$$H(f) = \frac{\int_{-\infty}^{\infty} |X(f)|^2 df}{\int_{-\infty}^{\infty} |F(f)|^2 df} \tag{5}$$

In this relationship ***X (f)*** is the power spectral density of the signal force, ***F (f)*** the power spectral density of the signal force, and ***f*** is ***the*** frequency in Hertz.

The essence of the measurement of input and response system for e designate of measures of mutual shown in Figure 1.

Fig. 1: Model components present measurement metrics mutual

The opportunities created by the presented approach allows to solve many technical problems during testing of real objects, which measure defined below each other are widely use [3,5,7,13].

Correlation Function of The Vibration Signal

Estimator function is signal that can be obtained by averaging in the time domain and examining the mutual relationship between the two segments of the delayed time interval *T*. It has the following form [16,18,19]:

$$R_{uu}(\tau) = \frac{1}{T}\int_{-T}^{T} u(t,\theta)u(t+\tau,\theta)dt \qquad (6)$$

In practical applications observation time *T* is chosen sufficiently high so that a correlation estimator properties are independent of the integration time *T*. A prerequisite for obtaining this property is the selection of *T,* that the time was much greater than the correlation time of the processτ_k. Defined correlation function may be in the range (-1,1). A very important and convenient property of this estimate is its relationship with the power spectral density (for operational modal analysis) by Fourier trans-formation, because:

$$R_{uu}(\tau) = \int_{-\infty}^{\infty} G_{uu}(f)\exp(2\pi jf\tau)df$$

$$G_{uu}(\tau) = \int_{-\infty}^{\infty} R_{uu}(f)\exp(-2\pi jf\tau)d\tau \qquad (7)$$

This shows that the correlation function and power spectral density are the same as if the estimators of the test process, but the area they determine is different. Therefore, some of the properties of the process can be better pinpoint the time-domain retardation τpressure than the frequency *f.*

Cross-Correlation Function

For the purpose of examining the similarity of processes at two points of the material and check if there is only one source of vibration in Fig. 2 shows the flow pattern signal *u (t)* of such a case.

Fig 2. Signal flow model for assessing the similarity of processes x(t) and y(t)

The initial process of the vibration that two different ways by the dynamic systems of the pulse transfer function $h_1(t)$, $h_2(t)$ enters the measuring points X and Y to form new processes vibrating designated *x(t)* and *y(t),* [2,4,6].

The cross-correlation $R_{xy}(\tau)$, which is in the form of unor-plated should be equal to one if the signals *x(t)* and *y(t)* are the same, it is defined as:

$$R_{xy}(\tau) \equiv \frac{1}{2T}\int_{-T}^{T} x(t)y(t+\tau)dt \qquad (8)$$

$R_{xy}(\tau) = R_{yx}(-\tau)$, *and* $Q_{xy}(0) = 1$ if $x(t) \rightarrow y(t)$.

In terms of diagnostic correlation function makes it possible to detect changes in signal power ratio determined for the noise interference. It is therefore a measure of the functional arrangement of these moments of the process tested. In diagnostic applications it is sometimes used to measure the delay time determining signal path and signal detection in noise and playing them.

The Coherence Function

A measure of the consistency of the two vibration processes, *x(t)* and *y(t)* is the coherence function defined as follows [11,12]:

$$\gamma_{xy}^2(f) \equiv \frac{\left|G_{xy}(f)\right|^2}{G_{xx}(f)G_{yy}(f)} \qquad (9)$$

Calculating the spectral density of the source *of* the process *(t)* and the known

transfer function $H_1(f)$, $H_2(f)$, we have:

$$G_{xy}(f) = H_1(f)_2 * H(f)\, G_{uu}(f)$$
$$G_{xx}(f) = [H_1(f)]^2\, G_{uu}(f) \qquad (10)$$
$$G_{yy}(f) = [H_2(f)]^2\, G_{uu}(f)$$

Hence, we obtain:

$$\gamma_{xy}^2(f) = \frac{\left|H_1(f)H_2(f)\right|^2 G_{uu}^2(f)}{\left|H_1(f)\right|^2 G_{uu}(f)\left|H_2(f)\right|^2 G_{uu}(f)} = 1 \qquad (11)$$

Regardless of the nature of transmittance passageways coherence function always assumes the value *1* if only the signals *x(t) and y(t)* come from the same source. For more than one source coherence function which is a non-negative it is always less than unity (0-1). The coherence function as a measure of the consistency of the two signals has good diagnostic properties, because the appearance of a new signal failure violates the consistency of the previous ones, so that coherence function decreases.

It is the local measure of similarity between signals from different sources of vibration. In practical action, measured at different times living facility, detects the appearance of defects and changes in transmittance. The function, which of the two points defines it, which provides more information about the technical condition object.

Transmittance

The dynamic properties of linear with constant parameters can be described using a *transfer function* defined in the time domain or with a *transmittance* defined in the frequency domain. These measures fully characterize the dynamic behavior of the object (linear systems, for which it is satisfied superposition principle) and is defined as the ratio of output to input [2,7].

The transformation of input to output in the time domain can be written as:

$$y(t) = \int_0^{\infty} h(\tau)x(t-\tau)d\tau \qquad (12)$$

where: *y(t), x(t),* - input and output signals; *h(t)* - pulse transition function.

Pulse transition function is defined as a response to the force in the form of a Dirac's pulse:

$$y(t) = \int_{0\infty} h(\tau)\delta(t-\tau)d\tau = h(t) \qquad (13)$$

The transmittance of the frequency response is defined as:

$$H(j\varpi) = \frac{Y(j\varpi)}{X(j\omega)} \tag{14}$$

where: $Y(j\varpi)$ - Fourier Transform output signal; $X(j\omega)$ - Transform of the input signal.

Characteristics of the frequency (transmittance) is the size of the complex, m and the real part and the imaginary part:

$$H(j\varpi) = \mathrm{Re}\{H(j\varpi)\} + \mathrm{Im}\{j\varpi\} \tag{15}$$

The transfer function $H(j\omega)$ and *the* impulse response $h(t)$ are related to a clear relationship:

$$H(j\varpi) = \int_0^{\infty} h(\tau) e^{-j\varpi\tau} d\tau \tag{16}$$

Transmittance carries a lot of information about the behavior of the system under load. During the test masonry using transmittance are assessed changes in stiffness (real part) and damping (the imaginary part) reflecting the change in the destruction of the materials tested under varying load.

FRF – Frequence Responce Function

It is the function describing the frequency relation between the strength force ***F(t)*** and the vibration acceleration ***a(t)*** as ***the*** response signal measured at two points in the system under study. Spectral function of transition *(FRF - Frequency Response Function)* can be described as a quotient of the Fourier transform vibration exciting force $F(\omega)$, the Fourier transform of the response signal $A(\omega)$.

$$FRF = \frac{\sum F(\omega)}{\sum A(\omega)} \tag{17}$$

The *FRF* as the main measure of experimental modal analysis is an inversion defined previously transmittance *H(f)* and is referred to as real and imaginary parts. The method of its determination on the actual objects shown in Fig. 3.

Fig. 3: Research *FRF* facility

The *FRF* is a complex function of the frequency, which the module shows the characteristics of amplitude - the frequency, and the argument is the angle of the phase shift between the power of forcing a response [4,6,]. The FRF is an inversion of the transmittance, which is an important observation resulting from the analysis and testing of these measures global propagation of energy [19].

Due to the possibility of the use of force or strength kinematic introduced different characteristics depending on the nature of the physical processes the input and output, highlighting: the vulnerability of dynamic mobility, acceleration, dynamic stiffness, impedance and dynamic mass [4.8,10].

Research Methodology

Verification of the indicated measures of mutual propagation of vibration energy was carried out at a laboratory in the EAFIT University of Colombia. Being investigated size vibration energy flow between the points of attachment rails to the sleepers of the track has been switched on Fig. 4.

Correct inference requires redundancy of information and statistical analysis to obtain a model of bonding between the assumed technical condition and the value of mutual measures. To implement this project proposed in the work of the author's methodology dedicated research facilities in the "construction" [1,3,9] uses redundancy procedures, OPTIMUM, SVD and modeling cause - effect. The essence and the algorithm good measure of changes in the method of OPTIMUM (Figure 8), and in the method of SVD (Figure 8B) is shown below.

Fig. 8: Optimum algorithms for carrying out the method OPTIMUM (A) and SVD (B)

Examples of the results of the proposed optimization methods usefulness of measures of mutual shown in Fig.9.

Optimization

Fig. 9: The results of the OPTIMUM (A) and SVD (B) method

Using the information contained in Table 1 processed according to the proposed methodology can confirm the good properties of measurement destruction of the cases examined the destruction of joints in order: ***FRFr, FRFu, H(f y, H(f)u, cohere.***

Taking into account all conducted a sensitivity analysis of the proposed measures of mutual propagation of vibration energy, using different statistical methods used in this work can continue to propose the following as the main measure of the state of destruction:

$FRF_{y,,}H(f)_R$, cohere.

For the indicated reduction measures of destruction was determined regression model binding shown in Fig. 10.

Fig. 10: Model binding measures of mutual technical condition of the

Summary

The substance of the development includes the results shows usefulness of mutual propagation measures of vibration energy than the various forms of applications in civil engineering. The main assumption was realized by exploratory research to present the possibilities of practical use of complex estimators vibration - as a tool to solve many fundamental problems with the condition of degradation and building construction elements dynamics.

These issues, it studies exemplify dedicated to the degradation state of the construction methodology procedure for determining the physical aspects and practical applications of propagation of vibration energy measures. The proposed methodology proceedings indicate that the important role and manner of acquisition and use of vibration composite measurements in the construction industry, revealing at the same time the need to take this issue in the area of research the destruction of existing structures. Served briefly elements of vibration theory focused on the physical aspects of the description and use of vibration estimators in the construction industry bring the issues of modeling the dynamic state of different structures and rules for their use.

Changes identification in the building structures degradation state becomes a method of assessing the structure operational status and modal analysis methods and related vibration estimates reflects well the elements and segments degradation.

New ways of obtaining and processing information contained in the processes of vibration often leads to improvement of various operating systems constructions, often leads to creative change existing practical solutions.

Network Assessment of a Selected Organization from The Personnel Outsourcing Sector

Rafał TRZASKA

Wroclaw University of Economics & Business, POLAND,
e-mail: rafal.trzaska@ue.wroc.pl; ORCID: 0000-0003-0261-7496

Abstract

In the environment displaying more and more characteristics of a network paradigm, enterprises seek solutions helping increase their efficiency. At the same time, strategic management does not offer solutions (methods and techniques) of strategic analysis dedicated to this paradigm. It is a serious scientific problem. Admittedly, methods and techniques borrowed from other disciplines do appear, like the SNA method, but strategic management itself has not prepared its own methods or techniques of network analysis. The aim of this paper is to present a selected method of strategic network analysis. It concentrates on three essential parameters of network assessment. The method comprises: the stricte assessment of the enterprise network, the enterprise strategy assessment in terms of its possession of network characteristics, and the assessment of the environment in which the enterprise operates in terms of network indicators of this environment.
The article discusses the structure of the network analysis method in a network approach, with particular emphasis on the following steps: the enterprise network, the network strategy, and the environment in which the enterprise operates. The empirical part presents results of an assessment of an enterprise network, network strategy and environment, using the example of a selected organization from the sector of personnel outsourcing services.

Keywords: Management, Strategic management, Resource Based View, Network assessment.

Introduction

In the environment displaying more and more characteristics of a network paradigm, enterprises seek solutions to increase their efficiency. At the same time, strategic management does not offer solutions (methods and techniques) of strategic analysis dedicated to this paradigm. It is a serious scientific problem. Methods and techniques borrowed from other disciplines may appear, like the SNA method, but strategic management itself has not prepared its own methods or techniques for the network analysis.

The aim of the research in this paper is to present a selected method of strategic network analysis. It concentrates on three essential parameters of network assessment: the stricte assessment of the enterprise network, the enterprise strategy assessment in terms of its possession of network characteristics, and the assessment of the environment in which the enterprise operates in terms of network indicators of this environment.

The article discusses the structure of the network analysis method in a network approach, with particular emphasis on the following steps: the enterprise network, the network strategy, and the environment in which the enterprise operates. The proposed method is an original assessment method. It takes into account the latest solutions concerning the network paradigm, at the same time concentrating on finding elements which connect particular fragments of network knowledge. It is only a part of an overall procedure of strategic network analysis, yet important enough to merit a separate presentation here.

The empirical part presents the assessment of an enterprise network, network strategy and environment, using the example of a selected labour service organization. The analysed case study shows and verifies the presented method for network analysis.

The findings presented in the paper are based on selected solutions included in R. Trzaska's Ph.D. dissertation (2017).

Method of Enterprise Network Assessment

The method of network assessment refers to the network paradigm. Its specific features include the following: the environment is composed of distinctive entities; the entities have various relationships with each other as well as with the firm; the organization partially controls the environment; opportunities arise in the network, which perceives, qualifies them and enables their use; resources do not have to be hierarchically controlled; competitive advantage depends on the structures, positions and relationships in the network; and conditions of the environment may be stabilised by networks (Czakon 2012, p. 19). The main problem is the choice of methods of network research. A. Zaheer, R. Gözübüyük and H. Milanov proposed the network perspective, they "develop an organizing framework based on three levels of network analysis (the dyad, the ego, and the whole network) and four theoretical mechanisms (resource access, trust, power/ control, and signaling) to organize and review the key findings and debates in the interorganizational network literature" (2019). Others, R. Gulati and D. Lavie "have proposed different perspectives on how such networks of ties shape organizational behavior and performance outcomes, but they have paid little attention to the underlying mechanisms driving these effects. (They) propose reach, richness, and receptivity as three fundamental mechanisms that jointly constitute a parsimonious model for explaining how network resources contribute to organizational performance (2011). S. Borgatti and D. Halgin suggest to use the theory of weaks ties and the structural holes theory in the network analysis (2011). In the literature on strategic management, there is still a discourse on methods of networks analysis and assessing their effectiveness. Most of the methods of network analysis come from works on Social Network Anlysis (Scott, 1988; Wasserman, Faust, 1994).

This way of thinking required the design of new methods of analysis which would be to a lesser extent connected with: the analysis of effects of experience curves (in the network world what matters is the right to access resources, not to own them), positioning in a sector (there are no sectors in the network world), and promoting innovation (innovation processes tend to be configured differently in the network world). That is why the existing methods of strategic analysis have a limited use in the new reality. This method was developed based on critical literature review, the use of deduction and analogy methods. The method was developed on the basis of SNA, graph theory, structure of network paradigm (Czakon, 2012) and the achievements of Niemczyk (2014).

The proposed method Network Assesment consists of three steps (stages). As mentioned above, they include:

- ***stricte* assessment of the enterprise** network,
- **enterprise strategy assessment** in terms of its possession of network characteristics,
- **assessment of the environment** in which the enterprise operates in terms of network indicators of this environment.

These three elements of the assessment take into account the three aspects of an organization's performance in a network environment. They verify whether the organization actually achieves the effects of network rents, whether the strategies have the characteristics of the network and whether the environment is already a network environment. Meeting these three conditions allows for effective application of methods appropriate for the network management.The first step in network assessment is the selection of a particular enterprise. The choice is difficult because it may concern an entire network of firms interrelated within a given network system or one particular node. In the selection process, it is worth taking into consideration that the research subject should be a real or potential strategic apex of a given network. Only after the choice of the subject has been made should the appropriate stage of network assessment be entered. The underlying assumption of the assessment is that *the inter-organisational network is a set of firms and relationships of contractual nature* (Niemczyk, Stańczyk-Hugiet, Jasiński 2012) *aimed at achieving the effects of network rents.*

The *stricte* network assessment may be carried out by means of a list of questions proposed by the author in Table 1, referring to the descriptive characteristics of network rents reported in the literature. The questions should be answered by a person who knows the operations of the entire organization, so preferably a senior executive. The procedure described here (Table 1) is based on the concepts of the network rent proposed in the works of J. Niemczyk (2013; 2014). The procedure assumes that if a half or more than a half of the answers to questions in Table 1 are affirmative, the enterprise is considered to be a network enterprise. In turn, when more than a half of the answers are negative, the enterprise is deemed to be following the classical paradigms of management, and thus requires methods of strategic analysis arising from traditional schools of strategic management.

Table 1: Enterprise network assessment

Part I (Williamson rent due to transaction costs)	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
Do the concluded contracts allow the reduction of costs of entering into next contracts?			
Does the enterprise optimize costs?			
Are the external contracting costs lower than the costs of solutions such as e.g. internalization?			
Part II (rent due to creating value in value network)	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
Is the enterprise open to using and implementing expert knowledge connected with the creation of the synergy effect?			
Does the enterprise continuously conduct research and implement solutions optimizing the value chain?			
Does the enterprise benefit from economies of scale with regard to production?			
Part III (rent due to appropriation of value)	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
Does the enterprise legally use organizational and market solutions generated by other entities?			
Does the enterprise protect intellectual property?			
In external operations, does the enterprise use its bargaining position in order to benefit from cost arbitrage?			
Part IV (rent due to knowledge diffusion)	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
Does the enterprise create tacit knowledge?			
Does the enterprise acquire knowledge from the market?			
Can knowledge diffusion be observed between various units of the enterprise?			
Part V (rent due to network effect)	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
Does the enterprise increase its efficiency as a result of incorporating a new entity into the network?			
Do the services, products delivered to the client increase efficiency owing to the extension of co-operation with other entities?			
Would a loss of one unit of the enterprise significantly affect the functioning of the enterprise?			
Mean			

Source: Own study based on Trzaska, R. (2017). Strategic analysis in the network approach, PhD Thesis, unpublished materials, Wrocław University of Economics and Business.

If the mean value calculated on the basis of the five parts is higher than, or equal to two, the enterprise is considered to be a network organization. If the resultant average is less than two, it is a classical organization.

The second stage of the procedure is assessment of the strategy pursued by the enterprise in terms of displaying characteristics of a network strategy. The first step is to select and to analyze elements of the enterprise which contain information about the strategy (Trzaska 2016). The next step is to assess those elements. The model used here base on the characteristics of network paradigms proposed by W. Czakon (2012), as well as characteristics of network

strategies listed by J. Niemczyk (2013). As a result, fifteen questions were formulated, also requiring "yes", "no" or "I don't know" answers.

Table 2: Network strategy assessment of an enterprise in terms of its possession of network features

Question	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
In the enterprise's environment, have all the entities with which the enterprise co-operates been identified?			
In the environment, do continuous changes take place in relationships between the entities and the enterprise?			
Does the environment have a significant impact on the enterprise?			
Does the enterprise benefit from the network relationships which may change the conditions of the enterprise's operations?			
Are the resources in the enterprise controlled in a non-hierarchical way?			
Does the enterprise's advantage depend on the structure of the environment?			
Does the enterprise's advantage depend on its position in the environment?			
Does the enterprise's advantage depend on its relationships with the environment?			
Are the conditions of the environment stabilized by relationships with competitors or mediation skills?			
Do the conditions of the environment change frequently and do they significantly influence the organization?			
Does the enterprise use and react to opportunities in the environment?			
Does the enterprise engage in continuous interaction with other economic entities?			
Does the enterprise carry out "non-financial" transactions with organizations from the environment?			
Does the enterprise continuously expand its network of partners and co-operators?			
Does the enterprise seek unique resources?			
Mean			

Source: Own study based on Trzaska, R. (2017). Strategic analysis in the network approach, PhD Thesis, unpublished materials, Wrocław University of Economics and Business.

The results are assessed according to the same principles as described earlier. If a half or more than a half of the answers are affirmative, it may be assumed that the enterprise follows a network strategy, or elements of a network approach to the strategy dominate in it. It may indicate that, more or less consciously, the enterprise applies the principles of the network approach in its operations. In turn, if more than a half of the answers are negative, it may be assumed that the enterprise displays characteristics of a classical approach to strategies, in which case it is recommended that it should follow classical strategies.

The third stage in the process of assessing the basic network aspects is assessment of the enterprise's environment. The first step is a preliminary analysis of the environment in which the organization in question operates. Possible methods used to this effect may include brainstorming, background research interviews, expert opinions or analyses of company annual reports. The next step is appropriate assessment of the enterprise's environment in terms of network characteristics, carried out by means of a questionnaire. The questionnaire was devised on the basis of an analysis of the network environment displaying characteristics of an ecosystem, as well as the definition of an ecosystem, proposed by Stańczyk-Hugiet (2015). Reference can be found in the bibliometric article L. Aarikka-Stenroosa and R. Paavo (2018).

The results are assessed according to the same principles as in the previous two cases. If a half or more than a half of the answers are affirmative, it may be claimed that the enterprise operates in an environment displaying characteristics of such a network ecosystem. It means that it actively initiates and creates contacts in groups of enterprises and organizations. It also maintains relationships, ensuring that the client remains loyal and the co-operators create added value for the client. In turn, if more than a half of the answers are negative, then the examined enterprise follows a

classical approach to the environment, operating in surroundings displaying the characteristics of an inactive environment. The questions listed in Table 3 do not constitute a fully separable classification.

Table 3: Assessment of the environment in which an enterprise operates

Question	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
Does the enterprise co-operate with a group of enterprises or organizations (entities) which are interrelated?			
Does the enterprise co-operate with a group of enterprises or organizations (entities) which are within the clients' scope of interest?			
Does the enterprise use dependency relationships benefiting all the co-operating entities in order to create value for the clients?			
Are the relationships between enterprises and other entities symbiotic?			
Through its relationships, does the enterprise influence the formation of another product, including a product of the network leader?			
Does the enterprise participate actively in building relationships, exchange of knowledge and experience?			
Has the enterprise identified the clients and their needs?			
Does the enterprise belong to a network of entities oriented towards generating, or actually generating, innovations?			
Is the network of entities in which the enterprise operates resistant to changes taking place outside the network?			
Does the enterprise react dynamically to changes taking place in the environment?			
Does the enterprise ensure the maintenance of relationships, as well as initiate new business relationships?			
Does the enterprise engage in relationships with new clients?			
Does the enterprise have regular clients who enable its functioning?			
Does the enterprise expand the group of its regular clients?			
Does the enterprise ensure an influx of innovation into the main value chain?			
Mean

Assessing the three network components (*stricte* assessment of the enterprise network, enterprise strategy assessment in terms of its possession of network characteristics, assessment of the environment in which the enterprise operates in terms of network indicators of this environment) may lead to a clear indication whether we deal with a network organization. Putting the three variables on a radar chart will enable us to establish the distance to a perfect network model for the organization which is the subject of our study. The knowledge gained in this way will allow the organization to build new strategies and action plans fitting the criteria of success characteristic of the network approach.

Using the method of enterprise network assessment to analyze the selected company

The developed method of enterprise network assessment can be used to analyze enterprises in every sector. It is universal and easy to use. It allows to answer the question: is the organization a part of the network. It allows for the precise use of management methods adapted to the network economy. The following section shows the possibilities of using the method, pointing to the practical aspects of this use. .

The subject of the enterprise network study is X Company Ltd. In the author's view, the company serves as a good case in verifying this method. The opinion can be supported by the fact that the firm is founded on relationships and elements of continuous and temporary inter-organisational co-operation, which is an essential network characteristic.

Profile of X Company Ltd.

X Company Ltd. is a recruitment company contracting engineers. It specializes in broadly understood technological projects and hiring IT specialists. The sector may be classified as personnel outsourcing. The firm has been present on the market for nine years and during that period it has carried out over a thousand projects for more than 150 clients. Its main competency involves selecting the best-qualified engineering staff and implementing individually tailored solutions for the development of new technologies and innovation. It focuses its activities on the automotive, aviation and energy sectors.

X Company Ltd. is the leader in the recruitment of top-class engineers and IT specialists in Poland. It also co-ordinates projects in Germany and the Great Britain. It is a partner of the Association of Employment Agencies (SAZ) – Poland's biggest employer organization uniting agencies which specialize in providing selected HR services: hiring full-time staff to work in Poland and abroad, personnel consultancy, temporary employment and outsourcing. SAZ represents large, domestic and international entities, as well as regional and local ones, operating in several provinces or smaller locations. This kind of broad cross-section of operational profiles of SAZ members allows a comprehensive viewpoint on the HR sector.

X Company Ltd. is also a partner of the Polish-German Chamber of Commerce and Industry (AHK Polska). AHK represents the interests of around a thousand member companies, and has been advocating the development of Polish-German economic relations for the last twenty years. Membership in the chamber guarantees invitations to numerous business meetings, access to valuable information, opportunities to promote companies among the other members of the chamber, as well as many other privileges.

X Company Ltd. contracts and recruits engineers and specialists, reduces absenteeism, trains staff, prepares engineering projects and supports the establishment of R&D centres.

Its core business of contracting engineers aims to provide highly qualified staff whose expertise allows the client company to handle its services and products. Its recruitment offer, in turn, encompasses the entire process of recruitment: from a thorough examination and definition of needs and expectations, through consultations, to the final selection of candidates and employment guarantee. Absenteeism reduction is a service comprising daily analysis of data related to employees' absence from work due to sick leave. Staff training is an offer of relevant professional training courses provided for the client. X Company Ltd. co-operates with many experienced specialists in various fields to prepare training programmes according to the client's guidelines. This service is addressed to organizations which have specific requirements concerning the development of their staff but are unable to find satisfactory solutions on the training market.

Network assessment of X Company Ltd.

X Company Ltd. was selected to be the subject of network assessment. The examination was carried out on the basis of an analysis of the firm's documentation, as well as an interview with the CEO, during which questionnaires based on solutions presented in Tables 1, 2 and 3 were used.

The assessment was conducted by means of a structured interview and with the use of questionnaires. The first part included questions which verified the network orientation, summarised in Table 4. The interviewee frequently pointed to characteristics implying a network nature of the firm. , The final mean score of 2.6 points (where the value "0" means a classical enterprise, and "3" – a fully network-oriented enterprise) may indicate that the company can be considered as a network enterprise.

Fig. 1: Network assessment of X Company Ltd

Source: Own study.

Table 4: Network assessment of X Company Ltd

Part I (Williamson rent due to transaction costs)	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
Do the concluded contracts allow the reduction of costs of entering into next contracts?	3		
Does the enterprise optimize costs?	3		
Are the external contracting costs lower than the costs of solutions such as e.g. internalization?		2	
Part II (rent due to creating value in value network)	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
Is the enterprise open to using and implementing expert knowledge connected with the creation of the synergy effect?	3		
Does the enterprise continuously conduct research and implement solutions optimizing the value chain?			1
Does the enterprise benefit from economies of scale with regard to production?	3		
Part III (rent due to appropriation of value)	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
Does the enterprise legally use organizational and market solutions generated by other entities?	3		
Does the enterprise protect intellectual property?			1
In external operations, does the enterprise use its bargaining position in order to benefit from cost arbitrage?		2	
Part IV (rent due to knowledge diffusion)	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
Does the enterprise create tacit knowledge?	3		
Does the enterprise acquire knowledge from the market?	3		
Can knowledge diffusion be observed between various units of the enterprise?	3		

Part V (rent due to network effect)	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
Does the enterprise increase its efficiency as a result of incorporating a new entity into the network?	3		
Do the services, products delivered to the client increase efficiency owing to the extension of co-operation with other entities?	3		
Would a loss of one unit of the enterprise significantly affect the functioning of the enterprise?	3		
Mean	**2.6**		

Source: Own study.

On closer inspection of the particular parts of the survey (Fig. 1), as well as the influence of characteristics of a given rent on the enterprise, it can be observed that X Company Ltd. probably gains its competitive advantage mainly thanks to knowledge diffusion and the network effect. On the other hand, the elements potentially increasing synergy which might probably be optimized in the firm include those connected with creating value in value networks and optimizing the value chain, together with appropriation. It is worth stressing, though, that from the point of view of the principles of a network organization, the enterprise can be classified as a network enterprise.

Strategy assessment of X Company Ltd. from the perspective of its possession of network characteristics

The assessment of the enterprise in view of its network characteristics was conducted by means of a questionnaire containing fifteen questions (Table 5). The respondent was asked the questions during an interview. The final result of this part of the study was 2.6 points, which confirms the preliminary conclusion that the enterprise follows a strategy displaying features of a network strategy. It must be pointed out here that in the case of the investigated firm three of the research areas do not match the model network approach. They are contained in the following questions: *In the enterprise's environment, have all the entities with which the enterprise co-operates been identified?, In the environment, do continuous changes take place in relationships between the entities and the enterprise?* and *Does the enterprise carry out transactions in the non-financial sense?* These areas require adjustments. Failing to acknowledge them may lead to the company limiting itself to already identified elements, which may mean stagnation and gradual ossification.

Table 5: Network strategy assessment of X Company Ltd.

Question	**Yes** (value=3)	**I don't know** (value=2)	**No** (value=1)
In the enterprise's environment, have all the entities with which the enterprise co-operates been identified?			1
In the environment, do continuous changes take place in relationships between the entities and the enterprise?			1
Does the environment have a significant impact on the enterprise?	3		
Does the enterprise benefit from the network relationships which may change the conditions of the enterprise's operations?	3		
Are the resources in the enterprise controlled in a non-hierarchical way?	3		
Does the enterprise's advantage depend on the structure of the environment?	3		
Does the enterprise's advantage depend on its position in the environment?	3		
Does the enterprise's advantage depend on its relationships with the environment?	3		
Are the conditions of the environment stabilized by relationships with competitors or mediation skills?	3		
Do the conditions of the environment change frequently and do they significantly influence the organization?	3		

Question	Yes (value=3)	I don't know (value=2)	No (value=1)
Does the enterprise use and react to opportunities in the environment?	3		
Does the enterprise engage in continuous interaction with other economic entities?	3		
Does the enterprise carry out "non-financial" transactions with organizations from the environment?			1
Does the enterprise continuously expand its network of partners and co-operators?	3		
Does the enterprise seek unique resources?	3		
Mean	**2.6**		

Source: Own study.

The results strongly confirm, however, that the enterprise's strategy displays characteristics of a network strategy, which are more or less consciously used by the examined firm.

Environment assessment of X Company Ltd.

Assessing the environment in which an enterprise operates is essential for the model to work. As pointed out earlier, the environment must display certain characteristics in order to be classified as a network environment in which a given enterprise operates.

In this part of the research, the interviewee was asked whether his enterprise operates in a network, which for the purposes of this study is used to define the area of the enterprise's operation (Table 6). The final result, amounting to 2.7, indicates that it is highly probable that the enterprise operates in an environment welcoming a network approach. It is therefore possible to analyse the organization from the network perspective. The fact may point to the enterprise's characteristics, as well as its model and influence on the space within which it functions. It is worth emphasizing here that also in this part of the research certain anomalies occurred, inviting reflection. The first element which does not support the operating space of the enterprise is failure to use the dependency relationships benefiting all the co-operating entities in order to create value for the clients. Another is the question whether the network of entities in which the enterprise operates is resistant to changes taking place outside the network. As a result, just like in the previous stage of the study, it may lead to a degradation of the enterprise's co-operation with its surroundings, and at the same time also shutting itself out from external stimuli and failure to adjust to the changing environment and operating conditions.

Table 6: Assessment of the environment of X Company Ltd.

Question	Yes (value=3)	I don't know (value=2)	No (value=1)
Does the enterprise co-operate with a group of enterprises or organizations (entities) which are interrelated?	3		
Does the enterprise co-operate with a group of enterprises or organizations (entities) which are within the clients' scope of interest?	3		
Does the enterprise use dependency relationships benefiting all the co-operating entities in order to create value for the clients?			1
Are the relationships between enterprises and other entities symbiotic?	3		
Through its relationships, does the enterprise influence the formation of another product, including a product of the network leader?	3		
Does the enterprise participate actively in building relationships, exchange of knowledge and experience?	3		
Has the enterprise identified the clients and their needs?	3		
Does the enterprise belong to a network of entities oriented towards generating, or actually generating, innovations?	3		

Question	Yes (value=3)	I don't know (value=2)	No (value=1)
Is the network of entities in which the enterprise operates resistant to changes taking place outside the network?			1
Does the enterprise react dynamically to changes taking place in the environment?	3		
Does the enterprise ensure the maintenance of relationships, as well as initiate new business relationships?	3		
Does the enterprise engage in relationships with new clients?	3		
Does the enterprise have regular clients who enable its functioning?	3		
Does the enterprise expand the group of its regular clients?	3		
Does the enterprise ensure an influx of innovation into the main value chain?	3		
Mean	**2.7**		

Source: own study.

The analysis shows that the respective components of the method amount to:

- *stricte* assessment of the enterprise network – 2.6,
- enterprise strategy assessment in terms of its possession of network characteristics – 2.6,
- assessment of the environment in which the enterprise operates in terms of network indicators of this environment – 2.7.

Fig. 2: Spider chart of network dimensions of X Company Ltd.

Source: Own study.

The indicated assessment values are exceptionally high. It is not surprising, however, as the company's profile itself implies its network potential. At the same time, it confirms the quality of the proposed method of network assessment, network strategy and network environment. Overall, X Comapny Ltd. may be considered a network firm consciously using network rents.

Conclusion

Networks are studied in many scientific disciplines. Despite this, there is a lack of research on network analysis and assessment for management purposes, especially in the strategic management literature. In Poland, especially in the works of: W. Czakona (2012), J. Niemczyk (2014), M. Zdziarski (2016), J. Światowiec-Szczepańska and A. Kawa (2018) and P. Klimas (2014), and in foreign literature apart from the already mentioned research of SP Borgatii, R. Gulati is, first of all, in all the achievements of M. Castell's (2007; 2011) and AL Barabasi (2009; 2016), we can find

a lot of knowledge about the network, helpful in defining also in the assessment of network. To this day, however, there is no full agreement as to whether network management is a completely new paradigm or just a new cognitive perspective. The described method shows that networks mean new knowledge and new research opportunities, as well as new management methods, not only interorganizational nets.

The presented method is only a preliminary step in the network management. If a given organization is assessed as networked, the next step will be to propose management methods suitable for network structures. Despite many works in this area, it is one of the most important directions of management development in the second and third decade of the 21st century.The results of the organization's network analysis presented in this paper point to the usefulness of the proposed approach. Obviously, the selection of the case in point was deliberate and resulted from a preliminary analysis, suggesting a network character of the organization. It is therefore gratifying that the proposed methodology led to a confirmation of the assumption. Networks in management appeared informally several decades ago, yet it has only been a dozen or so years since they were studied more extensively. An overall network theory is still lacking, though. In the author's opinion, it may be complemented by the study area of network assessment.

Abstract

In this article a new development path was created on the example of the Łódź Special Economic Zone. The main research effort in this case is focused on finding an event that gives a particular phenomenon a "cause and effect sequence with deterministic properties. This event is not without cause, but one that contradicts the predicted results resulting from the explanatory model used. It may therefore be an individual decision, but it may also be a random, large-scale phenomenon. Such an event may, for example, be the creation of a special economic zone in a given region. The analysis of a number of activities undertaken by the Łódź Special Economic Zone leads to the conclusion that the process of creating a new path assumes that the economy will diversify into technologically related industries. This process is in partial opposition to the six rules of industrialization reflected in the development of industrial cities. In an innovative economy, standardization is being replaced by uniqueness and creativity, with soft skills taking the place of specialization, and therefore social capital is becoming increasingly important to respond quickly to changes in the environment.

Keywords: Economy, New Development Path, Łódź Special Economic Zone, Innovation, Entrepreneurship, Business Law.

JEL Classification: A11, E24, E61, H23, H43, I25, K22.

Introduction

The concept of path dependency is increasingly being used by representatives of various social sciences, which is explained by a turn towards historical approaches to explain the course of various processes, because "The legacy of the past influences the set of available possibilities and is therefore essential in explaining the processes of change" (Gwosdz and Micek, 2020). This concept is also applied to economic geography, as it allows to understand the development of formal and informal institutions present in a given area, influencing the economic development of local (regional) systems. Originally, the concept of path dependency served the purpose of analyzing the institutions responsible for the region's embedding in a given path of development and seeking an answer to the question of what event from the past made the region follow that path, being the "victim" of economic success achieved in the past. The main research effort in such a case is focused on finding the event that gives a particular phenomenon its "cause and effect character of a sequence with deterministic properties" (Gwosdz, 2004). As explains Gwosdz, this is not an event without a cause, but one that contradicts the predicted results of the explanatory model used. It may therefore be an individual decision, but it may also be random, large-scale phenomena. Such an event may, for example, be the creation of a special economic zone in a given region.

Literature Review

The evolution of the concept of path dependency has also allowed research to focus on the issue of creating a new path of development by stimulating locally specific institutions to adapt the region to the changing economic environment. The creation of a path can be initiated by local actors if they are able to mobilize the necessary resources to leave the old path, but it can also be generated by decisions taken at regional, national or international level (Strambach, 2010). The sources of the new development path are presented in table 1.

Table 1: Mechanisms for creating a new development path

The source of the new development path	Characteristics	Recommended activities of institutions supporting innovation
Creating new economic activities "from within"	The emergence of new economic activities and technologies in a given region thanks to endogenous development, primarily through local innovation and *spin-offs* processes	- supporting breakthrough (*forefront*) research in social and technical sciences - aggressive patent policy - assistance in setting up new companies (business incubators) - cultivating links between scientists and entrepreneurs - creating an *industrial identity* - standard setting - the work of industry promoters ("evangelists") - conferences, workshops, business forums, etc.
Transplanting business and technology from other locations	Import of new activities and technologies through external investments or migration of people	- development of education and training (strengthening human capital) - *the corresponding curriculum* - technological support for subcontractors and suppliers
Diversification of the economy toward industries technologically related	The dominant industries are disappearing, but key competences are used by emerging, technologically similar but usually more advanced industries	- creating stakeholder links - filling "structural holes" - creating an industrial identity
Modernization (*upgrading*) existing branches economies	Restoring economic potential based on traditional industries that regain competitiveness through the use of new technologies or the introduction of new products and services	- solving problems in the industry through commissioned research, consultations *etc*. - development of education and training (strengthening human capital) - monitoring best practice in the industry - performing *foresight* analysis - organization of supplier forums with customers

Source: (Gwosdz, 2014).

The aim of the study is to show how a new development path was created in the Lodz Special Economic Zone in Poland. In the Development Strategy of the Łódź Special Economic Zone S.A. for the years 2016-2025 (Development strategy of the Łódź Special Economic Zone S.A. for the years 2016-2025), the zone was defined as a leader of integrated services for enterprises, supporting their innovation. This means the conscious creation of a new development path, in line with the trends set by the knowledge-based economy, while taking advantage of the existing economic potential of the region (Wojtaszek and Miciuła, 2019), especially specialization in the production of industrial products in the field of electrical engineering. However, it is worth reminding at this point the remark made years ago by Chojnicki and Czyż: "The growth and use of innovative knowledge in the region does not automatically shape the GOW [i.e. knowledge-based economy]. It occurs when the use of innovative knowledge leads to increasing market successes and economic benefits in those sectors of the economy where they are dependent on the absorption of technological progress and which acquire dominant importance" (Chojnicki, 2006). The new path is largely related to modern industries (mainly electronics and IT). Therefore, it is worthwhile to look at the institutional conditions created in the area of the zone in order to set a new path.

Within the Lodz Special Economic Zone, great importance is attached to supporting startups and coordinating activities aimed at establishing cooperation between the investor and the startup. Similar activities are carried out in the area of the Krakow Technology Park, with the difference that the Krakow acceleration program is aimed at startups that use Copernicus satellite data (Accelerator for satellite data startups, 2019). These activities gain particular importance in the face of the fact that in Poland 1 in 3 startups do not cooperate with any corporation (Beauchamp, 2018). Acceleration program Startup Spark 2.0 offered in the area of the Łódź SEZ, which is implemented under Measure 2.5 Acceleration programs, under Priority Axis II Support for the environment and potential of enterprises to conduct R&D&I activities of the Operational Programme Intelligent Development 2014-2020 is an example of stimulating the demand of large companies for innovative technologies and services (Kadłubek and Miciuła, 2019). Measure 2.5 aims at improving the innovativeness of the Polish economy by supporting startups in the development of solutions that will respond to the needs of the business client, with particular emphasis on solutions dedicated to the development of sectors indicated in the documentation. The aim of the measure is to increase the involvement of large and medium-sized enterprises in the development of startups by directing their own financial, personnel and technical resources into the acceleration process, gaining experience and creating a legal framework for such cooperation" (Ministry of Investment and Development, 2019). The program lasts 30 months and consists of four rounds of acceleration from 3 to 6 months each and four rounds of post-acceleration to 4 months each. In the current program at least 66 Beneficiaries will be qualified to all acceleration rounds, including at least 20 Beneficiaries that will fit into one of the three main industry tracks: Industrial Internet of Things (IIoT) / Augumented reality (AR), Artificial intelligence (AI) and Cyber security. The Startup Spark 2.0 acceleration program is aimed at the entities that are:

- are a micro or small enterprise and run their business in the form of a capital company, within the meaning of Article 4 § 1 point 2 of the Commercial Companies Code, for a period not longer than 5 years,

- have: full rights to dispose of the innovative business idea, solution, program or other project submitted in the application and to dispose of it on their own behalf,

- are free from any legal charges, security or any third party claim,

- are not listed on the exchange within 5 years from the date of registration in the relevant register,

- have not yet distributed the profit and have not been created by the merger,

- did not take over the activities of another entrepreneur,

- are in no way affiliated in capital or personal way with the Accelerator, Lodz Special Economic Zone, entities providing services within the acceleration program or the Recipient of Technology, which was indicated by the applicant for cooperation within the individual acceleration program.

Research Results

The application procedure assesses, among others, the innovativeness of the idea, its competitiveness, the team that has the applicant, the profitability and business model of the project, as well as the go-to-market strategy (individual criteria for project assessment are presented in Table 3.8.). Maximum single beneficiary may receive PLN 200,000.00 under the project, of which PLN 160,000 in cash and PLN 40,000 in a package of services.

Table 2: Selected criteria for project evaluation in the Startup Spark recruitment process 2.0

Quality criteria evaluated at stage 1 of recruitment		
Innovation		
Innovation (scale of innovation of the proposed project)	Local - innovation on the scale of a given Technology Recipient	0-3 points
	National - innovation on a national scale and other enterprises operating in Poland	4- 6 points
	Global - innovation on an international scale, companies operating in Poland and their global branches	7-10 points
The team		

Team potential	The applicant has sufficient team to produce the final product	0-3 points
	The applicant has a team that allows scaling of the product on a national scale.	4- 6 points
	The applicant has a team that allows scaling of the product globally	7-10 points
Quality criteria evaluated at stage 2 of recruitment		
Competitiveness		
Competitive advantages (scale of identified competitive advantages of the proposed project)	Local - competitiveness at the level of solutions already applied in a given Technology Recipient	0-3 points
	National - competitiveness at the level of solutions used in enterprises operating in Poland	4- 6 points
	Global - the project has a competitive advantage on a global scale	7-10
Cost-effectiveness and business model of the enterprise		
Cost effectiveness and business model	The applicant has a business model	0-3 points
	Reality of the business model of the Applicant for commercialization at OT	4- 6 points
	Business model has been validated (Applicant has customers)	7-10 points
Go-to-market strategy		
Go-to-market strategy	Defined sales channels/ potential for commercialisation due to sales channels	0-5 points
	Quality and replicability of the business model by industry	0-3 points
	Regulatory environment of the project	0-2 point

Source: (Rules of recruitment to the acceleration program Startup Spark 2.0 https://startupspark.io/storage/app/media/Regulamin_naboru_2019_02_11.pdf, 1.06.2019).

It should be emphasized that the program co-created by the Lodz Special Economic Zone crosses the borders of the zone and is also addressed to entities outside the zone - the regulations do not include the criterion of location of the entity applying for funding. The opening of the Łódź SEZ in January 2019 was an action which emphasized its involvement in the development of modern technologies. The "Fabryka" Centre of Creativity, which is a joint idea of the Łódź SEZ and the Digital Poland Association, which includes manufacturers of modern technologies such as Samsung, HP, Sony and Google. The Centre of Creativity is to inspire new initiatives, being an additional element of the ecosystem functioning around the Startup Spark gas pedal (Grzegorczyk, 2019).

In order to ensure the availability of adequately qualified human capital that could meet the demand for employees reported by the zone companies, the Education Zone Ltd., whose shareholder is, among others, the Łódź SEZ (75% of shares), established the Automation and Robotics Technical School, which is to educate in 4 professions: automation and robotics technician, electronics technician, mechatronics technician and automation technician. Companies have a 10% share in the company: Miele Technika Sp. z o.o. and Ceramika Tubądzin, while 5% of shares are held by Delia Cosmetics (Statute of the Technical School of Automation and Robotics in Łódź. The mission of the school is (in accordance with §7 point 1 of *the Statute*) "to prepare students to pursue a new profession necessary to accelerate economic development and stimulate innovation of the economy". Theschool pursues its goals through "cooperation with employers, scientific, educational, social and cultural institutions and non-governmental organizations". The Technical University of Lodz has been appointed the scientific and technical

supervisor of the Technical School. The Technical University of Lodz has agreed to make its technical and human resources base available to its students.

The establishment of the school, which educates in the directions for which the zone's enterprises are in demand, positively testifies to the strategic plans of the management board of the Łódź Special Economic Zone, which aim at saturating the zone's economic space with human (Becla and Czaja 2014) and social capital. Human capital consists of: a system of motivation to work, communication skills, predispositions and personal talents, creative, entrepreneurial and innovative attitudes, experience and practical skills, human health, fitness and motor characteristics, knowledge and education and skills (Miciuła, 2018). Social capital forms a network of elements which influence social and economic conditions of management. As a result, transaction costs are reduced and desired external effects appear. At the same time, unwanted external effects (effects) can be avoided. Relationships of trust and responsibility, recognized ethos and value systems as well as social and moral norms allow to build and maintain interpersonal and social communication networks". It also proves good cooperation at the level of institution-organization, which from the very beginning of the school's establishment is manifested by the commitment to the implementation of the educational experiment of the most important zone actors: the board, employers, future employees and, given the research and development potential of this organization, the Technical University of Lodz.

Due to the involvement of public and private companies' funds, the school is an effect of a kind of public-private partnership, which, as Zewald (President of the Education Zone) points out in an interview for *Dziennik Lodzki*, has not happened so far (Kałach, 2016). The involvement of the Technical University of Lodz in the educational process guarantees a high level of knowledge transfer, while the participation of future employers will not only ensure the practical use of the acquired skills, but will also allow future employees to gain such valuable experience on the labour market, develop their talents, as well as become acquainted with the specifics of various jobs offered by the companies located within the zone, become familiar with the organizational culture prevailing in selected companies, build relationships with future employers, as one of the pillars on which the idea of the school is based is, as W. Zewald put it. Zewald, the institution of "*growing up among employers*", which is primarily an informal institution. The great advantage of the close contact between students and employers is also the chance to acquire hidden knowledge, i.e. subjective knowledge that comes from personal experience and is therefore difficult to transfer. In such a case, a closer cooperation between education and business allows employers to get to know their future employees better, which has a positive impact on the reduction of transaction costs related to, among others, the recruitment process, shortens (and in the case in question properly eliminates) the period of several months of implementing an employee to his/her duties. Making entrepreneurs believe that in the future they will have no problems with finding highly-qualified staff may also encourage making decisions related to investing in the development of existing enterprises (Piotrowska, 2012).

Another event conducive to the creation of a new path of development organized by the Lodz Special Economic Zone in cooperation (Business Mixer Lodzkiej SSE) with the Polish-German Chamber of Industry and Commerce, the Netherlands-Poland Chamber of Commerce, the British-Polish Chamber of Commerce and the Scandinavian-Polish Chamber of Commerce was the 6th Business Mixer, a series of direct meetings of business representatives at round tables. The aim of the event was to enable the establishment of cooperation. The talks lasted over an hour and a half, during which 3 presentation rounds took place - each participant had 3 minutes to present his company and tell what business partners he is looking for. The talks were followed by networking. The event was attended by companies from eight provinces (including construction, IT, HR, legal services), which proves the supra-local range of the Lodz Special Economic Zone (Newsletter ŁSSE 2019).

The fact that the Lodz Special Economic Zone is focused on supporting innovative technologies and thus creating a new path of development can be proved by the pilot introduction of the fastest 5G Internet in Lodz. Łódź is to be covered by 5G by 2020, 5 years earlier than the rest of Poland. This measure may provide the zone with a competitive advantage over other regions and at the same time provide an investment incentive for entrepreneurs (*https://dzienniklodzki.pl/5g-dla-lodzi-ericsson-i-lsse-rozpoczynaja-wspolprace/ar/13328220*) .

Another activity that fits into the creation of a new development path for the region of Łódź is the establishment of the logistics cluster LODZistics - Logistic Business Network of Central Poland, which brings together, among others, companies from the logistics industry, research and development units and business environment institutions. Its statutory tasks are, among others:

- Stimulating innovation in the logistics industry and related industries by facilitating access to knowledge and assisting in technology transfer between science and business practice in logistics, including pro-ecological solutions related to improving the energy efficiency of products and services offered by members of the Association,

- Development of modern transport solutions to meet the challenges of supply chain management in the XXI century, such as intermodal transport, RFS system in air transport, eco-driving,

- Determining the quantitative and qualitative needs of the labour market in relation to logistics personnel, developing education profiles, study programmes, training and professional development for both operational and management logistics personnel,

- Supporting the cooperation of research centers with business practice,

- Support for obtaining patent protection of scientific research results.

Summary

The analysis of a number of activities undertaken by the Lodz Special Economic Zone leads to the conclusion that the process of creating a new path assumes the diversification of the economy towards technologically related industries (Marczyńska-Witczak, 2008). This process stands in partial opposition to six rules of industrialization reflected in the development of industrial cities (Kuciński, 2008). In the innovative economy standardization is replaced by uniqueness and creativity, the place of specialization is taken by soft skills, therefore social capital, which allows to react quickly to changes in the environment, becomes more and more important. Centralization, understood as a hierarchical set of competences, is being replaced by network structures. Interestingly, the creation of a new development path by the Łódź SEZ also has the characteristics of an endogenous path (especially through the development of local human capital and creation of bonds between investors and local human capital). The creation of appropriate institutional conditions to support this path includes both the creation of institutional infrastructure (e.g. the launch of a technical school for the local economy in the fields that have so far been reserved for university education) and the shaping of the institutional tissue in terms of formal institutions (e.g. statute of the technical school, cluster statute) and informal (development of attitudes conducive to entrepreneurship by organizing events such as Business Mixer or innovative attitudes by enabling cooperation with startups), conducive to building a network of business relationships.

Abstract

One of the factors playing an important role in the process of growth and economic development of spatial units of different geographical scale is infrastructure. The aim of this study is to show the impact of demographic change on the development of social infrastructure in Germany, which is considered to be an element of spatial planning that primarily serves the interests of citizens. It can be pointed out that in German politics the issue of spatial order is strongly linked to the demographic changes taking place in German society. The increase in the number of senior citizens in society requires the social infrastructure to be adapted to their changing needs over time. In this respect, there is scope for entrepreneurial and innovative action, especially in the service sector.

Keywords: economy, demographic change, development of social infrastructure, planning perspective, Germany.

JEL Classification: A11, A13, C02, E25, H42, H54, J11.

Introduction

There is no doubt that one of the factors playing an important role in the process of growth and economic development of spatial units of different geographical scale is infrastructure. As explains Kuciński, it is a condition for "proper functioning, effective use, development and spatial integration of individual subsystems of the spatial socio-economic system and their components" (Kuciński, 2002). He defines it as a system of "devices, objects and institutions that serve these spatial systems and connect them into one whole". Ratajczak emphasizes that the infrastructure significantly contributes to the increase of territorial cohesion and reduction of the so-called social distance (Ratajczak, 2000). Broadly understood public infrastructure can be divided into two basic categories: economic infrastructure and social infrastructure (Blessing, 2018). Table 1 presents the detailed conceptual scope of both categories of infrastructure.

Table 1: Division of public infrastructure

Infrastructure	
Business	**Social**
1. Transport and communication	**1. Science and higher education**
- Roads	- Institutes of science
- Railroad lines	- Universities
- Airports	**2. Education**

Literature Review

Economic infrastructure, also referred to as technical or economic infrastructure, is responsible for the proper functioning of individual departments of the national economy and for the integration of its spatial arrangements (Healey, 2009). In turn, the task of social infrastructure is to directly satisfy various human needs (European Commision, 2015). According to Leśniak, from the economic point of view, the purpose of the devices constituting the social infrastructure is to enable reproduction of the workforce (Leśniak, 1985). However, taking into account the demographic changes taking place, among others, in Europe, this view remains valid in the XXI century only in those areas where positive natural growth is recorded. It is also worth noting that in some countries (e.g. Germany) the demographic changes that are taking place are so important (see table 2) that they are an important factor determining the directions of development of the social infrastructure primarily at the local level (which to some extent also results from the legal solutions adopted in the Federal Republic of Germany).

Table 2: Population in Germany by 2060 by selected estimation variants*

Year (each 31.12)	Option 1	Option 2	Option 3
	Number of people in millions		
Total population			
2020	83,4	83,4	83,4
2030	83,1	83,3	84,3
2040	80,7	82,1	84,2
2050	77,6	80,2	83,6
2060	74,4	78,2	83,0
Population under 20 years old			
2020	15,3	15,3	15,4
2030	15,6	15,7	16,2
2040	14,6	14,9	15,6
2050	13,4	14,1	15,1
2060	13,3	14,1	15,4
Population aged 20 to 66			
2020	51,8	51,8	51,8
2030	48,4	48,6	49,2
2040	44,8	45,8	47,3
2050	43,2	45,0	47,4
2060	40,0	42,7	46,0
Population aged 67 years and over			
2020	16,2	16,2	16,2
2030	19,0	19,0	19,0

2040	21,4	21,4	21,4
2050	21,0	21,1	21,1
2060	21,0	21,4	21,6

Source: (Federal Ministry of Transport and Digital Infrastructure, 2016).

* Assuming a moderate development of the birth rate with an annual birth rate of 1.55 children per woman; assuming an increase in life expectancy at birth by 2060 for men to 84.4 years, for girls to 88.1 years, and assuming a different level of the average migration balance for each variant:

- Option 1: 147 000 people per year
- Option 2: 221 000 people per year
- Option 3: 311 000 people per year.

These demographic changes result in transformations that affect not only society but also spatial order, both locally, regionally and nationally (Parr, 2014). The growing percentage of elderly people in the region, combined with the decreasing number of young people, means that changes in the structure of the services provided must take into account the matching of the supply of goods and services offered with the local demand of the regions by a decreasing number of inhabitants. The general decline in the population (see table 3) results, among other things, in a decrease in municipal income, with a simultaneous increase in the cost of servicing the existing infrastructure per capita. In other words, one can say that demographic changes result in far-reaching socio-economic and spatial consequences (Zeffane and Morgan, 2003).

Table 3: Selected German regions with the lowest population density participating in the programme "Meeting Living needs from a regional perspective

	Area	**Number of inhabitants**	**Population density (os. / km2)**
Landkreis Uckemark	3 058 km2	129 378	42
Altmark Region	4 715 km2	212 762	45
Oderlandregion	811 km2	ok. 31 000	38
Spreewalddreieck	412 km2	34 500	84
County Elbe-Elster	1 890 km2	112 142	59
Amt Peenetal/Loitz	170 km2	6 700	39
Westmecklenburg	6 999 km2	481 000	69
Mitte Niedersachsen	2 320 km2	186 655	80

Research Results

From an economic point of view, it must not be forgotten that older people will become an increasingly significant group of consumers in society. Therefore, when developing the social infrastructure it is necessary to take into account their various needs (Jack, 2016) (for example, health care is not only access to a hospital or a pharmacy located near the place of residence, but also the possibility to take advantage of cosmetic treatments or wellness services). Today, innovation has become the main pillar of the development of economies, regions and entities (Miciuła, 2018). This is very important in the global market, the originality of the business carried out through innovation and technology transfer processes makes it possible to achieve competitive advantage (Rokita, 2005). Innovativeness of the economy comprises the activity of enterprises, government and self-government authorities, research and development entities and institutions which make up the business environment (Snell, 1992). However, innovative economy is not only the sum total of the elements it is composed of, but it is a synergy resulting from broadly understood cooperation based on developed network relations (Tabuchi and Thisse, 2011). It should also be stressed that these changes are essentially irreversibleand can be at least partly controlled by appropriate measures, providing benefits to both society and the economy (Kabus and Miciuła, 2019). The aim of this study is to show the impact of demographic change on the development of social infrastructure in Germany, as an element of spatial planning that primarily serves the interests of citizens

The sources of planning law in Germany include the Landesplanning Act (hereafter: uzp), the Land Planning Act, the 1960 Building Code, and the Land laws regulating the issue of building permits and regulating the technical requirements for buildings. The concept of social infrastructure appears in § 2 of the upp, which outlines the principles of spatial order to be observed for the implementation of sustainable spatial development. According to one of them, access to services and elements of infrastructure to meet the livelihoods of all groups of the population should be guaranteed in such a way that the inhabitants of the subregions and sparsely populated regions are not discriminated against. According to another rule, the spatial development planning process should take into account, among others, the challenges of demographic change. The change in the age structure of citizens directly affects the change in demand for various types of services. Decreasing number of children and youth makes it pointless to invest in kindergartens or schools in the immediate surroundings. On the other hand, the increase in the share of elderly people in society means an increasing demand for services related to, among others, care for the elderly. Since the ongoing demographic changes are not of a temporary nature, it is necessary to provide appropriate social infrastructure to meet the changing needs of living.

One of the key concepts in German spatial policy is the concept of *Daseinsvorsorge*, which can be translated as a living needs satisfaction. Measures are taken at both national and local level to ensure that citizens have access to certain goods and services that are seen as necessary for the proper functioning of the individual. The prices of such goods and services must be socially acceptable and they must be easily accessible in spatial terms, i.e. the distance from the place of residence to the place of service provision should be reasonable. As "reasonable distance" is not a precise concept, it has been established precisely according to the means of transport used and with reference to the places from and to which it should go (see tables number 4 and number 5).

Table 4: Travel time between the element of social infrastructure located in the central center and the place of residence

Central hub	**Travel time in minutes**	
	car	**by public transport**
Basic center	< 20	< 30
Intermediate center	< 30	< 45
The overarching center	< 60	< 90

Source: (Federal Ministry of Transport and Digital Infrastructure, 2015).

Table 5: Travel time to the central center from a neighbouring central center of the same degree

Central hub	Travel time in minutes	
	car	by public transport
Basic center	≤ 25	≤ 40
Intermediate center	≤ 45	≤ 65
The overarching center	≤ 120	≤ 150
Metropolitan region	≤ 180	≤ 180

Source:(Federal Ministry of Transport and Digital Infrastructure, 2015).

The aim to meet living needs in the context of demographic change includes, among others, the development of social infrastructure in the area of accessibility of cultural offer, health services and services provided in the field of elderly care. It is worth emphasizing that while previously the issue of meeting living needs was perceived as a task of the state and municipalities, nowadays it is a task performed by both the public and private sector (Klaassen et al., 1982). This means that the state does not have to provide certain services, but only acts as a guarantor, ensuring that certain services, which are of a certain quality and available at an affordable price, are provided in certain places. Modern demographic development makes it necessary for the state to take into account the shrinking population in selected regions as well as to adapt the existing infrastructure to the changing needs of an ageing society, while avoiding spatial disparities in meeting living needs, i.e. without discriminating against those areas that are less populated. For this reason, an increasingly important function is played by the spatial planning process,

within the framework of which appropriate regional strategies should be developed, which will enable integrated actions to be taken in order to guarantee appropriate access to high quality services located at a convenient distance.

From the point of view of ensuring spatial order, the aspect of regional diversification of demographic development is important, meaning that the actions taken cannot be universal in nature, but must be tailored to the locally and temporally specific needs of the residents living in a particular area. The implementation of such actions is associated with a change in the existing paradigm of spatial management. We should move away from actions implemented in the framework of ensuring "controlled growth" towards actions aimed at transforming and adapting regions and cities to the needs of residents. The effectiveness of these actions depends on the degree of implementation of several objectives:

1) The overarching goal of spatial policy, even in times of a shrinking and aging population, is to ensure equivalent living conditions throughout Germany (the concept of equivalent living conditions does not mean that they are to be identical). Although there is no doubt that the changes in the structure of society will also change life in cities and regions, the goal is to maintain an adequate quality of life. Due to the decrease of revenues to the public purse, it is necessary to save costs in the scope of public services and increase the effectiveness of undertaken actions. Therefore, it is necessary to reorganize the process of providing public services, trying to maintain decentralized structures for meeting the needs of the local population, as they are family- and elderly-friendly.

2) In order to counteract the low birth rate, which is the main cause of population decline and ageing, cities and regions must strive to improve the living conditions and quality of life of children and families. An important factor is also to make it possible to live and work in the intergenerational dimension.

The process of adapting social infrastructure to the local specific needs must take into account the characteristics of the infrastructure, as well as a wide range of possibilities for modification of existing forms of meeting living needs, which includes, among others, such activities as increasing the availability of elements of the existing infrastructure, reducing their number, their decentralization or centralization. The possibilities of action and examples of their application are presented in table 6.

Table 6: Spectrum of infrastructure development activities

Action	Designation	Description of the action	Example
Increasing availability		Improve road connections to increase capacity utilisation	optimization of urban transport network; frequency of transport services depending on the demand for these services
Reduction in availability		Proportional reduction of infrastructure elements adapted to the needs of the local population	reduction of the number of buses
Decentralisation		Division into smaller, efficient units (in case of high connection costs)	Several biological wastewater treatment plants instead of one large
Centralisation (with an appropriate strategy to guarantee accessibility)		Combining unused infrastructure elements with improved accessibility to them	Coordinating the process of connecting schools with school bus transportation services
Temporary mobile solutions		Access to services provided for a limited period of time	Weekly trade fairs, mobile libraries

Restructuring Substitution		The goal is achieved by means of a new way of accomplishing the task	Ordering goods on the Internet, transporting individuals by cab instead of public transport

Source: (Federal Ministry of Transport and Digital Infrastructure, 2015).

Shaping the social infrastructure taking into account the generational changes is a task that does not concern one area of sectoral policy, but constitutes a complex political network of activities that includes children, youth, working age population and seniors, as shown in Fig. 1. Thanks to adapting the social infrastructure to the needs of the above mentioned social groups, the ideal of holistic development of society is realized.

Fig. 1: Intergenerational policy

Source: (Federal Ministry of Transport and Digital Infrastructure, 2010).

Summary

As can be seen from the above considerations, the issue of spatial planning in German politics is strongly linked to the demographic changes taking place in German society. The increase in the number of seniors in society requires an adaptation of the social infrastructure to their changing needs over time. In this respect, there is scope for entrepreneurial and innovative activities, especially in the service sector.

Abstract

This study highlights the disparity in the property values of adjacent communities under different geographical and administrative jurisdiction. Also identified are the factors responsible for the variations and implications for the emerging megacity. Extant literatures were reviewed to establish divers' interests, perception and context of the study. Data were collected with structured questionnaires administered to two categories of respondents; residents in the neighbourhoods and professional property managers. A total of 236 questionnaires were administered. Statistical tools such as percentages mean and independent sample T-test statistics were used to analyse the data collected on rental values of residential properties and results presented in tables. Pearson coefficient of correlation was used to establish the degree of relationship. Results of data analysis showed that significant differences exist between rental values of residential properties in the two border communities while the Pearson correlation coefficient revealed a strong positive correlation between rental values of properties in the neighbourhoods. Significant amongst the factors affecting property values in the communities are the level of infrastructure development, adherence/enforcement of physical planning regulations, administrative jurisdiction, population density, proximity to CBD and level of commercial activities. The study concluded by recommending major investment in physical and socio-economic infrastructure in both communities and creation of joint development policy and programme by governments of Lagos and Ogun states so as to overcome administrative jurisdiction barrier militating against the actualization of the megacity project.

Keywords: Border, Infrastructure, Megacity, Residential, Value

Introduction

Growth and physical expansion of urban settlements is a global phenomenon which in recent times has gained momentum in regions regarded as less developed (Abiodun, Olaleye, Dokia and Odunaiya, 2011). The pattern of growth and development of urban areas is defined by several factors. While factors like presence of modern infrastructure such as pipe borne water, electricity good road network, access to social services and sporting facilities, employment opportunities, concentration of industrial and commercial activities, location of administrative and other government establishments etc. continues to attract population into urban areas, increase in

crime rate, all forms of environmental pollution, rising cost of living, rising cost of housing and land procurement, traffic challenge, breakdown of existing infrastructure, retirement and old age related reasons and several other factors over the years have pushed human population out of urban areas to peri-urban and rural fringes in droves. Of recent, many peri-urban areas are witnessing population growth on a scale that is unprecedented. For instance, Adelekan, Olajide-Taiwo, Ayorinde, Ajayi, and Babajide (2014) stated that while the average population growth rate per year in Ibadan metropolis was 0.5 percent between 1991 and 2006, average growth rate for the peri-urban areas was 4.8 percent over the same period. Urbanization is the lead cause of peri-urbanization and this according to Adelekan (2016) is a process whereby extensive areas earlier characterized by rural features get absorbed into the city or transformed into peri-urban areas. Peri-urbanization gradually absorbs existing physical developments and paves way for modern structures, social as well as economic infrastructure developments. People move from overcrowded city centers to the less populated sub-urban areas. As population of these areas increase, demands for land for different uses such as housing, commercial, education, administration, financial services and other economic purposes also increase. In most developing nations where physical planning regulations are weak and suffer poor implementation, sub-urban growth and developments are often unplanned, uncontrolled and disorganized, exposing the residents to diverse environmental risks and hazards.

Bloch, Fox, Monroy and Ojo, (2015) observed that the growth of Nigeria's urban population has been accompanied by the expansion of existing built-up areas and the emergence of new and identifiably urban settlements. For instance, Lagos megacity according to Mehrotra et. al, (2009), is one of the fastest growing urban centres. Aside the official estimate of about 9 million according to NPC (2006), the UN-Habitat estimated the city's population to be about 15 million in 2006 with 600,000 additional migrants added each year. This has been projected to about 20 million in 2015. Lagos state according to Salau, Lawanson and Odumbaku (2013) has continued to grow in terms of population and space, spilling excess population into the neighbouring Ogun state. The Lagos megacity project covers the whole of Lagos state and four local governments in Ogun State which are at the border of Lagos State. These include: Ado-Odo/Ota, Ifo, Obafemi-Owode and Sagamu (Bello and Olatubara, 2014). The Ogun State Government report (2015) revealed that Lagos side of the megacity is made up of 74% of the built-up area and has 85% of the megacity population. Ogun state side on the other hand has 26% of the built up area and accounts for about 15% of the megacity population. The communities in adjoining local government to Lagos State that forms part of Lagos State continues to experience influx of population from the over-populated Lagos metropolis. Thus the dual character of the Lagos megacity which comprises communities from two different geographical and administrative jurisdictions prompted the study. The study analysed and compared residential property values of border communities under the umbrella of Lagos megacity project.

Literature Review

Urban growth and development pattern

Ogu (2005) described the post-independence urban development process in Nigeria in the form of growth by densification and growth by expansion. This as explained exists at the edges of existing urban areas and refers to the appearance of new parts of a city. Atu et. al, (2012) opined that this occurs when detached improvements and settlements that were not part of urban areas are absorbed at the city borders as a result of physical expansion. This aptly describes urban development process that saw the fusion of scattered neighbourhoods that were hitherto located within the fringes of Lagos metropolis. Growth by densification on the other hand describes the emergence of independent houses in areas previously occupied by single large housing structures (Bloch, Monroy, Fox and Ojo, 2015). This pattern of growth as explained in the study is common with urban cores or existing urban areas and has led to the appearance of various forms of development within the traditional core of Nigerian cities, notably the emergence of informal settlements. This not only explained the process of urban transformation witnessed in major city centers such as Ibadan, Abeokuta and Lagos, but also that of Ota town in Ado-Odo/Ota Local government area of the Lagos megacity. Ota was a core ancient town with distinct cultural and morphological characteristics and a largely homogenous population. The expansion cum explosion of Lagos population resulted have over the past decades diluted the homogenous population of the ancient Ado-Odo/Ota towns and triggered the appearance of various socio-economic, administrative structures and infrastructures typical of urban transformation process. Thus urban expansion connotes the improvement and expansion of urban areas in terms of size in order to create space for urban growth. Notwithstanding, Adewale, Ibem, Amole and Adeboye (2020) observed that the plight of residents of inner-city slum has attracted attention because of the degenerated state of infrastructure. Urban growth results from three processes namely; natural population growth, rural-urban migration and reclassification of rural into urban areas. The emergence of Lagos megacity and the physical and geographical coverage therefore reflects the underlying process of these three forces at work. However, Bloch et al., (2015) found out that urban growth and

development further depends on the prevailing political and economic situation as well as government control mechanism. Lack of good government control results in spontaneous patterns of growth around urban fringes while proper control sets unnecessary expansion within limits. Urban growth and development increases competition among land use and resources, urban land cost and ultimately, renters and owner's housing procurement costs.

Urban infrastructure development

Infrastructure development is one vital socio-economic factor that makes a human settlement urban and livable. Basic infrastructure that facilitate development in any neighbourhood include housing, good road network, drainage, electricity, decent water supply system, waste management system, primary healthcare facilities, educational facilities, effective security architecture combined with well-planned and coordinated developments. Urban infrastructure provision is not only the responsibility of the government alone. The influx of people into the sub-urban areas of a city only culminates in demand for more housing and other socio-economic infrastructures. These demands not only reveal urgent government intervention in many areas but also create viable opportunities for private sector participation. Infrastructure development is found to be a vital factor that determines the value of a neighbourhood and is reflected in land and property values in the area. According to Oloke, Simon and Adesulu (2013), the level of infrastructure development in a neighbourhood is very critical to determining housing prices and as well attracts huge investment in broad range of real estate products. Providing infrastructure throughout the country has almost become impossible for the government and as such, it has become important for private sector and other stakeholders to contribute to infrastructure provision. Bello, Adeniji and Arowosegbe (2015) identified four participants in the provision of urban infrastructures namely: the government, formal private sector, informal private sector, and residents of the affected community. Alyafei, (2017) revealed that the government of Quatar considers the involvement of residents as key to the country's progressive development. Ahuja and Priyadarshini (2017) also emphasized that the people affected by a development need to be duly informed in order for them to be involved in the development. It was also noted by Ahuja and Priyadarshini, (2017) that the goal of sustainable development is likely to be achieved when the affected communities are actively involved in the process so that they do not indirectly impede on the benefits of the infrastructures provided.

Urban infrastructure and property value

Urban infrastructure and property value are closely connected as the level of development or the state of infrastructure determines the value of property in the vicinity. Real estate products include vacant/virgin land, and developed land ranging from housing to industrial, commercial, administrative, health and educational facilities, recreational, entertainment and hospitality developments as well as market structures located in an area. Land and landed properties are either rented or purchased to meet these different purposes and coupled with the portion of land laid out for infrastructure provision, the competing uses for land resources most times results in enhanced value of land and landed properties in an urbanizing neighbourhood. Other dimensions of value largely grouped as statutory or non-statutory values though exist for properties, these values generally are affected by the level or state of infrastructure. Property value worldwide is a metric for assessing the level of development in any given area. Babalola et. al. (2020) submitted that quality and sustainable housing environment is germane to quality living in public housing estates. The higher the value of properties, the higher the level of development in that location and vice-versa. This explains why different places have unique property market as location to a large extent determines value. Different studies have investigated the impact of different infrastructure on residential property value. For instance, Qin, Yu, and Liu (2019) examined the impacts of the HOPSCA (Hotels, Offices, Parks, Shopping malls, Convention centers, and Apartments) facilities on housing prices and found that HOPSCA had both positive and negative impacts on accommodation values. It was observed that different cases of HOPSCA had different impacts on accommodation values according to the situation and mode of arrangement. Also, Gargiulo (2010) assessed the impact of city renewals, focusing on the construction of an extravagantly fast rail route and its effect on property prices. The study also concluded that the development of fast rail system drastically increased property values in the area. In addition, the larger developed city centres were very much affected as the transport infrastructure helped revived the blighted areas. Bello, Adeniji, and Arowosegbe (2015) examined the important of urban facilities to property values in Abeokuta's city center, Ogun state, Nigeria. It was concluded that the provision and condition of infrastructural services led to an enormous rise in price. In order to place the pace of development of communities under the Lagos megacity project on the same page with the agenda of the vision, this study was conducted to serve as development metric particularly for the border communities.

Research Methods

The study population comprises residential properties owners in Alimosho and Ado-Odo/Ota local government areas of Lagos and Ogun States, as well as estate surveyors and valuers in Ikeja, Lagos. Two border communities were purposely selected from each local government area. The communities were Joke Ayo community in Alimosho and Akeja community in Ado-Odo/Ota. The sample size was determined by measuring a radius of 1km on either side of the bridge that demarcates the boundary between the two communities. A total of 63 houses were counted within the 1km radius in Akeju community and 89 houses houses within the 1km radius of Joke-Ayo community making 152 houses. Thus the first category of respondents is the 152 adult residents or household heads from each of the 152 houses surveyed. The second category of respondents are the estate surveyors and valuers in the 84 estate firms in Ikeja, Lagos as obtained in the 2016 directory of the Nigerian Institution of Estate Surveyors and Valuers. Estate surveyors and valuers according to Oloke, Ijasan and Oyedele (2013) are those trained and authorized to carryout valuation and other related services such as property management, sales, letting, feasibility and viability study etc. Sample sizes for the target population are the owners/adult residents of the identified houses and estate valuers in the capacity of manager or partner in the firm. Structured questionnaire was administered to the two set of respondents. Rent per annum of the various types of residential property in the study areas was obtained over a six year period (2014-2020). The impact of the factors influencing residential property values in the neighbourhoods was assessed on a five point likert scale namely: nil, low, moderate, high and very high with weight ranging from 5 (very high) to 1 (nil). Statistical tools of mean and range were used to determine point estimates of rents of different accommodation types as well as the change in rental values. Karl Pearson product moment coefficient of correlation was used to establish the relationship between rental values in the two localities. Findings were presented in tables, charts and then discussed.

Result Analysis

Response Analysis

Table 1: Analysis of response

Questionnaires	Joke-Ayo (Lagos)	Akeja (Ogun)	Estate Firms	Total
No. Administered	89	63	84	236
No. Retrieved	73	54	65	187
Response rate (%)	82.0	85.7	77.4	79.2%

One hundred and fifty-two (152) questionnaires were administered to household heads within the selected border communities. A total of 122 were retrieved constituting 83.6 percent response level. This was sufficient for subsequent analysis. The pattern of questionnaire administration and retrieval rate is as shown in Table 1.

Types of residential property in selected neighbourhoods

Table 2: Types of residential property in the communities

Property Type	Property Description	Joke-Ayo (Lagos) No.	Percentage	Akeja (Ogun) No.	Percentage
Type 1	Tenement building	3	4.1%	12	22.2%
Type 2	Self-contained	5	6.8%	3	5.6%
Type 3*	Blk of 2 bdrm flats	11	15.1%	9	16.7%
Type 4**	Blk of 3 bdrm flat	17	23.3%	11	20.4%
Type 5	2 bedroom bungalow	3	4.1%	5	9.3%
Type 6	3 bedroom bungalow	17	23.3%	8	14.8%
Type 7	Semi-detached	7	9.5%	4	7.4%
Type 8	Fully-detached	10	13.7%	2	3.7%
Total		73	100	54	100

Key:
**Block of 2 Bedroom Flats*
***Block of 3 Bedroom Flats*

Table 2 contains the different types of accommodation of respondents in study area. The Table revealed that tenement accommodation are common in Akeju community having 22.2% of the number of houses captured compared to blocks of 3 bedroom flat and 3 bedroom bungalow that have 16.7% and 20.4% respectively within the same community. However, blocks of 3bedroom flats and r bedroom bungalow have the highest occurrence with 23.3% each in the Joke-Ayo community of Lagos State. The survey further revealed fewer types of modern design accommodation in Akeju compared to Joke-Ayo neighbourhood.

Table 3 presents the average rental value of accommodation types in the two neighbourhoods over a period of 6 years. This was obtained from the responses of professional property managers surveyed. The figures were estimates of range of values supplied by the valuers for each property type between 2014 and 2020. It was observed that average rental values increase in both communities during some periods but remain constant at some other periods. For instance, similar average rent was observed in 2019 and 2020. However, neither the rate of growth nor the relationship between the values was immediately clear from the Table.

Table 3: Average rental value of residential properties in Joke-Ayo and Akeja communities

Types	2014		2015		2016		2017	
	Joke-Ayo	Akeja	Joke-Ayo	Akeja	Joke-Ayo	Akeja	Joke-Ayo	Akeja
Type 1	30,000	12,000	45,000	15,000	50,000	18,000	60,000	24,000
Type 2	90,000	22,500	120,000	25,000	120,000	35,000	150,000	50,000
Type 3	150,000	60,000	160,000	90,000	180,000	120,000	200,000	130,000

Type 6	250,000	110,000	280,000	140,000	320,000	170,000	350,000	200,000
Type 7	260,000	120,000	280,000	150,000	350,000	180,000	360,000	240,000
Type 8	280,000	150,000	300,000	180,000	360,000	240,000	400,000	280,000

Types	2018		2019		2020	
	Joke-Ayo	Akeja	Joke-Ayo	Akeja	Joke-Ayo	Akeja
Type 1	75,000	30,000	90,000	50,000	90,000	50,000
Type 2	150,000	75,000	180,000	90,000	180,000	90,000
Type 3	240,000	150,000	280,000	180,000	280,000	180,000
Type 4	280,000	160,000	300,000	200,000	300,000	200,000
Type 5	320,000	180,000	350,000	220,000	350,000	220,000
Type 6	350,000	220,000	380,000	240,000	380,000	240,000
Type 7	400,000	250,000	420,000	260,000	420,000	260,000
Type 8	450,000	320,000	460,000	340,000	460,000	340,000

Arising from Table 3, the mean rental value of all types of residential properties in the two communities were determined for each year. The result was plotted on a line graph to reveal the trend of rental values between the two communities. This is shown in Figure 1.

Figure 1: Trend of rental values at the selected border communities

Test of hypothesis

In order to ascertain the difference between the rental values of residential properties in the two communities, a null hypothesis was set and independent sample test was carried out to determine the veracity or otherwise of statement of the hypothesis. The hypothesis is as stated;

Null Hypothesis H_0: There is no significant difference between statistical mean of rental values of residential properties of selected border communities of Lagos and Ogun States.

Alternative Hypothesis H_1: There is significant difference between the statistical means of rental values of residential properties of selected border communities of Lagos and Ogun States. The result of the hypothesis is as presented in Table 4.

Table 4: Independent sample T-Test on rental values

Dependent (Test) Variable	**Independent (Grouping) Variables**	**N**	**Sig.**	**T**	**Df**	**Sig. 2-tailed**	**Mean Diff.**	**Std Error Diff.**
			Equal variances assumed					
Rental values	Residents	122	.043	.102	185	.032	.1017	.1964
	Estate valers	65						

**Equal variances assumed **95% confidence interval of the difference*

Arising from the Table, given the Sig. value of .043, equality of variance is assumed. The t statistic under the assumption of equal variances has a value of .102 and degree of freedom (df) value of 185 with an associated Sig. (2-tailed) value of .032. Since the sig. value of .032 is less than .05, the null hypothesis which states that there is no significant statistical difference between the mean rental values of residential properties in the selected border communities is rejected. By implication, the alternative hypothesis which states that there is significance difference between rental values of residential property values at border communities of Lagos and Ogun States is accepted. Furthermore, in testing the relationship between the two values of average rent per annum of residential properties in the two neighbourhood, Karl Pearson moment correlation coefficient was engaged to examine the direction and strength of the relationship. Data obtained from the professional firms were used for the analysis. A null and alternative hypothesis was set as follows;

Null Hypothesis H_0: there is no relationship between the average rental values of residential properties in the two border communities

Alternative Hypothesis H_1: There exists a relationship between the average rental values of residential properties in the two border communities

Table 5: Test of relationship of rental values between the two communities

Correlations		Rental value in Joke-Ayo Community	Rental value in Akeja Community
Rental value in Joke-Ayo Community	Pearson correlation	1	.672
	Sig. (1-tailed)		.209
	N	65	65
Rental value in Akeja Community	Pearson correlation	.672	1
	Sig. (1-tailed)	.209	
	N	65	65

As obtained in the Table 5, the Karl Pearson correlation coefficient is +0.672 and this showed that there is relatively strong positive correlation between rental values of residential properties in the two border communities. The coefficient of correlation shows that the rental values move in the same direction albeit at a significantly different magnitudes.

Factors affecting rental values in the study area

Respondents from the estate surveying and valuation firms were asked to identify the factors affecting property values in the neighbourhoods. The responses were measured against a 5-point Likert Scale ranging from very high impact (5), high impact (4), moderate impact (3), low impact (2) to no impact (1). Results of analysis were extracted and presented.

Table 6: Factors influencing property value

Factor	Joke-Ayo		Akeja	
	Mean	Rank	Mean	Rank
Population	3.891	4	4.312	1
Infrastructure development	4.512	2	2.918	5
Housing quality	4.512	2	3.212	4
Geopolitical Jurisdiction	3.891	6	2.183	8
Structural factors	4.733	1	2.702	6
Locational factors	4.132	5	3.691	2
Neighbourhood factors	4.306	3	2.433	7
Economic factors	4.141	4	2.918	5
Environmental factors	3.633	7	3.328	3

Presented in Table 6 are that factors affecting property values as obtained from the responses of the estate valuers. Also ranked is the significance of the each factor as perceived for each community. As shown, structural factors, level of infrastructure development, housing quality as well as locational and neighbourhood factors have high impact on residential property values in the neighbourhood in Joke-Ayo communities. On the other hand, population density, locational factor, housing quality are factors that have moderate impact on rental value of residential properties in Akeja communities.

Summary of findings and Discussion

Arising from the various analysis, it was observed that Joke-Ayo communities has more development density compared to Akeja community. This was attributed to the significant difference in the number of houses counted within the 1km radius of each community whereby, there are 63 houses as against the 89 within the 1km radius of each of the two communities. This reveals that Joke-Ayo is a sub-urban precinct experiencing urban fringe transformation. Figure 1 showed that the mean rental value of residential properties in the two communities increased between 2014 and 2019. This implies that the border communities witnessed similar growth pattern in the value of rental properties over the six year period. While the figure showed the pattern, Karl Pearson coefficient of correlation shows the direction and strength of relationship between the changes in the value of rents between the two communities. The coefficient of correlation clearly showed that there is strong positive correlation between rental values of residential properties in the two border communities although at different magnitudes. Finally, despite the closeness of the two border communities, the significant differences in rental value across the types of residential properties in the two communities corroborate the results in Table 5 where the study observed that different set of factors have very high influence on rental values in Joke-Ayo community compared to the factors that affect similar properties in Akeja community. The finding inherently indicates that population spill from Lagos into the border communities is an important factor contributing to the trend of rental value of residential properties in Akeja community of Ado-Odo/Ota local government of Ogun State.

Conclusion

The study investigated the correlation between residential property rental values of selected border communities of Lagos and Ogun states. The significant disparity observed in rental values as well as the pattern of rental growth revealed the blunt gap in the level of infrastructure development, neighbourhood density, housing quality, administrative jurisdiction and level of economic development in the two communities. This notwithstanding, the relatively strong positive correlation of rental values between the border communities is an indication of the enormous potentials of property market of the Ogun communities that border Lagos State. It is therefore recommended that Ogun state government invest in the development of socio-economic infrastructure, renewal programmes of Ota border communities. Recommendations from this study would facilitate the achievement of targets 9 and 10 of the United Nations sustainable development goals. The goals aimed at building resilient infrastructure, promote inclusive and sustainable industrialization, foster innovation and reduce inequalities among urban dwellers.

Abstract

Retail sector has always been an important source of revenue for the national economy. The retail business processes and consumer formation differ in each particular case, but it always involves interrelation between several parties and serve a special purpose. Consumer satisfaction and its management have become the cornerstone of business competitiveness and an integral part of business. Social networks, in particular, can today become a tool for targeted consumer awareness formation, as entrepreneurs become more effective regarding marketing activities and communications, and consumers become more educated and selective. Market globalization also affects retail businesses, the smaller retailers can become competitive. The aim of this work is to find out the main factors of the formation of consumer loyalty in the retail sector and to define the features of this process that will enable the enterprises to improve their activities and ensure their competitiveness in the real situation. In order to determine consumer loyalty trends in Latvia and to make proposals to companies to improve consumer loyalty formation processes through social networks, 388 respondents were surveyed. The following research methods have been used: logical-constructive method - comparing theoretical material with empirical results, analyzing SPSS survey data and graphical method - visually summarizing information. The study concludes that using social networks can help retail businesses in their satisfaction and loyalty boosting factors.

Keywords: Consumer Satisfaction; Loyalty; Relationship Management; Retail; Social Networking

Introduction

Retail sector has always been an important source of revenue for the national economy. The retail business processes and consumer formation differ in each particular case, but it always involves interrelation between several parties and serve a special purpose. Consumer satisfaction and its management have become the cornerstone of business competitiveness and an integral part of business. Social networks, in particular, can today become a tool for targeted consumer awareness formation, as entrepreneurs become more effective regarding marketing activities and communications, and consumers become more educated and selective. Market globalization also affects retail businesses, the smaller retailers can become competitive. The aim of this work is to find out the main factors of the formation of consumer loyalty in the retail sector and to define the features of this process that will enable the enterprises to improve their activities and ensure their competitiveness in the real situation. In order to determine consumer loyalty trends in Latvia and to make proposals to companies to improve consumer loyalty formation processes through social networks, 388 respondents were surveyed. The following research methods have been used: logical-constructive method - comparing theoretical material with empirical results, analyzing SPSS survey data and graphical method - visually summarizing information. Literature Review

Theoretical aspects of consumer loyalty

Consumer satisfaction is one of the prerequisites for building long-term and profitable business relationships with consumers, but loyalty is one of the most important end results of satisfaction. Loyalty is the result of the consumer perception of the offer (product, service, brand, etc.), leading to positive attitude (cognitive, trust and emotional) and favorable behavior towards the company (repeated purchases, additional purchases, high consumption intensity, etc.) (Linina and Zvirgzdina, 2016). Attracting new customers to businesses is significantly more expensive than retaining existing ones, as regular consumers spend more but pay less for the company (Karjaluoto et al., 2012). Researchers (Mueller and Riesenbeck, 1991) have found that maintaining only about 15-20% of the cost to attract new consumers is sufficient to sustain loyal consumers. Based on empirical research, other authors (Hermann and Huber, 1997) argue that acquiring new consumers is 5 to 7 times more expensive than retaining existing consumers.

Most empirical studies show that there is a strong correlation between consumer satisfaction and loyalty (Mittal and Kamakura, 2001). There is no unanimous agreement as yet on how this relationship manifests itself in a realistic way (progressive, degressive or otherwise). Some researchers believe that the type of relationship might depend on the market situation, supply characteristics, and the specifics of the target audience. In markets with high competition, the relationship between consumer satisfaction and loyalty has been shown to have a progressive graphical form, whereas in markets with relatively low competition intensity it is characterized by a degressive graphical form (Homburg and Giering, 2000). Empirical research has shown that there is a correlation between consumer satisfaction and loyalty, which can be graphically represented by the S-shape, because only when the consumer is seduced does loyalty increase very quickly when he is in the indifference zone and loyalty in the frustration zone leads to at the loss of loyalty (Matzler and Pechlaner, 2001). Other researchers have found that sometimes seemingly illogical situations occur when there are satisfied but loyal consumers and dissatisfied yet loyal consumers (Cano et al., 2001).

Service industry researchers (Giovanis et al., 2014) argue that customer loyalty is influenced by service quality, emotional satisfaction, and corporate image / reputation. The authors come to this conclusion after a survey of 600 respondents - clients of service companies in Greece. Other authors (Shukla, 2010; Ladhari and Soniden, 2011) have shown that product quality and company image directly or indirectly affect consumer loyalty in other industries. Although the authors of the research do not agree with the opinion, that emotional satisfaction is considered to be a factor influencing loyalty, because in essence, emotion is a component of the attitude dimension of loyalty and satisfaction is a result of consumption. In Norway, a special Consumer Satisfaction and Loyalty Rating (EPSI) rating was developed based on the model. The model implies that the values perceived by the consumer include the image of the company, the consumer's expected supply values, the actual quality of the product and the quality of service. These perceived values determine satisfaction and the resulting consumer loyalty (Pervaiz and Sudha, 2007). First, the model assumes that all factors that affect satisfaction can influence directly, i.e., without the consumer's perception. In the authors' opinion, this may be the case for consumers with a high degree of loyalty, when the pre-purchase selection process is practically automatic. Second, the image of the company and the quality of service can directly affect loyalty even without a satisfaction phase. Obviously, this relationship also depends on the level of consumer loyalty, that is, the higher it is, the less the importance of satisfaction in the process.

Perhaps the study of the attitudes and behavioral dimensions of loyalty would have led to other conclusions regarding the direct effect of value perception on loyalty. The authors of the current paper also disagree with the thesis that consumer supply expectations relate to values that affect satisfaction. Before determining satisfaction / dissatisfaction, there is a comparison between actual and expected offerings, and this largely psychological process is related to consumer perception. The monetary value (the price of the offer in relation to the consumer's costs), on the other hand, is wrongly excluded from the model.

Based on the analysis of the advantages and disadvantages of loyalty models, the authors suggest a conceptual consumer loyalty model for practical use (see Figure 1). This model is universal in nature, but it should be practically applied, taking into account industry / product / brand characteristics. As we can see, the consumer loyalty building processes include the following logically related elements:

- factors (values) affecting loyalty;
- perception of consumer values;
- characteristics of the target audience;
- consumer satisfaction;

• dimensions of consumer loyalty.

Fig. 1: Conceptual model of consumer loyalty building (Linina & Zvirgzdina, 2016)

The loyal consumers exhibit the following characteristics of market behavior: they buy more and stay loyal for longer, are less sensitive to price increases, advise other consumers to buy and consume / use a particular product / brand that is beneficial to the company because:

• Word-of-mouth communication costs nothing;
• Recommendations contain specific information based on consumption / use experience;
• Communication comes from friends and / or acquaintances you can trust.

In essence, the consumer loyalty increases the value and competitiveness of a business because it:

• Calls for lower consumer acquisition costs;
• Develops a solid consumer database;
• Allows to increase product / brand prices within certain limits.
• Promotes product sales and profit growth;
• Promotes a positive corporate image and reputation.

Of course, these characteristics of loyal consumer behavior and the benefits to the company depend on the level of loyalty. Therefore, it is necessary to investigate in more detail the process of loyalty building in a specific sector of the economy. Summarizing all of the above principles of consumer loyalty, it can be said that it is based on consumer satisfaction and relationship building. Social networks can be used to build long-term, high-quality relationships with consumers. The use of social networks is nowadays considered as one of the main tools for building relationships with consumers (Trainor, et al., 2014). Social networks can achieve high rates of information transfer, take a creative approach to information transfer, and also gain rapid feedback (Marolt, et al., 2020). Many researchers emphasize the availability and use of social networks precisely because of their low cost (Cappuccio, et al., 2012). With this information in mind, the authors of the study want to find out the quality of social networking applications from a consumer perspective in retail relationships with consumers.

Retail sector and its characteristics

Looking at the research of different authors, it can be concluded that there are differences in the satisfaction-building process in three sectors of the economy: the consumer goods sector (Swan, Combs, 1976), the industrial

goods sector (Homburg, Rudolph, 2001) and the services sector (Brandt, 1988; Cadotte, Turgeon, 1988). The proposition of the current research is the one that the retail sector belongs to the service sector.

As a member of the distribution channel, the retailing has the following functions (Praude, 2011), such as:

• elimination of the mismatch between supply and demand;
• management the stock of goods;
• promotion of product transportation efficiency;
• development an assortment of goods according to consumer needs;
• establishment of contacts and negotiate with product suppliers;
• serving consumers, sell goods and services to them;
• performing marketing activities (research, communication, etc.);
• assuming that the distribution channel operates smoothly.

Analyzing the retail situation in Latvia (see Figure 2), it can be seen that starting from 2016 the turnover of retail companies is growing rapidly. This is only one indicator of the sector, but does not indicate the processes within the sector as a whole.

Fig. 2: Retail trade turnover Latvia 2014. – 2018 (thousands Euro) (csb.gov.lv., 2018a)

Looking at the dynamics of the number of companies in the retail industry, the opposite is true. The number of retail companies has been declining rapidly since 2016 (see Figure 3), which indicates irreversible processes within the industry. Businesses are either going out of business or joining the big chain stores without competing. Such a merger does not benefit the consumer as it reduces competition. Market globalization is increasingly affecting retailers, forcing them to look for solutions to ensure competitiveness and development.

Fig. 3: Number of retail companies in Latvia 2014 – 2018 (csb.gov.lv., 2018b)

Despite the increasing internal competition within the industry, the retailers need a tool to ensure competitiveness and create the preconditions for building consumer loyalty.

Methods

Consumer and consumer behaviour surveys are used to study consumer attitudes and purchasing behaviour. In this study, a traditional method was used to directly and indirectly evaluate the activities of retail companies in the most popular social networks in Latvia - a questionnaire survey (Rust et al., 2004). The survey was conducted in Latvia to identify customer satisfaction factors and rank them in order of importance. The preparation of this method involves several steps.

First. Determining the degree of standardization and openness of the questionnaire. Given the purpose of the survey and the characteristics of the respondents, the authors chose a standardized open questionnaire. This means that all respondents were asked the same questions in the same sequence, which ensures an objective comparison of the answers. The questions were selected with a single-choice Likert scale on a 5-point scale.

Second. Defining the survey method. Out of all possible options - personal interview, mail survey, phone, fax, email and internet, the authors chose the following - the survey was created on the Google Forms website. Questionnaire with the random sample Snowball method (Kristapsone, 2014), via personal contacts of the authors of the work, was sent via e-mail to the respondents who further shared this link. 388 completed questionnaires were considered valid for the study. All residents of Latvia in 2018 were taken as general population. At 95% confidence level and 5% error margin, the minimum sample size was estimated at 385 respondents (Arhipova & Bāliņa, 2006). The expert survey was conducted between November and December 2019. Based on the research objectives and using the SPSS software, the authors calculated the following:

• average arithmetic expert evaluation ($\bar{X}$);
• median (Me);
• module (Mo);
• amplitude of variation;
• standard deviation;
• coefficient of variation (Kristapsone, Kamerādeu.c. 2011).

Based on the factors influencing loyalty and the opportunities offered by social networks, six blocks of questions were created for companies - total assessment of retail business activities on social networks, assessment of creative solutions on social networks, usefulness of published information, regularity of communication with consumers.

Results and Discussion

On the basis of methodology, then the authors of the thesis carried out the data processing and analysis of the assessments (see Table 1).

Table 1: Evaluation of retail activities on social networks (Facebook and Instagram)

Company activity in social networks	Arithmetic Mean	Standard error of Mean	Mediana	Moda	Standard deviation	Dispersion	Variation	Min	Max
Overall assessment of retail business activity on social networks	3.43	0.04	3.00	3.00	0.81	0.66	0.05	1	5
Opportunity to communicate with the company	3.03	0.05	3.00	3.00	1.04	1.07	0.08	1	5
Usefulness of published information	3.31	0.04	3.00	3.00	0.94	0.89	0.06	1	5
Regularity of communication with consumers	3.30	0.05	3.00	3.00	1.07	1.14	0.07	1	5
Business-generated content	2.99	0.04	3.00	3.00	0.89	0.79	0.07	1	5
Availability of current information	3.27	0.04	3.00	3.00	0.88	0.77	0.06	1	5

In order to assess the situation of retail business activities in social networks, the authors carried out in-depth processing and analysis of the survey results (see Table 1). As you can see, corporate content on social networks received the lowest rating ($\bar{X}$= 2.99; Me = 3.0; Mo = 3.00). This is a bad indicator because it is content that is crucial to building a relationship with a consumer. Table 1 also shows that consumers' ability to communicate with the company through social networks ($\bar{X}$= 3.03; Me = 3.00; Mo = 3.00) and access to up-to-date information ($\bar{X}$= 3.27) were underestimated ; Me = 3.00; Mo = 3.00). In-depth assessment of these issues further clarified the factors that influence them. Respondents pointed out the unprofessional nature of the company's employees involved in social networking activities. The regularity of communication with consumers ($\bar{X}$= 3.30; Me = 3.00; Mo = 3.00) and the usefulness of published information ($\bar{X}$= 3.31; Me = 3.00; Mo = 3) received slightly higher. In general, it should be noted that the overall rating of business activity is the highest (see Table 1), which indicates consumer attitudes towards this type of activity as a whole.

Conclusions

1. Consumer loyalty is the result of the consumer perception of the offer, which has led to a positive attitude and favourable behaviour towards the company.
2. The consequences of consumer loyalty vary, but the main manifestation is the repetition of purchases. Other signs of loyalty - low price sensitivity and positive word-of-mouth communication - are less common as they do not relate to the overall retail rating but to individual products / brands.
3. The survey found that the respondents rated the content created by the company in social networks the least ($\bar{X}$= 2.99). This is a bad indicator because it is content that is crucial to building a relationship with a consumer. Consumers' ability to communicate with the company through social networks ($\bar{X}$= 3.03) and access to up-to-date information ($\bar{X}$= 3.27) were also underestimated. One of the reasons was the lack of professionalism of the employees involved in the company to work in social networks.
4. The regularity of communication with consumers ($\bar{X}$= 3.30) and the usefulness of published information ($\bar{X}$= 3.31) were slightly higher.
5. The overall rating of retail business activity in social networks is highest ($\bar{X}$= 3.43), which indicates the attitude of consumers towards this type of activity in general. Based on the views of several researchers about using social networks as a basis for customer loyalty, the authors believe that retailing as a whole can use social networks to build consumer loyalty and ensure competitiveness.
6. In the retail sphere the consumer loyalty analysis deserves more detailed attention, this matter has not been researched enough until now.

Abstract

In Galicia and the north of Portugal, from the 8th to the 11th century, Viking and Norman peoples were present. Initially through piracy activities that they developed and later through their support in crusades and holy wars. Local communities felt the need to revitalise these memories through thematic festivals, to assess the possibility of developing these events and to understand which strategies should be used to ensure the cultural sustainability of festivals. In this study the qualitative method was used, where the participants who are part of the scientific community, event organizers and tourism promoters with links to Viking thematic festivals in the Euro-region of Northern Portugal and Galicia were selected. The main results show that the biggest challenge for those responsible for organizing *Viking thematic festivals* is to maintain the levels of authenticity, following the principles of conservation of intangible heritage.

Keywords: Viking; Heritage; Authenticity; Theme Festivals; North of Portugal; Galicia.

Introduction

Tourism can be a powerful incentive to preserve and enhance intangible cultural heritage to support the long-term survival of existing intangible cultural heritage, and above all, to generate revenue for communities (UNWTO, 2020). Viking memory in an Iberian context could be revitalised through festivals that depict this hidden cultural heritage. The context of Viking festivals in northern Portugal and Galicia has not been the subject of empirical studies. The only study evidence is presented by Hannam & Halewood (2006) on Romaria de Catoira, an internationally recognised Viking theme festival, whose main activity is the recreation of Viking landing. The growing visibility and notoriety of the Catoira Pilgrimage has enhanced the birth of new Viking theme festivals in the region. The case of the locality of Foz which annually recreates the contact between the Galician and Norman people through the testimony of the miracle of Saint Gonzalo (Norman Festival, 2020); the Romaxe Vikinga which presents the passage of the Nordic people in the village of Moutillós with a parade of Christian knights and Viking warriors through the streets of the locality (Concello O Vicedo, 2020) and the Medieval and Viking fair which recreates a market and stages the historic battle of the capture of the Castle of Vermoim (Municipality Famalicão, 2020). Bakhtin (1984) and Hannam & Halewood (2006) have shown that certain Viking theme festivals have a carnival character and constantly mix periods of history. In this sense, this study aims to examine the tourism demand for Viking festivals in the Euro-region; the involvement of the local community in festivals; best practices as a strategy for developing a culturally sustainable Viking theme festival; and evaluate communication and performance in managing historical accuracy in festivals.

Literature Review

Cultural Sustainability: Conservation Context

Cultural sustainability is a concept that has not yet been adapted as a strategic reality in tourism. Farsani et al. (2011) explain that cultural sustainability is a concept for the recovery and protection of culture and identity and linked to previous traditional practices through the celebration of local and regional histories and the transmission of cultural values to future generations. However, in tourism, according to the indicators proposed by Vebhi (2012) the most consensual way to measure culture is through the indicator of cultural wealth, in the field of social sustainability. Jamal et. al (2015) refer to the difficulty in addressing cultural sustainability due to the complexity and intangible aspects of culture. However, studies on cultural activities in tourism reveal the need to reflect on a potential cultural pillar within sustainability (Hawkes, 2001; Soini & Birkeland, 2014). Cultural vitality is defined as proof of the creation, dissemination, validation and support of the arts and culture, as a dimension of everyday life in communities, thus being resources that come out of communities and not just resources that are "brought" from outside into communities (Jackson, Green & Herranz, 2006). Soini & Birkeland (2014) warns about how cultural services, events and heritage manage changing consumer needs. In this sense, municipalities should implement tourism development strategies that focus on creative cultural events, based on, or inspired by intangible heritage, and that focus on authenticity, without causing harm to future generations (Ribeiro et al., 2019, p.37). According to Stebbins (1996), Seçkin Eser et. al (2013), and Jurigová & Lencsésová (2015) all tourist activities with the aim of art, knowledge of cultural values and historical areas linked to a particular culture, are included in the scope of cultural tourism, thus culture is understood as a route to our history. Historical memory is understood as a dimension of individual and collective (or social) memory, with a memory of the past and above all as a symbolic representation of that past (Repina, 2017). Tourism, in this case, should be a tool for the development or revitalization of communities' memories. Popular cultural tourism emerges instantaneously, and can surprise the actors in the receiving destination, since this type of tourism can have growth potential in the demand for the destination (Larsen 2013, p. 84).

Figure 1: Challenges from cultural heritage conservation context base on Palmer & Richards (2010) and Soini & Birkland (2014)

Authenticity and tourist experience in local cultural festivals

The management of cultural festivals continues to be a subject of study in the international dimension, directed towards the sustainability of host tourist destinations. According to Palmer & Richards (2010) the agents producing activities are increasingly concerned with the production and marketing of goods and services with symbolic cultural content, reinforcing the cultural importance of a place to strengthen the attraction and invitation to participate. The study of Ma & Lee (2012) represents the creation of a conceptual framework for festival tourism at local and national level through the factors of historical and geographical dimension, which result in four types of events: Local Heritage Festivals, Local Contemporary Festivals, National Heritage Festivals, and Global Contemporary Festivals. Pine & Gilmore (2008a, 2008b) present authenticity in 4 perspectives: (a) natural authenticity when the perception of authenticity exists in its natural state, without human intervention; (b) original authenticity, has a character of originality and exclusivity, never being repeated or replicated; (c) exceptional authenticity, the perception of authenticity is in the quality of how it is processed, executed individually and extraordinarily by someone who demonstrates human care; (d) referential authenticity when it refers to some specific context, drawing inspiration from human history, and exploring our shared memories and desires. Jamal & Hill (2002) presents authenticity

applied to the tourism sector through objective, constructive and personal authenticity. Different perspectives are defined by Cohen & Cohen (2012) that distinguish authenticity, specifically for events, through the sensory dimensions "hot" and "cool", with "hot" authenticity being presented as emotionally charged, belief-based, rather than proof-based, in which it involves a high degree of commitment and self-investment in participating in, safeguarding, and amplifying the authenticity of the venue or event. On the other hand, "cool" authentication is a unique, explicit, often formal, or even official, performative authenticity, whereby the authenticity of an object, site, event, custom, paper or person is declared original, genuine or real and often certified in a similar but broader sense, this process being evaluated and recognised through compliance with certain predetermined standards or qualifications.

Local Heritage Festivals	Local Contemporary Festivals
Features	
• Historical and not touristic origin, more conservative posture. • They promote authenticity and are based on historical and geographical context. • Focus on the development of local identity and representation of authenticity, sense of presence and local historical significance.	• Developed for tourism purposes, more commercial posture. • They promote authenticity and are based on historical and geographical context. • Focus on offering activities for entertainment (opt for offering authentic replicas of traditions rather than local identity).
Challenges	
• Constant development of practices for the preservation of cultural identity as a reinforcement of the symbols of local identity. • Support in the development and creation of ritual shows and exhibitions to promote local heritage. • Promote the historical origin in the local heritage and if applicable the ancestral origin.	• The preservation of cultural identity must contribute to strengthening the symbols of local identity. • Reinforce its dynamics through new shows and ritual exhibitions in order to promote the local heritage. • Concern with the festival environment and the levels of experiential satisfaction they offer participants. • Role play and role reversal in festivals.

Source: Ma & Lee (2012), adapted

The Days Study (2019, p. 50), shows, in the medieval fair of Óbidos, in Portugal, the 3 types of authenticity conceptualized by Jamal & Hill (2002) being present the objective authenticity associated to the historical rigour of the medieval costumes, the town and walls and the siege of the castle; the existential authenticity through the expressions that denote an empathic adhesion to the values of the community and references to a symbolic complicity with the local community; and the performative authenticity involves references to the costumes and historical characters, the importance of the procession and the participation in the procession dressed up. Dias (2019) considers that the motivations for the participation of tourists are related to the fun factor and socio-cultural animation. However, Hjalager & Kwiatkowski (2018) warns that event organisations focus too much on gastronomic activities, crafts, technology, and pastime phenomena that make medieval festivals intensely materialistic, and points out that historical recreation is the most important point in maintaining authenticity in the tourist product.

Historic re-enactment in medieval festivals

Historical recreation is framed in re-enactment events that can be defined as forms of heritage festivals, considered one of the fundamental activities to replicate historical moments or environments. Baldacci (2019) reaffirms the importance of image revitalization, stories of parts of history that have been forgotten, never written, censored or largely without testimonies, and are now transmitted through the reconstruction of works of art and exhibitions. The re-enactment often comes close to a fanciful staging in its elastic appropriation of both the real and the imaginary past (Agnew, 2005). However, Carnegie & Mccabe (2008) argues that this activity should consider the strict association of history as a basic principle in its representation. For Zotica & Malaescu (2015) there should be a concern to reproduce exactly in the script, in the language, in the materials and costumes to achieve the accuracy of the staged period. Recreation episodes should stage aspects inherent in the cultural heritage or a specific historically significant episode in the history of a locality with the aim of raising the cultural heritage and income of the host locality for business and/or community development purposes, with Carnegie & Mccabe (2008) recommend that re-enactment events should often be represented in historical settings, or heritage landscapes, allowing the space of the heritage

landscape to become a carefully preserved environment (in the case of a castle or manor house), or agricultural landscape (in the case of many battle festivals), a living landscape, at that time and in the presence of these activities and people, and how they represent the past through objects, weaponry and period detail (Carnegie & Mccabe, 2008).

Viking Thematic Festivals: Features and activities

According to Puchalska (2015) interest in medieval Nordic printing was initially influenced by art, through 19th century novels and operas, and later adapting to the cinema through the legendary saga of Ragnar Lothbrok. Studies on the relationship between tourism and Nordic culture are still quite limited. Hannam & Halewood (2001) identify Viking Heritage Tourism as all activities that promote the Viking presence in their territories through museums, heritage centres, theme parks, village reconstructions, seasonal festivals, trade fairs or markets complemented by Viking re-enactment activities or "living history" societies. By adopting a very broad understanding of this term, it can be argued that people have attempted to re-enact the Nordic past as early as the Viking era by commemorating events, stories, myths, or prominent individuals at elaborate funerals and using role-playing techniques and characters (Gardeła, 2016). From the perspective of Hannam & Halewood (2006) Viking festivals are built on or around an existing tourist attraction involving proven material heritage such as an archaeological site, museum, or historical centre, but also the location factor with links to fateful events, is also seen as providing added authenticity and symbolic value. The relationship between atmosphere and attractiveness, from the perspective of Palmer & Richards (2010), points out that localities need to think carefully about the use of space for tourist entertainment, as this influences the satisfaction of the local population, tourist attraction and in turn inward investment. In Viking festivals historical recreations are considered key activities to educate, interpret and entertain the population, based on the recreation of historical events that have marked the history of a people. Smed, Dressler & Have (2016) follow the same approach stating that historical re-enactments have a crucial importance in the tourist experience, warning that the reincarnation of characters in Viking Tourism must be the closest to the historical context, in the same sense as the knowledge presented by the agents of the recreation, since the consumers of the Viking tourism product are experienced. In this sense Gamito (2011) also advocates that the role-plays should be performed by actors and should demonstrate true historical events. Obtaining experience from tourists should be valuable for Viking reincarnations, and the involvement of tourists, considered a crucial factor (Smed et.al, 2016).

Figure 2: Historical re-enactment in Viking Thematic Events (Smed et. al. 2016, p.98)

The Viking Cultural Route is an integrated European project certified by the European Council, which aims to represent the common Viking legacy in Europe by promoting art and literature, archaeological sites, and intangible heritage, supporting various activities, initiatives, and projects (Council of Europe, 2020). The Wolin-Jomsborg-Vineta Slavonic Viking Festival is an example that develops the recreation of life and battles of the early Middle Ages, accurately representing garments, utensils, and tools of the time, based on material heritage left by excavations at Viking burials in nearby locations (Curry, 2007). The Up Helly festival, also recognised at European level, is celebrated in Scotland through the burning of a Nordic ship which represents a funeral ceremony for a sea king (Leslie, 2011).

Methodology

The study instrument used was the qualitative method, through semi-structured questions to allow greater concentration in the approach to the themes. Whether at a scientific or geographical level, few studies on Viking thematic festivals can be observed. The selection of participants was evaluated through a set of criteria based on their geographical link with the northern region of Portugal and Galicia and their professional or academic performance on Viking thematic festivals.

Source: Own Elaboration

Considering this criterion, 8 participants were selected, including tourism experts, Scandinavian medieval studies researchers, tourism promoters, representatives of cultural animation and organisers of Viking thematic festivals. The interview was conducted remotely via online platforms due to the epidemiological context of Covid-19, with informed consent for recording the interview via email or at the beginning of the interview. The interviews lasted approximately 30 to 35 minutes and were then transcribed verbatim. The structure of the interview and the questions developed are based on the objectives proposed for this empirical study with the support of the perspectives of the Carnegie & Mccabe (2008), Smed et.al, (2016) and Hannam & Halewood (2006) studies. The categories of analysis are divided between: (a) Knowledge and benefits; (b) Strategy; (c) Current evaluation.

Results

Knowledge and Benefits

The Viking theme in medieval festivals is a factor of differentiation and exclusivity among other medieval festivals that compete for attention from the regional market for both local communities and tourism (E8, E7, E2). Viking theme festivals act as a pedagogical tool in the conservation and promotion of local heritage, especially from events experienced in the medieval period which are unknown or misunderstood in the communities (E7, E2, E4). The participants (E1, E2) affirm the need to demonstrate to the public the relationship between Iberian culture and Nordic culture.

E7: "I think it's interesting to have Viking theme festivals on the Iberian Peninsula, or other areas that have contact with Scandinavia on the Iberian Peninsula, even to know moments of medieval history that are misinterpreted or unknown".

The tourism demand for Viking events, especially in Galicia, shows a growing demand for tourism, mentioning that in recent years the number of visitors has grown exponentially (E3, E5, E1). There is a disparity between the knowledge of tourism demand in the North of Portugal and in the region of Galicia. It can be concluded that all participants are unaware of any link to the size and characteristics of tourism demand in Portuguese territory. All respondents recognise the international dimension and reputation of Romaria of Catoira. Some interviewees mention that it is the only reference of Viking Festivals (Galicia) of which they are aware (E2, E4, E7). During the interview, participants (E2, E7, E5) mention the repercussions of the media coverage of historical and documentary TV series on Germanic culture, more specifically the success story of the Vikings TV series, as an influential element in the increase of tourism demand and interest in the knowledge of medieval Germanic culture, confirming the perspective of Puchalska (2015). The tourist profile was mentioned in the participants' responses. Most of the interviewees mention that there are two types of tourists: a tourist who seeks a mostly pedagogical experience, are very careful in the way the activities are developed and a tourist who prefers a more hedonic experience, being less critical regarding the historical accuracy in the presentation of socio-cultural activities.

E3: "(...) for a long time, many people have participated in this festival in several places that have this tourist recognition (...) had influence on the demand due to the Vikings series, in the way of increasing interest and especially on the younger population in getting to know the culture".

Regarding the benefits that the local community can derive from holding these festivals, it was mostly mentioned: (a) the economic development factor, having been mentioned by the participants that the realization of this type of festivals generates revenues for the local community, and in peripheral areas, mainly for local commerce and hotels (E1, E3, E4, E5, E6); (b) increasing knowledge about the memory of communities and the history of the relationship between Nordic and Iberian culture was widely reported by the interviewees (E5, E7, E4, E6), who consider that this type of events/festivals aim to promote ancestral social and cultural memories; (c) festivals promote the recognition of localities at the international level, capturing the attention of the media, scientific and diplomatic (E7, E3, E5). Respondents state (d) that by actively contributing to and participating in festivals, residents enhance the social success and quality of the festival itself (E2, E4, E5).

Strategy

In the selection of the venue for the Viking theme festivals, the participants, in general, mentioned 4 indicators of relevance when choosing a place for the festival: (a) the historical link in the locations was an argument unanimously mentioned by all the participants in the study. This perspective was widely advocated by Hannam & Halewood (2006) when they considered that authenticity, for Viking festivals, must correspond through the historical link with the localities, whether through a fateful or imaginary event; (b) the presence of material heritage with a Romanesque profile close to the areas where the festival is held is presented as an added value to the recreational setting, if possible referring to stories surrounding this intercultural contact between Iberian and Viking peoples (E5,E7,E8); (c) the landscape elements also enter into the strategy of selecting the place where the festival will take place, recommending that this natural resource has the least human intervention possible, in order to maintain the authenticity of the place and the theme (E3,E5); (d) the proximity to the infrastructures and accessibilities that support the basic needs for the realization of the festival, since the majority of the localities where these festivals are held are of small dimension, they have to be prepared with infrastructures of lodging, restaurants and drinks and good accessibilities to the place in order to extend the tourist experience and satisfaction (E5, E6, E7).

E8- "I think that the cultural history of this place should have a relationship with the Viking world, there should be a significant link between Viking/Scandinavian people and local people during the medieval age. To choose a place, not only infrastructure but also historical significance is needed".

The main activity for the Viking thematic festivals is the recreation of historical events, in the same orientation as Gamito (2011) and Smed et. al (2016), in which all the participants indicated the activities that represent the heritage evidenced in the locations. Participants state that the main objective of Viking festivals is to recreate historical events based on historical or historiographic articles that assist in the representation and interpretation of these same events such as landings, battles, looting and kidnapping of historical figures. Everyday activities that represent the Nordic culture and its origin were widely mentioned by the interviewees (E2, E3, E5, E7), affirming the importance of presenting the sacrifices, funeral rituals, mythological tales, and daily life of the Nordic culture in medieval times, as well as the daily life of the native people attacked (E2, E8). Co-creation activities have an importance in increasing

the loyalty and experience of the tourist and above all increase the perception and knowledge of the heritage. Participants also mention the need to develop technical-scientific activities such as conferences, lectures and seminars that promote and increase the public's knowledge (E3, E5). The parades were also mentioned as a complementary entertainment activity to the festival (E3, E7). The last element presented as a strategy to extend the tourist experience is the gastronomic offer. The participants affirm the importance of gastronomy in the region and the need for this element to be present in this type of events, configuring the space through properly represented food markets, inserting Iberian and Nordic gastronomy (E4, E7). Most of the participants recommend that the activities should be thought in a pedagogical way, without neglecting the public's entertainment nature, that is, they warn that festivals should be neither "carnival" nor too "academic".

E5- All kinds of activities that can be offered to the tourist/visitor, so that he/she feels protagonist in the historical immersion, because in activities that can participate, in recreations or digital experiences, things that... make the visitor enter this world, and above all look for different things, offer the visitor something different from what he/she has not seen in other territories.

Figure 3: Activities by importance based on respondents' responses

Source: Own Elaboration

According to the analysis, the answer to the question of how to promote a Viking theme festival is not very consensual among the interviewees. One party state that to promote the festival it is necessary to present demonstrations of activities carried out through social networks and the media (E2, E1, E6). Another group mentions that Viking thematic festivals should be promoted as a tourism product on a regional level to reach a wider target audience (E6, E4, E3). The interviewees (E3, E5) propose that promotion should include partnerships with other entities at international level to prioritise tourism reach and visibility. The latter proposal is based on a more internal aspect, i.e. the need for stakeholders to adopt a joint promotion strategy in which they mainly integrate residents in these same actions (E3, E4). Regarding the participation of tourists, the interviewees state that the hedonic aspect is an important factor in tourist satisfaction and loyalty. The interviewees affirm the need to create, together with the local community, a historical immersion festival to enhance the evaluation of the tourist experience (E2, E3, E4, E5). The need for entertainment activities with a pedagogical and social aspect for the public to be involved in the activities is defended (E1, E6, E7).

E4- First of all, the local population, but also tourists should be involved in the imaginary of these festivals. And if we are talking about medieval festivals and Viking festivals why not get people more involved in the activities, by participating actively in the festival, first of all, how to dress, being able to participate in the parades, being able to participate in the banquets, in the various activities.

However, they warn that the participation of the tourist should be mostly passive, i.e. the tourist should play the role of spectator during the historical recreation shows. They affirm the difficulty the organisers feel in maintaining the levels of authenticity and historical rigour in festivals when integrating the tourist in the interpretation of historical characters (E6, E7, E8).

Figure 4: Tourist participation based on respondents' answers

Source: Own Elaboration

Current Evaluation

Participants (E3, E5, E7) state that certain festivals have good cooperation with the scientific community, seeking to request and promote scientific papers, lectures and conferences. On the other hand, they also point out that certain festivals have not sought to remain close to the scientific communities (E7, E8).
Economic viability is a factor that currently damages the relationship between organizers, promoters and the scientific community. The interviewees state that they find it difficult to find a balance with the partners in the development of the physical spaces and activities at the festival between rigour and investment cost (E1, E2). Some interviewees state that the promoters' knowledge of Nordic culture is low and carefree. Consequently, it affects the relationship between the main stakeholders (E2, E4). Organisers and cultural animation show to be based on scientific documentation and articles to justify the recreation of cultural animation activities (E1, E2, E3, E4). The scientific community states that the levels of rigour in the participation of the tourist are far below what is expected and that they negatively affect the tourist experience, highlighting fewer positive cases as in Romaria of Catoira (E6, E7, E8). Some interviewees state that certain festivals misinterpret the characters and do not present the costumes according to records dating from the Nordic culture (E1, E7, E8).

E4- *"We do indeed try to recreate through the historical facts we know from literature, but also to imagine what it must have been like, because we have few records".*

Economic feasibility is mentioned once again as the main obstacle to involving the Viking theme in the physical spaces of the event (E1, E2, E3). They claim that these tools are very expensive and difficult to buy; however, event organisers and representatives of cultural entertainment claim to have a set of materials easily identifiable with Nordic culture for the recreation of rituals, boats, camps, war materials, among others (E1, E2, E3, E4).

E1- *"Here in Galicia, there are festivals, for example, in a bar you can see a drakkar (it has a dragon's head and is quite curious) represented. In Catoira and Viveiro for example they use certain shields, representative pieces, or symbols like runes".*

Regarding the scientific community, they state that at the level of support materials for cultural animation, those that exist are well represented (E6, E7, E8). On the other hand, the interviewees affirm that there are some stalls that are well characterized and others that have difficulty in adapting to the festival theme (E1, E2, E7). The event and tourist animation organisers feel that the involvement of traders in the characterisation and decoration of the stands has evolved positively over the years (E1, E5).

Conclusion

Authenticity has a clear link with cultural vitality since, according to Soini and Birkland (2014), people's participation in using and sharing cultural capital makes cultural heritage accessible in a sustainable way so that it can be preserved in an authentic way without harm to future generations. Historical rigour is thus linked to authenticity. The greatest

challenge for those responsible for organising *Viking* theme festivals is to maintain levels of authenticity, following the principles of conservation of intangible heritage. Based on the conceptual perspective of Ma & Lee (2012), Viking Thematic Festivals in the Euroregion of Galicia and Northern Portugal are assessed against their strategy as modern local festivals. The historical recreation is recognized as the main activity of Viking thematic festivals where they portray the lived contacts between the two peoples. However, historical contextualisation activities on Nordic and Iberian culture should be approached to broaden the interpretation of the main activity. Organizers seek the support of local communities as the main reinforcement in the organisation, participation and promotion of the events as opposed to the case study of Hjalager & Kwiatkowski (2018) in which the festival organisers show limited ambition as regards the productive combination of community and social objectives. However, according to the results, the local community hosting these events remains unaware of the historical events that marked the interaction between Iberians and Nordics. In this sense, it is important to develop pedagogical activities with the scientific community to educate and consequently improve the way authenticity is built in festivals. To enable the active participation of tourists, it is necessary to have the participation of a local community properly instructed in the processes of recreation, as advocated by Smed et. al (2016). Communication among stakeholders is hampered by a lack of knowledge and understanding of each entity's mission and objectives. In this context, the performance of socio-cultural animation activities, more specifically the elaboration of strict criteria in the application of the activities, are conditioned by the problems highlighted in the communication between stakeholders. The distance with the scientific community allows researchers to describe their experience at festivals since the last time they experienced it, denoting some inconsistencies in the way the organisers and the cultural animation defend it. The scientific community, the promoters and the organisation of the event should prioritise a closer link to jointly plan best practices, correctly highlight intangible heritage and establish a balance between conservation and economic viability at festivals. As Soini and Birkland (2014) point out, the authenticity of the venue does not have to be thought of exclusively in the sense of "traditional" or "pure".

What are the perspectives of Blockchain for the Supply Chains?

Vincenzo VARRIALE

Department of Industrial Engineering, University of Salerno, Via Giovanni Paolo II, 132,
84084 Fisciano (SA), vvarriale@unisa.it

Abstract

The success of blockchain technology in the field of cryptocurrencies has achieved considerable success, but its potential in other sectors is still unexplored. This study aims at analyzing the current state of the art of blockchain technology in the supply chain. In particular, the strengths and weaknesses of the technology within supply chains are highlighted. In addition, possible future developments of blockchain application are analyzed with the integration of new emerging technologies in order to automate processes management following the Industry 4.0 plans. Finally, research ideas on environmental, economic and social sustainability regarding the use of the technology for the supply chain are provided.

