizations or organizations should focus on changing their employees' behavior to comply with cyber security policies and measures? This study is a preliminary study for future research. Although this study aims to prove this hypothesis, some literature references are stated here for preliminary proof for our hypothesis's accuracy. No previous research was explicitly found on this topic, i.e., using technology for cyber security compliance; therefore, we are focusing on literature as a preliminary study. In the next stage, it will be validated through surveys and questionnaires.

Performance Expectancy

It is the concept of explaining that technology is expected to benefit the users in performing their activities in various ways (Escobar-Rodriguez & Carvajal-Trujjillo, 2014). This construct explains that using technology benefits an individual's performance at his job doing (Ain, Kaur & Waheed, 2015). Sumak et al. (2010) stated that performance expectancy directly affects behavioral intentions. Engotoit, Kituyi, and Moya (2016) investigated the performance expectancy's influence on commercial farmers' intention to use mobile banking communication systems in Uganda. The research interviewed 302 farmers. The findings state that performance expectancy is positively correlated with the commercial farmers' behavioural intentions related to mobile-based technologies of communication in Uganda. This study from Uganda is included because of its relevance with Authentication which is a trait of cyber security.

Similarly, a study conducted by Marshall et al. (2008) in order to identify the effect of end-user training on the performance expectancy. The results reported that end-users' training about how to comply with the developed security policies has a positive relationship with the performance expectancy. In another study (Muller & Lind, 2020), relationship of PE is also proposed and validated with cyber security compliance.

Effort Expectancy

This construct indicates an individual's belief about the effort or ease associated with technology use (Venkatesh et al., 2003; Escobar-Rodriguez & Carvajal-Trujjillo, 2014). Several studies have been conducted to validate and testify this construct for a relationship with behavior, user intention, and compliance with the security. A result of the study conducted in the context of e-government state that there is a significant positive relationship between the effort expectancy and behavioral intentions of the users regarding e-government technologies (Vinodh & Mathew, 2012). Moreover, (Raman and Don, 2013; Muller & Lind, 2020) also found out that effort expectancy has a significantly positive effect on pre-school teachers' acceptance of learning management systems and security compliance.

Alexandra (2020) conducted non-experimental correlational research in order to investigate the UTAUT construct's effect on behavioral intentions to comply with the financial services' National Institute of Standards and Technology Cyber security Framework (NIST CSF), while targeting the participants from professionals of cyber security's financial services. The study's findings analyzed using multiple regression analysis using SPSS states that effort expectancy is a significant predictor (with p=0.03 significance level) of behavioral intention for compliance with the National Institute of Standards and Technology Cyber security Framework (NIST CSF).

Social Influence

This factor is associated with the perceived value of the particular technology by the significant others, including friends, family, and other influencers (Venkatesh et al., 2003; Escobar-Rodriguez & Carvajal-Trujjillo, 2014, Ain, Kaur & Waheed, 2015). (Yazdanmehr et al. 2020; Alexandra, 2020) undertook a study to determine the moderating role of social influence on information security policy compliance. The study results propel that social influence plays a vital role in weakening and strengthening an individual's compliance towards security policies.

Moreover, Kim and Kim (2017) tried to identify information security usage as compliance management. The data was collected from 975 participants of various Korean energy companies that deployed a compliance system. The study's findings postulated that social pressure is the most significant moderating factor for the participants' compliance behavior, which strongly affected information security adoption and utilization levels. Also, Al-Shafi et al. (2009) also reported that peers' beliefs influence employees' views regarding e-government services. Also, social influence affects the employees' intention and behavior to use the services of e-government. The Saudi government is aware of e-government benefits. It can get substantial advantages from the e-government implementation for cross institutions services and delivery of services to citizens and besides (Santa, MacDonald & Ferrer, 2019). However, the efforts for e-government in Saudi Arabia are not yet completely implemented, and the advantage is not yet taken entirely and still in the implementation stage (Al-Zahrani 2020; Santa, MacDonald, & Ferrer 2019).

The organizational environment includes colleagues' behaviour, cues for action, and the employee's experience with several other factors (Li et al., 2019). According to (Herath and Rao 2009; Li et al. 2019), they note that their colleagues' behaviour influences employees' behaviour in cyber security as internal or external motivators. In the organizational cyber security context, people usually tend to behave as their co-workers and friends (Herath and Rao 2009; Venkatesh et al. 2003). In (Li et al. 2019), the author's proposed cues to action is an antecedent to cyber security behaviour. Cyber security behaviour directly leads to cyber security compliance, and 'use behaviour' is a significant construct of the UTAUT2 model.

Similarly, (Avina et al. 2017; Vance et al. 2012) also state a direct relationship of social norms with cyber security compliance behaviour.

Facilitating Condition

Facilitating conditions refer to as the perceived resources and facilities to an individual to perform a particular behavior (Escobar-Rodriguez & Carvajal-Trujjillo, 2014). This aspect also involves the support of an individual from various resources (Venkatesh et al., 2003). Studies show that unavailability or lack of proper resources can hinder students' performance on web-based technology and compliance with security protocols by an organization's employees (Nanayakkara, 2007). Catherine, Geofrey, Moya, and Aballo (2017) researched the moderating effect of the UTAUT model's constructs with ATM users' behavioral intentions with fingerprint authentication at banks in Uganda. This was a cross-sectional field study wherein the data was collected from 211 participants of Uganda's ATM users for this quantitative kind of study. The data were analysed using correlation and regression analysis. The results reported that facilitating conditions are strong predictors of behavioral intentions to comply with Uganda banks' fingerprint authentication policies.

Hedonic Motivation

Hedonic motivation is explained as an intrinsic pleasure drive while adapting to technology (Venkatesh et al., 2003; Escobar-Rodriguez & Carvajal-Trujjillo, 2014). A number of research have reported that hedonic motivation is also known as intrinsic motivation, directly impacts the technology adoption of the employees or individuals (Thong et al., 2006; Van der Heijden, 2004). Moreover, Brown and Venkatesh (2005) also find out that hedonic motivation is a significant predictor of technology use and behavioral intention for compliance with security policies. Additionally, Yoo, Sanders, and Cerveny (2018) proposed a study to determine the influence of flow (which is a synonym of hedonic motivation) and psychological ownership on security education, training, awareness, and compliance intention the participants. To conduct this study, a survey methodology was chosen for data collection and the theoretical framework. The study results identified that intrinsic motivation or flow positively influences the employees' security compliance intention.

In their study (Cialdini and Goldstein 2004; Griskevicius and Cialdini 2010) stated that social influence affects the behaviour through another person's actions, and the compliance to the cyber security policies is affected by behaviour. The strong influence depends on the ability to induce compliance. Six psychological principles influence the behaviour and compliance professional is based upon. These principles are Consistency, Reciprocity, Liking, Social validation, Authority, and Scarcity. The reciprocity principle states that people are most obliged to pay back the same behaviour, favour, or service they have first received from the others. The consistency rule for compliance is that people are consistent with things that they have said previously. One is more willing for compliance to request which he/she has committed to a position.

The person may first ask for a small favor, which can be easily complied with. A large favour is then asked, which is generally complied with by those who have previously served the small request. The social validation rule for compliance is that people comply more with a request for the behaviour if other people are doing similar things and consistent with it. The authority rule for compliance state that people tends to comply the suggestions of persons who have more legitimate authority. Authority may be regarding a specific situation or more it may exercise general authority. The liking principle for compliance is that people generally comply with the request of those individuals whom they most like. Before asking for any favour or request, the target is engaged to like them. The liking can be increased by physical attractiveness, similarity, compliments, and cooperation. The scarcity rule for compliance is that one tries to get and secure the scarce opportunities. There are varieties of techniques that can convert the power of scarcity to compliance.

As a whole, the above principles cover social, organizational, cultural factors that influence cyber security compliance. When a person requests explicitly or implicitly another person and the individual changes his conduct and behaviour due to this request, this norm is considered compliance. Compliance is a functioning form of social impact because it is ordinarily caused intentionally by an individual. The changes in internal beliefs and feelings of people sometimes become the reason for compliance. These purposes these changes are primarily not the compliance or necessary to comply, but the compliance may happen because of change in internal beliefs (Cialdini and Goldstein 2004; Leandre R. Fabrigar and Meghan E. Norris 2012).

Price Value

This factor is directed towards the users' perception of the benefits of the application versus the monetary cost of its usage (Escobar-Rodriguez & Carvajal-Trujjillo, 2014). In simple words, it means that the user's positive perception regarding the benefits of technology primarily impacts the user's intention to bear the cost of a particular technology. This is a cost-benefit analysis by the user, which subsequently affects the user's usage intention regarding a technology (Venkatesh, 2012). Ramamurthy and Wen (2014) identified that reward is a beneficial technique to promote employee compliance behavior. They argued that deterrence or penalties are sometimes ineffective in preventing the non-compliance behavior of the employees. However, rewards have a substantial effect in the direction of the employees' positive intentions regarding compliance with security policies.

Habit

This construct relates to technology's automatic usage because of the habit (Venkatesh et al., 2003). It can also be conceptualised as the performance of an act based on an individual's prior experience. This is because, after extended use of technology, it becomes a habit that may be referred to as a well-learned action sequence that is stimulated based on some environmental cues and may be repeated involuntarily (Bandyopadhyay & Fraccastoro, 2007). Several prior studies have cited habit as an influential predictor of behavioral intention towards technology usage (Lim et al., 2007; Kim & Kim, 2017; Venkatesh et al., 2012).

Karlzen and Hallberg (2017) studied the relationship between the theory of planned behavior and information security compliance. The hypothesis was tested using 645 white-collar workers; the data were recruited using random sampling and analysed using correlation and regression analysis. The research results suggested that habit was one of the strongest predictors of information security policy compliance with a correlation of 0.28.

According to (Avina et al. 2017; Herath and Rao 2009; Vance et al. 2012), social norms and habits directly influence security compliance behaviour.

Behavioral Intention

Niehoff et, al. in their study of the role of organizational behaviour in information system success, they found that organizational citizenship behaviour (OCB) ultimately leads to the effectiveness of ISS and OCB can improve individual and organizational compliance with information security policies which leads to success in information systems operations (Yen et al. 2008). Similarly, gender, age, education, and years of work are essential for compliance with security policy (D'Arcy and Herath 2011; Herath and Rao 2009).

Another primary reference to this relationship between cyber security compliance and technology adoption is a report published by Sandia National Laboratories (Avina et al., 2017). In this report, the authors stated that security behaviours are adopted based on the user's values and conduct standards. Intrinsic motivation and work rewards are critical for motivating behaviour change. Messaging, communication, and incentives should be tailored to the individual style, values, and attitudes towards cyber security. The individual-level requires most behaviour change and resources to implement cyber technology compliance. Avina et al. emphasized the frequency of communication of perceived risks and rewards for cyber technology adoption. Tangible and intangible incentives play an imperative role in an individual's behaviour change for cyber security compliance. They have proved a direct relationship between security behaviour adoptions and personal values and communicating perceived risks. Moreover, in this study, most of the constructs are related to personal behaviour, and perceived risks are a significant construct of our proposed model (Avina et al., 2017). Similarly, security behaviour is the same as behaviour intention of the UTAUT2 model.

A study (Choi et al. 2018) concluded that employees' behaviour directly relates to effective ISS compliance. The institutionalization of cyber security policies in practice encourages employees to adopt policies that make their behaviour more compliant. In a paper, Austin et al. concluded that relevance to perceived value and legitimacy is defined as internal incentives to comply with information system security (ISS) requirements, positively affecting them.

In (Sohrabi Safa et al. 2016), the authors state that sharing information security knowledge, collaboration, intervention, and expertise significantly affects employee attitudes towards compliance with organizational information security policies. Additionally, the results showed that personal commitment and norms influence employee attitudes. Also, attitude towards compliance with information security policies of an organization strongly influences the behavioural intentions associated with compliance of information security requirements.

The above statements are enough to establish a preliminary relationship between cyber security compliance and technology adoption and to start a detailed study to analyse each aspect and construct compliance and adoption. This study focuses on proving this relationship and then developing a compliance-based framework for cyber security compliance.

In response to the studies mentioned above and literature, it is found that behavioral intention, social influence, performance, and effort expectancy have a significant influence on the adoption and acceptance of technology and compliance with cyber security in various contexts (see table 2.).

Table 2 - UTAUT2 Relationship with Cyber Security Compliance

UTAUT2 Construct	Relationship with Cyber Security Compliance	Reference
Performance Expectancy	Yes	Ain, Kaur & Waheed, 2015; Sumak et al., 2010; Engotoit, Kituyi & Moya, 2016; Marshall, Mills & Olsen, 2008; El-Gayar & Moran, 2006; Muller & Lind, 2020

Theoretical and Practical Contribution

The current study is a useful contribution to the literature as a theoretical and practical framework. Theoretically, this study demonstrates a very new kind of relationship between technology adoption and cyber security compliance, which will contribute to the development of compliance or security frameworks of an organization of public or private sectors or e-governments not only of Saudi Arabia but across the globe. The study's findings state that the factors that influence technology adoption have a similar effect on cyber security compliance. However, this paper is practically very beneficial for people in authority or administration to plan various factors of their organizations to make their employees more compliant with their deployed frameworks. Hence, this paper will help the organizations strategize the security compliance framework that will work effectively.

Limitations & Recommendations

The study's first and foremost limitation is that less data has been cited from Saudi Arabia because of a lack of research on this topic within the intended context. Special surveys for UTAUT2 constructs and some proposed new constructs that affect cyber security compliance are designed and the authors are working on them. Less data has been cited related to the habit and price value because researchers have ignored these constructs while conducting research. Another limitation can be the vast spectrum of this study; the study has not been done citing the literature from a specific culture or context. However, the study needs to be given attention to a specific culture or context, which will further give a detailed look to the factors affecting technology adoption and security compliance in a particular information security cultural setting which is another important factor to be considered for better understanding (Karlsson et al., 2016,).

In the literature review, different literature from other cultures like Uganda, Korea are cited. These are for literature review purposes. The future work in this domain by the researchers will be focused on Saudi Arabia but not on employees from specific organization. In addition to these limitations, further researches can adopt different adoption or cyber security models to compare and contrast the results.

Conclusion and Future Work

Cyber security has been one of the most critical factors affecting the efficacious deployment of a security framework. Simultaneously, technology adoption and factors affecting technology acceptance and security compliance are of even more significance. Researchers have reported that many security breaches have been observed because of their non-compliance and negligent behavior. Hence, the current study has described various factors that may be proved effective to lure the employees into complying with a particular organization's security policies. This study has explained the technology adoption utilising the UTAUT2 model and its influence on the employees' compliance intention and behavior. The study's findings identify all of the seven constructs that affect the employee or user's intention and behavior differently towards complying with cyber security. Therefore, the study has established a connection between technology adoption constructs and cyber security compliance.

This is ongoing research and at a very preliminary stage. The hypothesis will be validated with surveys and questionnaires, especially in the context of Saudi Arabia. Our future study will focus on the impact of technology use for compliance compared to behavioral change for cyber security compliance. Technology can be used to enforce compliance with cyber security policies and measures. However, is this worthy to implement in organizations or organizations should focus on changing their employees' behavior to comply with cyber security policies and measures? These answers will be coming in our upcoming publications.

Contribution of The University Educational and Scientific Ecosystem in The Formation of a Regional Innovation System

Yuri PREOBRAZHENSKIY

Saratov State University, Saratov, Russian Federation,
topofag@yandex.ru

Abstract

Currently, universities largely determine the effectiveness of the formation of a regional innovation system and become a significant driver of innovative growth. The university is increasingly acting as an integrator, on the basis of which new knowledge is created and commercialized. Such integration can be carried out by understanding the principles of interaction between different actors and the principles of manifestation of a synergistic effect in the course of it. The application of the ecosystem model makes it possible to build an integral, consistent description of the processes of co-development and mutual enrichment of knowledge between the participants in the system. The nature of the dissemination of knowledge and its importance for the manifestation of externalities that allow the use of knowledge by all participants in the ecosystem are discussed. The balance of the educational and scientific ecosystems in the regions of Russia is estimated. Further research is associated with an empirical analysis of the interaction between the participants in the educational and innovation processes, the search for practices of optimal interaction between them on the example of specific regions.

Keywords: University Ecosystem, Knowledge Spillover, Regional Innovation Ecosystem

Introduction

Innovation is becoming more open, involving more diverse groups of participants and contributors than ever before. This trend has determined that in recent decades there have been significant changes in the nature of the relationship between universities and the subjects of the regional innovation system (RIS). Along with the traditional functions: educational (training), research (generation of new areas of knowledge and generations of technology) and educational and professional (formation of productive interaction of graduates with the environment), new functions of universities have emerged, among which we will single out the integration and transfer of knowledge, entrepreneurship, creation new types of activity, businesses, innovation infrastructure. The contribution of the university to the balanced development of the regional innovation system is growing (Firsova et al., 2020).

As a result, the task of describing the most productive model of organizing the interaction of the university with other subjects of the RIS is urgent. In recent years, the ecosystem approach has been increasingly used to describe such a model, which marks a transition from a rigid mechanistic system with indicative goals to a softer interaction of various agents with more degrees of freedom that form knowledge, innovation, business ecosystems.

Previous Research

The definition of a non-natural ecosystem allows for various interpretations. Actually, their basic discrepancy is whether the ecosystem approach is a full-fledged methodological tool or just a metaphor for strengthening (emphasizing) certain properties of a certain conglomerate of actors.

The attractiveness of this metaphor lies primarily in its ability to describe organic interaction, co-evolution of participants and the collective creation of results at the system level (Adner, 2016; Autio & Thomas, 2014). J. Moore's original work on economic ecosystems (Moore, 1993) is distinguished by the use of the term “ecosystem” to a greater extent as a metaphor for describing the interaction of enterprises in the aspects of competition and cooperation. It will be possible to substantiate the heuristic value of describing non-natural (i.e. related to society and economy) ecosystems by showing their differences from other forms of organization (value chains, networks) in the way of management, the nature of the interaction between participants, the specifics of information flows (including number and knowledge).

Cite this Article as: Yuri PREOBRAZHENSKIY“ Contribution of The University Educational and Scientific Ecosystem in The Formation of a Regional Innovation System ” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

In our opinion, an ecosystem differs from a simple system by the additional capabilities that parts of the system provide to other actors. These opportunities, as a rule, are free of charge and often do not have a specific addressee. The activity of innovation systems is not limited only to contractual obligations between its participants (Jacobides et al., 2018). First of all, this concerns knowledge. The ecosystem principle here manifests itself in the joint creation of knowledge, its greater availability for all ecosystem participants, and the possibility of further transformation and use in comparison with mechanistic systems. We are talking about an analog of natural ecosystem services when the value is created not during the removal of resources from natural ecosystems, but only due to being in a particular landscape (for example, during recreation).

Thus, we can expect that positive externalities, such as, for example, the knowledge spillover, in innovation and knowledge ecosystems are manifested more significantly. The transition from a rigid structure of a mechanistic system to a flexible ecosystem dramatically increases the importance of social interaction, and not only and not so much for profit. The soft presetting of the conditions of the system allows its elements to relatively freely "cross" ideas, skills, developments to obtain a new product, which was impossible in the system of rigidly preset parameters. Various paradigms of knowledge and various forms of generation and application of knowledge in an ecosystem coexist, co-evolve (Carayannis & Campbell, 2009, p. 203).

As can be seen from the diagram (see Fig. 1), the university is an organic part of both the knowledge ecosystem and the innovation ecosystem, which, in turn, acts as part of the entrepreneurial ecosystem.

Fig. 1: The position of university ecosystems among regional ecosystems (compiled by the author)

Thus, the university forms, firstly, an educational, and secondly, a scientific and innovative ecosystem. The function of the first is to improve the quality of human capital, the function of the second is to stimulate the innovative development of the region. When both of these functions are performed in the region, a multiplier effect is observed, since an increase in the quality of human capital leads to an increased potential for the implementation of the innovative component of the region. At the same time, the more successful the innovative development is, the higher the quality of human capital. The more efficiently these functions are performed by universities, the more influence it has in the entrepreneurial ecosystem, attracting business projects and shaping the innovation agenda itself, i.e. offering businesses the opportunity to commercialize technologies created within the framework of RIS.

At the moment, in many Russian universities, the scientific and innovation ecosystem is in the stage of formation, while the educational ecosystem is formed to a greater extent. The study of the level of formation of the ecosystem of higher education should be carried out both at the local level (using the example of a specific university) and at the subnational level. In the latter case, the ratio of the educational and scientific, and innovative functions of the university will show its influence on the development of RIS.

Methods

The main research method in this work is a critical analysis of theories of non-natural ecosystems (including knowledge and education), as well as approaches to their identification and assessment of their functioning.

In the empirical part of the study, the main method is structural and analytical. The university's integration into RIS can be assessed based on the share of research revenues. We collected information on the amount of income of universities in Russian regions and calculated the share of income from research and development (R&D) in the total amount of income of universities in the constituent entities of the Russian Federation.

Results and Discussion

Analysis of the structure of funds received by type of income allowed us to distinguish four classes of regional systems of higher professional education, differing in the share of income from research and development (see table). In all regions, it is less than income from educational activities and can be considered secondary.

Table: Share of income from research and development in the total amount of income of universities by constituent entities of the Russian Federation

%	Russian regions
more than 20	Tomsk region, Perm region, Belgorod region
10-20	Republic of Tatarstan, Moscow, Nizhny Novgorod region, St. Petersburg, Samara region, Sakhalin region, Sverdlovsk region, Udmurt Republic, Tyumen region, Republic of Mordovia, Ryazan region, Novgorod region, Republic of Karelia, Rostov region, Ivanovo region, Yaroslavl region, Tambov region, Irkutsk region
5-10	Kursk Region, Jewish Autonomous Region, Novosibirsk Region, Voronezh Region, Republic of Dagestan, Volgograd Region, Tver Region, Krasnoyarsk Territory, Kostroma Region, Kabardino-Balkar Republic, Chelyabinsk Region, Republic of Bashkortostan, Vladimir Region, Primorsky Territory, Saratov Region, Moscow Region, Oryol region, Kemerovo region, Leningrad region, Arkhangelsk region, Stavropol region, Kaliningrad region, Tula region, Omsk region, Ulyanovsk region, Altai region, Penza region, Krasnodar region, Smolensk region, Chechen Republic, Pskov region, Khabarovsk region, Kurgan region, Trans-Baikal Territory, Republic of Buryatia
less than 5	Republic of Mari El, Astrakhan Region, Orenburg Region, Kaluga Region, Bryansk Region, Vologda Region, Republic of Ingushetia, Lipetsk Region, Komi Republic, Chuvash Republic, Republic of Kalmykia, Republic of Sakha (Yakutia), Magadan Region, Amur Region, Kamchatka Territory, g Sevastopol, Republic of Altai, Republic of North Ossetia - Alania, Kirov region, Republic of Adygea, Murmansk region, Republic of Khakassia, Republic of Karachay-Cherkessia, Republic of Tyva, Republic of Crimea, Chukotka Autonomous District

There are three regions with a relatively high share of such income (more than 20%) of the total income: Tomsk and Belgorod regions, Perm Territory. The largest number of regions in the group with a share of income from research and development from 5 to 10%. One can notice a certain relationship between the share of funds received from research and development and their value (see Fig.2).

Fig. 2: Dependence of the share of research and development in the flow of funds to regional universities on its value (excluding Moscow and St. Petersburg)

The diagram shown earlier (Fig. 1) demonstrates, first of all, some desirable state and composition of ecosystems. In fact, in order to become the center of ecosystems, an integrator on the basis of which the entire assembly of the regional ecosystem is carried out, the university needs to form the foundations and tools for interaction with other actors of the potential innovation or knowledge ecosystem.

One of these tools is a platform for communication and interaction between various actors. Such sites have different names, are organized in different ways, but they are united by one goal - the creation and transfer of knowledge. Foreign experience shows the high productivity of creating the so-called spaces (for example, makerspace), these are specially equipped sites for joint (offline) activities, primarily in the field of "working by hand" or at the computer. However, this practice can be transferred not only to technical areas but also to natural science or humanitarian. The difference from seminars here is, firstly, a wider circle of people taking part in such coworking, and secondly, focus on the implementation of the innovative potential of interaction and, possibly, the subsequent commercialization of the result of such activities.

To understand the processes of knowledge spillover within such platforms, the idea of hidden, internal, non-formalized knowledge possessed by researchers or practitioners is of great importance. This knowledge, not being codified (that is, translated into a form understandable to everyone), can be transmitted only through personal communication, tete-a-tete (Nonaka, 1994). Interaction platforms, innovative spaces are designed to “extract” this knowledge from its carriers, spreading it. The exchange of ideas and experience remains productive, even if it is not in demand, the process of interactive communication, intellectual interaction, and enrichment is in many ways more important, which will sooner or later lead to the creation of innovations. Note that platforms should not be taken too literally - they are just a space for communication, more a process than a place.

A prerequisite for the functioning of such sites is the attraction of students, which will allow them, firstly, to communicate with professionals, perceiving practical experience in various fields of knowledge and production, and secondly, it will stimulate actors to a more thorough and accessible description of their theoretical developments experience.

Such processes will lead to the strengthening of the "third mission" of the university as an intellectual center of the local community, a place for discussion and expertise (Fadeikina et al., 2018, p.60) and, in general, will correspond to the transition to a new paradigm of world development, which is based on the formation of a new one, based on universal the values of ecological thinking, characterized by interdependence, interconnection, coherence of its components (Makhnovets & Popova, 2017, p. 144).

Regions differ in the intensity of knowledge codification. This can be estimated by the share of publications in collaboration with scientists from other organizations and by the share of publications with foreign scientists (Preobrazhenskiy, 2019). RIS are characterized by varying degrees of external (international, global) openness. The role of the university is also great in disclosing access to scientific information during conferences, discussions, presentations, exhibitions, etc.

An assessment of the university's involvement in RIS can also be based on an analysis of the number of creation of economic societies or economic partnerships by budgetary (autonomous) scientific institutions, educational institutions of higher education.

Conclusion

The innovation and knowledge ecosystem, as an indispensable part of it, is thus transformed from a metaphor into a working model with heuristic and practical value. The university acquires a special role in this model as a central link in the interaction of scientific and business actors. At the same time, it is important for him to simultaneously be both the most open and integral system. It is the positive externalities in the dissemination of knowledge within the ecosystem and between ecosystems that make it possible to speak about the heuristic value of the ecosystem concept.

In the context of embedding the university in the regional innovation system, the transformation of the educational process is inevitable, which will be carried out largely "from below", i.e. based on the needs and objectives of the ecosystem. This will reduce the problem of inconsistency between the structure of personnel training and the needs of the regional labor market. Functionally, the transformation of education will be carried out in the direction of greater interactive interaction on special platforms, allowing the creation and exchange of knowledge between actors of various institutions (scientific, business, etc.), and the commercialization of knowledge.

We have identified the relatively small importance of the scientific and innovation ecosystem in the universities of the regions of Russia. Its development will enhance the role of knowledge flow both in RIS and in between them (Preobrazhenskiy, 2020).

Further research will be associated with an analysis of the links between individual universities and identifying the level of formation of the scientific and innovative ecosystem.

Abstract

Robots and Artificial Intelligence (AI) have been dramatized in many Hollywood movies, and people's perceptions of them have become stigmatized. Four categorizations of stigma have been suggested: robots and AI act by themselves against human interest, humans project 'evil' onto robots and AI, cultural identity is lost and robots and AI cause a loss of control for humans to shape their own future. With the Japanese government continuing to promote Society 5.0, this research examines whether Japan and Western countries are socially accepting of this concept, which seeks to integrate robot and AI technologies into everyday human life.

Keywords: Robots, Artificial Intelligence, Stigma, Society 5.0, Technology Management, Japan.

Introduction

The Japanese government introduced the concept of Society 5.0 in January 2016 as a means to address the growing likelihood of an overarching technological infrastructure that would support and surround all daily human life (Harayama, 2017). This technology would include activities centrally related to the Internet of Things (IoT), Artificial Intelligence (AI) and robotics (Fukuyama, 2018). While the typical understanding of robotics is usually that of hardware such as the Softbank robot Pepper (Softbank 2020), Robotic Process Automation (RPA) describes the automating of repetitive and predictable processes using digital robots also known as bots (Schatsky, et al., 2016).

Society 5.0 represents the culmination of continuous evolution of digital transformation which began with basic computer technology, through to the internet and now into the complex integration of both hardware and software systems. Today IoT, AI and robotics are gaining traction in areas such smart homes, healthcare, the automotive industry, gaming as well as retail customer service, restaurants and manufacturing (Vinay-Sagar and Kusuma, 2015; Nag and Mukhopadhyay, 2014).

Literature Review

While the potential for robot and AI technologies are not only wide but also scalable, 70% of digital transformation has failed to meet target projections (Tabrizi, et al. 2019). Tabrizi, et al. (2019) suggests that such failure is caused by a reliance on technological merits rather than on the foundation of sound strategy. James, et al. (2018) suggests that machines are incapable of empathy and as a result, jobs which need higher degrees of empathy are not replaceable. However, Coulton (2013) postulated that IoT and technology create an opportunity for heightened communication and delivery of empathy. Technologies such as Paro, the robotic seal while in itself does not have an AI capable of feeling empathy, is able to exhibit behavior which promotes empathy in patients suffering from dementia.

This research examines several aspects of attitudes associated with the social acceptance of robots. Cave, et al. (2019) identify four positive robot associated stigma. Firstly, promoting a society with a freedom from repetitive and distasteful work. Secondly, the creation of a perfect friend, one which is empathic, caring, loyal and able to meet our personal needs. Additionally, the creation of robots and AI which can improve medical capabilities leading to longer and more comfortable living. And, the strengthening of security and military power ensuring local and national safety. However, Van Doorn, et al. (2017) suggest that people experience four categories of fear as shown in figure 1.

Category 1	Category 2
Confronting the unknown, humans project "evil" on to our digital doppelgangers	Utilization of robots and AI across all aspects of life leads to the loss of the human cultural identity
Category 3	**Category 4**
Robots act by themselves against human interest	As robots and AI become more self autonomous, human society has less control

Figure 1: Categories of Associated Robot Related Stigma

Source: Adapted from Van Doorn, et al. (2017).

Category 1 relates to the way in which people may experience a sense of paranoia when interacting with robots and AI. Robots today have no true sentience, mainly falling within the Artificial Narrow Intelligence (ANI) category which describes AI as reactive with responses primarily limited by the specifications of its programming (Pohl, 2015). Mori, et al. (2012) suggest that humanlike robots promote a shift in human expression from empathy to revulsion. As the human likeness increases, the human's affinity towards the robot decreases.

Category 2 refers to the ways in which environment influences our own sense of identity. Casakin, et al. (2014) states that beliefs, emotions, attitudes and previous experiences influence the construction of perceived reality. However, as AI optimizes human activities through Society 5.0, humans will begin to interact with robots and AI on a regular daily basis. Cultural norm will likely shift to incorporate robots and AI (Combi, 2016).

Category 3 relates to a fear of robots which have autonomy and intelligence. Kwon, et al. (2016) suggest that many people tend to overestimate robot capabilities as they are swayed by the continuous upselling of the expressions "Artificial Intelligence" and "Digital Transformation." Additionally, the popularization through science fiction movies has led to misconceptions of them (Meinecke and Voss, 2018; Bentley, et al. 2018). Famous films such as 2001 Space Odyssey, The Terminator, and The Matrix each have plots where AI gain autonomy and instigate scenarios which lead to the detriment of humanity.

Category 4 identifies the potential effect of long-term automation and integration of AI into increasing areas of human life. Wani, et al. (2018) indicates that automation through robotics and AI has led to increasing feelings of work insecurity. Arguments have been made that support the concept that jobs will not be eliminated, instead these technologies will support and augment human workers to be more productive and work more easily (Manyika, et al. 2017). Pham, et al. (2018) however, determined that humans who work alongside robots tend to suffer physically and mentally from having to keep up with the pace at which robots work. Additionally, due in part to the optimization of work-flow, their study showed that low-middle skilled workers saw a decrease in work hours which translated to a decrease in earnings.

Another aspect relating to the sense of loss of control relates to the increasing complexity of technologies. Rainie and Anderson (2017) states that within the vast amounts of code, algorithms are relatively invisible. As a result, systems are becoming less transparent as most people are increasingly in the dark as to how the technologies work.

Research Methodology

This research aims to recategorize the Negative Attitudes toward Robots Scale (NARS) questionnaire into the framework adapted from Van Doorn, et al. (2017). Through literature, we compiled NARS questionnaire responses from Syrdal, et al. (2013) which surveyed 1000 Japanese people and 146 Western participants.

By doing so, we examined whether negative associated stigma towards robots and AI are felt by people today, and therefore whether people are currently socially accepting of the fundamental premise of Society 5.0.

Additionally, 5 types of robots were examined based on functionality and appearance. Paro-Seal, Pepper and Roomba were chosen due to their physical presence. Humans physically interact with the machines as they perform their intended functions. Watson and RPA were chosen as digital representations of robots. Humans interact with them through graphical user interfaces. While Paro-seal and Roomba have no speech capability, Pepper and Watson can communicate directly with users. Pepper is programmed for verbal speech in multiple languages and has a digital display to assist with communication. Watson also has multi-language capability and has a chatbot function where communication occurs primarily through text. RPA is the least communicative, it is a programmed AI driven automation system with higher focus on practicality than on communication. Identification of the types of robots examined in this study according to function and appearance are shown in figure 2.

Figure 2: Types of Robots Classified According to Function and Appearance.
Source: Adapted from: Nitto, et al. (2017)

We examined a selection of variables associated with good to great customer experience (Hwang, 2010; Deloitte, 2016; Lotz, et al. 2018) and compared with the robots' core functions to identify whether there is compatibility. These variables were: the ability to be persuasive, to exhibit empathy, to be adaptable, to have effective communication, and to accept failure, or show ownership of responsibilities. Based on this qualitative assessment, we tried to determine whether these types of robots would exhibit qualities that are valued in customer service interactions.

Findings & Discussion

The findings of our comparative study between the five robots and the variables of good to great customer experiences can be seen in figure 3. The findings suggest that current level of technology is unable to meet human perception of great customer service. Additionally, because the technologies do not have self-awareness, or human equivalent cognition or intelligence, they are unable to take responsibility for their actions. Adaptability is primarily based on whether the robots have been given a sufficient bank of responses. In Watson's case, the robot assigns a probability factor to each response option, and makes a choice based on best probability. Pepper and Watson have programmed functions to apologize when unable to complete a user task, but these apologies are not heartfelt. Each of the robots have elements of empathy. For example, Paro-Seal's primary functionality is to enable dementia patients to form a bond with it. To do so, it has been programmed to make crying sounds, and to look into the patients' faces.

	Persuasion	Empathy	Adaptability	Communication	Responsibility
Paro Seal	Ability to impact dementia patients in a positive way.	Designed to encourage nurturing behavior in dementia patients.		Cries out for attention. Responds to being hit, stroked or being held. Able to emit seal-like sounds.	
Pepper	Pepper can engage with humans using	Able to pick up non-verbal cues.	Pepper's face is static. Gestures are not as flexible as a human's.	The robot communicates through spoken language.	Programmed function to apologize when answers cannot be found.
Robotic Process Automation		AI observes human interaction and learns from the experience.	Can be applied to any software system. RPA mimics human actions.		
Watson	Watson has the ability to impact user behavior towards technology through repetitive interactions.	In built Tone-Analyzer Understand emotions and communication style in text.	Ability to direct customers to humans when unable to find answers. Probability based algorithms for choosing answers	Conversation AI platform providing fast and straightforward answers.	Programmed function to apologize when answers cannot be found.

Figure 3: Representation of Robot Functions Compared to Good to Great Customer Service Variables.
Source: Author's own conception

In Figure 4, we can see that people have concerns about a number of categories, some of which overlap into different categories of the negative associated stigma towards robots and AI. Interestingly in category 1, some of the fear seems to be arbitrary, but other concerns are related to the potential unknown impact of robots being around children or the potential risk that robots might cause accidents. Additionally, concerns exist relating to potential conflict with religion such as the concept of "playing god" (Gent, 2015). In category 2, people are concerned about the potential robots and AIs have for affecting human cultural identity. While these technologies may enable humans to work more productively and perhaps more easily as boring and repetitive work is taken over by machines, some people may feel that the situation may have an adverse effect on how humans develop. Dagdeviren, et al. (2016) suggest that humans learn through overcoming challenges or living through hardship. If robots are used to shortcut human difficulty, this may lead to a decrease in learning opportunity.

Category 1 Confronting the unknown, humans project "evil" on to our digital doppelgangers
If robots had emotions or independent thoughts. If robots cause accidents or trouble. Robots can be bad influences for children. Robots are scary but for no apparent reason. Robots are a blasphemy against nature. The technologies needed to develop robots are fields that humans should not advance too far in. The development of robots is blasphemous from a religious perspective.
Category 2 Utilization of robots and AI across all aspects of life leads to the loss of human cultural identity
Robots can create new forms of interactions between humans and machines. Utilization of robots may make humans lazier. Use of social robots in society changes the way in which people work. Less people need to struggle, but human culture has been influenced by the challenges we have faced. Less interaction between people, as robots take on more jobs such as education and healthcare. Human robots may make us forget what it is like to be human. The development of robots is a blasphemy against nature. Interaction with robots could lead to problems in relationships between people. Organizations that produce robots, or regulate them might not think about the thoughts and feelings of the users. The public might not be aware of how human cultural identity is being lost until it's too late.

Figure 4: Determination of Negative Associated Stigma toward Robots and AI
Adapted from: Syrdal, et al. (2013); Billing, et al. (2019); Van Doorn (2017).

In figure 5, category 3, some concerns are raised regarding the ways in which robots and AI may make judgements which affect human lives. One example may be the autonomous vehicle and the trolly-dilemma which relates to the actively killing of one or more persons to save other persons. Wiseman and Grinberg (2017) suggest that car makers may want to convince potential customers that vehicles are safe, which would suggest that the AI should give priority to car occupants. In category 4, concerns are raised regarding the high costs for maintaining robots. In addition, the risks relating to dependency on technology are a source of worry. Ongoing questions of whether robots and AI will take away jobs are also represented.

Category 3 Robots act by themselves against human interest
If robots and artificial intelligences make judgements about things. If robots develop into human beings by becoming self aware, having emotions such as prejudice and bias, gaining rights. If information is not transparent, robot actions may go unchecked. Organizations may allow robot actions to go against human interest. Interaction with robots could lead to problems in relationships between people.
Category 4 As robots and AI become more self autonomous, human society has less control
Widespread use of robots lead to high maintenance costs for them. Robots may have bad influences on children. Robots have the ability to make judgements about things, automation will take away control from human society. Depending on robots too much could lead to disaster, if the technology is suddenly unusable. Widespread use of robots will take away jobs from people. Robots will take the boring, dirty and dangerous jobs, takes control away from people who rely on those types of jobs. Robots which may gain rights in the future, may take away control or rights from humans. Society will be dominated by robots. As robots become more complex, humans must advance further into potentially more dangerous fields of technology. Organizations that produce robots might not be trustworthy and transparent. Interacting with robots could lead to problems in relations between people. Humanoid robots will encourage less interaction between humans.

Figure 5: Determination of Negative Associated Stigma toward Robots and AI
Adapted from: Syrdal, et al. (2013); Billing, et al. (2019); Van Doorn (2017).

Conclusions

In this article, we examined whether societies are ready for the acceptance of robots and Artificial Intelligence as promoted by concepts such as Society 5.0. We identified types of robots already visible and affecting human lives and their functions compared to human perceptions of good customer service. The results of this research suggest that while robots and Artificial Intelligence are being promoted by governments such as in Japan, there is still a lot of concern and fear associated with robots and AI. Some of the fears seem arbitrary perhaps stemming from negative associated stigma from media as well as unanswered questions regarding job loss.

Limitations of this study include the limited scope of variables covered, for example our research does not elaborate on the frequency of issues raised by respondents to the original study. For example, according to the Syrdal, et al. (2013) NARS study, the frequency of respondents raising concern about robots having emotions and independent thoughts were higher than fears of robots causing accidents. Nonetheless, our research does not go into detail on this. Future research could be carried out to investigate how the frequency of respondents' concerns will affect people's perception of Society 5.0.

Investments in Russian Art as a Protective Market Asset

Anton F. TIKHOMIROV

Abstract

The paper considers the recent investment trend established on the art market. This trend is related to development of shared ownership for works of art. The emergence of the trend is determined by a significant rise of prices for works of art, on the one hand, and involvement of numerous small investors, who are ready to invest into a broad range of assets, on the other hand. However, it causes the problem of reducing investment risks related to a poorly chosen art object. This problem can be solved by implementing the shared ownership model in the form of an investment mutual fund. In Russia it is defined as a closed-end fund (CEF), whose assets replicate one of the art indices. On the example of the Russian market the authors show that tools of the investment funds established on the basis of Russian art indices can be used as a protective asset for the equity portfolio that models the Russian stock index MOEX10. The effect of deep diversification is achieved due to a strong negative correlation between the MOEX10 index and the Russian art index ARTIMX-Rus.

Keywords: Financial Market; Mutual Fund; Portfolio Optimization, Protective Asset.

Introduction

The uncertain macroeconomic situation causes considerable fluctuations of stock prices on the financial markets (*Baker,et al., 2016*). The price fluctuation of investment objects is the main risk factor for investors (*Kudryavtseva, et al.,2019),* whereas the main method to reduce this risk is diversification of an investment portfolio *(Sharpe, 2010)*. The essence of the effective diversification is to buy the portfolio of the assets, the reduced price of which can be compensated by the increase in the price of other assets.

The opportunities to use conventional market assets (stocks, bonds, exchange commodities, foreign currency) for diversification of investment portfolios are well studied by markets. However, resulting from the wide spread of securitization processes, new financial tools have recently emerged on the market. The value of these tools is related to the value of unique objects, e.g. real estate or cultural heritage. Are these tools challenging for investors?

The purpose of the present work is to unlock the investment potential of financial tools based on prices of works of Russian art exemplified by the Russian financial market.

Specifics of Art Investment

Today a lot of long-term investors are trying to diversify their investment portfolios by putting up for a variety of asset types. One of the most popular and fast-growing alternative types of investment are works of art, in particular – painting. According to the art market research by the Artnet platform, the price of art has risen more than 100% within the recent 30 years *(The Art Market 2020)*. As more and more people become aware of profitability of this investment sector, the art market has boosted.

The global experience is based on two main methods of investing into the art market: direct and indirect. The direct method of investment implies direct purchase of works of art via auction houses, art fairs, galleries and art dealers. The vast majority of high-value deals in this sector are made by major galleries and auction houses *(Woodham, 2017)*. Currently, this is a dominant technique of investment into artworks.

To possess world masterpieces is a pipe dream for numerous art-lovers, as the price of most works of art exceeds a million dollars. The price factor is an obstacle for most art investors. Therefore, the type of the direct method which has recently gained popularity is the one related to the model of shared ownership of art. This model has become widespread for the last two years, due to the rapid development of blockchain technology *(Greenhill, 2020;*

Arutunyan, Kudryavtseva,et al.,2018) and readiness of investors to put up for a wide range of assets, from real estate to intellectual property and art.
However, although blockchain technology increases security of possessing a work of art, it does not relieve an investor of the risk connected with the volatile price of a specific object *(Arutunyan, M., Skhvediani, et al.,2018).* Volatility of stock prices, in particular, increases with the rising ratio of intangible assets on the company's balance sheet. This bears an additional risk of a considerable fall in the company's market capitalization caused by a change of the factors that form these intangible assets *(Tikhomirov, Komshilova, 2019).* For instance, such a factor for artistic treasures can be fashion for certain artistic trends.

About 85% of online art-platforms enable offering the shared ownership to their customers. According to Hiscox Art Online Report 2019 *(Hiscox, 2019),* there is a significant priority gap from generation to generation. For instance, approximately 48% of young buyers under 35 consider the shared ownership of art as an investment form, whereas the percentage of such buyers over 50 is only 29%.

Nevertheless, there are new methods of indirect investment via different types of deals, i.e. securities and investment funds. Primarily, we can note investments into art-stocks of companies, the revenue of which is generated by offering goods and services related to art market. For instance, they are sale of art objects, consulting services or providing information about valuation of artworks. It can be exemplified by Sotheby's *(The History of Sotheby's, 2010; Sothebys Stock Price, 2020),* Artnet AG *(Artnet AG, 2020)* stocks etc.

Unlike the first method, the second one is based on buying art-stocks, created as a result of securitization of assets, i.e. works of art. This method of indirect investment into art objects is ensured by several companies. These are such online platforms as Masterworks *(Masterworks, 2020; Masterworks Review, 2020)*, Maecenas *(The Art Investment Platform, 2020)*, Feral Horses (*Own shares of museum-worthy artworks, 2020)*, OMNIA Global company *(Is fine art the safest, 2020)*, which deals with securitization using bonds *(The Omnia bond, 2020).* Most of these platforms capitalize on blockchain technology in recording securities ownership.

The shared ownership model is also implemented in investments into mutual funds specialized in purchasing works of art. Frequently, world's most experienced art experts work for such companies. Investors, who are not professionals in art, can rely on advice from these funds.

However, in this situation investment requires securitization of art objects and turning them into art assets of the financial market. For an investor, securitized art assets represent a formalized financial tool, which can describe the situation on the market with common indicators, such as profitability, volatility, liquidity, time lags etc. Due to this, the most convenient investment tools are Mutual Funds, or their Russian equivalent - Closed-End Funds (CEF) *(Zhdanova, O. (2015).* Firstly, these funds have more significant financial resources than individual investors, which gives an opportunity to create more complete (or vice versa, more diversified) collections. In addition, the funds have the financial potential to invite qualified consultants for selecting more quality and promising assets. Unlike individual investments, the funds ensure economizing on custody and insurance of assets due to its large-scale effect.

Art Indices

For the successful operation of the market of financial art assets it is required to have a generalized market indicator, e.g. similar to S&P500 index for the stock market, and also preferably to have sectoral indicators. These indicators are essential for investors to collect information about the current state of their investments, and also to make strategic decisions when building portfolios. At present there are a lot of price and non-price indices that reflect dynamics of the art market as a whole, and its separate segments, in particular. The best-known art market indices are the following:

- Mei Moses repeat-sales index (WAAI – Mei Moses World All Art Index);
- BASI – Blouin Art Sales Index;
- C50 – Contemporary Art Index 50, developed by Artnet company;
- AMC – Art Market Confidence, developed by Artprice company;
- ST 5 000 index (Skate's Top 5 000) presents the database of the world's 5,000 most valuable artworks.

Calculation methods for each index is unique, though they are based on either statistical processing of repeat sales, or changes in capitalization of auction art market, or their combination. Obviously, the most famous art index is WAAI - World All Art Index *(Mei, Moses,. 2002).*

Financial market and artwork market: are they related?

The art market is evolving at a frenetic pace, and today its capitalization is comparable with a number of other economic areas. Is there any interrelation between the art market and the price movement of financial assets? Is it possible to use the works of art as an investment tool when building portfolios?

Studies on the interaction of the artwork market with the financial market provide controversial results. Some researchers point out that returns on investments into works of art, calculated with the use of an offered index, exceed returns on USA bonds and S&P 500 index *(Goetzman, 1993),* whereas the work *(Pesando,1993)* obtains the opposite results. The authors *(Renneboog, Houtte, (2002)* draw a conclusion that investment into art is worse than on the stock market. The study *(Mei, Moses, 2002)* presents the intermediate result: WAAI index yield is higher than the bond yield, but lower than the yield of S&P 500 and DJIA stock indices. However, most research papers highlight lower volatility of artwork market indices compared to the stock market. A specific feature of the artwork market is noted in *(Mei, Moses,(2002)* and *(Pesando,1993)*: profitability of most valuable artworks remains lower than the average in the market, which makes investments into masterpieces less profitable than investments into the middle or lower-end market segments.

Several research publications *(Goetzman, 1993), (Mikhlin, 2014), (Renneboog, Spaenjers, 2013).* reveal a positive correlation between the artwork market and the stock market. The art market and the non-ferrous metal market also show a positive correlation *(Mikhlin, 2014).* However, according to the well-known study *(Mei, Moses,2002)*, the obtained value for the coefficient of the correlation between the yield of S&P500 and DJIA and WAAI indices at the rate of 0.04 and 0.03 respectively proves the fact of no correlation between the above-stated indices. In addition, the authors *(Ginsburgh, Jeanfils,1995).* conclude that there is no correlation even between the markets.

From our standpoint, such a discrepancy in the market research results can be caused by the fact that the survey samples, the researchers used, refer to different time periods, countries, and rely on works of different schools, authors, lines of research.

Russian art as an Investment Object

The Russian art market reflects the situation, common for the national market, when, primarily, Russian works of art are traded. They are works of artists, who were born, lived and worked in the territory of the Russian Empire, USSR, and Russian Federation.

Table 1. Indicators of the auction market of Russian art (Visual art, IZO) from 2010 to 2019 (The market of Russian art,2020)

Indicator / year	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
Sales at internal auctions, mln USD	6.6	14.5	21.1	21.4	12.9	4.6	7.1	8.9	7.2	10.1
Ratio of sold items at internal auctions, %	49	37	31	35	41	35	44	38	47	54
Sales of Russian art at international auctions, mln USD	523	462	550	525	667	575	292	469	525	411

Ratio of sold Russian art items at international auctions, %	54	49	49	52	49	48	52	47	52	56

Since the middle of July 2014, the purchasing activity in the segment of Russian art has shown a significant growth *(Sothebys Stock Price,2020)* which is explained by the economic situation, i.e. a reduction in oil prices on the global market and ruble depreciation. In such a situation investors diversified their funds into works of art, in particular, in the segment of Russian art.

When it comes to cost features of the Russian art market, the portal ARTinvestment.ru *(The market of Russian art,2020)* provides data stating that the total sales only in the Russian internal auction market amounted to 10.1 mln USD in 2019 (table 1). Compared to the data 2018, it experienced an upturn. However, in comparison with the pre-recession indicator 2013 (21.4 mln USD), the market failed to recover after the decline in 2014, related to the economic slowdown in the country.

Nevertheless, in art market experts' opinion, today the world's art market has not lost interest in Russian art. On the global auction art market the sales of Russian artworks amount to 411 mln USD, which is close to the average for the previous decade (table 1).

Let us consider the ranking of the most expensive works of Russian artists, which were sold at Russian auctions in 2019 (Table 2). Generally, the canvasses of Russian artists occupy the medium-price niche, hereby they do not bear the risk of inefficiency, which happens when investing into masterpieces, which was described in *(Mei, Moses,2002)*. Apart from this, the price of Russian artworks has the great potential for growth, which is confirmed by the list of the most expensive items of Russian artists, sold at international auctions in 2019 (Table 3). Thus, the works of Russian art have become attractive for a wide range of investors.

Table 2: Top-5 most expensive paintings of Russian artists at Russian auctions
(The market of Russian art,2020)

Ranking	Artist, painting	Price, USD
1	Harlamoff A.A.,«Girl with a fan»	448,000
2	Serov V.A.,«After the Kulikov battle»	290,625
3	Aivazovsky I.K., «The Caucasian range from the sea»	186,000
4	Goncharova N.S., «A room in the Goncharovs' Manor Linen Factory»	168,300
5	Chagall M.Z., «Bell tower in Chambon-sur-Lac»	157,000

Table 3: Top-5 most expensive paintings of Russian artists at global auctions
(The market of Russian art,2020)

Ranking	Artist, painting	Price, USD
1	Rothko, Mark, Untitled	50,095 248
2	Staël, Nicolas de, «Parc des Princes»	22,248 000
3	Lempicka, Tamara, «The Pink Tunic»	13,362 500
4	Petrov-Vodkin, K.S., «Still life with lilac»	11,760 107
5	Soutine Ch.S., «Woman in red»	19,970 600

Currently, alternative investments into art are becoming one of the most popular ways of capital growth and preservation. Investment into works of art requires understanding of its features, as they are absolutely different from conventional investment tools.

On the Russian art market the role of indicators is played by art price indices of the ARTIMX-Rus family (*Kudryavtseva, et al.,2019).* Art index is a tool which is used to analyze the artwork market. This implies monitoring the dynamics of purchasing activity for different market segments, changes of average prices in the segment of painting and graphics. Primarily, investors focus on price indices that allow evaluating profitability, volatility, investment risk for an asset. In Russia this information is obtained by using the following indices:

ARTIMX-Rus (general), ARTIMX-Rus (painting) and ARTIMX-Rus graphic art *(ARTIMX Art Market Indices, 2020),* which are based on the data of auction sales in the segment of visual arts (Fig.1).

Russian experience of collective investment in works of art

Russia has limited and, unfortunately, not very successful experience in the functioning of mutual investment funds based on Russian works of art *(Zhdanova, 2015).* In total, since 2010, 9 mutual funds of art treasures have been registered. Of these, the investment units of two funds (CEF "Atlanta Art", CEF "Telefond") could circulate at organized auctions.

The most successful of these was CEF "Atlanta Art", which worked under the management of Management Company "Atlanta" *(News. Management Company Atlanta,2020).* The property of the fund was the "Italian Album" by Karl Bryullov - a collection of thirty-three studies and sketches, created in 1828 - 1832. The basis for evaluation - a complete collection of museum quality, which is ready to be exhibited by leading Russian museums. During the period of placement at the Moscow Exchange, "Atlanta Art" demonstrated the following dynamics of the unit cost (Figure 2, curve 1).

Fig.1: Price indices of Russian art ARTIMX art *(ARTIMX Art Market Indices, 2020):*
1 – ARTIMX-Rus; 2 – ARTIMX-Rus painting; 3 – ARTIMX-Rus graphic art

Figure 2: Asset value chart:
1 - Unit of CEF "Atlanta Art", par value 500 000 rubles *("Atlanta" Management company,2020);*
2 - Investments in stock index MOEX10;
3 – Portfolio: CEF "Atlanta Art" (50%) + stock index MICEX10 (50%).

The maximum value of a unit of par value of 500, 000 rubles was reached on April 28, 2012 and amounted to 917, 011.40 rubles. However, the chart also shows a decline in the value of the unit from May 31, 2016 with a mark of

the value on that day at 651, 180.35 rubles. The value of the unit of CEF "Atlanta Art" before the closing of the fund was equal to 479, 734.42 rubles. Such a drop in the unit value resulted in the MC's decision to liquidate the fund. Thus, MC "Atlanta" was the first to form the closed-end mutual fund of Russian art treasures "Atlanta Art", thus creating a new segment of the investment market in Russia *(Zhdanova, 2015).*

We believe that the decision to close the "Atlanta Art" fund due to only a drop in the value of the unit was a mistake, as was the very concept of investment in art, based on the expectation of only continuous growth in the value of assets. It will be shown below that works of art used as financial assets are also of interest to investors from a different perspective.

Analysis of financial indicators of the Russian art market

Despite the unsuccessful launch of the first Russian CEFs based on works of Russian art, in our opinion, these assets have great potential in the financial market. But this potential can be identified if we consider them not separately, but as one of the components of investment portfolios that are formed on a broad financial market. Let us consider some indicators characterizing works of Russian art as a market asset. As a price parameter, let us choose art indices of the ARTIMX-Rus family.

Dynamics of asset prices

Fig.1 shows a chart of dependencies of value of the ARTIMX-Rus family indices on the time horizon of 2001-2020 in relative terms (the initial value of the indices is accepted to be 100 in early 2001). We also calculated the average values of the indices' values, the values of the square deviation (usually denoted as SD), and the coefficients of variation CV for the time period considered. The data are presented in Table 4.

Table 4: Indicators of changes in the value of assets for the period of 2001-2020.
(ARTIMX Art Market Indices, 2020; Moscow Exchange indices,2020)

Asset	Average price value	SD_i	CV_i,%	R_{efi},% annual.
ARTIMX-Rus	122.90	40.95	33.32	-0.95
ARTIMX-Rus -painting	120.65	35.90	29.75	2.17
ARTIMX-Rus – graphic art	163.70	74.77	45.67	-1.01
RTSI	1096.20	564.00	51.50	21.52
MOEX10 INDEX	2848.20	1552.95	54.52	26.79
S&P500	1658.74	628.1	37.90	5.18
Gold (USD/ozt)	899.31	450.49	50.10	10.60
Brent Crude oil (USD/bbl)	60.50	29.19	48.24	7.97

For comparison, the same Table 3 presents similar indicators for the most popular financial assets among investors - Russian (MOEX10 and RTSI) and American (S&P500) stock indices, as well as gold and oil contracts. The table shows that the price dispersion of the art market assets, characterized by SD and CV indicators, is lower than that of stocks and commodity contracts. It is also known that SD and CV indicators are used by investors to assess the risk of their investments. Therefore, investments in works of art are less risky than those in traditional assets.

Table 4 also calculates the indicators of average effective yield of these assets R_{ef}, expressed in percent per annum. The table shows that the yield of art indices is significantly inferior to that of traditional assets.

However, investments in one single asset in the financial market are rare. The main operations of investors are portfolio investments made on the basis of diversification. Diversification of an investment portfolio implies inclusion of a large number of assets, each of which has its own unique set of profitability and risk indicators. The share of each asset is determined by investors themselves according to the required indicators of profitability and risk of the portfolio as a whole.

Diversification of an investment portfolio in order to reduce its risk is based on certain rules. One of them states that the most effective way of diversification is to include assets in the investment portfolio with as negative values of correlation coefficients of price changes over time as possible *(Sharpe,et al., 1998,Ch. 8).* In this case, risk indicator of the portfolio SD_p will be minimized.

Indeed, the square deviation of the value of asset portfolio σ_p is related to the values of the assets' SD by ratio:

$$\mathrm{SDp} = \sqrt{[\sum_{i=1}^{n}\sum_{j=1}^{n} SD_i\, \mathrm{SD}_j \rho_{ij}]} \quad (1)$$

where: - n is the total number of assets combined in the portfolio;
- $SD_{i,j}$ is the square deviation of cost for the i, j-th assets;
- ρ_{ij} is the pair correlation coefficient for the i-th and j-th assets; $-1 \leq \rho_{ij} \leq +1$.

In particular, for a portfolio containing two assets, 1 and 2,

$$\mathrm{SD_P} = \sqrt{\mathrm{SD}_1^2 + \mathrm{SD}_2^2 + 2\mathrm{SD}_1\mathrm{SD}_2\rho_{12}} \quad (2)$$

From the simplest example described by formula (2), it is clearly seen that the more negative the correlation coefficient $\rho_{1,2}$, is, the lower the value of square deviation SD_p **,** i.e. the risk of the portfolio as a whole.

Analysis of asset price correlation.

Let us determine how closely the changes in the prices of the assets presented in Table 3 are related. In order to do this, we have calculated the pair correlation coefficients for the period of 2001-2020, which are shown in Table 5.

Table 5: Values of coefficients of asset pair correlation

Asset	ARTIMX-Rus	ARTIMX-Rus -painting	ARTIMX-Rus – graphic art	RTSI Close	MICEX 10	S&P500	Gold	Brent
ARTIMX-Rus	1							
ARTIMX-Rus - painting	0.973	1						
ARTIMX-Rus – graphic art	0.871	0.784	1					
RTSI	0.399	0.437	0.208	1				
MOEX10 INDEX	**-0.212**	**-0.151**	**-0.345**	0.678	1			
S&P500	**-0.597**	**-0.532**	**-0.642**	0.197	0.762	1		
Gold	0.258	0.249	0.178	0.567	0.809	0.461	1	
Brent Crude oil	0.562	0.549	0.394	0.786	0.485	0.003	0.807	1

It follows from Table 5 that the coefficients of pair correlation between the art indices of Russian art and traditional market assets are in a wide range of values. The most interesting paired assets from the perspective of investment portfolio diversification, as will be shown below, are stocks from the US S&P500 index and the Russian stocks included in the MOEX10 index, as well as gold contracts.

Thus, characterizing the works of Russian art as assets of the financial market over a long (20 years) time horizon, the following conclusions should be drawn:

1. Their return is inferior to that of traditional assets.
2. The risk of price change is significantly lower than that of traditional financial assets.
3. The prices of financial assets - works of Russian art with such assets as Russian and US stocks have negative correlation coefficients.

Works of Russian art as a protective asset of a stock portfolio

The noticeable negative correlation of the value of Russian art objects with the indices of the stock market (Table 5) allows using them as the so-called "protective assets" when building stock portfolios.

Protective assets are assets with zero or reverse dependence on changes in the financial market. These are financial market tools that react minimally to fluctuations in, for example, stock prices. And some, the most valuable in terms of portfolio value protection, even become more expensive when market indices go down due to negative correlation with other assets of the portfolio. As a rule, their return is small, but their value to the investor consists in stabilization of the portfolio value (return). Their purpose is to hedge portfolio risks, creating a "safe haven" situation at a time when quotes of other components of the portfolio sharply fall.

The works of Russian art studied in this work, if positioned on the financial market, are ideal protective assets for stock portfolios. In this connection, it is possible to use such an asset as a component of a stock portfolio in which it will act as a protective asset. The weight of the component should be defined by investors themselves according to the planned level of profitability and risk.

Let us consider the possibilities of using the protective asset offered by us on a specific example. In section 4, the history of functioning of the Russian CEF "Atlanta Art", whose assets were formed from little-known works of the famous Russian master of the XIX century, Karl Bryullov, is considered. During the period of its existence, the CEF demonstrated both periods of strong growth of the unit's value and periods of its fall. The fund was liquidated when the value of a unit dropped below the nominal value of 500 000 rubles (fig.1, curve 1). The effective return on investment in the fund for the entire period was R_{ef} =-0.67% per annum at the time of its liquidation.
Fig.1 also shows the chart of the Moscow Exchange index MICEX 10 (curve 2). The effective return on investment in the index over the period of its existence was R_{ef} =4.60% per annum. The coefficient of correlation of a unit and stock index value ρ = -0.758. Thus, there is a strong negative correlation between the values of a unit of the CEF and investments in the index, which would allow forming a well-diversified portfolio with a minimum set of assets.

Curve 3 in Fig.1 represents the value of such a virtual portfolio, consisting 50% of investments in MICEX 10 and 50% - in CEF "Atlanta Art". The effective return of the portfolio for the period was 2.12% per annum. However, the volatility of the portfolio value, estimated by coefficient of variation CV, turned out to be significantly lower than that of its components (Table 5).

Table 5: Indicators of changes in the value and effective return on assets over the period of existence of the CEF

Asset	Average cost value	SD	CV, %	R_{ef},%
Unit of CEF “Atlanta Art”	1.443	0.303	21.0	-0.67
MOEX10 INDEX	0.966	0.130	0.135	4.60
Portfolio 50% CEF+50%MICEX10	1.204	0.111	0.092	2.12
Portfolio 10% CEF+90%MICEX10	1.013	0.096	0.095	4.12

Fig.1 and Table 5 show that combination of assets into a portfolio reduces both risk (SD and CV) and return on investment. By varying the share of assets in the portfolio, an investor is able to achieve the required return/risk ratio. For example, a portfolio consisting 90% of index assets and 10% of units of a CEF shows a higher effective return with a slight increase in risk (bottom row in Table 5).

In our opinion, a protective asset based on works of Russian art is advisable for long-term investment portfolios, the main requirement for which is to preserve their value. However, for effective use of an asset - works of Russian art - on the stock market, it is necessary to transform it into an acceptable market instrument - stocks, i.e. to securitize it.

Conclusions

In recent years, investment in art has been trending towards following the shared ownership model, where an investor without being an art enthusiast seeks to achieve the required return/risk ratio for their investment portfolio. However, there is a problem of reducing the risk of investment related to a poorly chosen art object. As shown in

the paper, this problem can be solved by implementing the model of shared ownership in the form of an investment fund, in Russia - a CEF, whose assets replicate one of the art indices.

The peculiarity of the dynamics of the Russian art price indices is their high negative correlation with the stock market indices and low volatility. This makes it possible to use stocks of a CEF primarily as a protective asset within investment portfolios.

Abstract

This study examines the relationship between the Hofstede cultural values of long-term-short-term orientation, indulgence-restraint, and risk aversion in 53 developed and developing countries. To test our two hypotheses, we controlled for the country's per capita income, and religiosity. Using multiple linear regression analysis and secondary data from Hofstede's Cultural Study in 2010, Relative Risk Aversion Around the World, the Country-level Religiosity Index, and the World Bank Group; the results suggest that indulgence has a positive and significant impact on the country's risk aversion but the long-term orientation has a positive and non-significant impact on the country's risk aversion. This study confirms that cultural values matter when it comes to risk aversion across countries. The study also shows that not only do the cultural values of individualism and uncertainty avoidance influence risk aversion in countries but also indulgence-restraint.

Keywords: Risk Aversion, Risk Attitude, Risk Preference, Risk-Taking.

Introduction

Cultural values indeed cause considerable differences in risk-averse and risk-taking in societies (Rieger, Wang, and Hens, 2011). Risk aversion is critical in multinational business, behavioral economics, entrepreneurship, life insurance, financial institutions, banking, consumer behavior, and unemployment (Gandelman and Hernández-Murillo, 2015). Risk aversion has a significant impact on the country's economy and entrepreneurial investments (Guiso, 2012). Therefore, it is worthwhile for researchers to examine many factors that could influence risk preference at the individual, firm, and country level. Managers and other policymakers make decisions in several areas that affect businesses in organizations and economies in countries. These decisions might be influenced in one way or another by business and policy decision-makers level of risk preference. The micro-level decisions made by policymakers, business managers, and executives could influence a country's development outcome and economic growth (Gandelman, and Hernández-Murillo, 2015).

There are few studies on cultural values and their impact on risk-taking (i. e., willingly making risky decisions or taking some actions that may have unwanted results), risk aversion (i. e., avoid taking a few risks to minimize uncertainty and get around failure), and risk acceptance at the firm and individual levels. However, the majority of the studies on risk, aversion has focused on the cultural values of masculinity (MAS), individualism (IND), uncertainty avoidance (UA), power distance (PD), indulgence-restraint (ING), long-term/short-term orientation (LTO), and gender (i.e., male/female). Previous studies have used various proxies as a measure of risk aversion such as the Z-score, Hofstede uncertainty avoidance, self-assessed risk attitudes, the Pratt-Arrow measure of absolute risk aversion, and other proxies. For example, Kanagaretnam, Lim, and Lobo (2014) found that banks in high uncertainty and low individualism cultures are more risk-averse than banks in low uncertainty avoidance and high individualism. This study tries to cover the gap by empirically examines the relationship between the Hofstede cultural values of long-term-short-term orientation (LTO), indulgence-restraint (ING) and risk aversion at the country level in 53 developed and developing countries using the coefficient of relative risk aversion as a proxy for risk aversion.