Keywords: Supply Chain, Emerging Technologies, Sustainability,

Introduction

In recent years, the term Blockchain has achieved great successes in the financial field thanks to the Bitcoin platform created by Satoshi Nakamoto in 2008 (Nakamoto, 2008). Gartner has ranked Blockchain as one of the top ten strategic technologies for 2020 (Cearley et al., 2019). However, in that report, the Blockchain technology in the hype cycle resulted in a phase called "Trough of Disillusionment", as interest has decreased in both technology and markets because experiments and implementations failed to guarantee suitable performances. Despite this, for other mature markets, such as banking, Gartner expects the final implementation of the Blockchain in 2023.

Certainly, the rise to the success of the Blockchain has depended on its operating mechanism for the exchange of cryptocurrencies which avoids the risk of fraud and counterfeiting (Smith and Kumar 2018). Recently, the Blockchain has penetrated several markets starting from tourism (Önder and Treiblmaier, 2018), health services (Meng et al., 2019), transport (Qu et al., 2019), energy (Hou et al., 2020), intellectual property management (Park et al., 2020) and waste management (França et al., 2020). However, research in these different areas is still in its infancy and is being tested. This technology is also taking its first steps in industry and in Supply Chains (SCs). On the one hand, it can revolutionize organizational dynamics by integrating it with other operations for production management to improve the companies' performances (Hughes et al., 2019; Mickiewicz and Rebmann, 2020). Therefore, the Blockchain will certainly modify the technological strategies of companies (Cammarano, Michelino, Lamberti et al., 2019, Cammarano et al., 2020). On the other hand, in the field of SCs, the technology would allow several improvements for the batch tracking and the anti-counterfeiting systems (Hastig and Sodhi 2020; Kamble et al., 2020). Another issue concerns sustainability, which has become increasingly strategic for businesses, also in consideration of the now consolidated link between sustainability and innovation (Michelino et al., 2019). Therefore, it is necessary to verify whether new technologies such as Blockchain are suitable for sustainable approaches.

The current state of the art of Blockchain for SCs will be described below and the strengths and weaknesses of the technology are identified. In addition, the Blockchain scenario integrated with new emerging technologies in relation to the Industry 4.0 plan is shown. Subsequently, the attention will focus on how the Blockchain can improve the sustainability of production and logistics processes in current SCs. Finally, discussions and conclusions will close the work.

Blockchain and SCs

One of the goals of SCs is to serve customers quickly and at the lowest cost (Flint, 2004). In recent times, one of the many risks in SCs is the opportunistic behavior of SC actors, especially for global SCs (Cole et al., 2019), as well as issues related to shipments optimization. Therefore, the adoption of new technologies is necessary to solve these problems. Several studies have shown that using Blockchain would make transactions in the SC faster, reducing order delivery times and paperwork (Kshetri, 2018). One of the strengths of the adoption of Blockchain for SCs is the authentication and certification of any asset (Choi, 2019; Bai and Sarkis, 2020). In fact, since the Blockchain is a distributed ledger, those who can carry out transactions must have credentials guaranteeing the ownership and authenticity of the traded asset. This process greatly facilitates the bureaucratic effort required to authenticate goods during cross-border shipments (Bai and Sarkis, 2020). For example, Tradelens shipping project aims at providing information to participants authorized to enter transactions into the Blockchain, allowing them to comply with regulatory frameworks by reducing administrative time and the risks of fraud and counterfeiting (Jensen et al., 2019). In addition, another important feature is the immutability of the distributed ledger (Pedersen et al., 2019; Schmidt and Wagner, 2019). This peculiarity makes it possible to avoid changes and alteration of the data within the distributed ledger and guarantees complete traceability of the goods exchanged between the participants. In this way, each participant knows all the transactions starting from its origin to the destination. Blockchain-based traceability would allow to solve many SC problems (Lezoche et al., 2020; Yadav and Singh, 2020). In the agri-food sector, knowing the origin of certain products allows the consumer to be sure of the authenticity of the good (Kamble et al., 2020). Additionally, in the pharmaceutical sector, monitoring and tracing the history of climate-sensitive drugs can help improving procurement practices and constantly monitoring physico-chemical properties (Hastig and Sodhi, 2020). The distributed ledger is fully visible to those who own the keys in a private Blockchain, but at the same time the consumer can be provided with all the information of the product he is purchasing thus ensuring the privacy and security of the actors (Pournader et al., 2020). Therefore, the mechanism of the Blockchain guarantees trust to all the actors of the network thanks to the strengths mentioned above (Chang et al., 2020). On the technological side, the Blockchain is efficient and reliable as it allows a reduction in the number of operations and time spent on process management (Manupati et al., 2020; Bai and Sarkis, 2020). Indeed, highly volatile demand could be managed using Smart Contracts that would ensure automation of the entire procurement process (Hasan et al., 2019). Furthermore, the distributed ledger contains all the transactions that the actors exchange in the platform, which can be goods, money, bureaucratic documents and certificates. This ensures greater collaboration between members who work in the same SC (Longo et al., 2019). Thanks to the Blockchain it is possible to manage flows of information, knowledge, intellectual property and intellectual capital deriving from collaborations, alliances and relationships with partners (Michelino et al., 2014; Cammarano et al., 2017). Other important features of the Blockchain are decentralization and disintermediation (Kamilaris et al., 2019; Wang et al., 2019). In the first case, each actor accesses the Blockchain autonomously through its own device and carries out its actions without a common purpose with other participants. On the contrary, disintermediation allows several devices to collaborate with each other while remaining physically far. In this way, intermediaries such as banks or central authorities are eliminated and this leads a reduction in transaction costs (Min, 2019).

Obviously, there are not only positive sides to the adoption of the Blockchain. One of the first obstacles to be considered for the adoption in SCs is the lack of skills of the managers and the network participants (Hastig and Sodhi, 2020). Furthermore, the actual gain from using the technology is not known by comparing it with the implementation costs of the entire architecture (Kamble et al., 2019). Furthermore, there are no standards or regulations that establish the procedures to be carried out for its correct use (Saberi et al., 2019; Chang et al., 2020). For these reasons, entrepreneurs are increasingly reluctant to adopt this new technology. Indeed, privacy issues arising from the full visibility of the distributed ledger must be considered (Chang et al., 2020). The participants of the SC could perform opportunistic behaviors by analyzing the transactions made by a partner (Montecchi et al., 2019). Finally, the biggest drawback is certainly the performance of the technology in terms of storage capacity, scalability, throughput and latency (Zhao et al., 2019; Pournader et al., 2020). These problems are related to the slow speed of storage data, reading transactions and data management. As Blockchain platforms for SCs need Smart Contracts, these programs could slow down the system by far. Table 1 summarizes the strengths and weaknesses.

Table 1 : Strengths and weaknesses of the Blockchain for the SCs

Strengths	• Authentication & Certification (Choi 2019; Bai and Sarkis 2020) • Automation (Hasan et al., 2019) • Disintermediation & Decentralization (Kamilaris et al., 2019; Wang et al., 2019) • Efficiency (Manupati et al., 2020; Bai and Sarkis 2020) • Immutability (Pedersen et al., 2019; Schmidt and Wagner 2019) • Partner Support (Michelino et al., 2014; Cammarano et al., 2017; Longo et al., 2019) • Reliability (Manupati et al., 2020; Bai and Sarkis 2020) • Risks Reduction (Cole et al., 2019) • Security (Pournader et al., 2020) • Traceability (Tracking & Tracing) (Lezoche et al., 2020; Yadav and Singh 2020) • Transaction Cost (Min 2019) • Transparency (Visibility) (Chang et al., 2020) • Trust (Chang et al., 2020)
Weaknesses	• Implementation Cost (Kamble et al., 2019) • Organisation (Montecchi et al., 2019) • Regulation (Saberi et al., 2019, Chang et al., 2020) • Privacy (Chang et al., 2020) • Standardization (Saberi et al., 2019; Chang et al., 2020) • Technical Skills (Hastig and Sodhi 2020) • Technology Performance (Zhao et al., 2019; Pournader et al., 2020)

Blockchain with the emerging technologies for the SCs

In literature it is known that Blockchain works with the bits and helps to improve processes when there is a digitization of assets (for example cryptocurrencies). Therefore, Blockchain in SCs must be integrated with other technologies in order to transform a physical asset into a digital one. For this reason, research is moving towards the mixed use of multiple technologies to ensure the optimization of business processes. In particular, in the food sector, the combined use of sensors, drones, Internet of Things and Big Data would ensure greater efficiency and safety of food production (Astill et al., 2019). For example, traditional traceability systems with the Internet of Things can monitor and store information from all stages of production, processing, distribution and consumption using sensors such as RFID. However, this system is based on the centralized server-client paradigm which from the IT point of view could be hit by hacker attacks. As a result, most actors find it difficult to acquire comprehensive transaction information and trace product origins (Feng et al., 2020). With Blockchain this problem could be solved thanks to its characteristics of immutability and security. With this configuration, sensors would collect information, the Internet of Things would communicate information and, finally, Blockchain would allow secure access to the transactions (Venkatesh et al., 2020). The transparency of information and its accuracy will improve managers' abilities to make the right decisions. Finally, the study of big data deriving from Blockchain archiving would allow manufacturers to make decisions on inventory flows and evaluate the placing on the market of new products in response to demand. In this way handlers will be able to see where their supplies are and actually know their arrival (Zelbst et al., 2019). Depending on the industry, this leads to savings on inventory storage costs and associated labor. In practice, the cost of recalls should be reduced thanks to the ability to know where defective products are located (Ivanov et al., 2019). This system could be combined with two other emerging technologies such as artificial intelligence and machine learning. Indeed, machine learning algorithms can be used to predict delays in outbound and inbound shipments, optimization of vehicle routing and better fleet management. The use of machine learning will ensure real-time monitoring of products allowing product traceability, monitoring of food safety regulations and recall of products in case of contamination or identification of fake products (Sharma et al., 2020). In addition, information on customer purchasing behavior will help Artificial Intelligence technologies to predict customer preferences and needs. This will also improve supplier relationships by reducing supplier-related delays and the accuracy of inventory forecasts (Lezoche et al., 2020). In other sectors this automatism is completed with 3D printing technology that would allow the on-site production of the asset in order to reduce congestion in the SC by creating an alternative source of fulfilment and the quick recovery of the emergency due to rejects or recalls (Rodríguez-Espíndola et al., 2020).

Figure 1: Processes management using the combination of several emerging technologies

SCs with Blockchain from a sustainability point of view

It is known in both the business and academic fields that the Bitcoin platform is unsustainable as it wastes huge amounts of electrical resources for mining (Köhler and Pizzol 2019). However, this condition is not valid for other platforms such as Ethereum that use other mechanisms for block validation. Therefore, Blockchain may improve sustainability within SCs. From an environmental sustainability point of view, the Blockchain can act in SCs in relation to the carbon tax (Saberi et al., 2019; Bürer et al., 2019). In traditional systems, the carbon footprint of each product is difficult to measure. With Blockchain technology, tracing the footprint of a company's products becomes easier. In fact, the technology can determine the amount of carbon tax that should be charged to a company. In this way, participants are encouraged to find a solution for reducing emissions to achieve economic benefits and have a good reputation (Astill et al., 2019). Additionally, a visible distributed ledger that tells the story of the products ensures consumers that the purchased goods are supplied and manufactured from sources that have been verified and certified. Smart contracts can automatically follow the tracking and control rules of sustainable procedures and, consequently, apply the appropriate corrections. Finally, monitoring of expired or damaged products can help to reduce rework and recall, thus reducing resource consumption and greenhouse gas emissions (Saberi et al., 2019). On the social sustainability side, a significant reputational risk concerns the fashion sector, relative to the high intensity of labor and its low cost (Cole et al., 2019). Blockchain technology could allow companies to extend the visibility of their SCs to have greater transparency for slavery legislation (Howson, 2020). Still in the field of luxury goods, the diamond SC is controlled by groups that finance activities in war zones. These so-called "blood diamonds" and the use of child labor in mines (Epstein and Yuthas, 2011) are known problems in the SC. Therefore, increasing the transparency and traceability of diamond SCs should improve their social sustainability because it offers a better guarantee of human rights and fair working practices (Helo and Hao, 2019). Few papers have analyzed the economic sustainability of Blockchain in SCs. Scholars speculate that the economic value created by Blockchain through sustainable practices - such as improving recycling or carbon reduction plans - can lead to an increase in both reputation and profitability (Saberi et al., 2019). Finally, the economic advantage created by implementing sustainable practices through Blockchain against its implementation costs is unclear (Choi and Luo, 2019).

Discussions and conclusions

Since the Blockchain was born as a virtual currency platform, the amount of financial documents has a greater share. However, the vision on the Blockchain is changing, thanks to its features including decentralization and disintermediation. Indeed, the Blockchain can be considered as a decentralized computer running programs publicly. In this case, the computer is not physical, but its operations consist in the collaboration of several computers belonging to different organizations. However, if compared to other IT systems, data entered in the Blockchain are verifiable by everyone, making it a transparent and anti-counterfeiting tool. Of course, the road to new horizons is still long: few articles focus on the implementation of some processes through Blockchain. Currently there are few real case studies or virtual simulation models. Consequently, SC is a fertile ground for the application of technology. Using Blockchain as an anti-counterfeiting tool is one of the many reasons that pushes companies to adopt this technology. The use of Smart Contracts will modify and facilitate the purchasing and control processes of the products shipped. Daily monitoring of the product phases (e.g. product conditions or payment status) will allow to place greater trust in the supply system. On the other hand, the use of Smart Contracts could slow down the Blockchain system. Therefore, technological performance decreases when the code implemented by these contracts increases. This is one of the biggest challenges in Blockchain that slows down its adoption. Furthermore, implementation costs for all SC actors can be a huge problem for adoption, as it is necessary to consider not only big organizations but also small and medium-sized enterprises that may have difficulty accessing to these new technologies. Furthermore, the Blockchain works through bits and helps to improve processes when there is a digitization of resources (for example cryptocurrencies). Therefore, Blockchain must be integrated with other technologies in order to transform a physical asset into a digital one. For this reason, it is necessary to integrate multiple technologies in the context of Industry 4.0 plans. The combined use of these technologies would produce huge savings for companies and increase their reputation in terms of innovation and sustainability. The application of the Blockchain within SCs can achieve new goals in terms of economic, environmental and social sustainability. Future research needs to address the problem of implementing Blockchain

for agri-food and luxury goods SCs to achieve energy, economic and resource savings. Moreover, it should be investigated how much the Blockchain will impact on innovation strategies and how it can facilitate the adoption of open innovation (Michelino et al., 2015; Lamberti et al., 2017; Cammarano, Michelino and Caputo, 2019). The proposed work provides a first starting point for the evaluation of SC using Blockchain, showing strengths and weaknesses of the technology. Furthermore, although some ideas for future research have been proposed, these are entirely theoretical in view of real future developments.

An Explorative Analysis of The Relationship Between Legal Status Event Data and Patent Quality Metrics

Andrea CELONE

Uniroma2 Tor Vergata, Via del Politecnico, 1 00133 – Roma –Italy

acelone@unisa.it

Abstract

The work presents an explorative analysis of the relationship between legal status event data and patent quality metrics. Indeed, legal status event data might disclose a list of events that have changed the likelihood of exploitation of a patented technology, and consequently its quality. A classification based on 124 categories of events is presented and such categories are studied for a sample of 118,850 patent applications. The correlation analysis between legal status event data and traditional patent quality metrics confirms the usefulness and the potential of legal status event data, since the occurrence of specific events is related to the quality associated to a patented technology.

Introduction

The aim of this work is to present preliminary results about an explorative analysis aiming at uncovering a relationship between legal status event data and traditional patent quality metrics. Indeed, the life of a patent is featured by events that will change the status and the effectiveness of the patent itself. Therefore, legal status event data refer to a series of "forward events" and "updates" reported in the "legal status" section of a patent application. These events might change the usefulness of the patent legal protection and, consequently, it is likely that the value and the quality of a patented technologies correlate with some events. Since patents are proxy of the innovation and technological performance of a firm, this exploratory analysis aims at uncovering the relationship between legal status events and a company's capability of exploiting its own technologies.

After a literature review about the elements under investigation, the patent-based framework is presented and the explorative analysis performed on a sample of 118,850 patents filed in 2008. Findings are discussed and conclusions will close the work.

Literature Review

Patent Data and Innovation Quality

Technological innovation is one of the drivers of technological progress and economic growth of companies. The ability of a company to develop technologies and products is strongly conditioned by its wealth of knowledge, skills and technologies deriving from previous research and development activities (Arts, 2012; Cammarano et al., 2020; Michelino et al., 2014). The knowledge base of companies is the output of the investment activities carried out during the exploration phase of research and development. This asset positively contributes to the future financial performance of companies and, consequently, to its market value (Hall et al., 2005; Lamberti et al., 2017; Michelino et al., 2015). The higher the level of innovation of the invention, the greater the expected technological and financial impact. The analysis of technological innovation needs objective and standardized data, which is why scholars often refer to patents (Griliches, 1990). Patents are the direct result of the inventive process, and more specifically, of those inventions that are expected to have a commercial impact; moreover, they measure the competitive and proprietary dimension of technological change (Archibugi & Pianta, 1996). Patents have been treated as the most important output indicators of innovative activities and patent data has become the focus of many techniques and tools for valuing innovation (Cammarano, Michelino, & Caputo, 2019; Ma et al., 2009). Among the information available in such documents, technology classification, assignee field, patent families and citations are used to define different innovation metrics (Ahuja & Lampert, 2001; Belderbos et al., 2010; Flores et al., 2009; Geum et al., 2013; Graff, 2003). When a patent is cited by other inventors (**forward citation**) it can be assumed that it has a higher technological quality: the cited patents are more relevant (Albert et al., 1991; Alcácer & Gittelman, 2006; Dahlin & Behrens, 2005), innovative and important than ignored ones (Lahiri, 2015; Miller et al., 2007; Rosenkopf & Nerkar, 2001). Fleming & Sorenson (2004) argued that the number of forward citations of a patent is highly correlated with its technological

importance, as measured by expert opinion, social value and industry awards. Furthermore, highly cited patents usually lead to higher economic profits than patents that are cited less frequently (Cammarano et al., 2017; Hall et al., 2005; Harhoff et al., 1999). Instead, the analysis of data on **backward citations** provides important information on the extent of reliance on previous technology (Jaffe, et al., 2017), defining the incremental nature of innovation (Lanjouw, et al., 2001) and identifying the patent as basic or trivial (Trajtenberg, et al., 1997). This can also define the value (Harhoff, et al., 2003), technological importance (Von Wartburg, et al., 2005), originality (Hall, et al., 2001) or quality of the patent, when linked to other data (Lanjouw, et al., 2004). Scope and clarity of patent **claims** have been interpreted in the academic world as indicators for the quality of patents (Petherbridge, 2009; Rai, 2013; Wagner, 2009), impacting on innovation in some business sectors (Choi & Gerlach, 2015; Rai, 2013). In literature, the number of countries in which patent protection is requested (the **family size**) is positively correlated to the value of the patents (Lanjouw & Schankerman, 2001; van Zeebroeck, 2011), while the presence over the years of a payment of the patent **maintenance fees**, provides a measure of the private value of the patent (Schankerman & Pakes, 1986). Finally, the fact that an application has become a **granted** patent or not, may indicate the potential value of the patent itself (Guellec et al., 2002; Guellec & Pottelsberghe, 2000).

Legal status event data and innovation quality

The information on the legal status mainly concerns the future of the granted application and records operations such as changes in ownership, forfeiture of terms or expiration and extension of these (Adams, 2003). Studies on the innovative impact of patents have shown that long-term patents are of greater importance than short-term ones (Guellec et al., 2002; Guellec & Pottelsberghe, 2000; Pakes & Schankerman, 1984). The explanation provided by the researchers is that patent holders are willing to pay the annual fees required to keep patents if the economic return is positive (Griliches, 1990; Schankerman & Pakes, 1986). This idea was implemented through studies of grants, legal status, oppositions and disputes (Guellec et al., 2002; Guellec & Pottelsberghe, 2000; Harhoff & Reitzig, 2004; Lanjouw & Schankerman, 2001; Pakes & Schankerman, 1984). In particular, the legal status of patents was analysed in the entrepreneurial strategies regarding the useful life of patents (Gans et al., 2008; Régibeau & Rockett, 2010), observing the behaviour of patent applicants. Dirnberger (2016) argues that tracking the progress of patent applications over time can serve as an initial indication of the performance of even academic inventors' efforts to commercialize their patented research results and, as legal status data can be linked to expenses associated with the phases of the patent pursuit process, they can be used in the control of academic budgets dedicated to patents. For these reasons they suggest that legal status data in combination with patent counts can be used for research evaluation. For example, according to Hoock & Brown (2020), an opposition at the EPO seems to be a good idea to test the arguments of invalidity, if you are a third party worried about the scope of the patent. Bessen (2008) notes that, in some areas, litigated patents are of significantly higher quality if compared to non-litigated ones.

Methodology

The sample was extracted from PATSTAT database 2018 version. All the patents filed in 2008 at the EPO, WIPO and USPTO offices were considered. Since 2008 is the filing year, information is downloaded for the period 2008-2018, leaving a time interval of 11 years to allow events to "happen". The priority date of patents was considered, which relates to the earliest filing of each patent family, i.e. the first granted patent applications filed to protect an invention. In fact, having analysed only the priorities claimed, only high value applications are considered (Harhoff et al., 2004; Johnstone et al., 2012). For each patent, the dependent variables (quality metrics) and the independent variables (the count of each legal event recorded) were extracted. In particular, the following dependent variables, which are widely acknowledged and employed by scholars (Cammarano, Michelino, Lamberti, et al., 2019; Michelino et al., 2019), were used:

- number of backward citations, providing an indication of originality and level of pioneering;
- number of forward citations, exhibiting the technological value;
- patent family size, proxying the marketability of the invention;
- number of claims, showing the scope of the patented technology;
- number of backward non-patent literature citations, underscoring the existence of knowledge flows between scientific and technological actors and industry-science relations;
- year of renewal of the patent, i.e. "10" means the renewal fees have been paid for ten years, giving information on the commercial response. Renewing the fees presumably means that the revenues from the use of a patent are higher than the maintenance costs;
- granted, a dummy variable that indicates the presence of the initial requirements for patentability, a formally correct submission process that has been successfully completed.

As to the independent variables, since the dataset consists of thousands of events, it was necessary to define macro-categories through a careful analysis of all the legal status events. A macro-category was assigned to each event, according to their description. The goal was to define in which macro-category events fall, based on their characteristics and with respect to their location in the patent process. The classification work starts from a base

of events already classified, i.e. the INPADOC classification, that foresees only 21 macro-categories of events: “Application filing”, “Re-publication of document after modification”, “Application discontinuation”, “Document publication”, “Application revival”, “Party data change”, “Search and examination”, “Information on licensing and similar transactions”, “Pre-grant review request”, “Administrative procedure adjustment”, “IP right grant”, “Payment”, “Protection beyond IP right term”, “Appeal”, “IP right cessation”, “Other”, “IP right revival”, “Correction and deletion of event information”, “IP right review request”, “Classification pending and IP right maintenance”. However, one of the most important aspects of legal status data is the question of data quality: in fact, transposition of little information, missing information, an incorrect reformatting algorithm at the time of automatic database loading or manual errors can cause chaos, not only in research but also in the commercial consequences of decisions made in the light of research (Adams, 2003). Furthermore, events with mixed impacts (both positive and negative) on the patent process could be included within the same macro-category. For this reason, the definition of the individual macro-categories and of the events falling within them was achieved using a further and more specific classification with respect to the INPADOC one. The items identified, which will provide the pool of independent variables to be analysed, were called sub-categories: 124 sub-categories were found. Table 1 shows as an example the events belonging to the “Failure to grant” sub-category, which falls within the INPADOC macro-categorization under the heading “search and examination”, considering codes employed in all the countries. This labelling activity has been performed for all the other 123 sub-categories in a similar way.

Table 1: An example of event labelling within an INPADOC macro-category. Failure to grant is a sub-category of the macro-category classified in the INPADOC "Search and examination", and indicates the events for which the patent is not granted by the competent offices, in the absence of one of the requirements, after careful analysis.

Country	Code	Event	Sub-category
BR	B09Z	DECISAO: DECISAO ANULADA	Failure to grant
NL	NP1	NIET AUTOMATISCH VERLEENDE OCTROOIEN	
MC	PED	PAS ENCORE DELIVRE	
US	XB	PATENT (REEXAMINATION CERTIFICATE) NOT ISSUED	
BR	HIFF	DESPACHO DE DEFERIMENTO ANULADO	
DE	8231	ZURUECKWEISUNG	
BR	MT	EXIGENCIA SEGUNDO ARTICOS 230 and 231 DA LEI 9279/96	
NL	NZ80	AANVULLING BIJ OCTROOI	
JP	A765	WRITTEN ABANDONMENT OF PRIORITY CLAIM BASED ON THE PARIS CONVENTION FOR THE PROTECTION OF INDUSTRIAL PROPERTY	
US	DJB	ALL REFERENCES SHOULD BE DELETED, NO REEXAMINATION CERTIFICATE WAS ISSUED	

Therefore, for each sub-category a counter variable disclosing the number of occurrences associated to the focal patent is estimated. Since no event was present in the sample for some sub-categories, the analysis was conducted only on the useful sub-categories that is, those with at least one occurrence (70 out of 124).

Findings

A sample of 118,850 patent applications has been extracted from PATSTAT database. Table 2 displays descriptive statistics for the dependent variables under investigation, allowing a focus on the traditional patent quality metrics. In particular, an average patent records about 13 backward citations, 9 claims and 1 non-patent literature citation, as well as receives 8 forward citations and belongs to a patent family consisting in 2 patent applications. On average, during the time interval 2008-2018, i.e. 11 years, renewal fees are paid until the 6th year. Only about the 63% of patents has been granted by the patent office.

Table 2: Descriptive statistics (dependent variables)

Variable	#	Min.	Max	Avg.	Std. dev.
# backward citations	118,850	0	444	13.46	18.567
# forward citations	118,850	0	483	7.69	12.406
# family size	118,850	1	105	2.41	2.627
# claims	34,340	1	203	9.00	8.967
# non-patent citations	118,850	0	239	0.60	3.994
fee renewal year	57,613	3	11	5.78	2.509
granted	118,850	0	1	0.63	0.483

As to independent variables, i.e. the variables counting the number of events associated to the focal patent, Table 3 displays descriptive statistics. It emerges that the most frequent events are:

- related to the application phase, such as “PCT application”, “extension designation”;
- linked to the patent examination process, such as “notification”, “proceedings” and “application filed”;
- referring to the payment of fees, i.e. “fee paid”;
- associated to the termination of the patent protection, such as “patent revoked”, “patent lapsed through no payment” and “application not submitted”;
- signalling changes in the ownership of the patented technology due to the transfer of rights, i.e. “change ownership”.

Regarding correlations between patent quality metrics and the count of each legal event, Table 4 exhibits a wide group of statistically significant relationships, confirming the potential of usefulness of the information stored within the “legal status” of a patent application. For an explorative summary of such relationships, only few correlations are presented, focusing on the most statistically significant. The number of backward citations is negatively correlated to the PCT application, i.e. PCT applications are likely to be more original. The number of forward citations is positively correlated with events of changes in the ownership of the patented applications: this means that the new owner recognizes the value of patents highly cited and decides to buy them. Family size, being a proxy of the market impact of a technology, is associated to events of limitation, amendment or discontinuation of the patent protection, resulting from complaints and legal disputes with third parties, which are stimulated to limit the patent’s commercial exploitation. Similarly, the higher the number of claims, the higher the likelihood of findings events of correction or modification of the original patent application, i.e. to limit the scope of the patent protection. Regarding the occurrence of non-patent literature citations, it is associated with events of error correction or extension of the patent application. This means that such documents are attached by the applicant to prove the scientific, technological and industrial value of the patent. Many correlations, but no conceptually significant relationships, have been uncovered for the variable “fee renewal year”, since it is clear that the higher its value, the higher the likelihood of finding events, being the life of the focal patent larger. A similar behaviour characterizes the label “granted”, since a granted patents exhibits a larger number of events compared to non-granted ones.

Conclusions

Considering the existence of many statistically significant relationships between legal status event data and traditional patent quality metrics, this work has demonstrated the potential of such explorative research. Future advancement will be addressed to an enlargement of the sample under investigation. In addition, regression analyses will be performed to add more statistical robustness to the relationships under investigation. Furthermore, other patent quality metrics will be added to the model, such as those proxying the radicalness of the invention. Finally, results suggest a deepening of the role of oppositions and disputes, i.e. to understand if they are motivated by a relevant quality of the patented application and they block the market exploitability of the patented technology.

Abstract

The study investigates the effect of firm characteristics on timeliness of financial reporting of listed Nigerian financial services companies between 2012 to 2018. The study makes a substantive methodological advancement in the measurement of timeliness of financial reporting by adopting the regulatory requirement instead of the financial reporting lag and audit reporting lag. The study population comprises of fifty-seven quoted firms listed on the financial sector of the Nigerian Stock Exchange as at 31st December 2018. Using purpose sampling technique, sample size of fifty (50) companies was selected. Data was obtained from corporate annual reports and websites of the selected firms listed on the NSE from 2012 to 2018. Results from the study reveals that a significant relationship exists between firm characteristics and timeliness of financial reporting of listed financial services firms in Nigeria. This implies that the composition of the firm characteristics affects the timeliness of financial reporting. The study therefore recommend that regulatory agencies and standard setters should take into cognisance the firms attributes that affect timely reporting of financial report in order to reduce delay.

Keywords: Audit Type, Cashflow, Firm Size, Leverage, Profitability and Timeliness.

Introduction

Timeliness is a key qualitative feature of accounting information that defines the significance of information to decision makers in annual reports. The only means through which the investors and other market players can assess the activities of the firm before taking any investment decision is through the financial report (Li, Zhang & Wang 2014). The major objective of the financial report is to provide information to users to enhance their economic decisions. However, the information provided should be made available at the shortest time possible otherwise, it will become irrelevant (Al-Ajmi, 2008). The usefulness of published corporate report depends on their accuracy and

AKALAKINI "Firm Characteristics and Timeliness of Financial Reporting of Listed Nigerian Financial Services Companies" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

timeliness. The information contained in the financial report becomes less relevant for decision making as time passes (Efobi & Okougbo, 2014). In ensuring timeliness, attention needs to be given to accuracy because of the trade-off between timeliness and accuracy (Bakare, Taofiq & Jimoh, 2018). A firm might be timely in releasing its annual financial reports, but the required information might not be available in such reports. The accuracy of information also constitutes the quality of the reports. Accuracy of financial reporting is the common concern of standard setters and practitioners.

In various countries, the current law on the timing of corporate entities' annual reporting varies. Section 345 of the Company and Allied Matters Act of 2004, as revised, mandates businesses in Nigeria to furnish stakeholders with their annual reports three months after the end of the financial year. The Security and Exchange Commission (SEC), which is the Nigerian Stock Market Regulator, sets March 31 for each public company to file its audited financial statements that ended the previous year on December 31. However, firms' financial report takes much longer than this date (Modugu, Eragbe & Ikhatua 2012). Also, the National Insurance Commission (NAICOM) also sets the 30th of June for every insurance firm to submit its annual financial report. Despite these, few listed insurance firms only meet up with the deadlines, while the remaining firms submit their report after the deadline dates. According to SEC, early filers are those firms that submit their financial report four (4) weeks before the deadline. The SEC compliance report of 2017 showed that out of the 28 listed insurance firms on the stock exchange, none of these firms submitted four weeks before the deadline, its financial reports for 2014, 2015 and 2016 financial year-end. The Nigerian Stock Exchange (NSE) recently levied a fine of N429.5 M on 38 companies who did not file their financial accounts as at due for the 2018 reporting year in an attempt to enforce prompt reporting of financial details to market participants (Popoola, 2019).

Corporate governance is the procedures or actions, by which firms are run and thereby meet shareholders, employees and the society demand (Eslami, Armin & Jaz 2016). McGee and Yuan (2012) asserted that financial reporting timeliness is one of the characteristics of good corporate governance defined by the World Bank and OECD as knowledge is required by investors when it is still new. The more time that information is delayed, the more the information gets stalled and the less importance it will have. Because corporate governance has always drawn considerable attention at all times. Its existence is like a pillar for any business that stresses its role in the long term for survival and sustainable development (Odit, 2015). Maintaining consistent procedures and reporting practices is one characteristic of strong corporate governance for the organization. The concept of transparency implies clarity of information both in the decision-making process and in the disclosure of the company's material and related information. The theory of openness must provide information that is timely, sufficient, clear, specific, comparable and readily available to stakeholders (Fujianti, 2016).

Several studies have been conducted on the timeliness of financial reporting both in developed and developing countries using diverse characteristics. For instance, Iyoha (2012), Al-tahat (2015), Adebayo and Adebiyi (2016) examine company characteristics and timeliness of financial reporting in Nigeria. However, several studies have been conducted using determinants of timeliness of financial reporting both in Nigeria, and developed countries provided evidence on the effect of corporate governance on timely reporting. Still, the results from their studies were found to be inconsistent. However, most of all these studies measure their timeliness using the time lag of the firms which is from the financial year-end to the time the annual report was signed for publication while neglecting the statutory requirement for reporting. Most of these studies have viewed timeliness from the perspective of audit reporting lag (ARL) which is measured as the numbers of days from the financial year-end to the day the auditor signs the audit report which does not actually depict delay. Some of the studies carried out also addressed the financial timeliness from the date of the financial year-end to the date of the Annual General Meeting.

Detailed review of previous studies did not determine whether, within the legislative deadline of ninety days, any of the companies analyzed in their studies released their annual reports (90) as needed by the Security and Exchange Commission, as well as other related regulatory bodies, such as the Central Bank of Nigeria (CBN) 2004 and the Banking and Other Financial Institution Act (BOFIA). Alternatively, what is required is that, after the required financial reporting deadline, the corporation would have published its annual report in order for there to be a delay. This study therefore suggests a different approach for calculating delay using a dummy variable when there is a delay, i.e. the analysis codes it as 1 above the regulatory criteria, but otherwise we code it 0.

Against this background, this study investigates the influence of firm characteristics on the timeliness of financial reporting of listed financial services companies in Nigeria. Also, the study ascertains whether there are significant relationships between firm characteristics (firm size, auditor type, profitability, leverage and cashflow) and timeliness of financial reporting in Nigeria. Hence, this research expands the knowledge of timeliness of financial reporting and fill these obvious gaps. This study contributes to body of knowledge in two ways. Firstly, it makes a substantive methodological advancement in the measurement of timeliness of financial reporting by adopting the regulatory requirement instead of the financial reporting lag and audit reporting lag. Secondly, beyond the common cross-sectional and pooled data studies, this study provides empirical evidence using the binary logistic regression technique, which has not been used in other studies in Nigeria.

The remaining part of this article is structured as follows: section two includes literature review and theories relating to firm characteristics and timeliness of financial reporting; section three consists of materials, design and model specification adopted in the study; section four is the data analysis and discussion of results; lastly, section five includes the conclusion, recommendations, limitation of study and suggestions for further studies.

Literature Review

Timeliness ensures that reports to be made public as soon as possible to recipients of financial information, and if annual reports are to be useful, it is a required requirement to be met. The shorter the time between the end of the financial year and the date of reporting, the more the annual statement will be of value to the users (Turel, 2010). Lack of timeliness or delay of financial reports could render the information irrelevant for decision-making. The Financial Accounting Standards Body (FASB) and the International Accounting Standards Booard (IASB) have identified timeliness as "having information available to decision-makers before it loses its capacity to influence decisions" (IASB, 2008, p.40). Liu, Jaikaeo, Shen and Hwang (2009) conclude that information is relevance when it is timely. Therefore, the timeliness of financial statements is to ensure that financial information meets the recipients of the target financial statement early enough to enable investors with accurate and relevant decision-making information.

Turel (2010) averred that one important attribute of financial reporting quality is timeliness. It is noted that timeliness is an essential requirement to meet the quality of the financial statement that is useful for decision-making, regardless of whether one considers timeliness as a characteristic of useful accounting knowledge. Accounting standards setters have regarded the timely reporting worldwide as the overall critical quality of financial statement, and delays in its release will result in costs for decision-makers as well as relevant consumers (Brown et al., 2009; Aldaoud, 2015).

Further highlighting the value of financial reporting was the SFAC No.2 of the FASB (FASB, 1980). It noted that annual reports should offer information in a timely manner to prospective buyers, borrowers and other consumers who are expected to make investment decisions in the fiscal year at an acceptable period. This is aligned with the accountancy practice and the SEC (1970) definition of timeliness of financial reporting as being one of the key standard accounting goals.

Measures of Timeliness of Financial Reporting

Several researchers on the timeliness of financial reports have measure timeliness from various viewpoints. Some research assessed timeliness from the point of view of Audit Report Lag (ARL), (Dibia & Onwuchekwa 2013; Fagbemi & Uadiale, 2011; Modugu et al., 2012; Sharinah, et al., 2014), which is measured as the date between the end of the financial year and the date of the annual report, thus ignoring the period after the audit. The Ibadin et al. (2012) research regarded timeliness as the number of days from the close of the fiscal year before the date of signing of the notice of the Annual General Meeting (AGM). Similarly, three indices of financial reporting timeliness were established by Oladipupo and Izedonmi (2013); audit delay (AD), management delay (MD) and absolute delay (TD).

Theoretical Review

This research adopts the principle of stakeholders because of the need to interact efficiently with internal and outside investors regarding the issues that influence the organization's timeliness of financial statements (Ozordi et al., 2020; Uwuigbe, Olorunshe, Uwuigbe, Ozordi, Asiriuwa, Asaolu, & Erin, 2019). The concept of stakeholder was spearheaded by Freeman (1994) as "any group or individual who can affect or is affected by the achievement of the firm's objectives". The equal expression is "any human agency that can be influenced by, or can itself influence the activities of the organization in question" (Gray, Owen & Adams, 1996, p.33). Evan & Freeman (1988) further buttress the definition by describing stakeholders as "those groups who have a stake in or a claim on the firm". Thus, the major stakeholders of a company initially include consumers, trade suppliers, shareholders, lenders, financial institutions, competitors, industries, the community and governmental bodies (Okere et al., 2019).

Firm characteristics and timeliness of financial reporting being an integrated and structured system suitable for complex and dynamic organisation fits in properly with stakeholders' management theory which believes that organisation is a complex network of multidimensional relationships (Zsolnai, 2006). There are several benefits from consulting with stakeholders, these include: stakeholders are in the best position to contribute to risk decision affecting their future; it places them in a better position to understand their risks and take collective responsibility in managing them; it places higher level of trust with stakeholders group and stakeholders feel their interests are being protected (Eluyela et al., 2019b; Asiriuwa, Akperi, Uwuigbe, Uwuigbe, Nassar, Ilogho & Eriabie, 2019). Based on this premise, this study adopts stakeholder as a theoretical framework underpinning this work.

Empirical Review on Firm Characteristics and Timeliness of Financial Reporting

Prior review has shown that firm's characteristics are the major determinaning factors of financial reporting timeliness. Karuna (2009) suggested that a firm's characteristics determine its internal governance mechanisms and

affect the performance of the organisation. Engel et al., (2002) divided firm features into three classes: characteristics that are controllable, partly controllable and uncontrollable. Uncontrollable qualities are those that are not in the company's influence. Partially controllable qualities are ones that the corporation cannot modify at will that are vulnerable to long-term adjustment and require organizational capital and operational sophistication. Controllable characteristics are those that fall within the organization's control (Iyoha, 2012). In order to investigate the impact of company features on the timeliness of financial statements, this study review variables such as organizational size, auditor type, performance, debt and cash flow.

Akingunola, Soyemi and Okunuga (2018) analyzed client characteristics and audit report lag. A sample size 27 listed companies were surveyed for the period 2010-2015 on the NSE. To evaluate the data obtained, OLS regression analysis was introduced. The result reveals that with audit report lag, firm size was statistically important. Similarly, Adebayo and Adebiyi (2016) investigated the impact of firm attributes on the timeliness of corporate financial statements. Data was obtained from 15 firms in the banking sector from 2005-2013. In evaluating the data obtained, the analysis used the OLS and the panel estimation process. The study showed that, company size is statistically significant with financial reporting timeliness. Also, Ohaka and Akani (2017) evaluated the timely financial report and relevance of financial reporting in Nigeria quoted firms. The study surveyed 50 firms listed on the NSE from 2000 – 2011. The independent variables of firm size, board independence, firm performance, debt and age were analysed using the pool regression technique. The study showed that company size was statistically significant association between firm size with timely financial reporting.

Rahmawati (2018) examined variables such as company size, earnings quality, audit opinion, profitability, capital structure, accounting complexity and audit firm. The study surveyed 434 firms from the Indonesian Stock Exchange from 2003 – 2008. The study revealed that the audit firm was statistically significant. This was also in agreement with the study of Septiyan and Puspitasari (2017) who conducted a study on company attributes and audit-relevant variables on the timely financial statement. The result from their study showed that audit firm has was statistically significant with timely financial statement. Hassan (2016) examined factors determining audit report lag in Palestine. A sample size of 46 listed companies was selected from the Palestine Stock Exchange for the year 2011. The study evaluated the data obtained with the use of multiple regression analysis from the sampled firm. The result revealed auditors' type was statistically significant.

Adebayo and Adebiyi (2016) investigated the impact of company attributes on the timely financial reporting. The result found out that profitability exhibited a significant association with the financial statement timeliness. Similarly, AL-Tahat (2015a) in his analysis of the timeliness of Jordanian public companies' audited financial accounts. Showed that profitability has a significant correlation with the timeliness of financial reporting. AL-Tahat (2015b) also examine companies attribute and interim financial statement timeliness in Jordan. The result from the study revealed that profitability was statistically significant.

Hamidi and Rasouli (2016) conducted the research on accounting factors affecting timely financial report in Tehran Stock Exchange. The study selected a sample size of 160 firms using a systematic sampling method for the period 2009 – 2015. The study employed a multivariable model for the data analysis, and the result revealed that leverage exhibit a significant association with timely financial statement. Similarly, Maggy and Diana (2018) conducted a study on the internal determinants of audit delay in Indonesia. Data were selected from 42 manufacturing companies that are listed on the Indonesian Stock Exchange from 2013 – 2015. Result revealed that debt is statistically significant with audit delay.

Methodology

This study adopted the use of ex-post facto research design (Creswell, 2008; Adesina, Oyero, Okorie, Amodu, Adeyeye, & Yartey, 2020). The ex-post facto research design helps to establish the causal effect among variables between dependent and independent variables. This study is based on dynamic panel data since it involves the combination of time series and cross-sectional method in pooling the required data (Adegboyegun et al., 2020; Adeyeye, Amodu, Odiboh, Okorie, Adesina, Yartey, & Ekanem, 2019; Eluyela et al., 2019a: Uwuigbe, Felix, Uwuigbe, Teddy & Falola, 2018). The method of data analysis is the Panel binary logistic regression. The reason for the choice of binary logistic regression was due to the dichotomous nature of the dependent variable. Data for this study was sourced from the corporate annual reports and websites of the selected firms quoted on the Nigerian Stock Exchange from 2012 to 2018.

The sample population consists of all the fifty-seven companies listed as of 31 December 2018 on the Nigerian Stock Exchange's financial market. This research was of interest to the Nigerian financial industry because of its attractiveness of companies quoted on the Nigerian Stock Market. The reason for choosing of this industry is based on the premise that on the Nigerian Stock Exchange, the financial industry accounts for 32 percent of the overall market capitalization (NSE Factsheet, 2018). The sample size that was used for this study is 50 companies (see table 1). The sampling technique used is the purpose sampling via filtering technique (Amodu, Omojola, Okorie, Adeyeye, & Adesina, 2019; Nwanji et al., 2020). The justification for the selection of 50 companies are based on the criteria

that these companies must be active, and also, they must have existed for ten years consistently and publishing their complete financial statements.

Table 1: Sample of Firms in the Financial Sector

Sector	Industry	No of Firms (Population)	No of Firms (Sample Size)
Financial	Banks	15	13
Financial	Insurance Firms	32	28
Financial	Investment Firms	10	9
Total		57	50

Model Specification

Timeliness of financial reporting is posited to be a function of firms' characteristics. The research adapted the model of Adebayo and Adebiyi (2016). This can be stated explicitly in equations 1 and 2, respectively.

$$TRF = f(FSIZE, AUDTYP, PROFIT, LEV, CASHFLOW) \quad 1$$

Adding time series and cross-sectional properties to equation 1, we have:

$$TRF_{it} = \beta_{0it} + \beta_1 FSIZE_{it} + \beta_2 AUDTYP_{it} + \beta_3 PROFIT_{it} + \beta_4 LEV_{it} + \beta_5 CASHFLOW_{it} + \mu_{it} \quad 2$$

Where, TFR = Timeliness of Financial Reporting; $FSIZE_{it}$ = Firm Size; $AUDTYP_{it}$ = Auditor Type; $PROFIT_{it}$ = Profitability; LEV_{it} = Leverage; $CASHFLOW_{it}$ = Cash flow; β_0 = Intercept of the regression line, regarded as constant; β_{1-5} = Coefficient or slope of the regression line or independent variables; μ = Error term that represents other independent variables that affect the model but not captured. '*t*' = year or period and *i* = *firm*.

Measurement of Variables

The dependent variable is timeliness of financial reporting. The independent variable is firm characteristics. The proxy for independent variables are firm size, auditor type, profitability, leverage and cashflow. Table 2 present the measurement of each variables.

Table 2: Measurement of Variables

S/N	Variables	Symbols	Measurement	Used by	A priori Sign
	Dependent				
1	Timeliness of Financial Reporting	**TFR**	Measured using the dichotomous procedure of 1 and 0. A firm will score 1 if they disclose their financial report within the statutory requirement with the 90 days and 0 if they disclose outside the period.	Schwartz and Soo (1996)	
	Independent Variable				
2	Firm Size	**FSIZE**	Measured as the natural log of total asset of the firms.	Ibadin et al., (2012), Efobi & Okougbo, (2015)	+
3	Auditor Type	**AUDTYP**	Measured using a dichotomous variable of 1 and 0. Assign 1 if the firm is audited by the Big 4 and 0 otherwise.	Owusu-Ansah and Leventis (2006), Wu, Wu and Liu (2008))	-
4	Profitability	**PROFIT**	Measured as the ratio of profit after tax to a total asset of the firm	Kingunola, Soyemi & Okunuga (2018)	+
5	Leverage	**LEV**	Represented as the proportion of total debt to total asset	Ezat & El-Masry, (2008)	+
6	Cash flow	**CASH**	Measured as the net operating cash flow of the firm in the financial year	Al-Shwiyat (2013)	+

Results and Discussion

This segment provides a detailed description of the varied findings contained in this study. Firstly, it provides a detailed description of the findings through the use of descriptive statistics and correlation analysis to show the level of association between firm characteristics and timeliness of financial reporting in Nigeria. Secondly, it provides the result, through binary logistic regression on the impact of firm characteristics and timeliness of financial reporting in Nigeria.

Table 3 shows the descriptive statistics of firm characteristics and timeliness of financial reporting in Nigeria. The dependent variable, which is the timeliness of financial reporting (TFR) has a maximum value of 1 and a minimum value of 0 and a reported mean value of 0.523256. This implies that 52% of the selected firms in the financial sector present their report within the stipulated time frame of 90 days. From the independent variables point of view, firm size (FSIZE) reported a mean value of 7.77 billion, a maximum value of 5.96 trillion and a minimum of 3.82 billion. This suggests that the sampled financial firms are large in size. For leverage (LEV), the maximum value reveals 8.88, a minimum value of 0.00 and a reported mean value of 0.832. This implies that suggests that on the average, the sampled companies are highly reliant on debt financing.

Profitability (PROFIT) has a maximum value of 1.32, while the minimum value shows -0.56, with a reported mean of 0.0087. This indicates that on the average, the sampled companies yielded a return of 1%, which implies that the investments in those companies have not yet yielded the desired effects. In the same vein audit type (AUDTYP), has a maximum value of 1, a minimum value of 0 and a reported mean value of 0.721. This suggests that 72% of the sampled companies engage the services of the big four audit firms. The cash flow from operating, reported a maximum value of 6.060 billion, while it reported a minimum value of -4.89 billion. The cash flow from operating reported a mean value of 2.08 billion. This implies that on average, the sampled companies are not having a problem with cashflow. From the descriptive analysis, the skewness value falls within the normal range of ±1.96 (Creswell, 2014) while the kurtosis figure falls within the range of ±3 (Wong & Millington, 2014). It is assumed that the data are normally distributed data falls within this range.

Table 4: Correlation Analysis

Probability	FSIZE	PROFIT	LEV	CASHFLOW	AUDTYPE	TFR

	1.900776	-1.026289	-1.381358	0.149863	2.319838	-----
	0.0585	0.3058	0.1684	0.8810	0.0212	-----

Table 4 reveals that a variable's correlation coefficient with regard to itself is 1,000. This means that a variable has a perfect association with respect to itself result displays the correlation coefficients of the variables tested used in the analysis. The main focus in the research is the connection between the timeliness of financial statements (TFR) and firms' characteristics of the selected listed companies. TFR is positively associated with FSIZE (r= 0.121284), CASHFLOW (r= 0.09633) and AUDTYP (r= 0.147494), as observed. The result shows that TFR interacted adversely with PROFIT (r= -0.065829) and LEV (r= -0.088449) respectively. The outcome, however, demonstrated a poor association with financial reporting timeliness. For most variables, the inter-correlations between the explanatory variables do not appear to suggest the existence of risks of multicollinearity.

Table 5: Binary Regression Analysis

Dependent Variable: TFR

Prob (LR statistic)	*0.000000			

*5% significance level

Source: Researcher's Computation (2020)

The table above revealed the result of the binary regression analysis. The McFadden R-squared value has an explanatory influence of 8.5 percent which indicates the degree of impact on the dependent variable (TFR). This means that the independent parameters (FSIZE, AUDTYP, PROFIT, LEV and CASHFLOW) taken collectively contributed to approximately 8.5% of the cross-sectional disparity in timeliness of financial reporting, which leave the residual accounted for by the stochastic term. It was observed that the overall model was statistically significant since the LR statistic and the related prob value of 37.914 and 0.000000 (p-value<0.05) respectively. This means that there exists a significant linear association between financial reporting timeliness and all the independent variables taken together. Based on the specific significance level of the variables, as shown by the Z-stat and their associations with the (TFR), the findings revelead that firm size (FSIZE) has a significant positive relationship with TFR having a Z-value of 2.095 and probability value of 0.0361 is greater than the critical Z-value of 1.96 at 5% level of significance. This implies that a percentage increase in firm size will result in about 1% increase in timeliness of financial reporting. Similarly, auditors' type (AUDTYP) also showed a significant positive relationship with TFR having a Z-value of 3.278 at a p-value (0.0010<0.05). This implies that a change in auditor type will result in 52% increase in timeliness of financial reporting.

However, profitability (PROFIT) revealed an insignificant negative relationship with TFR through a Z-stat of -1.488 at a p-value (0.1366>0.05). It therefore suggests that an increase in the firm's profitability will result in 2.26 decrease in timeliness of financial reporting but not significantly. In the same vein, leverage (LEV) reported an insignificant relationship with TFR having a Z-value of -0.659 with a p-value (0.5093>0.05). This implies that an increase in leverage will result in 9% decrease in timeliness of financial reporting but not at a significant level. Cashflow (CASHFLOW) also showed negative insignificant relationship with timelines of financial reporting through a Z-stat of -0.656 and a p-value (0.5112>0.05). This signifies that a percentage increase in the firms cashflow level will result to about 1% decrease in timeliness of financial reporting.

Andrews Statistic	71.6977	Prob. Chi-Sq(10)	0.0000

Source: Researcher's Computation (2020)

To test the accuracy of the stated model, the Hosmer-Lemeshow test of goodness of fit was used. The goodness-of -fit H-L test registered a surprisingly high likelihood value of 0.7080, which did not support the mis-specified model's null hypothesis. The effect of the finding is that our model of regression was well established. Therefore, the null hypothesis is denied. Therefore, the model matches the results.

The assessment of the model depending on the anticipated and expected outcomes as seen in table 7. To measure the model 's success, the test uses a 0.5 cut off mark. Higher cut off points should be used for more rigorous checks. The model provides for the grouping of persons subject to the priority of the judgment given to them. The results of testing this study in the table above shows that overall prediction accuracy reaches 94.29%, with a sensitivity of 100% so it can be concluded that the model is quite good.

Discussion of Findings

The research investigated the impact of firms' characteristics (firm size, type of auditor, profitability, leverage and cashflow) on timeliness of financial reporting of listed financial services firms in Nigeria. Quite a number of studies have shown that the size of a firm positively influences the quality of financial reporting (Adebayo & Adebiyi, 2016; Akingunola, Soyemi & Okunuga, 2018). In the same vein, big corporations rely more heavily on external sources of funding, which makes them more vulnerable to the high-quality knowledge needs of current and future investors. The result from the analysis (see table 5) reveals that firm size (FSIZE) has a positive significant relationship with

timeliness of financial reports (TFR) having a Z-value of 2.095 and probability value of 0.0361 is greater than the critical Z-value of 1.96 at 5% level of significance. This implies that large firms have the capacity (financial and human resources) to prepare timely financial reports in order to meet up with the regulatory requirement and satisfy the needs of investors. The result is in agreement with previous literature (Dibia and Onwuchcka, 2013; Ohaka and Akani, 2017) which confirms that firm size contributes to the timeliness of financial reporting. This is consistent with stakeholder theory claiming that large firms voluntarily disclose full information within regulatory period in order to fulfil their social contracts with stakeholders.

Also, one of the proxies for firm characteristics is auditors' type, the result of auditors' type (AUDTYP) showed a positive significant relationship with timeliness of financial reports (TFR) having a Z-value of 3.278 at a p-value (0.0010<0.05). This implies that a change in auditor type will result in 52% increase in timeliness of financial reporting. Big accounting companies are argued to have a greater desire to perform their accounting work on schedule in order to preserve their credibility and identity. Normally, major accounting companies have a more effective audit staff as they have more personnel to perform preparation with their employees, as well as being able to use more powerful audit tools to minimize audit work time. Therefore, it is expected that firms with big external auditors tend to prepare their financial statements to meet up with regulatory deadlines. The findings of this study show that auditors' type have significant impact on timeliness of financial reporting. This empirical evidence is in agreement with other studies like Owunsu Ansah & Leventis (2006); Septiyan & Puspitasari (2017).

Further analysis of the regression result showed that profitability (PROFIT) revealed an insignificant negative relationship with TFR with a Z-value of -1.488 at a p-value (0.1366>0.05). This means that an increase in the firm's profitability will result in 2.26 decrease in timeliness of financial reporting but not significantly. This implies that the level of profitability has not contributed meaningfully to the timeliness of financial reporting of financial firms in Nigeria. This result is consistent with previous studies (Ibadin et al., 2012; Septiyan & Puspitasari, 2017; Akingunola et al., 2018; Rahmawati, 2018). However, there have been a divergent view in literature as to the impact of firm's profitability on timeliness of financial reporting. Prior literature argued that firms with negative performance (profitability) delay the publication of their financial report than firms with positive performance (Owusu-Ansah, 2000, Al-Ajmi, 2008). While studies also opine that firms with positive performance tend to publish their financial report on time because of the positive impact of market share/share price.

Furthermore, the result of leverage (LEV) reported an insignificant relationship with TFR having a Z-value of -0.659 with a p-value (0.5093>0.05). This implies that an increase in leverage will result in 9% decrease in timeliness of financial reporting but not at a significant level. The same result is observed in the analysis of cash flow (CASHFLOW) which showed negative insignificant relationship with timelines of financial reporting with a Z-value of -0.656 and a p-value (0.5112>0.05). This signifies that an increase in the firm's cash flow level will lead to a decrease in timeliness of financial reporting.

Conclusion and Recommendations

The research deals with the impact of firms' characteristics on timeliness of financial reporting of listed financial services firms in Nigeria. It aggregated the various characteristics of firm variables. The research concludes that a significant relationship exists between firm characteristics and timeliness of financial reporting of listed financial services firms in Nigeria. This implies that the composition of the firm characteristics affects the timeliness of financial reporting. However, in terms of individual significance, firm size and auditor type documents a positive and significant relationship with timeliness of financial reporting. While, profitability, leverage and cashflow revealed a negative and an insignificant relationship with timeliness of financial reporting in Nigeria. The study therefore recommend that regulatory agencies and standard setters should take into cognisance the firms attributes that affect timely reporting of financial report in order to reduce delay.

The study observed a few limitations which could be a basis for future research. First, the sampled data is limited to firms in the financial sector only, thus the result cannot be used to conclude on firms in the non-financial sector. Second, this study is country specific and the findings cannot be used to compare other country reporting regulations. Further studies could consider the impact of market reaction to timeliness of financial reporting. This study only examined the firms operating in the financial sector. Therefore, the non-financial sector could offer fruitful areas for future research, and a comparative study could be conducted between the financial and non-financial sector. Also, future research could examine other variables such as penalties and merger and acquisition on timeliness of financial reporting either at a country level or cross-country setting. This will help to provide better understanding of the reporting regulations of different countries and the level of implementation.

Abstract

In paper, we present results of digital technologies development for natural risks management technologies for Arctic and Subarctic, adapted to Covid-19 pandemic. In studies, we used methods of data bases constructing within digital educational platforms, web-technologies and virtual reality tools. Also, we used Foresight technologies, theory of decision making under uncertainties, risk management approach. From the point of view of geo-information management, we structured geo-space to allocate the interconnected components of the solution space. As digital tools, we propose to use digital online platforms, which integrate heterogeneous hardware and software resources with the use of web-technologies in distributed networks and wide application of cloud services. As study result, we proposed a structural model, that combines the investment objectives with cost of adequate managerial

support, adapted to Covid-19 pandemic. While research, we used platform https://www.researchgate.net/profile/Valery_Abramov2/ for data exchange and preliminary discussion.

Keywords: Digital Tools, Natural Risks, Arctic, Covid-19 Pandemic.

Introduction

Last year, the Covid-19 pandemic shocks the global economy, including education at university level (UL). Note, this pandemic shock matched the time with Industry 4.0 period, during which a lot of enterprises plan and implement wide spectrum of information technologies (Drabenko, 2019), (Grobitski, 2016), (Frolova, 2019), (Lukyanov, 2019), (Sikarev, 2020), (Trunin, 2019). Industry 4.0 leads to serious technological changes in natural risk management (Berboushi, 2014), (Ershova, 2018), (Garcia, 2018), (Isaev, 2015), (Istomin, 2018), (Shilin, 2019), which requires the development of new educational technologies, especially for UL (Averkiev, 2020), (Estrin, 2020), (Korinets, 2020), (Popov, 2019), (Tatarenko, 2020).

In the article, the authors describe results of digital technologies development for natural risks management in Arctic and Subarctic, adapted to Covid-19 pandemic, in geo-information management area (Burlov, 2018), (Gomazov, 2018), (Fokicheva, 2016), (Lednova, 2014), (Malakhova, 2014), (Yaily 2019), (Zavgorodniy, 2020), in large environmental projects (Burlov, 2018), (Gomazov, 2018), (Fokicheva, 2016), (Lednova, 2014), (Malakhova, 2014), (Yaily 2019), (Zavgorodniy, 2020), within environmental economics (Bidenko, 2019), (Golosovskaya, 2014), (Karlin, 2014), (Karlin, 2009), (Kolbina, 2020), (Popov, 2016). Significant attention in the implementation of such industrial projects should be paid to geo-information support systems (GISS) of natural risk management (NRM) in the context of climate change (Bidenko, 2019), (Golosovskaya, 2014), (Karlin, 2014), (Karlin, 2009), (Kolbina, 2020), (Popov, 2016), including the issues of information collection and processing (Fokicheva, 2019), (Khaimina, 2014), (Popova, 2019), (Tatarnikova, 2019), (Ya, 2019). The educational technologies, discussed in this article, take all above mentioned factors into account.

Methods and Data

In research, we used Foresight technologies, theory of decision making under uncertainties, risk management approach, methods of data bases constructing, web-technologies and virtual reality tools. Also, we used big data technologies (Popova, 2019), (Yaily, 2019) From the point of view of geo-information management, geo-space is structured to allocate the interconnected components of the solution space (Bidenko, 2019). While study, we used data bases and tools of geo-information digital online platforms (GIDOPs) Earth (Sanina, 2020) and EOS, including its Land Viewer (LV) product (Bolshakov, 2020), (Prostakevich, 2020).

Results

Currently, economic activity in the Arctic (EAA) is a hot place in global environmental economy. We made a statement, that EAA in modern stage is to be carried out in the sustainable development paradigm as related set of large natural-industrial projects (NIPs) within common space area and time period. In figure1, we present a block model of investment structure while EAA, that combines the investment objectives of such NIPs (blocks 1-5) with cost of adequate managerial support (blocks 6-8), including NRM's goals and tasks (block 7). Our analysis shows that the largest part of the cost of managerial support is the environmental monitoring (block 8), the essence of which is determined by the content of block 7. Significant part of the cost in block 8 is hardware and software, the cost of which varies significantly. Now, in Covid-19 pandemic conditions, cost of NMR for EAA can arise greatly because of general economic situation. On basement of above mentioned model, we proposed to develop the managerial support system (MSS) for EAA with combined structure for access, storage and analysis of information from open geo-spatial data sources, including archives and operative mode web tools. As a result of the research performed using foresight technologies, we suggest to use geo-information distributed online platforms (GIDOP) as the main technological solutions for MSS for EAA. We give preference to open platforms like Google Earth. Also, we recommend to use GIDOP EOS eos.com, including its product LV https://eos.com/lv/, which allows to operate with space images from the Landsat-8 and Sentinel-2 satellite systems with limited open access.

Figure 1: Block model for investment structure while EAA: 1 – block of distribution of resources; 2 – block of formation of resources; 3 - block of formation of private income; 4 - block of formation of total income; 5 – block of formation of the investment share of resources; 6 - block of comparison with the permissible level of risk; 7-block of formation changing in time set of natural risks, including climate risks and ; 8 – block of environmental monitoring while Covid-19 pandemic conditions

In our research, essential goal is block of environmental monitoring within MSS for EAA while Covid-19 pandemic conditions. Reducing the cost of MSS is an important question for EAA while Covid-19 pandemic conditions. We propose to use GIDOP EOS eos.com, including its product LV https://eos.com/lv/, as basement for low-cost MSS while EAA while Covid-19 pandemic.

Let's go to examples. In figures 2-4, we show the results of sequential operations performed online with LV for the port of Pevek, the largest Russian port in East Siberian Sea. In figure 2, there is space image on 12th May 2020 (general view by DOP EOS LV) visualized with Natural Colors Application of LV.

Figure 2 - Port of Pevek space image on 12th May 2020 visualized with Natural Colors Application of LV

Figure 3 - Port of Pevek space image on 12th May 2020 visualized with Atmospheric Removal Application of LV (as in figure 2)

In figure 3, there is the same as in figure 2, space image, visualized with Atmospheric Removal Application of LandViewer. Obviously, that figure 3 is more informative for space decoding. Note, space decoding was not goal of this article.

As essential result, we propose to use GIDOP EOS eos.com as basement for low-cost MSS for EAA while Covid-19 pandemic.

Discussion

Also, we propose to use GIDOP EOS for long-period monitoring for important maritime infrastructure area. For example, in figures 4 and 5, we post port Pevek space images on 5th June with roughly three weeks' gap to pictures 2 and 3.

Figure 4 - Port of Pevek space image on 5th June 2020 visualized with Natural Colors Application of LV

Figure 5 - Port of Pevek space image on 5th June 2020 visualized with Atmospheric Removal Application of LV

In figure 5, there is the same as in figure 4, space image, visualized with Atmospheric Removal Application of LandViewer. Obviously, that figure 5 is more informative for space decoding, which was not goal of this article.

Discussion

Note, GIDOP EOS can be used in educational and training purposes. The essential task of university practical learning (UPL) will be to teach students the practical aspects of work with GIDOP EOS tools, which requires a developed learning base within special geo-information systems (GIS) laboratory. In some cases, real practical work in special GIS laboratory can be undergoes with virtual reality (VR) technologies, that can reduce total cost of learning process while Covid-19 pandemic.

Conclusion

We consider results of digital technologies development for natural risks management technologies for Arctic and Subarctic, adapted to Covid-19 pandemic. In studies, we used methods of data bases constructing within digital educational platforms, web-technologies and virtual reality tools. Also, we used Foresight technologies, theory of decision making under uncertainties, risk management approach. From the point of view of geo-information management, we structured geo-space to allocate the interconnected components of the solution space. As digital tools, we propose to use digital online platforms, which integrate heterogeneous hardware and software resources with the use of web-technologies in distributed networks and wide application of cloud services. As study result, we proposed a structural model, that combines the investment objectives with cost of adequate managerial support, adapted to Covid-19 pandemic conditions. The research results presented in this article has significant scientific novelty and can be useful for private investors, public environmental organizations of the civil sector and state environmental control bodies. They can be used in the preparation of master's programs in environmental economics.

As essential result, we propose to use GIDOP EOS eos.com, including its product LV https://eos.com/lv/, as basement for low-cost MSS for EAA while Covid-19 pandemic.

Abstract

The increasing growth of the amount of noisy and unorganized data on the Internet made the processing of such data a challenging research issue. Data Warehouses (DW) and online analytical processing (OLAP) are some of the widely recognized and used technologies to process and analyze structured data. Providing an accurate DW model with the appropriate facts, measures and dimensions in the context of Homeland Security is a key issue for Intelligence agencies and homeland security tasks. In this paper, we propose a DW model for Online Social Networks (OSN) to assist Security Intelligence agencies in retrieving sensitive information. This model would have a great impact in assisting cyber security specialists in identifying terrorist and crime trends online. The proposed model will be enriched using the Global Terrorism Database (GTD) that reports worldwide events related to terrorism. Besides, these two models will be enriched using a scoring capability to put forward the most imminent information.

Keywords: Data warehousing, online social network analysis, online analytical processing, generic data models, multidimensional modeling

INTRODUCTION

DWs as initially detailed by Kimball et al (2011) and Vaisman et al (2014) and Ariyachandra et al (2010) provide analysts with an advanced analytical methodology called OnLine Analytical Processing (OLAP). This approach has great capabilities to rapidly retrieve sensitive and pertinent knowledge related to a specific content from huge data repositories. DWs use structured and unstructured data from disparate sources for forecasting, analytical reporting, and business intelligence. Some major applications of DWs across different industries can be given as follows:

- Banking: Identify risks and performance analysis of each product, service, interchange, and exchange rates; track accounts performance and user data; provide feedback to bankers regarding customer relationships and profitability.
- Finance: Evaluation of customer expenses trends; maintain transparency in transactions and predict/spot defaulters and act accordingly;
- Government: Maintain and analyze tax records, health policy records, and their respective providers; predict criminal activities from patterns and trends; searching terrorist profile; threat assessment and fraud detection.
- Retail: maintain records of producers and consumers; track items, their promotion strategies, and consumer buying trends (trend analysis);

DWs are huge data repositories that can incorporate data integration, analysis and reporting capabilities. The results will be retrieved by executing advanced and complex queries that differ from traditional SQL and are unfortunately, very time and memory consuming as explained by Roelofs et al (2013) and Al-Azmi et al (2013) et Chung et al (2013). Analyzing Online Social Networks (OSN) steams is one of the most motivating applications in

the field of intelligence. Online posts can encapsulate valuable information to collect and analyze related to users, topics discussed, sentiment, behavior, etc.

In this study, we propose a method to model and analyze data collected from OSN. To be more productive, an open source database related to terrorist attacks worldwide called the Global Terrorism Database (GTD) will also be used to make joins when necessary. In addition, the model will be enriched using a weighting method to assign an appropriate score to each stored information in the DW. This scoring capability would permit spotting most important information within the DW related to our context of investigation.

The rest of the study is organized as follows. Section 2 describes related works in Warehousing OSNs such as Twitter. In Section 3, we provide the corresponding architecture of the proposed model and its main benefits. Section 4 presents the experiments conducted on a set of data collected from Twitter and finally a conclusion is provided in section 5.

RELATED WORKS IN WAREHOUSING OSN

To the best of our knowledge, most existing studies mainly focused on a specific analysis of tweets including enrichments for sentiment analysis and topic detection or extracting specific dimensions to a given domain. Using OLAP analysis capabilities on large volumes of data collected from various OSN has motivated all fields of research such as the topics investigated by Khan et al (2012) and Ortiz et al (2010). Due to the diversity of communication channels on social media, it is possible to consider a multidimensional model for this kind of applications as stated by Kazienko et al (2011). In Bringay et al (2011), the authors proposed a star model to analyze textual tweets. NLP is then applied on the text collected for the Tweets for topic understanding and investigation. An adapted measure, called "TF-IDF $_{adaptive}$", was also proposed to identify the most significant words according to some levels of hierarchies. This method permitted spotting valuable trends such as top-*k* most significant words that appeared over a given period of time or the most representative word of a city or country, for a certain month, in a year, etc. A multi-layered system for warehousing Streams from Twitter was proposed in Rehman et al (2012). The original Tweets stream collected was transformed into a structured multidimensional dataset consisting of measures *(#friends, #followers, #status, #favorited, #listed*) and dimensions. Additional enrichments were incorporated by means of derivation, data mining, linking to additional sources or using external APIs such as language and topics detection. As an extension of the previous work, Rehman et al (2013) integrated extensive OLAP Natural Language Processing (NLP) capabilities to perform multidimensional text analysis.

In Mansmann et al (2014), the authors converted the semi-structured data provided by the Tweet API to a multidimensional data cube. Besides, a data enrichment layer was introduced to detect new structural elements such as user activity, popularity, messaging behavior, as well as to classify messages by topic, impact, origin, method of generation, etc. The authors proposed a new measure called ranking and defined as follows: *ranking = 0.8* x *#followers+0.2* x *#friends* to classify the users according to their popularity: *superstar*, *celebrity*, *popular*, *regular*, and *unpopular*.

In Ben Kraiem et al (2014), the authors proposed a conceptual and logical generic constellation model to analyze the OSN content of Twitter. In the proposed model, two facts were identified:

- A conventional fact called *Activity-Twittos*: this fact corresponds the user accounts observations and used to analyze the user activity over a given period of time. This fact is composed of the following numerical measures: *Fav_C* (Number of favorites tweets this user has), *Sta_C* (Number of tweets this user has), *Fre_C* (Number of friends (users) this user is following), *Follow_C* (Number of followers for this user).
- A reflexive fact called *Activity-Tweet*: this fact represents the links between a given tweet and the person answering that tweet. Being reflexive, this fact links instances of the same entity. It is composed of a textual measure, a measure list of elements (Hashtags) and a numerical measure (Retweet-c) characterizing the number of times a tweet was re-tweeted.

In the proposed model, four dimensions were used to create the DW: USER, PLACE, TIME and SOURCE.
In Ben Kraiem et al (2015), the authors proposed the OLAP4 Tweets platform, which is a model dedicated to the OLAP of tweets with some enrichments. The proposed enhancements correspond to two additional types of attributes initially not returned by Twitter given as follows:

- *ETL (Extract, Transform and Load) calculated data*: four additional attributes are introduced: *Tweet-Type*, used to classify the Tweets into four types (normal tweet, mention, responses and Retweet), *Tweet-Language*, *Tweet–Sentiment* and *Tweet –Topic and entities* in Michelson et al (2010). These new elements are grouped

into a newly generated dimension called *Junk Dimension.*

- *Runtime calculated data*: Two new hierarchies, *User Category* and *User-Activity* are added. User category permits classifying the users into three categories -Information Seeker, Information Sharing and Friendship relationship. User-Activity classifies the users into four clusters: Old-Active, New-Active, Old-Passive, and New-Passive.

Other studies aimed to associate a tweet to a specific geographic location in order to facilitate the multidimensional analysis. The content of the tweets was analyzed in order to retrieve the relevant terms that might correspond to a specified location as given in the works of Bouillot et al (2012) and Benhardus et al (2013) and Hecht et al (2011). Then, the location information is retrieved from the meta-data tweets and the geographic location was determined.

OLAP MODELING FOR HOMELAND SECURITY APPLICATIONS

The Multidimensional Model

A DW is composed of a *fact table* containing the *measures* and connected to a set of *dimensions* that provide the context surrounding the topic of interest. The concept of dimension gave life to the broadly used metaphor of *cube*s to represent multidimensional data such as given in Figure 1.

Figure 1: An OSN cube with the dimensions and the measures

The cube corresponds to posts on an OSN that an intelligence service wants to analyze. The given cube is composed of three dimensions:

- DIM_LOCATION (IRAQ, TUNISIA, SYRIA, EGYPT, ALGERIA, LYBIA).
- DIM_HASHTAG (#Arbata (A famous location in the south of the country known for its terrorist activities), #Chaambi (A famous location in the south of the country known for its terrorist activities), #terror, #IslamicState, #IS, #AlQuaeda, #Terrorist).
- DIM_TIME (2015, 2014, 2013, 2012, 2011 and 2010).

Four measures are associated with the given cube: *Reply_count*: the number of replies for the post; *Like_count*: number of times the post was liked; *Repost_count*: number of time the post was reposted; *Dislike_count*: number of times the post was disliked and *Score*: the score of relevance of the post

THE DW MODEL FOR OSN: THE EXAMPLE OF TWITTER

On Twitter, the proposed model includes the users of the platform, their posts (tweets), and the relationships within those two classes such as the “follow”, “tag”, “author of”, “retweet” relations. In the model, we consider a central fact table, FACT_TABLE_PUBLICATION to analyze the tweets posted by the users, groups, pages, etc online. The following dimensions can be defined:

- DIM_USER: user information.
- DIM_STATUS: post information.
- DIM_COMMENT: comments about the post with various types (text, photo, image, url, etc).
- DIM_PHOTO and DIM_VIDEO: multimedia content.
- DIM_HASHTAGS: define specific topic.
- DIM_USER_MENTION: a person’s @username.
- DIM_LOCATION and DIM_TIME: geospatial and temporal characterization of the facts.

- DIM_SOURCE_DEVICE: source of the post (Facebook, Twitter, etc) and the device represents the equipment that was used for that.

The measures are as follows: *reply_count* (Number of comments), *repost_count* (Number of reposts), *like_count* (number of likes for the publication), and *dislike_count* (number of hates for the publication).

The Proposed Data Warehouse Model For The GTD

The GTD is an open-source database including information on worldwide terrorist events since 1970. The proposed multidimensional model for the GTD is composed of a central fact table (FACT_TERRORIST_ATTACKS) to analyze terrorist attacks associated with the following dimensions:

- DIM_TIME and DIM_LOCATION.
- DIM_INCIDENT: data about the attack.
- DIM_WEAPON_TYPE: weapons used in the attack.
- DIM_ATTACK_TYPE: The method of the attack (*Assassination, Hijacking, Kidnapping, etc*).
- DIM_TARGET: targets of the attacks.
- DIM_TARGET_SUB_TYPE: the target subtype.
- DIM_TARGET_CORP: the specific person, building, installation, etc., that was targeted.
- DIM_PERPET: the group that carried out the attack.

The measures are: *Nkill* (number of persons killed), *nwound* (number of wounded), *nreleased* (number of hostages who survived the incident), *Ransom_amount* (amount of money demanded by the terrorists), *Propvalue* (amount of damage caused), *nperp_cap* (number of arrested perpetrators) and *Nper* (total number of perpetrators). The two proposed models will be joined to form a unified model as given in Figure 2.

Figure 2: The proposed unified Snowflake DW model.

EXPERIMENTS AND DISCUSSION

In this section, several experimental datasets are used and python was used to scrap twitter data. The information related to the targeted accounts are given in Table 1.

Table 1 : Experimental datasets

User name	@alqaeda	@Abou_Cha_ bouche	@alsomood	@Hashimi Qureishi	@Daish_ OnLine_01	@Abo_ al_hassan
Nb_follwers	35439	4043	2569	99	1297	42
Created_at	07/2017	11/2011	06/2009	06/2015	03/2015	25/2014
Nb_friends	2	790	0	414	160	214
Nb_lists	1249	72	37	2	6	1
Nb_likes	318	57589	0	22	7	120
Nb_statuses	1590	23553	1518	184	1332	596
Nb_tweets_collected	200	200	200	180	155	200
First_tweet_ Scrapped_date	23/11/2017 13:44:35	14/07/2019 03:35:42	17/03/2014 03:14:37	15/07/2015 19:34:14	25/07/2015 14:24:25	27/05/2015 22:33:03
last_tweet_ Scrapped_date	11/08/2019 02:05:16	05/08/2019 15:26:26	28/03/2017 07:21:22	26/05/2016 22:52:42	07/09/2015 07:56:42	25/08/2015 02:36:19

In the other hand, the computation of the scores in the DW is also problematic. These scores have a great impact on the identification of the most pertinent insights to be extracted from the collected data such as the most cited user (user_mention) and hashtag or the most shared photos and videos. These scores will also contribute to identify the most pertinent posts. In the DW, it is possible to distinguish three types of information and thus three types of scores to be computed:

- *Score on categorical data:* such as *user_mention* and *hashtags* contained in each tweets. The score of a categorical measure will be computed as follows:

$$\mathcal{S} = f_r(mod_i|att_j) = \frac{nb_occ_{mod_i}}{N}$$

  (f_r) is the relative frequency of the modality *i* in attribute *j*, *nb_occ* is the number of occurrences (repetitions) and *N* is the cardinality of the dataset. Thus, if the score is high then the considered categorical value is more and more frequent in the dataset and thus is more pertinent.
- *Score on numeric data:* two types of numeric data were collected in our experiment: *user data* (number of followers, statuses, friends, etc) and the *measures* given in the fact table of the model such as the number of retweets and favorites. For user data, the score would be computed as follows:

$$\mathcal{S} = \frac{att_j}{\sum_{j=1}^{l} att_j}$$

  att_j corresponds to the value of the numerical attribute and *l* is the total number of accounts considered (an example is given in Table 1).
  For the measures, the score of a given measure will be computed as follows:

$$\mathcal{S} = \frac{m_k^T}{\sum_{j=1}^{p} m_k^{T_j}}$$

  m_k^T corresponds to the kth measure in the fact table for the current Tweet *T* and *p* is the total number of Tweets collected for that user (an example is given in Table 1).
- *Score on unstructured data:* for unstructured data such as photos, videos and text, additional and more complex analysis can be performed using NLU/NLP and visual recognition capabilities to derive the scores and identify the most interesting patterns. This case was not considered in this study.

As an example, consider the following table that contains data related to five posts collected from Twitter:

Table 2 : Tweets sample

	measures		User_data			Categorical_data	
T	Nb_retweet	Nb_likes	Nb_followers	Nb_friends	Nb_lists	hashtags	User_mention
1	15	3	1254	65	32	#alqaeda	@abu_jihad
2	12	15	5613	10	23	#aqmi	@abu_sofien
3	5	19	1254	65	32	#alqaeda	@abu_jihad
4	4	20	5613	10	23	#aqmi	@abu_jihad
5	26	1	120	1	3	#aqmi	@abu_jihad

In Table 2, it is supposed that (*post 1, post 3*) and *(post 2, post 4)* correspond to the same user. For each attribute in Table 2, a score will be assigned for each post. In this case and according to what was explained before, the score of the Nb_retweets for post 1 will be 15/(15+5)=0.75 and for Nb_likes the score will be 3/(3+19)=0.13. The score of the Nb_followers for post 1 can be computed as follows: 1254/(1254+5613+120)=0.17. The score for hashtags #alqaeda is 2/5=0.4

In the experimental dataset, data related to the tweets were collected: *created_date, user_name, text, url, user_mention, user_followers, user_friends, user_listed_count, retweet_count, favorite_count, user_favorite_count, statuses_count*.

In Figure 3, the most cited user mentions in the dataset are reported. In fact, a highly cited user (@) in the dataset would correspond to a high activity and interest for that user. The most cited account corresponds to the user *@Censored31q* with 22% of the total user citations.

Figure 3. Most cited users in the collected tweets.

Figure 4. Most cited hashtags in the collected tweets.

However, when trying to access the account and inspect the content, it was found that it was unfortunately deleted from twitter. For example, in the following Tweet, the user *@Censored31q* is not accessible.

Deleting suspicious accounts on Tweeter is part of tweeter's security policy towards blocking extremist content. Using this method, it would be first possible to identify most pertinent suspicious profiles and remove them from the user monitoring list if they are suspended. When investigating the list of user mentions, it is found that some accounts were related to Tunisian users such as @Qacem_Ariana_44, @qacem_Djerba_44, @qacem_Gafsa_44, @qacem_Nabeul_44, @qacem45_sfax, @qacem_Remada_44, @Qacem_Tbarqa_44, @qacem45_sousse, @Tounsi_Marouan, @tunsi_marwan, @qacem_Dheeba_44. These accounts were all suspended.

In Figure 4, the results regarding the citation of the hashtags are represented. According to these results, the most cited hashtags were (#داعش, *i.e* daesh) and (#داعش_غدر_خيانـة_إجرام, *i.e* ISIS_treachery_betrayal_crime). As mentioned before in the scoring procedure, in the dataset, the user mention *@Censored31q* registered a score of 0.031, followed by @MustafaKlashin with a score of 0.012. (#داعش, *i.e* daesh) and (#داعش_غدر_خيانـة_إجرام, *i.e* ISIS_treachery_betrayal_crime) registered a score of 0.009 both. Thus, it is expected that Tweets that mention one of these elements will have higher scores and thus will be spotted and can depict more interesting patterns. The *retweet_count* and *favorite_count* related to each tweet were also scored since they can highlight how important is the tweet under consideration.

In the proposed classification, the post published by Abou_Cha_bouche on 27/07/2019 at 08:46:28 AM "*@davidperrotin: Après la mort de Mamoudou Barry, des députés LR (G. Larrivée, Valérie Boyer, Eric Ciotti..) ont relayé des intox*", was the tweet with the highest score. In fact, the tweet corresponds to the user @ Abou_Cha_bouche that has according to Table 1, high values for the *nb_followers*, *nb_friends*, *nb_likes* and *nb_statuses* that were incorporated in the scoring method and thus will increase the total value of the score for the tweets belonging to that user.

The second most scored tweet also corresponds to the same user published on 31/07/2019 at 08:27:58 "*@AbouZilleur_ Qu'Allah te facile les vacances akhy*"'. In the Tweet, @AbouZilleur, that was cited 10 times in the dataset as given in Figure 3, was also cited. Although the tweet was not retweeted, it was liked 11 times.
Considering the following Twitter post:

The translation of the previous Tweet is: "*Paktika: Two puppet soldiers killed in Xerok: two puppet soldiers killed in attack by Mujahideen in Sri Medan district*". Using the proposed snowflake model given in Figure 4, it becomes possible, based on the time and location common dimensions to gather more information from the GTD especially when the spotted event to be investigated and initially identified on the OSN is related to a terrorist attack. The information that were reported in the GTD and related to this Tweet is as follows:

- The location of the event: the GTD provided more details regarding the *country* (Afghanistan), the *region* (South Asia), the *province/state* (Paktika), the *city* (Ziruk district) and even the *latitude* (33, 158056) and *longitude* (69, 312778) of the location.
- Description: 04/28/2014: Assailants attacked an Afghan National Army (ANA) checkpoint in Ziruk district, Paktika province, Afghanistan. This was one of two attacks targeting checkpoints in Ziruk on the same day. At least 65 people, including 5 soldiers and 60 assailants, were killed and an unknown number of people were injured in the assaults. Additionally, at least one soldier was abducted across the two incidents and the outcome is unknown.
- The attack type used: Hostage Taking (Kidnapping) and Armed Assault.
- The targets: Military Checkpoint of the Afghan National Army (ANA) and their nationalities Afghanistan.
- The terrorist group involved: Haqqani Network, *i.e* (شبكة حقاني) which is an Afghan guerrilla insurgent group using asymmetric warfare to fight against US-led NATO forces and the government of Afghanistan.
- The motive: unknown; however, Afghan defense ministry officials stated that the attack was meant to be a high-profile event after the Taliban had failed to mount significant opposition to the presidential elections on April 5, 2014.
- The total number of terrorists participating in the incident (*nperps*=500).
- Number of persons captured *nperpcap*=0.
- The number of kills in the attack *nkill*=33.
- The number of perpetrator fatalities *killterr*= 30.

CONCLUSION

The analysis of OSNs is a complex task that requires dealing with a huge amount of structured or unstructured data. In this paper, a scoring capability was implemented to analyze OSNs according to the published Tweets. For this purpose, a multidimensional model was proposed to incorporate multiple distinct databases (OSN, GTD, etc) according to several dimensions and various data types. The proposed model for OSNs was enriched using the GTD to provide a wider understanding of our topic of research. It is also possible to use other databases and integrate them with the current model in order to enhance the capabilities of the system.

Design and Validation of Interview to Analyze Social Representations in the School Field

Leidy Diana GONZÁLEZ RINCÓN

Bogotá, Colombia, leidy.gonzalez.r @uniminuto.edu

[1] Corporación Universitaria Minuto de Dios - Uniminuto, Bogotá, Colombia.

Abstract

The objective was to design and evaluate an interview to learn how the social representations of the indigenous in the school environment between teachers and students are processed. This construction process was based on Rosana Guber's theory, working from three categories: imaginary, speeches and practices.
The instrument was applied to 10 public school teachers who voluntarily participated in this study. It was evaluated by three professionals in the area of education. The results of the analyzes show that the instrument is capable of implicitly revealing the imaginary, speeches and practices, and that it is possible to arrive at an in-depth analysis about its visions on education and its pedagogical work.

Keywords: School, Non-directive interview, social representations, school practices.

Introduction

Society has been historically configured through different relationships that we establish through language. This is impossible to understand, capture or measure in its entirety, since it is the result of a multiplicity of interventions that converge with each other and constitute the historical framework in which we are all involved. Each era and each society has been configured for itself, in order to respond to the established hegemonic models, which prevail and regulate the conditions, thoughts and attitudes in the face of an endless number of social representations that we all feed and reconfigure through individual and collective experience.

To ask about the imaginaries, discourses and practices that are developed in the school environment, turns out to be of great relevance, since it responds to the need to understand the contents and meanings that are processed in the school environment, specifically in relation to social representation. The conception that moves around these contents is fundamental to understand, on the one hand, the pedagogical task and its correspondence with the hegemonic reconstructions that are made in relation to "the other" and the representations for people in formation.

The development of a methodological tool for the tracking of these imaginaries, discourses and practices was thought from a reflective approach, in order to attend as a priority, the voice of the others; the reflexivity can contribute to detect interpretative frameworks, as well as to identify the way in which they give account of their experience (Guber, 2001). Given that there are no instruments "prefigured for the extraordinary variability of socio-cultural systems, not even under the apparent uniformity of globalization" (Guber, 2001; 7) it was necessary to recognize through the own experience of the researchers the pertinence of a method that gives account of those practices for which it is investigated, in such a way that "the instrument is the same researcher with his socio-culturally considered attributes -gender, nationality, race, etc.- in a social relation of the field" (Guber, 2001; 7).

With this exercise, it was determined that the interview would be the most consistent tool for teachers to show what they know, what they think, and what they believe about their representations of what is indigenous and the practices that are developed in the school environment, which allow them to reconfigure and process ideas that feed stereotypes and generate gaps between what is considered habitual and what is called "other". The need to create and use an effective and valid tool to obtain information through oral exercise has been the reason for initiating this study. In this way, the design of an instrument that would become an adequate and specific tool for the treatment of this information was promoted in order to provide new research material that could be used in studies such as those presented here.

Different elements are presented for the construction of a semi-structured interview oriented towards "non-directivity" proposed by Rosana Guber (2004) through an exercise of piloting, expert validation and analysis of the questions

Cite this Article as: Leidy Diana GONZÁLEZ RINCÓN "Design and Validation of Interview to Analyze Social Representations in the School Field" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

proposed by the research group, which aims to trace in the discourse of interviewed teachers their imaginaries, discourses and practices in relation to the social representation of the indigenous.

The interview is one of the most appropriate techniques to recognize the meanings of people, it is a social relationship through which statements and verbalizations are obtained that can later be analyzed (Guber, 2004). From the positivism, it has been established that orthodox interview in which questions are made that look for a concrete, unique answer and that gives account of the true thing, nevertheless, as Guber affirms (2004) this turns out to be "partially true" since it supposes that the questions formulated by the researcher belong to the same universe of sense that the answers of the interviewed.

By posing the questions as researchers, interpretative frameworks of the answers are established, that is, the relevant information within the research, this will be decided from the moment the topic, the categories of interest and the terms of the questions for the subsequent analysis are established; of course, this implies the recognition of the universe of the interviewee, which contains different meanings and preconceptions from that of the researcher, "even though they apparently handle the same language, they talk about different things, but they do not know it" (Guber, 2004)

Non-directivity can help to introduce us into the cultural universe of the interviewee, since it presents us with indications to understand its logic and to dialogue within the same terms and meanings: the floating attention of the researcher that is an exercise of the researcher and consists of listening to what the interviewee says without privileging any point of the discourse beforehand, the free association of the informant that unfolds from the interrogations carried out by the researcher, these must be very general, since they are simple provisional links that will allow the interviewee to pour out by free association themes and concepts through conversations that are related to the object of investigation, but are not in themselves, conversations about the object itself, and the deferred categorization of the researcher which consists in the first place, in the formulation of open questions that intend to generate a basic substratum of the interpretative framework of the interviewee, this, supposes an active role of the interviewer in order to identify the interstices of the informant's discourse to understand its logics, and in second place to register the information "that apparently has no reason to be" (Guber, 2004) but that will become his new questions, categories and concepts.

Methodology

Participants

Two types of participants were used for the development of the research. First, the support of three experts in the area of education was requested for the evaluation of the development of the questions; the selection of experts was made through the consensus of the research group, following the theory of Landeta (2002) which states that "there is no way to determine what is the exact optimum number of experts" (P. 62), in this way we chose to work with three professionals in the area of education who could contribute to the research work and motivate through their validation exercise the initiation of the Delphi method which consists, as stated by Linstone and Turoff (1975) in a technique of structuring a group communication process in order to deal with a complex problem. Taking into account these definitions we chose and responded positively to the project three professionals in the area of education (table number one).

Table 1*:* Characteristics of the experts group selected for the investigation.

professional qualification	research area	age range
Master degree in direction and management of educational institutions	Education and educational management	1 – 15 years
Master degree in education	Education and Society	1 – 10 years
Master degree in education	Education	1 – 10 years

Secondly, an interview (pilot) was conducted with teachers in the areas of social sciences, humanities and arts in the elementary and middle cycles of district schools in southern Bogotá.

Ten (10) teachers from different public schools in southern Bogotá participated voluntarily in this study. The pilot sample was made up of six male teachers, aged between 31 and 65, and four female teachers, aged between 39 and 60.
The investigation procedure was made up of several phases, in which the concepts with which to work for the construction of the definitive instrument were defined. The first phase consisted of the theoretical development of the

central concepts of the interview, the second phase was the development of the first version of the instrument and the review by experts, the third phase was based on the pilot exercise and finally the fourth phase consisted of the reworking of the questions for the final instrument.

PHASE 1: Theoretical development of the central concepts of the interview.

In this first phase a theoretical construct was developed based on three specific items: Imaginaries, discourses and practices, in order to determine how these, relate implicitly to the teaching task, relating them to the phases of the interview oriented to non-directivity:

Imaginary:

The imaginaries are a tool that allows to endow with meaning the world instituted in the margins of the social ones, through this it is possible to give meaning to the individual experience, being configured as a transitory form of social reproduction, a historical cultural substance and articulation between them to give a sense. (Pintos, 2001)

For Castoriadis (2006), imaginaries characterize humanity and are configured as a tool of language, ways of doing and values, that is, everything that imposes with or without sanction ways of acting and thinking; circumstances are those that guide this construction in a constant recreation of society and the way it is expressed:

"The language, the customs, the norms, the technique, cannot be explained by external factors to the human collectivities, so it is absolutely natural to call this faculty of radical innovation, of creation and of imaginary and imagination formation" (Castoriadis 2002: 94).

In such a way, the imaginaries are an interweaving that penetrates the psyche of the individual and directs him/her to act in society, it is a grammar to interpret the "legitimated social reality", the human being goes to his/her power of creation and formation to give an explanation to those institutions immanent in human collectivities and in their singularities, such institutions are "made of socially sanctioned meanings and of procedures that create meaning. These meanings are essentially imaginary -and not rational, functional or reflections of reality- they are social imaginary meanings" (Castoriadis, 2002: 133)

The real, is always something significant for a subject, the social imaginary is the element that allows to grant a particular meaning to reality, in this sense Castoriadis (2002) affirms that it is necessary that this imagination is "dominated, channeled, regulated and turned into suitable for life in society and also for what we call reality" (Castoriadis 2002: 97)

This process of channelling towards meaning will take place through socialization, at first, through a direct encounter with the main institutions such as the family and later, more diverse institutions such as religion, morality, the nation, traditional education and the state that will embody the psyche of the individual in the same way in order to orient our lives.

"Each society defines and elaborates an image of the natural world, of the universe in which it lives, trying each time to make of it a significant conjunct, in which must certainly find their place the objects and natural beings that matter for the collective life, but also this same collectivity, and finally certain order of the world" (Castoriadis 1989: 258).

Therefore, the world is never a pre-existing ontological entity, but it is an interpretation that carries an anchored meaning, which provides the individual to be able to communicate and cooperate collectively, the imaginary constructs the idea, creates it and gives it form; thus, it can be affirmed that what exists around that idea is the work of the human and therefore of the social imaginary.

Finally, the imaginary is always an interpretative construction, therefore, it must be understood as a matrix of determined sense that hegemonically imposes itself as reading of social life, the individual assumes it above his own experience and deals with it as a symbolic element, a set of plausible senses to which one accedes in certain social situations and that determine the regulatory entities that constitute us and make part of society.

Speech:

The discourse has become a term that is developed in different disciplinary spaces, its allusion refers to all the processes of linguistic production that are put into play to produce something, it can be seen from the discursive materiality as much as the behavior of its producers and interpreters (Karam, 2005).

According to Karam (2005) this can be conceived from three big aspects, the first one refers to the discourse as source of itself, an approach towards the syntactic or the narrative, as for construction of story, a glance of the discourse as linguistic unit major to the sentence; a second perspective, considers the discourse as part of a communication model, a determined circumstance of place and time in which a subject of enunciation organizes his language in function of his addressee, and the materialistic perspective, which understands the discourse as a social practice linked to its institutional, social, ideological and cultural production.

For the previous thing, the speech is understood from the materiality that constitutes it, and that this permeated by different social processes, we are born and we are constructed in society, we learn the language that structures the thought, allows the communication, grants meaning and constantly mutates through the historical happening, the interweaving of all these elements is what composes the speech. This, in turn, constitutes units with complete meaning, ideologies, culture, individual thought and collective construction.

Therefore, it is the compilation of unifying actions, permeated by power, persuasion, value, ideology and communication regarding a concrete way of understanding things and acting on them, it is a way of accessing the world, representing and reproducing society.

"with words we not only say -semantic dimension- but also do things -pragmatic dimension-. And if what is said so much designates things -referential component- as it allows us to relate some words with others -structural component-, the study of doing of what is said, allows us to know (speaking with more property, allows us to infer) an image of who says what he says; since when saying we remain said in what is said -sociolinguistic commitment- "(Montañés 2010: 2).

The language is the tool by means of which we construct ourselves, interact and relate with other subjects, for Mota de Cabrera and Villalobos (2007: 413) the language "is the mechanism through which the meaning negotiation occurs", it is there where the speech occurs, in that elaboration between the interior, the individual, the collective and the attributed meanings, the speech is dynamic, changing and multiple, it is always dialogical and conative. The speakers provide varied, contradictory and constant perspectives, going to their social world that is not unique or finished, but rather a collective production that is at the service of all and is interchangeable according to the perspective and the moment. (Wetherell and Potter 1996 and Gee 2005).

Practices

In a very broad sense, pedagogical practices are those actions that the teacher constructs, plans and executes in order to provide the student with an integral formation, which requires the use of didactics, as well as of constitutive elements that are presented in the school environment and that are determinant in the formation processes. For Huberman (1999: 25), pedagogical practice is a "conscious, deliberate, and participatory process implemented by an education system or an organisation with the purpose of improving performance and results, stimulating development for renewal in academic, professional, and labour fields, and forming the spirit of commitment of each person to society and particularly to the community in which he or she works". Pedagogical practices involve a conceptual analysis of the relations that are established through pedagogical communication, not only from the individual of a subject, but from an analysis of the structures in which all educational entities converge, among these, society.

Society can be identified in the educational context from the simplest and most complex interactions, from the micro (the practice) and the macro (the social structure) as meanings to which we respond due to the representations that have been established as generic logic for all; pedagogical practice responds on the one hand, to the large scales instituted and hierarchized within society, but also to individual processes, primary preferences, and interactions that are natural to the educational environment.

In this sense, the pedagogical practices, are at the same time social practices, Bourdieu (1984) defines the Habit as a mediating element, a set of principles of perception, valuation and action due to the introjection in society, these generate characteristic habits of synchronic and diachronic positions, which make people close, perceive and act in a similar way before the same situations. In this way, education and specifically the school as an institution contribute to the social structures to reproduce them.

This means that pedagogical practices are representations that explain the contextualization of the educational environment that are crossed by subjectivities that converge among themselves by all the entities that are involved in the specific environment, it is the space in which all the ideas and meanings that have been constructed and re-constructed in society converge and that are processed in the constant contact between what is done, what is said and what is thought.

Opening and focusing/deepening.

In the first stage of the interview, the frames of reference of the interviewees are constructed from the "free association", from these frames, the most significant questions and topics for focusing and deepening are extracted; This is achieved through what Guber (2004) calls "the art of not going to the point" in which "questions to discover questions" are used, that is to say, using descriptive questions in which the interviewee is asked to talk about a certain topic, its social context, the places in which it plays, inviting it to expand as much as possible its answers, improve its descriptions, including what it considers trivial or secondary. (Guber, 2004)

After this, comes the stage of focusing and deepening, this is only possible when it is obtained a "dense" material in words of Geertz quoted by Guber (2004) that has been obtained from deep descriptions, assessments and explanations that are analyzed at the same time in the field, in this stage, the direction of research is determined, expanding, By deepening and systematizing the material obtained and for this purpose using the categories or recurrences that have been traced in the first moment of the interview, these are obtained in the common expressions of the interviewee, so it will be the task of the researcher to investigate not by the definition, but by the use of the category, to later analyze them and create by himself the definition that accounts for the object of investigation.

PHASE 2: Development of the first version of the instrument and expert review

Once the draft of the "non-directivity" interview has been designed, it has been passed on to the group of selected experts made up of three suitable people in the research topic (information referenced in table one). To facilitate the verification of experts, a Likert scale from 1 to 5 has been applied to each question (table number two), where 1 is in disagreement and 5 is in total agreement, in terms of relevance, clarity, form and exploration of the category oriented in the question. Likewise, at the end of each one of the items contained there is a space for observations so that the evaluator may qualitatively expose any comment that he/she considers appropriate.

Table 2*:* Likert Scale

Likert Scale				
1	**2**	**3**	**4**	**5**
Non-compliance The question does not comply with the evaluated item	Lack of relevant information compared to what was evaluated	The question does not fulfill the necessary aspects	The question meets most aspects for the evaluated item	The question fully complies with the evaluated item

After the expert review was elaborated, the information collected was analyzed and tabulated, thus reducing the number of questions, generating changes in form and wording, effectively using the contents of the questions and the associations that were intended to be tracked with the instrument.

PHASE 3: Pilot test

Once the sample selection was made and the draft for the pilot exercise designed, we organized the spaces for the interview and the way it would be conducted, we gave each interviewee a copy of the interview evaluation matrix, a consent form that they read and signed before the exercise, and each interviewer had a copy of the draft interview for note taking and category organization.

The interviews, in paper format, and recorded on audio, were conducted during the school day in the mornings (6:00 am to 12:30 pm), although no time limit was established, the interviews lasted between 22 and 30 minutes per each interviewee. The dynamic of the interview consisted of a discussion that began with the basic question and was broken down into the categories that the interviewee himself proposed, in such a way that the interviewee was asked to answer the question and the interviewer was in charge of tracking down the categories that he or she considered relevant to the research process.

The interviewed teachers completed at the same time with the interview exercise the validation rubric for the instrument in order to specify through a Likert scale, relevance, clarity, form and exploration in each of the questions.

PHASE 4: Data sources, reworking questions for final instrument

In order to evaluate the teachers of basic and secondary education of the public schools located in the south of Bogotá with respect to their social representations and specifically, to the practices, imaginaries and discourses that they process in the school environment, we developed a semi-structured interview oriented to "non-directivity" (Guber, 2004), after an exhaustive analysis of relevant scientific articles. This interview, formed by open questions of implicit type, had as main base Rosana Guber's theory and the concepts that guide the evolution of this work, described in the previous phases. The first part of the interview (from question 1 to 5 "1-4") aims to evaluate the practices of teachers from their pedagogical work. The second part of the interview (from question 6 to question 10 "5-8") aims to evaluate the discourses presented by teachers in the spaces converging with the students and the third part (from question 11 to question 15 "9-12") aims to evaluate the teacher's imaginary in relation to specific aspects of their pedagogical work and the relationship that they present with the students.

Evaluation rubrics were constructed (applied later to the interviews) in order to clarify the relevance and intention of the question, as well as to request explanations and clarifications of the questions used.

Discussion/ Conclusions

The objective of this study was to design and develop an interview instrument that tracks the imaginaries, discourses and practices in relation to the social representations of what is indigenous in Bogotá's public schools. The results obtained in the research show that the design and elaboration of an interview focused on "non-directivity" requires the execution of different phases, as well as the judgment of experts.

Interviews are crucial because they allow for more complete and detailed concepts to be traced through the interviewees' discourse from their experience, and it is important to apply them in qualitative studies. The internal consistency has proven to be efficient, which facilitates its applicability in different contexts. The validity here evidenced shows an adequate development through Rosana Guber's (2001) theory and technique, leading to the adaptation of the initially selected items and a greater tracking of the analyzed categories.

This study provides, not only a theoretical construct, but also an instrument that allows to establish more assertive communication bridges between the researcher and the interviewee, in order to trace through the cultural codes in which we live, how social relations and representations are given in the educational field. In this sense, the instrument can be used by teachers and management teams to obtain information that allows them to propose new strategies or mechanisms for the different difficulties that arise in the school.

From the reviews that were elaborated during this qualitative work, it is presented that there are different interviews and/or questionnaires that intend to measure the relationships in the school environment. Most of the studies are aimed at inter-subjective relationships in order to improve the quality of education.

The piloting exercise and the re-elaboration of questions based on the experience of the first two phases of the research support the reliability of the instrument, formed by 12 questions, grouped in 3 contents (imaginary, speeches and practices). Thus, the interview instrument for tracing social representations of the indigenous in public schools in Bogotá has a high level of validity for the persons interviewed and the overall research. This instrument will allow a qualitative analysis, through "non-directivity", of how relationships are handled in the school environment. However, this study presents certain limitations that should be taken into account, such as the dependence of the factors that intervene in the context, as well as the pre-concepts of the interviewee and the interviewer that may bias the information obtained through the instrument.

Finally, one may conclude that, after this procedure aimed at creating a qualitative instrument to track the imaginaries, discourses, and practices that influence relations in the school, the results are satisfactory, since it allows for the collection of sufficient information to establish consistent theories in qualitative studies with which the instrument may be related.

Abstract

The power industry holds a prominent place in the activities of the Shanghai Cooperation Organization member countries. The main players in the intergovernmental organization under analysis in the energy sector are China, Russia, India and partly Kazakhstan. It is due to the results of their activities that the SCO achieves high figures in the development of the fuel and energy complex, which are reckoned with and competed with outside its borders. However, absolutely not all countries of this alliance play a significant role not only in the world stage, but also within the SCO. These states are Uzbekistan, Kyrgyzstan and Tajikistan that hinder the development of the energy sector not only in their region, but also in the organization as a whole. However, all the members of the alliance benefit from cooperation in the energy sector. Russia and Kazakhstan have expanded their market outlets for energy resources, supported a more efficient use of the existing potential and resource advantages; China, India and Pakistan got the opportunity to diversify energy resource imports in a higher degree and increase the volume thereof in order to satisfy the domestic needs of the economy and population. Uzbekistan, Kyrgyzstan and Tajikistan have acquired advantages in the shape of a certain status due to cooperation with world powers, the acquisition of energy resources at special rates, and the solution of acute social issues.

Keywords: Shanghai Cooperation Organization, world energy markets, sustainable economic development.

Introduction

So far, the SCO has become one of the largest regional associations. With India and Pakistan acceded, the total area of the SCO is about 25% of the total area of the world, the total population of its member countries is about 3.4 billion people, or 43% of the world, and the SCO occupies about 60% of the area on the European continent. The SCO includes four nuclear-armed nations, two of which are permanent members of the UN Security Council.

The SCO intergovernmental organization has a great weight on the world stage due to the successes of co-operation in border security in the region. The development of relations between the SCO member countries have gradually begun to expand and affected many sectors, including the economic one. The Shanghai Cooperation Organization includes countries with a high level of economic development. For example, in 2019, the share of the SCO countries in world GDP was 31.635% – almost 1/3, and if this indicator is examined over time, then since 2013, it has been stably grown: + 4.285% for 6 years.

The main contribution to the total GDP of the SCO countries is certainly made by China with a share of 74.2% in 2019, followed by India with 14.88% and Russia with 7.65%. It is these countries that are the main players and competitors at the Shanghai Cooperation Organization, that determine, in most instances, the vector of the development of the organization.

Cite this Article as: Tatyana Mikhailovna SHPILINA, Natalia Yurievna SOPILKO and Sergey Vladimirovich SHAMSHEEV, " Assessment of the Impact of the Energy Factor on the Economic Development of the SCO Countries" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The fuel and energy complex is one of the priority areas of the Shanghai Cooperation Organization countries; according to its constitutional document, this is due to the availability of significant reserves of various energy resources, which divide the countries of the alliance into exporters and importers. As there are common and inter-complementary interests, the development of energy markets in the region should strengthen relations within the organization (Ishmeeva, 2015). From the creation of the Energy Club in 2013, the share of the SCO countries in the global FEC turnover has grown by + 2.25%, reaching 26.37% in 2018, when it exceeded for the first time the figure of 2015 and rose after a sharp decline in 2016. It should be noted that the unstable behavior was due to changes in energy prices. In order to prevent their fall, in 2016, the OPEC + countries signed an agreement on the reduction of oil production, which remedied the situation in the market, increased demand and prices.

The Shanghai Cooperation Organization includes countries that have a significant reserve of energy resources that play an important role in the economy of those countries. Certainly, the main energy resources are oil, natural gas, coal, uranium and electric power, more attention in the development of which has been given to renewable energy sources, including solar and wind power, and hydroelectric power plants (Vikhoreva, 2016). Thus, according to official data, the proven resources of the Shanghai Cooperation Organization countries are shown in Figure 1.

Fig. 1: Share of the SCO countries in the world reserves of energy resources and in the world electricity production in 2019 (Source: Enerdata and EconomicData).

When compared to the world figures, given that the SCO includes 8 countries only, the reserves of hydrocarbons, uranium and electric power potential are imposing. Indeed, oil reserves account for about 8% of the world's reserves, those of natural gas about 25%, those of coal over 41% and those of uranium over 74%. In addition, the production of electricity should be noted, since the share of the SCO countries in its generation is 38.42%, and on average about 40% of the generated electricity are generated by alternative sources, including solar and wind power plants, and hydroelectric power plants (Vikhoreva, 2016).

However, energy resources are unevenly distributed among the member countries of the alliance. The main oil reserves are in Russia – 4.5% of world reserves, in Kazakhstan – 1.7% and in China – 1.4%, natural gas reserves are in Russia – about 20% and in China – more than 3%, coal reserves are in Russia – more than 15%, in China – more than 13%, in India – about 10 % and in Kazakhstan – almost 2.5%.

As for the uranium potential, here, the undoubted leader is Kazakhstan with uranium reserves of 29.67% of the total world reserves, followed by Russia with about 23% and Uzbekistan with about 9%. In electric power production, China ranks first not only among the SCO countries, but also in the world, due to the power-consuming production of high-tech products, and to its large population. The situation in electric power generation using alternative sources is of special interest, this figure is 97.48% in Tajikistan and 86.97% in the Kyrgyz Republic. This is due to the features of the terrain in these countries and to the lack of alternative options for its production.

Therefore, a conclusion can be made that most reserves of energy resources among the SCO countries are in Russia; moreover, they play a large role in its economy with about 40% of the turnover and more than 62% of exports. Although the reserves of Kazakhstan are not so large if compared to those in Russia, they hold pride of place in its economy, accounting for about 74% of total exports, respectively. As noted earlier, the Shanghai Cooperation

Organization includes both energy suppliers, with Russia, Kazakhstan as the main suppliers, and large ever-growing importers (China and India). Based on this, the energy industry has taken a priority place in the further development of the organization. However, it should be noted that it is these countries whose contribution determines the position of the SCO on the world stage as a whole, the contribution of the other countries is insignificant.

In order to determine the place of the SCO countries in the world energy market, and a particular share of influence on it, the member states of the organization should be analyzed in comparison with the leading countries in the especially important energy sectors. These energy sectors are the oil and gas producing industries, as well as the increasingly developing renewable power industry.

Methodology

During research, the following general scientific methods were used: the content analysis method, designed to analyze the semantic content of text arrays and products of communicative correspondence on the research subject, as well as inductive and deductive analysis tools, which allowed us to combine individual authors' conclusions on this problem and formulate the author's vision of the problem. Special methods were also used during the research: absolute and relative statistical indicators, dynamics indicators, and research finding visualization methods. When constructing and describing models, the authors tried to adhere to the principles of an integrated approach that allows establishing the most significant relationships and trends of events and processes in the world energy markets and formalize the most significant effects

The research database consisted of official statistical and analytical materials of the International Energy Agency, energy research and consulting company EnergyData, the World Bank, the State Committee of the Republic of Uzbekistan on Statistics, the Ministry of National Economy of the Republic of Kazakhstan, the Committee on Statistics of the National Statistical Committee of the Kyrgyz Republic, National Portal of India, National Bureau of Statistics of China, Pakistan Bureau of Statistics, Federal Customs Service of the Russian Federation.

Results

Today, the most demanded resource is oil. It has become one of the tools of political influence, the object of wars between countries wanted by many. Figure 2 shows the SCO countries: Russia, China and Kazakhstan, and the USA and Saudi Arabia – the main producing countries of the world. Russia is in the Top 3 for crude oil production, behind the USA and Saudi Arabia, and China is in the Top 7. In general, the behavior over time shows a gradual increase in production, with an interruption in 2016-2017 due to lower oil prices, except for China. Since 2013, this figure has decreased by 10% in the country. This is due to the depletion of developed oil fields in China.

	2013	2014	2015	2016	2017	2018	2019
Kazakhstan	82.31	81.11	80.17	78.59	86.98	91.21	90.50
China	209.96	211.43	214.56	199.69	191.51	189.11	190.00
Russia	532.22	535.11	541.79	555.90	554.29	563.34	560.20
Saudi Arabia	538.41	543.82	568.03	586.71	559.32	578.34	571.40
USA	447.16	523.00	566.61	541.94	573.91	669.37	678.50

Fig. 2: Amounts of oil production in the USA, Saudi Arabia, Russia, China and Kazakhstan in 2013-2019 (Source: International Energy Agency).

The self-cost of oil production includes capital, production, transportation (transportation to oil storage facilities) expenses and taxes. These figures reflect the profitability of crude oil production in conjunction with its prices. As the curve in Figure 3 shows (Shabaeva, 2017), the cheapest oil production is in Saudi Arabia and in general in the OPEC countries. This is due to the fact that oil deposits are shallow and the Saudi Arabian producers are exempted from production taxes in respect to this natural fossil. The self-cost of oil production in Russia averages US$ 32 per barrel, but the price varies with the location, for example, according to RusEnergy's estimates, the self-cost of producing Arctic oil is about US$ 150 per barrel, since the complexity of extracting "black gold" is different. In these selected countries, China has the highest production self-cost. Oil is being extracted from hard to extract areas due to the rapid decline in fossil fuels with insufficient development of new fields. In Kazakhstan, this figure was $ 48.5 per barrel in 2019.

Fig. 3: Self-cost of oil production by country in 2019 (Source: International Energy Agency).

Global pricing is mainly related to the behavior of prices of Brent and WTI grades. Brent is considered the benchmark for its quality and is used by many countries to evaluate their own oils. With such a large impact of the Brent grade on global oil pricing, worldwide agitation about the latest trends starting in 2016 is easy to understand. When the price of Brent crude oil reached its lowest value. This is due to a number of causes, the main one being the increase in oil supply over its demand. For example, the production of OPEC countries in 2015 showed a record value and was 2524.8 million tons. In this regard, the OPEC countries – the largest exporters of oil, and Russia agreed to a cut in the output of "black gold". This decision delivered benefits and prices began to rise. The growth was + 24% already in 2017. However, in 2019, prices declined again; according to Reuters, the cause of the fall in prices for these grades of oil was the trade war between Washington and Beijing.

Fig. 4: Behavior of prices of Brent and WTI oil grades in 2013-2019 (Source: International Energy Agency).

As for natural gas production, there are two main producers – the USA and Russia, which top the list in this area (Fig. 5). During the whole period under analysis, gas production in China has been growing steadily. Russia saw a period of decline to 502.5 tons of oil equivalent in 2015 due to the reduction in domestic demand and export supplies. However, already in 2016, this changed due to an increase in gas supplies to boiler houses and power plants of the Unified Energy System of Russia, and due to an increase in exports to Europe in 2017.

	2013	2014	2015	2016	2017	2018
USA	536.8	606.0	636.5	625.4	641.2	715.2
Russia	528.4	508.3	502.5	506.7	546.5	575.6
China	104.7	112.8	116.7	118.6	128.3	138.9

USA Russia China

Fig. 5: Natural gas production in the USA, Russia and China in 2013-2018 (Source: International Energy Agency).

Globally, the major nuclear energy producers are the USA, France, China and Russia, which are major nuclear powers and, therefore, their development in this industry is obvious (Fig. 6). Moreover, the main players among the SCO countries – China and Russia – are annually increasing electric power production due to NPPs. Thus, in Russia, 35 power units with a total capacity of 132.2 MW are in service at 10 operating NPPs. The nuclear power industry in China has 46 operating industrial nuclear reactors at 17 NPPs with a total capacity of 42.8 GW (as of October 2018) (Yakushkina, 2019). In addition, 12 units are under construction and about 30 are planned to be built. This development of the Chinese nuclear power industry is connected with the gradual abandonment of coal

utilization for power production due to the global problem of environmental degradation, climate change, and a general lack of sufficient energy resources for its own domestic consumption, not to mention exports.

	2013	2014	2015	2016	2017	2018
China	111.6	132.5	170.8	213.3	248.1	294.4
Russia	172.5	180.8	195.5	196.6	203.1	204.5
France	423.7	436.5	437.4	403.2	398.4	413.2
USA	830.5	839.1	839.1	848.1	847.3	849.6

USA France Russia China

Fig. 6: Nuclear power production in the USA, France, Russia and China in 2013-2018 (Source: International Energy Agency).

In electric power production using hydro resources, the undisputed leader in generated electricity is China, which is 3 times as high as its closest competitor – Canada. Together with Russia, it maintains gradual growth, increasing its potential and share in this energy sector, given instability seen in Canada and Brazil. And India reached its record value of 139.7 terawatts per hour in electric power production using hydro resources in 2018, which is almost 6% higher than in 2013.

	2013	2014	2015	2016	2017	2018
India	132,0	139,0	133,3	128,4	135,7	139,7
Russia	181,2	173,4	168,0	184,8	185,3	190,2
Brazil	391,0	373,4	359,7	380,9	370,9	387,7
Canada	391,8	382,5	382,2	387,2	396,5	387,3
China	909,6	1051,1	1114,5	1153,3	1165,1	1202,4

China Canada Brazil Russia India

Fig. 7: Hydropower production in China, Canada, Brazil, Russia and India in 2013-2018 (Source: International Energy Agency).

As earlier noted, in connection with the global environmental concern – pollution of the atmosphere, water resources, carbon dioxide emissions, climate change and much more – society encountered a serious challenge of solving this problem, so those countries that have sufficient financial resources began to develop alternative sources – mainly solar batteries and wind-powered generators. From 2013 to 2018, a stable growth was seen in all the countries shown in Figure 8. However, China is distinguished, which has by now become the leader in power production using renewable sources, a sharp increase in which in 2016 was + 27% per year, and that of India was +19 %. At the moment, the figures continue to grow at a quick pace.

	2013	2014	2015	2016	2017	2018
Japan	41,2	52,2	68,2	83,1	98,8	112,1
India	55,9	63,0	65,1	79,8	95,8	121,5
China	186,9	226,0	283,4	360,9	492,4	634,2
UK	48,5	58,6	77,1	77,7	93,4	105,6
Germany	129,3	142,9	169,8	169,1	196,2	209,2
USA	266,2	296,8	315,8	367,4	417,8	458,5

Fig. 8: Renewable energy production in the USA, Germany, UK, China, India and Japan in 2013-2018 (Source: International Energy Agency).

The main sources of renewable energy are wind and sun. Figure 9 shows the ratios of the countries where this industry is most developed in electric power production using the above sources. The wind potential still plays a great role, since it tends to prevail over the solar potential in the USA, Great Britain, Germany, China, India. An interesting situation is in Japan, where more than 90% of renewable energy is produced using solar resources, which confirms the second name of the nation: "the Land of the Rising Sun".

	USA	Germany	UK	China	India	Japan
Sun	97.1	46.2	12.9	177.5	30.7	71.7
Wind	277.7	111.6	57.1	366.0	60.3	6.8

Fig. 9: Renewable energy production in 2013-2018 (Source: International Energy Agency).

The analysis of the resource availability of the SCO countries makes it possible to conclude that half of the organization's countries do not have sufficient reserves of energy resources that could contribute to the sustainable growth of the nations' economies. In comparison with other leaders of the Shanghai Cooperation Organization, the figures of Uzbekistan, Tajikistan, Kyrgyzstan and Pakistan in the energy sector are insignificant at the world level, and, therefore, interaction among the SCO countries is inefficient and hinders the progress of the whole organization (Koldunova, 2013). Then, what are benefits for Russia, China, Kazakhstan from cooperation with them, or benefits for other countries from the main players of the SCO, and what are the reasons for this interaction?

Internal trade turnover among the SCO countries and the share of the fuel and energy complex in its structure are shown in Figure 10. The behavior over time shows a relatively symmetrical change in the internal total trade turnover and internal FEC trade turnover, that is, the observed trends of the two indicators coincide on the chart. In 2018, the share of the FEC in internal trade between the SCO countries reached a record value in the entire period under analysis, that is, the growth was + 10.7% from 2013 to 2018. However, there was a sharp decline in 2016. This was due to a sharp drop in oil prices, therefore, the turnover in terms of value also showed the decline, given that the main energy resource is oil despite the development of alternative energy sources.

Fig. 10: Share of the FEC in the domestic trade turnover of the SCO countries in 2013-2018 (Source: TrendEconomy).

Figure 11 shows a diagram as evidence discussed earlier regarding the contribution to the development of the energy sector of the Shanghai Cooperation Organization member states. It shows the contribution of the SCO countries in the internal trade turnover of fuel and energy resources in 2013-2018. Thus, there are two main leaders in interaction in the SCO energy sector – China and Russia. It is they that have figures that are several times higher than those of the other countries. For example, in 2018, trade in the energy sector reached record values of + 40% for Russia and + 59% for China. In most cases, this awesome growth is due to the trade war between China and the USA and the rise in oil prices. This resulted in the decrease of the export of energy resources from the United States to China by -43%, unleashing the floodgates for Russian exports of fuel and energy resources. The next countries that are gathering pace in energy cooperation among the SCO countries are Kazakhstan and India. The growth of India's contribution to the domestic FEC trade turnover starting from 2017 – when the state acceded to the SCO –

shows good growth rates: + 128.5% in 2016 against 2017 and + 44.24% in 2017 against 2018. After a decline seen from 2013 to 2016, Kazakhstan is gradually attempting to return to previous volumes. Upon recovered from the oil price shock in 2015-2016, the growth rate was 119% in 2017and + 46% in 2018. An increase in the turnover of the fuel and energy complex is also typical for Uzbekistan; in 2018, the record value of this indicator for the period of 2013-2018 was US$ 2.5 billion. Trade of the other countries within the SCO in the fuel and energy complex is also in gradual increase, but does not show significant success.

	Kyrgystan	Russia	China	India	Pakistan	Kazakhstan	Uzbekistan	Tajikistan
2013	1,366,4	33,102	39,174	2,037,7	63,926.	15,553	1,401,2	546,609
2014	986,531	32,700	36,551	4,007,9	73,909.	9,573,2	755,360	692,362
2015	798,952	23,228	24,064	2,114,1	57,005.	2,506,4	1,143.4	628,250

2018	978,671	46,294	48,294	7.103,4	121,987,	6,404,6	2,539.9	578,444

2013 2014 2015 2016 2017 2018

Figure 11: Trade turnover of the FEC within the SCO countries in 2013-2018 (Source: TrendEconomy).

Based on the figures of China and Russia, their dependence on the rest of the organization's countries should be analyzed. To this end, Tables 1 and 2 have been compiled, which clearly show the contribution of all the members of the organization to the turnover of China's and Russia's FEC in the Shanghai Cooperation Organization.

Table 1 shows the importance of the SCO countries in the trade turnover of Chinese fuel and energy resources, and also shows the interaction structure in export-import operations.

Table 1: Place of the SCO countries in China's trade turnover (Source: TrendEconomy)

Country	Domestic FEC trade turnover with China, thousand US$	Share of FEC exports to China in total exports within the SCO countries, %	Share of FEC imports from China in total imports within the SCO countries	Balance
Russia	41,359,375.37	99.68%	0.32%	41,093,454.03
Kazakhstan	2,187,577.97	98.29%	1.71%	2,112,806.88
India	4,360,484.55	73.89%	26.11%	2,083,689.32
Pakistan	41,192.52	0.00%	100.00%	-,41,192.52
Uzbekistan	491,370.33	55.40%	44.60%	53,035.57
Kyrgyzstan	13,938.21	94.23%	5.77%	12,329.11
Tajikistan	251,230.00	44.51%	55.49%	-,27,570.82

Most countries of the group have a surplus in energy resources trade with China (Fig. 12). This indicates that China's participation in the Shanghai Cooperation Organization means expansion of import opportunities for the

country. The main partner in this alliance is Russia (the share of exports in the commodity structure of China's FEC was more than 95%), followed by India with a share of about 9%, then followed by Kazakhstan with about 4.5% and Uzbekistan with a little more than 1%. The share of the other countries is less than 1%.

Fig. 12: Country's share in the trade turnover of China's FEC within the SCO, % (Source: TrendEconomy).

According to ICIS, China's dependence on energy resource imports will increase from year to year. The causes of the increased dependence on imported raw materials are:

firstly, an increase in refining capacity in China, i.e., due to increase in energy consumption, in particular, by power-consuming industries that form the core of the country's exports (China plans to become the most powerful energy-processing power ahead of the USA by 2024),

secondly, the transition from the utilization of coal to natural gas due to the aggravated environmental situation (intensive coal combustion for power generation has resulted in large carbon dioxide emissions),

thirdly, an increase in the population, despite restrictions imposed by the authorities.

In the aggregate, all this means that the SCO has a potential for development in this area, and not only for Russia, but also for other members of the organization (Alexandrova, 2020).

The fuel and energy complex in the structure of the Russian economy is much more important than in developed countries. In Russia, the fuel and energy complex serves not only as an infrastructure, but is also the main complex of the national economy, providing a considerable part of the country's revenues: 2/3 of export revenues, more than 40% of tax revenues to the budget and more than 27% of the GDP. For that reason, most attention is by default paid to the prospects for the development of this complex (Sinyak, 2017).

The situation in the FEC of the other SCO member states is different (Table 2). All the countries of the organization have a trade balance deficit in the FEC. This indicates that Russia is a net exporter of energy resources, and the SCO countries are more or less dependent on fuel and energy exports to satisfy domestic demand, primarily that of the industrial sector (Minakir, 2017).

Table 2: Place of the SCO countries in Russia's trade turnover (Source: TrendEconomy)

Country	Domestic FEC trade turnover with Russia, thousand US$	Share of FEC exports to Russia in FEC trade turnover within the SCO, %	Share of FEC imports from Russia in total imports within the SCO countries, %	Balance
China	41 359 375,37	0,32%	99,68%	- 41 093 454,03
Kazakhstan	1 827 981,36	25,21%	74,79%	- 906 240,58
India	1 722 282,27	0,38%	99,62%	- 1 709 253,85
Pakistan	54 550,79	0,00%	100,00%	- 54 550,79
Uzbekistan	723 170,44	7,64%	92,36%	- 612 704,34
Kyrgyzstan	425 003,78	1,06%	98,94%	- 415 960,17
Tajikistan	182 232,60	2,64%	97,36%	- 172 604,80

Thus, the priority area of the Russian development of export relations is China (the share of energy resource exports to this country from the Russian Federation was 89%). The next country in the share of the trade turnover of the Russian FEC is Kazakhstan – 3.9%, and the share of exported energy resources to Kazakhstan was about 75%. Next is India with a share of 3.7% in the FEC trade turnover with Russia, almost 100% of this share are imports. The share of each of Uzbekistan, Kyrgyzstan, Tajikistan and Pakistan is less than 1%, and the imports of the FEC from Russia is more than 90% in their figures.

Upon considering the place and influence of the SCO countries in the fuel and energy resources trade turnover of the leaders of the Shanghai Cooperation Organization, we will analyze how, in general, the countries depend on interaction in the energy industry within this organization. This will make it possible to determine the advantages of cooperation between the SCO member states.

The data of the official statistical agencies of the countries and foreign TrendEconomy Open Data Portal were used to draw up Table 3, which reflects the degree of the member countries' dependence on the FEC trade turnover within the SCO (the percentage ratio of the FEC trade turnover of the SCO countries within the organization to the total FEC trade turnover of the SCO countries).

Table 3: Dependence of the SCO countries on the FEC trade turnover within the organization in 2013-2018, % (Source: TrendEconomy).

Country	2013	2014	2015	2016	2017	2018
Russia	3,92	4,18	4,42	4,03	5,65	6,73
China	11,40	10,60	10,28	11,22	10,64	12,18
India	0,72	1,47	0,81	1,41	3,79	4,10
Kazakhstan	24,12	15,90	8,24	9,04	14,50	15,18
Pakistan	0,10	0,12	0,19	0,24	0,31	0,29
Uzbekistan	31,60	19,00	33,53	45,31	56,71	71,51
Kyrgyzstan	94,47	76,15	79,02	71,40	94,27	94,04
Tajikistan	81,27	85,02	95,99	80,54	84,40	90,07
Domestic FEC trade turnover of the SCO countries, %	**5,80**	**5,59**	**5,02**	**5,41**	**7,00**	**8,35**

As a result, it can be noted that the share of dependence of India and Pakistan was the lowest and was 4.1% and 0.29%, respectively, that of Russia and China was 6.73% and 12.78%, respectively, and that of Kazakhstan was 15.18%. These countries show a gradual increase in dependence on the FEC trade turnover within the countries, which indicates progress in cooperation with one another. As expected, in spite of insignificant figures at the global level, Uzbekistan, Kyrgyzstan and Tajikistan are most dependent on energy interaction within the organization with their share of dependence of 71.51%, 94%, 90.07%, respectively. However, this dependence implies a slowdown in the development of the SCO in the energy sector, as a large share of the trade turnover of these countries is formed by their imports due to the lack of energy resources (Romashkina, 2017).

After the collapse of the USSR, where there was a well-defined specialization of countries, Russia, Kazakhstan, Uzbekistan, Kyrgyzstan and Tajikistan had to rebuild their states. Russia was the luckiest due to its significant reserves of energy resources. Kazakhstan was a little less lucky, but compared to the other countries, the situation has more or less stabilized due to oil and uranium. However, the fortune turned away from the other countries of the former USSR that were SCO members. As they had little or no FEC, the economies of the countries have not seen economic growth, since there is no investment object. Due to their unattractive investment position, these countries do not receive funds that could be invested for development. Up to now, these countries have used outdated infrastructure left after the collapse of the USSR (Kolegova, 2013).

Conclusion

The analysis of the resource availability of the SCO countries allows the following conclusions:

1. Russia and China are two countries that have significant energy resources and a certain weight in the world market. India and Kazakhstan also have a resource potential, which is definitely not so significant compared to the world leaders, but which plays a significant role in some energy sectors;

2. compared to Russia, whose national well-being depends on the extraction and export of energy resources, China, on the contrary, depends on imports thereof due to its powerful economy, which is primarily focused on the production of high-tech products, therefore, there is a shortage of its own resources, and a growing population size only aggravates the situation. This is also the case of Kazakhstan – an exporter and India – an importer. However, the role of the other countries (Uzbekistan, Kyrgyzstan, Tajikistan and Pakistan) is extremely minor, and their share is so miniscule that it is not taken into account on the world stage. This explains the significant slowdown in the development not only of the energy industry, but also the Shanghai Cooperation Organization as a whole.

3. our analysis made it possible to identify the benefits of the Shanghai Cooperation Organization member states from common interaction in the energy sector and their role in the further development of the alliance. Russia and China are a kind of engine rooms for the SCO. China is developing economic cooperation with the SCO countries, in particular, in provision of reliable energy resource supplies to the country, and in creation of transport corridors for the export of Chinese products to Europe and to the internal markets of the SCO member states. Russia, first of all, is interested to develop economic cooperation with China, as it is China that is a growing importer of energy resources, and expand sales markets in the Asian region, similarly to Kazakhstan. Uzbekistan, Kyrgyzstan and Tajikistan are interested to obtain privileges in respect to the imports of energy resources in order to at least maintain the operation of their economies, mainly from Russia, and big up their status in connection with participation in the alliance with world powers. India needs reliable supplies of raw materials and energy resources, so does Pakistan, for their rapidly growing economies and they are interested in this respect in cooperation with the countries of the region, including within the SCO.

Navigating Uncharted Waters – The Shipping Sector's Response to the COVID-19 Pandemic and Its Impact on The Perishable Food Supply Chains

Magdalena KLOPOTT

Gdynia Maritime University, Poland
m.klopott@wpit.umg.edu.pl

Abstract

The global reefer trade of perishable food products (e.g. meat, vegetables) safeguards rising demand for food globally, contributing to the struggle against famine or malnutrition worldwide. Unfortunately, the COVID-19 pandemic has not spared shipping. Although the maritime sector has experienced many crises in its history, the recent global upheaval seems to be quite different, impacting the industry in two critical ways: a steep decrease in demand for shipping services, as well as by huge operational disruptions that no one was prepared for.
Therefore, in the light of the current development of the coronavirus situation globally, the aim of this article is to scrutinize how shipping lines have managed disruptions caused by the pandemic and to investigate the ripple effects of measures taken by them on the perishable food supply chains (PFSC).
The article starts with a glance at the global trade and maritime transport of perishable chilled or frozen food products and highlights the unique features of the PFSC, which make them significantly more vulnerable and prone to operational disruptions than other supply chains. Further on, disruptions in the maritime reefer shipping unleashed by the COVID-19 pandemic are examined as well as measures undertaken by ocean carriers in response to these disruptions. Finally, the ripple effects of these disturbances on PFSC management are scrutinized.
The article reveals, that COVID-19 has placed unprecedented stress on the perishable food supply chains on a global scale and highlights certain limitations in the containerised trade of refrigerated products. First, congestion in seaports caused by measures taken after the coronavirus outbreak had detrimental effects on reefer operations, as they led to a massive shortage of electrical plug points in the ports to connect the reefer containers. Moreover, as a response to the congestion and to declining demand for shipping services, ocean carriers have restructured their service scheme by ships' capacity management (e.g. by the cancellation of sailings). This, in turn, has had a huge repercussion on PFSC globally, resulting in an urgent need to address challenges such as enormous delays in cargo deliveries, shortage of reefer containers, and a lack of container ships' capacity for perishable cargo. Furthermore, shippers have experienced increasing difficulties in keeping up with carrier scheduling changes, that rendered mid-term and long-term planning extremely difficult. Generally, the ripple effects of the pandemic have been more pronounced for the cold logistics of perishables than for those for dry cargo. The regrettable consequences of these disruptions are huge perishable food cargo losses and food wastage along the entire supply chain.

Keywords: Reefer Shipping, Disruption Management, Coronavirus Disruption, Perishables, Cold Supply Chains, Port Congestion, Reefer Shortage.

Introduction

Along with an increase in the world's demand for food, the global demand for perishable commodities (chilled and frozen food products) is also growing, which is reflected by the steady growth of perishable trade since 2000, with a CAGR 3,9% (Klopott, 2019). This trend is particularly visible in the most promising markets of Asia Pacific, South America, and the Middle East.

Consequently, the same tendency is observed in seaborne reefer traffic, which, according to Drewry forecasts (Drewry, 2020), will reach 156 million tonnes by 2024, representing a CAGR of 3.7%, which is more rapid than the growth

Cite this Article as: Magdalena KLOPOTT "Navigating Uncharted Waters – The Shipping Sector's Response to the COVID-19 Pandemic and Its Impact on The Perishable Food Supply Chains" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

anticipated in the dry cargo trade. Despite of a smaller increase in 2019 (only 1,7%, and 130.5 million carried tones of perishables), that was caused by natural disturbances (weather, diseases etc.), it is forecasted that reefer trade will be more recession proof (Drewry, 2020), given the broader resilience of the food supply chains (Stone and Rahimifard, 2018).

The contemporary global trade of perishables relies more on shipments in refrigerated containers on container vessels than on dedicated, specialized reefer ships, which was a norm some time ago. In 2019 as much as about 80% of total perishable cargo was carried on-board container vessels, carrying about 10.6 million TEU, whereas the conventional reefer fleet started to sink into oblivion (Drewry, 2020; Waals, 2019). It has a certain repercussion on global PFSC, since it caused their strong dependence on the liner shipping services[i] and the need to comply with ocean carriers' schedules and organisational procedures.

It is essential to note, that supply chains (SC) of perishable food (PF), are very complex and require continuous and uninterrupted cooling for preservation, as well as controlled humidity and air composition throughout the whole SC. Perishables deteriorate easily, have a limited shelf life and their prices are time-sensitive (Klopott, 2019), therefore breaking the cold SC integrity (i.e. any deviation from precisely defined conditions as e.g. temperature), as well as delays in transit, may potentially lead to losses of food cargo (Aung & Chang, 2014; Klopott, 2019). All this makes the PFSC significantly more vulnerable and prone to operational disruptions than other SC.

The recent outbreak of a new coronavirus SARS-COV-2 has come as shock on all stages of the PFSC, but it did not equally affect different parties of the chains. (OECD, 2020c) Therefore, in the light of global pandemic, and having in mind the importance of global perishable food supply chains, their complexity and fragility, as well as the role of container reefer shipping in safeguarding those chains, three research questions arise:

1. What kind of disruptions in the PFSC were caused by the COVID-19 pandemic?
2. How did shipping lines respond to these disruptions? What measures have been put in place by ocean carriers?
3. What are the repercussions for the PFSC caused by measures undertaken by ocean lines?

In order to answer these questions, information and data from ocean carriers' websites (carriers belonging to one of the three global ocean alliances: 2M, THE Alliance, Ocean Alliance) have been systematically gathered and scrutinized since the end of January until the end of August 2020. Furthermore, circulars, newsletters, and documents issued by those carriers, referring to rate announcements and route scheduling, since the end of January until the end of August 2020, have been carefully analysed. In order to augment gathered data with expertise opinions, qualitative research interview (Qu and Dumay, 2011) with seven professionals working in the maritime freight forwarding and logistics business was conducted in the end of August 2020.

Maritime Reefer Transport Disruptions Generated by the COVID-19 Pandemic – Ocean Carriers' Response

Shipping sector has experienced many economic crises in its history, however the recent global upheaval, generated by the outbreak COVID-19 is quite different, impacting the industry in two critical ways: by a decrease in demand for shipping services, as well as by huge operational disruptions that no one was prepared for. (Heiland and Ulltveit-Moe, 2020)
At the beginning of 2020, a lot of measures were put in place in countries attacked by SARS-COV-2 virus in order to prevent or slow the spread of the new disease COVID-19. Then, a serious looming risk as congested ports and changes in ocean carriers' schedules have started to jeopardize the functioning of perishable food supply chains on a global scale.

Congestions in Seaports

First, the coronavirus outbreak has severely impacted some of the Chinese ports like Shanghai, Ningbo, Xingang, Shenzhen or Yantian (Kelly, 2020). The everyday management of container terminals' operations have been inhibited by measures and preventive actions undertaken by port authorities and government. It resulted in unprecedented congestions, that is to say, that in a lot of cases vessels had to queue up outside the port waiting for available berth to unload or load the cargo. Among factors that have triggered seaport congestion are:

1. the scarcity of terminal and port workers due to mandatory quarantine and lockdown,
2. changes in terminal work organization,
3. the slowdown in the clearance of imports,
4. deferring or delaying receipt of containers after clearance by some consignees,
5. restricted access to roads,
6. restriction on container movements,
7. the shortage of truck drivers, and
8. enormous backups at storage facilities.

Considering the fact that China is home for 7 of the world's top 10 container ports (UNCTAD, 2019), the ripple effects on the PFSC management was really noticeable worldwide. Along with spreading the coronavirus, subsequent ports experienced Covid-19-driven congestion in India, North and South America, and Philippines. Unfortunately, in August, when the situation eased slightly, shippers[ii] experienced the second wave of congestion, this time cause by additional screening and other preventive measures taken in ports (e.g. in China) after coronavirus was found on cargo packaging from Brazil and Ecuador. (Putzger, 2020)

In particular, congestion has detrimental effects on reefer operation (Manaadiar, 2020), as it leads to a massive shortage of electrical plug points in the ports to connect the reefer containers, that should be done immediately after discharge in order to safeguard uninterrupted cold chain. Unfortunately, many shipping lines were unable to discharge reefer containers at the designated ports because most reefer plugs were totally utilized. The situation was the more severe because, as mentioned previously, perishable cargo is time-sensitive, has limited shelf life, and its market value is decreasing the longer time of transit is.

Ocean carriers addressed the congestion problem in a similar way by:

1. giving customers an option to divert cargo to different port or even ship it back to the port of loading,
2. invoking clause 19 of Bill of Lading[iii], and
3. introducing a Port Congestion Surcharge (PSC) to the basic freight rate.

In order to avoid congested ports, ocean carriers (e.g. Maersk, CMA CGM, MSC, ONE, Hapag Lloyd) recommended diverting containers to other ports or even countries. This recommendation was of particular importance for the perishable, time-sensitive and chilled cargo. In the case, when goods were already in transit, some carriers offered free of charge possibility to change the destination port (e.g. Maersk). However, in a case, when customers insisted on shipping to congested ports, they had to accept that the routing, transit and delivery time to these ports were not guaranteed.

Amid all of this, ocean carries started to exercise their rights stipulated in one clause of Bill of Lading (usually clause 19 of terms and conditions), written in very tiny print, of which customers were not always aware. This includes the right of a carrier to discharge a reefer container at an intermediate or alternative port without the consent of the merchant, where the goods could be stored ashore or afloat until it is possible to forward them to the designated port of discharge. And in case when it was not be possible, even to abandon the voyage.

Furthermore, shipping lines, due to the ongoing terminal reefer plug shortage, have also implemented a congestion surcharge per every reefer container, in order to cover losses and additional expenses caused by congestion and idle time for vessels serving the port. Shippers had to pay in addition to the basic freight rate (FAK) an incomparably high surcharge e.g. USD 1000 (Maersk, ONE) or even USD 1250 (CMA CGM) per reefer container for cargoes to specified Chinese ports, whereas the FAK rate was about USD 2500.

Reduction in number of vessels' calls and liner shipping services

Port congestions, however, have not been the only gripe of shippers. At the beginning of 2020, as a result of the lockdown in China, many shipping lines announced changes in their liner schedules and services connecting China with other major shipping ports around the world. The primary reason for it was the need to significantly reduce the spread of the highly contagious coronavirus, as well as to bypass congested ports. However, thereafter, ocean carriers started to

restructure their service scheme by efficient ships' capacity management in order to meet declining demand and to avoid freight rates collapse.

Capacity management and reorganization of services took the form of:

1. so called blank sailings (void sailings), that refer to:
   - a sailing bypassing one or more specific ports on the route (while still traversing the rest of the scheduled route), e.g. because of operational inefficiency of congested ports,
   - reduction of the number of vessels on the routes,
   - skipping one particular voyage of one vessel;
2. cancelling or suspending the entire sailing route (loop) for a given period of time, or only outbound or inbound voyages belonging to these routes (e.g. 2M alliance partners Maersk and MSC suspended Asia-Europe AE2/Swan and AE20/Dragon services for the full third quarter of 2020);
3. merging strings from different routes, thereby introducing a new rotation;
4. adjustments of vessels' capacity (e.g. m/v "HMM Algerciras", the world's largest containership, with a capacity of 24,000 TEU, was idled for indefinite period and was substituted by vessels with a capacity of 7,500 – 11,000 TEU on the FE4 loop from Quingdao in China).

From the beginning of the pandemic cancellation of voyages were increasing and reached historic highs during this period. According to data provided by Ocean Insights (2020) the number of blank sailing announcements between mid-March until the end of April 2020 reached as much as 386. In numbers, these cancellations in the trans-Pacific routes amounted to the equivalent of 198,500 TEUs, and to 151,000 TEUs between Europe and Asia. (Moss, 2020)
Regarding the service suspension plans of sea carriers, as they still struggle to match capacity with falling demand, there have been announced 191 blank or suspended services across the world for the months of August and September (Ocean Insights, 2020). Shipowners operating on Asia- Europe liner services intended to void 17% of Asia-Europe capacity during September (Wacket, 2020). Similar plans involve North America routes as well. THEA and 2M alliances alone announced 75 blank services for September.

Overall, the efficient capacity management by ocean carriers yielded better results than it was expected, and, considering the Q2 figures published by container lines, they are, in general, actually more profitable than a year ago, despite decreasing volumes and revenues. It seems, that ocean carriers weathered the crisis relatively well.

Repercussion of the ocean carriers' measures on the PFSC

The research has revealed that measures undertaken by ocean carriers as a response to port congestions, as well as to a falling demand for ocean services had a ripple effect on the entire PFSC management, as disruption in one part of the supply chain causes a bottleneck and will trigger disruption elsewhere (Ivanov et.al., 2019). Although, operations on the main sea terminals have revived to some extent, the knock-on effects are still noticeable.

Freight forwarders and logistics providers are among many parties in supply chains grappling with these logistical disturbances. As their role is to facilitate the movements of goods worldwide, they are generally used to work in uncertain environment. However, this pandemic brought unseen turbulences to their everyday work, and consequently to their customers' businesses, especially those trading the perishable food. Enormous delays in cargo deliveries, constant changes in rates, frequent last-minute cancellations of sailings, a shortage of reefer containers, lack of ships' capacity for perishable cargo were among challenges that had to be answered immediately. The need for exceptional SC management has become more important than ever.

From the beginning of 2020, reefer operations have been dominated by **delays unseen on such a scale**: delays in deliveries to destination ports, delays in getting empty reefer containers back, delays in reception of reefer containers after clearance. In some regions and routes delays have taken as long as 3-4 weeks, and shippers had to wait for FAV (i.e. first available vessel) for weeks. It constituted additional risk to perishable food cold chains, because, as it was mentioned earlier, any increase in transit time can negatively affect the quality of cargo and shorten its shelf life, leading to losses and wastage.

Furthermore, congestions and restrictions on container movements have led to **the refrigerated containers shortage** in particular. It is worth noting, that, regardless of whether there is a pandemic or not, the availability of refrigerated container equipment always remains a challenge due to the highly imbalanced nature of reefer trade routes, as well as because reefers manufacturing does not keep pace with projected cargo demand. Therefore, once the pandemic went global, it was nearly impossible to get reefer containers when and where they were needed. Delays in reefer container collection by importers, as well as liner schedule changes only exacerbate the shortage of reefers. Shippers really struggled to get reefer containers, which was often impossible, and exporters were not able to ship their perishable cargo at all! This have had a huge repercussion on major fruit exporting countries (e.g. Chile, Equador), which need a constant flow of empty reefer boxes, and their shortage have affected a multitude of trade routes.
As mentioned earlier, an increasing number of operational limitations around the world have also triggered ocean schedule changes at a rapid pace. Given the high likelihood of changes, **maritime PFSC planning has become virtually impossible in mid-terms and long-terms** in some directions, as majority of sea carriers decided to limit booking approvals to only several weeks out, as for longer terms they were not able to provide reliable, accurate vessel outlook. For shippers it has become increasingly difficult to keep up with carrier scheduling changes. The chaos has been exacerbated by **a lot of inefficiencies in communications systems** among carriers, ports, terminals, and shippers. Interviewed freight forwarders have complained about insufficient, inconsistent and non-coherent information, as well as different and changing means of communication, even among the alliance partners. They also pointed out confusions over whether a service was blanked or suspended, and over sometimes different information, that came from alliance partners as to when a loop would be reactivated. Moreover, they indicated the lack of uniform patterns in cancellations between the alliances, that only added uncertainty to PFSC planning.

Another, but probably the most acute repercussion for PFCS managers has been **the lack of capacity of containerships for perishable cargo**, as ocean lines continue to suspend their loops as there is no sufficient quantity of cargo to utilize the capacity of the existing fleet. However, having in mind, that on every ship there is only some limited space (TEU electric plugs) for reefer containers, shippers of this kind of cargo are facing the problem of moving it forward to the place of destination. Moreover, as mentioned earlier, shipping lines have also responded to the lower trade volumes, not only by changing schedules, but also by **replacing large volume vessels, e.g. with a capacity of 24,000 TEU, with smaller ones of capacity from 5,000 - 11,000 TEU**. This practice had an adverse effect on the PFSC management, as there was too little space for reefer containers and shippers faced difficulties with ensuring enough capacity for their perishable cargoes.

In the light of a severe capacity crisis, a shortage of reefers, and uncertainties in scheduling, shippers were forced to **search for alternative ways to ship perishable goods**. Some highly skilled freight forwarders managed to ensure perishable cargo shipments by chartering vessel for a voyage(s) between specific ports or for a given period of time. In other words, they returned to conventional, dedicated reefer ships – with containers on deck and pallets in the hold – that were neglected in the recent years. Being a charterer means, that shippers can dictate loading and discharge schedules and no longer need to rely on ocean container services, so they can completely safeguard their shipments. Consequently, while container lines continue to see large downfalls in demand resulting from the pandemic, traditional reefer ships are seeing an uptick in business. (Whelan, 2020) Ripples from the global pandemic helped specialized reefer sector make a comeback. (Sowinski, 2020) Probably, this trend will continue, and some interviewees expressed the opinion that it is highly probable that cancelation of routes will be the rule, as keeping the vessels capacity below demand allows ocean carriers to keep freight rates high and thereby remain profitable, notwithstanding the repercussion on the global PFSCs.

All these disturbances involve **additional costs** for shippers and cargo owners and could be finally pass on to the final customer. Thus, firstly, the costs of delays: containers were off loaded in an alternate location (even in a different country) or waited for reception by a cargo owner in various ports, which incurred additional expenses to shipper e.g. port storage, demurrage[iv] and plugging, that can at times accrue up to 20 times the value of the container itself. Therefore, some countries (e.g. the Indian government) decided to obligatorily waive all extra charges such as demurrage or detention and this measure was a real relief for cargo owners (OECD, 2020b). Secondly, unexpected costs resulting from congestion surcharges and rising freight rates on some routes, that were not driven by economic situation, but by organizational issues. While it is not unusual for shippers, that the freight rates change on a regular basis, the magnitude of these changes was sometimes shocking (on some Europe-Asia routes from 40 to 60 percent).

Conclusions

The level of disruptions in global supply chains caused by the COVID-19 pandemic was not heterogenous, and, generally, the greater the role of a country in a maritime trade, the more noticeable and severe was the impact on supply chains. It is worth pinpointing, that the Asia Pacific countries, mainly China, are a case in point. And although maritime transport operations revived to some extent, the knock-on effects are still noticeable.

Overall, the ripple effects of the pandemic have been more pronounced for perishable food logistics than those for dry cargo. Rapidly changing shipping schedules, a shortage of reefer containers, a lack of capacity of containerships for perishable reefer cargo, have made the PFSC management increasingly difficult for all stakeholders, especially for cargo owners, freight forwarders and logistics operators. Moreover, it has had a huge repercussion on major fruit and meat exporting countries. In turn, as noticed by OECD (2020a), it has had flow-on effects for the price of cargo, including food products. Unfortunately, the regrettable consequence of PFSC disruptions are huge perishable food cargo losses and food wastage along the entire supply chain. A lot of cargo in reefer containers lost its market value or were unsuitable for human consumption, therefore an avalanche of insurance claims may be expected and as well as an increase of insurance premiums in the near future.

The current events associated with the coronavirus pandemic has also highlighted certain limitations in the containerised trade of refrigerated goods. It should prompt the PFSC managers to rethink if it is reasonable to rely only on ocean lines reefer services and to consider diversifying modes of reefer transport by utilizing specialized, dedicated reefer fleet, which proved to be reliable at this volatile time.

Moreover, the pandemic has demonstrated the need for exceptional management and contingency planning in the PFSC. Cargo owners and freight forwarders should take steps to minimize risk in everyday operation during the existing pandemic, especially resulting from schedule changes and reefer container shortage. The crisis has also revealed a lot of inefficiencies in communications systems. The ability to provide real-time information to others in the supply chain has become paramount, as awareness of arrival times and container availability are more important now than ever.

Abstract

The article presents a research problem considered in the context of the analysis and selection of optimisation algorithms which are used to solve the tasks of assigning vehicles to transport orders and measuring their economic efficiency. Two optimisation algorithms were compared and used for the present analysis. The first was the Hungarian algorithm, which is a classic transport algorithm, used in most TMS systems, that is, in the Transportation Management System, the second was an original algorithm, based on heuristic methods and implemented in some selected transport companies under the name: the Improvement Algorithm.

Keywords: Allocation Issue, Heuristic Method, Algorithm, Economic Efficiency

Introduction

In economics and business practice, there are many methods with which to measure economic efficiency; these methods depend on what has been assumed as an effect and what has been assumed as an expenditure. Usually they express the ratio of the effects obtained, in such as production, added value, national income, profit, etc.,) to the expenditure incurred *vis-à-vis* employment, fixed assets, investments, raw materials and materials consumed and energy and fuel, etc. On this basis, it is possible to examine, analyse and draw the conclusions necessary for conducting economic policy and enterprise management. In theory, economic efficiency should ensure maximising the effects of given inputs and minimising the inputs of given effects. The basic efficiency relations are work efficiency, the productivity of fixed assets and the effectiveness of investment, where their growth and the reduction of material and energy consumption, taken up in production and services, are expected (Lenort et al 2019, Szajna et al., 2018).

The concept of economic efficiency in transport processes is a very important factor in logistics (Chamier-Gliszczyński and Staniuk, 2018) and supply chain management, as much for a single enterprise as it is for the entire sustainability of a development. In the literature on the subject one can find more and more complex, differentiated and complicated methods of examining the economic efficiency of transport processes, which further hinders analysis of this issue. These difficulties are related to the ambiguity in assessing the effectiveness of the transport processes examined and, in particular, in measuring the costs incurred (Chamier-Gliszczyński, 2016). In the context of the national and global economy, cost reduction is a very current topic. However, it is worth considering how the problem of costs is solved in enterprises carrying out transport orders in the field of road transport. Bearing in mind the fact that the basic assumption in transport should be an increase in economic efficiency and then maintaining it at a set, acceptable level, it is difficult to relate this to the *dynamics of change* in transport orders, *vis-à-vis* supply and demand and the irregularity and unpredictability of transport orders for various geographical locations! Electronic exchanges and transport platforms support the problems identified, so that the goals are achieved of increasing revenues and reducing "*empty*" journeys, *so-called,* or at least partially covering travel costs until the start of the next transport order planned. As the name implies, the general concept

of an exchange is related to the conscious trade of transport orders between service providers and service recipients. However, the values of these services (*contracts listed on the exchange*) do not represent the actual costs of carrying them out. Even if there is no information about how to get to the place where the transport order starts, the current costs of obtaining it, i.e. *by purchasing it on the transport exchange*, or the invisible costs of ecology and the problems of sustainable development are prohibitive presented by Ambroziak et al (2014). Research showed that the strength of the relationship between transport infrastructure and freight transport performance differ in various circumstances therefore it is also worth considering such aspects, Gnap et al. (2019). Hence, economic efficiency in road freight transport services can be assessed through the selection of methods that enable quick decision-making when obtaining transport orders from electronic exchanges (one-off transport orders) and/or transport platforms (obtaining transport orders for the entire transport fleet submitted). Developing of such solutions is of high importance, especially that development of services is based on the knowledge of employees working with mentioned methods (Marczewska, 2016).

In turn, such methods should strive to determine the best- or, at least, the most acceptable- solutions for the transport company analysed, in terms of economic efficiency (Ambroziak, 2015).

Identification and Complexity of The Process of Obtaining Orders from Transport Exchanges

Obtaining transport orders from transport exchanges is a complex process and relies on the ability to observe and analyse quickly, taking into account the multiple criteria for purchasing them. By doing such activities for a single means of transport, the freight forwarder can buy an order that is optimal for one or even several criteria without much of a problem. The work of the forwarder, however, is very different since he/she must obtain several or even several dozen transports offers for transport means which could be available at any given moment and then optimise those offers according to the criterion adopted; then and only then, may the forwarder carry out the purchase procedure.

Despite the wide range of activities that the forwarder carries out in his/her position, the criterion for assessing his/her work by the owner of a transport company boils down to an analysis of the economic effectiveness of the orders commissioned and introduced into the planning which was purchased on the transport exchange. On the other hand, the economic efficiency of the order is essentially affected by the full cost of its execution, in particular the forwarder's working time, in terms of indirect costs and in reaching the loading bays, in terms of direct costs. In practice, it is rare to find a loading bay, to load up a new transport order, in the very same place where it had previously been unloaded, without carefully following the freight exchange and sending hundreds of enquiries to bidders.

It is also difficult, even impossible, for competing companies which use the services of a freight exchange at a given moment, to define uniform costs for completing an order. Hence, the important function of the forwarder, who is, in many cases – the owner of a small transport company, consists in the ability to quickly assess the economic efficiency of transport orders, presented on transport exchanges and, simultaneously, also assess the possibility of taking those orders on, from the perspective of his/her own transport company. In addition, this assessment is associated with the analysis of parameters such as: loading regions (industrialised regions of Europe guarantee the transport of more volumes, which means that the likelihood of finding further loads is very high); route length (the longer the transport route, the higher the price and the lower the travel costs); deadlines (a short deadline is, in most cases, a determining factor when it comes to increasing the price for the customer; and price (the ability to estimate the cost of travel to the loading-up area and the cost of travel to the place of unloading, in support of the calculation of the order), etc. In practice, the freight forwarder's experience largely relates to the ability to quickly locate available transport resources on a digital map and to then estimate the costs of carrying out the transport orders issued or observed on transport exchanges.

Methods Supporting Quick Decision Making in The Obtainment of Transport Orders from An Electronic Transport Exchange

An important factor to be taken into account when making the correct decisions regarding the economic efficiency of transport orders acquired, are the results of analyses, supported by computer calculations, and implemented on the basis of accepted models resulting from observations of the situation on the transport market. The constant development of programming methods and computer technology, conditions the increase in computing potential, resulting in an increase in the possibility of using computer-aided decision-making.

Both of the methods for planning specific transport routes, as well as for making decisions in the field of obtaining transport orders from electronic transport exchanges, focus on solving the transport issue – *using transport tasks interchangeably*- where the key is to explore the issue of assignment and the '*travelling salesman problem'*, *so-called*. In this regard, classic and modern methods can be distinguished. Classic methods, which are also exact methods, allow the best differential and continuous functions to be calculated. The limited practical application of these analytical methods comes as a result of the complications which occur when solving non-differential or non-linear equations. Classic planning methods are used, *inter alia*, for tasks with many variables or one function, both with and without restrictions. Hungarian or Little's, classic planning method algorithms can be distinguished, along with those of Dijkstra and Simpleks. The second group of methods, known as modern or approximate, uses heuristic algorithms that look for the best solution within a group of solutions available, but do not guarantee finding the optimal solution. Thus, the general use of heuristic algorithms is to improve the efficiency of solving complex problems. This group of methods uses, among other methods, genetic algorithms, ant or neural networks, modelling transport system as in Chamier-Gliszczyński (2013) and simulation modelling of road transport distribution network as in Kostrzewski (2017), Kostrzewski and Grzybowska (2016) and modelling transport system.

The article presents and compares two methods supported by the Hungarian algorithm and the proprietary "improvement" algorithm, respectively. The purpose of the comparison was to determine economic efficiency as the time it takes to allocate transport orders, *obtained from electronic transport exchanges*, to available resources. Economic efficiency was measured by the cost of the execution of the transport order and was expected to be minimised with the assumption of full coverage, *or allocation*, of all available resources, *or transport means,* for transport orders obtained from available exchanges.

In addition, both algorithms were compared with respect to the quality of the result, that is, the obtaining of the best result, although in the case of the "Improvement" algorithm, only an acceptable solution was expected. The Hungarian and "Improvement" algorithms had already been compared in articles by Woźniak et al. (2015) in terms of time complexity and then, the "Improvement" algorithm showed a much higher efficiency and time to obtain the result.

The Hungarian algorithm and its application in solving transport issues

One of the most common algorithms used to plan routes and solve the problem of allocation is the Hungarian algorithm**,** in other words, the Hungarian method. It allows 'n' transport tasks to be assigned to 'n' transport modes. On the basis of the above, a matrix with 'n' *x* 'n' dimensions is created, in which, for example, a cost, time or other characteristic parameter is assigned to the means of transport during the implementation of a given transport task. The Hungarian method can be divided into three steps.

Step I is to strive to obtain zero in each column and row of the matrix. The lowest value of the assigned, or analysed, parameter found in the matrix is subtracted from each row; if these actions do not bring the expected result, an analogous subtraction follows, but this time in relation to the columns.

Step II consists in deleting the smallest possible number of lines from all columns and rows containing zero elements. If the number of lines necessary to delete all the zeros is equal to the dimension of the matrix, the result obtained is optimal and the transport tasks are assigned to that means of transport.

Step III. If the number of lines is lower than the dimension of the matrix, the minimum is determined among the undefined elements. This minimum is subtracted from the remaining, unspecified elements and added to the elements lying at the intersections of the lines. Elements that have only been deleted with one line, remain unchanged. One then returns to Step II**.** In the above method, there may be a situation in which it is impossible to clearly indicate the optimal solution. In this case, the selection should be made intuitively.

In mathematical terms, the algorithm described solves the problem of optimal allocation or the problem of set covering.

In the implementation of transport orders, the use of the above algorithm is used to minimise the selected parameters, which include the cost of the transport order, the travelling "*empty*" to the loading place, the length of time taken to complete transport orders and so on. Transport industry problems mean that the issue of getting the means of transport to the best places is much more complicated and leads to the creation and analysis of much more complex mathematical models, especially when considering the dynamics of changes in transport orders on the transport exchange. The complexity of the issue, and especially the changing restrictions which are often

difficult to define, create the problem of the multi-dimensionality of the relationship: the order, the driver and the vehicle as a function of time and were already explained by Kostrzewski and Likos (2019), Trojanowski (2015), Kozieł (2014), Jacyna et al (2018), Jacyna (2014), Pisz et al (2016). The Hungarian algorithm is able to solve very complex tasks and it is complete. However, the waiting time for the result limits its efficiency.
The idea of this heuristic algorithm is to determine the best initial result, known as the *base solution*. In the next steps, *as in the in-depth search algorithm*, the base solution is expected to be improved. The algorithm finishes its operation as soon as the result shows no improvement in the following step. The mathematical model of the "*improvement*" algorithm is presented below

Mathematical model of the "*improvement*" algorithm:

Algorithm A: Determining the initial base solution
Step 1: Based on the cost matrix C = $[c_{ij}]$,
specify the set of order indices J = {1,2, ..., n}.
Step 2: For each vehicle Pi, $_i$=1,2, ..., m, perform
(a) For the Pi vehicle, assign the order Z_k for which the transport cost is

$$Cik=\min_{j \in J} Cij \quad (1)$$

(b) J=J\{k} (2)

Step 3: Calculate the transport cost *Kb* for the base solution

Algorithm B: Find the minimum base solution
Step 1: Find the initial base solution with the transport cost *Kb*
Step 2: If there is a *Zl* order with a *lower* cost for the Pi vehicle than in the base solution, then:
(a) Assign a Zl order for the *Pi* vehicle, while selecting the order with the lowest possible cost for the vehicle that has the Zl order assigned in the base solution
(b) Calculate the transport cost *Kl*
(c) If $Kl<K$, set the solution obtained as the base solution with the transport cost $Kb=Kli$, and return to Step 2.

The mathematical model of the developed "improvement" algorithm is broadly described and supported by an example in the next chapter.

A comparison of Hungarian and "Improvemment" algorhithms vis-à-vis economic efficiency – case study

The comparison of the "*improvement*" algorithm with the Hungarian algorithm in the aspect of analysing the economic efficiency of orders obtained from electronic transport exchanges was presented on the basis of the following case study. The example under consideration is based on a situation reflecting the work of a forwarder who searches transport exchanges and analyses transport orders that, in terms of economic efficiency, will be acceptable for implementation in the transport company serviced. Due to the problem of the selection of orders for available means of transport, the principle was adopted that there is an excess of them in relation to vehicles. Therefore, not all orders will ultimately be assigned to the vehicles. It is expected that the decision to choose orders will be supported by mathematical calculations determining the optimal or acceptable solution due to their short availability on the stock exchange. In the case studied, based on the same data, it was limited to determining the solution through the "*improvement*" algorithm due to its presentation and understanding. In the case of the Hungarian algorithm, it was limited to providing only a relation of orders with means of transport and the result of optimal costs in contractual units.
The improvement algorithm is presented as follows, according to the mathematical model previously written:
1. A relationship matrix was built, in which a column number indicates the order that can be obtained from the exchange and a row number, indicating the means of transport available for deployment, while the cell values present the costs of the orders being carried out by vehicles, as presented in contractual units. The matrix is three-dimensional, because in each cell an additional priority is set, namely, the lowest number – in brackets- meaning the highest priority or the highest economic efficiency of the lowest cost of the order, being carried out by the vehicle (Table 1).

Table 1: The cost matrix of orders that can be carried out by the available means of transport – an example

Orders/ Vehicles	Z1	Z2	Z3	Z4	Z5
P1	100 (2)	150 (2)	50 (1)	300 (2)	250 (2)
P2	50 (1)	200 (3)	100 (2)	250 (3)	250 (3)
P3	200 (3)	120 (1)	150 (3)	200 (1)	200 (1)
P4	250 (4)	300 (4)	200 (4)	400 (4)	500 (4)

2. It was then checked whether each vehicle was assigned the first (best) order in the sorted matrix (Table 2)

Table 2. The cost matrix of orders sorted, by priority, to available means of transport – an example

Vehicles/ Priority	P1	P2	P3	P4
(1)	Z3 50	Z1 50	Z2 120	Z3 200
(2)	Z1 100	Z3 100	Z3 150	Z1 250
(3)	Z2 150	Z2 200	Z1 200	Z2 300
(4)	Z5 250	Z4 250	Z4 200	Z4 400
(5)	Z4 300	Z5 200	Z5 200	Z5 500

3. In the next step, the base solution was determined (Table 3), i.e. from the first to the last vehicle, the first (best) order from the sorted matrix that was not selected before (i.e. selected by another vehicle) was assigned. The same colours indicate the conflict of priorities in the allocation of orders to vehicles with yellow indicating the only possible solution in this configuration for assigning orders to a P4 vehicle. Therefore, this allocation is treated as a base solution.

Table 3: Matrix of costs for orders sorted and allocated according to available means of transport

P1	P2	P3	P4
Z3 50 (1)	Z1 50 (1)	Z2 120 (1)	Z4 400 (4)
Z1 100 (2)	Z3 100 (2)	Z3 150 (2)	Z3 200 (1)
Z2 150 (3)	Z2 200 (3)	Z1 200 (3)	Z1 250 (2)
Z5 250 (4)	Z4 250 (4)	Z4 200 (4)	Z2 300 (3)
Z4 300 (5)	Z5 200 (5)	Z5 200 (50	Z5 500 (5)

4. In the next step, it was checked which vehicle was assigned the best order and then it was checked whether a better result than before would be obtained. If there is an improvement, the orders remain. If not, the next order that is before the given order in the matrix, is checked. If there is even one change, the loop starts working from the beginning.

The whole process was presented using bipartite graphs. Figure 1 indicates the base solution for which economic efficiency is 620 contractual units (the sum of: P1Z3, P2Z1, P3Z3, P4Z4). The symbols and captions contained in the drawings are consistent with the mathematical model previously presented. In turn, the base cost and transport cost are determined on the basis of data from Table 1 in the contractual units accepted.

Fig.1 Bipartite graph of transport costs for the initial base solution with the cost of Kb = 620 (step 1, algorithm A). Orders with a lower cost for a P4 vehicle are marked in red, in ascending order, according to previously assigned priorities / according to index k = 1,2,3.

Fig.2 Bipartite graph of transport costs when assigning a Z3 order to a P4 vehicle (k = 1) with a cost of Kl= 620> =Kb (step 2a, 2b, B algorithm). Orders with a lower cost for a P1 vehicle are highlighted in green.

Fig.3 Bipartite graph of transport costs when assigning a Z1 order to a P4 vehicle (k = 2) with a cost of Kl= 670> =Kb (step 2a, 2b, B algorithm). Orders with a lower cost for a P2 vehicle are highlighted in green.

Fig.4 Bipartite graph of transport costs when assigning a Z2 order to a P4 vehicle (k = 3) with a cost of Kl = 600 <Kb (step 2a, 2b, algorithm B). Orders with a lower cost for a P3 vehicle are highlighted in green.

Fig.5 Bipartite graph of transport costs for a new base solution with a cost of Kb = 600 (step 2c, algorithm B). Orders with a lower cost for a P3 vehicle are marked in red in ascending order according to the index k = 1,2,3.

Fig.6 Bipartite graph of transport costs when assigning a Z2 order to a P3 vehicle (k = 1) with a cost of Kl= 620> =Kb (step 2a, 2b, B algorithm). Orders with a lower cost for a P4 vehicle are highlighted in green.

Fig.7 Bipartite graph of transport costs when assigning a Z3 order to a P3 vehicle (k = 2) with a cost of Kl= 650> =Kb (step 2a, 2b, B algorithm). Orders with a lower cost for a P1 vehicle are highlighted in green.

Fig.8 Bipartite graph of transport costs when assigning a Z1 order to a P3 vehicle (k = 3) with a cost of Kl = 800 <Kb (step 2a, 2b, algorithm B). Orders with a lower cost for a P2 vehicle are highlighted in green.

As can be seen from the calculations presented through bipartite graphs, the base result at the beginning of the assignment of orders to vehicles was 620 contractual units (P1Z3, P2Z1, P3Z2, P4Z4). By improving the result with the method described above, economic efficiency was obtained at the level of 600 contractual units as a consequence (P1Z3, P2Z1, P3Z4, P4Z2). For P1 and P2 vehicles, the orders assigned in the first step remained unchanged. Only the order allocation for P3 and P4 vehicles changed. On the other hand, by using the Hungarian algorithm, representing the exact optimisation method, a result of 600 contractual units was also obtained, but in a different allocation system: P1Z2, P2Z1, P3Z5, P4Z3.

Summary

In most cases, the Hungarian algorithm solves the transport issue and returns the optimal result in terms of economic efficiency adopted for the analysis of transport orders. However, as previous and current research has

shown, the time to obtain a result increases in a polynomial way, due to the construction of the algorithm itself. This, in turn, limits the ability to calculate and make decisions to obtain transport orders from electronic transport exchanges. In the case of solving a transport problem, the aim of which is to increase or maintain a constant level of economic efficiency with dynamically changing offers of transport orders, its incompleteness may lead to loops. Then, even with very simple matrices, the algorithm will not be able to assign data and will be interrupted, without returning any result at all.

In the case of the "improvement" algorithm, calculation of the economic efficiency of the transport orders analysed on electronic transport exchanges strongly depends on the initial solution. The better solution we get at the beginning, the faster the algorithm will end its activity. Due to the use of heuristic methods, the "improvement" algorithm does not guarantee that the optimal solution will be found and strongly depends on the forwarder's experience. However, in the case of the acquisition and analysis of a significant number of transport orders, the "improvement" algorithm can be a very good tool for making decisions and calculating the economic effectiveness of the orders observed on the transport exchange or for verifying decisions made by the forwarder.

The Impact of Foreign Direct Investment on Comparative Advantages in Foreign Trade – The Case of The CEE Countries

Katarzyna TWAROWSKA

Maria Curie-Skłodowska University, Lublin, Poland, k.twarowska@umcs.pl

Małgorzata TWAROWSKA-RATAJCZAK

Maria Curie-Skłodowska University, Lublin, Poland, k.twarowska@umcs.pl

Abstract

The aim of the paper is an assessment of the impact of foreign direct investments (FDI) on the achievement by the Central and Eastern European (CEE) countries the revealed comparative advantages in exports. The panel regression analysis with random effects are used, which allow to examine the relation between the FDI inflow to particular industries and the having the revealed comparative advantage (RCA) in these industries. The analysis covers the period 2005-2015. The analyzed CEE countries are: Poland, Hungary, the Czech Republic, Lithuania, Latvia, Estonia, Slovenia, Slovakia. The analysis indicates that in the CEE countries FDI inflow was a significant factor influencing the export competitiveness measured by the RCA index. Furthermore, in the CEE countries the inflow of FDI in the manufacturing sector was relatively high and with economic development the importance of FDI inflow to the service sector increased. The structure of FDI inflow to the service sector is dominated by financial services. In industries with high FDI inflows, the improvement in RCA rates is noticeable. A new value of the analysis is the study of both the inflow of FDI and the achievement of comparative advantages at the level of industries. In addition, a particularly innovative analysis is for the service sector, which receives a significant part of FDI.

Keywords: Foreign Direct Investment, Exports, Comparative Advantage, Central And Eastern Europe

JEL classification: F10, F14, F15, F17

Introduction

Foreign direct investment (FDI) is one of the factors supporting structural change and economic development. They directly contribute to the growth of investments in fixed capital, increase the employment rate, technology transfer, as well as increasing the value and dynamics of exports and improving its structure. Eventually, these factors affect economic growth. Observed dependencies between FDI inflow and export are a premise for undertaking an empirical analysis, the aim of which is an assessment of the impact of foreign direct investments on the achievement by the Central and Eastern European (CEE) countries the revealed comparative advantages in exports of goods and services. In order to achieve such a goal, the following hypotheses have been adopted for verification:

1) The inflow of foreign direct investment to CEE countries increases the export potential of these countries.
2) FDI inflows contribute to the achievement of revealed comparative advantages in industries where foreign capital is invested.
3) In the CEE countries the inflow of FDI to innovative industries is significant, which improves the technological advancement of exports of these countries.

A new value of the analysis is the study of both the inflow of FDI and the achievement of comparative advantages not at the level of entire national economies, but at the level of industries. In addition, a particularly innovative and valuable analysis is for the service sector, which receives a significant part of FDI. In 2017 average in CEE countries 70% of total FDI stock was in service sector (OECD 2019). Another pioneering feature of the analysis is the value-added export survey, which allows to assess the real impact of FDI on the production and export potential of the economy, since goods and services that have previously been imported from another country are eliminated.

Theoretical background and literature review: linkages between FDI inflow, economic growth and trade

The rich world literature provides many theoretical and empirical studies on the impact of foreign direct investment on host country's exports. Studies concern the impact of FDI on the export volume and export potential of countries,

Cite this Article as: Katarzyna TWAROWSKA and Małgorzata TWAROWSKA-RATAJCZAK" The Impact of Foreign Direct Investment on Comparative Advantages in Foreign Trade – The Case of The CEE Countries" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

changes in the export structure and its competitiveness, but also on the technological advancement of the host country, which also affects exports. There are also more comprehensive studies that focus on the impact of FDI on economic growth, but usually include the trade channel.

T. Ozawa (1992, 27-54) formulated the basic assumptions of the theory explaining the influence of foreign direct investments on the economic development. He was interested in the changes taking place in the structure of the foreign direct investment inflow in transition economies. According to the Ozawa's concept, at lower levels of economic development, the inflow of FDI is invested primarily in labour-intensive sectors, and the basic motive for investment is access to the cheap labour force. With the increase in physical asset and specialisation in skilled labour-intensive industries, market factors related to the economic potential of the host country are becoming increasingly important. Whereas, in the last phase the role of human capital is growing and indexes of the revealed comparative advantage are improving in technology-intensive sectors.

Moreover, E. Akalper and H. Adil have studied the relationship between FDI and economic growth. The main conclusions of their analysis are as follows:

- the absence of a long-run relationship or causality that runs from gross savings, foreign direct investment, trade and gross fixed capital formation,
- negative associations between GDP and gross savings as well as FDI and international trade,
- positive relations between gross fixed capital accumulation and economic growth.

A. Cieślik and M. Tarsalewska (2008, p. 1 - 13) studied the relationship between international trade, foreign direct investment and economic growth using the open economy version of the expanding product variety growth model for the CEE countries. They demonstrated that both international trade and foreign direct investment lead to the increase in the level of per capita income in the long run and affect the speed of convergence. The estimation results show that both trade and FDI are positively related to economic growth in the CEE countries, although the significance of these variables crucially depends on the employed estimation method.

B. Mucha-Leszko and K. Twarowska (2018, 1054-1067) analyzing the role of investment as a determinant of the sustained economic growth in the European Union after crisis 2008-2009, noticed that investment, TFP and labour productivity growth are key prerequisites for closing the economic gap in new EU member states. In the years preceding the crisis, the inflow of foreign direct investment and access to low-interest loans contributed to high economic growth rates in the Baltic states (Lithuania, Latvia and Estonia), Romania and Bulgaria. FDI also caused growth of TFP, labour productivity and exports. But in the second half of 2008, when the financial crisis began, the Baltic states have suffered the greatest losses in GDP. The crisis increased the risk and led to withdrawal of foreign investors, which took place mainly in Estonia, Latvia, Lithuania and Romania (European Central Bank 2010, 87-88).

A popular issue for research is the impact of FDI on exports, including export potential, changes in the structure of exports and their competitiveness. OECD experts (Fontagne 1999, 7-12) have developed many analytical works in order to explore the nature of these links in quantitative terms. These empirical works revealed the complexity of these links but, at the same time, showed the main and positive influence of foreign direct investment on international trade particularly after the mid–1980s. The results of the research carried out by L. Fontagne (1999, 23-24) show that foreign direct investment abroad stimulates the growth of exports from countries of origin and consequently this investment is complementary to trade. W. Zysk and S. Śmiech (2014, 7-18) analysed the influence of FDI on foreign trade in the Visegrad Countries from 2001 to 2011 using the linear gravity model. They confirmed the hypothesis that FDI makes a significant impact on Visegrad Countries' foreign trade.

P. Folfas (2018, 22-26) focused his research on the impact of FDI on structural changes in exports and was searching for an answer to the question whether FDI inflows to Poland affect branch structure of Polish exports (gross and value-added exports). The results of his research covering the years 1996-2011 indicated that FDI inflows do not influence on the branch structure of Polish exports. Only in case of value-added exports there were weakly statistically significant dependencies. He also presented a rich literature review grouped into two categories: 1) studies answering the question whether international trade and FDI are substitutable or complementary to each other, and 2) studies containing research on the impact of FDI inflows on host country exports.

S. Jaksic, N. Erjavec and B. Cota (2018, 835-849) investigated the role of foreign direct investments (FDI) and labour productivity in describing export dynamics for the period from 2004 to 2015. The results of the estimated panel models confirmed the importance of strengthening manufacturing as well as strong comovements of exports and imports as a consequence of the internalization of product chains. Ł. Ambroziak (2016, 23-42) investigated the extent to which foreign direct investment (FDI) influenced intra-industry trade (IIT) in automotive products in six New EU Member States (NMS: the Czech Republic, Hungary, Poland, Romania, Slovakia and Slovenia) in the 1995-2014

period. He confermed that FDI inflow to the automotive sector of the NMS has been a key factor shaping IIT in automotive products.

Furthermore, the impact of FDI on the technological advancement of developing and developed countries, on the example of China and Japan, was studied by C. Liu, X. Zhang, and T. Tamamine (2019, 536-545). They confirmed the occurrence of the following phenomena:

- the influence of technology spillover of inward foreign direct investment (IFDI) and outward foreign direct investment (OFDI) on improvement of a country's technological innovation level,
- the weaker one-way causality intensity of inward FDI to technological innovation in China than that in Japan,
- the stronger FDI volatility in China than that in Japan,
- the low one-way causality intensity of outward FDI to technological innovation both in China and Japan, and not identical patterns of long-term and short-term effects.

The subject of the research of T. Białowąs and M. Wojtas (2014, 31-40) was the role of foreign value added in creating Poland's comparative advantage in world's merchandise exports. They analysed the development of comparative advantage using the Balassa index calculated on the basis of the traditional method (gross export) as well as the alternative method (national value added). The application of such an approach to analysing exports has revealed a significant increase in the importance of foreign value added.

The presented studies indicate that the relationship between FDI, export volume and its competitiveness, technological advancement of the host country and its economic development are not straightforward and the same across all countries, although many analyses confirm the significant positive impact of FDI on the indicated fields.

In the further part of the paper, the author, inspired by the conclusions of T. Ozawa and other scientists, will attempt to assess the impact of FDI on the competitiveness of exports of Central and Eastern Europe developing countries that have undergone transformation.

Data and Methods

An analysis of the relationship between FDI inflows and export competitiveness was conducted for eight developing countries in Central and Eastern Europe. These countries are: Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Slovakia, Slovenia. The analysis was carried out at the level of 17 industries divided into 3 sectors: primary sector, manufacturing, business sector services, which are presented in Table 1. The following industries have been considered as technologically advanced within business sector services: information and communication (15), financial and insurance activities (16) and within manufacturing: computers, electronic and electrical equipment (8), chemicals and non-metallic mineral products (6) and transport equipment (9).

Table 1: The classification of sectors and industries

Sector	No.	Industry
Primary sector	1	Agriculture, forestry and fishing
	2	Mining and quarrying
Manufacturing	3	Food products, beverages and tobacco
	4	Textiles, wearing apparel, leather and related products
	5	Wood and paper products; printing
	6	Chemicals and non-metallic mineral products
	7	Basic metals and fabricated metal products
	8	Computers, electronic and electrical equipment
	9	Transport equipment
	10	Electricity, gas, water supply, sewerage, waste and remediation services
	11	Construction
Business sector services	12	Wholesale and retail trade; repair of motor vehicles
	13	Transportation and storage
	14	Accommodation and food services
	15	Information and communication
	16	Financial and insurance activities
	17	Real estate activities

Source: own compilation based on (OECD 2019).

Exports are analysed on the basis of trade in value - added (TiVA) (OECD 2012, compare: Ceglowski 2017, 275-296). For the assessment of export competitiveness, the Balassa index of revealed comparative advantages (RCA) was used (more about the advantages and disadvantages of using the RCA index you can find in: Laurse 2015, 99-115). RCA index (Balassa 1965) is calculated according to the formula:

$RCA_j^A = \frac{s_j^A}{s_j^R}$, where

RCA_j^A – index of revealed comparative advantage of country A

s_j^A – share of j - product group (industry) in exports of country A

s_j^R - share of j - product group (industry) in exports of the reference group R

The reference group consists of the European Union member states (28). The index ranges from 0 to infinity. Values between 0 and 1 mean that in a given product group/industry country A does not have a revealed comparative advantage relative to the reference group. Values greater than 1 indicate that country A has a revealed comparative advantage for that product group/industry.

In order to verify the formulated hypotheses, empirical studies have been carried out, including a descriptive comparative analysis of statistical data (point 4) and panel regression analysis (point 5). In the first step of the panel regression analysis, the model was built using the generalised method of the least squares, and then, using the Breusch-Pagan test, the hypothesis of the existence of individual effects was verified. The Breuscha-Pagana test has shown the validity of introducing individual effects, which may have two types: fixed effect or random effect, so panel regression analysis with fixed and random effects was used. In the next stage, the Hausman test was used to select the model. The Hausman test showed that a model with fixed effects was better.

Therefore, panel regression analysis with fixed effects using least squares dummy variables method (LSDV) has been applied, which allowed to examine the relation between the FDI inflow to particular industries of the economy and the having the revealed comparative advantage (RCA) in these industries. To test how FDI inflow influences comparative advantages in export, the analysed equation for the model of panel data has taken the following form:

$RCA_{i,t} = \alpha + \beta * FDI_{i,t} + \varepsilon$, where:

$RCA_{i,t}$ – explained variable has been defined by having revealed comparative advantages in exports in particular industries, $RCA_{i,t} \in [0, \infty]$,

$FDI_{i,t}$ – vector of explanatory variables [share of particular industry in FDI position - inward]

α, β – estimated coefficients describing the impact of explanatory variables on the explained variable

ε – random.

The data are from the OECD database. The analysis covers the period 2005-2015, which is determined by the availability of statistical data (data for exports in value added is available for 2005-2015 and data for FDI inflows by industry is available for 2005-2017).

An assessment of comparative advantages in foreign trade and the structure of FDI inflow in CEE countries - descriptive comparative analysis

The aim of this part of the paper is to identify the structure of the FDI inflow (by sectors and industries) and to assess in which industries countries have a revealed comparative advantage. Changes in the structure of FDI inflows over time will also be analysed.

Table 2: Structure of FDI inflows to CEE countries by industry (in %, average 2005-2017)

Countries/Sectors	Primary sector (1+2)	Manufacturing (3+4+5+6+7+8+9+10+11)	Business sector services (12+13+14+15+16+17)
Czech Republic	2,3	28,8	47,7
Estonia	2,0	16,0	66,9
Hungary	0,9	25,3	40,0
Latvia	3,5	17,0	61,1
Lithuania	1,9	22,0	63,1
Poland	0,7	30,5	50,8
Slovak Republic	1,1	35,2	44,8

Note: the shares do not sum up to 100% due to exclusion of public services and industries classified as other.
Source: own calculations based on (OECD 2019).

In all analysed countries, FDI was focused on the service sector (see tab. 2). The largest amount of FDI was invested in financial and insurance activities (16), wholesale and retail trade, repair of motor vehicles (12) and real estate activities (17) (see tab. 3).

Table 3: Structure of FDI inflow to CEE countries (in %, average for 2005-2017) and changes in the shares of particular industries between 2017 and 2005 (in percentage points)

Source: own calculations based on (OECD 2019).

Some trends in the changes in FDI inflow structure can also be observed in the analysed countries. These changes led to an increase of service sector share (see tab. 3 i tab. 4), with the largest increase in the financial and insurance activities (16) in Czech Republic (8,2 percentage point), Slovak Republic (4,9 pp), Lithuania (3,3 pp) and in real estate activities (17) in Latvia (7,7 pp), Slovenia (4,5 pp) and Estonia (4,0 pp). In the other service sector industries growth was not so strong, and in the information and communication (15) there was a decrease in Hungary, Latvia, Lithuania and Czech Republic. Relatively high increases were also observed in such industries: electricity, gas, water supply, sewerage, waste and remediation services (10) in Slovak Republic (7,6 pp) and Czech Republic (4,3 pp), transport equipment (9) in Hungary (7,3 pp), chemicals and non-metallic mineral products (6) in Hungary (4,5 pp), food products, beverages and tobacco (3) in Slovenia (4,2 pp), wholesale and retail trade, repair of motor vehicles (12) in Estonia (3,7 pp) and construction (11) in Poland (3,3 pp). In all analysed countries, the share of primary sector in the inflow of FDI decreased.

Table 4 presents detailed data on the share of business sector services in the inflow of FDI to CEE countries over the years. In all countries there was an increase in the share of business services, with the exception of Estonia. The largest increase took place in Slovenia, Slovak Republic and Hungary.

Table 4: Shares of business sector services in the inflow of FDI to CEE countries (in %)

Source: own calculations based on (OECD, 2019)

In the analysed period, all countries had revealed comparative advantages in the following industries: agriculture, forestry and fishing (1), electricity, gas, water supply, sewerage, waste and remediation services (10) and construction (11). All countries with the exception of Hungary: wood and paper products, printing (5), all countries except Latvia and Lithuania: computers, electronic and electrical equipment (8) and all other than the Czech Republic and Slovakia: real estate activities (17).

In the most innovative industries (except 8: computers, electronic and electrical equipment and 9: transport equipment), only a few countries had a revealed comparative advantage in exports. In industry 16 (financial and insurance activities) only Latvia, and in industry 15 (information and communication) only Estonia and Latvia had a revealed comparative advantage. Thus, as the analysis of tables 3 and 5 shows, only in a few cases in industries receiving a significant part of FDI, countries had a revealed comparative advantage over the whole analysed period. As theoretical considerations and earlier empirical analyses show (see point 2), it can be assumed that an inflow of FDI will improve competitiveness in the industries where it is concentrated. This assumption can be verified by analysing data from table 6, which presents average RCA indices in the analysed countries at the level of 17 industries in the years 2005-2015.

Table 6: RCA indices by industry in 2005-2015 (average in the analysed countries)

Source: own calculations based on (OECD, 2019)

The indices have improved in industries: 2, 5, 8, 9, 10, 13, 14, 16, of which 8, 9 and 16 can be considered as high-technology industries. There was a lot of FDI inflow to financial and insurance activities (16), which may indicate that the improvement of competitiveness of financial services export took place thanks to foreign capital.

Relationship between FDI inflow and obtaining comparative advantages in exports - panel regression analysis

In order to assess the impact of FDI on export competitiveness panel regression analysis have been carried out. Models with fixed and random effects were tested. The Hausman test showed that a model with fixed effects was better. This means that the fixed effects estimator is unbiased and random effects estimator is biased. Results of estimation for all analysed countries are presented in table 7.

Table 7: Fix effects model describing the impact of FDI inward on export competitiveness (RCA)

**** indicates significance at the 99% level*
Source: own calculations by using Program GRETL, (OECD, 2019)

R^2 is varied among industries and has the highest values in: chemicals and non-metallic mineral products (0.77), computers, electronic and electrical equipment (0.67), agriculture, forestry and fishing (0.64). This means that from 64% to 77% of changes in the RCA index in the industries mentioned above can be explained by the inflow of FDI. The FDI variable is statistically significant at the level of 99% with the exception of the following industries: 2, 10, 11, 12 and 14.

Conclusion

Carried out analysis indicates that in the CEE countries FDI inflow was a significant factor influencing export competitiveness measured by the RCA index. In addition, differences between industries have been found and the greatest impact of FDI has been observed in high-tech sectors.

The inflow of FDI in the manufacturing sector in CEE countries was relatively high, and as the level of economic development increased, the importance of FDI inflow to the service sector increased. This confirms the Ozawa's concept (Ozawa, 1992, 33-40), that at lower levels of economic development, the inflow of FDI is invested primarily in labour-intensive sectors/industries, and with the increase in physical asset and specialisation in skilled labour-intensive industries, market factors related to the economic potential of the host country are becoming increasingly important. Whereas, in the last phase, the inflow of FDI to innovative industries is increasing, which means that the role of human capital is growing and indexes of the revealed comparative advantage are improving in technology-intensive sectors and industries.

In the case of CEE countries, this pattern can be observed in particular in the service sector. The structure of FDI inflow to the service sector is dominated by financial services. In technology-intensive industries with high FDI inflows, the improvement in RCA indices was noticeable. However, due to the characteristics of services, the provision of many services still requires direct contact between a service provider and recipient, and even if it is now possible to provide various services at a distance, in many areas it is the most appropriate way of delivering services to foreign clients, especially in those areas where trust plays an important role, for example in financial services. Therefore, the domination of the service sector in FDI flows is a normal phenomenon, and the definition of trade in services according to the WTO even assumes that it is one of the four modes of service delivery to foreign markets (mode 3 - commercial presence, which accounts for about 50% of all transactions in international trade in services).

However, on the basis of the conducted research it is not possible to conclusively assess that a high inflow of foreign capital results in an improvement of the country's competitive position in international trade. It may have a positive impact, but in some industries it has not been significant.

Discussion: limitations and directions for future research

The applied method of analysis is not free from defects and limitations. It should be noted that obtaining a competitive advantage in exports is influenced by many factors other than the inflow of FDI, some of which are specific to particular industries. The most important factors include: natural environment and availability of raw materials, the quality and cost of labour force, participation in international production chains, the possibility of achieving economies of scale in production, access to technological facilities, the development of global sourcing (outsourcing and offshoring) and the resulting development of trade in intermediates, which significantly intensifies these links etc. Some factors are of a qualitative nature and are difficult to measure. Another aspect that should also be considered is the diversity among countries. Although the analysed CEE countries have many common features, the structure and specificity of their economies differ. Moreover, it should be noted that the period analysed is quite specific as it covers the years of the financial and economic crisis of 2008-2009. Therefore, cyclical factors may have distorted the results. A limitation of the conducted research is also the relatively short period of analysis, which is due to the availability of data at the level of sector/industry.

The results of the analysis and the knowledge of the limitations of the conducted research allow to formulate certain recommendations for the directions of future research. The proposed issues for further analysis are: 1) to compare the results for CEE countries with highly developed countries and Asian developing economies, 2) to consider a longer analysis period, if the availability of data allows, 3) to compare the results of the method used in this paper with other methods. This could lead to interesting conclusions.

Abstract

The aim of the research was to identify problems of Polish-German cross-border cooperation during the COVID-19 pandemic, including those related to the implementation of projects under the Interreg programmes. The research carried out in the article was based on quantitative secondary data, primary information and analysis of available source literature. The research methods used in this paper include: critical analysis of the source literature, the method of secondary data analysis and the method of in-depth interviews.
The purpose of the article is to indicate the degree of implementation of the selected, Polish-German cross-border cooperation Interreg programme, to identify related problems resulting from the COVID-19 pandemic and to assess their impact on the effects of the cooperation. The identified problems include: delays in the implementation of subsequent stages of the project; failure to achieve all the effects of the project, including e.g. indicators of the number of people participating in the planned activities; problems with the organisation of the required tenders; problems with the financial liquidity of partners implementing the project or the need to replace on-site activities with online forms.
The analysis and assessment carried out in the article indicated that the COVID-19 pandemic and its consequences have affected in particular border areas of the European Union and their inhabitants, and have adverse effects on cross-border cooperation, including on the implementation of joint projects. The results obtained may be used to develop programmes to counter the effects of the crisis in border areas and in the implementation of EU programmes carried out as part of cross-border cooperation.

Keywords: management of cross-border, project management, Covid-19, pandemic, EU.

Introduction

In the age of globalisation of world economy, international cooperation is inevitable and necessary for the development of countries' economies (Krugman, Obstfeld, Melitz, 2018) and strengthening their position internationally. Cross-border cooperation is one of its forms and occupies a special place in the European Union. The EU promotes joint actions of neighbouring Member States, based on the principles of the territorial cooperation model (Medeiros, 2018). European Cross-border cooperation aims to tackle common challenges identified jointly in the border regions and to exploit the untapped growth potential in border areas, while enhancing the cooperation process for the purpose of the overall harmonious development of the Union (European Commission, 2014). Cross-border cooperation has been identified as having real added value for Europeans (White Paper…, 2017). There is also no doubt that it has so far proved to be the most effective tool for overcoming the border barriers, integrating border areas and improving the quality of life of citizens in border regions (People-to-people…, 2017).

The COVID-19 pandemic caused by the SARS-CoV-2 coronavirus has affected virtually all levels of the global economy, leading to unprecedented disruption (del Rio-Chanona at al., 2020; Açikgöz, Günay, 2020; Barua, 2020). One of the most pronounced consequences of the pandemic was the exceptionally rapid closure of national borders, even within the EU, in order to ensure the safety and health protection of the citizens. The national borders began to serve

Cite this Article as: Agnieszka MALKOWSKA and Karolina DRELA "The Issues Concerning the Management of Cross-Border EU Projects During the Covid-19 Pandemic" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

functions (Canale, 2020; Kolosov, Więckowski, 2018) which were not a priority until the outbreak of the pandemic (Eckardt, Kappner, Wolf, 2020). There is no doubt that the effects of border closures and related restrictions have particularly affected border areas located on both sides of state borders. These areas naturally live in a certain symbiosis with each other, which is enhanced by cross-border cooperation and which has been disrupted in an unprecedented manner. The implementation of numerous EU-funded cross-border projects, including Interreg, encountered a number of unexpected problems (Ambrušec, 2020) which required additional and unplanned action.

The aim of the research was to identify problems of Polish-German cross-border cooperation during the COVID-19 pandemic, including those related to the implementation of projects under the Interreg programmes. The research carried out in the article was based on quantitative secondary data, primary information and analysis of available source literature. The research methods used in this paper include: critical analysis of the source literature, the method of secondary data analysis (online database of Interreg VA projects) and the method of in-depth interviews. The research was preliminary and covered ten projects. The interviews were conducted in July 2020.

Cross-border cooperation in the German-Polish border area

Poland borders with three German states: Brandenburg, Saxony and Mecklenburg-Western Pomerania. Due to the difficult history of both countries, the beginnings of cooperation on the Polish-German border were not easy. It was not until 1990s that institutional cooperation was established in this area. At that time, the idea of creating a Euroregion emerged, which, inter alia, was an effect of the local government cooperation promotion. In 1995, the Pomerania Euroregion was established on the northern German-Polish border. It initiated euro-regional cooperation in the area under discussion and, thereafter. other forms of cooperation. During this period, Poland also began to benefit from the so-called EU pre-accession funds. Cross-border EU Interreg programmes played an important role in the process of European integration of the Polish-German border area and in overcoming peripheral and regional disparities of these areas (Drela, Malkowska, Zieziula 2020; Greta, 2007). The name Interreg is commonly used in public communication regarding EU programmes, precisely in the field of cross-border cooperation.

Before Poland's accession to the European Union, the cross-border cooperation of Polish border regions with neighbouring German regions was established in the years 1994-2004 under two EU programmes: Interreg IIA (for the German side) and Phare CBC for Poland. Since 2004, when Poland became a member of the EU, Polish regions located along the western border have participated in three such programmes, i.e: INTERREG IIIA (in the years 2004-2006), INTERREG IVA (in the years 2007-2013), and INTERRREG VA (in the years 2014-2020). These programmes are implemented in accordance with the programming periods adopted by the EU.

The Structural Funds, including Interreg, are the main instrument for implementing Community regional policy in the European Union, including in border areas. It should be stressed that in practically every programming period, the cross-border cooperation programmes have placed emphasis on social issues related to the integration of the inhabitants of the border areas. Hence their significant role in the context of building an integrated EU.

The current programming period for 2014-2020 EU funds is certainly marked by the outbreak of the global COVID-19 pandemic caused by the SARS-CoV-2 coronavirus, which has affected the EU projects, including cross-border cooperation. One of these is the INTERREG VA Cooperation Programme Germany Mecklenburg-Western Pomerania/ Brandenburg/ – Poland under the "European Territorial Cooperation" objective of the European Regional Development Fund (ERDF). For the purposes of the article, this programme is abbreviated to INTERREG VA 2014-2020.

The programme is implemented in the northern German-Polish border area. Its aim is to further develop cross-border cooperation between institutions and administration in all areas of social life and meetings between inhabitants of the assisted area. This includes the northern section of the Polish-German border and areas located on both sides of the Oder and its estuary. It is almost 42.2 thousand sq km and has 2.9 million inhabitants (including 1.7 million in its Polish part and 1.2 million in its German part). Its largest urban centre is the city of Szczecin. However, it should be stressed that the discussed area is also influenced by the Berlin metropolis and the Baltic Sea.

Interreg cross-border cooperation programmes are among the ones with the lowest EU funding. The budget of the programme under examination for the period 2014-2020 was EUR 157.6 million, of which EU funds amounted to EUR 134.0 million. Projects under this programme could receive funds of up to 85% of their value. Only projects which

comply with the individual priorities assigned to the main objectives of the programme could apply for funding. Four priority axes were identified in the area under examination and they were assigned five objectives (see Table 1).

Table 1: Objectives and funds allocation under the Programme INTERREG VA Mecklenburg-Western Pomerania and Brandenburg and Poland (Zachodniopomorskie Province) for 2014-2020

Priority axes	Allocation of funds	
	[million EUR]	[%]
Priority axis I Nature and culture 1. Increasing the attractiveness of the common natural and cultural heritage 2. Joint maintenance and development of biodiversity	50.45	32
Priority axis II Transport and mobility 3. Addressing deficiencies in cross-border transport infrastructure	31.53	20
Priority axis III Education 4. Expanding the joint general and vocational education services	15.76	10
Priority axis IV Cross-border cooperation 5. Intensifying cooperation between institutions in a cross-border context	50.44	32

**No technical assistance. As at 8 June 2020.*

The largest share of the budget was allocated to cross-border cooperation, or rather its enhancement, and to projects to support the region's natural and cultural heritage and the development of its biodiversity (see Table 2).

Table 2: Use of funds according to the priority axes under the Programme INTERREG VA Mecklenburg-Western Pomerania and Brandenburg and Poland (Zachodniopomorskie Province) for 2014-2020

Priority axes	Number of projects	Value [million EUR]	Utilisation rate
Priority axis I Nature and culture	17	30.270	60.0%
Priority axis II Transport and mobility	2	26.798	84.9%
Priority axis III Education	5	9.005	57.1%
Priority axis IV Cross-border cooperation	17	33.144	65.7%
TOTAL	**41**	**99.217**	**62.9%**

**No technical assistance. As at 8 June 2020.*
Source: own study based on: https://interreg5a.info/pl/ (accessed 15 September 2020).

The total eligible expenditure of the contracted projects was nearly EUR 99.3 million. This expenditure is co-financed by the European Union from the European Regional Development Fund for a total of almost EUR 84 million. It is worth noting, however, that approx. 37% of the funds of the said programme have not been contracted yet (see Table 2).

Problems with managing cross-border projects in the COVID-19 period

In March 2020, the Managing Authority, the Joint Secretariat of the Cooperation Programme Interreg V A Mecklenburg-Western Pomerania / Brandenburg / Poland and the partners of the Interreg VA Programme introduced restrictions which involved meetings in smaller groups, limiting contacts with others and cancelling joint (German-Polish) meetings and events (Informacje Sekretariatu Technicznego…, 2020). It was proposed that the participants of the Cooperation Programme should stop going on any business trips, not only those abroad, and request reimbursement of costs incurred for hotels, tickets, catering, conference rooms, etc. in accordance with the terms of the concluded contracts. As regards the non-reimbursable funds, the recovery of which was requested and documented, the expenditure incurred was to be considered eligible. Additionally, with the COVID-19 pandemic, a special call for applications for the Small Project Fund was issued, which was implemented innovatively, only in the Euroregion of Pomerania. The call had to be targeted at new objectives: reducing the consequences of the pandemic by working out

solutions for maintaining and developing social and cultural cooperation in the border area, developing cross-border activities to combat coronavirus (e.g. cooperation of health care institutions, information campaigns, prevention activities) and model activities for remote education.

Moreover, it should be noted that the inability to cross the border freely by the inhabitants on both sides of the Polish-German border was very unfavourable. The immediate closure of the borders not only hindered the lives of thousands of inhabitants and workers who, for example, commuted to work on a daily basis or lived on the other side of the Polish-German border, but also shook one of the pillars of the European Union, which is the free movement of persons.

Cross-border cooperation between Germany and Poland did not pass the test during the coronavirus pandemic. Germany is Poland's main trading partner. Approximately 125,000 Polish citizens were commuting to Germany every day and this was by far the largest group of cross-border workers in the Community (People on the move…, 2020). Many of them worked in production plants, health care centres and nursing homes in the eastern German states. Therefore, the lack of preparation and coordination of crisis management activities at the common border may come as a surprise. Approx 17 000 people commuted to work every day in Berlin and Brandenburg alone. Poles and 3.4 thousand workers to Mecklenburg-Western Pomerania (Metropolregion Stettin…, 2020).

Both governments decided to close the border relatively quickly (Poland in March 2020) and the Polish government decided to introduce a 14-day quarantine for all Poles who wanted to return to the country. From 27 March 2020, everyone who crossed the border had to go to a 14-day quarantine in Poland. As a result, commuting to work in Germany has become almost impossible. Even tens of thousands of people could lose their source of income. These activities impeded the daily lives of a large number of cross-border workers. Thousands of them had to make the difficult decision of staying home with their families or looking for temporary accommodation close to their place of employment. For example, the Germans offered Polish doctors and nurses to stay in Germany to help fight the coronavirus epidemic. Polish doctors could receive 85 euros a day to support themselves and their families in Germany. Some of them stayed on the German side, leaving their families on the Polish side. The governments' decisions to close the border have caused dissatisfaction among hundreds of people and have led to protests against restrictions. It took almost two months for cross-border workers to be able to cross the border freely again. From 4 May 2020, the mandatory quarantine was abolished for persons who crossed the Polish border for the economic, business, professional and educational purposes (however, this did not apply to medical professionals and those employed in social welfare centres) and on 15 June 2020 the Polish-German border was opened, with a minor exception. It was only on 4 September 2020 that the government of Mecklenburg-Western Pomerania opened its borders to one-day tourists (Jaszczyński, 2020).

Therefore, in order to prevent such difficult border situations, the task of developing common cross-border procedures in crisis situations should be undertaken. In the context of close socio-economic ties between Poland and Germany, cooperation during the crisis is insufficient. For example, there have been no bilateral consultations on the economic impact of the pandemic, and overcoming difficulties of the neighbour will benefit both Poland and Germany due to trade relations (Jurczyszyn, Wissmann, 2020).

The closure of the border and the related restrictions had a significant impact on the implementation of cross-border projects under the Programme Interreg VA in the German-Polish border area. The following problems were identified on the basis of in-depth interviews with the project contractors:

- delays in the implementation of subsequent stages of the project and the need to extend the project duration;
- inability to achieve all effects of the project, including e.g. indicators of the number of people taking part in the planned activities;
- problem with the organisation of the required tenders;
- problems with the financial liquidity of project partners;
- problems in reporting expenses according to guidelines;
- the need to replace activities carried out on-site (such as training courses, events, meetings, etc.) with online forms, using Internet platforms (videoconferencing, webinars), websites, social media, etc;
- limited access to equipment such as laptops, headphones or appropriate online meeting software;
- the need to replace the planned forms of promotion, e.g. travelling abroad to the fair;
- the need to abandon some of the planned activities and expenses, e.g. room rental, catering;

- the need to replace some of the expenses with others, related to the allocation of funds for other purposes directly related to the reduction of the negative impact of the COVID- 19 pandemic on the project, e.g. purchase of access to Internet platforms;
- the problem with finding partners from abroad to implement new projects;
- the problem with contacting the Joint Technical Secretariat staff;
- the need to bear the costs of the electronic signature.

The above problems occurred unexpectedly and required immediate reactions and solutions. The research indicates that some of the problems were solved systematically by introducing new, non-standard guidelines of the Managing Authority of the Interreg VA Programme. National legal regulations have also proved helpful, e.g. the Act on special solutions supporting the implementation of operational programmes in connection with COVID-19 in 2020 of 3 April 2020. Unfortunately, as the project contractors admit, certain problems have still not been solved, which determines the implementation of cross-border cooperation projects. Their aim is to achieve the so-called cross-border effects, which due to the COVID-19 pandemic may prove to be less significant in the future than originally assumed. This in turn may have a negative impact on the processes of integration of local communities in the Polish-German border area and the functioning of the area.

Conclusions

The COVID-19 pandemic caused by the SARS-CoV-2 coronavirus has had and continues to have an unprecedented impact on the global economy and its real consequences may only be assessed in the future. Undoubtedly, one of the most evident consequences of the pandemic was the closure of national borders and the various accompanying restrictions, the aim of which was to ensure the safety and health protection of the citizens of each country. Adverse effects of these events additionally affected the border areas and its inhabitants, and it seems that their impact there was much greater. This situation was also faced in the European Union, which treats border regions in a special manner, aiming at their development and integration of the inhabitants of the neighbouring regions on both sides of the borders, by allocating special EU funds for this purpose, including Interreg. They are dedicated to the implementation of projects based on cross-border cooperation. The studies carried out showed that they were also adversely affected by the pandemic. The study identified a number of unexpected problems that were faced by Interreg contractors. The most significant problems included the difficulties with the implementation of the established result indicators and problems with acquiring partners for new projects. A significant part of the projects in the discussed area is concentrated on tourism, which may further increase the difficulties in implementing and managing Interreg projects. The problems indicated in the paper may reduce the expected so-called cross-border effects of the projects, which will have an adverse impact on the development and functioning of border areas in the European Union and the cross-border cooperation, which has already been impaired. Overcoming the problems identified in the paper and finding solutions is a challenge for all partners implementing and managing cross-border projects co-financed by the EU.

In general, the results of the study showed that employees of PKP CARGO S.A. Cargo Carriage Enterprise in Szczecin value their work, are loyal to the employer and most of them work in the railway industry out of passion and family traditions. Despite the currently good situation on the Polish employment market where low unemployment and increase in demand for work are observed, many respondents would not make an immediate decision on transfer to another enterprise should such an opportunity arise, 69% of employees would have to think about it and 31% stated that they are not interesting in changing their job at all.

Acknowledgements

The project is financed within the framework of the program of the Minister of Science and Higher Education under the name “Regional Excellence Initiative” in the years 2019 - 2022; project number 001/RID/2018/19; the amount of financing PLN 10,684,000.00.

Abstract

Description of a main objective of research. In 2018, the population of Tambov region began to show much more interest in cultural services and cultural objects. About 12.2 million people visited cultural institutions and took part in cultural events in 2018, which was 7.0% more than in 2017. The authors of the study made an attempt to develop a mechanism of interaction between the state and private investors to conserve cultural objects. The researchers proposed the measures to preserve the manor of the famous Russian lawyer F.N. Plevako which is a cultural heritage site of regional significance. Apart from that, the authors gave some recommendations on how to stimulate state bodies and private investors to develop mutually beneficial cooperation and preserve the historical heritage.
Short description of methodology. The authors of the study used the following methods: analysis, synthesis, deduction, induction and classification. In addition, the researchers applied such methods as desk research, study of documentation, description and modeling.
Compilation of the most important research results and their significance. The research is practically oriented as it contributes to the restoration of F.N. Plevako's manor located in the village of Vishnevoe in Staroyuryevsky district in Tambov region. The authors determined the market value in accordance with the Federal Valuation Standards and calculated the total amount of investments for the reconstruction of the estate. The financial model of the return on investment was developed in accordance with the methodological recommendations proposed by the Ministry of Economic Development (recommendations for the implementation of PPP projects).

Keywords: public-private partnership, cultural heritage objects, concession agreement, concessionaire, concessioner.

Introduction

The state cultural heritage monuments are part of people's history and past. They are considered as the traces of the material and spiritual life of the society. However, natural and anthropogenic forces have a negative effect on the cultural heritage. Thus, as Lytkina K.D. (2019), it is crucial to preserve and restore the country's cultural wealth. As for the state, it annually allocates funds for the restoration of cultural sites: 5.5 billion rubles in 2016, 7.3 billion rubles in 2017 and 9.8 billion rubles in 2018. Thanks to these allocations, in 2016, 161 objects were restored, in 2017 - 283 objects, in 2018 - 240 objects. Nevertheless, currently, more than 34 000 objects need to be restored, which proves

Cite this Article as: Yana Yu. Radyukova, Adamov Ernest Valeryevich , Dorozhkina Natalia Igorevna and Makareva Elena Afanasyevna " Public-Private Partnership in The Sphere of Conservation of Cultural Heritage Objects: Legal Security and Economic Efficiency (On the Example of F.N. Plevako's Manor Located in The Village of Vishnevoe In Staroyuryevsky District in Tambov Region)" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

the need to search for alternative sources of funding (Abankina, T.V., Derkachev P.V. (2016)). For this reason, the authors of the research claim that it is vital to promote public-private partnership.

Today public-private partnership plays a great role in many areas of public life: social sphere, energy and utilities sphere, transport sphere, urban environment and infrastructure and agriculture.

The public-private partnership mechanisms are widely applied to protect cultural heritage. Today they turn out to be quite effective.

The Aigins' manor located in Pushkinsky District in Moscow Region can serve as a good example of efficient public-private partnership in the field of protection of cultural heritage objects in Russia. The complete process of restoration of the estate took more than two years, and the investor ActiveSaleGroup spent 250 million rubles on it. The expected payback period of the investment is approximately 15-20 years. The restored estate contributes to the socio-economic development of the village and attracts a considerable number of tourists to Moscow region. Nowadays, guided tours are offered in the merchant's estate (tourists find this place attractive since such famous personalities as I.S. Turgenev, S.T. Aksakov, M.Ye. Saltykov-Shchedrin stayed there) (Bolekhov I.Ye. (2012)).

Methods

The project financial structure was developed on the basis of the recommendations proposed by the Ministry of Economic Development (recommendations for the implementation of PPP projects).

Calculating the cost of reconstruction, the authors determined the land rent and rental payments, and applied the unit cost method and the method of recapitalization within the cost approach. To employ these methods, the researchers used appraisal guidelines (the directory under the editorship of L.A. Leifer, directories on consolidated index of construction cost and Ko-Invest, and Internet sources).

Results

Table 1: Approximate terms for signing a concession agreement

Stage	Term
Development of the project implementation plan	60 days
Consideration of the proposal	up to 40 days
Making an offer on the website	45 days
Making a decision on concluding a concession agreement	up to 65 days
Creation and operation of facilities	10-49 years

Table 2: Calculating the costs of reconstruction of the cultural heritage object

Indicators and adjustments	Building, purpose: non-residential, total area 247.5 sq. m, number of floors: 2, object address: Tambov region, Staroyuryevsky district, Vishnevoe village, st. Plemzavod, house number 23
Complexity of architectural design	Average
Structural system class	КС-2
Volume / Area of the appraisal object, cubic meters/square meters	1675
Reference indicator, rub / cubic meter	22 574,00
A source of information	Objects of architectural heritage, 2015, A3.01.001, 22
The first group of adjustments (rubles per 1 cubic meter (sq. m.) (+ rise in price, - reduction in price) related to	
- missing part of the outer walls	0
- the difference in floor heights	0
- basements	0
- special service and equipment	0
- the difference in the strength of soil, the depth of the foundation and the degree of water encroachment	0
- different constructive solutions	0
Total (for the first group of adjustments)	0
The second group of adjustments (in the form of correction factors) related to	

Indicators and adjustments	Building, purpose: non-residential, total area 247.5 sq. m, number of floors: 2, object address: Tambov region, Staroyuryevsky district, Vishnevoe village, st. Plemzavod, house number 23
- the difference in the volume of the building	1
- regional and economic differences	0,751
- the amount of other unforeseen costs	1
- the prices that changed after the publication of the reference book (from 01.01.2015 to 01.04.2020)	1,148
General correction factor related to the second group of adjustments	0,862
Adjusted cost indicator, rub / m3.	19 459
Amount of replacement costs for the appraisal object on the estimation date, excluding VAT, (rounded numbers), rub	32 593 825
Physical deterioration	0,94
Market value of the object, rub	1 955 629
Costs of reconstruction of the appraisal object, rubles	30 638 196

Table 3: Terms of lease

Legal acts regulating the procedure for leasing	
Lease term	10-49 years
Market rent (rub/month) (A grantor can establish a preferential rent)	23 423 (95 rubles per 1 sq. m)
Land rent (rubles / month) (A grantor can establish a preferential rent)	15 444,33

Table 4: The fundamental commitments regarding object restoration (conservation)

Information about the characteristic features of the cultural heritage object	The appearance of the building and the land should remain unchanged.
The ways to use it	It can be used as an office building where certain activities are carried out (the activities are aimed at increasing legal literacy / providing legal advice)
List of basic works on restoration (repairs, reconstruction) of the object	Reconstruction of the building. It compensates for 94% of physical deterioration and preserves the cultural heritage object. A full list of works is compiled when a contract on reconstruction is concluded
Execution period	Implementation deadlines are set when a contract on reconstruction is concluded
Other requirements and restrictions for restoration, reconstruction and modern use	Compliance with the requirements established in accordance with the preservation order of the legal owner (approved by the Department for State Protection of Cultural Heritage Objects of Tambov Region No. 333 dated 28.12.2018)
Reconstruction costs, rub	30 638 196

Here is the project financial structure (Fig. 1).

Fig. 1: Project financial structure

In Tables 5-7 there is a description of the financial plan.

Table 5: Description of monthly income

Service	Anticipated average sales volume per month	Cost (rub)	Revenue (rub)
Consultation	85	1000	85000
Client representation in court	12	2000	24000
Conducting the case	6	15000	90000
Total			199000

Table 6: Description of monthly expenses

Consumption	Amount / rub.
Concessionaire's fee (land rent and rental payments)	720
Key staff salaries and social security contributions (3 lawyers and 1 advocate)	120000
Advertising and website maintenance	150000
Working capital	5000
Tax	15000
Total	155720

Table 7: Final financial result

Index	Amount / rub.
Total income	199000
Total expenses	155720
Net profit	43280

To attract investment for the reconstruction of a cultural heritage site, the authors have developed an investment passport for a cultural heritage object.

The investment passport contains data on the market value — the building rental costs, land rent, the cost of reconstructing the cultural heritage object. The reconstruction expenditure was calculated as 94% (the degree of physical deterioration of the cultural heritage object, taken according to the technical passport data) of the market value of the property.

Discussions

Varnavsky V.G., Klimenko A.V., Korolev V.A. (2010) the basis of public-private partnership for the preservation of cultural heritage sites is the system of interaction between authorities and private investors. The more efficient the system is, the more targets can be achieved through the partnership channels. Implementing such projects provides municipalities and regions with the opportunity to ensure a higher standard of living for the population as well as their own investment and social appeal. At the same time the federal authorities obtain a tool for the effective promotion of national tasks. According to Belitskaya A.V. (2012) the State has an interest in attracting massive investment in the region's economy, while business is concerned with securing political and administrative support for long-term projects and dealing with the emerging challenges. Furthermore, competent interaction between government authorities and private business allows not only for preserving cultural heritage objects, but also for adapting them to performing socially significant tasks (Lebedev V.N., Yakushev A.Zh. (2010)). In the course of this research, the authors have developed a plan for the use of a reconstructed cultural heritage object ("The main house of F.N. Plevako's estate").

The project will be of interest to investors and has the following social and economic consequences:

1. Commemoration and tribute to the great Russian lawyer F.N. Plevako, a famous legal adviser who pioneered the judicial rhetoric in Russia.

Restoration of F.N. Plevako's manor will contribute not only to perpetuating the memory of the outstanding Russian counsel, but also to the development of the cultural sphere and tourism industry of Tambov region alongside with reinforcement of legal education of the general public.

2. Reinforcement of legal education of the population (the establishment of a law center named after F.N. Plevako, where the Federal Chamber of Lawyers will provide legal advice).

The concession contract appears to be the most effective form of the public-private partnership for the project implementation, since privatization of a cultural heritage object is impractical, and the mechanism of a concession agreement is the most well-ordered.

In accordance with Article 14 of Federal Law No. 73-FZ of June 25, 2002, an investor in restoration of cultural heritage sites is granted benefits for the building rental costs and land rent for these particular sites. The amount of the preferential rent is determined by the owner of the property.

Since the municipality, which owns the estate, has a minimal chance of attracting the required reconstruction investment compared to the resources of a federal subject of Russia, the authors of the article consider it advisable to transfer the estate to the property of Tambov region. In this regard, the authors assume that Tambov region, represented by the State Legal Bureau of Tambov Region, will act as the grantor for the agreement.

One of the objectives of the Federal Chamber of Lawyers of the Russian Federation, which is enshrined in the charter of the organization, is legal information and legal education of the general public. Therefore, in the opinion Zolotukhin A.D. (2017), this institution will be motivated to establish the Legal Center named after F.N. Plevako at the site of the manor. Accordingly, the Federal Chamber of Lawyers of the Russian Federation appears to be the most probable concessionaire, as it will provide both free and chargeable consultancy in the legal center.

The concessionaire undertakes to develop scientific and project documentation for the preservation of the cultural heritage site. In compliance with the planned agreement, the concessionaire will be held accountable for conducting a range of works to maintain the cultural heritage object: restoration of load-bearing and enclosing structures; restoration of facades, including windows and doors; restoration of the roof and roofing cover; restoration of interiors; restoration of engineering systems.

The stages of the public-private partnership project implementation can be presented as follows: project development / consideration; project evaluation; decision-making on the project implementation; publication of a private alternative; development and coordination of the concession contract, the tendering process, agreement conclusion; development and operation of the object; control and monitoring of the project implementation.

Since the appraisal object is a cultural heritage site - a unique entity, the market value was calculated by means of the unit value methodology and by means of calculating replacement costs based on the Consolidated construction indices.

To calculate the cost of the object development (the construction cost), the authors referred to the directory of the Consolidated renovation and restoration work indices "Objects of architectural heritage 2015". Rescaling to the price level as of the estimation date for Tambov region was based on the system of price indices in construction specified in current regulations in the building and construction industry. It also proceeded from cross-regional information and analytical bulletins "Price indices in construction" issue No. 90, 110 (hereinafter KO-INVEST).

The appraisal object is a cultural heritage site of regional significance - “The main house of F.N. Plevako’s estate" with an area of 245.7 sq.m. The object that is closest in its characteristics was adopted as a counterpart. Namely, it implied the residential buildings of the estate type and monastery residential premises (two-storeyed stone facilities without a basement), the construction cost of which in per unit volume is 22,574 rubles in prices of the year 2015. (see Coll. "Objects of architectural heritage 2015", No. AZ.01.001 pp. 22-23) (Fig. 1).

Adjustments to the benchmark costs:

1. Adjustments determined in rubles per 1 cubic meter (square meter):

1.1. outer walls partially missing - unchanged;

1.2. the difference in floor heights - unchanged;

1.3. special works and equipment required- unchanged;

1.4. differences in the soil strength, the foundations depth and the degree of water encroachment in soils - unchanged;

1.5. design differences:

- underground part, including the foundation - unchanged;
- walls, pillars, columns, abutments - unchanged;
- partitions - unchanged;
- ceilings, vaults, arches - unchanged;
- stairs, steps - unchanged;
- windows, doors - unchanged;
- floors, porch areas - unchanged;
- interior finishing and external cladding - unchanged;
- decor - unchanged;

2. Adjustments determined as correction factors:

2.1. The correction factor for the difference in volume / area was not given since the volume of the estimated object falls within its counterpart range.

2.2. The correction factor for regional economic differences. The coefficient was taken as equal to 0.751 based on the values for Tambov region for the correction factor (КСр-2) (see section 4.1 of the Collection “Objects of architectural heritage 2015”, page 143) (Figure 3);

2.3. The correction factor for the contingency and other costs. The coefficient is obtained by applying the formula:

$$K_{пз} = \frac{П_о}{П_{спр}}, \quad (1)$$

where $П_о$ is the region-specific ratio between the total estimated cost of real estate construction following all the twelve chapters of the summary cost estimate plus contingency works and costs according to local estimate calculations. Those include direct expenses on works accomplished, overhead costs and estimated profit. For Tambov region, $П_о$ is equal to 1.15;

$П_{спр}$ is the ratio described above and recorded in the KO-INVEST appraiser's directory as equal to 1.15. Thus, the correction factor for the contingency and other costs stands at:

$$K_{пз} = \frac{1,15}{1,15} = 1$$

2.4. The correction factor for price volatility succeeding the Directory issue is to rescale the construction cost of the estimated object, which has been determined on the basis of KO-INVEST, to the price level as of the estimation date. The coefficient is obtained by applying the formula:

$$K_{инфл} = \frac{И_о}{И_{спр}}, \quad (2)$$

where: Ио is the average regional index calculated by 01.01.2000 in relation to the actual prices of April 2020 (the estimation date), excluding VAT. $И_о$ is equal to 10.413 (Ko-INVEST 110).

$И_{спр}$ is the average regional index calculated by 01.01.2000 in relation to the actual prices of January 2015 (the reference date of the price level in the directory "Objects of Architectural Heritage 2015"), excluding VAT. $И_{спр}$ stands at 9.071 (Ko-INVEST 90).

Consequently, the correction factor for price volatility will be equal to the ratio of indices 10.413 / 9.071 = 1.148.

Determination of expenses on replacing the appraisal object is presented in Table 2.

Therefore, the reconstruction cost of the appraisal object will amount to 30,638,196 rubles.

The concessional rent will be set by the grantor. The minimum preferential amount of rent for a cultural heritage object is 1 ruble per 1 square meter annually, i.e. 247.5 rubles per year. The concessional land rent will be determined as 1,5% of the land cadastral value per annum, i.e. 8403.19 rubles. It is calculated in accordance with the resolution of Tambov region administration No. 270 "On approving the Procedure for determining the amount of rent for the use of land plots in the state ownership of the Tambov region, leased without bidding" dated as of March 18, 2015.

In accordance with the Resolution of the administration of Tambov region (18.03.2015) within the framework of the public-private partnership model, it is advisable to enforce a mixed concession pattern. Thus, the concessionaire will gain income from entrepreneurial activity by operating the object of the concession agreement for its intended purpose. Besides that, allocation of subsidies from the budget at the rate of 10 million rubles has been planned. In this case investment arrangements will be as follows.

The concessionaire is obliged to provide security in the form of pledging the concessionaire rights to the grantor under the bank deposit agreement for a period of 1 year with subsequent annual prolongation until the termination of obligations. The bank deposit is to hold 3.1 million rubles (approximately 15% of the private investment amount - the average collateral in concession agreements with a similar investment volume).

Within 60 calendar days after signing of the concession agreement, the financial close is scheduled, i.e. the concessionaire is required to document access to funding sufficient for fulfilling the obligations.

Having restored the manor, the concessionaire is entitled to establish a legal center. According to the plan, with the legal center generating a net profit of 500 thousand rubles, which corresponds to a moderate legal center's average yield (Tables 3, 4, 5), the project will pay off in 41 years and 10 months. The calculation considers the costs of project documentation, reconstruction, lease of the cultural heritage object and land during reconstruction as well as the expenses for ensuring business activities. The term of the agreement is 49 years. Therefore, the concessionaire will gain revenue for 4 years and 2 months. The project is a typical public-private partnership pattern as regards cultural heritage preservation. As noted Chachkiev G.G. (2017) the concession discussed is not comparable with those in the housing and public utilities sector or road construction, because in this case the cost-efficiency is extremely low or totally unavailable.

Therefore, the anticipated outcomes of the proposed project are preservation and reconstruction of the cultural heritage site - F.N. Plevako's manor located in the village of Vishnevoe, as well as establishment of a legal center named after F.N. Plevako on the premises of the estate. The Federal Chamber of Lawyers of the Russian Federation will provide both free and chargeable consultancy in the legal center.

Conflict of Interests

The authors argue that the data presented in the article do not contain a conflict of interest.

Abstract

Purpose: The purpose of this study is to develop methods for indirectly assessing the value of land in a single property. **Design / Methodology / Approach:** This study proposes an alternative approach to calculating the value of a land plot (by analyzing the share of a land plot in the value of a single property). In the article, the authors consider the share of a land plot in the value of a single property as a result of the action of various pricing factors. The method of regression analysis was used as a methodological basis. **Findings**: Based on the results of the regression analysis, the authors gave recommendations on the use of each of the formulated factorial models and made conclusions about their applicability. **Practical Implications:** The results of this study can be used in cadastral valuation practice as well as market valuations used to challenge the cadastral valuation results. **Originality / Value:** The presented study is an alternative way of calculating the value of land in a single property, which is especially valuable in the face of a lack of initial information required to implement the traditional methodology of comparative sales.

Keywords: Cadastral Value, Reliability of Cadastral Valuation, Share of A Land Plot in A Single Real Estate Object.

Introduction

According to Decree of the Government of the Russian Federation (1999) cadastral valuation in Russia as an institution in August 2019 celebrated its 20th anniversary. For quite a long time, the cadastral assessment concerned only land legal relations. One of the most acute problems of cadastral valuation is the accounting/exclusion of land values from a single real estate object.

However, if such land is not excluded from the value of the real estate, then this increases the taxable base, and therefore overestimates the tax.

Summing up, we can conclude that the option of assessing land based on the methodology of a comparative approach with its subsequent deduction from the value of a single property has extremely narrow practical application.

An alternative and, as it seems, more promising option for calculating the value of land in a single real estate object looks based on an assessment of the share of a land plot in the value of a single real estate object (the so-called distribution method, widely used in the assessment of built-up plots). According to this method, the market value of a land plot is calculated as:

$$MV_l = SC_l * MV_{sp} \quad (1)$$

MV_l – market value of the land plot; SC_l - the share of the cost of the land plot in a single real estate object (hereinafter for convenience "share of the land plot");

MV_{sp} – market value of a single property.

Cite this Article as: Yana Yu. Radyukova, Sutyagin Vladislav Yuryevich , Svetlana V. Zenchenko and Chernyshova Oksana Nikolaevna "Estimation of The Share of Land in Industrial Real Estate by The Method of Regression Analysis" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

If it is necessary to assess the value of a capital construction object (MV_{cco}) (for example, as in an assessment situation for the purpose of challenging the results of a cadastral valuation), its market value can be obtained as:

$$MV_{cco} = (1 - SC_l) * MV_{sp} \quad (1)$$

Justification of the size of the share of the land plot is the subject of this study.

Methods

The general theoretical basis of the study was the logical method, as well as the methods of analysis and induction.

In addition to general scientific methods, the study widely used statistical methods, such as sample observation, grouping (clustering), structural analysis, and correlation-regression analysis.

In the sample observation, the analysis was made of the results of evaluations of real estate objects of a number of Tambov appraisal firms for the period from 2012 to 2019, and a sample of 139 objects was formed at the preliminary stage. In the course of selective observation, an analysis was carried out for the presence of "gross errors" in the sample based on the Smirnov-Grubbs test and atypical objects were excluded. The final sample was 132 objects.

The cluster "Industrial and warehouse real estate" contains information about the appraisals of real estate (buildings, rights in common ownership and premises) for industrial, warehouse, garage (vehicle maintenance) purposes.

The structural analysis involved the study of the values of individual elements (land plot and capital construction object) of each single real estate object included in the sample, with the subsequent calculation of the relative indicator - the share of the land plot.

Within the framework of the correlation-regression analysis, the factors influencing the cost of capital structures and land plots were identified. The identification of these factors was carried out on the basis of an analysis and generalization of the main pricing factors taken into account in the assessment reports. In particular, in relation to the sample for the cluster " Industrial and warehouse real estate", the following factors were identified and analyzed: "Floor / number of storeys"; "Technical condition"; "Finishing"; "Location"; "Heating availability"; "Availability of railway lines"; "Construction material". The identified factors are largely qualitative, which required their digitization.

As a result, factorial models of the dependence of the share of a land plot in the value of a single property (function) on the values of the main pricing factors (function arguments) were compiled. Within the framework of this study, functions with 3, 4, 5, 6 and 7 factors were compiled. The alignment was carried out on the basis of a linear function. Further, the quality of the obtained functions was analyzed (using indicators of the coefficients of correlation, determination, average error of approximation and F-test of Fisher) and recommendations for their use were given.

The informational basis of the study was the archival database of appraisal reports for the period from 2012 to 2019 of a number of appraisal firms and individual entrepreneurs-appraisers of the Tambov region.

Results

A number of scientific studies have been devoted to the assessment of the share of a land plot in the scientific community, among which there can be distinguished works by such authors as Demidovoy P.M., Gorelikova V.G. (2015), Morozovoy E.V. (2015), Leifera L.A. (2003), Gladkikh N.I., Kuznetsovoy V.V. (2015) and Sutyagina V.Yu. (2019).

As a rule, the efforts of the authors are reduced to assessing the average value of the share of a land plot in the value of a single object for different segments of land (type of development), and in some cases, assessing the most likely range in which such a share is concluded. And most often such studies are carried out on the material of any region.

There are still no studies based on the material of the Russian Federation (except perhaps Real Estate Appraiser Handbook – 2018; Real Estate Appraiser Guide – 2018).

Within the framework of this study, an alternative approach to calculating the share of a land plot is proposed - calculating the share based on a regression model. Let us briefly recall: the essence of the correlation-regression analysis is to identify the tightness of the relationship between the independent variables (hereinafter the cost factors) and the resulting indicator (hereinafter the share of the land plot), as well as obtaining the equation (regression) that characterizes the nature of this relationship. For practical purposes, it is advisable to use multiple regression, since most often the cost depends on several factors (and not one).

The regression analysis algorithm in this case will look like this:

I. Formulation of the initial economic hypotheses. In contrast to purely mathematical and statistical problems, the use of correlation and regression analysis is based on the formulation of initial economic hypotheses, including:

- a hypothesis about the nature of the relationship between the cost factors and the share of the land plot;
- hypothesis about the number of independent variables in regression;
- a hypothesis about the economic nature of the digitization of non-quantitative regression factors.

The essence of the first hypothesis is that the selected function, on the basis of which the alignment is carried out, should be consistent with the nature of the influence of factors on the share of the land plot (and in fact, on the proportion of the value of the land plot in the value of a single real estate object). In this case, the economic meaning of the nature of the relationship of the factor should prevail over the purely mathematical one. Please note that all the factors described below significantly affect the value of a single property (and, consequently, its elements), which is illustrated by their use as pricing factors in assessing (in the assessment reports).

Second, economic processes are more consistent with the logic of linear alignment, that is, economic factors are most often summed up, that is, they contribute to the final result, and do not interact in any other way. This means that the choice of a linear function is preferable; in this regard, in the future, a linear function will be used for alignment.

The third important aspect concerning the choice of the function is taking into account (or not taking into account) the intercept of the regression. The free term in our situation, from an economic point of view, describes: what is the share of the land plot with zero values of all arguments. A preliminary analysis of the formation of models with a free term showed that in the overwhelming majority of cases its value is negative, which is devoid of economic sense.

II. Formation of the initial sample and its analysis for the presence of gross errors. To this end, the authors selected 139 objects for the period from 2012 to 2019. We draw your attention to the fact that the use of data for such a long interval is permissible, due to the fact that the analysis is subject to the relative indicator in which the influence of inflationary processes is eliminated.

When forming the initial sample, it is important to analyze for the presence of gross errors ("statistical outliers") in it. An explanation of the nature of such gross errors can provide additional information about the effect of unaccounted factors. In the framework of this study, the test for the presence of outliers was carried out on the basis of the Smirnov-Grubbs test (t). The pre-sample is ranked, and the mean and standard deviation of the sample are calculated. And then the maximum and minimum values of the sample are analyzed for the presence of a gross error, for the purpose of which the $t_{val.}$

$$t = \frac{|x_i - x_{aver}|}{\sigma} \quad (3)$$

The calculated value is compared with the tabular t_α. If $t_{calc} > t_\alpha$, the result x_i is considered a gross error and discarded.

According to the results of screening out, 132 objects remained (the full list of objects is posted on the Ocenka + portal http://ocenka-plus.pro/f/povesit_ps.xlsx). The results of the analysis of the final sample for the presence of gross errors are given in table1.

Table 1: Sample analysis for gross errors

Indicator	Quality rating	Critical value
Average value(x_{aver})	0,269	
Confidence levels (P)	0,95	
Standard deviation (σ_{ch})	0,109	
Sample size (n)	132	
X_{max}	0,417	
t_{max}	1,363	3,350
X_{min}	0,036	
t_{min}	2,140	3,350

III. Selection of the type of function by which the alignment will be carried out. As we noted, economic processes are most often associated with a linear contribution to the result. In this regard, the alignment was carried out on the basis of a linear function, in general form looking like:

$$f(x) = b + a_1 * x_1 + a_2 * x_2 + \ldots + a_n * x_n + \varepsilon \quad (4)$$

f (x) - the resulting feature; x_1, x_2, x_n - independent variables; a_1, a_2, a_n - coefficients for independent variables (degree of sensitivity of the resulting feature to the independent variable); b - free term of the regression; ε is the influence of unaccounted factors.

The resulting regression equation and its terms are tested for adequacy (statistical significance) (for example, by evaluating the mean approximation error and Fisher's F-test). Only then can the obtained regression equation be used for practical purposes.

IV. Identification of independent variables - cost factors. The choice of independent variables was carried out on the basis of an analysis of typical pricing factors taken into account when assessing the corresponding types of real estate. The following factors were analyzed as arguments:

1. "Floor / number of storeys";
2. "Technical condition";
3. "Finish";
4. "Location";
5. "Heating availability";
6. "Availability of railway line";
7. "Building material".

Below is a description of the economic meaning of the identified factors and the gradations they accept. It should be noted that conditionally all factors can be divided into factors of "land" (that is, influencing mainly the value of land) and "capital construction objects". The former increase the value and share of the land plot; the latter, on the contrary, reduce it. The logic is as follows: improvement of the condition (by some factor, for example, finishing or technical condition) of the capital construction object redistributes the share in its favor, on the contrary, the deterioration of the factor increases the share of the land plot.

Note that, in the overwhelming majority, all the indicated factors do not have a quantitative nature, which naturally complicates their use and requires their digitization, that is, the assignment of digital labels for each qualitative state of one factor or another.

One more nuance: the gradations of factors in Table 2, in accordance with the economic hypothesis put forward, are given in accordance with the logical hierarchy, that is, as we move from top to bottom, the share of the land plot increases.

Considering that almost all factors are of a qualitative nature, let us assign them digital labels, where 1 is the minimum contribution to the share of the land plot, and as it increases, the contribution to the share of the land plot increases. Initially, the labels are evenly spaced (i.e. 1, 2, 3, etc.).

Table 2: Numeric labels of value factors

Cost factor	Cost factor gradation
Floor / number of storeys	Accepted values: The ratio of the number of floors in the assessment object to the total number of floors in the building is calculated Accepted values: from 0 to 1.
Technical condition	Accepted values and digital labels: • Good - 1; • Satisfactory - 2; • Unsatisfactory - 3.
Finishing	The nature of the factor: qualitative (characteristics of the object of a capital structure) Accepted values: • Standart finish - 1; • Without finishing (or in a condition requiring replacement of finishing) - 2.
Location	The nature of the factor: qualitative (characteristics of the land plot) Accepted values: • Rural settlements -1; • Other cities of the region - 2; • Center of the subject of the Russian Federation - 3.
Availability of heating	The nature of the factor: qualitative (characteristics of the object of a capital structure) Accepted values: • Yes - 1; • No - 2.
Availability of railway line	The nature of the factor: qualitative (characteristics of the land plot) Accepted values: • No - 1;

	• Yes - 2.
Construction material	The nature of the factor: qualitative (characteristics of the object of a capital structure) Accepted values: • Brick / concrete - 1; • Wood - 2; • Metal / sandwich panels / quick production structures - 3.

V. Derivation of the regression equation and analysis of indicators characterizing its quality. Within the framework of this study, 12 regression equations were derived with a different number of factors (from 7 to 3). It is worth noting that as the number of factors decreased, the quality of the regression increased, and its compliance with the put forward economic hypotheses improved.

The alignment was carried out on the basis of the least squares method using MS Excel tools.

Table 3: Regression equations and regression quality indicators

	Number and list of factors	Regression equation	Regression Quality Indicators r - multiple correlation coefficient (r> 0.7); r^2 is the coefficient of determination; A_{aver} - average approximation error (A_{aver} <15%); F_c - the calculated value of F-statistics of Fisher; F_{crit} - critical value of Fisher statistics (F_c> F_{crit})

Discussions

All regression equations (see Table 4) have a high level of statistical significance, which follows from the analysis of Fisher's F-statistic indicators. Moreover, the correlation coefficient shows that there is almost a functional dependence between the share of the land plot and the identified cost factors, since the latter is more than 0.96. Further, from the point of view of the analysis of the coefficient of determination, the result (share of the land plot) by more than 93% (with the exception of the last function) is explained by the action of these factors, that is, the influence of unaccounted factors is minimal.

At the same time, the predictive nature of the functions is rather limited, which is illustrated by the high average approximation error. Comparatively good results are given only by 4- and 3-factor models.

More important is the fact that in a number of regression equations the presence of a negative factor in the arguments, which is a violation of the formulated economic hypotheses, because with the growth of the factor, the share of the land plot does not grow, but falls (which does not correspond to reality).

From the point of view of the formulated economic hypotheses, models No. 10 and 12 look the most adequate.

The quality of the regression can be improved by means of optimization procedures, the essence of which boils down to changing the numerical values of the labels and the distances between them. This problem can be solved in several ways: sequential recoding or using optimization procedures [20, 21]. Both methods are based on the fact that the distance between the labels affects the quality of the regression. In fact, the question is only a toolkit for assessing such tags.

During sequential recoding, the expert sets the numerical value of the labels, after which the regression analysis procedures are repeated. However, this raises the problem of the subjectivity of labeling. The following expert rating scale can somewhat increase the objectivity (see table 4).

Table 4: Ordinal scale of expert assessments (according to Anisimova I.N., Barinov N.P., Gribovskiy S.V. (2004))

5	Ordinal scale value
Worst value of the cost factor	1-2
A slight advantage of a factor over another	3-4
A significant advantage of a factor over another	5-6
Significant advantage of a factor over another	7-8
The absolute advantage of a factor over another	9

Considering the fact that the first two ratios are quite high, their further increase is not significant. In this regard, the indicator of the average approximation error was the optimization criterion.

The results of the optimized functions are shown in Table 5.

• Building material (x3).	Brick / concrete - 1; Wood - 3; Metal / sandwich panels / prefabricated structures -5.		

Note that the optimization procedures for the most part had little effect on the coefficients of multiple correlation and determination. On the other hand, in many models the average approximation error has noticeably improved (although it does not reach the recommended values).

In a number of cases the sign changed (from negative to positive) with the argument multiplier, which means that these functions began to correspond to the formulated economic hypotheses (now these are models № 8, 10, 11, 12).

The second method is based on optimization procedures and implies an iterative selection of labels, which increases the regression quality indicators. This approach usually works well with spreadsheets. In particular, MS Excel has an add-in "Search for a solution" (Sutyagin V. Yu. (2015), Anisimova I.N., Barinov N.P., Gribovskiy S.V. (2004)). At the same time, the analysis showed that this approach is unsatisfactory in practical terms. In the course of its implementation, the regression quality indicators increased, but the economic sense of digitization was lost. So, the order of digitization of marks often changes (for example, it often turned out that in a satisfactory condition the share is higher than in an unsatisfactory and good one). In this regard, the results of optimization procedures in the framework of this study are not presented.

Finally, a few words should be said to summarize the economic meaning of the derived regressions, as well as basic recommendations for their use.

First, the predictive nature of using the models is rather limited, which is associated with a relatively high approximation error. In this regard, the use of the obtained models is most in demand in the absence of the possibility of direct calculation of the cost of land.

Second, the most popular models look like № 8, 10, 11, 12, since the formulated economic hypotheses "work" in them.

The third, 5-, 6- and 7-myth-factor models are of a general nature and are applicable for any type of industrial estate and land plots below them, since they cover a fairly large list of cost factors.

Abstract

The reform of state-political systems in Eastern Europe included the creation of a new public service institution. One of the most important issues in the formation of a professional public service is recruitment. The purpose of this article is to conduct a comparative analysis of the features of entering the civil service in Eastern Europe as the initial stage of professional socialisation of a servant. The study consists of the following: first, it provides an overview of civil service recruitment practices in Eastern Europe; secondly, the theoretical aspects of the study of recruitment for civil service in post-Soviet states as the initial stage of professional socialisation of an employee are generalised, and, thirdly, on the basis of the data obtained, a comparative analysis of technologies and methods of recruiting for civil service is carried out. service is carried out in the countries of the European Union. Research results have shown that these systems are not uniform or universal; integration into the EU has a significant impact on regional (country) characteristic.

Keywords: recruitment, public service, civil service, entering the civil service, assessment, professional socialisation, Eastern Europe, European Union.

Introduction

The professional activity of public servants is an object of close attention of researchers, because the achievement of the main goals of public administration depends on its effectiveness. Professional activity begins from the moment of entering the public service and the "entry" of the individual into the professional environment. In general, this process is called professional socialisation. The previous stage of professional training or professionalisation is not always and not in all countries is mandatory, therefore, we will consider the features of the system of hiring public service personnel as the initial stage of professional socialisation of an employee.

Admission to the civil service is a fundamental moment on which the quality of public administration personnel and its effectiveness depend. The recruitment system should ensure that the objective characteristics and individual qualities of a person meet the requirements of the public service as a professional activity. The formation of personnel selection systems in the civil service in national states was influenced by such factors as the political regime, civic culture, and the socio-economic status in the state. Thus, joining the civil service is a historically determined system of searching and selecting citizens who are most suitable for this type of activity.

The collapse of the communist system in the 1990s forced Eastern European states to independently lay the foundations of public service in the new economic and political conditions. However, even now, after 30 years at the institute of public service in European Union, there is no uniform approach to the organization of the recruitment system.

What are the results of public service reform in Eastern Europe today regarding recruitment procedures? This study examines the question of filling this gap in research and highlighting the national characteristics of civil service in Eastern Europe. In our study, we included the following states in these studies, according to the UN definition:

Belarus, the Republic of Bulgaria, Hungary, Moldova, Poland, Russia, Romania, Slovakia, Ukraine, the Czech Republic.

The purpose of this article is to conduct a comparative analysis of the current state of the public service personnel recruitment system in Eastern Europe. Reform of public service admission is one of the most important stages in the democratization of the public service, increasing its openness and effectiveness. And the current state of the hiring system is a reflection of national characteristics, the communist past and the need to comply with European requirements for countries integrated into the Eurozone.

Theoretical and methodological foundations of the study of the results of reforming recruitment system in public service

Changes in the system of recruitment for public service were due to reforms of the system of state and municipal government. Public administration reforms began actively not only in Eastern, but also in Western Europe at the end of the XX century. The new management approach as a new methodological approach that attracts the attention of researchers, says Toonen (2007). Against this background, the key task of establishing the executive branch of the post-communist countries was to build their capacity in the development of politics and to increase the professionalism of its employees (Goetz & Wollmann, 2001).

The reform of public service employment relations in Eastern European countries, based on the approach of the new public administration (NPM), has led not only to positive trends in European integration. Some authors see the main reason for this as neglecting the hallmark of the employer (state) as a political institution and excessive attention to moral hazard and agent costs (Bordogna, 2008). For other authors, the reason is the difference in the goals of reform and European integration themselves - for the countries of Central and Eastern Europe, the initial positions, problems, ability to change and the initial goals were very different from most countries of Western Europe (Bouckaert, 2009).

However, the development of Eastern European countries in the new capitalist conditions led to their desire to be in the European Union, and, therefore, to fulfill a number of requirements for the government structure (Schimmelfennig & Sedelmeier, 2005). Indeed, the formation of the European Union required states to rethink politics, administrative power, organise public service and allocate financial responsibility (Nunberg, 2000).

In a number of Eastern European countries that have joined the EU or intend to do so, civil service reforms have been carried out in preparation for this process. The development of administrative capacity was one of the conditions for EU membership (Dimitrova, 2005). The civil service reform policy was based on the “principles of the European administrative space” that were developed by the Sigma program in the late 1990s in line with the continental tradition (SIGMA, 1999). Membership in the European Union requires that each administrative branch and industrial sector of an EU member state comply with the acquis communautaire (community rules). Therefore, the main direction of the reform was to be a review of the basic laws of the member countries and EU candidates. During the first decade of the XXI century, in order to solve this problematic system, a meritocratic, but very static hiring system was set up and it was based on formal qualification rules and hiring competitions (Kostina, Zaytseva & Bannykh).

In 2004, the following European Union countries joined the EU - Hungary, Slovakia, Poland and the Czech Republic, and in 2007 - Bulgaria and Romania. Ukraine and Moldova are currently candidates for EU membership. As noted in the Sigma report, after entering the EU, public service reforms lost an external incentive and were carried out entirely on their own initiative (SIGMA, 2009). Also the 2009 report noted that in all countries that joined the EU in 2004, there was a departure from reforms in the spirit of following European principles. However, exams and selection were additionally deregulated, and they no longer reach the average level of compliance with European principles of administration.

The remaining countries of Eastern Europe - Belarus and Russia - have paid quite a lot of attention to the reform of their civil service over the XXI century. At the same time, although they were not limited to the pan-European principles of public service organisation, they also generally proceeded from them, including with regard to the openness of contests upon entering the service/

Methods

The study assessed the procedure for admission to the civil service of Eastern European countries according to several criteria that imply adherence to general European principles. First of all, who could be considered as a public servant in a nation-state is essential. In this case, the most important issue is, inter alia, the allocation of

political posts and senior service in the public administration system. It was also assumed that the particularities of revenue would depend on the organisation of the public service itself - i.e. its division into types and categories (classes, groups). Secondly, the features of the national requirements for candidates entering the public service were studied.

The procedure for recruitment itself was evaluated in terms of, firstly, the presence of uniform conditions (order) of admission. Secondly, the selection and assignment of candidates were examined, including how open these procedures are.