Litreature Review and Hypotheses Development

Risk Aversion

Risk aversion as a concept in business has been defined by many researchers. In this study risk aversion is defined as a person's preference of a riskless outcome by avoiding making risky decisions (Mandrik and Bao, 2005). Hence, individuals who are risk-averse have the tendency to seek guaranteed outcomes and avoid ambiguity.

Risk aversion is an essential factor in everyone's life decisions including investors, economists, and policymakers for financial and economic development decisions that might influence many people's lives. Risk aversion is viewed as a cultural trait at the country level because people with shared culture are more likely to cluster inside one country (Lehnert, Frijns, Gilbert, and Tourani-Rad, 2011). At the country level risk aversion plays an important part in economic development and the country's competitiveness (Zahra, 1999). For example, entrepreneurs' risk aversion has a critical influence on a country's employment rate and innovation because entrepreneurs create new job opportunities and innovate new services and goods to consumers (Burton, 2015).

Researchers have developed several measures as proxies to measure risk aversion. For instance, Szpiro (1986) developed the relative risk aversion constant by examining data from liability insurance in 15 countries between 1950 and 1980. Gandelman and Hernández-Murillo (2015) developed the coefficient of relative risk aversion using the Gallup World Poll self-reports data of self-reports on personal well-being in 117 developed and developing countries worldwide in 2006.

Power Distance

Power distance is the degree of expectations and acceptance of individuals to inequality and power differentials in their society. Karimi and Toikka (2014) found a negative and a significant relationship between power distance (i.e., the degree of expectation and acceptance of unequal power distribution by less powerful individuals in a society) and risk acceptance. In other words, societies in countries score high in power distance are less risk acceptance than societies in countries score low in power distance.

Individualism Versus Risk Aversion

Individualism is the extent to which individuals in society prioritize their personal needs and goals over their groups' goals and well-being. The extant literature shows that there is a relationship between Hofstede's cultural values and risk attitudes (i.e., risk aversion). Researchers have examined the influence of cultural values on risk aversion among individuals. Breuer, Riesener, and Salzmann (2014) found that investors' low individualistic countries are more risk-averse than their counterparts in high individualistic countries. In the study conducted by Karimi and Toikka (2014) on the influence of Hofstede's cross-cultural dimensions on risk acceptance, the two researchers concluded that the positive and a significant relationship between the cultural value of individualism and risk acceptance means societies in individualistic countries are more risk acceptance than societies in collectivistic countries. Therefore, in countries with high level of individualism, investors will be less reluctant to invest in assets that contain high elements of risk.

Masculinity Versus Risk Aversion

Masculinity is how much a society assigns different gender social rules for females and males. Iliyanova (2016) measured masculinity by using the industry sector where men and women work and found that masculinity has no significant impact on risk aversion. However, Iliyanova (2016) found that gender does have a relationship with risk aversion where men are less risk-averse than women. It is important to keep in mind that at this point did not use Hofstede's or the Globe Study indices as a proxy for masculinity. In addition, Karimi and Toikka (2014) found a negative and significant relationship between masculinity and risk acceptance. In other words, societies in countries score high in masculinity are less risk acceptance than societies in countries score low in masculinity.

Uncertainty Avoidance Versus Risk Aversion

Uncertainty Avoidance Index (UA) is the cultural value that measures the extent to which society members adapt to changes, handle anxiety, and deal with uncertainty. Hofstede (2001) suggests that cultures with high UA values usually feel less comfortable with ambiguous situations and prefer official rules. Whereas cultures with low UA values feel safe and enjoyable with the unknown. Countries with high UA values are more likely to be less socially stable, low economically, and politically stable than countries with low UA values (Khambata and Liu, 2005). There is a belief that UA and risk aversion are related because the two dimensions are caused by the same psychological actors (Kahn and Sarin, 1988).

Another study conducted by Munro-Smith (2002) found that individuals with high UA are inclined toward bureaucracy and risk-aversion. In addition, Karimi and Toikka (2014) found a negative and significant relationship between uncertainty avoidance and risk acceptance; long-term orientation and risk acceptance; and indulgence and risk acceptance. In other words, societies in countries score high in uncertainty avoidance are less risk acceptance than societies in countries score low in uncertainty avoidance.

Long-Term Orientation Versus Risk Aversion

Long-term orientation (LTO) - short-term orientation (STO) is the extent to individuals in society are future-oriented toward rewards, especially thrift (i.e., using money and other resources wisely and not wastefully) and determination in pursuing something regardless of difficulty (Hofstede, 2001). We expect that LTO societies are more likely to be cautious about making risky decisions, and therefore, more risk-averse. On the other hand, short-term orientation individuals are more oriented toward the present and the past, specifically, face-saving, credibility, reputation, respect for tradition, and satisfying social obligations" (Hofstede, 2011). Hence, we expect that STO societies are less to be cautious about making risky decisions, and therefore, less risk-averse. Following the above argument, we propose hypothesis 1(H1):

H1: Societies in countries score high in the cultural value of long-term orientation will be more risk-averse than societies in countries score low in the same cultural value.

Indulgence Versus Risk Aversion

Indulgence is defined by Hofstede and Minkov (2010). as "the extent to which people try to control their desires and impulses". According to Hofstede (2001) societies in low indulgence countries are inclined to distrustful, and skepticism. On the other hand, societies in high indulgent countries are inclined to be more confident, optimistic, and hopeful about the future (Hofstede, 2011). According to Yıldırım, Arslan, and Barutçu (2016) trust relates to optimism and trust depends on optimism when it comes to the future as trustful people believe that tomorrow is always going to be better than today. Studies have shown that there is a correlation between pessimism and risk tolerance as there is a belief among scholars that optimistic people are less risk-averse than pessimistic people (2008). In finance Guiso (2012) showed found that investors who are optimistic and have a high level of trust are more to accept risky investments such as stocks. In other words, optimism decreases risk aversion. Prior research done on developed nations has suggested that people who are trusting tend to take more financial risks when it comes to investing in stocks (2018). However, greater risk aversion could make trust between people to decline (2001).

The cultural value of indulgence mirrors an inclination towards gratification of human beings' natural desires of life, enjoying life and having fun (Minkov and Hofstede, 2012). Indulgence cultures attach more importance to pleasure and leisure which lead to more hedonic behaviors (i.e., behaviors that establish positive or pleasant experience) (Hofstede and Bond, 1988; Minkov and Hofstede, 2012). Hedonic behaviors could lead to riskier decisions and less risk-averse since pleasure is believed to be more important than the cost taking risk (Minkov, 2007). Finally, Karimi and Toikka (2014) found a negative and significant relationship between indulgence and risk acceptance. In other words, societies in countries score high in indulgence are less risk acceptance than societies in countries score low in indulgence. Following this line of discussion, we expect that indulgence negatively relates to risk-averse and posit the following hypothesis (H2):

H2: Societies in countries score high in the cultural value of indulgence will be less risk averse than societies in countries score low in the same cultural value.

Methodology

The Variables' Measurements

The Dependent Variable

Risk aversion (i.e., avoid making risky financial and/or non-financial decisions) is the dependent variable for this study measured by the coefficient of relative risk aversion at the country level. The coefficient of relative risk aversion was developed by Gandelman and Hernández-Murillo (2015) using the Gallup World Poll self-reports data of self-reports on personal well-being in 117 developed and developing countries worldwide in 2006. The coefficient of relative risk aversion ranges from zero to three, where zero means the population of the corresponding countries are not risk-averse society and three means the population of the corresponding country is an extremely risk-averse society. We choose the coefficient of risk aversion among many risk aversion proxies because this proxy incorporated

many developed and developing countries (117 countries) which might more comprehensive than other proxies that focused mainly in developed countries and covered fewer countries (15 and 31 countries respectively) around the world. The dataset on relative risk aversion is available at https://dspace.ort.edu.uy/bitstream/handle/20.50 0.11968/274 3/documen todeinvestigacion98.pdf.

The Independent Variables

Hofstede's cultural dimensions of long-term orientation (i.e., the degree to which society members are future reward oriented, especially perseverance and prudence) and indulgence (i.e., the degree to which individuals in society show a favorable or unfavorable reaction to their desires) are our independent variables measured at the country level. We borrowed the measures for these two cultural values from Manikov and Hofstede's (2012) study. Hofstede made his data on cultural values available to researchers at his website (https://www.hofstedeinsights.com/countrycomparison/). Hofstede measured the cultural values using a survey of IBM employees in many countries where the IBM subsidiaries are located. However, long-term orientation cultural value was added from Hofstede and Bond (1988) where they compared students from 23 different countries using Bond's Chinese Value Survey. Hofstede adopted indulgence versus restraint in his after he extracted this cultural value from the World Values Survey. Hofstede's cultural measures have shown reliability and validity.

The Control Variables

Both per capita income and religiosity are used as control variables measured at the country level. We controlled for religiosity because a prior study done by Noussair, Trautmann, Van de Kuilen, and Vellekoop (2013) have shown that religious people (i.e., people who attend church regularly) are more risk-averse than non-religious people. We borrowed the measures of religiosity in countries from the Extensive Country-Level Religiosity Index (ECLRI) developed by Joshanloo and Gebauer (2019) at https://psycnet.apa.org /record/ 2019-76861-001. The ECLRI was derived from the 2005 – 2017 Gallup World Poll (GWP) data where 1,862,900 randomly selected male and female respondents in 167 countries were asked about the importance of religion in their daily lives.

Per capita income (i.e., the average income of an individual in a given country). There are conflicting findings regarding the relationship between income and risk aversion. Shaw (1996) found a positive correlation between wage income and risk aversion at the individual level. Haushofer and Fehr (2014) concluded that poor countries are more risk-averse than rich countries. However, l'Haridon and Vieider (2019) showed that poorer countries are more risk tolerance than rich countries. In this study, we borrowed per capita income data from the World Development Reports in 2019 published by the World Bank at https://www.worldba nk.org/en/publication/wd r2019.

Data Analysis

The influence of the cultural values of long-term orientation and indulgence on risk aversion with per capita income and religiosity as control variables in 53 developed and developing countries was examined using multiple linear regression analysis because the dependent the variable dataset is not normally distributed which violates the least squares regression assumptions. To run the multiple linear regression analysis: First, we checked the Pearson correlation between the variables of interest (see Table1). Second, we checked the least-squares assumptions and found that the dependent variable data are not normally distributed. Hence, we decided to check for the multiple regression assumptions. We found that the assumptions are fulfilled (i.e., the mean of the residuals is zero; equal variance or Homoscedasticity of residuals, and multi-collinearity) (see Figure 1). Finally, we ran the multiple linear regression analysis of the two independent variables (i.e., long-term orientation and indulgence) after controlling for per capita income and religiosity.

Table 1: Descriptive statistics and inter-correlations

Variables	PD	UA	MAS	IND	LTO	ING	RA	PCI	Religion
PD	1								
UA	.373**	1							
MAS	-.068	-.191	1						
IND	-.697**	-.401**	.203	1					
LTO	.084	.164	-.014	.090	1				

ING	-.339**	-.234*	.254*	.139	-.646**	1			
RA	-.173	-.216	.107	.100	-.031	.281*	1		
PCI	-.713**	-.206	.177	.716**	.251*	.185	.165	1	
Religion	.416**	.027	.047	-.578**	-.539**	.185	.027	-.615**	1
Mean	64.66	72.04	49.02	39.75	49.53	47.09	.9425	25905.62	59.421
SD	20.910	19.613	19.109	23.816	25.247	23.234	.49973	20580.023	23.5258

Note: N = 53. PD = Power Distance. UA = Uncertainty Avoidance. MAS = Masculinity. IND = Individualism. LTO = Long-term Orientation. ING = Indulgence. RA = Risk Aversion. PCI = Per Capita Income. Religion = Country Level of Religiosity. SD = Standard Deviation. Comp. = Country Level of Competitiveness.

Figure 1: Standardized residual for the dependent variable (risk Aversion)

Empirical Results

Through the regression analysis results, we try to explain the differences across countries in the tendency to be risk-averse. Table 2 shows the summary of the multiple linear regression analysis results for variables (i.e., LTO and ING) predicting risk aversion (N = 53). ANOVA shows that the model is significant and fit (i.e., R2 = 0.118; R2 change = 3.49*; P < 0.05). The results of the multiple linear regression analysis also show indulgence appears to be a more important cultural variable than long-term orientation. Indulgence was significant when the two (i.e., religiosity and per capita income) control variables were included in the regression and also when we did not control for per capita income and religiosity. Long-term orientation shows no significant relationship with risk aversion. Surprisingly, the two control variables (religiosity and per capita income) were not significant at the country level.

Table 2: Summary of the multiple linear regression analysis for variables predicting risk aversion (N = 53).

Variable	B	SE	β	t	Sig.
ING	0.010	0.004	0.448	2.577	0.013*
LTO	0.005	0.003	0.259	1.487	0.143
R^2			0.118		
F for change in R^2			3.49*		

*Note. ING = Indulgence. LTO = Long-Term Orientation. B = Unstandardized Coefficient. **β** = Standardized Coefficient. T = T-Value. Sig. = Significance. *P < 0.05.*

Conclusion

The multiple linear regression results of examining 53 developed and developing countries suggest many conclusions about risk-aversion among countries. First, the national culture of all countries matters when it comes to the level of risk-aversion at the country level. Risk preference is a critical element component of economic behavior because it determines many of a country's economic decisions such as asset allocations, insurance purchases, and strategic decisions made by corporations (Rieger, Wang, and Hens, 2015). In general, we expect that highly developed countries with strong economies to be less risk-averse than developing countries. Second, not only individualism and uncertainty avoidance influence risk-aversion but also indulgence. Perhaps indulgence might have a significant influence on a society's level of risk-aversion because of confidence, trust, optimism, and hedonic behavior. Third, a country's level of religiosity and per capita income seem to be less important factors that influence risk-aversion among countries and societies. Even when we regressed religiosity and per capita income as independent variables on risk-aversion, we found no significant relationship between religiosity and risk-aversion and per capita income and risk-aversion. Finally, this study used the coefficient of relative risk aversion as a proxy for risk-aversion developed by Gandelman and Hernández-Murillo (2015) because it is a more comprehensive measure and also the data availability in many countries. However, future research could other proxies for risk-aversion to understand whether or not different risk-aversion measures can provide similar results.

Finance and Management, Szczecin, Poland, joanna.drobiazgiewicz@usz.edu.pl
ORCID ID: 0000-0001-6726-8579

Abstract

The aim of the article is to present the areas of logistic support of omnichannel strategy in the fashion retail and to indicate the directions of its development. The article uses the method of critical analysis of source literature and case study. Based on a critical analysis of the literature, the first part of the article presents the essence of the omnichannel strategy and defines the role of logistics in its implementation. Logistic support for the omnichannel strategy involves many activities, both in the area of stationary sales and e-commerce. It requires the introduction of system solutions, which concern the management of the entire supply chain both in terms of goods flows as well as the accompanying information and funds. These solutions should ensure flexibility of operation, speed of reaction and customization, which is particularly characteristic of the fashion industry strategy.

In the next part of the article theoretical considerations have been referred to practical logistic solutions used in implementation of omnichannel strategy in the fashion sector. The areas of logistical support and solutions applied in these areas were defined. Next, possible directions of their improvement were indicated.

Finally, there have been presented the conclusions drawn from the performed research.

Keywords: e-commerce, omnichannel, logistic support,

Introduction

Increasing market competition and increasingly higher customer requirements have a significant impact on the activities of fashion companies. Companies producing clothing, footwear, accessories, etc. have to adapt their designs, production and store styling to the signals received from customers. At the same time they have to optimize the costs of production, transport and promotion. The key success factors in the fashion industry are (Macchion, Moretto, Caniato, Caridi, Danese, Vinelli, 2015): final product price, production costs, target country, quality, style and design, brand reputation, exclusivity, uniqueness, technological innovation, customer service, flexibility, reactivity and sustainability. To achieve success, it is necessary to introduce an appropriate management concept (Teece, 2010). Enterprises in the clothing industry are characterized by excellence of organizational solutions in terms of logistics and high flexibility of operations. This is particularly true for the fast fashion sector. Clothing industry, in the fast fashion sector is characterized by complexity and variability of the environment resulting from: short lead times, rapid changes in fashion trends, unpredictable demand and high competition in the industry.

The main goal of this article is to present the areas of logistic support for the fashion industry in the implementation of the omnichannel strategy as well as to show the changes taking place in individual areas of this support.

Research Methodology

The first part of the article is based on literature research and presents the essence of the omnichannel strategy and the importance of logistics processes in its implementation.

In the next studies, we can distinguish two essential parts. In the first one, on the basis of the analysis of processes taking place in the supply chains of the fashion sector as well as the scope of services offered by logistics operators, basic areas of logistics support were distinguished. Then, they were characterized and modern trends in this area were indicated. In the second part of the empirical research, in relation to specific areas of logistical support, practical solutions and services offered by logistics operators for Polish fashion sector were shown. This part of the article is based on information about the offer of industry services from selected leading logistics operators, such as: Fiege, Hellmann, Scheenker, UPS, Quehenberger and DHL, also delivered to the Polish market. The main areas analysed were order management, warehouse and stock management, transport and return management.

Defining omnichannel as a concept

Meeting the expectations of customers and increasing the efficiency of retail stores forces companies to change their business models (Hosseini, Merz, Röglinger, and Wenninger, 2018; Massa, Tucci, and Afuah, 2017). The e-business models of that time are characterized by innovation, flexibility and openness (Teece, 2010). Significant trends in running an electronic business are the growing importance of value chain creation (Zot, Amit, 2000; Bhatt, Emdad, 2001; Wang, Lu, 2008). Important aspects are access to content, offering online services, new technologies and access services, good communication as well as appropriate software and hardware made available to users (Szpringer, 2012). Omnichannel can be defined as the operating strategy of e-business entities (McCornick, Cartwright, Perry, Barnes, Lynch & Ball, 2014). Ominichannel allows for new shopping experiences by combining different channels in which the interaction between the vendor and the customer occurs. The channels can be defined as contact points such as traditional or stationary and modern ones such as mobile or online. The customer can use whatever he thinks is best at any stage of the purchasing process in which he is (Mosquera, Pascual, Ayensa, 2017). The benefits for the customer resulting from the full integration of multi-channel sales are: the use of similar prices and promotional campaigns in all channels (possibility of redeeming coupons), the possibility of returning goods at all points of sale, regardless of where it was purchased, consistency of goods and services in all channels.

The implementation of the omnichannel strategy requires a thoughtful introduction of a structure of activities related to marketing, ordering system, inventory management, returns and support for their extensive and automated IT. In the omnichannel strategy customers use different channels at the same time, which requires their integration. Unlike the multi- or cross-channel strategy, omnichannel allows for the integration of objectives of all channels, joint channel management and the possibility of their full integration as well as common data management (Verhoefa, Kannanb, Inman, 2015; Mosquera, Pascual, Ayensa, 2017; Beck and Rygl, 2015). An important role in this respect is played by logistical support in the implementation of the flow of goods, information and financial resources both between sales channels, vendor and customer as well as between other participants in the supply chain (Metters, Walton, 2007).

Introducing a well-functioning omnichannel strategy requires designing and implementing changes in the organizational structure of the company and the use of modern technologies as well as process automation infrastructure (Xie, Jiang, Zhao & Hong, 2014). The implementation of the omnichannel strategy requires, above all, cooperation in the areas of logistics, sales and marketing. The basis for coordination activities between teams which participate in all stages of the customer value creation process is to design and implement an effective system of information flow and communication (Christopher, 2016). It seems necessary to use modern IT systems, which should be a basic element of the infrastructure both internal and external information flows. This is essential to handle sales in the omnichannel strategy (Piotrowicz, Cuthbertson, 2014). It must, among other things, provide information whether the selected goods are available, where they are and when they will be ready for release or shipment. On this basis, it is possible to provide the consumer with reliable information on the forms of delivery or collection and the lead time.

A prerequisite for omnichannel retailing is the creation of central and integrated information systems that include elements such as CRM, WMS, order management, financial management, payment services and ERP system (Hübner, Wollenburg, Holzapfel, 2016; Nettsträter, Geißen, Witthaut, Ebel & Schoneboom, 2015).

In the implementation of multi-channel sales, it is necessary to provide logistic support in all phases of the distribution process, both in the pre-transactional, transactional and posttransactional phase.

Logistical support for omnichannel strategy - areas and directions for improvement

The implementation of the omnichannel strategy requires a number of logistical processes that can be applied to different areas (Fig. 1).

Fig. 1: The areas of logistic support of the omnichannel strategy

Source: own study.

In the considerations, a division into the following areas of logistical support was adopted:

- order management (processes from the moment of the customer's order to the moment of delivery to the customer),
- transport management,
- warehouse and inventory management,
- return management.

Order management

Order management is a complex process which consists of many elements. Order management involves the need to ensure proper communication both with the customer and with other participants in the supply chain. This communication is the basis for accessing up-to-date stock information and ensuring an efficient flow of goods. Each stage of the sales process is important and one of the most crucial is the customer's ordering itself. Access to relevant information and product description will determine whether the customer will purchase the right product for himself, which he will not return later. What is also important is that the customer who buys the product online should receive current information about the availability of the product. In case they are out of date, it may turn out that the purchased product is no longer in stock. In this case the customer will not receive the product and must wait for a refund. Poorly organized order fulfillment may not meet customer expectations, lead to delays in shipment, cause out-of-date information or discourage purchase. As a result, it can lead to a definite loss of the customer.

Orders in the sale of omnichannel can be realized in various forms, such as:

- online order sent to a traditional store, collection takes place in the store (click & collect) (Gao and Su, 2017);
- purchase and collection in a traditional store (immediately or after a certain time);
- online order placed with a sales agent (eRetail channel, e.g. Zalando, Answer) realized directly to the buyer's house through the sales agent distribution infrastructure or the seller (Pawłowski, Pastuszak, 2019);
- orders sent to the consumer from the manufacturer of the product via the online retailer,
- orders sent directly from the manufacturer.

In recent years, customer requirements for increased speed, flexibility and last mile delivery convenience have been increasing. Expectations of changing the place and time of delivery are also growing (Hübner, Kuhn, Wollenburg, 2016) . Forms of order completion are related to the so-called last mile, which is an important and challenging element of the supply chain. The moment when the customer receives the parcel in hand and how it is done will influence the evaluation of the quality of the whole purchase process. The efficiency of last mile deliveries is of particular interest in various aspects, such as: lowering delivery costs by optimizing transport routes (Geetha, Poonthalir, & Vanathi, 2013), changes in the distribution network (Verlinde, Macharis, Milan and Kin, 2014), new forms of delivery to the customer, or organization of loading goods on the means of transport (Lin, Yu, 2006).

Companies that use omnichannel sales offer their customers the following forms of delivery:

- delivery of the product to the customer's house,

- delivery of goods to a parcel locker,

- collection at a point (e.g. post office, local store, gas station),

- collection at the stationary store.

Apart from deliveries to the customer, the issue of deliveries (supplies) of individual stationary stores is very important. An significant problem that may arise here is the problem of time windows, i.e. limited possibility of delivering goods to stores. They can only be delivered in specific, narrow time frames.

Returns Management

The requirements of customers purchasing goods in different channels also apply to problem-free returns. In omnichannel's strategy, customers should be able to return a product at different points of sale, regardless of where they made their purchase. As part of this strategy it is necessary to implement an appropriate reverse logistics infrastructure (Rao, Rabinovich & Raju, 2014; Dekker, Fleischmann, Inderfurth, and Wassenhove, 2004). It should ensure good customer service also in the post-sales phase and support the optimization of return costs for products related to transport and re-storage (Fleischmann, Bloemhof-Ruwaard and others 1997).

The clothing industry is one of those where return management plays an important role. It is particularly important when a large number of products are ordered online, without the possibility of seeing and trying them on (Bell, Gallino & Moreno, 2014). One way to reduce the number of returns of products purchased online may be to provide more accurate information about the product, better quality photos and the possibility of a virtual try-on.

In addition to transport and storage, the logistics operator's tasks in the area of return handling often include added-value services such as minor repairs of returned products, ironing or repackaging.

Transport Management

The basic area of logistic support for the sale of products is transport related to the movement of goods between the participants of the supply chain. Multi-channel sales cause that many stocks are in transport, which requires a solution for real time visibility of goods. Advanced logistic solutions ensure control of shipments, orders and the means of transport themselves. These solutions also include opportunities for cooperation between partners in the supply chain. Through appropriate communication and data exchange between trading partners, it is possible, among other things, to determine a more accurate estimated time of delivery.

Warehouse and inventory management

Growing e-commerce market related to, among others, introduction of omnichannel strategy results in increased demand for warehouse space and modern tools supporting warehouse management. Entities offering the handling of warehouse processes are faced with ever higher requirements, especially with regard to such aspects as (Richards, 2017; Żuchowski, 2016):

- speed and faultless acceptance of deliveries,

- efficiency and effectiveness of the picking process,

- the speed of shipping the goods,

- efficient operation regardless of large seasonal sales fluctuations,

- creating additional space related to the provision of value-added services, such as creating promotional sets, labelling, repackaging.

In order to meet the requirements it is necessary to properly design the warehouse space and apply appropriate techniques, technologies and systems supporting effective and efficient warehouse processes. The increased complexity resulting from multi-channeling requires the use of Warehouse Management Systems (WMS). Knowledge about the inventory of goods and their location is essential. This information is necessary to effectively manage orders. Knowledge of inventory levels is essential for planning activities throughout the supply chain. Managers should continuously conduct extensive analysis in the area of inventory management. The problem is also knowing the state of inventory that is in transit.

The more sales channels a vendor offers, the more complex inventory management becomes (Kumar, Eidem & Noriega Perdomo, 2012). Optimizing the level of inventories is possible primarily due to the involvement of qualified IT personnel who appropriately redesign business processes (Frazer, Stiehler, 2014).

A new trend that can be noticed is the new role of the physical store, which can be an additional place of distribution and storage. The store can be a place where the customer can receive orders online. Besides, the seller can send orders that are placed online directly from the store to the customer (Napolitano, 2013; Giannopoulos, 2014). This increases the amount of products in stationary stores, which are treated as micro-magazines.

This solution has many advantages:

- possibility of quick delivery to the customer from a store located close to the customer (Napolitano, 2013);

- using pickup in the store and shipping the goods to the customer allows the seller to make better use of existing inventory and thus reduce excess inventory that could otherwise be sold at a discounted price (Giannopoulos, 2014);

- offering the customer the possibility of collecting the goods in the store allows to reduce the costs of the "last mile". Delivery of the product to the customer is a relatively expensive part of distribution for the seller (Agatz, Fleischmann & van Nunen, 2008);

- besides, personal collection of the goods in the store can also be an incentive to purchase other goods that the customer will see in the stationary store (Zhang, Farris, Irvin, Kushwaha, Steenburgh & Weitz, 2010).

New trends in warehouse management also include giving the warehouse new functions such as acting as showrooms or sales points. There is now also a trend to segment supply chains by channel, resulting in duplication of inventory and infrastructure. Some companies such as DHL (DHL, 2015) are beginning to offer multi-channel distribution center projects. Separate channel spaces in the same warehouse and different automation solutions are used to meet the different requirements of the B2B and B2C channel supply chain, but stocks are common to both channels.

Modern solutions supporting omnichannel strategy

The fashion market is growing, online shopping is becoming more and more popular, the number of orders is increasing and customer requirements are growing. Sellers need to adapt to this new situation and they find it really challenging. In addition, the fashion industry is specific and is characterized by, among other things, dynamic changes in the offer, the need to move goods quickly and the need to ensure the safe transport of delicate products. The involvement of specialized logistics service providers is essential for the implementation of logistics processes (Rabinovich, Knemeyer & Mayer, 2007). The growing needs of the fashion sector in terms of logistic support mean that there are more and more entities of this type on the market. Thanks to their experience and knowledge they offer solutions tailored to the needs of their customers.

Currently, the most dynamically operating on the Polish market are international and global logistics operators, such as: Fiege, Hellmann, Scheenker, UPS, Quehenberger, DHL. They provide a wide range of industry services, including those supporting the fashion industry. Services dedicated to the fashion industry are both typical logistic services as well as additional services that go beyond their typical scope.

Table 1 presents practical logistics support services for the fashion industry based on information from Fiege, Hellmann, Scheenker, UPS, Quehenberger and DHL.

Table 1: Selected logistic support services for fashion industry provided by logistic operators

Support areas	Services
Procurement management	order processing in the online store carriers' management the operator's partner's ability to track the entire order process, from receipt of the order, through picking and packing, even up to the cash refund for the completed return packaging logistics for internet sales collecting personalized orders data management debt management document management content management
Return management	handling of returns, including quick receipt of the return, its classification, cash back, or sending another size complaint handling recycling of clothing recycling of hangers recycling of packaging
Transport	GOH transport (clothes on hangers) store deliveries Track & Trace real-time tracking optimal route planning with state-of-the-art IT solutions special transport equipment (dedicated containers) customs services traffic management in the area adjacent to the production plant

Warehouse and inventory management	GOH storage (clothes on hangers) hanging transport high-bay warehouse cross-docking services management of storage of store equipment and commercial materials separation of zones for high value goods services of a picking robot, which picks cartons of shoes or clothes and moves (transfers) the completed packages to the packing and shipping area automatic conveyor systems with sorters Separation of storage space for different types of packing into different channels logistics centers transshipment hub
Value added services	unpacking and commissioning putting on clothes on hangers country-specific labelling attaching safety tags washing, drying and ironing of clothing quality control of finished products dimension and color control, cataloguing of articles sending patterns to photographic studios conducting own photographic studies preparation of promotional kits collecting goods from the sewing room and performing preliminary quality control

Source: own study based on based on information from logistics operators Fiege, Hellmann, Scheenker, UPS, Quehenberger, DHL.

As can be seen, the scope of services provided by logistics operators is very wide in each of the analyzed areas of logistics support. Return services play an important role, and there are more and more of them due to the increase in online sales. Another important service accompanying material flows is information flow management. The needs of the fashion sector also contributed to the creation of a number of value-added services that differ from the typical nature of logistics services. Examples of such services are washing or ironing clothes. Another example is conducting photographic studies to prepare an appropriate product presentation.

Conclusion

The different distribution channels in the omnichannel strategy require different approaches and logistics solutions. Online stores need above all up-to-date information about stock levels, an efficient order picking system and fast and flexible deliveries to the customer. On the other hand, deliveries to stationary stores must be demand-driven and planned so that the goods can be received in narrow time windows outside work. Additionally, companies operating in accordance with fast-fashion ideas strive for frequent but smaller deliveries and have greater demand for picking and transport services. Specialized logistics operators provide services to fashion companies. They offer their customers solutions tailored to their needs. As the requirements of the industry grow, so does the range of these services. Particularly important are added-value services that go beyond the typical scope of logistics services such as transport and storage and the accompanying information flows. The takeover of this type of services by logistics operators allows to relieve companies from the fashion industry and allows them to focus on the preparation of new collections.

Directions of Shaping the Open Data Performance Expectancy in Europe In the Light of Text Mining Analysis

Iwona ZDONEK
Gliwice, Poland, iwona.zdonek@polsl.pl

Anna SOLTYSIK-PIORUNKIEWICZ
Katowice, Poland, anna.soltysik-piorunkiewicz@ue.katowice.pl

Abstract

The main purpose of the paper is to describe the directions of shaping open data performance expectancy in Europe. There are three objectives of the paper: (1) finding the currently dominant terms in open data performance expectancy creation; (2) finding the geographical areas of Europe that have a dominant contribution in creating open data performance expectancy; (3) exploring the links between the geographical areas of Europe in open data performance expectancy creation. The research methods are based on: text mining, visualization techniques, and correlation analysis. The analyzed data come from texts promoting digital products and services that use open data. The research covers 287 digital products and services based on open data. The time frame covers the period 2018-2019 and the research focuses mainly on European issues. The research results show that the most popular digital products and services based on open data are applications, websites and platforms. The main direction in presenting the benefits of their use is related to promoting them as tools to provide real time information on public issues, primarily in areas such as transport, education, culture and sport, economics and finance and health. The most uniform geographical area in terms of creation of open data performance expectancy is Western Europe; in Northern and Southern Europe dominating countries can be found, while Eastern Europe shows the smallest activity.

Keywords: Open Data Performance Expectancy, Open Data, Text Mining.

Introduction

This paper is a part of the research area dedicated to describe the directions of shaping open data performance expectancy in Europe. The open data performance expectancy is formulated as a predictor in the UTAUT model. It is defined as „the degree to which an individual believes that using the system will help him or her to attain gains in job performance" (Venkatesh et al., 2003, p. 447). Moreover, Venkatesh and Speier (1999) admit that obtaining valuable results, such as earnings increase or work efficiency increase, are significant motivators to use a particular technology. In the context of open data technology this means that "availability of open data technologies, such as data platforms, software, tools and interfaces increases individual's or organization's expectancy to perform better" (Zuiderwijk et al., 2015, p. 431) and that the availability of these technologies will allow for tangible financial benefits. Zuiderwijk and his co-workers postulate that measures should be taken to raise awareness of the benefits of open data in order to increase social performance expectancy. When analysing materials promoting open data in the Internet one can see that this postulate is strongly realised. Different countries are building open data portals and promoting the benefits of open data technologies there. In this context, it seems interesting to examine the direction of these activities promoting the expected benefits of using open data (performance expectancy). Thus, three objectives of this paper were formulated: (1) finding the currently dominant terms in open data performance expectancy creation; (2) finding the geographical areas of Europe that have a dominant contribution in creating open data performance expectancy; (3) exploring the links between the geographical areas of Europe in open data performance expectancy creation.

The achievement of these goals will bring to literature a new perspective of the study of the "performance expectancy" construct for open data. This perspective is based on the analysis of materials promoting the use of open data using text mining and visualization techniques with supporting methods. It is also worth adding that the continuation of the proposed research in the long term may give an interesting insight into the development of values promoted in society.

Literature Review

Since the main idea of using open data is to generate their economic value by using open data in different ways and by different users, it is worth noting that this idea is firmly anchored in the realization of the idea of creating a "society of imagination", which leads us directly to the idea of Society 5.0 (Keidaneren 2016, Keindanren 2018). In such society the technological transformation and imagination and creativity of different people lead to problem solution and value creation (Keidaneren 2016, Keindanren 2018). As open data stem from the Society 5.0 concept, numerous researchers explore both the influence of open data on society functioning and factors that improve the use of open data. Among papers dealing with open data one can find works focusing on a selected field, e.g. Medicine (Burton et al. 2020, Conrado et al. 2020a, Conrado et al 2020b) or environmental issues (Salas et al. 2020, Rantala et al. 2020, Pafi et al. 2020). However, there are also papers dealing with open data in a more general perspective. Such papers are those that describe the issue of economic value of open data (Verhulst & Young 2016, Zeleti et al. 2016, Carrara et al. 2015, Jetzek et al. 2014, Worthy 2015, Janssen et al. 2012). There are also papers on the influence of open data on democratic processes through expanding transparency, citizens' active participation in decision-making processes, policy making and solving social issues (Ruijer et al. 2020, Ruijer et al. 2017a, Ruijer et al. 2017c Verhulst & Young 2016, Sivarajah et al. 2016, Dawes & Helbing 2010). In literature on open data one can also find papers focused on exploring the conditions favourable for open data utilisation (Zuiderwijk et al. 2014, Susha et al. 2015a, Susha et al. 2015b, Susha et al. 2015c Dawes et al. 2016, Kampars et al. 2020). Many of them bring the issue of open data quality to the fore (Vetro et al. 2016, Zuiderwijk & Janssen 2015). Among papers concerning research on conditions favourable for open data utilisation are also those that consider the issue of design of platforms dedicated to open data. Such papers focus on very sophisticated issues, such as context-specific approach (Ruijer et. al. 2017b).

It is not difficult to notice that although the papers devoted to open data focus on various economic, social or technical issues, two main research trends can be indicated. The first explores the question of open data usability and value. The second focuses on analysing factors that foster or hinder the increasing use of open data by the society. Both trends lead straight to the subject concerning the acceptance of new technology. Though there are several models describing the acceptance of technology (theory of reasoned action (Fishbein and Ajzen, 1975), theory of planned behaviour (Ajzen, 1991), technology acceptance model (Davis, 1989)), in this paper one of the most important models describing the acceptance and use of new technology – the UTAUT model (Unified theory of acceptance and use of technology) – was chosen as a background. This model is very often used to test the acceptance and use of Information Technology (Venkatesh et. al 2003). Open data acceptance has already been analysed with this model (Zuiderwijk et al., 2015) as well as with the use of the model resulting from social cognitive theory (Wang 2020, Wang & Lo 2016). However, the observations made by the author of this paper refer more to the constructs proposed in the UTAUT model. The key idea of the UTAUT is that a number of factors lead to the behavioural intention to accept and use technology, while this behavioural intention in combination with facilitating conditions leads to the actual use of this technology (Sykes, Venkatesh, Gosain, 2009). Thus, in the UTAUT model Behavioural Intention to use Information Technology is an important construct. It is determined as an individual's intention, prediction or plan to use a technology in the future. Four constructs have a direct influence on Behavioural Intention to use Information Technology. These are Performance Expectancy, Effort Expectancy, Social Influence and Facilitating Conditions. In addition, there are four more important moderators for this construct, i.e. Gender, Age, Experience and Voluntariness of Use.

The relation between the trends surrounding open data research and the UTAUT model stems from the fact that in order to use open data it is necessary to use the related dedicated technology. (Zuiderwijk et al., 2015). The first mentioned trend, which analyses the usability and value of open data, is related to the UTAUT model construct described as "performance expectancy". The second trend, which explores stimulants and destimulants of the growing use of open data, is connected with the UTAUT model constructs called "Effort expectancy" and "Social influence". The research on the acceptance and use of open data technology with the use of UTAUT model was conducted by Zuiderwijk and his co-workers (Zuiderwijk et al., 2015). They proved that "performance expectancy" and "social influence" are positively correlated with behavioural intention to use and accept open data technologies. On the other hand, "Effort expectancy" and "Voluntariness of use" are negatively correlated with the use intention and acceptance of open data technology (Zuiderwijk et al., 2015). Zuiderwijk and his co-workers have indicated a number of recommendations on how to develop individual constructs in order to increase behavioural intention to use and accept open data technologies. Each of these constructs is a broad research area with several subareas, which can be seen in the available literature on open data.

Materials and Methods

Research questions and hypotheses

Based on the theoretical research and to fulfill the objective of the paper no. 1, research question (RQ1) and hypothesis (H1) were formulated:

RQ 1: How are products and services created on the basis of open data presented? What terms are dominating in the descriptions of presented case studies?
H1: Applications and websites use open data. The dominant terms in the descriptions of open data-based products and services indicate the relationship with Society 5.0

To fulfill the objectives of the paper no. 2 and no. 3, research question (RQ2) and hypothesis (H2) were formulated:

RQ2: How are products/services created on the basis of open data promoted in particular parts of Europe? Were there similarities between those geographical areas?
H2: There is a similarity in promoting open data-based products and services in particular parts of Europe.

Conceptual scheme of research elaboration

In order to meet the main objective of the paper, the conceptual scheme of research elaboration was used:

Step 1: *Collecting data*

The research data were retrieved from European Data Portal. This portal implements the policy of promoting benefits resulting from using open data and collects descriptions of applications, websites, portals and services using open data (the so-called use cases). The collected use cases come from different countries. Thus, files with descriptions of created products/services from the last two years, i.e. 2019 and 2018, were retrieved. This period covered descriptions of 287 applications, websites, portals and services using open data. The files were processed into a text format, organised into a data frame and further analysed using text mining, visualisation techniques, and correlation analysis.

Step 2*: Processing of text variables*

The analysis was made with the use of R packages dedicated for text mining. Thus, text data were tokenised into words and bigrams, and cleared from the so-called stop words (words that do not carry an important meaning). The resulting set of tokens (words or bigrams) were subjected to counting and visualisation, usually on bar chart diagrams. The obtained results were compared with the terminology used in the literature relating to Society 5.0. Thus, the hypothesis 1 was verified.

Step 3*: Creating subsets and searching for similarities between them*

Text variables were analysed in the context of the remaining variables, i.e. Country, region of Europe (north, south, east, west). Thus, the above-mentioned operations of text mining were also performed on data subsets. Due to this, an analysis was performed for countries and regions of Europe. As a result of text mining, sets of tokens characteristic for a given subset were achieved. In order to answer the question concerning the similarity of subsets, data base techniques were used, which enabled us to link the created sets. The link was a field containing tokens selected at an earlier stage. Thanks to this it was possible to use calculate the correlation coefficient for the subsets. Thus, the hypothesis 2 was verified.

Description of Research Sample

In order to present the research sample, meaning the collation of countries promoting products/services based on open data in 2018-2019, a bar chart and map visualisation were developed, as presented in figure 1.

Figure 1: Number of new products and services using open data in 2018-2019 in particular countries (visualisation on a European scale on the right)

As shown in the figure, United Kingdom had a dominant role in the period under analysis. Among top three countries there was also Spain and Netherlands. The visualisation on the map shows that Germany, Italy, France, Belgium and Ireland should be included in the group of countries that dominate in terms of promoting products and services based on open data. The identification of these countries is quite important because in the following part of the study the considerations are divided into Northern, Southern, Eastern and Western Europe. Thus, it is worth noting that Northern Europe, which in the analysed period showed the highest activity in performance expectancy creation, was dominated by UK and Ireland with a small share of other countries from this part of Europe. It was similar in Southern Europe where Spain and Italy dominated with a small share of other countries. This means that these parts of Europe features large variation in the degree of activity of individual countries. The situation was different in Western Europe, where one can see a significant activity of several countries, i.e. Netherlands, Germany, France and Belgium, which means that with respect to activity in promoting products and services based on open data this part of Europe was less diverse in the analysed period. Eastern Europe is characterised by similar low diversity. However, countries from this part of Europe showed low activity in the analysed period.

Results

The most popular products and services and terms that dominate in descriptions of products and services using open data

When answering the research question about the presentation of open data based products and services, the bar chart was created (fig. 1). it points that websites and application are the most popular.

Figure 2: Categories of products/services with usage of open data (with amount of cases)

When answering the research question about terms that dominate in products/services descriptions a set of words (fig. 3) and bigrams (fig. 5) was created. The analysis of words showed a large number of the term "data", which dominated all other terms. This huge domination shows the leading role of data in the analysed products and services, which of course is not surprising. Therefore, in further analysis, this term was treated as an outlier, which could have a significant impact on the subsequent stages of the analysis of the obtained data. Then, the terms "information", "users" and "public" scored big numbers. This is an evidence of promotion of the benefits of providing user-oriented information linked to public objectives, which is of course closely linked to the nature and idea of open data. The focus on users is also highlighted by the presence of the following nouns in the further part of the ranking: "people", "citizens" and "user", as well as verbs: "provide", "collects", "access", "enables", "helps", "offers", "create". The role of these terms will be more broadly discussed in bigrams analysis. The large number of such terms as "application", "website" and "platforms" is also worth noting. This ranking presents options of available products/services created based on open data. The most popular are then applications and websites, while platforms take the third position. As it was possible to compare the results of analysis obtained through the text mining technique with the visualisation techniques on "Products/services" variable, such comparison was made. This way it was found that the most popular products/services in the analysed period were applications and websites with a smaller share of platforms, companies and services.

Apart from the terms related to user benefits and those describing options of created products/services, the ranking also presents a group of terms connected with a particular business sector. The dominant role in this respect is played by terms related to transport, i.e. "transport", "location", "traffic", "parking". The domination of these terms does not surprise if we analyse the ranging of business sectors in the analysed period, where transport is at the forefront (see fig. 4).

Figure 3: The most common words occurring in the descriptions of products/services using open data

Figure 4: Ranging of the biggest business sectors using open data in 2018-2019

Analysis of bigrams (fig. 5), similarly as the analysis of words, selected the term that has the role of an outlier. In the case of bigrams it was the term "real time", which illustrates the main benefit of using open data. In the bigrams one can see the presence of an outlier determined at the stage of words analysis, meaning the term "data", which now appears with other terms, i.e. "collect (-s, -ed) / gathers data", "public data", "data sources", "data portal", "data visualization", "data driven", "weather data", "transport data", "traffic data", "data quality" and "geospatial data". The analysis of bigrams selected also further phrases connected with presenting benefits of products/services based on open data. These are phrases containing verbs like: "collects data", "enable people", "provide users", "helps users/people", "provide real", promotes transparency", as well as phrases containing adjectives like "user friendly", "easily accessible", "additional information". The use of these phrases in communication is to encourage users to use the new product/service. It also suggests a high focus of the promotional message on the end user, which is characteristic of marketing communication. The second group of phrases consists of those related to the specificity of a sector for which the created product/service is dedicated. Thus, these are such phrases as: "parking facilities", "public transport", "traffic information" "bike citizens", "arrival times", alternative fuelling", "air

quality", "public toilet", "real estate", "land insight", "house price". Thus, with reference to Figure 3 presenting the dominant sectors during the period under examination, it can be seen that in the bigrams terms characteristic for the transport sector are the leading group. The third group of phrases present in the bigrams are those related to methods of open data processing and visualisation, i.e.: "machine learning", "artificial intelligence", "search engine", "predictive models", "data visualization", "interactive maps", "graphic information".

Figure 5: The most common bigrams occurring in the descriptions of products/ services using open data

The analysis of the number of words present in the descriptions of products and services based on open data showed a large presence of terms related to the words "data" and "information". These terms are characteristic of the terminology present in the texts describing Society 4.0 and Society 5.0. (see Webster 2014). The analysis of bigrams depicted terminology typical for Society 5.0 ("machine learning", "artificial intelligence", "search engine", "predictive models", "data visualisation", "interactive maps", "graphic information", "data driven"). Thus, while the terms "data" and "information" have grown out of the concept of Society 4.0, the promotion of data processing by artificial intelligence and its provision to physical space for human use shows that in materials that promote the usefulness of open data there are ideas stemming from the concept of Society 5.0. This postulate is reinforced by the fact that both the analysis of words and bigrams show significant user focus, which is also directly connected with the postulates of the Society 5.0 (Fukuyama 2018, Keidanren 2018).

Analysis of terms in a geographical context – finding similarities between sets

The answer to the question about similarities between geographical areas was sought by means of scatter plot diagrams and a correlation coefficient. First of all, sets of words characteristic for four geographical areas of Europe were created, i.e. Northern Europe, Southern Europe, Western Europe and Eastern Europe. Then they were paired and relevant calculations were made (table 1). Correlation test was also performed, which showed that the correlation coefficients are significantly different than zero. As the term "data" was identified as an outlier before, it was not considered in the diagrams and calculations.

Table 1: Coefficients of correlation between sets of words describing products/services

Description	**Northern Europe**	**Western Europe**	**Eastern Europe**	**Southern Europe**
Northern Europe	1			
Western Europe	0.532	1		

Eastern Europe	0.312	0.337	1	
Southern Europe	0.465	0.443	0.303	1

The presented research results show that the most correlated sets of words are those for Northern Europe and Western Europe (0.532), Southern and Northern Europe (0.465), and Southern and Western Europe (0.443). Relatively lower correlation coefficients could be observed everywhere where Eastern Europe was present. Undoubtedly, this was influenced by the small number of use cases from Eastern Europe.

Table 2: Hypotheses verifying results

No	Study assumption	Verified result
H1	Applications and websites use open data. The dominant terms in the descriptions of open data-based products and services indicate the relationship with Society 4.0 and have implication into development of Society 5.0	Accepted, based on visualization of amount of cases (fig. 2) and based on text mining analysis shown by the words and bigrams analyses (fig. 3 and fig. 5)
H2	There is a similarity in promoting open data-based products and services in particular parts of Europe.	Partly accepted, based on the correlation analysis (tab. 1). There are some similarities in relationship between Northern, Western and Southern Europe. The relationship between Eastern Europe and other parts of Europe is weaker.

Conclusion and Discussion

The research results show that the most popular digital products and services based on open data are applications, websites and platforms. The analysis of the documents promoting the use of open data has also shown that the main direction in presenting the benefits of open data products and services is to promote them as tools to provide information on public issues in real time, primarily in areas such as transport, education, culture and sport, economics and finance and health. The issues of data collection and provision to the user, enabling them to access information, and ensuring transparency related to public issues are highlighted. It is worth noting that the transport sector is one of the sectors that use open data most frequently in the analysed period. This may be explained by a noticeable intensification of innovative activities in logistics and seeking new and better performance of logistics tasks through digitalisation of its processes (Witkowski 2017). This brings us to a subject related to the idea of Industry 4.0, where digitalisation of logistic processes allows sustainable development in areas indicated by Kayikci and described by him as three dimensions of sustainability, i.e. economic, environmental and social dimension (Kayikci 2018). Therefore, it can be assumed that a large number of products and services that use open data in the transport sector fit into these dimensions and allow for more reasonable fuel consumption (fuel savings), implying financial (and therefore economic) savings and reduction of environmental pollution and use of non-renewable resources (environmental dimension) and social benefits (social dimension) in terms of improved health through cleaner air and noise reduction.

As the research has shown, the development of “performance expectancy” has not been evenly implemented in Europe over the years under study. The most uniform geographical area in terms of creation of open data performance expectancy is Western Europe; in Northern and Southern Europe dominating countries can be found, while Eastern Europe shows the smallest activity. The most active countries in this respect are United Kingdom, Netherlands, Spain and Germany, Italy, France, Belgium and Ireland. When comparing these results with analysis of open data maturity in Europe (Blank 2019, Cecconi & Radu 2018, Open data in Europe 2019, 2018, 2017, and 2016) one can see that these are the countries referred to as “trend setters” or “fast trackers”. It is therefore not surprising that they are very active in promoting products and services based on open data, and therefore very active in performance expectancy. It is also worth mentioning that research by Zhong (Zhong 2017) indicated the scientific centres from United Kingdom, Germany, France and Italy as those publishing numerous papers devoted to the idea of “intelligent manufacturing”, which is another important idea related to Industry 4.0. This gives rise to the assumption that the high positions of these countries in both rankings related to open data use and rankings of scientific publications on intelligent manufacturing can be linked. The similarity of sets of words for Northern, Western and Southern Europe also shows the economic relations of these parts of Europe.

Limitation

The main limitation of the conducted research is the short research period (2018 - 2019). A period of 10 years would be a better research period. However, so far data from such a long period are not available. The research sample also included big disproportions between the number of promoted solutions based on open data. For example, Eastern European products/services were few in number, while the United Kingdom dominated all other countries in its geographical area. In subsequent studies, however, with more use cases available for analysis, these limitations will no longer be present.

Abstract

The main objective of the research is to identify exogenous conditions for growth and development through innovation in the economy on the example of Polish tourism companies and to define a general course of action for improvement in the scope covered by the research. The rationale for research is regarding growth and economic development as an up-to-date and important issue. The research process involved the method of critical analysis of the source literature, especially in the theoretical part. The empirical part was based on the analysis of the research material obtained by means of a survey and the observation method, while the application part uses mainly logical reasoning and the synthesis method. The article presents results of the surveys conducted in tourism companies regarding the external determinants of innovative growth and development, in terms of macroeconomic, formal, legal, institutional and socio-cultural aspects. The study was conducted twice at an interval of five years. The results of the surveys indicate that in the case of the first survey, the formal and legal factors prevailed in the structure of external determinants of growth and development of tourism companies, while in the second survey – macroeconomic factors.

Keywords: Macro- and Microeconomic Growth and Development, Tourism, Innovations, Tourism Company.

Introduction

Modern reality, both social and economic, creates the need to skilfully combine science with practice. This is primarily about increasing the pragmatism of scientific research which should not be solely confined to the ideological sphere. This means that the representatives of the world of science should not create new, strictly theoretical concepts, without the possibility of their practical application. Such an approach to science is justified by the omnipresent changes. Due to the progress of civilisation and its implications, including the transposition of business models, new applications of scientific and technical solutions, cultural changes, as well as transformations taking place in the daily life of individuals and groups, innovation is and will be integral part of social and economic life.

In view of the above, it is necessary to emphasise the importance of undertaking new and continuing research on creative and innovative behaviours and attitudes, both in the theoretical and cognitive as well as empirical and application dimension, adequately to the main spheres of human activity (tourism in this article). The cognitive view on the subject matter of this article, the research objective, the organisation of work and its content refers in general to the field of social sciences and, more specifically, to the economic issues of spatial management on the example of tourism. The main stages of the conducted research are schematically presented in Figure 1.

Fig. 1: Model of the research approach applied in the article

Source: own work.

The main aim of the undertaken research is to identify (systematise and analyse) external determinants of innovative growth and economic development on the example of tourism companies in Poland and to recommend specific actions to improve the current situation within the scope covered by the research.

The research process involved the method of critical analysis of the source literature, especially in the theoretical part devoted to the issue of innovation in the context of economic growth and development. The empirical part was based on the analysis of the research material obtained by means of a survey and the observation method, while the application part uses mainly logical reasoning and the synthesis method.

Two surveys by means of questionnaires were conducted. The first survey was carried out in 2011 (Brojak-Trzaskowska 2012) and the second in 2016 (Brojak-Trzaskowska 2018). The questionnaires were sent out through the traditional means (by registered letter), and only a small group of business entities operating in the tourism sector were reached via the Internet. A total of 57 complete questionnaires were returned in the first survey and 254 correctly completed questionnaires in the second survey. The research sample, both during the first and second survey, covered a set of tourism business entities, diversified in terms of the organisational and legal form of tourism business, size of the enterprise (measured by the number of employees), type of business activity in tourism (accommodation, catering, tourist transport, sport and recreation and other related services, e.g. activity of tourist guides, entertainment and culture), sector and ownership form, as well as location by provinces [*voivodeships*] according to the administrative division in Poland, and the scope of activity.

Due to the complexity and multifacetedness of the research carried out, this article presents a comparative analysis only in relation to the main external determinants of innovative growth and development of tourism companies in Poland. This means that the analysis of the structure of internal determinants has been omitted as it requires a separate specific study and thus a more detailed analytical approach.

It should be stressed that both the first and the second study were carried out under relatively stable economic, political and social conditions. Therefore, the impact of specific conditions such as epidemics, threat of terrorism, armed conflicts and others has not been taken into account. These are extraordinary phenomena, difficult to predict, and a reliable and comprehensive assessment of their actual socio-economic impact, including their scale would be challenging. They should therefore be treated as crisis or crisis-generating situations, even if they do not ultimately trigger an economic crisis. This is best illustrated by the current epidemic situation and, especially, its global scope, i.e. the virus is not limited to a specific region but has a supra-state, supra-regional dimension – the effects of its spread may affect every sphere of human life and every individual, to a greater or lesser extent.

It is worth noting that tourism and transport are the sections of societies and economies which are most vulnerable to the adverse effects of the pandemic. This is in reference to the spread of COVID-19 (coronavirus SARS-CoV-2) throughout the world, and in particular to the consequences of the formal, legal and institutional solutions introduced in individual countries, which are more or less restrictive, and which directly or indirectly affect the movement of the population and thus tourism. This, as a result, may lead to a partial and in some cases even complete suspension of tourist traffic in certain areas, e.g. regions of Italy, but also in other parts of the world, including Poland.

In addition, the discussed phenomenon may have other implications, such as a general decline in demand for tourism and related products and services, taking into account spatial and temporal differentiation. In addition to health aspects (deaths, illness, absenteeism), formal and legal restrictions should be mentioned, especially those related to:

- partial or complete closure of national borders at a given time;
- restriction of liberty of movement in international traffic;
- partial reduction of transport mobility in domestic traffic;
- restrictions on trade, especially in large areas, in catering, entertainment, education, etc.

Strictly economic aspects are undoubtedly crucial, e.g. the increase in prices and, consequently, the rise in inflation, the decline in the population's purchasing power, stock market crash and others. In addition, the importance of psychological factors should be emphasised. It should be noted that these factors are not only significant now (during the pandemic), but may also exert an effect in the future, once the situation has stabilised. This effect includes aspects relating to fear, uncertainty and unwillingness to travel to places which have been affected by the pandemic or other phenomenon associated with a state of danger to human health and life.
This may result in a significant reduction in tourist traffic and tourism-related benefits.

Growth and economic development through innovation – cognitive and perceptive perspective

The subject matter of the research undertaken creates the need to systematise the discussed conceptual categories i.e. growth and economic development.

In the source literature, economic growth is usually defined through the prism of increasing production capacity in the economy, which in turn is determined primarily by the volume of tangible and intangible production, capital resources (not only financial but also human), investment and savings rates, as well as technical progress and the efficiency of institutions. They say so: Leszczyński (2018), Woźniak (2008), Fiedor(2007), Gordon (2016), Ostry, Berg (2017) and Pritchett (2000). It is important to underline that the main determinants of economic growth are also valid for economic development. However, this influence is particularly evident in technical and technological progress, changes in scientific, technical and innovation policy, efficiency of governance (both at the central and local government level), quality of human capital and investment processes.

An appropriate analysis of the term “economic development” on the basis of the economic sciences literature shows that this term refers to complex changes with a broader cognitive scope than economic growth, including institutional and structural transformations in the economy, e.g. with regard to the departmental and sectoral structure, as well as changes in the structure of demand and supply of specific goods and services at a given time and structural changes taking place in the labour market (Leszczyński 2018, Jaffee 1998, Ghosh 2013).

Modern economic systems and subsystems should be characterised by the interpenetration of activities aimed at economic growth and development. In comprehensive terms, this should not only be economic growth and development, but overall growth and development in the social and economic sphere, additionally including environmental requirements, and above all based on the initiation and promotion of creative and innovative attitudes. Such an approach, i.e. development and growth based on the social, economic and environmental triad, underlining the importance of knowledge and innovation, corresponds in fact to sustainable development principles.

In contrast to traditional economies, usually based on outdated industrial production and often oriented only towards economic growth, without simultaneous social and economic development – in modern economies and societies there should be a correlation between growth and economic development. It is desirable that these phenomena occur concurrently or alternatively with a slight time lag. The importance of information, knowledge and innovation should be emphasised as a major driver of economic growth and development in place of traditional resources, which, when used unskilfully, become useless.

It is worth noting that nowadays economic growth is usually identified with one of the main economic categories based on a quantitative approach, while economic development is based on qualitative changes. Implicitly, it may be indicated that, on the one hand, these concepts may be considered in terms of similarities, and, on the other hand, in terms of differences between them. By analogy, it may be stated that both growth and development are economic categories, essentially of an ameliorative nature (in terms of social and economic effects and consequences), conditioned by different external and internal factors. The second cognitive perspective of these phenomena, relating to the differences between them, implies that – as has already been indicated – economic growth is of a quantitative nature, while economic development of a qualitative nature. As a consequence, different indicators must be applied to measure them. For example, for economic growth on a macroeconomic scale, GDP is used (despite certain imperfections, this measure is widely used and generally accepted by practitioners and representatives of the scientific community, including economists), while on a microeconomic scale, e.g. for a specific business entity (company), such a synthetic measure is the financial result. The NEW (Net Economic Welfare), MEW (Measure of Economic Welfare), ISEW (The Index of Sustainable Economic Welfare) may be adopted to measure socio-economic development. Other options in this respect include the HDI (Human Development Index), which inter alia measures average life expectancy, levels of illiteracy (reading and writing comprehension), gross enrolment rates and GDP per capita. As regards the development of business entities, this may include an improvement in terms of customer service, product quality, etc. Furthermore, it should be stressed that the diversity of these conceptual categories is additionally reflected in the detailed structure of the factors determining them. This means that despite the identification of exo- and endogenous conditions, there are clear differences in their detailed specification.

When considering the examined issues in the context of enterprises (including tourism companies) as one of the key elements of economic systems (including the tourism economy), it should be noted that the growth and development through innovation of these specific business entities is determined by a set of factors which may be considered from two perspectives:

1. In general terms, when the examined factors are considered as a whole according to logical divisions based on transparent classification categories. If the source of these determinants is recognised as the main criterion for their division, external (exogenous) and internal (endogenous) factors may be distinguished. The source of the former is the widely understood environment of tourism companies, while the latter – the internal environment of these specific entities of the tourist economy, their human potential together with knowledge, skills, as well as technical, organisational and financial resources.
2. In more specific terms, based on a more thorough identification and analysis of the factors determining the innovative growth and development of tourism companies. Therefore, the following specific factors may be further identified in the established groups of external and internal determinants:
   a) in the group of external factors – macroeconomic, formal and legal or administrative and institutional or socio-cultural determinants;
   b) in the group of internal factors – economic and financial, organisational and management, intellectual and other determinants.

The presented systematisation is one of the possibilities in this respect. Another option may be based on a two-tier classification in which the in first level two basic groups are identified, i.e. demand and supply factors, while the second level involves their more detailed specification, i.e. further subdivision of the groups into specific subgroups, and even additional types and classes (within a given subgroup).

Among other classifications in the research area under consideration, the division into economic and non-economic determinants (Dziedzic, Skalska 2012, Dwyer, Forsyth, Dwyer 2010, Sinclair, Stabler 1997), as well as general and specific determinants may be indicated. General factors include the processes characteristic for the economy as a whole, such as: increasing leisure time resources, departure from the phenomenon of so-called synchronisation (combination of work, mobility and leisure), individualisation of consumer behaviour and, at the same time, customisation of products, as well as the increased importance of knowledge, customer requirements and the level of their education, and the increased importance of experiences of tourists. In the group of specific determinants, however, the following should be considered the most important: predominance of tourist services, complexity of the tourist product, susceptibility of the tourist market to changes, customisation of services and forms of recreation, digitisation of the tourist market, especially channels in the distribution system, which allows tourists to independently and freely compose travel packages, eliminating completely or to certain extent the involvement of travel agent. Other specific factors include: global standardisation as a consequence of globalisation processes taking place in the economy, the phenomenon of co-creation, which replaces the typical process of exchange on the tourism services market, the emergence of new, diverse needs and requirements of tourists, the growing importance of pro-ecological attitudes, the growing importance of regular customers, and the renewability (restitution) of demand for tourism services (Kachniewska, Niezgoda, Nawrocka, Pawlicz 2012, Niezgoda 2011, 2014).

Nowadays, innovations are present in almost every sphere of social and economic life (thus also in tourism). However, they are perceived and, consequently, defined differently. Literature review, as well as review of the opinions formulated by business practitioners, politicians and even the media on the understanding of innovation and its role in economic life and in society, allow us to conclude that despite many specific differences, numerous common (universal) aspects may be observed. There is a general consensus on the very core of innovation, which is identified with the novelty and pragmatism of creative ideas. Naturally, the range and level of novelty may vary. On the one hand, innovations may be absolute, radical, e.g. concerning new tourism products or the creation of new tourism markets. On the other hand, there may also be relative innovations which are related to the design and application of new elements in existing products or the improvement of existing solutions, such as marketing activities and instruments.

Economic and development through innovation – empirical and pragmatic perspective

In spite of the great diversity in the determinants of growth and development through innovation from the point of view of business entities in the tourism industry presented in the theoretical and cognitive section, the classification of these factors into external and internal groups was adopted as a reference for further research.

Table 1: external determinants of growth and development through innovation – exemplification of Polish tourism companies

Determinants	**Survey I – answers of respondents** (n = 57)			**Survey II – answers of respondents** (n = 254)		
	In absolute numbers	Share (in %)	Average number of indications per 1 respondent	In absolute numbers	Share (in %)	Average number of indications per 1 respondent
Macroeconomic	128	32.2	2.25	486	37.1	1.91
Formal and legal	156	39.2	2.74	418	31.9	1.65
Socio-cultural	114	28.5	2.00	406	31.0	1.60
Total	**398**	**100**	**6.98**	**1310**	**100**	**5.16**

Source: own work based on survey results.

The results of the surveys presented in Table 1 indicate that in the case of the first survey, the formal and legal factors prevailed in the structure of external determinants of growth and development of tourism companies, while in the second survey macroeconomic factors prevailed. Taking into account the percentage share of particular external determinants, the importance of macroeconomic factors increased by almost 5% in survey II compared to survey I. In the case of socio-cultural factors, this was an increase of 2.5%, while in respect of formal and legal aspects it was a decrease of 7.3%.

Too broad generalisation of the empirical data presented in Table 1 requires additional explanations, especially as regards the structure of individual determinants.

As regards the first survey, it should be noted that in the case of the dominant group of determinants of innovative growth and development of the tourism companies, i.e. formal and legal factors, particular indications of the respondents were as follows (in descending order): bureaucracy (22.2%), insufficient support for innovators by authorities and institutions at the local government level and heavy tax burdens in tourism (18.5% each), variability and low transparency of legal regulations concerning running a tourism business (almost 15%). Moreover, a relatively low percentage of issues related to difficulties in obtaining patents, as well as those related to the protection of intellectual property was observed (7.4% and 3.7% respectively). As regards macroeconomic determinants, one in four respondents had difficulty in obtaining external sources of financing for innovative activities, and one in five respondents experienced unfavourable economic downturn. Market factors, including those related to a limited sales market and lack of demand for innovative solutions, were of lesser importance for the surveyed entrepreneurs. Furthermore, it was determined that the tourism sector has generally not experienced problems related to a lack of information on innovation (including new technologies) or the establishment of innovation cooperation, e.g. with business environment institutions, other companies or representatives of the scientific community. In the group of socio-cultural conditions for growth and development of tourism companies through the initiation of innovative activities, the highest ranked aspect was failure to adjust the educational system

to the needs of business practice (25% of the total number of respondents' answers), distrust of the society towards implementation of changes, including innovations, lack of relations between science and business, and at the same time – lack of orientation of scientific activity towards the needs reported by entrepreneurs representing the tourism sector. As all of the factors indicated above inhibit innovative development of enterprises, it is worth noting a positive phenomenon, i.e. creative and innovative behaviours and attitudes, which – in the opinion of the respondents – characterise Polish society.

As regards the second survey, it should be noted that in the case of the dominant group of determinants of innovative growth and development of the tourism companies, i.e. macroeconomic factors, the indications of the respondents were as follows: low purchasing power of tourists (24.3% of all answers), limited demand for tourism services (19.7%), as well as unfavourable economic situation (16.5%). Slightly less important for entrepreneurs representing the tourism sector in Poland were difficulties in obtaining external sources of financing for activities aimed at development, including innovations (15.2%). The second most important group of determinants of innovative growth and development for the surveyed enterprises, i.e. formal and legal factors, included: heavy financial burdens relating to tourist business activity (almost 34% of the total number of answers provided by the respondents), excessive bureaucracy (slightly over 20%), lack of transparency of legal regulations (17%), as well as too frequent changes in legal regulations (13.9%). In the third group of factors, i.e. among socio-cultural determinants, the unfavourable structure and demographic changes in the Polish society obtained the highest percentage of answers, whereas the distrust of tourists towards changes initiated by tourist companies and lack of entrepreneurial attitudes in the nation were indicated relatively less frequently.

It should be emphasised that the examined categories of determinants of innovative growth and development of tourist companies in Poland are of a limiting (inhibitory) nature. Therefore, they are in fact barriers to this growth and development.

Conclusions

On the basis of literature review and empirical research, it may be concluded that in the case of innovative activities in the tourism sector, innovative cooperation, effective technology transfer (Pansiri 2008, Zhang, Song, Huang 2009, Shaw, Williams 2009) and creation of innovation networks are recommended and are considered by many researchers as the most effective path to implement and promote innovation (Burbiel 2009, Schepers, van den Berg 2007) and even stimulate and entrepreneurship in the tourism economy (Pikkemaat, Weiermair2007, Najda-Janoszka 2014, Faems, Van Looy, Debackere 2005). This applies in particular to the areas of the tourist destination (regional perspective), as well as to individual locations striving to perform and develop the tourist function (local perspective). Furthermore, numerous authors often underline the importance of, and at the same time the need for, further in-depth studies and research, not only theoretical and cognitive, but also theoretical and empirical on innovation and innovativeness in tourism(Hall 2009, Hall, Williams 2008, Sundbo, Orfila-Sintes, Sørensen 2007). In addition, crisis management in tourism should play an important role today(Sharpley 2005). Changes, such as globalization, emphasis on the sustainable development(Baghdadi 2019, Chew 2009, Wang 2010), the increase of clients' awareness, the importance of innovation and the pressure of competition, are the determinants affecting changes in the whole economy, thus entailing the service sector (e.g. the tourism sector).

In addition to these aspects, others may be pointed out, such as the fact that innovation in tourism should generate specific value for certain stakeholders, thus contributing to socio-economic development. It should be emphasised, however, that the value (economic, social, environmental, cultural, psychological or other), the interest group (tourists and so-called visitors, tourism companies, other competitive and cooperative business entities, local communities, business environment institutions, tourism organisations and associations, central and/or local government authorities or other stakeholders) and the degree of impact depend on various factors. These factors primarily include the reasons for a given undertaking or, in other words, the potential benefits from developing a given innovation in relation to its specific type, scope and applicability of an innovative solution, as well as the level of participation of a given interest group in innovation processes.

In the context of external conditions for the growth and development of tourist companies, it is crucial to render modern, alternative sources of financing of innovative activities more accessible to entrepreneurs, to minimise the adverse consequences of economic downturn. Furthermore, it is necessary to diversify the products and services offered by tourist companies and to customise them to the needs and expectations of customers, yet taking into account the competitive potential of specific tourism business entities, as well as coordinated promotion of branded tourist products and/or services with high potential together with the development of the tourist information system at a macroeconomic and mesoeconomic level. It is also recommended to diversify the distribution channels of tourist services, with a simultaneous differentiation in terms of instruments for sale stimulation, and to make the state's innovation policy more dynamic through system, institutional and administrative solutions, including a

comprehensive system of economic incentives (fiscal and non-tax ones, e.g. tax relief, technology credits and loans, subsidies) and non-economic instruments (simplification of administrative procedures, popularisation of innovative behaviour – development of innovation culture) encouraging entities of direct and indirect tourism economy to conduct innovative activity.

From the point of view of entrepreneurs providing services to tourists, it is important to increase transparency and reduce the frequency of changes in the applicable legal regulations concerning establishing and running a tourist business, as well as provide tourist companies with better access to external highly specialised advisory, information, promotion and training services, i.e. services supporting the functioning and development of tourism business.

Moreover, a major role may and should be assigned to the development of tourist infrastructure (primary and auxiliary), as well as accompanying facilities, attracting tourists by enhancing the image of Poland, individual regions and specific host locations with a high development potential in terms of tourism by means of the outstanding tourist values, building an integrated system of tourist information and supporting and coordinating activities of the business environment for the benefit of tourist development at various levels of the economy by supporting the creation and diffusion of innovative undertakings in tourism.

It is important that the recommended solutions are not solely declared, but actually implemented.

Benchmarking in The Armed Forces – A New Field of International Cooperation

Janusz MATERAC and Zdzislaw KNECHT

General Tadeusz Kosciuszko
Military University of Land Forces,
Wroclaw, Poland

corresponding author e-mail: jmwielun@gmail,com
author e-mail: zknecht@wp.pl

Abstract

The article aims to diagnose the application of the benchmarking concept in the Polish Armed Forces. The article describes the research methodology and presents the benchmarking partners of the Polish Armed Forces. Next, the "Lessons Learned System" functioning in the Armed Forces is presented as a benchmarking tool. In the following part of the study, there are given selected examples of its application. Conclusions from the conducted research are described in the context of applying and extending benchmarking use in the Armed Forces. A parallel goal is to bring the scientific staff and readers of the scientific periodical closer to the military benchmarking field of international cooperation.

Keywords: Benchmarking, Polish Armed Forces, Management Concepts

Introduction

If benchmarking is to be understood as a management concept in which an organization "*compares itself with the best ones, sets the course for the best products and services provided, and acquires knowledge from partners and competitor*" (Zimniewicz, 2009, p. 43).

As far as the Armed Forces are concerned, this is even more important, because armed conflicts are practically confrontations of military capabilities. Contemporary conflicts, especially the so-called hybrid warfare, in which the very clash of troops is already the end of the conflict, prove the concept. Political and strategic multilateral preparations precede them.

Thus, since the dawn of time, the armed forces have been organizations watching solutions of both their enemies and allies. The armed forces must continuously expand their knowledge and acquire the most effective technical means. Such data is necessary to catch up with or surpass the leaders.

The article is a stage of a research project aiming to answer the question: Are modern management concepts applied in the Polish Armed Forces?

Research Methodology

The research problem was the question: Is the management concept of benchmarking used in the Polish Armed Forces? The objective of the research was to diagnose the application of benchmarking in the Polish Armed Forces. For the study, a hypothesis was adopted for verification: the concept of benchmarking is used in the Polish Armed Forces. The following methods were employed for the research:

- standardized interview;
- participatory observation;
- analysis of legal acts and source materials.

Cite this Article as: Janusz MATERAC and Zdzislaw KNECHT "Benchmarking in The Armed Forces - A New Field of International Cooperation" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

A questionnaire was prepared to conduct a standardized interview in order to solve the research problem. The following questions were formulated:

1. Is benchmarking used in the Armed Forces of the Republic of Poland?
2. What are the fundamental objectives of benchmarking applications in the Polish Armed Forces?
3. Which types of benchmarking are used in the Polish Armed Forces?
4. What are the practical examples of the application of this concept?
5. What is the main driving force for using the concept?

12. What are the essential documents that standardize or support the application of benchmarking in the Polish Armed Forces?

The research was carried out in 2019 and covered officers who performed duties of personnel supervising the implementation of the "Lessons Learned System" (Polish abbrev. SWD), (Manual, 2014). These were specialists of the tactical level, appointed to the SWD structures by their respective command. In total, 17 structured interviews were conducted.

Benchmarking partners of the Polish Armed Forces

Finding the right partner is believed to be one of the essential elements of the benchmarking concept. The partner can be internal, external, or functional (general). As a NATO member, Poland has gained many benchmarking partners and has opened up to extensive cooperation between allied Armed Forces.

Over the years, the Polish Armed Forces have participated in many overseas missions; these include Organization for Security and Cooperation in Europe (OSCE), United Nations (UN), North Atlantic Treaty Organization (NATO), or cooperation with the United States troops. The largest Polish overseas missions were Iraqi Freedom in 2003-2008 in Iraq and International Security Assistance Force in Afghanistan in 2004-2014. The participation of Polish troops in those operations allowed the Armed Forces to open up to the world. It gave the opportunity to cooperate side by side with their allies. It allowed for the observation of the best and latest solutions in the military field (Rudaś, Kramski, 2012).

Another opportunity to benefit from the knowledge and experience of world leaders of military craftsmanship is provided by the presence of allied troops in Poland (Materac, 2019). On 8-9 July 2016, the first North Atlantic Alliance Summit was held in Poland. Summit meetings are held at the level of states and heads of governments (Soloch, Pietrzak, 2016). During this important event, key decisions were taken for the security of Poland and the entire region. Thanks to these decisions, allied troops are stationed on Poland's territory, and command structures of NATO and United States troops have been deployed on the eastern flank. The allied troops currently staying on the Polish territory are implementing two initiatives (MON, 2020):

- NATO (eFP);
- US (Atlantic Resolve).

As mentioned above, all the opportunities are a basis for cooperation with external partners within the framework of benchmarking. The presence of the allied forces, the possibility of permanent observation of their actions and solutions applied in practice are an excellent chance for the development of the Polish Armed Forces. Polish soldiers can learn from the best and later implement the acquired knowledge.

The Lessons Learned System as a benchmarking tool

As already noted in the introduction, since the beginning of history, the Armed Forces have tried to use lessons learned from won or lost wars. One of the war objectives has always been the improvement of applied strategies, operational art principles, and updating doctrine, organization, and armament (Jabłoński, Lis, 2012). To benefit

from the experience gained effectively, appropriate regulations, procedures, and tools, such as the benchmarking method, are required.

Most of the borrowed solutions and lessons learned transferred between the allied armies come from the allied armies within the North Atlantic Alliance (Manual, 2014). They fit precisely into the benchmarking concept, which assumes the comparison to the best and catching up with them (Zimniewicz, 2009). Polish soldiers have drawn their solutions mainly from the United States Armed Forces. Given the above, an appropriate system of collecting, gathering, and disseminating experience from operations conducted outside the country was created in 2007. Changing external conditions and essential operational needs forced the system to evolve in 2012. The old system was replaced by a new - national and universal Lessons Learned System (SWD) (Jabłoński, Lis, 2012).

The holistic and comprehensive incorporation of lessons learned in military activities is closely related to management theory and practice (Manual, 2014). The ideal field of the application here is the Armed Forces, operating under conditions of constant change.

Methods and procedures for gathering, analyzing, and finally utilizing experiences function in most countries of the North Atlantic Alliance and the European Union. The development and continuous improvement of these systems is a priority. They bring measurable benefits, transforming into (Manual, 2014):

- improvement of training results;
- implementation of the best organizational solutions;
- use of higher quality equipment and armaments;
- increasing the effectiveness of the use of troops in operations;
- enhancement of soldiers' safety.

The document which practically norms the principles of functioning and organization of the system of experience use is *Instrukcja Systemu Wykorzystania Doświadczeń (the Manual of the Lessons Learned System)* developed by the Center for Doctrine and Training of the Armed Forces. It takes all standards binding in the North Atlantic Alliance into consideration. With this, the Polish national system is consistent with Lessons Learned standards used in NATO, the European Union, and other allied armies (Manual, 2014).

The Lessons Learned System is a way of gaining knowledge, integrating knowledge, and managing change (Manual, 2014). The elements of these two management concepts are presented in Table 1.

Table 1: Knowledge management and change management elements

Knowledge management	**Change management**
Identification of observations	Planning the implementation of corrective actions and setting up tasks
Analysis	Implementation of corrective actions
Dissemination	Verification of corrective actions

As a process of applying experiences, the Lessons Learned System (SWD) consists of the following stages (Manual, 2014):

1. identification of observations,
2. analysis of observations,
3. planning the implementation of corrective actions and setting tasks,
4. implementation of corrective actions,
5. verification of implemented corrective actions.
6. dissemination.

Although the SWD Manual does not define the process of using lessons learned as benchmarking, it can undoubtedly be stated that anatomically it is identical with the essence of benchmarking and closely related to it, because observation is present in the benchmarking process and the SWD. In benchmarking, it is directly defined as understanding and documenting the processes implemented in the partner (Andersen, 1995). However, using the SWD Manual, an observation should be treated as a description of events and factors that affect the organization's functioning.

The objects of observation in the SWD are not limited since it is impossible to predict the situation, undertakings, and events requiring correction in the future (Coursebook, 2014). The main difference between these two

approaches is the place of observation in processes. In the SWD, it constitutes the first step, but the third one in the approach proposed by B. Andersen. The stages of the proceedings in other items of literature are described as presented in Figure 1.

Fig. 1: Repeated stages of the SWD in the benchmarking process

A working document, used by soldiers to inform about their observations, is the "Observation report sheet," as presented in Figure 2. It provides the observer's necessary data and observation data. The author of the sheet then places the causes of the event, conclusions, and recommendations accordingly (Manual, 2014).

The course of action described in it gives the possibility to conduct observations at foreign partners - allies Due to apparent reasons resulting from the arms race, the activity of the Armed Forces is widely secret and, therefore, the use of benchmarking activities in the allied structures has a value and importance challenging to assess.

Observation Report Sheet

First name		**Surname**	
Rank		**Organizational cell/unit**	
Post		**Military Branch (equivalent)**	
Telephone			
Fax.		Open email	
Mobile phone		Mil-Wan email	

Date of observation:
Title:
Specifying the main observed event, problem, negative phenomenon, good practice.

1. **Type of activity:**

Specifying the area of activity where the observation took place, e.g.: international operation, exercise with troops, staff training, training activities, functional component of capabilities, etc.

2. **Description of the observation:**

Brief description of the event. Providing a concise description of the problem, negative phenomenon, or good practice.

3. **Reasons for the event:**

Identifying the causes of the event with the reasons and circumstances that influenced its occurrence. Detailing the observation with answers to questions according to the scheme: who, what, where, when, why, and how. Precise presentation of actions that were taken to eliminate the problem or negative phenomenon and indication of reasons why it was not solved (no data from previous points of the form repeated).

4. **Conclusions:**

A concise and logical summary of the observed causes and effects of the negative event or good practice.

5. **Recommendations:**

The proposal should include, if possible, recommended corrective actions and their contractors. Indicating actions to be taken (e.g., making positive changes, improvements) to avoid a repetition of the observed problem, and proposing corrective actions to the contractor. These could be, for example, actions to change instruction records, publications, procedures, reorganize command structures, improve training processes, equipment, etc.

Examples of the use of benchmarking in the Polish Armed Forces

An example of the application of benchmarking in the Polish Armed Forces is the "Leadership Training System" and its essence: *a purposeful integration of the development of individual personality traits and substantive, performance, and social competences acquired by cadets in the course of their studies. The system is based on the American experience, currently implemented by the US Army within the West Point Leader Development System, as well as on university experience gained through extensive international cooperation in the scope of implemented projects and courses* (Military University, 2020). The way of transferring knowledge changed within the framework of the system. It is not only transferred by lecturers (instructors), but also between cadets themselves. The method is modeled on solutions implemented for years at West Point. Through these activities, the University aims to *create the so-called "character leaders," who will show significant effectiveness in the realization of tasks set for an officer of the 21st century"* (Military University, 2020).

Another example of "borrowing" from the American Armed Forces is the "*Concept of Development of the Professional NCO Corps* (The Minister of Defense, 2018)." According to that concept, the new organization of the Armed Forces is to draw on the proven experiences of the allied countries. A team was formed which took advantage of the comments of experts and non-commissioned officers in formulating the new concept (PAP, 2020). The concept defines the role of a non-commissioned officer as a leader, who must build a team, motivate soldiers, and effectively command them. It is connected to gaining the necessary knowledge from the Americans and borrowing it in the training processes.

An example of using benchmarking in the native Armed Forces is the field uniform WZ 2010. The previously used uniform WZ 93 has been criticized. It was accused of poor functionality on the current battlefield, confirmed during missions in Iraq and Afghanistan. Many times, there were situations that a Polish soldier went on patrols in an American uniform (Bączyk, 2008, p. 46–47).

The consequence of these events was the decision to design and introduce a new, safe uniform. It was preceded by analyses, evaluation, and tests conducted by soldiers during overseas missions (PKW Afghanistan, PKW Chad, PKW Iraq). It was a novelty in the implementation of innovations with the participation of methodology known in

benchmarking and common in the civil economy (Szulejko, 2008). Many changes have been introduced to the Polish model, and "borrowings" prove the value of benchmarking practice.

It should be added that such tendencies are becoming increasingly common between science, economy, and the Armed Forces. They are patronized by the Armed Forces Command suggesting organizing joint exercises with representatives of business executives in the future: "...it would be beneficial to both sides, would overcome some mental resistance resulting from the historical burden, and develop new habits and competencies, allowing for even more effective command...(Andrzejczak, 2018)."

The software-based on SAP Business One, using ERP (Milewski, 2014) solutions, and the Integrated Multi-Level National Defense Ministry Information System (Polish abbrev. ZWSI RON) (Decision, 2008) exemplify the implementation of solutions used in the civil environment in the Armed Forces. These systems are designed to increase efficiency and profitability. Their task is to support the decision-making process. Easily accessible and transparent data enable that. Global corporate giants apply this type of software. The system operates based on a secured, departmental ICT network - MILNET-Z (Cyberdefence, 2020). SAP Business One is a solution designed to meet the specialized needs of organizations and enterprises. The software performs a wide range of functions such as management of finance, production, warehouse, or customer relationship, as well as reporting and procurement. The system allows for its adaptation and implementation in a short time.

The adapted sets of SAP for Defense & Security solutions that allow for the improvement of transparency of possessed resources and assistance in making decisions are dedicated to the Armed Forces worldwide. Another advantage of this system is the reduction of costs and reaction time (Milewski, 2016, p. 216). Minimizing the use of resources is one of the primary objectives of military operations. Appropriate use of resources often determines the success of operations or missions. Software such as SAP allows for a meaningful review of resources with the use of existing knowledge. Thanks to such measures, the user saves time and money. The importance of this activity can also be attributed to building the Armed Forces prestige as an organization implementing innovations and improvements, and which is efficient and prone to progress (Wełyczko, Kałużny, 2010).

The illustrations presented in the study are examples of "borrowings" introduced to the Polish Armed Forces, both from allied Armed Forces and the civilian environment. The issues discussed concern implementations in the whole structure of the Armed Forces, starting from a military education. The military uses benchmarking borrowing from the lessons learned of civil organizations, implementing proven tools. The illustrations given have been selected from a wide range of benchmarking practices in the Armed Forces. Attempts were made to select more recent examples of its application. The presentation of the examples, however, is significantly limited due to the confidentiality of processes taking place in the military. The above examples are open and have been confirmed by media reports or publications.

Conclusions from research on the application of the benchmarking concept in the Polish Armed Forces

The first interview question asked whether benchmarking is used in the Polish Armed Forces. The answer was positive, although this fact is not described by clearly defined normative documents. The armies are constantly watching the solutions implemented by someone, both in allies and enemies. The data collected is essential to catch up with or outdo leaders. In the next question, an attempt was made to examine the validity of the benchmarking objectives. It was pointed out that the primary purpose of applying this concept is to increase operational capacity continuously. When using benchmarking methods, the military gains essential data necessary for more effective training of soldiers. By comparing procedures used in different armies, the Armed Forces are able to choose the best solutions in a faster, more straightforward, and cheaper manner. Soldiers are stimulated to create new concepts of classes; the innovativeness of the Armed Forces as the whole is increased.

In the further part of the interview, an attempt was made to determine which types of benchmarking defined in the subject literature and employed in the Polish Armed Forces. While considering the subjective approach, it was found that internal, competitive, and functional benchmarking is used in the Armed Forces of the Republic of Poland (Adamik, 2015). The use of internal benchmarking is manifested by the fact that military units taking part in joint exercises observe and compare the ways of task execution or procedures.

The basis for the use of competitive benchmarking is contacting with the Armed Forces of other countries, mainly within the North Atlantic Alliance.

In the simplest terms, the use of functional benchmarking can be explained by "borrowings" from civil organizations or management sciences and introducing them to the Armed Forces.

It was then recognized that the driving force behind the application of the benchmarking concept is Poland's presence in the NATO structures. Lagging in modernization and incomplete unification of the training of Polish soldiers in relation to their foreign colleagues, determine the benchmarking as an apt tool for development and continuous improvement. Using solutions that have been proven from conflicts and stabilization missions around the world is an excellent opportunity for the Armed Forces. It saves time and money and, last but not least, soldiers' physical and mental health.

The vivisection to indicate conditions conducive to applying this concept in the Armed Forces indicated that it is primarily having a benchmarking partner. This task is currently facilitated by the presence of the Polish Armed Forces in NATO. Thanks to this, the Polish Armed Forces can take advantage of the best solutions. Currently, there are many allied troops on Polish territory, which facilitates observations.

As for the matter of how the process works in the Armed Forces, it was considered that it is similar to most of the processes of this type known in practice. Moreover, when comparing the course of the classic benchmarking process with the processes of knowledge management and change management described in the Manual of the Lessons Learned System, it was indicated that there are insignificant differences. They relate to the fact that it starts with the identification of observations, and the benchmarking process starts with the specificity of planning, depending on needs.

As regards the identification of an institution applying or supporting the application of this concept, everyone stressed the role of the Center for Doctrine and Training of the Polish Armed Forces as an entity liable for the use of experience at the political-military level and the Inspectorate for the Implementation of Innovative Defense Technologies.

The Centre is an independent organizational unit operating within the Ministry of Defense. Its tasks include standardization in the operational area (allied and national) and collection and use of lessons learned gained. It is also responsible for experimenting and searching for new abilities or concepts of the Armed Forces' training. Implementing these tasks is essential for the modernization of the Polish Armed Forces and ensuring their compatibility with the allies within NATO.

Besides, the interviewees were well familiarized with the objectives and tasks of the Inspectorate for the Implementation of Innovative Defense Technologies as an institution responsible for the identification, analysis, and monitoring of innovative technology development. The activities aim at the introduction of new weapon systems and military equipment. In addition, the process of using the lessons learned is implemented at each command level and is executed by the designated structures depending on the command level.

In the further part of the interview, an attempt was made to identify barriers in the application of benchmarking in the Armed Forces. The organizational culture, related to the application of this concept, was indicated as essential, as the Armed Forces are a hierarchical organization based on numerous normative documents. Therefore, the introduction of new procedures or solutions requires opinions at many levels and thus extends over time.

In the next question, an attempt was made to indicate the period in which benchmarking began to be implemented in the Armed Forces. The use of this concept was closely related to Poland's efforts to become a NATO member. The Armed Forces had to adapt to its western allies. Overseas missions, during which Polish soldiers have had contact with NATO partners, are another significant stimulus for the development of benchmarking in the Armed Forces.

It was then probed how the specifics of the service changed after the implementation of benchmarking. It was concluded that benchmarking has a positive impact on functioning. The introduction of the latest solutions, procedures, or technologies increases the Armed Forces' operational capabilities. The application of benchmarking appears essential for the Armed Forces' permanent modernization as an essential guarantee of security. This concept improves the operation of the entire Armed Forces, from increasing the comfort of an ordinary soldier who has received a new uniform pattern to reforms in the modernized system or training in the officers' corps.

In the last question, an attempt was made to identify the essential documents that standardize or support benchmarking. The interviewed persons stated that there are no unequivocal documents concerning benchmarking. However, when taking the documents containing its essence into account, the Manual for Lessons Learned System can be listed. Another document was once the Decision No. 161/MON of 9 April 2008 on rationalization activities in the Ministry of National Defense. Currently, that document is no longer valid. However, there is an approval for

this kind of innovation, hence the postulate to popularize the essence, principles and appropriate regulations in the formal implementation of benchmarking is increasingly urgent.

Conclusion

The Armed Forces of the Republic of Poland is an organization with a structure of over one hundred thousand people (soon one hundred and fifty) and a budget of 2% of GDP. The responsibility facing the Ministry's decision-makers, commanders of Military Units, or administrators of state budget funds should force them to know, adapt, and apply proven management concepts and other global solutions. That includes the concept of benchmarking.

The accession to the structures of the North Atlantic Alliance can be compared to the opening of the once closed economy to the global market. As in globalization processes, the military is forced to standardize their actions, unify processes, and adapt to new partners. Undertaking these actions is a challenge, characterized by a considerable number of problems and spread over a long period. On the other hand, this need should be understood as an opportunity to leave the periphery of the "military world" and join the most modern armies.

The concept of management that undoubtedly makes it possible to implement the actions mentioned earlier is benchmarking. The specificity of the Armed Forces and their somewhat specific adaptation of benchmarking - in the authors' opinion - has considerable cognitive values for its application in other activity segments: companies, social organizations, administration, or, as is currently the case, the occurrence of global threats. Here, a good case is the current coronavirus protection action, entrusted to a large part of military medical and military structures recognized as efficient and competent. Generalizing the problem of using this method of improving the Armed Forces, there is still a need and possibility to make full use of benchmarking, its potential, and capabilities. There are plenty of civil organizations' experiences in the use of benchmarking in management, so the authors believe that it can be used more fully in command, which is sister to management.

The benchmarking discussed in the paper is a somewhat anonymous field of international cooperation. Its specific feature is - as opposed to know-how - the lack of need for funding. However, its scope depends on the military responsible for those activities: on their cooperation with the industry, the armaments industry, and the research and implementation activities of military universities. It depends on the scientific activity of military inventors and implementers and scientific activity and careers. When it comes to the development of cooperation between the economy and the military, the authors recommend benchmarking. It can play an essential role as a specific economic activity, having more benefits, because not only economical, but also social, defensive, and with excellent development prospects (Gutt et al. 2013, p. 257). It is worth remembering that in the sphere of military technology, the highest-ranking raw materials, goods, or products tested even in space are made. Like everything that concerns social support, the descriptive activity can also be adequately supported by its promotion (Knecht et all. 2013, p. 2013).

Shaping the Armed Forces' Image During the Covid-19 Epidemic Based on Territorial Defense Forces' Activities

Janusz MATERAC and Zdzislaw KNECHT

General Tadeusz Kosciuszko
Military University of Land Forces,
Wroclaw, Poland

corresponding author e-mail: jmwielun@gmail,com
author e-mail: zknecht@wp.pl

Abstract

The article presents information activities in the Polish Armed Forces, conducted by Territorial Defense Forces (TDF) units in the coronavirus epidemic outbreak era. They are presented in the context of image-building activities of an individual unit; then, there are made analyses and generalizations, which are original recommendations for further activities. To some extent, the article reflects the usefulness of military actions in the event of a crisis and other manifestations of danger. Based on the image-related activities, the anti-crisis operation code-named "Resilient Spring" was presented, along with an analysis of the 14th West Pomeranian Territorial Defense Brigade's participation. The recommendations for building a positive image of the Territorial Defense Forces in the future were also suggested. The experience gained in the special, challenging conditions of the epidemic, or cooperation with other uniformed services, allowed proposing new activities of shaping the Armed Forces' image as a formation serving the society in times of peace.

Keywords: Crisis, Epidemic, Territorial Defense, Brigade

Introduction

In the event of a crisis, it is possible to verify the usefulness of the entities responsible for counteracting, reacting, and overcoming the crisis. There are many such organizations and the nationwide crisis management structure is the coordinator (Pieterek, 2018, p. 87).

In many countries, such as the USA, Italy, or Sweden, in the event of crisis situations, it is the territorial defense units that coordinate the control of most symptoms of the crisis (Polcikiewicz, 2016). In Poland, the Territorial Defense Forces are tasked to be ready to defend local communities, including counteracting the effects of natural disasters and fighting them, and carrying out rescue operations in crisis situations (Pytel, 2020).

In Poland, Territorial Defense Forces were established in 2017, and the process is still being continued (Stachowicz, 2017). The process of forming subsequent brigades by voivodship allowed individual units to take over Permanent Regions of Responsibility throughout the Republic of Poland territory. Not all regions have established battalions for territorial service following the law, tasks, and powers set for this structure. Therefore, the undertaken topic is a vivisection of this new military organization's practical testing in Poland and its prospects. Based on the actual events and the anatomy of the taken actions of an image-related nature, it was possible to analyze public relations programs in this formation that have not yet been verified (Dojwa, 2013). Taking up this topic has specific cognitive values, as it enables the adoption of appropriate recommendations for further activity.

Characteristics of the operation code-named "Resilient Spring"

In Poland, the first case of the coronavirus Covid-19 appeared on March 4, 2020. The threat of this disease caused that on March 6, 2020, the Armed Forces, for the first time after 1989, engaged in anti-crisis operations on such a large scale. On March 12, 2020, the Territorial Defense Forces changed the model of functioning from training to anti-crisis [Internet 1], and from March 18, 2020, they began an anti-crisis operation under the code name "Resilient Spring" [Internet 2].

Cite this Article as: Janusz MATERAC and Zdzislaw KNECHT "Shaping the Armed Forces' Image During the Covid-19 Epidemic Based on Territorial Defense Forces' Activities" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The purpose of this operation is (...) *to mitigate the effects of the crisis and strengthen the resilience to the crisis of local communities, support all local government and sanitary institutions providing aid (...) support the Border Guard and the Police* (...). To rationalize the activities of TDF troops as part of this operation, those in need were classified and groups of people covered by support. They were [Internet 3]:

- *families of health professionals involved in preventing the spread of the virus,*
- *combatants,*
- *veterans of operations outside the country,*
- *elderly people over 60 years of age,*
- *disabled people,*
- *single parents,*
- *quarantined persons.*

The operation in terms of media coverage was marked (tagged) with hashtags classifying individual activities into groups for information purposes and rationalization of cooperation with the society [Internet 3]:

courage - helping families of medical staff, the disabled, people in quarantine;
tradition - they also support combatants and the elderly;
#brotherhood - support for the charges of social welfare centers and Caritas (foundation, nongovernmental organization) of individual dioceses;
responsibility - specially selected soldiers, who are less than 45 years old, delegated to the operation do not suffer from chronic diseases and do not report any health problems;
psychological assistance - 24-hour, free, nationwide psychological help line;
blood donation - blood donation in brigades, military education institutions and individual blood donation by soldiers
#always ready - activities related to the formation creed - "I am a helping arm and shield to my community."

At the peak of the operation, even 5.5 thousand Territorial Defense Forces soldiers and cadets from military education institutions participated in it every day. From the beginning of the operation, 16.5 thousand Territorial Defense Forces soldiers were involved, which constituted nearly 70% of the formation, 80% of them were soldiers – volunteers [Internet 4].

The areas of activity of the Territorial Defense Forces during the operation "Resilient Spring" are presented in Table 1.

Table 1: Support provided by the Territorial Defense Forces during the fight against the Covid-19 virus

TDF support	
Hospitals and sanitary services	Construction of field emergency rooms, Staff assigned to work in medical care, Support for staff families, Triages, interviews, temperature measurement, Taking swabs, Blood donation.
Local Government and Non-governmental Organization (NGO)	Food distribution, Distribution of anti-crisis measures, Medical and logistic support for nursing homes (DPS), DPS evacuation - Crisis Intervention Teams.
Border Guard	Surveillance of the state border, Border crossing control, Help for travelers.
Police	Preventive patrols, Quarantine monitoring.
Material Reserves Agency	Securing three logistic warehouses, Transport of materials to end users.
Civil Aviation Office	Sanitary and epidemiological control of controllers and crews, Sanitary and epidemiological control of passengers, Collecting location cards.
Individual and social resilience	Demonstrating presence, Education / Building awareness, Helping people in quarantine Help for people in need and combatants, Line of psychological and pedagogical support.

The activities of "territorials" as part of the operation were widely reported in the media. The TDF commands' activity corresponding with public relations and contributing to the deepening of cooperation, and thus the effectiveness / efficiency of work of this still little known in Poland military organization established to directly serve the society (Black, 2018), deserves attention. Information on the formation's activities is available on the TDF website - in the Crisis Management / Resilient Spring tabs. The Territorial Defense Forces also widely covered their activities in social media - mainly on Facebook and Twitter.

Building a positive image among the local community during the implementation of anti-crisis measures by the 14 BOT (during the promotional activity of 14 BOTs subject to analysis, evaluation, and recommendation)

The subject of the analysis was the work done to shape a positive image of the organization during anti-crisis activities (Knecht, 2018). The authors analyzed reports and media reports on the 14 BOT (the 14th Territorial Defense Brigade). In addition to the analysis of media messages, the study also used the participant observation method. The works covered the period from March 12, 2020 to May 11, 2020, which is the hottest intensity of work to counteract the restrictions of the pandemic. A summary of media reports from the discussed period is presented in Table 2.

Table 2: List of media reports

Period	Type of media	Number of publications	Topic
March 12, 2020 - March 19, 2020	Local TV	1	- Information on sending West Pomeranian territorials to the borders and deploying them to help with medical services.
	Newspapers / Internet local portals	9	- Zachodniopomorskie territorials conduct patrols, support border guards, and help veterans - West Pomeranian territorials support border guards and help veterans
	Press service	1	- Territorials to fight coronavirus
	Radio	1	- Territorials bring help
	Nationwide newspapers / portals	1	Soldiers on the border. They support border guards.
	National portal on security and defense	1	- Characteristics of the brigade's operations during a pandemic
	Paper-based press	2	- Territorials at the borders
March 20, 2020 - March 31, 2020	Newspapers / Internet local portals	7	- Territorials help Caritas fight the epidemic - Food transport for the commune (Karlino - people were in quarantine there). - Blood donation campaign
	Paper-based press	6	- Support for border guards - Territories help Caritas. - Food transport for the commune of Karlino - Information on the activities of TDF soldiers.
	Radio	3	- Support for Caritas in food transport - Help for the commune and the food bank. - Territorials' actions.
	National portal on security and defense	1	- Adoption of "dark and silent" as a patron (Heroes of the Polish Underground during World War II)
	Office website	1	- Food transport
	Local television - material and reportage on the website	2	

April 1, 2020 – April 4, 2020	Newspapers / Internet local portals	8	- Blood donation - Unloading gifts for the Polish Red Cross (PCK) - Support for the commune and NGOs - Organization of food shipments - Helping foundations - Cooperation with the Police
	Paper-based press	3	- Blood donation - Helping foundations - Cooperation with the Police
	National portal on security and defense	1	- Aid for NGOs, MOPS and veterans
	Social media	1	- Joint TDF and Police patrols
	Radio	4	- Helping foundations - Food transports - Cooperation with the Police - Support for the health care
	Local TV	1	- Aid to the food bank
	Nationwide television	1	-Aid to the food bank
	Other web portals	1	- Helping foundations
April 11, 2020 – April 20, 2020	Newspapers / Internet local portals	12	-Support for medical services -Easter in the barracks -Support for DPS
	Paper-based press	2	-Aid for medical services
	Social media	2	- Transports for the health service -Support for DPS
	Radio	4	-Easter in the barracks -Support for medical services -Support for DPS
	Local TV	1	- Support for DPS - Aid for DPS
	Nationwide television	2	
	Other websites	1	
	Nationwide portals	2	
	Office website	1	
	National portal on security and defense	1	
April 21, 2020 – April 30, 2020	Newspapers / Internet local portals	10	- Organization of Crisis Intervention Teams - Summary of the month of activities - Help for animal shelters
	Paper-based press	1	- Help for animal shelters
	National portal on security and defense	2	
	Social media	5	
	Radio	4	- Summary of the month of activities - Help for animal shelters
	Local TV	2	- Summary of the month of activities - Help for animal shelters
	Nationwide portals	4	- Help for animal shelters
May 1, 2020 – May 11, 2020	Newspapers / Internet local portals	9	- Distributing food to the poorest - Helping animal shelters

			- Mobile coronavirus testing - Organization of drive-thru +3 points - Food transport - Organization of drive-thru points - Food transport
	Paper-based press	4	-Helping animal shelters - Support for Nursing Homes - Food transportation - Organization of drive-thru points
	National portal on security and defense	1	- Giving food to the poorest - Appealing to join TDF
	Social media	2	- Food transport
	Radio	50	- Organization of drive-thru points - Food transport
	Local TV	2	- Organization of drive-thru points - Food transportation
	Nationwide portals	3	- Appealing to join TDF
	Nationwide television	4	- Giving food to the poorest - Appealing to join TDF
	Office website	1	- Organization of drive-thru points

The period: March 12, 2020 - March 19, 2020

In the first week of anti-crisis activities, 16 publications on activities carried out by the 14 BOT appeared in the media. The main task performed by West Pomeranian territorials in the first week of anti-crisis activities was to close the borders of the Republic of Poland. Information on cooperation with the Border Service appeared in all 16 publications concerning 14 BOT.

The strong publicity of the brigade's activities in the first week of the operation was a proper marketing procedure. Since the unit operated in Szczecin for several weeks, frequent information about the 14 BOT allowed to instill in the local community the knowledge about the existence of the Brigade and its tasks in crisis situations. Public relations activities, in addition to building awareness of the newly created Brigade, made it possible to reach potential recruits with information. The positive image of the TDF soldiers helping in a crisis presented by the media encourages young people to join the Armed Forces and take up military service.

The greatest number of publications about the Brigade appeared in newspapers, websites, and local websites. Considering that the target group in the recruitment processes for the unit are young people from the West Pomeranian Voivodship, which is the Permanent Responsibility Region (SRO), the Brigade is obliged to look for people willing to serve in the military.

The media coverage also raised the subject of territorial cooperation with other services, primarily medics and fire brigades. That allows the residents to become aware of the nature of TDF activities - it is not only training, but also providing help in times of crisis. For shaping a positive image, such activities are an effective tool for consolidating a positive image (Knecht, 2006).

It should be emphasized that information about BOT activities appeared in all media (except social media). Most of the information was in the local media, but there was also an interview with the commander of the 14 BOT on the nationwide Defence 24 industry website. Thanks to this, the knowledge about the Brigade's creation and scope of activities could be transferred across the country.

The period: March 20, 2020 - March 31, 2020

In the next ten days of operation under the code name "Resilient Spring" 20 media publications on the 14 BOT appeared in the media. In the next ten days of the operation, the tasks reported in the media changed. The main media "burden" concerned the coverage of food transport for Caritas (a foundation - non-governmental organization) and people in quarantine. Support of NGOs (non-governmental organizations) such as foundations built a positive reception of the Brigade and shaped the image of a soldier (a territorial) characterized by

brotherhood. Support for people in quarantine was the main media topic in the discussed period. The number of publications on the activities of the 14 BOT on local websites, portals, and newspapers was similar to the number published in paper form.

Information about the choice of a patron by the 14 BOT has appeared on industry websites. That is the only information not related to the operation code-named "Resilient Spring".

At the end of the period in question, the topic of blood donation by soldiers appeared; it as important from an image point of view. The military has been one of the most active in this area for years (Strąk, 2020, p. 98).
Media coverage in this period created the image of a soldier who fulfilled not only orders or official tasks but was also a member of the local community, providing help to those in need (Klein, 2019). It warms up the image of the Armed Forces and brings it closer to people. The Armed Forces ceased to be a hermetic organization. Soldiers are no longer perceived as an organization prepared for the time of war, but they are always useful, efficient and well-organized, as was proved in life during the current pandemic. It is the Armed Forces that respond to those called even in an emergency.

The period: April 1, 2020 – April 4, 2020

During the discussed period of the operation code named "Resilient Spring", there were 20 publications on the activities of the 14 BOT. In the period from April 1 to April 10 publications about the activities of the 14 BOT increasingly appeared in the media. They concerned the activities of the Brigade in many fields of the fight against the coronavirus. The event, which was strongly publicized and promoted in the media, was a blood donation campaign in which territorial groups participated. During this difficult period for the medical services (with large blood shortages in banks), the soldiers presented an attitude of readiness to perform any task assigned to them. Under the slogan "blood ties", together with commanders, they supported the action, donating priceless blood. The event was very positively received by the media.

It is worth paying attention to the fact that the reports on aid to food banks were shown on nationwide television (TVP INFO – the news program). This topic was also discussed on the radio and internet portals.

The campaign to help the Centaurus Foundation (an organization helping animals in need) was widely publicized. This allowed for the creation of the silhouette of a soldier acting selflessly, providing support to the weakest, including animals.

There were reports in the media about TDF's cooperation with the Police during patrols. This shaped the image of TDF as an organization capable of cooperating with various services.

The appearance of the uniform on the streets undoubtedly increased the importance of anti-virus activities and the sense of danger, which favored mobilization for cooperation (Piekarski,2019). The presence of TDF soldiers on the streets served the purpose of demonstrating the presence and building awareness of the Armed Forces' constant struggle with the "invisible enemy".

From media reports, it was possible to learn about the support of veterans by TDF soldiers. It is from them that they take over the traditions of wearing a uniform. They show that what matters to them is history and educated attitudes of loving Homeland.

The period: April 11, 2020 - April 20, 2020

In the discussed period of the operation under the code name "Resilient Spring" there were 28 publications on the activities of the 14 BOT. At this stage of the operation, the number of publications on the 14 BOT increased. There were almost thirty of them. It was related to the Brigade's performance of key tasks. These tasks were followed by the media and websites. The Brigade Command and the press spokesperson were of great importance for the promotion of the image, they reported, for example, on Easter in the barracks.

The task that was most strongly emphasized in the mass media was the support for the West Pomeranian DPSs. These events were reported in all kinds of media. The reports showed that the military is where the threat is the greatest and the support is most needed.

The media also reported support for doctors and medics, including in hospitals when soldiers took temperature measurements. These relationships built the image of a soldier (territorial) that performs tasks "on the front line". It

was pointed out that the Armed Forces soldiers spend Easter in the barracks, carrying out tasks related to the operation under the code name Resilient Spring. This information was accompanied by interviews with the command and the press spokesperson of the 14 BOT. Spending holidays on the implementation of tasks built an image of the Armed Forces that one can count on. The Armed Forces should be perceived as a guarantor of security. The reports emphasized the motto of the Territorial Defense Forces - "always ready, always close" [Internet 6].

The period: April 21, 2020 - April 30, 2020

In the discussed period of the operation under the code name "Resilient Spring" there were 28 publications on the activities of the 14 BOT. Then, the most widely reported in the media was helping animal shelters, this time with the participation of the cadets from the Military University of Land Forces, who strongly supported the Szczecin territorial. These events were reported in all media. Two reports were published on industry websites related to security and defense.

Soldiers were presented as people to whom the harm of others, including animals, is not indifferent. The soldiers, at their own expense, collected food, and then delivered it to the most needy animals. The reason for starting the action was the difficulties of shelters in collecting funds and animal food caused by the outbreak of the pandemic. The action was also widely reflected in social media on portals related to animal lovers, which could expand the number of recipients of information on the activities of the 14 BOT. There were also numerous reports in the media regarding the summary of the first weeks of the operation, where the activity of the West Pomeranian territorials was positively described.

The period: May 1, 2020 - May 11, 2020

This decade saw 26 publications and numerous radio reports on the 14 BOT's activities. In the first ten days of May, topics published in the media about the activities of the 14 BOT concerned the distribution of food to the poorest, food transport, the organization of drive-thru points (test and go) and the appeal to join the ranks of the Brigade.

The organization of drive-thru points in Koszalin by the 14 BOT was the most frequently discussed event in the media in the analyzed period. The event was particularly aired on the radio. The military relieved the medical services and the State Sanitary and Epidemiological Station by organizing swab collection points from people in quarantine. The Armed Forces showed their multitasking and organizational skills, and the capabilities of supporting medical services.

It is worth noting that while the government was planning to lift the first restrictions, the Command of the 14 BOT started sending out through the media an appeal to join the territorial service. The use of increased, positive media coverage is the right thing to do in terms of developing the human potential of the Brigade. Numerous publications on military activities in the last two months increased the number of people who heard about the existence of this formation in the West Pomeranian voivodship. A wide range of activities, helping those in need, cooperation with other services can be convincing arguments for joining the TDF ranks.

Conclusions and Recommendations

The analysis of the media activities proves that the 14th Territorial Defense Brigade is an example of an organization shaping a positive image during a crisis. It allows the conclusion that for the Armed Forces the time of danger is a period of increased public relations activity. Their participation in controlling the epidemic is the right time to promote them and provide the society with information about their tasks, responsibilities, and role in society. The Armed Forces resemble and even strengthen the image of the military among citizens as a guarantor of security and defense. The military is presented as a security pillar that cooperates with other services (Klein, 2019). Recent public opinion polls (2019) show that 3/4 of Poles positively assess the Polish Armed Forces [CBOS]. This result will probably be corrected after the epidemic ends.

The intensive military activity during the epidemic created an opportunity to deepen ties with the society. The cooperation was established between TDF and local authorities, all types of uniformed services, medical entities, and non-governmental organizations. Its result is the agreement signed in August 2020 between the Territorial Defense Forces and the Caritas Foundation. The cooperation means, among others, helping the victims of natural disasters and catastrophes in the country and aiding the elderly, the needy and the sick, including combatants, repressed people and war veterans [Internet 5].

The cooperation of territorial defense services and others, as part of COVID-19, has become a testing ground for fighting an unknown crisis, based on which the military has created new capabilities (Materac, 2019).

Reports on the soldiers' life in the era of epidemics, generalizations and conclusions from the "front" of the fight of a specific entity (14 BOT) with the threat - coronavirus, make the values of this military formation visible to the public. Territorial Defense Forces as a new - fifth type of troops, have become in the public perception an important element of the country's security, subject to ennoblement.

Vivisection of new needs in communication with the media is a kind of test of the media's ability to respond to communication needs with the military. All media channels are used. It should be concluded that the promotion of the Territorial Defense Forces must be carried out both by the Brigades in the Permanent Responsibility Region - voivodship, and centrally by the Territorial Defense Forces Command in nationwide media. It is essential to use all available media. The need exists to formulate for TDF units the framework of a specific program of image-related - public relations - activities in the event of an unpredictable crisis, which would additionally increase the building of a positive image of the organization. However, it should be stated that the work of the commands and press spokespersons in the Territorial Defense Forces in the analyzed period remained at a high level. All events related to the fight against COVID-19 were reported locally, and the most important events were additionally made available and promoted at the central level by the TDF Command.

During the pandemic, the Territorial Defense Forces, as a new formation, gained the opportunity to establish permanent channels and communication contacts with local media.

TDF are still looking for its place in society and in military formations. Foreign designs cannot be transferred in their entirety. It is the time to construct own concepts, influence the shaping of, for example, social, educational, and civic life, or service to society in times of peace. The Territorial Defense Forces must obtain full public support. Initiatives in the form of the action code named "Resilient Spring" positively test the military capabilities in practice, they are an opportunity to gain social trust and support in everyday activities, including recruitment and development of this military formation. It should be emphasized that in Poland, the Territorial Defense Forces are still in the period of formation. The staffing needs are still significant, and the positive image of the military undoubtedly helps. Additionally, the positive "media hype" around TDF is helpful since it is important in reaching many potential recruits.

An interesting conclusion is the fact that the effectiveness in shaping a positive image of the Armed Forces, including TDF, is greater if it is illustrated on specific examples of providing aid to the society. Reports in the media at that time created the image of a soldier who fulfilled not only orders or official tasks but was also a member of the local community, providing help to the needy, acting selflessly, providing support to the weakest, and who is not indifferent to the harm of others (Knecht, Materac, 2020). It warms up the image of the Armed Forces and brings it closer to people. The Armed Forces cease to be a hermetic organization. Soldiers are no longer perceived as an organization prepared for the time of war but as useful at all times, and at the same time efficient and well-organized. It should also be noted that in recent years there has been a renaissance of pro-defense and paramilitary organizations in Poland. They are close allies to cooperate in the implementation of tasks performed within territorial defense and their potential can be used (Knecht, 2018).

In the discussed period, in relation to the 14 BOT, it is easy to notice the principle of "herd journalism". It should be understood as journalists' interest in the same topic. The same information is often reproduced in different media (Jabłoński, 2006).

Abstract

Today, real-time monitoring of public transport is crucial as it significantly influences traffic, and if the transit of vehicles is not managed efficiently, it could result in a congestion of vehicles in transit routes (traffic). Most companies find implementing technologies such as a global positioning system (GPS), cameras, sensors, and Internet expensive. This paper focuses on an exhaustive review of 69 articles, extracted from various recognized academic sources and published in 2016–2020, that have explored different ways to improve transport management using technology. This study presents the different ways of using geolocation, utilization of improved tools, and transport management. Therefore, the results can help in attaining an enhanced understanding of public transport management.

Keywords: Geolocation, GPS, Monitoring, Server, API, Public Transport, Web Servers

Introduction

Public transport is vital in today's world because it helps people reach their destinations [5]. As the users of public transport cannot perceive or visualize the trajectory of the vehicles they are travelling in, the companies that provide this service must monitor not only the location of their vehicles but also their quality of service. In most places across the world, there is inadequate monitoring of public transport because of the considerable number of vehicles, especially buses, on routes. Not much technology is used for process management and monitoring as most public transport companies, at present, do not have the budget required to implement monitoring tools in each bus. A manual control system is tedious to use and easy to tamper because of its dependence on the human factor [59]; such systems have been in place since the 1960s and contribute to information disorder while failing to provide adequate service.

There is extensive competition in public transport in terms of providing services, because of the large variety of buses; this results in more disorder, traffic, and informality. Traffic is an important factor in every city in the world as the high congestion of cars and buses and lack of public transport monitoring can result in delays on the route.

Cite this Article as: Fernando POLANCO-SOLGORRE, Joel CUENCA-VILLOGAS, Javier GAMBOA-CRUZADO, Liset RODRIGUEZ BACA, Carlos CHAVEZ HERRERA and Anibal SIFUENTES DAMIÁN "A Systematic Literature Review on Management of Public Transport in Real Time using a Geolocation System" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Sometimes, two or more buses ply on the same route, which can lead to the buses competing with each other to get more passengers and arrive at their destinations first, thus putting the lives of passengers at risk by speeding and not following the traffic rules. Users may not know when their bus will arrive at the bus stop [59], and thus, may have to wait for several minutes; this may make them prey to robbery and other crimes [5].

In most companies, buses are monitored by controllers that are placed on the route [63]. These controllers keep track of the transport when it is in the domain of the controller and determine whether the vehicle is late or on time. If the controllers are placed far apart on the stretch of a route or are missing, then the transport is not adequately monitored, thus causing irregularities. These irregularities include transports going slower than normal to get more passengers, making unnecessary stops, reaching a certain point and returning without going to the final destination, and creating small routes, which are considered as ghost routes, to make more profits. In addition, during the day, there is a greater influx of passengers and a greater demand for public transport. If the number of transports on the route is not increased at the time of arrival [20] at the bus stop, there will not be enough space or seats for passengers. To address this issue, various solutions have been proposed globally. For example, in the city of Cúcuta [5], a web system was implemented using the bus's GPS, which showed its real-time location.

This paper focuses on researching different approaches of improving public transport management.

The rest of this paper is organized as follows. Section II presents the background and important concepts related to the topic. Section III explains the methods and materials used (formulation of questions, sources, search equations, exclusion criteria, classification, and review of studies). Section IV examines the methods and materials used for the research. Section V outlines the results. Finally, Section VI presents the conclusions and recommendations for future work.

Background and Related Work

Different solutions have been proposed for varied public transport needs as research has evolved over time regarding how technology can be used to benefit the transport business and provide a better user experience.

Poonawala et al. [2] conducted a study on the use of mobile phones and smart cards utilized by the user for payment to determine the time at which they took the bus and got off it, the amount of time for which they traveled, and where they went. These collected data served as behavioral patterns that were used to improve the processes of the services provided. Using two technologies, such as smart cards and mobile GPS, their study provided a detailed report on the user's behavior pattern.

Derevitskiy et al. [29] implemented GPS in their transport vehicles to evaluate passenger behavior and the load generated on the roads, especially during traffic, to calculate the travel time and provide solutions while reducing the congestion of transport, depending on the direction in which it is going.

James and Nair [62] proposed a model that used Long Range (LoRa) wireless transmission as an alternative to GPS. LoRa is located in the central and radio frequency (RF) is located at each bus stop. Information is sent to the central to track a bus each time it arrives at the bus stop and estimate its time of arrival. The implementation of LoRa costs significantly less than that of GPS, cameras, or other technologies on the buses; it also consumes less energy.
Castro-Correa et al. aimed [5] to improve the public transport system by implementing GPS on buses, with all information stored on a server and displayed on the website using Google Maps to determine the route of the bus and its time of arrival.

Velázquez et al. [59] developed a system based on free technologies that could monitor the route of transport units to facilitate decision-making for releasing new transport units. They intended to offer an accessible system that could present a viable alternative from an economic viewpoint and met the administrative staff's needs.

Saad et al. developed [20] a bus tracking system to show the real-time location and estimate the time of arrival of the buses at the next stop. This tracking device, which was integrated into the bus, had a GPS receiver and ESPresso Lite V2.0. The GPS receiver retrieved the latitude, longitude, and speed of the bus, and these data were sent to the database server via Wi-Fi. The web application helped the user to control the bus's location in real time, and thus, help plan the trip based on the information provided, such as bus routes, number of stops, and time of arrival.

In [4], a GPS-enabled mobile phone was used instead of a GPS device to track the real-time location of the bus and helped with monitoring and planning transportation routes; it was enhanced with Google Street View. The device was also used [6] in the GSM network to locate the bus in real time and identify its coordinates. Another way of

sending coordinates efficiently [14] is the general packet radio service (GPRS) technology, which is a stable signal similar to GSM. Thus, various solutions are available for improving the management of public transport.

Methodology

Here, research in the software engineering field was conducted using the systematic literature review (SLR) process. In this research method, an exhaustive review of documents is conducted on a certain study theme, which in this case is the public transport management by geolocation. These documents are then evaluated and synthesized to reach a rational conclusion regarding what is known about the management of transport by geolocation.

Research Questions

To construct the review protocol, first, the research questions were carefully formulated; this would guide the review process. In this review, the objective was to map the research on geolocation transport management and to answer the questions specified in Table 1.

Table 1: Research Questions

Research Questions	Motivation
RQ1: Why is it important to implement a geolocation system to improve the public transport management?	To know the greatest need in the world to implement a geolocation system in the area of public transport.
Q2: Which tools are being used to develop geolocation systems?	To know what tools have been used to develop a geolocation system.
RQ3: Which geolocation application programming interface (APIs) are used most frequently?	To determine the most used API in geolocation.
RQ4: In which countries has research been conducted on geolocation systems?	To know the most active countries in geolocation systems research.
Q5: What programming languages are most used to develop geolocation systems?	To know the most used languages to develop a geolocation system.

A. *Search Sources*

The search engine selection process for the articles focused on several sources to select the best and most prestigious ones, including Google Academic, ScienceDirect, Microsoft Academic, IEEE Xplore, Springer Link, DOAJ, Dialnet, Taylor & Francis, Wiley Online Library, ResearchGate, EBSCOhost, Scopus, and ACM Digital Library.

B. *Search Equations*

An extensive search process was conducted for primary studies published between January 2016 and June 2020, which combined automatic and manual searches. In addition, a manual search was performed on relevant journals and conference proceedings (Table II). The researchers searched for the titles of all published articles in each source used in the manual search.

Automatic search was performed on 13 search engines and indexing systems, including ACM Digital Library, Google Scholar, ScienceDirect, IEEE Xplore, EBSCOhost, Scopus, ResearchGate, Wiley Online Library, Taylor, Dialnet, DOAJ, Springer, and Microsoft Academic. All searches throughout the document were performed automatically. To achieve high coverage, an automatic search string was used (Table 2).

Table 2: Manual Search Sources

Source	Generic Search Chain
Google Academic	Geolocation system methodology OR model OR method "SCRUM"
	Geolocation system AND transportation management
ScienceDirect	Geolocation system and transportation management
Microsoft Academic	Geolocation system AND transportation management
Scopus	ALL ("Geolocation" AND "Transportation")
IEEE Xplore	("All Metadata": Geolocation) AND "All Metadata": transportation)
Springer	Transportation AND management AND "geolocation"
DOAJ	Geolocation and transportation
Dialnet	"Geolocation system" and "transportation management"
Taylor & Francis	[All: geolocation system] AND [All: transportation management]
Wiley Online Library	"Geolocation" anywhere and "transportation management" anywhere
ACM Digital Library	[All: geolocation system] AND [All: transportation management]
ResearchGate	(Geolocation system) and (transportation management)
EBSCOhost	TX geolocation system AND AB transportation

C. *Consolidated Number of Results by Source*

The process of article selection is illustrated in Fig 1. Thirteen researchers evaluated the results of the automated search (N = 310 369) by considering the titles and excluding articles that were clearly not relevant.

Fig. 1: Stages of the Study Selection Process

D. *Exclusion Criteria*

Studies were eligible to be included in the review if they presented research on transport management by geolocation. Given the abundance of theoretical research concerning the study of personality, it was determined that only those studies that addressed traits or type theories were to be included. Studies addressing other individual characteristics (e.g., behavior, cognition, competence, skills, and roles) were excluded.

No restriction was placed on the type of studies; therefore, articles reporting empirical studies (based on direct observation or experiments), theoretical studies (based on an understanding of the topic by experience or reference to other work), industrial experience reports, and literature reviews were eligible. Only articles written in English and Spanish were included.

Furthermore, studies that included opinion articles, views, or purely anecdotal evidence, as well as those presenting ongoing research or incomplete results, were excluded. Table 3 lists the exclusion criteria used in our study.

Table 3: Exclusion Criteria

Exclusion Criteria
SG1: Exclude proposals that do not apply geolocation.
CE2: Exclude items that are more than five years old.
CE3: Exclude thesis or book; it should be an article or paper.
CE4: Exclude articles that are not written in English or Spanish.
CE5: Exclude items that did not use the software to obtain the solution.
CE6: Exclude items that are not openly accessible.

E. *Consolidated Number of Results when Applying Criteria*

Exclusion criteria were applied to the set of potentially relevant studies (n = 310 369), resulting in 69 articles being selected for review (Fig 2).

Fig. 2: Stages of the Study Excluding Process

F. *Criteria for Evaluating the Quality of Studies*

The following quality criteria for were developed for reviewing articles.

QA1. Does the topic belong to the fields of computer science, information systems, or management?
QA2. Is the article relevant to the topic?
QA3. Are the bibliographic sources of good quality?
QA4. Are the authors relevant and reputable?
QA5. Is the use of geolocation adequately described?
QA6. Is it clear in which area a geolocation system is applied?

It was validated that all items met the quality criteria and thus, no more articles were eliminated.

G. *Classification of Studies to be Reviewed*

The reports were drawn up with Mendeley:

Fig. 3: Mendeley's Report

H. Miscellaneous Reports

This section presents various graphics that despite being good did not help in answering the RQs captured at the beginning.

Fig. 4: Articles and Range of Quotations by Country

Fig 4 shows all countries that were cited, and Fig 5 shows the range of citations.

Country	<5	≥15	≥5 and <15	Total
USA	2	3	4	9
China	5		2	7
Colombia	2	2	3	7
France	1	3	2	6
Brazil	2	2		4
Spain	2	2		4
India	1		2	3
Italy	1		2	3
Algeria		2		2

Fig. 6: Number of Items per Source

Results

After conducting the SRL process on the 69 selected articles, the questions that were raised in this paper were addressed.

RQ1: *Why is it important to implement a geolocation system to improve public transport management?*

The SLR shows that it is necessary to implement a geolocation system to improve public transport management as it can help with traffic, routes, security, and time of arrival.

Table 4: Answer for the Need of Implementation

No	Necessity	References	Qty. (%)
1	Traffic	[2], [7], [8], [9], [10], [12], [14], [15], [16], [20], [21], [22], [23], [24], [25], [26], [27], [28], [29], [30], [31], [32], [33], [34], [35], [36], [37], [38], [40], [42], [43], [44], [46], [47], [48], [49], [50], [51], [52], [53], [59], [60], [62], [63], [64], [66], [67], [69]	48 (70)
2	Route	[2], [6], [7], [8], [9], [10], [11], [12], [13], [14], [15], [20],	4

		[22], [24], [25], [26], [27], [28], [29], [31], [32], [33], [36], [37], [38], [39], [40], [42], [43], [44], [46], [47], [49], [51], [52], [53], [54], [60], [61], [62], [63], [64], [65], [67], [69]	(65)
3	Time of arrival	[9], [12], [14], [19], [20], [32], [35], [37], [38], [39], [43], [45], [47], [52], [53], [54], [55], [59], [60], [61], [62], [63], [68], [69]	24 (35)
4	Security	[16], [20], [23], [25], [27], [33], [35], [36], [40], [42], [56], [57], [60], [63], [64], [65], [66], [67]	18 (26)

Table 4 shows that one of the reasons for implementing a geolocation system is the constant traffic caused by the increasing population and modernization, which creates a need for people to move from one point to another [5] more quickly and increases the number of cars on the streets across the world. Another reason is to monitor transport and observe its route [63], so that it can benefit the user waiting at the bus stop and control the driver's location.

RQ2: Which *tools are being used to develop geolocation systems?*

Based on the SLR, the following table presents the tools used most frequently to develop geolocation systems.

Table 5: Type of Development Tools

No	Kit	References	Qty. (%)
1	GPS	[2], [3], [4], [5], [6], [8], [10], [11], [13], [14], [16], [17], [18], [19], [20], [21], [22], [23], [24], [26], [27], [28], [29], [30], [31], [32], [33], [37], [38], [40], [42], [43], [46], [48], [50], [51], [52], [53], [56], [57], [58], [59], [60], [61], [62], [63], [64], [65], [67], [68], [69]	51 (74)
2	Mobile	[1], [2], [8], [10], [12], [13], [14], [15], [19], [20], [22], [23], [24], [26], [27], [28], [29], [30], [35], [36], [37], [38], [40], [41], [43], [44], [45], [46], [48], [49], [50], [51], [53], [55], [57], [60], [61], [62], [64], [65], [67], [68]	42 (61)
3	GSM	[3], [6], [7], [10], [14], [16], [23], [28], [56]	9 (13)
4	Satellite	[3], [4], [6], [17]	4 (6)

Table 5 shows that the tools used most frequently to develop geolocation systems include implementing a GPS module [6] [20] and using a mobile to track a vehicle through its integrated GPS [1] [13].

RQ3: *Which geolocation application programming interface (APIs) are used most frequently?*

As per the SLR, Table 6 shows that the most used geolocation APIs for the development or case study of the articles.

Table 6: Answer for API Software

No	APIs	References	Qty. (%)
1	Google Maps	[1], [5], [10], [13], [14], [20], [29], [39], [48], [59], [60], [62], [68], [69]	14 (20)
2	Google Street	[4], [13], [19], [29], [35], [56], [60], [68], [69]	9 (13)
3	Google Earth	[3], [14], [20], [51], [65]	5 (7)
4	OpenStreetMap	[15], [25], [33], [35], [56]	5 (7)

The most used and common geolocation API is Google Maps because it offers updated locations and satellite observation, and helps with directions toward a designated point on the map and routes between different locations.

The rest are services similar to Google maps but are part of the large group of Google programs. Finally, open-source systems, such as OpenStreetMap [35], which is similar to Google maps but free, are also used.

RQ4: *In which countries has research been conducted on geolocation systems?*

To determine the countries in which the geolocation system was used, the exclusion criteria were applied. This resulted in only 69 items, which are shown in Fig 7.

Fig. 7: Items by Country

Fig. 8: Items by Country

Figs 7 and 8 show that the United States makes the most use of the geolocation system with nine items, followed by China and Colombia, both with seven items each.

RQ5: *What programming languages are most used to develop geolocation systems?*

Based on the SLR, the most used programming languages for developing a geolocation system and that are mentioned in the articles are presented in Table 8.

Table 8: Answer of Languages for Software Development

No	Language	References	Qty. (%)
1	Android	[1], [5], [6], [13], [14], [17], [18], [19], [20], [36], [38], [41], [56], [57], [59], [60], [65], [68]	18 (26)
2	Java	[1], [5], [6], [14], [15], [17], [20], [23], [33], [39], [41], [56]	12 (17)
3	JavaScript	[1], [5], [6], [14], [17], [20], [23], [41], [56]	9 (13)
4	Php	[5], [6], [14], [20], [23]	5 (7)

Table VII shows that the programming language most used and mentioned by various authors to develop geolocation systems is Android as it is used by the incorporated GPS and Google maps. The second most used language is Java as Android study is based on Java, followed by JavaScript as it is a language that all web pages use currently.

Discussion

The present transport management system is very important and extensive. Of the 69 articles regarding development, most did not specify [14] a methodology for implementing the geolocation system and most of them used Google Maps as a complement to the development of the transport system. However, the API is expensive, because it does not allow much manipulation; thus, more emphasis needs to be given on open-source systems.

The simplest method of tracking nowadays is using the GPS present in the mobile phone, as it does not require extra costs to implement it on the transport vehicle because almost everyone uses a smartphone. For companies, making an investment or implementing new technologies is not as feasible as using already available technologies such as mobile phones.

Conclusions and Future Work

This paper used the SLR to analyze the studies that were published less than five years ago. It was initiated with a base of 12 academic searchers, of which only 10 obtained results that provided 309–947 articles. After applying the exclusion criteria, only 69 articles were left. Implementing the SLR made it possible to answer the questions raised in this investigation successfully, and the findings helped identify the benefits of implementing the geolocation systems for public transport management. The areas in which these systems were applied include public transport, the public transit, and taxis. Moreover, the tools used to develop geolocation systems were GPS, satellite, and GSM; the most used APIs were Google services and OpenStreetMap and the most used programming languages were JavaScript, Android, Java, and Php. Finally, the articles that support these study results correspond to the most active authors in the subject.

This study has certain limitations. First, it fails to explain, in detail, the steps that should be taken for the construction and development of the geolocation devices. However, it does explain where the bus can be installed, so that in the future, it will not be affected by the constant breaking of springs and the blows that the device may receive due to the poor condition of the roads.

It is recommended that future work use studies published less than three years ago that explore the construction of the geolocation devices and the development of the systems that will monitor these devices in detail.