So the hypothesis of the study are:

1. Recruitment systems are not uniform or universal
2. Integration in the EU has a significant impact on regional (country) features
3. The proximity of the state to the West or East in the course of ongoing reforms matters

The study is based on an analysis of modern legislation in Eastern Europe, including changes that have occurred in the past few years, as well as a secondary analysis of studies conducted on similar topics. In the course of the study, we use qualitative and quantitative research methods: content analysis of laws and other normative documents, analysis of documents and statistical information.

The results of the study

Civil Service Organization

The basic principle of organization of public administration in Europe indicates the need to separate the political and administrative spheres, which involves the separation of senior positions in the service and special selection procedures for these positions. As a result of the reforms in the analysed countries, a limited concept of public service was generally adopted, when only professionals in public administration and administration and professionals with public authority are public servants. In a number of countries, legislative regulation of the recruitment and passage of public service took shape in the early 2000s and was only being amended; in other countries, new laws on public service were adopted quite recently (see Table 1)

Table 1: legislative regulation of public service

Country	First law in force	First changes to law
Romania, Bulgaria	1999	2000
Belarus	2003	2019
Russia	2003-2004	2006
Poland	2006	2008
Moldova,	2008	2009
Hungary	2011	2014
Czech Republic, Slovakia	2014	2017
Ukraine	2015	2018

The analysis showed that all national public services have sufficient uniqueness, and sometimes significant complexity of the internal organization, which affects the systems used to hire employees. First of all, we are talking about the separation of political and administrative services, as well as the allocation of senior services. In a number of countries, political positions are excluded from the civil service corps. In Russia, the highest positions in government bodies (deputies of all levels, top officials of the subjects of the federation, ministers, judges, ambassadors, representatives, etc.) are excluded from the number of state employees. In Slovakia, on the contrary,

employees of state and local authorities, the police, the army, customs, members of parliament and politicians are recognized as public servants.

The status of senior civil service is formalized in Romania and Poland (secretaries general, deputy secretaries general, prefects, sub-prefects and government inspector). There are no special conditions for senior service in Bulgaria, Hungary and the Czech Republic, Russia, Belarus, Moldova.
In addition, the structure of the public service itself, which can be quite complex, also influences the organisation of recruitment. So, for example, in Russia there is a division of public service into state (service in government) and municipal (service in local government). In turn, the civil service is divided into three types (civil, military, other types) and two levels (federal and regional). Civil service posts fall into three categories and five groups.

Большой проблемой в последнее время остается политизация старших служащих, фаворитизм и тенденция к патронажу в найме служащих, что отмечается и в материалах OECD (OECD, 2011).

Qualification Requirements

In the CE countries, mainly qualification requirements consist of two parts - general requirements established for all civil servants centrally, and special ones established by state bodies independently. General qualification requirements could be established in laws on public service (Russia), or in separate legal acts. For example, in a number of EE states, documents such as the National Qualifications Framework (Republic of Bulgaria) and the unified Qualification Directory “Public Positions of Public Servants” (Belarus) have been adopted.

General requirements, for example, include citizenship, legal capacity, lack of criminal record, medical fitness, knowledge of the state language, and the level of professionalism. But even these requirements have their own specifics. So, in Ukraine, upon entering the civil service it is necessary to provide a document confirming knowledge of the state (Ukrainian) language and its receipt is in a paid form.

Some countries require their employees to know not only the state, but also foreign languages. For example, in Moldova, knowledge of the official languages of interethnic communication functioning in the respective territory is required. Since 2018, in 2018, knowledge of English or French is required to fill the so-called new posts in the public service category “A”. A certificate of proficiency in English, German or French is also required for public servants in Hungary. In Poland, a mandatory requirement is knowledge of at least one foreign language from the working languages of the European Union.

Criminal record restrictions may also vary. While civil service laws in Russia and Belarus provide for the absence of any outstanding criminal record, in Poland this is the absence of a criminal record for a deliberate crime or deliberate financial crime, as well as the absence of a ban on filling managerial positions in government bodies or the performance of functions related to the availability of public funds.

The issue of citizenship of civil servants has been resolved in various ways. The criterion for applying the provisions of the EU Treaty on the Free Movement of Labor between EU Member States was also the concept of exercising state powers or protecting the common interests of a state or local government. From then on, jobs in the public sector should be open to any EU citizen from any EU member state, with the only exception being those positions that are directly intended for citizens of the state in accordance with internal rules on public service. It is estimated that today between 60 and 90 percent of public service posts in EU member states are open to citizens of all EU member states [Sigma, 1999]. For EE states, the application of this rule is ambiguous. In some countries, only a citizen of a given country (Russia, Belarus, Ukraine, Moldova, Hungary) can be a civil servant. In other countries, mainly EU members, national legislation allows citizens of EU countries to enter the service, and in some cases also countries of other confederations. For example, in the Czech Republic citizens of another member state of the European Economic Area may enter the service, and in Bulgaria also the Swiss Confederation; in Poland - other countries that, in accordance with international agreements or legislative provisions, have the right to employment on the territory of the Republic. In Romania, according to the law (Section 50 of Law No. 188 of 1999, reprinted in the Statute of Civil Servants), a person who meets conditions such as citizenship and residence in Romania can apply for a civil service position. Slovak law provides for the possibility of entering the civil service of a citizen of another state, in this case, the applicant for the position must submit an extract from the criminal registry of his country.

In addition, among the general requirements, next one can be distinguished: providing information on income and property (Russia, Belarus), expenses (Russia), presence on the Internet (Russia); lack of membership in a political party (Poland); impeccable reputation (Poland), lack of defamatory biography (Czech Republic), impeccable lifestyle (Hungary); anti-corruption obligations.

Of particular interest is the system of requirements for professionalism. They may include requirements for education, work experience and possession of specific competencies (Bulgaria), knowledge and skills (Russia, Ukraine, Poland), personal and business qualities (Romania, Ukraine).

First of all, consider the requirements for formal education. They are established starting from the opportunity to enter the service with secondary school education (Czech Republic, Romania, Slovakia, Hungary), and ending with the requirements of only higher education (Bulgaria, Belarus, Ukraine). Education requirements are generally differentiated depending on the type of public service posts. For example, in the Czech Republic, job titles are indicated in the basic law and depend on the education received: the assistant assumes a secondary education with a certificate of apprenticeship, and the head assumes a higher education obtained as a result of training in a magistracy. In Romania, the necessary level of education for the implementation of a public function is established as follows: for class I - 4 years or more at a university; for class II - short-term licensed courses at the university; for class III - high school. In Ukraine, category “B” posts are accepted with a bachelor’s diploma, and categories “A” and “B” - a master’s degree (Ukrainian law). In the Russian Federation and Moldova, candidates with secondary vocational education can be accepted for lower positions. Only persons with a diploma of specialty and master's degree can apply for leadership positions in the Russian Federation. In Hungary, only candidates with higher education can be admitted to the central administration. In some cases, requirements may be established not only for the level of education, but also for its orientation in accordance with the content of the duties performed (Russia, Ukraine), or profile (Hungary).

As for the requirements for professional experience, they are present in one form or another in most countries of EE. In a number of countries (Belarus, Russian Federation, Bulgaria), the requirements for the length of service and experience in the specialty are established depending on the position.

However, there are exceptions to these rules. For example, in the Republic of Belarus it is allowed to hire people who do not have the necessary education and work experience if they carry out the duties assigned to them in full, show initiative and a creative attitude to work. In Hungary, it is allowed to hire municipal employees who do not have special education and training, but only for the time that they need to receive it - from a year to two. If during this period the employee has not received the necessary education, the contract with him is terminated.

Types of Admission

The most important characteristic of the system of admission to the civil service is the way of occupying a position. European traditions provide for various approaches to solving this issue - an open or closed system. In any case, a competitive selection system is provided for non-political posts. In all EE countries, the competition system in one form or another is present, although it was introduced in different countries at different times. However, the question of the procedure for joining the service in different countries has not been resolved unambiguously. If in some countries the competition is the only and mandatory way to fill posts, in others there is a non-competitive procedure for admission, the conditions and technologies for conducting competitive procedures vary quite a lot.

The competition is considered the most democratic procedure and the most effective method of selection, because it allows you to select the most capable. Legislation of EE countries provides for both an open and closed competition. An open competition for filling public service positions suggests that any person who meets the established requirements has the right to submit an application (Bulgaria, Russia, Moldova).

In most EE countries, the competitive procedures are mixed (i.e. there is an open and closed competition). For example, in Ukraine, an open tender is provided as the main procedure, but for a number of posts related to ensuring defense and national security, it is closed. The legislation of Belarus provides for two options for the competition - open and closed. All citizens of the Republic of Belarus who meet qualification requirements have the right to take part in the open competition. A closed competition is held among the civil servants in the reserve.

In Poland, all bodies have open competitive selection posts. There is also a closed selection system - appointments of civil servants. It can be attended by employees who have at least three years of service, a master’s degree, speak at least one foreign language from the number established by law, are a reserve soldier.

There are three types of competition in Slovakia: all citizens applying for public service can take part in an “open” competition, a “closed” competition is held among public servants in the relevant authority, and both active and freed people can take part in the “intermediate” competition civil servants.

From the point of view of organizing competitive procedures, the range of options for conducting a competition ranges from centralized to decentralized. To ensure the principle of openness, it is very important who conducts the competitive procedures, and to what extent subjective evaluations are excluded in this case.

The decentralized nature of the competition implies that each state body (organization) independently determines the rules for the competition, and the competition itself is conducted by the commission created in the body. This procedure has been adopted in Bulgaria, Hungary, Moldova, Russia, the Czech Republic. In Hungary, the composition of the commission is determined on the basis of the conditions of a particular competition, the composition of the commissions is quite numerous, but however, it does not have outside representatives of other organizations, including public ones.

In a number of EE countries, there is a semi-centralized version of the competition - when some part of it is held centrally, and the rest - by the body itself. So, in Bulgaria, the order of the competition involves two stages. The centralized stage of the competition is organized by the Institute of Public Administration and is carried out through tests to determine the level of general competencies and basic knowledge required to perform public service. Candidates who have successfully completed the centralized stage are admitted to the second stage - the decentralized one, which is carried out by the competition committee of a specific state body and is aimed at determining the level of specific competencies, professional and business qualities of candidates necessary for a certain position. In Ukraine, the task of holding a competition for employees of category “A” is assigned to the Commission on issues of the highest corps of public service, for categories “B” and “C” - to the competitive commission of a state body. In Romania, contests for vacant managerial positions, with the exception of the head of the office and the head of the service, are organized by the National Agency for Civil Servants, and for the rest - by government bodies and central and local administration institutions, a competition commission created to hire civil servants.

Methods for selecting and evaluating candidates. The essence of the competitive procedures is the selection of candidates who most meet the qualification requirements for the civil service position. It is precisely this that makes it possible to form a highly professional corps of public servants capable of solving new tasks of public administration. Although the set of methods for assessing candidates would seem to be standard in nature, its application for each BE country is unique. The most common methods are document verification, testing, interviews, and written examinations. However, very specific methods can be applied - for example, a polygraph (Russia). In many ways, the choice of methods is associated with established qualification requirements for public servants.

In Moldova, the selection procedure includes verification of application documents, a written exam, consisting of several tasks and interviews. A written exam tests the knowledge and skills necessary to complete the tasks and responsibilities of the public service. Candidates who pass the exam are accepted for an interview. The main questions asked during the interview are aimed at assessing professional and personal abilities relevant to this position; factors that motivate and demotivate the candidate; and behavior in various situations, including crisis situations. For leadership and managerial positions in the civil service, issues are also related to leadership style, ways to motivate subordinates, team work, etc.

In the Slovak Republic, the selection committee will examine the general knowledge, professional knowledge, skills and personal characteristics of the candidate. The following assessment methods are applied - a written test to verify the applicant's knowledge; a written test to test general knowledge, in particular the constitutional order, the organization of state power, about public service; written test to test knowledge of the national language; a written test to check the level of knowledge of a foreign language (if its knowledge is included in the requirements); written testing to test the skills and personality of the applicant; case study; a personal interview with candidates to test for the necessary skills and personality characteristics.

In Hungary, the following methods are most often used when applying for public service: suitability tests (health, physical, mental), screening (medical and psychological health), regulatory requirements checking (for example: incompatibility, compliance with national security), interviews (group, structured and stress interviews), the use of screening tests, an assessment method (competent choice, an assessment center), a letter of motivation, a questionnaire on life paths, a request for recommendations, internships and programs graduates probationary period.

In Ukraine, the competition involves testing. Candidates for the posts of categories "A" and "B" must solve situational tasks - the number of such tasks is determined by the competitive commission. After passing the test, candidates are interviewed, the purpose of which is to assess the conformity of the professional competence of the candidate with the established requirements, were not evaluated at the previous stages of the competition.

In Belarus, for those who enters the civil service for the first time, a qualification exam is held on the same issues for all (except for those who fill public positions, military personnel, employees of the internal affairs bodies, and a number of others). The form of the qualification exam (exam, interview, testing) is determined by the state bodies (organizations) in which the examination commissions are created.

Conclusion

The article analyses the system of admission to public service in the Eastern Europe countries in the context of reforming the public service system. The specificity of the analysis of changes in the recruitment system for public service in Eastern Europe is that the national civil service systems of post-communist states were at different stages of its development by the time of European integration, which significantly complicated the process of qualitative changes and the implementation of European principles by all participating countries

The analysis of the characteristics of recruitment systems was carried out according to several parameters: consolidation of the status of a civil servant in national legislation, differences directly between civil service and "senior" service, qualification requirements for candidates, selection procedures for public service. The analysis showed that in the first two decades of the new century, as a result of reforms, the selection procedures, qualification requirements for candidates and other characteristics underwent changes in Eastern Europe. For example, today the selection procedures in all analysed countries are based on information technologies, qualification requirements in individual states include knowing not only the state language of their country, but also other European languages, and not only citizens of the state can act as candidates for public service , but also citizens of other European countries. Part of these changes was due to a change in the paradigm of public administration, the need for greater transparency and accountability, and the other - to European integration.

However, in the analysed countries there is no uniformity of procedures for all categories of civil servants, which confirms the first hypothesis. The second hypothesis was also confirmed: for countries that joined the eurozone, there was a need to adjust the conditions for entering the civil service in accordance with European principles. This condition was met by the eurozone member states with certain differences, expressed in the status of a civil servant, qualification requirements and competitive procedures. The third hypothesis has not been confirmed: the geographical proximity of states to the West or East does not matter for recruitment system.

Thus, the organization of public services in Eastern Europe countries is significantly different and bears the imprint of national traditions. The use of acquis in the administrative sphere as a whole, and in the hiring system in particular, depends on the availability of state capabilities and resources in this sphere, on the structures and horizontal management systems.

A comparative analysis of recruitment systems made it possible to understand what changes have occurred in the civil service recruitment system in Eastern Europe. Harmonization of the legislation of Bulgaria, Hungary, Czech Republic, Slovakia, Romania in accordance with the requirements of the European Union, increased the transparency and accountability of the activities of state bodies of these countries. At the same time, the implementation of laws and the introduction of procedures and institutions were not enough to create an effective public service system. The best conditions for fulfilling the requirements of SIGMA are in Hungary and Poland. Belarus, Russia, and Ukraine have also made changes to democratise the public service, open recruitment procedures and accountability, but additional reforms are needed to implement European principles of public administration

The Subject-Matter of Judicial Proceedings Against Insurance Companies for Compensation for Traffic Accidents in Poland

Abstract

A lot of cases for compensation for traffic accidents against insurance companies are adjudicated by Polish courts. Reports of the Institute of Justice show that a vast majority of them (over 90%) are cases won by the parties injured in these accidents. This state of affairs has a special legal meaning, but it also plays a significant economic role. This results from the determinants of the insurance market in Poland. The functioning of the society and economy and the activity of the courts has grave effects. The subject-matter of court cases against insurance companies does not only cover disputes between the parties of these proceedings, but also their negative social implications. The purpose of this study is to demonstrate the possible legislative and non-legislative solutions that lead to a reduction of the number of court cases against insurance companies and, in consequence, positive social and economic changes. The analysis covers judicial decisions, including the case-law of the Polish Supreme Court, and also reports on the functioning of the judiciary and the insurance market in Poland. The starting point for the research was to present legal approaches to liability for damages in the Polish civil code. The method of interpretation of applicable law and the statistical method were used in the analysis. The research produced a conclusion that the activity taken up by state authorities should be focused on ensuring that insurance companies observe the law and good practices, whereas legislative steps should primarily include the strengthening of the position of the injured party at the stage of pre-jurisdictional dispute resolution with the insurer.

Keywords: Compensation, Traffic Accidents, Insurance Companies

Introduction

A lot of cases for compensation for traffic accidents against insurance companies are adjudicated by Polish common courts of law. According to a report of the Institute of Justice, the number of such cases grew more than fourth-fold in 2004-2017 (Siemaszko A., Ostaszewski P., Włodarczyk-Madejska J. 2019, p.15). The rising trend continued in subsequent years. The data gathered in the research conducted by the Institute of Justice shows that the courts adjudicated in favour of the aggrieved party in more than 90% of cases, awarding them compensation in full or in part (Krajewski 2017, p. 12).

A high number of cases for compensation for traffic accidents and a significant majority of cases lost by the insurance companies have a special legal significance, but they also play an important economic role. A question arises, about the reasons of such a state of affairs and its resulting effects. The starting point of reflections in this regard is the legal basis of claims pursued in courts by the aggrieved parties and the reasons that underlie the judicial decisions.

A high number of cases concerning compensation for traffic accidents is especially essential in the context of the courts' burden and its economic effects. From the economic perspective the problem of costs borne by the parties to proceedings is also important, in particular by the losing party, and also the problem of profitability of losing court cases by these companies from the point of view of the consequences for car owners who are burdened with higher premiums for the obligatory third party insurance. This question affects the functioning of the society and the economy.

Liability for damages in traffic accidents in Poland

Liability for damages resulting from traffic accidents is regulated in the Polish legal system in the Civil code (hereinafter: CC). It is based on the principle of risk and the principle of fault (Nestorowicz, Ludwichowska-Redo 2014, p. 15). In the case of liability under the principle of risk, the issue of fault of damage perpetrators is irrelevant.

Cite this Article as: Karolina ZIEMIANIN "The Subject-Matter of Judicial Proceedings Against Insurance Companies for Compensation for Traffic Accidents in Poland" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

In such a case it is sufficient to establish that the damage was done and that it was done due to the vehicle's being in motion, and there is a cause-and-effect relationship between the damage and this vehicle's movement. In cases where liability is based on the principle of fault, the premise of the liability for damages also involves the damage's perpetrator's fault-inducing actions.

Pursuant to Article 436 in conjunction with Article 435 CC, the owner-like possessor of a mechanical vehicle propelled by natural forces is liable for personal or property damage done to anyone by the motion of this vehicle, unless the damage is due to force majeure or solely to a fault on the part of the aggrieved party or a third party for whom he is not responsible. However, if the owner-like possessor has given his vehicle over for dependent possession, the liability is borne by the dependent possessor. Vehicles propelled by natural forces include i.a. cars or motorbikes. In the light of the above regulation, liability for the movement of the vehicle in based on the principle of risk. The risk is also the basis of liability for damages in traffic accidents that involve one vehicle driving into another while the other vehicle is not moving.

The case is different when vehicles propelled by natural forces collide. Article 436 § 2 CC stipulates that in the event of a collision of vehicles owners-possessors may claim remedy of damage suffered only on general terms. Those persons are also liable only on general terms for any damage caused to persons they transport out of courtesy. This means that in the case of a collision of vehicles, liability is based on the principle of fault.

Liability based on the principle of risk and the principle of fault is irrelevant from the point of view of the amount of compensation. This issue is regulated under Article 363 CC. This article points out that damage should be remedied, at the aggrieved party's choice, either by the previous condition being restored or a relevant sum of money being paid. If, however, restoration of the previous condition is not possible or it results in excessive difficulties or costs for the obliged person, the aggrieved party's claim is limited to monetary performance. If the damage is to be remedied by payment of money, the amount of the compensation should be set according to prices as at the compensation determination date unless extraordinary circumstances require that prices existing at another time be taken as the basis. In the light of this provision, damage may be remedied in two ways: by natural restitution or by recompense. Both of these forms are equivalent. However, in some situations the aggrieved party has no possibility to make a choice. This concerns a situation e.g. when the thing is unique or when it results from the debtor's legitimate interest.

The insurance for owners-possessors of vehicles for third party liability is obligatory in Poland. In the light of Article 822 CC, by a third party liability insurance contract, the insurer commits to pay the compensation set forth in the contract for any damage caused to third parties with regard to whom liability for damage is borne by the policyholder or the insured, while the loss payee, in connection with an event covered by a third party liability insurance contract, may raise claims directly against the insurer.

Judicial decisions in cases for damages

Disputes for compensation due to traffic accidents between the aggrieved parties and insurance companies are, in principle, of a standard nature. Their subject-matter may be brought down to a few basic threads, among which the concept of the manner of remedying the damage is most important, including the type of spare parts used and methods of vehicle repair, the sum of the compensation and its payment forms or the issue of total loss and renting a replacement vehicle. The courts have given decisions on these matters numerous times, including the Supreme Court, by issuing judgements and passing resolutions which set a line of judicial decisions which is favourable to the aggrieved parties. Manners of establishing compensation in traffic accidents was also the subject of studies prepared by the Polish Financial Supervision Authority which oversees insurance risk (KNF, 2014).

In the light of judicial decisions, it is assumed i.a. that the insurer's obligation involves the payment of the monetary performance which constitutes compensation for damages caused by the insured to third parties. The aggrieved party may therefore claim hypothetical restitution which corresponds to the costs of restoring the vehicle to the previous condition or compensation calculated according to the method of difference in the aggrieved party's property. The payment by the insurer of the sum due to compensation does not depend on whether the aggrieved party did have their car repaired and what the cost of such repair was, or even on whether they intend to do so. The sale of the damaged vehicle remains irrelevant in this respect. The vehicle should be repaired using original spare parts and only in exceptional, particularly justified cases, by using replacement spare parts. In terms of assessment of the amount of the partial and total loss the same criteria should be applied. The aggrieved party is entitled to a replacement vehicle for the time of the repair, irrespective of whether they have access to other forms of transport (i.a. decision of the Supreme Court of 7.12.2018, III CZP 72/18, www.sn.pl).

Reasons for a large number of cases lost by insurance companies

The cited report of the Polish Institute of Justice shows that for cases brought by the aggrieved parties, in 32.5% of them (out of the 244 analysed cases) the claim was awarded in full, whereas in a further 60.2% of cases the claim was awarded partially. Only 7.3% of cases ended with dismissing the claim in full in favour of the insurance company. In cases where the aggrieved party's claim was awarded in part, on average 74.65% of the claim was awarded (Krajewski 2017, p. 12). The number of cases for compensation due to traffic accidents at the same time increases each year (Siemaszko A., Ostaszewski P., Włodarczyk-Madejska J. 2019, p. 15). Such a state of affairs triggers controversy. Most of all a question arises of why so many cases for compensation for traffic accidents are heard by common courts of law, since most of these cases are adjudicated in favour of the aggrieved party.

The basic reason for which the courts deal with a great number of traffic accidents compensation cases involves the widespread nature of such accidents and the obligatory nature of third party insurance for vehicle owners. In fact, almost any traffic accident involves vehicle damage. Determining the principles of liability, fault and circumstances of the incident is often affected by the facts established by Police officers on the scene. The obligation to remedy the damage by the perpetrator is taken over by the insurer under obligatory insurance, which encourages certainty that the compensation will be paid irrespective of the solvency of the perpetrator himself. A greater number of court cases is a result of growing social awareness in terms of the existing right to justice.

The popularity of cases associated with traffic accidents is not, however, the only reason for the multiplicity of court disputes against this background or the significant majority of cases lost by insurance companies. The most important reason for this situation must involve inappropriate practice of insurance companies in terms of settling damages caused due to traffic accidents. Such conclusions result i.a. from a Supreme Audit Office's report entitled "Consumer Protection on the Insurance Market" of 23.07.2019. Detailed guidelines on compensation for traffic accidents have not changed the practice of insurance companies concerning its payment. Settlement proceedings conducted by these companies in a majority of cases result in the payment of low compensation, which is only raised in the course of judicial proceedings. An analysis of settlement proceedings' files leads to a conclusion that in a vast majority of cases insurance companies use ready-made model answers and do not take into account the basic assumptions of establishing compensation pursuant the provisions of civil law or guidelines resulting from the views of the judicature and of the Polish Financial Supervision Authority. They use incorrect argumentation which is mainly based on the fact that decisions taken by the insurer do not generate additional costs of vehicle repair. Lowering the sum of compensation is explained by caring for the economy of repairs, despite of such economy violating the aggrieved party's interest in most cases. Such practices are also applied by companies that dominate on the insurance market.

Reasons for such opinions of insurance companies are based on an inadequate interpretation of regulations and judicial decisions i.a. by referring to judgements of courts of the lowest instances which are often non-final and amended in the course of further proceedings by subsequent courts. Correspondence of insurance companies at the pre-jurisdictional stage is not based on solving a specific dispute and presenting counterarguments against the aggrieved party's claims, but only on giving their own mode to the reasoning, which often does not refer to the essence of the problem. Responses from insurance companies are greatly based on the aggrieved parties' ignorance and mislead as to the legitimacy of their arguments. Such findings come from i.a. a report of the Insurance Ombudsman (2015) entitled "Case-law of the Supreme Court and the settlement practice in traffic accidents".

This is why in compensation cases practically no negotiations are held at the stage of the so-called settlement procedure, nor are other attempts made to resolve the dispute amicably. The use of arbitration is not widespread at that. Therefore, the aggrieved party is only left with pursuing their claims before a common court of law. Such a solution is most often applied as a consequence of privately obtaining an opinion of a valuator specialising in the operation of vehicles, the content of which confirms the legitimacy of the aggrieved party's claim. However, bringing in a claim preceded by obtaining an expert opinion on one's own is costly, which is why only some of the aggrieved parties decide to do so. The activity of the so-called compensation firms which deal with obtaining unpaid compensation is helpful in this respect. Their activity is, however, not regulated and raises doubts.

Consequences of a large number of cases lost by insurance companies

Unreliable behaviour of insurance companies and a large number of court cases which end with the aggrieved party winning is not irrelevant to the functioning of society, economy and the judiciary. The statistics of over 90% of court cases concerning compensation for traffic accidents which are lost by insurance companies – where there are significant numbers of such court cases in general – contribute to lowered trust in the activity of insurance companies and state authorities which review and supervise insurance activity. The fact that the State Treasury is the main shareholder of the largest insurance company on the market is also important in this regard.

Obtaining compensation only at the court stage also results in blocking the financial liquidity of the aggrieved parties, who get their due performance only after the court procedure has been conducted, thus often a few years after the damage occurred. Such negative consequences concern primarily business operators whose business activity depends on functioning vehicles.

Resolving compensation disputes only at the court stage also leads to a significant increase in damage settlement costs and to the burdening of the aggrieved party with the need to credit these costs when initiating the proceeding and also in their course. The aggrieved party who brings the claim is forced to pay a court fee dependent on the sum of the claim, and in the course of the proceedings - to cover the costs of a deposit for the remuneration of an expert witness whose opinion is the basis of the judgement in a vast majority of cases. Obtaining compensation in court is, therefore, often unavailable for the poorest and those with lesser legal awareness. Higher costs of settlement of traffic damages also result in raised premiums for third party insurance for vehicle owners.

A great number of compensation disputes additionally result in a considerable burden placed on courts, extending court proceedings and difficulties in obtaining a ruling without undue delay. This does not only concern excessive length in compensation cases, but also other court cases with a more serious weight.

An increase in the number of compensation cases led to the development of a branch of economic activity which involves professional handling of disputes for unpaid compensation due to traffic accidents. The activity of these so-called compensation firms raises controversy. They concern i.a. their establishing the remuneration dependent on the result of the case (success fee) where establishing such remuneration by professional procedural representatives is prohibited by statute. The development of entities dealing with compensation for traffic accidents and a greater number of court cases brought by them resulted, inter alia, in a change of insurance-related settlement procedures. One may assume that this activity, therefore, has a positive and negative impact on the possibility to pursue compensation claims by parties aggrieved in traffic accidents.

Possible solutions to the problem

The problem of the number of court cases lost by insurance companies which concern damage due to traffic accidents has far-reaching social effects. Therefore, specific actions need to ne undertaken, signalled i.a. in MP questions (MP question no. 9141 to the Minister of Finance regarding the activity of insurance companies of 24.07.2020). However, a question arises whether such steps should have a legislative nature.

In the light of the presented civil law regulations and also in the light of judicial decisions, it seems that taking the legislative initiative with regard to liability for damages resulting from traffic accidents is not necessary. These provisions, interpreted consistently by the judicature, in particular by the Supreme Court, give a clear basis for pursuing compensation claims and for specifying the amount of these claims.

The change in the activity of insurance companies, and also an introduction of observance of good practices as part of the conducted activity, have a basic significance for resolving the problem of the great number of court cases for compensation. Certain legislative activity may prove purposeful in terms of the manner of conducting settlement proceedings by insurance companies. The state authorities' taking appropriate supervisory steps should also provide a significant solution. Developing relevant and fair legislative and supervisory solutions requires participation of representatives of insurance companies and representatives of the social side in the consultations. It would be reasonable, as part of the undertaken supervisory activity, to impose severe penalties in the event of finding activities that are contrary to the Guidelines developed by the Polish Financial Supervision Authority, which do not only concern exceeding the time limit for compensation payment. Increasing costs of court proceedings for parties who lose evident court cases should be also considered. However, one needs to point out at that, that insurance companies in part transfer the burden of financing the costs of compensation proceedings onto vehicle owners by raising premiums for third party insurance.

It is also necessary to streamline the procedure of pursuing claims for compensation. A conclusion about creating the measure of an additional, independent valuer at the stage of settlement proceedings should also be viewed positively. Due to the large number and standardization of cases for compensation which concern traffic accidents, an additional pre-jurisdictional opinion obtained in the course of negotiations between the aggrieved party and the insurance company may result in the dispute ending at the pre-jurisdictional stage. Promotion of arbitration, which also deals with resolving insurance-related cases, also seems beneficial. Focus needs to be given to taking into account the equality of parties is such proceedings, which is often distorted in the practice of conduct between consumers or small companies and actors with a significant position on the insurance market. In the context of liability for damages, it is also important to raise social awareness in terms of the rights of the aggrieved parties and to regulate the activity of the so-called compensation firms.

Abstract

Analyzing terrorist groups' trends using innovative Data Analysis techniques was widely used in many research fields related to fighting terrorism. Data analysis models are used to identify crime trends, investigate unsolved attacks, predict potential threats, etc. One motivating issue that was not widely developed in the literature is the clustering of terrorist groups based on some parameters to provide actionable information. In this study, a set of armed groups identified between 1970 and 2016 in North Africa and Middle East are investigated. These groups were partitioned based on their activity and lethality parameters that can provide highly valuable results concerning their spread and fame. This study was carried out using the open source Global Terrorism Database (GTD) dataset.

Keywords: Terrorism, North Africa, Global Terrorism Database, Terrorism Groups Profiling, Data Mining, clustering, pattern recognition

Introduction

The economic development and prosperity of a country are directly linked to its national security and can be seriously affected by the political and social instability that they may incur, especially with the raise of terrorism as stated by Meierrieks et all (2013). Brutal and bloody actions characterize the lethality of a terrorist group and attract the public opinion and the mass media, especially when a high number of casualties is registered. Homeland Security departments and intelligence agencies are increasingly implementing new counter-terrorism strategies based on data collection and analysis techniques including Data Mining and Machine Learning. One of the most effective actions in fighting terrorism is to identify the factors that are related to the formation of armed groups and the conditions that enable them to operate and find support for their activities.

Numerous researches were proposed to dissect the terrorist threat based on a data analysis perspective. Very large datasets were collected and statistically processed to help specialized departments better investigate terrorism. In this line of research, we attempt to bring a methodologically robust approach by employing Data Mining. Data Mining is the process of analyzing data to find meaningful patterns and previously unknown relationships. Data Mining is a useful technique for studying the complex phenomenon of terrorism. One of the applications of classification techniques in the field of terrorism is to reveal which countries are especially prone or immune to terrorism, when and why. In this endeavor, we focus on a dataset that includes all religiously motivated terrorist attacks between 1970 and 2017 in North Africa and Middle East. To this end, new form of Data Mining dedicated to counter terrorism known as Investigative Data Mining (IDM) has emerged initially defined by Wadhwa et al (2013) and also reconsidered in the study of Hassani, Hossein, et al (2016). This research contributes to the growing literature on the determinants of behaviors of individual militant groups and some results can be interpreted to be

broadly in line with prior researches into militant group characterization.

This paper is organized as follows: in the second section we explain the usefulness of Data Analysis methods in investigating terrorism trends as well as the open source dataset used in the case study. In the third section, the proposed parameters to characterize the activity and lethality of terrorist groups, the means used and the targets selected by these groups are presented. In the fourth section, a case study of the Islamist terrorist groups in North Africa and the Middle East is provided. The last section presents the conclusions and perspectives.

Previous Works in Investigating Terrorism Using IDM

Terrorism was investigated from several perspectives and the researches motivated by the extensive use of new technologies by terrorist groups during the last years including Jailun et al (2010) and Klein et al (2016). The activity and lethality of terrorist groups are among the characteristics that, in our opinion, require further consideration and study. Identifying and classifying militant groups according to these two parameters is a promising research line that was considered by Danzell et al (2013) and Mierau et al (2015). However, this kind of analysis does not differentiate between lethality and activity; groups that produce a high number of casualties may be very active groups, but not necessarily highly lethal. Besides, Choi et al (2014) focused on which organizational characteristics are associated with lethality and which are associated with activity by classifying militant groups' strategy choices, in terms of ideology, capacity and environment. It was shown that groups from countries with intermediate levels of democratization are significantly more lethal than groups from either very autocratic or very democratic countries. In Choi et al (2014), the authors proposed a two-step method to characterize the activity and lethality of terrorist groups in terms of ideology, architecture and environmental parameters. Their results showed that ideological factors such as religion were more determinants of lethality than other factors while capacity and environment such as economic development factors matter more for activity. However, in their research, the authors did not provide an extensive statistical analysis to classify terrorist groups based on their lethality and activity. In Gartner et al (2019), the authors proposed a method to classify web documents to reveal and identify terrorism-topic related documents. Thus, it would be easier to focus on specific portion of the documentation under consideration. Internet provides a lot of valuable information to the users and the amount of web contents is progressively increasing. This fact makes the identification of potentially dangerous patterns more challenging and prone to error. Simply extracting keywords from documents is not enough to classify the contents. In the study, a method based on word similarity using WordNet hierarchy is used. In Alsaedi et al (2019), the authors used the Global Terrorism Database and the South Asian Terrorism Portal to apply "shallow Machine Learning models" to train themselves and facilitate the exploration and the understanding of the complex dynamics of terrorism, state and society. In Mo et al (2017), the authors also applied Data Mining and Machine Learning techniques to the Global Terrorism Database to acquire valuable information about the predicted attacks and attackers. The study focused on two tasks: predicting the success of an attack and predicting the identity of the terrorist organization that is behind the attack. To implement this, the authors used three Machine Learning algorithms: K-nearest neighbor (KNN), Naive Bayes (NB) and Random Forest (RF) to train the models. Each algorithm was used to construct two models, one for each task. In Byman et al (2014), the authors demonstrated how Machine learning can be applied to predict terrorist events hidden in terrorist attack events and by which the experts expect to get a clear picture of what the terrorists are thinking about in order to step up defense against these organized acts. The Global Terrorism Database (GTD) was then used. Support Vector Machine (SVM), Naive Bayes (NB) and Logistic Regression (LR) were adopted in the study. Two feature selection methods including Minimal-redundancy maximal-relevancy (mRMR) and Maximal relevance (Max-Relevance) are used to further improve the classification accuracy.

The Experimental Dataset

Traditional sources and means of intelligence, including human intelligence, intuition and continual hypothesizing, have provided accurate and valuable results during main international crises as stated by Mattern et al (2014), Stottlemyre et al (2015) and Freilich et al (2014). However, nowadays the extensive use of new information technologies requires focusing on improving our abilities in collecting and analyzing large amounts of data automatically. Accurate datasets were extremely difficult to obtain until recently, since dealing with such information was considered confidential and restricted. Open source databases previously motivated by many researchers such as Sheehan et al (2012), Giroux et al (2013) et LaFree et al (2014) dedicated to terrorist activities have gained popularity and consideration in the recent decades. In this study, a subset extracted from the Global Terrorism Database (GTD) is employed as in the work of Berkebile et al (2017). The last online published version of the GTD can be downloaded from https://www.start.umd.edu/gtd/contact/. The GTD is an open-source database including information on terrorist events around the world since 1970 with more than 180,000 cases recorded. For each incident, the date and location of the incident, the weapons used and the nature of the target, the number of

casualties, and the group or individual responsible are given, when identifiable.

In our study, the dataset is composed of entries including 21097 terrorist attacks with additional information, such as: the date of the attack (year, month, day), the region, the country, the city, the location, the type of the attack, the target, the number of casualties and victims, the terrorist group involved. These attacks took place in the region of North Africa and the Middle East, spanning over 20 countries (Algeria, Bahrain, Egypt, Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Libya, Morocco, Qatar, Saudi Arabia, Syria, Tunisia, Turkey, United Arabs Emirates, Western Sahara, Yemen, Gaza). Notably, the number of casualties (killed and wounded) for each attack was also reported and it will be used in determining the lethality of the group.

Case Study: Middle East and North Africa Armed Attacks Between 1970 And 2017

Terrorism Trends Between 1970 And 2017 In North Africa And Middle East

The number of terrorist groups and their affiliates has grown exponentially especially since 2011. In figures 1(a-b), we report some trends related to terrorism in North Africa and Middle East.

Figure 1(a). Number of terrorist attacks in North Africa

Figure 1(b). Number of terrorist attacks in Middle East.

Figure 1: Terrorist trends in North Africa and Middle East betwenn 1970 and 2017.

According to the figures 1(a,b), the region of North Africa and Middle East was hit by several terrorist attacks almost every year since 1970. Three main periods can be reasonably outlined: 1979-1984, 1989-1995 and starting from 2011 to 2017. By interpreting the terrorist trends separately in North Africa and the Middle East, it is shown that the same features are shared over the same periods of conflicts respectively: 1979-1984, 1989-1995 and finally 2011-2017.

Evaluating the Activity of Terrorist Groups: The Activity Parameter

The activity of a terrorist group is determined by the total number of attacks carried out by that group. An increase in the number of terrorist attacks suggests a higher activity for that group. The activity parameter characterizes the impact of a group on the public community: most active groups will be most famous among the international community and this would increase their impact and influence. A group‘s period of activity is an important parameter in the evaluation process. The proposed activity measure proposed in this study and denoted by (A) is given as follows:

$$A(year)=\frac{NB_total_attacks}{period_of_activity\ (age)}$$

This value measures the number of attacks carried out by a terrorist group per year. The age of a terrorist group represents the number of years between the first and the last attack carried out according to the information given in the database. Groups with a higher activity may correspond to groups containing more affiliates, which could help them to perpetrate attacks more frequently or simultaneously.

Evaluating the Aggressiveness of Terrorist Groups: The Lethality Parameter

In this section, the second parameter proposed to characterizing a terrorist group is the lethality measure. This parameter can evaluate the aggressiveness of a terrorist group. The lethality measure (L) is defined as follows:

$$L = \frac{(NBkills + NBwounds)[group]}{NBkills + NBwounds}$$

It is possible to carry out the computation over a specific period covering a finite number of months or years (some periods considered immanent for Islamist terrorist groups). This could flag specific periods where the lethality increased or decreased, which may be then further investigated and explained according to specific context.

Experiments

Based on the measures of the lethality and activity, it is proposed to cluster these groups to identify the most prominent ones. The experimental dataset is composed of 740 armed groups extracted from the GTD. In the obtained results, the values for the lethality and activity parameters range from 0 to 0.074 and from 0.068 to 148.3 respectively. On the other hand, it is important to standardize the range of the values of the attributes to obtain better results. In the first step, we performed a standard scalar standardization on the experimental dataset. The implementation of the approach was performed using the python coding language and the sickit learn library dedicated to the development of Machine Learning models. StandardScaler will transform the data such that its distribution will have a mean value 0 and a standard deviation of 1. The standard scalar (SS) can be defined as follows:

$$SS = \frac{x_i - \mu}{\theta}$$

Where μ is the mean of the attribute x_i and θ is the standard deviation. The mean and the standard deviation are defined as follows:

$$\mu = \frac{1}{N}\sum_{i=1}^{N}(x_i) \qquad \theta = \sqrt{\frac{1}{N}\sum_{i=1}^{N}(x_i - \mu)^2}$$

In this study, clustering is used to partition armed groups. It is then necessary to identify the most appropriate number of clusters to consider. To tackle this issue, the Elbow method is used. The idea of the elbow method is to run k-means clustering on the dataset for a range of values of K, and for each value the sum of the squared errors (SSE) is computed. The average internal sum of squares is the average distance between points inside of a cluster. Mathematically, it is given as follows:

$$W_k = \sum_{r=1}^{K}\frac{1}{n_r}D_r$$

Where K is the number of clusters, n_r is the number of points in cluster r and D_r is the sum of distances between all points in a cluster defined as follows:

$$D_r = \sum_{i=1}^{n_r-1}\sum_{j=i}^{n_r}\left\|d_i - d_j\right\|_2$$

In Figure 2, the Elbow method is given for two cases: without and with standardization.

Figure 2(a). Elbow method for the original dataset.

Figure 2(b):Elbow method for the standardized dataset.

According to the Figures 2 (a,b), it is evident that the second Figure provides more reliable results concerning the value of K=4. In the third step, several clustering methods were used to observe and interpret the formation of the clusters either with or without standardization. The clustering methods used are the *k*-means, an agglomerative method and BIRCH (Balanced Iterative Reducing and Clustering using Hierarchies), which is an unsupervised data mining algorithm used to perform hierarchical clustering over particularly large data-sets.

Figure 3. *k*-means clustering for standardized experimental dataset.

Figure 4. *k*-means clustering for the original dataset without standardization

Figure 5. Agglomerative clustering for the original dataset.

Figure 6. Agglomerative clustering for standardized dataset.

Figure 7. BIRCH clustering for the original dataset.

Figure 8. BIRCH clustering for the standardized dataset.

According to the Figures 3 to 8, the same results are almost obtained using the three clustering methods either for standardized or original datasets. However, better clustering outcomes are evident using the standardization approach. In fact using standardized dataset permitted ensuring uniformity within the values and thus resulting in more compact and separated clusters.

According to the terrorist groups dataset considered, the ISIL (Islamic State of Iraq and the Levant) group registered the highest values of the activity and lethality computed, 1,390.75 and 0.4 respectively. The group has perpetrated 5564 terrorist attacks in 4 years mainly in Iraq (86.21%). In fact, a lethality value of 0.4 corresponds to an average of 40% of the total number of victims (kills and casualties) that were registered in the database for almost 50 years.

This also indicates that the ISIL terrorist group that appeared in 2013, and had only four years of existence at the temporal limit of the dataset, has generated almost the same number of victims as of all the other terrorist groups that appeared in North Africa and Middle East since 1970.

On the other hand, even in terms of the activity, this group showed the greatest value with 1,390.75 attacks per year, that is almost four attacks daily.

In the Figures 3-8, four clusters were identified as depicted by the Elbow method.

- The first cluster is composed of two elements with very high activity but low lethality corresponding to the SPIS (Sinai Province of the Islamic State) and TPIS (Tripoli Province of the Islamic State). This cluster represents groups with high activity (activity≥116) and low lethality (lethality≤0.02). The two groups SPIS and TPIS had an activity value of 148 and 116 respectively which means almost 3 and 2 attacks per week, but are not lethal (1.6% and 0.5% respectively). This class represents more active terrorist groups, but not necessarily the more aggressive ones.
- The second group is composed of six elements. The lethality of these groups ranges from 3% to 7.5% and their activity from almost 36 to 97. These groups are more lethal than those given in the first cluster and are as follows with their corresponding activity and lethality parameters: Houthi extremists (Ansar Allah, 96.54, 0.0385), Al-Qaida in the Arabian Peninsula (AQAP, 78.23, 0.0375), Kurdistan Workers' Party (PKK, 64.75, 0.0512), Al-Qaida in Iraq (63.7, 0.0748), Al-Nusrah Front (55.4, 0.0298), Islamic State of Iraq (ISI, 36.25, 0.0312). These groups have an activity measure higher than 36 which almost corresponds to one attack per ten days.

- The third cluster is composed of elements with low activity and low lethality. This cluster is composed of 72 terrorist groups. The activity parameter of these groups ranges almost from 10 to 50 and their lethality reaches almost 2% in the best cases.
- The fourth cluster is composed of armed groups with very low activity (activity ≤16) and very low lethality (lethality ≤0.01). This class represents the least active and lethal terrorist groups including BPIS, MR, AQMI, IE, GSPC. These are arguably the least priority groups and fewer resources should be devoted to them compared to the others. 627 groups were classified in this category.

In the second part of the experiments, it is proposed to compare the armed groups for both regions: North Africa and Middle East in a way to highlight some main features:

Table 1: Number of attacks by country and region

Region	Countries	#of attacks	% from total
North Africa	Morocco, Algeria, Tunisia, Libya, Egypt	3,705	17.56%
Middle East	Bahrain, Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Qatar, Saudi Arabia, South Yemen, Syria, Turkey, United Arabs Emirates, West Bank and Gaza Strip, Western Sahara, Yemen	17,392	82.43%
		21,097	

In North Africa, 170 armed groups were spotted from an experimental list composed of 730 groups. This corresponds to a percentage of 23.28% of the total number of groups. These North African armed groups perpetrated almost 3.705 attacks from 21,097 total attacks registered in the two regions (17.56%). It is also important to report that this number corresponds to all armed groups that appeared in the region since 1970 according to the data provided by the GTD. According to our clustering results and the clusters generated, the first cluster contains two groups: TPIS in Tripoli (351 attacks) in Lybia that started action in 2014 and the SPIS (446 attacks) in Egypt that started action since 2014.

In this section, the means of the attacks used by these armed groups are investigated. In fact, the classification of the means of attacks is a key determinant in the lethality and activity of an armed group: some types of attacks are more deadly than others such as armed assault and bombing. In Table 3, the total number of attacks carried out for each attack type is reported.

Table 3: Number of attacks according to the type of attack.

Attack type	Bombing/ Explosion	Armed Assault	Hostage Taking (Kidnapping)	Assassination	Unknown	Facility/ Infrastructure Attack	Unarmed Assault	Hijacking	Hostage Taking (Barricade Incident)
#Number	10705	4328	1808	1790	1539	638	132	81	76
#average	50,74	20,51	8,56	8,48	7,29	3,02	0,62	0,38	0,36

According to the results, the most widely used attack type is Bombing/ Explosion followed by Armed Assault. These two means represent more than 80% of the total attacks in North Africa and the Middle East. These two means correspond to 321,502 victims out of 400,648 with an average of 80.24%. Considering the first cluster of our dataset composed of SPIS and TPIS that are two very active groups but not highly lethal. These two groups perpetrated 796 attacks in three years (2014 → 2017) with an average of almost 5.5 attacks every week. In these attacks, the Armed Assault and Bombing attacks were deployed in 480 attacks (60.30%). In the other hand, the second cluster, with active and very lethal groups, contained groups that perpetrated 6070 terrorist attacks (1984 → 2017). In these attacks, 4305 attacks were executed using Armed Assault and Bombing (71%). This outline identifies that these two types of attack means have a great contribution in the lethality of an armed group.

Conclusions and Perspectives

This research represents an investigation on terrorism with a focus on North African and Middle East armed groups. More generally, the study characterizes most prominent terrorist groups based on their activity and aggressiveness using two measures: the activity and lethality. Their tactical and strategic behaviors were also investigated in terms of the attack types used and targets selected.

According to results previously obtained, it is evident that military and security efforts combined with intelligence-enhanced capabilities have a great positive impact on combating these groups.

Jana HINKE
Czech University of Life Science, Prague, the Czech Republic, hinke@pef.czu.cz

Abstract

The aim of the paper is to conduct a desk research of the current state and development of the use of leasing financing to address the operational needs of companies in the field of circular economy, which is one part of problematic of sustainable development, and to identify research opportunities in this area. After specifying the views on the concept of circular economy and its possible use today, which emphasizes the need for environmental measures in business behavior, the description will continue in the field of research opportunities in this areas. The benefit of this study is the identification of research areas that would be feasible in the Czech or Central European conditions. After the analysis, it can be argued that leasing is not a new form of external financing within the new approach of circular economy, but only that, while meeting certain parameters, it is part of one of its parts, within the product-services system and the use-oriented services model. The authors consider the research through which it would be possible to verify the research question within the Czech companies that the adoption of a "greener" business model, as in the case of leasing, does not promote companies economically, but it is a catalyst for increasing their performance.

Keywords: Circular Economy, Leases, Leasing, IFRS 16, Tangible Assets, Reporting.
JEL classification: M14, M21, M41.

Introduction

Like the circular economy, the concept and issue of leasing is a very broad area. Leasing is currently used to deal with a large number of corporate investments. It is largely about securing operational needs such as the issue of a vehicle fleet, renting a business unit for the needs of an establishment or production plant, or gaining the possibility of an operative way of handling and managing operational and production resources. Leasing as a form external financing solution in the case of strategic and long-term investments is not very common. These investments are usually solved by financing in the form of one of the bank loans or other capital market instruments. A closer look at the concepts associated with leasing financing will also be the subject of this paper.

The aim of the paper is conduct a desk research of the current state and development of the use of leasing financing to address the operational needs of companies in the field of circular economy and to identify research opportunities in this area. After specifying the views on the concept of circular economy and its possible use today, which emphasizes the need for environmental measures in business behavior, the description will continue in the field of research opportunities in this area. The benefit of this study will be identification of research areas that would be feasible in the Czech or Central European conditions.

The paper deals with the issue of leasing financing in companies focusing on the circular economy. The second chapter is devoted to the definition of its concept for the purposes of this paper and at the same time to the possibilities of using the given principles from the point of view of corporate finance. It also analyzes existing research using citation databases of research works Scopus and Web of Science. The third chapter contains research possibilities arising from the second (description) part and identifies the connection between the issues of leasing, circular economy in connection with accounting, respectively financial reporting of individual entities. By comparing the findings, the authors propose research opportunities in the third chapter and the fourth chapter of the conclusion synthesizes the findings.

Research of Scientic Works

The circular economy is an interesting and yet so far innovative approach in companies in the EU and the US, which could be expressed as a model aimed at resource efficiency through waste minimization, long-term value retention, reduction of primary resource requirements and product loop closure., parts of production or material in the context of environmental protection and socio-economic benefits. The circular economy should lead to sustainable development, which will also be separated from economic growth with negative consequences of resource depletion and environmental degradation (Murray, 2017). The financial crisis at the turn of the last decade raised many questions about how to increase the economic performance of companies or even entire sectors and countries. One of these options is to find external ways of financing to support growth. These external sources can be traditional bank loans or just leasing financing options (Ghisellini, 2016).

The circular economy is essentially linked to sustainable development, the use of natural resources and the issue of climate change, etc. This is also related to government initiatives or initiatives at European Union (EU) level aimed at promoting the circular economy in the Member States. These programs include, for example, the "A zero waste program for Europe" (European Commission, 2014), ongoing initiatives on plastic waste (European Commission, 2018), energy recovery from waste (European Commission, 2017) and still initiatives in general renewable energies, eco-design and energy efficiency (European Commission, 2015).

One of the terms that could be associated with the economic level of the circular economy is the older term "environmental accounting", which essentially a general term is based on a combination of information and environmental costs based on different uses of accounting methods based on mutual study of relationship between accounting and ecology, in particular by distributing the costs of environmental awareness, environmental costs and their distribution into relevant environmental products and processes, environmental policies and organizational strategies (EPA, 1995).

Environmental accounting is basically used to identify business benefits gained from the use of existing natural assets with a comparison of the costs arising from their use (Bengü, Can, 2009).

Like other financial reporting systems, environmental accounting aims to share information and provide relevant reports to other stakeholders. Among other things, environmental accounting provides information on the interaction between the corporate level and the environmental level, by taking into account the macroeconomics aspect of creating the value of these resources. From a microeconomics point of view, it is possible to observe and recognize fiscal added value from the use of natural resources (Kırlıoğlu and Can, 1998 a Eray, 2011).

Thanks to the added value of environmental accounting and social developments, the use of data from these sources and procedures in creating circular economy analyzes and implementing management and accounting procedures of natural resources management companies to ensure cleaner production has become more widespread in the EU (Burrit at al, 2019). The established term for the application of these tools is "Environmental management accounting" or EMA. Burritt et al., (2019) thus defined accounting as an effective tool for providing relevant sources of information within the circular economy to ensure operational planning and decision-making processes, especially in aspects related to material flows and waste management.

The management system and application of the EMA principles is very key in grasping other dimensions of the issue of circular economics in relevance to corporate finances, especially in the field of agrarian culture. As Scarpellini (2020) states, the EMA will contain a large amount of other information depending on the nature of the business, such as:

- tangible and intangible assets related to environmental legislation,
- investments and expenditure related to carbon trading,
- assets related to contaminated soil, groundwater or air or hazardous substances,
- waste disposal issues,
- fines and periodic penalty payments and dangers arising from them,
- investments to improve the environment, reduce the impact of pollution risks and support wildlife, etc.

In such a case, companies applying EMA principles may have costs included in their financial reporting, according to other authors (Qian et al., 2011 and Zhou et al., 2017):

- life cycle management,
- the cost of environmental commitments,
- other environmentally oriented investment projects,
- direct costs, material flows and eco-innovation

In her study, Albelda (2011) demonstrated the demonstrable added value of managerial accounting for the purposes of environmental policy, resp. economy. Nevertheless, according to Scarpellini (2020), so far no study has demonstrated sustainability in the application of EMA procedures in all types of companies, not even in companies that have already applied EMA principles to their managerial accounting.

The behavior of market entities, which aim to apply not only the principles of EMA, but also other possibilities of environmental behavior within their market operations, are highly associated with the concept of "corporate social responsibility", or CSR or corporate social responsibility.

CSR is a form of voluntary activity of companies meaning the integration of social and environmental practices and responsibilities into their business model to all stakeholders (Andronie et al., 2019). As Dinu (2011) points out, CSR is not only about following certain set rules, but also about being willing and actually investing in human and environmental capital in a civic, political and social commitment that will benefit the whole community in a broad sense. Other authors also focused on the differences in this concept from the point of view of geographical specifics, where this perception is understood differently in the USA, Spanish America, Japan or Australia (Dinu, 2011). For this reason, as mentioned by some research and summarized by Dinu (2011), it would be appropriate to find international agreement on the development of program initiatives supporting the measurability of social, civic and socially responsible initiatives and measures on an international scale.

Large companies and multinational corporations increasingly report in their published reports activities related to environmental and social responsibility, from which the interested partners (banks, investors, competitors, customers) continue to draw. These resources are also used for academic research (Scrapellini, 2020). Gupta et al. (2019) in his research, which, like other authors, called this connection "triple bottom line" of sustainability. More or less, it is said here that mutual coordination and support of all stakeholders from the supply chain allows the creation of a quality basis for achieving the so-called triple bottom line of sustainability, which is meant the economic, environmental and social level.

However, investment in the activities of the circular economy requires large financial and other resources. Several authors have researched the model of circular economy in terms of the interconnectedness of individual activities that bring about improvements in the social or environment (Banaité et al., 2016). Likewise, the effects of improving the relationship with the customer and the subsequent resilience of the organization to other market fluctuations were investigated (Pauliuk et al., 2018). Nevertheless, much research has not focused on the specific effects and market (customer) pressures causing the introduction of the principles of the circular economy at a specific microeconomic level. Scrapellini (2020) found a look at how to solve this problem in her study, which focused on Spanish companies with more than 50 employees who participated in the Spanish government's call for an industrial, transport, logistics, waste, energy, etc. company that decides to innovate in the circular economy. The resulting sample was further selected from these companies - 87 companies (using the EU-SABI database). In the quantitative part of their research (Scrapellini, 2020) they based on metrics based on the proposed indicators based on MFCA and LCA, which were previously defined as methods for evaluating the environmental strategy of companies (Pauliuk et al., 2018). An example of the metrics used is given in Table 1 below.

Table 1: Selected metrics used in Scrapellini research, 2020

CW1	% of recycling waste within the company itself (treated to be recycled)
CW2	% of waste recovery and reuse within the company
DR1	% of resources replaced by other fully recycled materials to manufacture products or provide services
DR2	% of products' design or services modified to reduce resource intensity
CSE1	% of products' design or services modified to increase function (multifunction)
CSE2	% of products' design or services modified to extend life
CSE3	% of products' design or services modified to increase recyclability (waste prevention)
SR1	% of equipment or facilities replaced and/or improved to reduce energy consumption
SR2	% of processes and operating procedures replaced or improved to reduce energy consumption or exploit renewables
SR3	% of components of products or services replaced with innovative components to comply with environmental regulations

Source: Scrapellini, 2020

Standardized indicators were used, which are ROE, ROS, ROA, number of employees, total turnover and total value of assets (Scrapellini, 2020). The above indicators were subsequently analyzed using SmartPLS software using the

PLS method, where the measurement model was first estimated and then the structural relationships of the model were outlined. The study found several areas where there are links between economics of performance and the application of the principles of circular economics in given microeconomic conditions. Possibilities for further research or decision-making processes for the management of the companies concerned have been identified (Scrapellini, 2020).

The individual aspects of the circular economy as such were specified above and a basic overview of current research was made, which aims to demonstrate this model as sustainable and economically interesting for companies that decide to apply these principles at their microeconomic level. The intention of the authors of this paper was also to search for the context of the circular economy with financing by leasing. Based on the research performed in the Scopus and Web of Science databases, this dimension resp. so far, none of the authors has gone deeper into the interconnectedness, with one exception. This was the team of Romanian authors Ion and Mihaela Ionașcu from the Bucharest University of Economic Studies (Romania), who basically followed up on the possibility of using leasing financing mentioned, but not further explored, in the works of Italian author Patriza Ghisellini (2016) and her colleagues from the University of Bologna. An interesting contribution of the research (Ionașcu, 2018) was a closer analysis of the usability of leasing and renting in the circular economy for the reuse of products and services in business.

Circular economy models include a very wide range of activities - such as recycling raw materials or waste, ensuring minimal pollution, adapting and innovating products and services in current and potential portfolios, or providing services for today's dynamic economic environment through leasing, renting or simultaneous use of goods) by several users, or so-called sharing (Lewandowski, 2016). Thus, in a circular economy, companies do not provide services or produce goods with the aim of selling them as such, but should sell their functionality or usability in their business model (Mont, 2002).

Some large companies have in the past approached the practical application of the circular economy and the further / longer use of their products. For example, since 2007 Michelin has been selling its tires to hauliers for mileage limits. Therefore, in order to extend the service life, it built a network of mobile workshops for repairs and pruning. To complete the circulation of tires, they are also sent to regional plants for refurbishment and re-use (Stahel, 2016). A similar procedure was applied by the Swiss company Elite to hotel mattresses, uniforms, hotel and hospital textiles or tablecloths (Stahel, 2016).

One of the other dealer models is the so-called product-service system (PSS), which can be understood as a system of products and services of several partner networks and other support infrastructures that are competitive, meet customer needs and at the same time have less impact on the environment compared to other models on the market (Mont, 2002).

Another of the authors (Tukker, 2004) defined the three main currents in this PSS model, which are:

Product-oriented services

A model that is characterized by the fact that there is still pressure to sell the final product, which is only supplemented by some extra after-sales service. This may include servicing and maintenance, consulting, securing or arranging financing, training, securing consumables to ensure the operational activities of the product, or subsequent repurchase. It is the dimension of this repurchase that is often crucial in the context of the circular economy.

Use-oriented services

This model is just typical for leases or rentals. The target and final product is still the main object of the business activity and the relationship with the customer. However, he acquires the right to use the asset only and the ownership rights are left to the original owner (supplier). Often, this use-oriented services model can often be supplemented by activities and products from previous product-oriented services (typically service, maintenance and provision of consumables). In the case of this model, it is very often possible to encounter reuse by multiple users, so-called "product pooling".

Result-oriented services

A business model where the supplier and customer agree in advance on the desired result without specifying a specific product or using specific tools. The supplier then ensures the delivery of the required result to the customer through

its own resources and its own management (management). Typical examples are outsourcing services in general (cleaning, accounting, tax consulting, call centers, etc.)

Leasing is in some cases complicated to define. Nevertheless, thanks to a recent change in International Financial Reporting Standards (IFRS), it is most appropriate from today's globalized perspective to proceed from the definition of the new IFRS 16 Leases, which refers to a lease as a contract that gives the lessee the right to use the underlying asset for a period of time, in exchange for consideration to the lessor. It has benefits and control over the underlying asset for the duration of the lessee's leasing contract (IFRS Foundation, 2016).

Many authors deal with leasing in their research. E.g. Giner & Pardo (2018) examines the impact of IFRS 16 on the reporting of operating leases in Spanish listed companies. The authors of Grosu & Hlaciuc (2018) analyze the consequences of reporting leasing under IFRS 16 on Romanian companies, arguing that leasing is closely linked to the country's economic development and that Romania appears to be more prone to negative changes in the economy.

In order for a lease to be considered part of the circular economy, it must include after-sales services and goods recycling, which brings new possibilities of use - such as partial renewal, renovation, product reorganization, material recycling and environmental disposal after termination of the lease contract (Ghisellini, 2016). Therefore, the leasing model is divided into two components (Ionașcu, 2016):

- Ownership of the supplier, who remains the owner of the underlying asset according to legal standards
- Economic ownership of an operator who, for pre-agreed payments, acquires the right to use the underlying asset and thus enjoys most of the economic benefits.

This makes the possibility of leasing financing an alternative to the traditional “Buy and own” model (Lewandowski, 2016).

One of the research (Ionașcu, 2018) was therefore conducted on listed companies of the Bucharest Stock Exchange in 2013-2016 from the premium and standard level, reporting according to IFRS and which were not in insolvency proceedings. The resulting sample contained 266 companies. The most represented companies were from the manufacturing and financial industries. The source of information was the Thomson Financials database, with all the missing data being subsequently used from documents published on the website of the Bucharest Stock Exchange. In addition, four performance indicators were selected. Two of them were classic profitability ratios, namely ROA and ROS. The other two indicators were based on stock market indicators. The first is Tobin's Q, which is measured as Equity market value / Equity book value, ie the ratio between the sum of the market value and the book value of the company (Herciu 2018). The fourth indicator was the size of liabilities and a comparison of their book and market value (Ionașcu, 2018).

One of the surveys (Ionașcu, 2018) was therefore conducted on listed companies of the Bucharest Stock Exchange in 2013-2016 from the premium and standard level, reporting according to IFRS and which were not in insolvency proceedings. The resulting sample contained 266 companies. The most represented companies were from the manufacturing and financial industries. The source of information was the Thomson Financials database, with all the missing data being subsequently used from documents published on the website of the Bucharest Stock Exchange. In addition, four performance indicators were selected. Two of them were classic profitability ratios, namely ROA and ROS. The other two indicators were based on stock market indicators. The first is Tobin's Q, which is measured as Equity market value / Equitybook value, i.e. the ratio between the sum of the market value and the book value of the company (Herciu 2018). The fourth indicator was the size of liabilities and a comparison of their book and market value (Ionașcu, 2018).

- the size of the board members,
- age of society,
- number of years listed on the stock exchange,
- investment opportunities (measured by the size of the assets invested),
- internal investments in assets (inventories, land, buildings).

The results of the research discussed that leasing transactions can be an illustrative business model for a circular economy that allows products to be recirculated both through multiple uses and through renewal or renovation. Nevertheless, the aim of the research (study) was to prove the fact that leasing does not penalize companies deciding to follow the path of a circular economist on their performance, but enables them to develop them sustainably (Ionașcu, 2018).

Further research (Richardson, 2014), which linked leasing transactions to financial performance, analyzed the financial impact of various types of air leasing in the period 2011-12 at major US airports. The research was conducted on the basis of structured interviews with airport representatives, airline financial managers and financial officials. Based on these interviews, quantitative indicators relevant for obtaining the possibility of measurable financial performance were identified. They are (Richardson, 2014):

- revenue data (based on dozens of indicators from the Transport ResearchBoardReports),
- capital investment,
- commercial performance,
- cost-effectiveness,
- financial profitability.

The resulting indicators from airlines were analyzed in relevance to the cost structure of selected airports in the USA and further compared with performance indicators (usability) of individual airports. After data collection and analysis of individual selected indicators, benchmarking of both individual airports and the airlines themselves was performed. The results of the research found links between the chosen model of operation of the airport, the form of investment and also the collection of fees from airlines. Conversely, opportunities for airlines to increase financial performance through the use of leases or leasing options have been identified (Richardson, 2014).

Research Opportunities

Based on the desk research performed in the previous chapter, several options for future research can be identified.

Following the research by Ionașcu (2018), it is important to mention that leasing is not a new form of external financing within the new approach of circular economy, but only that while meeting certain parameters it is part of one of its parts, within the product-services system as model use-oriented services. The research activity could be carried out similarly to the Romanian authors Ionașcu (2018) by starting from companies traded on the Prague Stock Exchange and using publicly available sources published in stock exchange database (Thomson Financials, etc.) or by the companies themselves after classification into a representative sample. Furthermore, for the purposes of comparison, the indicators of financial analysis ROA and ROE and subsequently also two of the stock indicators, which are the Tobin coefficient Q, could be used as the sum of the market value of shares and liabilities of companies. The second indicator will be the Market to Book indicator, which determines the ratio between the market and book value of shares. Based on the performed simulations and financial analyzes, the result should be to determine whether leasing in the circular economy model has sufficient potential to promote sustainability with an ecological dimension, which would, however, sufficiently inspire investor confidence.

It would also be possible to continue the latest research of the author´s team around Scrapellini, where the possibilities of further research in the field of efficiency and demonstration of financial stability in the case of large corporations that have decided to apply circular economy models in their paper, or in the research itself, this is a relatively new fact in the world economy and much empirical evidence and research has not yet been done.

Research by Richardson (2018) could also provide an inspiring look at the possibilities of using leasing financing to obtain higher or comparable performance in the case of a circular economy. In terms of applicability in Czech or European conditions, it would be interesting to conduct research, for example, on bus carriers and in the strength of competitiveness when using the model of operating leases. Especially in the case of Student Agency and its new strong competitors on the Czech market, namely FlixBus. The model of behavior of a stronger competitor (FlixBus), which disrupts the dominant positon of the current market leader (Student Agency), has been observed very similarly in the past in the case of the position of Student Agency vs. ČSAD and local carriers.

Conclusion

The paper summarized the current and latest research in the field of circular economics in relevance to the use of leasing financing to address the capital and operational needs of business in the market. Following this research, opportunities for further research were identified. The authors consider the research through which it would be possible to verify the research question within the Czech companies that the adoption of a "greener" business model, as in the case of leasing, does not promote companies economically, but it is a catalyst for increasing their performance.

Abstract

Digital twins have become a phenomenon of global interest with the incensement of Industry 4.0. The aim of this conference paper was to provide a brief overview of the selected academic research on digital twins as innovation, especially in the context of logistics circulating around the concept of Industry 4.0 (Logistics 4.0). The authors of this paper reviewed existing literature on digital twins (published in the recent period) in order to map this research stream and identify the most substantial contributors to this area of interest. This brief overview uses particular bibliometric tools and techniques to present most influential authors, journals, and publications. The analysis allowed to map and describe overtime evolution of publications on digital twins in logistics in the early phases of digital twins research.

Keywords: Digital Twin, Innovation, Industry 4.0, Logistics 4.0.

Introduction and background

The concept of digital twins gained attention and importance in recent years (Hu et al. 2020; Greif et al. 2020). Its implementation and development seem promising especially in the era of Industry 4.0. and more technology-dependent societies (Kuehn, 2018; Sun et al., 2020; Liu et al., 2020; Machado et al., 2020, Saniuk S. et al., 2019). The digital twins is a technology, which based on data from different sources develops a digital representation of products, processes, machines or components (Schmetz et al., 2020). This technology fits into the concept of innovations within the Industry 4.0, which refers to, among others, means of automation and data exchange in manufacturing technologies including Internet of Things, cloud computing, Cyber-Physical Systems, big data and analytics, simulation and augmented reality (Tay et al., 2018; Trotta, Garengo, 2018; Muhuri et al., 2019, Szajna et al., 2018).

The study attempts to build on research related to digital twins and its potential as an innovation in the era of Industry 4.0 and context of Logistics 4.0, published in recent years. As of 2020, many important contributions to the knowledge on this topic have been made, thus it seems beneficial to map this research stream in order to identify most important publications, authors and topics, as well as define future paths of studies. Since until 2020, the only one review article has been published on this topic (Gregor et al., 2017), this conference paper seeks to fill this gap in the study by presenting research results of a bibliometric analysis. Precisely, it aims to provide a brief overview of the selected academic research on digital twins as innovation, especially in the context of logistics circulating around the concept of Industry 4.0 (Logistics 4.0). The review addresses the following research questions:

Cite this Article as: Mariusz KOSTRZEWSKI, Magdalena MARCZEWSKA, Norbert CHAMIER-GLISZCZYNSKI and Waldemar WOŹNIAK "Digital Twins as Innovation in The Era of Industry 4.0" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

1. What are the size and publication evolution of research publications on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0?
2. What sources, papers and scholars have been most influential in research on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0?
3. What are the most important clusters of keywords related to the topic of digital twins in the context of Industry 4.0 with the focus on Logistics 4.0?
4. What are the future research directions of the studies on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0?

This conference paper contributes to existing body of knowledge in the following ways: it presents quantitatively the knowledge base related to digital twins in the context of logistics circulating around the concept of Industry 4.0 (Logistics 4.0); identifies most influential research of the topic based on highly-cited journals, papers and scholars; describes the most important clusters of topics related to the research area; concludes with the identification of future promising research directions.

The article proceeds as follows. First, the focus of the analysis and the theoretical background related to the concept of digital twin as an innovation within the framework of Industry 4.0 with the focus on Logistics 4.0 was presented. The next section describes methods used for the analysis, along with data selection and extraction process. It is followed by research results. The paper ends with conclusions and outlines research limitations.

Method and Data

The article is based on bibliometric analysis and graphic mapping of research base on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0. The data used in this research was retrieved from Scopus database on 20th of September 2020. It was processed with the use of Microsoft Excel and VOSviewer software (van Eck and Waltman, 2010). The following set of keywords was analyzed: TITLE-ABS-KEY ("Digital twin*" AND "Logistics"). Such search resulted in 74 records, which were briefly screened (based on titles, abstract and keywords) in order to confirm their relevance to the analyzed topic. Among all 74 records there were 71 written in English, 2 in Chinese and 1 in Russian, thus the screening was possible to perform. Since all the records extracted from database were relevant, a final research sample included 74 records.

Research Results

The Scopus-indexed knowledge base related to digital twins in the context of Industry 4.0 with the focus on Logistics 4.0 included 74 documents published between 2017 and 2020 and demonstrates an increase in scholarly interest in the topic. Annual increase in number of publications is presented in Figure 1. More than 25% of these publications come from authors with German affiliations and additional 16% from Chinese ones. Other important contributions are affiliated in United States (10%), Russian Federation (8%), South Korea (8%), Hong Kong (6.75%). Since the last quarter of 2020 is still ahead, we can expect that the total number of publications related to digital twins and Logistics 4.0 will increase and probably exceed the total number of publications from 2019.

Figure 1: Evolution of publications on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0, 2017-2020 (n = 74). Source: Own elaboration based on Scopus database.

The publications from the research sample, although related to Industry 4.0 with the focus on Logistics 4.0, are classified under various subject areas, with engineering and computer science being the most common ones. Figure 2 presents details on all areas of these publications' classification.

The studies on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0 include articles, conference papers, book chapters, conference reviews and reviews (Figure 3), where articles and conference papers account for almost 92% of all publications related to this research topic. Interestingly, looking at year-to-year distribution of these publications, it can be concluded that articles constantly gain importance, whereas conference papers picked in 2019.

Since digital twins is a relatively new topic of researchers' interest, there are many sources (journals, conference proceedings and books) that constitute a knowledge base of this topic, most of which published only one research contribution (Table 1). Three titles stand out - IFIP Advances in Information and Communication Technology with 4 publications in total, International Multidisciplinary Scientific GeoConference Surveying Geology and Mining Ecology Management (SGEM) with 3 and Proceedings of the Summer School Francesco Turco with 3. However, in order to identify the most influential research, one should take into account not only number of papers published, but most importantly most cited papers, authors and sources.

Source: Own elaboration based on Scopus database.

When it comes to most influential sources in research on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0 (defined based on citations), Procedia Manufacturing (ranked 11th in terms of number of publications) is the leader with 43 total citations (Table 2). Two other journals also stand out - Robotics and Computer-Integrated Manufacturing with 28 citations (ranked 13th by number of publications) and International Journal of Computer Integrated Manufacturing with 26 citations (ranked 8th by number of publications). Among top ten sources there are most cited, there are six journals and four conference proceedings.

In order to identify most influential scholars, it is worth to look at least at two variables – number of papers published on certain research topic and number of total citations of these papers. Tables 3 and 4 present such data ranked accordingly. It seems that in terms of author's productivity there are only twenty authors that published more than one paper. Such a productivity of individual authors publishing papers on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0 can be justified by relatively young research field, thus yet not many research contributions have been made. Looking at an increasing interest in this research topic, it can be expected that this should change in the coming years.

Table 3: Most productive authors publishing papers on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0.

Rank	Author	Number of publications	Number of citations	Total link strength
1	Zhong R.Y.	3	21	9

Interestingly, only one author among top 15 most cited authors published more than one paper on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0 (Table 4), namely Zhong R.Y. (Xu et al., 2018; Wang et al., 2020). Consequently, this means that in most cases most influential authors are the authors of most cited papers (see: Table 5) (e.g. Brenner, Hummel, 2017; Nikolakis et al., 2019; Wang et al. 2020).

Table 4: Most cited authors publishing papers on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0.

Table 5 presents publications on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0 ranked based on their total citations that attract attention of other researchers. Among top 12 highly cited papers there are eight articles and four conference papers. Four of these publications were published in 2017, three in 2018, four in 2019 and one in 2020. Interestingly, the paper by Wang et al. (2020) is available online for less that a year and managed to already collect 19 citations.

Source: Own elaboration based on Scopus database.

Interesting insights into the research on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0 can be concluded from the analysis of keywords listed by authors in their publications. Authors listed in total 691 keywords. Not surprisingly, more than 60% of papers were tagged with “digital twin” or “digital twins” (Table 6). Other frequently used keywords include Industry 4.0, manufacture, embedded systems, life cycle, decision making, simulation, logistics, cyber physical system(s), real time systems, supply chain and supply chain management.

The keywords most frequently used to describe research on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0 form four clusters. Clusters were formed based on an assumption of minimum number of occurrences of a keyword set to five. This resulted in twenty keywords in total. The most important clusters with the relationships and links between keywords are presented in Figure 4 and consist of:

- Cluster 1 (yellow): digital twin, Industry 4.0, life cycle, information management,
- Cluster 2 (green): digital twins, logistics, simulation, big data, decision making, supply chain management,
- Cluster 3 (blue): cyber-physical systems (cps), cyber physical system, embedded systems, manufacture,
- Cluster 4 (red): Internet of Things, real time systems, supply chain, materials handling, discrete event simulation.

These clusters present the topics related to digital twins that are highly interesting to researchers and can be treated as a direction for the future research.

Table 6: Most occurring keywords on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0.

Rank	Keywords	Occurrences	Total strength

Conclusions

The review addressed four research questions aimed to characterize the size and publication evolution of research publications on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0; identify the most influential sources, papers and scholars; characterize the most important clusters of keywords and describe the future research directions.

The analysis of knowledge base related to digital twins in the context of Industry 4.0 with the focus on Logistics 4.0 performed based on data obtained from Scopus confirms the novelty of the research field and its increasing importance in recent years. The interest in the topic reflected in publications dates back to 2017, until when there were 74 research contribution published by various authors, 25% of which have German affiliations. Most of these publications were published in different journals and conference proceedings. Eleven sources published two papers related to the topic, two sources - International Multidisciplinary Scientific GeoConference Surveying Geology and Mining Ecology Management (SGEM) and Proceedings of the Summer School Francesco Turco published three each, and only one - IFIP Advances in Information and Communication Technology - published four. However, none of the sources listed above, apart from Proceedings of the Summer School Francesco Turco, can be classified as the most influential sources in research on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0, because their citation rate in the field is relatively low. Top three most influential journals include: Procedia Manufacturing, Robotics and Computer-Integrated Manufacturing and International Journal of Computer Integrated Manufacturing. The same trend can be observed with regards to the most influential scholars. Since only a few scholars published more than one paper in the research field (maximum two or three), and these papers are not highly cited, the conclusions related to the most influential researchers had to be drawn based on total number of citations per each researcher. Consequently, the most influential scholars in research on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0 are: Brenner B., Hummel V., Alexopoulos K., Chryssolouris G., Nikolakis N., Xanthakis E., Zhong R.Y., Wang. W. and Zhang Y. These authors also prepared the most influential and highly cited contribution to this research field entitled:

- Digital Twin as Enabler for an Innovative Digital Shopfloor Management System in the ESB Logistics Learning Factory at Reutlingen – University, by Brenner, B., Hummel, V., published in 2017 in Procedia Manufacturing and cited 43 times,
- The digital twin implementation for linking the virtual representation of human-based production tasks to their physical counterpart in the factory-floor, by Nikolakis, N., Alexopoulos, K., Xanthakis, E., Chryssolouris, G, published in 2019 in International Journal of Computer Integrated Manufacturing and cited 26 times,
- A proactive material handling method for CPS enabled shop-floor, by Wang, W., Zhang, Y., Zhong, R.Y., published in 2020 in Robotics and Computer-Integrated Manufacturing and cited 19 times.

The analysis also allowed to identify the most important and frequently used keywords. Out of 691 keywords used to describe research on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0, more than 60% of papers used digital twin or digital twins, whereas among other popular ones there were Industry 4.0, manufacture, embedded systems, life cycle, decision making, simulation, logistics, cyber physical system(s), real time systems, supply chain and supply chain management. The keywords allowed to classify them in clusters based on their co-occurrence, which seem to form interesting future research directions:

- Research direction 1 (Cluster 1): digital twin, Industry 4.0, life cycle, information management,
- Research direction 2 (Cluster 2): digital twins, logistics, simulation, big data, decision making, supply chain management,
- research direction 3 (Cluster 3): cyber-physical systems (cps), cyber physical system, embedded systems, manufacture,
- Research direction 4 (Cluster 4): Internet of Things, real time systems, supply chain, materials handling, discrete event simulation.

The research allowed to draw some interesting conclusions; however, some research limitations should be taken into account while drawing general conclusions related to research on digital twins in the context of Industry 4.0 with the focus on Logistics 4.0. Firstly, the research results presented above are based on data extracted from Scopus database, which does not include all ever-published papers related to the research topic. Secondly, the analyzed research field is relatively young and at the same time dynamically developing. This means, that we can expect that there will be more research contributions to this research field in the near future. Thus, these research results should be interpreted considering the period covered. Thirdly, the research results presented in this paper are meant to be informative, not aimed at discrediting any publication, author or journal.

Abstract

The COVID-19 pandemic has significantly affected the transport industry functioning. Changes in the volume of transported cargo were observed in particular transport modes, and above all in ports transshipments. The aim of the article is to investigate the impact of the COVID-19 pandemic on the selected stevedore companies functioning in seaports during the initial stage of the pandemic. Selected companies operating in Polish and Ukrainian seaports were analyzed as a case study. The condition of chosen transshipment terminals was examined during the first four months from announcement of pandemic in these countries. Survey method was used to conduct the research. On the basis of the prepared questionnaire, the survey was conducted among representatives of cargo transshipment terminals and the impact of the pandemic on the functioning of stevedore companies was examined. It was found that all companies had to introduce changes to the organization of terminal's operation. However, the impact on the volume of cargo transshipments, ships service and cargo handling was varied. The article presents preliminary research results that will be continued in the future.

Keywords: COVID-19, seaport, stevedore company, cargo handling.

Introduction

The COVID-19 pandemic has introduced significant changes in transport and logistics industry. These changes mainly affected the goods trade on the world market, that caused changes in the demand for transport services and the volume of cargo handling in seaports.

Seaports, as key nodes of global supply chains, had to take measures to adapt to current changes. Under the influence of the situation caused by the COVID-19 pandemic, seaports were obliged to introduce a number of organizational changes in their daily functioning, associated, inter alia, with the need to comply with sanitary standards to prevent the spread of coronavirus. These changes covered various areas of ports' operation, including handling of bulk and general cargo, as well as providing services to passengers.

According to the Notteboom and Pallis (2020), ports located in different regions of Europe and the world have been affected by the pandemic differently. It could deal with cooperation with various geographic markets and economic ties of countries, which directly influenced the volume of imports, exports and transit of different groups of goods handled through seaports.

The impact of the pandemic was felt both by port authorities and companies providing transshipment and storage services for various cargo. Stevedore companies, that perform services for cargo, ships and hinterland transport means, had to implement restrictions and changes in current approach to conducting their business.

The aim of the article is to investigate the impact of COVID-19 pandemic on the functioning of selected stevedore companies operating in seaports during the initial phase of the pandemic. The case study was considered, and selected companies operating in seaports of Poland and Ukraine were analyzed in detail. An additional goal of the article was to compare the situation observed in selected seaports of Poland and Ukraine in the analyzed period. Surveys were used to conduct the research.

The article consists of a literature review, research methodology, and the obtained results analysis. The study is summed up with conclusions and definition of further research directions.

Literature Review

The spread of the COVID-19 pandemic had a global impact and poses tremendous threat to human health (Chakraborty and Maity (2020); Hoehl et al. (2020); Liu et al. (2020); Organization (2020); Pongpirul et al. (2020); Sohrabi et al. (2020)). The economic shock centralized within the rapidly-escalating pandemic was felt globally (Corbet et al. (2020)). It was noted that the widespread lack of regulation and international legislation pose serious challenges for decision-makers to resolve the occurring problems. The need to determine the possible ways in which the disease can be controlled was pointed out (Chakraborty and Maity (2020)).

The impact of the pandemic was observed in global supply chains functioning (Gostin and Wiley (2020); Ivanov (2020); Loske (2020); Luo and Tsang (2020)). These chains should be planned and arranged appropriately in order to deliver benefits to their users (Kostrzewski and Kostrzewski (2019); Mańkowska et al. (2020); Postan and Filina-Dawidowicz (2017)). Gray (2020) noted the influence of COVID-19 crisis on agriculture and transportation, including some disruption in intermodal containerized movement of grains and food products from the lack of empty containers in North America.

Available literature analysis revealed that attempts were made to analyze the impact of COVID-19 pandemic on the functioning of the transport and logistics industry, however, it was done to a limited extent.

The available literature put attention, among others, to the impact of pandemic on air transport (Abu-Rayash and Dincer (2020); Amankwah-Amoah (2020); Browne et al. (2016); Nakamura and Managi (2020); Nižetić (2020)). Abu-Rayash and Dincer (2020) analyzed the mobility trends during the coronavirus pandemic and explored the impacts on global aviation and travel in selected cities. Wang et al. (2020) stated that air freight and ocean-going ships play a non-negligible role in spreading COVID-19 due to frequent visits to countries with infected populations, and introduced a method to dynamically assess the infection risk of ships based on a data driven approach. Conducted analysis demonstrated that some airlines and industrial bodies sought to sidestep environmentally friendly commitments and practices to overcome new challenges, such as cost pressures, survival threat and deprioritizing environmental initiatives in the wake of COVID-19 (Amankwah-Amoah (2020)). Moreover, scenarios of air travel restriction were considered, and the change in the risk of importation and exportation of COVID-19 were calculated by Nakamura and Managi (2020). The attempts were done to estimate and project air passenger traffic during the COVID-19 outbreak and its socio-economic impact (Iacus et al. (2020)).

The impact of coronavirus disease on road safety was also investigated (Vingilis et al. (2020)). It was stated that preliminary information on factors such as the increased stress and anxiety brought about by the COVID-19 pandemic, more “free” (idle) time, increased consumption of alcohol, and greater opportunities for speeding and stunt driving, could have the opposite effect on road safety. Dzisi and Dei (2020) explored the adherence to social distancing and wearing of masks within public transportation during the COVID 19 pandemic. Initial research was conducted on volume and capacity dynamics in road haulage (Loske (2020)).

Regarding to maritime transport, it was stated that the effects of national lockdown policies on maritime settings of the region should be systematically analyzed using Automated Identification System (AIS) data from fishing vessels, passenger ships, tanker and cargo vessels collected through the Aqua Alta Oceanographic Tower (AAOT) (Depellegrin et al. (2020)). Michail and Melas (2020) explored the reactions of freight rates for dry bulk, clean, and dirty tankers impacted by COVID-19. Liu and Chang (2020) pointed out that COVID-19 has severely impacted the global cruise tourism industry. The authors concluded that for a long-term mechanism construction, three aspects need to be considered: i) risk emergency management mechanism of cruise lines, ii) health and epidemic prevention supervision mechanisms, and iii) international cooperation mechanisms of infectious disease prevention. Aggressive efforts are required to contain spread, including cruise shipping (Moriarty et al. (2020)). A

comprehensive outbreak response was implemented, including surveillance, provision of essential medical care and other activities (Nakazawa et al. (2020); Yamagishi et al. (2020)). Precautions have to be taken to prevent the effects of a pandemic (Sun and Zhai (2020)). Chokepoints usage was proposed to rapidly and efficiently vaccinate and prophylax the transportation worker cohort and to implement transmission prevention measures and thereby protect the ability to move goods (Luke and Rodrigue (2008)).

In the research studies the issue of the impact of COVID-19 pandemic on the seaports functioning is still undertaken to a limited extent. Donnan et al. (2020) paid attention that it is critical to simultaneously formulate and adapt multiple strategic plans of individual ports to the stressors such as pandemic. That is why ports and terminals should develop and assess strategic plans to manage the port during such disruptions. The detection of the virus in a ship's crew member affects the behavior in the ports where the ship calls (Fernandes et al. (2020)). Proper and early risk communication of ship, seaport and media may prevent panic, facilitate good support and prevent false communication (Subramaniam and Madala (2020)).

Zhang et al. (2020) evaluated COVID-19 impact on different market segments, impacts on ports, containers, tankers, dry bulk cargoes, cruise ships and other subdivisions. As a result of the research, it was found that the recovery will be a slow process. It was stated that COVID-19 will continue to have a negative impact on the shipping and port industry. Zhang et al. (2020) suggested that some measures should be put forward such as strengthening overseas port policy and port linking tracking, avoiding ship charter disputes and legal risks, improving the system of prevention and control of cruise ships, as well as promoting the development of smart ports and smart shipping.

An extensive study of seaports' functioning during the pandemic is presented by Notteboom and Pallis (2020). Based on statements sent by seaports, the volumes of transshipments and ship calls at ports were determined. It should be noted, however, that this report presents the general situation on the world market and does not analyze the problems faced by ports' companies that handle and store the cargo. There is also a lack of studies describing the condition of Ukrainian and Polish port's companies involved in reloading of various cargo groups.

Methodology

In order to conduct the research, a survey method was selected. Based on the observations of transport market development and preliminary discussions with representatives of port companies, a questionnaire was elaborated. This questionnaire was developed in Polish and Russian, and was divided into two parts. The first part concerned the data about a person completing the survey, as well as the type of a stevedore company. The second one examined the companies' functioning during the COVID-19 pandemic.

The scope of the research covered the first four months of companies' operation (March-June 2020) and aimed at getting answers to the following questions:

1. What was the impact of COVID-19 initial phase on the operation of stevedore companies?

2. What has changed in port companies functioning throughout the initial phase of the pandemic?

3. What are the forecasts of industry representatives regarding the further impact of pandemic on the seaports functioning?

Using the developed questionnaire, the survey was conducted among representatives of seaports' companies in Poland and Ukraine. These two countries were considered, due to the possibility to analyze the viewpoint of enterprises, operating in seaports of Baltic Sea and Black Sea, servicing different economic hinterland markets (Poland, Ukraine, other countries of this region). The companies which provide handling and storage services for various types of cargo in these ports were selected as the research sample. It was assumed that this sample should include enterprises that operate general cargo and bulk cargo terminals, as well as companies that have experience in handling wide range of cargo (universal terminals) and specific cargo groups (specialized terminals). Therefore, certain terminals willing to take part in the survey were chosen.

In Poland the survey was carried out in form of direct interviews. During telephone calls and interviews conducted using MS Teams platform, the answers to the developed questions were received. The persons directly responsible for managing the stevedore company took part in interviews. In turn, in Ukraine the questionnaire was distributed in electronic form by the Ukrainian Sea Ports Authority. The questionnaires were filled in by people involved in companies' management.

On the basis of obtained responses analysis, it was possible to indicate the opinions of the surveyed enterprises' representatives about the impact of COVID-19 on Polish and Ukrainian stevedore companies' operation and to compare the results. Then, the relevant conclusions were drawn.

Results

Thirteen stevedore companies operating in seaports of Poland and Ukraine participated in the study (Table 1), with one company B serving two transshipment terminals located in ports of Szczecin and Świnoujście (opinions of 14 terminals were examined).

Among the surveyed enterprises, 6 companies operate in Poland and 7 in Ukraine. These were companies handling various types of cargo, both bulk and general cargo (universal terminals), as well as handling a selected cargo group (specialized terminals).

The questionnaire was completed by the companies' managers with experience and knowledge related to company's operations. The respondents included companies directors (5 respondents), deputy directors (5 respondents), terminal managers (2 respondents) and operational director (1 respondent).

While answering the question "Does the COVID-19 pandemic have/had an impact on the company's operation?", the representatives of surveyed enterprises unanimously replied that the pandemic had an impact, however, the type of impact was varied (Fig. 1). All analyzed terminals had to introduce the changes in organization of their work. In turn, changes in the volume of transshipments, organization of ships and cargo handling were not indicated by all enterprises, greater number of these changes was noticed by representatives of Polish companies.

Fig. 1: Responses to the question: "What type of COVID-19 impact on the operation of stevedore company was observed during initial phase of the pandemic?"

Table 1: The surveyed companies of the Polish and Ukrainian seaports

No.	Abbre-viation of company	Sea (seaport)	General cargo terminal		Bulk cargo terminal		Comments
			uni-versal	specia-lized	uni-versal	specia-lized	
1	A	Baltic Sea (Szczecin)	v*	-	v	-	company that handles various groups of bulk and general cargo
2	B	Baltic Sea (Szczecin and Świnoujście)	-	-	-	v	company operating two liquid bulk cargo terminals, dominant import relationship
3	C	Baltic Sea (Szczecin)	-	-	-	v	two capital-related companies operating specialized grain cargo terminals, one export and one import terminal
4	D	Baltic Sea (Szczecin)	v	-	-	-	company operating universal

							conventional general cargo terminal
5	E	Baltic Sea (Gdańsk)	-	v	-	-	company operating a specialized container terminal
6	F	Baltic Sea (Gdańsk)	-	v	-	-	company operating a specialized frozen cargo terminal
7	G	Black Sea (Kherson)	-	-	-	v	company operating specialized grain terminal
8	H	Black Sea (Odessa)	v	-	-	-	company operating a universal general cargo terminal
9	I	Black Sea (Odessa)	v	-	v	-	company operating universal terminal that handles various groups of bulk and general cargo
10	J	Black Sea (Odessa)	v	-	-	-	company operating universal general cargo terminal
11	K	Black Sea (Odessa)	-	-	-	v	company operating a specialized grain terminal

13	M	Black Sea (Odessa)	-	v	-	-	company operating a specialized container terminal
* v – indication of terminal's kind							

Among other areas of influence, representatives of companies mentioned i.a. extension of the storage period for bulk cargo (e.g. in company A), while company (F) noticed a shortening of the storage time of cargo due to the increase in demand for food. Attention was also paid to the impact of the pandemic on delays in delivering investments in the terminal's expansion (company B), as well as extended time of cargo clearance at the beginning of pandemic (company E).

The respondents were asked to indicate the nature of COVID-19 pandemic impact on company's operations. Responses analysis revealed that this impact was varied. Representatives of 7 terminals described the impact as negative (3 Polish and 4 Ukrainian terminals), which was mainly related to the decrease in terminals' throughput, as well as other difficulties. A positive impact was indicated by one Polish terminal, which recorded an increase in transshipments in the analyzed period, that had a positive impact on the company's performance. The remaining 6 terminals (3 from Poland and 3 from Ukraine) indicated that it is difficult to determine the impact type, because the changes mainly concerned the organization of the terminal's work.

The next question aimed to examine the impact of pandemic on the transshipments' volume. Among the analyzed enterprises 6 terminals (3 from Poland and 3 from Ukraine) recorded transshipments decrease. The increase in transshipments faced one Polish terminal. In turn, other 7 terminals stated the lack of significant changes compared to previous years. This allowed to draw the conclusion that the impact of the COVID-19 on analyzed enterprises functioning in initial period of the pandemic was different, and it cannot be clearly stated that it had a negative nature.

The representatives of the companies were also asked about the dynamics of pandemic impact on the company's throughput during the period of March-June 2020, and detailed phases (stages) of this process (Fig. 2). Terminals that experienced decrease in transshipments' volume have determined the phases (stages) of pandemic influence. These terminals included universal general cargo terminals and specialized terminals for containerized cargo, as well as specialized terminals servicing grain and vegetable oils. Three of the analyzed Polish terminals noticed the

pandemic impact on the structure of goods being transshipped. None of the Ukrainian terminals indicated changes in this regard.

Fig. 2: Responses to the question: "Was the impact of pandemic on the company's operation constant during March-June 2020, could the detailed phases (stages) of this impact be distinguished?"

The research showed that changes also were observed in freight transport relations. The surveyed terminals recorded changes in the volume of imports, exports and transit within the selected cargo groups. In case of some enterprises, the decrease in imports of goods was compensated by the increase in exports. A detailed analysis of cargo transshipments in selected global seaports was presented in report developed by Notteboom and Pallis (2020).

Changes in the organization of ship service were noticed by all Polish terminals and one Ukrainian. These changes covered mainly the application of more restrictive sanitary procedures necessary for control and inspection of vessels. The same observations were applied to the organization of cargo handling. Some terminals introduced the reduction of work shifts duration and number of shift workers. Several terminals paid attention to the extension of cargo and ship handling times in seaports, but this did not result in downtime penalties. In turn, one terminal noticed that the procedures related to the workflow of documents within the company were simplified, this terminal implemented electronic exchange of documents, which influenced the time needed to prepare the necessary documentation accompanying cargo transport. Some terminals were forced to accept longer storage periods for cargo and set more loyal cargo storage conditions for their customers. Moreover, resignation from subcontractors of services was also observed, at the time the terminals began to provide services on their own. This action was related to the need to reduce the level of current costs and protect terminals' staff against dismissal.

The respondents also indicated the scope of actions that terminals had to undertake under COVID-19 pandemic influence (Fig. 3). All terminals introduced regular disinfection of premises. Numerous points with available means for disinfection were established. At the entrance to 4 Ukrainian and 2 Polish terminals, temperature measurements were carried out for visitors and employees.

Fig. 3: Answers to the question: "What actions related to pandemic occurrence have been undertaken in the stevedore company"?

The last survey question concerned the examination of respondents' opinions on the impact of COVID-19 pandemic on the further operation of terminals (Fig. 4). Representatives of all Polish terminals and one Ukrainian indicated that the pandemic would leave a permanent impact on terminals' operation. At the same time, experts from Poland mentioned that this permanent trace may have clearly positive nature, which they associated with:

- optimization of employees' work and remote work,
- improvement of documentation flow,
- implementation of a management system for the company's secretariat,
- progressive computerization/digitization within the company,
- implementation of new technologies,
- usage of autonomous devices,
- monitoring of employees' health - temperature tests,
- increasing of hygiene among employees, etc.

The opinions of the majority of Ukrainian experts were different: 4 experts pointed that the influence would not remain, while 2 people did not have an opinion due to the dynamically changing economic situation.

Fig. 4: Answers to the question: "Will the impact of pandemic remain permanent trace on future operation of company?"

In order to summarize, it could be stated that both Polish and Ukrainian terminals suffered the effects of the pandemic. The terminals pointed to the increase in their operating costs in the analyzed period due to the need to purchase disinfectants and personal protection means and equipment, that faced significant prices increase at the beginning of the pandemic. Moreover, companies' management boards were deeply involvement in challenging activities striving to minimize the negative impact of the pandemic. The difficulties to access the terminals for older people (over 60 or self-isolated) were also mentioned.

Conclusions

This article presents the preliminary results of research on the impact of COVID-19 on the operation of selected stevedore companies located in the seaports of Poland and Ukraine in the initial phase of the pandemic. The obtained research material allowed to determine the opinions of representatives of selected companies regarding their functioning during COVID-19 development. Therefore, it may be important to define models of enterprises behavior considering changes in economic environment.

On the basis of the conducted research, it was found that the surveyed companies were influenced by the pandemic, especially in the field of work organization. The impact was varied in other areas of examined companies' operation.

It should be noted that representatives of the surveyed companies operating in Poland were willing to describe the impact of the pandemic on their functioning in more detail, while representatives of Ukrainian companies were more cautious in their statements. The results of the research could have been influenced by the level of accuracy to complete the questionnaires by respondents, however, it was possible to identify the basic problems encountered by stevedore companies during the initial phase of COVID-19 pandemic.

Moreover, it should be noted that seaports of both Baltic Sea and Black Sea serve not only domestic markets, but also various foreign markets (e.g. transit), which directly affects the volume of transshipped goods. Furthermore, the perception of the pandemic was influenced by economic relations and world trade. Taking into account these factors, as well as conditions of companies' operation, it is possible to have a better look at the reasons for occurring changes. Therefore, the future directions of the authors' research will focus on a detailed analysis of the sea-land supply chains running through the seaports. Changes to the ports' transshipment structure should also be analyzed in more detail. That will allow to identify types of cargo that were more or less exposed to the impact of the pandemic. A valuable knowledge may also deal with the identification of new cargoes that possibly appear within sea-land transport chains, which prior to the pandemic were carried only by land transport. These issues are important in face of possibly occurring second and further COVID-19 virus infection waves (Loske (2020)).

The obtained research material may be interesting for companies operating in transport and logistics industry, and may constitute the basis for development of decision-making models supporting key future decisions in the conditions of rapid changes. The results can also provide an important information base for decision makers responsible for setting up support mechanisms for entities affected by pandemic.

Acknowledgment

The authors would like to thank the representatives of Polish and Ukrainian stevedore companies for completing the questionnaire survey, as well as the Ukrainian Sea Ports Authority for the assistance in disseminating the survey. Moreover, the authors would like to thank the Reviewers for their reviews and valuable suggestions.

Abstract

This study investigates the effect of job satisfaction on employees' productivity in the Nigerian public sector with specific reference to the Federal Airport Authority of Nigeria (FAAN), Lagos. The study employed a descriptive survey research design based on primary and secondary data. Out of 939 population which is made up of 729 senior staff and 210 junior staff employees in FAAN, 281 copies of structured questionnaire were administered to FAAN and 213 (75.8%) was returned while 68 (24.2%) was not returned. A simple random sampling technique was used. Secondary data were sourced from published materials and analysed textually. The Statistical Package for Social Science (SPSS) statistical tool was used for the analysis of data. This study adopted the Herzberg two-factor theory which rejuvenated the discussion and findings. The study unveils that there is a positive significant relationship between job satisfaction and employees' productivity in Nigeria. Therefore, the study concludes that employees are an integral part of any organisation, and as such their satisfaction should be a priority for improved and optimum performance and a high opportunity for a competitive edge, especially in the public sector. Therefore, based on the findings of this study, it is recommended that; it is imperative for managers to make acceptable incentives to mitigate employee dissatisfaction at the workplace to improve productivity.

Keywords: Employee Productivity, Job Satisfaction, Public sector, Nigeria

Introduction

The contemporary business environment is very competitive in terms of different strategies or rewards that organisations apply to attract highly skilled workers and also to maintain a fulfilled, motivated and satisfied employee. Public organisations in Nigeria operate in a profoundly competitive environment due to the global business competition (Muna, Zain & Shaju, 2017). Job satisfaction is a vital factor of competitive edge for employee productivity since it requires human capital for the success and achievement of the organization (Morozov, Murashova, Lustina, Panova & Danilova, 2017). The human resource of an organisation has been recognized as the most significant assets of that organisation as its success relies to a great extent upon their effective and efficient commitments. The task of human resources management is to recruit the right kind of individuals that are morally justified with quality abilities or skills as when required, but for the Nigerian public sector, it is a reverse case (Dibie, Edoho & Dibie, 2015). As posits by Abasilim, Gberevbie and Osibanjo (2018) leaders in some organisations are

Cite this Article as: Osayande Q. ITUA, Fadeke E. OLU-OWOLABI, Daniel E. GBEREVBIE , Oluwatoyin A. MATTHEW and Romanus A. OSABOHIEN "Job Satisfaction and Employees' Productivity: A Study of Federal Airport Authority of Nigeria (FAAN), Lagos" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

blamed for the adoption of leadership style that suits only the top-down as well as the chain of command to lead their subordinates. Hence, the subordinates react negatively most times to some forms of leadership style, as it demotivates their workforce.

Sikowo, Namusonge, Makokha and Nyagechi (2016) posit that every organisation that intends to encourage good work relationships with their workforce would need to invest in their development and ensure their satisfaction in the workplace. Some organisations perceive job satisfaction as a significant factor that inspires employee retention to work willingly and apply considerable effort towards their job in that organisation and keep up a solid relationship, thereby leading to increased productivity. (Miah, 2018). As agreed by Shaju and Subhashini (2017) agree that when employees are satisfied, it motivates them to deliver maximally in that organisation. The outcome and performance of every organisation largely depend on employees' job satisfaction. A satisfied employee would have a cordial relationship with the organisation and be motivated with high morale (Toban & Sjahruddin, 2016).

The public and private sector, around the world, depend on employees for ensuring maximum delivery thereby leading to productivity. This initiates the demand in ensuring that employees are satisfied as a matter of necessity in an organisation. An organisation that lacks employee motivation can lead to low productivity which is harmful to the continuous development of that organization because job satisfaction is linked to productivity in terms of emotional and behavioural components that are attached to job satisfaction (Mohammd, Rand & Ra'ed, 2019).

The incessant industrial conflict of workers in the public sector emanated from workers' complaints on the dissatisfaction of workers due and non-payment of salaries, denial of various benefits, low compensation, and little attention to employee welfare programmes. All these lead to confrontations between government and workers thereby result in low productivity. As observed by Oyebamiji (2018), over 90 percent of patients died due to this incessant strike in the health sector. This was attributed to the misunderstanding between the union and the government.

There is a consensus of opinion about the fallen standard of workers which is due to poor welfare package. Nigerian Governments has recorded and experienced poor attitude and low productivity of workers from both public and private corporations. This sad experience is still experiencing today. The government has done a lot in their effort to increase their performance but all was to no avail and has become a persistent challenge facing the Nigerian public sector.

Moreso, the shortage of training and capacity development is an increasing challenge in the public sector. Poor attitude and support training and career development is an increasing challenge in the public sector inadequate funding of training and development for an employee. The low response of support and cooperation from the effectiveness of manpower training in the public sector would lead to job dissatisfaction Aluko, Adewusi, & Kalejaiye, 2016; Adiele & Ibietan, 2017). Inadequate or denial of workers employees' participation in the training programme might lead them to develop a poor attitude and low productivity of workers leading to the negative perception that is against the overall organisational goals.

In view of the foregoing, this study investigates the effect of job satisfaction on employees' productivity, a study of Federal Airport Authority of Nigeria (FAAN), Lagos State with a specific objective to examine how training and career development as it affects the productivity of the staff of Federal Airport Authority of Nigeria (FAAN), Lagos. In view of the stated objective, the hypothesis is formulated and stated in null form viz:
H_0: There is no significant effect of training and career development on employees' productivity in the Federal Airport Authority of Nigeria (FAAN), Lagos State, Nigeria.

The place of job satisfaction cannot be over emphasised in every organisation as every as they depend on their employee for achieving organisational goals and objectives. This can be realised if their workforce is satisfied and productive. Professionals believe that job satisfaction trends can affect the behaviour of labour market and also attract organisational growth (Lopes, & Bandura, 2020). This study is relevant especially in the Federal Airport Authority of Nigeria (FAAN), Lagos in improving productivity and mitigate against job dissatisfaction among the employees. The study analyses the effect of job satisfaction and would serve as a measuring parameter for the Federal Airport Authority of Nigeria (FAAN), Lagos for addressing the issue of job satisfaction. Policymakers in Nigeria and of human resource managers will derive valuable lessons as it would help improve the level of workers' attitude to work, provide training and re-training to employees, provides a good working environment and improve worker's wages in the Nigerian public sector among others. In addition, it would enhance the leadership style and administration in the public sector as they adhere strictly to the recommendations provided by in this study for improvement in support for training and career development for a high level of productivity and competitive advantage. Finally, the study would serve as a basis for further research to other scholars who intend to research job satisfaction and employee productivity and will also broaden their knowledge and understanding on the subject matter using other variables or study.

This study was chosen due to the fact that; in FAAN the productivity of the employees seems to be very low compared with other government-owned parastatals, and this is largely due to low job satisfaction morale enjoyed by the employees.

Literature Review and Theoretical Framework

Concept of Job Satisfaction

Job satisfaction refers to the degree to which an employee contends with their work in terms of work itself. Sikowo, Namusonge, Makokha and Nyagechi (2016) agree that job satisfaction is a psychological state of someone, feelings or attitudes in terms of intrinsic and extrinsic characteristics towards their job and in the organisation in which they perform their work. In the same vein, it is the view as the character which an employee possesses in terms of the task work which is an indication of being satisfied or dissatisfied with the work or not (Armstrong & Taylor, 2014). Bello, Ogundipe and Eze, (2017) view by identifying five factors that are associated with job satisfaction namely: satisfaction with salary, work itself and work relationship with colleagues at work. They are also of the opinion that quality supervision and relationship with managers and co-workers is key to the success or failure of a worker in a given task. Castaneda & Scanlan (2014) sees satisfaction as a worldwide inclination about one's work or a connected bunch of perspectives about different aspects of the workplace. Sikowo et al., (2016) see job satisfaction as a concept used in describing whether employees are happy with their desires and needs. Ndulue and Ekechukwu (2016) explain that job satisfaction is caused by employees' thought on satisfied their task was able to deliver those things that are perceived as crucial. In addition, it is viewed as a positive emotional state of an employee is an achievement of the pleasure from the job (Jyoti, 2020).

Concept of Employee Productivity

According to Embuldeniya (2017), productivity is the quantity of output produced per unit of input, and it could be a term of output per unit of time. It is the available resources, time, materials, and capital effectively and efficiently utilized that culminates into productivity in an organisation (Bhatti, 2015). Employers expect their workforce to be productive as it is believed that they are the most relevant resources in an organisation (Mayson, & Barrat, 2016; Shaban, Al-Zubi Ali & Alqotaish, 2017). This implies that employee low productivity would reduce their morale for motivation. Employee Productivity is referred to a measure of quality and quantity of an accomplished job, with the understanding of the cost of capital incurred. Chukwudumebi and Kifordu (2018) posit that the more organisational productivity, the higher the competitive advantage. Bhatti and Qureshi (2007) perceived productivity as the measure of performance which comprises of their efficiency and effectiveness. This implies that productivity is likened to a total measure of capacity and transforms the inputs which is the raw material into finished products and services. Jonathan, Sunday, Ayobami & Iruobe (2012) posits that quality can be determined by accessing the performance, reliability, conforming to the required standards, and also complying with customer requirements which will, in turn, lead to employee productivity and then organisational growth. Mustapha and Omorede (2017) explained that productivity can be referred to the ratio of input such as cost of labour and production, number of hours spent on a particular task and cost of equipment while output includes profit, sales and market share. It could also be defined as the combination of all the factors of production as well as output needed to get the desired results. The vital issue in an organisation is employee productivity, for this reason (Ezeamama, 2019) research further on employee productivity and posit that productivity can be referred to all the desire of the organisation from discrete conduct test of every individual during the explicit timeframe.

Determinants of Job Satisfaction

Diverse factors are involved to intrigue satisfaction in an organisation, for example, adequate welfare package, promotion, incentives, training and career development, job security, work environment and adequate infrastructure among others.

Adequate Welfare Package

According to Mabaso and Dlamini (2017), organisation who adequately pay their employees would enjoy a demonstration of a pleasurable attitude in return from their employees because the workers would deliver their tasks satisfactorily this will improve employee's performance as well as increase the productivity of that organisation. Mayson and Barret (2016) also support that organisation can experience greater performance and productivity if the salaries they pay are competitive salaries as this would attract qualified employees. Sule, Amuni, Obasan and Banjo (2015), posit that salary and wages are in the form reward in exchange to services rendered in an organisation and it is called "human endowment" which is in form of rewards. They further mentioned that salaries are as a fixed annual amount, paid monthly while wages are paid daily or weekly. It is mandatory by law for the employer to pay employee

salaries or wages as stated in section 1 of Labour Act, LFN 2004 CAP L1. Every employer either public or private is expected to pay for his or her work as agreed. An employee who decided to enter a contractual agreement with an organisation to render services is entitled to a return in form of a reward. As declared by Agburu (2012), paying adequate wages and salaries is not fully satisfactory but it must be paid in line with fairness and equity because in as much as we are human, the absence of this would make the employee dissatisfied. This would help to retain and motivate employees of that organisation and also improve the employee's performance thereby enhance organisational productivity. Organisation should ensure that what they pay their workers is equitable, fair, and in line with the internal and external regulations. Wang & Seifert (2017) added that an employee whose wages are cut would have a negative feeling and also affects employees' performances and leads to employee dissatisfaction. He further explains that most organisations lay off employees rather than cut their salaries.

Promotion

The vital role of an employee in an organisation cannot be overemphasized due to the fundamental role they play. Many scholars agreed that manpower in any company is important (Tahmeem & Sadia, 2018; Lestari, Syabarudin, Zurnali & Murad, 2018; Kimani, Ngui & Robert, 2017). It has been proven that workers are the most relevant asset of an organisation. Promotion is defined as an employee's upward movement from a lower position to a higher rank within the organization that leads to more responsibility (Magaji, Akpa and Norom, 2018). Karunarathna and Weligamage, (2018) posit that promotion encourages employees for job satisfaction especially if within the stipulated employment contract. Promotion is seen is an opportunity for advancement from a lower designation to a higher designation. Adler, Campion, Colquitt, Grubb, Murphy, Rob Ollander-Krane & Pulakos (2016) posits that a weak performance appraisal system is one of the causes of employee poor performance as this jeopardise the activities and success of any organisation.

Incentives

Incentives also are one of the factors responsible for employee satisfaction to deliver beyond expectation in any given tasks. According Cross (2019), employees as seen as a key human capital that occupies a strategic position in an organisation. They carry out the tasks of converting inputs into outputs for organisation productivity. George (2015) also agrees that is the major source of competitive advantage in every organisation that helps bring out the goals and objectives in an organisation, if the workers are well compensated. It was further stated that incentives are in two categories namely monetary and no- monetary incentives. Financial incentives are paid directly as cash while non-financial incentives may be in form of participation and engagement in decision making, promotion, flexible time, etc. Financial incentives are basically to encourage employees to boost their efficiency, effectiveness and employee's productivity to improve their output in order to increase the sales turnover, cost reduction, quality customer service and also improve the organisation productivity (Cross, 2019). Jean, Ngui and Robert (2017) assert that incentives, rewards or fringe benefits could be paid directly or indirectly, financial or non-financial and could also be limited to weekly or monthly cash payment in exchange for their work done.

Training and Career Development

Training and Career Development is necessary for employee performance and increased productivity and it also enable the organisation for a competitive edge. Although, some organisation in Nigeria embrace the support to engage their workforce in skills and knowledge but many of these executives still pay less attention to encourage the necessary skills and development of their workers. To support this Al Ali, Yusoff, Ismail, and Kazi, (2018) opine that employee training and development is vital to feature that impacts positively on employee's productivity. Maslow (1954) in one of his research on "human motivation" agrees that training is a motivational factor for employees due to self-esteem (ego) needs, this can be acquired if employees are trained in order to boost employee's self-confidence. He further explained that training and development helps an employee to develop their competence. Ofobruku and Nwakoby (2015) posit that some scholars see training as imparting knowledge or being enlightened. This implies that the characteristics of training and development are important and helps to develop an employee for effective performance in order to cope with the advanced technology and be able to compete in the industry. Kurtessis, Eisenberger, Ford, Buffardi, Stewart and Alihodzic, Tuba and Tuba, 2017 and Mayson & Barrat, 2016) agree that employee being assets or human capital and have received comprehensive training for advancement is important to any organisation because it motivates the employee to be satisfied and more certain that the employee would remain in that organisation and also increases employee productivity and job satisfaction leading to productivity.

In the work of Borst, Kruyen and Lako (2019) with the aim to observe job demand resources and the strategy of engaging a worker using insight from public administration review of the literature. It was discovered that there is a link between work engagement and public service motivation. Kappagoda (2017) studied job satisfaction and its

impact of psychological capital on the job satisfaction of the non-managerial employees in the banking sector. The study shows that there is a positive correlation between the psychological capital of the non-managerial employees and that of job satisfaction. Edet, (2017 in his study, identifies what should be done to achieve maximum performance in the civil service in spite of various reforms embarked on. The result revealed predication upon the level of commitment and fidelity by the leading operator of the service. Qureshi and Hamid (2017) investigated the impact of supervisor support on job satisfaction. The study reveals that empirically, supervisor support has a positive relationship with job satisfaction and is a significant predictor for several organisational feedback such as employee performance, commitment, citizenship behaviour and so on. Vann (2017) also investigate the nexus between employee job satisfaction and supervisor support. The study shows that supervisor support improves a high level of employee job satisfaction.

Theoretical Framework

This study employs Herzberg two-factor theory popularly known as motivator-hygiene theory. The two-factor theory was propounded by Fredrick Herzberg, who is a behavioural scientist (Herzberg, 1959). Herzberg's Two Factor Theory explains that satisfaction and dissection are being driven by motivator or hygiene factors. This theory anchors on the attitudes that lead to job satisfaction and job dissatisfaction. It also concentrated on the following determinants of job satisfaction which are: work itself, recognition, responsibility, growth, achievement and advancement. These determinants help an employee. This research employs this theory in order to achieve the effect of job satisfaction on employee performance as it relates to FAAN employees and what they want from their job for productivity.

The theory is relevant to this study because it unveils the hygiene aspects for example supervision, benefits, organisations' policy and administrative style, job security, quality supervision, good inter-personal relationship at work, work environment, employee welfare and other benefits and allowances. All these factors are very essential as it would help cube job dissatisfaction and encourage satisfaction such as training and career opportunities, recognition for performance, advancement and growth opportunities and promotion. According to Bayraktar, Araci, Karacay and Calisir (2017) job satisfaction is attributed to the value of what an individual wants from his or her job. It is also relevant to this study due to the fact that motivator and hygiene factors are the cause of the push of human's prospective needs for excellence. A satisfied employee is a productive employee and would be easy to achieve psychological growth, overcome an environmental challenge and self realisation thereby productivity is assured.

Methodology

The study adopted a survey design. The survey design was used in order to describe the variables and to explore the effect of job satisfaction on employee productivity using the data collected from a field survey. The idea of survey design was employed becomes is because the data is given at a point in time across a sample population of the study.

The population for this study is the staff of the Federal Airport Authority of Nigeria (FAAN), Lagos. The total population of workers as of June 2020 is 939 (I.T. Unit, FAAN Headquarter, 2020).

A simple random sampling technique was used to select the sample. This technique was used to ensure that every segment in the random sample has an equal chance to be selected or drawn. It would also help to avoid bias during the selection process and results. The total population for this study is 939 - FAAN employees. This consists of 729 senior staff and 210 junior staff. Two hundred and eighty-one employees were used as the sample size to participate in the survey by filing and return the questionnaire. Taro Yamane formula (1973) was used to calculate the sample size as shown below:

$$n = \frac{N}{1+N(e)^2}$$

Where: n = sample size, N = Population size, e = 0.05 (5%) Margin error, 1 = constant

$$n = \frac{939}{1+939(0.05)^2}$$

$$n = \frac{939}{1+939(0.0025)}$$

$$n = \frac{939}{1+2.3475}$$

$$n = \frac{939}{3.3475}$$

$$n = 280.50 = \text{approx. } 281 \text{ staff}$$

This implies that the sample size is 281.

The sample size was necessary to determine and applied in order to generate accurate data from the total population of study 939 of FAAN employee. A structured questionnaire was administered to 281 FAAN employees being the sample size in the course of this study. It would enable the researcher to gather all necessary information required for effective research and to also elicit the views from the respondents. Two hundred and thirteen questionnaire representing (75.8%) were returned while sixty-eight questionnaire representing (24.1%) was not returned. Secondary data was sourced from published materials and were analysed textually. A simple random sampling technique was used to select the sample. This technique was used to ensure that every segment in the random sample has an equal chance to be selected or drawn. It would also help to avoid bias during the selection process and results. The descriptive analysis was used for this study with the aid of frequency table, percentage and regression. The regression method is popularly used to ascertain whether which of the variable is dependent on each other or combining other variables. Regression can also be employed to test hypotheses for the study. A statistical package for social sciences (SPSS) was used to analyse the data.

Data Presentation

Table 1: Qualification of Respondents

Qualification	**Frequency**	**Percentage %**
OND	26	12.2
HND	45	21.1
B.A/B.Sc/B.Eng	90	42.3
M.A/M.Sc/M.Eng	50	23.5
Ph.D	2	0.9
Total	**213**	**100**

Source: *Researcher's Fieldwork, 2020.*

Table 1 result shows that 26 (12.2%) respondents have OND, 45 (21.1%) respondents have HND, 90 (42.3%) respondents have B.A/B.Sc/B.Eng, 50 (23.5%) respondents have M.A/M.Sc/M.Eng while 2 (0.9%) have Ph.D. The above data reveals that respondents with B.A/B.Sc/B.Eng has the highest percentage of 90 (42.3%), followed by respondents with M.A/M.Sc/M.Eng, 50 (23.5%) but respondents with Ph.D have the lowest 2 (0.9%).

Table 2: Work Experience of Respondents

Work Experience	**Frequency**	**Percentage %**
1 - 5 years	26	12.2
6 - 10 years	62	29.1
11 -15 years	59	27.7
16 -20 years	48	22.5
21 years and above	18	8.5
Total	**213**	**100**

Source: *Researcher's Fieldwork, 2020.*

Table 2 shows that out of 213 respondents, 26 (12.2%) are with work experience between 1 – 5 years, 62 (29.1%) respondents have work experience between 6 - 10 years, 59 (27.7%) respondents are between 11 - 15 years work experience, while 48 (22.5%) have 16-20 years of work experience while 18 (8.5%) respondents have work experience of 21 years and above. This analysis indicates that the respondents between 6 - 10 years of work experience 62 (29.1%) have the highest percentage while the respondents between 20 years and above have the lowest percentage.

Table 3: Training and Career Development
FAAN encourages and sponsor me for training regularly and as at when due

Responses	Frequency	Percent %
Strongly Agree	16	7.5
Agree	48	22.6
Disagree	90	42.5
Strongly disagree	58	27.4
Total	212	100

Source: *Researcher's field survey Result (2020).*

Table 3 shows that 7.5% of the respondent strongly agreed that FAAN encourages and sponsor me for training regularly and as at when due; 22.6% of the respondents agreed that FAAN encourages and sponsor me for training regularly and as at when due; 42.5% of the respondents strongly disagreed that FAAN encourages and sponsor me for training regularly and as at when due; while 27.4% of the respondents disagreed that FAAN encourages and sponsor me for training regularly and as at when due. This means that majority of the respondents who choose disagree (42.5) and strongly disagree (27.4) total of (69.9%) are against the view that FAAN encourages and sponsors them for training regularly and as at when due. Therefore, FAAN should support and invest adequately in manpower training to enable their staff development in their career, learn new skills and increased productivity for a competitive edge.

Data Analysis

Test of Research Hypotheses

The hypothesis for this study was tested using regression analysis. Regression analysis requires that, when the significance level (sig) value is less than 0.05 for 95% confidence level or less than 0.01 for 99% confidence level, we reject the null hypothesis and accept the alternative hypothesis and vice versa.

There is no effect of Training and career development on employees' productivity of Federal Airport Authority of Nigeria (FAAN), Lagos.

To test the hypothesis, the linear regression technique was used. The dependent variable is employee productivity while the independent variables are a set of indicators of adequate training and career development for FAAN staff.

Table 4: Model Summary

Model Summary				
Model	**R**	**R Square**	Adjusted R Square	Std. Error of the Estimate
	.147a	.022	.017	.606

Source: *Researcher's Fieldwork, 2020. Note, Predictors: (Constant), Training and career development.*

Table 5: ANOVA

	Sum of Squares	df	Mean Square	F	Sig.
Regression	1.713	1	1.713	10.860	.001b
Residual	77.564	211	.368		
Total	79.277	212			

Source: *Researcher's Fieldwork, 2020. Note: a. Dependent Variable: Employee productivity; b. Predictors: (Constant) Training and Career Development*

Table 6: Coefficient

Table 6 Regression analysis illustrating whether there is no significant relationship between training and career development and employee productivity						
Training and career development	efficients		Standardized Coefficients			
	B	Std. Error	Beta	t	Sig.	95% CI
Training and career development	.157	.073	.147	2.158	.032	0.009-0.283

Source: *Researcher's Fieldwork, 2020.*

The result in Table 6 shows the standardized co-efficient of 0.147 (p-value<0.05), significant at 5 percent level. This, therefore, indicates the training and career development effect of 0.147 percent on employee productivity. This further suggests that human capital development constitutes an integral component of employee motivation for higher productivity impact in an establishment. Based on the result in Table 6 therefore, the null hypothesis is rejected while the alternate hypothesis is accepted.

The reliability test of the study was carried out using Cronbach's Alpha. It reveals that measurement is consistent because a measurement that is not reliable lacks validity. As mentioned by Ojo (2003), measurement is said to be reliable when tested reputedly and it yielded the same outcome. This study shows that reliability is accepted when it falls between 0.70 and above, however, 0.60 may be acceptable. The reliability test of the construct was produced using Cronbach's alpha as shown in Table 7:

Table 7: Reliability Test

Construct	**Cronbach's Alpha**	**Items**
Welfare Package	0.781	6
Training and Career Development	0.654	7
Employee Productivity	0.706	5

Source: *Researcher's Fieldwork, 2020*

Summary of Findings

The study finds that training and career development have a significant impact on employee productivity in Federal Airport Authority staff (FAAN), Lagos. This finding also endorses the Herzberg's two-factor theory. This is necessary as organisastion need their goals to be achieved and hence, would need the positive attitude of the worker to achieve optimum employee behavior for organisational productivity.