Analysis of Preferences of Rail Passengers In the Context of Sustainable Development

Grazyna ROSA
University of Szczecin, Szczecin, Poland, grazyna.rosa@usz.edu.pl

Abstract

The aim of the article is to analyse the preferences of rail passengers in the context of using the results of research to enhance sustainable development. In order to achieve this aim, a method of critical analysis of available secondary research results and a questionnaire method used in primary research were adopted. The author's own research was conducted on a representative sample of 331 young travellers. On the basis of the available secondary research results, the price, time and modern technology categories and the detailed elements thereof were selected for analysis. The results of the research may be used to formulate a strategy for the sustainable development of transport, contributing to the reduction of road passenger transport in favour of rail transport.

Keywords: user preferences, passenger transport, rail transport, sustainable development

Article category: research

Literature review

The notion of "sustainable development" is regulated in the Polish Environmental Law in Article 3, which provides the following definition: it is social and economic development in which the process of integration of political, economic and social activities occurs with the maintenance of the natural balance and sustainability of the basic natural processes, in order to guarantee that the basic needs of the community or citizens of both the contemporary generation and future generations are satisfied (Dz.U. – Journal of Laws – 2001, No. 62, item 627 of 20 June 2001). Many international researchers deal with the issues of sustainable development: Parris and Kates (2003), Egelston (2012), Kahle and Gurel-Atay (2014), Sachs (2015), Mensah and Casadevall (2019), Dehghanmongabadi and Hoşkara (2020).

According to this definition, sustainable development priorities should additionally apply to transport (Makarova, et al. 2017), both of passengers and cargo (Nijkamp, 1994; Gudmundsson and Höjer 1996; Raitasuo, Bask, Rajahonka, 2019; Dembińska, 2020). The issue of reducing the adverse impact of transport on the environment has been reflected in key European transport documents. The objectives set out in subsequent Green and White Papers on transport, including the European Commission's White Paper on Transport by 2050, are aimed at alleviating the adverse environmental impact of transport (European Commission, 2010). This approach is justified by the rapid development of transport and traffic and the resulting problems: traffic congestion, air and noise pollution, problems with road safety, which are caused to a much greater extent by road transport than by rail transport (Deakin, 2001; Wang et al, 2018 ; Akinyemi and Zuidgeest, 2000). As a result of the implementation of these objectives, strategies and action plans at all levels of decision making indicate the need to increase the use of railways in passenger traffic in Poland over the next few years and to reduce private transport in particular.

According to Eurostat data, between 2000 and 2017 the number of cars per 1,000 inhabitants increased in Poland from 261 to 593. This is the largest increase in the motorisation coefficient among 27 European Union countries (Eurostat, CSO, 2019). This means that in Poland, a potential rail transport customer may actually choose between a passenger car and a train. The modern transport services market is therefore a customer's market. The studies and analyses carried out indicate that competition in passenger transport primarily involves instruments such as product (time, comfort and safety, physical accessibility and number of connections) and price (Rosa, 2020, p. 108; Kos et al, 2020, p. 114). The rolling stock is being successively renovated, both by car and rail operators (with the participation of the state and local governments), customer service is improving as well. Drivers have more and more expressways and motorways at their disposal, which has improved the safety of car travel and significantly shortened the travel time between major cities in Poland.

Experience and solutions introduced in other countries may be useful in achieving the defined objectives. Switzerland has the highest rate of rail use in Europe, with nearly 70 journeys per capita per year. Travelling by rail in this country is characterised by (*Wykorzystanie i potencjał...* 2017, p. 11):

- high availability of railway services (large number of trains per day and cyclical train timetable);
- reliability;
- travel comfort (comfortable and well-muted cars available even in regional transportation);
- well-organised connections with other modes of transport, as well as a wide range of services offered under a single ticket for all modes of transport.

Another factor encouraging the use of rail operators is the relatively high costs associated with the use of a car in a city.

The potential of railways in Poland and other European countries may be compared on the basis of the average number of passenger trains passing daily on a statistical kilometre of railway line. In Poland, an average of 20 passenger trains pass each day on one kilometre of railway line, i.e. about 7 times less than in the Netherlands. The European average in this category is 45 trains per 1 km of railway line (*Wykorzystanie i potencjał...* 2017, p.11). The behaviour of travellers, which is based on their preferences, is changing as well.

Consumer behaviour on the market is limited by a number of factors, the most important of which include: consumer tastes and preferences; the amount of money available, i.e. an available budget, and the prices of alternative goods (*Teoria wyboru konsumenta*). Preferences of consumers depend on their knowledge, opinions, emotions or beliefs; they are a reflection of their perception of a given product and brand. This perception is subjective (Rosa (eds.), 2015). Consumers' preferences result from the fact that they strive to satisfy their needs by selecting goods which are available on the market in great numbers and which meet their expectations. These choices reflect their tastes, preferences and personalities; they are a determinant of demand, specifying the products consumers want to purchase (Szymańska, 2012).

The analysis of the approaches to passenger transport presented in the literature reveals that for many years, common carriers and transport providers have assumed that if their services are relatively reliable and the condition of their vehicles (often outdated) does not pose an immediate threat to travellers, then the customers will be satisfied with the service provided (Bąkowski, Szewczuk (ed.) 2000), (Engelhardt, 2007, 2018), (Paprocki, 1996), (Wyszomirski, (ed.), 1994, 1998), (Tomanek, 2002). They considered price as the main instrument of competition. The analysis of the results available in the literature indicates that the capability to provide reliable services is insufficient to achieve and maintain a strong competitive position in a changing environment. The importance of standard services is diminishing. The role of knowledge, cooperation skills, entrepreneurship and innovation is growing. The importance of innovation in the field of transport service, technology as well as customer relations is recognised (Rosa, 2013, 2018), (Kos et al, 2018), (*Koleje pasażerskie…* (b) April 2017), (Drewnowski, 2019). The customers are increasingly demanding in respect of, for example, the quality of services offered, safety, provision of current information, the carrier's partnership approach, customer service, often even comprehensive logistics service on a national and international scale (Bocheński, Wojtkiewicz 2019), (Krawiec, Ćwiek, 2019), (Massel, 2019), (Mężyk, 2019), (Szałucki 2019, (Kos et al, 2020). Where these elements come to the fore, companies competing in the passenger transport market must carry out a professional analysis of the market and the preferences of customers in order to provide the values most appreciated by customers.

On the other hand, customer preferences are a new subject which is insufficiently investigated in the literature (cf: Rosa, 2018), (Kos et al, 2020). The preferences of passenger rail transport customers stem from the necessity to satisfy transport needs, which reflect their expectations and personality.

Research method

The research was carried out from October 2017 to March 2018 on a random sample of 350 people from all over Poland, meeting the age requirement and thus constituting a homogeneous sample of “young adults” aged 18-29 years. Survey methodology involving a questionnaire was applied. The analysis of the completed questionnaires revealed that 19 of them were incomplete, and thus a sample of 331 persons was eligible for further study.

Table 1 presents the characteristics of the respondents based on the information contained in the particulars.

Table 1: Respondents' socio-demographic characteristics (N=331)

	Total (%)
Gender	
Female	50.61%
Male	49.39%

City with 100,000 to 199,000 inhabitants	14.29%
City with over 200,000 inhabitants	30.70%

Source: own work

The aim of the research was to select the key features of passenger transport services relevant to customers, and have these features assessed by the providers of rail passenger transport services in Poland. In order to achieve the intended aim of the article, an attempt was made to answer the following research questions:

1. What is the importance of the characteristics of passenger rail transport services in the context of the activities included in the price category?
2. What is the importance of the characteristics of services provided by passenger rail transport operators in the context of the activities included the time category?
3. What is the importance of the characteristics of services provided by passenger rail transport operators in the context of the activities included in the modern technologies category?
4. What is the opinion of the characteristics of passenger rail transport services in the context of the activities included in the price category?
5. What is the opinion of the characteristics of services provided by passenger rail transport operators in the context of the activities included the time category?
6. What is the opinion of the characteristics of services provided by passenger rail transport operators in the context of the activities included in the modern technologies category?
7. What statistically significant socio-demographic variables correlate with the preferences of rail passengers?

The hypothesis formulated in the research states that the greater the importance of particular categories (price, time and modern technologies) for the passengers, the higher the overall opinion of rail transport. The answers available to the respondents included “very important”, “important”, “less important”, “unimportant” and their opinion was measured on a scale of “very good”, “good”, “bad”, “very bad”.

In order to answer the research questions and test the hypothesis, statistical analyses were carried out using the IBM SPSS Statistics version 25. The software was used to analyse the main descriptive statistics, characterise the respondents with the use of frequency analysis, as well as to carry out several Pearson's Chi^2 correlation tests, Student's t-tests for independent samples, one-way analysis of variance, Pearson's r and regression analysis. The classical threshold of $\alpha = 0.05$ was designated as the significance level. The probability results of the test statistics at the level of $0.05 < p < 0.1$ were interpreted as significant at the level of statistical tendency.

Research results

The analysis of the answers provided by the respondents allowed the following conclusions to be drawn:

Basic descriptive statistics of the measured quantitative variables with a normality test

In the first step, basic descriptive statistics were calculated (Table 2) with the Shapiro-Wilk test analysing the normal distribution of all measured variables on the quantitative scale. The result indicated that the distributions were significantly different from the Gaussian curve. However, the skewness of all variables did not exceed -2 < Sk. > 2, therefore the variables could be considered to have distributions close to normal.

Table 2: Descriptive statistics of the measured quantitative variables with a normality test

	M	*Me*	*SD*	*Min.*	*Max.*	*Kurt.*	*Sk.*	*S-W*	*p*

Correlation between socio-demographic variables and preferences of rail passengers

In order to identify statistically significant socio-demographic variables which correlate with the preferences of rail passengers, Student's t-tests for independent samples and one-way variance analyses were performed. It was verified whether the reported significance level of modern technologies in trains and the time and ticket price correlate with socio-demographic variables such as gender, education, household size, income, professional status, student status and place of residence. The t-test for independent samples was used for socio-demographic variables having only two groups (Table 3).

Table 3: The correlation between rail transport preferences and socio-demographic variables

		t	*p*	*d*	95% *CL*	
					LL	*UL*
Significance of modern technology	Gender	-2.11	0.036	-0.01	-0.27	-0.1
	Professional status	0.16	0.874	0	-0.15	0.18
	Student status	-1.24	0.215	-0.01	-0.25	0.06

t – result of t-tests, p – significance of t-test, d – Cohen's d, 95% CL – 95% confidence level, LL – lower limit of confidence level, UL – upper limit of confidence level

In the next step, a one-way analysis of variance was performed several times, in which the variables tested included the opinions on the significance of modern technologies, ticket price and travel time in rail transport. The statistics were carried out for grouping variables located on a qualitative scale and had more than two groups. These socio-demographic variables included education, household size, household income and place of residence of the respondents. The correlation strength was calculated using omega^2 (Table 4).

Table 4: The correlation between rail transport preferences and socio-demographic variables

F – result of variance analysis, p – significance of variance analysis, ω2 – omega-squared

Correlations between preferences regarding modern technologies and travel time as well as ticket price and gender proved to be significant. In other analyses, a weak correlation was observed between the significance of travel time and student status and the relationship of education with this preference. In addition, a correlation

was established at the level of statistical trend for the preference of modern technology with education and place of residence and for the preference of rail travel time with place of residence. All the correlations, both significant and at the level of statistical trend, were weak.

In order to determine the respondents' preferences concerning modern technologies, a factor analysis was carried out for all questions included in a given category. In addition, Pearson's Chi^2 analysis was performed to verify the relationship between gender and the specific responses regarding the opinion on the significance of modern technology.

It was decided that general preferences in relation to modern technologies should be described first. The respondents' mean was M = 1.8 with standard deviation SD = 0.57, which meant that for most of the respondents modern technology was important or very important, as the lower the score, the more important the aspect was for the respondents. Modern technologies were less important for women (M = 1.73; SD = 0.5) than for men (M = 1.48; SD = 0.63). The category defined as "modern technologies in passenger rail transport" included*(end note):

- being able to check information in social media during the journey;
- provision of additional services, such as Wi-Fi;
- being able to check rail connections online;
- availability of an electronic ticket during the journey;
- being able to purchase a train ticket online;
- being able to purchase a ticket using mobile devices;
- being able to track the route and location of the train during the journey through the mobile application.

It was established on the basis of a detailed analysis of travellers' preferences regarding modern technologies that only the significance of ability to check rail connections online varied significantly in statistical terms with respect to gender. The answers to the remaining questions given by women and men were similar enough to conclude that there is no statistically significant correlation.

In addition, it was established that, overall, the most important element of modern technology was the ability to check rail connections online. It was reported very important by the greatest number of people. After conversion of the answers into the numbers so that the lowest number would represent the greatest significance of a given aspect, the mean for the significance of the ability to check rail connections online was M = 1.43, i.e. between "very important" and "important", with a slight leaning towards the "very important" answer.

Another significant element of modern technology was the ability of buying a train ticket online. In this case as well most people considered it very important. After converting the response variants into numbers, the mean score was between "very important" and "important", slightly closer to the "important" answer (M = 1.54).

Being able to buy a train ticket via a mobile device was the third significant element of modern technology. Again, more than half of the respondents considered this to be a very important aspect of rail travel. Moreover, the lowest number of respondents reported this aspect as completely unimportant. Once again, after the conversion of the answers, a mean was obtained between "very important" and "important", with a leaning towards "important" answer (M = 1.6).

The last element generally considered as important by the respondents was the availability of an electronic train ticket. After converting the verbal answers into numbers, the mean M = 1.66 was obtained. This was the last aspect of modern technology whose mean did not exceed 2, which meant a "less important" answer. Less than half of the respondents reported the availability of an e-ticket as very important.

The provision of additional services, such as Wi-Fi, and the ability of the mobile application to track the route and location of the train during the journey were much less important than the above issues. Both issues were assessed similarly in terms of their significance, and after the conversion obtained a mean of M = 2.01, indicating low importance of the two elements. When assessing the significance of providing additional services, most respondents considered this to be a moderately important aspect of the rail transport service. However, the most common answer to the question about the importance of the ability to track a train's route during the journey was "very important". A considerably smaller number of "important" answers and larger number of respondents who considered it less important than the provision of additional services contributed to a similar mean of both issues.

The least important issue, according to the respondents, was being able to check information in social media. This element of modern technology gathered the greatest number of "completely unimportant" answers.

Moreover, far fewer respondents reported it was very important than in the other questions. After conversion of the answers, it was observed that the mean obtained is between the "less important" and "completely unimportant" answers (*M* = 2.47).

The analysis of the second element – time should begin with the presentation of the overall result for the significance of travel time. The mean for the significance of travel time was *M* = 1.38; *SD* = 0.55, which meant that the importance of this category was assessed between "important" and "very important", with a greater inclination towards the "very important" answer. Women were more concerned about travel time (*M* = 1.21; *SD* = 0.33) than men (*M* = 1.48; *SD* = 0.53).

In order to examine in more detail the preferences regarding travel time in rail transport, frequency analyses were carried out for each question separately. Since, as in the other categories of rail transport services, a strong correlation with gender was observed, correlation analyses were performed for individual questions and the answers of the respondents were presented. The category "travel time in passenger rail transport" included: duration of the journey, number of transfers, convenient connection times, number of connections, punctuality of trains.
After converting the answers into numbers, it was established that all aspects relating to travel time have a mean of less than 1.5, which means that their importance was usually reported to be very high.

Convenient connection times had the lowest mean, i.e. proved to be the most important for the respondents (*M* = 1.34). It was also the question which collected the highest number of "very important" answers. Moreover, in the case of convenient times of rail transport connections, the fewest respondents reported that this aspect was completely unimportant.

The respondents attached less importance to the punctuality of rail transport than to convenient connection times (*M* = 1.37).

The number of connections (*M* = 1.4) was ranked third in terms of importance in the category of rail transport travel time. It is this aspect from the travel time category that the respondents most often considered important.

The least important of the railway travel time category was the duration of the journey and the number of transfers. In both cases the mean was M = 1.41. More respondents considered the duration of the journey as very important than the number of transfers. The mean was levelled by the lower number of respondents considering the travel duration as unimportant.

The last and third category in which the respondents' preferences were investigated was the ticket price. According to the mean obtained, this was the most significant aspect in rail transport (*M* = 1.57; *SD* = 0.57). In addition, a statistically significant difference was observed in the assessment of the significance of the ticket price between women (*M* = 1.48; *SD* = 0.47) and men (*M* = 1.67; *SD* = 0.66). Women attached more importance to the price of rail travel than men.

Due to a strong correlation between gender and the reported importance of the ticket price, it was decided to carefully examine the preferences of the respondents, while at the same time analysing their correlation with gender. For this purpose, Pearson's Chi^2 correlation analysis was applied and, depending on the result of the significance of the correlation, a frequency analysis was performed for all respondents or by gender. This allowed the determination of importance of refunds guaranteed due to delays, special offers and railway ticket prices for respondents. The following elements were included in the category of price in passenger rail transport: refunds due to delays, special offers, ticket price.

The ticket price was the most important price element for the respondents (*M* = 1.4). However, the assessment of the price significance varied according to gender. Women were more concerned about ticket price (*M* = 1,29) than men (M = 1.52).

Special offers ranked second (*M* = 1.54). While women were more inclined to believe that special offers were very important (*M* = 1.38), men usually considered special offers to be important, yet not a priority (*M* = 1.73).

The least important element of the price category was the refund for delays in rail transport (*M* = 1,78). Nevertheless, it was still recognised as an important aspect of rail transport. It is with this question that the opinions of men (*M* = 1.8) and women (*M* = 1.76) were most similar.

Overall assessment of passenger rail transport services

Having examined the priorities of the respondents concerning railway transport, it was decided to analyse how the respondents evaluate the services provided currently. The respondents assessed individual elements of services from 1 to 4, where 1 meant a very good grade and 4 a very bad grade. After calculating the average of the grades, it was established that the respondents have a good opinion of rail transport services (M = 2.1; SD = 0.49).

In addition, it was decided to examine whether the preferences of the respondents were related to their opinion. For this purpose, a correlation was analysed between the overall assessment of the respondents and their opinion on the importance of modern technology and the time and ticket price (Table 5). Pearson's r test was used for calculations due to the quantitative scale of variables and distributions similar to the Gaussian curve.

Table 5: Correlations between the assessment of rail transport services and the preferences of the respondents.

	Assessment of rail transport services	
Significance	r	p
Significance of modern technology	0.25	<0.001
Significance of the ticket price	0.18	0.008
Significance of travel time	0.06	0.363

Source: own study based on primary research (N=331)

It was observed that opinions on the significance of modern technologies and the ticket price correlate strongly with the overall assessment of rail transport services. In addition, all correlations had a positive value, which meant that the greater the importance of the individual categories, the better the rail transport was assessed in general by respondents. Only the opinion on travel dime did not statistically correlate with the assessment of the rail transport service.

As regards the ticket price, the correlation was poor whereas the relationship with the importance of modern technology was weak.

Since both correlations proved to be significant, a regression analysis was carried out. It allowed the determination of how the model, with these categories, explains the assessment variances.

The regression analysis showed that, knowing the given preferences of the respondents, it is possible to predict approximately 7% of the general assessment variance concerning railway transport [$F(2.212) = 6.54$; $p = 0.002$; $R^2 = 0.07$]. However, the significance of modern technology proved to be an irrelevant predictor ($t = 0.06$; $p = 0.952$; $\beta = 0$; $B = 0.06$). The only relevant predictor was the opinion on the ticket price ($t = 2.49$; $p = 0.013$; $\beta = 0.07$; $B = 0.17$). Since the value of the intercept B = 1,71, the model equation is as follows:
Assessment of rail transport = 1.71 + 0.17**opinion on the significance of the ticket price*

Research summary and conclusions

Considering the low share of rail transport in passenger transport in general, in the EU and Poland, the reasons and objectives for using passenger cars as an alternative means of travel should be analysed very carefully. They are used primarily for commuting to work as well as for shopping and leisure activities. The main reasons indicated by the respondents (presented in the results of secondary research) for choosing a passenger car for commuting to work or school instead of public transport include: too long distance to the nearest public transport stop/station, the lack of appropriate connections in the public transport timetable and unacceptable time of public transport travel (Pilot study on the behaviour of travellers in Poland, stage III – final report 2015), (Kos, Krawczyk, Tomanek, 2020, p. 114-117).

This was confirmed by the results of the presented primary research which indicated that for young customers (service users) convenient connection times are the most important (the most important characteristic). The following elements were almost equally important for respondents: ticket price, safety in the means of transport,

duration of the journey, number of transfers, number of connections, punctuality, quality of services provided and ability to check connections online.

The research shows that the best feature of rail passenger transport services (the execution of which was assessed as “very well” and “well” by the respondents) according to young customers (service users) include: safety in the means of transport, the availability of an electronic ticket, employees' competences, the ability to check connections online, purchasing a ticket using mobile devices, displaying/informing about the next station/stop.

On the other hand, the worst features of rail passenger transport services (answers: “bad” and “very bad”) according to young customers (service users) include: punctuality, tracking the route and location of the train during the journey through applications, refunds due to delays, provision of additional services, such as Wi-Fi, duration of the journey, convenient connection times (the most important feature), number of connections.

While with the increase in importance of the modern technology and price categories, the overall assessment of the respondents concerning passenger rail transport improved, which allowed the confirmation of the hypothesis set out in the introduction concerning these two categories, the opinion on travel time and the factors included in this category (duration of the journey, number of transfers, convenient connection times (the most important feature), number of connections, punctuality) did not correlate statistically with the assessment of these services, which allowed the rejection of the hypothesis set out for the third category. This is a particularly important conclusion which indicates the trends in the provision of passenger rail transport services.
The results of research carried out on rail passengers in Poland suggest that the carriers and passenger transport operators should take into account their preferences. This may result in a gradual redirection (shift) of demand for rail transport in line with the preferred goals and objectives of sustainable transport.

*__Endnote:__ It should be additionally emphasised that the implications and the rate of development of modern technologies in passenger rail transport in Poland differ from the global level, and, as a result, the solutions examined are not the latest or up to date from a global perspective, yet they fully reflect the level of advancement of these services in Poland.

Abstract

The article studies the stages of formation and development of the information society abroad and in Russia. Special attention is paid to the analysis of the development and implementation of ICT as the main factor of successful formation and development of the information society. Relevant from the standpoint of economic theory is the study of the relationship between state and market regulators in the process of formation and development of the information society, both in Russia and abroad. The author reveals that the process of formation of the information society in Russia took place under active state regulation aimed at the introduction of ICT in various levels of government. Moreover, the further development of the information society in Russia requires a well-founded program of state support for information industries, which is the key to ensuring the country's competitiveness.

Keywords: Global Information Society, information society, information and communication technology (ICT), state, market, digital economy.

Introduction

The first mention of the term "information society" by Professor Yu. Hayashi in reports submitted to the Japanese government in the second half of the 1960s [1]. Reports prepared by reputable organizations (the economic planning Agency, The Institute for the development of computer use, the Council on industrial structure) defined an "information society" as a society in which the development of computerization will provide subjects with access to reliable sources of information and ensure a high level of automation of production. Products produced in such a society contain more "information".

The basic research on the problems of formation and development of the information society was based on the work of D. Bell «The Coming of Post-Industrial. A venture in Social Forecasting» [2]. According to the concept of D. Bell, the history of human development can be divided into three stages: agricultural, industrial and post-industrial. In his study of the post-industrial stage of development of society, D. Bell relies on the characteristics of the industrial stage. Based on the approaches of T. Veblen and other theorists, it considers industrial society as "a society in which the main goal is to produce the maximum number of machines and things" [3]. A characteristic feature of post-industrial society is the transition from the production of material goods to the production of services related to education, health, research and management. Knowledge and information become a strategic resource of post-industrial society. Further development of the concept of the information society is reflected in the work of I. Masuda [4], which presents the main principles and features of the information society. From the point of view of I. Masuda, the Foundation of the information society is computer technologies designed to replace or strengthen intellectual labor. The information technology revolution is creating a new production force that allows mass production of new technologies and knowledge. In such a society, the leading sector of the economy is intellectual production, whose products are accumulated and distributed through ICT.

T. Stonier's conceptual ideas are reflected in his work "Information wealth: the profile of the post-industrial economy" [5] and were reduced to understanding "information" as a form of capital that can be stored and accumulated for future use. According to T. Stonier's concept, in a post-industrial society, national information resources become a

Cite this Article as: Anna KAMYSHOVA and Valery LEVENTSOV“ The State and The Market in The Process of Formation and Development of The Information Economy in Russia” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

potential source of national wealth. In this regard, it is the information industry, which is based on ICT, that is becoming the leading sector of the economy, the development of which determines the potential of any national economy. It is this industry, which is the basis of the service sector, that is becoming the dominant industry in terms of its share in the total output of the country and employment in the economy.

The innovative views of scientists such as Marshall McLuhan [6] and Alvin Toffler [7] have been criticized by traditional science and the General public. A distinctive feature of M. McLuhan's scientific position was his statement that communication technologies are becoming the main factor determining the formation and development of the socio-economic basis of society. McLuhan assigned a special role in this process to the telecommunications and computer networks, which act as the nervous system in the formation of the "global embrace". In his arguments, McLuhan presented mass communication on the one hand as a part of society, on the other hand, as a force, unlimited power over society. A. Toffler in his work "The Third wave" offers his own vision of the history of the development of society, highlighting three waves in the history of the development of civilization: agricultural (before the 18th century), industrial (before the 50s of the 20th century) and post-industrial (since the 50s of the 20th century). A. Toffler also believes that the beginning of the third wave is associated with the information revolution. Interesting from the point of view of transformation of the usual forms of interaction is the contrast of traditionally bulky corporations of small firms, among which a special place was given to "individual activity in an electronic cottage" - a workplace in the house remotely from work (a modern form of remote employment). [8-11]

At the turn of the 1980s and 1990s, a new stage in the development of the concept of the global information society was marked by the publication of scientific works by Peter Ferdinand Drucker and Manuel Castells. Peter Drucker in his research "Post-Capitalist society" [12] tried to formulate a new vision of the concept of post-industrial society. One of the Central elements of this concept, distinguishing it from the works of the predecessors, is justification of transformation of national States under globalization of economy and society.

M. Castells in his research "the Information age: economy, society and culture" [13] referred to the main features of the new emerging world order as the global economy and international financial markets. The main focus of Castells 'work is on the research of trends underlying the formation of a"network society". At the same time, network structures are both a cause and a consequence of globalization. Information, its collection, processing and transmission, becomes an element of the productive forces of society and a source of power.

All these concepts of formation and development of information (post-industrial) society are united by the fact that they consider the rapid development and spread of ICT as a distinctive feature of the global information revolution, which affects all spheres of social and economic life, both in the world and in individual national economies. The importance of these trends was reflected in the Okinawa Charter of the global information society, which States: "Information and communication technologies are one of the most important factors influencing the formation of society in the XXI century" [14]. Taking into account the current changes, it is important for economic science to understand the role of the state and the market in these processes.

The purpose of this research is to identify the role of the state and the market in the formation and development of the information economy in Russia and abroad. The research is aimed at substantiating the mechanism of interaction between the state and the market in the development of ICT in Russia as the main factor in the formation and development of the national information economy. [15-18]

The article will consider the research methodology, carry out a comparative analysis of the stages of the formation of the information economy abroad and in Russia, identify the role of the state and the market in this process and the main conclusions of the work, which make it possible to substantiate the role of the state and the market in the development of ICT in Russia.

Method of Research

The methodology of this research is based on the application of philosophical methods of scientific knowledge, such as:

- a combination of the historical and the logical, which makes it possible to reveal the logic of the formation of the information-network society abroad and in Russia, based on the analysis of the historical stages of the formation of modern society;
- a combination of synthesis and analysis, which implies the simultaneous study of global processes within the system of world economic relations and the analysis of particular processes inherent in various economic systems.

The theoretical basis of the research is the works of famous foreign and domestic scientists, which present the main provisions of modern science in the era of the formation and development of the global information-network society. [19-20]

An important role in this research is assigned to the analysis of problems associated with the peculiarities of the formation and development of the information network society in different countries, as well as to identify the role of the state and the market in various models of the information society.

Research on the role of the state and the market in the formation and development of the information society abroad

The research of the role of the state and the market in the process of formation and development of the information society abroad is based on the analysis of models of development of the information society (models of informatization), which allows us to identify the differences between national economies. As a rule, these differences are based on the features of macroeconomic policy and conceptual provisions of the state in the process of formation and development of the information society. In economic theory, two models are conditionally distinguished: Western and Eastern. At the same time, when analyzing the Western model, one should distinguish between the American and European models, and within the Eastern model, the path of China and other Asian countries.

The process of formation and development of the information society in the EU has the main feature - the search for a certain balance between the state and the market, the basis of which is a combination of state and market regulators, depending on the changing environment. This approach, which determines the role of the state in the formation and development of the information society, was enshrined in the 1993 EU resolution and assumed the need to achieve a balance between social and market orientation. Also in the report of the Danish government "Information Society 2000" it was emphasized that "the market cannot be allowed to take control of the strategy of developing information highways, but this strategy must take into account the possibilities of market forces" [21]. Nevertheless, the macroeconomic policy of the EU countries assigns a serious role to the market, paying great attention to solving the problems of privatization and liberalization of the ICT market. Moreover, the problem of privatization has long been resolved, and the discussions concern only the ICT liberalization policy.

Countries such as Great Britain, Finland, Sweden and the Netherlands completed the discussion on ICT liberalization in the late 90s of the last century, an impulse for which was the "agreement on the liberalization of the telecommunications services market" signed in February 1997 by 69 countries.

The American model of information society development is based on the dominant role of the market while minimizing the functions of the state in the process of formation and development of the information society. This model assumes complete liberalization of the ICT market. Moreover, like the United Kingdom, the United States, when allocating priorities, considers the building of information highways to be paramount, on the basis of which the service sector subsequently develops. [22]

Within the framework of the eastern model, Japan, the group of countries "Asian tigers", China and India are distinguished. The common thing for the countries of the eastern model of the formation and development of the information society is the cooperation of the state and the market, the establishment of a connection between cultural values and social changes. The basis of cooperation between the state and the market is the assistance of the state in achieving the above principles at the level of a single firm.

Japan's successes, dubbed the "Japanese economic miracle," were made possible by a competent macroeconomic policy aimed at stimulating R&D spending and prioritizing ICT in the country's socio-economic development. The strategic goals of the country in the field of ICT are: development of a system of compatible and interconnected telecommunication networks; development and implementation of ICT; creation and distribution of information devices and technologies; development and implementation of software and information services; preparation of qualified workforce for the information sphere. [23] The subsequent implementation of the strategic goals has become an incentive for the development of ICT and information-oriented activities. Moreover, in the 2000s. ICT has become a powerful driver of economic growth in Japan. For Japan, whose demographic processes are characterized by a rapid aging of the population against the background of a decrease in the birth rate, ICT is a factor that makes it possible to compensate for the negative impact of these phenomena.

The basis of the model of the formation and development of the information society in the countries of "Asian tigers" is the model of economic cooperation between the state and the market. The success of this model is based on

government intervention in making investment decisions that require large capital investments, government participation in the creation and development of the national information infrastructure. The problems arising in the process of creation and development of the information society, requiring active government participation, include: increased competition in the creation and implementation of ICT; uneven realization of potential in the ICT product market and the labor market; the need to ensure equal access to information resources for all market participants. [24]

The Chinese model is based on a competent macroeconomic policy of the state, the purpose of which is to ensure a significant inflow of foreign investment in the economy, including in the information sphere. An important feature of investment activity is the large share of TNC investments in the total volume of investments in the country, and in the information sphere in particular. This process is being enhanced by the growing number of qualified Chinese ICT professionals.

The model of the formation and development of ICT in India has been called “intermediate”, since this country has abandoned both full privatization (state enterprises are not transferred to the private sector) and soft liberalization (competition is allowed in the domestic market for services with a limited presence of foreign firms). Human capital is considered the main factor that ensures the successful process of creating and developing the information society in India, which is expressed in a high level of scientific and technical potential according to world estimates.

Summing up the analysis of the relationship between the state and the market in different models of the development of the information society, it is important to note that the relationship between the state and the market in economic systems of different types is determined by the structural characteristics of the real sector [25-26]. At the same time, one of the main roles in the development of a model for the development of the information society is played by national cultural characteristics that dominate the formation of demand for types of ICT [27].

Research on the role of the state and the market in the formation and development of the information society in Russia

The study of the role of the state and the market in the process of formation and development of the information society in Russia is based on the analysis of the stages due to the alternate solution of emerging problems. At the same time, the formation of an information society in Russia is a prerequisite for ensuring sustainable development of the country and its full integration into the world economic system.

The initial stage of state regulation of the formation and development of the information society in Russia was the development of the basic principles of state information policy. The concept of state information policy was developed and approved by the Committee on Information Policy and Communications of the State Duma of the Federal Assembly of the Russian Federation on October 15, 1998 [28]. The basic principles of the concept of state information policy were: the principle of openness; the principle of equality of interests; the principle of consistency; the principle of priority of the national producer; the principle of social orientation; the principle of state support; the principle of priority of law. Analysis of the content of the basic principles of the concept of state information policy allows us to assert that it is the state that is assigned the main role in the formation and development of the information society in Russia.

In 1999, the Concept of Formation of the Information Society in Russia was developed [29], and on May 28, 199, it was considered and approved by the State Commission for Informatization under the State Committee of the Russian Federation for Communications and Informatization. The purpose of the concept is to find a Russian way of developing the information society, the main directions, provisions and priorities of the state information policy that ensure this process. The concept emphasizes that the leading role in the process of formation and development of the information society should belong to the state. The main task of the state at the initial stage is to develop a legislative framework.

In order to preserve Russia's national interests in the information sphere and ensure information national security, the Doctrine of Information Security of the Russian Federation was developed in 2000 [30-31], which was approved by the Security Council of the Russian Federation at a meeting on June 23 and approved by the President of Russia on September 9, 2000. The role of the state in ensuring national information security is the leading one and is reduced to the implementation of the following measures: development of mechanisms and implementation of the regulatory framework in the information sphere; development of mechanisms for increasing the effectiveness of public administration in the information sphere and economic policy in general; creation and development of a professional training system for employees to ensure the country's information security; development of domestic ICT for defence purposes to ensure the country's technological independence; development and implementation of federal programs

aimed at creating publicly accessible archives of information resources of federal and regional authorities; prevention of computer crimes.

In January 2002, by a decree of the Government of the Russian Federation, the Federal Target Program "Electronic Russia" was approved [32]. The main role in its implementation is assigned to the Ministry of Economic Development and Trade of the Russian Federation and the Ministry of the Russian Federation for Communications and Informatization. The main objectives of the program are: increasing the efficiency of the economy and public administration through the introduction and mass dissemination of ICT; ensuring freedom of access to information; an increase in the number of qualified ICT specialists. The main sources of financing for this program are budgetary funds, private investment of Russian business and foreign investment.

Analysis of the development of the information sphere in Russia: the dynamics of the introduction of ICT in the activities of enterprises and the life of households

Analysis of the dynamics of costs for ICT on the part of business and households allows us to assert that in Russia there is a steady increase in private sector spending on information and telecommunications technologies. So, in the period from 2005 to 2018, organizations' expenditures on ICT increased from 215 billion rubles. up to 1,676 billion rubles, demonstrating growth over the entire study interval. Moreover, 26.6% were the costs of paying for the services of third-party organizations and specialists in information communication technologies (except for communication and training services) in 2018 compared to 16.2% in 2005. Organizations' expenses for the purchase of computers and office equipment decreased from 36.5% in 2005 to 19.9% in 2018 amid an increase in the cost of purchasing software from 10.2% in 2005 to 18.1% in 2018 [33].

The data presented by the Federal State Statistics Service indicate that enterprises and organizations are increasing their spending on ICT, thereby demonstrating the deepening of Russian business into the information economy: information resources are becoming a full-fledged factor of production. Thus, the share of ICT costs in the total volume of investments in fixed assets in 2005 was 5.95%, and by 2018 it increased to 9.43%.

The number of enterprises using ICT in Russia has also increased. According to official statistics, the number of enterprises using personal computers increased from 91.1% in 2005 to 94.0% in 2018.The number of organizations using servers increased from 9.3% in 2005 to 53.4 % in 2018 The number of enterprises using e-mail in their work also increased from 56.0% in 2005 to 90.9% in 2018.The number of organizations with a Web site on the Internet increased from 14.8% in 2005 to 50.9% in 2018 [34].

Analysis of the inclusion of ICT in the life of households showed that the number of active subscribers of fixed access to the Internet increased by 22.1% from 26,944 thousand people in 2015 up to 32,910 thousand people in 2019. At the same time, the number of active subscribers of mobile access to the Internet increased by 32.5% from 109,926 thousand people in 2015 up to 145663 thousand people in 2019 The data provided by the Federal State Statistics Service indicate that the growth rate of the number of mobile Internet users significantly exceeds the growth in the number of fixed Internet users. Analysis of access to the Internet in households (based on data from sample surveys of the population on the use of ICT; as a percentage of the total number of households) allows us to state that the percentage of households with access to the Internet in the period from 2017 to 2019 changed insignificantly and amounted to 76.9% in 2019 compared to 76.3% in 2017. At the same time, the largest share among Internet users was made by households using other mobile devices (mobile phones or smartphones, devices for reading e-books, etc.) to access the Internet: 56.0% in 2017 and 66% in 2019 [35].

The presented data of the Federal State Statistics Service indicate that the increase in the expenditures of the population (households in particular) on the Internet, access to which from mobile devices is increasing, making up the largest proportion, is a consequence of the increase in the standard of living of the population. At the same time, providing mobile access to information via the Internet becomes a necessary condition for the normal functioning of the average household. This fact confirms the inclusion of Russia in the global processes associated with the formation and development of the global information society. Thus, the process of formation and development of the information society is inextricably linked with the transition of the economy to a new technological order, which causes qualitative transformations in all spheres of the reproduction processes of socio-economic systems. Despite the presence of a steady trend towards the inclusion of ICT in the activities of enterprises and organizations, the predominant use of ICT is observed in the sphere of consumption and exchange. At the same time, the use of ICT directly in the production process remains at a low level. In 2018, only 86% of organizations in the business sector have access to the Internet, while in Finland 100% of organizations. Providing employees with mobile devices for Internet access in business organizations in the Russian Federation is only 5% of the total number of employees, and

in Finland - 49% of employees. The use of the Internet in organizations for purchasing and selling (as a percentage of the total number of organizations in the business sector) in the Russian Federation is 20% and 15%, respectively, and in Sweden - 78% and 32%. The use of ERP and CRM systems in organizations (as a percentage of the total number of organizations in the business sector) in the Russian Federation is 22% and 18%, respectively, and in Finland - 39% and 39% [36].

Conclusion

In the course of the research, devoted to the analysis of the ratio of state and market regulators in the process of formation and development of the information society in Russia, the main patterns inherent in this phenomenon were identified, both in the world and in Russia.

1. All national economies in terms of the ratio of the state and the market in the process of formation and development of the information society can be conditionally divided into two groups: countries that have assigned the leading role in this process to the state; countries that have preferred market mechanisms for the formation and development of the information society.
2. The model of the formation and development of the information society in Russia presupposes the domination of the state as a regulator of this process, and the main areas requiring state participation in this process are: formation of the legal framework; financing the process of creation and implementation of ICT in all spheres of the country's socio-economic life; formation of human capital that meets the requirements of the information society.
3. The main trends inherent in the process of formation and development of the information society, both in the world and in Russia, are the following:
   First, it is obvious that information is becoming one of the factors of production of any national economy, along with labour, capital and natural resources. Today, the scale of the involvement of information in the process of socio-economic development of the national economy is comparable to the traditional factors of production in terms of total costs.
   Secondly, there are changes in the structure of the real sector of the economy in favor of increasing the share of the information sector in the gross national product. The increase in the share of the information sphere in the structure of the Russian economy is confirmed by data from the Federal State Statistics Service, according to which employment in the field of information and communications in the period from 2010 to 2019 increased from 1.9% to 2.1% of the total employed population. This trend is accompanied by an increase in labor productivity in this sector, where in the period from 2015 to 2018 productivity increased from 100.4% to 103.0%. The expansion of production activities in the field of ICT is confirmed by an increase in investment in fixed assets. So, in the period from 2015 to 2019 investments in fixed assets in telecommunications increased by 61.98%, and in information technology - by 4.6 times. [22]. The growth of investment activity in the information sphere is reflected in the results of economic activity, measured by the volume of gross value added by sectors of the economy. The share of computer software development, consulting services in this area, other related services and activities in the field of information technology increased from 0.7% to 1.1% in the period from 2014 to 2018. At the same time, the share of activities in the field of telecommunications decreased from 1.5% to 1.0% during the study period [23].
   Fourth, the change in the role of the state in the process of formation and development of the information society, which is a global trend. As shown in this study, a number of countries at the stage of formation of the information society assigned the state the main role as a regulator of this process. The Russian model of the formation and development of the information society has followed this path of development. However, the further process of development of the information society within the framework of national systems is increasingly becoming a part of the global process, involving more and more countries of the world community. In this regard, a number of functions that belonged to states within their national borders are gradually being transferred to supranational institutions (regulators), which exacerbates the problem of ensuring national information security [24].

Abstract

In Russia social media, in particular instant messengers, have advanced rapidly in recent years. The most popular ones are WhatsApp, Viber, Skype, Telegram. The purpose of this article is to systematize factors of market positioning of social media channels as a digital analytical and planning technology of advertising campaigns. A systematic approach and comparative analysis were used to study this problem.
The authors attempted to develop a methodological approach towards analyzing and planning of advertising campaigns in social media based on the analysis of the factors characterizing quantitative parameters of the Internet platform development and its target audience distribution.
The proposed approach was tested by the authors for determining the development features of Telegram messenger, analyzing its target audience (users with higher education engaged in science, technique, information technology, etc.) and its promotional product (posts in the form of a native format, etc.).
The analysis concluded that Telegram platform is suitable for analyzing and planning of promotion campaigns in any business field.

Keywords: social media, advertising campaign, messengers, target audience, digital advertising technologies

Introduction

Telegram, as an advertising campaign planning tool, is a relatively young online platform. In July 2017, it started as a channel catalog with the ability to track reposts; currently it is positioned as a tool for analyzing and planning of advertising campaigns with a monthly attendance of more than 600 thousand people. It should be noted that in 2018 the number of active service users increased sixfold (compared with 2017), and in December 2018 alone, they viewed more than 2.5 million pages.

A high popularity of the application, in our opinion, is due to the applied encryption technology, which guarantees users' anonymity and restricts access to personal data. According to the results of the Project Group study, focused on the analysis of using Telegram by the central government, the messenger is convenient for information dissemination: access to any Telegram channel can be purchased for a certain amount of money and the customer remains anonymous.

A potential Telegram's advantage is its user-friendly interface and the targeted nature of advertising, while a high conversion percentage is ensured by placing information on relevant channels and focusing on a potentially interested consumer. Therefore, manufacturers are actively using the application for business purposes, and channel

Cite this Article as: Elena ISAENKO, Elena MAKRINOVA, Irina ROZDOLSKAYA, Elena MATUZENKO and Svetlana BOZHUK" Research of Social Media Channels as A Digital Analytical and Planning Technology of Advertising Campaigns" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

owners make a profit of advertising placement, which contributes to the steady growth of the messenger's popularity.

Finally, popular channels owners profit successfully by selling them. A promoted channel with a large number of subscribers can cost several hundred thousand rubles.
Currently, the number of Telegram users is growing, and along with the growth of the target audience, political and business structures are starting to view it as an effective PR mechanism, an advertising and propaganda tool.

Research Methodology

Cabinet research methods were used in the analysis: analysis of scientific and methodological literature on the topic under study, generalization and classification of the investigation, overview of the existing foreign and Russian experience in the field of marketing [1, 2] and Internet advertising. A systematic approach and comparative analysis were used for examining this problem.

This study is a continuation of the authors' previous researches [3-8] on the development issues and features of social media in the digital marketing technology system. The purpose of this article is to investigate the results of using social media for both analyzing and planning of advertising campaigns [9-10].

In contrast to previously published works (Arshad, 2018 [9]; Cavaliere, 2018 [10]; Jain, Subhash, 1999 [11]; Moskaleva et al, 2018 [12]; Neumann, 2018 [13]), devoted to digital technologies development, the authors attempted to work out a methodological approach to analyzing and planning of advertising campaigns in social media based on the analysis of factors, characterizing quantitative parameters of the Internet platform development and its target audience distribution.

The proposed approach was tested by the authors when determining developmental characteristics of Telegram messenger, analyzing its target audience (users with higher education engaged in science, technique, information technology, etc.) and an advertising product (posts in the form of a native format, etc.) [13-14].

Results obtained

A study of various sources on the use of Telegram messenger for planning advertising campaigns allowed the authors to conclude that currently there are no methodological approaches satisfactory for such studies. The available statistics, as well as the polls conducted on Telegram messenger development, do not provide a holistic picture for making managerial decisions regarding planning an advertising campaign by using this online platform [15-16].

In that context, the authors attempted to systematize the factors of Telegram messenger market positioning in order to use it as an advertising platform for business promotion. Moreover, the authors systematized market-positioning factors in two groups (Fig. 1).

The first group gives an idea of Telegram's development trends. It includes the following criteria: distribution geography, distribution of channels on subject matters, number of channel subscribers, channel citation index, number of channel links to media sites and social networks. The indicators of the second factor group of Telegram messenger market positioning give an idea about its target audience according to gender, age, occupation, interests, objectives of using, number of contacts, number of channels read by users, share of other Internet services usage, frequency of commercials on various platform channels. [17]

Fig.1: Systematization of social media factors of market positioning

Let us consider these factors in more detail.

Initially, Telegram focused on the Russian market (63 thousand channels at the end of 2018), and now the Russian-language segment remains the main priority, but geography of the channel penetration in other countries is expanding (Fig. 2). [18-20]

Monthly Attendance 600,000 people
Channel Base
100 312

Fig.2: Distribution geography of Telegram in 2018, %

Currently, users from 6 countries communicate in Telegram messenger, whereof 62% are Russians, 25% are citizens of Iran, 7% are from Uzbekistan, 4% are Ukrainians, and citizens of Kazakhstan and Belarus –1% each. On average, 600 thousand people visited the channel per month, using 100312 channels; in Russia 856 channels link to Telegram.

Analyzing Russian Telegram users by region, we can conclude that a large share is constituted by residents of Moscow (36%) and St. Petersburg (15%); large cities range from 1.5% to 2.7%. The share of Telegram users in the central part of Russia accounts for almost 50% of the total.

During 2018, the number of Telegram channels increased and by the end of the year, almost 40 thousand new Russian-language channels were indexed.

In 2018, interests of Telegram users changed (Fig. 3). Despite the fact that almost every major entertainment public in the social network Vkontakte has a Telegram channel, according to criteria *number of channels* the author's blogs regained the first place (at the end of 2017 humorous channels were on top for a short time), and the second place belongs to business issues; music channels have risen in ranking by several times. Cryptocurrencies are currently not as popular as they were at the end of 2017, so this subject matter is in the sixth place on Telegram. Moreover, Technology category channels, which took the leading position a year and a half ago, are now not included in the top 10, giving way to Health and Sports channels as well as to Art and Photo channels.

Fig.3: Telegram channels share by subject matters, %

Let us consider the most popular channels of Telegram platform by the number of subscribers (Fig. 4). Mash channel is at the top with 470.1 thousand subscribers, in second place is KB with 376.5 thousand users, and third place is taken by MDK.

Fig. 4: The number of Telegram subscribers in 2018 by channels, thousand people

Compared to 2017, the number of subscribers in 2018 increased in the following way: Mash channel – more than 3.5 times, Futlyar ot Violoncheli channel increased the number of subscribers fivefold, Dvach and MDK channels doubled the number.

In 2018, specialists of Telegram platform changed the formula for citation index calculating because this figure did not reflect reality due to a large-scale purchase of commercials at low-quality channels. At present, it is possible to realistically assess the most influential and popular Telegram channels inside the messenger at year's end (Fig. 5).

Fig.5: Telegram channels by citation index

The figure illustrates that the citation number of Nezygar channel ranks first, Mash channel is in 2nd place, and Futlyar ot Violoncheli is in 3rd place. The last two channels have significantly increased the number of subscribers by the end of 2018.

Let us estimate the rating on *number of channel links to media sites* in Telegram in 2018 (Table 1). Medusa is at the top with its own six popular channels (they account for 80% of the entire link mass).

The five most mentioned media also includ TJournal, vc.ru, Kommersant and RBC. If to sort the top channels descending, it is as follows: 1st place is taken by Medusa, RBC is in 2nd place and Vc.ru is the 3rd one.

Table 1: Number of channel links to media sites in Telegram in 2018

№	Mass media	Site	Number of views of publications with a link to a media site	Number of publications with a link to a media site	Number of channels with at least one link to a media site

Figure 6 shows the services most often mentioned by Telegram. YouTube is at the top with more than half a million posts in almost 17 thousand channels (30% of the entire Russian-language Telegram). Social network VKontakte ranks second; 3rd place is taken by social network Twitter; Instagram is in 4th place and Facebook is the fifth one.

Fig. 6: Services mentioned in Telegram in 2018, thousand units

In order to correctly promote business in Telegram, it is necessary to study the target audience and their needs. Entrepreneurs, executives, freelancers, and Internet marketing specialist are popular users of Telegram. [21]

Let us consider the Telegram's audience based on a survey conducted by @aboutSMM channel. Currently, men constitute the majority of the messenger users (57%).

Telegram's target audience, depending on gender and age, is shown in Fig. 7. The figure depicts that 48% of women aged from 18 to 24 are users of the platform, and 40% constitute men aged from 25 to 34. Men and women aged from 45 to 64 and schoolchildren aged from 12 to 17 use Telegram the least. Therefore, we can conclude that the active audience of Telegram messenger is in the age range from 18 to 34 years.

Fig.7: Distribution of Telegram target audience according to gender and age, %

The most active users of Telegram are “experienced specialists” (35%), “students” (25%) and “young specialists” (17%), a small proportion of Telegram users constitute schoolchildren and unemployed population (5% each). [22-34] The rest of the audience is made up of mid- and top-level executives; 57% of users have higher education, which proves a high quality of the target audience.

Fig. 8: Distribution of Telegram target audience according to occupation, %

Figure 9 shows interests of Telegram users. Almost half of the messenger users (47%) are interested in information technology, 42% are interested in science and technology, 41% – watch movies and TV shows (Fig. 9). 39% of Telegram users enjoy reading news on large media channels and 35% are interested in reading books. The proportion of Telegram users subscribed to entertainment channels amounts to 29%.

Fig. 9: Distribution of Telegram target audience according to interests, %

The largest share of Telegram target audience use the messenger via Androids (60%), about 40% of users get access to the platform via iPhones, and 2% of the audience use Windows platform.

In the course of the survey, it turned out that more than 90% of Telegram users enjoy the messenger to see something they need, 88% – use the platform for correspondence purposes, 45% of users prefer chat rooms (Fig. 10). The number of Telegram messenger’s authors in 2018 reached 16%, and the number of subscribers using bots was 45%.

Fig. 10: Distribution of Telegram target audience according to the objectives of using, %

Any social network or messenger user has a list of contacts (friends). Unlike social networks, Telegram messenger opens chat on adding a contact. Therefore, most users have only 5-10 contacts of their closest friends and partners with whom they often communicate (Fig. 11).

Fig. 11: Telegram target audience distribution according to the number of contacts,%

Approximately one third of Telegram messenger users (30%) are subscribed to 10-25 channels, 27% of users – to 5-10 channels, and 24% – to 1-5 channels. Those who are not subscribed to any channel and those who are subscribed to more than 50 channels amount to less than 5% (Fig. 12).

Fig. 12: Telegram target audience distribution according to number of channels read by users, %

Almost 70% of Telegram audience are either registered in the social network VKontakte or often use it, 56% of them chat in WhatsApp, 30% use Viber, 30% use the social network Facebook, 19% use iMessage via iPhone (Fig. 13).

Fig. 13: Distribution of Telegram target audience according to the share of other Internet services usage,%

In Telegram messenger an advertisement is placed as a post or a native format. Therefore, 25% of Telegram users do not see advertising on the messenger channels, 30% see it very rarely and 25% see it only occasionally.

Fig. 14: Distribution of Telegram target audience according to frequency of commercials on various platform channels, %

Approximately 17% of users see advertisements very often and 5% see them constantly. Apparently, they are subscribed only to entertainment channels.

Telegram has become a popular messenger and its audience is very diverse. Now the messenger is used not only by entrepreneurs and IT specialists, but also by different categories of users.

Currently, there is no fierce competition on this platform; there are no clear leaders in every economic realm. Therefore, nearly any author with minimal skills can develop their channel and get first profit in 2-3 months.

To evaluate Telegram target followers' feedback we use the ER indicator (engagement rate of followers'), which is calculated as follows:

ER = the sum of all engagements (likes, reposts, comments) / number of subscribers * 100%.

However, in the judgment of the authors, the drawback of this indicator is that it does not take into account coverage, involvement on specific days and interaction with individual posts.

Therefore, in our opinion, to evaluate Telegram target followers' feedback, it is necessary to use several subtypes of ER.

1. Reach engagement rate (ERR) = number of engagements / coverage * 100%.
This indicator shows the approximate share of those who have seen community publications and reacted to them in one way or other.
2. Engagement rate per day (ER Day) = number of engagement per day / number of subscribers * 100%.
Daily engagement shows how many times a day the average subscriber showed his/her activity.
3. Engagement rate per post (ER Post) = the amount of involvement per 1 publication / number of subscribers at the date of publication * 100%.

The indicator allows evaluating interest in specific publications, comparing them in terms of effectiveness.

4. View engagement rate (ER View) = number of engagements per 1 publication / number of views * 100%.
This indicator shows the specific share of the target audience who made comments on a specific advertisement viewing.

Social media analytics tool "Popsters" is used for running community analysis in social networks and messengers. It automatically calculates all of the listed above indicators.

Thus, in order to enable effective advertising communications in messengers, many advertising specialists calculate rates of both return on investment and target followers' feedback, while advertising on several platforms to achieve appropriate goals and decide on the format for each target audience.

Conclusion

The study on Telegram's market positioning factors for analyzing and planning of advertising campaigns for business operations leads the authors to the following conclusions.

The active Telegram messenger audience is in the age range from 18 to 34 years. 57% of users have higher education, which proves the high quality of the audience. 47% of the messenger users are interested in information technology, 42% are interested in science and technology, 41% watch movies and TV shows, 39% read news channels of major media companies, and 35% read books. Almost 70% of the Telegram audience are either registered in the social network VKontakte or often use it, 56% of them chat in WhatsApp, 30% use Viber, 30% use the social network Facebook, 19% use iMessage via iPhone. In Telegram messenger an advertisement is placed as a post or a native format. Therefore, 25% of Telegram users do not see advertising on the messenger channels, 30% see it very rarely and 25% see it only occasionally.

Based on the above stated, we can conclude that Telegram messenger is currently an effective platform for analyzing and planning advertising campaigns in any business field.

Abstract

The purpose of this article is to develop recommendations for implementing the marketing strategy of organizations of consumer cooperation following the formation of the marketing information system for ensuring their competitiveness.

The article discusses the essence of the organization's marketing strategy and the main stages of its formation; the components of the organization's marketing strategy were selected; the role of the marketing information system for developing and implementing of the marketing strategy is shown; the competitive advantages of organizations of consumer cooperation from the standpoint of their marketing strategies are identified; and strategic directions for retail trade development within consumer cooperation are shown. In the process of research, an algorithm for the organization's marketing strategy development by means of using a marketing information system is proposed; the conceptual diagram of the organization's marketing information system formation is given; factors of macro- and microenvironment are studied; SWOT analysis aimed at the expansion of information base for making managerial decisions is carried out; grouping of the consumer cooperation benefits is carried out in accordance with the identified strategies with a view to their use for marketing strategies developing. The article presents a model for marketing strategies formation that allows to track the sequence of operations from setting goals to adjusting the strategy and contribute to the achievement of sustainable competitive positions and rise in the consumer's loyalty. The article contains a system of assessment indicators and presents the results of a comprehensive assessment of the retail strategies implementation within consumer cooperation under the selected components. The information base for research comprised official statistics, publications on retail trade and consumer cooperation development, marketing researches, as well as source materials collected during the authors' interviews with customers and heads of organizations of consumer cooperation.

Keywords: Marketing strategy, marketing information system, organizations of consumer cooperation, competitiveness, retail trade, algorithm for marketing strategy development, comprehensive assessment of marketing strategies implementation.

Introduction

Activation of market-driven processes results in the need to consider various organizational and economic aspects of entities operating in the consumer market, in particular organizations of consumer cooperation. Studies have shown that the need to improve competitiveness of organizations of consumer cooperation is becoming particularly relevant, as there is a significant

TARASOVA" Marketing Strategy of Organizations of Consumer Cooperation Based on the Formation of the Marketing Information System as the Foundation for Ensuring Their Competitiveness" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

decrease in the number of these enterprises and exclusion of organizations of consumer cooperation from the rural market which is their traditional segment. Competitive environment is enhancing in the Russian consumer market both due to the increasing number of individual private retail trade enterprises, and the rapid development of Russian and international retail chains, which are gaining market share not only in large cities, but also in cities of regional significance [1-3].

In this regard, there is a growing need for monitoring of development trends of the enterprise's external environment and taking into account the characteristics of consumer behavior. From the standpoint of ensuring competitiveness, it is also important to apply digital technologies in marketing activity of organizations of consumer cooperation, and to develop a marketing information system for making sound management decisions in the face of increased competition on the consumer market.

Innovations and information technologies are being introduced in the retail organizations of Russia and foreign countries, making competitive activity more complex. There are constant qualitative changes in customer preferences, significantly differentiating in different consumer segments [2-5].

Under the current conditions, promotion of competitiveness of organizations of consumer cooperation is possible through the development and application of an effective marketing strategy based on the widespread use of digital technologies at all stages of its development and implementation. It should also consider the influence of both external factors and internal resources and features driven by organizational and economic activity of organizations of consumer cooperation.

Research Methods

The theoretical background of the study were the works of Russian and foreign scientists examining issues concerning marketing strategies formulating, economics, management and marketing, and consumer cooperation. Methods of economic-statistical analysis and sociological analysis constituted a methodological basis of the study, namely: analytical (to study the essence of marketing strategy); dialectic (to study marketing strategy development in conjunction with external and internal factors); statistical (to study trends and characteristics of the consumer market formation and development).

The achievement of the envisaged targets was carried out on the basis of the general scientific method, including: induction and deduction, analysis, synthesis, observation method, economic-statistical method, method of dynamic series construction, method of comparative analysis, index method, graphical method, structural and marketing analysis. Systemic and integrated approaches have been used in the research process.

The information base was provided by the data of Russian organizations of consumer cooperation, in particular, the Belgorod Regional Consumer Union, as well as research findings accumulated by domestic and foreign scientists.

Findings

The development and implementation of marketing strategies in a rapidly changing external environment is a necessary and indispensable condition for increasing the entity's competitiveness. Marketing strategy allows to determine the main goals and substantiate principal ways to achieve them in a certain period of time. [6] The marketing strategy of the retail trade of organizations of consumer cooperation is understood as the general course of the organization's development in the long term, aimed at achieving its marketing goals and allowing to justify directions for implementing marketing activity in the field of product and pricing policies, allocation and promotion policies, customer relations shaping while considering activity orientation of organizations of consumer cooperation.

Of particular relevance is the problem of determining priorities in the formation of the marketing information system as a mechanism for providing managerial decisions based on the interaction of its core and interconnected elements – the marketing information system (MIS) and the system for marketing information collection. [7]

Implementation of the marketing information system would enable the development of the enterprise's effective marketing strategy and help in assessing information needs. The marketing strategy development is based on the analysis of the enterprise's external and internal environment and on the availability of strategic information.

The theoretical and practical significance of the organization's marketing strategy development and its implementation through the effective marketing information system formation, as well as its under-development for management decisions justification, determined the relevance of this study.

Various aspects of the marketing strategy and the marketing information system formation, development of marketing activities of organizations of consumer cooperation were considered in the works of Russian and foreign scientists: Ansoff I. [3], Blank I.A. [4], Gilbert D. [5], Isaenko E.V. [6, 7, 8], Kotler F. [9], Tarasova E.E. [10, 11, 12, 13, 14], Teplov V.I. [15, 15, 17], Evans J. [18] and others.

Marketing strategy determines the vector of the organization's development and promotion of goods for maximizing incomes and profits in the long term. The result of the marketing strategy is a marketing plan aimed at strengthening the product position in the industry, reducing potential risks and threats from competitors and profit maximization. [19]

Marketing strategy development involves a number of stages: formulation of the organization's mission and goals; macro-environment assessment; microenvironment assessment; SWOT analysis implementation; marketing goals formation; demand segmentation and target audience selection; research of marketing potential; analysis of the marketing mix; competitive analysis; development of strategic alternatives; definition of the marketing strategy; implementation of the marketing strategy; control over the strategy implementation; assessment of the strategy implementation; strategy adjustment.

For organizations of consumer cooperation, it is advisable to carry out each stage of the marketing strategy development and implementation with the use of the marketing information system and digital technologies for making managerial decisions and dealing with clients.

Marketing strategy involves management decision-making and action development connected with marketing mix tools: product, price, place, promotion. Each of these components also requires a strategic approach, i.e. development of marketing strategies at the operational level concerning formulation of product and pricing strategies, distribution and promotion strategies [20-22].

The algorithm of the organization's marketing strategy development with the use of the marketing information system is shown in Figure 1.

Figure 1: Algorithm of the organization's marketing strategy development with the use of the marketing information system

Application of the proposed algorithm of the marketing strategy development and implementation within organizations of consumer cooperation will attract potential buyers and shareholders, as well as help increase the market share.

Retail marketing is primarily focused on the consumers, their needs, expectations, preferences and tastes, and is aimed at profit maximization due to the fully satisfied customers' needs. In this regard, the developed marketing strategies in the context of marketing tools should promote improvement of relationships with the customers.

Under the modern conditions, the system of consumer cooperation is undergoing the stage of market adaptation. Organizations of consumer cooperation have significant marketing potential. However, as practice shows, they cannot fully balance their own marketing opportunities with the existing market requirements, which is a limiting factor for the organizations' development in a competitive environment [23-26].

To increase competitiveness, attract customers, boost demand, it is necessary to review existing marketing strategies, conduct an in-depth analysis of the used marketing mix, and develop a customer relationship strategy.

In this regard, in the course of the study, the authors analyzed the elements of consumer cooperation's retail marketing complex: product, price, place, promotion.

To increase competitiveness of organizations of consumer cooperation, it is necessary to manage the marketing mix tools in order to most effectively influence the market, consumer's behavior and achieve the desired objectives under the existing conditions and the chosen marketing strategy.

In the process of developing and implementing a marketing strategy, senior management should adequately assess the existing competitiveness factors of organizations of consumer cooperation.

From the combination of factors, it is necessary to single out the main ones, identify market environment trends, analyze organization's competitiveness factors and benefit from them, evaluate influence and interconnection of external and internal factors[27-28].

To ensure competitiveness of organizations of consumer cooperation, it is important to collect and analyze information on demographic, economic, political, legal, scientific and technical changes in the external environment of organizations. The marketing information system plays a significant role in meeting these tasks.

A marketing information system (MIS) is the totality (single complex) of personnel, equipment, procedures, and methods designed to collect, process, analyze, and distribute, at a set time, reliable information for making marketing decisions. The marketing information system is designed to solve both marketing problems and strategic planning tasks. The main advantages connected to the use of the marketing information system are: formatted and systematic collection of information; wide range of marketing information; high speed of marketing information analysis[29-30].

MIS transforms the data obtained from internal and external sources into information necessary for the heads of marketing departments and includes subsystems of internal reporting, external environment monitoring, marketing research and decision support.

Functioning of the marketing information system serves to solving the following problems:

– the amount of incoming information may be too large to be processed by marketing service employees;
– generalization and dissemination of a large amount of operational information, for example, on realization of products, can take up too much time and distract employees from performing their basic marketing functions;
– the cost of the marketing information system creating may exceed its effectiveness.

Therefore, the organization must independently establish its accounting system on the grounds of the organization's specificities and marketing objectives.

In the process of developing and implementing the marketing strategy for organizations of consumer cooperation, it is proposed to use a conceptual scheme for formation of the marketing information system aimed at reducing uncertainty in the process of managerial decision making (Fig. 2).

Figure 2: Conceptual scheme for formation of the marketing information system

The internal environment analysis of any enterprise and assessment of its competitive strength should result in the identification of competitive advantages and evaluation of the entity's competitiveness. Competitive advantages are crucial characteristics of the organization's market activity that create a certain superiority over competitors. Creation of competitive advantages is associated with the development of a set of measures concerning goods, distribution, prices, incentives, which provide superiority over similar actions of competitors. The main marketing activity directions of organizations of consumer cooperation are associated with the use and enhancement of competitive advantages due to the specifics of their functioning in the consumer market [31-33].

In the course of the study, the competitive advantages of organizations of consumer cooperation were grouped in accordance with the identified strategies: product, price, distribution strategy, promotion strategy and customer relationship strategy. Using competitive advantages in the process of developing and implementing marketing strategies by organizations of consumer cooperation will increase their marketing activity efficiency and competitiveness in the consumer market.

Strengths and weaknesses of the activity of organizations of consumer cooperation can be esteemed through SWOT analysis.

The SWOT analysis matrix presents strengths and weaknesses, opportunities and threats of the activities of organizations of consumer cooperation in the Belgorod region.

Table 1: The SWOT analysis matrix of organizations of consumer cooperation in the Belgorod region.

Strengths	Weaknesses
The established image of a socially oriented system	Low share of non-food product sales
Very own social base – shareholders – allowing to have a guaranteed sales segment	Slow response to changing market conditions
Cohesion of organizational system	Lack of mobile and retail distribution network
Diversified nature of the activity, allowing to create integrated economy	Insufficient level of physical infrastructure development of enterprises of consumer cooperation, especially in rural areas
Availability of own commodity resources	Insufficient level of employees' interest in their labor results
Availability of a stationary trading network	Lack of working capital
Availability of very own educational institutions that provide training, retraining and advanced training of personnel to meet the market needs	Underutilization of the COOP brand capacity
Public confidence	Poor operation on attracting shareholders and providing them with benefits and discounts for goods and services
The opportunity to study and implement best practices of cooperative organizations	Lack of in-depth analysis of each organization's results
Interaction of organizations of consumer cooperation with public authorities	
Opportunities	**Threats**
Entry into new markets through retail development in urban areas and district centers	High competition from private entities, retail chains
Diversification of activity	Low solvency of the rural population
The possibility of attracting public funds	Unpredictability of the socio-political situation
Reaching new consumer groups through expanded services	Growth in inflation, prices and tariffs for rates of utility services, transport and other services
Possibilities for using digital technology	High interest rates on bank loans
	Unfavourable demographic changes
	Menace of unemployment
	Poor rural infrastructure
	Coronavirus pandemic (COVID-19)

In order to increase competitiveness and efficiency of organizations of consumer cooperation, to attract shareholders and customers, it is necessary to develop a retail strategy.

Implementation of the retail development strategy of consumer cooperation is possible with an effective marketing strategy. In this regard, we propose the retail marketing strategy for consumer cooperation, which includes five strategy blocks in line with the marketing mix tools (product, price, place and promotion), as well as a strategy for interaction with consumers [34].

Important factors influencing development and implementation of the marketing strategy are the policy coherence with the external environment, internal balance, orientation to available resources and effectiveness.

The retail marketing strategy of consumer cooperation is aimed at achieving market and intra-organizational goals and involves competitor analysis, analysis of marketing potential, analysis of the marketing mix, selection of the target segment, development of measures to attract the target segment through marketing components, development of measures to improve relationships with consumers (Fig. 3).

Figure 3: The retail marketing strategy

Use of innovative marketing technologies is important for the retail marketing strategy implementation within consumer cooperation.

For a more detailed analysis and evaluation of each strategy, the authors developed an indicator framework that allows to evaluate each of the applied marketing strategies concerning product, price, distribution and promotion [25].

The following indicators are recommended for the product strategy evaluation: retail turnover; retail turnover growth rate; share of food products in total retail turnover; share of non-food products in total retail turnover; share of certain product groups in retail turnover; coefficient of income elasticity; coefficient of price elasticity; stock amount; turnover of goods; turnover profitability; amount of essential commodities in the paycheck; number of items with one purchase; range of goods coefficient; coefficient of assortment renewal; coefficient of goods assortment updating; coefficient of goods assortment stability; range of goods provided by the assortment list; volume of sales of own-produced goods; volume of paid services.

The following indicators are recommended for evaluation of the pricing strategy implementation: average purchase price (average check); average mark-up; check growth rate; share of expensive goods in the paycheck; share of low price category goods in the paycheck; coefficient of price elasticity; retail floor space; the share of retail floor space in the total store area; average store size.

The following indicators are recommended for distribution strategy evaluation: retail sales per square metre of the retail floor space; coefficient of retail floor space elasticity; the amount of inventory placed on one square metre of the retail floor space; installation area coefficient; exposure area coefficient; retail sales per square metre of the retail floor space; number of self-service stores; number of self-service stores equipped with modern cash registers; number of working places for cashiers; coefficient of introduction of modern forms of customer service; share of self-service stores in their total number; share of retail self-service stores in total retail trade turnover; retail delivery trade turnover; coefficient of the store usability; coefficient of attractiveness of the retail floor space interior; coefficient of the goods display attractiveness; increase in the number of stores using ACS; amount of self-service checkouts; number of smart carts with integrated devices; amount of funds aimed at modernizing stores.

The main indicator of promotion strategy assessment is market share. However, indicators are proposed to detail block assessment:

Incentives (volume of the shareholders' mutual fund; average size of the shareholders' mutual fund; amount of cooperative payments; amount of benefits provided to shareholders; number of discount programs available in the store; amount of funds allocated for holding an incentive event; amount of shareholders' bonuses; shareholders' dividend value);

advertising (advertising costs; share of advertising costs within circulation expenses; level of circulation expenses directed to advertising; number of advertisements, placed in the media; number of television and radio commercials; coefficient of in-store advertising media usage; breadth of advertising coverage of potential consumers; frequency of advertising occurrence; impact of the advertising message; brand recognition, brand name);

personal sales (average monthly salary of trade workers; average monthly salary of salesclerks; number of staff with upgraded qualifications; amount of funds allocated for personnel's training and retraining);

public relations (the number of fairs with actual participation; turnover received from participating in fairs; number of the held holidays; number participation in donor events; the number of seminars held for advertising purposes).

The effectiveness of the customer relationship strategy implementation should be assessed by the following indicators: number of people served; number of shareholders; share of shareholders among the served population; retail turnover per a shareholder; retail sales per a person; number of shareholders per a shop; retail floor space per 1000 people; number of consumer complaints; quality of customer service; customer loyalty; customer satisfaction (costs, conveniences, communications); conversion rate – a number of people who made purchases of the total number of store visitors; average number of customers per day; number of one buyer's visits to the store per month; average time spent by one customer in a store; the proportion of regular customers in their total number; share of new customers in their total number; share of the newly cooperated population in the total number of shareholders; proportion of dissatisfied customers in their total number.

We propose a methodological approach to assessing strategies implementation based on the proposed indicators and corresponding to the following:

1. The purpose of the assessment – for an operational audit of the marketing strategy implementation; monitoring of strategies implementation by regional organizations of consumer cooperation; comparative analysis of the strategies implementation by organizations of consumer cooperation; assessing enterprises' competitiveness (an integrated assessment of the implementation of a set of strategies).
2. Application of the results. The results of the assessment can be used by employees of organizations of consumer cooperation to improve marketing activity in their organizations, adjust implemented strategies, and make decisions on skills improvement of marketing services specialists.
3. For whom it is intended. This technique is intended for independent employees of organizations involved in developing strategies, auditing, monitoring of strategies implementation and making decisions on their adjustment.

To carry out an integrated assessment, we used tempo indicators instead of quantitative ones. Index indicators were selected for the calculation, that allowed us to show the dynamics of each strategy applied in all consumer societies of the Belgorod region.

To evaluate each strategy, we have chosen from one to 3 indicators. For a more complete assessment, the calculation should include the maximum possible number of indicators, but the principle of their further integration

can remain the same [26]. Therefore, to bring all the indicators within each strategy to one summarizing indicator (Isum = Ip, Ip, Ip, Ip, Ic) we used the following formula

$$I_{\text{sum}} = \sqrt[n]{B_1 \cdot B_2 \cdot ....Bn},$$

where $Isum$ – is equal to the summarized indicator for each strategy Isum = I_p, Ip, Ip, Ip, Ic;

B1, B2, ... Bn - growth indices of indicators taken for evaluation within each block of strategies;
n - number of indicators

Summarizing indicator is sufficient to assess which strategy is being implemented better or worse, and in order to assess how all the strategies are implemented and identify leading or lagging consumer societies, it is necessary to calculate the integral indicator.

For an integrated assessment of the implementation of all strategies, we propose to calculate the integral indicator of the growth index

$$Ip = \sqrt[5]{Ip \cdot Ip \cdot Ip \cdot Ip \cdot Ic},$$

where Ip – integral indicator of the growth index of strategies totality;

Ip, Ip, Ip, Ip, Ic – summarizing indicators for each strategy.

Table 2: Integrated indicator on consumer cooperation retail strategies

№	Business entities	Product strategy Index	Price strategy index	Distribution strategy Index	Promotion Strategy Index	Consumption index	Integral indicator
1	Alekseevka district consumer society	0,97	1,03	1,02	1,00	1,04	1,01
2	Belgorod district consumer society	1,01	1,01	0,01	1,05	1,14	0,41
3	Oktyabrskiy Khlebokombinat consumer society	0,96	1,00	0,01	0,90	1,04	0,39
4	Ivnya consumer society Alliance	0,95	1,00	0,70	0,99	0,66	0,85
5	Krasnaya Gvardiya district consumer society	1,00	0,95	0,01	1,21	1,06	0,41
6	Prochorovka district consumer society	0,95	0,99	0,96	1,05	1,01	0,99
7	Rakitnoye district consumer society	0,56	1,08	0,01	0,87	0,67	0,32
8	Staryi Oscol district consumer society	0,93	0,94	0,01	0,94	0,59	0,34
9	Tomarovka village consumer society	0,97	0,96	0,90	0,84	1,00	0,93
10	Urazovo consumer society	1,01	1,00	0,72	1,15	0,88	0,94
11	Shebekino district consumer society	0,99	1,03	1,10	1,13	0,87	1,02
12	Jakovlevo consumer society	0,56	0,78	0,50	1,41	0,83	0,76
	sum-total	0,95	0,97	0,83	1,05	0,87	0,93

From the above data it can be seen that the leaders are organizations of consumer cooperation functioning in Alekseevka and Shebekino. Marketing strategies are worst implemented in Rakitnoye and Staryi Oscol district consumer societies and Oktyabrskiy Khlebokombinat consumer society. They did not reach the leaders of Prokhorovka, Tomarovka, Urazovo district consumer societies.

This assessment methodology is universal and makes it possible to compare districts both for each individual strategy and for their totality. In the calculation, it is possible to take any number of indicators demanding evaluation. Comparison should be carried out by using another set of indicators.

If to assess all regional organizations of consumer cooperation, it is clear that product, price, distribution, and customer relationship strategies are not being implemented effectively and only the promotion strategy has a

positive implementation dynamic. Therefore, either adjustment of the developed strategies is required or the development of a new marketing strategy.

Conclusion

Thus, the assessment of the achieved level of the core marketing strategies (product, price, distribution, promotion, relationships with consumers) determines development directions of the organization's marketing activity. In the process of developing and implementing of the organization's marketing strategy, it is advisable to take advantage of the formation of an effective marketing information system.

The implementation of the proposed directions for the marketing strategy implementation will allow organizations of consumer cooperation to increase their market share, satisfy customers' needs, and ensure the competitiveness of organizations.

Summary

Today, healthcare systems have a great wealth of information about patients. This has a direct impact on the way people seek information and care. The objective of this research is to provide a systematic literature review (SLR) of different studies that have been carried out since 2015 regarding the development of web applications in different areas of healthcare. Further, we provide a comprehensive statistical analysis, and specifically, we extracted 70 journal articles published between the years 2015 and 2020. The results provided in this document have enabled us to answer the questions posed and led us to conclude that web applications are necessary in medical systems. This is because such applications facilitate rapid access to essential patient data to any healthcare professional, thereby avoiding loss of data, delays in treatment while requesting information, and duplication of information.

Keywords: Medical Care, Medical Appointment, Web Application, Methodology, Scrum

Introduction

Development of web applications for information management is one of the current trends within companies or private institutions in the healthcare sector. The lack of organization of information is unhelpful for institutions. Inadequate information management has consequences such as delays in the delivery of or access to information, loss of data, duplication of information, all of which can result in a loss of consistency and reliability. The lack of organization of information in health care companies is affected while requiring access to medical care and medical appointments.

Studies have reported that there is currently a waiting time of 1 to 4 hours for medical care. Although the benefits of Information and Communications Technology (ICT) are clear and sufficient, studies show that the adoption of new information systems at the clinical level is not an easy task, and utilization rates are not as high as expected for the current technological situation; they are very low [1]. This is due to the fact that computerization of the clinical sector has crucial barriers that can cause any project to fail if certain situations are not taken into account; for example, having the political and economic support that guarantees governance of the project, adequate strategic planning with clear objectives in the short, medium and long term, a set of external regulations (mainly laws and resolutions) and internal regulations (defined and documented business processes) that provide a legal framework and regulate these

aspects, the definition and adoption of a set of standards that allow the integration and interoperability of data from different systems and, finally, an adequate organizational change management process at all levels [10]. In other words, the implementation of information systems in the clinical environment has technological limitations on the system itself and the infrastructure that supports it, but the greatest challenge lies in the limitations of the environment and context (strategic plan that frames it, governance, planning of professional training and change management, recycling of processes and workflows, local standards and laws, budgets, communication, etc.).

This research is structured as follows: The topic has been introduced in Section I; Section II presents the background and related works; Section III describes the methodology applied; Section IV presents the results of the study; Section V contains a discussion of the results, and finally, Section VI presents the conclusions and future research.

Background and Related Works

With each day, the technological advancements applied to the business world are becoming beneficial in developing a competitiveness that forces the application of this technology for the benefit of healthcare companies and their customers.

The term *business competitiveness* refers to the different strategies and methods that the various entities carry out in order to not only obtain the best results, but also to ensure that these results are the means by which the company becomes a leader in the services it provides [13].

Technology plays a critical role in a company's competitiveness and is one of the intangible factors that makes management more difficult. However, applying technology appropriately will result in better service from the company and greater customer satisfaction, while also providing time and resource optimization. This would project a better future for the company, broaden its criteria, and develop an image that may even lead it to cross borders [43].

Today, the management of patients by clinics, hospitals and health centers is of great importance to improve the treatment of these patients, as well as substantially favoring doctors in the performance of their work. This allows for better care, and better control of patients, diseases, and statistics.
There is a significant amount of software that is dedicated to conducting such tasks in an efficient way, thus enabling the generation of a centralized database, a control for the doctors, and the design of strategies to obtain solutions to a patient's problems.

As in all cases, there are different degrees of quality among software and options for adapting them to the needs of health centers, hospitals, or clinics [32].

Methodology

The systematic literature review (SLR) method allows to identify, evaluate, interpret, and synthesize all the existing and relevant research on a topic of particular interest; it requires considerably more effort and formal procedure to prepare the review than conventional literature reviews. The SLR method allows the validation of the results reported in the systematic review, and these results are supported and endorsed by the Review Protocol (see Fig 1) .

Fig. 1: Systematic Literature Review

Definition of Research Questions

The study aims to answer some questions (see Table 1) by reviewing a few scientific articles.

Table 1: Research questions

Research Questions	Rationale
RQ1: What are the criteria for measuring the effectiveness of web applications in WordPress?	Determine the effectiveness of web applications in WordPress.
RQ2: How much satisfaction arises from using web applications developed with different frameworks including WordPress?	Determine the effectiveness of web applications developed with Scrum.
RQ3: Are the results of the web applications in WordPress related to the improvement of medical care and appointments in clinics?	Determine the results of WordPress web applications related to the care- and appointment-enhancement feature.
RQ4: How many studies have been published since 2015?	Calculate how many studies were published since 2015.
RQ5: In which areas have web systems been applied in WordPress?	Define who are the most active authors in the area.
RQ6: Which methodologies are used for web application development?	Know which methodology is used for the development of web applications.

Search and Selection

A total of ten sources were considered for the search: Dialnet, EBSCO host,
Google Scholar, IEEE Xplore, ProQuest, Science Direct, Scopus, Springer Link, Taylor & Francis Online, Wiley Online Library.

To define a scope for these sources, search queries were developed as listed in Table 2.

Table 2: Search queries by source

Sources	Search Query
Google Scholar	Medical attention Medical appointments SCRUM OR Methodology OR Method OR Model "Web Application"
Scopus	(TITLE-ABS-KEY (“Web Application”) AND ALL (method OR methodology OR model) AND ALL (medical AND appointments))

A. Identified Studies

After searching in each of the 10 sources that were considered according to the queries, the results of the journal articles required for the review were obtained, as shown in Fig 2.

Fig. 2: Identified studies through search results

B. Exclusion Criteria

According to the results shown in Fig 2. 90 963 articles were obtained, and six exclusion criteria were applied to the search results; this was to decrease the burden of reading many articles, as can be seen in Table 3**.**

Table 3: Exclusion criteria

Id.	Criterion
EC1	They are not articles OR
EC2	Articles older than 5 years OR
EC3	Articles not in the Technology or Computing area OR
EC4	Articles not containing sufficient information OR
EC5	Articles not written in English OR
EC6	Articles are not open access

C. Summary of the number of results when applying Exclusion Criteria

According to Table 3, six exclusion criteria were applied to reduce the number of articles obtained to carry out the review; this resulted in 90 articles.

Fig. 3: Summary of criteria applied

Source	Initial articles	Filter 1: EC1 EC2	Filter 2: EC3 EC4	Filter 3: EC5 EC6	Filter 4: EC7 EC8	Filter 5: EC9 EC10	Final articles	% TotFinal

Total	**90963**						**90**	**100%**

Fig. 4: Application of exclusion criteria

D. Criteria for assessing the quality of studies

Table 4 shows the six quality criteria formulated to assess the selected scientific articles.

Table 4: Quality assessment criteria

Go.	Description
QA1.	Do the articles have quality bibliographic sources?
QA2.	Do the articles have a good explanation of their purpose?
QA3.	Are the articles relevant to the research?
QA4.	Does the article have a well-organized structure?
QA5.	Is the finding of the article clearly explained?
QA6.	Are the data on the articles properly collected?

All articles were assessed against all quality criteria. Some of them did not meet the criteria, and hence, they were eliminated, leaving 70 articles selected, as shown in Fig 5.

N° of Papers per Source

Source	2015	2016	2017	2018	2019	2020	Total
Springer	1	5	3	3	2	2	16
ProQuest		2	3	1	6	2	14
IEEE Xplore	1			2	8	2	13
Dialnet		1	3	4	2		10
Science Direct	2	1	3	1			7
Ebsco Host	2		2				4

Taylor & Francis Online						2	2
Wiley Online Library			1				1
Total	6	9	15	12	19	9	70

Fig. 5: Items by year and source

E. Mendeley reports of the classified studies

Fig 6 shows a Mendeley report detailing the management of the 70 selected studies.

Fig. 6: Mendeley's Report

F. Miscellaneous Reports

As can be seen in Fig 7, these are the number of articles published in different sources per year, with 2015 being the year with the lowest number of articles published on healthcare and medical web applications and 2019 being the year with the highest number of articles. The journal publisher named Science Direct had the greatest number of research articles.

Fig. 7: Items by year and source

Fig. 8: Number of item citations by source and citations range by country.

In Fig 8, it can be seen that China, the USA, and a part of Europe have the highest number of citations per article.

Number of articles by Publication Type and Source

Publication Type	Dialnet	Ebsco Host	IEEE Xplore	ProQuest	Science Direct	Scopus	Springer	Taylor & Francis Online	Wiley Online Library	Total
Conference proceeding					3	3	1		1	8
Journal	10	4	13	14	4		15	2		62
Total	10	4	13	14	7	3	16	2	1	70

Fig. 9: Articles by publication type and source

From the data presented in Fig 9, it was determined that the number of journals is greater than the number of conferences in which information about web applications applied to medical care and appointments can be obtained, in addition to the fact that the greatest number of journals are published by Springer.

Results

The results of each of the research questions (RQ) posed in this paper are presented below:

Q1: What are the criteria for measuring the effectiveness of web applications in WordPress?

To answer this question, the SLR methodology was applied, in which the effectiveness of web applications in WordPress was determined through the implementations in the different scientific articles analyzed for the elaboration of this work. Many authors concluded that web applications in WordPress are effective based on the following indicators: Promptness, Well-being, Productivity, Security.

Eirini & Kleanthis [12] developed a Web System to improve the follow-up procedure of patients examined at the hospital. This had positive results as it allowed quick access to information for visualization and to determine if patient recovery was positive.

Gu, D. & Guo, J [64] in their research work, determined that the development of web applications is beneficial in the area of medical care, wherein it increases the number of patients served in the shortest time possible.

In Tables 5 and 6, all selected articles that demonstrate an indicator that supports the effectiveness of web applications in WordPress are detailed:

Table 5: Productivity indicator obtained in the studies analyzed

Effectiveness of websites	Articles	No. (%)
Fast	[5], [11], [13], [16],[17], [20], [21], [27], [29], [30], [31], [33], [48], [49], [53], [54], [56], [65], [66], [67], [68], [69]	22 (43)
Good	[12], [19], [22], [32], [34], [35], [36], [38], [41], [42], [43], [45], [55], [58], [60], [62], [63], [70], [72], [73]	20 (39)
Productive	[37], [56]	2 (4)
Safe	[14], [37], [44], [51], [59], [61], [71]	7 (14)

Table 5 shows that in 22 items, equivalent to 43% of the total number of items, the promptness when performing activities using web applications is convincing. In addition, in 20 articles referring to 39% of the total, it is beneficial to perform different processes through the use of web applications.

RQ2: How much satisfaction results from using web applications developed with different frameworks including WordPress?

When applying the SLR, we can see the satisfaction and confidence in using a web application. According to the articles published, we can conclude that people feel satisfied with the use of a web system on a large scale.

Chávez & Verduzco [12] developed a web application to search for patients in an administrative module of the platform, which allowed them to refer to their registered information. As a result, they were satisfied with the usability of the web application and the benefits it provided.

Libert & Timothy [14] implemented a web application for health-care monitoring. The results of their usage were moderate, as the number of patients they served was higher than the number that the web system could handle, making it slow at times.

Table 6: Table of satisfaction with the use of web pages

Satisfaction with the use of web pages	Articles	No. (%)
Moderate	[2] [9] [14] [18] [20] [27] [30] [32] [40] [45] [48] [54] [56] [64] [68] [69] [73]	17 (77)
Satisfied	[12] [15] [21] [44] [67]	5 (23)

As can be seen in Table 6, there are 17 articles that have moderate satisfaction in the usage, implementation, or development of web applications, and only 5 articles show satisfaction with their usage as the evaluation results were positive.

RQ3: Are the results of the web applications in WordPress related with improvement of medical care and appointments in clinics?

A SLR was applied and data analysis was performed in Power BI, which shows information of hospitals and clinics focused on medical care. The expected results are that the improvement of medical care is associated with improvement, while showing negative results due to low-quality care.

Table 7: List of websites in medicine

Relatedness of websites with medical care	Articles	No. (%)
Medical Attention	[11] [12] [13] [14] [16] [17] [19] [20] [21] [27] [28] [29] [31] [32] [33] [34] [35] [36] [37] [38] [39] [40]	22 (42)
Clinical Attention	[41] [42] [43] [44] [45] [46] [49] [50] [51] [54] [55] [58] [60] [61] [60] [64] [65] [66] [67] [68] [69] [72]	22 (42)
Hospital	[1] [15] [23] [30] [48] [56] [59] [73]	8 (16)

Table 7 shows that there are 22 items in relation to the medical care process and 22 items in clinical care, both having a 42% equivalence. Both belong to the field of medicine, and hence, it can be deduced that there is a close relationship in the use of web applications for the field of medicine

RQ4: How many studies have been published since 2015?

After reviewing the articles, it can be seen that in the last 5 years, from 2015 to 2020, 90,963 articles were obtained. Nonetheless, when applying the exclusion criteria (EC1, EC2, EC3, EC4, EC5, EC6 and EC7), a total of 70 articles were obtained that were of the journal and conference types.

Fig. 10: Studies published in the last 5 years

Figure 10 shows that in the last 5 years, approximately 70 articles were published on medical care and appointments, with the year of greatest research being 2019, with 19 articles.

RQ5: In which areas have web systems been applied in WordPress?

To answer this question, the SLR methodology was performed. It is mentioned that the areas where web systems are applied in WordPress are within the 70 articles reviewed during the SLR methodology. Further, this question was analyzed with the Power BI tool, and the results obtained are listed in Table 8.

Table 8: Areas of application of web systems

Areas where web development is applied	Articles	No. (%)
Business	[15] [35] [48] [51] [54] [61] [62]	7 (13)
Education	[11] [14] [28] [30] [31] [37] [43] [44] [45] [52] [53] [56] [58] [61] [63] [64] [73]	17 (31)
Medicine	[12] [13] [17] [18] [19] [20] [21] [22] [23] [27] [32] [33] [34] [36] [38] [40] [42] [50] [55] [59] [60] [65] [66] [67] [68] [69] [70] [71] [72]	29 (54)
Politics	[63]	1 (2)

As can be seen in Table 8, the areas most represented are medicine and education, which are the ones with the largest number of articles found and in which much interest has been expressed.

RQ6: Which methodologies are used for web application development?

In Table 9, the most applied methodologies for the development of web applications are listed. As mentioned in the graph plotted using the Power BI tool, it can be seen that four methodologies were obtained.

Table 9: Methodologies used to develop web applications

Most used development methodologies	Articles	No. (%)
Cascade	[2] [5] [14]	3 (4)
RUP	[1] [3] [4] [6] [7] [8] [9] [10] [17] [20] [40] [58] [61] [71]	14 (20)
SCRUM	[54]	1 (1)
METH XP	[11] [12] [13] [15] [16] [18] [19] [21] [22] [23] [27] [28] [29] [30] [31] [32] [33] [34] [35] [36] [38] [39] [41] [42] [43] [44] [45] [46] [47] [48] [50] [51] [52] [53] [55] [56] [57] [58] [59] [60] [62] [63] [64] [65] [66] [67] [68] [69] [70] [72] [73]	51 (75)

As shown in Table 9, the most commonly used methodologies were XP and RUP.

Discussion

As the results of the questions raised earlier in this study have been presented, we will proceed to discuss the results in this section. The effectiveness of web systems in WordPress was determined based on indicators obtained by the authors during their research, which is reported as analysis of implementations. Furthermore, the effectiveness of web systems in WordPress promotes that certain authors implement them in multiple areas and fields, and not only in medicine.

In addition to the importance of working with a development methodology to structure, plan, and control the entire development process, from start to finish, it is necessary to emphasize that these development methodologies are used depending on the type of work or project to be developed.

This work is a match for Wang's study [19], wherein it was found that the proportion of hospitals that offer appointments on their websites is much higher among medical health centers than among clinics. This finding may be related to different volumes and outpatient admissions at different hospital levels.

Conclusion and Future Research

In this research, a SLR method was used to analyze studies published during the years 2015 to 2020. The study initially began with 10 academic databases applying search queries, which provided an initial number of 90,963 articles; subsequently, six exclusion and quality criteria were applied to the results, thus reducing the number of articles to 70.

With the SLR, all the questions raised in this research work have been successfully answered. The findings allowed to identify that the web systems with WordPress are efficient in different areas or fields where its implementation is required. There are several aspects that have been identified and have been beneficial, such as promptness in processes, productivity of work or tasks, ease of usage, and security of web systems; these are the indicators that demonstrate the effectiveness of web application development in WordPress.

More than half of the hospitals or clinics have public online appointment systems. However, most systems simply serve the function of registration and rarely take advantage of the opportunity to meet.
Therefore, there should be efforts to strengthen the functions of these online appointment systems to improve the efficiency of consultations. Some methodologies for information extraction and retrieval of unstructured medical

records should be considered to improve the efficiency of the appointment process.

Abstract

Business, government, and public institutions continuously experience challenges in the use of modern information technology, requiring integrated measures for the protection of information and ensuring three fundamental aspects: confidentiality, availability, and integrity. To carry out these actions, strategies must be established where action policies are adopted for each of these cases. Therefore, the following research work was carried out to determine the benefits and effectiveness of the implementation of good practices developed under the ISO/IEC 27001 standard. An in-depth research was conducted with articles published from 2015 to 2020, which were extracted from various academic sources. This study explores the dynamics that occur in the use and application of standards up to the present time, considering the present situation of COVID-19, where the securities in the institutions are being violated.

Keywords: Good Practices, ISO 27001, Information Security, Systematic Review.

Introduction

Recently, information has become an important asset for organizations. However, it requires special protection. Information must be adequately protected regardless of its format and mode of transmission. Therefore, the objective of information security is to adequately protect high-profile information from piracy, intrusion, identity theft, unauthorized disclosure, interruption, modification and destruction. Owing to its demand, information security is considered as an administrative issue.

A recent survey has shown that the total losses incurred in a single security incident, including direct financial losses owing to operational losses or negative stock market reactions [1, 2], loss of reputation, and business disruption, have become more severe.

Cite this Article as: Jorge ACHULLA PALACIOS, Carlos GRANADOS SORIA, Javier GAMBOA-CRUZADO, Huber RODRIGUEZ-NOMURA, Leonidas ASTO HUAMAN and Amanda DURÁN-CARHUAMACA "Systematic Review of the Literature on Information Security Management Implementing Good Practices based on ISO 27001" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

To facilitate the development of information security management in organizations, the ISO 27001 standard has been developed and adopted by organizations globally. This standard first emerged in 1995 as BS-7799, and then was revised in 2005.

ISO 27001 is a standard that defines a set of principles on the implementation of an information security management system (ISMS), with appropriate security controls among all the controls provided by ISO/IEC 27001. During recent years, several initiatives related to quality and best practices of security have emerged. Therefore, it is a priority for companies to ensure their continuity, in order to minimize potential injuries, and maximize the return on investment and business opportunities.

The objective of this research is to use the systematic review of the literature to determine the main advances of the use of good practices, based on ISO 27001 standards in information security management. The efficiency and effectiveness of the ISMS by implementing good practices based on ISO/IEC 27001 can benefit an organization in terms of operational performance or stock market reactions. Furthermore, the positive impact on operational and financial performance of companies is demonstrated.

The remaining part of this document is organized as follows: Section II presents the background, and Section III presents the methodology followed for the review of the study documents. Section IV presents the results, Section V reports the discussion, and finally Section VI presents the conclusions and future work.

Background

Business organizations support their business activities using information and communication technologies. Therefore, they should equip their networked computer systems and infrastructure with the policies and protection measures that guarantee the development and sustainability of these business activities. Maintaining the confidentiality, integrity, availability, and authorized usability of the information is significantly important, and thus, it requires professionals capable of ensuring, managing, and maintaining the security of information in their systems for present and future use.

Best Practices

Good practices can be beneficial for organizations that want to improve their IT services. An organization should aim to close capability gaps by adopting best practices for IT service management at all levels. Network management tools and processes are necessary to control potential failures or degradations in network services that support IT services. Therefore, it is important to have a general foundation on network management and its current importance. The network management must include a global vision of the different network elements involved in the service provision and the scope of its management (Hernández Valverde, 2014, p. 3).

Adopting good practices can help an organization develop or improve the skills required to deliver services. A "good practice" is the integration and application of frameworks, methods, and standards. To adopt a good practice, it is necessary to consider the sources, enablers, scenarios, and drivers involved. (Hernández Valverde, 2014, p. 3)

ISO 27001

The ISO 27001 standard for ISMS enables organizations to assess risk, and implement the controls necessary to mitigate or eliminate the risk. (ISO Tools, 2019)

Information Security

Information security is a critical issue compared to a computer data security issue; it should be oriented to protect intellectual property and important information of organizations and individuals.

The risks of information are present when two elements flow:

Threats and vulnerabilities are intimately linked, and there can be no consequences without their joint presence. Threats utilize vulnerabilities, and can originate from any part, internal or external, related to the organizations' environment (Tarazona T, 2007, p. 137).

Vulnerabilities are weaknesses in technology or information-related processes, and thus, are considered as characteristics of the information systems or infrastructure that contains it. A threat is any situation or event that affect the possibility of organizations or people to develop their activities; thus, directly affecting the information or the systems that process it. (Tarazona T, 2007, p. 137)

This implementation has increased the security of the information assets of the company Card Perú S.A., which guarantees that the information security risks are known, assumed, managed, and minimized in a documented, systematic, structured, repeatable, efficient, and adaptable manner during changes in the risks, environment, and technologies. (Barrantes Porras & Hugo Herrera, 2012, p. 5).

Therefore, the current ISMSs are becoming increasingly important. Through the guidelines provided by the ISO 27001 standard, any company can obtain an advanced protection of its data and information, owing to the assistance it provides in the evaluation and execution of information security controls.

Methodology

Systematic Literature Review

For the development of this research work, the systematic literature review (SRL) process shown in Fig 1 was used, with the objective of summarizing the existing information regarding a particular topic; in this case on information security management. These documents are evaluated, analyzed, and synthesized to reach a coherent conclusion on what is known and what is not known about information security management.

Fig. 1: RSL process

A. Research Questions

Table 1 presents the research questions to be answered through the identification and analysis of the selected articles related to information security management.

Table 1: Research questions

Research Question	Motivation
RQ1: What are the effectiveness criteria of the good practices based on the ISO 27001 STANDARD to improve information security management?	Determine the effectiveness of good practices based on the ISO 27001 STANDARD to improve information security management.
RQ2: What are the most widely used means of publication?	Determine the means of publication found for the research.

RQ3: What types of technological support have information security oriented techniques provided?	Delimit the technologies that have provided information security oriented techniques.
RQ4: In what areas have good practices based on the ISO 27001 standard been applied?	Specify the areas in which good practices based on ISO 27001 have been applied.
RQ5: What are the security controls for the development of good practices based on the ISO 27001 standard?	Define security controls for the development of good practices based on the ISO 27001 STANDARD.

B. Search Sources

For the classification of scientific articles, 10 academic meta-search engines were used: IEEE Xplore, Springer Link, Google Scholar, Taylor & Fancis, DOAJ, Science Direct, Microsoft Academic, EBSCOhost, and Scopus.

C. Search Equations

Various search engines for academic sources have a defined search structure, which allows articles on a particular topic to be obtained in a more precise way. Table 2 shows the search equations for these engines.

Table 2: Equations by source

Source	Search Equation
IEEE Xplore	((("All Metadata":Good Practice) And "All Metadata": ISO 27001 Standard) And "All Metadata": Information Security) Or "All Metadata": Methodology)
Springer Link	"Good-Practices "And "Information-Security" And “Methodology Or Method Or Model”
Google Academic	ISO 27001 Standard And "Information Security Management" Or Methodology
Taylor	[All: Good Practices] And [All: ISO 27001 Standard] And [All: Information Security Management]
Dialnet	("Good Practices"-" ISO 27001") And ("Information Security Management" Or "Methodology")
DOAJ	"Information Security": "And", " ISO 27001": "Or", "Methodology"
Science Direct	" ISO 27001 Standard" And "Information Security Management" Or "Methodology"
Microsoft Academic	" ISO -27001" And "Good-Practices" And "Security-Information-Management"
EBSCOhost	((Good Practices) And (ISO 27001 Standard) And (Information Security Management)
Scopus	All ("ISO 27001") And All (“Information Security Management”) And All ("Good Practices") Or ("Methodology") Or Methodology Or Method Or Model

D. Number of Results by Source

After the search equations have been applied, a certain number of scientific papers are obtained for each search source, as shown in Fig 2.

Fig. 2: Total Results by Source

E. Exclusion Criteria

Some exclusion criteria have been formulated to filter the articles found, and thereby obtaining the documents indicated for the development of this research work (Table 3).

Table 3: Exclusion criteria

Id.	Exclusion Criteria
CE1	Search results are not articles OR
CE2	The items are not less than 5 years old OR
CE3	Articles are not written in English OR
CE4	The articles do not propose a solution with the development of the ISO 27001 OR
CE5	Items do not show the sample unit OR
CE6	The articles do not contain keywords related to the research

F. Results when Applying Exclusionary Criteria

Fig 3 details the number of items excluded when applying each of the six exclusion criteria. Finally, the items left are 100.

Fig 3. Results by Source

G. Evaluation of the Quality of Studies

For the evaluation of quality scientific articles, six quality criteria were formulated in addition to the exclusion criteria (Table 4).

Table 4: Criteria for Evaluating Quality

Id.	Quality Assessment Criteria
QA1	Does the article have a well-organized and described structure?
QA2	Is the article relevant to the investigation?
QA3	Are the bibliographic sources of quality?
QA4	In the article, is the purpose of the research clearly explained?
QA5	In the article, are the research findings clearly explained?

After applying the five quality evaluation criteria to each of the 100 scientific articles, it was found that they all met these quality criteria.

H. Reports with Mendeley of the Classified Studies

The Mendeley application was used to record and store the 100 scientific articles, as shown in Fig 4.

Fig. 4: Reporting with Mendeley

Results

After performing the RSL of the 80 selected studies, the initially planned questions in the research are answered.

RQ1: What are the effectiveness criteria of the good practices based on the ISO 27001 STANDARD to improve information security management?

Based on the systematic review of the literature, it is possible to determine the effectiveness of the ISMS and the benefits that were obtained in its implementation in the different scientific articles analyzed in this work. Many of the authors determined that the ISMS under the ISO 27001 standard as the solution to solve the problems of vulnerabilities and information leakage related to quality processes, security assessment, and security management, as shown in Table 5.

Table 5: Effectiveness criteria in studies

Benefits	Articles	Cant. (%)
Quality Processes	[1] [3] [4] [5] [6] [7] [10] [13] [14] [15] [16] [17] [18] [21] [23] [25] [29] [30] [31] [32] [33] [35] [36] [39] [46] [47] [51] [52] [53] [54] [55] [56] [61] [62]	34 (32.08)
Security Assessment	[1] [2] [3] [4] [5] [6] [7] [8] [9] [11] [12] [13] [14] [15] [16] [18] [21] [22] [23] [24] [26] [27] [28] [29] [30] [31] [32] [33] [34] [36] [37] [38] [39] [40] [41] [43]	36 (33.96)
Security Management	[1] [2] [3] [4] [5] [6] [7] [8] [9] [10] [11] [12] [13] [14] [15] [16] [18] [20] [21] [22] [23] [24] [25] [26] [27] [28] [29] [30] [31] [32] [33] [34] [35] [36] [37] [39]	36 (33.96)

In the study conducted by Khajouei, H., Kazemi, M. & Moosavirad, and S. H [33], a fuzzy analytical hierarchy process was used to prioritize and select effective management domains, as well as to control objectives in information security controls. According to the results, access control, information systems acquisition, development, and maintenance have the highest priorities among the information security controls in the management domains.

Santos Olmo Parra, A. and Sanchez Crespo [65] carried out studies presenting a proposal for an innovative methodology for risk analysis and management called MARISMA-ARG. This allows for a completely dynamic risk analysis system that can output information at all times of the real situation of the company, which is of significant value to it.

RQ2: What are the most widely used means of publication?

Nine search sources were used for this research: IEEE Xplore, Springer Link, Google Scholar, Taylor & Francis, DOAJ, Science Direct, Microsoft Academic, EBSCOhost, and Scopus. Each source contributed a considerable number of scientific articles; the most important being Google Scholar with 33 articles and Springer Link with 15 scientific articles. The graph of the total number of scientific articles per search source is shown in Fig 5.

Fig. 5: Total number of articles by source

Fig 6 shows that Google Scholar accumulates the highest number of publications and obtained the highest number (i.e., 12) in the year 2016.

N° Papers by Source

Fuente	2015	2016	2017	2018	2019	2020	Total
DOAJ			1	1		1	3
EBSCOhost		1			1		2
Google Scholar	7	12	3	7	4		33
IEEE Explore				1	1	2	4
Microsoft Academic	1	3	1	5	3		13
Science Direct			1	1	3	1	6
Scopus		1	1				2
Sprink Link	1	2	4		2	6	15
Taylor & Francis Online	1		1				2
Total	10	19	12	15	14	10	80

Fig. 6: Items by source and year

RQ3: What types of technological support have information security oriented techniques provided?

To understand the support at technological level provided by the techniques oriented to the security depends on how the solution of the information security is developed in the organization.

Nelli V. Syreyshchikova & Liviu Moldovan [5] in their research work reported that company JSC "K" experiences difficulties that require timely protection of the company's information processes. Thus, it has implemented the design, development, and mastery of rules of information security in accordance with the requirements of ISO 27001 standard for 9 conditions of the company to minimize any vulnerability and ensuring integrity and confidentiality of the company information.

Marko Niemimaa [37] studied the cost factors of information systems security breaches. He determined that 76% had experienced or expected to experience result in the loss of customers or business partners. Therefore, to prevent such violations, organizations should implement the best practices in the management standard, such as ISO 27001;

This will ensure that they obtain security policies that will prevent violation; for instance, in the case of a computer attack (Table 6).

Table 6: Technological supports implemented with information security

Technology Support	Articles	Cant. (%)
Safety Rules	[3] [5] [8] [10] [32 [35] [47] [52] [66] [80]	10 (11.76)
Security Policy	[1] [2] [5] [6] [7] [8] [9] [10] [12] [13] [14] [15] [16] [17] [18] [19] [20] [21] [22] [23] [24] [25] [26] [27] [28] [29] [30] [31] [32] [33] [34] [35] [36] [42] [45] [47] [48] [50] [51] [55] [56] [59] [61] [68] [70] [72] [74] [75] [77] [79] [80]	51 (60)
Strategic Planning	[4] [6] [14] [17] [30] [31] [32] [33] [39] [44] [46] [51] [57] [58] [61] [64] [65] [66] [67] [68] [71] [72] [74] [80]	24 (28.24)

RQ4: In which areas have good practices based on the ISO 27001 standard been applied?

When analyzing in detail the 80 scientific articles to carry out the research, it has been verified that the information security management has been applied in different areas and fields because they have important information. Furthermore, many of these companies fear being vulnerable.

Nader Alber & Myvel Nabil [21] in their research work reported the impact of information security on the performance of Egyptian banks using a sample of 32 banks. They established that the ISO 27001, COBIT, and PCI-DSS standards are necessary to prevent information security threats, as well as the types of security threats in the banking sector ranging from accidental threats (employee acts, program problems, and fires) to intentional threats (hacker, virus, spyware, and employee acts). Finally, they concluded that if a bank does not have information security management, it can be vulnerable to the loss of its customers' information, which would cause a lawsuit against the bank, and may result into a loss of billions of dollars.

Gabor Breda & Miklos Kiss [10] conducted research on how the industries previously and currently perform information security management by applying the ISO 27001 STANDARD and are eligible for audit by the ISACA association of auditors, as well as the realization of a framework in COBIT that assists in IT security procedures.

Finally, Table 7 shows the areas in which information security management has been implemented with ISO 27001.

Table 7: Areas of implementation of ISO 27001

Areas	Articles	Cant. (%)
Bank	[13] [20] [21] [23] [32] [35] [38] [40] [44] [47] [49] [51] [54] [59] [69] [78]	16 (20.25)
Industry	[1] [3] [4] [6] [7] [10] [12] [13] [14] [17] [18] [20] [21] [23] [25] [26] [27] [28] [29] [30] [41] [44] [45] [50] [55] [59] [60] [66] [69] [71] [72] [74] [75] [78] [80]	35 (44.30)
Telecommunication	[10] [13] [14] [18] [23] [27] [30] [33] [47] [51] [52] [55] [61]	13 (16.46)
University	[12][13] [14] [16] [22] [25] [30] [45] [47] [52] [63] [64] [65] [66] [70]	15 (18.99)

Q5: What are the Security Controls for the development of good practices based on the ISO 27001 standard?

The development of good practices based on the ISO 27001 STANDARD depends on how it is implemented in the organization; Therefore, the following authors are considered as reference:

Joffre Velasco & Rodrigo Ullauri [44]. They studied the benefits of implementing an ISMS according to the ISO 27001 STANDARD, in which the main controls implemented are the information security policy, such as asset management as well as encryption and key management. The mentioned managements are some controls that in this study have been implemented for the corresponding certification.

Darko Paspalj [80]. The security of the information systems counts on the controls of security of the human resources and management of assets operational security, in which the controls are obligatory considering the applicability within the institution. Furthermore, people who are in charge of the information security are those who are assigned, i.e., those in charge of the implementation of the NORM ISO 27001 within the organization.

Table 8 shows the list of articles in which security controls have been considered for the development of good practices.

Table 8: Security controls for the development of good practices

Controls	Articles	Cant. (%)
ISO Standard Controls	[1] [2] [3] [4] [8] [9] [10] [12] [13] [14] [15] [16] [18] [20] [21] [22] [24] [25] [26] [27] [28] [29] [30] [31] [32] [33] [34] [35] [36] [37] [38] [40] [42] [43] [44] [45] [46] [48] [49] [50] [51] [53] [54] [55] [56] [57] [58] [59] [61] [62] [64] [65] [66] [67] [68] [69] [70] [71] [72] [73] [74] [75] [78] [79] [80]	62 (66.67)
Quality Management	[1] [3] [4] [5] [6] [7] [10] [13] [14] [15] [16] [17] [18] [20] [21] [23] [25] [29] [30] [31] [32] [33] [35] [36] [39] [46] [47] [48] [56] [60] [61]	31 (33.33)

Discussion

The effectiveness of ISMS based on good practices under ISO 27001 was determined according to the benefits obtained by the authors in their research, i.e., the achievements in their ISMS projects. Furthermore, the effectiveness of ISMS allows many authors to apply it in various areas or fields where the use of information is not desired by its users. The results of their research also determine the importance of following a development methodology that ensures the quality and security standards of the project; thus, it is important to know the types of tools or techniques of ISMS. Moreover, it has been demonstrated that data require special treatment to ensure the availability, confidentiality, and integrity of information, because a deficient ISMS project would bring losses of valuable information for industries, both operational and economic.

The evidence of this study suggests that ISMS is a good option when there is leakage or loss of information. Therefore, it is the task of the professionals to determine the ideal way to implement ISMS in a company considering the development methodologies that exist, tools, and techniques that support it, as well as quality standards and security. All this requires a good analysis and knowledge of the company, in which the ISMS solution will be developed.

Conclusions and Future Works

In this research, we used SLR to examine the research carried out worldwide in the last five years on information security management that implements good practices based on ISO 27001. Studies that were analyzed were from the year 2015 to 2020. We started from a base of 10 academic searchers applying search equations, and then applied a series of exclusion and quality criteria to finally obtain 80 articles. The SRL has successfully answered the questions posed in the research work; the findings have identified how to implement the ISMS under ISO 27001 in organizations. There are several benefits that have been determined as the strategic advantages; thus, improving data quality, reducing time, and reducing operating costs. These results demonstrate the effectiveness of ISMS. The ISMS is increasingly being implemented in various areas, including education, medical and banking sector, agencies, and areas of preference owing to the amount of data it handle, and the need to be safeguarded and protected. In addition, it has been demonstrated that ISMS relies on various techniques and tools that help improve its effectiveness in confidentiality, integrity, availability, and accessibility of information. Finally, the articles supporting the results of this study are from the active authors in the field and important search sources.

The limitation of this study includes being conducted with articles found in a period of 5 years, which restricts it to a time limit. Furthermore, new methodologies, tools, and techniques are constantly being developed; thus, leading the ISMS to new paradigms that will require new studies. For future research, it is recommended that the studies to be utilized to be within a period of less than 3 years, in order to obtain the recent trends related to ISMS, which can provide the authors with new concepts to contribute to their research and cover the knowledge gaps found.

Resumen

Este artículo mediante el análisis de la teoría del comercio internacional y las actuales tendencias económicas en el mundo, evalua la posibilidad de mejorar el desarrollo del sector económico exterior en América Latina en su conjunto y en particular en Perú.
Mediante el uso de estadísticas del sector de comercio exterior y considerando las tendencias globales del comercio internacional durante la última década, haciendo un especial enfasis en el periodo 2019-2020, se evalua la capacidad de Perú para satisfacer la creciente demanda diferenciada y así especializarse en sectores ventajosos, permitiéndoles integrarse en cadenas de suministro globales, proporcionando recursos (tales como insumos o ya sean productos finales), bienes y servicios en los distintos niveles de mercado. Peru esta dentro de los 20 principales provedores de alimentos en el mundo, segun la agencia especializada en inteligencia comercial, "Fresh Fruit", teniendo en cuenta este potencial y su diversificada oferta, se ha determinado que existe una posibilidad real de crear cadenas de valor alrededor de los nichos de mercado que existen en el comercio global.
El presente estudio utiliza la teoría de la ventaja comparativa como base para cuantificar la competitividad de los productos a partir de la comparación global, lo que nos permite indicar cómo avanzar hacia mayores niveles de especialización en la estructura productiva y exportadora (Lauterbach, 2015). Como resultado, se obtuvo veinte productos con una tendencia positiva en sus exportaciones y doce productos que a pesar de contar con cifras inferiores en sus exportaciones, tienen un mayor potencial de crecimiento.

Palabras clave: Comercio internacional, ventajas comparativas, exportaciones, América Latina, Perú.

Introducción

Este articulo pretende reflexionar sobre la importancia que tiene el comercio internacional en los países de Latinoamérica para identificar los tipos de producción (productos, bienes o servicios) e intercambios que se deben realizar para lograr beneficios económicos sostenibles; para ello se estudia la teoría de comercio internacional y su modelo de ventajas comparativas.

En el marco macroeconómico, según datos del FMI, Perú en el 2018 logró elevar las exportaciones totales hasta $ 48.09 mil millones de dólares (+ 7.5% de 2017), logrando así un récord histórico para las exportaciones peruanas. Este crecimiento se explica por el notable crecimiento del sector no tradicional, que alcanzó los $ 13,2 mil millones (+ 12,6% respecto a 2017). En diciembre de 2019, las exportaciones peruanas sumaron un total de US$ 45.985 millones, lo que supuso lo que evidencia una caída del 4.2% con respecto a lo registrado en diciembre del año anterior. La proyección de crecimiento para 2020 ha ido sustancialmente a la baja, -14% del PIB y con una caída en las importaciones de US$9,058 millones y una caída de las exportaciones de US$ 8,304 millones, todo esto debido a la poca demanda externa generada por el período de cuarentena en el mundo y conjunto con el largo confinamiento de 3 meses y 14 días que en Perú han eclipsado el importante plan de apoyo económico implementado por el gobierno, y ha provocado importantes pérdidas de empleo.

A pesar de los importantes avances macroeconómicos registrados en la última década, la economía todavía no ha salido de su trampa de ingresos medios ni ha elevado significativamente su rango de ingresos medios. Este resultado se debe a que los peruanos poseen sólo una pequeña parte del crecimiento económico interno, y a la continua

dependencia de la industria del estado del mercado de recursos naturales. Esto se debe al hecho de que la economía peruana está abierta, lo que significa que es altamente susceptible. a las fluctuaciones en el entorno externo, como en la crisis del 2014.

Sobre la base de lo anterior, la aplicación de reformas estructurales relacionadas con una mayor diversificación de la economía en sectores más prometedores dará lugar a un aumento de nuevos puestos de trabajo altamente cualificados y a un aumento de las exportaciones de valor añadido, lo que reducirá la dependencia de la demanda externa de materias primas (Lauterbach, 2015).).

En este contexto, y dada la composición actual de la canasta de exportación peruana, este estudio busca identificar productos de exportación con potencial para el comercio internacional. Para ello, el estudio considera dos elementos importantes. En primer lugar, analiza aquellos tipos de productos en los que el país ha obtenido ventajas comparativas en los últimos años y que se beneficiarían satisfacer la creciente demanda mundial. En segundo lugar, se evalúan los productos que tienen la menor participación en la cesta de exportación, pero que pueden seguir creciendo y ganar dominio del mercado con el tiempo.

En el desarrollo de esta investigación, se aplicó la metodología del IBCR e IB, que se basa en diversas teorías de ventaja comparativa que han surgido a lo largo de los años. Como resultado, se realizó un estudio sobre la base de treinta y dos productos, como se mencionó anteriormente.

Como resultado del estudio, se ha identificado que Perú ya cuenta con productos líderes en la exportación de mercancías a nivel nacional, como minerales de cobre y oro; productos agrícolas como espárragos frescos, frijoles secos, quinua, maca, arándanos frescos, cortezas de agrios (limón), mangos frescos, uvas frescas, mandarinas frescas; productos marinos congelados como jibias, globitos, calamares y pota; productos textiles como la vicuña fina y la lana de alpaca, entre otros. Sin embargo, la oferta de exportación es mucho más grande y deja espacio para el comercio internacional de otros productos con ventajas comparativas, como joyas, piedras preciosas o semipreciosas, semillas agrícolas, residuos de polímeros de estireno y otros productos que ofrecen ventajas comparativas ocultas.

Perú y su impacto en el mercado internacional

Para un mejor estudio las exportaciones peruanas, es importante entender definición de los términos productos tradicionales y productos no tradicionales. Las ***exportaciones tradicionales*** *incluyen básicamente productos mineros, agrícolas, hidrocarburos y harina de pescado determinados por el Decreto Supremo 076-92-EF[1]. Son considerados como* ***exportaciones no tradicionales*** *las demás partidas arancelarias no señaladas en esa norma y son productos que tienden a tener un mayor valor agregado, se agrupan en agropecuarios, textiles, pesqueros, maderas y papeles, químicos, metal-mecánicos, sidero-metalúrgicos y joyería, minería no metálica y otros.*

En los últimos años, Perú constantemente ha ido elevando sus volúmenes de exportación, llegando a tener desempeños históricos (véase la figura 1) en 2019 logró exportaciones equivalentes a 45,9 mil millones dólares. Pero no solo ha mejorados sus volúmenes, a su vez se ha diversificado la oferta exportadora. El crecimiento fue impresionante; en el 2000, se registraron exportaciones de tan solo 12 productos no tradicionales por un valor de más de 30 millones de dólares (producción de metal y ropa, principalmente); mientras que en 2019 este indicador aumentó a 72 productos, siendo los más exportados los productos agrícolas.

Figura 1: Año 2019, tercer mejor desempeño histórico de las Exportaciones Peruanas (mil millones de dólares).

https://www.bcrp.gob.pe/estadisticas/cuadros-de-la-nota-semanal.html (Consultado el 10 de agosto del 2020).

En 2000, el valor de las exportaciones agrícolas alcanzó los 644 millones de dólares; en 2019, esta cifra aumentó a 6341 millones de dólares estadounidenses, según BCRP (2020) (véase la figura 2). En el 2019 se ha obtenido una cifra récord de exportaciones no tradicionales, se registraron envíos al exterior de 732 productos, 13 791 millones de dólares, 4,1% mas que en el año anterior.

Figura 2. Perú: Evolución de las exportaciones no tradicionales 2000-2019 (millones de dólares).

Fuente: Construido por el autor basado en datos del Banco Central de Reserva del Perú. https://www.bcrp.gob.pe/estadisticas/cuadros-de-la-nota-semanal.html (Consultado el 10 de diciembre de 2019).

Los progresos realizados por el país en materia de nuevos bienes exportados y mercados objetivo se basan a los 20 acuerdos comerciales vigentes (véase la Figura 3), como los acuerdos de libre comercio con China(en el 2019 China importó productos peruanos por una cifra equivalente a 13 503 millones de dólares), la Unión Europea, Estados Unidos, México y Chile, permitiendo el acceso de los productos peruanos a 54 mercados internacionales, en su mayoría transportados por vía marítima (89.1%, fuente PROMPERU). El país líder Según datos de PROMPERU, actualmente el 49.1% de la población mundial tiene acceso a los productos peruanos.

Figura 3: Volumen de exportaciones Peruanas a través de la Red de Acuerdos Comerciales Vigentes (millones de dólares).

Fuente: Construido por el autor basado en datos del Banco Central de Reserva del Perú. https://www.bcrp.gob.pe/estadisticas/cuadros-de-la-nota-semanal.html (Consultado el 15 de septiembre del 2020).

En cuanto a los mercados objetivo, sobre la base de 2019 informaciones, cuatro países concentraron alrededor del 57% de las exportaciones peruanas: el 30% se centró en el mercado Chino, mientras que los Estados Unidos representaron el 16,6 por ciento, Suiza el 5,3 por ciento y la República de Corea el 4,8 por ciento suministren productos peruanos. Otros mercados importantes son la India (4,4%), Japón (4,2%) y España (4,2%), entre otros (véase la Figura 4).

China es el principal mercado de destino para las exportaciones tradicionales, principalmente la minería (38%) y la pesca (47%); Si bien los Estados Unidos son el principal destino de las exportaciones no tradicionales, incluidos los textiles y el vestido (50 por ciento) y la agroindustria (32%) (Mincetur, 2017).

Además, del 88,7 por ciento de las exportaciones peruanas, que estaban cubiertas por las preferencias en el marco de las zonas francas existentes, destacan los mercados de China, los Estados Unidos, la Unión Europea, Corea del Sur, la Comunidad Andina, la AELC y el Mercosur, entre otros.
Sin embargo, existe una concentración de entregas en el extranjero tanto en los productos como en los mercados; por lo tanto, es necesario identificar y estimular nuevas actividades de producción, que son un factor adicional en el crecimiento económico, lo que permite diversificar la cesta de exportación e integrarla en las cadenas de valor mundiales (Producción, 2014).

Figure 4. Peru: Major export destinations, 2000 and 2019 (in percents).

Fuente: Construido por el autor basado en datos de SUNAT http://www.sunat.gob.pe/operatividadaduanera/index.html (Consultado el 15 de diciembre de 2019).

Cabe señalar que Perú en los últimos años se ha convertido en líder mundial y regional en la exportación de productos no tradicionales, el Perú es ahora el primer exportador mundial de arándanos, espárragos, lacas colorantes, quinua, cemento Clinker y Maquinas perforadoras, y esto debido a la política de diversificación de los mercados de destino.

Perú se encuentra en el segundo lugar de exportaciones en el mundo de mandarinas, pota precocida, conchas de abanico, zinc sin alear, suturas quirúrgicas, vidrios de seguridad, placas y baldosas. Tercer lugar en la exportación de paprika, palta, Fosfato de calcio, conservas de anchoas, aceitunas conservadas. Cuarto lugar en Palmitos de conserva, oxido de Zinc, oxido de Boro. Quinto lugar en la exportación de uvas, oxido de hidrogeno de cobre y oxicloruros de cobre.

Perú registra récords en la producción de los sectores agroindustria y pesca no tradicional, actualmente se exportaron 732 productos nacionales.

Los principales productos no tradicionales que alcanzaron récord de exportación en el 2019 destacan la uva (8%), los arándanos (51%), el abocado (4%), la pota cruda congelada (65%), los mangos frescos (1.5%), la pota precocida congelada (5.5%), la plata aleada (200%), la mandarina (128%), el alcohol etílico (80%) y los langostinos (54%).
Estos 12 productos representan el 30% del total exportado en productos con valor agregado.

Se ha visto una inclusión más amplia de los productos en la oferta exportada, haciendo hincapié en una mayor proporción de productos agropecuarios (43,5%), productos químicos (11,8%), textiles (10,8%), acero (9,8%) y otros. Sin embargo, se observa que los mayores volúmenes de exportaciones siguen enfocados en los recursos naturales y productos de bajo valor agregado.

Con respecto a lo anterior, el FMI (2019) señala que las exportaciones de los países andinos se concentran en el sector extractivo, principalmente en las industrias petrolera y minera, lo que afecta al resto de las exportaciones, contribuyendo al fortalecimiento de las exportaciones no reembolsables con baja productividad ("enfermedad holandesa") y baja competitividad a nivel internacional. (véase la figura 6).

En los últimos años, Perú, como parte de una estrategia para consolidar los ingresos de sus productos en diversos mercados, ha iniciado negociaciones sobre acuerdos de libre comercio con países con los que ha tenido un intercambio comercial más amplio con el fin de buscar mayores beneficios permanentes para los productos peruanos y aprovechar las oportunidades de Mercado Ampliado (Mincetur, 2018).).

Figure 6. Peru: Exportaciones de los principales grupos de productos no tradicionales, 2000 y 2019 (en porcentaje).

Fuente: Elaborado por el autor con base en datos del Banco Central de Reserva del Perú. https://www.bcrp.gob.pe/estadisticas/cuadros-de-la-nota-semanal.html (Accessed 05 December 2019).

En cuanto a la exportación de productos no tradicionales, en 2000 Perú registró ventas por un total de $ 2.044 millones de dólares (BCRP, 2018), estableciendo diversos productos entre las principales entregas, tales como camisas de algodón, espárragos, alambre de cobre, pelo de cardán delgado, camisas de algodón, aleaciones de zinc y madera y otros. La apertura comercial y la búsqueda de nuevos mercados permitieron que las exportaciones no tradicionales alcanzaran los 13,783 millones en 2019 (BCRP, 2020), lo que representa un aumento del 674% en comparación con 2000, debido principalmente a las mayores ventas de productos agrícolas líderes en calificación (véase figura 7)

Figura 7. Perú: exportaciones totales 2000-2019 (millones de dólares).

Fuente: Construido por el autor basado en datos del Banco Central de Reserva del Perú. https://www.bcrp.gob.pe/estadisticas/cuadros-de-la-nota-semanal.html (Consultado el 10 de diciembre del 2019).

Se requiere una especialización relativa en el campo de los recursos naturales, así como una política sectorial de diversificación de la producción, destinada no sólo a agregar valor a los sectores potenciales, sino también a asegurar que el país se desarrolle productivamente e integre productos pequeños (Ghezzi, 2018).

En este contexto, sobre la base de la información sobre las operaciones comerciales internacionales, los siguientes son aquellos productos (tradicionales y no tradicionales) en los que el Perú obtuvo ventajas comparativas en el período 2010-2016 y que deberían seguir contribuyendo a la diversificación de la economía y al logro del crecimiento económico a más largo plazo. Aunque el país tiene un gran potencial que aún no se ha utilizado plenamente, existe el

riesgo de perder progresos significativos si se estancó o comete un error al continuar exportando productos predominantemente tradicionales.

Variación de las exportaciones peruanas en el primer trimestre del 2020.

https://comtrade.un.org/
(Consultado el 10 de octubre del 2020).

Por otro lado, China se posicionó como principal destino durante el periodo mencionado en el 2020, a pesar de que los envíos a dicho mercado disminuyeron en 21.64%, en relación al año anterior. Como segundo mercado de destino se encuentra la Unión Europea, con un 9.16% de disminución; seguido de Estados Unidos, 10%. En la tabla 2, se puede observar que, dentro de los 15 principales destinos, las exportaciones a Corea del Sur, Chile, Emiratos Árabes y México fueron las únicas que registraron incremento. Asimismo, se muestra que, en el 2019, Suiza se posicionó como cuarto principal destino; sin embargo, en el 2020, bajó de posición al puesto 8. Similar desempeño tuvo Japón, que bajó un puesto.

Métodos De Investigación

El proceso metodológico desarrollado se basó en información comercial internacional de diferentes plataformas como Contrade, el Centro de Investigación Estratégica del Perú, INEI (Instituto Peruano de Estadística e Informática), Banco Mundial, RBC Daily Business Newspaper y otros. Así como estudios realizados por diferentes autores peruanos, rusos, entre otros, que han proporcionado un acceso detallado a los principales datos sobre el comercio exterior mundial, así como el análisis de los datos del comercio internacional.

Con esto se ha tenido acceso a las exportaciones e importaciones que Perú y los paises Latinoamericanos han hecho a los diferentes mercados y a su vez se ha identificado las exportaciones de cada producto peruano al mundo durante el período 2010-2020.

Luego de la recaudación de datos y trabajando en funsion del metodo de ventajas comparativas, se procedió a la identificación de los productos potenciales, que cuentan con un crecimiento progresivo para el periodo de estudio. Seguido, se han comparado los productos peruanos con los de otros países, a través del cálculo de los índices de Balanza Comercial Relativa (IBCR), paso en el que se pudo cuantificar e identificar los países con los cuales Perú muestra una ventaja comparativa; luego se calculó el Índice de Balassa (IB) e indice de Balassa Normalizado (IB), con lo cual identificamos los productos que aún no han llegado a considerarse potenciales, pero tienen gran perspectivas de mejorar en el mercado internacional.

Y para finalizar el estudio se midio la variacion y como se han visto afectadas las exportaiones peruanas y latinoamericanas de los productos identificados como potenciales de los años 2019 y 2020 en sus primeros trimestres.

Resultados

Productos tradicionales y no tradicionales en los que se encontro una ventaja comparativa con el resto del mundo.

Conclusión

En los ultimos años se ha demostrado la inestabilidad del mercado internacional, las ultimas crisis mundiales que afectaron significativamente a la region, como la crisis financiera de 2007-2008 genero una contraccion mundial del 2.9%, la guerra comercial entre China y Estados Unidos iniciada en el 2018 y ahora en el 2020, debido a la crisis ocasiona por la pandemia COVID19, generó una contraccion mundial estimada del 6.2%. Pero ubieron otros eventos importantes que abrieron nuevos mercados a Latinoamerica, como las sanciones a Rusia por Estados Unidos y la Union Europea, a partir de la guerra con Ucrania en el 2014, que abrieon un nuevo mercado con grandes oportunidades, demostrando la volativilidad de la economia global. Otro factor importante en los paises de la region es la poca demanda diferenciada con la que cada pais Latinoamericano cuenta.
Y es por esto que se propone la creacion de una estrategia de comercio Internacional para la region, teniendo en cuenta las ventajas comparativas de cada país.

Tomando en cuenta a Perú como ejemplo de estudio, usando la teoria de ventaja comparativa y los datos del comercio internacional se hizo posible determinar una lista de treinta y dos productos que cuentan con ventajas comparativas con respecto a los paise de la region y el mundo, de los cuales se identificó, veinte productos (tradicionales y no tradicionales), que aumentaron las ventas en el extranjero de manera constante para el periodo de estudio 2010, hasta el primer trimestre del 2019, y los otros doce, con volúmenes de exportación bajos, pero con un gran potencial de crecimiento.

a. Productos tradicionales basados en recursos naturales que Perú exportó entre 2010-2020. con una mayor participación en el comercio de estos productos. Esto le permite obtener un IBCR positivo, que expresa una ventaja en los intercambios de comercio.

Entre los productos se encuentran cobre, oro, zinc, plata, plomo, molibdeno, harina y aceite de pescado, gas natural y café; Es necesario tener en cuenta la estrategia regional, que permitirá exportar productos más complejos, especializados y diversos, para aumentar no sólo su competitividad, sino también para hacer que la economía sea menos vulnerable a las fluctuaciones de los precios de los bienes exportados.

b. Productos no tradicionales con mayor valor añadido y exportados al Perú con ventajas comparativas en el período 2010-2018. Este grupo está formado principalmente por productos agroindustriales, como uvas, aguacates, espárragos, arándanos, mangos, plátanos, cacao, pero también zinc sin endulzar o leche evaporada, que representan una dinámica de comercio exterior que los pone con un IBCR positivo y un valor significativo de exportación en este grupo. Esto requiere un aumento de los altos costos logísticos, altos estándares laborales, una infraestructura de transporte débil, entre otras cosas, con el fin de distribuir los factores de producción necesarios para crear una industria con un alto componente tecnológico.

c. productos no tradicionales para restaurar la cesta de exportación y dirigirla a grandes cadenas de valor mundiales. Aquí se identificaron los siguientes productos: guisantes verdes, granada, pulpo, manteca de cacao, mantas de lana o pelo fino, abrigos y suéteres de lana, Pisco, cebollas, zinc y productos de fresa. Estos productos ofrecen la oportunidad de estimular el desarrollo local mediante el fortalecimiento de las actividades de producción con potencial de exportación. De hecho, el plan nacional para diversificar la producción requiere la creación de nuevos mecanismos de crecimiento, identificando potencialidades de las cadenas de valor mundiales y coordinando los esfuerzos en el lev els intersectoriaal y territorialpara aumentar la competitividad.