The findings in Table 4.5.3 clearly shows the effect of training and career development on the productivity of the Federal Airport Authority staff (FAAN), Lagos. The standardised beta co-efficient of 0.147 (p-value<0.05) indicates the positive and significant impact of 0.147 percent on employee productivity in FAAN, Lagos. In terms of the direction of effect, a positive effect is also observed. This implies that as expected from theory, an increase in training and career development of the workers in the agency of interest leads to an increase in job satisfaction. With regard to the magnitude of the impact, the value '0.147' implies that a one-unit increase in the training and career development of the FAAN workers will lead to a 0.147unit increase in the job satisfaction derived on the job. This further suggests that human capital development constitutes an integral component of employee motivation for higher productivity impact in an establishment. This finding supports and extends the studies by Al Ali, Yusoff, Ismail & Kazi, (2018).

Conclusion and Recommendations

Employees are dissatisfied due to inadequate training and career development as it is revealed in their responses. The study concluded that job satisfaction has a significant relationship with employee productivity. It also concludes that employees are an integral part of any organisation and as such their satisfaction should be part of organisational priority for improved and optimum performance and productivity and a high opportunity for a competitive edge,

especially in the public section. Also, the satisfaction of FAAN employees would enable them to be more committed to their job, hence the need to plan in the area of satisfying their employee for productivity. The findings validate Herzberg two-factor theory, one can conclude that a lot of workforce generally sees job satisfaction as that which affect them most psychologically with respect to productivity. Also, the study reveals that job satisfaction is key to employee productivity; however, it affects them psychologically majorly but preferably as a part of the entire package given to a worker in an organisation.

This study recommends the following based on the findings and conclusions:

i. It is therefore recommended that FAAN management should concentrate on those factors that enhance job for satisfaction such so as to spur their commitment to their work and high-level productivity.
ii. Promoting career and development training need to be a continuous exercise which organisation should encourage for the increase and sustainable productivity. Moreso, FAAN's management should see this as a matter of necessity to invest on valuable time and resources in ensuring the continuous training of its workforce so that productivity would be assured for increased satisfaction among workers and for a competitive edge.
iii. Finally, FAAN Management should provide an avenue for feedback or an opinion box for complaints, suggestions or observations would be harvested and addressed afterwards for increased productivity.

Abstract

Unfortunate, unpredictable, and catastrophic events can happen and nonprofit organizations (NPOs) are not immune. Crisis management seeks to help organizations, in general, to cope with these events, and although it continues to be a hot topic in public relations literature, there has been little attention paid to crisis response strategies in one of the largest sectors that continues to play an increasingly influential role in social and economic life: NPOs. This study uses the context of the new coronavirus (SARS-CoV-2) and its spread disease (Covid-19), to identify the level of crisis management preparedness of the North Portugal NPOs, in response to an actual infectious disease pandemic, with enormous numbers of spread disease and deaths, mainly in their senior segment. Considering the topic of research, a qualitative approach is developed with an exploratory and explanatory study based on six semi-structured interviews. The results of this study demonstrate that NPOs were not prepared or had any type of planning to face a pandemic crisis, such as the Covid-19. The study adds to previous research on crisis management on NPOs, by proposing the identification and exploration of a set of activities that accurately enables the assessment of crisis management strategies within the context of NPOs, on an emergency event. This study argues that NPOs need to actively engage in everyday maintenance and updating to prevent crisis activities to build organizational security, transparency, and accountability.

Keywords: Nonprofit organizations, crisis management planning, North Portugal, coronavirus (Covid-19).

Introduction

Organizations operate in highly volatile environments (Spillan and Crandall, 2002). As the environment is becoming increasingly complex, the crisis that organizations face will also increase not only in extent but also in impact (Spillan, 2003). As Mitroff and Anagnos (2001, p. 3) state "crises have become an inevitable, natural feature of our everyday lives". The demands of day-to-day operations and crisis management are very important and challenging, and organizations need to implement crisis management plans and teams to achieve business continuity (Spillan, 2003). The level of crisis preparedness as well as the ability to detect crises at an early stage are crucial (Schwarz and Pforr, 2011). For decades, planning and crisis management have been recognized as important areas of management, both by practitioners and academics (Spillan, 2003). According to Caponigro (2000) and Spillan (2003) crisis management is the function that works to minimize the impact of unexpected, unfortunate, and catastrophic events and helps the organization to gain control of the situation. Crisis management, the impact planning process and crisis mitigation, are an important strategic concern that must be incorporated into an organization's overall planning process (Spillan and Crandall, 2002). The ability to manage a crisis can determine survival and disaster (Spillan and Crandall, 2002), however, there are organizations that consider crisis planning and management important, others less so (Spillan, 2003).

The extent to which the NPOs are strategically prepared to deal with crises is an unknown fact (Schwarz and Pforr, 2011). The literature on crisis management is abundant, but regarding NPOs, little has been written on the subject, given that few studies have explored the crisis management of the NPOs (Spillan, 2003). In the same way, the preparation of the NPOs crisis communication has received little attention in the investigation (Schwarz and Pforr,

Cite this Article as: Luisa LOPES and Lara SANTOS "Crisis Management in The Nonprofit Organizations – The Case of North Portugal on COVID-19" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

2011), where although crisis communication remains a hot topic in Public Relations literature, there has been little attention to strategic responses to the crisis in NPOs. This may be an indicator that many managers of these organizations are not aware of or ignore the risks and vulnerabilities that exist in their organizations (Spillan and Crandall, 2002). Most of the crisis management literature addresses the profit sector. However, NPOs must also plan for the unthinkable (Spillan and Crandall, 2002).

Addressing this literature gap, the forthcoming qualitative study aims to know better about crisis in NPOs, specifically it intends to capture the critical issues of concern by leadership, the level of preparedness for crisis and, if it is the case, the reasons or motives for the lack of preparation and planning, and finally, get to know better what are the activities and practices that can expand crisis management planning and prevention.

The article proceeds as follows. First, with the research background in mind, it separates crisis management, in general, from crisis management planning in the NPOs sector. Doing so allows knowledge of this field to be adapted to this specific context, browsing themes as types of crisis and their phases. Second, it presents the methods carried out in this phase of the study and clarifies the data collection process. It, also, examines and discusses preliminary results obtained on this exploratory field study to be explored. Finally, conclusions and implications for further research are drawn.

Crisis Management

With the perspective that time allows, one can easily identify today the 60s of the 20th century as the beginning of the literature about organizational crises (Mendes and Pereira, 2006). One of the first authors to write about this subject was Charles Hermann, in 1963, and his concern was to analyse the consequences that certain disruptive phenomena, which he called crisis, had on the viability of organizations. This author defined a crisis as something that threatens the fundamental values of the organization, allows only a limited period of time for decision making, is unexpected by the organization and originates in the relevant environment of the organization (Hermann, 1963). Fink (2002, *cit. in* Wrigley, Salmon and Park, 2003), one of the leading authors in the field, conceptualizes crisis as something that impacts positively and negatively an organization and as something (time, phase, or event) that is decisive or crucial. Devlin (2007, p. 5) refers that a crisis is "an unstable time for an organization, with a distinct possibility for an undesirable outcome. This undesirable outcome could interfere with the normal operations of the organization, it could damage the bottom line, it could jeopardize the public image, or it could close media or government scrutiny". Seeger et al (2003, *cit. in* Jordan, Upright and Tice-Owens, 2016, p. 162) add on the definition of crisis as "a specific, unexpected and non-routine organizationally based event or series of events which creates high levels of uncertainty and threat or perceived threat to an organization's high priority goals".

A crisis starts from an onset of illness, which is accentuated and draws the attention of the organization and causes disruption of the business routine and, consequently, threatens the reputation and financial viability of the organization (Fink, 2002, *cit. in* Wrigley, Salmon and Park, 2003). Pauchant, Mitroff and Ventolo (1992) and Ulmer (2001) also share the crisis trilogy developed by Fink (2002, *cit. in* Wrigley, Salmon and Park, 2003): disruption, threat, and potentially negative consequences for the organization. The authors highlight that a crisis is a serious and critical phase in the evolution of things or situations. It is a rupture, a disturbance in the organization's balance. It is a turning point characterized by great instability that can result in undesirable consequences, affect the organization's reputation, and hence produce negative public notoriety.

Although crises can arise in infinite sizes, shapes, intensity, complexity, uncertainty and magnitudes (Eriksson and McConnell, 2011), in the opinion of Marcus and Goodman (1991) different types of crises can be distinguished, such as: accidents, scandals, product safety and health incidents. According to Devlin (2007), there is a panoply of types of crises, which can range from fires, floods, tornadoes, bombings, earthquakes, product failure, a product market-shifts, a product safety issue, an incident that results in a poor image or negative reputation, a financial problem, and so on. Regarding the types of crisis, it should be noted that any organization is sensitive to an endless number of crises. For this matter, there is an immense number of classifications of crisis events in the literature. Crisis management researchers have classified crisis into 2x2 matrix (e. g. Meyers and Holusha, 1986; Marcus and Goodman, 1991; Coombs and Holladay, 1996), through cluster analysis Pearson and Mitroff (1993), and by categories (Spillan, 2003; Devlin, 2007; Crandall, Parnell and Spillan, 2014).
Also, recommendations for crisis management usually take a developmental stage approach (Jordan, Upright and Tice-Owens, 2016) as models range from three to five stages or phases.

Because the world, and in particular, the North of Portugal, is still in a pandemic situation, this study focuses on the first two phases of Coombs (2012) and Coombs and Laufer (2018): pre-crisis phase, and crisis phase. In this sense, the pre-crisis phase involves the prevention, and preparation for crises to minimize damage to the organization (Coombs and Laufer, 2018). This stage includes activities, such as signal detection and prevention which include

knowing potential areas of vulnerability, evaluating potential crisis types, preparing a crisis management team, selecting and training an organizational spokesperson, developing a crisis management plan, and preparing organizational communication systems (Coombs, 2012). The crisis management plan (CMP), developed during the pre-crisis stage, as some advocate (Coombs, 2012), should explain whom to contact, when to contact them, and how to contact them (Seeger et al, 2003, *cit. in* Jordan, Upright and Tice-Owens, 2016). Additionally, within this stage, organizations should expand their issue management to their active social media platforms because problems or concerns of individuals may now go viral (Jordan, Upright and Tice-Owens, 2016). Coombs (2012) agrees that social media has implications for crisis management and has a role in crisis management ranging from pre-crisis monitoring of warning signs to postcrisis communication. Concerning the crisis phase, this phase represents the response to the crisis, including the response of the organization and its stakeholders (Coombs and Laufer, 2018). The crisis response is what management does and says after the crisis hits (Coombs, 2012) in order to limit the effects. Pearson and Mitroff (1993, p. 53) call this phase "damage containment". Effective management of this phase must go through plans to prevent a localized crisis from affecting other uncontaminated parts of the organization or its environment. For example, through evacuation plans or procedures for neutralizing or damage containment mechanisms and activities (Pearson and Mitroff, 1993).

Crisis management planning in the NPOs sector

Despite their status, NPOs are some of the at least understood segments of society, they are among the most crucial ones (Waters, 2014), and are not immune to crisis (Spillan, 2003; Wrigley, Salmon and Park, 2003; Schwarz and Pforr, 2011; Sisco, 2012; Jordan, Upright and Tice-Owens, 2016). NPOs play an increasingly influential role in economies and societies as a catalyst for new approaches, service provision and a crucial actor in social and economic life (Salamon and Anheier, 1992; Spillan, 2003; Crandall, Parnell and Spillan, 2014).

NPOs are extremely vulnerable organizations in times of crisis (Sisco, 2012). Patterson and Radtke (2009, *cit. in* Jordan, Upright and Tice-Owens, 2016) refer that nonprofit organizations face one of two types of crises: emergencies and controversies. On one hand, an emergency may result in injury to individuals, damage to or loss of facilities, financial loss, or lapses in services (Patterson and Radtke 2009, *cit. in* Jordan, Upright and Tice-Owens, 2016). Emergencies differ from routine events in critical and timely information requirements and a high level of uncertainty (Kapucu, 2007). On the other hand, controversies may damage an organization`s reputation as a result of fraud or accusations, legal difficulties or challenges to organizational leadership integrity and effectiveness (Patterson and Radtke 2009, *cit. in* Jordan, Upright and Tice-Owens, 2016). According to Jordan, Upright and Tice-Owens (2016), during crises, NPOs face increased pressure for accountability through different organizational practices, as organization, its stakeholders, and the community at large try to move from the crisis. Furthermore, these entities should be prepared for common potential crises considering that time spent preparing helps leaders to navigate through the crisis (Coombs, 2012).

Methods

This investigation uses a two-part data collection process. Qualitative and quantitative data will be connected during the phases of research, following a mixed method approach (Creswell, 2003). Based on the literature review, it started with an exploratory qualitative data collection, where data analysis and its results will be used to inform the quantitative phase developed subsequently. The qualitative study included six in-depth semi-structured face-to-face online interviews with key informants of six Northern Portuguese NPOs, including 36 different social facilities, carried out in May 2020 (see Table 1). Both authors were present in all interviews. All were taped, transcribed, and analysed. Data were categorized, and transcripts repeatedly read during this analysis.

Table 1: Methodological overview of the interviews

Temporal basis	*Cross-Section*
Sector	NPOs (charities)
Unit analysis	Executive directors representing 36 social facilities
Sample	6 interviews; 236 minutes.
Data collection	Semi-structured face-to-face online interview
Date	May 2020
Data analysis	Qualitative: exploratory and explanatory

The sampling for the interview process was carried out for convenience, encompassing a total of six executive directors of NPOs in the North of Portugal, according to the stratification (Table 2) here described. The respondents are familiar with the context considering their experience amount. The NPOs they represent deal with a variety of social issues such as drug dependency, elderly, childhood, homeless, among others.

Table 2: Sample stratification for the interview

Interviewee	Age	Northern City of Portugal	N. of social facilities
JR	49	Melgaço	7
JB	49	Porto	3
CR	54	Vila Real	5
AG	66	Mirandela	13
AC	65	Bragança	5
PA	40	Braga	3

Results and Discussion

Based on the script and taking into account the research objectives, it was possible to outline an analysis grid (Table 3) for the interviews carried out with the six executive directors, from which the presentation of the data will be structured, illustrated by explanatory excerpts of the positions taken by the interviewees in relation to each of the categories and subcategories considered.

Table 3: Categorization structure of the interview process

Categories	Sub-categories
Pre-crisis (prevention and preparation)	• Crisis definition • Types of crisis • Critical themes before and in the beginning of a crisis • Level of preparedness • Motives for the lack of preparation and planning
Crisis phase (response)	• Reactive or proactive actions • Contingency planning practices • Procedures and activities of crisis management planning and prevention

Source: Based on Coombs and Laufer (2018)

Following is presented, in a structured way, some of the data and information obtained through the interviews, for each of the categories under analysis.

a. Pre-crisis (prevention and preparation)

Crisis definition

When people think about a crisis, they think about unprecedented events that result in catastrophic damage and mass casualties. However, not all crises fall into this category. So, the problem with associating only catastrophic events with a crisis is that they sound so dramatic that most leaders assume an "it can't happen to us" mentality (Crandall, Parnell and Spillan, 2014). The interviewees mention this clearly:

> "We think it only happens to others and it doesn't happen to us." (CR)

In common with the interviews, literature reveals that researchers when defining crisis use words as surprise, insufficient information, event escalation, loss of control, intense scrutiny, panic, urgency, loss, disruption of normal activities, and threat to financial stability, creditability, and reputation (Coombs, 2002, *cit. in* Jordan, Upright and Tice-Owens, 2016). For instance:

> "Crisis is everything that differs from what is normal functioning and always causes a moment of adaptation." (PA)

> "This crisis that fell on us ... has a very heavy burden ... so hell fell on the institution, literally overnight." (JR)

Some respondents stated that this crisis was unpredictable, they felt that it constrained and changed the course of events, organizational models, and practices, as following:

> "A crisis is always something that can condition it, so it's always in the negative aspect. The crisis always changes the course of events, changes the organizational models, changes practices, therefore changes the regular functioning of the institutions, forces us to, in a very short period, reformulate everything and get out of the box, so we cannot be in a functionalist structure, we have to rethink all the strategies, all the organizational models, the practices, the intervention models and adapt them to the moment of crisis." (JB)

Types of crisis

Although crisis can arise in infinite sizes, shapes, and magnitudes, concerning the types of crisis, there is no agreement on the universal classification of crisis events (Marcus and Goodman, 1991; Pearson and Mitroff, 1993; Spillan and Crandall, 2002; Devlin, 2007). Some respondents mentioned unpredictable, health/diseases/pandemics crisis, economic and financial crisis, and political crisis as the types of crisis faced by NPOs. Others referred to catastrophes, disasters, and sabotages. Some examples are advanced here:

> "We have an unpredictable crisis and it is catastrophes, disasters, sabotages and other things that can happen." (CR)

> "Financial crisis, health or public health crisis (...)." (AG)

> "The types of crisis that can negatively impact a nonprofit organization are those of a political dimension, an economic-financial dimension and a disease dimension." (JB)

Critical issues before and in the beginning of Covid-19

With regard to previous critical issues, it's important to remember that issue management represents a valuable proactive method of potential threat analysis, understanding external issues potentially affecting the organization and its stakeholders (Coombs, 2012; Mitroff, 1994 *cit. in* Jordan, Upright and Tice-Owens, 2016). For the respondents of this study previous critical issues are related to: low economic capacity and scarce financial resources, high dependence on the supervisory entity, establishment of partnerships with support institutions and networking, lack of equipment and human resources, unemployment; demographic aging and changes, the ignorance and devaluation of risk and planning. Some interviewees highlighted this in a clear way:

> "Critical issues before this?... any situation that affects the well-being of the population… unemployment, of course, but it has to do with the financial crisis. There is an aspect that harms us immensely, which is the desertification of the interior, the demographic issue (...). The lack of revenue, of course, is reflected in the financial health of the institution." (AG)

> "(...) in an initial phase there was a sharp devaluation of risk, perhaps associated with ignorance." (JB)

> "(...) we are doing what the social security institute asks us to do." (CR)

> "(...) we can solve or help to solve, because the institution alone does not solve the problem." "We have partnerships (...)." (AC)

> "We have a series of partnerships (City Council, Fire Department, Civil Protection, Social Security, Health Delegate) that in such situations, they are always available." (PA)

Also, respondents mentioned that in the beginning of the crisis, they were exposed to public opinion, attacks on the institution's good name and reputation arose, depending on the goodwill of employees, confirming that NPOs are extremely vulnerable in times of crisis (Sisco, 2012). Literature suggests that the more an organization is held responsible for the crisis, the more accommodative a reputation repair strategy must be, in order to protect the NPO´s reputation (Coombs and Holladay, 1996).

> "But right now, everyone is looking at institutions." "(...) some attacks that we have been feeling that jeopardize our ability as managers and even as an organization, to deal with this." (JR)

> "(...) we are not omnipotent, and we do not have infinite resources." "Human resources are never enough. But we tried to manage (...) we formed two teams to work in a mirror regime (...) and we managed to articulate all these people. Of course, it depends on their goodwill." (AC)

Level of preparedness for the crisis

In what emergency preparedness concerns, crisis management involves four interrelated factors: prevention, preparation, response and revision (Coombs, 2015, *cit. in* Coombs and Laufer, 2018). All respondents stated that they were not prepared at all, no one could plan a pandemic crisis like Covid-19, given its size and seriousness. Interviewees stated that clearly:

> "Predict a situation like this, with this magnitude? Nobody is prepared for a hurricane. (…) What is normally required, we try to comply and try to have minimally legal things." (PA)

> "Nowhere was predicted a situation like this (…) it never crossed my mind, going through the situation I did (...) in March I had very bad days! (…). Before Covid-19 we had no plans." (AG)

> "We were neither prepared nor mentalized." (AC)

Reasons for the lack of preparation and planning

According to Pearson and Mitroff (1993) the preparation/prevention stage includes the creation of a crisis team as well as crisis training and simulation exercises. In this study, interviewees point out as reasons for the lack of preparation and planning: issues of leadership, non-professional management, lack of human resources, insufficient training in management and planning, historical reasons, among other reasons.

> "Have I delegated in the technic staff responsible for each valence (...) to specify it in detail? What are the steps? It doesn't pass me by." (PA)

> "We have "big ships" coping with non-professional management for years. (…) We had contingency plans, we followed the guidelines that came from different public institutions. (…) We had some human resources that allowed us to organize, creating offices/teams." (JR)

> "We are talking about structures that have an administrative and bureaucratic system that is often very slow, which obeys very strict criteria that are framed in specific legislation. (…) There is also a devaluation of planning, on one hand, and on the other, there is little training and awareness in the areas of planning. (…) NPOs do not think like market companies (...) are dependent on subsidies and state funding. (…) They are controlled by the State that gives NPO guidance. Not receiving guidelines, these structures consider that there are no reasons to do so, they are not obliged to do so, and therefore they do not do it. (…) Structures that work a lot from volunteering and with people's solidarity. (…) People have no training in management and planning." (JB).

b. Crisis phase (response)

In this phase, the purpose is the "damage containment, is to limit the effects" with detailed plans for preventing a localized crisis from affecting other uncontaminated parts of the organization through an evacuation plan or procedures or mechanisms or activities (Pearson and Mitroff, 1993, p. 53).

Reactive or proactive actions, and contingency planning practices

Spillan and Crandall (2002) and Spillan (2003) state that there are two ways to observe a crisis: ignore the signals and react to the crisis or prepare to prevent or manage a crisis. As an accomplished result, it is possible to confirm that the NPOs, of this sample, tend to respond and react to the crisis events, simply following the guidelines of official bodies, and creating contingency plans oriented by these entities. The following sentences demonstrate this:

> "It was reactive in the sense that we were reacting, we started adapting what were the guidelines that were left by the official and public organisms." (JR)

> "We are going to react a little to situations." (CR)

> "The structures are reactive and not proactive." (JB)

Procedures and activities of crisis management planning and prevention

As for this phase, the respondents referred that there is a need to create entry and exit circuits, operationalize mirror teams, reintroduce hygienic-sanitary practices, concept and implement internal and external communication teams and offices, create segmented routing, reception and transport protocols, list and prepare different volunteer platforms (of health, care and support staff) along with recruitment mechanisms and partnerships to provide emergency human force.

> "Regardless of the contact with the family and communication with the population in general, it must be well defined who does this, how they do it, what information should be conveyed and how often, in each type of crisis." (JR)

> "Updated phone book"; "signage"; "routines"; "mirror teams." (PA)

> "Complaints management"; "A specific plan for each social facility." (CR)

Conclusions and Future Research

In summary, the data collected, and here discussed, echo a reality, partial, it is true, shared by researchers who focus on the subject under study. Despite the exploratory nature of these results, most of the arguments of recent literature are confirmed.

Pre-crisis activities were suggested, namely: a plan for each social facility, the preparation of different crisis teams and offices (e.g. internal, external, and digital communication, recruitment and voluntary). It must be well defined who does what, how it does it, what information should be conveyed and how often. Other processes should be in practice in a continuous way, as systems of alert and trend awareness for a proper risk evaluation. For the crisis preparation, specific plans should include complaint management mechanisms, in and out flows, alternative teams, reception, routing and transport protocols, proper signage, routines, and the reintroduction of hygienic practices.

Specifically, for the pre-crisis phase, future research suggests two fundamental areas: risk assessment, diagnosing crisis vulnerabilities, and crisis management plans as primary tools for crisis managers (Coombs and Laufer, 2018). The lack of preparedness can be further exploited in what reasons and explanation mechanisms concerns. Further research could, also, confront leadership perspectives with the perception of technical staff and its operational lenses, as they have a fundamental role to play and are immersed in each specific context.

Crisis of Liability for Medical Injuries - Global Trends Aimed at Remedying Damage Caused During A Medical Treatment

Michal Bialkowski

ORCID 0000-0002-3366-6883

Abstract

The aim of the paper is to present changes occurring in the area of liability for medical injuries through the lens of experiences of Poland, New Zealand and Sweden. Basic research methods applied in the paper are the legal comparison method and the method of interpretation of applicable law. The paper presents transformations that have occurred in the Polish legal order around the traditionally understood tort liability for medical injuries and two proven out-of-court systems of pursuing claims for damages known from Sweden and New Zealand. Insurance, i.e. indemnity insurance and patient-injury insurance, takes a special place in legislative works that aim at facilitating the patient in obtaining the compensation pay. The increasing role of insurance, a transformation in understanding tort liability and its function allow an assumption that the future of tort liability departs from the principle of fault and repression directed against the injuring party. The main task that legislators face is to create conditions in which the patient obtains the payment regardless of the doctor's fault. This is why the experience of New Zealand or Sweden should be an inspiration to create good and financially balanced no-fault systems.

Keywords: No-Fault System, Compensation, Insurance, Medical Error, Health Care System

Introduction

Protection of the patient who got injured in the course of a treatment definitely goes beyond civil law thus becoming a subject of interest to the theory and practice of other branches of law, in particular administrative and insurance law, or even social security law (Jończyk 1999, p. 5). This thesis, undoubtedly valid on the ground of Polish law, is also valid in the light of global trends referring to indemnification of an injury caused in treatment. This search for new solutions also on the ground of branches of law which are associated with regulating traditionally understood principles of civil liability is proof to the existence of a crisis which in Western literature is called the malpractice crisis (Furrow, Greaney, Johnson, Jost, Schwartz 1997, p. 283). Attempts to amend legislation in countries such as New Zealand, Sweden, France or some US states aim at introducing no-fault or arbitrary systems intended to make it possible for the patient to obtain recompense for the injury suffered in the course of a treatment process fast and fully, without the requirement of proving fault of a specific health care professional (Tunc 1978, p. 31). Poland too began to see views in the literature in the late 1960s according to which the traditional model of civil liability for injuries caused in a treatment does not fulfil its role and in practice often does not lead to ensuring at least partial indemnification to the injured party (Karkowska, Chojnacki 2014, p. 31).

Reasons for a crisis in the subject-matter of remedying damage caused during medical treatment need to be sought primarily in difficulties in proving premises of liability (Tunc 1978, p. 30), in particular fault and a cause-and-effect relationship, in excessive lengths of compensation lawsuits or in costs of court proceedings (Lean1993, p. 134). The existence of the crisis and its reasons have been extensively discussed in the literature. The time has come in this context to answer the question about how the world is doing in dealing with the crisis, how it perceives the problem, whether it identifies its causes adequately and whether it is trying to apply relevant measures that mitigate its effects. The aim of this paper is to demonstrate the existing models of repairing damage caused during medical treatment that aim at making it easier for the patient to obtain compensation and to attempt to assess whether these systems fulfil their role. The paper's prime goal at that is to demonstrate that no-fault systems introduced in some countries provide an answer to the malpractice crisis. In order to accept them, however, one needs to understand the change in the function of liability for damages and to depart from repressions against the injuring party towards, most of all, compensation for the injury suffered by the patient.

The role of insurance and verification of the function of liability for damages in court proceedings - Poland's example

The first, one may say traditional, model that affects further development of alternative routes to indemnify personal injury was an introduction of third-party insurance to continental legal orders. As early as the 19th century, due to economic changes (industrial revolution) and social and economic changes (the clash of liberal doctrines with pursuits to ensure broader protection of employee rights), the process of departing from the principle of fault as the basis of liability for damages began, which entailed dynamic development of insurance (Eyben 2000, p. 34). The development of insurance was also associated with the problem of a growing discrepancy between the "potential of causing damage" and "the compensation potential", which was especially evident in the case of damage caused by the movement of the company (Kowalewski 2012, p. 271). Insurance as a method of compensation of damages gave a very positive impetus to obtain indemnification, because it was a tool that allowed efficient, comprehensive and certain repair of damage, at the same time being a safety buffer for risky economic projects, thus positively affecting the development of entrepreneurship. This is why at the beginning legislative works in this area intended to introduce systems of compensating damage caused as a result of performing one's work, motion of vehicles, water transport or motion of companies (Bączyk-Rozwadowska 2013, p. 215). However, with time, as is the case in e.g. the European Union countries, the practice of higher risk professions (e.g. medical professions) involved an obligation to sign a third-party insurance agreement, which greatly improved the patient's chances to obtain a compensation payment. In Poland, entities who carry out a medical activity and those that practice medical professions (doctors, nurses, laboratory diagnosticians) are obliged to enter into a third-party insurance agreement as a requirement for providing health care services (Article 25(1) and (5) of the act of 15 April 2011 on medical activity).

However, the requirement to obtain a compensatory performance in such a case still involves the need to demonstrate premises for liability for damages of the insured doctor, including his fault. This is why the scholarship has also started to address the need to objectify liability for damages, i.e. the need to detach it from the subjectively understood fault and to only investigate violations of the principles of practising the profession of a doctor (Safjan 1998, p. 85). In Poland it is visible in particular on the ground of a medical entity's liability for damage caused by a task delegated by a doctor, which is done by means of a broad application of the so-called concept of anonymous fault (Pytlarz 2013, pp. 146-148). It involves the exclusion of an obligation on the injured party to demonstrate which hospital employee caused the occurrence of the injury, which in consequence truly excludes even the possibility of examining a subjectively understood fault, making it easier for the injured party to pursue their claim. However, it is worth pointing out that objectification, and in consequence expansion, of civil liability, has certain negative effects too. It makes doctors and health care institutions' apply the so-called defensive medicine, understood as an attempt to secure oneself against possible patient claims by running numerous additional (most often unnecessary) test (Merry, McCall Smith 2001, p. 215), which may lead to extending the treatment process and raising its costs.

The dynamic development of insurance and the progressing objectification of liability are coupled with the evolution of the function of liability for damages (Bagińska 2012, pp. 74-76), which must be stripped of the repressive function if compensation for damage in no-fault systems - due to no need to attribute fault to a given injuring party - is to be possible This problem is associated with a departure in many foreign systems from individualised liability for damage, towards liability based on insurance (Kowalewski 2012, pp. 282-285). The economic factor was also significant in terms of the function of liability for damages, which demonstrated itself in a disproportion between the damage caused and the real possibility of equalising it by the injuring party. This provided a stimulus for strong development of insurance, which "cushions" financially the burden of repairing the damage (Kowalewski 2012, p. 278). Transformations of the function of liability for damages are also reflected in the development of a given society (Warkałło 1972, p. 34). This development, moving away from repression towards a preventive-educational function, reached a point in which the function of liability for damages involves primarily reparation of the damage suffered by the injured party (in Polish literature this process is called economization of civil liability) (Warkałło 1972, p. 35-36). Thus, transformations in terms of the function of liability were coupled with the said development of insurance, which allowed one to "bail out" of liability for the price of an insurance premium (Kowalewski 2012, p. 280).

Attempts to move away from litigation in seeking redress - examples of New Zealand and Sweden

The turn of the 20th and 21st centuries brought a phenomenon called "collectivisation" of tort law, which on the one hand involves considerable expansion of insurance, acceptance of liability for the company's dangerous activity and introduction of legal instruments that allow distribution of the burden of damage repair among a number of entities (internal collectivisation); on the other, it boils down to excluding specific types of facts from general rules of tort liability and subjecting them to special out-of-court indemnification regimes (Bagińska 2012, pp. 74-75). The aim of collectivisation is to streamline redress and to lower its costs by considering the possibility of moving indemnification

of personal injury towards public law by creating funds or systems of compensation with a strictly administrative or mixed nature (in terms of combining public funds with funds coming from private insurance) (Bagińska 2012, p. 75).

As has been pointed out above, many European countries and the USA (Cooper, Egeberg, Stephens 1977, p. 262) have introduced various proposals to create a more effective mechanism for recompensing injuries that were through the doctor's fault and through no fault of a doctor. On the basis of comparative research, it may be concluded that two fundamental systems (not related to third-party insurance) have been developed in this scope: the system of patient-injury insurance and the idea of creating a guarantee fund for compensating injuries suffered by patients (Nesterowicz 2002b, pp. 15-24).

The former was introduced in Sweden (1975), followed Finland (1987), Norway (1988) and Denmark (1988) (Farrell, Devaney, Dar 2010, p. 37). It is a good idea to present the construction of this system on the basis of the Swedish experience. The currently applicable system in Sweden has evolved from the system introduced in 1975 on the basis of an agreement concluded between the National Association of District Councils (twenty-one district councils are responsible for the organization of health care in the territory of Sweden) (Cooper 1976, p. 1268) and a consortium of four largest private insurance companies (*Scandia*, *Folksam*, *Trygg-Hansa* and *Länsförsäkringsbolagen*) (Danzon 1994, p. 455). A crisis of tort liability in Sweden led to a practically complete stop of patients' pursuing claims for compensation for injuries suffered in the course of medical treatment (Cooper 1976, p. 1268). The reason for the stagnation in pursuing claims involved difficulties in obtaining compensation under tort liability based on fault (Cooper 1976, p. 1268).

On 1 January 1997 provisions of the Patient Injury Act (Patientskadelag) (hereinafter: PIA) entered into force (Farrell, Devaney, Dar 2010, p. 39), which shaped the currently applicable system by the introduction of obligatory insurance for the benefit of patients which covers operators from the private sector and the public sector alike (Wendel 2004, p. 372). The system introduced in Sweden is an alternative for court proceedings, which means that the patient may still take the case to court, thus avoiding the functioning system (Farrell, Devaney, Dar 2010, p. 42).

In the Swedish system, the award of compensation and recompense does not depend on demonstrating fault of the injuring party or on identifying them (no-fault system) (Farrell, Devaney, Dar 2010, p. 40). In PIA provisions liability is based on a principle according to which the proceedings involve examining whether the damage could have been avoided if e.g. different treatment had been applied (avoidability rule) (Farrell, Devaney, Dar 2010, p. 40). This principle, introduced in place of the principle of fault well-known in the Swedish system, makes it possible to recompense the damage suffered by the patient if the damage could have been avoided (Farrell, Devaney, Dar 2010, p. 40).

In the discussed system, compensation covers six categories of personal injury:

1. treatment injury;
2. material-related injury;
3. infection injury;
4. accident-related injury;
5. diagnostic injury;
6. drug-related injury (Hodges 2006, p. 150).

It is worth noting that the Swedish system allows recompensing "accident-related injury", which includes all bodily injuries and health disturbances caused as a result of sudden and unexpected incidents that do not fall under the scope of medical actives and are not related to a general health status or organism's properties. Hospital accidents include injuries caused i.a. by slipping on a wet floor, falling off the stairs, an ambulance accident, fire or an explosion in a hospital (Bączyk-Rozwadowska 2011, p. 45-46). Patients benefit from the fact that "the prerequisite for compensation of accidental injury is that the accident some way be related to the care" (World Bank 2013, p. 30), from which one must conclude that proving a cause-and-effect relationship in the discussed group of incidents occurs only when the injury is caused to the patient during his stay in a medical entity.

It is also worth noting that the Swedish system assumes a restriction of the amount of compensation pay and is subsidiary towards compensation for damage which the patient may obtain on the basis of the social insurance system (Bączyk-Rozwadowska 2013, p. 267). The principle on which compensation for damages is based in the Swedish system is the principle of full compensation (Strömbäck 2009, pp. 431-432) established according to the principles of civil liability limited by adopted thresholds for repairing the damage (Strömbäck 2009, pp. 431-432). PIA provisions regulate amount limitations that cover benefits paid under the Swedish system where the limit is 1,000 times the base amount (which is about EUR 4,000) for each injury and 200 times the base amount for one patient (Nesterowicz 2002a, p. 125). Inclusion of the social insurance system in the system of repairing an injury caused

during medical treatment leads to a situation where the limits introduced by PIA are sufficient (Bączyk-Rozwadowska 2011, p. 53). It is a consequence of a very extensive system of social security benefits which also in part directly compensate health injuries (e.g. health insurance that covers costs associated with a loss of earnings) (Strömbäck 2009, p. 432).

Positive opinions of the Swedish model of repairing injuries dominate in scholarly writings (Strömbäck 2009, p. 432). This is evidenced by statistics which point to an increase in the interest in the discussed procedure among citizens of Sweden. In 1990 4,500 claims for compensation were filed, in 1999 there were 8,600 of them, while from 2010 onwards - about 10,000 a year (Farrell, Devaney, Dar 2010, p. 40). The attractiveness of the model adopted in Sweden is also proven by the fact that the injured parties turn to litigation only sporadically (Bączyk-Rozwadowska 2013, p. 277). A great virtue of the system adopted in Sweden is the possibility to obtain compensation very quickly or no fees for initiating the proceedings (Farrell, Devaney, Dar 2010, p. 37).

The second type of the system is the idea of establishing a guarantee fund to compensate patients' injuries. This concept was discussed in particular in France, New Zealand, USA, Belgium or Lithuania (Nesterowicz 2002b, pp. 19-23). According to a general assumption, such a fund is fed by contributions from doctors and medical entities or possibly also patients themselves. The fund's task is to repair the damage regardless of the reasons or the doctor's fault. However, the performances paid from the fund have a limited character and this is why they are an alternative route (other than litigation) to pursuing compensation or recompense. The fund operates automatically to a certain degree, allowing limited but inexpensive, quick and certain recompense of the experienced damage (Nesterowicz 2013, 457-460).

The system introduced in the1960s in New Zealand is an example of such a system (Farrell, Devaney, Dar 2010, p. 14). The system originally entered into force on 1 April 1974 (The Accident Compensation Act), and after a few amendments it is based on the provisions of the Injury Prevention, Rehabilitation, and Compensation Act 2001 (Public Act 2001 No 49) (hereinafter: IPRCA), which entered into force on 1 April 2002 (Farrell, Devaney, Dar 2010, p. 14). In 2005 a reform was introduced which gave the New Zealand no-fault system the current shape. It is crucial that this system is comprehensive and includes not only injuries caused in treatment, but also e.g. accidents at work or injuries caused as a result of traffic accidents (Brown 1985, p. 977).

At the moment, meeting the treatment injury prerequisites provides the basis for compensating the damage (section 32.1 IPRCA), where the said injury is understood as injury suffered by a person seeking treatment from a registered health professional. In order for the injury to be eligible for compensation under the discussed system, it must result from the treatment and at the same time it may not constitute a regular (predictable) consequence of the treatment (e.g. a scar after a surgery). When assessing the last premise, one needs to take into account the current state of knowledge at the time of causing the injury (Manning 2006, p. 703) and the patient's health status at the time of receiving medical treatment (section 32.1 a-c IPRCA) (Farrell, Devaney, Dar 2010, p. 19). According to the views of legal scholars and commentators, the term personal injury was constructed by the New Zealand legislator in such a way so as to include all injuries caused in treatment, those that can be foreseen and prevented and those entirely unforeseeable (Farrell, Devaney, Dar 2010, p. 27). At that, it is not, however, a necessary premise that the injury be caused during the treatment itself (Manning 2006, pp. 698-699).

In terms of the scope of compensation, the New Zealand system has evolved away from the system based on the principle of full compensation (real compensation) to a system based on the principle according to which the amount of payment is to be at the level that corresponds to the injured patient's needs on the one hand, and on the other it must guarantee financial stability of the system (financial affordability) (Bączyk-Rozwadowska 2013, p. 238). The change in question was necessary due to rising costs of maintaining the system (Farrell, Devaney, Dar 2010, p. 27). Due to the adopted rule, the amount of compensation for a loss of earnings and the amount of a disability pension granted in the event of permanent or temporary incapacity to work was limited to 80% of the general sum that the injured would have received if the injury had not occurred (Bączyk-Rozwadowska 2013, pp. 238-239). In turn, the compensation covers reimbursement of all costs incurred by the injured party as a result of medical treatment, rehabilitation, transport, purchasing food to follow a certain diet, purchasing medicine or medical equipment (Farrell, Devaney, Dar 2010, pp. 25-26). Moreover, as of 1 August 1999, the New Zealand system does not allow for pursuing recompense for non-financial injury to a person (Lean 2011, pp. 29-31).

A characteristic feature of the New Zealand system involves the way funds for its operation are obtained. While in the Swedish system recompense for damage is done through the payment from the obligatory insurance taken out by doctors for the benefit of patients, in the New Zealand system the funds are obtained from premiums paid obligatorily by entities operating i.a. a medical activity which form the Accident Compensation Account (Dute 2004, p. 464).

The New Zealand system allows reparation of an injury caused due to treatment, without conditioning the compensation on demonstrating that the injury was a consequence of a medical fault. At the moment, the system operates as entirely detached form fault, which frees doctors and other medical personnel from individual liability for the injury. Despite the limitation of the scope of recompense, the amounts of repairing the damage are specified in such a way that litigation motivated by an unsatisfactory degree of repairing the injury occurs extremely rarely (Bączyk-Rozwadowska 2013, p. 241). Despite that, one must refer critically to the absence of a possibility to repair a personal injury involving grief or loss of joy in life. Unfortunately, the system's financial burden proved too great and in order to maintain the possibility of obtaining compensation quickly and with certainty, a decision was made to limit the scope of indemnification.

Conclusions

Changes in compensation of damage caused in medical treatment have occurred in various legal systems. Firstly, by adopting legal solutions which modified the legal situation of the injured parties in the existing model of tort liability based on the principle of fault; and secondly, at the same time, by linking the liability of a medical entity with the obligatory third-party insurance. The development of insurance along with progressing objectification of liability and a departure from the principle of fault have somehow become a foundation for the "development of a civilisation of indemnification" (Warkałło 1972, p. 28). It centres on the injury suffered by the aggrieved party and on pursuing its effective reparation. Both above factors driving changes in approaching civil liability are associated with the development of capitalist societies and a dynamic development of industry, which with time have also translated onto the legal situation of injured patients. These transformations lay a foundation for changes in understanding the very function of liability for damages, which to a lesser degree focuses on repression and to a greater degree aims at compensating the damage.

The second variant proposed by legislations involved a departure from traditional rules of compensating "medical injuries" and an introduction of a system of compensation detached from the principle of fault. More and more countries follow into this direction. The presented system of compensating no-fault medical injuries meets the principles of a system which is quick, does not burden the injured patient financially, facilitates pursuit of compensation by eliminating a premise of fault and actually intends to repair the damage done. The history of the New Zealand system teaches us that it is not always possible to fully repair a personal injury and that it will be necessary to limit the performance claimed by patients in order to balance the principle of full compensation with the principle of obtaining the payment within a reasonable time and at a low cost. A system functioning in such a way may be supplemented by - as is the case in Sweden - an extensive system of social insurance which would take over in part the costs associated with recompensing medical injuries, thus relieve the strain of no-fault system.

A consequence of transformations presented above involves a further departure from perpetrator's liability and moving towards guarantee liability. The future should bring dynamic development of insurance aimed at further objectification of liability for damages. At the same time one needs to expect a limitation of the role of tort liability based on the principle of fault in the socially most important areas and development of simplified no-fault systems of compensation based on insurance. It is natural that a great share of injuries caused during medical treatment are not due to the doctor's fault. Does this mean, however, that such an injury should be left without a recompense? Looking at the system systemically, not only from the perspective of the doctrine of civil law, it seems that there is no axiological reason for differentiating between the situation of the injured patient who suffered an injury due to the personnel's fault and one who suffered an injury as a result of a simple fall. Both injuries deserve reparation. This is why when one adopts such a point of view it is necessary to depart gradually from the concept of fault as the basis of construction of the system of liability for damages and to look for a system which will enable injured patients to obtain just compensation. Arguments that liability for damages deprived of its preventive or repressive function does not fulfil its role end up in a void as regards systems of criminal, professional and disciplinary liability prescribed for medical personnel that exist in democratic states.

Legal and Financial Aspects of Participatory Budgeting in Poland

Jakub BARANOWSKI

University of Szczecin, Szczecin, Poland, jakub.baranowski@usz.edu.pl
ORCID 0000-0002-9863-7864

Abstract

Citizens' budget (used alternately with the term "participatory budgeting") is one of the key ways for local residents to meaningfully engage in local government processes. Since late 1980s, when first participatory budgeting projects were implemented, this form of public participation has gained popularity and wider acceptance. It translates into tangible benefits, such as collaborative city development and residents' involvement in participatory democracy.
In Poland, participatory budgeting was initiated in 2013. It was only after five years from this first edition that the Polish legislator decided to regulate the legal status of the participatory budget. An obligation to create annual participatory budget was introduced for large cities, i.e. above 100,000 inhabitants, also setting the guaranteed minimum of funds to be spent under the participatory budget. It has been two years since these legislative changes were made, shaping a new attitude of municipalities towards civil society participation, so it is a good time to look at the consequences of these changes, in particular at the issue of financing participatory budget schemes from municipal funds. The future of the participatory budgeting movement depends on continuous improvement of the budgeting procedure which in turn is conditioned by legal regulations and growing citizen engagement.

Keywords: Local Government Funds, Participatory Budgeting, Citizens' Participation.

Introduction

Continuous development of civil society in Europe should remain one of the key priorities of EU member states in the years to come. The development of civic society and citizen participation will depend on people's engagement in community welfare, from simple supporting one another to electoral participation, that is involvement in social and political life. Indeed, social participation is treated today as the foundation of modern democracy which encourages citizens' participation in the management of public affairs (Gralak, 2018, p. 153). Social participation inspires and enables personal fulfillment, and also gives a sense of belonging to a local community and a sense of agency or empowerment (Gawroński, 2015, p. 273). In semantic terms, the word "participation", "to participate" means to partake, to take part – and combined with the word "public" it denotes participation in public life. According to one of many definitions of citizens' participation, the latter can be understood as consideration of the needs of others in decision-making processes (Pietraszko-Furmanek, 2012, p. 63).

Participatory budgeting (PB) is one of the key participatory tools used by local communities. By amending the Act on municipal self-government at the level of municipality ("gmina"), the Polish legislator attempted to regulate the legal status of the participatory budget. Among the most important changes was enforcing the obligation to draft citizens' budgets in larger cities, while indicating the minimum percentage of funds to be spent on the year to year creation of the PB. However, having regulated this issue successfully, the legislator did not regulate some other issues of participatory budget funding. First of all, the legislator did not determine how the operating costs of investment ventures established under such participatory schemes should be funded. After almost two years since the amendment, a question should be posed whether the applicable regulations ensure adequate funding mechanisms for local government units that are obliged to produce a citizens' budget.

This paper attempts to shed light on the legal and financial situation of participatory budgets in Poland. By applying the method of interpretation of the law applicable in Poland with regard to the participatory budget, and the empirical method, i.e. a case study analysis of PB funding principles applied in one of the largest Polish cities, the author attempted to highlight the consequences of actions taken by the Polish legislator in this regard. The secondary goal of this paper was to identify the issue of funding for investments implemented under the PB, which lack regulation under Polish law.

Participatory Budgeting – Introductory Remarks

Participatory budgeting is a citizen engagement process that was initiated in Porto Alegre in late 1980s in a conjunction of top-down and bottom-up processes. In result of growing interest, this form of social participation and grassroots democracy is now proliferating around the globe, including European countries. The PB is an instrument enabling civil society to play a greater role in local governance (Augustyniak, 2017, p. 374). The goal of participatory budgeting is to empower community members to realize the influence on local governance and decision-making they have (Gilman, Rousson, 2016, p. 3) by suggesting changes needed in the neighborhood and immediate environment. Participatory budgeting is a kind of social and civic innovation, which emerged in result of the process encompassing the state and civil society (Novy, Leubolt, 2005, p. 2023). It is often emphasized that the PB is one of the most effective participatory processes of recent years (Džinić, Murray Svidroňová, Markowska-Bzducha, 2016, p. 33).

At its core, participatory budgeting is a politically neutral tool given directly to community members. Such approach aims to promote the idea of innovation and entrepreneurship among local residents, as well as to strengthen the confidence residents have in the local government and its representatives (Kębłowski, 2013, p. 14). Moreover, the PB procedure improves both the resident-to-local government and the resident-to-resident interactions. Indeed, it is when talking to local residents when one can really get an insight into the local community life and identify its actual needs. The effect of the participatory process is the creation of groups of local leaders who inform what are the priorities for their community, thus building their position as efficient, involved citizens.

The participatory budget can also be an element of long-term municipal policy, thereby engaging local residents to take part in shaping the cities and towns they inhabit. This model of engagement can also point to certain directions of development by identifying the most urgent needs of the community. Furthermore, the PB allocates funds to the most pressing tasks in given parts of the city, and it is also able to engage social groups which thus far have not participated in the public debate (Kębłowski, 2013, p. 16). The PB model of democracy may result in enhancing the quality of life local residents have, including their overall satisfaction with the way the city operates.

Participatory Budget – Effects of Normative Changes Implemented in The Polish Legal System In 2018

The first edition of participatory budget took place in 2013 in Sopot. At that time, the process of PB implementation was not regulated under the Polish legal order – it was treated as a form of public consultations with residents, in absence of legal regulations that would address this specific process of collaboration. After a few years from the first PB edition, the Polish legislator attempted to work out the legal framework of participatory budgeting. In 2018 the Act on municipal self-government was amended, imposing an obligation on large cities to create participatory budgets on an annual basis. Moreover, the obligation was correlated with specific budget amount which, from 2018 till this day, is closely related to municipal expenditure. The legislator decided that the minimum amount of funds to be spent under PB should not be equal to at least 0.5% of the municipality's expenditure as presented in its last submitted budget execution report. Moreover, the legislator imposed on local government units an obligation to adopt a resolution determining minimum formal requirements to be met by a proposed participatory budget (Act on municipal self-government, Article 5a, sections 3-8).

Equipped with the five-year long experience of participatory budgets schemes operating in some cities, the Polish legislator decided to create a new form of public consultations. From 2018 onwards, participatory budget is recognized in Poland as a "special form" of public consultations. In reality, the implementation process of PB schemes had always differed from the standard public consultation procedure. First of all, citizens' interest in participatory budgeting is much bigger. To exemplify that, let us look at the numbers: in 2019 in Szczecin, as many as 31,690 persons voted for participatory budget proposals in contrast to the standard public consultations on where certain monument should be erected- the number was down to only 35 persons he guaranteed minimum amount of funds to be spent under PB should not be less than 0,5% of municipality's expenditure, contained in the last submitted report from the budget realization he guaranteed minimum amount of funds to be spent under PB should not be less than 0,5% of municipality's expenditure, contained in the last submitted report from the budget realization (Public Information Bulletin of the City Council of Szczecin, 2019; Public Information Bulletin of the City Council of Szczecin, 2019). The growing interest in participatory budgeting schemes also encourages residents to identify with the entire process of building a civil society in a local context. This special form of public consultation ends in voting on the participatory budget, in which residents act as involved citizens and select tasks to be implemented by local government.

The growing interest in this form of citizen participation also translates into youth being more engaged in community governance. For this very purpose in 2019, in Szczecin, a new project was initiated called the Youth Citizens Budget, which is an offspring of the municipality's participatory budgeting. Its main role is to encourage active participation

of young people (students) in the matters of local community, develop their civic knowledge and build political efficacy. During the first edition of the project, students of 38 secondary schools were given the opportunity to submit their proposals. Pursuant to the principles set by the Youth Citizens Budget, projects related to the so-called hard actions – e.g. class equipment or creation of leisure space, as well as soft actions, such as trainings and conferences. (Szczecin Education Portal, 2019). Even though the total budget for all participating schools was not big, it allowed each of them to work on some civil society tasks. This form of engagement of young people proved to be very successful, as the participation rate was as high as 92% in one of the high schools, and among the winning projects were bins for proper garbage segregation (Voting protocol, 2019). Such a big engagement proves that the best way of citizen education is to give young people a hands-on experience with self-governance.

Funding of participatory budgets – case study of the city of Szczecin

The aforementioned legislative changes made the creation of annual citizens budgets obligatory in large cities to and placed emphasis on funding them. The obligation to allocate a percentage amount of funds to the PB means that its actual size depends on how well the city did in a given year in terms of revenue. A great example here is the case of the city of Szczecin where in 2019, the amount of participatory budget was ca. EUR 2,852,000, whereas just a year later, in 2020 – ca. EUR 3,275,000 (Ordinance No. 204/19; Ordinance No. 272/20). This difference is solely the result of Szczecin's increased municipal expenditure, as both in 2019 and 2020 the city allocated toward the participatory budget schemes only the minimum statutory amount of 0.5% of municipal expenditure. Nevertheless, such budget enabled implementation of roughly 30 projects in 22 sub-districts of the municipality of Szczecin, as well as other city-wide projects.

At present, the amount of funds intended for the creation of PB in a given year is specified in the city budget plan under "tied-up reserve", which cannot be used to fund other tasks. The legislator stated explicitly that a certain part of the city budget must be allocated to the PB – and there are no exemptions from that in the statute. Large Polish cities have experienced that firsthand in the early stage of SARS-CoV-2 pandemic, as without the legislator's intervention they could not re-allocate the PB funds to fund emergency management or public safety initiatives. In consequence, the participatory process was conducted as usual in the year of global SARS-CoV-2 pandemic.

Moreover, the legislative changes led to a redistribution of funds by the city authorities within the PB framework. Till 2019 Szczecin was divided into 4 districts – each receiving an equal amount of funds, while city-wide projects were allocated a different amount of funds (Rules of Procedure, 2016). At present, the city is divided into 22 sub-districts, which mostly include residential areas, and 1 central city district which is supposed to meet the needs of wider population, i.e. residents of more than one sub-district (Rules of Procedure, 2019). The participatory budget funds are no more divided equally to each sub-districts, as a special algorithm was introduced which allows to calculate funds to be spent. The total PB funds is now divided in the proportions 30:70, which means that 30% funds are allocated to the central city district projects and 70% to projects intended for sub-districts. Furthermore, the distribution of funds among sub-districts follows the aforementioned percentage based algorithm, where 70% of the funding depends on a sub-district's population and 30% on its land area in km^2. In other words, the most populated and largest sub-districts receive the most PB funds. Distribution of funds based on an objective algorithm seems to be a more just solution than the mere territorial division, as it was the case before the amendment of PB procedure in Szczecin. The previous division of the city into just 4 districts, which differed drastically in terms of land area and population, did not provide equal opportunities to all residents of Szczecin (an issue rightly pointed out during the public consultation on the new Rules of Procedure of the Szczecin Citizens Budget). To exemplify that, let us say that one district encompassed 10 residential areas. According to the old rules, the largest residential areas were most likely to implement the biggest number of projects, which instilled a sense of unfairness among residents of smaller residential communities. This is why the redefinition of the territorial division of Szczecin (shifting from large districts to smaller territorial units – sub-districts consisting of residential areas) and the algorithm-based distribution of funds is definitely a positive change. Its effects were also reflected in the increased number of winning projects – in 2019 there were 28 projects compared to 13 in 2018, prior to the procedure's change.

These changes are being underlined by the author deliberately. The city's new territorial division and the creation of sub-districts encompassing aggregate and single residential communities allowed Szczecin's inhabitants to experience participatory budgeting as an empowering process. The rules that govern Szczecin citizens budget clearly state that if at least one project is submitted from a given sub-district, it will be selected in voting and implemented. Building on this assumption, it can be said that Szczecin as a city has made a huge step towards encouraging its residents to participate more actively in improving their residential areas.

Aside from the positive changes arising from legislative reforms regarding the legal status of PB in Poland, consideration should also be given to another element, important from the perspective of funding, i.e. the issue of maintenance of the projects realized under the PB framework. The legislator specified the percentage of the city's

expenditure that must be allocated to the enabling of the participatory process, and thus, to the funding of the projects selected. However, the Polish legislator has completely overlooked the finance needed to maintain the projects implemented, and this fact is a significant challenge to local governments. A good example here is the park revitalization projects. The amount of investment specified by municipal investment experts was spent on the creation of parks. A problem arose when it was time to carry out some green maintenance works. It turned out that in such case it is the municipal entity in charge of the city's green areas that has to cover all the maintenance costs. Till today, there is no statutory mechanism that would ensure funds to maintain in proper condition such kind of investment projects after their implementation. Municipal entities receive funds only for the realization of investment projects, and receive no funds for further maintenance of the investments.

The aim of participatory budgeting is to encourage citizen engagement in projects that enhance the quality of life in the cities. However, the lack of regulations on the funding for maintenance of investment projects after their implementation may lead to a situation in which the municipality will not be able to pay for the maintenance of investments delivered in each consecutive year. If the institution of participatory budgeting is to continue its empowering role, regulating the issue of PB finance should become the legislator's priority. Since, undoubtedly, it is the proper maintenance of the projects carried out that has more meaning to the community than the mere fact of their implementation.

Summary

Participatory budgeting is becoming increasingly popular all across Europe and it is a fundamental tool enabling civic engagement in local communities. However, this enthusiasm should be supported by legal mechanisms that would regulate the legal and financial situation of the participatory budgeting model. The fact that an attempt to regulate these issues was also made in Poland deserves a positive reception, although we should bear in mind that this kind of solutions have to evolve parallel to community development trends.

The creation of participatory budgeting in Poland, in particular in large cities, is obligatory. The size of participatory budgets has been correlated with the size of the cities' expenditure. In consequence, the amount of participatory budget depends on the financial situation of municipalities in a given calendar year. Continuous development of cities, including new investments, is the reason why Urban dwellers can spend more funds under the participatory budget scheme in each consecutive year.

An issue that requires further regulation is the financing of maintenance of PB projects after their implementation. Due to the absence of such regulations, municipal budget is charged with all maintenance costs. Formally, it is the city that is burdened with the task and additional spending, without being allocated any funds towards that goal. If the present situation continues, cities may not have sufficient funds to cover expenses related to the maintenance of PB projects in the years to come, which may eventually lead to the shutting down of some projects.

To answer the question posed in the introduction, legislative changes that regulate the legal and financial situation of participatory budgeting in Poland are definitely a good step towards a more comprehensive regulation of the participatory budgeting procedure. Nonetheless, as cities and costs of participatory budgets continue to grow, a separate, comprehensive regulation of participatory budgeting in form of an act on citizens budget may be necessary. To accommodate the future, such solutions should be contemplated today, in particular among the theorists and practitioners of participatory budgeting.

Important Public Interest as A Constitutional Basis of Limitations of Freedom of Establishment in Poland

Jerzy CIAPALA

University of Szczecin, Szczecin, Poland
jerzy.ciapala@usz.edu.pl
ORCID 0000-0002-5062-3834

Abstract

Freedom of establishment in defined in the Polish Constitution of 2 April 1997 as freedom of economic activity. It is a basic pillar of social market economy. It is followed in the Constitution by private ownership, and solidarity, dialogue and cooperation between social partners as the second and third pillar. Pursuant to the Constitution "limitations upon the freedom of economic activity may be imposed only by means of statute and only for important public reasons" (Article 22). The problem in the practice of judicial decisions of the Constitutional Tribunal and courts involves ongoing specification of what incidents, facts and circumstances may fall under important public interest.
The aim of this paper is to compare in constitutional terms the said goods and values, that is the basis of limiting all constitutional freedoms and rights (Article 31(2) of the Constitution), with the category of "important public reasons" and to accentuate the changeable ways of understanding this term by the Polish Constitutional Tribunal and by the Court of Justice of the European Union. In this context it is important to establish the relationship of the term "important public interest" with "public interest", "social interest" and also with "state interest". The analysis cannot avoid the growing impact of the EU law and CJEU case-law due to the fact that the Polish Constitutional Tribunal and legal scholars and commentators accept - so far - the pro-EU interpretation of the Constitution. The Author's intention is to convince readers how destructive domination of political factors is on the functioning of the legal and institutional system.

Keywords: freedom of establishment and its limitations, important public interest, decisions of the Polish Constitutional Tribunal and the Court of Justice of the European Union

Introduction

During the works of the Constitutional Committee of the National Assembly it was argued that limitations of freedom of establishment must involve strictly interpreted exceptions. This is why Article 22 features the term "only" twice (Bulletins XXXI and XLV KK ZN, 1996, 1997). Therefore, historical interpretation, invoking the so-called will of the legislative authority, should encourage the legislator to maintain restraint and cite well-founded reasons when introducing limitations of freedom which results from natural human dignity. This freedom includes spheres of activity in the following scopes: a) the very decision to take up the activity, b) identifying its objects, c) selection of legal forms of operation, and d) freedom to limit or cease operation. The gravity of this provision is justified by it being placed in Chapter I of the Constitution entitled "The Republic".

The practice of constituting law has not confirmed these principles. In the period of transformation of the economic system the legislator standardized (and still is standardizing) the discussed freedom too often and too restrictively. The opinions of the Constitutional Tribunal (hereinafter: CT) were not uniform or consistent. On the one hand, the CT believed that the introduced limitations are inadequate, violate the principle of proportionality and do not take into account the "axiological balance" (OTK 2008, K 46/07). On the other hand, it pointed out that limitations of freedom of establishment can be more restrictive, especially compared to personal and political rights and freedoms (OTK 1998 – K 10/97; OTK 2003 – SK 24/02; OTK 2004- SK 21/03). It is also very important that the CT established that the freedom formula cannot refer to entrepreneurs who operate on the basis of a public capital, that is state or self-government capital (OTK 2001, K 19/00).

Understanding important public interest and its relation with other constitutionally protected goods

In Article 22 of the Constitution the term "important public reasons" was considered a general clause, that is a provision with an under-defined expression. When interpreting it, it is important to refer to non-legal assessments, to the state of affairs and to facts and circumstances which the legislator will consider as "co-shaping" the important public interest. It needs constant redefinition and specification in judicial decisions, relevant to the varied economic and social context. Article 22 gives authorisation to invoke economic criteria and parameters, e.g. economic balance, budget balance, or anti-trust practices, and also non-economic criteria, e.g. protection of human health, animal welfare, or rights and freedom of another person. The scholarship used to assume that it is an expression which should encourage interpretation *in favorem libertatis* (Garlicki 2005, pp. 6-7), because general clauses due to their nature formulate a specific type of desired argumentation (Ziembinski 1980, pp. 242-243, 472-475). This provision creates "open, intentional, oriented and controlled clearance" for the legislator and may be used to de-formalize the law application process (Leszczynski 2001, p .36).

The author assumes that there is no absolute primacy of public interest over private interest in a democratic rule of law, and the entrepreneurs' interest must be taken into account in the context of legal changes which serve to implement state policy objectives. The basic problem, however, involves the degree of interference and the frequency of changes (e.g. in tax law, in statutes that regulate the activity in specific branches of the economy). No long-term strategy of social and economic development has been developed in Poland since 1990 that would go beyond a term of office of a given parliament and a government legitimised with its support. In consequence, regulations of economic activity are too frequent and devoid of consequences as to liberalisation (Hausner 2019, p. 355).

As stated above (Abstract), the Polish Constitution also features a provision of Article 31(3) included in Chapter II "The Freedom, Rights and Obligations of Persons and Citizens". It seems that it has basic significance in limiting all rights and freedoms. Four essential elements of content (interpreted jointly) were included in it: 1) it names goods and values that justify limitations: security of the state, public order, protection of the natural environment, health or public morals and protection of freedoms and rights of other persons; 2) the principle of proportionality of limitations was emphasized by the expression "when necessary in a democratic state"; 3) a requirement that limitations be imposed only "by statute" was introduced; 4) it was concluded that limitations cannot violate the essence of a given freedom or right, and thus they cannot preclude or exclude them. When it comes to economic freedoms, the Constitution stipulates, however, for one exception - nationalization made in the form of a statute (Article 216(3) of the Constitution), which must correspond to restrictive constitutional requirements. The significance of the principle of proportionality, accepted among Polish legal scholars and commentators, has special importance. In order to comply with it one needs to answer three questions: 1) is the introduced regulation able to bring about intended results? (praxeological rationality); 2) is the regulation really necessary for the protection of public interest?; 3) are effects of the regulation proportional to the burdens imposed on its addressees? (axiological account) (Wojtyczek 1999, pp. 159-161).

In the author's opinion, invoking public interest which, as must be emphasized, needs to be "important" cannot leave the legislator with discretion in specifying the type of the protected interest. When establishing it, goods and values listed in Article 31(3) must be taken into account as well as a general hierarchy of constitutional values that results from a democratic rule of law. Therefore, one must first invoke the goods and values enumerated in Article 31(3). Then, since the semantic scope of the term "important public reasons" under Article 22 is broader than the one under Article 31(3), one needs to "extract" other goods and values from further provisions of the Constitution or from the European Union law. In the author's opinion, the term "important" requires a high and extensive standard for justifying limitations. This is related to the need to prefer a communicative and argumentative dimension law making and application (Matczak, p. 195-199).

In the context of the coronavirus pandemic, it needs to be emphasized that limitations of freedom of establishment in Poland are also determined by constitutional and statutory provisions on extraordinary measures. Provisions on a state of a natural disaster were also introduced with prevention of infectious diseases in mind. Therefore, the government's 2020 policy related to the coronavirus pandemic needs to be severely criticised: instead of introducing a state of a natural disaster, the government decided to pass regulations in a chaotic and inconsistent way in the form of a few statutes and government regulations. In order to pursue the political interest of the "Law and Justice" party (choosing a convenient time for presidential elections) a few violations of the Constitution were made, including the discussed freedom of establishment. Unconstitutional prohibitions concerned both limitations on and exclusion of activity of many entrepreneurs, especially those from the services sector.

Constitutional principle of protection of economic activity and important public interest

The order to protect economic freedom has properties of the constitutional principle of law in the Polish study of constitutional law and the theory of law. A constitutional principle of law is a legal norm or group of legal norms with a particular significance for operative application of the Constitution. It is similar in other law branches (criminal, civil, administrative law) which identify principles which are "reference points" to their interpretation and application. Only certain provisions of the Constitution have properties of principles of law (Zielinski 1997, pp. 58 -78). Their axiological and political significance and, as has been pointed out, usefulness in interpretation and application of the Constitution decide here. This fact cannot be irrelevant in understanding important public interest. A few functions of the principle of protection of freedom of establishment can be identified:1) in terms of specifying objectives and directions of constituting law; 2) as an interpretative directive in the law application process (*in dubio pro libertate, in favorem libertatis);* 3) as justifications of derogations of sub-constitutional norms that are inconsistent with it, and 4) as a basis to reconstruct basic law.

Given the weight of this principle, one may identify a few goods and values which the Constitutional Tribunal attributed to important public interest in its decisions: 1) introducing sanctions on such a level that infringements of law are unprofitable (OTK 2004, SK 40/01); 2) counteracting tax fraud which leads to evasion of tax obligations (OTK 2002, K 45/01); 3) protection of children and young people against demoralization resulting from alcohol consumption (OTK 2011, P 26/09); 4) an order to protect social market economy (OTK 2014, SK 20/12); 5) protection of health of citizens by facilitating the use of medicine refunding procedures (OTK 2014, SK 20/12); 6) guaranteeing artists and authors minimum royalties for using their works and rights (OTK 2006, SK 40/04); 7) the need to regulate immediately the legal state of real estate due to quick implementation of public road construction plans or improvement of road infrastructure (OTK 2006, K 23/05); 8) ensuring architectonic and spatial order for the safety of users of facilities (OTK 2011, Kp7/09); 9) the need for necessary changes in the organization of the fish market (OTK 2010, Kp 1/09); 10) eliminating from the market game entities that influence rules of this game, that is political parties (OTK 2004, K 25/03); and 11) introduction of a limited obligation to purchase energy and heating from unconventional and renewable sources (OTK 2016, P 24/05). It needs to be added that in its reasoning to many judgements, the CT often referred to "public interest" without the quantifier "important" and specified what values and goods it had in mind.

European Union law context

The term "important public interest" has not been worded in the treaty law of the European Union. However, the term "interest" features multiple times independently or with modifiers. For instance: "its interest" (Article 13(1) of the Treaty on European Union, hereinafter: TUE, "interest of the Union" (Article 17(1) TUE), "interests of Member States" (Article 13(1) TUE), "public or private interest" (Article 15(3) of the Treaty on the Functioning of the European Union, hereinafter: TFUE), "general economic interest" (Article 14, Article 106(2) TFUE), "financial interests of the Union" (Article 85(1), Article 86 TFEU), "interests of consumers" (Article 169(1) TFEU), "public interest" or "general interest" (Article 17 of the Charter of Fundamental Rights). Limitations of freedom of movement of goods may be justified by reasons of public morality, public order and security, protection of health and life of people and animals, protection of cultural goods with an artistic or historical value, and protection of industrial or trade property. Such limitations may be a product of arbitrary discrimination or hidden limitations in trade between Member States (Article 36 TFUE). In turn, TFEU provisions on establishment do not apply to activities which in that State are connected, even occasionally, with the exercise of official authority (Article 51 TFUE). The above comments prove a significant degree of similarity of the provisions of EU law with provisions of the Polish Constitution.

On the other hand, the term "overriding reasons relating to the public interest" was shaped in the CJEU case-law concerning Article 43, Article 46, Article 49 and Article 55 TFEU. Directive 2006/123/EC of the European Parliament and of the Council of 12 December 2006 on services in the internal market is reliable for specifying and summarising this interest. In line with the CJEU case-law and recital 40 of the Directive, the framework of overriding reasons relating to the public interest covers more than 20 goods and circumstances, i.a.: public order, public security, public health, social policy objectives, protection of the recipients of services, preservation of the financial balance of the social security system, prevention of unfair competition, safeguarding the sound administration of justice, promotion of the national language, veterinary policy or need to ensure a high level of education (OJ L 376, 27.12.2006, p. 36–68). These examples prove that the "overriding reasons relating to the public interest" were specified in the EU law more frequently and in more detail than "important public reasons" under the Polish Constitution.

The context of constitutional interpretation of freedom of establishment and important public interest in the light of EU law outlines the principles of Poland's Constitution: the principle of observance of international law binding upon it (Article 9) and the principle of supporting processes of European integration, derived by legal scholars and commentators from CT decisions under Article 90 and Article 91 of the Constitution. The Union's *acquis communautaire* is therefore often a reference point to specify boundaries of freedom of establishment and to concretize important public interest. The author believes that we may be dealing with a specific co-application of the Constitution and the EU law, because the content of constitutional norms would be specified by EU norms. It is proven by at least three legal facts: 1) amending the content of Article 55 of the Constitution in order to introduce the European arrest warrant to the Polish legal order; 2) CT declaring the act relating to the so-called bio-fuels unconstitutional due to violation of freedom of movement of goods and non-discrimination under Treaties (OTK 2004, K 33/03); and 3) declaring the introduction of restrictions for entrepreneurs managing large trade facilities unconstitutional due to the risk of violation of the Union's non-discrimination order in the sphere of economic activity (OTK 2008, K 46/07).

Freedom of establishment versus humanitarian aspects of animal protection and animal welfare - Poland's example

On 18 September 2020, the Sejm (lower house of the Polish parliament) adopted an act on amending the animal protection act and certain other acts (The Sejm Paper no. 597 of the 9th term of office). The statute, which as at 15 October 2020 had not entered into force, triggered a severe political conflict. It is because it included a ban on fur farming and on ritual religious slaughter, i.e. raising and slaughtering cattle then mainly exported to Arab countries and Israel. The important public interest that underlay such regulations was specified by reasons of public morality, humanitarian reasons and the need to protect animal welfare. Without a doubt, the act would infringe on the freedom of establishment because it threatened the existence of interest of thousands of entrepreneurs - breeders and their employees. Journalists assessed its negative impact on the life of over 150 thousand people. Moreover, the act would also greatly affect the volume of the entire Polish export. Thus, a problem of weighing "important public interests" emerged and so did the problem of axiological and strictly economic balance.

In the author's opinion, axiological, praxeological and economic reasons are key here, while a very difficult legal assessment would have to be based on an analytical use of the principle of proportionality. It would involve establishing a long, multiannual intermediate stage - *vacatio legis* and a fair specification of the amount of equivalent compensation which would take into account both the real damage and the lost benefits, i.e. *damnum emergens* and *lucrum cessans.* The assessment of the adopted act points out that it does not meet such requirements. Therefore, a judgement of the Constitutional Tribunal or the political will of a prevailing (qualified) parliamentary majority should determine the case here.

The author believes that it will not be possible to prejudge a real important public interest and to solve the legal and political dispute. First of all, the act does not have a chance to be confirmed by a qualified majority in the Sejm (opposed by the Senate and the President). Second of all, after 2015 the authority of the Constitutional Tribunal was definitely disregarded by the dominant political class, especially persons from the "Law and Justice" party: violation of the rule of law, significant limitation of independence of the judiciary, or "politicising" the composition of the Constitutional Tribunal.

Summary

Reflections presented in this paper lead to a few basic conclusions.

The first conclusion boils down to stating that "important public interest" is classified as a provision on the ground of Polish legal culture – a general clause which includes an under-defined term. It is important in so much that the Polish legal culture differentiates between provisions, i.e. editorial units of law texts and norms (orders, prohibitions, authorisations) which are derived on the basis of interpretation of provisions. Important public interest cannot be interchangeably defined and invoked by means of expressions such as: "public interest", social interest, or "state interest". The terms above need to be adequately "reinforced" with axiological, economic or political arguments so that their justification leads to the adoption of "particular importance of the interest".

The second conclusion relates to specifying important public interest. It is possible thanks to the introduction of norms and values and identification of goods referred to in Article 22 of the Constitution, that is in a provision that addresses general principles of limitation of all constitutional freedoms and rights. A holistic interpretation also encourages reaching then to norms, values and goods enumerated in other constitutional provisions, in texts of primary legislation, in EU secondary legislation and in the CJEU case-law. The Polish constitutional scholarship and the line of judicial decisions of the Constitutional Tribunal (at least until 2015) prove this. When giving reasons for and specifying

important public interest it is truly valid to note the argumentative and communicative dimension of interpretation and application of the law, including judicial activism which does not manifest itself sufficiently in Poland.

The third conclusion concerns the institutional practice in Poland. To this end, one may identify a period from 1986 (first decisions of the Constitutional Tribunal) to 2015 (electoral victory of the "Law and Justice" party). The Tribunal managed to establish - though not without a shadow of doubt - a relatively consistent line of judicial decisions. It tried to "catch up" with frequent changes made by the legislator and to correct them. Solving constitutional problems is markedly difficult after 2015 as a result of undemocratic changes in the country's political system, the questioning of the division of power and the erosion of the Tribunal's authority. The example of the conflict against the background of freedom of establishment of farmers and breeders presented in the final part of this study proves the dominance of political factors and – though difficult to accept - constitutional nihilism.

Abstract

The key areas of implementation of digital technologies in the regional economy management system that are available at the current level of ICT technology development: creation of systems for objective control of the state and activity of all economic entities operating in the region (both endogenous residents and representatives of exogenous structures localized within the RES); organization of digital monitoring of key socio-economic processes, differentiated by us depending on the source of origin and significance for the results of the RES operation; monitoring the composition, intensity and effectiveness of management impacts at the local (local), regional, sub-Federal, and Federal levels based on a specific set of quantitative indicators generated and verified in digital format. The creation of a regional digital information and economic space based on the author's initiative - the regional target program "Digital enterprise - the leader of the region's economy", even within the exclusively corporate sector of the region's economy, will significantly realize the existing reserves for accelerating regional development through the implementation of incentives for preferential access of "digitized" economic entities to municipal and regional public procurement procedures; through the formation and operational calculation of a system of regional ratings that reflect not abstract economic assessments, but indicators of financial condition, operational activities and their derivatives in terms of real credit load, creditworthiness, investment attractiveness, financial stability and bankruptcy forecast, etc.; when using corporate and regional ratings in the development and implementation of appropriate regional / Federal programs of targeted incentives/ support/ demotivation and elimination.

Introduction

The existing theoretical approaches to implementing the technological foundations of the "digital revolution" at the regional level of management currently look as follows:

- new opportunities in the organization of regional socio-economic processes and management associated with quality growth implementation of functional and system digital technology mean in the short and medium term a major breakthrough in the implementation of state management functions to the regional economy associated with a sharp increase in the availability of factual information on the status and activities of subjects and objects of economic management, speed of collection, verification, scale accumulation and primary processing in real-time;
- the best regional practices for implementing modern digital technologies have a significant potential for scaling and can be widely applied in the management of modern Russian regions at the regional, macro region, and Federal district levels;

- for the applied implementation of the "regional" digital revolution and the implementation of the existing fundamental groundwork in specific management technologies, functions and mechanisms, an up-to-date digital infrastructure is needed that is adapted to the specifics and content of regional socio-economic management processes and provides a real increase in its functionality, quality and efficiency.

Method of Research

Current state and dynamics of development of the regional digital infrastructure of the southern Federal district was estimated on the basis of: regional indicators of development of the digital economy, based on a study of the Ministry of digital development, communications and mass communications of the Russian Federation, Rosstat, HSE "Indicators of the digital economy:2018"; data on the number of subscribers with broadband and mobile Internet access by regions of the Russian Federation; Rosstat information about the availability of computers and levels of Internet corporate actors of the regional economy.

On average, in the Russian Federation and its constituent Federal districts, the level of subscriber access to broadband Internet opportunities in 2017-2018 was quite high, totaling almost 100% of the potential subscriber base. As part of the southern Federal district, the Krasnodar territory had the highest infrastructure opportunities in terms of the Internet, while the Republic of Crimea and the city of Sevastopol had the lowest, which was due to the international community's sanctions pressure.

On average, 72.6% of households in the country had broadband Internet access.even the international embargo did not prevent the high value of this indicator in the Republic of Crimea and Sevastopol.

In the total population of the country, more than 83% were active users of the Internet, 29.1% used its opportunities for consumer activity, and another 64% converted the document flow with state and municipal authorities to electronic form, feeling all the advantages of such a technical solution (these estimates in the Federal districts and regions of the southern Federal district were quite close to the national average).

More than 80% of corporate entities in the regional economy actively used the information and communication capabilities of the Internet, although only 20.5% of organizations reported effective use of cloud services as an element of the corporate management system.

It should be noted that despite the ranking of Federal districts and regions of the Russian Federation presented by HSE specialists in the implemented study, the actual level of digitalization of economic processes in the whole country was approximately the same and steadily growing, reflecting the continuous growth in the number of digital innovations and the effectiveness of their application.

There is an almost linear relationship between the proximity of the territory to Federal cities and the level of availability of fixed / mobile Internet access, although the total volume of infrastructure opportunities already suggests that there are objective regional infrastructure opportunities for the introduction of digital technologies in the economy and management. It should also be noted that the growth of infrastructure and management regional capabilities is closely linked: the growth of the number and functionality of digital services contributes to the growth of demand for infrastructure services and Vice versa.

In General, in the Russian Federation and its constituent Federal districts, more than 90% of enterprises and organizations used modern computer technology in their own activities (the lowest level of penetration in 2018 was characterized by the city of Sevastopol, where only 73% of organizations used the appropriate equipment). At the same time, the availability of modern computer technology or access to the Internet are only the initial basic conditions for the implementation of economic processes in a digital format, including within the framework of the concept of electronic document management and information flows of regional scale and significance proposed by the author.

The readiness of corporate entities to implement electronic document management and digital technologies in the regional economy and management in 2014-2018 should be recognized as high across the entire territory of the Russian Federation: on average, 89.2% of enterprises and organizations actively used information and communication functional capabilities of the Internet (in the southern Federal district, this indicator in 2018 was on average 86.8%, in the leading region – the Republic of Crimea – 99.1%, in Sevastopol – 68.7%).

To sum up, we once again emphasize the very significant infrastructure opportunities of private and corporate economic entities in the regions of the Russian Federation to digital opportunities and Internet resources, which allow us to effectively transform document flow and regional socio-economic processes into a digital form, achieving their continuous coverage, systematic growth in speed, reliability and security. At the same time, the current level of use

of digital capabilities of regional economic entities is mainly associated with private and corporate digital initiatives, and to a certain extent – with the national digital initiative "Public services". Regional digital systems and services are currently at the initial level of their development and are more likely to be in the field of scientific research, rather than applied implementation and maximum possible expansion of the scale of digital activity.
The implemented research was developed as a field research component containing the results of author's research in terms of evaluating the potential of participation of corporate entities located within the Krasnodar territory in the organization and implementation of regional digital economy processes.

In order to clarify the current state of Affairs regarding the involvement of corporate entities of the economy of the Krasnodar territory in the process of its digitalization, we conducted a field author's study, the plan and methodology of which are presented in table 1.

Table 1: -Plan and methodology for research on the use of digital technologies in the economy and management of corporate entities in the Krasnodar territory (January-March 2019) (author's result)

Stage	The maintenance phase
1	2
Development of the research concept	
Definition of the problem	To determine the specifics of the perception and use of digital technologies at the corporate level of the regional economy, to highlight the problems of mass implementation of ICT at the regional level and to characterize possible ways and prospects for their solution
Goal setting	Screening of organizations participating in the study. Assessment of the importance and functionality of the ICT sector in the economy of the Krasnodar territory. Assessment of the availability, state and functionality of the regional digital infrastructure. Availability and efficiency of internal electronic document management. Experience in using electronic document management in interaction with corporate contractors of the region's economy. Experience in using electronic document turnover in interaction with municipal and state contractors of the regional economy. Plans for the development of digital corporate culture in 2019-2020
Formulation of the working hypothesis of the research	The economy of the Krasnodar territory is characterized by a sufficient level of formation and development of digital infrastructure that allows to implement the Foundation for the transition to the digital form of regional economic processes based on the introduction of the concept of regional electronic document management and ensuring the functionality of digital localized nodes " Bank-business entity»
The selection of information sources	
Secondary information	Data of the territorial Department of the Federal state statistics service of the Russian Federation for the Krasnodar territory. Data from the statistical collection based on the results of the research of the Ministry of digital development, communications and mass media of the Russian Federation, Rosstat, and HSE " Indicators of the digital economy: 2018»
Primary information	Sources of primary information - information received from the heads of commercial organizations of the Krasnodar territory that issued an electronic digital signature in 2018-2019 for the implementation of specific types of economic activity within the region
Information collection	
	The array of empirical information was formed on the basis of a survey of 121 organizations-subjects of the economy of the Krasnodar territory, which had an internal digital structure, management system and used elements of electronic document management (electronic digital signature) in economic activities
Field stage	
	The period of the field stage of the study is January – March 2019.
Analysis of information, development of conclusions and recommendations	
	After receiving the primary information corresponding to the problem and goals of the author's research, it was subjected to verification procedures, primary statistical processing, scaling and generalization. The obtained estimates allowed us to confirm the working research hypothesis, achieve solutions to the array of research goals, and characterize the problems and prospects of digitalization of the regional economy of the Krasnodar territory in the near and medium term

Infrastructure provision processes of digitalization of the regional economy in the Krasnodar region as of 2019 is almost nonexistent, the main elements of the regional information system have not been formed, which will affect the almost universal pessimism of respondents in terms of the availability and functionality evaluation of regional digital infrastructure, experience and satisfaction with the level of functionality of regional digital infrastructure.

The plans for the development of digital corporate culture in the organizations of the economy of the Krasnodar territory, represented by respondents, in 2019-2020 were as follows. Respondents positively evaluated the plans for the development of a digital corporate culture in organizations they represent in the short and medium term, considering the most promising directions of upgrade of corporate digital infrastructure (98,35% of answers), the increased use of cloud services (86,78%), training of specialists in ICT (81,82% of responses), development of corporate personnel reserve of ICT specialists (46,28%).

Optimism about the prospects for the development of the digital economy in the Krasnodar region was almost absent: only 3.31% of respondents planned to participate in the regional program for the development of the digital economy in 2019-2020, and 0.83%-in the corresponding municipal programs.

We note the existing real deficit of efforts and funding for the development of the digital economy of the Krasnodar region by the structures of municipal and regional management, which is expressed in the almost complete absence of specialized regional digital infrastructure, situational attempts to organize electronic document flow, and the concentration of digital interactions mainly within the corporate sector of the region's economy.

In our opinion, this state of Affairs requires the development and implementation of a long-term regional target program for digital economic development, including the use of theoretical and methodological innovations proposed by us in the author's dissertation research.

We also note the progressiveness and optimism of the corporate sector of the region's economy, which has long appreciated the advantages of digital organization of interaction between regional economic processes and is actively implementing its specific forms in its own operational activities. The administration of the Krasnodar territory can and should play the role of initiator of the processes of creating and developing a regional digital economy, which directly affects the long-term socio-economic development and regional competitiveness of the Krasnodar territory.

For practical implementation of target comprehensive programs of economic development of the regional economy of Krasnodar region, we suggest a pre-program "Digital enterprise – the leader of regional economy".

Implement regional core facilities should be massive (ideally complete) translation accounting and reporting functions of the corporate entities within the cloud services servicing commercial banks (regional credit institutions and localized representations of foreign banks), which will provide application solution of complex economic problems:

- formation of a relevant digital system of accounting and reporting on a regional scale, which allows to increase the speed of presenting, processing and issuing economic information about the state and results of the activities of individual entities and their formations (strategic groups, clusters, etc.) within the regional economic system;
- system saving of resources that accompany analog exchange of economic information between corporate entities of the regional economy and the system for collecting statistical information;
- system saving of resources of corporate entities for the implementation of synthetic accounting, reporting and audit functions based on the use of outsourcing tools;
- a qualitative increase in transparency of regional economic processes in the corporate sector, the ability to track, analyze, evaluate and correct regional dynamics in real time (in contrast to the current state of Affairs, which allows for primarily incremental impacts and adjustments).

A significant advantage of the proposed approach for the subjects of the corporate sector of the regional economy is the possibility of free and representative audit of accounting and reporting systems due to the implementation of the principle of mandatory audits of the activities of modern commercial banks (which can easily be extended to the services they offer).

The creation of a regional digital information and economic space, even within the exclusively corporate sector of the region's economy, will significantly realize the existing reserves for accelerating regional development:

- based on the implementation of incentives for preferential access of "digitized" economic entities to the procedures of municipal and regional public procurement;
- through the formation and operational calculation of a system of regional ratings that reflect not abstract economic estimates, but indicators of financial condition, operating activities and their derivatives in terms of real credit load, creditworthiness, investment attractiveness, financial stability and bankruptcy forecast, etc. It should be noted that

the data of the author's estimates, calculated in an automated manner using the system of "digitized" economic entities, can be further aggregated into regional indices and indicators based on real (and not as currently covered by Rosstat) regional economic processes and the effectiveness of the functioning of regional economic entities;
- when using corporate and regional ratings in the development and implementation of appropriate regional / Federal programs of targeted incentives / support / demotivation and elimination.

A special feature of the technical implementation of the proposed program is the need to implement two stages of complex automation:

1. the stage of pairing of the existing information system of accounting of the corporate entity of the regional economy with about personal service supports the credit of the organization (analysis of the needs and characteristics of conjugation, optimization of accounting and reporting procedures and processes, a formalized statement of accounting and reporting tasks, creation and adaptation of software and technical infrastructure of the digital hub, project implementation, staff training, testing of the project, at the digital host, the beginning of release of information in incorporated and integrated);
2. phase conjugation information system digital informational node, "Bank – economic entity" with the regional data center and information systems users, regional economic information of the next level (the structure of state management of the economy of the region, regional users: the population, economic entities, the structure of the meso-level, in originally users).

Integration of the regional information system into the national information process requires the following specific tasks:

- implementation of the accounting process and analysis of the level of use of components of the regional accounting system);
- implementation of tools for primary and in-depth processing, processing, analysis, evaluation and archiving of regional, sub-Federal and Federal socio-economic information;
- optimization of expenses of subjects of regional and sub-Federal information systems for their creation, operation (including joint) and modernization;
- providing customized modes of access for certain categories of users to regional, sub-Federal and Federal arrays of socio-economic information.

A specific institutional innovation planned for implementation based on the results of the author's proposals is the creation of a regional rating Agency that can provide a relevant assessment of the socio-economic situation of the corporate sector of municipalities, districts and the territory of the Krasnodar territory as a whole. This structure will be able to automatically generate and inform interested users about the financial condition and operating results of enterprises in the main branches of the regional economy (residents, localized structures), calculate and publish industry and regional ratings and rankings, and provide the opportunity to implement comprehensive socio-economic research on a municipal and regional scale.

Specific national economic results of creating and functioning such a structure, the mission of which can be considered an objective control of the economic condition and dynamics of the corporate sector of the region's economy should be:

- qualitative growth of information efficiency of the management decision-making base at the municipal and regional levels;
- formation of an alternative digital information source that ensures the rapid formation, issuance and interpretation of regional economic information;
- qualitative improvement of the regional investment climate by ensuring confirmed transparency of reporting of the corporate sector of the regional economy, improving the efficiency of procedures for selecting potential counterparties, the ability to analyze their credit / investment history, the ability to apply quantitative models for assessing creditworthiness and investment attractiveness, both according to Russian and international research and evaluation criteria and procedures.

Abstract

Modern concept of organizing electronic document management on a regional scale based on the digital information and telecommunications network of the regional scale "Bank – economic entity", as well as the possibility of localized banking structures as nodes of the regional digital infrastructure that can provide the formation of architecture and information and management flows in the regional economic management system can be implemented in the Big Data format and has very significant information and communication and management capabilities in terms of improving the efficiency and targeting of regional efforts and impacts in terms of promising regional initiatives: improvement of the regional investment climate based on a systematic increase in information security of existing and potential subjects of the regional investment process; implementation of targeted personnel programs to ensure the regional economy; regional technological platforms and initiatives; regional social and infrastructure initiatives; regional programs for the formation and use of regional human capital.

Keywords: Telecommunications Trends, Regional Economy, Digital Infrastructure, Big Data.

Introduction

Evaluation of the current level of theoretical and methodological approaches to the implementation of the state function of economic management of the Russian regions are as follows:

- a single and universal definition of the regional economy or regional economic system in the modern theory of regional economy no, the most reasonable scientific approaches to management of economy of the Russian regions is a systematic approach G. B. Kleiner and analog imaging V. Akishina;
- among the problems that hinder the growth of efficiency in managing regional economies are: the lack of a unified national strategy for territorial development, the multiplicity of centers and levels of management and the resulting unjustified fragmentation of managerial functions, the accumulated Agency costs of personnel at each level of management in the region, the lack of differentiation of goals and objectives of sectoral and territorial development, the disparity between the needs and opportunities of regional development, and the predominantly fiscal nature of interaction " region – Center", the real lack of a Federal government structure that can implement the function of state management of the region from the macro level;

Cite this Article as: Sergey KRETSY, Nadezhda VAKHRUSHEVA, Valery LEVENTSOV and Sergey SALKUTSAN "Promising Digital Telecommunications Trends and Their Regional Eco-nomic and Management Capabilities" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

- a separate and independent national economic task of the regional level, the solution of which can contribute to addressing the above questions, we believe the lack of information efficiency that accompanies the operation of the regional economic systems and their actors, which justified the use of outdated methods, technologies and media-centric traditional workflow.

Method of Research

The main trends of digital evolution and their application on a regional economic scale are systematized in table 1.

Table 1: Promising digital telecommunications technologies and their capabilities at the regional level of economic management (compiled by the author)

Digital trend	Technical features	Opportunities for use in managing the region's economy
1	2	3
Big Data	Formation of practically unlimited digital arrays describing multi-parametric economic processes and phenomena	Formation of an array of information that characterizes the state and economic activity of subjects of the regional economy Predictive Analytics of regional socio-economic development
Quantum technology	Processing Big Data arrays in real time	Creation and development of regional data processing centers based on quantum computers with the ability to monitor, analyze, model and predict the activity of individual regional economic entities, as well as their meso-level structures and levels of regional economic systems
Robotics and sensor technology	Replacement of skilled labor with machinery, displacement of employees at the level of qualification "labor force" and " personnel»	Managed modernization of regional industrial complexes in order to increase regional competitiveness, the scale of GRP and the balanced financial result of regional economic entities
Neural capabilities of artificial intelligence	Formation, training and use of machine intelligence systems focused on solving system problems at the global level	Implementation of regional intellectual systems for modeling and forecasting local and regional socio-economic processes and functioning of the region's economy as a whole, as well as its individual subsystems
New materials	Increasing the quality and functionality of consumer goods and services while increasing their environmental friendliness	Managed modernization of consumer behavior for the purpose of environmental protection of regional markets, growth of social responsibility of business and ensuring sustainable functioning and development of regional economic systems
Industrial Internet	Growth of the scale of application and functionality of industrial information and analytical systems	Growth of the share of high-productivity jobs and disposable incomes of the working-age population employed in the region's economy
Registry systems for distributed storage and access (blockchain)	Streaming information systems at the regional, national and global levels	Creation and implementation of regional standards for electronic document circulation covering all levels of the regional economic system
Wireless communication and telecommunications technologies	Increasing the coverage of the territories of countries by the Internet and increasing the speed of connections, which	Full coverage of the territory of the Russian Federation and its regions and the ability to access the Internet in 4G and 5G formats (1.0 GB / s) Harmonization and synchronization of regional socio-economic processes

	makes it possible to use progressive software solutions and services	
Virtual and augmented reality	Improving the efficiency and reducing geo-graphic barriers in terms of training and joint activities of national and global scales	Joint search and innovation activities between the subjects of regional economic systems and beyond The possibility of implementing a number of regional-scale economic activities at the national level (education, health, employment, etc.)

Let's consider the most promising of the presented digital trends – Big Data-and describe its current and future opportunities in terms of using it as part of the regional economy management function.

Big Data technology in the modern sense of the word includes components for collecting, storing and processing arrays of information, the size of which exceeds the current level of development of computing power and requires the use of qualitatively new technical and software solutions. According to researchers AT the HSE, the key indicator of the implementation of Big Data capabilities in managing economic processes at the micro, meso and macro levels is the dynamics of global IP traffic, shown in figure 1, whose growth in 2021 should exceed the indicators of 2016 by 2.5-3 times.

Fig. 1: Dynamics of global information exchange, (Petabytes per month)

Unfortunately, these authors do not provide specific economic forms and tools for using Big Data technologies in management at the regional or national level, limiting themselves to forecasting the following technological changes:

- growth of research opportunities for relatively large and ultra-large socio-economic systems;
- increasing the speed of verification and research of ultra-large information arrays;
- implementation of new standards for collecting, checking and selecting, storing and processing socio-economic data and facts;
- implementation of qualitatively new features for personal data protection;
- the possibility of implementing new models and forecasts of a predictive analytical nature, using a set of socio-economic parameters of the functioning of systems and the identified patterns of "factor-indicator" between them;
- the emergence of new professions and the creation of a number of jobs in research technologies of large and ultra-large dimensions.

According to open research data, the real management capabilities of Big Data technology at the regional level are currently associated with the activities of state / infrastructure enterprises that carry out economic activity within localized socio-economic systems.

It must be emphasized that the implementation of specific techniques and technologies of Big data as applied to the specifics of virtually any structure of municipal / regional management, regional Institute or company is able to provide a system of effects available today, only the most progressive corporate structures, oriented to the non-linear nature of economic impact of such targeted investments.

At the same time, the implementation of Big Data projects at the regional level is almost non-existent, which can be explained by the following systemic problems that are typical for both the micro and meso - and macro levels.

Unfortunately, the current level of digital management solutions at the regional level (as of the beginning of 2019) is represented by a very vague impulse of the Agency for Strategic Initiatives.

At the same time, the authors of the initiative see only functional areas that lie outside the competence of regional authorities as the main directions of regional digital solutions:

- segment of public services (actually implemented as a portal "Public services" with the ability to integrate a specific regional block);
- healthcare segment (national scale with subordination to the Ministry of health of the Russian Federation);
- education segment (Ministry of education, Ministry of science and higher education of the Russian Federation);
- land management and cadastral accounting segment (Federal cadastral chamber of the Federal service for state registration, cadaster and cartography»);
- agriculture segment (Ministry of agriculture of the Russian Federation);
- tourism and culture segment (Federal Agency for tourism, Ministry of culture of the Russian Federation);
- segment of the social sphere (system of the target ministries and agencies);
- solutions for creating / modernizing the urban environment (the only segment that has a meaningful meaning for the regions of the Russian Federation, but is not available due to budget restrictions).

We emphasize that the regions themselves should formulate specific regional management of problems amenable to solution-based technology solutions Big Data that, in the opinion of the initiators of the competition, will contribute to the "tree" specific targeted research projects (in practice the design correct definition and formalization of the problem represents a 50 to 70% of the total research project and require the most skilled performers, which directly affects the actual level of implementation of the research initiative and its informational value).

In our opinion, the prospects for the implementation of the competition look absolutely vague:

- improvement of the regional socio-economic situation – on the basis of what and to what extent, the authors of the competition do not explain;
- reduction of regional costs for the development of digital management technologies-not confirmed in terms of the maximum cost of the stage of setting and formalization of the research task;
- prevention of violations of regional legislation is not confirmed in the absence of specific goals and objectives of competitive initiatives that are obviously relevant for each specific region;
- formation of a Big Data array of regional scale and specificity-it is obvious that it can be standardized and unified, as well as solutions at the national level for managing socio-economic processes;
- the growth of the competence of regional management teams in the field of ICT is obviously an indirect result that has no direct relation to the results of the functioning of the economies of specific regions of the Russian Federation, Federal districts and the country as a whole.

Conclusion

In conclusion, we note that the southern Federal district is among the regions with very significant potential of all types of economic resources, but lacks their level of use as in comparison with the average indicators and comparison with the performance areas – the leaders of the Russian regional development. Among the main problem assessments that indicate the possibility of intensifying the level of use of economic resources in the southern Federal district of the Russian Federation and its constituent regions, we include the GRP of territories included in the southern Federal district, normalized by population and employment factors, which throughout the period under review was significantly lower than the national values, which required increased attention to applied problems of reproduction and effective use of labor resources in target territories, this includes reducing unproductive costs and increasing the coverage and speed of socio-economic processes.

The author's research has identified very significant infrastructure opportunities for private and corporate entities of the economy of the regions of the Russian Federation to digital opportunities and resources of the Internet, allowing to effectively transform the document flow and regional socio-economic processes into a digital form, achieving their continuous coverage, systematic growth in speed, reliability and security. At the same time, the current level of use of digital capabilities of regional economic entities is mainly associated with private and corporate digital initiatives,

and to a certain extent – with the national digital initiative "Public services". Regional digital systems and services are currently at the initial level of their development and are more likely to be in the field of scientific research, rather than applied implementation and maximum possible expansion of the scale of digital activity.

Abstract

The article deals with the role of telecommunications techniques and the digitalization in the innovation-oriented economy. The authors note that digital solutions and the telecommunications infrastructure development are of key importance for the banking sector. The authors prove that in terms of innovative digital and telecommunications solutions it is reasonable to focus on two key directions, such as: the offer and the introduction of new banking products to the market and the offer of neobanking products designed within the framework of an ecosystem approach in combinatorics with business partners. Consumers can also access these products remotely using telecommunications. It is necessary for this to determine the main trends in the banking sector development and to study the telecommunications techniques role in remote banking. It is important for the study of the telecommunications techniques role in remote banking focusing the industry innovative evolution to determine the main trends in the innovative development of the banking sector; to analyse the existing solutions and the situation in customer service involving modern telecommunications techniques. The compliance with ecosystem requirements based on the digital platform, introducing new digital banking and neobanking products to the market involving telecommunications techniques, as well as implementing process innovations based on telecommunications are the main trends for traditional banks in the new conditions. Advanced telecommunications techniques and, accordingly, the digital interaction with consumers make it possible to detail their capabilities and requests significant in remote banking and to conduct their enlarged refined segmentation. Based on the opportunities offered by modern telecommunications in segmenting consumers and interacting with target segments, banks can offer targeted products and services, as well as use the joint promotion of banking and neobanking products in which the target audience is interested. Telecommunications techniques are the driver of the banking sector's development in remote services, their use makes it possible to implement an innovative scenario of functioning. A certain lag in remote banking services in Russia in comparison with a number of foreign countries can be considered as a growth potential that will be realized thanks to the innovative development of telecommunications in the banking sector.

Keywords: Telecommunications; Banking Sector; Remote Banking Services; Main Trends; Innovations

Introduction

The modern economy is innovation-oriented. Innovations determine the leadership of companies in developing markets and countries in the world. The innovative scenario in the economic systems is possible, in many respects, due to the innovative achievements in the sphere of telecommunications today and the potential for creating digital business ecosystems operating on the updated communication platform that allows to bring new products, introduce techniques and further modernize them, according to new business requests, the business models of interaction with

Cite this Article as: Viktoria BONDARENKO, Svetlana SHKHALAHOVA, Natalya MUKHANOVA and Vladimir SHCHEGOLEV "Telecommunications Techniques in Remote Banking: Focus on the Innovative Development" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

partners and customers. This is true for the banking sector. It is the economy digitalization development and the telecommunications infrastructure that determine the innovative potential possibilities of economic systems and some industries. For this reason, it is important to determine the digital component share in the countries' GDP (Figure 1).

Fig. 1: The digital economy contribution to some countries' GDP in 2017, % [1]

As we can see, now the digital component share in Russia's GDP is lower in comparison with the indicators of other countries, however, according to expert forecasts by 2025 this indicator will reach 34% [1], providing new opportunities for the national economy.

In relation to the banking sector, the expert community predicts significant prospects in the development predetermined by the capabilities of telecommunications and digital techniques [2]. Technological solutions and strengthening relationship with consumers in the remote service capabilities have become the key to the growth of banking sector assets (Figure 2).

Fig. 2: The banking sector assets growth in Russia in 2010-2017, trillion rub. [2]

As for innovative digital and telecommunications solutions, there are two key trends, such as: the offer and the introduction of new banking products to the market and the offer of neo-banking products designed within the framework of the ecosystem approach in combinatorics with business partners. Consumers can also access these products remotely using telecommunications. It is necessary for this to determine the main trends in the banking sector development and to study the telecommunications techniques role in the remote banking focusing on the industry innovative evolution.

Research Method

It is important for the study of the telecommunications techniques role in remote banking focusing the industry innovative evolution:

- to determine the main trends in the innovative development of the banking sector;
- to analyze the existing solutions and the situation in customer service involving modern telecommunications techniques.

Defining the main trends in the innovative development of the banking sector

For attracting and retaining customers, as well as building relationships with partners, banks make innovative solutions in the three main areas (Figure 3).

Fig. 3: The main directions of the innovative development in the banking sector [2]

For the innovative development banks focus on the remote availability of new product services, the ability to offer products using the consumer profile determined by the artificial intelligence. Thus, based on digital and telecommunications capabilities, banks take into account the behavioural characteristics of customers, and accordingly, the specific behaviour of consumption, along with financial capabilities [3]. In their loyalty programs, banks focus on the active use of the Internet and social networks by their clients [4]. Telecommunications and digital techniques play a key role in the product innovation process, as they determine the speed of launch and contact with customers, which contributes in reaching the success and increasing the competitiveness [5].

Process innovations in banking are directly connected with the digitalization and the telecommunications infrastructure, which allow monitoring the interaction with consumers and using the customer data similar to the data base of mobile operators [6, 7].

The innovative development in the cooperation between banks and partners, including the non-banking sector, is aimed at the ecosystem approach, which creates digital business ecosystems that include key consumers in addition to counterparties. The cooperation with business partners and the interaction with them in the market, combining co-branding and co-promotion on the digital and telecommunications basis, contribute to attract consumers, their loyalty and to get a foothold in a certain ecosystem [8].

Accordingly, the compliance with ecosystem principles based on the digital platform, introducing new digital banking and neo-banking products to the market involving telecommunications techniques, as well as process innovations based on telecommunications are the main trends for traditional banks in the new environment.

As for business model, traditional banks can become niche players focused on customer requests; service providers under the client's brand, managing balance services; ecosystem owners, major players involving non-banking partners and key consumers in their "orbit"; a fully digital bank, diversifying its various remote consumer services [2].

The analysis of solutions and the situation in customer service involving modern telecommunications techniques

Describing the situation with the remote banking segment development, it is necessary to take into account the active use of Internet techniques in the world. According to the report of the International telecommunication Union in 2018, about 3.9 billion people are Internet users (more than 51% of the world's population) [9]. Figure 4 illustrates the situation in Russia.

Fig. 4: The internet users' share dynamics in Russia aged 16 and older, % [10]

As we can see, the Internet users' segment is increasing as well as the number of potential stakeholders in the use of remote banking services based on telecommunications techniques. At the same time, the number of persons involved in financial transactions via the Internet in Russia is lower than this indicator in a number of foreign countries (Figure 5).

Fig. 5: The Internet use by the population of a number of countries in their financial transactions (% of the number of Internet users aged from 15 to 74 years old) in 2017, % [11]

At the same time, the number of persons involved in financial transactions via the Internet in Russia is lower than this indicator in a number of foreign countries

According to the data, the number of persons involved in financial transactions via the Internet in Russia is lower than this indicator in a number of foreign countries, but it is possible for it to develop this segment. Experts also note that remote banking or electronic banking, including SMS banking, mobile banking and Internet banking, has great prospects for increasing in Russia [12]. For example, according to the empirical data, Russians already use remote banking techniques based on the telecommunications infrastructure development (Figure 6).

Fig. 6: The involvement of Russians in certain types of remote banking services in 2018, million people [13]

At the same time, it is interesting that various components of payments are dominant in the structure of the remote service option selected by clients (Figure 7).

Fig. 7: The payments structure via remote banking channels in Russia in 2018 (according to the empirical data) [14].

The main criterion for choosing a specific channel for a particular operation is the convenience and the simplicity for consumers. Currently, the leader in the parameter of provided services and the share in the market in the B2C segment within the framework of remote services is Sberbank, building its business ecosystem and actively implementing its product and process innovations with the use of telecommunications techniques. Five leading players, including Sberbank, occupy about 75% of the remote banking market [12].

The remote banking services development is possible thanks to the innovations in telecommunications and improving through the process innovations introduction. Banks are interested in remote banking services not only because of the integration in the digital ecosystem and the extension of the serviced persons segment, but also because this service allows to earn commissions and to invest funds, including telecommunications development for reinforcing their market position. For example, advanced telecommunications techniques and, accordingly, the digital format of the interaction with consumers allows banks to detail their capabilities and requests important for remote service and conduct their enlarged, refined segmentation.

In this way, the researchers aggregated the data on remote banking users, their income, volume and list of consumed remote banking services, which allows to determine the average portrait of the consumer ("Budget Employee", "Specialist", "Director") and offer them the required remote services (Figure 8).

Fig. 8: Typical profiles of the remote banking services customers [12]

Based on the opportunities offered by modern telecommunications in segmenting consumers and interacting with target segments, banks can offer targeted products and services, as well as the joint promotion of banking and non-banking products for target audience.

Nowadays, telecommunications techniques allow to improve and expand remote banking services, including through actively implemented mobile applications that reduce time costs for consumers and simplify their access to various services. Accordingly, telecommunications techniques are the driver of the banking sector's development in remote services, their use makes it possible to implement an innovative scenario of functioning. We believe that a certain lag in remote banking services in Russia in comparison with a number of foreign countries can be considered as a growth potential that will be realized thanks to the innovative development of telecommunications in the banking sector.

Information and telecommunications technologies are actively used not only in the banking sector, but also in the sphere of commodity circulation. Integration of the banking sector and commodity circulation will facilitate the use of innovative tools, in particular through the use of telecommunications technologies [15,16,17,18,19,20].

Conclusion

1. The modern economy is innovation-oriented, this is its significant feature which determines the competitive positions and potential opportunities of the state on the world stage, and also allows innovative companies situated on the territory of the country to separate from competitors.
2. The innovative scenario of functioning is possible largely due to the digitalization of economy and telecommunications infrastructure development, which determines the growth potential of economic sectors.
3. In the banking sector, telecommunications techniques and digital business ecosystems allow to bring new products, introduce techniques and further modernize them, according to new business requests, the business models of interaction with partners and customers.
4. The compliance with ecosystem requirements based on the digital platform, introducing new digital banking and neo-banking products to the market involving telecommunications techniques, as well as implementing process innovations based on telecommunications are the main trends for traditional banks in the new conditions.
5. Remote banking or electronic banking, including SMS banking, mobile banking and Internet banking are very promising in Russia. Telecommunications techniques make it possible to improve and expand remote banking services. Telecommunications techniques are the driver of the banking sector development in the remote services, allow to implement an innovative scenario of functioning.

Abstract

The article analyzes the impact of information and communication techniques on the Russian industrial sector development in terms of revealing the trends that have already appeared and the expected positive prospects. Enterprises and organizations in all the federal districts of Russia actively invest in information and communication techniques, as well as use special software and communication tools, which indicates their practical interest in this issue.

Currently, according to experts, the share of Russian production in the information and communication sector in the structure of world GDP is no more than 0.2%. At the same time, to successfully integrate into the global economy in the context of widespread digitalization, Russian enterprises need to increase the implementation of modern information and communication techniques contributing to successful development and compliance with the emerging realities.

As the current trends emerging due to the introduction of information and communication techniques in industry are enterprises competitiveness growth and market risks reduced through an advanced research function and high-quality information about markets, partners and consumers in real time. Due to the results of empirical studies the formation of business models based on new communication techniques; innovation in electrification; active introduction of techniques of artificial intelligence and machine learning; scaling the Internet of things; strengthening attention to the issue of cybersecurity because of the widespread use of communication techniques are considered to be trends affecting the industrial enterprises.

The main predicted positive effects of the "Industry 4.0" introduction are supposed to be increasing the labor productivity and the efficiency of production processes based on full-fledged analytical study, widespread automation of routine procedures, strengthening relationship with partners and consumers, which is necessary for the industrial sector development and strengthening its competitive position.

Keywords: Information and Communication Techniques; Current Trends; Expected Consequences; Industrial Enterprises; "Industry 4.0"

Introduction

The information and communication techniques play a key role in modern conditions transforming the quality of work in the enterprises that reorient their activity on consumers and their interests as well as use marketing techniques involving telecommunications to increase their competitiveness. Enterprises and organizations in all the federal districts of Russia actively invest in information and communication techniques, as well as use special software and communication tools, which indicates their practical interest in this issue.

A number of researchers note the importance of modern telecommunications in providing competitive advantages for business, which is achieved through coverage, automation of processes and procedures, ability to conduct periodic research, feedback, and economies of scale [1]. This is confirmed by the interest of enterprises and organizations in costs on information and communication techniques, data on which in the context of federal districts of Russia are shown in Figure 1.

Fig. 1: Costs of organizations on ICT, including communication services, telecommunications equipment, and personnel training in 2018 in federal districts (FD) of the Russian Federation, million rubles [2].

According to the presented data, the Central Federal district (67%) is the leader in costs on this component, it is followed by the PFD (8.8%) and the NWFD (6.7%).

Another criterion that indicates the interest of enterprises and organizations to actively implement information and communication techniques in their activities aimed at the business competitiveness growth is the use of special software and communication tools (Figure 2). The information in Figure 2 shows similar trends in the interest of enterprises and organizations in various federal districts of Russia to use special software and communication tools.

The introduction of information and communication techniques into production changes the demand for labour skills and competencies of human resources. And human resources in turn tend more and more to get high technological skills and the ability to work effectively in the digital environment [3].

Fig. 2: The share distribution of special software and communication tools in 2018 by Federal districts (FD) of the Russian Federation, million rubles [2]

Russia is currently focused on the active development of information and communication techniques, that is reflected, for example, in the national program "Digital economy of the Russian Federation" [4].

However, until recently, according to large-scale research and expert conclusions [5, 6] Russia was significantly behind a number of other countries in the world in terms of the development of information and communication techniques. Today, despite the general trends focused on the development of information and communication techniques, their implementation in various federal districts of Russia is still uneven [12].

Increasing the role of digitalization means a constant increase in the volume of stored data based on the latest technologies. Simplification of multimedia, including images, tests, and videos created the conditions for the transformation of digital channels. In the center of the digital channel is the consumer. The consumer's communication channel is based on media technologies [7, 8].

According to experts, despite the interest in the development of information and communication techniques in Russia and the efforts to implement them in various sectors of the economy, as well as the significant growth of this sector the Russia's production share in the information and communication sector in the structure of the world GDP is no more than 0.2% [13]. At the same time, to successfully integrate into the global economy in the context of widespread digitalization, Russian enterprises need to increase the implementation of modern information and communication techniques contributing to successful development and compliance with the emerging realities [19].

It is very important to understand the further development of the real economy under the influence of modern information and communication techniques. Taking into account the significant role of industry for the Russian economy and its national security, it is important to study the key trends in the impact of information and

communication techniques and evaluate the long-term consequences of the "Industry 4.0" introduction in the Russian industrial sector.

Research Method

Identifying the impact of information and communication techniques on the of the Russia's industrial sector development presupposes the following:

- evaluate the main theoretical aspects and empirical results that indicate trends in the industry under the influence of information and communication techniques;
- validate the long-term consequences of the "Industry 4.0" introduction in the industrial sector of Russia.

The evaluation of the main theoretical aspects and empirical results that indicate trends in the industry under the influence of information and communication techniques

Information and communication techniques in the context of digitalization create new opportunities in the work of enterprises, which is provided by artificial intelligence, which allows, for example, to process massive information resources. Based on the introduction of information and communication techniques in their work, industrial enterprises strengthen their work with consumers in the production and consumer markets [15].

Foreign scientists, such as V. Delon, E. Mclins and S. Petter in terms of evaluating the security opportunities for the industrial development, pay special attention to the information and communication component in cooperation with partners and consumers [16]. Russian researchers such as G. Bagiev, L. Bushueva, O. Tretyak and others wholly agree with them on this score [17].

For substantiating the current trends in the introduction of information and communication techniques in the context of generalizing the theoretical views of specialists on this issue, along with strengthening work with consumers and, as a result, increasing the enterprises competitiveness, their role in validating and reducing market risks through an expanded research function and high-quality information about markets, partners and consumers in real time are supposed to be important [7,8].

Today, in Russia, industrial enterprises on digitalization and automation of production, and the use of modern telecommunications techniques are significantly behind a number of successful foreign counterparts [18].

Evaluating the empirical results of changes in the industry under the influence of information and communication techniques, it is reasonable to cite the results of a study by Mckinnzie experts in 2017-2018.

The problem field of research is unplanned and unreliable results for substantiating current trends in the introduction of information and communication technologies in the context of generalizing theoretical views of specialists on this issue, along with increasing work with consumers and, as a result, increasing the competitiveness of enterprises, their role in justifying and reducing market risks by expanding the research function and quality information about markets, partners and consumers in real time [9,10, 11].

The study is a survey of 300 managers of industrial enterprises (in the mechanical engineering sector), which resulted in the following promising trends that affect the work of industrial enterprises: the formation of business models based on new communication techniques; innovation in electrification; active introduction of techniques of artificial intelligence and machine learning; scaling the Internet of things; strengthening attention to the issue of cybersecurity because of the widespread use of communication techniques [3].

The survey also revealed a difference between the readiness of the industrial sector to change in these areas and the potential positive effect on the industry (Figure 3).

Fig. 3: The difference between the industrial sector readiness to change in these areas and the potential positive effect for the industry according to expert data [3]

The given theoretical basis and empirical research data indicate significant manifestations of information and communication techniques in the development of industry in Russia, which causes interest in the study of the future consequences of the "Industry 4.0" introduction, based on the full-scale digitalization and modern telecommunications.

The validation of the long-term consequences of the "Industry 4.0" introduction in the Russian industrial sector

As part of the evaluation of the development prospects of the industry in Russia, the full-scale penetration into the practical sphere of the "Industry 4.0" is very important. It means the introduction of communication techniques, the Internet of things and the IT component in all the functional areas of the industrial sector. Based on the forecasts, it is reasonable to take into account the following expert data on the positive consequences of the introduction of the Internet of things in a number of industries in the world (Figure 4).

Fig. 4: The expert evaluation of the impact of the Internet of things on the world economy in a number of industries by 2025, trillion US dollars [14]

According to the data, the future impact of the Internet of things on the world economy is significant both in a realistic forecast and in an optimistic one. In particular, the full-scale growth of this influence is predicted in the industry. Also, as part of expert evaluation, it is possible to get information about the main benefits for the industry from the introduction of elements of "Industry 4.0" in daily practice of enterprises (Figure 5).

Fig. 5: Expert evaluation of the benefits of implementing "Industry 4.0" by 2025, % (an optimistic forecast) [14]

It should be noted that these promising positive consequences are very important for Russia's industry, where the labour productivity, for example, lags behind foreign counterparts. Despite the objective difficulties in the global and national economy, there are also positive forecasts of the introduction of information and communication techniques in the Russian industry in the format of "Industry 4.0" and connected with these circumstances results of influence on a number of industries (Figure 6).

Fig. 6: The expert evaluation of the effectiveness of implementing elements of "Industry 4.0" in Russia by 2025, billion rubles [19]

These positive effects are, in many respects, defining for the Russian industrial sector, which needs innovative updates and overall improvement in the efficiency of production processes, which can be achieved through the full implementation of information and communication techniques.

In many respects, the positive results of the implementation of ''Industry 4.0'' are aimed at improving full-fledged analytical processes, the widespread automation of routine procedures, and strengthening communication with partners and consumers, which is necessary for the development of the industrial sector and its competitiveness.

Conclusion

1. The interest of enterprises and organizations in investing in information and communication techniques in Russia in the context of federal districts presents that the real sector of the economy and industry are aware the importance of information and communication techniques in the competitiveness of enterprises and organizations.
2. Despite ongoing initiatives to digitalize the economy and to introduce information and communication techniques in all the areas of the national economy, there is a lag in this criterion from a number of other countries, which can be considered as the potential necessary to achieve in the foreseeable future.
3. As the current trends emerging due to the introduction of information and communication techniques in industry are enterprises competitiveness growth and market risks reduced through an advanced research function and high-quality information about markets, partners and consumers in real time.
4. Due to the results of empirical studies the formation of business models based on new communication techniques; innovation in electrification; active introduction of techniques of artificial intelligence and machine learning; scaling the Internet of things; strengthening attention to the issue of cybersecurity because of the widespread use of communication techniques are considered to be trends affecting the industrial enterprises.
5. The main predicted positive effects of the "Industry 4.0" introduction are supposed to be increasing the labour productivity and the efficiency of production processes based on full-fledged analytical study, widespread automation of routine procedures, strengthening relationship with partners and consumers, which is necessary for the industrial sector development and strengthening its competitive potential.

Abstract

In the article, new strategic guidelines for enterprise development are associated with the formation of relational strategies based on infocommunication interactions with other network entities. The purpose of this work is to develop and study a model for forming relational strategies of an enterprise operating in the conditions of network interactions. Norms of behavior of relational actors are regulated not only by formal obligations, but also by largely informal agreements. The theoretical and methodological concept of the work is based on the idea that relational relations between partners in interaction due to a high level of self-organization, adaptation to infocommunication interactions and ordering of activities can ensure the achievement of strategic targets for the development of the enterprise. The results of the work consist, first, in expanding the category of relational rent: its content is supplemented with a network component, which actively contributes to the inclusion of potential partners in the processes of information relationships; second, in updating the system of principles for the formation of relationships based on additional principles of networking and giving new content to the known ones; thirdly, in the development, clarification of the definition of "relational strategy", resulting in the addition formulas of the relational space connected with two-way interactions, the concept of the perspectives of a network of relationships; fourth, the modernization approach to the development of integral indicator of assessment of the potential and outcomes of relational interactions that are based on multivariate models by incorporating additional components, reflecting slavishly. These results determine the theoretical and practical value of the work, have signs of scientific novelty, which is significant for specialists in the field of strategic planning at the enterprise. The relevance of the research is due to the incorporation of a set of issues related to the relational network component in the theory and practice of strategic planning.

Keywords: Interactions, Relational Contract, Strategies, Factors, Principles, Network, Model.

Introduction

Rapid development of infocommunication technologies and NTP leads to radical changes in the structure of companies operating on the market. Classical value chains include an increasing number of transactions related to both the processes of production and exchange, distribution, exchange. The processes of creating goods begin to imply not a one-way flow along the main trend, as was the case earlier, in a sequential traditional chain. Now the movement of resources is transformed into mutually connected and multidirectional relationships, including flows of their own suppliers, suppliers for suppliers, customers, and so on. This is the only way to ensure high rates of enterprise development and widespread introduction of innovations. Innovation activity leads to a transition from vertical network interactions with subject-object relations, often with non-equivalent exchange, to horizontal subject-subject economic relations. M. Castells points out that «the Network form of organization ... is made up of many cultures, many values, many projects, representing ... more like a patchwork quilt sewn from the experience of interests than a Charter of rights and responsibilities. This is a diverse virtual culture» [1]. A new mechanism of interaction is being created that allows agents to maintain their independence in terms of functional (production-economic) relationships. Autonomous enterprises should build bilateral relations based on the conclusion of contracts with network participants.

Full (classic) contracts are aimed at fully formalizing the future terms of joint activity. Models of behavior of actors in incomplete (neoclassical) contracts assume less strict details of actions. However, the company's actions for both types of these contracts do not extend to a long, strategic period, often the agreement covers only one transaction. Relational contracts are more acceptable for achieving long-term goals.

Relational contracts are a contract that contains a set of mutual obligations between independent partners -participants of the agreement for a set period [2], fixing only the most priority relationships. For relational relationships, informal relationships prevail over formal ones, and joint business processes are focused on self-organization. Trust determines the priorities of relational contracts [3]. The agreement is self-fulfilling, the presence of formal agreements only forms the direction of the joint vector of relations [4]. The object of contractual obligations are highly specific assets that cannot actually be used alternatively, so it becomes not rational for the transaction actors to break the contract. The defining feature of specific assets is not their uniqueness, but the impossibility of copying, the presence of «isolation mechanisms» [5]. In relation to interactions, this is achieved by the complementarity of assets, the complexity and cost of switching to new actors. The long-term nature of relational relationships leads to the need for the formation of relational strategies, which was recently proposed by the authors [6]. However, at present, the relational strategies of the enterprise are not sufficiently studied, which actualizes the authors appeal to the analysis of a new concept that makes up the content of the presented work.

Method of Research

The following scheme is proposed for the process of explication of the method for forming relational strategies:

- system analysis of the main categories and basic patterns of relationships;
- research of existing models of relational strategies and unified basic relational strategies;
- content of the key principles underlying the methodology of relational strategies;
- suggestions on the method of calculating the integral index of the relation.

Basic categories and basic patterns of relationships

Let's consider a number of fundamental categories of relationships, the source of which is the object of the relationship. the Category reflects the direction of two-party interactions.

«The object of relation is a limited specific area of production, economic, innovation, investment, market and other activities of the enterprise, within which relational relations are implemented» [7].

Many two-way relationships are represented by another category.

«The relational space of an enterprise is a set of two-party system interactions, both inside and outside the borders of the enterprise, with other economic entities» [8].

This definition reveals, on the one hand, the opportunities to attract the resources of actors, and on the other hand, indicates the formation of the enterprise's own security area, created through cooperation with a partner. The presence of a security zone is aimed at reducing the risk of unstable development of the enterprise due to the threat of losing a partner, its opportunistic behavior, and eliminating possible problems with the search for new actors.

An important characteristic of the strategic development of an enterprise that develops the previous definition is the category «portfolio of relationships». This is a set of real and potential interactions, including intra-company and inter-organizational relationships. In fact, this is a higher-level space containing all possible relationships, including information about prospective contracts that can potentially be concluded [9].

Most modern views of enterprise strategy are based on resource theory (RBV). It is postulated that the priority factor for obtaining competitive advantages of the enterprise is the extraction of rent from the effective allocation of resources, which is provided on the basis of the abilities (special qualities) of firms [10], [11].

G. B. Kleiner proposed to generalize the resource theory, moving from the firm (RBVf), as an object of analysis, to the economic system (RBVs) [12]. The subject of research is now becoming both larger associations (corporations, clusters, holdings, etc.) and other subjects of economic systems (projects, processes, environments, etc.). the Key concept of the resource theory of the system organization of the economy is the category of «partner advantages», which reflects «the conditions that ensure the inclusion of this subject in mutually beneficial relations with other

subjects» [13]. Interaction of enterprises within the economic system will allow attracting additional resources that the enterprise cannot develop independently, or it is not rational for any reason. The perspective of access to the resources of the economic system allows you to carry out the processes of production, consumption, distribution, exchange at the enterprise, using the potential of the formed relational space and relational portfolio as a mechanism for implementing strategies.

The effect of relational partnerships can be measured using the «relational rent» category. This rent, according to J. Dyer and X. Singh is defined as «a superprofit that is jointly obtained as a result of an exchange relationship that cannot be shared by any of the partners in isolation from each other and that can only be created by the joint idiosyncratic efforts of the partners specialized in their alliances» [14].

We will use the following concept of relational rent extended by the authors in the framework of partnership relations.

Relational rents from the use of partner resources can provide the following benefits:

– first, various types of economic rents: Ricardian (possession of limited valuable resources); monopoly (market power of Association); entrepreneurial (joint innovation projects and risk sharing), which causes the receipt of income, the formation of which cannot be carried out independently;
– second, quasirents in the form of: increase goodwill; expand the field of safe development; create a Foundation for obtaining possible synergies from relationships, which creates the potential for the formation of new competitive advantages.
– third, network rent in the form of acquiring network advantages: increasing the speed and intensity of interactions; increasing the scope of activities; organizing joint team work.

The given interpretation of relational rent allows us to formulate the following author's definition of a relational strategy.

Relational strategy – a strategy aimed at fostering the relational space between the enterprise and other economic entities, which create partnership benefits businesses, with the aim of: firstly, obtaining relational rents – the profit received based on the exchange relationship, which can form only the total stress s partners; secondly, creating conditions in the form of goodwill growth, expanding the area of safe development of the enterprise, and strategic prospects for obtaining a synergistic effect as a result of joint actions of partners, third, obtaining network advantages associated with the creation of a new economic entity – a local network, which contributes to improving the competitiveness of the enterprise, allows you to form a local network market.

The strategy provides allocation of resources in the specified areas of enterprise development, as a result of using the opportunities and reserves of the economic system (network of interacting agents) to which the enterprise belongs. In fact, the content strategy is determined, on the one hand, the potential to use certain resources partner with other identifying necessary resources provided in return that pay back of own contribution and interest to partner, as well as de-termination of period of validity of the contract. In addition, relations also contribute to the formation of a set of opportunities that improve the market conditions for the development of the enterprise based on the growth of goodwill and other partner advantages within the framework of the relationship.

The basic attitudes of relational actors are largely reflected in table 1, which contains a set of motives that guide the subjects of relational interactions to achieve their respective strategic goals.

Table 1: Motivational behavior of actors in implementing relational interactions

Motives for implementation interactions	Стратегическая цель
1. The impossibility of an Autonomous achievement of the goals of the company	The solution is achievable when solving problems together
2. High uncertainty of market development, the need to adapt the company to various forecast situations	The risk of costly competition is reduced when market participants cooperate
3. Cooperation with competitors that have approximately equal levels and rates of overall development	Stability of development and the need for complementary market, production and other resources
4. Availability of technical, managerial and other relationships between market agents	The need to complicate the complex of existing relationships
5. Diversity, heterogeneity of available resources, competition for the possession of other necessary resources	Getting access to additional resources using a partner

6. The presence of a complex of problems that dominate the actors	Cooperation will solve some of the lateral problems
7. The Need to expand the scope and scale of the enterprise	The growth of the interaction space, which can be interpreted as the expansion of the enterprise boundaries, the scale effect is achieved without mergers
8. Industry innovation activity	Integration of competencies, investment potential, etc.
9. Need for support in various projects, establishment of framework agreements on cooperation	Coordination of production and other activities on a soft associative basis, increasing the potential of actors

Motives represent the organizational and economic conditions that shape the behavior of actors in the implementation of relational relationships. each motive corresponds to its own strategic goal-a reference point. At a higher level of goal-setting, the determining motive, which covers the entire set of goals-guidelines, is the achievement of goals-systems (interpreted in the well-known terminology used in management, in particular, by A. Prigozhin [15]), which for relational relations can be identified as target installations aimed at: a) attracting certain complementary resources; b) forming a zone of stable, safe development.

The strategic focus on attracting complementary resources is often considered to be the main motive behind relational interactions and related to the actor's needs for new opportunities that cannot be obtained independently. This is the content of the 1st goal-the system. This setting should probably be significant, but it is not the only one possible.

You can count on getting partner advantages without resorting to «dense», effective interaction, limiting your economic interests not to enhancing the potential of the enterprise by obtaining resources from the partner, but on the basis of reducing market uncertainty under the simple assumption that positive interactions strengthen the enterprise. Ensuring safe development is the content of the 2nd goal-the system. An enterprise in a number of market situations, instead of maximizing profits and steadily minimizing costs, seeks to find an «economically satisfactory» solution that would significantly reduce the level of uncertainty and risk in the market. In fact, instead of looking for directions of development related to maximizing profits with acceptable security, the company tries to increase its own security with acceptable profitability. The concept of providing high security with acceptable returns often comes to the fore in relational relationships [16], [17], [18].

Existing models of relational strategies

Currently, there are two approaches to the formation of relational strategies. The first one is based on the model of Krymov S. M. (2015), developed with co-authors [6], [7] based on the assessment of the relational effect, i.e. on the appearance of additional opportunities for the enterprise in the implementation of relation. However, the prospects for exchanging material and technical resources between partners in the production and technological chain are actually being explored. For infocommunication network interactions, such an exchange cannot be taken as a basis, since it is not sufficiently focused on obtaining key sources of intangible, specialized values, and is poorly represented in accounting reports, which is typical for the digital age.

The second approach was developed by V. A. Liventsov (2019), another co-author of the presented study [19]. The basis of this model is the following innovations, discussed below:

– key principles of relationships are proposed;
– unified basic relational strategies have been developed;
– developed a method for calculating the integral index of the correlation, taking into account the indicators determined by the specified key principles underlying the methodology for implementing relationships.

As special principles that define the relational strategy, we suggest using the following four most significant ones. Trust, valence, congruence, and pertinence.

The principle of trust. Coordinating the interests of participants in relational interactions is based on trust. This is the basic principle of relationships. After all, relational contracts, as noted above, are also called trust contracts.

By K. Arrow «Trust is a commodity that has real economic and practical value: it increases the efficiency of the entire system as a whole, allowing more goods to be produced» [20]. In fact, this statement of the Nobel laureate allows us to identify trust with an economic resource, which determines the significance of the principle.

The principle of valence. The ability of actors to implement relationships – the valence of relationships – should reflect the requests and requirements of participants to implement interactions. The possibility of interaction implies a high degree of expectation from the implementation of the correlation. Valence indicates the value of relationships: the implementation of interactions should lead to the improvement of various characteristics of the enterprise, the achievement of the intended strategic orientations.

The principle of congruence. A high level of congruence, i.e., the integrity of relationships, is required. Interaction requires, as any exchange in modern economies, according To D. North [21], institutional reliability. Congruence reflects, first, the consistency and mutual correspondence of actions of relational actors. It can be manifested in maintaining coordination of structures, volumes of manufactured and sold products. Second, in Economics, congruence is often identified with the correspondence of informal and formal rules. Since informal relations prevail over formal ones for relationships, there must be a faciliation of interaction processes between the actors of the relationship. Only by using soft associative interactions can the initial settings of a relational contract be fulfilled [22].

The principle of permanence. Pertinence expresses the share of useful information in the total information about the relationship. It is necessary to be able to obtain a high level of reliability and significance of information about the interaction, which reflects the measure of pertinence of the correlation.

In this model, basic relational strategies have been developed that reflect universal methods for achieving competitive (partner) advantages.

First, the strategy of complementarity. For inter-firm interactions, this is achieved due to the complementarity of partner firms ' resources and the potential for new opportunities. In addition, due to the synergistic effect of the relationship. The latter is most clearly seen when combining efforts to implement a project related to the creation of new products and various technologies. Strategies reflect new ways to gain competitive (partner) advantages.

Second, security strategies. Strategies reflect new approaches to the understanding of the methodology development. For inter-company interactions, this means abandoning the traditional strategic guidelines related to maximizing profits with satisfactory security. The company does not want to take risks, so it chooses to maximize security at an acceptable yield. Based on reducing market uncertainty with the simple assumption that positive interactions strengthen the enterprise.

The integral correlation indicator is a weighted sum of confidence (T), valence (V), congruence (K), and pertinence (P) indicators, i.e. it is a 4-factor model. The content of each of the indicators T, V, K, P is determined based on the explication of the above principles. A multivariate model is also used to evaluate the confidence, valence, congruence, and pertinence indicators, in which proper factors are identified [9]. Factors and weights are determined by an expert method.

The choice of a specific type of basic strategy, complementarity or security, is determined by the values of the integral indicator: at high values, it is possible to count on the exchange of resources with the partner, i.e., on the complementarity strategy; for lower values, you can only count on the security strategy. At the same time, indicators below a certain threshold (depending on the industry, life cycle, and other conditions) indicate that building joint strategic guidelines is difficult.

Author's network model of relational strategies

In the development of the existing model Of V. A. Liventsov, a model is proposed that takes into account the features of network interactions.

To do this, we have expanded the set of key principles that reflect the methodology of relational interactions. In addition to the principles of trust, valence, congruence, and pertinence, the principle of networking is used.

The principle of networking-economic networks are created from firms that are difficult to develop independently in a high market competition, so they are combined to isolate the firms in the network, which allows you to form a local network market.

The integral indicator will now represent a multi-factor model containing the sum of five weighted indicators:

$$I_и = w_t T + w_v V + w_k K + w_p P + w_s S, \quad (1)$$

where wt, wv, wk, wp, ws are the weight coefficients; factors: T – trust, V – valence, K – congruence, P – pertinence, S – networkings.

The method of calculating the confidence, valence, and congruence indicators is determined in full accordance with the Leventsov V. A. model, which is already noted above, by using multi-factor estimators, as described in [19]. Based on them, basic relational strategies of complementarity or security are formed.

For a wide network of interactions promising another view of the underlying relational strategies – a strategy for the formation of local networks. Their formation requires the use of estimates of the networked indicator based on the following content interpretation of the networked principle.

The formation of infocommunication networks is associated with the search for economic niches where it is possible to aggregate resources to create local production and economic systems. In this case, the niches become a platform for production, distribution, exchange and consumption of resources. There are wide opportunities for relationships with other niches [23]. The reason for the emergence of niches is the presence of strategic development prospects that cannot be implemented in many areas at the same time. After all, the enterprise infrastructure is simply not able to provide competitive advantages in all business processes, and there are not enough resources. Niches are filled with networks created by small and medium-sized firms. Partnership with niche participants not only creates opportunities to reduce the degree of industry concentration, but also creates a new local market, which is primarily aimed at the principle of networking.

Factors of technical and economic indicators of niches can be used to assess the networked indicator. In many ways, the effectiveness of networking depends on the coordination of actions (coordination) of actors involved in network interactions. The list and perspectives of measuring these factors are determined by the current situation in the industry.

Conclusion

The following main results were obtained during the research:

1. A Relational contract, as a mechanism that forms trust relationships, can be a means of developing relational strategies of enterprises, including not only two-state, but also network interactions. The relational strategy allows us to ensure allocation of resources on the basis of mutually beneficial relationships between actors in promising areas of enterprise development.
2. The basic patterns of correlations associated with the formation of the inter-relationships between enterprises, based on partnerships from the relations. The prospect of access to the resources of the economic system, the network allows you to carry out production and economic processes at the enterprise, using the potential of the formed real space as a mechanism for implementing strategies.
3. The Methodology for forming relational relationships is related to the following important principles that were developed earlier: confidence, valence, conruence and pertinence of relationships. In addition to them, the principle of networking has been developed. Economic networks are created from firms that find it difficult to develop independently in a highly competitive market, so they combine to isolate the firms that are part of the network, which allows partners to form a local network market.
4. Basic relational strategies that reflect universal methods for achieving partner advantages can be divided into the following types:

- complementarity, which is carried out due to the complementarity of resources of partner firms, the potential of new opportunities, due to the synergistic effect of relationships;
- security based on maximizing security with acceptable returns. They are implemented on the basis of reducing market uncertainty with the simple assumption that positive interactions strengthen the enterprise;
- strategy for the formation of local networks. The formation of networks is associated with the search for economic niches where it is possible to aggregate resources to create local production and economic systems. Niches become a platform for the production, distribution, exchange and consumption of resources; there are wide opportunities for relationships with other niches.

Abstract

The article deals with the use of rationalization methods for the proposal to improve the current state of the workplace. The design of the new workplace is focused on increasing the efficiency and productivity of the workplace while respecting ergonomic limits and considering work safety. The proposal consists of the initial discovery of the potential for improvement and subsequent implementation of measures at the workplace to achieve higher efficiency. The study aimed to develop a proposal for the modification of the workplace to increase its efficiency while adhering to the principles of ergonomically appropriate work and the principles of safe work.

Keywords: Design, Industrial Engineering, Ergonomics, EMG

Introduction

At present, one of the basic priorities of companies is to improve their production to achieve the highest possible efficiency and productivity. Tools and methodologies for rationalizing work and workplaces have long been used for this purpose. With the correct use of these approaches and the implementation of methodologies, it is possible to achieve an efficient production system or partial production units.

Kosturiak (2000) mentioned that increased productivity can also be achieved by constantly searching for, identifying, and eliminating waste in the workplace. Such waste is mainly related to long material flows, long transition distances of workers, incorrectly designed transport and handling routes, or inappropriate arrangement for work safety and ergonomics. One of the main goals of companies is to eliminate or at least reduce any waste, reduce production costs, and achieve higher production productivity. Bures mentioned that one of the possible solutions to increase the efficiency of the workplace is to spatially arrange the production unit in a suitable way. It is necessary to support and verify the change of the spatial arrangement with sufficient input data, devote sufficient time to the design, and ensure the correct input data. Any changes to an already established proposal are often complex and costly. The solution of the spatial arrangement is closely related to the nature of the workplace, type of production, product base, etc. These factors must be thoroughly addressed during the design of the workplace.

Vranek and Simon (2018) mention that due to the rapid progress of various support tools in connection with industry 4.0, spatial solutions are supported by software and programs enabling not only classic 2D layouts, but also 3D visualization, models for superstructure using devices supporting virtual reality, or visualization and display of material flows of products or product lines. Kosturiak also mentioned that all proposals for changes must be based on sufficient input data obtained by observation and analysis of the current state. Part of the analysis is the definition of factors influencing production productivity, which must be addressed in the next phases.

The article is focused on improving the production of the selected workplace according to the approaches and methodologies of improving and rationalizing the production unit.

Measurement and analysis of time consumption – time studies

Commonly used methods of detecting and measuring time consumption are designed to detect, assess, and evaluate time consumption. They determine the expected consumption of working time by measuring and analyzing individual events. Miller et al (2013) mention that the time aspect is the focus of the study of work and it allows us to quantify the events in the system that is under study. Various methods are used to determine time consumption, including time studies and motion studies. The basic methods used for measuring time consumption are briefly described by Miller et al (2013) in Figure 1.

Fig. 1. Basic Methods of Measuring Time Consumption – Miller at al (2013)

Kosturiak (2000) mentions that the standard procedure for measuring time consumption consists of several sub-steps, starting with the selection of the work to be measured. Subsequently, a detailed study and assessment of the work process, the sequence of movements, and working conditions is done, including the division into groups of productive and unproductive times. Furthermore, the measurement of time consumption itself is carried out using appropriate techniques according to the nature of production mentioned by Rybnikar and Kleinova (2019).

Novak et al (2007) mention that time studies are one of the basic tools of industrial engineering. They are based on the principle of time measurement and serve as a basis for improving work processes. Time studies can be divided according to their nature into continuous-time studies and instantaneous observations. For the input analysis, it is appropriate to choose the method of continuous observation to obtain the data by continuous monitoring and measurement of work. The output of the continuous observation most often used in practice is snapshots of the operation (chronometry) or snapshots of the whole working day described by Simon et al (2013). Snapshots of operations detect the time consumption of repetitive operations or tasks, while snapshots of a working day track the consumption of time by continuous monitoring throughout the whole work shift. It is to some extent a universal method, which can with certain adjustments be used to observe not only the work of a worker, administrative or manager, but also the activity of production equipment as described by Pavelka (2007).

Spatial Study

Simon and Miller (2014) mention that input analyses of the spatial arrangement of the workplace are usually based on various steps. Using these steps, deficiencies in the spatial arrangement of the work unit, in the organization of the work unit, and waste are gradually identified. There are several options to choose from in the spatial arrangements of the work unit. It depends mainly on the nature of production and the basic structure of the material flow.

Fig. 2: Basic material flows structures – Hlavenka (2005)

When designing production units, it is very important to pay attention to the spatial arrangement. The design of the spatial arrangement of the production unit or the creation of the layout significantly affects the efficiency of the process. By designing the layout of the workplace, we mean a graphical representation of the area, which shows the arrangement and layout of the production space described by Vranek and Simon (2018). The basic distribution methods include the CRAFT method mentioned by Hlavenka (2007), the Spaghetti diagram, the Sankey diagram mentioned by Srajer (2014), two of the oldest methods – triangular or center of gravity method mentioned by Zelenka and Kral (1995). The design and representation of the spatial arrangement of the production unit should be supported by 2D and 3D visualization in one of the available software (for example, the visTable tool from Plavis GmbH) mentioned by Srajer (2014).

Ergonomic Study

Dianat et al (2020) mentioned that one of the methods used for the evaluation of working positions is the RULA method. The RULA method was created in 1993 at the University of Nottingham. It is known worldwide and recognized for the assessment of ergonomic risks in the working position and when handling loads. RULA is mainly used to assess damage to the upper limbs arising in connection with work activities. Within the RULA evaluation, the position of the upper limbs (arms, forearms of the wrist), neck, torso, and legs are evaluated. Each body part is assigned a score. The points are then corrected for muscle and strength and then the total score is calculated as described by McTamney and Corlett (1993).

The total score is divided into 4 risk categories mentioned by Middlesworth (2018):

Category 1 - work is acceptable, no need for changes in the workplace,
Category 2 - the work is slightly hazardous, it is appropriate to make certain changes,
Category 3 - hazardous work, it is very desirable to make changes to improve the workplace,
Category 4 - extremely hazardous work, there are urgent requirements for workplace changes.

Kacerova and Bures (2018) mentioned that the division of works into categories by RULA analysis does not correspond to the division of categories of works within the categorization of works in the Czech Republic. This division is a basic tool that contributes to the evaluation of the impact of work on the health of the employee. Individual categories are defined by the degree of exceeding hygienic limits and the risk of health hazards.

The obligation to categorize works is given by §37 of Act No. 258/2006 Coll., On the protection of public health, incl. Decree No. 432/2003 Coll., which divides works into 4 categories according to established rules.

Within the categorization of physical factors, workplaces are divided into three working categories:

Category 1 - there is no likelihood of adverse effects on workers' health.
Category 2 - adverse effects on workers' health are rare, they may occur in sensitive individuals. Hygienic limits are not exceeded.
Category 3 - hygienic limits are exceeded, it is necessary to use personal protective equipment, statistically, there is also a more frequent occurrence of occupational diseases.

According to statistical data, the most common assembly workplaces in the Czech Republic are manual or semi-manual described by Kacerova and Rybnikar (2020).

Bures and Cadkova (2020) mentioned that manual work can be understood in different ways. One way is to understand the concept of manual work as an operation performed by a worker using basic hand tools. A second way is a person performing the work without any support in the form of tools. This way considers work to be manual only if it is completely performed by a person based on his abilities, and no human function is replaced. Bures and Cadkova (2020) also mentioned that most production systems combine human work and automation. Therefore, tasks are divided between manual work and automatic work. Production is considered to be semi-automatic if at least one of the tasks of the human worker is performed by another source. That is the reason why the local muscular load is measured in the workplace.

The local muscular load is measured by integrated electromyography. Electromyography is an examination method, thanks to which we can evaluate the condition of the human nervous and locomotor system. Integrated electromyography aims to record the electrical activity of a selected muscle, which is caused by a change in the electrical potential that arises due to muscle activation. Activity is recorded from nerves or muscles. Muscle activity is induced either by stimulation of the proband or by the will of the subject.

Kaba and Kacerova (2019) mentioned that many instruments can be used to measure local muscle loads, such as Biometrics from DataLog or EMG Holter from GETA. The results of these gauges are the same, but in the Czech Republic, the only gauge permitted by the legislation for measuring local muscular load is the EMG Holter device from GETA, see the figure below. The package contains a measuring device (EMG Holter), an interface for connection to a computer, electrodes, and EMG modules. The electrodes are disposable and are removed from the proband after measurement.

Fig. 3: EMG Holter – GETA

The skin impedance must be reduced before the electrodes are glued, the skin must be dry and clean. Previously, the skin used to be degreased with a fatty solvent (ether, acetone, ethyl alcohol, propyl alcohol). If the skin impedance persisted, it was recommended to scarify the skin with sandpaper or a special abrasive paste. Nowadays, the skin is cleansed with an abrasive gel, then the designated electrodes are glued to the forearm. Two electrodes, approximately 3 to 10 mm apart, are glued to each of the mentioned muscles. The electrodes are glued to musculus extensor digitorum and musculus carpi radialis. The ground electrode is glued in the elbow area - outside the musculature. For better attachment, the glued electrodes are further covered with a hypoallergenic patch. EMG modules are attached to the forearm or arm so as not to interfere with work activities. The cables are wrapped to reduce noise and secured with an elastic bandage to the worker's upper limb mentioned by Kaba and Kacerova (2019).

Due to the effect of BMI on EMG measurements, people with a BMI higher than 30 kg / m2 were omitted as described by Nordander et al (2003). Subsequently, the measurement parameters in the computer are set. After the measurement, the data is dragged into the special software EMG Analyzer and evaluated according to NV 361/2007 Coll.

Fig. 4: Example of captured muscle EMG signal – Tichacek (2008)

Methodology Application on Real Workplace

Within the time analysis, a total of 5 snapshots of the working day were taken at the workplace, which was measured over the entire shift (8 hours). Three snapshots were taken on a morning shift at weekly intervals, two snapshots on an afternoon shift at weekly intervals. Production takes place in two shifts. Based on observations of the workplace and workers, the main activities and operations were defined. The measured activities of the employee were noted in a prepared document, which indicates the time consumption of individual activities of employees. The document was analyzed to identify waste, its causes, the potential for improvement, and reveal mistakes made by employees, including personal and organizational losses. The snapshot of the working day divides the individual activities into groups of productive, conditionally necessary, and loss-making activities. Productive activities are value-adding, which means that the customer is willing to pay for them, they transform the material, and they are carried out correctly on the first try. Conditionally necessary activities are activities that do not add value but are necessary to ensure productive activities, they should be eliminated or reduced by appropriate adjustments. Loss-making activities are activities that need to be eliminated and can be caused by employee errors or organizational deficiencies.

It is evident from the graph that a high percentage of the time was spent on productive activities associated with gluing, grinding, drilling, and cutting products. 6 % of the total time was spent on personal needs, which include staff breaks and personal needs (toilet, refreshments, snacks). Organizational losses, with a share of 7 %, include downtime not caused by the employee (for example, caused by missing material). Personal losses represent a waste caused by the worker, eg. the worker is not working, even though there is no break (cigarette, personal interview). Non-productive activities include, for example, employee movements and transitions, an inspection of the finished piece, work with documentation or manipulation.

The following graph shows the productive activities in green, the conditionally necessary activities in orange, the loss-making activities in red. Productive activities here include gluing, grinding, drilling, and cutting activities. Loss-making activities are divided into personal losses caused by the employee and organizational losses caused by the insufficient organization of work. Other activities were included among the activities conditionally necessary.

Fig. 5: Graphic representation of activities

More than half of the average time consumption per work shift is spent on unproductive activities and loss-making activities. In these activities, it is necessary to further look for the potential for eliminating waste, improving, and thus increasing productivity. Loss-making activities should be eliminated according to the correct procedure, the responsibility of the employee, and the organization of work. The issue is unproductive activities, which cannot be completely excluded from the process, as they are necessary to ensure productive activities. However, there is often a hidden waste in these activities, which has the potential to increase efficiency, and some improvements can be made by introducing appropriate remedial measures in the form of rationalization approaches and methodologies.

The following Figure shows a 3D model of the workplace created according to the spatial analysis of the current state of the workplace. The location of the tables and input/output material in the current layout do not provide a sufficient amount of workspace for the worker. The input and output material is indistinguishable and is located on a pallet on the ground, while the handling of pieces from the pallet to the work table and back is performed manually by a worker. Tool cabinets also do not meet the requirements of the workplace, the tools are neatly stored in them and do not have enough capacity.

Fig. 6: 3D visualization of the current state of the workplace

The last step of the initial analysis was the implementation of an ergonomic audit, which included the evaluation of working positions according to RULA, Government Regulation 361/2007 Coll. and measuring local muscle load. As part of the observation of work procedures, a video recording was made for a more detailed capture of work tasks and work positions. The video recording was then subjected to a detailed analysis of individual activities and working positions of the angles of the assessed body parts. The analysis was performed in Tecnomatix Jack software.

The output of the RULA analysis was the finding that the workplace falls into the 3rd Category, ie hazardous and it is desirable to make changes leading to the improvement of the workplace. The RULA analysis does not correspond to the categorization of occupational safety concerning Czech legislation. For this reason, an analysis was performed according to NV 361/2007 Coll. Green boxes indicate positions that are acceptable to the worker, yellow boxes are conditionally acceptable, and red boxes stand for unacceptable positions. According to NV 361/2007 Coll., the worker can only spend 160 min from the average 8-hour shift in a conditionally acceptable position, in case of unacceptable positions the limit is 30 min from the average 8-hour shift. It is clear from the table down hat the worker has a back, neck, and left wrist in a conditionally acceptable position, the back and neck are mainly caused by an insufficiently high table, which is very unsatisfactory for the worker. The worker´s shoulders and wrists are both in an unacceptable position. The following Figure shows the evaluation of the working position according to Czech legislation.

Fig. 7: Ergonomic evaluation of working positions according to Czech legislation

Another examined position was the position where the worker carries the foam part of the boiler over his head. Even though this position is unsatisfactory at first glance, the workers transfer the foam parts from and to the workbench in this way. The following figure shows the evaluation of the working position when handling the load according to Czech legislation.

Fig. 8: Ergonomic evaluation of working positions whe handling the load

According to Government Decree 361/2007 Coll. the working position is unacceptable for the neck, both hands (shoulder, wrist). The foot position is OK. It should be noted that workers should not carry any burdens this way.

The most problematic areas were the positions of the upper limbs, which are not suitable due to their position and can cause health complications for workers, such as carpal tunnel syndrome. Due to the negative indications of the RULA analysis and the evaluation of working positions according to Czech legislation, it was decided that the workplace will be re-measured in terms of local muscle load using integrated electromyography. During the measurement, electrophysiological biopotentials are sensed from the examined muscle groups of the hand and forearm (extensor, flexor). The measurement results are the relative values of the muscular forces expended in the so-called % Fmax. As part of the research, the results of EMG measurements were synchronized with a video of the work process. Thanks to the synchronization, the operations, where the used force exceeded the limit of 70% Fmax, were found. The figure shows the EMG evaluation curve.

Fig. 9: Example of EMG evaluation curve

Due to the sensitivity of the data, the measurement results cannot be published. However, the measurements confirmed the current concerns. The position of the upper limbs was marked as unacceptable and urgent corrective action had to be taken.

Potential for Workplace Improvement

During the analysis of time frames, shortcomings were revealed, and thus also the potential for a gradual improvement of the production unit. By introducing appropriate measures, it is possible to improve this unit and achieve higher efficiency and productivity in the workplace. The analyzes revealed the following shortcomings causing hidden waste:

- clutter in the arrangement of tools and implements,
- a long route between the individual workplaces used by the worker,
- input/output material designation is missing,
- lack of space,
- clutter in the tool cabinet,
- clutter on the desk,
- unmarked places for trucks,
- trolleys are too high or too low,
- poor handling of trucks,
- mixed templates on the work table,
- storage space is too high,
- spray guns and other tools on the work table,
- uncleaned pieces,
- tables are too low or too high,
- reading documentation, searching in drawings.

One of the basic approaches that will help improve this production unit is the principle of the 5S methodology. This methodology, consisting of several basic steps (categorize, organize, clean, standardize, improve) helps to maintain a clean, organized, and efficient workplace that can be used in any workplace. The methodology aims to remove excess material, tools, implements, templates, and other workplace equipment that is not used. Another principle of the methodology is the introduction of a workplace standard for its sustainability in a clean and organized state. At the same time, every object in the workplace should have its place and should be found at this place at any time. To prevent inappropriate handling of the material from ergonomics and work safety, it would be appropriate to purchase ergonomic trolleys at the workplace to facilitate handling. The introduction simplifies handling, ie saves time required for handling and at the same time ensures ergonomically suitable working conditions for the worker. At the same time, it is necessary to consider the evaluation of working positions and local muscle load according to NV 361/2007 Coll.

A similar problem from the ergonomic point of view is caused by workbenches, which are too high for some lower-ranking workers and, conversely, too low for taller workers. Therefore, it is advisable to introduce ergonomically suitable height-adjustable workbenches into the workplace.

A mess in the form of chaotic and confusingly stored tools and instruments, or a mess in the tool cabinet and on the desk, also has to be addressed to increase workplace efficiency. This deficiency can be solved by using suitable storage spaces with defined spaces for tools and implements. To avoid the problem of confusing storage of templates,

it is necessary to create suitable spaces, for example, using a shelf for these templates. Some tools lie freely on the worker's desk, even though he is not working with them at the moment. This problem can be avoided by simply inserting the holders under the tabletop.

To store material in storage spaces, it is possible to use a solution that utilizes carousel cabinets, which can accommodate a large amount of stored workplace equipment with a defined location for each of them. One of the major shortcomings of the process is the fact that the worker spends a lot of time reading the drawing documentation to figure out how to carry out the production. According to the snapshot of the workday, the employee spends approximately 10% of his time searching for information in the documentation.

Workplace design and visualization

Several variants were created during the design of the workplace. Due to the company's criteria, a suitable solution was selected and applied to the workplace.

The design of the new spatial arrangement of the production unit was created concerning ergonomics and work safety. At the same time, proposals for measures to reduce the hidden waste caused by shortcomings were applied, which were observed in the temporal, spatial, and ergonomic study.

The following Figure shows a 2D layout of a new workplace spatial arrangement. The proposal is based on the identified shortcomings and the potential for improving the efficiency and productivity of the production unit. Due to the spatial arrangement, larger working space was created around the workbenches by pressing the tables together, which also extended the workspace. The tables are rotated 90 ° for better access to the input and output material. The workbenches have been significantly innovated, containing balls that help the worker to handle larger and heavier pieces. The tables are height-adjustable and are placed on secured castors for possible movement. Holders for tools and implements needed at this workplace (spray guns, drills, cutters, grinders) are located under the worktop of the table due to respecting ergonomic rules (not raising the arm above 60 °, etc.), the worker does not have to bend to reach this tool, everything is located in a comfortable range. A corner carousel cabinet was placed at the workplace, where it is possible to store all the tools, templates, drills, etc. In addition to the carousel cabinet, there is also a cabinet for storing personal belongings - food, drink, etc. The worker has a PC with a monitor, equipped with a reader for reading documentation and projecting drawings. To facilitate material handling, the workplace is equipped with scissor pallet trucks.

Fig. 10: 2D layout of a new spatial arrangement

The following Figure shows a 3D visualization of the design of a new spatial arrangement of the workplace, including the introduced rationalization elements increasing the efficiency, ergonomics, and safety of the workplace.

Fig. 11: 3D visualization of a new spatial arrangement

Conclusion

Workplace rationalization is one of the important methods of industrial engineering. There are many approaches to solving the rationalization of the workplace, and the benefits of implementation are always a significant advantage for the company. One of the possibilities of rationalization of the workplace is to understand the functioning and mapping of workplace activities, perform temporal, spatial, and ergonomic analyzes, then determine the shortcomings and potentials for improvement and finally make these changes and then maintain them in the long term. This kind of approach was used in this study when a new spatial arrangement of the workplace was created, reflecting the proposed changes concerning the elimination of waste. The design was created concerning workplace ergonomics and work safety.

Abstract

We use synthetic control group methods to analyze the economic performance of a small set of Italian single establishment manufacturing firms that underwent SA8000 certification in 2009 or 2010. We find positive and weakly significant effects of SA8000 certification on firms' turnover to assets ratios, but no evidence of a positive or negative impact of SA8000 certification on firm profitability and wages. We conclude that SA8000 certification may be a viable marketing tool that increases company sales but has no strong impact on firm profitability and wage costs.

Keywords: Corporate Social Responsibility, Synthetic Control Groups, SA8000 certification, Company Performance

Introduction

The number of firms resorting to voluntary but costly external certification for social and environmental standards has rapidly increased in the last decades. According to Kitzmueller and Shimshak (2012) more than one third of the large firms in the US resort to such certifications. As a consequence also research on the impact of corporate social responsibility (CSR) and of the certification of CSR activities on the economic performance of firms has boomed in recent years. Within this literature the analysis has so far mainly focused on the impact of environmental standards such as ISO 14001 (e.g. Koe Hwee Nga 2009, Boulash *et al.* 2010, Heras-Saizarbitoria *et al.* 2011 and De Vries *et al.* 2012). The impact of social accountability standards (e.g. ISO 28000 or SA8000) on financial performance has been much less considered. This especially applies to the SA8000 standard. For this widely used international social accountability standard two recent surveys (Hiscox et al., 2009 an Sartor *et al.*, 2016) state that they are unaware of any evaluations of their impact on the financial performance of firms.

The current paper therefore extends previous research by using data on a small group of Italian firms to assess the impact of the SA8000 standard on company profitability, wages and sales. One important methodological challenge in such an evaluation is the potential endogeneity of the CSR practices (see Hiscox et al., 2009 for a discussion of this in the context of SA 8000 certification). We address this issue by using a synthetic control group method (Abadie and Gardeazabal, 2003 and Abadie et al. 2010).1 As argued for instance by Fremeth et al. (2016) this method is particularly well suited for constructing comparison groups in cases where the sample of treated units is small as it avoids the arbitrariness involved in defining control groups.

Background

The starting point of our discussion is the rather large literature on the impact of CSR implementation on a firm's financial performance (see Margolis and Walsh 2003, Orlitzky *et al.* 2003, Margolis *et al.* 2009, Hiscox *et al.*

Cite this Article as: Eva ABRAMUSZKINOVÁ PAVLÍKOVÁ, Marcela BASOVNÍKOVÁ and Peter HUBER" SA8000 Certification and Firm Profitability, Wages and Sales: Evidence from A Small Sample of Italian Firms" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

2009, Benabou and Tirole 2010, Kitzmueller and Shimshack 2012 for surveys). This has followed two lines of reasoning to explain the impact of CSR on financial performance. The first is based on the assumption that consumers, investors and workers are indifferent as to how a good or service is produced, but that managers or owners prefer socially responsible production.[2] Proponents of this line of argument (e.g. Reinhardt *et al*. 2008, Melo 2012) suggest that CSR is undertaken to satisfy the preferences of managers or owners. Since, more profitable firms are (all else equal) better prepared to cover the additional costs of CSR, this line of reasoning predicts that firm profitability causes CSR adoption, because higher profits allow managers and owners to implement CSR.

The second line of reasoning, assumes that investors, consumers or workers prefer socially and environmentally responsible production and holds that CSR has a causal impact on a firms' financial performance through sales, credit and labor market channel. The sales channel arises if customers prefer socially responsibly produced goods. This implies that CSR adoption increases the demand (or the willingness to pay) for a firm's produce. This will result in increased sales and higher profits if net revenues from increased sales exceed the costs of CSR implementation. The credit channel, by contrast, stresses that investors have a preference for CSR and will thus be willing to accept a lower returns (interests) on funds provided to firms applying CSR. If the savings from lower interest payments exceed the costs of adopting CSR, this too will improve a company's financial performance. Finally, the labor channel argues that if workers (all else equal) prefer to work at socially responsible firms, this will increase their productivity either because working at such firms increases motivation or because socially responsible firms have more applicants and can thus choose to employ more productive workers. If this increase in productivity exceeds the cost of CSR adoption, this will also increase firm profitability.[3]

A large empirical literature aims to measure the correlation between CSR adoption and firm level financial performance. This literature has recently been surveyed in encompassing meta-studies by Margolis *et al.* (2009) and Orlitzky *et al.* (2003). Margolis et al. (2009) survey 251 estimates the correlation between CSR and financial performance. They show that in average these studies find a weak positive correlation (of 0.13) between financial performance and CSR-adoption. Orlitzky *et al.* (2003) find a positive association between corporate social responsibility and firm financial performance, which is stronger for accounting-based measures of financial performance and CSR reputation indices.

Similarly, in the recent literature on the separate channels through which CSR adoption may affect firm performance El Ghoul *et al.* (2011) use a sample of over 12,000 US firms to show that investments into CSR, are significantly negatively correlated to a firms' cost of equity. Tamm *et al*. (2010) focusing on the labor channel by using survey data from Estonia, Lithuania and Latvia show that employees in firms that are deemed more socially responsible also have higher job satisfaction and work ethics and Korschun *et al.* (2014) find that employees in Fortune 500 firms that implement CSR policies are more customer-oriented. Furthermore Saedi (2015), in line with the sales channel, finds higher customer satisfaction among Iranian firms following CSR policies.

These contributions have differed in the definition of CSR and financial performance. With respect to the definition of the CSR-status of a firm some authors (e.g. Flammer 2015) use corporate disclosures, while others (e.g. Lin *et al.* 2009) focus on charitable donations and quite a few resort to various indices measuring the reputation of firms in implementing CSR (Wu 2013, Cavaco and Crifo 2014, Bechetti and Ciceritti 2009) or CSR awards (see Dasgupta, Laplante, and Mamingi, 2001; Jacobs, Singhal, and Subramanian, 2010; Klassen and McLaughlin, 1996). One drawback of these measures is that they provide only limited information on compliance with CSR practices. As a consequence a number authors (e.g. Hiscox *et al.* 2009) advocate the use of industry standards or certifications to measure CSR implementation. This is because compliance to these is controlled by external auditors and because recent experimental evidence suggests that such standards are considered more credible signals of CSR by customers (Etile and Teyssier 2015).

With respect to the measure of financial performance authors focusing on firms listed on the stock exchange have used measures of a firm's value such as Tobins Q or the market value of a firm as these are likely to better reflect the long run profitability of a firm than bookkeeping measures (Becchetti and Ciciretti 2009, Becchetti *et al.* 2013). By contrast, contributions focusing on smaller enterprises or enterprises not listed on the stock exchange (e.g. Lin *et al*. 2009, Tsoutsura 2004, Wu and Shen 2013, Belu and Manescu 2013) have mostly focused on accounting measures of profitability such as returns on assets and returns on equity.

The SA8000 Standard

In this paper, CSR adoption is measured by the implementation of SA8000 certification. This is one of the internationally most widely used social accountability standards for retailers, brand companies, suppliers and other organizations.[4] It is based on international agreements (including the International Labor Organization

convention, Universal Declaration of Human Rights and the Convention of the Rights of the Child) and requires certified firms to adhere to a set of norms related to working hours, health and safety, prevention of discrimination, work of children and adolescents and forced labor. It also requires certified firms to respect the freedom of association, to follow a specific code of conduct with respect to disciplinary practices, to provide sufficient remuneration, to meet the basic needs of workers and to implement continuous control systems for improving working conditions. In addition SA8000 certified firms are required to provide a safe and healthy workplace environment and to take effective steps to prevent potential health and safety incidents and occupational injury or illness associated with, or occurring in the course of work. They are also required to abide to existing laws with respect to working hours and remuneration (Social Accountability International, 2015).

Any organization seeking certification with SA8000 must apply to an auditing firm accredited by Social Accounting Accreditation Services (SAAS), which acts as a certification body for the standard. The process consists of a preliminary assessment at the beginning of procedures. In this, any necessary improvements to meet the requirements in the standard are identified. This is followed by a certification audit, where the auditing firm examines whether the necessary improvements have been implemented and provides the certification if this is justified. After this the firm is subject to regular (annual or semi-annual) surveillance audits for three years, after which the certificate expires and must be renewed under simplified procedures. These surveillance audits ensure the continued compliance to the standard as well as continued improvements in meeting the standard, and may result in a list of suggested improvements or even withdrawal of the standard in cases of severe abuse (see Gilbert 2001 and http://www.saasaccreditation.org/certification).

The out-of-pocket costs of certification consist of the costs of taking corrective and preventive action in order to comply with the standard, preparing and conducting the audit by an SAAS-accredited certifying body as well as the costs of taking corrective actions to resolve problems if nonconformities are identified. The certification bodies base their auditing activities on market prices depending on the size, scope, and location of the facility, at prices that typically range between $500 and $1,500 per day (Gilbert 2001 and http://www.saasaccreditation.org/certification-costs).

Method

The central methodological issue arising in evaluating the impact of the standard on firms' financial performance is the potential endogeneity of applying the standard. This arises because firms choose to adopt SA8000. Profit maximizing firms will therefore only do this if they expect certification to increase profits. Comparing firms implementing SA8000 to firms not implementing it, therefore implies comparing firms that expect to profit from SA8000 to firms that do not. Such a comparison will overstate the true effect of SA8000 adoption, if firm expectations of profitability of SA8000 adoption are met. To assess the impact of CSR certification on a firm's sales, profitability and productivity, therefore a comparison group of non-adopting firms that can be expected to have developed similarly to SA8000 adopting firms in the absence of adoption must be sought for.

In the current paper, we use synthetic control methods to define this comparison group. This method (introduced by Abadie and Gardeazabal 2003 and Abadie *et al.* 2010), has recently been used in many studies relating to various fields of economic analysis (e.g. Peri and Yasenov, 2015, Kreif *et al.* 2016, Billmeier and Nannicini 2013). It provides a systematic way to avoid the arbitrariness necessarily involved in defining ad-hoc control groups (e.g. industry averages) and to identify the impact of an event on a treated unit relative to a control group of untreated units at the hands of a control group that is derived by statistical methods. Furthermore, as emphasized by Fremeth et al. (2016) this method is particularly well suited in contexts such as ours, where few occurrences of treated units preclude the possibility of making strong inferences from traditional regression analysis.

The method consists of, in a first step, using data on firms that did not adopt SA8000 (referred to as the donor pool) to define a fictitious untreated firm (the synthetic control) that has developed as similarly as possible to the firm adopting the treatment prior to treatment. In a second step, then, the post-adoption development of the firm adopting SA8000 is compared to this fictitious firm. This method therefore allows for an identification of a reasonable control group and to conduct a difference-in-difference analysis on the outcomes of the certifying firm relative to the endogenously defined synthetic group. The method consists of considering N+1 firms (indexed by n) over a time period (indexed by $t \in [1 \ldots T]$). Assuming that, without loss of generality, the first of these firms has certified for SA8000 for the first time in period τ, the vector of observed firm characteristics (X_n) can be defined, such that X_1 denotes the treated firm's characteristics and $X = (X_2, \ldots, X_{N+1})$ the characteristics for firms in the donor pool in the pre-treatment period. The synthetic control method then consists of first estimating weights that produce a convex combination of firm characteristics among the donor pool so as to as closely as possible approximate the behavior of the variable vector (X_1) of the treated firm in the pre-treatment period (i.e. up to τ). This is done by choosing a vector of firm specific weights $W=(w_2, \ldots w_{N+1})$, with $\sum n=2N+1 wn=1$ and

$$0 \leq wn < 1$$

, to solve the minimization

$$W* = \text{argmin} W(X1 - XW)'V(X1 - XW)$$

(1) subject to

$$\sum N+12wn=1$$

with V a kXk positive definite diagonal matrix (and k the number of firm characteristics included in X) which determines the weight for the contribution of each characteristic in the objective function and is chosen so as to minimize the standard error of the estimate. In a second step the weights calculated from this optimization are used to calculate hypothetical post treatment variables for the "synthetic control". These are thus compared to the development of the variables of interest in the post treatment period in SA8000 adopting firms.

One issue related to this method is that it does not directly allow for hypotheses tests as is it is not clear what the standard deviation of the estimated effect is. Abadie *et al.* (2010) suggest applying procedures of classical permutation tests for inference in the synthetic control group analysis. These consist of applying the synthetic control method to a number of untreated observations in the sample and to simulate the distribution of deviations between the treated and synthetic control group. Through this the size of the difference between the synthetic control and the treated firm relative to the effects estimated for randomly chosen placebo firms can be assessed by standard difference-in-difference methods. To implement this approach, we conducted a synthetic control group analysis as above for a set of 250 randomly selected placebo firms from the donor pool and imposed a fictitious adoption in the same year as the treated firm.

A further issue with the synthetic control group method is that it is not entirely clear how to deal with multiple treated units. Abadie *et al.* (2010) suggest that in such a case, the treated units should be collapsed into a single unit by taking averages across the individual observations (see Kreif *et al.* 2016 for an application). We follow this suggestion by taking averages for all firms treated in 2009 and 2010 respectively and performing the synthetic control group analysis for these two aggregated firms. An advantage of this approach is that it reduces issues related to measurement error. A disadvantage is that it also masks heterogeneity in treatment effect across firms. As a consequence we also conduct a firm by firm level analysis.

A third issue with the method is whether the estimated effects are causal. Abadie et al. (2010) show that this is the case if the outcome indicators of the treated unit and the synthetic control follow a slightly weaker version of the parallel trend assumption in standard difference-in-difference estimates (i.e. if the synthetic control would have developed similar as the treated firm in the absence of treatment). Although this hypothesis is cannot be formally tested, it is usually suggested that it is more credible if the synthetic control and the treated unit behave similarly prior to treatment (see e.g. Fremeth et al., 2016, and Lechner 2010). Thus in the subsequent analysis we will take care to compare the pre-treatment development of the treated firm and its synthetic control.

Data

We use data on Italy, as this country provides the largest number of SA8000 certified firms in the EU (see Sartor, 2016) and merge data from two sources. The first is a list of manufacturing firms that received CSR certification in the years from 2009 to 2010. This was acquired from the SA8000 accreditation homepage (see http://www.saasaccreditation.org) and provides the name of all establishments that received SA8000 certification and the year in which this certification was first granted. It also provides information on the address of the establishment and its industry affiliation.

The second is the Amadeus data base of Bureau van Dijk. This was used to extract bookkeeping data on firm profitability, sales and total wage costs as well as total assets for all Italian single establishment manufacturing firms for the years 2007 to 2012.[5] Using an exact matching algorithm on names and address to merge these data sets we were able to identify 10 single establishment firms that received an SA8000 certification in the years 2009 or 2010, retained the standard until 2012[6] and have a full panel of observations from 2007 to 2012 for all indicators. These firms were defined as the treated firms, while single establishment firms that never received SA8000 certification and had a full panel of observations for 2007 to 2012 were used as the donor pool.

This data was also used to calculate values of firm level return on assets (ROA), turnover to assets ratios and total wage costs relative to total assets[7] which are the variables in the current analysis. Returns on assets are used as a measure for the firm's overall financial performance, while turnover to assets ratio and wage costs relative to assets account for the importance of the sales and labor channel, respectively.

The left-hand side panel of Table 1 provides descriptive statistics for these indicators for the 10 firms adopting SA8000 for the first time in the years 2009 or 2010 by reporting the average ROA, turnover to assets ratio and wage costs as a percentage of assets in the period before and after SA8000 adoption. Of the 10 establishments two operate in manufacturing of leather and related products (i.e. NACE 2 digit industry 15)[8], other non-metallic mineral products (NACE 2 digit industry 28) and in manufacturing of fabricated metal products (excluding machinery and equipment - 25) and one each in the manufacture of beverages (11), chemicals and chemical products (20), basic metals (24) and other non-metallic mineral products (23). Six received SA8000 certification in 2009 and four in 2010. Only one firm is a public limited liability company all others are private limited liability companies.

The descriptive statistics for the indicators in the pre- and post-treatment period for firms that are potential members of the donor group by NACE-2digit industry groups shows that in general, the industry level trends between the pre- and post-treatment period of these indicators accord with the firm level trends over that time period. In the majority of cases analyzed ROA, turnover to assets ratio's as well as wage costs relative to assets were lower in the post-treatment period than in the pre-treatment period both among the firms applying SA8000 as well as in the average firm of the respective industry group these firms belonged to. Standard difference-in-difference tests for differences among the treated firms relative to the developments in the respective industry group, however, are mostly statistically insignificant[9] and a comparison of the pre-treatment mean of the indicators suggests substantial differences between the firms applying the SA8000 standard relative to their respective industry averages. In particular 9 of the 10 SA8000 applicant firms have higher turnover ratios than their respective averages, while 6 respectively 5 have higher ROA and wages to assets ratios. This suggests that a comparison with industry averages may be invalid as SA8000 applying firms and their respective industry averages already differed prior to SA8000 adoption and thus provides justification for the synthetic control group approach.

Results

Results for aggregates

The key results of the synthetic control group analysis for the pre- an post-treatment period compare the evolution of the respective outcome indicators (ROA, turnover to assets ratio and the wage costs as a share of assets) of the average firm applying the SA8000 standard in 2009 and 2010 to the respective synthetic control in the period from 2007 to 2012. In all of these results the lines for the treated firms and their respective synthetic control are very close to each other in the period before SA8000 adoption for all outcome variables. This provides (ex-post) validation of the method used, as it indicates that the treated and the synthetic control group follow very similar trends before treatment.

In the post-treatment period, however, the developments of the treated firms and the synthetic control start to diverge. The evidence on ROA suggests a positive impact of SA8000 adoption on firm profitability for firms that adopted this standard in 2009, as their average ROA is by around six percentage points higher at the end of the observation period than among the synthetic control group. For firms that adopted the SA8000 standard in 2010, by contrast, results indicate a decline in profitability after the introduction of the standard relative to the synthetic control, as the ROA of firms adopting SA8000 certification in 2010 is by around three percentage points lower throughout the post- treatment observation period than that of their synthetic control group.

Evidence with respect to the turnover to assets ratio is more compelling. Both firms adopting SA8000 in 2009 and 2010 experienced a noticeable increase in their turnover to assets ratio relative to their synthetic control after SA8000 adoption. This difference amounts to over 20 percentage points (i.e. around one third of a standard deviation of this indicator among non-adopting firms) throughout the post-treatment period for firms adopting SA8000 in 2009 and to five to ten percentage points for firms adopting SA8000 in 2010. Finally, the results with respect to the total wage costs of the firm suggest a sizable negative impact of SA8000 adoption on total wage costs for firms adopting the SA8000 standard in 2009 but a sizeable positive one for firms adopting SA8000 in 2010.

These results, must, however, be interpreted in the context of the variability of the variable of interest among untreated firms. To allow for such an interpretation, we observed the estimated gaps for the first 50 of a total of 250 placebo treatments estimated for firms not adopting SA8000 and compares them to the estimated gap for the average firms treated in 2009 and 2010. Again in this figure in the pre-treatment period most series are located very close to zero. This indicates a good fit of the placebo treatments. Furthermore, in the post-treatment period the placebo effects – although varying more than in the pre-treatment period - are well centered on zero. This provides further ex-post validation to the method used, as in average no effects are found in the post-treatment period for firms where no treatment occurred.

Furthermore, we were interested in the empirical distribution of the placebo treatment effects for all 250 placebo treatments. These are defined as the differences-in-differences between the treated firms and the control group over the pre- and post-treatment period in the outcome variable generated. The results show the estimated effect for the average of the firms adopting SA8000 in 2009 and 2010, which is for the respective group of firms positive and large relative to the placebo treatments, while it also indicates a large negative effect of SA8000 adoption. We tried to compare the estimated pre- to post treatment differences in pre-tax profits, sales and wage costs to the average pre- to post-treatment differences in the placebo treatments in a difference-in-difference estimate of treatment effects. This can be interpreted as a test of the null hypothesis that SA8000 had no effect on firm level returns on assets, turnover to sales ratios and wage costs relative to assets. A number smaller than 0.1 suggests a statistically significant positive impact of SA8000 certification on the respective indicator at the 10% significance level, while a value larger than 0.9 indicates statistically significant negative impact of SA8000 certification on the respective indicator at the 10% level.

Taken together the evidence presented, it indicates that in the average firm adopting the SA8000 standard in 2009 ROA increased by 2.8 percentage points, while the turnover to assets ratio increased by 21.7 percentage points and total wage costs as a share of assets reduced by 4.7 percentage points. By contrast, in the average firm adopting the SA8000 standard in 2010 returns on assets reduced by 1.3 percentage points while the turnover to assets ratio and wage costs as a share of assets increased by 8.4 and 1.4 percentage points. Comparing these figures to the effects found for placebo treatments suggests an average treatment effect on the treated (ATT) for firms adopting in SA8000 in 2009 of 3.2 percentage points for ROA, 24.4 percentage points for the turnover to assets ratio and 5.1 percentage point for wage costs as a percentage of assets, with all these effects except for the one on turnover to assets ratios statistically insignificant at conventional significance levels. For the firms adopting SA8000 in 2010, by contrast, the estimated ATT is -0.9 percentage points for ROA, 10.1 percentage points for the turnover to assets ratio and 1.0 percentage points for wage costs as a percentage of assets, with all effects statistically insignificant at conventional levels of significance.

Heterogeneity in treatment effects and results for individual firms

The results of a similar analysis for each firm in the sample are almost always statistically insignificant at conventional significance levels for the development of ROA and wages as a share of assets, and often also disagree in sign for these outcome indicators. Thus ROA increased statistically significantly (by 17.8 percentage points) only in firm number 3, while wages as a share of assets decreased statistically significantly in firm number 2 but increased statistically significantly in firm number 7. This also suggests an insignificant or at least highly heterogeneous impact of SA8000 on wage costs.

The only outcome indicator where results are statistically significant more often is the turnover to assets ratio. This increased statistically significantly in 3 of the 10 firms considered. In addition for these firms this increase is also of economic significance as it amounts to 19.0 to 30.3 percentage points (i.e. around one third of a standard deviation of this measure in the industries to which the firms were affiliated).

Furthermore, correlating the average treatment effects on a firm level with indicators of firm size such as the number of employees and total assets before SA8000 adoption, suggests that larger firms are more likely to profit from SA8000 adoption than small ones in terms of turnover ratios. The correlation coefficient of the treatment effect for the turnover ratio with the number of employees at a treated firm is 0.46 and with total assets 0.60. By contrast for ROA and wages as a share of total assets the correlation of the firm level treatment effects with firm size are much smaller. They amount to 0.13 respectively -0.14 with the number of employees, and to 0.09 respectively 0.29 with total assets.

Regression Results

Finally, we follow Peri and Yasenov (2010), who use a difference-in-difference analyses to assess the significance of the estimated effects from the synthetic control group method. This approach consists of a regression analysis in which the pre- to post-treatment difference in the outcome variable under consideration between treated firms and their synthetic control group as well as the same difference for the 250 placebo treatments are entered as observations. Thus dividing the output from the synthetic control group method into a subset of observations (R) that refer to the differences of the treated firms to their synthetic control group and another subset of observations that refer to the same differences for the placebo treatments, the impact of SA8000 adoption can be assessed by the significance of the parameter

d

in a regression of the form:

$$yit=biDi+\lambda Dt+dDt\geq tDi\in R+xjit$$

(2)

where [Equation] is a disturbance term and [Equation] is the respective outcome variable of the firm adopting the SA8000 standard or of its respective synthetic control group and [Equation] is a dummy variable for each firm and [Equation] for each year, while [Equation] and [Equation] are indicators for the post treatment period and the set of SA8000 adopting firms.

Table 1: Difference-in-difference Regression Results

	ROA	Turnover to assets	Wagest to assets	ROA	Wagest to assets	Turnover to assets
	DiD Synthetic versus treated			DiD treated with placebos		
	Average of firms					
Treatment dummy	2.0	17.8*	-1.4	-2.0	21.4*	-2.0
	(1.6)	(8.1)	(1.9)	(3.4)	(12.5)	(3.4)
Observations	24	24	24	2480	2480	2480
R squared	0.42	0.4	0.13	0.01	0.02	0.01
	Firm level analysis					
Treatment dummy	3.6	5.4	4.5	3.3	9.5*	5.2
	(2.7)	(3.0)	(3.7)	(3.2)	(4.7)	(4.2)
Observations	120	120	120	1536	1536	1536
R squared	0.09	0.12	0.02	0.03	0.11	0.02

*Notes: Table report result of the estimated treatment effect in a regression as in equation (2). Values in parentheses are standard errors of the estimate, ***, (**), (*) signify significance of the coefficient at the 1%, (5%), (10%) level. ROA= Return on assets. Treatment dummy is interaction of post treatment period with indicator for treated firms (i.e. Dt≥tDi∈R in Equation 2)*

The results of this analysis is reported in Table 4. In this table the right-hand side presents results for the regression in which differences between the treated firm and the synthetic control as well as placebos are analyzed while the left-hand side focuses on the comparison of treated firms to their respective synthetic control. In addition, the top panel reports the regression results for the analysis on the level of averages across firms, while the bottom panel presents the same analysis for the analysis at the firm level. Once more these results do not suggest a significant impact of SA8000 certification on either firm level profitability or wages, as the coefficient on the interaction term on the treated firms and the post treatment period are insignificant in all specifications. Also the sign of these coefficients differs between specifications. By contrast, SA8000 certification has a weakly significantly positive impact on sales as a share of assets in three of the four specifications and the coefficient on the treated firms and post treatment period interaction is positive in the fourth of these specifications.

Conclusion

In sum, using a synthetic control group analysis to identify the effects of SA8000 certification as one of the internationally most often applied standards for social accountability, we find little evidence of either a positive or negative impact of SA8000 certification on firm profitability and wages. Our results, however, indicate a potential impact of such certifications on sales. This suggests that SA8000 may be a viable marketing tool that increases company sales.

Given that most of our firms do not operate in consumer industries we would argue that firms may use such a certification to strengthen their position in world-wide delivery networks. Our results, however, also indicate substantial heterogeneity in the impact of SA8000 certification on different firms. Exploring these sources of heterogeneity, using larger data sets than those available to us, may therefore be an interesting task for future research.

Abstract

In a complex, turbulent environment, the ability to sense changes and promptly respond to them is an important determinant of the company's success. A desirable feature of every organization is agility, understood as ease and speed with which companies can adapt their processes. Simultaneously, centralized information processing using ERP systems gives a possibility to obtain a set of stimulating signals even to those users who have not noticed any specific dependencies so far. The purpose of the article is to determine whether the implementation of ERP class systems affects business agility. In order to achieve the adopted goal, a discourse has been conducted in order to obtain an answer to the questions: What is agility? What are the attributes of an agile enterprise? How does the application of integrated ERP systems affect the quality characteristics of information? How does the application of integrated ERP systems affect the parameters defining the organization's agility? Is there a relationship between the quality of information acquired from ERP systems and business agility? As the research method, the authors have used literature research and dependency analysis in the form of rank correlation significance and contingency analysis.

Keywords: ERP, Managerial Information, Agility, Statistic Dependences Between Factors.

JEL Classification: M10, M20

Introduction

The contemporary reality is very demanding for enterprises. Technological progress, growing competition, increasing customer requirements, uncertainty in the field of legal regulations - these are just some of causes of this situation. In a complex, turbulent environment, the ability to sense changes and promptly respond to them is an important determinant of the company's success. This means that a desirable feature of every organization is agility, understood as ease and speed with which companies can reconfigure, redesign and adapt their processes in order to respond to the needs, threats and opportunities (Raschke, David 2005) resulting from the turbulent environment. Simultaneously, the popularity of IT management systems is growing, and a fundamental feature of these systems is integration of information. As emphasized by Newell et al. (2003), centralized processing gives a possibility to obtain a set of stimulating signals even to those users who have not noticed any specific dependencies so far.

One of the most important factors increasing the organization's competitiveness is efficient information management, therefore, the decision to implement an integrated ERP system becomes a strategic decision. However, the question appears: can integrated ERP systems contribute to an improvement in the organization's agility. And perhaps, as suggested by White (2004), companies are not fully taking advantage of the analytical potential embedded in integrated systems and other software?

Bearing in mind the above, the purpose of the study was to try to determine whether ERP class system implementation projects affect the quality of management information obtained, and thereby business agility. In order to achieve the adopted goal, a discourse has been conducted in order to obtain answers to the following questions: What is agility? What are the attributes of an agile enterprise? Is there a relationship between the quality of information obtained from ERP systems and business agility? As the research method, the authors have used literature research and dependency analysis in the form of rank correlation significance and contingency analysis.

Literature Review

The "agility" concept, with a special focus on agile manufacturing, was introduced by scientists from the Iacocca Institute in the report *21st century manufacturing enterprises strategy: An industry-led view* (1991) and has attracted unchanged interest as a concept for years, both among academics and in business. When defining business agility, the subject literature specifies many attributes that are assigned to the term, stressing them with varying intensity. And so, business agility is the ability to instantly and effectively react to (unexpected) market changes (Brown and Bessant 2003), in order to meet varying customer requirements in terms of price, specification, quality, quantity and delivery (Prince, Kay 2003). Agility is also reflected in the company's ability to produce and supply new products in a cost-effective manner (Swafford et al., 2006; Tsourveloudi, Valavanis 2002, p. 330). According to Kidd, agility can be reached by integration of the organization, highly qualified and experienced people and advanced technologies (Kidd 1994). On the other hand, Banaszczyk sees business agility in that (Banaszyk 2014, p. 204):

- is close to the market and the end customer,
- is characterized by strategic leadership,
- has a flexible operating potential,
- efficiently cooperates with suppliers,
- utilizes IT management support systems.

The organization's agility capabilities were organized by Sharifi and Zanga (2000). These researchers proposed four, mutually dependent, areas of agile capabilities: ability to react, competence, flexibility and speed. They assigned the respective skills to each area (Tab.1).

Table 1: The capabilities that an agile organisation should have to be able to make appropriate response to changes taking

Capabilities	Specific skills
Responsiveness	– sensing, perceiving and anticipating changes, – immediate reaction to change by effecting them into system, – recovery from change
Competency	– strategic vision, – appropriate technology (hard and soft), or sufficient technological ability, – products/services quality, – cost effectiveness, – high rate of new products introduction, – change management, – knowledgeable, competent, and empowered people, – operations efficiency and effectiveness (leanness), – cooperation (internal and external), – integration.
Flexibility	– product volume flexibility, – product model/configuration flexibility, – organisation and organisational issues flexibility, – people flexibility
Quickness	– quick new products time to market, – products and services delivery quickness and timeliness, – fast operations time

Source: (Sharifi, Zhang, 1999)

Sharifi and Zanga also proposed a model of agility implementation based on: agility driving forces, agile skills (features) and agility providers. The driving forces behind agility are changes in the environment and pressure exerted on the organization, forcing the company to seek new ways to gain competitive advantage. Agile skills allow the organization to react quickly enough to changes (also in search of opportunities to capture). On the other hand, agility providers (practices, methods and tools), supported by proper organization, technology, people and innovation, allow the desired agility skills to be obtained and maintained.

Making the right business decisions depends on access to valid information concerning the business (e.g. balance of assets, costs and revenue, balance of receivables and liabilities, relationships with clients and other). Information, in particular management information, is the entity's resource that ensures that the management function can be realized and the foundations can be determined for making decisions on the organization's different levels. This type of information allows the organization to adapt to the changing environment. Therefore, a demand appears for tools that allow information to be collected, systematized, analyzed. The answer to this demand are ERP-class IT systems.

ERP systems are systems intended to integrate business functions, defined as configurable IT system packages, which integrate information processes and information-based processes within various business areas (Metaxiotis, Zafeiropoulos, Askounis 2005). The profile and the history of integrated ERP-class IT systems have been described in great detail in the literature (for instance: Lech 2003; Hadaś, Cyplik (ed.) 2012). The latest versions of ERP systems (referred to as ERP II) have enriched functionalities, e.g. sharing of system databases by means of a web browser (to employees, customers, suppliers). They are also linked to team work support systems and labor flow support systems. Also, they have connections to data warehouse-based analytical systems. All these functionalities ensure support for the company in many areas, e.g.: actions intended to adapt to changing market requirements, efficient realization of processes related to cooperation with suppliers and customers, instant analysis of collected data, effective performance of internal processes and other.

According to Oosterhout, Waarts and Hillegersberg (2006, p. 120) such systems as resource management (ERP), customer relationship management (CRM) or supply chain management (SCM) help companies to build agility. This agility takes the form of "sensing agility" and "responding agility". These authors created a model under which every organization can be classified on the basis of these dimensions. The abilities to detect and respond can therefore be recognized as types of dynamic capabilities (Sambamurthy et al. 2003). It is important that there is coherence between the potentials to detect and to respond, in order to effectively capture business opportunities. If organizations are not able to work out the effective sensing capability, the opportunities will be lost, the responses will be ineffective, and the resources will be wasted. Referring to examples of well-known companies, the effect of modern IT solutions on the formation of "agile capabilities" was emphasized by improving detectability and speed of response (Overby et al. 2006).

Before choosing the IT system, the areas in which it will bring the greatest benefits for the entity should be identified. In the first place, it has to be examined which information should be collected and processed, in order to ensure that the executed process proceeds in an optimal manner (Stronczek, Krajewska, 2015). J. Unold (2005, p.19) defines an information need as "*forwarding to the organization's IT system a request for such information as is necessary to solve management problem k using algorithm i*". It results from the above that the basic structural components of an information need are (Unold, 2005, p. 19-20): the entity reporting the need, a management problem, a set of possible algorithms to solve the given problem, the required deadline for satisfying the need, the frequency of the need, postulated characteristics of the information sought.

Many years ago H. Miller (1996) claimed that managers have to understand the dimensions and the dynamic nature of information quality, in order to effectively use it as an element of manufacturing processes and as a planning and management control tool. He assigned a set of features to management information, namely:

- relevance - information increases the effectiveness of any decisions made
- accuracy – information reflects the reality,
- timeliness – up-to-date information is supplied in real time (the timeliness problem consists in new information still being generated, resulting in the presence of a "replacement" cycle, dependent on how quickly new information may be processed and transferred to the recipient). This characteristic is sometimes also identified as the speed of obtaining information,
- completeness – understood as full, complex – complete information includes all aspects of a phenomenon,
- coherence – means that information is internally coherent.
- format – it is presented in a proper way, dependent on the recipient,
- accessibility – specifies that the resource can be used on request, in the assumed time, by authorized persons,
- compatibility – consists in the possibility to refer the given information to other data, previously delivered to the user.
- security - the attribute which can be examined in two aspects: information protection from unauthorized recipients and information protection from natural calamities,
- validity – credible information can be verified as true and meeting respective standards concerning other dimensions such as: accuracy, relevance, completeness and safety.

Research Question

A positive impact of the implementation of the integrated IT system on the organization's agility is demonstrated by Gattiker et al. (2005), referring to the fact that ERPs have embedded mechanisms for flexibility, integration of processes,

integration of data and accessibility of "additional" applications to serve agility. Interesting conclusions were also drawn from the research by Mondragon, Lyons and Kehoe (2004). The companies they examined demonstrated a substantial support from the IT system in some organizational processes (e.g. in the production process). However, they stated that, although information systems are frequently used to support efficiency, information systems themselves are not sufficient to obtain business process agility. None of the companies they studied identified IT systems as a critical factor required to improve business process agility. Their study found out that information systems are not a prerequisite for efficiency, although use of an information system, allowing information about demand needs to be obtained quickly may improve the ability to respond in the area of the production process.

In our earlier research we found that:

1. the implementation of ERP has a positive influence on quality characteristics of information (Stronczek et. al, 2017),
2. the implementation of ERP has a positive influence on the organization's agility (Stronczek, 2018).

Therefore, następujące informacje o hypothesis can be asserted:
H: An improvement in the quality parameters of the characteristics of information obtained as a result of the implementation of ERP has a positive influence on the organization's agility.

The conceptualization of the conducted research has been presented in a visual way in Figure 1.

Figure 1. Research model

At the beginning, a general model was shown of the dependencies between the quality properties of information created with the help of ERP systems, and agile skills supported by the implementation of these systems. On the basis of the collected data, the initial dependencies were determined as Spearman's rank correlation coefficient (Bruce &Bruce 2016; Dalgaard 2008). Owing to a small data quantity, the authors used the correlation coefficient significance test.

The next stage was the application of the chi-square independence test (Bruce &Bruce 2016; Dalgaard 2008) in comparison with the pairs of all the mentioned quality characteristics of information created with the help of ERP systems, with particular agile skills supported by the implementation of these systems.

Then, with the use of proper coding data, the contingency table was put together, specifying, on the one hand, high and low assessments concerning the quality of information obtained from ERP systems, and, on the other hand, the indicated high and low assessments of agile skills supported by the implemented systems. The presented general model of associated positive and negative dependencies was then discussed in detail according to the strength and direction of the effect of ones on the others.

All data preprocessing and analyses were conducted using R 4.0.2 (R Core Team, 2020) and RStudio (Version 1.3.1093). For preprocessing data, we mainly used the R package dplyr (Wickham et al., 2019). The correlation analysis was performed by the R package Hmisc (Harrell et.al., 2020). For data visualization, we applied ggplot2 (Wickham, 2016) and corrplot (Wei & Simko, 2017).

Research Design and Methodology

The source of empirical materials for this article was a questionnaire survey, conducted in 2017 using the intentional selection method (snowball method). This method is a typical example of nonrandomized sampling, consisting in a completely subjective choice of the examined entities (Noy, 2008). The sample number was 30 surveys. The research was conducted among SME companies from southern Poland (Silesian voivodeship) as a pilot study of a study plan being prepared concerning, among others, the discussed problem area. Entities having an ERP system, intending to purchase such a system, or having other developed IT solutions, were selected for the survey.

The methodology employed in this research was quantitative approach which falls within the positivism paradigm.

The data collected through the questionnaire were subject to quantitative analysis using software. This approach helped to bring coherence to the research while leading to an enriched understanding of perceptions and events.

The respondents were asked to evaluate the effect of IT system implementation on agility. In the questions, reference was made to the agility attributes specified by Sharifi and Zanga. The assessment was made in the scale 1 to 5, where 5 means that the given characteristic is significantly connected with ERP system implementation. A summary of the received results is collected in Table 2.

Table 2: Agility capabilities that, according to the respondents, are supported by ERP implementation

	5	4	3	2	1
Benefits related to responsiveness					
immediate reaction to change by effecting them into system (R1)	60,00%	26,67%	13,33%	0,00%	0,00%
sensing, perceiving and anticipating changes, (R2)	46,67%	26,67%	13,33%	13,33%	0,00%
Benefits in the area of competency					
strategic vision (C1)	13,33%	26,67%	56,67%	0,00%	3,33%
cost effectiveness (C2)	43,33%	26,67%	16,67%	13,33%	0,00%
operations efficiency and effectiveness (C3)	50,00%	30,00%	20,00%	0,00%	0,00%
change management (C4)	40,00%	30,00%	20,00%	10,00%	0,00%
cooperation (internal and external) (C5)	46,67%	26,67%	26,67%	0,00%	0,00%
Benefits in the area of flexibility					
product model/configuration flexibility (F1)	30,00%	26,67%	26,67%	13,33%	3,33%
people flexibility (F2)	6,67%	20,00%	23,33%	23,33%	26,67%
Benefits in the area of quick					
quick new products time to market (Q1)	26,67%	56,67%	13,33%	3,33%	0,00%
products and services delivery quickness and timeliness (Q2)	23,33%	23,33%	26,67%	6,67%	20,00%
fast operations time (Q3)	23,33%	23,33%	26,67%	6,67%	20,00%

Source: Own study

The surveyed respondents gave a high assessment to the impact of the implementation on the skills that are typical of agile organizations. In particular, benefits were observed in creating and supporting skills in the area of responsiveness and competency.

The respondents were also asked to assess the quality of information generated by ERP systems, referring to the characteristics specified by Miller. The assessment was made in the scale 1 to 5, where 5 meant that the given characteristic is significantly assigned to the information generated by the system. The absence of this characteristic is 1. The obtained results are presented on Fig. 2.

The surveyed respondents gave a high assessment to the quality of information generated by the implemented systems, particularly its validity, accessibility and accuracy. The other characteristics were evaluated equally well. Taking account of the fact that "changes of information needs in the field of management" was one of the most important reasons for the implementation, such indications prove that this expectation has been met.

Figure 2: Quality characteristics of information (according to Miller) generated, according to the respondents, by ERP systems

Source: Own study

The general model of the dependencies between the quality properties of information generated with the help of ERP systems and agile skills supported by the implementation of these systems, received on the basis of the collected data, has been presented as rank correlation in Table 3 and in Figure 3.

Table 3: List of Spearman's rank correlations between information characteristics and selected agility capabilities; significant correlations have been distinguished in bold font

Source: Own study

In Table 3 rank correlations are presented (with verification of the correlation coefficient significance test), significant ones have been distinguished in bold. In Figure 2 the same correlations have been marked with larger and darker circles expressing the strongest dependencies between the studied assessments. In particular, both in the matrix and on the drawing, the assessment of data accuracy is characterized by high values of rank correlation coefficients with agility skills such as: cost effectiveness, rational management of company's resources, improved cooperation inside and outside the company, faster pace of introducing new products, speed of product and service delivery, speed and punctuality of deliveries. Timeliness of information is correlated with improvement in cooperation inside and outside the company, but also with product model/configuration flexibility, flexibility of employees, faster pace of introducing new products and services as well as speed and punctuality of deliveries. Completeness of information contributes to a faster response to market changes and to sensing, perceiving and anticipating changes on the market. On the other hand, the accuracy of received information contributes to a significant extent to faster response to market changes, improvement in overall business efficiency, rational management of company's resources, speed of product

and service delivery, speed and punctuality of deliveries. Validity of information is related to rational management of company's resources.

Figure 3: Spearman's rank correlations. The greater and darker the circle, the more important the dependence between the characteristics

Source: Own study

Owing to a small data quantity (the data set was represented by 30 entities) the authors used the correlation coefficient significance test, the results of which are shown as a diagram in Figure 4.

Figure 4: p-values for Spearman's correlation coefficient from Table 2. Significant are values $p < 0.05$

Source: Own study

The next stage was the application of the chi-square independence test in comparison with the pairs of all the above-mentioned quality characteristics of information created with the help of ERP systems, with particular agile skills supported by the implementation of these systems. The collected results of the calculated significance level (p-value) have been compiled in Table 3. Significant p-value levels ($p < 0.1$) have been distinguished in bold font. The significance level limit α=0.1 has been adopted.

Table 4: The calculated significance levels for the chi-square independence test; significant p-value amounts have been distinguished in bold font

Source: Own study

Repeated presence of some dependences from the rank correlation can be observed here. Namely, accuracy of information substantially affects rational management of company's resources as well as speed of product and service delivery and speed and punctuality of deliveries. Timeliness is significantly connected with faster response to market changes, production flexibility/configuration flexibility, speed of product and service delivery and speed and punctuality of deliveries. Completeness of information has strong linkages to faster response to market changes and sensing, perceiving and anticipating changes. Format affects cost efficiency, improved cooperation inside and outside the company, speed of product and service delivery, speed and punctuality of deliveries. Accessibility of information is a factor contributing to faster response to market changes, improvement in overall business efficiency and rational management of company's resources. Compatibility of information is related to sensing, perceiving and anticipating changes, improvement in overall business efficiency and improvement in cooperation inside and outside the company. Security contributes to product/configuration flexibility and faster pace of introducing new products.

The data set received from the completed questionnaire survey was encoded so as to allow for a distinction into assessments lower than the value 3 (namely values 1 and 2 marked as weak /w/) received in the results of the completed study as low assessments and assessments with values 3, 4, and 5 as high assessments (strong) encoded as a positive effect (strong marked as /s/).

Then, with the use of this data coding, the contingency table was put together, specifying, on the one hand, high and low (strong/weak) assessments concerning the quality of information obtained from ERP systems, and, on the other hand, the indicated high and low (strong/weak) assessments of agility skills supported by the implemented systems. The prepared contingency table, verified the using chi-square test, allows to fix the so-called Pearson residuals (r) for each cell (or standardized residuals). These residuals have been presented in Fig. 5.

Figure 5: Pearson residuals received from chi-square test. Positive residuals are in blue opposite negative ones are in red. Positive values in cells specify an attraction (positive association) between the corresponding row and column variables. Negative values in cells describe negative association.

Source: Own study

An important initial piece of information resulting from Figure 5 is the observation that in most cases there are positive relationships between weak assessments in both areas (most blue circles are in the top left part of the diagram). In the bottom right part, namely for associations between strong assessments, there are definitely fewer such dependencies. The bottom left and top right part are dominated by negative associations, which is natural. Strong assessments of the quality characteristics of information created with the help of ERP systems will naturally be negatively connected with weak assessments of the agility skills supported by the implementation of these systems. Likewise, the top right part of the screen is dominated by red circles and there are a little bit more of them than in the bottom left part. This means that weak assessments of the quality characteristics of information from ERP systems have a stronger impact on positive assessments of agility skills.

Figure 5 allows distinguishing of four very strong consistent associations, and two relatively strong negative associations in the left part of the diagram. The strongest positive dependence (the largest and the darkest blue circle) is between data timeliness with low assessments and the agile ability, also having low assessments, to improve cooperation inside and outside the company. The second significant positive dependence is related to a low assessment of completeness of data obtained from ERP systems and a weak assessment of faster response to market changes, which seems to be a natural consequence. The third and the fourth dependence are, respectively, a weak assessment of compatibility and a low assessment of improvement in overall business efficiency and low relevance with a low assessment of product or configuration flexibility. On the other hand, the following are indicated among negative associations: a negative effect of low assessments of data validity on weak assessments of improvements in overall business efficiency and a weak assessment of data format, which has a negative effect on production flexibility/configuration flexibility. Among the dependencies between good assessments (the bottom right part of the diagram) three positive and one negative association can be mentioned. In particular, positive associations are the effect of data validity on flexibility of employees, speed of product and service delivery and speed and punctuality of deliveries. The distinguished negative dependence is between data format and production flexibility/configuration flexibility.

The high assessments of the quality characteristics of information created with the help of ERP systems are naturally a factor that negatively affects low assessments of agility skills supported by the implementation of these systems. Such an example are four strongly negative associations: data validity and improved cooperation inside and outside the company; data completeness and faster response to market changes; data format and improved cooperation inside and outside the company as well as data compatibility and improvement in overall business efficiency. One strongly positive association stands out among these associations, namely data format and product flexibility/configuration flexibility. On the other hand, the low assessments of the quality characteristics of information created with the help

of ERP systems are naturally a factor that negatively affects high assessments of agility skills supported by the implementation of these systems. Here, an important factor contributing to the negative effect on high assessments of agility skills is low data validity level. It negatively affects, among others, product flexibility/configuration flexibility, flexibility of employees, speed of product and service delivery and speed and punctuality of deliveries. The only positive association is high assessment of data format with a low assessment of product flexibility/configuration flexibility.

The presented general model of associated positive and negative dependencies was analyzed in detail according to the strength of effect of ones on the others (see Fig. 6).

Figure 6: The contribution (in %) of a given cell to the total Chi-square score;

Source: Own study

The contribution (as %) of a given cell to the total Chi-square score was calculated and presented in Fig. 6. As it can be noticed, the strength of the association is greatest in the top left part of the diagram. Here, three significant points stand out: relevance and improved cooperation inside and outside the company (timeliness and cooperation (internal and external)), completeness and faster response to market changes (completeness and immediate reaction to change by effecting them into system) and compatibility and improvement in overall business situation (compatibility and operations efficiency and effectiveness). Also, three largest and darkest points can be noticed in the top right part of the diagram, and in all the basic contributing factor is a weak assessment of data validity. This factor has the strongest associations with flexibility of employees, speed of product and service delivery and speed and punctuality of deliveries. An interesting conclusion is the lack of any clear associations in the bottom part of the diagram i.e. for higher assessments of the quality characteristics of information created with the help of ERP systems.

Conclusion

The common use of enterprise resource planning (ERP) systems fundamentally affects the approach to business information, its collection, storage, dissemination and utilization. This change of the information processing orientation affects many areas of business operations. The possibility to use integrated ERP class systems offers the following benefits: shortens the time of answering requests for quotation and the lead time of the delivery itself, increases the possibility to complete the offer professionally as well as flexibility in formulating the offer, provides direct contacts with people involved in the entire process, facilitates customer identification at the next order and improves the quality of customer service by collecting information about the parameters of their previous deliveries and the course of the cooperation process (Lech 2003, p. 62-63).

After implementation of the ERP-class IT system, the management should have the possibility to immediately react to changes in economic parameters, a result of which will be the streamlined decision-making process. All these benefits are at the same time those parameters that build the organization's agility. However, the relationship between

the organization's agility and the quality properties of information from the implemented ERP system seems to be ambiguous. It seems that the examined companies have not been able to take advantage of the potential of the implemented systems to the fullest. Building agility in business processes and their implementation is not easy and depends not only on the IT infrastructure, but also on many other factors: organizational culture, possibility to manage business processes or specific processes typical of the particular organization (Seethamraju, Sundar 2013, p. 147).

In the opinion of the authors, there is a need for in-depth research in the problem area addressed in the article.

Abstract

In this article groups performance indicators, which in the economy of industrial and commercial companies include profit as an absolute indicator, and profitability as a relative indicator. The presented approach allows management to see the current situation in the management process, which negatively or positively affects the effective financial results of work (profit or uncovered loss). Therefore, the presented theoretical and methodological approach with a practice-oriented approach, including the use of a factor-based estimated method, gives financial analysts a reason to identify factors that negatively affect the profitability of companies and develop a strategy to eliminate them. The purpose of the research is to describe the theoretical, methodological and practice - oriented approaches of the factor method of performance analysis and demonstrate the calculation and analytical approach in the management process by relative and absolute values of profitability and efficiency of activities on the example of a production company.

Keywords: performance indicator, asset profitability, profitability of sale, overall profitability, profitability of current assets, profitability of production assets.

Introduction

At the moment, every day there are more and more companies that present their products and services on the market and strive to get the maximum return in the form of profit with minimal costs and expenses [2,4]. An entrepreneur can achieve this goal only if he/she has well-thought-out planning of his/her organization's activities.

In the economy there are two main indicators that show the efficiency of an organization, which are: profit, as an absolute indicator, and profitability, as a relative indicator.

Profit is the very purpose of the organization's existence, and the profitability indicator helps to understand and analyze the level of effective development of the organization [1,3].

Profitability is an economic indicator that shows whether such resources as raw materials, cash, personnel, and other tangible and intangible assets are effectively used [5,7]. It is possible to calculate the profitability of a single individual asset, and the total production enterprise as a whole.

Gololobova "Theoretical-Methodological and Practice-Oriented Approach to Factor Analysis of The Performance of The Production Company in Management Decisions" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Also, in other words, profitability can be characterized as a value that determines how amount of money is invested in the production, sale of goods, works, and services, and as a result - the amount of profit received.

In summary, profitability is a relative indicator that shows how much profit is returned from each ruble invested in the business, in production.

Material and methods

From the point of view of the authors I. A. Blank, M. A. Chaplygina, A. I. Zolotarev, [1.14.16]. the analysis of profitability coefficients in dynamics for different periods of time, and subsequently their comparison, are necessary for an effective assessment of the profitability of production. The mentioned economists note that an increase in the profitability indicator will show that there is a positive dynamic in the development of the economic entity, and production is profitable. World-class economists U. Brigham and J. C. Van Horne note that the definition of profitability is also necessary in order to determine the level of development of the company in comparison with its competitors. As a result of the analysis presented below, we can conclude whether the company should continue to conduct production in the chosen direction, or whether there is a need to change something in order to increase profitability, or whether it is necessary to re-profile the existing production.

Results and Discussion

The profitability coefficient, as indicated earlier, shows whether resources are being used effectively in the enterprise. It is defined as the ratio of the profit received to the resources invested to get it [6,8].

This indicator is calculated in numerical expression or as a percentage, but it can also be reflected in the amount of resources spent to get a fixed amount of profit.

The profitability threshold is the minimum amount of profit that covers costs. It is also common to use the term «break-even point» as a synonym.

Profitability indicators are calculated:

- when drawing up a business plan,
-when analyzing management,
- when selling an economic entity,
- when planning income and expenses,
- to determine pricing, etc.

The calculation of the coefficient of profitability is the necessary business parameter.

The analysis of profitability coefficients [10,13] is also required if it is planned to issue a loan, or expand production, to notify investors, and so on.

The main indicators of profitability:
1) return on equity (assets);
2) product profitability;
3) indicators that are calculated based on cash flows;
4) overall profitability;
5) return on current assets;
6) profitability of production assets.

The indicator of profitability on capital (assets) is defined as the ratio of profit to various [9,12]. Indicators of advanced funds, where all assets of the organization are considered the most important; investment capital (long-term liabilities + equity) and equity (equity) capital.

$$\frac{\text{net profit}}{\text{all assets}}; \frac{\text{net profit}}{\text{investment capital.}}; \frac{\text{net profit}}{\text{share capital}} \quad (1)$$

The profitability of products is formed in connection with the calculation of levels, as well as profitability in terms of profit, which are reflected in the reporting of organizations.

$$\frac{\text{profit from the sale}}{\text{sales}};\frac{\text{balance sheet profit}}{\text{sales}};\frac{\text{taxable profit}}{\text{sales}};\frac{\text{net profit}}{\text{sales}} \quad (2)$$

To determine the profitability of products, use the indicators of the reporting (K_1) and base (K_0) period, as an example:

$$K_0=\frac{P_0}{N_0}\times 100 \quad (3)$$

$$K_1=\frac{P_1}{N_1}\times 100, \quad \text{or} \quad (4)$$

$$K_0=\frac{N_0-S_0}{N_0}\times 100 \quad (5)$$

$$K_1=\frac{N_1-S_1}{N_1}\times 100; \quad (6)$$

$$\Delta K = K_1 - K_0, \text{ where} \quad (7)$$

K_1, K_0 – are the profitability of products for the reporting and base period;
P_1, P_0 – reflect profit from sales for the same periods;
N_1 , N_0 – sales of products for the reporting and base period;
S1, S_0 - cost of production for the reporting and base periods;

To calculate the change in profitability in the reporting period compared with the base one, it is determined by the formula:

$$\Delta K = K_1 - K_0 \quad (8)$$

The last profitability indicator is calculated similarly to the first two groups presented above, but net cash flow is taken into account instead of profit.

$$\frac{\text{NCF}}{\text{sales}};\frac{\text{NCF}}{\text{total capital}};\frac{\text{NCF}}{\text{own capital}}, \quad (9)$$

where NCF – net cash flow.

These calculations help management get information about the company's ability to meet its obligations.
The profitability is determined in such a way as:

1. Total profitability is the most common indicator used to determine the profitability of an organization's operations. This indicator is defined as the ratio of profit before tax to the revenue received by the organization from the sale of manufactured products.

$$R_{\text{общ}}=\frac{\text{П}_{\text{дн}}}{\text{В}_{\text{реал}}} \quad (10)$$

where $\text{П}_{\text{дн}}$ – profit before tax;
$\text{В}_{\text{реал}}$ - sales revenue.

2. Return on current assets. It is calculated as the ratio of net profit before tax to the current assets of the organization. The higher this indicator, the more efficiently the organization's working capital is used.

$$R_{\text{обА}}=\frac{\text{ЧП}}{\text{ОА}}, \quad (11)$$

where ЧП – net profit received by the organization;
ОА - average annual value of the organization's current assets.

3. Profitability of production assets. It is calculated as the ratio of the balance sheet profit to the average cost of fixed assets, intangible assets and working capital in goods and materials.

$$R_{\text{Пф}}=\frac{\text{П}}{\text{ПФ}}, \quad (12)$$

where П – profit before tax;
ПФ - average annual cost of the organization's production assets.

4. And other types of profitability required and used for calculation by companies.

5. These indicators are an integral part of the financial analysis and assessment of the organization's condition. They reflect the organization's performance, profitability, and cost coverage. The calculation of profitability shows the final results of the organization's activities to the greatest extent than the profit.

The presented methodological part of the profitability indicators is summarized in one table.

Table1: Grouped profitability indicators

Name of the indicator	Mathematical calculation formula	Descriptive characteristics of the indicator
Profitability of sales	$\frac{\text{net profit}}{\text{sales}}$	Shows the amount of profit received by the business entity from each ruble of products sold.
Profitability of assets	$\frac{\text{net profit}}{\text{all assets}}$	Shows the degree of effective use of the property
Total profitability	$R_{общ}=\frac{П_{вал}}{Себест.}$	Characterizes the share of profit in each earned monetary unit
Profitability of current assets	$R_{обА}=\frac{ЧП}{ОА}$	Shows the amount of profit per ruble invested in current assets.
Profitability of production assets	$R_{Пф}=\frac{П}{ПФ}$	Characterizes whether the fixed assets of the business entity are used effectively

Based on this table 1, you can trace the dependence of some indicators on others and understand that their calculation allows you to analyze the enterprise.
Table 2 shows the initial data for calculating the profitability indicators of the production enterprise of JSC « LLL».

Table2: Initial data for calculating the profitability of a manufacturing enterprise

Indicators	At 31 December 2017	At 31 December 2018	At 31 December 2019	Changes (2018 from 2017)	Changes (2019 from 2018)
1. Revenue from sales of products	3 511 044	4 312 001	3 905 576	800 957	-406 425
2. Gross profit	319 997	449 888	432 479	129 891	-17 409
3. Profit before tax	252 141	369 850	375 746	117 709	5 896
4. Profit from sales of products	267 519	413 865	375 215	146 346	-38 650
5. Net profit	202 924	279 050	288 971	76 126	9 921
6. Total cost of sales	(3 191 047)	(3 862 113)	(3 473 097)	(671 066)	389 016
7. Balance sheet currency (value of the company's property)	2 367 924	2 360 458	2 305 265	-7 466	-55 193
8. Own capital	460 332	674 382	693 473	214 050	19 091
9. Long-term loans and borrowings	31 355	27 495	48 330	-3 860	20 835
10. Current liability	-	-	201 143	0	201 143
11. Cost of working capital	380 724	334 483	630 665	-46 241	296 182
12. Cost of fixed assets	165 296	191 129	202 521	25 833	11 392
13. Cost of the active part of fixed assets	162 369	187 885	190 206	25 516	2 321

According to table 2, you can see that the company's activities are profitable, because in each of the years under review, net profit was obtained, which increased every year. Compared to 2017, profit in 2018 increased by 76,126 rubles, and compared to 2018 in 2019, it increased by 9921 rubles.

The analysis of profitability was carried out according to the balance sheet and the report on financial results of JSC «LLL» using the method of calculating profitability using formulas 1-12.

Table3: Analysis of profitability of JSC « LLL»

Indicators	At 31 December 2019	At 31 December 2018	At 31 December 2017	Changes (2019 from 2018)	Changes (2018 from 2017)
1. Total profitability, %	12,45	11,65	10,03	0,8	1,62
2. Profitability, %	10,80	10,71	8,38	0,1	2,3
3. Profitability of implementation, %	9,61	9,59	7,62	0,02	1,97
4. Sales margin, %	7,39	6,47	5,78	0,92	0,69
5. Asset profitability, %	12,53	11,82	8,65	0,71	3,17
6.Profitability on working assets, %	13,1	9,3	12,07	3,8	-2,77
7. Profitability on assets, %	187,9	141,5	153,39	46,4	-11,89

Thus, it is possible to track the company's position, draw conclusions about its condition for the years under review, development prospects and opportunities. According to table 3, it can be concluded that each of the types of profitability calculated above only increased every year, which indicates an improvement in the financial condition and activities of this economic entity.

We will calculate the factor analysis of the overall profitability ($R_{общ}$).

The index model of total profitability is presented in the formula 13:

$$R=\frac{pq-qz}{zq}=\frac{pq}{qz}-1, \quad (13)$$

where pq- gross income,
qz- production cost.

Levels of overall profitability that allow you to identify the impact of each of the factors:

1. $R_0=\frac{p_0q_0}{p_0z_0}$ – calculation of basic profitability; (14)
2. $R_1=\frac{p_1q_1}{p_1z_1}$ – calculation of profitability for the reporting year; (15)
3. $R_1^1=\frac{p_0q_1}{p_1z_1}$ – calculation of actual profitability calculated in base year prices (16)
4. $R_0^1=\frac{p_0q_1}{p_1z_0}$ – calculation of basic profitability in the form of the actual volume of the product range by an economic entity. (17)

Calculation of profitability according to the formulas (14-17) presented above and the available data of the company «LLL» (balance sheet and financial results report), in table 4, we present below:

1. Underlying profitability (2017):

$R_0=\frac{319\,997}{3\,191\,047}=0{,}1003\times100=10{,}03\%$;

2. Profitability for the reporting 2017/2018 years:

$R_1=\frac{449\,888}{3\,862\,113}=0{,}1165\times 100 = 11{,}65\%$; (2018 г.)

$R_2=\frac{432\,479}{3\,473\,097}=0{,}1245\times 100 = 12{,}45\%$; (2019 г.)

When making actual calculations in the prices of base periods, we take into account the index factors of the Federal state statistics service that allow us to recalculate the volume of sales of the previous period in the prices of the reporting period (calculated data with the price index are presented in table 4).

1. The price Index for 2017 = 1.028
2. The price index for 2018 = 1,041

3. Actual profitability, at basic prices:
$R_1^1 = \frac{437\,634}{3\,862\,113} = 0{,}1133 \times 100 = 11{,}33\%$;
$R_2^2 = \frac{415\,445}{3\,473\,097} = 0{,}1196 \times 100 = 11{,}96\%$;

4. Basic profitability in the form of the actual volume of the range of products produced by the business entity:
$R_0^1 = \frac{437\,634}{3\,756\,919} = 0{,}1165 \times 100 = 11{,}65\ \%$
$R_1^2 = \frac{415\,445}{3\,336\,308} = 0{,}1245 \times 100 = 12{,}45\ \%$

A detailed and visual calculation of profitability based on these formulas is presented in table 4.

Table4: Calculation of the basic profitability in the form of the actual volume of the product range of JSC «LLL»

Indicators	2017	Indicator 2018 in 2017 prices	2018	Indicator 2019 in 2018 prices	2019
1. Gross profit, thousand rubles.	319 997	437 634	449 888	415 445	432 479
Gross profit symbols	$p_0 q_0$	$p_0 q_1$	$p_1 q_1$	$p_1 q_2$	$p_2 q_2$
2 Cost price, thousand rubles.	3 191 047	3 756 919	3 862 113	3 336 308	3 473 097
Cost symbols	$p_0 z_0$	$p_1 z_0$	$p_1 z_1$	$p_2 z_1$	$p_2 z_2$
3. Profitability,%	10,03	11,65	11,65	12,45	12,45
Profitability symbols	R_0	R_0^1	R_1	R_1^2	R_2

Finding the quantitative impact of factors on the example of calculations and data of the company «LLL»:

1. In order to determine the impact of price changes on the overall profitability of $R_{\text{общ}}$ the actual profitability in the prices of the base period should be deducted from the profitability indicator for the reporting period.
$\Delta R_{\text{p1}} = R_1 - R_1^1$; (18)
$\Delta R_{\text{p2}} = R_2 - R_2^2$. (19)

Substitute the data found and calculated earlier for the company in question in the formula:

$\Delta R_{\text{p1}} = 11{,}65 - 11{,}33$=0,32 %;(2018 г.)
$\Delta R_{\text{p2}} = 12{,}45 - 11{,}96$=0,49 %. (2019 г.)

2. In order to determine the impact of changes in cost on $R_{\text{общ}}$ the base profitability, which will be calculated on the actual volume and product range, should be deducted from the actual profitability in the prices of the base period:

$\Delta R_{z1} = R_1^1 - R_0^1$; (20)
$\Delta R_{z2} = R_2^2 - R_1^2$. (21)
$\Delta R_{z1} = 11{,}33 - 11{,}65$= -0,32 %; (2018 г.)
$\Delta R_{z2} = 11{,}96 - 12{,}45$= -0,49. (2019 г.)

3. In order to determine the impact of changes in the product range on $R_{\text{общ}}$, you should subtract the base profitability from the actual profitability, which will be calculated on the actual volume and range of products:

$\Delta R_{\text{ассорт1}} = R_0^1 - R_0$; (22)
$\Delta R_{\text{ассорт2}} = R_1^2 - R_1$. (23)
$\Delta R_{\text{ассорт1}} = 11{,}65 - 10{,}03$=1,62 %; (2018г.)
$\Delta R_{\text{ассорт2}} = 12{,}45 - 11{,}65$=0,8 %. (2019 г.).
The results of the factor analysis of the total profitability of the production enterprise are presented in table 5.

Table5: Results of calculating the impact of factors on total profitability for 2017-2019

Factors that caused changes in profit in the current period	The size of the impact of factors on the overall profitability	
	Absolute changes in 2018 to 2017 (+/-), thousand rubles	Absolute changes in 2019 to 2018 (+/-), thousand rubles
1. Price changes, %	0,32	0,49
2. Cost change at the expense of resource prices,%	-0,32	-0,49
3. Changing the range of products,%	1,62	0,8
Total	1,62	0,8

The aggregate result of the company's calculations allows us to note that the factor calculation was performed correctly, since the results converged, and specifically the «total» line in table 5 is equal to the deviation:

$\mathbf{\Delta R_{2018/2017}} = R_1 - R_0 = 11{,}65 - 10{,}028 = 1{,}62\%$
$\mathbf{\Delta R_{2019/2018}} = R_2 - R_1 = 12{,}45 - 11{,}65 = 0{,}8\%$

Thus, on the profitability in the 2017-2019 years have affected price changes in the direction of growth by 0.32% in 2018, and an increase of 0.49% in 2019; a reduction of production costs by 0.32% in 2018 and 0.49% in 2019; and changing the range of products increase by 1.62% in 2018 , 0,8% in 2019.

Conclusions

For more effective work of the considered enterprise of JSC «LLL», we can assume the following ways to improve the work and increase its efficiency: increase and diversity of output, in particular, expanding the range of output.

Ways to improve efficiency:	
1.	Increase in output and volume of products
2.	Improving the diversity of the range
3.	Reducing material intensity
4.	Rational use of the company's resources
5.	Finding new markets
6.	Using scientific and technological advances and improving production

The abundance of profitability measures allows you to choose the most convenient and effective method individually for each enterprise. A significant factor of survival and profitability of the company's activity is the constant expansion of its markets, improving the quality and competitiveness of products and reducing its prices for consumers.

However, it is important to reduce production costs, increase output and other internal factors.

Based on the calculations, we can conclude that:

- when the profitability of the products produced increases, the profitability of the company's assets increases;
- with an increase in the turnover rate of current assets and the return on non-current assets, and with a decrease in total costs, the return on assets indicator increases;
- when the return on sales indicator decreases, it is necessary to accelerate the turnover of assets.

It is also important to note that a separate analysis of any factors is inefficient and not appropriate, due to the fact that the dynamics, level and other indicators of profitability are affected by a combination of factors, such as:
- quality, volume of output and product composition;
- production costs and production costs;
- profit and its direction of use;
- the level of use of production resources of the enterprise;
- and other factors.

The purpose of periodic analysis and management of the company's profitability is to establish ways to develop and

optimize the company's profit. The cycle consists of the following stages:
- forecast of financial indicators;
-analysis of factors that affect the profitability and profit of the enterprise.

The main task of analyzing profitability indicators is to reveal the trends that have formed in the distribution of income and profit for the current period in comparison with the basic dynamics.

According to the results of the analysis, prescriptions and recommendations are developed for generating profit and using it more effectively by the enterprise.

Abstract

In the context of the digital economy, while promoting the development of network insurance, it has brought unprecedented risks to the traditional insurance model. The data involved is usually very private and important identity information. Once leaked and used illegally, it will cause more serious problems. s consequence. This has brought huge challenges to personal information security and supervision. Therefore, with regard to the information security of the Internet insurance market in the context of the digital economy, China can only learn from the successful experience of Western developed countries, combined with the actual situation in China, and on the basis of strengthening security technology research, adhere to the law as the main supervision method and formulate With the improvement of personal information protection laws and the promotion of the establishment of an Internet insurance credit system, the information security issues of China's Internet insurance can be effectively resolved.

Keywords: Digital Economy, Insurance Information Security, Legal Supervision, Risks, Internet Financial Platforms, Internet Insurance Market

Introduction

With the advent of the "digital economy era", China's big data, mobile Internet, Internet of Things, cloud computing, artificial intelligence and other technologies have been rapidly updated, and the Internet insurance industry has developed rapidly. "The Father of Big Data" Victor Meyer Schönberg wrote in "The Age of Big Data": "Today, data has become a valuable company asset, an important economic investment and the cornerstone of new business models."[i] In 2014, the State Council of China issued the "Several Opinions on Accelerating the Development of Modern Insurance Service Industry", clearly supporting financial insurance companies to actively use modern Internet technologies such as cloud computing and big data to innovate sales channels and service models, which will undoubtedly be the Internet. The development of insurance provides a broad space for development. By the end of 2016, more than 200 insurance companies in China had launched Internet insurance business, accounting for 74% of the total number of insurance companies nationwide, five times that of 2011.[ii] On January 29, 2019, the Bank of China Insurance Supervision Committee released the 2018 insurance data statistics

CHARAEVA and LAIBING SUN "Legal Supervision of China's Internet Insurance Information Security under the Background of Digital Economy" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

report. According to statistics, in 2018, the original insurance premium income of the insurance industry was 380.162 billion yuan, a year-on-year increase of 3.92%.[iii]

Although the development of China's Internet insurance is strong, the huge economic value of information data in the digital economy era has led to the illegal acquisition and use of personal information, and the use of Internet technology, the leakage and improper use of personal information in the digital economy era. The hazard is broader and farther than the traditional data age. According to the “China Netizen Rights Protection Survey Report 2016” (hereinafter referred to as “Report”) published by the Internet Association of China, As many as 84% of Internet users in China have personally experienced the adverse effects of personal information leakage, and 21% of them believe that the information leakage is very serious. The "Report" estimates that in 2016, Chinese netizens suffered economic losses of 133 yuan per capita due to spam, fraudulent information, and personal information leakage, and the overall economic loss was approximately 91.5 billion yuan. Internet Society of China: "Investigation Report on the Protection of Chinese Netizens' Rights and Interests 2016."[iv] It can be seen that the issue of personal information security in China has become very serious.

Literature Review

Scholars have discussed the legal supervision of China's Internet insurance information security in the context of the digital economy from different perspectives. Zhu Junsheng and Zhu Shuangshuang, in the article "Innovation and Development of Internet Insurance in China" published in "Financial Research", analyzed the current situation of China's Internet; Zeng Dejun and Liu Zeyi in the article published in "Shanghai Finance".Personal Information Security Issues and Governance in Internet Finance",ZhaoXu's article "On the Protection of Internet Financial Consumer Information Security" in the "Business Economics" article, they conducted an in-depth analysis of personal information security issues under the Internet background; Wang Shu’s doctoral dissertation in Jilin University "Comparative Research on Insurance Regulatory Systems in Major Developed Countries", and Ge Tinglei’s article "Experiences and Enlightenments of Foreign Government Internet Insurance Supervision" in "Liaoning Economics", introduced the insurance regulatory system in western developed countries in more detail. Duan Yan's master's degree thesis in Jiangxi University of Finance and Economics "Research on China's Internet Insurance Laws and Regulations in the Era of Big Data", Shan Lei's article "Public Information Protection Paradox and Legal Challenges in the Big Data Era" published in "Internet Finance Legal Review", Liang Junju's article "Research on China's Internet Insurance Legal Supervision System", from different perspectives of the law, It sorts out and analyzes the legal supervision of Internet insurance information security.

Although the above-mentioned Chinese scholars have conducted research on this topic from various angles, they all have their own shortcomings. These articles and studies either did not put the issue of Internet information security in the context of legal supervision, or although they were under legal supervision Discussed in the background but did not specifically address the field of insurance information security. There are only a handful of articles that can conduct in-depth and detailed analysis on this topic.

Research Methodology

For the information security problem of the Internet insurance market under the background of digital economy, in theory, many concepts need to be clarified, and some theoretical problems need to be systematically combed and analyzed, and theoretically provide guidance. In practical terms, the issue of information security in the Internet insurance market is related to whether the legitimate rights and interests of citizens can be guaranteed, and whether

the national supervision is effective or not is an important issue that needs to be resolved urgently.

The existing regulatory concept of the Chinese government is lagging behind, and the existing legal supervision system cannot cope with the risks of Internet insurance. Therefore, in the digital background, how to maintain institutional and citizen information security and improve existing legal supervision and supporting systems has become a problem that must be seriously studied.

There are two main research methods used in this paper: the first is literature analysis. Through the channels of libraries, the Internet, and electronic databases, we collect theoretical results related to the digital economy and Internet insurance legal supervision system. Through the systematic reading and learning of digital economy and insurance theory and related literature, we can understand the current status of Internet insurance development at home and abroad. It has a general understanding of the Internet insurance supervision system of major countries in the world, and discusses the analysis of the lack of information security legal supervision system in China's Internet insurance market. The second is comparative analysis. It is to read foreign papers and books on the Internet insurance legal system, and to compare the development status of China's Internet insurance legal system.

Information Security Supervision Risks Faced by China's Internet Insurance Market

In the digital economy, the continuous innovation of information technologies such as mobile Internet, big data, cloud computing, Internet of Things, and blockchain has changed the lifestyle of consumers and made consumers have a high dependence on the Internet. The Internet risks faced by consumers when they use the Internet for insurance consumption are also the problems that Internet insurance development will face. Brown J.R. Goolsbee A proposed that Internet insurance is a new marketing model that has emerged with the development of society. The sales model of traditional insurance companies is being changed by the rapidly developing network. There are many risks in this new sales model, which requires the government and industry organizations to pay more attention.[v]

I classify the insurance market information security risks into four categories: insurance market information security technology risk, insurance market information security moral risk, insurance market information security legal relief risk, insurance data monopoly risk.

Insurance market information security technology risk

The technical basis of Internet insurance lies in the improvement of information technology systems. At present, the development of China's Internet finance is still in the early stage of development. The various information technology systems are not yet mature. The basic technologies of Internet financial platforms such as big data, cloud computing and mobile Internet need to be improved. Firewall technology and information isolation technology still need to be improved. The customer information and personal data collected by the Internet insurance platform are still difficult to be effectively protected.

In terms of transaction data security risks, Internet insurance services have higher requirements for network technology, The series of processes such as insurance, underwriting, insurance premiums and insurance payments are dependent on the network. Although it is relatively fast, insurance companies use cloud technology to store data, data management is more dispersed, and it is difficult to control data processing for consumers. The location cannot distinguish the legitimacy of the user. If the computer operating system fails and the database is vulnerable, it is very easy to constitute a security risk of the insurance transaction data.

In terms of customer information security risks, the acquisition of big data is crucial to the development of Internet insurance. The vast amount of customer information exists in the form of electronic data, which makes transmission and use very convenient, greatly increasing the risk of customer information leakage or abuse. Once an insurance company is attacked by a "hacker", customer information is tampered with, stolen, deleted, or even abused, insurance funds are stolen, and the insurance company's product pricing, operation management, and business development will be seriously affected, thereby harming the interests of the insured.

Insurance market information security moral hazard

In addition to the technical risks of information security, the information security of the Internet insurance market, especially the information of insurance consumers, faces great moral hazard.

On the Internet platform, consumers can choose whether to provide personal information, but the insurance industry often needs to provide detailed personal information, such as ID number, home address, bank account number, etc.In order to confirm the identity of the insured, even the insurance company in the process of business development. It collects a lot of customer's private data, such as medical records, living habits, family property status, etc., and if this information is not provided, it is likely to affect underwriting and claims, but it is difficult for consumers to understand the personal information provided. Where does the insurance company use it? In fact, insiders of insurance companies are likely to leak or sell customer information, including publicizing or privately disseminating personal information of policyholders, insureds, and beneficiaries, tampering with others or disclosing information of others without the permission of the parties.

In addition, organizations or individuals that illegally obtain information on the consumer insurance market also have the possibility of illegally using personal information. For example, fraudulent use of other people's information, damage the legitimate rights and interests of insurance consumers, and even use insurance market information to implement fraud. □

Insurance data monopoly risk

The core of insurance lies in the actuarial and determination of risks through big data. Under the Internet insurance model, the traditional law of large numbers will bear the brunt of the impact and change of Internet technology. Under this trend, data competition will become the biggest competition in the insurance industry in the future. An insurance team with more user data and more powerful data processing capabilities will take the lead in the Internet insurance innovation tide and gain the advantage of Internet insurance development.

On the other hand, under the characteristics of the development of technology in the digital economy era, the industry gap will become more and more significant. Insurance companies and Internet platforms with platform and technology advantages will have a stronger monopoly in the Internet insurance model. The survival space of some emerging Internet platforms and small and medium-sized insurance companies is likely to be squeezed by the big platform because of the disadvantages of acquiring and processing data. This trend is not conducive to the long-term development of the Internet insurance industry. Therefore, in the development stage of Internet insurance, while encouraging and actively pursuing innovation through big data technology, we should establish a sound data sharing mechanism to avoid the negative impact of the formation of data monopoly on the development of the Internet insurance industry.[vi]

Insurance market information security legal relief risk

There are not many laws in China to protect the information security of citizens in the insurance market. The supervision of insurance is mainly based on the Insurance Law of the People's Republic of China. The Electronic Signature Law promulgated in 2004 determines the legal effect of electronic signatures. This is an advancement of the law in the Internet and provides legal protection for Internet insurance transactions. On July 18, 2015, the People's Bank of China and other 10 ministries and commissions issued the “Guiding Opinions on Promoting the Healthy Development of Internet Finance”, of which Article 11 provides guidance on information security and financial security in the Internet insurance market. On July 22, 2015, the China Insurance Regulatory Commission issued the Interim Measures for the Supervision of Internet Insurance Business (hereinafter referred to as the “Interim Measures”). Although the “Interim Measures” also stipulates that insurance institutions should keep confidential customer information, without the consent of the customer. Disclosure, causing adverse consequences, ordered rectification, and administrative punishments were severely imposed, but the regulations were still too general and insufficient to create a shock to insurance companies. Moreover, the level of legislation is too low to be effective.

China's current Consumer Protection Law is mainly aimed at consumers in the real economy. Articles 14 and 29 stipulate that personal information is protected according to law and the confidentiality obligations of operators are clearly defined, but consumers of Internet insurance Compared with the consumers of the real economy, it is unique. If the protection of its rights is only protected by the Consumer Protection Law, it cannot effectively solve the real problem. In addition, although the Insurance Law of the People's Republic of China also stipulates the protection of the privacy of policyholders, insured persons and beneficiaries, it is also not detailed enough to meet the special needs of the Internet insurance field.

In China's regulatory positioning, traditional insurance and Internet insurance have not yet been distinguished. The current insurance laws and regulations are based on traditional insurance, which leads to the use of traditional insurance supervision methods and means. Relevant legislative bodies and regulatory agencies have not fully prepared for the speed of Internet insurance development, which has led to the lag of the construction of relevant laws and regulations, and the legal system of insurance supervision is not perfect. Insufficient legal system construction has led to a lack of regulatory system. At present, there is no comprehensive set of regulatory supporting laws and regulations that cover the development of Internet insurance, such as Internet insurance access, business rules, risk prevention, and consumer rights protection.

At the same time, the lack of understanding of Internet technology and information security knowledge by relevant departments has also led to the vacancy of some relevant security technology laws. The current e-commerce regulations are still not perfect. The general Internet supervision laws and regulations cannot meet the regulatory requirements of Internet insurance. The legal effects of the transaction, customer privacy protection and other issues still cannot be relied upon, and these are easy to cause transaction disputes.

This kind of legal supervision will have the following adverse effects: First, with the development of Internet insurance, some regulatory policies can’t adapt to the new model of Internet insurance, which has long been inapplicable and has become a factor restricting the development of Internet insurance, affecting the regulatory effect. Second, the regulatory policy has not kept pace with the times and has been unable to regulate the new situation triggered by the development of Internet insurance, which has led to a vacuum in supervision. However, the risks caused by Internet are not available in traditional insurance. If not regulated and regulated, it will have

serious consequences for the healthy development of Internet insurance.

The Enlightenment of America and Europe's Internet Insurance Market Information Security Supervision System to China

Internet information technology has arisen in the United States and has since spread to the world. First enter the developed countries, such as the United Kingdom, France, Germany, Japan, etc., and then enter the developing countries. Internet insurance has developed earlier in these countries and has developed rapidly. Therefore, it is necessary to absorb and learn from foreign related information security supervision experience in the Internet insurance market, and to develop a legal supervision system that conforms to China's national conditions.

US Internet Insurance Market Information Security Supervision System

In the mid-1990s, the financial environment of the US economic market was quite mature, and the country has been focusing on the development and application of Internet technology, which led the US financial industry to expand to the Internet. Undoubtedly, in such a big environment, the United States has also become the first country in the world to have Internet insurance. After more than two decades of development, almost all insurance companies in the United States have launched Internet insurance services on their official websites. According to statistics, as of 2014, 71% of Internet users in the United States shop online, and 61% of consumers choose to search for insurance products online.[vii]

Internet insurance in the United States started early and developed rapidly, enjoying the technological advantages of platform big data, cloud backup, cloud computing, etc., which is inseparable from its efficient and reasonable regulatory policies.

The US Internet insurance agencies are the state's insurance regulatory agencies, which use a loose and prudent regulatory model. In the US Internet insurance market, it emphasizes the leading role of the market and avoids excessive government intervention in the development of the Internet insurance industry. The maintenance of the Internet insurance market order mainly relies on the self-discipline of the industry. The government provides policy guidance, the company provides funds to support the establishment of non-profit organizations, and formulates and implements industry trading standards and self-discipline clauses, which provide a good foundation for the development of the Internet insurance market. Order specification.

According to Ge Tinglei’s research, The US government has successively issued a series of laws and regulations to promote and regulate the healthy and orderly development of the Internet market, and provide institutional guarantee for information security in the Internet insurance market. For example, the National Information Infrastructure Plan promulgated in 1993. In 1996, the Uniform Commerce Code included Article 2B-Licenses to regulate Internet insurance sales; The 1997 Framework for Global Electronic Commerce stipulates five aspects of regulatory principles and nine areas of international collaboration, which indicates that the US government has formed a systematic policy in the development of e-commerce. In 2000, the Electronic Signatures in Global and National Commerce Act promoted the process of electronic data signing, providing a good legal framework for Internet transactions in terms of reliability and security. This is the basics of Internet insurance in the United States. legal protection. Protect the information security of the Internet insurance market from various aspects.[viii]

In 1998, the National Association of Insurance Supervisors (NAIC) detailed the provisions on the effectiveness of electronic signatures and privacy principles of Internet insurance in "Marketing Insurance over the Internet", and in 2000, "Electronic Insurance Supervision" The Regulatory Issues Associated with the Provisions of Insurance Electronic ally proposes and explains the three major rules of Internet insurance: information preservation, information transfer, jurisdiction and licensing.

Vance Gudmundsen believes that the emergence and development of the Internet has had a profound impact on the insurance industry and overturned the traditional sales model. Under the new situation, the supervision of the insurance industry should also follow the trend, including market access, electronic signatures, and rate determination. The US Federal Trade Commission and the American Association of Insurance Supervisors are obliged to formulate relevant regulatory systems for the current development of Internet insurance.[ix]

The United States insists on cautious and appropriate supervision of the Internet insurance market by means of legal means, administrative means and technical means. On the one hand, it pays attention to Internet technology and information security, and guarantees transaction security in a timely manner; on the other hand, it encourages innovation in the Internet insurance market, timely updates and perfects relevant laws and regulations, and maintains market vitality and healthy development.[x]

EU Internet Insurance Market Information Security Supervision System

The development of Internet insurance in Europe lags far behind the United States. Its main reason is that it is composed of different countries. The establishment of the regulatory system is difficult to keep up with the speed of Internet insurance development. However, the EU has legal supervision and protection of information security in the insurance market. It is far more systematic than the United States. "

European countries have established separate insurance regulatory agencies for independent regulatory principles. The "consistency" regulatory principle is the basis of European Internet insurance regulation, supervising the effective coordination of the regulatory authorities, and paying attention to the efficiency and fairness of supervision. These have clarified the responsibilities and regulatory scope of the regulatory authorities and created a good regulatory environment.

Take the General Data Protection Regulation adopted by the European Union in April 2016 as an example. This regulation applies to all EU countries and unifies the previously loosely distributed personal data protection regulations of the European Union, which came into effect in May 2018. This regulation is more rigorous from all angles and will have the following major impact on European insurance companies:

2.2.1. Authorization, the insurance company can use personal information only after the customer gives clear and clear authorization. More importantly, the customer has the “right to be portable” and “right to be forgotten”, and can take the initiative to request, modify and recover his own authorization, thus requiring the insurance company and the third-party enterprise shared by the insurance company to delete relevant information;

2.2.2. In the process, the insurance company needs to add the authorization and modification process of the customer, the internal use supervision and evaluation of personal information, and the privacy protection of personal information to the current operational process;

2.2.3. IT systems need to further enhance the data center's IT capabilities for personal data management, hacker attacks, data breaches, etc., otherwise it will be subject to a sky-high ticket that can reach up to 5% of the

company's global annual revenue;

2.2.4. In terms of compliance, the insurance company shall report to the personal information regulatory agency regularly the operation of personal information management and leave a draft;

2.2.5. In terms of organizational structure, more than 250 employees must have a DPO (Data Protection Officer), which is solely responsible for the personal information security protection of the company.

The adoption of the General Data Protection Regulations is a challenge for companies planning to innovate insurance business through big data analysis of customer personal information, increasing the cost of insurance companies to obtain authorization, collecting information, using information and managing information, and increasing information. Once the leak is punished. European insurance companies must update their business processes in personal information management and increase IT investment in information security in order to properly use personal information big data to carry out business innovation.[xi]

The Enlightenment of the Information Security Supervision Experience of the Extraterritorial Internet Insurance Market to China.

By understanding the development of Internet insurance in developed countries and the comparison of their regulatory models, it is not difficult to see that although the regulatory models adopted are not the same, they have promoted the development of the local interconnected insurance industry and established developed insurance. The market, the useful experience is worth learning and learning from.

On the whole, from the perspective of the regulatory focus of Internet insurance in various countries, the United States focuses on solvency supervision, and Europe focuses on the prevention of Internet insurance fraud, but they all regard the protection of consumer rights, including information security, as an important factor in Internet insurance supervision. content.

Moreover, the United States and European countries have relatively complete legal supervision systems. A sound legislative system is the premise of Internet insurance supervision. Developed countries have experienced decades of development and practice, and gradually formed a relatively perfect legal system. From the information security protection of Internet insurance, the access and exit mechanism, the conclusion of insurance contracts, and information disclosure, they are highly targeted and Practicality.

Internet insurance market information security legal supervision and improvement of supporting system

The China Insurance Regulatory Commission proposed in the "13th Five-Year Plan for the Development of China's Insurance Industry" issued in 2016 that it is necessary to adhere to the unity of institutional supervision and functional supervision, adhere to the unity of macro-prudential supervision and micro-prudential supervision, and adhere to risk prevention and consumers. Both rights and interests are protected. Improve the three core regulatory systems of corporate governance, solvency and market behavior, and establish a comprehensive risk management system.[xii] It can be seen that China's Internet insurance supervision must improve corporate governance supervision, solvency supervision, and market behavior supervision system under the legal system.

There is not much research on the Internet insurance market in China's insurance academic circles. Especially in the legal supervision system, the accumulated Internet insurance theory is not enough to support the improvement

of relevant Chinese legislation. Therefore, it is necessary to discuss the Internet insurance supervision system from the perspective of legal supervision and supporting systems, and find out the problems existing in the process of supervision of China's Internet insurance. Learn from the experience of Internet insurance supervision in the United States and European countries, and the health of China's Internet insurance. Development proposes feasibility recommendations.

Improve personal information protection legislation

Although on June 1, 2017, the "Network Security Law of the People's Republic of China" (hereinafter referred to as the "Network Security Law") was implemented, which involved the protection of personal information in cyberspace. The "Insurance Law of the People's Republic of China" only provides general provisions for the protection of personal information of policyholders, insured persons and beneficiaries. Its practicality is not strong, and it is difficult to apply to the virtual Internet insurance field. In addition, the general provisions of the Chinese Civil Law and the protection of personal privacy in the criminal law are also regulated accordingly. Saizheng believes that, in general, China's current protection of personal information has not yet formed special legislation. The relevant provisions are mainly scattered in laws, regulations, departmental rules and normative documents in various fields, showing a decentralized regulatory status. And because different norm-setting subjects can only proceed from the value orientation of their respective functions and norms, the current norms on the security protection of personal information lack systematic and coordination, which easily lead to regulatory conflicts and gaps. Legislation to improve personal information is of paramount importance to the protection of personal privacy in the era of big data. At present, personal information is frequently leaked, digital top-level security design is missing, and digital transaction security supervision is absent. In this context, the individual suggested that a system of Personal Information Protection Act be established as soon as possible. [xiii]

In my opinion, in order to regulate the acquisition and use of personal information more comprehensively and effectively, the following issues should be clarified in the process of perfecting the personal information protection legislative system: First, personal information protection legislation should balance the protection of personal privacy and public interest. The starting point is the realization of technological innovation and the promotion of conflicts in the development of the digital economy. In the era of big data in the Internet, there is an eternal contradiction between the protection of personal privacy and public interest and the realization of the commercial value of the Internet. How to balance the conflict is the most critical core of network information security legislation, and it is also the most difficult pain point. Therefore, in the legislative technology, the reserve of flexible space is the key to the effective operation of the personal information security protection system.[xiv]

On the whole, China's current legal norms do not have a clear and specific description of citizens' information security rights and remedies. The only provisions are only general and not practical. The Internet has developed so rapidly that if the relevant laws are not formulated in time, more Internet insurance disputes will arise, which is not conducive to the stable development of the economy.