A su vez se evaluo el comportamiento de los productos potenciales para los primeros trimestres de los años 2019-2020. Econtrandose que los productos exportados, de la lista de los principales productos, los envíos de harina de pescado fueron los más afectados, con una caída de 58.04%; seguido de las grasas y aceites de pescado, -57.32%; jibias, -56,71%; y arándanos, -51.89%. Por otro lado, las exportaciones de aceites crudos de petróleo mostraron un incremento considerable, tal como lo muestra la tabla 2. Además, los envíos de minerales de oro y sus concentrados crecieron 675%.

En el primer trimestre del 2020, y según los datos de la Cámara de Comercio de Lima, las exportaciones peruanas sumaron US$ 9,201 millones, monto 15.9% menor al mismo periodo del año anterior. Dentro del macro sector tradicional (que tuvo una baja de 18.65%), el sector más afectado fue la tradicional, cuyas exportaciones disminuyeron en 55.60%; seguido del petróleo y gas natural, con una caída de 39.66%. Por su parte, el macro sector no tradicional tuvo una variación negativa de 9.45%, dentro del cual el más afectado fue el sector joyería, que tuvo una disminución de 84%; seguido de la pesca no tradicional, 37.62%.

Para el cierre del año, según datos del FMI, se prevé que la actividad económica se recupere gradualmente, y que en 2021 se registre una expansión en el PIB del 6.5%, cifra que se encuentra por encima de los países vecinos Latinoamericanos (Encontrándose Chile en segundo lugar con un crecimiento proyectado según el FMI de un 5%, seguido de Colombia con 4%, Argentina 3.9%, Brasil 3.6% y México con un 3.3%), de igual manera para el 2021según datos del BCR se espera un incremento en las exportaciones de 7,336 millones y en las importaciones de US$ 5,016 millones.

Las ventajas comparativas que el país tiene a nivel de diversos tipos de productos permiten seguir promoviendo inversiones en estos sectores y, en particular, asegurar el desarrollo regional a través de tasas productivas que fortalezcan la estructura empresarial, el desarrollo de una infraestructura logística competitiva y una red de proveedores, que pueden incluirse en la cadena de valor global, que aumenta el empleo y el bienestar de la población. Por último, cabe señalar que el modelo teórico por el que está justificado este análisis nos permite identificar las mercancías líderes en la exportación de mercancías a nivel nacional; sin embargo, la cesta de exportación es más ancha y deja espacio para el comercio internacional de otros productos con ventajas comparativas, tales como joyas, piedras preciosas o semipreciosas, semillas de semillas, pinturas y dibujos hechos a mano, desechos de polímeros de estireno y otros productos identificados, mostrando el índice positivo de equilibrio comercial y el índice balassa bilateral.

[1] Decreto Supremo 076-92-EF, ley que define la lista de exportaciones tradicionales, tales como: Minería, petróleo y gas natural, pesca tradicional y agro tradicional (algodón, azúcar, café, etc.). Los productos que no se encuentren dentro de los sectores mencionados, son considerados productos no tradicionales (Agro no tradicional, Químico, Textil y confecciones, Sìdero metalúrgico, Pesca no tradicional, minería no metálica, madera, joyería, etc.).

Summary

With the passing of years, the market has undergone a technological transformation, making the business environment more competitive. Thus, companies such as those in the automotive mechanics sector, which is mostly composed of micro and small businesses, cannot continue to work in traditional ways. To be competitive and meet the demands of the environment, it is necessary to seek advantages, such as the implementation of technologies. Currently, people are tied to smartphones, PCs, and laptops for communication, work, information searches, etc. This paper is an exhaustive review of documents published between 2016 and 2020, which have been extracted from 10 academic sources; 100 of these articles were selected by means of search queries. By applying a quality-criteria assessment, 81 definitive documents were obtained. From this study, the research questions were answered, showing that the development and use of mobile applications is relevant in broader areas and generate great competitive advantages.

Keywords: Mobile Application, Scrum, Geolocation, Location, Access, Information, Systematic Review.

Introduction

In today's business world, there is competition in the marketplace, so businesses promote offers to attract customers; however, this is not enough to be competitive and increase revenue. In modern times, with people's busy and hectic lifestyles, it would be advantageous if they could be provided with up-to-date information on the establishments they wish to find [81], such as the location of a store, entertainment venue, restaurants, bars, hotels, roads, or specific addresses [63][14].

Currently, in Latin America, the auto mechanic industry has a big problem. When one needs to find one of these centers must be acquainted this service through a friend, family member, or social network that recommends it, or the first one available nearby. In the case of an accident, one must search for telephone numbers to call and confirm whether the business is open. Then, if the establishment is closed, one must keep looking, even if the car repair shop is not nearby. A tow truck is needed to help transport the car, and even if one finally finds a service provider, there would be no information regarding the quality of their service or a guarantee on the spare parts they use. Because of this, the traditional environment in which these establishments work must change, and they need to implement new alternatives.

The growth of mobile devices and wireless networks is reaching users of various ages across societies, increasing the interest in accessing online information services anywhere, anytime. Mobile platform technologies (Android and iPhone) that are circulating in the community are among today's information technologies, which are the basis for bringing about changes in various aspects for basic needs of human life. Most smartphones today have built-in and available technology features, such as sensors, location-based services, and internet access [5][33].

Therefore, it is clear that today, the Internet has become an important tool for communication, and applications have appeared as indispensable instruments for the propagation of information, as well as the provision of services to network users [52].

The paper is organized as follows. Section I is the introduction, Section II presents the background and related research, Section III explains the methodology of the research, and Section IV presents the results of this study. Finally, Section V presents the discussions and Section VI describes the conclusion and future research.

Background and Related Research

In the last several years, several investigations have been carried out on the development and use of geolocation applications to locate and access places in different sectors, or areas, such as services, transit, medicine, education, tourism, emergency alerts, and public safety. These fields may be subjects of study where technology and tools [6] would help improve and facilitate people's lives and companies' marketing, as using geolocation technology to deliver information to a large number of people about locations is a current real-world application [21].

There are a variety of mobile system research works, such as G. Suddul, K. Nundran, J. L. K. Cheung, and M. Richomme [11], in which a local geolocation API is presented for rapid application development on the France Telecom Orange Lab Emerginov platform [6]. This is an open platform that provides a rich set of APIs to support the development of microservices and aims to empower local communities to design and deliver multimedia content (voice, SMS, USSD), and to generate an application called MapPie for all-in-one geolocation. It has a development environment to test all the functionalities available for the client application.

A. Delgado and J. Sosa [12], show a mobile application with geolocation capabilities to find solid-waste-processing facilities in areas where they are not readily available. For this need, a solution has been proposed in the Olivos District, as users do not know which company is responsible for collecting solid waste, or the time, place, or day of collection, nor the specific location for pickup. Therefore, to contribute to the reduction of pollution in the Olivos District, a mobile application with specific activities and a simple operation has been developed. This application has been developed for the Android operating system to implement a geolocation system for solid waste-collection units that works in real time as a preventive measure to reduce the high levels of environmental pollution in the district of Los Olivos, as well as to reduce social conflicts.

The "Peluquerías" application by L. Enciso-Quispe, P. A. Quezada-Sarmiento, E. Chavez, C. Sanmartín, and E. Zelaya-Policarpo [13] has a more specific concept. It was developed for the web and then adapted to mobile devices; it is also a multiplatform application. It locates beauty salons within the city of Loja, shows information such as name of the business, slogan, description, days of operation, and, very importantly, emphasizes the times when it is open to the public; it also has a system that helps the user arrive at the beauty parlor by suggesting a route, which is obtained using Google Maps API services. These characteristics are differentiating factors, as its use is intuitive and very easy. The application is developed using Scrum, which is a process in which a set of good practices are applied regularly to work collaboratively in teams and obtain the best possible result from a project.

Research Methodology

This study is a systematic literature review (SLR), which, according to B. Kitchenham [82], is an iterative process that combines all existing literature on a specific topic or research question. It consists of the following stages: asking questions, developing search queries, identifying search sources, searching for and selecting articles, applying exclusion criteria, assessing the quality of primary studies, reviewing documents, and identifying findings. Therefore, it is appropriate to identify the current state of such studies in software engineering and to identify the evidence for conducting a systematic review of the literature.

Fig. 1Systematic literature review process

A. Research Questions

The following research questions have been defined and will be answered through the analysis of the scientific articles to be identified in the study (Table 1).

Table 1: Research questions and reasons

Questions	Motivation
RQ1. What are the criteria for measuring the overall effectiveness of mobile applications using geolocation**?**	Know the overall effectiveness of mobile applications with geolocation.
RQ2. What are the criteria for measuring the overall effectiveness of mobile applications developed using the scrum methodology**?**	Determine the overall efficiency of mobile applications developed using Scrum.
RQ3. What are the criteria for measuring the overall efficiency of mobile applications using geolocation that were developed through the scrum methodology**?**	Identify the overall efficiency of Mobile Applications with geolocation, developed using Scrum.
RQ4. What sources and means of publication are the main objectives of research development in the topic**?**	Determine which sources and means of publication are the main objectives of research production in the area.
RQ5. In what areas have mobile applications developed with geolocation been used**?**	Identify in which areas mobile applications developed with the Scrum methodology have been used.

B. Exclusion Criteria

In this section, the main objective is to ensure that all articles selected in this study are relevant and related. The information found was chosen from various documents, such as journals and conference papers, all written in English or Spanish and published in digital databases between 2016 and 2020. The authors of the research did not include articles that were irrelevant or unrelated to the topic and context of study. Table 2 shows the exclusion criteria applied.

Table 2: Exclusion Criteria

Id.	Criteria
EC1	Articles that are not less than 4 years old OR
EC2	Articles that are not written in English and Spanish OR
EC3	Articles that have not been published in journals or conferences OR
EC4	Articles that do not use a methodology in their research OR
EC5	Articles not in the technology and communications area

C. Search Strategy

The search strategy describes the organizational structure of the key terms used to search a digital database. This technique is used to manually and automatically scan sources to retrieve and review data for use in the study. The scoping was carried out in ten digital databases: IEEE Xplore, Science Direct, ProQuest, ACM Digital Library, Springer Link, EBSCOhost, Wiley Online Library, Scopus, Taylor & Francis Online, and Google Scholar.

These databases were selected because they were considered to be the most notable, up-to-date, accessible, and easy to work with, showing that they are outstanding in the publication of journals and conference papers in their respective fields of research.

The research questions and titles were scoped for key words or terms of agreement and relevant interest to define the search limits to be considered. The queries that ended up being used are listed in Table 3.

Table 3: Table of Search Equations

Data Sources	Queries
IEEE Xplore	((("Full Text & Metadata":mobile application) AND "Full Text & Metadata":location) AND "Full Tex0t & Metadata":Scrum)
Science Direct	mobile application AND location AND Scrum
ProQuest	(mobile application) AND (location to place) AND Scrum
ACM Digital Library	And All: location And All: Scrum
Springer Link	mobile AND application AND Scrum AND "location
EBSCOhost	TX mobile applications AND TX location AND TX Scrum
Willey Online Library	"mobile applicative" anywhere and "location" anywhere and "Scrum" anywhere
Scopus	ALL (mobile AND application) AND ALL (location) AND ALL (Scrum)
Taylor & Francis Online	And All: location And All: Scrum
Google Scholar	application mobile AND "Scrum" AND "location

D. Study Selection Process

The number of research studies first rendered by the search queries was 3,754, taken from the ten different databases. These are shown in Fig 2.

Fig. 2: Summary of number of results by source

The five selected criteria were used, resulting in 100 research pieces related to the present study, as shown in Fig 3.

Fig. 4: Summary of the number of results after applying exclusion criteria

E. Quality Criteria Assessment for Studies

Five criteria were used to evaluate the quality of the 100 articles obtained, of which, only 81 investigations were left that met all the criteria (Table 4).

Table 4: Quality criteria used

Id.	Quality Criteria
QC1	Does the article have a well-organized and described structure?
QC2	Are the bibliographic databases of sufficient quality?
QC3	Does it clearly show the purpose of the research?
QC4	Does the article discuss the validity and/or limitations of the research?
QC5	Is the article relevant to the research being conducted?

Results

This phase of the review will answer the questions that were raised.

A. RQ1. What are the criteria for measuring the overall effectiveness of mobile applications using geolocation?

To answer this first question, criteria were identified to measure the effectiveness of the application using geolocation:

Table 5 shows that the criterion that has the most support is real-time location with 33%, representing 29 articles out of the 81 analyzed, whereas the criterion that has the least support is the creation of routes with 11 articles, representing 12%.

Table 5: Effectiveness criteria for mobile applications using geolocation

Criteria	Articles	No. (%)
Accuracy	[20], [23], [37], [38], [39], [42], [44], [45], [49], [65], [67], [69], [73], [75], [76], [81]	16 (18)
Saving time	[3], [6], [9], [16], [22], [24], [29], [33], [43], [45], [46], [53], [57], [58], [62], [63], [77], [78], [81]	19 (21)
Proximity	[3], [20], [26], [37], [41], [47], [49], [50], [60], [69], [70], [71], [75], [78]	14 (16)
Real-time location	[2], [3], [7], [13], [29], [34], [36], [38], [42], [44], [45], [46], [47], [48], [49], [53], [58], [60], [61], [62], [63], [68], [69], [70], [71], [75], [76], [78], [80].	29 (33)
Routes	[8], [14], [27], [30], [45], [46], [48], [63], [65], [67], [75]	11 (12)

Using geolocation significantly shortens the duration and extent of searches by improving location accuracy, which is easy to comprehend and is precise within meters in space and minutes in time.

Positioning technology makes high-precision real-time continuity monitoring feasible for positioning and navigation, including geographic information and satellite maps [20][23][44][69].

Location-estimation techniques can be divided into three general categories: proximity, triangulation, and scene analysis.

Proximity-based methods can only provide an approximate position of a device based on link or connection information.

When more than one antenna detects the same moving target, the location is defined by the antenna that receives the strongest signal. This method is simple to implement [75][69][70][78][63].

One of the most important problems for users is that they may take a long time to reach routes, places that are not familiar to them, and shorter roads to get home faster or detours to avoid city traffic. Using geolocation through mobile applications provides assistance in performing these routes, as well as a history of routes taken that shows details, such as other routes taken or places stopped [14][45][48].

B. RQ2. What are the criteria for measuring the overall effectiveness of mobile applications developed using the Scrum methodology?

To answer this question, criteria were identified to measure the effectiveness of the application using geolocation.

Table 6 shows that the criterion with the most support is quality, with 36 articles, interpreted as 45%. In contrast, the incremental criterion shows the least support with 11.25%, representing 9 articles out of the 81 analyzed.

Table 6: Effectiveness criteria for mobile applications developed with Scrum

Criteria	Articles	No. (%)
Agile	[5], [9], [12], [28], [35], 36], [55], [56], [66], [67], [77]	11 (13.75)
Iterative	[9], [12], [17], [19], [28], 32], [35], [39], [61], [67], [70], [74], [75]	13 (16.25)
Flexible	[9], [12], [17], [28], [31], [32], [35], [56], [63], [77], [78]	11 (13.75)
Incremental	[5], [25], [28], [32], [36], [47], [51], [68], [72]	9 (11.25)
Quality	[1], [3], [6], [7], [9], [12], [14], [19], [20], [21], [24], [28], [32], [33], [34], [36], [37], [39], [40], [44], [45], [46], [48], [50], [56], [57], [61], [72], [73], [74], [75], [76], [77], [80]	36 (45)

Agile methodologies are widely implemented and used worldwide, with more than 20 different agile methodologies and types. The agile approach is considered one of the best approaches for mobile application development and identifying changes in the processes. The selection of the agile process will often depend on the experience and knowledge of the development team, and the time of delivery of the application.

Mobile applications require a higher degree of flexibility than desktop systems, and achieve this by integrating various mobile development processes with agile techniques and versatile and flexible process mapping.

Agile techniques focus on development activities and tasks around analysis and design. In these techniques, continuous Sprint application development is performed. The main contribution of the proposed framework is the guidance provided for the consideration of key aspects of agile development, as well as software attributes in the mobile domain [9][5][12][56].

Scrum shows criteria such as flexibility to change, small iterations, and short time releases; iterative customer response; high quality; and teamwork to achieve objectives [35].

From the very first moment of software development, the ISO/Quality IEC 25010 should be considered, which demonstrates the quality characteristics to be used [6] [19].

C. RQ3. What are the criteria for measuring the overall efficiency of mobile applications using geolocation, and that were developed through the Scrum methodology?

To answer this question, several criteria were identified to measure the effectiveness of geolocation applications developed through Scrum methodology.

Table 7 shows that the criterion with the most support is low cost with 37%, representing 41 articles out of the 81 analyzed, whereas that with the least support is adaptiveness with 11 articles, that are interpreted as 10%.

Table 7: Efficiency criteria of mobile apps with geolocation developed with Scrum

Criteria	Articles	No. (%)
Functional	[1], [2], [3], [20], [23], [9], [12], [14], [16], [17], [19], [20], [26], [28], [29], [36], [38], [40], [48], [49], [50], [61], [62], [63], [67], [70], [71], [75], [76], [77]	28 (25)
Low Cost	[1], [2], [6], [9], [13], [21], [22], [24], [25], [26], [28], [31], [32], [33], [36], [37], [39], [40], [43], [46], [47], [48], [50], [56], [57], [60], [63], [67], [68], [69], [70], [71], [72], [73], [74], [76], [77], [78], [80], [81]	40 (36)
Adaptive	[8], [9], [12], [26], [28], [39], [46], [47], [61], [70], [75]	11 (10)
Interactive	[6], [7], [8], [14], [17], [28], [30], [31], [37], [60], [61], [63], [67], [73], [77]	15 (14)
Exact location	[20], [23], [37], [38], [39], [42], [44], [45], [49], [65], [67], [69], [73], [75], [76], [81]	16 (15)

The developed design of an application must be functional to facilitate navigation and provide accuracy, maintainability, portability, and adaptability [2][17][12].

Geolocation is one of the technologies used frequently in mobile phones today, and has proven to be useful. Mobile phones have a function that is integrated into a tool that can send and receive satellite signals to collect the exact location of the person, device, or place. This can determine the consumer's information, needs, and choices of products and services. This is important because without finding the right location information, the user does not know where to find what they need [34][24][36][64].

An interactive method is presented using Scrum, which in each iteration obtains feedback from stakeholders for constant improvements and to obtain a good final product [8].

D. RQ4. What sources and means of publication are the main objectives of research development in the topic?

This question can be answered with Fig 4, which shows that of the total of 81 articles examined, there are two publication objectives, with the highest percentage (64.2%) being journal articles with 52 articles, and the lowest (35.8%) being proceedings with 29 articles.

Fig. 4: Articles by publication type

By analyzing the 81 articles, the results shown in Fig 5 were obtained. The source with the most public proceedings is IEEE Explore, with 14 articles, whereas in the case of journals, it is Springer Link with 11 articles.

Number of articles by Publication Type and Source

Publication Type	ACM Digital Library	EBSCO host	Google Scholar	IEEE Explore	ProQuest	Science Direct	Scopus	Springer Link	Taylor & Francis Online	Wiley Online Library	Total
Conference proceeding	5	3	3	14		3		1			29
Journal	1	4	3	1	10	3	10	11	5	4	52
Total	6	7	6	15	10	6	10	12	5	4	81

Fig. 5: Articles by publication type and source

E. RQ5. In what areas have the mobile applications developed with geolocation been used?

In the articles reviewed, different areas were found to be used for the implementation of applications using geolocation.

Table 8 lists the areas of implementation, where transport shows the most degree of support with 22 items, which is 27.1%. In contrast, medicine shows the least support with 7 items, which is 8.6%.

Table 8: Areas of implementation

Areas	Articles	No. (%)
Medicine	[2], [6], [19], [34], [49], [60], [62]	7 (8.6)
Transport	[2], [7], [10], [17], [22], [26], [30], [32], [34], [42], [48], [53], [54], [61], [63], [65], [74], [75], [76], [78]	22 (27.1)
Tourism	[4], [6], [14], [30], [31], [33], [48], [59], [60], [63], [50], [61], [62], [63], [75],	12 (14.8)
Daily life	[2], [7], [14], [36], [37], [41], [47], [48], [67], [71], [73], [75]	12 (14.8)
Emergency	[2], [8], [13], [16], [17], [19], [20], [24], [29], [36], [43], [53], [62], [63], [69], [74], [75], [80]	20 (24.6)
Marketing	[1], [6], [9], [14], [30], [33], [34], [36], [49], [53], [63], [69], [71], [72], [73], [76], [81]	18 (22.2)
City	[15], [16], [27], [40], [63], [65], [74], [75], [76], [77]	10 (12.3)

Discussion

Once the results of the questions posed in this study are defined, the results can be discussed. The effectiveness of the mobile applications with geolocation was determined based on the criteria obtained by the authors as achievements in their research. Further, the effectiveness of the mobile applications with geolocation prompts many authors to use them in various fields where the use of personal information is not desired by its users. The results of this work also determined how important it is to follow a development methodology that ensures the quality standards and security of the project. In turn, it is important to know the types of tools used to create mobile applications with geolocation to be used. Depending on the needs of the users, not all tools are necessary for the same scenarios. It has also been shown that the data require special treatment to ensure that true and reliable information is provided.

The evidence in this article suggests that mobile applications with geolocation are a good option because they cover an impressive number of important areas. It is up to the professionals to determine the best way to implement them, taking into consideration the development methodologies, the tools and techniques that exist to support them, as well as the quality and security standards.
This work is consistent with the research by F. Kamoun, M. El Barachi, A. Hachani, F. Belqasmi, A. Ben Said, and I. Amri [32] on the use of mobile applications with geolocation for the emergency supply of oxygen cylinders to patients suffering from sudden respiratory distress.

Conclusion and Future Research

In this research, a systematic literature review (SLR) was used to analyze studies between 2016 and 2020. This work was based on 10 academic databases by applying search queries, which provided a total of 3,754 articles initially. The SLR successfully answered the questions raised in this research work. The findings enabled the identification of very important data when creating a mobile application with geolocation, such as tools for their creation, areas in which they are used, and which methodologies could work. Compared to traditional methods, the use of Scrum methodology has several advantages, such as the development of incremental projects; specifically, one can create applications based on customer needs. It can be concluded that today, the use of applications with geolocation is very important because it can provide solutions to the most common problems in everyday life, such as finding places for free or reaching a location in case of emergency. In addition, this function can be combined with many others, such as a panic button, which has been implemented in various areas.

For future research, it is recommended to use studies with a period of less than 3 years to obtain the latest trends in mobile applications with geolocation that can contribute new concepts for new authors to apply to their research.

Assessment of Causes and Effects of Corporate Restructuring

Kinga BAUER

Cracow University of Economics, Department of Accounting, Krakow, Poland

kinga.bauer@uek.krakow.pl

Abstract

Constant changes that take place in the economic environment of enterprises force them to constantly adapt to current conditions. Ignoring changes can cause serious crises and even bankruptcy of companies. A method of counteracting crisis situations, as well as a method of overcoming them, is the restructuring process. In the event of a crisis situation, the starting point is restructuring aimed at remedial actions, and only then taking development measures. Carrying out restructuring requires a series of analyses to determine the grounds and effects of the changes which have been implemented. The goal of the article was to determine the measures used in the diagnosis of the needs and effects of restructuring, as well as the importance of plans and forecasts in the assessment of the implemented changes. In order to achieve this goal, literature studies and surveys in the form of questionnaires were conducted on a group of restructuring specialists. As a result of the conducted research, it was found that there is no uniform set of indicators used in the restructuring process to assess the need to restructure and the achieved results. Popular indicators for diagnosing the needs and effects of restructuring are liquidity, solvency and profitability ratios. Restructuring specialists also identified as important, information on the company's plans, forecasts, goals and strategy which could affect its future cash flow.

Keywords: corporate restructuring, financial measures, financial statement, financial ratios

Introduction

Restructuring is equated with activities that lead to an increase in the value and effectiveness of business operations. Its purpose is to develop and improve competitiveness. However, the impulse to carry out the restructuring process may be not only the improvement of good but unsatisfactory results, but also the recovery from a crisis situation of a given enterprise. When a company experiences a serious crisis, the first step to take must be restructuring with the purpose of remedial actions, and only then development. In extreme cases, that are the risk of insolvency or insolvency, this process may be conducted with the consent of the law court and under the supervision of court-appointed restructuring advisors or other court representatives. The designation of persons responsible for carrying out judicial restructuring proceedings depends on the law of a given country. The commencement of the restructuring process, as well as the assurance of gaining positive effects after its completion, requires the use of a number of measures, created both on the basis of financial statements and other assessments resulting from the achievements in the theory and practice of management. The results should be compared to the plans and forecasts prepared for the purpose of restructuring. Due to the wide spectrum of the subject of assessment of causes and effects of corporate restructuring, this article focuses on issues related to the financial measures used and sources of information prepared *ex ante*, such as plans and forecasts.

The purpose of this article is to determine the measures used in the diagnosis of the needs and effects of restructuring, as well as the importance of plans and forecasts in the assessment of the implemented changes. The research method consists of a critical literature review, questionnaires and methods of mathematical statistics. As part of the objective, the essence of restructuring and indications for conducting financial analyses preceding the initiation and completion of the restructuring process will be determined. A literature review pertaining to the diagnosis of the needs and effects of restructuring will be conducted. Financial indicators used in the restructuring process will be specified as well. A survey, which was conducted among a group of restructuring specialists, on the information selected for the evaluation of the restructuring process will be used. The research sample contains the opinion of 103 specialists in the field of restructuring, most of them with many years of experience in restructuring proceedings. The empirical research was conducted in Poland.

Cite this Article as: Kinga BAUER "Assessment of Causes and Effects of Corporate Restructuring" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The purpose of this study is to obtain an answer to the following questions:

- which financial indicators are specified as important in the diagnosis of the causes and the assessment of the effects of restructuring?
- is the information on plans, forecasted targets and operating strategies of the restructured entity important for restructuring specialists?

The above questions were formulated on the basis of literature studies and previous experiences of the author regarding the restructuring processes.

Restructuring as a process of changes in an enterprise

Enterprise restructuring can be considered from a theoretical point of view or legal regulations and economic practices, and its essence is the subject of research of many scientists around the world. In economics, "restructuring" is a concept that does not have a single, universally accepted definition. The definitions of restructuring used in the literature, share common features. The definitions indicate that, restructuring is a rapid and radical change that touches upon important areas in a given enterprise. The definitions make explicit reference to the strategy, from various perspectives. Restructuring is called a growth strategy, a strategic process leading to maximization of monetary worth, as well as a major change of strategy (Borowiecki and Nalepka, 2003, p. 75).

Emphasis put on the role of change is included in one of the best-known definitions of restructuring, which was created by H. Singh (1993, p. 147). While defining restructuring, he stated that it is a multifaceted term used among practitioners and is still a relatively new term. Restructuring involves significant and rapid changes in the organizational structure as well as in the structure of assets and capital of a given enterprise. He also draws attention to the controversy around the effects of restructuring. He notes that, restructuring proponents argue that more efficient organizations have emerged as a result of a thorough assessment of the ability to generate monetary resources. Critics argue that, organizational disruptions resulting from restructuring exceed the expected benefits of restructuring.

G. L. Clark (1994, p. 9) called restructuring a deliberate process of rebuilding the overtaken system towards a possible and more desirable method of acquirement. When planning and implementing restructuring, a choice is made between different options. On the other hand, D. Vance (2009, p. 3) notes that, restructuring is not a magical change, on the contrary: it is difficult and may be frustrating. Multiple techniques should be used, even more than once. Sometimes a business will take two steps forward and one step back. Restructuring involves the repeated application of various techniques. However, most companies can be saved if they start restructuring quickly enough and the management is ready to take aggressive action. Restructuring is not limited to companies in difficulty. It can also be the process of transforming a company into an increasingly stronger organization. N. Alias, M. H. Yaacob and N. Jaffar (2017, p. 13) point out that, carrying out the restructuring process brings a number of benefits, such as increasing knowledge, experience and skills within an enterprise. The positive role of restructuring processes is also recognized and discussed, among others, in the works of: N. Malačič and I. Malačič (2016), T. Hoshi,, S. Koibuchi and U. Schaede (2018), A. Chandel, and A. Tiwari (2018), S. Kumaraswamy, Ebrahim and Nasser (2019), Y. Arsenyev et al. (2020).

Managers of a particular enterprise can play an important, both positive and negative role in the restructuring. Managers can be the party responsible for the emergence of a crisis situation, and at the same time, create a new structure thanks to their involvement in the change process. Referring to the reasons why the implementation of restructuring was needed, H. Singh and C. Markides (1997, pp. 213-219) pointed to the predominance of management errors in the choice of the organizational structure, rather than managerial abuses. On the other hand, G. L. Clark (1994, p. 9) notes that, the restructuring process requires the involvement of managers as the ones responsible for restructuring, optimization of resources and searching for new income.

The definitions of restructuring also include references to its impact on the financial condition of an enterprise, which will be reflected in financial measures such as profitability and items on financial statements. For example, I. Altman and E. Hotchkiss (2006), when defining restructuring, referred to such effects as changes in assets and structure of capital, increased value for owners or improved operational efficiency, and changes in the level of debt and ability to be in debt.

Although restructuring means activities aimed at improving the company's performance, M. Zorn, P. M. Norman, F. C. Butler and M. S. Bhussar (2017) point out that, scientific research on the impact of restructuring on the company's performance does not give clear results. Organizational restructuring may lead to negative consequences, ultimately ending in bankruptcy.

Due to the need to plan changes and the uncertainty of achieving the intended effects, a rational approach to the restructuring process is an analysis of the needs to carry out particular activities and afterwards, measure their results. This can be achieved by both, measures that use data derived from financial statements, and other methods of diagnosis resulting from science and the practice of management.

Measures Used in The Diagnosis of The Needs and Effects of Restructuring: Literature Review

Constant adaptation to the changing economic environment in order to cope with competition, forces enterprises to use various methods and tools, and contributes to the dynamic development of the theory and practice of strategic management as a method of reducing the negative impact of sudden turbulence an enterprise may experience (Masztalerz, 2007). Restructuring processes are a response to the volatility of the economic environment. They also cause changes in the science and practice of management, as well as new, improved approaches to the analysis of implemented changes. The need to monitor changes is indicated in scientific research. The publications indicate the need for continuous supervision over the course of the change process, and after the repair period, the comparison of goals with the achieved results, both in the short and long term (Nowak, 2012, pp. 18-19; Borowiecki and Wysłocka, 2012, pp. 104- 156).

The complexity of the restructuring processes and the need to adapt them to individual cases, affects the variety of information used. One of the main sources of information in the restructuring process is the financial statement. P. Bartkowiak and R. Borowiecki (2001, pp. 9-22), while analysing the complexity and effectiveness of the restructuring processes, noted that the nature and type of information affect the reliability of analyses and an objective assessment of enterprises undergoing changes. In their opinion, an indisputable fact is that the periodic financial statements of enterprises provide the most valuable information on the financial condition of enterprises and are a basic source to conduct correct analyses of these specific activities in the enterprise. R. Borowiecki and E. Wysłocka (2012, pp. 104-156), in their analysis of the list of possible financial indicators, conclude that indicators based on financial statements are the most important and most frequently used in practice.

On the basis of a financial statement, a financial analysis is carried out, which can be prepared both *ex post* before starting the restructuring process in order to determine the need to carry out particular activities and *ex ante* to define planned changes. It can also be carried out after the completion of the process in order to determine the obtained effects (cf., among others, Nogalski and Marcinkiewicz, 2004, p. 28; Waściński, 2010, pp. 109-113, 300-303; Borowiecki and Wysłocka, 2012, pp. . 104-156). There is no clear indication as to which of the financial indicators should be used in the assessment. For example, A. Nalepka (1999, pp. 67-71), D. Czerwińska-Kayzer (2018, p. 243) and A. Duliniec (2007, pp. 115-120) emphasize the importance of liquidity and profitability in the restructuring process. It is worth noting that although maintaining liquidity is a prerequisite for maintaining economic activity, excess liquidity leads to a reduction in profitability, which may limit the company's development. Low level of liquidity may also have negative effects on profitability, and thus in the long term lead to loss of solvency or even bankruptcy (Czerwińska-Kayzer, 2018, p. 243). When referring to actions to avoid bankruptcy, S. T. Surdykowska (2012, pp. 44-45) mentions profitability and solvency as the necessary conditions. The role of profitability in the survival of a company is also emphasized by Z. Dresler (2014, p. 12). He points out that a long-term lack of profit causes not only a problem with the development of the enterprise, but also may lead to bankruptcy. Bankruptcy is preceded by a lack of liquidity, the loss of which is, however, the result of processes resulting from the lack of profit. In turn, H. Sokół (2014, p. 146) mentions the loss of solvency as the most important symptom of a crisis situation. The loss of solvency follows the stages of stalling development, a decline in market share and a systematic deterioration of the economic and financial condition. On the other hand, the research by N. H. Wellalage and S. Locke (2012, pp. 1-17) shows that profitability, liquidity and the size of the enterprise have an impact on the risk of bankruptcy. The importance of financial indicators in the assessment of the needs and effects of restructuring also results from the fact that they constitute the basis for building early warning models against bankruptcy. Their role is also related to the ease of measurement (Zorn, Norman, Butler and Bhussar, 2017; Wójcik-Jurkiewicz and Karczewska, 2019). The aforementioned indicators refer to the risk of bankruptcy; they are also important in the diagnosis of the need to restructure enterprises which are in a crisis.

Financial indicators are not the only measures used in the restructuring process. Recent research into bankruptcy risk assessment has combined financial and market data with other “soft information” such as legal actions, timely reporting, employee loyalty and quality of management (Altman, Sabato & Wilson, 2008). B. Nogalski and H. Macinkiewicz (2004, pp. 61-62) point out that the assessment of the competitiveness of a company undergoing a crisis is an important element of the management process. Research should be conducted in the areas and scope adjusted to the needs of the recipients of such information. The study of an entity should take into account not only its economic performance, but also other factors (e.g. organizational or cultural). According to N. Crutzen and D. Van Caillie (2008, p. 292), the possibility of diagnosing the risk of bankruptcy depends on the stage of the crisis situation

in which the company is at the time. In the early stages, crisis manifests itself in organizational problems or in the structure of an entity. Only a serious crisis situation is reflected in financial indicators.

Due to the complexity of the restructuring process, the overall assessment of the current situation of a company should be quite broad and include both an analysis of the environment as well as an analysis of the mission, goals, strategy and resources. The assessment of the current condition of an enterprise is one of the main elements of the restructuring program, which should be prepared in several versions, e.g. optimistic, pessimistic and realistic. An integral, though more detailed, element of the restructuring program is the restructuring plan (Garstka, 2006, pp. 36-40). The restructuring plan should include an assessment of the crisis situation, an economic and financial analysis of the indebted enterprise, as well as an action plan specifying the tools to be used for its implementation (Niebieszczańska, 2014, p. 162). One of the important elements of the restructuring program are financial projections, which in monetary units express basic financial documents, i.e. financial statements prepared *ex ante* and financial indicators calculated on its basis (Zakrzewska-Bielawska, 2005, pp. 74-75).

A model approach to the restructuring process proposed by M. Porada-Rochoń (2009, p. 75-77) indicates that activities should begin with a diagnosis of threats of a crisis in an enterprise, afterwards with the phase of creating a concept, then implementing changes and assessing the effects. Therefore, *ex-post* measurement of the company's financial condition should take place at the beginning and at the end of activities and operations, and *ex-ante* assessment of planned changes should also be made.

Assessment of usefulness of plans and forecasts in the restructuring process: the stand of specialists in the field of restructuring in Poland

Based on the conducted literature studies, it can be concluded that the assessment of the causes and effects of restructuring is inherently related to the measurement of economic quantities. Information obtained from an entity's financial statements is of particular importance. Financial indicators from the liquidity, solvency and profitability groups are indicated as significant in the assessment of a company's financial condition, which should be carried out both before initiating the restructuring process and after its completion.

At the same time, other sources of information that can and should be used in restructuring processes and their evaluation are also indicated. In Poland, such sources include restructuring plans and various types of forecasts that indicate the adopted strategy and planned activities of a given entity, which may in turn affect its future financial flow. These issues are regulated in Poland by the Restructuring Law, requiring the preparation of a restructuring plan at the initial stage of the proceedings, the implementation of which is subject to assessment during and after the end of court proceedings (Restructuring Law, 2015, Art. 9, 31, 33).

In order to determine the significance of this type of information, prepared *ex ante*, on the basis of plans and estimates prepared by those involved in the restructuring process in an enterprise, a question was asked to specialists in the field of restructuring in Poland regarding the significance of this particular information. Transparency of the restructuring process is required to carry out a correct assessment, and so this study was made under this assumption.

The study sample consists of responses from 103 specialists in the field of restructuring. The respondents also have knowledge and experience in the field of bankruptcy. The respondents include practitioners, i.e. judges specializing in restructuring and bankruptcy proceedings, restructuring advisors, scientists specializing in restructuring processes, as well as people who were part of a team responsible for creating the current Restructuring Law in Poland. The choice of Poland for research is purposeful. Poland is a country which has undergone a thorough reform of its restructuring law in recent years.

The research sample included:

- 29 judges conducting insolvency proceedings,
- 12 members of the Minister of Justice Council for the Amendment of Bankruptcy and Reorganisation Law,
- 96 people who have declared that they have practical experience in insolvency proceedings conducted in 2013-2015; 62 of them have declared to also have practical experience in proceedings under the Law that went into effect in 2016.

The research sample collected allows to assume that the completed questionnaires contain the opinions of those who, in their professional work, influence the scope and even the quality of documentation collected in court for the purpose of restructuring proceedings.

The empirical research carried out is part of a much broader research project regarding the informational role of accounting in restructuring and insolvency proceedings. The questionnaire contains 149 detailed questions.

Below is the research question the respondents were asked:
Please assess the importance of information on the plans, forecasts, goals and strategy of the entity in restructuring, with particular emphasis on the circumstances of its activities that may affect future cash flow, using a scale of 1 to 5 (where 1 means completely irrelevant information and 5 means crucial information).

"I don't know" or "not applicable" was a possible answer to each question. The distribution of answers to the question asked is presented in Table 1 and in Figure 1.

Table 1: Distribution of assessments of specialists in the field of restructuring on the validity of information

Information on:	number of individual assessments on a scale of 1 to 5					number of "I don't know" "not applicable" answers	no answer
	1	2	3	4	5		
the plans, forecasts, goals and strategy of the entity in restructuring, with particular emphasis on the circumstances of its activities that may affect future cash flow	0	4	13	41	41	2	2

Source: own elaboration

The share of high ratings (4 or 5) is 0.828, which proves that information on the plans, forecasts, goals and strategy of the entity in restructuring, with particular emphasis on the circumstances of its activities that may affect its future cash flow, is important. The error of this assessment is 7.4%, which means that the expected share of high ratings in the entire population with a 95% probability is in the range of 0.75 to 0.90.

As the respondents rated on a scale from 1 to 5, it was also possible to determine the mean score, which was 4.2 (the error of the mean estimate is only 0.16). The high average confirms that the indicated information is of great importance to the respondents.

The respondents' assessment of the significance of information on the plans, forecasts, goals and strategy of the entity being restructured indicates that this type of information prepared *ex ante* is important for the restructuring process.

Conclusions

Restructuring of enterprises is a complex process that requires both a diagnosis of the condition prior to its initiation and an assessment of the effects achieved. Assessments should be carried out in many aspects, using financial measures and assessments derived from management theory and practice. An important aspect of diagnosing the needs and effects of restructuring is the construction of plans and forecasts, and then the assessment of their implementation at each stage of changes and after the entire process is completed.

As it results from research, despite a growing role of information not related to the accounting of enterprises, financial indicators are still important in assessing the need to conduct restructuring and measuring its effects. There is no one specific set of financial indicators for this assessment, but the most common are liquidity, solvency and profitability ratios, which are also the basis for building bankruptcy prediction models.

Plans and forecasts of an entity's future are of great importance for the restructuring process. This is clearly indicated by the results of empirical research carried out among a group of specialists in the field of restructuring. The research was carried out in Poland, but the type of information that may be of importance for the restructuring process, diagnosis of the grounds for its initiation and assessment of the effects of implementing it, is of universal importance. As a result of the conducted research, it was found that restructuring specialists pay great attention to information on forecasts, plans, goals and strategies of the restructured enterprise, which may positively affect its future cash flow. The average score obtained was 4.2 (using a scale of 1 to 5 (where 1 means completely irrelevant information and 5 means crucial information).

The relatively small research sample is a limitation of the research. However, considering the low errors of the obtained evaluations, the results can be considered reliable. Further research is planned on assessing the restructuring process in conjunction with the data used for its implementation.

Stock and Market Trading Volume As Factors of Return Volatility

Leslaw Markowski

Abstract

This study examined the relationships between conditional volatility of individual stock returns and stocks and market trading volume and mixed variable in terms of trading volume with price movement indicator. Using GARCH(1,1) model specification in the sample of 20 stocks listed on the Warsaw Stock Exchange the results reveal a decreasing of volatility persistence in nineteen stocks when contemporaneous trading volume was added to the variance equation. The model with indicator variables demonstrates a reduction of the persistence in all stocks compared to the model without any exogenous variables. Moreover, the model with stock volume outperforms the model with market volume for all stocks as far as persistence reduction. Models with both market trading volume and market price movement find a much greater impact of market volume on stocks volatility in downward market price movement than in upward market price movement.

Keywords: Conditional Volatility, GARCH, Mixture of Distribution, Trading Volume, Volatility Persistence.

JEL: C32, G12

Introduction

Investors throughout the trading day receive a lot of information at different times. This information is reflected in intermediate equilibrium prices and when investors glean the new information the final informational equilibrium in prices is reached. The flow and adoption of information is defined as sequential information arrival hypothesis (SIAH) (Copeland 1976). It can be assumed that with the simultaneous arrival of information, the trading volume of any asset will increase. Therefore, the volume can be a variable predicting variability in price changes. There should be a positive correlation between trading volume and absolute returns of price changes (Copeland, Friedman, 1987). This statement, in turn, is the subject of the mixture of distribution hypothesis (MDH) and proposed by Clark (1973). Price changes and trading volume as an information arrival rate are independently distributed but they can also be considered as a joint distribution. This implies positive contemporaneous relation between price volatility and volume. Conditional variance of price change and trading volume are positive function of information arrival. The potential impact of trading volume on price volatility can be tested using GARCH model in which the variance of returns is heteroskedasticity due to the information that arrive to the market. Using the contemporaneous trading volume should decrease the volatility persistence in conditional variance equation compared to the equation without that volume. This statement has found support in many studies. Lamoureux and Lastrapes (1990) discovered that phenomenon of variance clustering diminishes when the contemporaneous trading volume is included to the variance equation. Gallo and Pacini (2000) also observed reduction of the estimated persistence in the GARCH(1, 1) and EGARCH(1, 1) for US stocks. Bohl and Henke (2003) in Polish stock market showed a reduction of persistence in conditional volatility after including trading volume in the model. Wang et al. (2005) used trading volume as a proxy of information arrival rate and found that the volume effect is positive and substantially reduces the persistence of conditional variance. Ezzat and Kirkulag-Uludag (2014) in the Saudi Exchange provided strong evidence for the validity of the mixture of distribution hypothesis. They demonstrated that volatility persistence decreases when the trading volume is included in the conditional variance equation. The same effect Tan et al. (2015) revealed using the sample in Australian stock market. The relationships between trading volume and return volatility for the sample of bank stocks was examined in study of Rotila et al (2015). They found the above relations but under certain conditions such as stock's size and for the financial crisis period in 2009. MDH and SIAH are verified by Tseng et al. (2015) and Shen et al. (2018). They supported the sequential information arrival using lagged volume to predict volatility. Wang et al. (2019) in the Bitcoin market documented significant relationship between trading volume and return volatility and supported the SIAH incorporated different kinds of measurements of volume and sample periods.

Cite this Article as: Leslaw Markowski" Stock and Market Trading Volume As Factors of Return Volatility" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

In this paper, in addition to the impact of trading volume on volatility, a problem of the relationship was raised in connection with the sign of arrival rate. The question arises whether good or bad information strengthened the volume and whether there is an asymmetry in the impact of a given type of information. A broad study on this topic was carried out by Tan et al. (2015). They proposed price movement indicators and revealed that model with these variables reduce persistence in returns' volatility more than models with volume alone. Furthermore, they observed that upward price movement influence conditional volatility more than a downward price movement.

The last aspect raised in the work is the study of the impact of market volume and market volume with price movement (good and bad) on the volatility of the stock. The noteworthy question is whether the overall activity of all investors in the market and this activity in periods of positive and negative market returns have an impact on the volatility of individual stocks. Moreover, it is interesting whether market trading volume contributes to a reduction of persistence in volatility of returns. Past research does not investigate the relationship between stock volatility and market condition rate.

The study is to clarify whether there is a contemporaneous relationship between stock trading volume or market trading volume and conditional volatility of any stock. Research also introduces the volume with a price movement.

Methodology

Conditional volatility-volume relation

The explanation that stock returns are generated according with a mixture distribution hypothesis can be verify in using of proper ARCH model. That model can describe of the rate of information arrivals as a generating process of mixing variables (Ahmed et al., 2005). One of that variables is trading volume and it is incorporating to explain of conditional volatility stock returns. The volume plays an important role from investors' point of view because it reflects their expectations. It seems important to study the joint distribution of returns and volume to confirm the mixture of distribution hypothesis. The GARCH(1,1) model is the tool that use contemporaneous trading volume and allow to measure the level of persistence' reduction. Including trading volume generalised variance specification with the mean equation considering autocorrelation in returns is given by:

$$R_t = \varphi_0 + \varphi_1 R_{t-1} + \varepsilon_t \tag{1}$$

$$\sigma_t^2 = \alpha_0 + \alpha_1 \xi_{t-1}^2 + \beta_1 \sigma_{t-1}^2 + \delta Vol_t, \tag{2}$$

$$\varepsilon_t = \sigma_t \vartheta_t \; ; \; \varepsilon_t \sim IID(0, \sigma_t^2); \; \vartheta_t \sim IID(0,1) \tag{3}$$

where R_t, Vol_t is return and trading volume of any asset in trading period *t*, respectively. The volume reflects an appropriate proxy of information arrival rate, where news tends to increase the trading volume. Therefore, the estimation of δ is expected to be positive, which means increasing conditional volatility of stock returns. The sum of parameters $\alpha_1$and β_1 measures the level of volatility persistence. Including the mixing variable in the form of volume should reduce the persistence in conditional variance that is eliminate the ARCH effect in time periods of returns (Lamoureux and Lastrapes, 1990).

Trading volume and price movement direction in conditional volatility

In this paragraph, the study is expanded to include the impact of the type of information (good and bad news) on volatility-volume relation. Investors may react in distinct way to different types of information. Considering growing and descending price movement the conditional volatility equation with a trading volume is as follows:

$$\sigma_t^2 = \alpha_0 + \alpha_1 \xi_{t-1}^2 + \beta_1 \sigma_{t-1}^2 + \delta_1 Vol_t^+ + \delta_2 Vol_t^- \tag{4}$$

where

$$Vol_t^+ = \begin{cases} Vol_t & if \quad P_{t-1}^{close} < P_t^{close} \quad or \quad R_t > 0 \\ 0 & if \quad otherwise \end{cases} \tag{5}$$

$$Vol_t^- = \begin{cases} Vol_t & if \quad P_{t-1}^{close} \geq P_t^{close} \quad or \quad R_t \leq 0 \\ 0 & if \quad otherwise \end{cases} \tag{6}$$

and P_{t-1}^{close}, P_t^{close} denote close trading prices of any asset in *t-1* and *t* periods, respectively. Obviously, the indicator volume variables (5) and (6) aggregate to the trading volume. The equation (4) leads to the following two research questions. Firstly, whether volume in upward and downward price movement periods more reduce a persistence in conditional volatility than contemporaneous trading volume in equation (2). Secondly, assuming that investors react much more strongly and immediately to good news than to bad information, good arrival rate persuade conditional volatility more than bad arrival rate.

Market trading volume in conditional volatility

Another research problem raised in this work is the influence of market volume on volatility-volume relationship of any asset. Including market trading volume, the generalised variance specification is given as follows:

$$\sigma_t^2 = \alpha_0 + \alpha_1 \xi_{t-1}^2 + \beta_1 \sigma_{t-1}^2 + \delta Vol_{M,t}, \tag{7}$$

where $Vol_{M,t}$ is market volume in trading period *t*.

Taking into account growing and descending price movement the conditional volatility equation with a market trading volume Vol_M is as follows:

$$\sigma_t^2 = \alpha_0 + \alpha_1 \xi_{t-1}^2 + \beta_1 \sigma_{t-1}^2 + \delta_1 Vol_{M,t}^+ + \delta_2 Vol_{M,t}^- \tag{8}$$

where

$$Vol_{M,t}^+ = \begin{cases} Vol_{M,t} & if \quad P_{M,t-1}^{close} < P_{M,t}^{close} \quad or \quad R_{M,t} > 0 \\ 0 & if \quad otherwise \end{cases} \tag{9}$$

$$Vol_{M,t}^- = \begin{cases} Vol_{M,t} & if \quad P_{M,t-1}^{close} \geq P_{M,t}^{close} \quad or \quad R_{M,t} \leq 0 \\ 0 & if \quad otherwise \end{cases} \tag{10}$$

and $P_{M,t-1}^{close}$, $P_{M,t}^{close}$ denote close market trading prices in *t-1* and *t* periods, respectively.

In the context of relations (7) and (8), two questions can be specified. Firstly, whether market volume influences the conditional volatility in the same degree as an asset volume and secondly, whether market price movement matter in the impact of market volume on asset volatility.

Data

A dataset includes a series of daily log returns of stocks quoted on the Warsaw Stock Exchange and belonging to the index WIG20, of which 14 stocks are characterized by full time series. The returns in the research period for trading day are calculated as follows:

$$R_t = \ln(P_t^{close}) - \ln(P_{t-1}^{close}) \tag{11}$$

The sample period is from January 4, 2010 to December 30, 2019 what spans 2497 observations. The volume of WIG20 index is used as the market trading volume approximation. Before the test (which has not been presented), the autocorrelation and stationarity of the tested time series were examined. The results of the Ljung-Box test indicate that the rates of return exhibit autocorrelation in volatility, which justifies the use of ARCH class models. The statistics of the same test reject the null hypothesis that the volume time series is not autocorrelated. The statistics of Augmented Dickey-Fuller test confirm the stationarity both return and volume time series. For modelling conditional volatility of returns is used GARCH(1,1) model which provides a good fit.

Results and Discussion

The study of the impact of volume on conditional volatility compares the estimates of GARCH(1,1) model and the model with trading volume. Results in Table 1 indicate the high level of persistence in 19 of 20 stocks which varies from 0.6996 to 0.9999. The estimates of variance equation with contemporaneous trading volume in Table 2 reveal a substantial decreasing of volatility persistence in 16 stocks and for the remaining four stocks there was a slight decline of the persistence. Except for Bank Pekao stock trading volume has positive and statistically significant influence on conditional volatility of other stocks. These results are consistent with those obtained by Lamoureux and Lastrapes (1990). Furthermore, in five stocks contemporaneous trading volume procures lagged one period volatility insignificant in any significancy level.

Source: own study.

The next stage of the study of volatility-volume relationships is the estimation of GARCH (1,1) model covering the impact of both volume and price movement. The results are presented in Table 3. The model provides similar results to the model with trading volume in the variance equation as far as persistence reduction. For 19 stocks, the sum of $\hat{\alpha}_1 + \hat{\beta}_1$ is lower than the sum of these parameters for variance equation without any exogenous variables. Moreover, when the trading volume and the volume with price indicator were added the ARCH effects considerably decline and in the case of 5 stocks become even insignificant. Variables considering price changes make an additional contribution to the explanation of conditional volatility. As expected, the impact is mostly positive and statistically significant in the case of 17 stocks with the price movement both in a positive and negative direction. However, the above effect is asymmetric. Using the Wald test in fourteen stocks the combined variable (upward price movement and volume) has a greater impact on conditional volatility than the variable connecting downward price movement with trading volume. This shows a stronger and less immediate response of investors to good news than bad news. These results are consistent with the results obtained by Tan et al. (2015).

In the last part of the research the volatility-volume relationships are estimated in GARCH(1,1) models where conditional volatility of any stocks is dependent on market trading volume and market price movement. The results are presented in Table 4. Market volume increases conditional volatility in 13 stocks (for 8 stocks statistically significant) and for seven stocks market volume impact was negative for conditional volatility but only four of them are statistically significant. The models with contemporaneous market trading volume indicate a decreasing of volatility persistence in 12 stocks in relation to the models contained in Table 1. However, these results are much weaker than in the case of models using stock trading volume.

Table 5 provides the estimation results of variance equations with the impact of both market volume and market price movement. Models with indicator variables decrease the persistence in volatility to a much lesser extent (14 stocks out of 20) than models with stock trading volume (19 stocks). The model with stock volume outperforms the model with market volume for all stocks as far as persistence reduction.

Source: own study.

An interesting information is provided by estimates of parameters δ_1 and δ_2. In periods with downward market price movement the market volume increases conditional volatility in 19 stocks (15 statistically significant), but in periods with upward market price movement the market volume decreases conditional volatility in the half of stocks. In the case of the second half of stocks the market volume increases volatility, but generally not more than during in periods with downward market price movement. Market trading volume has a higher influence on stocks volatility during upward periods than downward periods only in the case of four stocks. Therefore, the results suggest a much greater impact of market volume on stocks volatility in downward market price movement than in upward market price movement. Comparing the estimates in Tables 3 and 5, investors perceive information on stock trading volume differently (opposite) than market trading volume.

Conclusion

The paper presents research the relationship between return volatility and trading volume using GARCH(1,1) model on the example of 20 companies listed on the Warsaw Stock Exchange and belonging to the WIG20 index. Changes of persistence in volatility are investigate considering trading volume in upward and downward price movement.

The study provides some important findings. The results of variance equation reveal that contemporaneous trading volume causes a substantial decreasing of volatility persistence in 19 out of stocks and it has a statistically positive influence on conditional volatility of these stocks. The model with indicator variables considering both the volume and price movement demonstrate a reduction of the persistence in all stocks compared to the model of variance equation without any exogenous variables. Moreover, as expected, for more stocks the upward price movement has a greater impact on conditional volatility than the downward price movement. The combined variables, volume and indicator of price movement direction have positive and statistically significant influence on returns' variation.

Moreover, the research also concerned models where conditional volatility of any stock is dependent on market trading volume. The models with market trading volume decrease the volatility persistence for less stocks than models using stock trading volume. The model with stock volume outperforms the model with market volume for all stocks as far as persistence reduction.

Models with both market trading volume and market price movement find a much greater impact of market volume on stocks volatility in downward market price movement than in upward market price movement. In periods with downward market price movement the market volume mostly increases conditional volatility, but in periods with upward market price movement the market volume decreases conditional volatility in a half of stocks. The results suggest that investors perceive information on stock trading volume differently (opposite) than market trading volume.

The research verifies investors' behaviour in the trading period due to the type of information related to movement in price. Furthermore, it expands the capabilities of modelling and forecasting variation of traded stocks returns.

Abstract

Nowadays, in the era of a great challenge in managing organizations, the model of teal organizations described by F. Laloux is becoming more and more popular. Many organizations are considering entering this way, and those that are already following it ask themselves at what stage are they "on the way to teal". The research problem is the attempt to answer the question: what are the maturity levels of the organization "on the way to teal" in the area of human relations? What characterizes a mature teal organization in the field of human relations? The aim of the article is to develop the initial concept of Human Relations Management Maturity Model in a teal organization. The research methods used in the study include critical analysis of the subject literature and logical reasoning.

Keywords: Maturity Model, Teal Organization, Human Relations, Recruiting and Selection

Introduction

Currently, due to the fact that traditional management methods seem to be less and less effective, the teal organization model described by F. Laloux (Laloux 2014, Laloux 2015) is gaining more and more interest among contemporary organizations. Although this concept seems fairly new, many organizations have used elements in their activities that refer directly to the teal organization model. Teal organization is the way that allows contemporary companies to cope with changing conditions and to better adopt to the current reality. As it is a complex approach especially connected with the human resources area, it requires maturity to fully benefit from expected results. “The way to teal" is a long and complex process that requires, above all, a change of consciousness. This change cannot be made ad hoc overnight. Moreover, teal organizations are human-centered, which means that they put people in the center, and based on their knowledge, skills, intuition, spirituality, i.e. full of humanity, they organize the work of employee teams and cooperation with all stakeholders. These organizations, wanting to start the transformation from the traditional to the teal model, are asking themselves where they are “on the way to teal”.

Every organization seeks to improve its way of managing especially in the field of human resources. The basis for achieving excellence in management are described e.g. by maturity models (MM). In the literature on the subject, there is a number of areas in which researchers have developed maturity models in many sectors**,** e.g. in the areas of project management (Souzaa and Gomes, 2015), process management (Tarhan et al, 2016), quality management (ISO 9004:2018), supply chain management (Yahiaoui et al, 2019), lifecycle management (Myrodia et al, 2019). Maturity models are frameworks for assessing an organization’s management competences and for the planning of actions that shall result in an improvement of organizational management competence. The majority of the models depict the maturity of an organization in a step-like structure with so-called maturity levels (generally, 5 levels are identified) (Klaus-Rosińska, 2016). The main elements of maturity models are: (1) a number of maturity levels, (2) a descriptor for each level, (3) the characteristics of organizations in each maturity level, (4) a number of important dimensions of the discipline being assessed, (5) important activities under each dimension, and (6) the description of the way in which each activity might be performed in each maturity level (Niknam et al, 2013).

Having considered the above, the authors have attempted to develop a conceptual management maturity model to help organizations determine the level of maturity of their organization on the way to teal in the teal organization in the area of human resources management. Human resources management in traditional organizations involves the following elements: human resource planning, gaining people for the company (recruiting, selection, onboarding), the development of human resources (motivation, payment, training and development, employee appraisal) and discharge (dismissal) (Listwan, 2010).

Cite this Article as: Joanna IWKO and Aneta PISARSKA“ Human Relations Management Maturity Model in The Teal Organization - Selected Issues” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The knowledge gained by the authors after interviews with representatives of several organizations that are "on the way to teal" has shown that these organizations are moving away from traditional naming of the area concerning employees "human resources" in favour of, among others, "human relations". This is due to the completely different range of employee practices that are undertaken in teal organizations. The traditional understanding of the "human resources" area does not correspond to what is concerned with employee issues in teal organizations. Due to the fact that in these organizations the term "human relations" is more often used, the authors of the article proposed to name the developed model "Human relations management maturity model".

The research problem is to answer the question: What are the maturity levels of the organization "on the way to teal" in the area of human relations? What characterizes a mature teal organization in the field of human relations? The aim of the article is to develop the initial concept of Human Relations Management Maturity Model in a teal organization. The research methods used in the study include critical analysis of the subject literature and logical reasoning.

Proposal of maturity model in human relations management in a teal organization

Human Relations Management Maturity Model in teal organizations presented in this article constitutes a framework that divides teal organizations into four maturity levels based upon maturity of all elements of human relations management. It can be used for evaluating the maturity of teal organization in the area of human relations. Figure 1 shows the four levels of maturity of the teal organization in this model in human relations management.

Fig. 1: Maturity levels of teal organizations in Human Relations Maturity Model

Source: Own work

Taking this into account, a teal organization can be considered fully mature, i.e. one that has achieved level 4: Excellence in human relations management, if it is characterized by the following features:

- The culture of the organization and its values permeate all personal subfunctions. The values of the organization are the basis of all personnel decisions in the organization. All employees are fully themselves in the workplace and identify themselves with the evolutionary purpose of the organization, which is the result of the convergence of the employee and organizational values.
- The personnel function in the organization is transparent, which means that all decisions concerning employees are open, beginning with the recruitment and selection stage.
- The organization shares its knowledge on the implementation of the personnel function with other teal organizations, as well as with traditionally managed organizations. It helps other organizations to implement teal practices in the area of personnel function.
- Employees are promoters of their organizations in the local environment.
- Self-managed teams independently implement all personnel subfunctions according to their needs, i.e .:
    - they recruit and select job candidates. They look for candidates primarily suited to the culture of the organization, but with high knowledge, skills and experience (at the level of management in traditional organizations). Furthermore, the candidates should have a high level of awareness, be mature, responsible, competent, committed (physically, mentally, emotionally), internally motivated;
    - they actively support new employees in the process of social and professional adaptation;
    - they determine the rules and amount of remuneration, also taking into account the non-professional situation of an employee. Team remuneration is fair, low-spread and transparent;
    - they create conditions for the development of motivation (internal and external);

- they perform many roles in the organization, working for the team with full commitment, applying to their talents, knowledge, skills, professional experience (flexible roles);
- they provide continuous feedback on an ongoing basis in an atmosphere of mutual respect and trust using non-violent communication. Failures and mistakes are natural elements of everyday life in the organization and are treated as the opportunity to learn;
- they create conditions for continuous training and development of knowledge, skills and experience within the organization. Employee development is based primarily on the strengths of team members. On the other hand, however, employees are aware of the areas that need further development;
- they build trust in the team constantly: relations between employees based on respect, dignity and trust; deep relationships, built not only on a professional basis;
- they talk openly about problems in the team and use so-called open communication in the conflict resolution process;
- they offer various support for employees leaving the organization when the decision to part with a particular team member is made. After the termination of the cooperation, they maintain good relations with the departing employees (long-term cooperation);
- team leaders fill the concept of servant leadership.

In the further part of the study, the authors have presented the details of the Human Relations Management Maturity Model in teal organizations in the area of recruiting and selection, which is one of the most developed and most important elements of the personal function in teal organizations (Pisarska and Iwko, 2018).

Maturity assessment sheets in the area of recruiting and selection in the Human Relations Management Maturity Model in a teal organization

Human Relations Management Maturity Model in teal organizations in the area of recruiting and selection was developed taking into consideration the following dimensions:

1. The values of the organization and the values of the candidate for the job.
2. Participation of members of the team to which the recruitment is conducted.
3. Status of the recruitment and selection process in the organization and its duration and complexity.
4. Transparency in the recruitment and selection process.

The maturity assessment sheet in the area of recruiting and selection in this model in teal organizations is presented in Tables from 1 to 4.

Table 1: The maturity assessment sheet in the area of recruiting and selection - The values of the organization and the values of the candidate for the job - in Human Relations Management Maturity Model

Dimension	Maturity levels	
	Level	**Features**
The values of the organization and the values of the candidate for the job	1	The organization's values are not defined or written down, but the organization knows they exist and addresses them informally or ad hoc in the area of recruitment and selection. The inclusion of the candidate's values in the recruitment and selection process and their diagnosis takes place in an informal or ad hoc manner. Including values in the recruitment and selection process and their diagnosis takes place in an informal or ad hoc manner. The relationship between the organization and the job applicant is mostly formal.
	2	Identifying and writing down the values of the organization. Including the values of the organization in the recruitment and selection process of job candidates, informing candidates about the values of the organization. The inclusion and diagnosis of the candidate's value in the recruitment and selection process takes place in a formal manner. The relationship between the organization and the job applicant goes beyond formal issues.
	3	Organizational values are the basis of most elements of the recruitment and selection processes.

		The candidate's values are the basis for making decisions about hiring him/her, as well as knowledge, skills (hard and soft) and experience. The similarity of the values of the job candidate and the organization is high and determined based on a reliable diagnosis.
	4	Full sharing of the values of the organization by the candidate is the basis for making a decision on his/her employment. The candidate's values are more important than his/her knowledge, skills and experience. Taking into account the spiritual values of the organization (organization as a living organism with its "soul") and the candidate. Building deep relationships with the job candidate based on shared values. The basis of the recruitment process constitutes mutual trust, respect and honesty between the organization and the job applicant. Both the job applicant and the organization are equal partners.

Table 2: The maturity assessment sheet in the area of recruiting and selection - Participation of members of the team to which the recruitment process is conducted - in Human Relations Management Maturity Model

Dimension	Maturity levels	
	Level	**Features**
Participation of members of the team to which the recruitment process is conducted	1	The selection process is initiated only by the owner of the organization. The recruitment and selection processes are carried out by employees of the personnel unit with the participation of members of the team to which the recruitment process is conducted. Employees of the personnel unit select the candidate most suited to the organization and recommend him/her to the owner of the organization. The owner negotiates the working and payment conditions and signs the employment contract.
	2	The recruitment process is initiated by the owner of the organization or members of the team being recruited. The recruitment and selection processes are conducted by the members of the team to which the recruitment is conducted with little participation of the personnel unit employees. Team members, with little participation of the personnel of the HR unit, select the candidate who is best-suited for the team and organization, recommending him/her to the owner of the organization. The owner negotiates the working and payment conditions and signs the employment contract with the candidate.
	3	The recruitment process is initiated by the members of the team to which the recruitment is conducted. Team members independently conduct the selection process and are fully responsible for its implementation. Team members select the candidate best-suited for the organization and team and recommend him/her to the owner of the organization. Together with the team members, the owner negotiates the working and payment conditions and signs the employment contract with the candidate.
	4	The recruitment process is initiated by the members of the team to which the recruitment is conducted. Team members independently conduct the selection process and are fully responsible for its implementation. Team members select the candidate best-suited for the team and the entire organization. Team members together with the candidate determine the terms of work and pay and sign the employment contract.

Table 3. The maturity assessment sheet in the area of recruiting and selection - Status of the recruitment and selection process in the organization and its duration and complexity - in Human Relations Management Maturity Model

Dimension	Maturity levels	
	Level	**Features**
Status of the recruitment and selection process in the organization and its duration and complexity	1	Recruitment is treated on a par with other elements of the personnel function. The organization does not educate the labour market about its specificity, values, organizational culture, and what candidates it is looking for. The recruitment process is short, not very extensive and intuitive. There are no written procedures for the selection process. The organization uses the support of external companies in the recruitment process.
	2	Recruitment is an important element of the personnel function. The organization occasionally educates the labour market about its specificity, values, organizational culture, and what candidates it is looking for. The recruitment process is longer, more complex. Some processes and procedures in this area are written down and followed reliably. Recruitment procedures are developed by employees of the personnel unit. The organization occasionally uses the support of external companies in the recruitment process. The organization occasionally educates the labour market.
	3	The recruitment process is a very important element of the personnel function. Most processes and procedures in this area are written down and followed reliably. Sometimes the candidate who does not fit the organizational culture is not employed, despite having the necessary knowledge and skills. Long and extensive process. The procedures for the recruitment process are developed by team members with the participation of personnel unit employees. The organization frequently educates the labour market.
	4	Recruitment is the most important element of the personnel function and other functions performed in the organization. All processes and procedures in this area are written down and followed reliably. Permanent education of the labour market. Resignation from employing the candidate who does not fit the organizational culture despite having the necessary knowledge and skills. A very long and complex process, it continues until the organization becomes sure that the given person fits its specific organizational culture. The procedures for the recruitment process are developed by team members and tailored to the specificity of the team.

Table 4: The maturity assessment sheet in the area of recruiting and selection - Transparency in the recruitment and selection process - in Human Relations Management Maturity Model

Dimension	Maturity levels	
	Level	**Features**
Transparency in the recruitment and selection process	1	Transparency of recruitment and selection processes for job applicants is either informal or ad hoc. The organization creates a positive image in the eyes of the candidate and provides them with information only about its strengths. First of all, the candidate presents his/her advantages and achievements. The organization does not inform the candidate about the applicable salary ranges.
	2	The organization informs the candidate about its strengths as well as some of the challenges it faces. The candidate reveals not only his/her advantages, but also selected areas that need further development. The organization informs about the salary scales in the job advertisement and discusses them during the selection process.
	3	The organization provides the candidate with information about its strengths, as well as the challenges or difficulties they face. The candidate is aware and speaks openly about his/her advantages, successes and failures or weaknesses. The organization includes the information about the organisation's salary ranges in the job advertisement and discusses it during the selection process.
	4	Both the organization and the candidate stand fully towards each other, i.e. they are authentic, openly talk about their advantages and disadvantages, finances, challenges and difficulties. The decision to hire the candidate is based on the real image of the candidate. The decision to choose the organization by the candidate is based on its authentic image. Access of employees of the organization, the candidate him/herself and the organizations cooperating with the given teal organization to the documentation regarding the entire recruitment process. Conducting the recruitment and selection processes of job candidates in a transparent manner, using open recruitment and remuneration criteria. Salary information, financial data, including company profits available to everyone. The organization shares knowledge on good recruitment practices with other organizations.

Source: Own work

With the help of the above sheets, an organization "on the way to teal" can determine its own level of maturity in the area of recruitment and selection. These sheets can also be used to identify areas and steps the organization could undertake to reach a higher level of maturity in the future. However, it should be remembered that each teal organization and the employed individuals are different. Hence, the "way to teal" of any organisation may differ. The model proposed by the authors, like every model, is a kind of simplification of the reality under study and it should be used with this awareness.

A mature teal organization in the area of recruitment and selection is an organization that:

- gives priority to the recruitment and selection of employees,
- respects employees who are the greatest value of the organization, including candidates for employment,
- the recruitment process is based on mutual trust and openness between the organization and the candidate to work,
- does not employ candidates if their values are not consistent with those of the company, even though they have the appropriate knowledge, skills and experience,

- employs only those candidates who are suited for the organization and its purpose,
- employs only those candidates who accept integrity as an internal benchmark,
- employs candidates who have the ability to identify and resolve conflicts and compromise,
- recruits people who are primarily guided by professional ethics and high social sensitivity,
- employs mature and conscious people with whom deep relations can be built on a partnership basis,
- the processes of recruitment and selection of candidates for work are carried out in a transparent manner, using open recruitment criteria,
- creates the conditions for both parties to make a better-informed decision about future cooperation through openness and being authentic both in the areas of strengths and areas for development,
- self-managed teams initiate and implement the recruitment and selection process, including the selection of the most suitable candidate for the team and the entire organization and the determination of the employment conditions of the candidate to work,
- continuously informs the labour market about its organizational culture,
- the recruitment and selection process is complex,
- the recruitment and selection process is transparent,
- shares good practice knowledge with other organizations.

Conclusions

The paper presents Maturity Model that can be used to diagnose level of maturity in human relations management in teal organization. This model divides teal organizations into four maturity levels based upon maturity of all elements of human relations management. This model can suggest further steps to be taken to improve maturity level in human relations management in teal organization especially in the area of recruiting and selection. Based on this model, each organization will be able to arrive at the answer to the question of on which stage it is "on the way to teal" in the area of recruitment and selection. Finally, it is worth emphasizing that the foundation of recruitment and selection constitutes the organizational culture, which is confirmed by the practices of many organizations that have entered "the way to teal". According to the authors, teal organizations are characterized by a high quality culture, which A. Blikle called the "teal culture of quality" (Blikle, 2016). These organizations put people at the centre, and therefore they give a great importance to the recruitment and selection of suitable candidates for work. The research conducted by K. Cameron and W. Sine (Cameron and Sine, 1999) shows that in organizations with a more advanced culture of quality one can observe, i. al., high level of orientation on the optimal use of human resources, which can be seen in teal organizations. The authors of the article, based on a qualitative approach, will plan to conduct a comparative study of several teal companies in the future in order to determine their level of maturity in the field of human relations management.

Abstract

The authors have developed proposals for specific directions for improving the activities of customs authorities in the field of resolving disputes over the customs value of goods. During the process of the developing the customs risk profiles of the customs value of the goods is required to consider not only the price characteristics of the product, but also the materials contained in the public domain. It is advisable to improve the software of the customs authorities by creating a full-fledged information base for making decisions in the field of customs value control.

Keywords: International Business, International Trade, Customs Value, Judicial Disputes, Customs Value Adjustment, Foreign Trade Operators, Customs Authorities.

Introduction and the research Question

The role of the customs value is very significant in the transboundary movement of goods since it is not only the basis for calculating the amount of customs payments due but is also used to take government measures for regulating the foreign trade. The reliability of the customs value of goods declared by the participants of foreign economic activities has an impact on the efficiency of the customs and tariff regulation of foreign trade activity [3].

The methodology for treatment and control of the customs value is complex and depends on many factors. Its value for the same goods may often vary, at times depending on the customs authority to which the goods are declared. Problems and discrepancies arise even in the customs value treatment to determine commodity structure at the state level in many countries [1.2].

Nowadays, customs authorities and participants of foreign economic activities often act as competing parties, opponents, rather than effectively interacting partners [8]. The customs value is always a kind of "stumbling stone" in relations between them, because foreign trade operators, acting on commercial basis, prefer a lower size of the customs value, which allows keeping down the costs associated with the payment of customs duties.

Murashova "Modern Approaches to the Judicial Settlement of Disputes over the Customs Value of Goods in the Russian Federation Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

On the other hand, customs payments remain the main source of federal budget revenues. Therefore, disputes related to the amount of customs value and the procedures for determining it are often the subject of litigation.

Methodology of the study

The study provides a comprehensive analysis of the regulatory framework for calculating the customs value of goods in the Eurasian Economic Union (EAEU) and the Russian Federation, as well its control process. Several resolutions of the Plenum of the Supreme Court of the Russian Federation, which are important in the area of declaration and control of the customs value, have been analyzed. Their influence on the judicial dispute settlement in this area has been revealed.

Firstly, the analysis was made on the cases in which the court decisions were taken in favor of participants of foreign economic activities, then on the cases where they were made in favor of customs authorities. Based on the results of the analysis, the factors contributing to the adoption of this or that decision were identified. Thus, the possibilities of being successful in an action against the customs authorities on the customs value increase and against the foreign trade operators on its decrease were summarized. At the same time, several issues related to the settlement of disputes over the customs value of goods were highlighted. In conclusion, the foreign trade operators and customs authorities were given recommendations in the settlement of disputes over the customs value of goods.

Results of the study for discussion

The purpose of this study is to develop proposals for improving the process of settling the disputes over the customs value of goods in the Russian Federation.

The role of resolutions of the Plenum of the Supreme Court in the regulation of the judicial disputes related to the customs value

In the process of determining and controlling the customs value of goods, there is a clash of interests of two opposing parties, namely the foreign trade participants and the customs authorities. It often leads to disputes and conflicts that in some cases can be resolved through the courts. Even though the majority of decisions of the customs authorities on declaration or control of the customs value are appealed through the pre-trial process (about 71% of all decisions in 2015-2018), the number of cases requiring litigation remains significant (about 33% of all cases in which the customs authorities were involved in 2015-2018; according to the statistics of arbitration courts, the participants of foreign economic activities were able to appeal successfully the customs value adjustment in court in 55% - 60% of cases in 2018-2019).

It is worth noting that every year the number of judicial disputes related to determination and control of the customs value of goods is growing. This may indicate the ineffectiveness of the procedure for pre-trial settlement of such disputes, as well as the complexity of the unambiguous application of customs legislation in this area. Thus, six methods of determining the customs value are currently applied. Each method has its specifics and features of the application, which are not always clearly indicated [5,6]. At the same time, in the Customs Service Development Strategy of the Russian Federation until 2030 the important goals are considered as following: the reduction in the number of lawsuits brought against the customs authorities and the shift in emphasis from judicial to pre-trial customs dispute resolution [4].

The current situation is aggravated by the fact that a uniform practice for interpretation and application of customs legislation by courts has not been formed yet in the Russian Federation.

In this regard, the Plenum of the Supreme Court of the Russian Federation adopted two resolutions, which clarify and concretize the law enforcement in the cases related to the customs value of goods.

As a result of the relevant resolutions adopted by the Plenum of the Supreme Court, a number of factors formed in the judicial practice can be identified.

Some of them strengthen the position of the customs authorities in court:

The court's acceptance of the customs authorities' arguments about the low price level of imported goods compared to the value of similar goods;

The court's admission of the customs authorities' arguments that, if there is a relationship between the seller and the buyer of goods, it is the declarant who is responsible for proving that such a relationship does not affect the deal price.

However, there are some factors that weaken the position of the customs authorities:

1. In litigation practice, there is a position that the documents initially submitted by a participant of foreign economic activities when declaring goods are sufficient for the customs authority to accept the declared customs value, and the submission of additional documents requested by the customs authority is a right, not an obligation of the declarant;
2. The obligation to provide documents at the request of the customs authorities to confirm the declared customs value of goods may be imposed on the declarant only in respect of those documents that are available to the declarant;
3. The identification of certain flaws in the documents submitted by the declarant to confirm the customs value of goods in accordance with the requirements of the civil legislation, which does not refute the fact of the transaction on certain terms, cannot constitute grounds for making changes or amendments to the declaration of goods.

Despite the above mentioned factors, negative for the customs authorities , the percentage of decisions on the customs value that were not subsequently reversed through judicial procedures in 2016-2018 not only remained steadily high (at least 95%) but also increased , reaching 98.5% in 2018. This testifies to the high competence of customs officials in controlling the customs value of goods, which allows them to prove the validity of their decisions in court.

Analysis of litigation practice in cases concerning the customs value of goods

The study of specific rulings of the arbitration courts of the Russian Federation has revealed in which cases the decisions are made in favor of the customs authorities more often, and in which in favor of the foreign trade operators.

In general, the outcome of court proceedings relating to the customs value of goods depends entirely on the court's documentary base presented by the parties to the process:

1. A set of documents from the declarant and additional documents and information sent by him at the request of the customs authorities;
2. The availability of the necessary information and evidence of an inaccurate declaration of the customs value;
3. The presence or absence of contradictions in the documents submitted by the declarant;
4. The specific reasonable doubts of the customs authorities on the reliability of the declared customs value;
5. The rate of the revealed deviations of the declared customs value from the prices for identical or similar goods.

The court makes decisions in favor of the foreign trade operators more often in cases where the decision to make changes (amendments) to the goods declaration does not provide justification for taking such a decision, when there are no specific signs of an inaccurate declaration of the customs value identified by the customs authorities or specific information misdeclared by the declarant.

Also, decisions are not made in favor of customs authorities in the absence of justification for the impossibility of applying the method of determining the customs value declared by the declarant if there are documents submitted to the customs authorities.

In practice, one of the main problems of the customs authorities in customs value control is the fact that decisions on making changes (amendments) to the goods declaration are often made only on the basis of the fact that the customs value declared by the declarants differs downwards from the one contained in the databases of the customs authorities. However, this fact in itself is not a cause for making such a decision.

At the same time, in court proceedings, the customs authorities often cannot justify the validity of refusing to use the first method for the customs value determination.

As an example, the ruling of the Moscow District Court of Arbitration of 02.08.2019 NoF05-11448/2019 in the case No A40-238116/18-94-2609 overturns the decision taken by the customs authorities to make changes (amendments) in the goods declaration. The decision was made by the customs authorities on the basis of the fact that the customs value declared by the declarant differed from the price information available to the customs authorities. The customs authorities also concluded that the additional documents and information provided by the declarant were contradictory and unconfirmed, which made it unacceptable to use the first method of determining customs value, and thus the need for applying the sixth method was pointed out.

In this particular situation the court took the side of the declarant, since the documents submitted by the declarant to the customs authorities confirmed that:

1. The customs value of goods is specified without any conditions and fixed;
2. The price of the commodity lot is formed in a free commercial sale environment on the basis of a commercial offer from a foreign society;
3. The slight deviation of the value of the goods from the values determined by the customs authorities is explained by the discount granted, based on the legal relationship between the parties.

At the same time, the customs authorities did not provide any evidence of the inaccuracy of the documents and information submitted by the declarant. No reasons for rejection to use the first method for determining the customs value were found. When applying the reserve method based on the price information on the goods, the customs authorities used price information for goods that did not correspond to the comparable imported goods.

Nevertheless, the absolute majority of decisions of the customs authorities on making changes (amendments) to the goods declaration related to the customs value of goods are not overturned by the courts.

In this regard, the courts take the side of the customs authorities in cases where the customs authorities provide additional evidence of the under-declaration of customs value received during customs control, addressing the specific inconsistencies and contradictions in the documents and information submitted by the declarant, the unjustified significant deviations of the declared customs value from the price level for identical or homogeneous goods.

Another example is the decision of the Arbitration Court of the East Siberian District No. F02-1772/2019 dated June 18, 2019, in case No. A10-3699/2018. It confirms the legality of the decision made by the customs authorities on making changes (amendments) to the goods declaration. In this case, the declarant did not comply with the structure of the customs value of goods, which led to the understatement of the amounts of customs payments made.

When the goods were released by the customs authorities, customs audit was carried out. It revealed that the declarant had concluded a unified freight forwarding agreement, which included the transportation of goods both before the import into the customs territory of the EAEU and directly across its territory. The costs of transportation through the customs territory of the EAEU were not separately identified. Therefore, their deduction from the customs value could not be made. Based on the results of the inspection, the customs authorities decided to make changes (amendments) to the goods declaration.

The court confirmed the validity of the decision, as the costs for transportation of goods on the customs territory of the EAEU were not allocated by the declarant from the contract price of the goods and documented.

Thus, in the course of legal proceedings on the issues related to the customs value of goods, the customs authorities find it most difficult to prove the necessity of the following actions:

1. The legality of the decision to make changes (amendments) to the goods declaration;
2. The legitimacy of refusal to apply the first method of determining the customs value of goods if there is a set of documents submitted by the declarant.

The current issues in customs control over the customs value of goods make it complicated to prove the above mentioned facts:

1. The imperfection of the risk management system in control of the customs value of goods, which is expressed in the use of only the price characteristics of imported goods in the risk profiles for controlling the customs value. Unscrupulous declarants find out benchmarks and declare the lowest possible customs value;
2. The lack of reliable sources of price information available to customs authorities on the value of transactions with goods;
3. The lack of a specific and exhaustive list of documents that foreign trade operators must submit to the customs authorities during the customs control of the customs value of goods, which leads to the need to form a list of requested documents and information for each specific transaction, increasing the time spent on the process of controlling the customs value of goods;
4. The lack of developed interaction between the customs authorities of the Russian Federation and foreign customs authorities and organizations.

Conclusions / Recommendations

Several proposals for improving the process under consideration have been developed to solve the identified issues. They are mainly as follows:

1. When developing risk profiles on the customs value of goods, it is necessary to take into account not only the price characteristics of goods but also the trademark, terms of delivery, as well as the empowerment of customs officials in the application of measures to minimize risks;
2. The refinement of customs authorities' software that contains the price information about goods by adding the real-time data on stock-exchange quotations, the product features (trademark, quality characteristics, country of origin, etc.), the world prices for the evaluated goods, some extra information from the manufactures' price lists;
3. The approval of the minimum list of documents, which the declarant is required to submit to confirm the declared customs value for each of the methods of its determination;
4. The creation of a single standard for requesting information from foreign customs authorities, since such a standard does not exist, as well as providing the possibility of making the requests directly at customs checkpoints, without the mediation of regional customs offices.

Based on the analyzed judicial practice in declaration and control of the customs value of goods, several recommendations for foreign trade operators can be developed.

When importing goods into the customs territory of the EAEU, the customs value of which is less than the price level for identical or similar goods, it is reasonable for foreign trade operators to prepare in advance a set of documents confirming the actual conclusion of a foreign trade transaction and zero influence of factors on the contract price, the effect of which cannot be quantified (the seller's price list in the form of a public offer, export customs declaration, payment orders to pay for consignments of goods, bank control records).

If it is impossible to submit the documents and information requested by the customs authorities, the declarant should send the written explanations to the customs authorities to clarify the objective reasons for the impossibility of their submission.

Provided the reliable information and documents are submitted, the actions mentioned above will minimize the possibility of making a decision by the customs authorities to make changes (amendments) to the declaration of goods. If the appropriate decision is made by the customs authorities and the declarant disagrees with it, these actions will strengthen the position of a foreign trade operator in court.

On the other hand, in the process of controlling the customs value of goods, it is advisable for customs authorities to pay attention to the following:

1. The need for a more thorough customs audit of the documents and information submitted by the declarant, in particular those parts of the corresponding documents that deal with the terms of delivery of goods, cost of their transportation, payment terms;
2. The basis for recognizing documents or information used in the process of calculating the customs value of goods as unreliable can only be clear evidence that is documented: the document examinations acts, invoices, as well as other documents on the basis of which the customs authority can prove the identified inconsistencies;
3. It is necessary to make it obligatory for the customs authority to request from the declarant the documentary evidence of the facts that affect the size of the customs value, which will require its adjustment and serve as a basis for making changes to the customs declaration;
4. Specification of particular grounds for making amendments to the goods declaration in case the customs authorities decide to bring about changes.

Abstract

The use of Android applications for information management in organizations is highly beneficial for their economic development, as it can aid in effective decision making and thus avert a significant amount of risk. This study aimed to develop a systematic literature review on information management based on Android mobile applications, in which search and selection techniques regarding documents are applied, the used methods are identified, and potential future research directions are reported. The results obtained based on the systematic review provide a broader perspective to evaluate decision-making based on information management in organizations.

Keywords: Management Information, Mobile Apps, Android, Technology Information, Systematic Literature Review

Introduction

The growth and development of information technology have significantly influenced the global market over the past 15 years. With the emergence of powerful hardware tools, versatile software applications, and high-speed networking, the Industrial Age has been transformed into the Information Age. This rapid evolution creates uncertainty regarding the suitability of technologies for mobile programming. One of the most commonly implemented architectures has been provided by the Android system. The accelerated change in the technology and information market has generated a new horizontal approach to business processes in information technology (IT) companies. Therefore, information services management has gained prominence as it seeks to ensure the correct operation of processes involved in the information management, change management, and requirements of a company. Consequently, information management is regarded as fundamentally relevant in companies. Therefore, this study tries to study technology to guarantee efficiency in information management.

The rest of the paper has been organized as follows: Section II provides the background and related studies; Section III presents the methodology; Section IV describes the evaluation results of the Systematic Literature Review (SRL); Section V presents a discussion of the results; and Section VI concludes the paper.

Background and Related Work

The importance of the use of mobile applications, programming languages, and mobile operating systems has been widely researched over the past few years, based on which mobile applications are adopted for process optimization. The use of mobile applications has been prevalent in various fields, such as administration, tourism, and medicine, and has yielded desirable results (e.g., efficiency).

Mobile applications speed up management, consultation, and purchase processes, allowing companies to be "within reach" of their customers at any time. At present, the immediacy factor is the main requirement of the business world (López Gallegos, 2015).

Recent studies have confirmed that the market for mobile applications has increased considerably as 80% of the internet users have smartphones. The growing use of mobile devices has generated the need for companies to develop their applications, especially in business management (i.e., process, services, and information management). This is aimed at having a presence in the mobile world, in addition to other significant advantages (DIGETBI, 2016).

During the analysis and design phases of management application development, 52% of the companies were found to have followed testing programs that consider the opinions of the users; only 48% use analytical reports to understand the concerns of the users of these applications. As management is key to company operations, the management applications that are used throughout project life cycles can help reduce the incidence of failures, which frustrate the users or affect security, and realize good decision making (Funds & Markets, 2015).

Recommendations have been presented herein so as to guide future studies in the selection of methodology and interpretation of results.

Review Method

In this study, we performed a systematic review of the literature that included search, collection, classification, and information analysis methods, with which we reduced the time and effort required to approach a research problem. The following steps were adopted: questions were posed according to the research; search equations were prepared; search operations were conducted using different article search engines; exclusion criteria were applied; questions were posed to check the quality of studies obtained; the obtained studies were selected and classified; and review analysis and data extraction were performed.

A. Research Questions

The following research questions (RQs), which will guide the review process of studies, were developed to analyze a mobile application based on Android for information management:

RQ1: Which methodologies have been used to develop Android mobile applications?
RQ2: Which databases have been used the most to develop mobile applications?
RQ3: How many studies have been published over the years?
RQ4: Based on the SCRUM methodology, in which areas have the Android mobile applications been used?
RQ5: What operating systems are being used to develop Android mobile applications for information management?

B. Search Equations

Search equations are derived according to the search terms grouped based on the variables (Table 1).

Table 1: Search Terms

Descriptor		Description
English	English	
Mobile application	Mobile application	Independent variable
SCRUM	SCRUM	Intervening variable
Methodology	Methodology	
Method	Method	
Model	Model	
Information management	Information management	Dependent variable

The words provided in Table 1 were fundamental to form search equations as they perfectly describe the research topics: management information, mobile applications, and Android operating system (OS). The topics entail a series of techniques and tools. As a variable involved was used, by the SCRUM methodology since to perform this research work requires a methodology that allows you to follow an order of procedures that lead to good results. The dependent variable was considered for information management; owing to the inclusion of these variables, search equations were obtained in different article search pages, as shown in Table 2.

Table 2: Search Equations

Source	Generic Search Equation
Science Direct	(“mobile application” and “android” and “information management” and (“method” or “methodology” or “model”))
IEEE Xplore	((("Full Text & Metadata": mobile application) AND "Full Text & Metadata": android) AND "Full Text & Metadata": information management) OR "Full Text & Metadata": method or methodology or model).
ACM Digital Library	[All: mobile application] AND [All: android] AND [All: information management] AND [All: scrum methodology]
Google Scholar	Mobile application with SCRUM and methodology or method or model and information management.
Springer Link	Mobile application with SCRUM and methodology or method or model and information management.
Microsoft Academic	Mobile application and Android and SCRUM methodology and information management.
Redalyc	Mobile application with SCRUM and methodology or method or model and information management.
Taylor & Francis	[All: mobile application] AND [All: Android] AND [All: information management] AND [All: method or methodology or model]
Cern Document Server	Mobile application with SCRUM and methodology or method or model and information management.
SciELO	(Mobile application) AND (Android) AND (methodology or model or method).
WorldWideScience	Title: Mobile application with Android and SCRUM or methodology and information management.
WILEY	Mobile application anywhere and Android anywhere and information management anywhere and method or methodology or model anywhere.
ETHzurich	All fields contain mobile applications and all fields contain Android or all fields contain information management and all fields contain (method or all fields contain methodology or all fields contain model).

C. Search

When the search operations were performed using the above equations, several documents were obtained, the most relevant being the ACM Digital Library. Fig 1 depicts the number of output documents corresponding to each source.

Fig. 1: Consolidated Numbers Based on Source

D. Exclusion Criteria

Numerous studies were compiled for this research; however, as the knowledge is regularly updated in the technological field, several criteria were introduced to select good articles. The first criterion was that the articles should not be more than 5 years old and should have quantitative data that are relevant to the research.

As some search engines provide a large amount of information pertaining to different areas, the exclusion criteria were selected for articles that did not use Android mobile applications, that is, articles that are not written in English, Spanish, and Portuguese languages.

As the search for articles related to mobile applications uses various methodologies for development, it was decided to exclude developmental methodologies other than SCRUM; moreover, the articles that did not provide answers for the RQs and were not experimental were excluded.

Finally, the researches that help more to carry out this work, are the articles that describe the collection of data in a suitable way, many of the results found are from diverse areas, then the criterion of exclusion will be applied that the articles that are not from the area of technology, and do not speak of management will not be included, also the articles will be excluded that do not specify the methods of collection of data, these applied criteria will help to select researches that are more oriented to the topic, and thus, to be able to have better results that allow to evidence the use of these techniques in the bibliographical analysis.

E. Study Selection

The selection of the articles was classified in an orderly manner based on search sources using the Zotero tool, in which 85 articles were read and stored for research (Fig 2).

Fig. 2: Reports in Zotero.

By applying the search equations, 3,745,383 articles were selected. Subsequently, the exclusion criteria were applied, in which 10 criteria were grouped into pairs to rapidly reduce the number of articles, resulting in 85 articles, as shown in Fig 3.

Fig. 3: Consolidated Results Chart with Excluded Criteria

In the study selection process (Fig 3), the results of the automatic search (N = 3 745 383) were evaluated based on the exclusion criteria by examining the titles, and the studies that were not relevant (N = 3 745 298) were excluded. Finally, 85 articles were selected for review.

F. Quality Assessment

The quality assessment (QA) criteria to evaluate the articles were formulated. It selected the corresponding articles to answer the afore described RQs. These reviews were performed after the application of the exclusion criteria. All the articles satisfied the following seven quality criteria selected in this study:

QA1: Are the results of the study established and supported by the findings?
QA2: Is the purpose of the research explained in detail?
QA3: Does the topic belong to the fields of computer science, information system, or management?
QA4: Is the analysis of the data used in the study adequately described?
QA5: Is the research methodology explained in detail?
QA6: Are the research objectives identified in the document?

Following the QA, all 85 articles were found to comply with the QA criteria; thus, no article was removed.

G. Data Extraction

Data extraction was performed on the 85 articles, wherein each study was assigned a unique reference number ([1]). The following data were extracted from each article: title of the article; the source or search engine; year of publication, country, number of pages, and the language in which the article is located; type of publication (maybe a scientific article or an RSL); name of the publication; research methodology; authors or author; author affiliations (university); number of citations; summary of the article; keywords; and sample size.

H. Synthesis of Findings

An exhaustive analysis of the selected studies was performed manually. The data were used to obtain various plots for further elucidation.

Fig 4 depicts the articles based on country quotations.

Fig. 4: Items according to country quotations.

Fig 5 shows the number of items per country.

Fig. 5: Items per country.

Fig 6 shows the number of items per country and the percentage represented by the number of items.

Fig. 6: Items per country and their percentage

Results

A. Answers to the Research Questions

This section presents the results of the RSL responding to each of the established RQs:

RQ1: What are the methods used to develop Android mobile applications?

Among the 85 articles, we found several methodologies to develop mobile applications, which are the most required by companies for management (Table 3). Moreover, this also answers RQ1.

Table 3: Methodologies used

Development Methodologies	Articles	Qty. (%)
SCRUM	[5] [8] [10] [36] [37] [41] [59] [60] [65] [68] [84]	11 (17.2)
RUP	[1] [4] [8] [12] [25] [55] [68] [73] [81] [82]	10 (15.6)
Mobile D	[3] [7] [13] [16] [18] [19] [20] [21] [23] [24] [26] [28] [30] [32] [34] [35] [37] [38] [39] [42] [43] [46] [47] [49] [50] [53] [57] [58] [60] [62] [63] [65] [66] [69] [70] [72] [74] [75] [76] [77] [81] [83] [85]	43 (67.2)

RQ2: Which are the most used databases in the development of mobile applications?

In the reviewed articles, it was found that the databases for mobile applications are fundamental for service, process, and information management. Among these, three types of databases were found, namely, MySQL, SQLite, and PHP. Most articles did not reflect what type of database would be more effective for a mobile application and Android but implied that a mobile application could not function without any database; then, an evaluation was performed to determine which database more effective according to the articles that mentioned databases. According to the investigated articles, any database that is applied to mobile applications would be 100% effective; but the suitability of each database would depend on the functions of the mobile application (Table 4).

Table 4: Mobile Application Database

Database of Mobile Apps	Articles	Qty. (%)
MySQL	[3] [11] [22] [40] [50]	5 (41.7)
Sqlite	[1] [33] [35] [72]	4 (33.3)
PHP	[23] [25] [76]	3 (25)

RQ3: How many studies have been published over the years?

To address RQ3, 3 745 383 articles were selected in the beginning, and finally, 85 articles published during the last 5 years were considered (Fig 7).

Fig. 7: Articles Published Based on Year and Source.

Fig 8 shows the search source, the year, and the total number of articles published during the last 5 years.

N° of Papers per Source

Source	2015	2016	2017	2018	2019	2020	Total
ACM Digital Library	3	1	3	5	4		16
Science Direct	4	2	1	3	1		11

Fig. 8: Articles by search source and year.

RQ4: In which areas Android mobile applications have been used based on the SCRUM methodology?

Several study areas concern the development of mobile applications with varied functions. The articles considered indicated the following: education, medicine, business, and tourism, which use Android mobile applications based on the SCRUM methodology; the area that used this method the most was the business area (Table 5).

Table 5: Areas of Study

Study Areas	Articles	Qty. (%)
Education	[5] [15] [17] [18] [20] [22] [27] [41] [45] [46] [50] [54] [56] [58] [59] [61] [78] [79] [81] [83] [84]	21 (41.2)
Medicine	[28] [36] [61] [76]	4 (7.8)

Business	[3] [16] [17] [26] [28] [36] [37] [41] [56] [58] [59] [61] [65] [67] [69] [70] [73] [77] [80] [81] [83] [85]	22 (43.1)
Tourism	[3] [22] [54] [81]	4 (7.8)

RQ5: What operating systems are being used to develop mobile applications for information management?

The OSs used in the development of mobile applications are Android OS, Linux, Windows, and BlackBerry; however, the selected 85 articles indicated that the OS for efficient management is Android, which is one of the greatest advantages offered in the current competitive market (Table 6).

Table 6: Operating Systems

OSs used in Mobile Applications	Articles	Qty. (%)
Android OS	[4] [5] [6] [7] [10] [11] [12] [15] [16] [17] [19] [21] [22] [24] [25] [26] [27] [28] [29] [30] [31] [33] [37] [43] [46] [48] [49] [51] [52] [53] [55] [57] [59] [60] [61] [62] [63] [64] [65] [67] [70] [72] [73] [74] [75] [76] [77] [82] [83] [84] [85]	51 (68)
Linux	[34] [35] [38] [44] [47] [50] [56] [73] [78]	9 (12)
Windows	[3] [39] [49] [73] [75] [81]	6 (8)
BlackBerry	[14] [23] [24] [27] [38] [39] [40] [45] [73]	9 (12)

Discussion

A. Implications for Research and Practice

Thus far, several reviews have been conducted to rule out the greatest possibility of errors while writing articles. Our findings indicate a large concentration of empirical research on the study of mobile applications and management, followed by studies on methodologies used in mobile applications.

The other research topics that were not related to this study were discarded to focus on the articles that are relevant. In addition, we found no external replication of studies that are unrelated to the research.

One of the implications of these findings is that this study has opened up several opportunities to be explored in the research community. In particular, replication is necessary if a consistent body of knowledge is to be consolidated, which can guide future research and influence the practice of mobile management applications. For practitioners, the direct application of the study results must be carefully performed. Conflicting evidence suggests that the field of research is not mature, and the direct application of the methods and tools used in the studies may not produce the desired effects. The interpretations of the results obtained must be carefully analyzed so as to have some good practices pertaining to article writing. Moreover, a careful analysis of the context, in which the research was conducted, is necessary to assess the possibility of generalizing the results to other settings.

B. Limitations of the investigation

The limitations found in this RSL research are the data collected throughout the research and the language of the article. These make the study selection process difficult. Selection errors can be prevented by adopting research protocols developed based on well-established guidelines. The selection of articles in various search engines, either paid or free, affects the timing of the research, as it depends on the ability of an individual to be able to access all articles relevant to the research. A multistage selection process was used, and the reasons for excluding articles were recorded at each stage. Although the search and selection processes were carried out by the researcher, conflicts in the selection process were resolved with the help of experts in the field.

Conclusions

In this study, 3,745,383 articles were obtained from the search operations, and after the application of the exclusion criteria, 85 articles remained, which were manually reviewed. These articles would provide answers to the formulated research questions. In these studies, which are related to the current research topic of information management through a mobile device, most articles considered mobile applications, the Android OS, and spanned various fields, such as medicine, tourism and administration. The empirical studies found that the selected 85 articles indicate the directions of relevant research over the years and the importance of mobile applications in various fields.

Considering the importance of the effect of human factors on several aspects of software engineering, the amount of research in this regard by engineers is limited. It can be concluded that the analysis of the Android mobile applications has been elaborated based on an evaluation of the developers (using the questions based on scales), resulting in several articles that complement the research.

Abstract

The article substantiates the need to use digital technologies in university marketing activity to implement informative, communicative, representational, image-building functions. The purpose of the work is to consider and estimate implementation of digital marketing technologies into directions of university marketing activity based on the systematization of digital marketing tools. In research process the authors used systemic and integrated approaches, economic and statistical methods, desk study, and methods of expert estimations. The article shows the role of digital marketing in higher institutions' activity; provides systematization of research tools used to promote the university in its online environment; their interaction is established and the influence on university website performance is determined. The study systematizes directions of university marketing activity with the use of digital technologies; the analysis is carried out from the perspective of various target groups; university sites content is analyzed and its assessment is given. The article proposes a methodological approach to university website performance evaluation on the basis of online analytical services; presents results of its testing and identifies the main directions for university marketing activity improvement by using digital technologies.

Keywords: Digital Technologies, Digital Marketing, University Marketing Activities, Target User Groups.

Introduction

The university brand and its promotion ensure competitive advantages, customers' loyalty, and employers' interests. Currently, educational institutions are widely using digital technologies, that is digital marketing, in their marketing activity for promoting a university brand, improving the present image and attracting customers.

The university marketing activity based on the digital technologies usage is aimed at implementation of informative, communicative, representational, image-building functions and, to a large extent, ensure their competitiveness and attractiveness for various target groups.

Cite this Article as: V.I. TEPLOV, E.E. TARASOVA, Abraham ALTHONAYAN, E.A. SHEIN, K.V. EVDOKIMOV and Aliya AYTASOVA" Use of Digital Technologies in Marketing Activity of Higher Education Institutions " Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Important areas of university marketing activity are markets of educational services, consumer research, communication activity, promotion. Implementation of these areas is associated with the use of digital technologies. In this regard, a study on the use of digital technologies in university marketing activity is relevant.

Research Methodology

In the course of the analysis, we used cabinet research methods: analysis of domestic and foreign scientific literature relevant to subject matter; generalization and systematization of scientific information in the field of digital marketing [1, 2, 3, 4]. Economic and statistical methods and the method of expert estimations were used when computing.

This study is a continuation of the authors' previous research [5, 6, 7, 8, 9, 10] on university marketing activity based on the Internet technologies implementation.

The goal, set in the framework of this article, concerned consideration and evaluation of the directions of university marketing activity by using digital technologies with the help of digital marketing tools. In contrast to previously published works, the authors attempted to develop a methodological approach to university website performance evaluation by the marketing component (optimization and attendance). The approach was tested and the indicators of university website performance evaluation obtained through online analytical services.

The proposed approach was tested by means of university website performance evaluation based on the digital technologies usage on the example of BUCEL and Brunel University, London.

Results obtained

Digital marketing is a general term used to refer to the targeted and interactive marketing of goods and services using digital technologies to attract and keep potential customers. The main objectives of digital marketing are brand promotion and sales growth through various means. Digital marketing includes a wide selection of marketing tactics to promote products, services and brands [11] .

The main goal of digital marketing is promotion of resources, increased recognition and relevance of organizations, goods and services; wide coverage of the target audience and feedback from potential consumers [12].

In relation to universities, the goal of digital marketing is to promote educational services and provide the necessary information to target groups of users (students, applicants, employees, authorities, employers, graduates) for further feedback.

University marketing should be considered against the position of university promotion in the online environment through special tools and technologies.

In promoting a university brand while interacting with various target groups, it is advisable to use digital marketing tools such as display advertising, contextual advertising, search engine marketing, direct marketing, mobile marketing, social marketing, time marketing and permission-based marketing.

In order to effectively promote universities it seems feasible to use search engine marketing in general and SEO (search engine optimization) in particular; SMO (social media optimization) and SMM (social media marketing).

Systematization of digital marketing tools used in marketing activity is given in Figure 1.

Fig. 1: Digital marketing tools used in university marketing activity

Different target audiences use various tools to gain access to information concerning university activity. The main tool of the university marketing activity on the Internet is its official website, which should be considered as an important tool for promoting universities and fostering digital opportunities. The study revealed the interaction of the university marketing activity tools in the course of implementing digital technologies [13]. It also disclosed their influence on improving the university website functioning by attracting new viewers for product and brand promotion with the aim to improve the university image and get loyalty from target user groups.

Universities have gained significant experience in using digital technologies to work with various target groups. The analysis of fostering digital opportunities in university marketing activity of was carried out on the example of BUCEL (Russia) and Brunel University (London, UK).

In previous studies [6] we made an attempt to systematize university marketing activity aimed at dealing with various target groups (students, applicants and their parents, employers) based on the digital technologies usage; analyze the content of websites of BUCEL and Brunel University devoted to universities' interaction with the target audience of students, parents, applicants, employers, etc. (table 1).

Table 1: Directions of the two universities' marketing activity through digital technologies

Directions	BUCEL site pages	University of Brunel site pages
– conducting marketing research of potential and real consumers, international and regional educational services market	UNESCO Chair Education for Sustainable Development of Cooperatives; International activity; News	Knowledge Transfer Partnerships (KTP) Brunel Research A-Z
– attracting potential consumers of educational services; formation of a database of potential applicants	Student admission Post-graduate student admission; Additional Education Center; Photo Gallery Video Library; Newspaper of the Belgorod University of Cooperation, Economics and Law University News	Study (Undergraduate, Postgraduate, International) Subjects Campus life Research Business Services News and Events Alumni About
– identification of interested applicants and personal work with the most promising ones	News archive; BUCEL pages in social networks: vk, facebook, twitter, instagram	Information for practitioners and schools Higher education fairs Professional Development Centre
– identification of interested students and personal work with the most promising ones	Cultural Work Center Additional Education Center; Students Research work; Internship and Work Placement Department.	Other funding Higher education fairs Professional Development Centre

– increasing of applicants' loyalty by involving them into the university life: receiving information about university events, campus life, contests, olympiads	News; Student achievements	News and Events
– informing applicants in advance about the fulfillment of formal requirements necessary for enrolment	Student admission	Study
– development of advertising policy - print advertisements, TV commercials, online advertising, etc.	Multimedia; Mass Media about us	Transparency Information
– arrangement of meetings with applicants' parents	News archive; BUCEL pages in social networks: vk, facebook, twitter, Instagram	Open Days Information for parents and carers Support for your students Clearing information for parents, guardians and carers Guide for parents, family, carers and friends
– development of social network contacts with potential consumers (online surveys, promotion of social network groups, information content availability), etc.	Links to social networks: vk, facebook, twitter, instagram	Links to social networks: facebook, twitter, youtube, flickr)
– development of practical activities in the framework of the university curriculum; contacts with enterprises and other regions	Internship and Work Placement Department Partners and employers; International activity	Alumni benefits New graduates Job Shop Employers
– student placement activity	Internship and Work Placement Department Automated Employment Information System	Business advice and support
– branding; university brand promotion activity	Announcements of events; University Achievements	Announcements of events; University Achievements
– study of the regional labor market to determine the most popular professions and their prospects for further development	Internship and Work Placement Department Analysis of the situation in the labor market in the Belgorod region	Advertising vacancies
— interaction of structural divisions aimed at the maximum satisfaction of the consumers' needs in educational services	University rules and regulations	Rules and Regulations

The analysis of both marketing activity implementation and corresponding BUCEL and Brunel University site pages content showed that the two universities actively use their sites for interaction and communication with various target groups – students, applicants and their parents, employers. However, attention should be paid to filling and regular updating of sites as well as to relevance of the information provided for various target groups.

In a competitive environment surrounding the educational services market and the labor market, universities find various ways and mechanisms to attract applicants and employers [14].

Particular attention should be paid to conducting marketing research of potential and real consumers, international and regional educational services market. Of specific interest is Brunel University activity announced at the site page *Knowledge Transfer Partnerships* focused on conveying knowledge and expertise from the university to small businesses for their expanding and venturing into new markets.

Any business should have a specific business task or a new innovative idea for further development. Participation in knowledge transfer partnerships can help significantly increase profit, improve personnel qualification, create new jobs, develop new products, processes or services, etc.

The direction of BUCEL's site *Conducting marketing research of potential and real consumers, international and regional educational services market* contains information on the UNESCO Chair, functioning at BUCEL, and materials about the section Cooperation in the Global World of the UNESCO Chair of the Faculty of Global Processes, Moscow State University, as well as data on the university's international activity.

In an increasingly competitive educational services market environment and in the face of demographic crisis, universities should pay more attention to such areas as identification of interested applicants and personal work with the most promising ones, arrangement of meetings with applicants' parents.

On the Brunel University website this information is presented on the following pages: Open Days, Information for parents and carers, Support for your students, Clearing information for parents, guardians and carers, Guide for parents, family, carers and friends.

According to a survey (Student Hut, 2019), the Professional Development Center (PDC) Employment Service was voted by the university students as the fifth best career service in the UK (Student Hut, 2019) as they support graduates' career development and enhance their employability. One-minute video is posted on the website. It contains the following appeals: unleash your potential; reveal strengths; develop skills; connect with employers; translate ideas into business; we can help you find a job; how to successfully pass an interview.

This site page includes the following headings: Supporting professional development; Moving on as a graduate; Skills programmes and awards as well as the tasks of the Professional Development Center team:

– The Career team will help you explore your career options and provide you with a wide range of support and opportunities. This site page offers a mechanism for interacting with employers who want to work with PDC. They are responsible for organizing campus events such as fall and summer recruitment fairs, presentations, employer information events;

– The Innovation Hub team is ready to provide support for students and graduates who want to develop their ideas into a winning business;

– The Job Shop team is ready to help students find part-time opportunities on and off campus. The team also acts as an HR function for all students working on campus;

– The Modern Languages team offers the opportunity to learn a new language, develop competence in four basic skills: listening, speaking, reading and writing;

– The Administration and Career Information team offers students the chance to secure a placement through their well-established connections in wide range of industries in public and private sectors. The career information staff manages PDC career information resources using electronic and traditional library materials.

Currently, such an important direction as development of social network contacts with potential consumers is gaining particular relevance, which allows to quickly disseminate information about the university activity, implement communication.

Digital technologies play an important role not only for promoting the university's brand, attracting applicants, but also for informing various target groups about university activity.

As it was noted above, the university website provides the necessary information for various groups of the target audience: students, teaching staff, employees, parents, employers, authorities, graduates, etc.

In the course of the study, we systematized the data posted on the BUCEL and Brunel University websites which is intended for different target groups of users.

The analysis of the cases disclosed that for applicants and their parents as well as for graduates universities should place virtual excursions and museums, information on professional development and employment, successful professional profiles, etc.

For foreign partners it could be interesting to get information in the English language on international projects, visa and invitation support service, useful contacts, various university activities, etc.

Analysis of the information presented on the universities' websites for different target groups, its comparative analysis with data of other domestic and foreign universities will help determine the directions for further development and application of digital technologies in the universities' marketing activity.

In our studies, we proposed a methodological approach to assess the university website functioning, substantiated university marketing activity directions based on the Internet technologies usage.

The methodological approach is based on the active use of digital technologies to evaluate university marketing activity aimed at various groups of users [15]. The proposed methodological approach was tested on the example of BUCEL and Brunel University, London. For evaluation, we used university website performance indicators obtained through analytical online services.

Table 2 shows website performance indicators of Belgorod University of Cooperation, Economics and Law, Belgorod and Brunel University, London, obtained through analytical online services.

Table 2: Website performance indicators of Belgorod University of Cooperation, Economics and Law, Belgorod and Brunel University, London, obtained through analytical online services

Review criteria			BUCEL	Brunel University London
Common	**Web address**		bukep.ru	brunel.ac.uk
	Page load time, sec.		4,26	3,67
	CMS		MODx	Contens
Search engine systems	Indexing	Yandex	13159	18670
		Google	18800	81300
Traffic	Page views	Day	2380	142000
		Week	16660	991000
		Month	71400	4390000
	Visits	Day	600	20400
		Week	4200	143000
		Month	17900	631000
Links to the site	Referred Pages		49404	1168928
	Referred Domains		502	12265
	Trust to the site	Trust Rank	21	39
		Domain Rank	24	40
Statistics systems	Yandex.Metrika		+	-
	Google Tag Manager		-	+

The interest of target user groups in various sections of the university website and the posted information is reflected in traffic indicators (views and visitors). The number of page views on the Brunel University website exceeds the number of page views on the BUCEL website daily, weekly and monthly by almost 60 times; the number of the Brunel University website visitors exceeds the number of the BUCEL website visitors by almost 35 times (Fig. 2). These indicators are inextricably linked with the number of users – target contact audiences.

Fig. 2: Website performance indicators of BUCEL and Brunel University by traffic review criteria

Important indicators of the university Website performance obtained through analytical online services are the following: site address; CMS (content management system); page load time; number of site indexed pages; views and visits; number of referred web resources; statistics systems.

The testing results allow us to conclude that, in general, the indicators of the Brunel University website are better than the indicators of the official BUCEL website. The loading time is less, which allows users to maintain their interest while working. Both sites are built using CMS, which makes placement of new content easier and cheaper, therefore, it increases the speed of providing new information for the target contact audience. In our opinion, the web address *bukep.ru* is more attractive due to a shorter spelling.

Indicators of such criteria as indexing by search engine systems, traffic and links to the site reflect the overall popularity and attractiveness of the site.

Both sites have connected web-analytics systems that allow to analyze site traffic by its target contact audience and, based on the information received, make decisions about the future development strategy of the resource.

Table 3 gives a comparative description of BUCEL and Brunel University websites on the availability of elements and information blocks demanded by users.

Table 3: Comparison of the official websites of Belgorod University of Cooperation, Economics and Law, Belgorod and Brunel University, London on the availability of elements and information blocks demanded by users

	Resource Objects	Information Objects	BUCEL	Brunel University London
1	Site navigation	menu	+	+
		information retrieval system	+	+
		quick (hot) links	+	+
2	Information about …	University history, structure, partners	+	+
		educational programs	+	+
		scientific work	+	+
		directions of training, rules of admission	+	+
		alumni	+	+
3	Information for …	applicants	+	+
		students, international students	+	+
		employees	+	
		alumni	+	+
4	News	news	+	+
		event announcements, calendar of events	+	+
5	Communication Objects	feedback	-	
		blog	-	
		forum	-	
		social networks	-	+
6	Interactive elements	media library	+	+
		class schedule	+	
		premises navigation	-	
7	Mobile Items	website as a mobile application	-	+
8	Contact Information	addresses and phone numbers of structural units	+	+

The user elements and information blocks given in table 3 are that very minimum that any educational organization's site should have. As can be seen from table 3, the sites of BUCEL and Brunel University are similar in both functional and informational content.

It should be noted that universities actively use the full-text search system, convenient site navigation, and introduce other control elements. The once-popular approaches of Web 2.0 are being replaced by Web 3.0, where high-quality content and services prevail against technology. The ever more numerous educational resources and services provide their services online. When determining the main university marketing activity directions based on digital technologies usage, it is worthwhile to take into consideration new approaches and prospects.

Important constituents of the university website performance evaluation are both the interactivity resource analysis and the marketing component analysis.

Interactivity resource analysis requires interaction with the site and other communication process participants (feedback, registration, polls and votes, news feed, forum, guest book, etc.).

Marketing component analysis:

– SEO analysis (Search Engaged Optimization – a set of internal and external actions aimed at site optimization in order to increase its position in providing search results) – search engine optimization (TCI[1], PR[2], links to the resource, inclusion in catalogue databases, key words, layout, content uniqueness);

[1] TIC (thematic citation index) - Yandex search engine technology, which consists in determining resources credibility by taking into account the quality characteristics - links from other sites.

– SMO analysis (Social Media Optimization – a set of measures aimed at attracting visitors by optimizing a brand's presence on social media networks) – website optimization for social media;

– clickstream analysis (geographic distribution of users, route, frequency of return, etc.);

– analysis of advertising materials.

To assess university website functioning we used economic and statistical methods and the method of expert estimations.

The technique output parameters are presented by individual, summarizing and integrated criteria.

We selected the most significant indicators, which, in our opinion, reflect the site's performance most accurately, and which can be quickly obtained through the site's databases and analytical systems.

During the assessment, it is recommended to convert site's performance measurement indicators with the marketing component into normalized estimates by measuring deviations from the average value of all as one standard deviation. Summarizing indicators are defined as arithmetic average of individual values distributed based on the sigmoid function [16]. The integrated indicator for the website performance evaluation is calculated as the arithmetic average of summarizing indicators.

Conversion of indicators for the website performance evaluation into normalized estimates is carried out by calculating deviations from the average value of all as one standard deviation. As a result of this operation, basic reference data are converted into a new set with the average value equal to zero and the standard deviation equal to one.

Normalized value of the *i* indicator is determined by formula 1:

$$N_i = \frac{x_i - \bar{x}_i}{\sigma_i}, \quad (1)$$

where N_i – normalized value of the *i* indicator;

x_i – initial value of the *i* indicator;

$\bar{x}_i$ – average value of the *i* indicator;

σ_i – standard deviation according to the general totality defined by the indicators.

Standard deviation according to the general totality defined by the indicators, is calculated by formula 2:

$$\sigma_i - \sqrt{\sum \frac{(x_i - \bar{x}_i)^2}{n}}, \quad (2)$$

where σ_i – standard deviation according to the general totality defined by the indicators,

x_i – initial value of the *i* indicator;

$\bar{x}_i$ – average value of the *i* indicator.

To determine the individual indicators for the university website performance evaluation, we place the obtained values of the indicators in the interval 0-1 based on the sigmoid function (formula 3):

$$p_{1i} = \frac{1}{1 + e^{N_i}}, \quad (3)$$

where p_{1i} – individual indicators for the website performance evaluation;

N_i – normalized value of the *i* indicator.

General indicators for the website performance evaluation are calculated by formula 4

$$G_{1j} = \frac{\sum_{i=1}^{m} p_{1ij}}{m}, \quad (4)$$

where

p_{1ij} – individual indicators for the website performance evaluation;

m – number of indicators in the *j*-component of the indicator system

Integral indicator for the University website performance evaluation is calculated by formula 5:

[2] PR (Page Rang) – calculation algorithm of page authority used by google search engine

$$I_1 - \frac{\sum_{j=1}^{k} G_{1j}}{k}, \quad (5)$$

where I_1 – integral indicator for the website performance evaluation;
k – number of analyzed components of the indicator framework

Table 4 shows the indicators for the University website performance evaluation according to the marketing component (optimization and site traffic), their average values and standard deviation for 2011-2019.

Table 4: The average value and standard deviation of indicators for performance evaluation of Belgorod University of Cooperation, Economics and Law website

Website versions by years / Indicators	2011	2012	2013	2015	2017	2019	Average value	Standard deviation
Marketing component (optimization)								
Number of internal links (average per year)	98	155	163	170	175	178	156,50	29,8446
Number of links from the site (average per year)	18	21	27	30	38	42	29,33	9,3737
Number of links to the site (average per year)	3326,7	1236,9	4240,8	4496,5	4785,9	4940,1	3837,82	1395,4324
Number of referring sites (average per year)	98,6	79,3	120,4	250,9	430,9	502,3	247,07	181,7613
Number of referring sites from education from the education field	8	6	15	18	30	32	18,17	10,8888
Marketing component (site traffic)								
Number of visits (average per day)	1684,1	1485,4	2145,1	2496,7	2987,3	3256,2	2342,47	704,4814
Number of unique visitors (average per day)	1236,7	1115,9	1653,6	1798,7	1895,6	1957,6	1609,68	353,0974
Number of viewed pages (average per day)	2554,1	2363,1	4918,3	5548,2	6108,6	6,985,5	4298,46	1732,8494

Calculations show that within the researched period there was a significant increase for all the selected indicators. As marketing indicators characterizing site optimization were selected the following ones: number of internal links, number of links from the site, number of links to the site, number of referring sites, number of referring sites from the education field. To assess site traffic we applied the following indicators: number of visits, number of unique visitors, number of viewed pages.

Applying this methodological approach, it is possible to conduct a comparative assessment of the university sites functioning according to selected criteria and indicators, depending on the aim of the study.

The results of university website performance evaluation make it possible to substantiate marketing activity directions on the basis of digital technologies usage

(Fig. 3).

Fig. 3: University marketing activity directions on the basis of the digital technologies usage

A set of specific marketing actions could be developed for each area on the basis of other universities' best practices concerning their usage of digital technologies in marketing activity for interacting with various target groups. Our own possibilities should also be taken into account.

The following marketing activity recommendations can be useful: apply innovative approaches to reflect students and post-graduate students' activity; encourage students' social network activity, answer their questions and provide necessary resources; encourage the staff's social network activity, their grouping in networks; display technical capabilities, discuss the latest achievements in this field; get a feel for online culture in order to promote the university's brand and improve its image; supervise the content created in the educational institution, and encourage further content creation taking into account modern approaches [17].

The article discusses the use of digital technologies in the university marketing activity from the perspective of university brand promotion and target groups of users (students, teaching staff, employees, parents, employers, authorities, graduates, etc.) attraction

Another important area of digital technologies usage is their implementation in the educational process.

Currently, Russian and foreign universities are actively using the Internet space as an electronic university. In this regard, the problem of improving specialists' professionalism in the field of information technology, as well as their engagement in university marketing activity is of great importance.

Conclusion

The study allows the authors to draw the following conclusions. The use of digital technologies can improve effectiveness of university marketing activity and contribute to the implementation of informative, communicative, representational, image-building functions. Various tools should be used to interact with different groups of users (students, teachers, employees, parents, employers, graduates, etc.) while implementing these functions.

To realize the directions of university marketing activity it is worthwhile to dynamically use university sites as an important tool for interacting with target groups. In order to improve functioning of the university website, it is advisable to estimate other universities' experience of using digital technologies for attracting customers and to analyze filling of the sites and content of individual pages.

It is advisable to conduct a comparative assessment of university sites functioning due to indicators obtained through analytical online services.

Important evaluation components of university website performance are the analysis of resource interactivity and the analysis of the marketing component (optimization and attendance). Using the proposed methodological approach, it is possible to conduct a comparative evaluation of university website performance according to selected criteria and indicators depending on the purpose of the study.
The evaluation results of university website performance make it possible to substantiate the directions for improving university marketing activity based on digital technologies usage.

The use of digital technologies in the university marketing activity will help attract target groups, promote educational programs, and increase attractiveness and competitiveness of universities.

Zbigniew TARAPATA
Military University of Technology, Faculty of Cybernetics, Warsaw, Poland, zbigniew.tarapata@wat.edu.pl

Abstract

In the paper, the authors presented the concept and elements of implementation of the subsystem to support the training process of operators of the anti-crisis system. It was made in the form of emulators of hazard monitoring systems for the needs of an IT system supporting the analysis of threats in the form of CBRN (Chemical, Biological, Radiation, Nuclear) contamination, forecasting their effects and alerting the population.

The genesis of building the emulator subsystem is the need to provide a tool to support the training process of people involved in the activities of the National System of Detection of Contamination and Alarming (KSWSiA) in Poland. However, the emulators designed in this way can also be used as a tool to support the development of emergency procedures and to support the software development process.

Emulators were proposed as pure IT tools, run in the same hardware environment as the constructed system. A constructive simulation was chosen as the emulation method, but reduced to a simple, determined data delivery in accordance with the previously prepared scenario.

Keywords: Emulators, Support of Anti-Crisis Training, Software Development, Dual-Use of IT Technology.

Introduction

The work is based on our experiences resulting from developing IT system supporting analyses of threats related to contamination and alarming (WAZkA) (see Tarapata et al (2017)) for the purpose of the National System for Detection of Contamination and Alarming (pol. *Krajowy System Wykrywania Skażeń i Alarmowania, KSWSiA*) in Poland (Binek and Czepiel (2014)). The implementation of the WAZkA system made it necessary to implement the subsystem to support the training process of operators. It was one of the main the WAZkA software requirements.

The purpose of the constructed the WAZkA system was to support the anti-crisis management system, mainly in terms of passing the information, coordinating actions, and forecasting the development of threats. The WAZkA system is aimed at collecting information obtained from various sources: starting from sensors (see Grabowski et al (2001), Lipiński et al (2001)) and single observers, through particular levels of the anti-crisis management system, and ending with national centers. The information is collected and supplemented with the results of the analyses conducted in the system environment. The so prepared data are made available to all interested parties: population, elements of the anti-crisis management system, other information media. The data are made available in different forms: tabular, descriptive, graphic on a background map, text, and voice notifications. Alerts and notifications, which confirm the development of threats and which constitute direct instruction to undertake preventive actions, are of special significance.

To allow the designed system work in the training mode, it must be possible to replace the actual environment with the training environment. The replaceable elements of the environment shall be as follows: databases, information sources and recipients of alerts and notifications. The sources and data recipients may be replaced with specialized operators and automatic machines. The logic of the information recipients is usually very simple. It is much more complex in case of the information sources. They need to deliver notifications in accordance with the principles effective while observing the phenomena and in accordance with the physics of the development of threats. Therefore, the information sources were chosen as the most suitable for automating the IT system.

Replacement of the actual information sources with automatic machines makes it necessary to build emulators. The behavior of the information sources suggests that the construction of the simulation software shall be a good way to

provide IT support. That is how the information tool to support the training process was created. During its development, it became necessary to quickly deliver the environment for launching and testing the emerging the WAZkA system. The assumptions and implementation were modified in such a manner so as to enable the same subsystem of emulators to support the system developers. Therefore, the functions supporting the manufacturing process were added to the tool to support the training process.

Although, the presented solution was designed for the anti-crisis system, however, the outlined problems occur in most of the constructed IT systems, in particular class C2 (Command and Control) systems (Tarapata (2011)).

The paper is organized as follows. First, we present placement of the emulator in the WAZkA system and its expected role. Next, we describe architecture of the emulator and its ultimate role in the WAZKA. Finally, we describe the possibilities of dual-use of emulators, particularly in software development process.

Placement of the emulator in the WAZkA system and its expected role

Requirements on the WAZkA system

The expectations of shareholders with respect to the presented anti-crisis system (WAZkA) may be summarized in the following points:

1. The basic result shall be in the form of the IT tool.
2. It should reduce the time between detection of a threat and passing of the information to the public.
3. The tool shall be intended for the bodies responsible for undertaking particular actions.
4. It should optimize the decision-making processes of the public administration bodies and coordinate activities of the rescue entities.
5. It should also be the system ready to react to new threats.
6. The tool must be a platform for organizing training sessions.

Based on such expectations, the requirements for the software were formulated. The requirements may be summarized in the following points (Tarapata et al (2017), WAZkA (2018)):

1. Exchange of information. The purpose of the requirement is to support the process of information exchange between the elements of the contamination detection and alarming system.
2. Assessment and analysis of threats. The requirement is a generalized functionality, aimed at developing and implementing the tool for the needs of the entities forming part of the contamination detection and alarming system of the tool supporting the process of preparation of expert assessments and analyses of contingency situations, resulting in biological, chemical or radioactive contamination, for the decision-making bodies.
3. Coordination of activities. The purpose of the requirement is to deliver the functionality for coordinating activities of the elements of the contamination detection and alarming system and analyses.
4. Access to the threat knowledge base. The purpose of the requirement is to provide access to the developed electronic catalog of threats of chemical, biological and radioactive contamination. The catalog needs to be in the form of a knowledge base, accessible and possible to expand by authorized users.
5. Training session. The purpose of the requirement is to allow training of the public administration entities, using the created products.
6. Emulation of the monitoring systems. The purpose of the requirement is to feed the system with the generated test, user-controlled data on threats. It facilitates the training process and allows to verify cooperation between the system and services in case of unusual threats. Furthermore, the requirement is aimed at supporting the training system by generating the data on threats to implement the predefined scenario of development and consequences of such threats.

The two last requirements are related to the training function of the system. The training sessions are usually conducted in a non-automatic manner, using operators. The preparation of exercises requires development of a plan for sending notifications, including the following information:

- operating and astronomical time of sending notifications,
- content of notifications,
- source or sender,
- recipient,
- manner of sending notifications.

The plan had to be developed by analysts having in-depth knowledge of the procedures and physics of the phenomena related to the spread of contamination. It is a long and labor-intensive process. The exercises are

performed in the form of sending the notifications by the properly instructed operators in accordance with the developed plan, without any significant deviations.
The concept of using the constructed the WAZkA system for the training purposes is based on applying the same system as in case of typical work. Therefore, it is necessary to change the entire environment, in which such system is supposed to be operating during the training session. The environment elements are as follows:

- sources of data on contamination,
- recipients of notifications and alerts,
- databases.

The exchange of sources and recipients usually comes down to replacing the actual elements with training services. It is often troublesome and costly to organize the training, as it requires many operators. Therefore, it becomes necessary to substitute a part of the personnel (or even all of them) for the specialized IT subsystem. It is easiest to do it in automatic or automated data sources.

Placement of emulator in WAZkA and its role

The emulator, in general, is the system which behaves like another computer system, but which was designed in a different technology and environment. The emulator behaves like the actual system only from a certain point of view, depending on the purpose of application of such emulator. Since the emulator is "seen" only by the constructed IT system, it must be compatible with the system replaced at the interface level.

Emulators are used in different applications and contexts. For example, the paper by Greenberg et al (1995) presents test results using EM (real-time hazard monitor, historically termed an error monitor (EM)) in conjunction with a Flight Management System (FMS) emulator. In the paper by Bowman and Woods (2016) authors develop methodology for the two thin-plate spline, with application to atmospheric dispersion, to capture the spatial structure and fit a Gaussian process emulator to the coefficients of the resultant basis functions and demonstrate that these emulators significantly outperform the principal component emulator. Authors Yin and Song (2013 write about emulators approach to automatic malware analysis. Manatakis et al (2014) demonstrate the potential of the proposed simulation-driven WSN emulation approach by using it to estimate how communication and energy costs scale with the network's size when implementing a collaborative algorithm for tracking the spatiotemporal evolution of a progressing environmental hazard.

The behavior model of emulators depends on the required degree of adequacy. In case of the described application, the emulators do not have to behave in the exact same manner as the actual phenomena and the systems that track them. They do not have to and even should not deliver the most probable data. It is enough when such emulators provide the probable data. For didactic purposes, the training is much more valuable in the decision-making process when executed in new, not typical, conditions. Therefore, it may be concluded that the behavior models of emulators may be quite simplified, which significantly facilitates and accelerates their implementation and hence reduces the costs.

The most obvious application of such emulators is to "emulate" automatic sources of data on contamination. However, their limited use in case of non-automated sources, e.g. to send informal information via e-mail, is also possible.

A natural way to implement the emulators is to use the same techniques and environments as in case of the whole system. The easiest way of emulation is the computer simulation method. Physical phenomena are of continuous nature, but actual systems for collecting and delivering data are triggered by events. Therefore, the appropriate type of simulation is discrete-event ones.

It is possible to adopt various behavior models of emulators. According to the general principles of software design, it is essential to start the work from creating the riskiest behavior models, which are usually also the most complex ones. If the emulator subsystem is only a tool to support the training process, the order of creation needs to be established. Having a tool for easy delivery of the working environment of the whole constructed system allows to create a better system in a much easier and quicker manner. In such case, the priority is to deliver the environment as quickly as possible. Therefore, from the point of view of mitigating threats to the entire undertaking, it is essential to start building emulators in accordance with the models that may be delivered as fast as possible. These are usually the simplest models.

The above deliberations may be summarized with the following conclusions:

- since the WAZkA system is a purely IT system – the subsystem of emulators shall also be purely IT,
- with the above in mind, it is clear that the application of the computer simulation techniques shall be a good choice,
- actual behavior of the emulated systems (not phenomena) is based on events, therefore, such type of the computer simulation is preferred,
- the degree of adequacy does not have to be high, thus, simplified model of the emulated systems and phenomena may be adopted,
- it should be assumed that the emulators shall be built from the simplest to the most complex one (the purpose is to reduce the risk of creating the whole system, not the subsystem of emulators),
- the subsystem of emulators should be completely transparent for the system – it should be created as independent software integrated with the system through the same interfaces as the actual environment,
- the emulators are not only data producers, but also consumers; future system extension with emulators of data consumers may be taken into consideration,
- the simulation should be based on the predefined scenario (in a manner close to the implementation of the plan for sending notifications); scenario modification during the emulation process is an option worth considering.

Description of the architecture of the emulator and its ultimate role in the WAZKA

Layered software concept of the emulator subsystem

The analysis of the expected behavior of the emulator subsystem conducted based on the specification of requirements led to the development of the layer software concept. It was shown in Fig. 1.

Fig. 2 shows activation screen for the emulation subsystem prototype in the WAZkA.

The key component of the developed concept is the component of emulators. It appears in such a few copies that corresponds to the developed types of emulators. For the constructed system, three types of emulators were developed:

- simple generation of data as defined in the scenario,
- simple determination of the environment status as defined in the scenario and automatic data generation,
- data generation using the behavior model of the phenomenon with the parameters as defined in the scenario and automatic data generation.

They differ in the level of technological advancement, hence, complexity of performance. In the subsequent part of the article, the adopted solutions for types of emulators were described. The description was in accordance with the level of technological advancement, starting from the simplest emulator.