Therefore, in the construction of the legislative system for personal information protection, the improvement of relevant mechanisms and technologies, such as the establishment of sharing mechanisms, the supervision of databases, and the use of blockchain technology, can achieve the full process of personal information utilization. Supervision. In the supervision, it is necessary to improve the information disclosure and punishment mechanism, and strictly manage and punish the behavior of the Internet insurance policyholders.

Strengthening security technology research to establish a private network

Internet insurance uses information technology to carry out business development. At the same time, the technology of relevant regulatory departments should be improved accordingly, so as to better regulate Internet insurance transaction activities and find problems in time.

It is necessary to handle the relationship between data disclosure and personal information security. On the basis of not infringing on the security of personal information, publicly disclose data that is beneficial to social development, and at the same time effectively use the public data of other industries to broaden the thinking for the development of Internet insurance. Strengthen technical research and establish a private network for Internet insurance as soon as possible to ensure the security of information technology in the Internet insurance market. When the financial system is in a period of change and transition, the integration of new technologies such as blockchain, cloud computing, artificial intelligence and the Internet of Things will guarantee the process of sustainable development.[xv]

Promote the construction of Internet insurance credit system and avoid moral hazard

Establish a complete and systematic insurance basic data information platform. We will build an open credit hierarchy, improve the system of trustworthiness and encouragement, and reduce the system of credibility and credibility. We will encourage honest enterprises in a variety of ways, publicize and punish untrustworthy enterprises, and those who are seriously untrustworthy must withdraw from the market. Guide Internet insurance operators to operate in good faith, and reduce the adverse selection and moral hazard caused by information asymmetry in Internet insurance transactions. Refine insurance statistics indicators and accumulate diversified data for strategic decisions in the development of Internet insurance.

Research and development of unified Internet insurance supervision database

In the context of the rapid development of the current Internet insurance market, the regulatory authorities should actively consider how to improve regulatory efficiency and improve supervision. The use of modern information technology to establish a database is a key link in modern insurance regulation. Through the establishment of the official database, the regulatory response of the regulatory authorities will be improved, data sharing and regulatory disclosure will be promoted, various problems in Internet insurance supervision will be resolved, and scientific basis for regulatory decision-making will be provided.

Actively develop a unified Internet insurance regulatory database. The database should include unified data standards such as corporate information and systems, regulatory records, rewards and punishments records, and related data statistics and analysis functions to achieve scientific and informational decision-making. At the same time, on the basis of the unified database of insurance supervision, build a unified database of the financial industry to achieve regulatory cooperation. It is also possible to establish a cross-industry database based on this, so that insurance supervision can integrate data resources across industries and regulate the behavior of insurance institutions from different dimensions. The establishment of a broad and unified database platform can link the originally isolated insurance market information with a variety of data, making the information value of the insurance market higher, and providing strong support for the regulatory decisions of insurance regulatory agencies.

In the opening and sharing of public data resources, the government, as the main data resource controller, should further strengthen the opening of public data and the construction of sharing platforms without jeopardizing national interests and public interests.

Conclusion

In the context of the digital economy, Internet insurance, which began with traditional insurance channels, has continued to enrich its connotation and extension with the continuous development of Internet technologies such as big data. The development of Internet insurance is increasingly inseparable from the use of Internet technologies such as big data, and the use of technologies such as big data is also promoting the development of Internet insurance, bringing with it unprecedented risks under the traditional insurance model. huge challenge.

This paper analyzes the information security supervision risks faced by Internet insurance in the context of digital economy, and proposes that Internet insurance faces four major risks: insurance market information security technology risk, insurance market information security moral risk, insurance market information security legal relief risk, insurance data monopoly risk. Through the combing of the information security supervision experience of the US and European Internet insurance market, the author draws the enlightenment to China that the perfect legislative system is the premise of Internet insurance supervision. Next, the article answers one by one how to improve the information security legal supervision and other supporting systems in the Internet insurance market under the background of digital economy, and draws up the improvement of personal information protection legislation, strengthens the research of security technology, establishes a private network, and promotes the Internet insurance credit system. The construction and research and development of a unified Internet insurance regulatory database is a very targeted and feasible proposal.

In summary, the innovation and development of Internet insurance is inseparable from the improvement of the digital supervision system, especially the legal supervision. To build a sound digital supervision system, it is necessary to use the relevant infrastructure construction and technical level as the hardware foundation and the legal system. The soundness is the institutional guarantee, and the intervention of government supervision is the main means. Although China's Internet insurance market faces many problems, as long as it can learn the successful experience of Western developed countries, and combine the actual situation of the country, adhere to the premise of legal supervision, and cooperate with other measures, the government's supervision can be more effective, China Internet Insurance Information security issues can be effectively resolved.

Abstract

The paper analyzes the reasoning behind entering and exiting academia in case of Russian universities. It investigates the issue of coming in and out of academia in case of constant changes that occurred in the academic world in the past 25 years. They have led to drastic changes in the academic world and greatly influenced the paths one had to and out of academia. In this paper, we try to see whether the motivation to become an academician or leave this world is different for the Russian setting compared to what exists in the Western academic world

Keywords: Academia, Career, Situational Approach.

Introduction

The perception of academic careers in Russia and the majority of the USSR has changed significantly in the past 30 years, leading to a changed assessment of academic jobs. In this paper, we have analyzed interviews of 15 Russian academicians, who either spend their whole life at the university, or joined academia from business, or the ones left academia as a result of changes in the sphere. Their different perception allowed comparing their motivation with the mainstream discussion in the existing literature and figuring out specific features of academic careers in transition economies.

In this paper, we investigate the issue of coming in and out of academia in case of constant changes that occurred in the academic world in the past 25 years. They have led to drastic changes in the academic world and greatly influenced the paths one had to and out of academia. In this paper, we try to see whether the motivation to become an academician or leave this world is different for the Russian setting compared to what exists in the Western academic world.

Literature overview

The issue of academic careers is widely discussed in the existing literature. The problem drew attention due to dramatic changes in the sphere, starting in the 1960s (Geppert & Hollinshead, 2017). According to their study, the first substantial change was a shift in the volumes of higher education. For centuries, academia was a place for a few (mainly privileged), while from the second half of the XX century, the world experienced mass higher education. Nowadays, about 20% of the appropriate age population is involved in higher education (Frank&Meyer, 2007).

Moreover, even more in the continents where populations were usually undereducated (Aspiring Minds, 2016; British Council, 2016). Thus, universities required much more academicians to lead the teaching and research process, making the career massive, and academicians are rarely residents of the ivory tower nowadays. The second transformation of the higher education system is led by the emerging knowledge society that is unimaginable without a high share of the educated population.

Cite this Article as: Anna SVIRINA, Maksim SOLODUKHO and Natan SOLODUKHO "Paths in And Out of Academia in Russia: Implementation of Situational Approach" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Some researchers indicate that these changes led to the implementation of the American higher education model all over the world in the first place (Juusola et al., 2015). One of the primary outcomes from the late shift is the rise of technocratic management systems that measure academicians' performance by a set of indexes, rankings, number of publications, and others. According to Beyes and Michels (2011), this had driven pedagogical excellence out of the modern universities; and, on the other hand, according to Rutherford and Van der Voet (2017), inspired growing share of educational managers who transformed universities into service sector organizations rather than temples of teaching and science. These changes provoked moving of a few academicians out (Boltanski&Thevenot, 2006) while a different type of teachers and researchers (often coming from the business due to calling) start fleeing in (Buzzanel & Goldzweig, 1991).

The other issue of importance, but relatively uncovered by existing literature, is the specifics of academic motivation, which is an issue for us in this paper. Existing literature includes several studies regarding motivation, which is considered one of the critical management functions, each of these using different evaluation instruments that include experimental studies. The most significant experimental studies were conducted by Duke University (Ariely, 2008) and state predictably irrational behavior of humans, including their behavior in the workplace. Similar results are present in one of the cybernetics branches (Eccles&Pyburn, 1992; Von Hipel, 1994), which states that incentives and stimulus. Those are created for developing systems that would not necessarily work correctly in case of complex self-organizing systems: an opposite result to what is expected might occur. Both approaches lead to the same statement – for human-based systems, the natural outcome of a stimulus is rarely the outcome that appears in reality, which is a consequence of self-organized systems stochastic nature. In this paper, we analyze a natural experiment in one of the Russian universities where a fully quantitative approach to measure teaching and research staff performance was implemented four years ago and try to evaluate outcomes of this approach and relevant managerial practices. This setting is to be kept in mind, especially for academicians, as most experimental studies assess irrational behavior and motivation within the academic setting. Though existing literature assesses the following factors which are essential to creating incentives for employee behavior: creation and promotion of positive organizational values (Barrett, 1997), implementation of creative capital to ensure organizational development (Cushing, 2001), providing personnel with high quality challenging tasks to develop intrinsic motivation to work (Greenberg&Baron, 2000), continuous evaluation of organizational culture and creation of relevant stimulus for organizational change (Mengis&Eppler, 2008), creation of high-quality teams to ensure motivation and learning process. Still, the studies indicate that these incentives are not always directly related to academics' reasoning when describing their paths in and out of academia.

In terms of existing definitions in management, theory academics are more often driven by what is called intrinsic motivation. Intrinsic motivation has emerged as an essential phenomenon for educators. It was assessed as "a natural wellspring of learning and achievement that can be systematically catalyzed or undermined by parent and teacher practices" (Ryan & Stiller, 1991). It is associated with coming to academia since this is the area related to high-quality learning and creativity, as the main intrinsic motives are considered to be a sense of achievement, curiosity, and interest. At the same time, extrinsic motivation is focused on some external rewards (money, gratitude). In this study, we argue that intrinsic motivation, which is not always well-defined by the person himself, is the key to understanding one's path in or out of the academic world.

The changes leading to the introduction of the "American model" are more or less global. In the academic setting for our research objective, the Russian Federation, higher education evolved a bit differently. In the 1960s, when global higher education and science started the transformation, the USSR preserved the system in the state of a protected sphere. Up to the breakdown of the Soviet Union, both professors and scientists were both better paid (than the majority of the population) and acquired many privileges, such as extra vacation period, the possibility to take fully paid sabbatical for a year once in 10 years, get access to limited property like "the dachas" or less working hours than average (with better salary – for example, an associate professor's salary was at least two times higher than the one of an engineer) (Zdravomyslov&Yadov, 2003). After the breakdown, things changed: the higher education sector was living on government money, and when the state cut spending, professors and scientists could await their salary for 8-10 months. Those who were to feed the family left academia at these times.

Later in the 1990s, the lack of state financing was compensated by a boom of interest to higher education – leading Russia to the situation the world witnessed in the 1960-1970s when higher education stopped to be a privilege for the elite. During 1992-1999 the number of higher education institutions increased five times (both private institutions and new campuses of state HEI were established), and up to mid-2000s, almost everyone who wished to acquire education did so. Then the universities experienced the boom of Ph.D. thesis defenses. Massive defenses were partly due to increased demand for university professors, and partly – to the prestige of having a degree; as the process was relatively easy at the time, higher education system created a huge number of PhDs and habilitated doctors (compared to Soviet times). Finally, in the 2010s, the government started questioning the quality of education at the higher education institutions, created its non-customized monitoring system (see, for example, MICCEDU, 2017) and shut down about 400 higher education institutions out of existing 1000+.

After the introduction of state monitoring in 2012, the Ministry of Education and Science imposed a KPI-based system first for higher education institutions, then for professors and finally – on scientific institutions (united within the Russian Academy of Sciences) and scientists in these organizations. An example of KPI systems used by the Russian universities can be found in Table 1.

Table 1: the evolution of stimulus for academics (systematized based on 5 KPI systems from different universities in Russia)

Measure	Points awarded		
	2015	**2016**	**2017**
Development of teaching materials	60 points per 10 pages	60 points per 10 pages	Excluded
Conference presentations	30 points per conference paper	30 points per conference paper	Excluded
Journal papers published	120 points per 10 pages	120 points per 10 pages (national journals), 180 points per 10 pages (Scopus and WoS journals)	180 points per 10 pages (national journals), 360 points per 10 pages (Scopus and WoS journals)
Textbooks published	180 points per 10 pages	180 points per 10 pages	180 points per 8 pages

International conferences			30 points per conference paper

From Table 1, one can see how requirements were changing for the academics – these changes indicate how the focus was shifting towards internationalization and research; during the same time, period teaching workload was increasing drastically. An average professor was teaching 3-4 courses in 2015 (2 in the fall and 2 in the spring semester), while by the end of 2017, it became usual that full professor was teaching 10-12 courses (approximately five both in fall and spring semester). Due to that Russian academic environment experienced another wave of those who left it – mainly for non-traditional education and business.

At the same time, a massive PR campaign was started by the state, indicating the gap between higher education and science and the needs of the real sector of the economy. This combination provoked a new wave of leaving academia and an opposite wave – starting 2010s, several industry people entered academia, mainly led by the idea to bring the practice to the university classroom (Syupova&Bondarenko, 2014). Hence, one can see that compared to international experience, the Russian higher education sector had undergone the transformation, which took Western universities more than half a century, in less, than 25 years. The corresponding changes are analyzed in this paper to see the main academic motivation patterns and to compare them with the global ones

Method and Sample

To perform this analysis, we carried out 17 1-hour long (in average) interviews with (a) academics, who entered academia after finishing the university, (b) academics, who became educators after having some business experience and (c) academics, who left academia. In the sample, we had ten females and seven males (representing the average structure of teaching and research staff in the social sciences in Russia, which is dominated by women). In the sample, we had representatives of the new generation of educators (aged 25+, graduated from the university in 2000-2010s), mid-career generation of educators (aged 30+ to 40+, graduated from the university in 1990-s) and senior educators (aged 60+ to 70+, graduated in 1960-1970s). Seven of our respondents started their careers in academia but left it; 4 came from the industry, and six started in academia and stayed there for the lifetime.

In the interviews, we asked the following questions:

1) were you planning to become an academician?
2) how and why did you come to the academic world?
3) what do you like and dislike about academia?
4) how the things in academia changed during your lifetime?
Besides these questions, we let the respondents accurately share their experiences and thoughts.

The Main Findings

The main findings are presented along the line with the fundamental questions present in the interview outline above.

Planning to become an academician and actual coming to academia

Out of 15 respondents, we talked to only one indicated that he was always oriented to join the academic world.
I always dreamed of being a professor…yes, it is getting more difficult, but I cannot imagine being in any other place (associate professor, 35).

Everyone else was referring to a situation that led him/her to the academic world.

I was offered to apply for a job at the university; they were short of assistant professors. It seemed much better than to start my career in an assistant in the tax collector office, and I felt I could do it (full professor, 37).

I was never thinking about being an academic, and I already had a job for three last year in the university. However, when my diploma supervisor offered me to stay, I thought – I was always told I am good at teaching, why do not give it a try? (department head, 39).

Here it is worth mentioning that when those who are about 40 entered the world of academia, the salaries there were barely enough to provide one's living – the situation changed in about ten years, so for this generation acceptance of academic job meant the necessity to have another source of income. A couple of years after they started, it appeared to be opportunities to earn money, but at the moment of making a choice, they were not aware of that. The situation was very different both for 60+ and 25+ academicians – both were entering the academic world when it was both prestigious and profitable to seek an academic career. So their testimonials look a bit differently.

It was the Soviet system, and as I was one of the best in my class, I was offered Ph.D. studies in Saint-Petersburg…it was a daydream (dean, 59).

I was in a scientific institute for my whole life, when 20 years ago, I was offered to come to the university and teach. Moreover, I felt – this is what I was missing in my research career (department head, 63).
I was already working in the bank during my graduation year when our department head asked if I would be interested to send a resume to the university. I was happy to do, and they accepted me (associate professor, 29).

The way the majority of respondents speak about their path into academia, refer to as "being lucky," "having a feeling of a lifetime commitment," and indicate they did not think they can be chosen for the job (and it was valuable even though proposed income was quite low). Such feeling refers to the issue of "calling," raised by Hall and Chandler (2005). As the concept of calling is not common in a Russian setting, the respondents were using a different word to describe the feeling. Based on interviews, we can claim that our results prove the findings in existing literature, and in the case of academicians, the "calling" is one of the essential reasons to accept an academic job. Some of the similar indications are provided below.

The moment I walked into the university as a teacher, I felt this could be my place for the lifetime (full professor, 37).

It was like magic – I already decided where to go after graduating, but then the dean said they have a scholarship for my Ph.D. studies, but then I will need to return and teach (associate professor, 61).

The testimonials of business-world incomers support this finding.

I wanted to bring some real-world into the classroom. I do not understand how people who never walked out of the classroom can teach entrepreneurship. (company CEO, department head, 62).
(after teaching) I had a feeling I never experienced: I was shining from inside like a small Sun. It was worth all the time I invested (company CEO, 37).

The reasons people name for staying an academician despite the negative tendencies (especially widely mentioned increased paperwork) are almost the same – academics indicate they are not ready to leave a job which was brought by luck and is seen as calling. This brings up the issue of leaving academia – those in our sample who did so, describe their coming to the higher education and scientific institutions in basically the same words. Still, they have changed their career path in their mid-life.

Leaving Academia

The main reason for leaving academia for those who left in the 1990s is predictable: at some point, it was not possible to feed the family.

We had two children, and my wife was also at the university. When we had to wait for a salary for eight months, I decided that I was out of it (company CEO, 49).

Leaving was not my choice. We even stayed in the same building, but instead of teaching, we were making our business there (IT-company CTO, 51).

I enjoyed teaching and research, but the financial issue became most significant when we had the first child, so I left. However, I still feel almost a traitor when I meet my former colleagues from academia (IT-company employee, 45).

Later the reasoning became different – as we indicated above, universities started to earn money from the students. For those who wanted, it became possible to provide the necessary level of living. However, in line with increased financial well-being, the bureaucratic workload increased, driving the sense of calling, which brought academicians to work (coming to a peak in the 2010s).

My Dad started asking me two years ago – you are losing your health at this work, maybe you can find a regular job? (full professor, 36)

I started this job to make the world a better place – and what I see now? I am being told every single day that we need to serve the students, and if they fail the course, it is my fault, never theirs. It would make sense if they have at least impose any selection, but they accept everyone! (associate professor, 42)

I have fought for six years explaining how to teach to bureaucrats. I came here to teach, not to fight (full professor, vice-dean, 63)

When I thought that I should upgrade the contents of my subject, it would mean I will have to re-write all the papers. Moreover, I thought – well, it is good enough the way it is. However, this is not how I usually work – and I understood it is time to quit (associate professor, 38).

I understood I was not able to spend the time with my family: I did not have any days off – I was either in the university, catching up on work, or at home by my desktop computer. I felt somewhat a traitor, but I had to choose – life versus academia (associate professor, 39)

From these testimonials, one can see that a crucial reason for leaving academia is the opposite of calling. When academics see that their work is being treated as something unimportant, they tend to leave. In this case, they do not intend ever to come back, as they feel they have been used and mistreated.

I do not believe the things can ever change here in academia. We have got accountants ruling, what treatment one can expect? (full professor, 63)

Becoming a cashier is a better option…I never thought I would say that – but really, I would prefer selling tomatoes to listening to my guru-dean, who did not come to a classroom for eight years, telling me how easy it is to do. Moreover, she earns 15 times more than I do! (full professor, 36).

Interestingly enough, these people, who left academia, often use the word "traitor" or an analog or try to explain why they had to leave and what brought this decision up. This part of the interview is the most uncomfortable for the person who left. At the same time, when they talk about coming to academia, even having the negative experience they are describing, they still refer to it as "luck":

If it were not for the academic world, I would never get the job I have now. If I did not get the offer to teach, I would never know how great it is to be a researcher…I still miss that (associate professor – company engineer, 38).

What do you like and dislike about academia

What people like and dislike about academia corresponds to the theoretical framework of intrinsic motivation and continues the reference to calling – most of the respondents indicate how their expectations in working in the classroom were fulfilled.

I was preparing to teach my first lab work for two weeks. I still remember the rewarding feeling I had when it was over (associate professor, 38).

It was as I expected – I felt in the right place! (associate professor, 35)

I was given seminars in accounting – when we got started, everyone was given seminars in accounting, no one wanted to teach it. I was lucky to find an excellent textbook, and I could explain the theme, and they understood! I could jump after the class! (department head, 39)

When I was shown a list of subjects I could choose from, I was scared – I did not understand what half of them were about. So I said: "physics" – it was something I knew (dean, 59)

I am always trying to get something new for an upcoming class – a bit of news, a fact, or even a citation from a blog – I see how the students appreciate they I am updated (full professor, 36)

As I was coming from the industry, I chose what I knew – and it was a surprise to find out they do not listen like my employees do. But next time I spend time preparing and got full attention, much more rewarding than compliments at work (company CEO, 37)

I worked at the plant for 35 years as an HR and thought I knew everything about the people. However, students surprise me every day, and I feel alive (former HR manager, 69).

From these testimonials, it is impossible to distinguish who are the newcomers to academia from business, who is there for the lifetime being, and who had left the academic world for different reasons. Almost all of the testimonials are about teaching, not research, and more or less, each respondent mentioned "reward" or "rewarding feeling," which correlates to the intrinsic motivation of academics as an essential stimulus. Interestingly, in the interviews, almost no one mentioned extrinsic motivation – the issue of money was raised concerning "earning the leaving," especially by those who left academia in the 1990s and early 2000s. However, it was never an issue described as something one liked about academia.

Same intrinsic motivation relation is valid for the negative sides of the academia:

When I came to the university, I thought I would be researching and developing new teaching materials, using new technologies. However, after a year, I understood that it is not always possible with the continually changing papers we have to write. This was devastating; I was not prepared (assistant professor, 26)

We have never stopped re-doing papers after the last accreditation in 2012; it is now five years in a row. I would prefer preparing new teaching materials, but instead, I am re-writing learning outcomes in a different format for the N-th time (associate professor, 38)

I found my way through meaningless hours of junk paper development – I try to think about it as a quest I need to pass to do what I like. But it is hard to keep on going – the worst is that I understand it is meaningless (department head, 39)

He wanted to talk to me as I was the youngest full university professor, and I was about to quit. Know what he told me? "You are an underdeveloped person; you will have problems everywhere you will go." I cannot imagine working for him ever in the future (full professor, 36)

I am fine with an increased workload; I am OK even with the paperwork. But I am mad that all the rules for academia are made by accountants, who had never been to the classroom (full professor, 63)

For the past five years, my life is an endless "Groundhog day." I am starting over the same things we have just finished, and I don't believe it could ever end (dean, 59)

I was always complaining about the papers we have to prepare for the tax office. However, that was before they brought me the papers from my department – just to sign. I have no idea how to keep doing his job well when he continually spends time on these tons of paper (department head, company CEO, 62).

As in the previous case, it is hard to distinguish when you see a testimonial from the one who stayed in academia in comparison to the one who left. The main things mentioned are not even paperwork, but its meaninglessness, and also much attention is given to the attitude from the ruling institutions – the feeling is described as an insult, thus leading to thoughts about leaving. Academics mention they are losing a sense of achievement and do not have time to do something that is of interest to them. As in terms of what they like in academia, the reasoning stays in the terminology of intrinsic motivation. Moreover, in several cases, we asked a direct question about a salary increase, respondents say they were more motivated with smaller salaries but more free time and the possibility to define their schedule and thus spend more time on something exciting and rewarding.

How the things in academia changed during your lifetime

In this part of the study, we talked about the issue over only with the respondents in their mid- or senior career, as the others did not have enough experience to evaluate the changes in the academic world. In line with existing literature, the majority of assessments of the changes were negative; some of the testimonials referred to new positive experiences:

I was educated to do all statistical calculations manually. When I was first shown statistical software, I felt I was given a hammer after trying to build a wooden house with a brick (department head, 39)

I was against presentations in the classroom, but when I've done them I realized how much time they save, and how the classes became more efficient and engaging (full professor, 63)

When I was a student, it was just chalk and blackboard, but when I came to teach from industry, they'd shown me the progress – even in the IT sector, I had to catch up with some things in their e-learning environment! (company CEO, 37)

So, the main positive changes are related to the use of new information and teaching technologies, which provide a better understanding and engagement in class. The main reason the respondents refer to them as positive change is that the time is being saved and can be used to explain some extra things in the classroom. The things could have been different for online studies, but these are not widespread in Russian universities.

On the other hand, quite a few testimonials refer to the negative changes in the academic world – besides already mentioned paperwork.

Due to information technologies, I am expected to be forever online – my department head writes me any time day or night, or calls up – and I have to pick up the phone, though it is 11 pm already (full professor, 36)

We have to deliver more and more and more. First, it was beautiful to have a grant application and one paper to fulfill KPI. But it is growing, and now I need to win a grant, publish at least three papers and teach my nine classes simultaneously (full professor, 63)

I liked research before it became a speed relay for publication. When I started, we did 1-2 papers if we had a grant. But now I am asked to deliver at least 5, and they say this is "inefficient" (associate professor, 38)

I left almost 20 years ago, and when I meet colleagues, I wonder – how do they fulfill their KPI requirements? Some of them seem impossible (company CTO, 51)

What surprises me most is that I have a KPI with a fixed number of citations my papers need to get every year – and I cannot explain to anyone, that this is something no one can guarantee (department head, 39).

When I graduated from Saint Petersburg and returned to university, I wrote a course description on five pages, and students read it. Now I write 70 pages and expect that no one will ever open them (dean, 59).

As it appears from the testimonials, the most significant problems are requirements that do not take into consideration individual strengths, weaknesses, and even workload. Due to that, it becomes almost impossible for the teaching and research staff to make a contribution, which would allow them to be proud of the work done – instead, they are asked to deliver the number of publications, and the quality is not significant. Most of the respondents mention that the result is adverse selection, and those who spend time trying to deliver quality gain less KPI points than those who are finding the way to deliver what is required.

The summary of the findings in relation to existing literature is presented in Table 2.

Table 2: Comparative analysis of the findings in relevance to existing literature

Feature	Russian setting	Difference from existing literature
The concept of luck	Fully revealed in the Russian setting. Only 6% of sample accepted the academic career as something expected	No difference revealed: within the existing research the majority of academicians speak about luck and unexpectancy in how they entered academia
Leaving academia	Two main reasons revealed: the need to earn the living, as academic world did not provide enough money; and loss of intrinsic motivation	The first reason is different from what is know in Western world; the second reason appears to be in line with existing research
Bureaucratization of academia	Fully revealed in the Russian setting. All respondent who left academia lately or consider leaving mention this reason	No difference revealed with the existing research: bureaucratization is being widely mentioned. The Russian setting is different in terms of teaching hours workload
Lack of respect	Revealed in the Russian settings. Some of the respondents mention this reason as main one for leaving	Corresponds to the findings in existing literature, especially published in 2014-2017, in line with global tendencies
Use of metaphors	Revealed in the Russian setting. Some of the metaphors were hard to translate, but almost every interview provided a few bright ones	In line with existing literature. Academics are considered to be the ones using metaphors to illustrate their findings and conclusions
New technologies	Significance revealed in Russian setting. The respondents refer to those mainly in positive way, even the older ones	Not fully in line with the literature, that states there is a huge debate about technology in classroom. For Russian setting the issue of saving time is very important (due to workload), that can explain the difference
KPI system introduction	Revealed in the Russian settings. Some of the respondents mention this reason as main one for leaving	Corresponds to the findings in existing literature, especially published in 2014-2017, in line with global tendencies
Intrinsic motivation	Fully revealed in Russian setting. Appeared to be the main motivation for academics	In line with existing findings. In some literature academics are being viewed as best example of intrinsic motivation
Negative selection	Revealed in Russian settings. Some of the respondents mention this reason as main one for leaving	Not clearly stated in existing literature. It could be fully Russian problem, or may appear to be better seen in this setting

As it can be seen from the Table, the majority of the findings are in line with existing literature; however, some issues, like implementation of new technologies or negative selection, appear to be different from what one can find in existing literature. Those findings indicate directions of future research.

Conclusions

The evaluation provided by midterm and senior academicians is mainly revealing lack of respect; respondents indicate the shift in decision-making – while in the early stage of their career major decisions were made by academicians (Scientific councils), now they are made by administrative staff, in full accordance with global practice (Rutherford&Van der Voet, 2017). In Russia the tendency is made worse by incoming managers with no educational or scientific background (for example, the head of the Russian education, monitoring system was accused of plagiarism in 2014 (Disseropedia, 2014), but it did not affect his position). Thus, our respondents claim that introduction of various KPI systems led to negative selection – it became easier to fake the quality rather than pursue it, driving academicians out to business world. This refers to the framework of intrinsic motivation which appeared to be the most important for defining paths in and out of academia; and intrinsic motivation, according to existing literature, can not be raised by implementing KPI system.

The main findings of the study are in line with the existing literature: Russian academicians view their career as a lifetime commitment, are motivated by the job itself and in many cases see it as a calling (Beyes&Michels, 2011; Hall&Chandler, 2005). The same is true in case of reasons for leaving academia: growing bureaucracy, demoralization, increasing share of administrative staff in higher education and science (Geppert&Hollinshead, 2017; Rutherford&Van der Voet, 2017). Still, one can find some specific features in entering and leaving the academic world in Russia. In almost all cases, our respondents indicate they felt they were to help universities, both with investments and experience to increase the quality of education and science (no matter, are they from business or the academic world, they don't rely on institutions to supply all the necessary equipment). In terms of leaving academia, our respondents indicated as specific reason their inability to keep the quality when both teaching and research volume was jeopardizing (some of the respondents started their assistant professor career with teaching one subject, but now they teach 14 different ones).

Finally, the majority of the findings are in line with the existing literature; in terms of increasing workload, the situation in Russian universities is not different from the one described by Berg&Seeber (2016). Still, Russian setting can provide better options for studying outcomes of increased workload, as here academics are to deal with double growth of workload – academics at the universities are expected to run more teaching hours and do more research at the same time. Thus this setting can reveal some tendencies which might occur later in the Western academic world.

It is significant to mention, that the study has some limitations. First, our sample seems to have a gender bias (which reflects gender bias in higher education sector of Russia). Second, we have same age misbalance in the sample: only 2 respondents represented the younger generation of educators, while the sample is dominated by midterm career respondents. Third, the respondents are coming from European part of Russia, where higher education is more linked to Europe and North America, while in Asian part the ties with Asian universities are much stronger. All of the above can lead to possible biases in the findings

Abstract

The European Union (EU) own resources system should support sustainable development, understood as integrated social, economic and ecological growth. However the current system meets the sustainability criteria poorly and requires change. The High Level Group on Own Resources (HLGOR) recommends an Electricity Tax on consumption as one of the new bases for the EU own resources system. Taxes on electricity are recognized as environmental ones. They can be implemented at the stage of electricity production, distribution and consumption, and most analyzes indicate consumption as the most appropriate stage for reasons of simplicity and fairness. In addition, presently excise on electricity consumption is harmonized in EU Member States with minimum rates. The paper examines, on the example of Poland as the EU Member State, whether the excise duty on electricity supports sustainable development by fair taxation of households and thus is a suitable candidate for the EU own resources scheme. An empirical part of the paper consists of excise on electricity analysis in the context of incidence and distributional effects. Respectively, multi-variable regression model and Pearson concentration coefficient are used. The analysis shows that in the years 1993 – 2014 the excise duty on electricity could even be more than full shifted on households. Additionally the excise duty charged was not a significant fiscal burden for households, although it led to a regressivity in the taxation on their disposable income. The excise duty had no significant effect on the distribution of disposable income among households. With reasonable rates the Electricity Tax-based EU own resource is acceptable.

Keywords: excise on electricity, tax incidence, EU own resources, sustainable development

JEL codes: H2, H87, Q01.

Introduction

The European Union (EU) should develop in a sustainable way, i.e. maintain a relative balance in economic, social and ecological development (Treaty on European Union; Commission 2010). One of the main tools for achieving this goal is the EU general budget, with the primary focus being on the budget expenditures allocated to the co-financing of various Member States' programs. However, the impact of the budget on sustainability should be integrated in order to increase its effectiveness, and therefore also include a revenue aspect. It means that no own resource may affect any aspect of sustainable development in a negative way.

Unfortunately, research confirms that the current EU own resources scheme supports sustainable development poorly (e.g. Cieślukowski 2016, Schratzenstaller et al. 2016, HLGOR 2016). These resources are assessed according to various economic, social and ecological criteria with the use of various research methods. One of the most important social criteria is fairness in the taxation of households or individuals. However, the conclusions of the studies are very similar. The main controversy is the contributions from EU Member States on Gross National Income (GNI), which, on the one hand, are the most efficient fiscally and guarantee budgetary balance (e.g. in 2015 and these payments

Cite this Article as: Maciej Cieślukowski, Sławomir Zwierzchlewski, Roman Stryjski and Waldemar Woźniak" Excise on Electricity as an EU Own Resource in the Light of Sustainable Development: The Case of Poland" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

represent 69,1% of total budget revenues), but on the other they are pure national contributions and do not represent real own resources, such as taxes. As a result they are not linked to the EU socio-economic policies, do not guarantee the EU financial independence and are opaque to EU citizens. Contributions based on VAT, which accounted for 12,4% of total budget revenues in 2015, are also assessed similarly. The only true own resources the EU possesses are traditional (customs duties and sugar fees). They are directly imposed on entrepreneurs and sugar factories, but they account for only 12,8% of total revenue in the budget for 2015 (Commission 2016). Such a system is not conducive to EU policy. The overwhelming direct national contributions make the Member States look at the budget from the point of view of the reimbursement of sums involved.

The literature on the subject argues for almost complete replacement of GNI resource with new real own resources, which ensure greater financial independence and directly support the EU socio-economic policies, including sustainable development. GNI payments, on the other hand, could be maintained in order to safeguard the budget balance. Many types of resources are considered in the literature, which can replace GNI payments. An important document in this field is the report of the High Level Group on Own Resources (HLGOR 2016), which includes a synthesis of current assessments of potential EU own resources carried out by various expert and scientific centers. Among others HLGOR recommends an Electricity Tax on consumption (paid by households and companies) as one of the new bases for EU own resources, which can replace the GNI resource. This resource was even rated the highest of all other possibilities for new EU own resources. Taxes on electricity can be implemented at the stage of electricity production, distribution and consumption. Most analyzes indicate consumption as the most appropriate stage for reasons of simplicity and fairness. Presently excise on electricity consumption is harmonized in EU Member States with minimum rates (ETD 2003). The harmonization is justified on the grounds of the internal electricity market integration which is expected to deliver tangible benefits such as security of supply, more choice in electricity sellers and reduction in electricity prices to consumers. The excise is included and shown in mandatory electricity bills, thus it is transparent for the consumers and easy to collect for public authorities. Fairness results mainly from the macroeconomic perspective due to the fact that electricity is consumed in all regions of EU Member States and richer regions consume more electricity than the poorer.

On the other hand there is empirical evidence testifying to the rather regressive nature of electricity taxation in in the case of households. In this situation some correction mechanisms are also recommended. Unfortunately research on the subject in the case of Poland is very limited. In fact, only Cambridge Econometrics carried out a comprehensive assessment for all EU Member States on the distributional effects of a 10% increase in minimum rates of excise on electricity (Commission 2011). However the results show that this change in rates (both for business and non-business use of electricity) is completely neutral for Poland as it does not change current excise rates. The objective of the paper is to investigate whether the excise on electricity in Poland supports sustainable development by fair taxation of households and thus is a suitable candidate for EU own resource. To reach the goal two main research questions should be answered:

1) to what extent is the excise duty on electricity placed on households?
2) what are the distributional effects of the excise duty on households?

To solve the first problem we need to investigate the excise incidence that aims to find out who (households or electricity suppliers) and to what extent pays the tax in fact. There is strong empirical evidence showing that environmental taxes may not be shifted forward entirely. The analysis covers households in Poland in the years 1993 – 2014 and is carried out with the use of the multiple regression function. The function is based on key market factors that determine the price of electricity in Poland and is also inspired by the model presented by Alm, Sennoga and Skidmore (2009) who investigated the impact of an increase in excise rate on the average retail price of unleaded petrol in the US in the years 1984 – 1999, although the analysis in this paper is not a panel data research. Analysis of regression is carried out with the help of the program Statistica 12.

Further investigation in distributional effects is justified if the excise is shifted in some part on households. In this case, if the excise burden is significant and poorer households bear a higher tax burden than the richer, the excise on electricity is regressive and does not support sustainable development. Then the European Union should refrain from introducing this resource in the general budget or should apply some compensation mechanisms to increase fairness. The distributional effects of the excise are assessed for the years 2009 and 2015 by comparing the excise paid on electricity to disposable income of households classified in quintile groups and by types of households. This method is usually used to investigate regressivity in taxation. The years of analysis and division in quintile groups result from available surveys on households in Poland. Finally, the Pearson concentration coefficient (K) is applied to measure the decomposition of disposable income among households before and after taxation.

Previous research on potential new EU own resources

The subject literature indicates three main scenarios of the reform of the EU own resources' system (de Feo and Laffan (ed) 2016; Fuest et al. 2015): 1) a simplification of the system by replacing traditional and VAT resources by GNI resource, 2) replacing GNI resource by new resources mainly in order to increase the financial autonomy of the European Union, improve transparency of the system for citizens and make the system more in harmony with EU policy and 3) the reform of the present correction mechanisms with the aim of greater transparency and fairness for Member States. Table 1 shows a ranking of potential new EU own resources in selected studies. The ranking is based on information and various evaluation methods contained in the studies analyzed. In the case where two or more resources receive the same score, this means that the author of the study assessed them identically or very similarly.

Table 1: Ranking of potential new EU own resources resulting from different studies (1 – first place)

Type of own resource	European Economy 1993	Keen 1995	Begg and Grimwade 1998	Gretschmann 1998		Cattoir 2004, 2009	Cieślukowski 2005	Begg, Enderlein, Le Cacheux, Mrak 2008; Begg 2011	Schratzenstaller 2016	HLGOR 2016

[1]on cashflow; [2]on profit; [3]with common tax base; [4]based on current national systems; [5]Begg 2011; [6]airplane charge on CO_2 emission; [7]no numerical assessment of fiscal efficiency and stability but it seems to have huge fiscal potential, [8]petrol charge, motor fuel levy; [9]revenues from the trade of CO_2 emission, [10]electricity tax-based own resource.

The most often studied and usually best rated candidates for EU own resources are modulated VAT, European corporate tax and environmental tax (CO_2 levy). However the latest studies from the years 2005 – 2016 pay more attention to financial sector taxes and various forms of environmental taxes. The first are related to the financial crisis from 2008 and the second – to the climate warming problem. Until the HLGOR report 2016, the taxation on electricity was not a special subject of analysis in the context of a potential EU own resource.

The HLGOR assessed the highest Electricity Tax based own resource of all other candidates for EU own resources. In comparison to the motor fuel levy it is fairer and more efficient with regard to the cost of collection and needs less political transaction costs. Additionally, in comparison to CO_2 levy it seems to be more fiscally sufficient and transparent for citizens (HLGOR 2016, p. 87). Previous studies on potential EU own resources can be characterized by the following features:

1) Particularly in Commission reports the link between criteria and theory is very loose,
2) The number of criteria used in evaluations is limited and the main attention is put on fairness between Member States. Additionally qualitative criteria outweigh the quantitative and the results of research are more debatable. Current statistical methods allow huge possibilities to conduct more objective evaluations,
3) Criteria are not weighed. Weighing improves the credibility and objectiveness of an evaluation,
4) In most cases resources are evaluated in short periods of time which creates difficulties in drawing reliable conclusions about changes in quality of the whole system over a longer period of time,
5) The evaluations do not compare particular resources,
6) The evaluations do not consider sustainable development objectives in an integrated and balanced way.

Studies on potential EU own resources need further improvement to achieve more objective and convincing results. Analysis should:

1) better link assessment criteria with theory,
2) apply a bigger number of detailed, weighed, qualitative and quantitative criteria,
3) use multi-variable exploration that allows the integration of different criteria, compare resources, achieve more objective results and evaluate the whole system over a longer period of time,
4) apply sustainable development criteria; the latest example of such criteria and analysis is given e.g. by Schratzenstaller et al. (2016) and Cieślukowski (2016).

Investigations on Tax Incidence

Economic theory usually draws a distinction between the statutory and economic incidence of taxation. Statutory incidence refers to those who legally pay the tax, while economic incidence refers to those who really bear the burden of the tax (Kosonen 2012). Environmental taxes may have various forms (tax, excise, duty, levy, charge, etc.), may be imposed on various items (eg. CO_2, energy sources, electricity, transport) and may be imposed on various stages of economic activity (production, distribution or consumption). Environmental taxes are usually classified as indirect and consumption taxes which are imposed on final consumers. It is assumed that producers or importers of goods are subject to the tax, however they only play the role of the formal tax payer whereas actually it is the consumer. Entrepreneurs add the tax to a price that is paid by consumers. The consumers usually do not know about it because the excise is not shown on receipts and invoices. VAT works in a similar way with the provision that it is imposed on the final (net) price (price with the excise) and is shown on the invoices. However it must be emphasized that the state, in imposing indirect taxes, is not able to predict who and to what extent bears the real tax burden. Such a distribution is mainly determined by the market mechanism.

The incidence of taxation changes the equilibrium both on the market of goods and production factors and therefore the only way to find out who bears the real tax burden is to analyze the changes of prices on the market. Tax incidence takes place if a tax added to a price changes the actual tax payer. This situation occurs when the tax imposed on an entrepreneur increases the price of a good it sells. Then the tax is shifted forward and a recipient of the product becomes the real tax payer as he pays the tax in the price of the purchased product. Instead, when the tax is paid the entrepreneur's suppliers or workforce (by reducing wages or salaries) – we can talk about backward tax shifting.

Analysis of indirect tax incidence is based on partial equilibrium models or empirical data from various market segments (Bernal 2014). With an assumption of perfect competition, tax shifting depends on demand and supply price flexibility. In an oligopoly market tax shifting depends on demand, the function of cost production and number of companies. On the basis of the Cournot model we can state that if the competitors are stronger in a particular sector, tax shifting is easier (Fullerton and Metcalf 2002). In a monopoly market, in the case of heterogeneous goods, the total value added tax can be shifted on to the consumers and the excises can be even more than full shifted (Dixit and Stiglitz 1977).

Empirical studies mostly concern forward tax shifting. For example Poterba (1996) analyzes the influence of the sale tax on the price of clothes in some US cities in the years 1925 – 1939 and 1947 – 1977. Before the II World War two thirds of the tax was shifted on to consumers and after the war – the total amount of the tax. Besley and Rosen (1999) investigate tax shifting in the case of 12 types of goods in 155 US cities in the years 1975 – 1997 and find that the tax over-shifted in a very short period of time after the tax rate changes.

The problem of VAT shifting in some European Union States (Sweden, Italy, Portugal and Ireland) in the case of different rate changes and different goods and services (books, shoes, magazines, drinks, restaurant and hairdressing services) is presented in the report *Study on Reduced VAT* (SRV 2007). In general the report indicates that the increase of VAT rates increases the final prices more than proportionally, whereas the decrease of VAT rates decreases the prices less than proportionally. Carbonnier (2007) analyzes the results of a VAT rate increase in France on the 1st of September 1987 on cars and on the 1st of September 1999 on renovation services. In the first case 57% of the additional tax burden is shifted on to consumers and in the second – 77%. The author also indicates that in both cases the tax is shifted very quickly, - two months after the changes.

Alm, Sennoga and Skidmore (2009) investigate the shifting of excise on unleaded petrol in 50 US states in the years 1984 – 1999. The analysis shows that a 10% increase in the tax rate causes an average retail price increase of 9,98%. The analysis also shows that in the rural states the extent of the shifting is lower than in the industrial states. Similar results were also received by Borenstein, Cameron and Shepard (1997) who investigated changes in the retail prices of petrol as a consequence of changes in the prices of the oil.

Investigation in backward tax shifting is very limited. Felix (2009) analyzes the relationships between corporate income and sale taxes in the United States on the amount of wages. The author states that the sales tax reduces wages very slightly. The extensive investigation on VAT shifting (forward and backward) on prices in the case of books in Poland is made by Bernal (2014). The author analyzes the 5 p.p. increase in VAT rate on books which took place on the 1st of January 2011 and states that the additional burden is rather more divided between consumers and publishing houses. However the reform causes more than a proportional increase of the average retail price of the book (over-shifting) and it differs between particular segments of books. The reform also reduced the demand for books. As a consequence publishing houses suffered a decrease in their income and capital profitability which also meant that they are subject to a part of the additional tax burden. The analysis also confirms the decrease in salaries in publishing houses, although it is not statistically significant.

Distributional effects of environmental taxes

Environmental taxes result in a series of distributional effects on the market. The literature on the subject classifies them into direct and indirect or static and dynamic (Kosonen 2012). Direct effects are mainly expressed in the increase in the cost of the taxed goods to the consumer. Instead indirect effects relate to the situations when taxes increase the input costs and thus affect the prices of other goods and services. The evidence on the last issue is rather scary. Jacobsen et al. analyzed both the direct and indirect effects of environmental taxes in Denmark (Kosonen 2012). The results show that the indirect costs of the taxes are much smaller to the consumers than the direct, although they are a higher burden for low-income households which makes the whole system of environmental taxes regressive. The dynamic effects of tax incidence, in contrast to the static, relate to behavioral changes of consumers. These take place when the price of a good is increased by a tax which causes the consumers to reduce their consumption of the good depending on the availability of substitutes and in this way they can reduce the burden of the tax. Some empirical evidence shows that low-income households are more responsive to price increases and reduce their consumption more than the higher-income households (Kosonen 2012). However Smith (1992), taking the example of a carbon tax in the UK, indicates that the effect of behavioral change is very small and does not change the regressivity of the tax.

The distributional effects of environmental taxes are usually considered in the context of their impact on household income. The analysis consists of two main stages. First, the households are classified in several groups of equal size (eg. quartiles or deciles) in ascending order of their disposable income. Then the share of income spent on taxes paid on the good is calculated for each income group. If this share increases with decreasing disposable income, the tax is regressive and progressive in the reverse situation. Global empirical evidence indicates various effects of various environmental taxes. Taxes on electricity and heating tend to usually be regressive while taxes on transport fuel are not always so (Boyd and Kouroush 2016; Commission 2011). However the final effects of taxation depend on various factors. Poterba (1990) indicates lifetime utilization whereas Cambridge Econometrics - how the tax revenues are used. The latter also shows that both economic efficiency and a distributionally neutral tax reform can be achieved if tax revenues are recycled in the form of cuts in the employers' social security contributions. The empirical evidence also indicates that the extent of regressivity differs among countries. For example the US energy taxation system is

more regressive than in the European countries, whereas the systems in Ireland and the UK are more regressive than in other EU Member States (Kosonen 2012).

The market, prices and taxes imposed on electricity in Poland

The energy market in Poland has been in existence since 1990. The process consists of three main pillars: 1) demonopolization consisting of separation of the production from trade, 2) liberalization by giving access of other participants to the energy infrastructure and 3) privatization of state companies. The main institutional solutions on the market, important with regard to the excise incidence, are presented in Table 2.

Table 2: Main institutional changes in Polish electric energy market

Date	Institutional changes
01.07.1993	Introduction of VAT (7% on electricity) and excise duty (although electricity is free of the duty)
01.01.1997	Energy Regulatory Office (ERO) is established. President of ERO i.e. regulates and promotes the market, counters monopoly practices, approves the tariffs (regulated prices of electricity) energy companies use in trading electricity. First the companies calculate prices based on official tariffs set by Ministry of Finance.
01.01.1999	Replacement of official tariffs for electricity set by Ministry of Finance by the separate tariffs for the electricity produced and its distribution. The new tariffs are calculated (according to official rules) by the producers and distributors. President of ERO controls and approves the tariffs every year.
07.12.1999	Polish Power Exchange (PPE) is opened
01.07.2001	President of ERO liberates prices for energy producers - he stops approving the tariffs
26.03.2002	Introduction of the excise duty on electricity (0,02 PLN*/KWh). The tax is paid by electricity producers
01.05.2004	Poland enters the European Union and is obliged to meet the rules of the electric energy market Directive (2003/54/WE). VAT rate on electricity increases to a standard rate 22%
01.07.2007	Division of the electricity distribution sector into distribution and trade. Liberalization of the electricity trade market. The final consumers (including households) are free in their choice of the electricity direct supplier (a trade company) on the domestic market
01.03.2009	The subject of excise duty is shifted from electricity producers to traders. The traders are formally allowed to shift the excise duty on to the final consumers and the tax is shown in electricity bills
01.01.2010	VAT standard rate increases to 23%

Source: own presentation based on (Energy Regulatory Office, online).
**PLN – Polish zlotys.*

In 2014 the Polish electricity market consisted of: 25 producers (power, heat and power plants), 1 transmission operator managing of the highest voltage cables, 5 main distributors transmitting energy with the use of medium and high voltage cables, 5 main trade companies (partnerships of main distributors) selling electricity directly to the final consumers or to another 59 trade companies. In the years 1993 – 2014 the total generation of electricity increased in Poland from 132,6 to 159,1 TWh, although its main source was still solid fuel. In 2014 solid fuel was used to generate 81,4% of electricity, whereas renewable sources (mainly from hydro and wind installations) generated about 12,8% of all electricity.

With reference to the wholesale market producers sell electricity mainly on the PPE (53,5% of TWh in 2014) and directly to the 5 main distributors under contract (35,6% of TWh in 2014). Next, distributors sell the electricity mainly to other traders (38,7% of TWh), directly to the final consumers (34,6% of TWh) or on the PPE (17,3% of TWh). In the years 1993 – 2014 the share of households consuming electricity slightly decreased from 20,8 to 18,9 Mtoe, however since 1999 the households have become the biggest final consumers of electricity. In 2014 there were 17,05 million electricity final consumers including 14,4 million (84,5%) of households. In the years 1993 – 2014 the yearly consumption of electricity per capita increased from 2244,2 to 3270,5 KWh.

The final cost of electricity for the households that is shown in the bill consists of four main elements: 1) cost of electricity consumed, 2) charge for transport (distribution) of electricity, 3) the excise duty which is imposed only on electricity used and 4) VAT. The prices are calculated by two companies: the distributor of electricity and the trade company which buys electricity from the producer and sells it directly to the final consumers by utilizing the distributor's lines. The prices are based on tariffs regulated by the state and the President of ERO controls and

approves them every year. Tariffs approved by the President of ERO should particularly: 1) cover the real costs of the economic activity of the electricity companies (production, distribution, trade) and give a reasonable rate of return and 2) protect the final consumers against an unjustified level of these prices.

The excise duty on electricity was introduced in Poland on the 26th of March 2002. The rate was 20,00 PLN per MWh and it was imposed on producers of electricity. Due to the fact that from 2001the President of ERO stopped approving the tariffs for producers, the producers officially could not calculate the excise in the prices, but they could shift the burden of the excise on to distributors and traders. In turn these companies expected the President of ERO to let them increase the prices. Since March 2009, according to European rules, those subject to excise duty has been shifted from producers to trade companies that sell electricity to final consumers. The excise rate was not changed. Since then the excise duty is added to the final price for the electricity used and is shown separately in the electricity bill. VAT is calculated on the final net retail price that contains the excise duty. In the years 1993 – 2015 the VAT rate on electricity increased twice, in 2001 from 7 to 22% and in 2010 up to 23%.

Empirical framework of the excise incidence

Methods and data

The incidence of the excise on electricity on households in Poland arises in two formal situations. The first concerns the period 2002 – 2008 when the excise was imposed on electricity producers whose prices are liberated. In turn producers were able to shift the duty on to traders in the prices and the traders – on to households. The second concerns the period 2009 – 2014 in which the traders were subjected to the excise duty and they were allowed to officially shift the duty on to households by adding it to the tariffs approved by the President of ERO. The excise was shown in the electricity bills. However in order to catch the impact of adding the excise to price the analysis covers the period 1993 – 2014. To investigate the extent of excise incidence the typical multi -variable regression model was built that assumes that the linear relationships between the price of electricity, the excise and other demand- and supply-side characteristics that may determine the price. The model is as follows:

$$(1) \quad P_t = b_0 + b_{1t}x_1 + b_{2t}x_2 + \ldots + b_{kt}x_k + \varepsilon_t,$$

where P_t is the real (inflation-adjusted) yearly average tax inclusive, end-user price of 1 KWh of electric energy in Poland in the period t, b_i (i=1, 2, 3…k) are regression coefficients, x_i (i=1, 2, 3…k) are independent variables representing demand- and supply-side characteristics that determine the price P_t, ε_t is a random error term and b_0 – a free term which is not interpreted.

The primary regressor is the inflation-adjusted excise duty on electricity in PLN per 1KWh. To assess the impact of the excise on the electricity price, it is necessary to check other factors (independent variables) that can potentially affect electricity prices. The below table 3 shows these factors with the sources of their collection.

Table 3: Independent variables

Symbol	Independent variable	Details	Source of information
e_t	Excise duty	The inflation-adjusted excise duty on electricity in PLN per 1KWh (may be lagged)	Statistical yearbooks of the Republic of Poland for the years 1994 – 2015
V_t	VAT	The VAT rate in percentage points on electricity	Legal acts on VAT from the years 1993, 2004, 2010 and 2016
Pl_t	Population	Population in thousands of people	Statistical yearbooks of the Republic of Poland for the years 1994 – 2015
E_t	Electricity consumption	Total electricity consumed by the households in GWh	Statistical yearbooks of the Republic of Poland for the years 1994 – 2015
Id_t	Disposal income per household	Average monthly inflation-adjusted disposal income per household in PLN	Statistical yearbooks of the Republic of Poland for the years 1994 – 2015

H_t	Heating degree-days	Heating degree-days	Information Portal of Central Statistical Office in Poland (http://www.stat.gov.pl)
S_t	Electricity suppliers	Total number of suppliers of electric energy to households (trade companies)	Country datasheets 2016 http://ec.europa.eu/energy/en/statistics/country; Reports of Energy Regulatory Office for the years 1998 – 2015 (http://www.ure.gov.pl/pl/urzad/informacje-ogolne/sprawozdania/2916,Sprawozdania.html)
C_t	Households that changed electricity supplier	Total number of households that used the right of a free choice of electricity supplier	Report of Energy Regulatory Office for the year 2015 (http://www.ure.gov.pl/pl/urzad/informacje-ogolne/sprawozdania/2916,Sprawozdania.html)
W_t	Wages in the section of electricity, gas, steam and air conditioning supply	Average monthly inflation-adjusted gross wages in the section of electricity, gas, steam and air conditioning supply (PLN)	Statistical yearbooks of the Republic of Poland for the years 1994 – 2015
I_t	Investment outlays in the section of electricity, gas, steam and air conditioning supply	Inflation-adjusted yearly investment outlays in the section of electricity, gas, steam and air conditioning supply (mln PLN)	Statistical yearbooks of the Republic of Poland for the years 1994 – 2015
Wp_t	Wholesale average prices of electricity sold by producers	Inflation-adjusted yearly wholesale average prices of electricity sold by producers (PLN per MWh) – data only for the years 1999 - 2014	Reports of Energy Regulatory Office for the years 1998 – 2015 (http://www.ure.gov.pl/pl/urzad/informacje-ogolne/sprawozdania/2916,Sprawozdania.html)
Ec_t	Installed electricity capacity	Installed electricity capacity (MW)	Country datasheets 2016 (http://ec.europa.eu/energy/en/statistics/country)

Source: Own presentation.

The analysis is made for the whole of Poland in the years 1993 - 2014, so it does not meet the criteria of panel data research. The selection of independent explanatory variables was inspired by the methodology presented by Alm, Sennoga and Skidmore (2009) who used panel data analysis to investigate the impact of an increase in the excise rate on the average retail price of unleaded petrol in the US in the years 1984 – 1999. Independent variables also reflect the specificity of electricity market in Poland and they are recognized as the key factors affecting the price of electricity. The variables concern the most important aspects of electricity market activity, i.e. production (eg. investment expenditure, cost of wages, electricity capacity), distribution (eg. wholesale prices, electricity suppliers), consumption (e.g. population, electricity consumption, disposable income of households) and external conditions (eg. excise duty, VAT, heating degree-days). All variables come from the sources indicated in Table 3 and from additional regular surveys in the field of the energy market in Poland carried out by the Polish Central Statistical Office (CSO 2012; CSO 2014; CSO 2017; GUS 2016).

In order to find the logic and significant relationship between the price, the excise duty and other independent variables various many typical l operations on data were carried out:

1) Analysis in different periods of time (data segmentations):
   - in the years 1993 – 2014 and 1993 – 2008 to find the difference before and after the change of formal excise payer (in 2009 the electricity producer was replaced by the electricity supplier),
   - in the years 1993 – 2004 to catch the moment of the excise duty introduction in 2002 and 2005 – 2014 to catch the effects of changing the formal tax payer (in 2009),
   - in the years 1993 – 2001 and the years 2002 – 2014 to find the differences before and after introduction of the excise duty.

2) All the investigations indicated were carried out without the control variable "wholesale real average prices of producers" (Wp_t) because of data limits. An additional investigation was carried out for the years 1999 – 2014 with the control variable Wp_t.
3) All investigations were carried out with one year lag and one year acceleration in the introduction of the excise duty. The acceleration is justified by the fact that producers, after the release the prices by the President of ERO in 2002, significantly increased the prices of electricity for 1 KWh from 0,30 PLN in 2000 to 0,37 PLN in 2001. It is assumed that electricity producers could anticipate the excise duty in 2002, thus they could increase their prices earlier in 2001 before the excise was introduced. However the model with one year acceleration was rejected because it did not bring satisfactory results.
4) All investigations were carried out in real (inflation-adjusted) prices and for the analysis in the years 1993 – 2014 the interpretation variable was applied (0 – for the years without the excise duty and 1 for the years with the excise duty) in order to emphasize the influence of excise duty on the price.
5) All investigations were carried out with the use of the forward and reverse progressive regression that helps to capture optimal and statistically significant results.

Estimation Results

Reasonable results are obtained by the analysis of the period 1993 – 2014 without a time lag (Model 1) and with one year time lag (Model 2). Statistically significant variables at 5% are: the excise duty (e_t), households that changed electricity supplier (C_t), electricity suppliers (S_t) and wages in the section of electricity, gas, steam and air conditioning supply (W_t). The statistically significant results of regressions in both cases are presented in Table 4.

Table 4: Main Results of regressions without a time lag (Model 1) and with a one year time lag (Model 2)

Independent variable and other indicators	Model 1	Model 2	Model 3
P_{t-1}			0,414334992*
e_t	1,708371/50 = 0,0341674*		0,186038098
e_{t-1}		1,513876/50 = 0,030278*	
W_t	0,000107***	0,000109***	0,0000679**

Source: Own calculations with the use of the program Statistica 12.

Both regressions have been verified according to the following criteria: 1) significance of the model, 2) significance of independent variables, 3) lack of commensurability between independent variables, 4) homoscedasticity, 5) lack of autocorrelation of the residuals (Durbin-Watson statistic), 6) normality in residuals' decomposition and 7) an expected value of a random error term ε_t is 0.

The Durbin-Watson statistic (2,665445) indicates that in the case of Model 1 the autocorrelation between residuals can exist. It can be caused by a limited quantity of data (22) or by other factors that affect the price. In order to account for the autocorrelation of residues, a model with autoregression of a dependent variable was also estimated. Estimates of this model were not satisfactory (see table 4, Model 3).

Taking into consideration other criteria, in all cases the regressions meet those criteria at a satisfactory level. As a result it can be assumed that particularly Model 2 matches the empirical data in a satisfactory way.

In all cases the poorest aspect of the models is the suspicion of a correlation between some independent variables. The results of the analysis for the case of Model 2 are presented in table 5.

Table 5: Linear correlation coefficients between variables in the case of Model 2

	P_t	e_t	W_t	S_t	C_t
P_t (dependent variable)	1,000000	0,840821	0,992327	0,797787	0,519414

Source: Own calculations with the use of Statistica 12.

Table 5 above shows that the variable S_t is correlated slightly higher with the excise and wages than with the price P_t. A similar situation exists in the case of the number of consumers who change their suppliers (C_t) and wages. However the results of the commensurability analysis (table 6) show that the tolerance for all variables is acceptable (higher than 0,1) and the influence of variables S_t and C_t on the price (P_t) is not substantial. As a result the variables S_t and C_t, which are statistically significant, can be kept in the model. Table 6 also shows that the excise duty affects the price in a very limited way (the semi-fragmentary correlation equals 0,038). It seems to be reasonable if the excise is only 0,02 PLN per KWh.

Table 6: Commensurability analysis between independent variables in the case of Model 2

Variable	Tolerance	R^2	Fragmentary correlation	Semi-fragmentary correlation
e_t	0,222598	0,777402	0,457060	0,038289
W_t	0,184540	0,815460	0,987207	0,461339
S_t	0,245691	0,754309	-0,637056	-0,061581
C_t	0,571573	0,428427	-0,619138	-0,058746

Source: Own calculations with the use of Statistica 12.

Then the analysis shows that if the excise duty rises about 0,02PLN per KWh, the average real gross price of 1 KWh of electric energy will rise about 0,03 PLN. It means that the excise duty is forward over-shifted. This result seems to be quite rational because in the years 2002 and 2003 the real price of a KWh increased from 0,38 to 0,41 PLN. First, the excise duty is shifted from electricity producers to trade companies and next the trade companies shift the duty on to the final consumers. An additional explanation of a total excise duty shift is that electricity belongs to the group of basic consumption goods which are rather less elastic or even inelastic with regard to prices and demand. In the case of such goods and services it is easier to shift the tax. Another important result is that it was impossible to capture the price effect when the excise duty payer was changed from the energy producer to the trader in 2009. However, because the duty is calculated in the final retail price, then it can be assumed that the reform did not affect the electric energy price significantly and the duty is completely shifted on to consumers. The regression also indicates that the real prices of electric energy in the period analyzed were mainly affected by the real wages in the energy sector. An increase of real average wages of about 1 PLN causes the increase of the real average gross price of 1 KWh of about 0,000109 PLN. Other results also seem to be rational. Every new supplier of electric energy causes the decrease in the real price of 1 KWh by about 0,001754 PLN. However the increasing number of consumers who change the suppliers does not affect the final price of 1 KWh.

Distributional effects of the excise duty on electricity

Analysis of the Quintile and types of household groups

The distributional effects of the excise tax is analyzed with the assumption that the whole amount of the tax (0,02 PLN) is shifted on to the final consumers. The investigation is carried out using the example of Polish households in the years 2009 and 2015 and covers two stages:

1) The comparison of the excise paid on electricity on the disposable income of households classified in quintile groups and by types of household ,
2) Calculation of the Pearson concentration coefficient (K) to measure the decomposition of disposable income of households before and after taxation.

This analysis is based on empirical data collected in four surveys carried out by the Central Statistical Office in Poland: Energy Consumption in Households in 2015 (CSO 2017), the Household budget survey in 2015 (CSO 2016),

Energy Consumption in Households in 2009 (CSO 2012) and the Household budget survey in 2009 (CSO 2010). Tables 7 - 10 and 12 – 19 based on these surveys are to be found in the Annex.

Tables 7 and 8 show the method of calculation used to ascertain the average monthly electricity excise duty burden for households in the years 2009 and 2015 classified in quintile groups (case I) whereas Tables 9 and 10 show the same calculation for the different types of households (case II).

The results of the analysis in two cases indicate that the excise duty is not a significant fiscal burden for households. It mainly results from the low excise rate and the stable prices of electricity. Let us remember that since 2007 households in Poland may choose their electricity supplier in a free market. On the other hand, the excise duty leads rather to regressive taxation of the disposable income of households. In case I the analysis was carried out with different prices of electricity for each quintile group. The prices come directly from the surveys of Central Statistical Office in Poland on energy consumption in households in 2009 and 2015 (CSO 2012, Tab. 22; CSO 2017, Table 22) and they are calculated on the basis of data on electricity consumption and expenditures of the households surveyed. The last rows of Tables 7 and 8 in both years show similar relationships in the excise burden among households. The households in the first quintile group (with lowest disposable income per capita) bear the highest excise burden, whereas households in the last group (with the highest disposable income) bear the lowest excise burden. Taxation in II, III and IV quintile groups seem to be fairer as the excise burden increases with an increase of disposable income. In the second case the relationships in the excise burden among households are more complex. Unfortunately the analysis was carried out at fixed average prices of electricity in each year due to the lack of data (there is no data on electricity prices broken down into types of households). In 2009 non-manual labor job households recorded the highest disposable income and the lowest excise burden whereas the households of pensioners (with the lowest disposable income) recorded the highest excise burden. In 2015 non-manual labor job households also recorded the highest disposable income with the lowest excise burden whereas pensioners (rated in third place with regard to the lowest income) recorded the highest excise burden. Then it seems that in 2015 relationships in the excise burden among households are slightly fairer than in 2009. The comfortable situation of households in non-manual labor work results mainly not only from the fact that they record the highest income but also from the fact that they, relative to other households, use less electricity (only households of manual labor jobs use less electricity). It may testify to their outdoor lifestyle. On the other hand pensioners and retirees noted a significant increase in 2015 in comparison to 2009 in relation to most other households, both in disposable income and electricity consumption. These people spend rather more time at home than outside which translates into a higher consumption of electricity.

Pearson Concentration Coefficient

The extent of decomposition in the disposable income of households caused by the excise duty is assessed with the use of the Pearson concentration coefficient (*K*):

$$(2) \quad K = 1 - \sum_{i=1}^{k} (F_{z_i} + F_{z_{i-1}}) \cdot w_i ,$$

where: $w_i = \frac{n_i}{N}$ - structure indicator, F_{w_i}, F_{z_i} - empirical cumulative distributions. The Pearson concentration coefficient (*K*) receives values in the bracket $0 \leq K \leq 1$. If *K=0*, it means equal decomposition, whereas K=1 means a complete concentration.
Table 11 shows the Pearson concentration coefficient (*K*) for households in Poland in the years 2009 and 2015.

Table 7: Pearson concentration coefficient (*K*) for households in Poland in the years 2009 and 2015

Research profile	2009		2015	
	Before the excise	After the excise	Before the excise	After the excise
Quintile groups	0,8019841	0,8019845	0,7974962	0,7974943
Types of households	0,7730145	0,7730385	0,7665509	0,7665606

Source: Own calculations based on Tables 12 - 19.

The rate of coefficiency in all cases is very similar and very high which means that there was a significant concentration of disposable income among households in Poland the years analyzed. The results show that in the best case (K = 0,7665509) less than 25% of households had over three quarters of the income. Thus the decomposition of

analyzed income analyzed is similar to the weak distribution. The excise duty on electricity does not affect significantly the decomposition in disposable income among households. It results mainly from the fact that the excise duty in the years analyzed was not a significant burden for households.

Conclusions

The paper investigates whether the excise on electricity in Poland, as part of the EU own resources system, may support the sustainable development by fair taxation of households. The analysis consists of two main stages. In the first an attempt was made to examine the extent of the excise incidence on households. An analysis was made on the example of households in Poland in the years 1993 – 2014 and with the use of a multi-variable regression model. The analysis shows that the excise duty on electricity could even be even over-shifted on to households. In the case of a one year time lag the increase of the excise rate of 0,02PLN in 2002 (when the excise was introduced) affects the electricity (1 KWh) price increase by 0,03 PLN. This phenomenon can be explained by the fact that the excise was imposed at the stage of electricity production (in 2002) after the ERO liberated prices for these producers in 2001. As a result the producers could increase the prices more than the amount of excise duty and could shift the excise on to traders very easily and the latter – on to consumers. In the years 2002 and 2003 the real price of 1 KWh increased from 0,38 to 0,41 PLN. It should also be stressed that in 2002 electricity was produced and traded in Poland rather than on the oligopoly market and was characterized by low price flexibility. As a result the producers could raise the prices to a certain level without the fear of creating falling demand.

The second stage of analysis concerns the distributional effects of the excise on electricity. It shows that the excise duty in Poland in the years 2009 and 2015 was not a significant fiscal burden for households which mainly results from the low excise rate and the stable prices of electricity. However it must be stressed that the excise duty in the years analyzed led to a regressivity in the taxation of the disposable income of households classified in both ways: quintile groups and types of household. Thus it confirms the previous broad empirical evidence of the regressivity of electricity taxes. The Pearson coefficient shows in all the dimensions of the analysis that the disposable income of households in Poland was very concentrated which testifies that the distribution of income is very unequal. On the other hand the amount of excise duty paid by the households had no significant effect on this distribution.

From the perspective of fair taxation of households in Poland the introduction of an Electricity Tax-based with reasonable rates on the concept of Own Resources seems to be quite safe in respect of effects on the EU general budget. In this regard the new resource is also quite reasonable from the perspective of sustainable development.

Abstract

The primary focus of quality management is to meet customer requirements and to strive to exceed customer expectations. Every aspect of customer interaction provides an opportunity to create more value for the customer. Understanding current and future needs of customers and other interested parties contributes to sustained success of the organization. The work provides an assessment of the use and effectiveness of the quality management methods used by the selected company. Methods, tools and principles for supporting and building quality were analyzed not only during production. Areas that are constantly in need of improvement and objectives that can be achieved in accordance with the principle of continuous improvement are distinguished, affecting the degree of implementation of the customer's requirements. The results of the improvements carried out are described, according to the individual tools.

Keywords: Quality Management, Overall Equipment Effectiveness

Introduction

This paper assesses the degree of the utilisation and effectiveness of the quality management methods used by a selected company. The methods, tools and principles to promote and build quality were analysed, including during production. The areas in constant need of improvement and objectives that can be achieved, in accordance with the principle of continuous improvement, affecting the degree of fulfilment of the customer's requirements, were highlighted. The results of the improvements carried out are described, according to the various tools.

Total Quality Management is a universal method of improving the performance of human teams. This method has a very wide application and is used both in the management of public administrations, education, health services and businesses as well as in the police and military. According to the standard currently in force, the quality is the degree to which a set of inherent qualities meets the requirements (Rose 2005, Bettina 2017).

The 9000-2015 series, ISO standard are not technical standards describing the technical parameters to be met by a product or service, but they do govern the organisational rules of an undertaking which are intended to ensure the appropriate quality of the product or service. In the interpretation of ISO 9000 standards, a company's actions are generally referred to as a '*process*'. The implementation of the process management concept is based on the outline of strategic objectives, as described in the company's quality policy; these include the identification of processes taking place in the company, the main distinguishing and ancillary processes, defining the target scheme of the organisational structure, setting strategic objectives, specifying long-term objectives, providing periodic targets to be achieved, implementing the system and the processes and measuring customer and party satisfaction (Thareja 2008, Littlefield 2012, Szczepańska 2011, Matejun 2009).

Characteristics of the object of analysis

The company, which analysed the functioning of the Quality Management System, combining the logistics and manufacturing industries, is a global, specialist provider of integrated logistics services and has countless warehouse spaces and production lines.

The production process is based on the *one-piece flow* principle, which is an extremely important element in optimising the flow process of raw materials and shaping working methods, as well as improving ergonomics at workplaces. Each piece is immediately transferred to the next post after the components are installed, and in its place the next enclosure appears, which requires the same elements to be installed, i.e. the product flows as a *one piece* batch. The basic assumptions for improving the process by implementing the *one-piece flow,* **are a reduction in** stocks of material, the phenomenon of over-production, the elimination of unnecessary movements, the fact that production is possible on a smaller surface and that order execution time is possible and also that time loss is eliminated. It is the responsibility of each operator performing a sequence of actions to check the accuracy of the installation of the previous station. Self-inspection aims to remove the defective product from circulation as soon as possible. Current inspection methods eliminate the costs that can be incurred with standard socket production where errors are only detected *after* the entire batch of the product has been produced. The continuous flow system significantly reduces the length of the product's stay in the plant.

Control is divided into three stages: *Drop test, Print test* and *Drain test* according to the process (Fig. 1.) and is carried out on any product from the production line, selected on a given production day.

Fig. 1: Block diagram of the PPVT process. [own study]

Input control must be carried out on a representative sample, the size of which depends on the findings and the type of material controlled. The basis for sample selection is ISO 2859-1. A measure of the quality level, described in the standard, is the fraction of non-compliant units expressed as a percentage, or the number of non-compliant units per 100 units. The sample size is selected at the *acceptable quality limit (AQL)* - Table 1. The AQL limit is the worst quality one can afford in the sense of the accepted measure of quality for which the batch is considered compatible with the requirement. In this standard, the limit is 0.01%÷10% when the fraction of non-compliant units is taken into account and 0.01÷1000 when the level is the number of non-compliant units per 100 units. According to the accepted findings of control level 1.0, **a sample of N=20 (letter code F)** taken from the batch **is compatible** when the number of non-conformities in the sample does not exceed 1 (Ac=1 pcs). If the batch exceeds 2.0, it should be discarded.

Table 1: Table - AQL the acceptable quality limit. [Own study]

Inspection table acc. to AQL										
Batch size	Code	Sample size	Level of inspection							
			0.65	1.0	1.5	2.5	4.0	6.5	10	15
2 to 8	A	2						1	1	2
9 to 15	B	3					1	1	2	2
16 to 25	C	5				1	1	2	2	3
26 to 50	D	8			1	1	2	2	3	4
51 to 90	E	13		1	1	2	2	3	4	6
91 to 150	F	20	1	1	2	2	3	4	6	8
151 to 280	G	32	1	2	2	3	4	6	8	11
281 to 500	H	50	2	2	3	4	6	8	11	15
501 to 1200	J	80	2	3	4	6	8	11	15	22
1201 to 3200	K	125	3	4	6	8	11	15	22	
3201 to 10000	L	200	4	6	8	11	15	22		
10001 to 35000	M	315	6	8	11	15	22			
35001 to 150000	N	500	8	11	15	22				
150001 to 500000	P	800	11	15	22					
500001 and above	Q	1250	15	22						

The process is reviewed daily during a 20-minute ***Gemba walk***, *Gemba* from the Japanese meaning "place of work". According to the Toyota rule, the first step to solving any problems in a production area should be *to undertake a Gemba*, that is, to have a walk around the workplace. Only a walk in the area where there are inconsistencies allows you to know the actual situation and gain knowledge from direct experience (Woźniak et al. 2017).

Key performance indicators used in the entity under investigation

KPI - key performance indicators, in a company, play a huge *rôle* in a company's ongoing supervision (Kostrzewski et al. 2020). KPIs influence the development and success of an organisation by controlling individual areas of activity. Success is defined as achieving defined goals, which is helped by indicators that measure the fulfilment of requirements imposed by the customer or by management. The selection of indicators depends on the strategy of the organisation. Key performance indicators are inseparable from *Visual Management*, the visual representation of the indicators studied in the subject.

This data is the basis for calculating the productivity of availability and quality, i.e. components of the OEE index, which is presented at level two of '*Operational Performance Meetings'*, a daily meeting between employees of all departments, including the Manager and the Quality Engineer, the Manager and the Process Engineer, Shift Manager, trainers, the lean engineer, the logistics manager, the planner and *operations* and the HR manager. All key indicators and the problems of the previous shifts are discussed at this meeting. The indicators presented by the quality department are mainly Pareto sums of the most common errors during production; errors most frequently occurring or having the greatest impact on production in the quality and production departments are dealt with by the A3 Kaizen Report in a separate meeting.

Another indicator discussed is the percentage created after dividing the sum of errors at each quality control station by the quantity produced on a given day. This is an indicator that accurately reflects the situation in production. Figure 2 provides data from the visual inspection station. The limit imposed by the customer is marked with a red line. The trend marked with the blue line clearly shows a decrease in the number of errors and indicates that the preventive measures implemented have had the expected effect.

Fig. 2: Visual inspection defectiveness index [Own study]

The next item on the agenda at the Operational Performance Meeting is a discussion by the quality Department regarding repairs performed by line leaders on products produced during the process. Figure 3 represents the quantities withheld and processed, *due to the error* and divided into the types of errors.

Fig. 3: Pareto graph of errors occurring on lines and resulting in repairs. [own study]

Another measure used in the enterprise is PPM (Part Per million). This measure shows the number of defects per million. A lower rate shows fewer defects and a greater likelihood of meeting customer requirements. In practice, the PPM is used to assess the supplier (Figure 4.). The number of defects, detected by the line operators, is measured by the quantity produced, multiplied by 1,000,000.

Fig. 4: Number of defective enclosures detected by operators - supplier's defects, [own study]

The main indicator is the OEE chart (Overall Equipment Effectiveness), an indicator showing losses caused by unplanned events on machines such as failures, unplanned downtime, problems regarding quality and extended machine cycle time. The indicator shows the level of loss in the assumed lifetime of the machine. The implementation of the OEE index results in improvements in machine performance, improved quality of the products produced, reveals the real needs to purchase more machines, allows constant control of the process, machines and problems and introduces an element of competition between the teams, leading to improved results. OEE consists of three components:

- availability - that is, the ratio of available time to total time; available time is total time (e.g. 8 - hour shift) less loss of availability (re-tooling, failures, repairs, settings, cleaning)
- efficiency -described as the ratio of productive time to available time; productive time is the time available, minus losses of efficiency (micro-stops, start-up losses)
- quality - described as the ratio of effective time to productive time; effective time is productive time minus losses in quality (deficiencies, defects, alterations).

After receiving the individual components, the OEE index is calculated from the formula:

OEE = (availability x efficiency x quality) x 100%

The use of methods and tools to support quality and production management is an element that contributes to an improvement in quality.

One of the tools used in the company is the Ishikawa Diagram, which helps to systemise the causes of the error. On the basis of the data collected by the quality department - *q.v. Fig. 5*- the problem of incorrect programming occurred 194 times during the month, with 85,600 checked pieces.

Fig. 5: Number of defects – un-programmed chips [own study]

Identifying the *root cause* and selecting the most relevant factors allows the project team to focus attention on the root cause that has impacted the most on the appearance of defects.

Assessment of the impact of the implementation of the quality management system, in the undertaking under investigation

The implementation of the Quality Management System in the company under investigation turned out to be a time consuming and labour intensive process, requiring the involvement of employees and, above all, the management of the organisation. The main problems observed by the Quality Representative were too much strain on staff due to the need to work in parallel with the implementation of the system and the fulfilment of day-to-day duties. The unwillingness of the employees to make changes, along with their lack of commitment and their fear of excessive red tape are cited as another problem. Companies also consider the cost of implementation and the cost of change, to be future problems which would crop up when implementing the system. Low-level management involvement is the main problem; the project should go ahead; the management team should have confidence in the success of the system development team.

Complicated forms of documentation can also be daunting, especially when people working on implementation do not have the right experience and skills. Depending on the size of the companies implementing the system, then the multiplicity of processes - *and therefore documentation* - is a legitimate factor causing employee reluctance, but a properly constructed system and the choice of the necessary documentation should not hinder the work of the employees; the definite benefit of the introduction of the ISO standard of the 9000 family promotes minimisation of the number of documents, with the ISO helping to organise and streamline the circulation of documentation in the enterprise.

Implementation and certification costs are a point to pay attention to, when planning to implement a system. Large companies have high implementation costs associated with consultancy fees, the purchase of measurement and control equipment and research, along with certification and employee training. Investment in employee training will be as cost-effective as possible in the future; since a well-trained employee knows full well what benefits the system can bring to the company, the employees who create the system have more confidence to convince others of the merits of change. Therefore, spending on training as a forward-looking investment will quickly bring tangible returns to the company and influence its correct implementation, since mistakes made during the construction of the system will have a significant impact on the operation of the activities implemented in the future (here: simulation methods might be used as well, as in Kostrzewski 2020). Mis-interpreted requirements result in the development of inappropriate and unsatisfactory documentation for the company. In addition, documentation, inconsistent with current processes, causes even greater resistance from employees. Mistakes made at the beginning are difficult to correct in the future.

Assessment of the benefits of implementing the system

An effective Quality Management System is one that produces measurable effects of the changes made, thereby increasing the value of the organisation. The quality management system requires a huge amount of work from the company in all areas of the organisation. It was time-consuming and labour-intensive not only to create a process approach to actions but also to reduce losses, as only planned and systematic actions throughout the organisation are effective. ISO 9001-2015 is a tool designed to improve work organisation, optimise processes and minimise losses. The correct functioning of the standard requires a process approach, qualitative objectives and continuous improvement. Only consistent and systematic actions by the entire team can achieve goals effectively and minimise losses.

A correctly implemented system positively influences how the company is perceived externally, how it adapts to the requirements and expectations of customers. When dealing with new contractors, the system is a convincing element, increasing the prestige of the company and competitiveness in the market; whether or not a company has an ISO system in place, too, is an increasingly common requirement in various tenders.

The standard, implemented through its provisions, requires systematic work to best meet the customer's requirements. This is influenced by the principle of customer orientation and the ordering of customer processes; the management of complaints and the supervision of the progress and history of complaints have become easier; this is the basis for assessing suppliers and enforcing reimbursement of costs incurred in the use of non-compliant materials. The ISO standard and the established quality objectives allow activities, important to the company, to be coherently implemented. The monitoring and measurement of products, as well as the supervision of the control equipment, as required by the standard, have a positive effect on increasing the quality of the products produced and reducing the costs associated with "poor" quality. The creation of the required procedure for dealing with non-compliant devices and monitoring and measuring of the effects in the process approach, leads to improved quality, along with reductions in losses and efficiency

The ISO standard is a tool that directly affects performance, it does not have such an issue in its requirements, but, because it prompts the ordering of the processes and activities undertaken in the company, it makes productivity more efficient. The standard refers to the necessary planning in producing the products, in order to meet the required deadlines without excessive stock in post-production. Monitoring production and eliminating losses not only of material but also of time, eliminating unnecessary movements also leads to *time gained* and increased productivity. Streamlining internal communication, proper reporting and requiring documentation in line with current processes provide huge benefits for the company, increasing efficiency along the way. Standardisation of processes is the starting point for further actions and the implementation of an IT system makes it much easier to control documentation. The cost principle of "poor" quality 1x10x100 with costs incurred at the design, production and customer stages, is reflected in ISO 9001. The standard systemises design and development elements to eliminate waste, which is a tangible benefit for the company. The ISO standard requires constant internal audits, which is a huge benefit because the periodic review of procedures and processes keeps processes and the documentation up to date with each other. The standard encourages the collection and analysis of data affecting the quality of products and services.

Due to the nature of the operation of the company under investigation, i.e. the production of products for the OEM sector, the quality requirements of one of the main customers created the need to implement the QMS. The primary objective of the implementation of the quality management system was to ensure the fulfilment of customer requirements and expectations and to continuously improve the ability to meet its needs. It has also become an additional objective to determine the way in which products (*printer cartridges*) are made, in order to ensure their high quality, safe processing and reprocessing with the assumed economic efficiency. Achievement of the objective is

accomplished by monitoring all work related to the course of the production process, monitoring the non-compliant product, i.e. one that has deficiencies and defects, analysing the amount of waste that arises in the production process, *that is, the number of cartridge casings misidentified by the assembly station operator.*

The implementation of the quality management system obliged the company, in accordance with EN ISO 9001:2015, to prioritise continuous improvement as one of the requirements of the standard. It involves constantly increasing the efficiency of processes in the organisation and system, in order to better meet the customer's expectations (Jazdon 2001Babica 2006, Hamrol 2015). Internal audits, reviews by management, as well as procedures for corrective and preventive action processes, are used to improve the processes of the audited entity and the tasks of the quality system. These actions are usually undertaken by interdisciplinary task forces to address the causes of non-compliance and potential non-compliance. The standard tool in this entity, to eliminate non-compliance, is the 8D report model. The use of the 8D reporting method facilitates identification of the cause of non-compliance and provides an indication of how the problem has been solved, as well as the possibility of verifying the actions carried out. 8D problem analysis was undertaken at the request of the main customer. In the first stage (1D), a task force was formed consisting of several individuals who were responsible for the implementation of the individual stages of the 8D programme. The size and composition of the group depended on the nature of the problem and the decisions taken, and consisted of employees of various departments: Process engineer, Operations manager, Quality manager, Quality Engineer. The leader was selected from the group to oversee the 8D programme with the authority to implement an appropriate solution to the problem. The next step was to describe the problem as accurately as possible (2D). In order to properly describe the problem, which is the starting point for the next step, the task force focussed its attention on a precise description of the phenomenon, where the problem was detected, as well as the determining of the scale of the problem. The problem, detected six months later, was found to be incorrect label graphics. The scale of the problem was estimated at 3,600 items, labelled in an incompliant manner. In the third stage (3D), immediate action was ordered to prevent an escalation of the problem by stopping production, by stopping shipping also and by segregating products into those products labelled with proper graphics and those products labelled in an incompliant manner. In addition, visual control was implemented at stations for packaging the finished product. The customer was informed of the problem in order to verify the product. Step four (4D) began to identify the actual root cause of the problem using the 5 - WHY methodology. It was determined that the cause lies both with the supplier and the customer. The corrective action (5D) was subsequently determined, namely the department responsible for making labels available, on behalf of the client, implemented *"first off"* control for printed labels and created a book containing golden samples. After one month, the corrective action was reviewed (6D). An inspection of the printing of the first label found no incompatibility. As a result, changes were made to the Quality Management System by defining preventive measures (7d) to ensure that the problem did not occur in the future. To this end, a process of improvement was developed, based on systemic improvements, namely, the permanent addition of the visual control element of the print and instruction at the work position. The final element is the evaluation and closure of the 8D report. The scale of the problem (described in 2D) was assessed with the results obtained during the checks of production lots (6D – 7d). A baseline positive assessment of the measures used was obtained.

The ISO Standard sets minimum requirements for the standardisation of an organisation's process. The preparation of the quality management system gives a positive effect in standardising and controlling the circulation of documents in the organisation. The audited undertaking should endeavour to pay attention to the quality level of its performance, which should go well beyond the requirements of EN 9001:2008, in the achievement of each objective in the unit and should also use other quality management techniques and tools, such as lean management. Employees of an entity, thus analysed, slowly become aware of the need to mentally go beyond the boundaries of hierarchy and functions in order to meet the expectations and requirements of the client. The terms of reference and responsibilities begin to be structured and clear. Attention is also gradually beginning to be paid to the employment of people with the appropriate skills required, in order to carry out specific actions. All of this demonstrates a company's maturity of process.

Summary and Conclusions

An analysis of the implementation of QMS in the selected entity showed that the process was successful. The implementation of EN ISO 9001:2015 had an impact on the systematisation of the situation in the company. All documentation has been standardised in procedures such as the handling of non-compliant devices, corrective, preventive and other actions, by which the work of persons of different departments know the procedure at the time of a defect or complaint. The work of the operators on the lines was described by process; responsibilities were assigned; work instructions were created. By separating and describing individual sub-processes, it has become easier to improve and eliminate losses. As one of the first branches of the company to implement the lean philosophy and work on Kaizen's continuous improvement programme, entity X became a leader in harnessing employee potential

and eliminating waste. Reducing unnecessary movement, material losses and properly evening out the line, by eliminating bottlenecks meant that one station was completely eliminated within a year of the start of production and the time cycle was reduced from 30 to 25 seconds per station, increasing the line's capacity to 150 units in a single production day. The requirement of the standard to collect and analyse qualitative data has made it possible to reduce the number of complaints and to analyse actions, in order to increase detection and minimise the possibility of error. Therefore, it is safe to say that the use of SJ tools and methodology, together with lean tools, facilitates a shorter production time and a higher level of quality at a lower operating cost, compared to the traditional production system.

Problems were also encountered during the implementation of the Quality Management System in the entity under investigation. The employees' fear, both of change and excessive red tape, proved to be the main reason for the slowdown in implementing the Quality Management System. Another factor affecting product quality and the level of losses incurred was the *one-piece flow* principle, socket production, while the buffers created between stations effectively **hid** equipment problems, the supply of parts and quality issues **from operators and from their** supervisors. The elimination of buffers between stations and the excess inventory of components quickly reveals real production problems that result in a failure to execute the daily schedule, which is the main task of the production department. Creating buffers also increases the cost of poor quality, as defects are only detected after a certain amount of time. The work incorporates elements of the Japanese philosophy pioneered by Toyota lean management. Lean ideology or lean management, through its tools, produces remarkable results in reducing production costs, improving ergonomics and increasing productivity. The main lean idea is to eliminate waste. Individual problems are solved according to W. Deming's concept of continuous improvement (Nawrocki et al. 2018). Kaizen Yellow and Green Belt projects are continuously implemented in the company; these significantly improve organisational efficiency and customer confidence.

The material gathered in the work confirms the validity of implementing the quality management system, with elements of lean ideology in production companies.

Restructuring Proceedings - New Regulations in the Polish Economy

Andrzej TOKARSKI
WSB University in Torun, Poland
andrzej.tokarski@wsb.torun.pl

Abstract

The problem of the accuracy of choice between the liquidation of an enterprise and its restructuring is one of the main topics of interest for practitioners and theorists dealing with the bankruptcy of enterprises. The decision to restructure constitutes an alternative to declaring an enterprise bankrupt.
The article presents kinds of restructuring proceedings taking into account their characteristics, advantages and disadvantages, benefits and threats resulting from the multitude of restructuring proceedings including.

Keywords: Restructuring Proceedings, Restructuring Of Enterprises, Second Chance Policy, Restructuring Law

Introduction

The new Restructuring Law is an implementation of the European principle of „the second chance" for entrepreneurs in Poland. It alters the philosophy of the approach to restructuring of companies. The purpose of such proceedings, apart from satisfying creditors, is mostly to suport restructuring activities and to leave these entities in business ((Tokarski, 2018).

The new regulations are to implement the state economic strategy aimed at protecting businesses, workplaces, intellectual capital and *know-how*. (DIRECTIVE OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL, 2016).

In accordance with the principle of survival formulated by H.I. Ansoff: *if any organisation faces the prospect of liquidation, it focuses all its energy on finding the way to survive*. Here, the objectives of the government and entrepreneurs become convergent, but a so-called survival capital is necessary. Naturally, the companies with a staged crisis or bankruptcy should (Masiukiewicz,2018) .
The decision to restructure a business entity constitutes an alternative to filing for its bankruptcy. *Reccomendations*, 2012).

This decision must be a thoughtful one because it creates an opportunity for entrepreneurs to continue their business activities without detrimental effects to creditors. Most of the creditors, mainly suppliers or employees, are not interested in the liquidation of the business unit (Banasik P., Morawska s., 2016).

In recent years, the approach to doing business has also changed. The general public understood that financial problems of entrepreneurs do not always the result from the bad will of managers. Many of them should be granted a second chance with the support of the legal system of the country. This help should be well thought out and supported with methods that will allow you to assess whether the decision related to restructuring has been right.

The aim of the article is to present types of restructuring proceedings taking into account their characteristics, classification, advantages and disadvantages, benefits and threats resulting from the multitude of restructuring proceedings including.

The descriptive analysis, the analysis of legal provisions and statistics on the functioning of the bankruptcy of enterprises as well as the implementation of the provisions of the restructuring law or the remedial restructuring in Poland and the analysis of literature on the subject were adopted in the article as the principal methods.

The solutions adopted by the legislator should therefore combine a particular individual element (the interest of the debtor and its creditors) with the interest of the society which should be understood as the safety of all market participants, including consumers, and thus affecting the wider the general public.

The state plays a particular role as it is responsible for shaping the legal environment for bankruptcy, which influences, inter alia, the possible scenarios of bankruptcy proceedings or the balance between the powers of debtors and creditors.

The decision to restructure a business entity constitutes an alternative to filing for its bankruptcy. This decision must be a thoughtful one because it creates an opportunity for entrepreneurs to continue their business activities without detrimental effects to creditors (Csikosova, Culkova, Antosova, 2016; Altman, Hotchkiss 2007).

In recent years, the approach to doing business has also changed. The general public understood that financial problems of entrepreneurs do not always the result from the bad will of managers. Many of them should be granted a second chance with the support of the legal system of the country (Tokarski, A, Tokarski, M, 2018).

The main aim of the article is to make an assessment and to show the directions of counteracting the bankruptcy of enterprises in the Polish economy with respect to the implementation of the restructuring law (remedial restructuring) in the years 2016-2018.

The descriptive analysis, the analysis of legal provisions and statistics on the functioning of the bankruptcy of enterprises as well as the implementation of the provisions of the restructuring law or the remedial restructuring in Poland and the analysis of literature on the subject were adopted in the article as the principal methods.

The Concept and Types of Restructuring Proceedings in the Polish Economy – an Analysis of Restructuring Law Regulations

Restructuring proceedings are organised by means of legal and procedural relations activities of judicial and non-judicial authorities restructuring proceedings involving concerned entities, aiming at the protection of social and individual interests expressed in striving to avoid declaring bankruptcy of the debtor through enabling them restructuring by means of an arrangement entered into with creditors, and in the case of sanative procedure also by conducting sanative actions aiming at restoring the debtor's abilities to perform obligations while safeguarding the legitimate rights of creditors through using in factual circumstances relevant provisions of law ((Zimmerman P., Filipiak P., 2018).

Restructuring proceedings by definition are of collective nature (STATEMENT OF REASONS, 2014, p.1). Its participants according to Article 65 paragraph 1 of the RL are: (LAW)
1)the debtor;
2) the debtor's personal creditor who is entitled to undisputed debt;
3) the debtor's personal creditor who is entitled to disputed debt and who rendered their debt credible and was admitted to take part in the case by a judge-commissioner.
Restructuring proceedings are conducted in relation to a company which is insolvent or threatened with insolvency (*Upadłości, 2017)*.

The subject of the proceedings is "a restructuring case" (see Article 15 paragraph 1 of the RL and Article 342 paragraph 1 of the RL). "A restructuring case" means a civil matter the subject of which is a comprehensive solution to the conflict of interests between the debtor and creditors and between creditors themselves in connection with debtor's insolvency or a risk of insolvency in a way adopted by the debtor and a specified majority of creditors.

Restructuring proceedings consist of an organised sequence of activities. They are addressed to companies which are insolvent or threated with bankruptcy. The Treasury, self-government units, state-owned banks, insurance companies, reinsurance offices and investment funds are exempted from the possibility of using restructuring proceedings (Antonowicz A.., Antonowicz P., Próchniak J.. 2018),

The aim of restructuring proceedings is to avoid debtor's bankruptcy by enabling them to restructure by means of entering into arrangement with creditors, and in the case of a sanative procedure also by conducting sanative activities while safeguarding the legitimate rights of creditors (Antoniewicz P., Banasik P., Chrusciak M., Morawska S., Prusak B., 2018).

Public perception of a particular legal regulation and proceedings of restructuring is of crucial importance for conducting successful restructuring of an enterprise. Practice shows that declaring debtor's bankruptcy itself repeatedly excludes any possibility of conducting a successful restructuring, whether it is bankruptcy with the possibility of concluding an arrangement or liquidation bankruptcy. Associating bankruptcy with ending business activity, insolvency and not being able to recover debts is so strong that in many cases creditors do not want to

negotiate with the debtor. For those reasons, the draft assumes separating restructuring proceedings from stigmatising bankruptcy proceedings. For clear and transparent separation, restructuring proceedings are regulated by a separate law – Restructuring Law.

As the new restructuring proceedings we include:((The law, 2011)
a) arrangement approval proceedings
b) accelerated arrangement proceedings,
c) arrangement proceedings,
d) sanative proceedings.

Restructuring proceedings differ in terms of the degree of involvement of a bankruptcy court in the course of individual proceedings and of interference in a debtor's assets matters. Basically, all of them relate to a debtor's liabilities being restructured (Tokarski A., Tokarski M., 2020).

Additionally, the fifth procedure can be distinguished, which is particular and different form the others, so called partial arrangement addressed only to selected creditors of a debtor, entered into in restructuring proceedings conducted according to general procedures in forecasts (it can be entered into as an element of a bigger arrangement, alongside it, like and as a separated arrangement, if it is enough for repairing a debtor's situation) (Tokarski, A., Tokarski, M,.2019).

A common characteristic of those procedures will be restructuring of the debtor's company – firstly, of their liabilities and also, to a varying degree, of their assets, the way of business management and employment (FAMIELEC, KOŻUCH, 2018). Prescribed procedures are supposed to ensure that the form of restructuring will be selected to meet the needs of a specific enterprise in a specific financial situation. In all restructuring proceedings identical regulations will be applied concerning the scope of debt covered by the arrangement, arrangement suggestions, entering into and approval of the arrangement and its consequences and also the rules of its changing and cancelling.

Table 1. Restructuring proceedings set out in the Restructuring Law

Type of proceedings	Main assumptions
Arrangement approval proceedings	– independent collection of creditors' votes by the debtor without the participation of the court, – active negotiations with creditors and presenting their results to the court, – the debtor independently selects a licensed advisor who verifies arrangement suggestions in legal and formal terms
Accelerated arrangement proceedings	– drawing up a list of receivables by the debtor, – convening the assembly of creditors by the court, – approval of debt under a simplified procedure, – suspension of the execution against debts subject to an arrangement (security on the debtor's property)
Arrangement proceedings	– drawing up a list of claims by the debtor, – convening the assembly of creditors by court, – approval of debt under a simplified procedure, – leaving control over the property to the debtor, – liabilities towards ZUS covered by an arrangement
Sanative proceedings	– the debtor or a creditor, and in specific cases an administrator, submits a request for the opening of sanative proceedings, – liabilities, assets and employment are subject to restructuring, – a judge commissioner manages and supervises proceedings, – the debtor's assets are secured by appointing a temporary court administrator (limitations in managing assets) or sanative assets administrator (the debtor loses the right to manage assets), – the court administrator or sanative assets administrator draws up a sanative plan together with the debtor, – authorisations granted by the debtor expire and execution against assets included into the sanative assets is suspended, – ban on encumbering assets in order to secure liabilities incurred before the opening of proceedings, – legal and administrative proceedings conducted only by the administrator, – ban on terminating renting, leasing, insurance, loan etc. contacts with the debtor.

Table 2. Advantages and disadvantages of restructuring proceedings from the debtor's and creditor's perspective

ARRANGEMENT APPROVAL PROCEEDINGS	
Advantages	**Disadvantages**
• the possibility of an independent collection of creditors' votes by the debtor without the participation of the court. The debtor presents creditors with voting cards with the methods of debt restructuring (arrangement suggestions). The votes are collected in the written form without the necessary participation of a notary public, • the debtor remains entitled to manage their assets and conduct the management's activities, including those of ordinary management, • proceedings are confidential at the pre-court stage, and the court stage is very short. Proceedings allow minimalizing a negative market message connected with a financial crisis, • proceedings give the opportunity to negotiate individually without the rigors of court proceedings and without security of the debtor's property • the proceedings administrator becomes the implementation of the arrangement administrator after its legal approval • proceedings is ideal for entering into a partial arrangement, with financial creditors in particular.	• the main disadvantage is the lack of protection of the debtor's assets from debt recovery. In the arrangement approval proceedings regulations on security re not used, therefore, an execution cannot be suspended, or seizure of bank accounts cannot be cancelled. It means that until the arrangement is approved, a creditor can collect receivables without limitations. Only after the arrangement is approved are execution proceedings suspended and is initiating an execution unacceptable. • creditors can also terminate contracts including financing agreements and renting or lease agreements during the proceedings, • additionally, selecting the arrangement administrator and establishing the arrangement day have no influence on the exemption of the debtor's board (of a member of the board) from liability for damages. Execution of bankruptcy application submitted by creditors is not stopped either. • lack of trust between creditors and the administrator selected by the debtor is also observed – the administrator is often seen as the debtor's proxy pursuing their interest, • time is a kind of limitation in these proceedings because the debtor has only three months from a fixed arrangement day for collecting votes and preparing with the administrator an application to court for approving the arrangement. If the liabilities structure is distributed, the time can be too short to obtain votes. • the capital majority required for approving the arrangement amounts to 2/3 of creditors entitled to vote the arrangement – in other restructuring proceedings this majority is calculated by reference to the sum of voting creditors. Therefore, the arrangement can be rejected when over 1/3 of creditors will be passive or will vote against. It is negative for active creditors that have reached a agreement with the debtor. • creditors do not possess means of appeal I the scope of the list of receivables, which does not constitute an enforcement order either. They can only submit a written reservation with respect to the compliance with law of the independent process of collecting votes or indicating other circumstances which may have an impact on the approval of the arrangement.
ACCELERATED ARRANGEMENT PROCEEDINGS	
Advantages	**Disadvantages**

• as early as on the day of the proceedings opening the debtor obtains assets protection in the form of the suspension of execution proceedings concerning liabilities covered by the arrangement by law, and their initiating after the opening of the proceedings is unacceptable; • execution proceedings concerning liabilities not covered by the arrangement by law can be suspended for three months, and a creditor secured by collateral by the debtor's assets can after that period conduct an execution against security (collateral) exclusively. • a short period of the proceedings prevents stigmatising the debtor in connection with conducting business with the existing company with the label "in restructuring"; • the administrator can give an agreement to conduct activities beyond the scope of ordinary management ex post, which eliminates the risk of decision-making blockage in current activities and of payment delays for contractors; • creditors obtain the decision on accepting and approving the arrangement much faster, therefore, they can benefit from the arrangement or resume suspended execution proceedings much faster.	• pressure resulting from short duration of the proceedings – restructuring unclear for contractors and employees accompanied by the fear with respect to their own situation can result in their moving away from the debtor when their need to obtain beneficial and reliable financial results inspiring creditors' confidence in the arrangement is the greatest. • lack of the debtor's protection when the period of suspended execution proceedings is over – creditors secured by the debtor's assets can conduct an execution against security (collateral), which is necessary for the debtor for conducting activities; • eliminating the institution of an objection to including a liability in the list of liabilities, because of which creditors cannot question its amount or omission; • too long period of "suspension" between a non-final decision to close unsuccessful restructuring proceedings and a declaration of bankruptcy.
ARRANGEMENT PROCEEDINGS	
Advantages	**Disadvantages**
• the fact that the management of a company should stay in the debtor's hands and only in an exceptional situation the court gives it to the administrator is an unquestionable benefit for the debtor, • the moment the arrangement proceedings are open, executing proceedings concerning receivables covered by the arrangement are suspended. New executions cannot be initiated. It is undoubtedly a beneficial regulation, because it allows the debtors to conduct uninterrupted negotiations with creditors aiming at negotiating an optimal method of debt restructuring, • creditors have a real influence on the proceedings under the board of creditors, which can be appointed by the judge-commissioner both ex offcio and when requested by the debtor or at least three creditors or a creditor or creditors having al least one fifth of the sum of receivables in total. The board is supposed to among others controlling the activities of the court administrator and giving consent to conducting activities which can be conducted only when allowed by the board of creditors. The board of creditors also provides opinions when requested by the judge-commissioner, court administrator or the debtor.	• arrangement proceedings are not initiated towards debtors as often as accelerated arrangement proceedings and sanative proceedings. Most likely it results from the fact that the provisions concerning these proceedings do not predict benefits which debtors are offered by other proceedings, • arrangement proceedings cannot be conducted as fas as (as assumed) accelerated arrangement proceedings, neither do they ensure such possibilities of such deep restructuring as sanative proceedings (e.g. withdrawal from unfavourable contracts or making employees redundant).
SANATIVE PROCEEDINGS	
Advantages	**Disadvantages**
• inadmissibility of obtaining execution against the debtor's assets included into sanative assets, also execution of receivables not covered by the arrangement – including those incurred after opening sanative proceedings and secured by collateral; • the possibility of withdrawing from contracts unfavourable for the debtor regardless of the mode specified by them to terminate a given contract earlier, • the possibility of terminating employment contracts	• inadmissibility of execution causes concerns relating to cooperation with the debtor and forces solutions such as a demand of early payments, which hinders business and maintaining liquidity; • loss of full control over an enterprise by limiting or taking away management form the debtor; • real inability to obtain new financing in the banking sector.

without personal situation limitations, which enables rationalisation of the employment structure and retaining staff necessary for conducting activity of an enterprise (e.g. admissibility of termination of contacts of employees using pre-retirement protection); • the possibility of declaration of no effect of legal actions undertaken by the debtor within one year before submitting a sanative application, e.g. establishing securities on their assets despite the lack of direct connection with the debtor obtaining a benefit, thanks to which the assets of a sanated entrepreneur is released from economically irrational securities; • the possibility of introducing so called "over-collateralisation", i.e. a situation of posting collateral higher than 150% of receivables on the sanative assets at the moment of providing collateral, which allows rebalancing for individual creditors; • the possibility of selling the debtor's assets with executive effect, i.e. without encumbrances, which facilitates selling redundant assets.	

Źródło: Zimmerman P. Filipiak P., Restrukturyzacja w Polsce w latach 2016-2017 (Restructuring in Poland in the Years 2016-2017), SPOTDATA, Warszawa 2018, p. 23-31.

Division Criteria and Characteristics of Restructuring Proceeding Classification in the Polish Economy

A. Hrycaj distinguishes the following division criteria of restructuring proceedings in the Polish economy (HRYCAJ 2015, pp 7-9):

- division from the point of view of the level of involvement of bodies of the court,
- division according to the subjective criterion
- division according to the scope of the debtor's protection
- division with reference to the debtor's limitations in assets management

From the point of view of the level of involvement of bodies of the court in the proceedings, there are proceedings conducted on the basis of court decision to open proceedings and under the supervision of a judge-commissioner (accelerated arrangement proceedings, arrangement proceedings and sanative proceedings) and proceedings the main part of which is of out-of-court character – arrangement approval proceedings. However, arrangement approval proceedings cannot be classified as clearly and entirely out-of-court proceedings. It results from the fact that in these proceedings the role of the court is not limited only to examining the procedure of collecting votes and the content of the arrangement, but it is much more complex. From the moment of submitting an application for the approval of the arrangement, the proceedings is of court character. The submission of an application itself implies the necessity to initiate a number of activities by the court. In particular, according to Article 222 paragraph 1 of the RL, the court immediately informs using means of long distance communication, particularly by phone, fax or electronic mail, the founding body or the competent minister in charge of the State Treasury, who can submit an opinion to the court, about the submission of an application for the approval of the arrangement which concerns a government-owned corporation or a company wholly owned by the State Treasury. The lack of an opinion does not suspend the examination of the case. Moreover, the fact of submitting an application is announced (Article 222 paragraph 3 of the RL). According to Article 224 paragraph 1 of the RL, from the day of issuing a decision as to the approval of the arrangement to the day of its validation, the arrangement administrator exercises the powers of the court administrator. At this stage of the proceedings, until the day of the validation of the decision as to the approval of the arrangement the provisions of Article 259 of the RL and Article 260 of the RL are used. Consequently, it must be stated that arrangement approval proceedings is divided into two stages. The first stage has the character of civil proceedings. It starts with a conclusion of an agreement with a person holding a licence of a restructuring advisor for playing the role of the arrangement advisor, and it ends with a successful submission of an application for the approval of the arrangement to the restructuring court. The second stage has the nature of court restructuring proceedings and it starts with a submission of an application for the approval of the arrangement, and it ends with the validation of the decision as to the approval of the arrangement or of the decision to reject the application or to discontinue proceedings.

From the point of view of the subjective scope, there are proceedings that can be conducted by the debtor in relation to whom the sum of the disputed debt entitling to voting the arrangement does not exceed 15% of the sum of debt entitling to voting the arrangement (arrangement approval proceedings, accelerated arrangement proceedings), and proceedings that can be conducted by the debtor in relation to whom the sum of the disputed debt entitling to voting the arrangement exceeds 15% of the sum of debt entitling to voting the arrangement (arrangement proceedings, sanative proceedings). Establishing the upper limit of 15% results from the necessity to ensure that in every situation the decision concerning entering into an arrangement can be taken by the required majority of creditors. In the situation when for entering into an arrangement it is crucial to obtain acceptance of creditors holding at least 2/3 of the sum of receivables owed to the voting creditors (Article 119 paragraph 1 of the RL), even omission of all creditors with disputed debts (maximum 15%) means that the decision can ba taken by creditors with at least 50% of the sum of receivables owed to the voting creditors. In the proceedings belonging to the first group, a simplified procedure of creating a list of receivables is provided.

Using the scope of specified in the law measures designed to restructuring of the debtor's company as a division criterion, there are proceedings in which the scope of the debtor's protection is small (arrangement approval proceedings), proceedings in which the scope of the debtor's protection amounts to the protection against execution proceedings conducted by creditors (accelerated arrangement proceedings and arrangement proceedings), and proceedings which enables initiating activities allowing deep and multidimensional restructuring of the debtor's enterprise (sanative proceedings).

Taking into account the division criterion of restructuring proceedings on grounds of the debtor's limitations in assets management, there are proceedings in which the debtor is not at all limited in assets management (arrangement approval proceedings), proceedings in which the debtor is limited in assets management by the necessity to obtain the court administrator's agreement to conduct activities beyond the scope of ordinary management (accelerated arrangement proceedings, arrangement proceedings), and proceedings in which the debtor has no right to manage assets (sanative proceedings).

Conclusion

The approach of the European Commission to insolvency issues can be considered revolutionary, as the legal bankruptcy is to be the last resort, if the ways of helping an entrepreneur are exhausted (Palmer, Rapisardi, 2009). Even despite insolvency, an entrepreneur should – with the support of various institutions – have a second chance to conduct its business activity again (European Commission Communication, 2008).

Polish companies have new possibilities of implementation of recovery restructuring processes and should use them in the interest of the entire economy (Krajewski J., Tokarski A., Tokarski M., 2020).
The priority now and in the future is the recovery and not insolvency of a company (Tokarski, A., Tokarski, M, 2019).

Moving from the liquidation to restructuring model of bankruptcy requires changes adopted by lawyers, economists, managers, business representatives and represetatives of the State because they create a group of interest whose main objective in this case is to conduct skilfully a bankruptcy process which leads to paying liabilities to creditors with simultaneous preserving a good economic and financial situation of an enterprise. Only meeting these conditions a restructuring agent becomes a real guide in a difficult reorganisation process, who creates new patterns of effective behaviours in favour of both a bankrupt enterprise and its creditors (Tokarski, A., Tokarski, M, 2019a).

In the opinion of the Ministry of Economy, in accordance with the assumptions of the New Chance Policy more emphasis should be placed on popularising the process of corporate reorganisation (Polityka, 2015). It implies the necessity to decide on inititating a recovery proceedings first, then an arrangement procedure and only in the case of the lack of reasons for starting restructuring – liquidation proceedings. One of the main objcetives of proceedings should be continuing activity of functioning economic entities in all those cases where it is consistent with rational management. It gives the chance to maintain jobs among others. The guideline for keeping those enetrprises (or their organised parts) which have made efforts to restructure and adjust to the changed economic environment in business should result directly from the amended legal regulations.

The role of the State should be to minimise negative effects of a crisis situation in an enterprise, and the objective of the New Chance Policy is not to prevent bankruptcy at any cost, but, when activity must be terminated due to financial difficulties, to conduct the process quickly and inexpensively.

The new Restructuring Law has changed the perspective of the restructuring and bankruptcy process in Poland (Tokarski, 2018). Emphasis has been placed on enabling a debtor to reach an agreement with creditors and save a company and not to liquidate it. In the place of one arrangement bankruptcy (which worked under the previous regulations in 1% of the cases) and one recovery proceedings (which did not work at all) as many as four restructuring procedures were introduced, with each one for a different situation.

For the first time in the history of Polish bankruptcy law, creditors hold the strongest position. Earlier creditors' interest was protected on paper only and decisions allegedly protecting their interests were taken without consulting creditors themselves.

Currently, Restructuring Law limits the role of court to controlling formal correctness and creditors are given a voice. It is by all means right, because it is their money and they have the right to make a debtor (as well as a liquidator in bankruptcy proceedings) accountable for the effectiveness of activity and care for creditors' interest. Such an approach to the problem results in creditors more often agreeing to restructuring and participating in the process referring to a simple economic calculation. It is for them simply more profitable than bankruptcy. At the same time jobs, taxpayers and GDP generators are saved. Creditors can raise a future service client or deliverer.

Abstract

The apparel industry is a very competitive industry. In Malaysia, the apparel industry consists of players from both the international and local brand. Due to the high competition, it is critical to attract and retain loyal customers. One way is to create brand loyalty where the customers will not switch to a different brand easily. Therefore, the main purpose of this research is to study the factors influencing apparel brand loyalty. The target respondents are the Malaysia women. The factors studied included price, product quality, service quality, uncontrolled communication and store environment. The data was collected from 200 respondents through the survey method. The multiple regression analysis identified that all the factors studied contribute to brand loyalty. Therefore, the retailers need to ensure these factors are considered and matched with the customer expectations to create brand loyalty.

Key words: brand loyalty, product quality, service quality, store environment

Introduction

According to Euromonitor report (2019) the apparel industry is still growing. In Malaysia, the industry consists of both domestic and international brands competing among themselves. The global market for apparel in terms of revenue is projected to reach around USD 445.3 billion in 2020. The revenue shows an annual growth rate (CAGR 2020-2024) to be 9.9%. By 2024 the project market volume is expected to be USD649.6 billion (Statisca.com). In Malaysia, the apparel industry is forecasted to grow at a CAGR of 3.6% between 2019-2024 and expected to reach MYR48.8billion. Womenswear growth is projected at 3.9% and expected to reach MYR21.5 billion by 2024 (marketresearch.com). This shows that the apparel market globally and in Malaysia is on the growing trend.

With e-commerce on the rise, it is putting pressures on the physical stores. While the offline is still the main mode of shopping, the online purchase of apparels is expected to increase. Online retail shopping sites include Lazada, Zalora and Shopee while Padini Holdings is the leading store for women apparel. It has a variety of brands such as Padini, PDI, SEED, Brands Outlet and Padini Authentics.

A number of researchers has highlighted the importance of branding to businesses such as ability to establish strong ties with customers and generate loyalty towards the brand. In addition, brand enables businesses to achieve higher profitability, cost-effectiveness as well as sustainability for the business (Drennan et al., 2015; Pappu & Quester, 2016; Hegner, Fenko, & Teravest, 2017).

Literature Review

American Marketing Association (AMA)'s 2017 report associated brand with the buyer's experience. Branding is done through a set of images or ideas and may include name, symbol, logo, slogan and even design. Kotler and Keller (2006) stated that when the brand's loyal customers percentage goes up, the market share increases and the profitability level of the brand becomes higher. Therefore, brand loyalty is the outcome of the consumer behaviour which is impacted by a person's preferences (Selvarajah, 2018). With brand loyalty, the consumers will keep purchasing their preferred brands since they like the brand and price do not impact their decision. They will also not buy substitute products. Similar definition was provided by Tweneboah-Koduah & Farley (2016) where brand loyalty holds commitment to repeatedly and consistently patronise a preferred brand in the future. According to Erdogmus and Ergun (2016) brand loyalty is a critical asset in apparel brands. This is because it provides continuity in consumer lifecycle and through that a positive advocacy for the business.

Alvarez et al. (2000) indicated that brand loyal consumers uses current market price as a comparative element for brands of a set choice. Price is referred to as the amount of money paid to get the product (Kotler & Armstrong, 2008). Devi and Setiawan (2018) found perceived price have a positive relationship with brand loyalty. Earlier studies supporting the influence of price on brand loyalty are Shih (2012), Beneke and Zimmerman (2014), Dewi and Anggraeni (2015), Tomida and Satrio (2016). They all found that the relationship is positive and significant.

Batra et al. (2012) pointed out that quality is an important factor in contributing towards brand loyalty. An earlier study by study by Cater & Cater, (2010) who tested the relationship between product quality and customer commitment as well on the combined effect on brand loyalty and found that there is both direct and indirect effect. This means product quality has both direct and indirect effect on brand loyalty. According to Khan et al. (2016)'s study of quick service restaurant a positive relationship was found between product quality and behavior base brand loyalty. Similarly Devi and Setiawan (2018)'s study on fashion products in Indonesia indicated that perceived quality have a significant positive relationship with brand loyalty. Saif et al. (2018) found that high perception on product quality influence strong brand associations with lead to brand loyalty.

According to Kuo et al. (2009) service quality has no direct effect on brand loyalty, nevertheless it does lead to brand loyalty as well as repeat purchases. This is through the moderating variables of customer satisfaction and enhanced perceived value. Their study was on mobile network loyalty. A later study by Alireza et al. (2011) in the Iran's telecom sector found service quality serves as the key factor of brand loyalty. Their study identified perceived value as the mediator between service quality, corporate image and satisfaction. Zehir et al. (2011) also found service quality leads to brand trust and brand loyalty in their study of automobile sector in Turkey. In other words, there is positive impact of service quality on brand loyalty through brand trust and positive brand image. Khan et al. (2016) found there is a positive relationship between service quality and behavior base brand loyalty in their study of quick service restaurant.

Uncontrolled communications are through modes such as word-of-mouth, non-paid publicity, or tertiary communication. It is found that uncontrolled communication influence customers' awareness and attachment towards the brand (O'Cass & Grace, 2004; Melewar et al., 2017). According to O'Cass and Grace (2004) customer believe on views through uncontrolled communication since the information is provided by other customers or other parties based on their expectation and post purchase experience of the brand. Yeap et al. (2018) in their study of Malaysian's millennials perception towards Japanese brand found there is a positive relationship between uncontrolled communication and brand loyalty. They pointed out that views from such mode are regarded more authenthic and trustworthy.

Store environment is the experience retailers provide for customers (Tong & Hawley, 2009). It is an important aspect in marketing and focus on the physical environment which includes music, lighting, layout of store and arrangement of the merchandise (Hu & Jasper 2006; Wang & Ha 2011). In creating a unique store environment, it provides a powerful tool for market differentiation (Wu et al., 2013). Store environment is found to influence customer loyalty by Ailawadi, Pauwels and Steenkamp (2008) and Hansen and Singh (2008). Fox et al. (2004) pointed out unique store experience is an essential added value in addition to other factors such as price, quality and product assortment. They found that these factors significantly influence store loyalty. A later study by Venter et al. (2016) in South Africa found store environment significantly influence brand loyalty. Based on the review of the literature, the research framework was developed and five hypotheses were formulated. There are presented as follows:

Figure 1: Research framework

H1: Price has a significant influence on apparel brand loyalty among Malaysian women.
H2: Product quality has a significant influence on apparel brand loyalty among Malaysian women.
H3: Service quality has a significant influence on apparel brand loyalty among Malaysian women.
H4: Uncontrolled communication has a significant influence on apparel brand loyalty among Malaysian women.
H5: Store environment has a significant influence on apparel brand loyalty among Malaysian women.

Methodology

The study applied the quantitative research method. Respondents consists of Malaysian women. In order to collect the data, questionnaire is used as a research instrument. The questions were selected from various researchers such as Dai and Chen (2017), Hyun-Joo et al. (2010), Su and Chang (2018), Yeap et al. (2018), Yee and Sidek (2008), Hamza (2011), Alice (2010) and Raj (2018). The scale used to measure the constructs is a 5-point Likert Scale. The sample size is 200 and purposive research sampling is used as the sampling method. The respondents are Malaysia women especially located in Melaka, Johor, and Kuala Lumpur. The data was collected through google form and also through personally administering to respondents. SPSS software version 26 was used to analyse the data collected. Among the tests applied to analyse the data include descriptive test, reliability test, and the multiple linear regression analysis.

Results and Discussion

Two hundred sets of questionnaires were collected and all the received questionnaires were acceptable and can be used for the study. Questions related to demographic characteristics include age group, race, spending range, occupation and source of brand. The highest percentage of respondents is from the 20-29 age group (36%), while the lowest was below 20 (13.5%). The rest is around 16-17% for other age groups. In terms of ethnicity majority is Chinese which around 76%. The respondents consist of manager/executive (8.5%), engineer/IT (10.5%), teacher/lecturer (9.0%), administrative assistant (17.5%), housewife (15%), students (31.5%) and others (8.0%).The average amount spent on product is below RM100 and this accounted for 60.5% of respondents. Around 25% respondents indicated they spend RM 100-200 on average. Majority of the respondents purchase both the international and local brand which is around 64%.

Table 1: Profile of respondents

Demographic Characteristics	N	%
Age		
Below 20	27	13.5
20-29	72	36.0
30-39	34	17.0
40-49	35	17.5
50 and above	32	16.0
Race		
Malay	18	9.0
Chinese	152	76.0
Indian	29	14.5

Others	1	0.5
Occupation		
Manager/Executive	17	8.5
Engineer/IT	21	10.5
Teacher/Lecturer	18	9.0
Administrative Assistant	35	17.5
Housewife	30	15.0
Student	63	31.5
Others	16	8.0
Amount Spent on Average		
Below $100	121	60.5
$101-$200	50	25.0
$200-$300	19	9.5
$300 and above	10	5.0
Source of Brand		
International	49	24.5
Local	23	11.5
Both	128	64.0

The respondents' brand preference is presented in Table 2. The highest is H & M (24%), followed by Padini (22.5%) and Uniqlo (22%) and Cotton-On (10%). The preference on the rest of various brands is found to be below 10%.

Table 2: Brand Preference

Brand Preference	Frequency	Percent
Uniqlo	44	22.0
H & M	48	24.0
Mango	6	3.0
Hush Puppies	7	3.5
Giordano	4	2.0
Cotton-On	20	10.0
Vior	7	3.5
Padini	45	22.5
YFS Concept Store	3	1.5
Others	16	8.0

Hypotheses testing is done using the multiple regression analysis and the result is presented in Table 3. The R Square value is 0.520, which mean that 52% of brand loyalty can be explained by the independent variables which include price, product quality, service quality, uncontrolled communication and store environment. The Anova result showed that the F value is 42.065 and the p-value is 0.000. This means there is a model fit. This result indicates all the independent variables predicts brand loyalty. The values as indicated are price (Beta = 0.140, p value = 0.049) , product quality (Beta = 0.225, p value = 0.001), service quality (Beta = 0.180, p value = 0.011) uncontrolled communication (Beta = 0.110, p value = 0.041) and store environment (Beta = 0.193, p value = 0.003). The p-values for all the variable are below 0.05. This means that all the hypothesis (H1, H2, H3, H4 and H5) are all accepted.

Table 3: Results of Multiple Regression Analysis

R = 0.721	**R square=0.52**	**Adjusted R Square= 0.508**	**F = 42.065**	**Sig value = 0.000**

Dependent variable: Brand Loyalty

Price (Price), Product quality (PQ), Service quality (SQ), Uncontrolled communication (UC)
Store environment (SE).

Discussion and Conclusion

Brand loyalty is an important factor to be considered in the apparel industry. Due to the high competition business looks into ways to ensure there is brand loyalty among their customers. The purpose of the study is to identify the factors that influence apparel brand loyalty among Malaysians women. The factors studied include price, product quality, service quality, uncontrolled communication and store environment. It is found that all the factors influence apparel brand loyal. Price is found to influence brand loyalty. The result is similar with the study by Devi and Setiawan (2018) who indicated that price and brand loyalty have a positive relationship. Another factor critical to brand loyalty is product quality. The result of this study is supported by various studies such as Batra et al. (2012) and Saif et al. (2018) where product quality is essential to influence the brand loyalty of apparels. The current study found that service quality also influences brand loyalty. This finding is in line with previous study by Zehir et al. (2011) and Khan et al. (2016). Therefore, to ensure there is brand loyalty the service rendered must be of high quality. The uncontrolled communication which is among others from the mode of word of mouth is another factor found to be critical for brand loyalty. The result indicated that uncontrolled communication influences brand loyalty. This result is supported by previous studies such as Melewar et al. (2017) and Yeap et al. (2018) who all found that uncontrolled communication to be an essential influencer towards brand loyalty. The last factor studied is store environment which the study found to influence brand loyalty. This result is also similar to previous studies such as by Hansen and Singh (2008) and Venter et al. (2016). This means to increase brand loyalty, business need to put effort on their store environment in order to appeal to their customers.