Fig. 1: Layered software concept of the emulator subsystem

Fig. 2: Activation screen for the emulation subsystem prototype in the WAZkA

Simple generation of data as defined in the scenario

This concept of emulation is the simplest, but also the most flexible. It means that the information to be passed in the notifications for the system was expressly defined in the scenario. Therefore, the emulation scenario must include:

- expected time of sending the notification,
- contents of the notification.

The difficulty in using such emulator is that the model of spreading the phenomenon and operations of the monitoring system must exist "in the mind" of a person creating the scenario (scenarist, analyst, or training manager). The emulator does not provide any support in that respect. A person with a specialist knowledge may develop the scenario, which is also labor-intensive.

Simple determination of the environment status as defined in the scenario and automatic data generation

This type of scenario has an in-built model of operations of the monitoring system. Such system is usually fully automatic and the algorithm of its operations relatively simple. The model of such system is simple thus, the emulator is easy to implement. The model of spreading the phenomenon must still exist "in the mind" of a scenarist. However, creation of the scenario comes down to the definition of the instructions, which shall appear in sensors. Therefore, the scenario needs to include:

- expected time of changing the value read by the sensor,
- identifier (location) of the sensor,
- value which needs to be read,
- parameters of reading the value from the sensors by the monitoring system:
  - frequency of reading the value,
  - frequency of sending data to the system.

This type of emulator does not support the scenarist in modeling the phenomenon but relieves them from the obligation to organize the procedure for sending data from sensors to the system.

Data generation using the behavior model of the phenomenon with the parameters as defined in the scenario and automatic data generation

In case of such emulator, it is necessary to include in the scenario only those parameters that initialize events and refer to the operations of the monitoring system. It is enough for the scenarist to know which events shall occur, not how they shall proceed. The scenarist is not required to have extensive knowledge in that respect. Additionally, the time necessary to develop the scenario (hence, the time of preparation of exercises) is significantly shorter. On the other hand, the process of constructing the emulator is much more complex. Nonetheless, while considering the

previously justified assumptions, the model of spreading the phenomenon may be significantly simplified.
Fig. 3 shows a schematic sample model, which illustrates its level of simplification. The model complies with NATO ATP-45(d) standard (ATP-45, (2010)).

The widening lines define the sector, in which the whole phenomenon shall appear with the probability of 0.7. The sector is set based on pragmatic methodology. In accordance with the so defined sector, the locations of the phenomenon are determined at subsequent times (shown in the form of circles). The passing of an event leaves a trace, which depends on the size of the phenomenon and passing time. Once the event passes, the effects of the phenomenon are spontaneously degraded. Furthermore, the pragmatic rule of degradation was also adopted here.

Weather information, limited to the wind direction and efficient speed, is used to determine the direction of spreading the phenomenon. Other parameters were omitted, which is acceptable in case of the model used for emulation. Certainly, the models used to assess the situation and to make the decisions must be much more advanced and hence more adequate for the actual phenomenon.

It follows from the above that the following should be included in the scenario:

- expected time of event,
- place of event,
- size of event,
- weather parameters:
  - change time of weather conditions,
  - wind direction,
  - efficient wind speed,
- parameters of reading the sensors by the monitoring system:
  - frequency of reading the value,
  - frequency of sending data to the system.

Other parameters are derived from the data included in the scenario. The parameters are as follows:

- trajectory of the phenomenon spreading (calculated based on the wind direction),
- speed of spreading (calculated based on the wind speed),
- duration of spreading (calculated based on the event size),
- speed of cloud broadening (calculated based on the event size),
- initial dose level (calculated based on the event size),
- half-life (a typical value was adopted).

Fig. 3: Sketch of the phenomenon spreading model (N – radiation level in sievert per hour (Sv/h) units, t – time that has passed from start of radiation, T – half-life of radioactive substance which is source of radiation)

Using WAZkA for training anti-crisis teams

In the paper by Kulas and Tarapata (2018), the authors presented the concept and elements of implementation of the subsystem to support the training process of operators of the anti-crisis system. It was made in the form of emulators of hazard monitoring systems for the needs of an IT system WAZkA. However, the emulators designed in this way can also be used as a tool to support the development of emergency procedures. Emulators were

proposed as IT tools. A constructive simulation was chosen as the emulation method, but reduced to a simple, determined data delivery in accordance with the previously prepared scenario.

Replacement of the actual information sources with automatic machines makes it necessary to build emulators. The easiest way of emulation is the computer simulation method. The behavior of the information sources suggests that the construction of the simulation software shall be a good way to provide IT support. That is how the IT tool to support the training process was created.

Fig. 4 shows an example of using emulators in WAZkA system and steps being conducted. Although, the presented solution was designed for the anti-crisis system, however, the outlined problems occur in most of the constructed IT systems, class C2 (Tarapata (2011)). It is important to emphasize that the presented solution is dedicated for replacing personnel on different levels during anti-crisis CBRN threats training, not during anti-crisis management or anti-crisis decision support.

Fig. 4: Example of using emulators in WAZkA system: (step 1) model of phenomenon, (step 2) emulation process control, (step 3) sending messages, (step 4) receiving messages in WAZkA, source: own elaboration

Description of the possibilities of dual-use

Typical application of the emulator subsystem was outlined in the requirements for the constructed IT system. During specific implementation of the subsystem, a possibility of additional use of the so defined software appeared. It means that the subsystem of emulators may be used as the testing environment for the currently created software. In this way, the tool intended for handling training activities of the system also became the tool supporting the software development process.

The new application did not require any changes in the functionality. What changes was only the time necessary to deliver the tool. The tool had to be delivered before the deadline set for acceptance tests. It was also preferred to deliver the useful product earlier, even without complete functionality. At the earlier stages of production, such tool is suitable to perform the integration testing of the subsequent software incremental changes.

The application of the subsystem of emulators as the tool supporting the software development process consists in the supporting of the construction of the testing environment. Such environment automatically delivers the input

data. It allows to construct automatic tests, hence, indirectly, allowing efficient implementation of agile methodology.

Simple emulators require clear definition of the data that are to be generated. It requires a lot of work on the part of both analysts and testers. Such emulators turn out to be efficient at the initial production stage, when the tests are not usually complex. On the other hand, the aforesaid emulators are very simple and may be quickly delivered.

The implemented phenomena development models and operations of the monitoring and data provision systems are included in the advanced emulators. Such a solution significantly simplifies the construction of tests. In extreme cases, it allows to eliminate the analysts while constructing the tests (their knowledge was included in the models and implemented in emulators). The data generated by such emulators may be complex, whereas the effort used for their preparation insignificant. A disadvantage of the aforementioned solutions is a high degree of complexity, which makes it difficult to quickly deliver such solutions. However, complex test data are usually necessary at the later stages of the software implementation.

The application of the computer simulation techniques also allows to easily introduce randomness of the data generation process. It offers new possibilities of testing.

An advantage of all emulators is the possibility of multiple use of the ready environment, without the necessity of repeated involvement of testers. Additionally, the speed of automatic data delivery exceeds the capabilities of a tester several times.

The advantages from the dual-use of the subsystem of emulators may be summarized in the following points:

- faster testing,
- reduced time of work of analysts and testers,
- easy repeatability of testing,
- automatic testing,
- added randomness of tests,
- low cost of adaptation of available solutions,
- supported implementation of agile methodology.

Summary

The presented emulation environment allows to construct and deliver emulators in a flexible manner. In the described case, it was used for the purposes of a specific system, but potentially it may be also applied in any other system. In the article, three implemented emulators were described, but it is possible to extend the environment with other emulators as well - designed both for a specific system and for general application.

The simplest of the designed emulators has great potential of versatility. Since there is no in-built model, the emulator may be used in any way. It may be the starting point for using the emulators while building any system. More complex emulators may be designed and gradually implemented while executing the undertaking.

The main objective of providing the emulators was a possibility of easy use of the system for the training purposes. However, the emulators also proved useful in the process of designing the software. They allowed quick provision of the environment for testing the designed product.

The principle of delivering emulators from the simplest to the most complex one was adopted. It seems at variance with the rules of software engineering, according to which it is required to start the procedure from the riskiest tasks. However, it should be remembered that the emulators are only the subsystem of the whole, thus, the risk of implementation must be considered with respect to the entire system. In such case, quick delivery of the testing environment is the priority and contributes to the risk reduction of the whole undertaking by allowing better testing more quickly.

In case of large systems, it is usually required to deliver the emulators together with the training environment. Extensive training sessions require substantial funds and time. It is indispensable to develop the exercise scenario and train personnel. The main personnel consist of people imitating the sources or recipients of notifications. In both cases, the emulators contribute to the reduction of costs and time necessary to prepare the exercises by:

- providing tools for building scenarios,
- simplifying the construction of scenarios by delivering the implemented models,

- providing tools for automatic generation of events, without the help of personnel.

The concept of emulators may be extended. One of the possibilities is to deliver the consumer emulators apart from the source emulator. Once initiated, the outlined emulators operate in accordance with the scenario, without a possibility of interference. In some cases, it may prove useful to influence the emulation process during its course. It is the second possible direction of development of the presented emulators.

Abstract

The paper aims to propose the influence of Green Human Resource Management dimensions on the Job Pursuit Intentions. Two mediators; Employers' Attractiveness and Employers' Prestige intervenes the aforementioned relationship. It reviews precedent conceptual and empirical papers in accordance to this subject. The past empirical papers were retrieved on the topic of Green Human Resource Management whereby a condensed table on these with relation to Job Pursuit Intentions is illustrated. Moreover, extracting information from both conceptual and empirical papers enabled an organisation based on each variable. Few studies in a quantitative approach has been conducted on the outlook of Green Human Resource Management dimensions on Job Pursuit Intentions as separate themes. From the past empirical studies, the Green Human Resource Management dimensions are commonly treated as either a whole or a selective fragment of the various components of Green Human Resource Management. This review paper will be beneficial for researchers with interest in exploring the concept of Green Human Resource Management factors influencing the Job Pursuit Intentions. In addition, this information and knowledge can serve as an awareness to practitioners to include green initiatives as a strategic talent acquisition and management tool. The review paper enables enrichment to the limited knowledge base on the outlook of potential employees towards Green Human Resource Management. Besides, this paper provides a combination of three underlying theories which are Ability-Motivation-Opportunity Theory, Signalling Theory and Social Identity Theory. Also, the proposed research framework is an extension whereby Green Employee Relations is presented in the hypothesized relationship.

Introduction

Research Background

Transitioning into a green economy enables reduction in environmental degradation and promotes efficiency in resources, sustainability and low carbon emission. The Global Green Economy Index (GGEI) in Malaysia is still at its infancy. Malaysia ranked 65 out of 80 countries in this index (Tamanini, 2016). The major concern of economic losses derives from weather and climate-related calamities which also includes industrial activities contributing to this effect (Shafaei et al., 2020). Malaysia has pledged under the Paris Agreement to diminish Greenhouse Gas (GHG) emissions by 45% by 2030 (Ministry of International Trade and Industry, 2017).

There is a total of 633,344 enrolments in the private Higher Educations Institutions (HEIs) of Malaysia whereby undergraduates comprise 313,214 enrolments (Department of Higher Education, 2019). The unemployment rate rocketed in May 2020 at 5.3% (Department of Statistics Malaysia, 2020a) while the graduates unemployment rate in 2019 is at 3.9% (Department of Statistics, Malaysia 2020b). There is a dire need to create more jobs to address this issue. Chief Economist and Head of Research of AmBank stressed a need in focusing new area for green jobs to perpetuate sustainability in the economy (Dass, 2018). The concept of Green HRM is depicted in two; "conserve and develop knowledge capital, and the implementation of eco-friendly HRM practices" (Deshwal, 2015; Prasad, 2013; Mehta & Mehta, 2017; Rana & Jain, 2014; Sheopuri & Sheopuri, 2015).

Problem Statement

The GGEI is at an advent stage in Malaysia. This is conspicuous in a study by the Asian Institute of Finance (AIF) revealing only 26% of Human Resource professionals voiced out in readiness to implement the Green HRM practices (Asian Institute of Finance, 2017). Thus, denoting an initiation phase for Green HRM. With effect of the rising unemployment rate, the former Human Resource Minister of Malaysia, M. Kulasegaran implied that the green economy is projected to produce a surge of job opportunities (Carvalho et al., 2019). According to the executive director of Malaysia Employers Federation (MEF), youths are gravitated to pursue jobs in organizations with green and socially responsible philosophies (Chin & Menon, 2020). However, it is unidentified, if any, the extent of the influence on each dimension of Green HRM towards the perception of undergraduates in the present milieu.

The Fourth Industrial Revolution on the basis of cyber physical-systems to augment digitization (Michalski et al., 2018) presents outlook to address ecological and sustainable matters (Bonilla et al., 2018; Estevez & Wu, 2017). Several researches have expounded on environmental achievements and green branding as a strategic tool to sell goods or deliver services (customer perspectives) (Alamsyah & Muhammed, 2019; Danciu, 2015; González-Rodríguez et al., 2019; Jamar, 2020). Nevertheless, in spite of the surge in precedent literatures related to Green HRM , the awareness and knowledge on the perspectives of potential employees are not entirely discerned (Chaudhary, 2018, 2019b). Thus, this research aspires to discourse the gap and uncover the current perception of undergraduates on this concept.

Research Objective

The purpose of the study is to investigate the perception of undergraduates on the relationship between Green HRM and Job Pursuit Intentions and also through the role of mediators; Employers' Attractiveness and Employers' Prestige.

Literature Review

Concept of Green HRM

The advent of green philosophy emerged in the early 1960s where in the United States central social movements issues comprised "civil rights, women's rights, consumers' rights and the environmental movement" (Babic & Tunc, 2020; Clark & Rempel, 2018; Kalva, 2016). It was surmised that the social and environmental factions greatly propelled companies to abide with policies designed to preserve the environment and the stakeholders (Shen et al., 2019). Green HRM is the amalgamation of HRM and environmental management (Jabbour & de Sousa Jabbour, 2016; Jyoti, 2019; Renwick et al., 2008; Sharma & Gupta, 2015).

Ability-Motivation-Opportunity (AMO) Theory

This model was expanded on the concept of high- performance work systems (HPWS) and its abbreviation stand for the three principles which boost human capital performance (Appelbaum et al., 2000).

The dimensions of Green HRM were coined under this theory (Arulrajah & Opatha, 2016; Jerónimo et al., 2019; Pham et al., 2019; Renwick et al., 2012). It is clarified that green behaviours may be fostered through incorporation of these three HPWS.

Green Job Positions and Descriptions (GJPD)

Green Job Positions and Descriptions stipulates tasks, duties and responsibilities reflected in environmental bearing (Ahmad, 2015; Arulrajah et al., 2015; Leszczynska, 2016; Renwick et al., 2008). Green jobs exhibited more cognitive skills, non-routine tasks and training juxtaposed with non-green jobs (Bowen et al., 2018; Consoli et al., 2016). Moreover, technical skills are required for green jobs (Bhiwajee & Docile, 2019; Colijn, 2014; Falxa-Raymond et al., 2013). In this viewpoint, it shows that green jobs require considerable insight and deepened re-training. An empirical study on the viewpoint of undergraduates towards GJPD displayed a positive bearing on Employers' Prestige (Nejati & Ahmad, 2015).

Green Recruitment and Selection (GRS)

This refers to the process of recruiting and selecting individuals equipped with EM behaviour, knowledge and skills (Castellini, 2019; Obaid & Alias, 2015; Peerzadah et al., 2018). Digitization can be used to diminish environmental deterioration (Bangwal & Tiwari, 2015; Kane, 2011; Mwita, 2019). It can be construed in the outlook of Industry 4.0 as it allows an automated recruitment climate. Also, a selection criterion like candidates' environmental stance permits an apt selection for the organization (Arulrajah et al., 2015; Hosain & Rahman, 2016; Mandip, 2012; Pham & Paillé, 2019). Bauer & Aiman-Smith (1996), a pioneer research on green recruiting efforts displayed affirmative

views. A similar discovery in Ali et al. (2017) empirical study was also noted. On the contrary, environmental information in recruitment websites did not entice individuals' attraction (Guerci et al., 2015).

Green Training and Development (GTD)

This represents a system of practices that govern the development of EM skills, knowledge and abilities through education and awareness (Das & Kumar Singh, 2016; Saeed et al., 2018; Tang et al., 2017). GTD can intervene in waste management and energy efficiency (Ahmad, 2015; Mandip, 2012; Sharma, 2016; Owino & Kwasira, 2016). Hence, it is pivotal for the success of other Green HRM components as it enables heighten green awareness. Past empirical studies revealed positive associations (Ali et al., 2017; Nejati & Ahmad, 2015).

Green Performance Management (GPM)

This comprises a system of appraisal concerning organizations' environmental interest, policies and responsibilities throughout one's profession (Ahmad, 2015; Jabbour et al., 2008). Renwick et al. (2008) expressed that there are challenges in measuring GPM standards across various business functions. Thus, creation of general GPM indicators for all levels allow a more systematic approach. Themes like green incidents, green responsibilities, green energy efficiency, etc. (Arulrajah et al., 2016; Peerzadah et al., 2018; Saeed et al., 2018; Tang et al., 2017). Feedback by superiors should be provided continuously (Ahmad, 2015; Arulrajah et al., 2015). With perspectives from future employees, the Green HRM which also comprise GPM scale showed significance on Job Pursuit Intentions (Chaudhary, 2018).

Green Pay and Rewards (GPR)

This refers to a system of monetary and non-monetary rewards which act as reinforcements for pro-environmental behaviours (Jabbour et al., 2008; Luu, 2018; Zaki & Norazman, 2019). Both remuneration styles should co-exist to intensify green behaviour. A prior research by Nejati & Ahmad (2015) exposed confirmatory findings between GPR and Employers' Attractiveness.

a) Green Pay and Benefits

Green base pay can be connected in the reward systems for accomplished green goals (Jackson et al., 2011; Langat, 2017; Mandip, 2012). Other financial rewards such as incentives, bonuses, (Labella-Fernández & Martínez-del-Río, 2019; Slavić & Berber, 2015) green travel benefits and green tax (Tang et al., 2017).

b) Green Relational Returns

Non-financial rewards for green achievements are public recognition, praise, special leave, gifts, etc. (Labella-Fernández & Martínez-del-Río, 2019; Mandago, 2018; Tang et al., 2017). Such green relational returns can increase one's worth to engage in green habits.

Green Employee Relations (GER)

Green Employee Relations refer to employers' facilitation for employee engagement, participation and empowerment (Ahmad, 2015; Ramus, 2001 as cited in Oyedokun, 2019). It has been addressed in past Green HRM conceptual papers as green employee involvement, participation and empowerment (Mandip, 2012; Pinzone et al., 2016; Renwick et al., 2008, 2012; Saeed et al., 2018; Tang et al., 2017). Organizations who authorize green innovative ideas to flow freely at any levels can be signified as transparent and ideal. The empirical study by Chaudhary (2019b) revealed Green HRM (included green employee involvement) relates affirmatively on Job Pursuit Intentions.

Job Pursuit Intentions (JPI)

This is defined as behavioural intentions of individuals towards the organization (Highhouse et al., 2003) which implies an active nature (Aiman-Smith et al., 2001; Boğan et al., 2020; Wayne & Casper, 2012). Therefore, it is signified as a dependent variable. Prior empirical studies presented affirmative discoveries between firm attributes such as Corporate Social Responsibilities (Kumari & Saini, 2018; Prihatiningsih et al., 2017; Truong, 2019), and Corporate Social Performance (Greening & Turban, 2000; Tsai et al., 2015; Wang, 2013) towards JPI. In addition, firm attributes like Green HRM also displayed positive findings on JPI (Chaudhary, 2018, 2019a, 2019b; Nejati & Ahmad, 2015; Ali et al., 2017).

Mediators

Both mediators; Employers' Attractiveness and Employers' Prestige have shown to mediate the relationship of Green HRM and JPI in precedent empirical studies (Chaudhary, 2018, 2019a, 2019b; Nejati and Ahmad, 2015). Moreover, these mediations offer relation with Social Identity Theory. As the theory states one would involve with favourable social groups (e.g. organizations that integrate Green HRM practices) to increase self-concept, both these mediators depict on the attractiveness and prestige level of the organization. Thus, it is proposed that individuals who deem

Green HRM as pertinent when seeking for jobs will strive to engage in such organizations as in their light, such social groups are attractive and prestigious. This justifies the introduction of the two mediators in the research framework.

a) Employers' Attractiveness (EA)

This is expressed as preliminary attitudes about the organization as a future workplace which denotes a passive nature (Highhouse et al., 2003). Precedent researches showed significant findings on Employers' Attractiveness intervening the relationship between firm attributes and JPI (Gomes & Neves, 2011; Phillips et al., 2014; Priyadarshini et al., 2019; Shaughnessy et al., 2016). It also mediates the relationship between Green HRM and JPI (Chaudhary, 2019a; Nejati & Ahmad, 2015).

b) Employers' Prestige (EP)

This represents the features of organizations which is defined by social consensus (Highhouse et al., 2003). Past empirical studies revealed positive findings on EP mediating the relationship between firm attributes and JPI (Devina et al., 2016; Shaughnessy et al., 2016; Wayne & Casper, 2012). In view of Green HRM as firms' features, EP intervenes the relationship (Chaudhary, 2018, 2019b; Nejati & Ahmad, 2015).

Signalling Theory

This theory was conceptualized by Spence (1973). It offers rationales where job applicants utilize limited information (signals) to draw assumption and comprehension of the organizations' environment (Ganesan et al., 2018; Renwick et al., 2012; Rynes et al., 1991; Pham & Paillé, 2019; Spence, 1973).

Social Identity Theory

This theory was theorised by Tajfel (1974) and defined as part of one's identity is ingrained to one's group affiliation. Moreover, it presents understanding that self-concept shapes a person to associate with illustrious social group (Yong et al., 2019; Shen et al., 2016) like green organizational image (Al-Ghazali & Afsar, 2020; Luu, 2018).

Table 1: Summary of Prior Empirical Studies between Green HRM and JPI

No.	Author(s)	Title	Journal	Key discoveries
1.	Bauer and Aiman-Smith (1996)	Green career choices: The influence of ecological stance on recruiting	Journal of Business and Psychology	• Potential United States recruits expressed positively when discovered proactive company's environmental stance
2	Nejati and Ahmad (2015)	Job Seekers' Perception of Green Human Resource Management	Conference on Green Human Resource Management	• GPR positively influence EA, GJPD positively impact EP • The most prominent; GTD positively relate EA and EP • The outcome variables from Green HRM significantly influence JPI of job seekers in Malaysia
3.	Guerci et al. (2015)	Green and non-green recruitment practices for attracting job applicants: exploring independent and interactive effects	The International Journal of Human Resource Management	• In Green Recruitment; green reputation attracts Italian applicants, but no impact on environmental information in recruitment websites
4.	Ali et al. (2017)	Impact of Green Human Resource Management Practices on Job Seekers' Attraction	Journal of Resources Development and Management	• Green recruitment and green training have assenting influence on Pakistani job applicants

				• Moderator: Employer reputation increases the above association
5.	Chaudhary (2018)	Can green human resource management attract young talent? An empirical analysis	Evidence-based HRM	• Green HRM relates significantly with JPI of future applicants in India. EP mediated the association. • Environmental Orientation revealed significant moderation between Green HRM and JPI • Moderator: Gender no impact
6.	Chaudhary (2019a)	Effects of green human resource management: testing a moderated mediation model	International Journal of Productivity and Performance Management	• EA partially mediated perceived Green HRM and JPI. • Moderator: Environmental Orientation strengthen the relationship
7.	Chaudhary (2019b)	Green human resource management and job pursuit intention: Examining the underlying processes	Corporate Social Responsibility and Environmental Management	• The effect of Green HRM on JPI through EP was significant, however EA showed insignificance • EP and EA sequentially mediated the relationship

The differences of this conceptual study as compared with Chaudhary (2018, 2019a, 2019b) is this paper integrates another theory which is AMO Theory to clarify on the Green HRM components. Green HRM practices like GJPD, GRS and GTD can effectively boost green behaviour as it highlights on one's ability. Next, GPM and GPR can motivate one to engage in environmental activities. Lastly, the third HPWS; Opportunity is linked to GER through an open and encouraging employer-employee relationship towards green practices. Moreover, this study treats the dimensions of Green HRM as an individual component rather than a unified or whole term in its framework. Thus, these components can be highlighted as the novelty of the study.

Green HRM studies in Malaysia, specifically on the intentions of job pursuit can be seen in an empirical study by Nejati and Ahmad (2015). The differences of this conceptual paper with Nejati and Ahmad (2015) is the extension of related theories where two more theories which are AMO Theory and Social Identity Theory are introduced. Next, this study integrates the 'Recruitment' and 'Selection' as one practice. Lastly, this study extends by introducing an additional Green HRM practice which is Green Employee Relations in the research model.

Proposed Research Framework

The paper proposed the following research framework which was supported by research objective, related theories and precedent literatures. The AMO Theory propounds understanding on the dimension of Green HRM (Fawehinmi et al., 2020; Renwick et al., 2012). Meanwhile, Signalling Theory and Social Identity Theory offer explanation for job applicants' JPI in attractive and prestigious organizations (Catano & Morrow Hines, 2016).

Fig. 1: Proposed Research Framework

Direct Effect

Green HRM practices were linked to AMO Theory; develop green abilities, elevate motivation in green behaviour and provide green opportunities (Renwick et al., 2012). This can be classified as GJPD, GRS, GTD (A); GPM, GPR (M) and GER (O). The Signalling Theory states each organizational practice are construed as signals sent by the organization (App et al., 2012). It is assumed that one who perceive Green HRM as favourable signals, will vigorously pursue such establishments. This can be viewed from precedent empirical studies (Ali et al., 2017; Chaudhary, 2018, 2019b) which relate significantly on JPI.

Thus, it is proposed that:

P1: There will be a positive relationship between GJPD and JPI.

P2: There will be a positive relationship between GRS and JPI.

P3: There will be a positive relationship between GTD and JPI.

P4: There will be a positive relationship between GPM and JPI.

P5: There will be a positive relationship between GPR and JPI.

P6: There will be a positive relationship between GER and JPI.

Mediating Effect: Employers' Attractiveness

Grounded by the assumption from Social Identity Theory where one engages in a social group as long as it fulfils self-concept (Tajfel, 1974). Thus, it can be attributed in EA as affiliating in Green HRM organizations may fortify one's self-worth. This sentiment is also shared by Chaudhary (2019c). Similarly, AMO Theory and Signalling Theory offer clarification of the dimensions of Green HRM. For instance, enrichment of (A) by acquiring and developing green talents, intensify (M) through green remuneration and performance evaluation, and enable (O) via knowledge-sharing at all units (Gholami et al., 2016). Meanwhile, it is put forward that HR practices signal to individuals what is proffered by the organization (Latorre et al., 2016). Job seekers who remark Green HRM determinants as upmost merit may be lured in pro-green firms. Related research discovered EA to mediate the relationship between Green HRM and JPI (Chaudhary, 2019a; Nejati & Ahmad, 2015).

Therefore, it is conjectured that:

P1a: EA mediates the relationship between GJPD and JPI.

P2a: EA mediates the relationship between GRS and JPI.

P3a: EA mediates the relationship between GTD and JPI.

P4a: EA mediates the relationship between GPM and JPI.

P5a: EA mediates the relationship between GPR and JPI.

P6a: EA mediates the relationship between GER and JPI.

Mediating Effect: Employers' Prestige

Affiliating with renowned social groups are yearned by some. As mentioned in the Social Identity Theory, part of one's self identity is influenced by the social group (Tajfel, 1974). It can be implied in the mediating variable; EP. Besides, AMO Theory and Signalling Theory posit explanation on Green HRM. Similar precedent literatures exhibited EP to intervene the relationship between Green HRM and JPI (Chaudhary, 2018, 2019b; Nejati & Ahmad, 2015).

Hence, it is hypothesized that:

P1b: EP mediates the relationship between GJPD and JPI.

P2b: EP mediates the relationship between GRS and JPI.

P3b: EP mediates the relationship between GTD and JPI.

P4b: EP mediates the relationship between GPM and JPI.

P5b: EP mediates the relationship between GPR and JPI.

P6b: EP mediates the relationship between GER and JPI.

Conclusion

This is a review paper. A detailed analysis will be done in the near future. The paper underlies theories from AMO Theory, Signalling Theory and Social Identity Theory. These theories are used to explain individual-level behaviour in relation to Green HRM (Kim et al., 2019; Nejati & Ahmad, 2015; Tahir et al., 2020). Empirical studies which researched on the perception of Green HRM on the Job Pursuit Intentions as separate/individual components are limited. As from these several studies, this contemporary variable is generally treated as either an amalgamation or a fragment of the various components of Green HRM. Thus, the research seeks to comprehend the significance of each Green HRM dimension.

Abstract

The outbreak of COVID-19 has swept its abrupt impacts in education around the globe. The higher education institutions in Hong Kong are in no exception. Instructors of a business subject were given limited time to plan, design, and implement emergent remote teaching, which is a transformation from conventional face-to-face teaching. To meet the ends, the instructors adopted the TetraMap® model, and deployed the four nature elements to shift the mindset on pedagogical design of various learning and teaching materials for 344 students. Without enormous adoption towards high-end technologies, the instructors made the mindset shift to explore new solutions that support students in their learning amid the coronavirus pandemic. The results were encouraging that positive feedback on emergent remote teaching was well received from students. Educators may further explore the application of TetraMap® model in their online and face-to-face teaching.

Keywords: mindset, emergent remote teaching, learning

Introduction

The unprecedented COVID-19 pandemic has disrupted the learning and teaching ecology with the sudden shutdown of schools and pressing need to transform face-to-face (F2F) teaching into emergency remote teaching (ERT) (Chen and Hu, February 26, 2020). Like other faculties around the globe, two instructors of a business subject were inundated with expectations: become nimble learners with digital technology, re-design semester-based curriculum and prepare teaching materials ready for remote teaching within a tight schedule (Lederman, March 18, 2020). The instructors were primarily familiar with conventional classroom teaching through which they interacted with students directly. Knowing most students were not completely prepared for the abrupt transition to remote instruction, the instructors believed the mere digitalisation of PowerPoint slides could hardly connect and engage students throughout the remote learning journey. Therefore, they adopted novel perspectives to transform face-to-face teaching into emergent remote teaching.

This paper reported the transformation of teaching pedagogies in a business subject with 344 students enrolled in spring 2020. Instead of replicating the face-to-face pedagogy over online platform, the instructors adopted the TetraMap® model, including the four elements (TetraMap®, n.d.), instigated "mindset shift" to rethink and experiment different teaching practices that could support students' learning in this exceptional era. Student evaluation of learning on ERT is comparable with student feedback in F2F mode.

The four elements of TetraMap® model

TetraMap® is a well-proven learning model that helps to unlock everyone's potential, understand diversity, and improve team performance. It uses four basic elements of nature: Earth, Air, Water and Fire to assist in defining aspects of people's nature. Individuals are unique with various orientations on the four basic elements that guide their thinking and influence their behaviours. The key ideas of the four elements are discussed below.

Earth element – like a mountain is firm (TetraMap®, n.d.)

Cite this Article as: Ivy CHAN, Carmen SUM and Joyce CHENG "Support Students to Learn – Use of TetraMap® to Shift our Mindset in Emergency Remote Teaching" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

- Individuals are confident and bold with their decisions. They are firm and conscientious to accomplish predefined goals.
- Typical question raised: "Where should we head to?"

Air element – like the wind is clear (TetraMap®, n.d.)

- Individuals are focused and methodical. They turn idea into detailed and orderly procedures.
- Typical question raised: "What are the next steps?"

Water element – like a lake is calm (TetraMap®, n.d.)

- Individuals are considerate and people-oriented. They show patience and are able to hold the team cohesion.
- Typical question raised: "How does this work affect others?"

Fire element – like the sun is bright (TetraMap®, n.d.)

- Individuals are inspirational and action-oriented. They stay open and explore different possible directions.
- Typical question raised: "Why not give a try?"

TetraMap® Adopted in a Business Subject

Prior to the outbreak of COVID-19, F2F learning mode was unanimously adopted across schools where students and instructors learned and interacted directly. The unexpected halt of schools induced immense stress to different stakeholders. Students and parents were not fully prepared for the novel learning experiences, such as hardware requirement and attention span. Instructors had to make swift move to ERT and curriculum transformation with limited time while they were uncertain their students could continue the learning pace as expected.

In a business subject, two instructors were pressed to restructure the 13-week face-to-face teaching as remote learning, ranging from pre-recorded teaching slides, assessments, online exercise, and interactive discussion. The adoption of TetraMap® model inspired the instructors to understand self-inclinations on four elements, value the difference from each other, embrace the new perspectives to develop sensible and feasible teaching strategies within the tight schedule (Table 1).

Four major learning and teaching constituents for ERT were considered while the four TetraMap® elements were deployed to derive a synergetic mindset shift to support students' learning. The Earth element helped the instructors to stay firm with the learning outcomes. The instructors connected and taught students with a consistent schedule for the learning outcomes via TEAMS as a well-suited tool. Synchronous and live lectures were essential to the students, in which the instructors can externalise new ideas to the students and support them to combine and foster with their resided knowledge that they learned before.

By adopting the Air element, the instructors organised weekly learning topics systematically, which corresponded to the learning goals on learning management system. This practice ensured the fit between know-who and know-how. Considering the disparity in IT devices and remote learning infrastructures, the instructors provided both learning and teaching materials that can be used at synchronous and asynchronous modes.

The Water element ignited more empathy to the students, particularly those who were less privileged or unable to engage in live lectures. Students were encouraged to embrace change together, and more student-driven learning activities were introduced, e.g., theme-based discussion, instead of mere lecturing by instructors. More encouragement on effort, embrace of mistakes and guided inquiry of knowledge can build students' confidence to progress.

Hesitation to show face or speak up in online platform presented more challenges to the instructors to ensure the students can progress accordingly. The Fire element transcended the instructors' idea about what they can do other than live virtual classroom learning. The pre-recorded videos prepared by the instructors, links to access relevant

videos (e.g., snap judgment in interview), and short articles posted on the Learning Management Systems enabled students to master the pertinent knowledge and learn at their own autonomy and pace. Therefore, the instructors designed content in small doses that enabled the students to comprehend easily.

Table 1: Four Elements of TetraMap®

	Earth	**Air**	**Water**	**Fire**
Mindset	Be sturdy	Be systematic	Be empathetic	Be innovative
Subject learning objectives	Follow the stipulated subject intended learning outcomes	Develop weekly learning topics and develop a visible learning progress	Embrace change, be flexible and have fun of the new attempts	Empower students to take the lead for better strategies; cutting back on traditional lecturing time
Teaching & learning materials (Asynchronous)	Mastery of knowledge	Neat and visible learning flow in learning management system	Be empathetic and care well-being	Encourage students to set their own pace
Teaching & learning materials (Synchronous)	Externalise and combine knowledge and good practices	Ensure fit between know-who and know-how	Appreciate efforts, trials and errors	Learn with bite-sized doses

Students' Feedback on Emergent Remote Teaching

Regarding teaching and learning design, the two instructors had been working as a team and teaching for a business subject in 2018/2019 and 2019/2020. In order to understand the learning impacts of ERT on students, a comparison of two student evaluation surveys' results was made (Table 2). At the end of the spring semester, students who enrolled in the business subject were invited to complete subject evaluation surveys. They were invited to rate their learning experiences along with a five-point scale from strongly disagree to strongly agree. There were 344 and 351 students enrolled in 2019/2020 and 2018/2019 respectively. The response rates were comparable: 184 (53.5%) and 203 (57.8%) completed and valid surveys were returned in 2019/2020 and 2018/2019 respectively.

The shift of mindset helped the instructors to face hectic situation, plan and reorganise the teaching pedagogies to support the students' learning (Shah 2016). In essence, the students had clear understanding about the learning objectives, and were able to progress accordingly. The distinctive learning modes did not undermine their participation or engagement in class.

Table 2: Students Feedback on Teaching

Students' Feedback on Learning	**2019/2020 Emergent Remote Teaching (n =184)**	**2018/2019 Face-to-Face Teaching (n = 203)**
1. I have a clear understanding of what I am expected to learn from this subject.	3.97	3.89
2. The learning materials, e.g. prescribed textbook, handouts and/or reference materials, have helped me achieve the subject learning outcomes.	3.99	4.03
3. The tests/assignments have helped me achieve the subject learning outcomes.	4.01	3.96
4. I understand the assessment criteria.	3.83	4.00

5. Relative to the subject learning outcomes, the amount of work required for this subject is reasonable.	3.96	3.92
6. I am encouraged to think about the material in a critical manner.	3.94	3.95
7. I am encouraged to find information on my own and learn independently.	3.87	3.97
8. I found the lectures stimulating.	3.84	3.89
9. There have been sufficient opportunities for me to ask questions/raise issues.	4.09	3.91
10. Students were encouraged to participate actively in class.	4.01	3.98

Conclusion and way forward

The emergent remote learning experience reported in this paper showed that the shift of instructors' mindset has yielded the positive outcomes on students' learning in spite of the absence of cutting-edge technologies. The unprecedented disruption amid the COVID-19 outbreak serves as a wake-up call to educators to revisit their habitual stickiness on conventional F2F learning (Bishop 2020; Oblinger 10 August 2020; Shah 2016).

In the long run, educators can utilise the four elements of TetraMap® model to design new instructional strategies to support students' learning, no matter in online or F2F mode. The Earth element addresses what to be achieved – outcomes. Educators have to plan the learning outcomes of a course or subject and then each learning topic. These learning outcomes have to be "SMART", that is simple, measurable, achievable, relevant, and time-based. Educators should then communicate these SMART goals to students via the learning platform or teaching plan. An outcome-based approach would guide the teaching process for instructors and facilitate the learning strategy for students.

The Air element addresses how the learning goals are to be achieved – processes. Educators could adopt different activities and feedback that help students understand the visible path to harness their learning capacity (Horspool and Lang 2012). Lesson plans could be used to specify the teaching contents, resources, references, and learning outcomes for each topic. The learning platforms or formats, for example, face-to-face, asynchronous, or synchronous settings, should also be announced in advance, which enables students to prepare well for the lessons. For example, students have to know "what are the key learning points in this topic?"; "what are the assessment criteria of my report?" and "how could I improve my presentation style next time?"

The Water element may encourage educators to balance students' psychological state, anxiety level, peer relationship when they have to improve the pedagogical competence (Biddix et al. 2015; Martin 2020). Educators should first understand students' ability and learning behaviours under different learning modes, and then adjust or balance the teaching materials for different students and teaching settings. Greater patience and empathy would instil greater harmony between instructors and students, and that would enhance students' commitment and involvement in their study.

In addition, educators may exert their Fire element to stimulate students to acquire the essential digital skills that enable them to learn in a new era, as well as the resilience to embrace change as lifelong learners (Tull et al. 2017). Educators might introduce different possible directions and suggestions to students in different learning situations. Various types of teaching and learning activities could be explored to motivate and engage students in the learning process. They should also adapt to any unprecedented changes or challenges with an open mind and respond in a fast and positive way. Educators with this kind of mindset and action would become the role models for students.

Abstract

Sentiment analysis is a process that uses natural language processing and machine learning to extract and identify the emotion associated with a text or an image. In the literature, we find different approaches to sentiment analysis that predominantly fall into two categories: machine-learning-based and lexical-based. When using machine learning for sentiment analysis, usually a classifier is required. When applying lexical-based methods, a list of known words, with each word having an associated sentiment, is used. The aim of the paper is to analyze the opinion of Instagram users towards the lockdown and social distancing caused by the COVID-19 pandemic, which spread rapidly worldwide at the beginning of 2020, with the use of various sentiment analysis tools. All the data collected for this study is public data gathered with the help of a tool called Phantombuster and is composed of over 15,000 posts. The posts were selected using several relevant hashtags and for the actual sentiment analysis process, Google Cloud was used. The collection and interpretation of the data are described in depth in this paper, providing suitable examples and possible explanations for the obtained result. The study might have importance for decision makers, but also for researchers, who have to choose or combine several sentiment analysis instruments in order to obtain meaningful results in their field of study.

Keywords: sentiment analysis tools; opinion about social distancing; opinions about COVID-10 pandemic; Instagram social network.

Introduction

Humans have always had the desire to express themselves, whether it is through their attires, their preferred activities, or their opinions regarding varying topics. With the rise of the Internet and different social media platforms, such as Instagram or Facebook, this desire became easier and easier to be fulfilled. Having this possibility of being heard is not only beneficial on an individual level but is also influential to the business landscape, especially but not exclusively when it comes to marketing. Companies are now able of gathering feedback in real-time from customers and can adapt their products to better fulfill their customers' needs and improve their strategy. Also, policy and decision makers can "hear" people voice before undertaking a certain action. This process of analyzing people opinions in online environments is called sentiment analysis and it is sustained by modern technologies, such as machine learning (ML) or natural language processing (NLP) tools. As it is said it generates a lot of economic value and improves our day-to-day lives, the current paper focuses on presenting a case study for sentiment analysis in the context of revealing various technologies, techniques, and tools for this. The case study is very actual, as we debate upon social distancing opinions in COVID-19 period on a well-

known social network – Instagram. The case study underlines how a performant sentiment analysis can be done combining various tools in a newly developed web-application.

Supporting Technologies and Techniques for Sentiment Analysis

There are to main techniques for sentiment analysis: machine-learning-based and lexical-based [1]. When using machine learning for sentiment analysis, usually a classifier is required. Classifiers make use of data labels and generate tags, such as positive, negative, or neutral. However, as mentioned in [1], labeling could be time-consuming or not even allowed in some cases. The other approach is lexical-based, using a list of known words, with each word having an associated sentiment. Creating this dictionary is not easy nor complete as slang, for example, is rarely included [1].

There have been some comparative studies [1], [2], [3] between lexical-based and machine-learning-based sentiment analysis, each using different data sets and evaluation metrics. In [1] the authors compare eight sentiment analysis methods, which are considered among the most popular in scientific literature, and use two different datasets, a near-complete log of Twitter messages, collected throughout three and a half years and six sets of messages rated as positive and negative by humans. The methods compared are emoticons, Linguistic Inquiry, and Word Count (LIWC), SentiWordNet, SenticNet, SailAil Sentiment Analyzer (SASA), Happiness Index, and PANAS-t. All these methods were evaluated and compared in terms of coverage, degree of agreement, prediction performance, and polarity. The authors also implemented a web service based on a combined method that relies on the methods previously analyzed. They concluded that combining all the methods does not lead to the best performance but combining some of the methods, in terms of the data is the best approach.

Another comparison study is conducted in [2], where two machine-learning-based approaches, Naive Bayes (NB) and Support Vector Machine (SVM), and one lexical-based approach, SentiWordNet, are analyzed. The dataset used consisted of two online Indian news archives, from which the political news about two parties was extracted. Their focus was on the polarity and the implementation steps included tokenization, stop word removal, lemmatization, and pos tagging, performed using NLTK and Stanford POS tagger. Among the sentiment analysis methods, the best F-measure was SVM.

Furthermore, in [3] a supervised structured machine learning and a lexicon-based technique are compared. The lexicon-based sentiment classification was performed using Apache Hadoop and for the machine-learning method, Stanford Sentiment Treebank and Recursive Neural Tensor Network (RNTN) are introduced. The Treebank contains fully labeled parse trees constructed from movie reviews. The tests were based on a sample Zooniverse dataset and the experimental evaluation shows the RNTN method has a better performance score that the lexicon-based in terms of accuracy. However, the lexicon-based shows better performance on positive comments.

When it comes to lexical resources, a tool that is heavily mentioned in literature studies [1], [2], [4] is SentiWordNet. It is based on an English lexical dictionary called WordNet, which groups words into synonym sets, called synsets [4]. SentiWordNet assigns three different scores to a synset to indicate the sentiment of the text (positive, negative, and neutral); scores that have values of [0, 1] and add up to one [4]. In [1] the average score of a given text was determined by computing the synsets of all the words and comparing the positive and the negative scores. However, there are other approaches, such as [5], where an improved SentiWordNet, which modifies the objective words, is proposed. Given the advances made in machine learning and data mining, a considerable number of sentiment analysis research papers focus mostly on this approach. As previously mentioned, machine-learning tools use classifiers for determining the polarity of a word [6].

The approaches described so far focus only on textual sentiment analysis, however, some studies that explore sentiment analysis on visual content [7], [8], [9]. Some only propose solutions for visual sentiment analysis [7], while others try to combine textual and visual sentiment analysis methods [8], [9]. In [7], the authors used images from which they automatically extracted the so- called objective text description. They concluded that the objective text extracted from the pictures provides better results than the subjective text provided by the user and suggest that their methods could be used for other image-text association tasks. Compared to [7], the methods presented in [8] and [9] combine visual and textual sentiment analysis by using deep learning techniques. The authors of [8] propose a model in which visual and textual sentiment representations are obtained through multi-layer Convolutional Neural Networks (CNN). The visual sub-network consists of five convolutional layers and takes 244×244 pixels RGB images as input, while the textual sub-network uses pre-trained distributed representations of words. The two network representations are combined in a pooling layer. The method proposed was tested on two data sets the Visual Sentiment Ontology (VSO) dataset and the Multilingual Visual Sentiment Ontology (MVSO) dataset, and proved to effective on VSO, having 1.3% accuracy gain [8]. Another approach to textual and visual integration for

sentiment analysis is explained in [9], where a bag of affective words (BoAW) that provides "visual cues" for sentiment analysis is introduced.

Sentiment Analysis Tools

Currently, there are several applications for sentiment analysis, each having features meant to address a specific purpose. Some are further described. MonkeyLearn [10] is a user-friendly machine learning platform for analyzing text. It uses a pre-trained sentiment analysis model and offers integrations with different applications, such as Excel or Google Sheets. Moreover, the platform allows the user to build a custom model for sentiment analysis; model that you can also test on the same platform. It has a free plan and multiple premium plans. Lexalytics [11] is another text-analysis tool, which focuses on the customer's response to the business. It uses NLP to analyze the text and compiles the information in a visualization dashboard. The data is collected from social media platforms and has applicability in multiple domains, such as the airline industry. It does not have a free plan, as MonkeyLearn has. Brandwatch [12] is another platform that provides consumer insights. Compared with the previous two tools, Brandwatch also has an image insights tool that can identify images associated with a certain brand. This information extracted based on images includes metrics like mention volume, aggregate followers, and latest activity. Brandwatch is a tool for brand management that allows companies to monitor changes in sentiment, understand customer opinions, and track fluctuations in brand health. The platform is not free. Repustate [13] is another tool for assessing the sentiment behind a customer's feedback. It has support for multiple languages, such as Chinese, French, and German, and can determine the sentiment behind slang, such as LOL, FYI and TBH, and also Emojis. Moreover, it allows the user to alternate meanings of words allowing full control over how the software analyzes customers' feedback. It is not a free platform, too. Comprehend [14] is a service provided by Amazon that uses machine-learning algorithms to identify the sentiment of the customer. It has several features for discovering insights and relationships from data, such as identifying the language of the text or organizing a collection of text documents by topic. Unlike the other tools mentioned above, this tool does not offer a visual dashboard or platform, but rather a functional API, with a pay-per-use policy. Google Cloud [15] works similarly to Amazon, offering a large variety of services, among which a service for NLP, called Cloud Natural Language. The sentiment analysis tool identifies the author's emotional opinion as positive, negative, or neutral. It supports a variety of languages, but unlike Amazon Comprehend one can, but is not required to specify the language of the text to be analyzed. If the language is not specified, it will be automatically determined when running the sentiment analysis method.

As it can be observed, each of the applications that are mentioned above has useful features, necessary to provide accurate sentiment analysis. Some of them are more versatile, letting business users customize their input more, while others are more restrictive in that sense. Furthermore, their price range varies a lot, with some being more affordable than others. A detailed analysis of these applications' features is presented comparatively in the table below.

A Case Study for Sentiment Analysis

As previously mentioned, sentiment analysis can be used to extract insights from public posts regarding different topics. In this paper, we have chosen to analyze the opinions of Instagram users towards the lockdown and social distancing from COVID-19 pandemic, which spread rapidly worldwide at the beginning of 2020. As tools, we used several ones, like Phantombuster, Google Cloud or Amazon Comprehend, but also created our own Node.js application, which calls other APIs.

Data collection

To automatically extract the data from Instagram, a specialized tool called Phantombuster [16] was used. Phantombuster has many automations (called "Phantoms") that can extract data on behalf of a user from all major social networks and websites (e.g. Facebook, Twitter, Instagram or LinkedIn) and offers the possibility to create automations for custom websites as well. In this case, an Instagram predefined Phantom (Instagram Hashtag Collector) has been used to scrape public data, with the setup from Figure 1 - a. To scrape Instagram posts by hashtag, one must authenticate so the automation will act on his behalf, that is why a session cookie is provided for this setup. The number of posts it scrapes per hashtag is 5000 (Max Posts), keeping track of data and removing duplicates. The program runs every day and collects the data in CSV and JSON format. The targeted hashtags are specified in a public Google Spreadsheet, per row, in the first column: see Figure 1-b.

Figure 1: (a) Instagram Hashtag Collector Setup. (b) Hashtags Spreadsheet for Sentiment Analysis

Analysis with Google Cloud

After gathering the data, it was analyzed with Google Cloud, since this tool is easy to integrate and work with. Initially, the data was organized as a JSON file, containing an array of over 25,000 posts. From this initial file, we extracted first the descriptions with more than three characters, obtaining an array with 24,940 posts. The sentiment detection API from Google needs the language of the input, and, for this, we used another API from Amazon Comprehend to detect the language of the posts. Since the file size was quite large, an asynchronous dominant language detection job for language detection was used. Amazon Comprehend examines the text to determine the dominant language, using identifiers from RFC 5646. The response contains a score that represents the confidence level that a particular language is a dominant language in the document. Using the language response, only posts having English as a dominant language were kept for further processing, the others being discarded. This is since all the posts that will be used for sentiment detection must have the same language. The remaining descriptions from the Instagram posts (over 15,000 posts) were written in a plain text file, line by line, and then analyzed with Google Cloud, like in Figure 2.

Figure 2: Part of file with Instagram Posts Descriptions

All the scripts for document processing, as well as API calls (Amazon Comprehend and Google Cloud), were implemented using Node.js; the function used for obtaining the sentiment scores is depicted in Figure 3. The analysis for the posts was performed by firstly reading the description txt file, line by line, since each description was written on a separate line, then collecting the lines in an array. After the file was read, the array contained all the descriptions and the *getSentiment* function was applied to each of its elements.

```
async function getSentiment(text) {
  // Imports the Google Cloud client library
  const language = require("@google-cloud/language");

  // Instantiates a client
  const client = new language.LanguageServiceClient();

  const document = {
    content: text,
    language: "EN",
    type: "PLAIN_TEXT",
  };

  // Detects the sentiment of the text
  const [result] = await client.analyzeSentiment({ document: document });
  const sentiment = result.documentSentiment;

  return sentiment;
}
```

Figure 3: Function to Determine Sentiment Scores

Interpretation of Results

The response sentiment has a score and a magnitude, the score indicating the overall emotion of the text, and the magnitude showing the presence of the emotional content, this value being proportional to the length of the text. If the text has a score of 0.0 could mean either that the text is neutral or that has both high positive and negative values. These cases can be interpreted using the magnitude score, a low magnitude value meaning the text is neutral, while a higher value being specific to mixed texts. Google offers in the official documentation an interpretation of the sentiment using the score and the magnitude as a guideline (see Figure 4); however, it can be adjusted for specific scenarios.

Sentiment	Sample Values
Clearly Positive*	"score": 0.8, "magnitude": 3.0
Clearly Negative*	"score": -0.6, "magnitude": 4.0
Neutral	"score": 0.1, "magnitude": 0.0
Mixed	"score": 0.0, "magnitude": 4.0

Figure 4: Interpretation of Sentiments from Google

For the interpretation of the result, the maximum, the minimum, and the average of the scores and magnitudes were computed. The values of these computations are highlighted in Figure 5.

Scores

(index)	max	min	avg
0	0.8999999761581421	-0.8999999761581421	0.22452158181807275

Magnitude

(index)	max	min	avg
0	17.200000762939453	0	0.8117658727026378

Figure 5: Maximum, Minimum and Average of Scores and Magnitudes

Given these values, the posts with a score higher or equal than 0.2 are considered positive, the posts with a score between -0.2 and 0.2 are either mixed or neutral, and the posts with a score lower or equal than -0.2 are negative. The value of the magnitude is a key element for differentiating between mixed and neutral posts, a value higher or equal than 0.8 indicating a mixed emotion, while a value lower than 0.8 represents a neutral emotion. The threshold of 0.8 was chosen since it is close to the mean of magnitudes.

```
//interpretation
const positive = sentArray.filter((el) => el.score >= 0.2);
const negative = sentArray.filter((el) => el.score <= -0.2);
const neutral = sentArray.filter(
  (el) => el.score > -0.2 && el.score < 0.2 && el.magnitude < 0.8
);
const mixed = sentArray.filter(
  (el) => el.score > -0.2 && el.score < 0.2 && el.magnitude >= 0.8
);
```

Figure 6: Filtering of Sentiments

After categorizing the posts according to the sentiment that they possess, the result are presented in Figure 7.

```
{
  "positive":0.6128414939949848,
  "negative":0.04883199155338524 6,
  "neutral":0.2815758215652633,
  "mixed":0.05675069288636664
}
```

Figure 7: Sentiment Scores

The interpretation of the emotion extracted from the given text can be better visualized in the graph below, where the feeling expressed on Instagram during quarantine was mostly positive.

Figure 8: Pie Chart of Sentiment Scores

The fact that the sentiment score for the positive feeling was the highest could be regarded as unexpected, given that it was a difficult and stressful time for everyone. However, it is possible that due to the problems caused by the pandemic and the lockdown and also due to the abundance of worrying news that was broadcasted in a short period, people felt the need to share positive thoughts and be supportive and encouraging with each other.

Another important factor is the extra free time that a lot of people had while staying at home, which made some of them try new things or discover new passions like these individuals (sample from the collected data):

"5 Crazy Exercises using the socks 🧦 at Home 🏠 give it a try 🏃 #stayhome #fitterplanet #summervibes #fitnessvideo #armenia #yerevan #foryourpage #foryourlife #lesmills #onefamily"

"Quiche 💛 What I love about this dish is that you can be so creative 😊 my version had spinach, mushrooms and feta cheese. By the way - it is spinach season right now 🌱 #quiche #stayhome #veggie #selfmade #baking #bakinglove #spinach #seasonalfood #seasonability #foodconcious"

Furthermore, a lot of businesses, such as gyms or restaurants, moved online during the lockdown and used platforms, such as Instagram to promote their services and attract customers. Online marketing has become quite essential for a lot of companies that managed to maintain a stable client base through the lockdown. Businesses who understood how to leverage this situation to their benefit continued to produce revenue or even had larger profits than before as people had more free time to invest in other activities, as previously mentioned.

*"Sunday's Online Classes 8:30 Am Deep stretch w/ Rasha Salhoub […] **Payment methodsVia Bank transfer Or Vodafone cash: Or Payme store (will send you a link to pay via fawry) Please make sure to take a picture of your payment receipt and send it to us and will send you the link to the class. [...]"*

Additionally, there was a big movement for celebrating doctors and nurses who were on the frontline and who put a lot of effort to treat many incoming patients. Among the collected data several posts resembled this:

"Happy (Maryland) Health Care Heroes Day to all doctors, nurses EMTs, and first responders! 🚑🚐🚨🏥🏥💉🧬🌡 May 2nd, 2020: You are not just essential workers, you are front line heroes. The challenges you face on a daily basis, risking your own life and well-being of your families, is truly an inspiration. We thank you for all you have done and continue to do. ❤️❤️❤️❤️ [..]"

Finally, the second largest category of sentiments is represented by the neutral one and the reason for that is that not all Instagram users post images or videos with long descriptive captions, but rather, short, and concise ones.

Some users type descriptions formed by a couple of words or hashtags, while others add only emojis or choose solely to tag their friends in their photos. Examples of these types of descriptions can be observed below.

"#drawing #eyes #sketching #stayhome"

" 🍉🍋🥝 #selfportrait #stayhome"

"Veg pizza #stayhome #staysafe"

Moreover, a lot of users described their activities objectively, without any "emotion" that can be extracted from their input.

"Playing with my best dog park friend Uma (black dachshund) and new friend Chubby (pug mix)"

"This Corona virus has a very big ego, He will not come to your house unless you go out and invite him. Stay Home! #stayhome #staysafe #stayhealthy #keepsafedistance #stopspreadcovid #gitanjaliindia #teamgitanjali #love"

To sum up, based on this dataset, it can be concluded that people expressed mostly positive opinions during the lockdown from the beginning of 2020. While the individual intention of their posts is difficult to pinpoint, a hypothesis is that they wanted to find positive activities to focus on, as a distraction from the difficult reality of the time.

Conclusions

This paper presents a proof of concept for sentiment analysis used as a tool in determining the general feeling regarding a current problem. The data consists of over 15,000 public Instagram descriptions, written in English, and collected at the beginning of 2020. Amazon Comprehend was applied for the language selection, and Google Cloud for the sentiment analysis process. The score and magnitude of the posts were classified using the maximum, minimum, and average of these values. The overall feeling obtained based on the given assumptions was a positive one, which could be regarded as a peculiar result. There are some possible explanations for this result which were detailed before, such as discovering new passions or encouraging others in the pandemic context. While the individual intention of the posts is difficult to pinpoint, a hypothesis is that people wanted to find positive activities to focus on, as a distraction from the difficult reality of the time. We claim that the analysis can be useful for authorities to make decisions related to school starting or for business to make decisions related to their future expansion plans and the work is important for social network analysis research [17].

Abstract

The hasty entering into the online learning system caused by the Covid-19 pandemic has brought certain benefits to students, governments and educational institutions, while on the other hand it has demonstrated certain shortcomings. Neither all students have fast internet, functional hardware, or the required level of information and communication technology skills nor all educators have digital competence. Apart from students, educators were even more expected to know information and communication technologies, and those who do not have required knowledge did not have enough time to get to know and learn. The transition to online learning has been a big challenge for governments, education systems and schools, so it is important to share knowledge and experience to learn important lessons because due to the Covid-19 pandemic the online learning expectations are high. The online learning system is considered to be the basis for creating a hybrid form of learning and a catalyst for a change of formal education.

The paper is based on the available information using the content analysis method and observation with participation describes the experiences of higher education institutions in the Republic of Serbia with e-learning concepts which those institutions used for teaching students as a response to Covid-19 epidemiological measures, the prohibition of assembly and a state of emergency that has been declared throughout the country.

Paper presents a case study as an example of good practice E-learning Experience of Information Technology School – ITS which uses a proactive approach and nurtures the quality culture. ITS is the first accredited private higher education institution in the sphere of information technology in Serbia. In addition to offering quality in the sense of excellent conditions for studying, state-of-the-art equipment, and highly trained personnel, ITS prepares students for a practical professional in IT while they are still in school. In the ITS curriculum, the school has included global computer science education standards, implemented top-quality programs and it`s incorporated founders' experience after years of working in IT education.

Keywords: E-learning, online learning, Covid-19, Information and Communications Technology, Smart University, digital competency

Introduction

Important areas for understanding the subject of the research are e-learning, information and communications technology along with Covid-19. A brief overview of important knowledge using reference literature from these areas, library and other sources, as well as an overview of other formal sources and content whose understanding is important for setting the research problem are given below.

This paper consists of three parts: research problem setting, content analysis and case study. Content analysis, participatory observation, case study and survey research will be used to collect the data necessary for the research. For the analysis of the results of the survey research, a mean score will be used to measure the level of student satisfaction with various elements of pedagogical work of teachers during classes in the summer semester 2019/20 and to compare with the basic results.

Research problem setting and reviewing sources

The group of scientists has formed an online data source about Covid-19 (Our World in Data, 2020). They have prepared Coronavirus Country Profiles including 207 country profiles which allow scientists to explore the statistics on the coronavirus pandemic for every country in the world (updated on the daily basis). Covid-19 is fast evolving pandemic and there is no easy way to identify success in progress against it. The major indicator is mortality and the rate of the confirmed deaths. Country Profiles have a purpose in tracking the impact of the pandemic and studying statistics on the coronavirus pandemic. Figure 1 shows daily new confirmed Covid-19 cases in Serbia during the period 07.03.2020. – 30.08.2020. (Our World in Data, 2020).

Figure 1: Confirmed Covid-19 cases in Serbia 07.03.2020. – 30.08.2020. (Our World in Data, 2020)

Important source of coronavirus information is an Agency of European Union European Centre for Disease Prevention and Control (ECDC, 2020) with daily and weekly surveillance reports and country profiles. The main indicators are The 14-day notification rate of new COVID-19 cases, and the 14-day death rate.

To understand how governments have responded to the pandemic, Our World in Data platform uses data from the Coronavirus Government Response Tracker (OxCGRT), which is published and managed by researchers at the Blavatnik School of Government at the University of Oxford.
According to Our World in Data the" tracker collects publicly available information on 17 indicators of government responses, spanning containment and closure policies (such as school closures and restrictions in movement); economic policies; and health system policies (such as testing regimes)." (Our World in Data, 2020)

Figure 2 shows how governmental response has changed over time. It shows the Government Stringency Index – a composite measure of the strictness of policy responses. The index on any given day is calculated as the mean score of nine policy measures, each taking a value between 0 and 100. See the authors' full description of how this index is calculated. A higher score indicates a stricter government response (i.e. 100 = strictest response). The OxCGRT project calculates this index using nine specific measures, including school and workplace closures; restrictions on public gatherings; transport restrictions; and stay-at-home requirements.

Figure 2. Covid-19: Government Stringency Index cases in Serbia 07.03.2020. – 30.08.2020. (Our World in Data, 2020)

Figure 3 shows Government Stringency Index of Serbia - the score is 45,37 on 25th August in context of world-wide data.

Figure 3: Covid-19: Government Stringency Index cases in Serbia 07/03/2020 – 30/08/2020 (Our World in Data, 2020)

The Government Stringency Index of Serbia ranged from 2.78 (22/01/2020) to 100% (for the period 21/03/ - 21/04/2020). The highest score of 100% lasted for 31 days, and for the next 26 days it was between 93.52% and $ 96.3. In the period when the Government of the Republic of Serbia had the strictest response, because of its specific measures like school and workplace closures; restrictions on public gatherings; transport restrictions; and stay-at-home requirements. The President of the Republic of Serbia declared a state of emergency on 15 of March at a time when, according to official data, there were 48 infected with Covid-19 and no deaths. (RS Ministry of Health, 2020) As of Monday, March 16, due to the state of emergency, schools, faculties and kindergartens were closed, and all sports events were suspended and all public gatherings were banned. Due to the declaration of a state of emergency, higher education institutions in the Republic of Serbia were declared at a different pace. Rare among them that have platforms for distance learning, software for communication with students, and the archive of lectures were able to react faster and offer their students quality content and an adequate replacement for lectures in amphitheaters and auditoriums.

Most faculties organized some kind of "teaching" such as sending presentations and other materials to students, and the organization itself was left to teachers. In the majority of cases, as evidenced by student testimonies on various forums and portals and survey results, even this way of teaching did not exist. Some faculties promptly informed students about the changes through their official websites. All forms of direct teaching (lectures and exercises) and consultations with students were realized via electronic communication.

The realization of colloquia and exams at all levels of studies was postponed at all higher education institutions in the Republic of Serbia until the conditions were created. After 52 days, the state of emergency was lifted, but certain measures that were introduced in order to reduce the possibility of spreading the virus remained in force (RS Government, 2020).

The Ministry of Education, Science and Technological Development informed higher education institutions that they can continue working on May 15, 2020. year, (Notice, 2020), followed by the General Instructions for the application of mandatory preventive measures during the pandemic at universities, colleges, academies of vocational studies and colleges. After the lifting of the state of emergency, most higher education institutions enabled the return of teachers and organized exam deadlines with strict observance of security measures. The general instruction included a recommendation that in the period after the abolition of the state of emergency, the higher education institution continue to organize online forms of teaching, consider the justification and possibility of a certain reduction of exam material and other recommendations regarding extending the deadline for final papers, validity of pre-examination obligations, consider tuition reduction measures, debt rescheduling, and more. (Proposed measures, 2020)

Major edtech investments were made before COVID-19, in 2019, US$18.66 billion and the market for online education projected to reach $350 Billion by 2025 globally primarily for “the introduction of flexible learning technologies in the corporate and education sectors”, according to global study – Online Education Market Study 2019. (Research and Market, 2019)

Mc Kinsey, in his 2016 study, emphasizes that adults learn best in an environment that provides them with a rich, interactive experience and freedom to experiment and the ability to make a variety of mistakes without risk. Dedicated learning facilities provide an ideal combination of exposure to real production problems and opportunities for employees to try new approaches without fear that something may go wrong. Experience shows that people not only learn faster in such environments, but also acquire knowledge faster and retain a larger amount of learning. (MC Kinsey, 2016)

Some studies show that we keep only 10% of the knowledge acquired through books or formal classes, that we keep 32% of the acquired knowledge through simulations and games, and that if we learn based on experience, we adopt and keep 65% of what we learn. It is best to learn through work (learning and transformation of knowledge) because in that case 80-100% of what is learned is retained. (Ilić, et al 2019)

Many worldwide universities try to develop the Smart University concept and its related concepts like smart education, smart e-learning, smart campus, smart classroom ie. they are looking for the best ways to transform a traditional university into a smart university. (Tikhomirov, Dneprovskaya, 2015). Major components required for that are: smart software systems, smart hardware systems and equipment, smart technologies, smart pedagogy, and stakeholders (like students, professional staff, alumni, etc. (Uskov, et al 2016).

Regarding online learning in Covid-19 conditions, the OECD concluded that online learning is faced with several challenges, especially for children (the study was done for the primary school level) who did not have a good internet network and insufficient knowledge of information technology. and the difference between those who were privileged

and had good functional computers and those who did not. Some countries provided computers (OECD, 2020)

UNESCO assisted through various platforms by facilitating the maintenance of distance education, especially for vulnerable categories as school closures have affected 60% of the pupil and student population. (UNESCO, 2020).

All indicators before and after Covid-19 speak in favor of the importance of online learning so that future trends in education can be clearly predicted. In that context, the use of information-communication technologies and a wide platform of education for editors and students in this field is of great importance.