The finding of this study contributes to the existing body and knowledge on factors influencing apparel brand loyalty especially from a Malaysia context. This study presents an insight regarding the determinants of brand loyalty of apparel among Malaysian women. Moreover, this study able to assist apparel industry in establishing strong relationship with Malaysian consumers. This can be done by focusing on the factors that are important to compete more effectively. Factors such as price, product quality, service quality, uncontrolled communication and store environment are essential towards building a stronger brand loyalty in apparels. Those in the industry need to utilise their resources in these areas. It also helps in reaching out customers through having a better understanding of the women consumers' need, intention and behaviour when they purchase the product.

There are a few limitations that have been identified in this study First, the sample size collected might not represent the overall population of the Malaysian women. This is because data was collected only in Melaka, Johor, and Kuala Lumpur. Next, the study focuses on five variables. Recommendations for future study are to consider a bigger sample size and other demographic characteristics in conducting the study. The respondent in this study consist of only Malaysian women. Future research can include the male respondents as well.

Abstract

The world is rapidly changing and becoming even advanced with the existence of technologies. One of the major changes is the evolvement of traditional payment methods to electronic payment systems (EPS). EPS, which was accepted globally when e-commerce was introduced, has provided many benefits to its users. Individual's life has been enhanced as EPS provides ease in payment and is less-time consuming. Irrespective of innovations in e-payment methods, studies reveal that e-payment usage rate is lower in developing countries. Among the existing literature, very few studies focus on the consumers' point of view. In this paper, a research model is proposed to examine the effect of transaction procedures, technical protection and usability of EPS on the perceived security and perceived trust of EPS, and also the effect of perceived security and perceived trust on the usage of EPS is studied. The model is evaluated empirically and the findings reveal that transaction procedures, technical protection and usability of EPS have a significant impact on the perceived security and perceived trust of EPS. Perceived security and perceived trust of EPS are found to be significant factors of EPS usage. The study is useful for companies and businesses that would like to enhance their payment system through electronic transactions. Findings suggest that managers should focus on providing the best in transaction procedures, technical protections and usability in order to enhance the perceived security and perceived trust EPS, which in turn will have a positive impact on the EPS usage.

Keywords: Perceived security, Perceived trust, Transaction, EPS, Usage.

Introduction

Electronic payment system (EPS) has improved the lives of individuals through ease of payment for online transactions. As the world develops further technologically, it can be perceived that many devices are used to process the payments electronically. The e-commerce world offers many advantages compared to conventional commerce like anonymity, swiftness, openness and global ease of access, simplifying life and enhancing individual's life quality (Lee, Yu & Ku, 2001). This has created a financial requirement which cannot be satisfied by traditional payment system and initiated an investigation on electronic payment system also known as EPS; a conventional payment system that applies digital currency technology (Sumanjeet, 2009). As a part of e-commerce transaction, e-payment comprises of electronic payment for buying and selling goods available on the internet (Tella & Abdulmumin, 2015). Different types of EPS

are being developed to accommodate the growing e-commerce business so that consumers are able to complete their online transactions conveniently.

The development in the universal business atmosphere summons most of the organizations to change inevitably from the traditional money transactions to EPS (Kabir et al., 2015). EPS was created based on conventional cash-based and account-based payment model framework (Kim et al., 2010). EPS is generally understood as a platform where the payments are made for goods and services bought online using Internet (Roy & Sinha, 2014). EPS existence caused the world's payment system to be aligned with the latest trend of cashless deal among consumers, businesses and governments (Odi & Richard, 2013). This resulted in the world payment system to slowly change from traditional cash-based money to electronic forms that offer an even convenient, rapid and safe process to make payment between consumers and organizations (Premchand & Choudhry, 2015).

Usage of EPS in early economies is restricted, but literature revealed a few models and studies that explicate innovation acceptance linked with information and communication technologies (Eelu & Nakakawa, 2018). Even with the expansion of e-commerce, not all businesses and consumers immediately accept the idea of EPS. With e-commerce come e-payments. E-payments are done through the Internet without the use of paper instruments (Junadi, 2015). Though EPS are seen as a significant constituent in the achievement of e-commerce dealings, studies revealed that e-payments were not entirely successful in replacing conventional payment methods because of their weaknesses. Some of EPS flaws include security threats and complex infrastructure of physical receipts and lack of awareness. In turn to solve these obstacles, EPS designers have to be more detailed in including security features which can address consumers' perceived risk, security and trust. Usage of web assurance seals and websites usability should also be suitable for consumers' use.

Fatonah et al., (2018) reviewed the literature for e-payment system highlighting the need for more research to be carried out in enhancing customers' trust, interest and security in EPS. According to Fatonah et al., (2018), 46% of the empirical studies on EPS is done in Asia, 23% in Africa, 20% in Middle East, and the rest of the research conducted in Europe and America. Although majority of the research on EPS is conducted in Asia, very few studies has been done in Malaysia. Chavosh et al., (2011) carried out a study on the bank customers' satisfaction with the EPS, and a recent research by Intan et al., (2018) studied the adoption of EPS. Although several studies have been conducted on EPS, no research has been particularly conducted on the usage of EPS in Malaysia. Therefore, the current study focuses on the factors influencing the usage of EPS from the Malaysian consumers' perspective. The main objectives of the study are as follows:

1. To study the effect of transaction procedures, technical protections and usability on perceived security and perceived trust.
2. To study the effect of perceived security and perceived trust on EPS usage.

Literature

The emergence of Information and Communication Technology (ICT) has caused a dynamic change in the business's world environment, where business transactions are switching from cash-based transactions to electronic-based transactions (Al-Laham, Al-Tarawneh & Abdallat, 2009). EPS is a method for a consumer to make online payment for goods or services purchased without physical transfer of cash and cheques, regardless of time and location (Singh, Supriya & Joshna, 2016). Services offered by EPS appear as websites user-interface which entitle consumers to distantly control and handle their bank accounts and online transactions (Weir, Anderson & Jack, 2006; Lim, 2008). For businesses which are operating electronically, a crucial factor of accomplishment would be EPS. While comparing EPS and traditional payment methods, EPS techniques are more favourable as it is more secure, reliable, scalable, anonymous, acceptable, private, efficient and convenient (Linck et al., 2006; Cotteleer et al., 2007; Kousaridas et al., 2008). However, an EPS would only contribute to a business success if it is secure, an important requirement needed in the global e-commerce setting (Tsiakis & Sthephanides, 2005; Linck et al., 2006; Cotteleer et al., 2007). Based on previous studies, less human interaction and public relationships in EPS produce a security threat for EPS (Kim et al., 2010; Tsiakis & Sthephanides, 2005). Lack of privacy and trust are the two main causes for consumers' disinterest for engaging in e-commerce transactions (Van Dyke et al., 2007; Eastlick et al., 2006). In addition, other factors that could affect consumer's perceived security and trust were also analyzed to further understand the research phenomenon.

Security is considered among the most significant and well experimented fields of research in financial systems (Abrazhevich, 2004). One of the main concern of the EPS customers is the perceived security of EPS (Linck et al.2006; Kim et al. 2010) Security can be described as safeguarding the transaction details of consumers from interior and

exterior deceptions or illegal practices (Bindusara et al., 2009). Security is one of the highly considered reasons that affect EPS usage among consumers and has a significant relationship with EPS usage among consumers (Oney et al., 2017).

Trust is described as "desire, in the anticipation of advantageous results, to cause one to be susceptible to others based on assessment of resemblance of aims or principles" (Earle, 2009). Another definition of trust is the person's assurance that their belongings such as cash and private details would not be leaked and used against their personal interest (Bindusara et al., 2009). Consumers' professed trust of EPS is specified as consumer's personal view that e-payment transaction will be carried out according to their outlook (Tsiakis & Sthephanides, 2005; Mallat, 2007). According to Lim et al. (2007), superior intensity of consumers' assurance and faith in EPS is a major causal determinant for them to successfully adopt EPS in their online transactions. Trust has been recognized as a highly important factor affecting EPS usage among consumers, and consumers with a high level of trust would be willing to adopt EPS (Kim et al., 2010; Tsiakis & Sthephanides, 2005). Studies that revealed perceived trust has a significant impact on the EPS usage include by Bindusara (2009), Kim et al., (2010) and Oney et al., (2017).

Transaction procedures are a critical part of EPS that individuals have to be aware of for them to utilize EPS securely and professionally (Oney et al., 2017). If certain procedures are not done correctly, it may affect the transaction and cause problems. Therefore, it is advisable for consumers to understand the transaction procedures thoroughly before entering into any transactions. According to Barkhordari et al. (2017), transaction procedures are unique structures used by EPS to guarantee a successful electronic transaction. The transaction procedures in EPS were discussed frequently in previous literatures (e.g. Linck et al., 2006; Hwang, Shiau and Jan, 2007; Kousaridas et al., 2008). This shows that transaction procedures have been one of the factors that were considered to affect EPS usage.

Technical protections are also one of the determinants that could shape consumers' perceived security and trust on EPS. Kalakota and Whinston (1997) reviewed certain issues regarding EPS's security; the study revealed that EPS security should be strengthened in order to minimize security breaches as EPS's vulnerability is something that should be viewed seriously. Various technical methods were implemented and applied to guarantee the protection of electronic payment (Linck et al., 2006). Technical protections were claimed to be a key antecedent for EPS's safety (Kim et al., 2010). Technical safeguarding which includes stability, confidentiality and reliability have a constructive result on perceived security and trust (Kim et al., 2010; Chellappa & Pavlou 2002). In another words, by providing adequate technical protections, consumers' perceived security and trust in EPS would amplify (Oney et al., 2017).

Davis (1989) stated that when consumers are able to exert less effort in utilizing the machine, the more helpful they view it to be. Adopting any internet equipment depends strongly on the user's insight, abilities and proficiency in internet uses (Goudarzi et al., 2013). Besides security, other psychological determinants are also accountable in increasing trust from consumers' perspective which includes usability, accessibility, safety, reliability and confidentiality (Lichtenstein & Williamson, 2006). Perceived ease of use has a strong impact on purpose to transact (Sanayei & Noroozi, 2009). Consumers who are unaware of the ease of use (technology) would not be able to operate it effectively (Curran & Meuter, 2005). According to Polančič et al., (2010), continuous usage of a technology depends heavily on the purpose to use and view of convenience. Moreover, Goudarzi et al. (2013) mentioned that not understanding the EPS usage procedure would cause consumer to be hesitant in performing electronic payments, at the same time reducing the amount of faith and safety a consumer has while using EPS.

Review of existing studies on EPS reveals that transaction procedures, technical protections and usability have a significant impact on perceived security and trust which in turn has a significant effect on EPS usage.

Research Model and Hypotheses

Studies that examined the relationship between perceived security, perceived trust and EPS usage are scarce. Two of the noteworthy studies are Kim et al. (2010), and Theodosios and George (2005). From both studies, it can be concluded that perceived security and perceived trust has a positive impact on EPS usage. Theodosios and George (2005) also mentioned that EPS providers are advised to consider trust and security as significant determinants of EPS usage among consumers. This study borrows Kim et al.'s (2010) research model, which is designed to find out the impact of perceived security and trust on EPS usage among consumers. If an EPS does not sufficiently provide secure transaction environments, consumers will treat the system with wariness, which may reduce consumers' trust and eventually their use of the system (Guan & Hua, 2003; Mukherjee & Nath, 2003; Linck et al., 2006; Kousaridas et al., 2008). This is why it is important to examine the factors that manipulate consumers' perceived security and trust. However, this

research framework identifies a new factor usability which is also believed to be a prominent determinant for consumers' perceived security and trust. The research framework is as follows (see Figure 1)

Fig. 1: Research framework on The Determinants of Electronic Payment System Usage among Consumers

A well-defined transaction procedure guide the customers properly to ease their security concerns (Hwang et al., 2007; Kim et al., 2010). Kim et al. (2010) in their study acknowledged technical protections to be an important antecedent for EPS security. This is because EPS is vulnerable to security threats, and consumers would prefer a technically protected EPS to conduct their online transaction. Continuous usage of EPS mostly depends on consumers' intention to use and perception of usefulness (Polancic et al., 2010). Being vague about the usage procedure of EPS would make consumers hesitant to perform payments electronically, at the same time decreasing the consumers' perception of trust and security when using EPS (Goudarzi et al., 2013). The degree of perceived security has a huge impact on consumers' decision on EPS usage. According to Kim et al. (2010) and Tsiakis & Sthephanides (2005), consumers who have a low perceived security towards EPS are unlikely to engage in a transaction. Trust has been acknowledged as one of the significant factors to influence EPS usage among consumers, and that consumers with high level of trust would be more likely to adopt EPS (Kim et al., 2010; Tsiakis & Sthephanides, 2005). Mallat (2007) identified that trust is more important than security, if there is no trust consumers would not use EPS. Based on these findings the following hypotheses are developed.

Hypothesis 1: There is a significant relationship between transaction procedures and perceived security.

Hypothesis 2: There is a significant relationship between transaction procedures and perceived trust.

Hypothesis 3: There is a significant relationship between technical protections and perceived security.

Hypothesis 4: There is a significant relationship between technical protections and perceived trust.

Hypothesis 5: There is a significant relationship between usability and perceived security.

Hypothesis 6: There is a significant relationship between usability and perceived trust.

Hypothesis 7: There is a significant relationship between perceived security and EPS usage.

Hypothesis 8: There is a significant relationship between perceived trust and EPS usage.

Methodology

Data was collected from a sample of 150 respondents using questionnaire. The instruments were developed based on the studies by Oney et al.'s (2017), Barkhordari et al. (2016) and Özkan, et al., (2010). Convenient sampling method was used in this study. The respondents were students and working adults who had experience in using EPS or intend to use EPS or never used EPS. A total of 150 responses were collected, and the data was analysed using SPSS software version 25. Descriptive statistics and Multiple Linear Regression analysis were used for demographic analysis and hypotheses testing respectively.

Findings

Demographic Profile

The results of the demographic profile reveals that 56.7% of the respondents were male and 43.3% of the respondents were female. Majority of the respondents are in the age group of 21 to 24 years old (43.3%) followed by respondents aged 20 years old and below which makes up 32.7% of the total respondents. Respondents aged 25-29 years old and 30 years old and above each make 12.0%. 72.7% of the respondents were Chinese followed by 15.3% Malay respondents, 11.3% of Indian respondents and 0.7% under the 'other' category. 71.3% of the respondents have a monthly income of RM 2,000 and below, 14.0% respondents with RM 2,001-RM 4,000 monthly income. 7.3% of the respondents each have a monthly income of RM 4,001 – RM 6,000 and RM 6,001 and above. 86.7% of the respondents are single while only 13.3% of them are married. Academic qualification of the largest group of respondents are Degree holder with 49.3% and second largest group are certificate level with 30.0%. Remaining number of respondents were Secondary, Diploma and Master/PhD holders with 4.7%, 12.0% and 4.0% respectively. Students made up a large portion of respondents with 67.3%, followed by private employees of 19.3% respondents. Government employees and unemployed were 4.7% of the respondents each. The remaining 4.0% of the respondents were in 'Others' category. The highest number of EPS chosen was online banking and debit card with 32.7% and 31.3% of the respondents respectively. This is followed by credit card and ATM transfer with same number of respondents (18.0%). None of the respondents used electronic cheque. 40.0% of the respondents used EPS 1-2 times a month and 26.7% of the respondents used EPS 3-4 times a month, 23.3% of the respondents used EPS more than 5 times a month and 10.0% of the respondents never used EPS.

Hypotheses Testing

Multiple Linear Regression analysis was performed three times to test the hypotheses due to the unique structure of the research framework.

Multiple Linear Regression Analysis 1

The effect of perceived security and perceived trust on the EPS usage is shown in this part. The R^2 value of is 0.618 which reveals that the predictors have a symbolic effect of 61.8% variability in relation to the EPS usage. The adjusted R^2 of the study is 0.613 which explains that 61.3% of variance in EPS is due to at least one of the variables namely perceived security and perceived trust. The ANOVA table shows a F value of 119.021 and p-value less than 0.001, which proves that the overall regression model is significant.

Based on the coefficients table, both the variables perceived security (Beta =0.251, p value < 0.05), perceived trust (Beta = 0.492, p value < 0.001) has a significant effect on the EPS usage. Therefore, H7 and H8 are supported.

Table 1: Multiple linear regression analysis 1 model summary

		B	Std. Error	Beta		
1	(Constant)	1.222	.179		6.811	.000
	Perceived security	.251	.105	.276	2.396	.018
	Perceived trust	.492	.107	.530	4.607	.000

a. Dependent Variable: EPS usage

Multiple Linear Regression Analysis 2

The effect of transaction procedures, technical protections and usability on the perceived security is shown in this part. The R^2 value of is 0.687 which reveals that the predictors have a symbolic effect of 68.7% variability in relation to the perceived security. The adjusted R^2 of the study is 0.681 which explains that 68.1% of variance in perceived security is due to at least one of the variables namely transaction procedures, technical protections and usability. The ANOVA table shows a F value of 107.066 and p-value less than 0.001, which proves that the overall regression model is significant.

Based on the coefficients table, all the variables transaction procedures (Beta =0.371, p value < 0.001), technical protection (Beta = 0.360, p value < 0.001) and usability (Beta = 0.231, p value < 0.001) has a significant effect on the perceived security. Therefore, H1, H3 and H5 are supported.

Discussion and Conclusion

The potential of the e-commerce market has attracted many businesses to enter this field (Junadi[a], 2015). To cope with the fast-moving e-commerce business, EPS was introduced to make transactions easier and more convenient for consumers. However, not everyone is keen on using EPS even when it offers many advantages like convenience, low cost and availability. Therefore, the current study identified the significant factors which affect one's usage of EPS. The study consists of two parts, the first part investigates the effect of perceived security and perceived trust on the usage of EPS, the second part studies the impact of transaction procedures, technical protection, usability on the perceived security and perceived trust.

Results indicate that both perceived security and perceived trust have a significant impact on the usage of EPS. This shows that the consumers are more confident and willing to use the EPS if they perceive the system to be secured and trustworthy. The findings are consistent with the existing literature (Kim et al., 2010, Maroofi et al., 2012, Barkhordri et al., 2017, Oney et al., 2017). The second part of the results indicate that transaction procedure has a significant effect on the perceived security and perceived trust. The results are consistent with Romdhane (2005), however contradicting the studies by Kim et al (2010) and Oney et al., (2017). Technical protection is found to be a significant determinant of perceived security and trust, which is similar to the findings by Kim et al (2010) and Oney et al., (2017). Finally, the results show that there is a direct impact of usability on perceived security and perceived trust, the findings are consistent with the past studies by Juwaheer et al. (2012), Nasri and Charfeddine (2012).

In conclusion, simple transaction procedures that are easy to follow would enhance the consumer's perceived security of EPS. In other words, when consumers are able to complete a successful EPS transaction by following the procedures, their perceived security and trust will increase. Technical protections have also been determined to one of the strong determinants for perceived security and trust. Therefore, the proof shows that the existence of technical protections for EPS users can enhance consumers' feelings of security. If an EPS system implements technical actions to decrease the chances of payment delays and transaction times, or provide a final step of confirmation before conducting the financial transaction, consumers would definitely feel more secured towards EPS. Furthermore, if an EPS system has insufficient technical protections, consumers would not trust to use it (Barkhordari et al., 2017). This is because consumers' personal information can be stolen any moment if the technical protection is not strong enough. EPS usability has a

significant effect on the perceived security and perceived trust. When consumers understand how to use EPS, the transaction can be done easily. Goudarzi et al. (2013) stated that lack of understanding on the use of EPS would decrease the trust level of consumers. It is common for people to treat something they do not know with distrust. If EPS is user-friendly and easy to use, it provides convenience and builds trustworthiness in consumers. Improving perceived security shows intensification of EPS usage among consumers (Barkhordari et al., 2017). It is absolutely normal for consumers to reject EPS if they are unable to trust the system to complete the task required. Barkhordari et al. (2017) stated that EPS usage among the consumers intensifies when perceived trust is enhanced.

Implementing EPS in a business definitely makes it more convenient and quick to conduct any financial transaction, especially when the numbers of EPS users are increasing nowadays. Hence, managers should understand the impact of the influencing factors. The current study shows that perceived security and perceived trust increases EPS usage. Managers should implement ways to generate user's perceived security and perceived trust. Through this study, it is found that transaction procedures, technical protections and usability affects perceived security and perceived trust. Therefore, managers should focus on providing the best in transaction procedures, technical protections and usability. The EPS system should not leak user's personal information and uphold user-friendly features and reliability. Besides, the results show that consumers are more secured and trust to use EPS when it is easy to use and hassle-free. Thus, it is essential for managers to monitor consumer's satisfaction and act accordingly if there are any sign of dissatisfaction. Future studies may include other critical factors such as past experience, access to security guidelines, social influence that affects the usage of EPS. The model can be tested using structural equation modelling.

Abstract

The aims of the paper are to present the relationship between the concepts of innovative business models and digitalization in Industry 4.0, and to illustrate the impact those components have on current companies. In times of increasing dynamics, complexity and digital transformation of society and market, the demand for innovation applies not only for products, services and processes or day to day activities, but also for business models. Digitalization represents a key feature of the fourth industrial revolution or the so-called "Industry 4.0", a new phase in the development of industry all over the world. In Industry 4.0, products, logistics and services are technically and organizationally merged with one another by using cyber-physical systems in such a way that an increased and self-controlling production flow is created. For the economic success, it is of central importance to recognize future developments and trends in time, and to initiate corresponding measures and thus to address them by anticipating them with the goal of future market requirements and to generate long-term competitive advantages. Business model innovations in Industry 4.0 and digital transformation have reached companies. Yet, there are big differences in the speed of implementation of business model ideas. Most companies prefer a slow development of business models, as this does not radically change the evolution of the company. But there are also companies who enhance radical shifts which affect their whole logic of value creation. In order to reach the aims of the paper the authors used a quantitative research method and a case study. The findings of the research showed that digitalization and innovative business models improve the performance of today's organizations and, in the case of European companies, lead to providing safer products for customers and achieving better results. The paper contributes to the development of the scientific literature by emphasizing the key role played by digitalization and business models in Industry 4.0.

Keywords: Innovation, Business Model.

Introduction

The benefits of digitalization can be reduced to one simple definition: the increase of efficiency, process quality, sales and other factors as well as the reduction of costs and error rates (Tohanean et al., 2018). Depending on the industry and orientation, for example, the development of new markets is desired or innovative services for existing customers are to be offered. Similarly, the development of completely new business models is often sought. Like every innovation step, the digitization of business processes and models requires well-founded preparation from initial potential analysis to practical implementation and continuous further development. The fields of action range from the inclusion of appropriate consultants, through the selection or development of software, to questions of training and qualification or IT security.

The term business model starts with the challenge: although there is broad consensus in the literature that the development of new business models is of fundamental importance for successful positioning in the course of digital transformation. However, the definitions of which components actually make up a business model are very different. Nevertheless, some basic ideas can be summarized: In essence, a business model is derived based on corporate strategy (Puranam, 2016) and business idea and includes a number of different elements and an appropriate architecture, on the basis of which money is finally earned. Typical elements are customer segments, the cost

Cite this Article as: Dragos TOHANEAN, Loredana Nicoleta ZAINEA and Sorin-George TOMA "Business Model Innovations in the Age of Digitalization and Industry 4.0" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

structure, distribution channels, required resources, etc. These elements show possible starting points for the development of new business ideas in the course of digitalization.

Of crucial importance here is the understanding that "the one" digital business model does not exist, but business models (independent of digitization) must be either continuously re-developed or by using a variety of methods further developed in a differentiated manner. At the same time, it makes sense to consider existing business models of third parties and to discuss the transfer of various elements to one's own concept. This poses a major challenge to business model development: if these were limited to adopting obvious technologies or software products or copying specific ideas, all the competitors in an industry would be in the same position within a very short time. Demand and potential of the business model development are to identify those approaches and customer requirements, for which no technical solutions or business processes were yet found.

Literature Review

The main concepts of the paper are digitalization, business models and the Fourth Industrial Revolution. The concept of digitalization has been defined in different ways. Some researchers consider that the fresh thinking induced by digitalization leads to value creation (The Economist, 2017) while others see digitalization as the implementation of a new product/process, or a new way to think about business strategies (Kuczmarski, 1996). A business model shows the way an organization creates, delivers, and captures value (Osterwalder et al., 2014). On its turn, the Fourth Industrial Revolution refers to the fusion of several technologies (e.g., nanotechnology, quantum computing) and their interaction across the following three domains: physical, digital and biological (Schwab, 2017). As Industry 4.0 creates an integrated relationship between business and technology, digitalization is increasingly representing a key element of today's business models (Mandapaty and McClure, 2016). Moreover, successful business model digitalization leads to value creation (Wirtz and Daiser, 2017). Therefore, there is a link among digitalization, business model and the Fourth Industrial Revolution.

Research Methodology

In order to achieve the research objective, the authors used a quantitative research method combined with a case study. The information was gathered from numerous sources of secondary data, such as books and articles from the domains of management, IT, and digitalization, or corporate reports of business models in different industries, through a desk research. The literature review was carried on mostly on sources that have been found both in electronic databases (e.g. Springer, Wiley Online Library and Amazon) and in libraries (e.g. Central University Library "Carol I", British Council Romania). The case study had as focus existing business models from companies and countries all over Europe, companies like: UiPath, Continental Automotive Romania, Dell, BMW AG, SC Database for Commerce and Industry Romania SRL, DriveNow, IBM or SAP SE.

Digitalization in the context of Business Model

The current phenomenon of the economy-accelerated digitalization, known as the "Industry 4.0", will generate both an increased productivity, connectivity and several transformations on the labor force skills (Androniceanu et al., 2020).

For many companies, digitization seems at first glance to be an intangible phenomenon. Many classify you as a gentle breeze. But in truth, it is a hurricane that changes the existing industry landscape. Due to their cross-sectional characteristics, the upstarts of digitization cannot be limited to individual sectors, fields of application or company divisions (Wirtz and Daiser, 2017).

This change creates new germ cells, both at the product and business model levels. Changes in one area lead to adjustments in other areas, making opportunities or threats difficult to identify. Businesses need to rethink and see digitization as an opportunity (Kompetenzzentrum Geschäftsmodelle in der digitalen Welt, 2017). To do so, it is necessary to understand both the core and the patterns of digitization and their impact on business models, and thus on the implementation of corporate strategy.

Digital business models are performance transaction systems based on networked digital technologies. The transactions are recordable, process able, repeatable and exploitable. The exchanged services and considerations can be both digital and analog.

At the heart of digital business models (Kompetenzzentrum Geschäftsmodelle in der digitalen Welt, 2017) is the economic transaction of services and not just the human with its needs. The interface to humans takes place via

technical end devices. This fundamental difference between digital and analog business models requires rethinking the design of processes, products, and new business models in a digital context.

Industry 4.0 not only leads to technical changes, but especially to digital business models and processes. Against the background of this digital revolution, work must be redefined. A prerequisite for the implementation of Industry 4.0 in companies is the establishment of "networked thinking, working and leading". What is required are “free-thinking” employees and a start-up mentality that enables creative work.

Model of Digitization

Due to the manifold possibilities, a kind of gold-digging mentality has emerged. Everyone wants to bring forth the next Big Bang Disruption. Many try, and yet most fail. Looking at the development of the digitization wave from a bird's eye view, characteristic patterns of digitization can be identified.

Rising Dematerialization

The central pattern of digitization is the transfer of physical products / services into their digital images (Hoffmeister, 2017). Services can be consumed regardless of location and time, see for example music streaming services. Another aspect of dematerialization is the virtualization of hardware, that is, the replication of a hardware or software object by a similar virtual object. This digital twin is used, for example, in machine and plant engineering to optimize machine designs, make commissioning more efficient, improve process times and, last but not least, ensure fault-free operation. An intermediate stage of dematerialization are hybrid services that enable physical products, e.g. IoT.

Merging Domains

As a cross-cutting topic, digitization leads to cross-sector linking, imitation and recombination of services and business models. Digital business models do not have analogous boundaries and rules. The industry loses its importance as a reference point for strategic orientation and orientation. With its business model Clickapoint.com (Fortune 2018) dissolves the boundaries between ride-sharing and freight transport and between private and commercial.

Increasing benefits from more users

When the utility of a service or business model changes with the number of users, it creates a network effect (Hoffmeister, 2017). He's driving the tremendous speed and reach of digital business models. Contact platforms like Facebook (Fortune 2018) or auction platforms like eBay (Fortune 2018) are prominent examples of the exploitation of this pattern.

Falling Marginal Costs

Digital services or dematerialized physical performance have a zero marginal cost property, that is - both the production / reproduction and distribution of an additional unit results in only marginal costs. The effort for the duplication of a once generated digital music album is negligible. The copy has the same high quality as the original. Furthermore, there are negligible costs for the storage of digital services as opposed to physical services. Falling marginal costs lead to new degrees of freedom regarding the design of the revenue mechanics of digital business models.

Falling Transaction Costs

Transaction costs are all costs incurred from the inception of the transaction until its completion. If these are high enough, it is more economical to produce them than to procure them from the market. Digitization leads to falling transaction costs. The lower they become, the more inefficient the in-house production of services becomes. Falling transaction costs lead to decreasing benefits of integrated business models. Digital business models in which the

economic transaction is in the foreground become more attractive. For example, tripadvisor.de (Fortune 2018) reduces the search, comparison and booking costs for its customers through its business model.

Increasing Demonetization

The increasing demonetization is mainly due to falling frontier and transaction costs. As a result, digital business models can be designed that offer services "for free" (Hoffmeister, 2017). Thus, numerous software providers provide a free basic version of their program. However, once the user wants more functionality, they must purchase the paid upgrade.

Continuous Resource Access

Digital business models, such as the Airbnb (Fortune 2018) business model or the FlixMobility (Fortune 2018) business model, facilitate finding and accessing unused resources / capacities. The transition from ownership to benefit leads to increased flexibility and reduced fixed costs. The development costs of resources are also eliminated. This pattern is essential for exponential growth and opens up new degrees of freedom in the use of digital business models.

Rising Personalization

Digital services can be more easily adapted to individual customer needs than physical services, since the transactions are detectable, process able and recoverable. This affects both the content, the functionality and the performance. A basic software package can be adapted by extensions to the respective user. Furthermore, digital services can be further developed after sales and adapted to changing needs - e.g. update of software.

Increasing Decentralization

The increasing number of networked, internet-enabled devices creates new degrees of freedom for customer benefit and thus also for digital business models (Hoffmeister, 2017). There is a shift from localized to an anytime, anywhere consumption. Customers are becoming more and more independent and consuming content / services when they want it and need it, not when it is offered to them. This new status quo requires new digital business models that effectively and efficiently implement emerging degrees of freedom. The company Shpock (Fortune 2018) (flea market app - SHop in your POCKet) has recognized the potential. Customers can browse through offers in their area on their smartphones, or hire their own products.

Unlimited Growth

The economic peculiarity of digitization lies in the almost free scaling of its products. Therefore, unlimited growth is both a characteristic of digital products, processes and business models as well as a result of digitization itself. Prerequisite for this is the networking of people and things and the dematerialization of services. This leads to minimal marginal and transaction costs, i.e. the cost of copying and distributing digital services is close to zero.

These patterns of digitization should, on the one hand, sharpen the understanding of the success factors of digital business models and, on the other, provide food for thought for the development of new digital business models. Digital business models often have a resounding success because they combine multiple patterns and cover existing needs at a "higher level".

Types of digital business models

There are now a variety of business models in the digital environment (Wirtz and Daiser, 2017). However, there is still no uniform characterization and structuring of these business models in order to use them as an incentive for the development of new digital business models. Furthermore, there is a lack of embedding the different perspectives in an overall picture. However, the fields of application can be summarized in the optimization of processes, the improvement or redesign of products, adoption of platforms and the optimization or redesign of business models.

Company activities in the digital economy usually take place on their own or third-party platforms. Own platforms can include websites, online shops and apps. External platforms include, for example, Google, Facebook, Amazon and other high-reach companies. The own platform must generate relevance in order to assert itself on the market. Activities on third-party platforms must generate relevance in order to prevail against other platform participants. Some companies - such as Trivago - use the system of digital transformation KPIs to lead the organization around people. They also work internally as a platform and generate relevance, value, benefit and significance for customers, managers and employees.

With the help of the digital transformation KPIs, success and failure in companies of the digital economy can be measured beyond financial KPIs. They are to be understood as an indicator of the change from the industrial to the digital economy.

As a rule, companies in the digital economy replace the missing financial KPIs with measured values that are geared towards relevance. Relevance is the currency of every major platform. And as a company in the digital economy, they will either integrate external digital platforms into their business model (e.g. Facebook, Google, Amazon, Twitter) or set up their own platforms. And in both cases, they have to identify where and how relevance arises. Only those who generate relevance are welcome partners on foreign platforms. Only those who generate relevance with their own platform will remain in the market.

A key aspect to be taken into consideration is the migration from human resources to machines, by means of standardization, automation and robotization. Below image highlights the main differences and key activities performed by humans or machines.

Fig. 1: Migration from human resources to machines

Such a change applies the appearance of multiple or new digital business models. In the following a structuring by clustering and abstraction of the functional fulfillment of different digital business models takes place. The aim is to unite the different perspectives and definitions in this area in order to increase transparency and thus understanding and provide stimulus for the design of digital business model innovations (Tohanean & Toma, 2018).

Dematerialize

This business model type is mainly about the digitization of analog products and business models. In this context, digitization means the transformation of previously analogous products and business models into a digital environment.

By virtualizing production processes, for example, machine efficiency and thus overall process efficiency can be increased. This digitization is the basis for further services in the context of "as a service".

A hybrid form represents data-infused products, smart products. Intelligent, networked products offer users added value through supplementary data services based on sensor integration. These new services can only be monetized by means of a suitable digital business model. In the future, products will be data-centered, intelligent, networked, communicative, modal and customizable.

Materialize

Business models in the field of materialization deal with the transfer of digital data into a physical structure.

An exciting application, for example, is the long-term guarantee of spare parts. Siemens (Fortune 2018) depicts spare parts availability without bearings based on 3D data and additive manufacturing (EOS, 2018). Shapeways (Fortune 2018) transforms customer ideas into genuine, affordable and personalized products. The customer only has to upload their 3D data, which they can create on their own or through designers, and can then choose between numerous materials. Shapeways takes over the printing, post-processing and sending of the object for him.

Supply

One of the largest and at the same time imperceptible areas of digital business models is the provision of services / functions and resources / capacities. Resources are not physically acquired, but can be obtained and consumed over the Internet as needed. This continuous access to resources increases customer flexibility, opening up new levels of freedom.

In this context, the Xaas approach (Everything as a Service) (Search Cloud Computing, 2017) provides a valuable orientation and source of inspiration for the development of future digital business models. The core of the approach is that "everything" is provided and consumed as a service. For example, Dropbox (Fortune 2018) provides storage capacity. Amazon (Fortune 2018) provides its sales platform to other merchants. The XaaS approach is growing and has become indispensable in our private and working lives.

Analyze and process

These business model types focus mainly on analyzing and evaluating data. Due to the increasing data availability, big data, it becomes more and more important to select the relevant data and information in order to be able to derive developments from it.

Google (Fortune 2018) makes it possible with its product Google Analytics, for example, to analyze the traffic on a website.

Network

These business model types connect people for the purpose of communication, interaction, and knowledge sharing. Prominent representatives are social platforms like Facebook (Fortune 2018) or Instagram (Fortune 2018).

Selling

Business models of this type distribute goods via digital channels. Both digital products, dematerialized products and physical products are sold. This field is characterized by a high variety of variants and requires a specialization to be successful. Amazon or Zalando are prominent examples.

Connect / Transfer

This business model type merges demand with relevant offers. The supply side receives a market access or digital distribution channel as service. In contrast to the business model type networking, business models in the field of connecting / brokering focus on an exchange of services between companies or companies and individuals. There are fees for a completed transaction. The monetization of this service can be done both by the participants and by third parties.

Comatch.de (Fortune 2018) brings consultants together with companies, Google Search (Fortune 2018) brings searchers together with content, and MyTaxi (Fortune 2018) delivers customers to drivers. Crowdfox (EU Startups, 2017) has a business model that is on average 10% cheaper than Amazon. This is achieved by the merchants on the Crowdfox (EU Startups, 2017) platform pay no fees for the sale of their goods. These savings are passed on directly to the end customer, which allows internet best prices to be achieved.

Compare

Business models (Kompetenzzentrum Geschäftsmodelle in der digitalen Welt, 2017) of this type are similar to the transfer type, but are based on the demand-side transparency increase. By reducing the information asymmetry between the demand side and the supply side, individual best solutions can be achieved for the customer. Booking.com (Fortune 2018) or Trivago.de (Fortune 2018) are well-known companies with this business model.

Share / Replace

This business model type is based on collaborative consumption among individuals through sharing, trading, trading or giving. The focus here is on resource conservation through access to private resources. Airbnb brings together unused living space with guests, Uber (Fortune 2018) brings vehicle owners and passengers together.

Conclusions

Practice shows that many companies stick to the established, successful business models of the past. The protection of the existing and not the design of the new is in the foreground. The types of digital business models described are intended to provide inspiration for expanding existing business models and designing new digital business model innovations.

Digital business models are often based on already tested and functioning analog business models. In doing so, they focus on the industry-related weaknesses of analogous business models in terms of benefits or costs. The established business models are sometimes radically reconfigured.

Looking at evolved digital business models, they often combine multiple functions / business model types to create ecosystems, see Apple, Google or Amazon. Digital business models are often more agile, customer- and demand-oriented than traditional business models, creating forward-looking solutions beyond today's barriers to thinking.

When designing new digital business models, the focus should be on superior value for one or more demand groups and scalability. The observance of the digitization patterns increases the probability of success.

Abstract

This paper studies the drivers of company spending on research and development from a competition perspective. We study whether there is a mechanism that leads companies to spend on research and development. We proposed a model describing company spending on research and development explained by competitive forces. Our research helps to understand how the competition drivers of company spending on research and development work and may be useful as a framework for companies to assess their situation and help them find better than chance solutions. We describe a model consisting of competitive forces derived from the Porter's Five Forces framework and how these factors significantly impact the company spending on R&D, using multiple linear regression of variables selected from the World Economic Forum database. Our major contribution is that we identified a model of company spending on research and development majorly and significantly described by means of competition, which is addressing a problem of insufficient research of this topic stated in the literature.

Keywords: research and development; innovation; competition; competitive environment; competitive advantage

Introduction

In our paper we focuse on conditions for research and development from competitive perspective, so the companies can better understand the competitive environment and can work with it towards the research and development and sustainable businesses. Due to the explosion of technological innovation during the past decades, we witnessed the globalization of the economy with manifestations in foreign trade, the spread of technologies, the flow of capital and market integration (Shangquan, 2000) , this has a non-deniable impact on companies by intensifying competition. For companies, it is no longer sufficient to consider their direct neighbors as competitors because they now compete with companies all over the world. As information technologies develop, competition intensifies even more. The easily accessible and fast disseminated information might shorten the lifecycle of technologies and competitive advantage. Effective research and development of the company's products, processes, technologies or business model itself is a necessary reaction to this development. Therefore, it is crucial to understand the mechanisms and factors influencing research and development as well as competitiveness so the economies as companies can adjust to new conditions of the global environment.

In the terms of research gap, in this paper, we study the drivers of company spending on research and development (R&D) from a competition perspective. The justification, as well as the need for our research, can be summarized by the conclusion of Becker (2013) who in his survey of empirical research on determinants of research and development argues that there is some evidence of competition affecting the research and development, but direct evidence is still scarce. In this paper, we contribute to the reduction of this deficiency by enhancing the knowledge about the

mechanism of R&D as we provide new evidence to this issue. In this era of increasing technological progress, it is important to understand the relationship between R&D and competition. We study the mechanism that encourages companies to spend on R&D.

We describe a model consisting of competitive forces derived from the Porter's Five Forces framework (Porter, 2008) and how these factors significantly impact the company spending on R&D, using multiple linear regression of variables selected from the World Economic Forum database.

Theory and Hypothesis development

In the literature review, we focus on studies in three main areas: competition and research and development, competition and competitiveness and research and development and technology. In this paper, we make and test an a priori assumption that the competition has a significant impact on research and development. We consider this assumption fundamentally sound because companies compete for a limited number of customers by proposing different technologies with different attributes, which are a result of some research and development. We assume that customers have a reason to buy a product with a notion of its purposeful use and so implicitly valuing the product attributes that were made possible by the research and development either of the technology or the product itself.

We found several interesting sources dealing with research and development and a competitive environment. In summary, there is convincing evidence of the relationship between competition and research and development in the literature. However, the depth of the understanding is insufficient, and the request for more research is prevalent in the literature. Besides, there are some suggestions regarding the linearity of the effect (Becker, 2013), risk-taking (Thako – Lo, 2015)) and possible bidirectional effects (Dereli, 2015). Regarding competitiveness, there is a need for companies to innovate to stay competitive (Krugman, 1994) and we found evidence in the literature that competitive advantage is associated with spending on research and development (Dutz- Hayri, 1999 ; Porter, 1998). While competitive advantage and performance are arguably two different terms(Ma, 2000), competitive advantage is among barriers of entry (Greenwald – Kahn, 2005) so we may see the pathway leading from research and development to creating barriers as a potential defensive strategy and in opposite direction so the barrier makes the research and development viable. Some sources mention the need for some mechanism for interaction with other subjects by openness or partnership influencing the competitiveness and research and development (Siriphattrasophon, 2017; Malecki-Oinas, 1999). In our literature research, we found three different perspectives of research on research and development. First is the research and development itself, the second part of the research focuses on partnerships, and the third part on the protection of the intellectual property. Companies can use partners to obtain technology and enhance their competitiveness (Malecki-Oinas, 1999; Collins – Troilo, 2015) though this may have a downside that these companies rely on partnership and so will miss the opportunity to learn what could have negative long-term impact (Hamel, 1991). The intellectual property rights protection seems to be an important part of companies' motivation for research and development (Rapp-Rozek, 1990; Lai, 1998; Evenson-Kanwar , 2003) as its absence may weaken the company and make it vulnerable compared to its competitors.

Competition and Research and development

Competition is an important factor that affects the company's spending on research and development, as is reasoned in several sources. In the work of Becker (2013) five main driving factors of investment in the research and development were identified such as company or industry characteristics, competition in product markets, government policy, location and resources, cooperation with research entity, and spillover from foreign research and development. He further argues that while most of the empirical studies assume a positive linear effect where the companies use the research and development as a defensive strategy responding to competition, the impact of competition on the research and development might not be linear. He argues that increasing evidence suggests a relationship of competition and research and development in the shape of the inverted U-curve. The intensity of competition has a positive impact until a certain level is reached, and after its passing, it decreases the interest in investing in research and development because businesses are less able to extract the rent from the innovations that are the result in the research and development. This seems to be aligned with our argument used later in the paper, that companies might not be motivated to innovate if there is not enough protection as the cost of research would not be returned before competitors start to copy the technology or the product. According to Blazsek and Escribano (2016), the increase in competition intensity is a driver for innovation resulting in patent applications as well as in propensity to patent. A similar conclusion was made by Thakor and Lo (2015) who, based on biopharmaceutical industry evidence, imply that with the increase in competition, there is an increase in investment in research and development. However, they argue that their results are applicable to other sectors with intensive research and development as well. Gu (2016) argues a strong positive effect of competition on investments in research and development. He also argues that businesses that invest heavily in research and development are taking more risks.

However, they are also earning more than businesses with less intensive research and development, especially in highly competitive sectors. This is an interesting perspective especially compared to our argument that high risk may result in a low willingness to invest in research and development. Another empirical literature (Lee-Hwang, 2003; Rezaei-Schroder, 2017; Autor et al., 2017), which examines the linear effect, concludes that competition has a positive effect on the research and development. However, quantified evidence of the direct effect of competition on research and development is rather scarce. Dereli (2015) argues that innovation and competition influence each other. While competition initiates the need for innovation, innovation then makes the competition more intense. Even more arguments for the relation between innovation and competitiveness can be found in the works of Petrakis et al. (2015) and Huang (2011). Furthermore, Petrakis et al. (2015) stress the role of innovation culture over macroconditions. Huang (2011) argues that companies prefer being reactive rather than proactive to changes in the environment. The technology is then dictated by companies that are more confident in their research and development. Huang (2011) argues that different environment requires different technology and that this variety of different conditions might contribute to the company's innovativeness.

Competitiveness and competition

Competitiveness was studied by Krugman (1994). Krugman argued that a company must be able to maintain its position on the market to be competitive. He further claimed that a company that cannot increase its performance would leave the market. Krugman by defining a competitive company, considers the bottom line to be the ability of the company to pay employees, suppliers, and investors. Krugman also made a comparison of the competitiveness of businesses and countries. He concluded that because countries cannot end their existence as regular companies can, the concept of competitiveness on the country level is rather vague. Ma (2000) studied the association of competitive advantage and performance. He claims that competitive advantage and performance are rather two different constructs. He further argues that competitive advantage is not defined sufficiently. Dutz and Hayri (1999) and Porter (1998) argued for a positive association between competition and higher economic growth or progress. Ireland and Webb (2007), as well as Dyer and Singh (1998), are claiming that a possible competitive advantage is associated with spending on research and development. Dollinger (2008) in his book, wrote that a sustainable competitive advantage arises when a company creates and captures value and succeeds to protects it against competitors. In his book, Dollinger describes which four conditions affect the higher intensity of competition. Among conditions affecting intense competition are numerous equally balanced competitors, slow growth in the industry, high fixed costs and a commodity-type product. How rare is the real competitive advantage is argued by Greenwald and Kahn (2005). In their paper, they claim that competitive advantage is among the barriers to entry. They differentiate between competitive advantage that leads to lower costs and one that leads to higher demand. They identified three factors of creating a competitive advantage. These factors are customer captivity, proprietary technology and economies of scale. They argue that the limitation of technology as a source of competitive advantage is its short lifespan as it becomes rapidly available to everyone. Kapler (2007) considers the competitive success, growth and internalization of the company's activities for indicators of a company's success. The problem of keeping a company competitive was examined by Rocha and Abreu (2018). They argue for creating conditions for flexible governance regimes as this might help to reduce the power of the large retailers that set prices and production standards across the value chain. They further argue that this could reduce the financial pressures on producers to cut costs continuously, and would create the opportunity for investment in technological and organizational development. Siriphattrasophon (2017) examined the internal and external factors that affect the competitiveness of small and medium-sized companies. Siriphattrasophon argued that more competitive are companies with more international activities. He concludes that companies should continuously assess and monitor their readiness for the organization and product standard and assess their strengths and weaknesses, opportunities and threats. He claims that in order to build a competitive business, the development of organizational strategies is the most important step. He divides the strategy into a business, entrepreneurial and business unit strategy. Important part of sustainable and competitive business is its revenue model as studied by Remenova et al. (2020). Slavik and Zagorsek (2017) studied the association between company success, business model and strategic factors. They made an argument for the necessity of the compatibility of business model and strategy. They show that the idea of a company's competitive behavior must be supported by an appropriate strategy. In our research, we drew some inspiration from the works of Porter. While they might not always be identically applicable, we argue that they are well suited as an inspiration. For example, the mechanisms on industry level should be able to tell us something about mechanisms on the company level. We use Porter's work as a description of competition and justification of the need to understand competition. Porter (2008) identified and described five competitive forces. They can be used by the companies to describe the competition and the competitive environment and then to make appropriate changes to the strategy. Porter's model of five competitive forces is formed of supplier power; buyer power; the threat of new entry; the threat of substitution and competitive rivalry. According to him, it is necessary to understand the mechanism of the five competitive forces and how they are associated with profitability in the industry. This understanding will then allow for selecting the right strategy. Furthermore, Porter (1979) by focusing on competitive forces that have influenced the competitiveness of the companies concluded that the knowledge of competitive forces might allow the company to occupy the best defensible position on the market.

In another paper, Porter (1986) argued that the environment is changing due to international competition and this creates an environment that cannot allow the state parochialism to obstruct competitors' ability to turn a global position in a competitive advantage. How to use Porter's model of five forces framework in the analysis of industry was studied by Dobbs (2014). Dobbs found that Porter's framework of five forces is somewhat misapplied. He argues that it is not primarily used as it should be a tool assessing how a company can compete in the industry more effectively by getting a strategic insight into the competitive environment. Dobbs proposed templates for application of the five forces framework, by creating questions on an 11-point scale between low and high threats level for each of the five forces. Within evaluated forces, the number of questions varied. Porter's framework was also used by Beblavy and Kurekova (2014) in their study of competitive advantage of the antivirus industry. They argue that they found a possible weak point in this tool as it does not consider the needed level of internationalization to the full extent. While this study uses a different framework, it may be indicative of possible deficiencies in the globalized time.

Research and development and technology

Bharati and Chaudhury (2009) studied what the role of the information system in the competitiveness of small and medium-sized companies is. They argue that small and medium-sized companies are the innovators among companies despite not being known for their own technology demands. Compared to large companies, per employee in a year, they produce 13 to 14 times more patents. Dosi et al. (2015) studied what role the technologies and costs play in the international competitiveness of enterprises. They found that while market shares at the country level are influenced primarily by technology, the cost had rather an ambiguous impact. The argument that technology adoption does not have to be dependent on its superiority was made by Katz and Shapiro (1986). They identified the mechanism of technology adoption and its competitive advantage based mainly on whether the technology is sponsored and whether it is superior now or in the future. How national factors impact the competitiveness and innovation of companies was studied by Collins and Troilo (2015). They argued for public-private partnerships for innovation because this might increase the small and medium-sized companies' competitiveness. How the international alliances between companies focused on skill and technology transfer impacted the companies' competitiveness was studied by Hamel (1991). He argued that a company that has no ambition outside the investment avoidance and substitution of its partner's competitiveness for its own lack of competitiveness would likely not learn from its partner. Furthermore, a situation where a company fails to learn what undermines the competitiveness and independence of the company should not be considered as an indication of collaborative success. Off course, the innovation and the previous research and development must not be in the technological field but may be in the field of managerial innovation as studied by Jankelova et al. (2019). Malecki and Oinas (1999) claim that the level of innovativeness and competitiveness of companies depends on both local and external levels of embeddedness within supplier networks and markets. How intellectual property rights protection affects the research and development was studied by Lai (1998). He found an association of product innovation and the strength of intellectual property rights protection. He identified both positive and negative effect that the strength of intellectual property rights protection has, depending on the conditions of production transfer. Here we have to mention, that according to Blstakova et al. (2020) the values of companies that they consider as important for future success do not depend on the level of technological innovations. Rapp and Rozek (1990) argued that if the property rights are not protected sufficiently, the innovator has fewer incentives to devote resources to innovation and therefore, fewer new products and processes are introduced to the market. The positive impact of intellectual property rights protection on investments to research and development was also argued by Evenson and Kanwar (2003). However, they also present an opposite alternative argument against strong intellectual property protection, that weak intellectual property protection might help to keep lower market prices. Innovation for sustainability was studied by Leach et al. (2012) who proposed a three-dimensional model consisting of direction, diversity and distribution. Seebode et al. (2012) suggest that companies need to innovate and give up old approaches to innovate for sustainable development.

Objective and Methods

In this paper, we aim to identify the drivers of company spending on research and development from a competition perspective. We want to find out whether the research and development of companies could be described in the mean of competition and how well we can do it. We argue that the competitive environment has a significant impact on the company's research and development. However, the direction of the impact, as well as the factors with the most impact, are not well known yet. In our initial position, we believe that the competition might have two opposite directions of impact. The first direction could be one emerging from the need to differentiate the company in a competitive environment. The opposite direction could be the result of strategic thinking and uncertainty as more intense competition would make the pioneering innovation and research and development less desirable. Companies do not know which technology will become the industry standard. That is why their innovation effort might be wasted,

either due to easy access to information where the winning technology will finally become widely available or just by betting on the wrong horse.

Our research effort can be formulated in the following hypothesis.

H1: The spending on research and development can be majorly and significantly described by means of competition.
H0: There are too many factors influencing research and development to be significantly and majorly described by competition.

To reject the H0 hypothesis, we need to create a significant model of research and development consisting of variables depicting competition with adjusted R-squared over 0.50.

We were analyzing the data obtained from the World Economic Forum database. We used the Global Competitiveness Index dataset. The dataset holds the data for 137 countries of the world. Each country is represented by one data point per variable representing the mean value of the variable for the country. For this study, we used the dataset that was acquired between the years 2017 and 2018. The general construction of survey data is that data values can range from 1 to 7, where 1 being the lowest and 7 being the highest level of the variable. However, the variables number of days and the number of tasks required before starting a business are not from a scale, but they represent the real values in each country. Further information about survey questions and variables are available to greater detail in the Global Competitiveness Report 2017-2018. We describe the variables in Table 1.

Table 1: Variable description

Variable	N	Avg	St. d.	Med	Min	Max
Company spending on R&D	137	3.55	0.91	3.27	1.88	6.07
Intensity of local competition	137	5.04	0.58	5.09	2.82	6.21
Intensity of foreign competition	137	4.53	0.76	4.52	2.60	6.40
Intellectual property protection	137	4.28	0.99	4.06	2.02	6.58
Number of days to start a business	137	19.37	26.15	11	0.50	230
Number of procedures to start a business	137	6.78	3.14	6	1	20
Buyer sophistication	137	3.46	0.75	3.39	1.75	5.26
Degree of customer orientation	137	4.65	0.72	4.61	2.37	6.24
Domestic market size	137	3.72	1.22	3.69	1	7
Ease of access to loans	137	3.87	0.83	3.89	1.51	5.67
Quality of overall infrastructure	137	4.08	1.12	4.13	1.52	6.65
Production process sophistication	137	4.01	1.06	3.80	1.96	6.53
Local supplier quality	137	4.39	0.74	4.35	2.43	6.28
Local supplier quantity	137	4.46	0.57	4.55	2.37	6.16
Nature of competitive advantage	137	3.76	1.11	3.47	1.96	6.55

The variables that we used in our model were carefully selected on the basis of Porter's Five Forces framework (Porter, 2008). In this work, he identified five groups of factors that impact the competition: supplier power; buyer power; the threat of substitution; the threat of new entry and competitive rivalry. Using Porter's model of five competitive forces, we then evaluated the variables available in the World Economic Forum database, whether they are aligned with this concept. Here it is important to declare that we understand that Porter is applying his model on the industry level, and we use the model on the data of individual company responses averaging at a national level. We needed a strong, established framework that would lead us by selecting the relevant variables for our study. We further argue that while Porter's framework is set on industry level, it should tell us something about the company level and so if we inspire our variables selection by his framework, we will be better off than choosing the variables solely by chance or by other not well established frameworks. All selected data deal with the issues of individual companies. By using the national averages, we were able to dampen the volatility and focus on the fundamental associations. Meanwhile, there is still enough variability in the features so we can use them as a predictor. We also argue that if associations are present, our model should be able to show them.

We did the first processing of data with a spreadsheet processor. Then, we exported them to the statistics program PSPP for the descriptive statistics. Finally, we imported the database into a Python program that we wrote, where we used the Numpy, Pandas, Matplotlib, and Statsmodels packages. We subjected the data to graphical analysis and inductive statistics. The package Statsmodels that we used for multiple linear regression analysis is further described

by Seabold and Perktold (2010). When analyzing the data, we used the methods of descriptive statistics and graphical analysis to review and describe the data. Consequently, we performed multiple linear regression, ANOVA, Jarque-Bera test for normality, Breusch-Pagan and Goldfeld-Quandt tests for homoscedasticity, variation inflation factor to account for multicollinearity and a graphical evaluation of observed values, residuals and predicted values to assess the linearity. After testing, we found the need to apply a nonlinear quadratic transformation on the endogenous variable to adjust for the linearity assumption. The method of multiple linear regression was used as a tool for assessing and comparing the effects of individual exogenous variables on the endogenous variable. We are using it in a way to assess the impact and relationship between the variables but not to predict a certain outcome. We set the level of statistical significance at significance level $p \leq 0.05$ as is common scientific standard to consider the results to be valid. Moreover, we used Bonferroni correction to account for the larger number of variables that resulted in a required p-value of 0.008 in the final model.

Results

We created the regression model of company spending on research and development by the method of elimination of nonsignificant variables regarding the overall goodness of fit. Finally, we reached a model shown in Table 2.

Table 2: Regression model of the company spending on research and development (square root).

	coefficient	**standard error**	**p**	**VIF**
Intensity of local competition	-0.0828***	0.099	0.001	3.50
Intellectual property protection	0.0755***	0.067	0.000	4.76
Buyer sophistication	0.0368	0.078	0.079	3.65
Degree of customer orientation	0.0670***	0.082	0.008	3.75
Production process sophistication	0.0866***	0.082	0.000	7.97
Local supplier quantity	0.0575*	0.097	0.014	3.28
R^2	0.854			
Adjusted R^2	0.847			
F (6,130)	126.8***			
Durbin-Watson test	2.228			
Jarque-Bera test	1.394			
Breusch-Pagan test	7.691			
Goldfeld-Quandt test	0.793			
*p≤0.05 **p≤0.01 *** p≤0.008 Bonferroni 0.05/6=0.008				

The model is statistically significant F(6,130)=126.8 and explains the spending on research and development with R2 adjusted 0.847. The model also meets the requirements of multiple linear regression as the residuals are normally distributed (Jarque-Bera, Q-Q plot) and have no significant autocorrelation (Durbin-Watson). After testing for linearity, we found improvement of the model by application of a nonlinear quadratic transformation on the endogenous variable to adjust for the linearity assumption. Please note that because of this transformation, the coefficients may seem rather small, but this is because they are in relation to the square root of the endogenous variable. Both the Q-Q normal plot of regression model residuals, and linearity test after nonlinear transformation can be seen in Figure 4. Our model shows the factors influencing the company spending on research and development. We found that the factor influencing the spending on R&D positively and the most was the production process sophistication. Next, there was the negative impact of the intensity of local competition, followed by the positive impact of intellectual property protection, and the degree of customer sophistication. The local supplier quantity missed the threshold set by Bonferroni correction closely. The buyer sophistication missed the cutoff closely. However, we think both should be further investigated in future research.

Figure 1: Q-Q normal plot of regression model residuals, and linearity test after nonlinear transformation

Discussion

Using the multiple linear regression analysis, we created a model of company spending on research and development. Our model suggests that company spending on research and development is significantly influenced by production process sophistication, the intensity of local competition, intellectual property protection, and the degree of customer orientation. Local supplier quantity missed the threshold 0.008, and buyer sophistication missed the significance level 0.05 closely. Some of these factors are more obvious, and some are less, as we further describe in this section.

The most obvious and the one with the greatest impact is the production process sophistication. A more sophisticated production process signalizes a more sophisticated product (or a regular product with the need for sophisticated production process) that may be more receptible to setbacks due to errors in the production process as well in imperfection in product design. The more complex product has more ways for errors to emerge. This means that more development is needed to deal with such a problem. Also, if the product or the production process is more complex, there are more degrees of freedom and so more overall possibilities of how to arrange the variables. Thus more research and development is needed to find the right arrangement. Additional perspective on company spending on research and development and production process sophistication might be that companies whose competitive advantage emerges from unique products and processes need to do some research and development to get to these unique products and processes. We tested this with linear regression, where we found results supporting this argument. When the company spending on research and development was predicted, we found that the nature of

competitive advantage (coef = 0.7291, S.E.= 0.033, p<0.001) was a significant predictor. The model fit was R2 = 0.787.

The second biggest impact on company spending on research and development in our model is by the intensity of local competition. This impact has on a first sight surprising direction of influence as it is a negative one. The more intense is the local competition, the less is company spending on research and development. This might be due to several reasons. First, the situation where more companies are spending on research and development might be riskier. The reason is that if there are more competitors on the market, more ways how to improve the product or processes are invented. Additionally, in the early stage of technology development, companies do not know whether they are not spending all their money on an inferior improvement. Thanks to information dissemination, it might be of a benefit to wait until the innovations are tested. Then companies can improve the technologies and products of their competitors and so nobody might have the intention to commit to extensive research and development fully. A similar argument was made by Huang (2011), who concluded that committing to R&D might have a negative impact on innovation. He argues that if companies focus too much on developing old existing technologies, they might miss new opportunities. As the past showed that some superior technologies were unsuccessful, compared to their inferior competitors (Katz – Shapiro, 1986), it might be of a greater benefit to investing into marketing than to R&D and maybe take the way of buying technology startups to develop the product or process. Another reason might be that companies do not have enough financial resources due to intense competition and cannot allocate as much as they would like into R&D. An alternative explanation could be that because there might be more competitors in a more intense local competition, the company does not have to spend as much on R&D because it can see what works by observing the competitors and can partially use this knowledge, so it does not have to start from zero.

Better intellectual property protection impacts the company's spending on research and development positively as they are more motivated to do so. If there is less intellectual property protection present in the country, the risk of being copied or otherwise damaged is bigger, and so companies are less inclined to invest in R&D. Similarly, the negative effect of a lower level of intellectual property rights protection on R&D was argued by Lai (1998), however different directions, both positive and negative, were observed depending on conditions of production transfer. Our findings are consistent with the arguments of Rapp and Rozek (1990) that lower property rights protection may result in lower innovation of processes and products and with arguments of Evenson and Kanwar (2003) whose research implies that a lack of intellectual property rights protection might mitigate technological change.

The degree of customer orientation is also a significant factor influencing the company's spending on research and development. The regression analysis implies that more orientation on customers positively influences the company spending on R&D. The explanation might be that to be highly responsive to customers and seeking their retention either a higher level of product customization or some mechanism of gathering the customer feedback and working it in the product are needed. This has to be researched or developed, and this is where we see the major causality of customer orientation on company spending on R&D.

Local supplier quantity missed the threshold set by Bonferroni correction p=0.008 so its significance is disputable and should be further studied. It is potentially positively impacting the company spending on research and development. If there are more local suppliers, this supports the research and development because the company has the resources and flexibility available right on the spot. Being situated close to suppliers might also help to cooperate if there is a need for some customization or if the company needs to know what is possible and whether there is a suitable component available, or if the company might be able to choose which supplier fits the need the best.

Finally, we included the buyer sophistication in our model, although it closely missed the set level of statistical significance (p=0.079). The reason is that the borderline significance indicates a possible influence, this influence can be well explained, and the overall regression model gets more precise when we keep the buyer sophistication in. The explanation for this factor would be that higher buyer sophistication leads to higher company spending on research and development because if customers are better informed and are deciding based on product performance, companies are driven to develop better products aligned with customers' expectations.

However, the direction of causation is not completely clear and might be a case of a virtuous cycle, where companies that need to customize their product because their customers are well informed about the market. To customize their product means that the production process has to take into consideration more inputs and so become more complex and needs to be more sophisticated.

Figure 2: Virtuous cycle of spending on research and development (*p≤0.05,p≤0.01, ***p≤0.008)**

This creates the intention for companies to increase the spending on research and development, so the product and the production process meet the requirement. Finally, the research and development lead back to the more sophisticated production process, and the virtuous cycle starts over. The virtuous cycle of company spending on research and development is pictured in figure 2.

With the regard on Seebode et al. (2012) highlighting the need for innovation for sustainable development, our results support a company's understanding of what drives the research and development from competitive perspective. A company looking for a sustainable approach to business may look for a rather low local competition place with good intellectual property protection and with a number of local suppliers. Then by setting goals to create sophisticated product for sophisticated customers it will increase its chance of driving it to R&D and ending up with an innovative and sustainable business.

Conclusion

This paper investigated the drivers of company spending on research and development from a competition perspective. Using multiple linear regression, we created a model with variables selected from the World Economic Forum database, which selection was inspired by Porter's five competitive forces.

Based on the results, we are rejecting the H0 hypothesis and accepting H1 hypothesis that the spending on research and development can be majorly and significantly described by means of competition.

We found a model describing company spending on R&D consisting of production process sophistication, intellectual property protection, degree of customer orientation impacting positively and significantly, intensity of local competition impacting negatively and significantly, local supplier quantity that had positive impact but missed the 0.008 p-value threshold, and buyer sophistication that impacted the company spending on R&D positively; however it missed the cut off 0.05 p-value.

In our model, we potentially identified a virtuous cycle between product process sophistication and company spending on research and development.

At first sight, surprising was the negative impact of the intensity of local competition on the company spending on R&D. However, there might be several explanations as covered in the discussion; we lean to one that suggests that increased competition increases the risk of the spending on R&D being unsubstantiated. The developing technology might not be better than the technology of competitors. Meanwhile, the lifecycle of technology is shorter in an environment of more intense local competition. Here we want to emphasize that we do not think that the companies would not benefit from R&D and that we have rather a game theory view that considering the downside, the companies might not have the stimulus to do so.

A company that wants to shift to more sustainable business may do so by setting challenging goals by addressing knowledgeable customers an providing sophisticatedly produced products in combination with the right environment in less intense local competition, with a number of suppliers, and good intellectual property protection.

There are also many other interesting implications coming out of our research. This may be of importance for state dotation and subvention, as they can allocate more of these to industries with the more sophisticated production process.

In our research, the role of intellectual property protection emerged on several occasions. If a country wants to become more competitive and host more companies with sophisticated state of the art technology, they need to protect intellectual property rights. It seems to play a significant role in the competition and innovation field of research and should be focused on in future research.

An added value of ours is that in this paper, we used the data from the World Economic Forum database which has mainly macroeconomics use. Here we carefully selected the data that was relevant for study at the company level. Our results are providing a different viewpoint on company spending on research and development. Studying a problem from different perspectives is the foundation of scientific research.

Limitations

However, our research is not without some limitation; they are as follow. Some causation directions might not be entirely clear and in future research should be closely investigated in the best case with a natural experiment. There might be a possible generalization of the study. As a model represents a simplification of a complex system, there are more variables, and some of them might be more influential considering the individual basis of every case, so confounding variables might exist. This individual case would not show in our statistical analysis as it is a generalized model. Also, there might be some hidden variables that we did not consider in the model. Nevertheless, here needs to be mentioned that our model has a high coefficient of determination, so it should be considered as one of relatively high informative value. As we used the data from the World Economic Forum database, we had limited control over data collection.

Abstract

This elaboration is to present the general theoretical considerations connected with restructuring, particularly with the process of reengineering. The purpose of this article is to depict the key issues with the process of reengineering. The aim has been to discuss, based on literature and own scientific reflections, the general assumptions behind one of methods used for organizational enhancements, the so-called Business Process Reengineering (BRP) method which, like no other solution, allows a comprehensive approach towards issues of a company and, simultaneously, results in higher effectiveness of its operations. As the methodical goal, presentation of the reengineering process in a company has been deemed. To enrich the cognitive value, the article includes many diagrams.

Keywords: Reengineering, restructuring programmes, recovery plan

Introduction

Nowadays, management is becoming more and more sophisticated. It is the result of various circumstances, which one may synthesize and narrow down to ever increasing changeability and complexity of the world. Management has been currently considered as one of the most important factors of economic and social development in countries [St. Sudoł 2016]. Today, it is crucial for companies to apply modern processes that directly influence the functioning and efficient management of a company. Enterprises must operate as dynamic organizations that exhibit great responsiveness to changes in their environment. The market situation requires or even forces application of advanced methods, auxiliary techniques, information improved through processing, strategic decisions, as well as complex process-related changes in the company. Among such solutions, one may distinguish reengineering as the subsystem of modern management; its implementation, combined with the decentralization of process and decision-making competences, is to increase the effectiveness of an organization.

The aim of this article has been to discuss, based on literature and own scientific reflections, the general assumptions behind one of methods used for organizational enhancements, the so-called Business Process Reengineering (BRP) method which, like no other solution, allows a comprehensive approach towards issues of a company and, simultaneously, results in higher effectiveness of its operations.

The article discusses the general theoretical considerations connected with restructuring, particularly with the process of reengineering.

Reengineering vs. basic principles of company restructuring programmes

Companies that struggle with difficulties need help in restoring their economic stability by preparing and implementing a recovery plan. The challenge, however, is to choose and introduce a management concept that will be strictly connected with the company's tradition, its current condition, and external factors resulting from the system environment. Business Process Reengineering is one of the few concepts that helped companies avoid bankruptcy [J. Myszak 2011, p. 169].

The term reengineering has recently become extremely popular. BPR (Business Process Reengineering) is defined as the method of thorough transformation of whole processes in a company in order to optimize three general indicators of effectiveness: quality, costs, and delivery date, which is necessary to maintain the flexibility and competitiveness of the company. This method assumes the need for comprehensive changes in functioning processes and a proposition of re-development of the whole organization (as an institution), if it is to preserve profitability and solvency and improve customer service [K. Zimniewicz 2003, p. 23].

Reengineering is based on many ideas that had been known before. For instance, it focuses on customers' current needs and reduction of redundant costs already utilized in the concept of value analysis, which was developed in the 1960s, Reengineering also assumes cross-cutting thinking characteristic of inventive methods developed in the 1970s. Remedial restructuring involves restoration of the original, standard condition of the company's economy [Stabryła A. 2010, p. 318]. Reengineering serves as a type of stimulator of growth within the scope of sales, personnel effectiveness, and profitability of an enterprise [Berztiss A. 2012, p. 13].

Other major elements of reengineering include approaches popularized in the 1980s, i.a. benchmarking, just-in-time or total quality management. Reengineering, however, should not be considered as a conglomerate of old management methods; their elements are defined under new rules, which gives an amplified effect of synergy. One of the novelties of the discussed concept is the idea of organizing work around processes instead of functions. It owes its importance to the development of information technology, i.e. company information systems based on integrated computer networks. In consequence, effective management requires tools that will facilitate immediate flow of information on the company situation. Today, implementation of all organizational enhancements mainly involves computer technology. However, the improving contribution of computerization as such, in terms of company functioning, is insufficient to achieve a competitive advantage. Many enterprises "fell into the trap" of computerization. They automated all possible processes within their structure which directly led to an information overload that became one of the most significant reasons for creation and development of the concept of reengineering. In order to achieve organizational improvements, reengineering assumes redesigning the existing processes rather than automation of the current manner of business handling. Just like any proposed method of action, reengineering has solid support. It does not mean, however, that it is free from any criticism. Just as any other management tool, reengineering has its advantages and disadvantages, which have been listed in Table 1.

Table 1 Pros and cons of applying reengineering in companies.

Pros	Cons
• development of the concept of process management replacing functional management • assigning the highest priority to customer needs, declaring opinions on effectiveness of processes through the prism of customer satisfaction • very high potential advantages in many aspects of business activity • combination of well-known methods resulting in a synergy • usage of information technology • comprehensive thinking and actions, • increased efficiency, • shorter duration of processes • broad range of offered goals and benefits, • increased customer satisfaction, • higher position on the market, • positive radicalism, • flexibility and variety of methods applied simultaneously.	• an authoritarian management system during implementation of a concept, • a radical change in the course of processes and organizational structures that is rarely focused on the changing needs and expectations of customers, • excessive focus on cost reduction in the enterprise with respect to adjusting the offered bundle of values to the needs of selected customers • lack of recognition for intangible resources that develop values for the customer, particularly knowledge and experience of employees whose interests were affected • concentration on production (manufacturing) processes, negligence of promotion, distribution, R+D works the reengineering of which was difficult; in consequence, the interest in the enterprise on the market may decrease and this will expose it to financial losses • employees and personnel are unprepared for changes, • the aspect of employees is skipped during preparation of the reorganization, cultural aspects are neglected as well; this creates the risk of strong resistance to changes, which is

	tantamount to high risk regarding the implementation of reengineering • high costs of implementation, increased costs of employment • difficulties in implementation

Source: Own analysis based on [Brilman J., 2002], [Kisielnicki, J., 2004], [Martyniak Z., 2002], [Myszak J.M., 2001], [Toffler A., Trzecia fala, 2006]

Managers consider a market as effective when they are able to utilize its high potential. The utilization of human potential and operational resources might be deemed as the most effective use of company resources. Process effectiveness requires processes aimed at objectives of the corporation. Between those parameters, there is a conflict. Despite those conflicts, there is a strong pressure on process orientation in business. Companies make attempts to gain a position on an effective market by increasing their competitiveness. Effectiveness of resources is achieved when the factors of human potential in terms of efficiency and functioning are extremely flexible. Reengineering is a fundamental reconsideration, radical redesign of processes in the company which leads to a drastic (ground-breaking) improvement (...) of performance (within the scope of costs, quality, service and speed). [M. Hammer, J. Champy 1996, p. 57].

Reengineering specialists claim that reengineering is more than just a set of methods and techniques used to achieve a significant improvement with regard to: reduction of costs, increased quality, enhancement of speed of action. According to the referred subtitle of the general work by M. Hammer and J. Champy (A Manifesto for Business Revolution), reengineering is treated like philosophy of an organization the purpose of which is to revolutionize the structure and functioning. Such changes should translate into great and measurable effects. In order to implement such objectives, reengineering has developed general rules of procedure the application of which should allow better functioning of an organization [op. cit, p. 57]. The concept of engineering is constituted by fundamental reconsideration, restoration, and radical redesigning of an enterprise and its core processes by using advanced information technology [Czekaj J. 2009]. Detailed principles of reengineering provided by M. Hammer [Martyniak Z. 2002]:

1. action should be focused around results, not on tasks,
2. users of the process results should be organizers of the process concerned,
3. dispersed spatial resources must be treated as if they were in one place,
4. parallel processes must be coordinated while they are performed,
5. decisions must be made on-site of the process realization while the spatially dispersed management has only the right to supervise the decision,
6. gathered information should be transferred to one generally available data bank.

The first general condition to be met for reengineering, to revise HR management, is to create a working group that would fulfill the entrusted goals and form a partnership of people who know how to cooperate with each other. The team would need to be connected with strong bonds and will to succeed. In advance, the method assumes that the organization is bad and the first phase of the procedure is to determine the issue that requires improvement. A map must be created for the specific problem (Figure 1).

Fig. 1: Process analysis

Source: Own analysis based on W. M. Grudzewski, I. Hejduk 2000, p.17.

By using the map presented in Figure 1, one has to analyze the organizational system from the perspective of the following basic criteria:

1.What is the degree of intermediation, i.e. how many people and organizational cells is involved in solving a particular problem?

2.What is the degree of cooperation between executors with regard to problem solving?

Depending on the formed correlations between the listed criteria, namely: cooperation and intermediation, it is attainable to depict the following four general patterns of functioning of an organization (Figure 2):

- High intermediation and low cooperation - 1st quarter,
- High intermediation and high cooperation - 2nd quarter,
- Low intermediation and high cooperation - 3rd quarter,
- Low intermediation and low cooperation - 4th quarter.

high cooperation		B **B'**
low cooperation	A	
	high intermediation	low intermediation

Key:
A initial condition of the management system (before reengineering),
B condition of the management system after the 1st phase of reengineering,
B' condition after the management system after t time.

Fig. 2. Patterns of management processes

Source: Own analysis

. A centralized human resources management system is characterized by many decision-making levels. The decision is made at the highest level; it must pass through many organizational levels before it reaches the executor. In reality, the distance is duplicated. The first time is considered as the route that information must travel through from the executor's level, the second time is constituted by the route of information in form of the executor. The latter involves various types of information distortions. The general designing principle states that the longer the route, the higher

the probability that the conveyed information will be distorted. The time requirement is also extended. It is assumed that a centralized system features high degree of intermediation. A democratic human resources management system, on the other hand, means low intermediation and high effectiveness of operation. The first and the second quarter characterize a centralized system while the third and the fourth – a decentralized one.

The second analyzed criterion, namely cooperation, can be determined on the basis of frequency and intensity of exchange of information between members of the cooperating team. It may be concluded that the first and the fourth quarter feature a low degree of cooperation among team members, while the second and the third depict a situation in which the said cooperation is adequate. Thus, we may conclude that the situation illustrated by the first quarter is unfavorable for the organization while the best situation is when the organization can be described with the use of the third quarter. As to the remaining two quarters, one may claim that they are satisfactory, but the managerial team could still achieve more.

If a conducted analysis decides that the situation of the tested organization is best illustrated by point A in the Figure, the course of action should be focused on achieving point B.

There are many paths to follow. The choice of an optimum direction of improvements can be considered as the next step in the procedure aimed at improving the functioning of an organization. The said choice, first of all, depends on the type of an organization and on mobilization and dedication of its employees to strive for perfection. Next steps include implementation of improvements and determination of further directions of the procedure. The procedure can be presented as a loop of activities that lead to increased competitiveness of the organization and the adjustment of its development strategy to the market requirements, since achieving point B is unsatisfactory for the managers, so better solutions are sought for. After the t time, such a better solution is represented by point B'. The described approach is consistent with the general rule of reengineering, i.e. the continuous search for the best solution possible. In this philosophy, there is a consentient relation between the reengineering approach and the approach presented in the so-called "Kaizen" system. However, the methods used to reach perfection are different. Kaizen uses the method of "baby steps", which means constant yet slow improvement. Reengineering, as it has already be mentioned, involves revolutionary and dramatic changes. These two global principles of improvement (low intermediation and high cooperation) are realized, among others, thanks to partial improvements in the management process. The set of such partial changes is quite extensive. Among the most crucial actions, one may include:

1. Elimination of processes that are performed multiple times. If something is conducted two or several times, it will increase costs and result in acquisition of various information. Such duplication is sometimes used in situations that involve safety factors and special tasks.

2. Elimination of activities that contribute no new values to a particular procedure. Very often, a particular case is sent for reference to other organizational units that do not contribute anything to the case. It is very often used in order to disperse responsibility, but it leads to extended time of information flow and process realization, as well as it gives rise to risk of errors in the conveyed information. Elimination of the said process will accelerate case handling by an organization and, consequently, increase the functional efficiency of the organization.

3. Determination of priorities, i.e. implementation of the 30/70 rule. In practice, 30% of actions decides on 70% of the operations of an organization. Then, it is important to determined such most important actions and first of all focus on completing them.

4. Simplification of the formula, i.e. the language. Process standardization. Whenever possible,
individual processes should be standardized and adjusted to international norms, such as resulting from, e.g. ISO 9000. One may claim that all the listed rules of improvements are compliant with the general idea of reengineering, namely the constant improvement of quality, i.e. realization of CQJ rules (Continuous Quality Improvement) [S. Slatter, D. Lovett 2001, p. 145]. The main tendencies that affect the use of reengineering in companies are: the intent to implement strategic objectives by the management, problems of the company with competitors (i.e. when the position of those companies on the market is diminished, profits become lower, costs increase), expecting results of reengineering by managers within a period shorter than one year, the companies "comprehension" of the market and customer need, the impact of reengineering on the project realization time is more important than the risk and cost of a particular undertaking, realization of a goal connected with functioning of the company, namely, for instance, increased profits, evoking customer satisfaction, minimization of costs, increase in turnover.

Tools and techniques to support restructuring programmes

Reengineering was incontestably the key method used to improve organizations in the mid-1990s. Its application requires thorough reconsideration of every aspect and radical reconstruction of operating processes in order to achieve

a significant enhancement of critical and basic metrics, such as: costs, quality, level and speed of service. The managerial personnel of the organization is the most important factor that facilitates reengineering. It results in an upgraded management system and shorter time needed to make decisions and handle customers. The success of reengineering depends on many factors. Application of the BPR methodology will help the company make a great step forward. Reengineering is a process as a result of which the company constantly seeks for more and more effective methods thanks to which it will develop competitive advantage. One should bear in mind that implementation and application of the complete BPR methodology is quite risky and the challenge results from the difficulty of planning all the processes and changing people's mentality that accompanies such transformations [A. Toffler, 2006]. Reengineering should be supported with other methods, such as, for instance:

- Lean Management - the process of organization leaning,
- Outsourcing - the "make or buy" analysis,
- TQM - management through quality.

The process approach in management has been best reflected in concepts such as: quality management (TQM), restructuring of economic processes (BPR) and economic process management (BPM) [Nowosielski S. 2009, p. 273].

Tools applied during reengineering and their advantages

Business Process Reengineering is a concept that, despite it short existence on the market, has developed certain general conditions and rules of procedure that facilitate achieving a significant improvement both in functioning of an organization as well as in its structure. Implementation of the Business Process Reengineering concept, however, is demanding. The enterprise must be creative, eager to take action, as well as focused on constant changes in management processes that, in general, never end. Organizations that conduct reorganization are mostly those that learn eagerly and utilize the potential of modern technology. Execution of changes in the scope of a new vision, organizational culture, or a completely new management style forces the modern managerial personnel to make serious decisions: should they act with some risk involved or avoid the risk but hinder the company's development? [Myszak 2011, p. 169]. When selecting the tools that we intend to apply, we must be very tentative. If we utilize an incorrect tool, a lot of time will be wasted for familiarization. If we decide on an excessively complicated computer system, we will stay focused on learning the techniques and computer software while our objective (the tools were supposed to help achieve) will become set aside [C. Suszyński 2003, p. 98]. With proper tools it is possible to avoid the trap of an excessively high level of detail and the system will be improved at great speed. Every utilized tool must be treated like an investment that one expects to bring profit, but with different rules that apply.

Organizations willing to create a process-oriented structure should [Bitkowska A., Żyłko W. 2009, p. 151 - 155]:

- convince all its members to the positive influence of process development on the effectiveness of operation (with simultaneous identification of potential hazards);
- identify and describe their processes (create a map);
- introduce measurement for individual processes as the basis used to manage their effectiveness;
- implement a structure favoring an organizational system working towards process management;
- shift to active process management, establishing higher maturity of the process organization.

Effective management more and more often appears to be a process compliant not with functional structures, but rather with organizational processes since that is where added value is generated [Brzeziński M. 2016]. Proper tools used during process enhancement may also include: a pen, paper, a board, simple computer systems and advanced ones to facilitate process design.

Advantages of tool application include [M. Hopej 2000, p. 87]:

- improved productivity,
- increased quality,
- shortened task implementation time,
- elimination of redundant work and concentration on generated added value.

What is more, one should bear in mind that in order to achieve the above, every person implementing the project must familiarize with and learn how to use the tools. Despite the fact that there exist companies which succeeded thanks to reengineering, literature on the subject provides three main reasons of failure in implementing changes so radical like reengineering. The first reason: people generally avoid changes; they are afraid of them and resist them; it is a so-called psychosociological problem. Most often, employees criticize changes. Thus, in order to implement reengineering, it is necessary to introduce changes in a specific way, so that employees criticize them not as third-parties, but as someone who is involved in the innovation. The second reason of failure is wrong organization of the reengineering team. Such a group must comprise of people who are synchronized and cooperate with each other. According to the said rule, criticism is aimed at the concept and not its authors, while ideas belong to the whole

team. The third obstacle is about tradition, habits, customs. It is the more difficult than the previous to since it is invisible. These barriers constitute the existing culture of the organization. Introduction of information technology has changed the nature of individual jobs, affected the insights on them. According to the definition proposed by M. Hammer and J. Champy, the core idea of reengineering is the radical change and focus on organizational functioning based on processes. Although the term is evolving and the approaches of various authors towards reengineering differ from each other, all of them are consensual in terms of the two above-mentioned factors. What is more, these factors differentiate reengineering from other improvement plans, particularly from continuous improvement programmes, such as: total quality management, employment optimization, restructuring, or automation. What the said programmes have in common is that they introduce partial changes to improve the current manner of operations [I. Durlik 2002, p. 85]. They implement only selected goals or individual objectives at the cost of others. Reengineering, on the other hand, aims at simultaneous improvement of quality, reduction of costs, increase in flexibility, speed and accuracy of operation, as well as at improvement of customer satisfaction. To make it feasible, reengineering utilizes the process approach, whereby other programmes are concentrated on functions (TQM uses the process approach, but in a slightly different manner) [R. Muller, P. Rupper 2000, p. 127]. It also stimulates deep a deep analysis and thorough reconsideration of the current method of process realization. Occasionally, it leads to a complete replacement of the manner of operation. Reengineering employs a holistic approach towards organization; it considers both the technical as the social aspects of functioning of an organization. At the same time, reengineering is a viewpoint that involves various concepts of management and improvements as well as of methods they apply.

Financial restructuring stands for financial reconstruction based on a fundamental change in the finance management and capital structure, with the acknowledgment of changes in assets and ownership, in order to increase the company value in favor of shareholders and owners and improve relations with other stakeholders [Porada-Rochoń M. 2009, p.80]. There are many techniques that facilitate the decision-making process, yet the majority of present tools and methods is of financial nature, which indicates that efficient management of a modern company is allowed by economic optimization (so-called financial management). The measurement generally adopted by lending institutions or analyzing the reliability in order to assess the condition of companies in terms of, e.g. the rate of return on invested capital or the capability to generate profit, etc. must undergo special transformations. Thus, from the practical point of view, financial management of a municipal company involves adhering to the principal of financial balance, which is expressed through:

- efficient management, i.e. the ability of economical use of production factors available at disposal of a business entity,
- profitability, i.e. the expression of acceptance of products (services of a particular business entity by its environment.

Starting from the first attempts to measure effectiveness of conducted business activity, costs constitute the subject of thorough research, analyses, assessments and verification. Careless approach towards costs, reflected in undue trust in causative factors, high revenue and, consequently, lack of their control in the context of generated effects, is the best way to forfeit hopes for the profitability of undertaken actions. That is why managing business activity requires exhaustive calculations of the expected revenue, with regard to connected resources in a retro- and prospective setting. It means that each economic decision requires an estimation of future needs within the scope of financing by creating forecasts that constitute the core element of planning and the grounds for preparing a budget based on the analysis (diagnosis) of the current condition.

The above strategy requires a special system to coordinate specific management actions, mainly in the scope of planning and control as well as collection and processing of information, i.e. controlling (Figure 3). Development of market economy, the volatile environment of companies, increase in competitiveness, globalization, growing difficulties in coordination of company units - all these factors complicate company management which should be aimed at the future; they result in a need to conduct ongoing quality control of the decisions made. In this case, operational controlling is utilized. It facilitates creating a rational structure of competences and responsibilities at various levels of management and associating the achieved results with the incentive system [Sierpinska M. 2017 p. 15].

Elements of controlling, budgeting, and a cost theory were used in a recovery plan of a municipal local collective transport company operating in a large Polish city by introducing a large-scale programme of managerial contracts. It mainly comprises of a system of data regarding costs and revenue assigned by ranges of responsibility. The system is based on a premise that the manager should be liable for the implementation of tasks they were entrusted with, performance of their subordinates, as well as for any actions taken within their subordinated responsibility center. Settlement of responsibility in the categories of efficient management and profitability of undertaken actions:

Fig. 3. The idea of controlling

Source: Own analysis.

1. it decentralizes the decision-making process; decentralization of management means expanding rights and increasing the independence of lower-level organizational units; it provides the possibility of developing initiatives and creativity, using reserves and reducing the amount of information (also shortening the time of information flow). As a result, a simulation of market conditions and application of free market tools is created;
2. it helps the management with realization of the management concept through objectives; according to the concept, managers determine a certain set of objectives and the work of each manager is then assessed through the prism of set goals that have been achieved. Apart from ongoing effects, it will allow constructing a system of norms based on economic parameters and applied indicative planning.
3. it constitutes a point of reference to assess work results and help in determining task realization standards;
4. it allows effective usage of the management concept through exceptions; it means drawing the managerial staff's attention to any deviations from adopted standards and planned deliverables.

In order to create an effective system of responsibility settlement, three general conditions must be met:.

1. the organizational structure must be well-verified, all its levels must feature balanced responsibilities and competences, whereby both these parameters must be clearly specified and acknowledged;
2. standards in scope of costs, revenues and investments must be properly determined and precisely defined;
3. reports on settlement of responsibilities, i.e. achieved results, should include only those positions that are controlled by the manager of a particular responsibility center, as well as they should indicate the issues that require particular attention of the management at a given time.

To conclude, it should me mentioned that thanks to the application of reengineering methods a company may make a great step forward. Reengineering is a process as a result of which the company constantly seeks for more and more effective methods thanks to which it will develop competitive advantage. Reengineering requires an analysis of the whole system, not just one department or division of it. Actions must involve cooperation of many people and relevant HR management. Corporate changes mean incurring quite significant costs in order to modernize Information Technology as well as analyze the functioning system. Reengineering results in reduced costs and increased competitiveness of the organization.

What is more, one should mind the necessity of incurring (sometimes pretty high) costs to apply state-of-the-art Information Technology. Saving will forfeit the chance to utilize the process of reengineering**.**.

Conclusion

In times of intensified competition, success will be possible only for companies that are able to skillfully shape the incentive system, as well as of observe own costs, analyze their structure, and draw conclusions for future reference. The changing management conditions force the company to make difficult decisions while managers need fast solutions for diversified and urgent economic problems. Reengineering, as an applied company recovery plan, is considered to be an example of such solutions.

Reengineering is broader in literature than in the practice among Polish companies. Traditional tools, such as budgeting and budget control, can be used effectively, provided that they are mainly oriented at future development

of the company. One of the methods is delegation of decisions and creation of autonomous units. The next phase means mutual determination of objectives and their skillful translation into operating activities in form of well-constructed budgets with simultaneous division of costs into those dependent on and independent from the management of a particular unit. Association of work results with the remuneration system through determination of budget parameters that bonuses or allowance will be calculated from.

To sum up, reengineering stands for reorganization of processes. However, it rather refers to certain philosophy of conduct rather than reorganization as such. It can be understood as implementation of radical changes in business processes in order to achieve maximum effectiveness along with cost reduction. Reengineering does not provide a complete procedure formula. It is an expensive, complex model used to design processes in an enterprise. Thus, reengineering changes almost everything: it covers work positions and people who are to assume them, changes people's relations with managers, their career paths, employee assessment and remuneration methods, roles of managers and the management board, it even changes the mindset and culture of the company [Penc J. 2005. p.55]. In general, reengineering turns the company upside down.

Abstract

Transport companies often obtain differentiated and incomplete information, that obstruct the organization of cargo transport process. This issue is becoming increasingly current during the ongoing COVID-19 pandemic. The article presents the methodology for structuring information resources, used to make the right decisions when organizing transportation of sensitive cargoes. The application of classification procedures, clustering, as well as analysis and synthesis of ordered information resources for the sensitive cargo carriage as an integral approach have been proposed, which allow for ordering the information used by transport companies. Verification of offered methodology was presented on selected transport route example. Implementing the presented approach make it possible to group the information resources that may be beneficial for the decision making process, i.a. when selecting the route for sensitive cargo transportation during COVID-19 crisis.

Keywords: transport, information structuring, sensitive cargo, COVID-19.

Introduction

The development of sensitive cargo transportation was observed in last several years. During transport, these loads require ensuring of special conditions or use of specialized rolling stock, which is usually associated with the need to observe more restrict regulations comparing to conventional cargo transport. These include loads requiring controlled temperature, dangerous and oversized ones, and live animals. Organization of their transport enforces the decision makers to collect and analyze different information resources, including these that alter together with environmental conditions changing.

Currently, numerous changes in the road transport sector are observed, including:

- rising demand for specialized transport services, which forces sensitive cargoes carriers to be more accurate in development of transport routes, considering emergency situations occurrence,
- fast development of road transport infrastructure, which makes it necessary to use more effective technologies of possible threats prevention,
- high road accidents rates, even with their fall in recent years their level is still relatively high, which influence risk of failure to perform the transport task,
- increase in the consignor/consignee requirements, which is associated with the need to deliver undamaged cargo on time,
- use of computerized subsystems in vehicles, which in the event of their failure require specialized service stations to repair,

Cite this Article as: Iouri SEMENOV, Ludmila FILINA-DAWIDOWICZ and Piotr TROJANOWSKI "Information Resources Structuring to Support Decision-Making Process for Organization of Sensitive Cargo Transportation in the COVID-19 Crisis" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

- COVID-19 pandemic influence on road traffic and drivers' behavior etc.
- These changes mean that transport companies dealing with planning and organizing of freight transport, including sensitive cargoes, analyze a lot of information that should enable them to make appropriate decisions related to cargo transport activity. Therefore, two issues should be taken into account:

1. The need to acquire structured information that will enable, among others:

- proper classification of sensitive cargo, taking into account the entire spectrum of transported sensitive loads and their properties,
- mapping the road safety condition,
- identification of important factors of safety loss on particular sections of planned routes.
- Maintaining the quality of obtained information resources, including its searching, selection, sorting, aggregation, ordering, knowledge mining, etc. Data processing by transport companies may include:
- processing data acquired in past research - refers to transformation of databases accumulated during simulation, optimization of transport task draft, etc. into ordered information files. Consequently, the phenomenon of so-called "out-of-date information" may occur and it cannot be used to solve current issues,
- processing data over time - refers to the data acquisition and processing phase, during which the data may be subjected to change, e.g. fuel prices, customer preferences, etc. As a consequence, the data collected in the past does not always reflect the present reality, nor future situations,
- operational processing - refers to the stage of transforming information during the development of cargo delivery plan, when collected information can be utilized to support the decisions made. In consequence, the decision-maker may make mistakes when assessing the credibility of the previously collected information.

Incorrect information (e.g., false, out-of-date, inaccurate) used by transport companies to make decisions regarding transport of sensitive cargoes may result in losses, the magnitude of which may threaten their competitiveness or operations. Therefore, a new insight both for data itself and on how to process and organize them is required to establish and increase the credibility of information available to transport companies.

The objective of the present article is to introduce an information structuring methodology, which - once applied - may be helpful in decision making in the field of organization of freight transport of both conventional and sensitive cargoes, especially during COVID-19 crisis. The article presents a general view of the issues raised, and identifies areas, where this structuring is particularly needed.

Literature Review

Current knowledge of road safety and freight transport is quite extensive. The literature presents research on the impact of economic changes on the level of road safety (Girasek and Tylor, 2010). Various factors influencing the selection of freight route are analyzed, including vehicle ownership, household structure, family size, characteristics of road infrastructure, etc. (Galkin et al, 2019; Pulugurtha et al., 2013). The impact of demographic and infrastructure changes on traffic accident rates was also examined (Noland and Oh, 2004).

However, little attention was paid to the issues of sensitive cargo transportation. The need to secure appropriate transport conditions for these loads is usually stressed. The issue of their appropriate classification, when taking into account diversity of their characteristics (e.g. the LNG is both a dangerous cargo and one requiring controlled temperature), is observed.

Available subject literature also investigates information processing methods (Anderson, 2009; GUS, 2007; Ossorio, 1966), including those applied to road traffic safety. Jovanis and Chang (1986) point to the fact that the use of accident statistics segmentation techniques allowed for a much better understanding of the effects of road accidents than the one, which could be obtained from aggregate data contained in various crash analysis reports. In a number of subsequent studies, such an analysis was repeated (Miaou, 1994), while Levine et al. (1995) performed the analysis of relationship between spatial traffic characteristics and number of road accidents in order to isolate the so-called Black Spots. The advantages of information segmentation techniques finally allowed to conclude that it is possible to discover knowledge in already known sets of information (Thomas, 1996) by investigating the influence of infrastructure segments length on distribution of accident frequency. The research results proved that this frequency is variable.

Observed high level of road accidents contributes to development of another trend in research, which concerns the development of road transport accident models as a tool supporting making effective decisions. Such models are usually based on the use of "traffic analysis zones", i.e. territorial units commonly used in transport task planning models (Martinez et al., 2009). Lee (2014) showed that the majority of road safety studies concern urban traffic (75-82%) and only 18-25% of research relates to extra-urban traffic. Whereas the research conducted in Germany demonstrated that over 50% of accidents occur on just 10% of total length of transport routes (Brannolte et al., 2009).

Conducted literature review made it possible to conclude that there are systematic inaccuracies in data sources, which constitute one of the basic origins of erroneous inference about the condition of road safety (Bohanec and Rajkovic, 1988; ESMA, 2017). According to Iaych (2017) there is a number of independent institutions dealing with collection of statistical data on the effects of road accidents with the use of various methodologies. Available reports analysis revealed that, in Poland for example, there are six institutions dealing with the collection of data on road accidents, including: police units registering traffic accidents, medical facilities drawing up their own documentation of accepted patients, civil registry offices issuing death certificates, emergency rescue facilities, insurance companies, and the Office of Technical Inspection (Pol. "UDT"). This practice is the source of information noise (Table 1).

Moreover, discrepancies in terminology, used in institutions dealing with the collection of statistical data on effects of road accidents, were observed (Table 2). The problem with acquisition of data that would be detailed enough to allow understanding the issue of road traffic safety in a selected areas was also indicated (World Bank, 2014).

Table 1. Discrepancies in data on deaths in result of road accidents (own elaboration based on (Iaych, 2017))

Country	According to police reports	According to medical facilities	Deviation (%)
Egypt	6700	11000	64.2
Belgium	724	1014	40.1
Japan	4373	5971	36.5
Chile	1623	2116	30.4
Korea	5092	6374	25.2
Italy	3385	4192	23.8
Netherlands	570	650	14.03
Spain	1680	1915	13.9

Table 2. Discrepancies in terminology concerning deaths due to road accidents (own elaboration based on (Iaych, 2017))

Accident result	Place of death	Time of death
Deceased	on the site of the disaster	-
Deceased	undetermined	– within 24 hours after the accident
Deceased	undetermined	– within 7 days after the disaster
Deceased	undetermined	– within 30 days of incident
Deceased	undetermined	– within a year of the disaster
Deceased	undetermined	– time of death after the accident unspecified

During the last two years (2019-2020) a new factor in the formation of distortions in information about accidents has occurred, resulting from the COVID-19 pandemic. This factor influenced the mobility decrease of both passengers and goods, in particular cross-border traffic (Kraemer et al., 2020; Oguzoglu, 2020; Saladié et al., 2020). The attention was paid that the economic recession reduced the demand for transport services, which positively influenced the improvement of road safety. However, the analysis carried out by the authors of this study indicated that the decline in demand for transport services is only one of the effects of the pandemic, which could mislead researchers about the reported reductions in road traffic collisions, injuries and fatalities. Therefore, two suggestions may be formulated:

1. Contrary to the positive trend in road safety, a pandemic creates a number of negative factors that affect the level of road accidents. Such factors include increased stress and anxiety among drivers caused by the pandemic, increased alcohol consumption (Vingilis et al., 2020) etc. This contributes to the shift of smooth driving style to an increasingly dangerous one, which in turn causes an increase in speeding on urban roads and highways. During a pandemic, collisions caused by aggressive driving behavior become more noticeable against the background of reduced traffic, which in turn causes stress for other drivers. It is obvious that the relationship between the factors reducing the number

of collisions and the factors increasing their number is not simple. However, distorted information, convincing about increased security during a pandemic, can complicate the situation.

2. As restrictions of COVID-19 pandemic are eased, the likelihood of new patterns of road users' behavior will increase. Those who return to work will be reluctant to use crowded public transport and will choose to commute by private vehicles. Such a trend is likely to increase the number of hazardous incidents on roads. OECD (2015) research revealed that there is a relationship between economic growth and the number of fatal accidents. Studies carried out in various OECD countries showed that the existing relationship can be described by the following formula:

$$Ft = a\left(\frac{GDP}{h}\right)^2 + b\left(\frac{GDP}{h}\right) + c + \varepsilon t, \quad (1)$$

where:

F(t) - the annual number of deaths at the national level,
$\frac{GDP}{h}$ - GDP per capita,
a, b, c - coefficients, which values vary depending on the country,
εt - limit of possible statistical error.

The aforesaid situations influence the growth of significance of efficacy of cognitive processes, directed towards the investigation of potential events and phenomena capable of disrupting the transport processes organization. It justify the need to undertake the research on structuring information required to plan and organize the sensitive cargoes transportation.

Methodology

General assumptions of the methodology

Any attempt to broaden the knowledge is based on data collection and processing procedures aiming at their ordering (structuring) according to certain parameters, e.g. the hazards level within traffic flow, likelihood and consequences of road accidents, etc. Clustering or classification may be performed in order to organize the acquired data, thus allowing taking into account the requirements for subsequent analyzes within the so-called knowledge discovery process. Therefore, it was possible to identify groups of information processing procedures related to sensitive cargoes transportation (Fig. 1).

Fig. 1: The components of the cognitive process

Specific procedures may be created within specific groups and may include:

1. Procedures for organizing the set of information by dividing it (classification). Classification is understood as systematized division of group (e.g. units, objects or phenomena) into parts according to the adopted rules and

contractual criteria, where each of these parts is distinguished by features that the other ones fail to exhibit, as measured for the purposes of present statistical data. The classification structure can be both hierarchical (e.g. the classification of activities or products), as well as unstratified (GUS, 2007). It is performed on the basis of the division criteria (supervised classification). Such criteria will allow, e.g., for allocation of each sensitive load to one of the predefined classes, which can solve the problem of proper classification of such cargoes, and allow for more reliable planning of their carriage. These criteria may include sensitivity of cargo to, e.g., haulage conditions, transport duration, road geometry, damage or criminal activities (theft) etc.

The number of classes in an ordered set of information can be predetermined, e.g., by the variety of sensitive cargo characteristics. The loads with similar physical and chemical properties, as well as their transportability included in the same class of created classification, may differ from that of loads grouped in other classes.

2. Procedures for organizing the set of information by grouping it (clustering). This group of procedures includes sorting procedures for unstructured sets of information. An example of such a procedure may be sorting aimed at the separation of high risk zones located on the routes of sensitive cargo transport. The threat level of liquidity of supplies in such zones can be measured by an integral threat level indicator, where the variables are:

- the degree of imperfection of road infrastructure - taking into account the lack or excess of road signs, limited visibility fields, too-tight corners, high road curvature, low number of parking bays, etc.,
- the working order of road transport means,
- the severity of road accidents - taking into account the number of deaths, injuries of road traffic participants, amount of economic losses due to the accident or its negative impact on the environment, etc.

In order to properly group possessed information, the criteria are adopted, taking into account, for example:

- similarity of road accidents according to their effects using the criterion of minimizing the so-called distortion measure of collected information,
- black spots located along the analysed route, where extraordinary situations already took place in the past or they may occur in the future, etc.

The resulting groups, detected in ordered information set, form the basis for their concentration and are called clusters (e.g. high risk zones, where accidents with similar causes or consequences occurred or may occur). The result of sorting is the determination of all possible clusters.

3. Procedures for analysis and synthesis of an ordered information system. Properly structured information gives the opportunity to conduct the cognitive processes involving active processing (analysis and synthesis) of ordered information system. In this case, the cognitive process initiates with the compilation of individual elements in subsets of information (analysis according to their characteristics) and terminates with the synthesis of possible scenarios for carrying out transport tasks, i.e. prediction of future events (discovering knowledge in structured information databases - following the previously presented procedures).

Information structuring procedure

The procedure for structuring information on the transport of sensitive cargo was proposed. This procedure initiates with the analysis of information sets e.g.: cargo types , their features, errors in road transport infrastructure, directions of cargo transportation, working order of vehicles, road accidents, high risk zones, etc. As part of the performed research, three methods based on statistical indicator systems were used, reflecting the homogeneity of the phenomena and/or processes investigated, including:

1. Method for assessing the reliability of information utilizing the analogy principle. It is based on the procedure of comparing information on similar phenomena or processes from the past.
2. The method of assessing the reliability of information using the so-called standard deviation, the value of which indicates how much the values of tested feature deviate from the arithmetic mean. Standard deviation σ can be calculated using the following formula:

$$\sigma = \sqrt{\frac{\sum_{i=1}^{N}(x_i-\mu)^2}{N}} = \sqrt{\frac{\sum_{i=1}^{N}{x_i}^2}{N}} - \mu^2, \tag{2}$$

where:

x_i - values of the feature elements collected in the statistical data set,
μ - expected value,
N - number of objects in the statistical data set.

The following assumptions may be applied. If information about the analyzed phenomenon/process falls within:
- one standard deviation, the probability of this information is 0.68,
- two standard deviations, the probability of this information is 0.95,
- three standard deviations, the probability of this information is 0.995.

3. Method for assessing the reliability of information utilizing the correlation coefficient, i.e. the measure of the linear relationship between the *X* and *Y* characteristics.

   The assumptions applied are as follows. If the correlation coefficient:
- $r_{XY} < 0.2$, there is no interrelation and the analysed information is unreliable,
- $r_{XY} = 0.2 \div 0.4$, it denotes weak interrelation, and the analysed information is questionable,
- $r_{XY} = 0.4 \div 0.7$, it denotes moderate interrelation, and the analysed information requires additional verification,
- $r_{XY} = 0.7 \div 0.9$, it denotes quite strong interrelation, and there is high probability that the analysed information is reliable,
- $r_{XY} > 0.9$, the analysed information is reliable.

On the basis of test results analysis (Table 3; Ossorio, 1966; Singh and Raj, 2004), the concept of the space of the structuring process may be formulated, as an organizational structure containing a description of features of the research objects, which may differ. From the modeling theory it is known that each object can be described as a vector of certain functions of its geometric, functional, economic, and other features:

$$x = [f_1(x), \dots, f_n(x)], x \in X, \tag{3}$$

where:

$f_1(x), \dots, f_n(x)$ - functions of geometric, economic, etc. features of the object,
x - object described by listing its geometrical, economic, etc. features,
X - a set of homogeneous objects.

Table 3: Evaluation of information reliability in the analyzed databases

Reliability of information regarding:	Values of reliability of information		
	Analogy rating	**Standard deviation rating**	**Correlation coefficient rating**
Event scenarios	0.86	0.91	0.54
Collision kinematics	0.97	0.995	0.85
Parameter values	0.98	0.995	0.91

In analogy with (3), we suggest that it is possible to create a space for a set of homogeneous *X* objects, where the process of structuring recognized objects is executed by describing, verifying and ordering their attributes:

$$F_p: (X \rightarrow D_f), \tag{4}$$

where:

F_p - a function of creating the structuring space for unstructured databases containing information about the set of homogeneous *X* objects,
D_f - a set of possible attribute values for the set of homogeneous *X* objects.

Taking into account that structuring should be performed on all groups of objects, the concept of integrated space *P(f)* have been introduced and understood as a structuring containing descriptions (attributes) of all homogeneous sets of recognized objects D_f (a structuring space for unstructured databases):

$$P(f) = D_{f1} \times D_{f2} \times \ldots \times D_{fn}. \tag{5}$$

This space may contain the following types of attributes:

- binary, taking only two values (usually 0 and 1);
- compartmentalized, ordered and measured at fixed intervals (e.g. carriage temperature for perishable goods etc.);
- relative, determined by reference to their point of reference (e.g. transportability of oversize cargo, etc.).

Taking into account the results of classification techniques analysis (Table 4), the k-nearest neighbors algorithm was adopted as the basic scheme for conducting further consideration within the discussed topic.

Table 4. Classification schemes (own elaboration based on (Anderson, 2009))

Classification scheme	Description	Drawback
Bayesian belief networks	They are used to present dependencies between events based on the probability of their occurrence. They consists in predicting the probability of the object belonging to one of the classes.	The method requires extended classification time (depends on the number of classifiers used)
Decision tree algorithm	Made as acyclic graphs, in which there is only one path between two different nodes. It involves recursive division of the data set, up to construction of the maximum tree.	Possibility of drastic classification error in case of mistaken tested attribute.
Artificial neural network	Usually applied in research where there are no simple classification rules. It involves the processing of data by their grouping into layers. Results are obtained using learning process, which involves assessing the weights of examined objects.	Best results are achieved in the case of a connection with an expert system.
SVM (Support Vector Machines) algorithm	Applied in classification tests, when there is high level of information noise. It consists in searching for the direction of the fastest growth of the segregation function of the data set with the most accurate fulfillment of the optimization conditions possible.	It requires the use of methods for solving optimization problems in the field of programming.
K-nearest neighbors algorithm	The use of the concept of neighborhood taking into account not only the proximity, but also the spatial layout of the set of studied objects. Conceptual simplicity.	This method is sensitive to data unreliability.

The suggested steps for structuring process may be as follows:

1. Creation of a survey set *X*, i.e. a data file for the analysed area for cargo transportation.
2. Analysing the data file according to the reliability criterion, thus creating complete, reliable databases.
3. Data normalization, consisting, for example, in the transformation of the analysed values into an interval [0, 1].
4. Generating a decision rule, according to which objects will be assigned to particular classes:

$$R(x) = [+1, if\ f(x) \geq w(m)] \text{ or } [-1, if\ f(x) < w(m)], \tag{6}$$

where:

R(x) - classification rule,
w(m) - threshold value of inhomogeneity measures.

Applying this general approach to solving different problems of information structuring related to sensitive cargo transportation, the detailed procedures may be developed.

Results

The verification of the proposed approach to structuring information resources on the transport of sensitive cargo was carried out on the example of the analysis of the route running through Poland from Szczecin to Kalisz (see Fig. 2, Table 5).

Fig. 2. The analyzed route from Szczecin to Kalisz

Table 5. Preliminary results of the reliability test for information concerning the analyzed route from Szczecin to Kalisz

Parameters analyzed	Values
The length of the route	460 km
Locations on the route	Kalisz DK25/DK12 – Jarocin DK12 – Leszno DK12/DK5 – Strykowo DK32 – Grodzisk Wielkopolski DK32 – Wolsztyn DK32 – Sulechów DK32/S3 – Świebodzin S3 – Gorzów Wielkopolski S3 – Szczecin S3/A6/DK10
Number of examined sections	92 pcs.
Number of information reliability checks in the context of conceptual inaccuracies	– The range of possible inaccuracies (x_k), k= 20 – Verifications carried out - 1840 items
Number of information reliability checks in the context of design miscalculations	– The range of possible miscalculations (x_p), p= 20 – Verifications carried out -1840 items
Number of information reliability checks in the context of exploitation miscalculations	– The range of possible miscalculations (x_e), e=8 – Verifications carried out - 736 items
Results of assessing the reliability of the information analysed	– 0.68 in case of 2% of the analysed data – 0.95 in case of 12% of the analysed data – 0.995 in case of 86% of the analysed data

The regular traffic of heavy goods vehicles (HGVs) transporting cargo requiring controlled temperature (namely meat products) was observed on the selected route. During route audit in October 2018, it was possible to identify infrastructure errors along the route and to check the reliability of relevant information. Based on the analysis of these errors, and using the iterative classification scheme, the clusters of individual road sections, where the high risk zones are found, were created. The statistical data of the Polish Central Police Headquarters on accidents on the tested route in the years 2015-2017 was also analyzed.

In the result of the analyses carried out, the collected information was structured, enabling not only to determine the high risk zones on the studied route, but also to group the route sections, taking into account its reliability level (Table

6). Information on these zones and reliability classes made it possible to cargo delivery plan with omission of these sections, where high risk of undesirable events involving HGVs carrying sensitive loads prevails.

Table 6. Examples of reliability classes of road sections together with the corresponding level of reliability

Reliability class	Range of reliability level
Kl.1	1-0,980
Kl.2	0,979-0,959
Kl.3	0,958-0,938
Kl.4	0,937-0,918
Kl.5	0,917-0,897
Kl.6	0,896-0,876
Kl.7	0,875-0,855
Kl.8	0,854-0,834
Kl.9	0,833-0,814
Kl.10	0,813-0,793
Kl.11	0,792-0

The research enabled to carry out information structuring, which may be useful for making a decision on the carriage routes for sensitive cargo in different situations, including COVID-19 pandemic continuation. It was demonstrated that the impact of factors that threaten the transport processes in the case of:

- development of a cargo delivery plan, based on well-structured databases, gives the opportunity to avoid the appearance of an emergency situation with a probability of 79-86% (standard deviation - 0.372),
- development of cargo delivery plan, based on a non-structured database, provides the opportunity to avoid such situations with a probability of 44 - 51% (standard deviation - 0.637),
- lack of cargo delivery plan's chances to avoid the appearance of an emergency situation was estimated at 20 - 26% (standard deviation - 0.826).

Conclusions

The article presents the methodology for structuring of information resources required when organizing transport of sensitive cargoes, that may be useful during COVID-19 crisis. The particular attention was paid to various problem areas of information required to make key decisions related to transport of analyzed load group.

It should be highlighted that information structuring brings many benefits, allowing to organize distributed data and eliminate information noise. Nevertheless, the use of classification procedures carries a number of issues therewith. This is due to the poor formalization of these procedures, which results in a high sensitivity to errors made, e.g. during the selection of the classifier or the number of classes, dependence on the characteristics of the data being processed and the accuracy of the rules for assigning these data to classes, etc. During classification the attention should be paid to elimination of errors concerning incorrect selection of attributes (classifiers), as the main reason for decreasing the operating quality of classification algorithms, and deletion of false data that may distort the information contained in databases.

The proposed approach verification on the example of analysis of information related to selected route for sensitive cargo transport proved that the suggested methodology allows for information structuring, and may be used for making decisions related to the organization of sensitive cargo transportation.

Our further research will focus i.a. on the development of the detailed procedures related to the classification, grouping and synthesis of information used in the planning and organizing of sensitive and conventional cargo transportation.

Abstract

The blockchain technology with its disruptive nature has brought dramatic changes to the financial services sector in the last few years. The current environment marked by the coronavirus pandemic has further revealed its strong potential for providing tangible and unique solutions for individuals and companies, while also accelerating its implementation. The underlying technology behind cryptocurrencies, such as Bitcoin, promotes disintermediation, mutual consensus and the rethinking of value chains and is expected to inevitably induce architectural changes in how firms create and capture value within markets. This paper describes the blockchain technology, the main benefits that organizations can derive by exploiting it and well as its major applications in the financial services sector and beyond. The authors also presented the world of cryptocurrencies and opined on the future state of blockchain technology by presenting the investment plan of global organizations who want to be at the forefront of business models' innovation. In order to sustain and succeed in this constantly emerging economy, it is vital for companies need to develop a clear understanding of the driving forces behind blockchain technology so that they can best exploit its myriad of opportunities.

Keywords: Blockchain Technology, Distributed Ledger, Cryptocurrencies, Disruptive Technology.

Introduction

Blockchain is a disruptive technology which yields implications for a number of industries. A new digital society status quo has emerged as a result of the current coronavirus pandemic, one that will push forward major innovations such as the blockchain technology. Blockchain technology was developed as a distributed and immutable transaction ledger that replaces a central authority with algorithms. Blockchain technology offers numerous opportunities for capturing strategic value, while opening new market segments for current incumbents in the financial services and new players alike (World Bank, 2017).

Blockchain technologies can be used as public means of transactions as well as private ledgers for inter-company transactions and record keeping. The latter promotes a greater degree of control and privacy, suitable for companies with proprietary information where a trust-based system can be developed among participants in the network (Kimani et al., 2020).

First applications arose in the financial services sector with the cryptocurrency, which puts the payments industry at the center of innovations around blockchain technology. The core functions of the financial sector are closely aligned with the transformative nature of blockchain when it comes to the verification and transfer of financial information (McKinsey, 2018). The blockhain translated as a decentralized replicated ledger underlies Bitcoin and other cryptocurrencies, while successfully mitigating the challenges imposed by traditional transaction business governed by third party intermediaries (Upadhyay, 2020; Varma, 2019). Bitcoin, the first and most popular cryptocurrency, was launched shortly after the bankrupty of Lehman Brothers by no coincidence. (Athey, 2016). Bitcoin was developer as a peer-to-peer version of electronic cash that facilitates the direct online transactions among parties without going through a financial institution (Nakamoto, 2008).

The blockchain technology has many other potential applications in the financial services sector that go beyond cryptocurrencies. Blockchain can be used to secure the Know Your Customer (KYC) and Know Your Business (KYB) processes when onboarding new customers, for mainstream payment and settlement, for credit scoring of Small Medium Enterprises (SMEs), securities issuance, capital markets post-trade settlement, derivatives and other financial instruments, trade repositories, and many others. (Polyviou et al., 2019; Varma, 2019).

Another major area of applications is the asset management industry, where venture capitalists, private equity firms, real estate funds, need to significantly improve the liability risk management and engage in dynamic decision-making process under constantly changing regulations. Asset management firms can leverage blockchain technology to automatize the fund launch and administration, to ensure a seamless engagement with stakeholders by using digitized portfolios and many more.

Besides the wide array of applications in the financial services industry, the blockchain's great potential is starting to be leveraged in other industries as well, such as insurance, supply chain, healthcare.(Catalin, 2017). Worldwide spending on blockchain solutions is expected to grow to an estimated 15.9 billion by 2023 (Statista, 2020), as companies in nearly every industry are rushing to take advantage of the perceived benefits of the blockchain technology.

Figure 1 presents some of the sectors that will benefit from the disruptive nature of the blockchain technology.

Fig. 1: Blockchain potential applications

Source: By authors

According to a McKinsey's report (2017), besides the financial services industry, government and healthcare would be the sectors that would capture the greatest value by leveraging this technology. Governments can achieve large savings by enabling key record-keeping and verifying capabilities thorough blockchain-based records. The same applies to the healthcare sector, where blockchain-based records improve the administrative efficiency by exploiting the value of information availability and exchange across patients, doctors, insurers, researchers.

The number of blockchain users worldwide has increased since the creation of the Bitcoin virtual currency in 2009, reaching over 54 million users of Blockchain wallets in October 2020 (Figure 2).

Fig.2: The number of blockchain users worldwide

Source: By authors

Blockchain technology provided a number of attractive benefits for the financial services industry, that are synthetized below:

- Decentralization and independence from central repositories;
- Lower costs and faster processing of transactions;
- No intermediaries for transactions authorization;
- All the transactions and data are attached to the block, they are time-stamped and cannot be altered;
- The transactions that take place are transparent;
- It uses protected cryptography to secure the data ledgers.(Beck, 2016)

First, decentralization implies that all participants in the network have access to a full audit trail (Varma, 2019). Also, the decentralized ledgers are resilient and they do not require a central authority. As they operate as open source protocols, they secure transparency and integrity and eliminate the role of a third-party intermediary to execute transactions. This capability of removing intermediaries allows for lower transaction costs. Moreover, the distributed ledgers ensure the trustful sharing of information (Polyviou et al., 2019) while allowing users to operate with confidence because transactions are immutable- they cannot be altered or reversed (Treleaven et al. 2017). Lastly, the cryptographic integrity checks ensure requires a verification process by all of the nodes in the network (Varma, 2019).

Literature Review

Blockchain technology is a distributed database of records or shared public/private ledgers of all digital events that have been executed and shared among blockchain participating agents (Crosby et al. 2016).

In blockchains, value is represented in transactions recorded in a shared ledger and secured by providing a verifiable, time-stamped record of transactions, which provides secure and auditable information (R Collins, 2016). Trust is a main consequence of decentralisation since there is no need to assess the trustworthiness of the intermediary or other participants in the network (Nofer et al. 2017) and information is easily viewed and compared. Participants are able to view the ledgers and analyse transactions. This feature provides transparency (Tian 2016) while simultaneously ensuring anonymity through preserving records behind cryptographics (Crosby et al. 2016).

Blockchains can be generalised and used to implement an agreed upon set of rules that no one, neither the users nor the operators of the system, can break. They rely on a unique system architecture platform for applications involving multiple parties who require little trust in each other; for example, fragmented supply chains. (Maurer 2017).

Meanwhile, a new generation of transactional applications that establish trust, accountability, and transparency is fostered by means of blockchain technology; these applications are managed by a so-called smart contract. A smart contract is typically a software programme that stores rules and policies for negotiating terms and actions between parties. It automatically verifies that contractual terms have been met and executes transactions (Swan, 2015).

Blockchain technology first gained popularity as a platform for managing Bitcoin, a digital cryptocurrency. Apart from the digital currency, blockchain technology is a new computing and information flow paradigm with broad implications for future development in supply chain management and logistics (Maurer 2017).

The blockchain technology can highlight and detail at least five key product dimensions: the nature, the quality, the quantity, the location and the ownership. In this way, the blockchain removes the need for a trusted central organization that operates and maintains this system and allows customers to inspect the uninterrupted chain of transactions. (Maurer 2017).

Blockchain reliability and transparency are meant to more effectively facilitate material and information. This transformation may result in a broader shift from an industrial durable, commodity, products economy to information, customization economy. (Pazaitis, 2017).

Blockchain impacts both supply chain process and product management, and financial transactions between different network parties (Hofmann, Strewe, and Bosia 2018). A key potential blockchain supply chain advantage is the disintermediation of financial intermediaries, including payment networks, stock exchanges, and money transfer services.

The blockchain technology context facilitates trading in a trust-free environment. Transactions are verified by the majority of supply chain participants, who define the consensus rules, and there is less need for building trust between supply chain partners (Crosby et al. 2016).

Blockchain technology, with transparent systems that are distributed, may be more conducive to operational partnering rather than strategic partnering. The visibility of information, which may include cost, materials, capabilities, and performance measures, may cause organizations to seek out short-term relationships.

The smart contract may decide how often a bid goes out and how it is met. Given these situations, it is foreseen that operational relationships, rather than strategic, will become the norm in blockchain-enabled supply chain. Overall, new managerial decision making and governance models will be needed (Oliveira and Handfield 2018).

Blockchain applications in the financial services industry

The emergence of the distributed ledger technology has challenged many traditional players in the financial services sector by demonstrating new opportunities to deliver value across the entire financial value chain. Since in its most fundamental form, the blockchain technology was created for recording transactions, it can potentially found many applications across the financial services sector (Varma, 2019). In this section, we provide several practical examples to demonstrate the myriad of blockchain applications that can be implemented in the financial sector.

In 2016, we noted a wider applicability of the blockchain applications in the financial services industry. For example, Westpac, one of Australia's largest banks, partnered with Ripple, a distributed ledger start-up in order implement a low-cost cross-border payment system based on blockchain technology, with the ultimate goal of improving their payment experience. Also, the Federal Reserve of Atlanta partnered with IBM to automate its clearing house processing platform. In the same year, Ornua, an Irish manufacturer of dairy products, partnered with Barclays and succeeding in engaging and completing the first trade transaction based on blockchain technology worldwide (Barclays, 2016).

Other players, such as Credit Suisse worked with Symbiont, R3 and Ipreo successfully completed the first stage of a project related to the use of blockchain technology for loan market Improvements. This demonstrated that blockchain technology has the potential to fundamentally reshape the syndicated loan market and the capital markets more broadly (Credit Suisse, 2016). Two years later, seven international banks, namely BNP Paribas, BNY Mellon, ING, Natixis, HSBC and State Street Global Advisors have enjoyed in a join initiative to pilot Fusion LenderComm. This was the first commercially available blockchain-powered platform for syndicated loans which went live on R3's platform.

PricewaterhouseCoopers; report on blockchain technology (PwC, 2018) presented the year 2017 as one marked by plenty of functional, proof-of-concept projects that are leveraging blockchain for various applications such as: internal payments, custody and trade finance, and custody.

Moreover, some securities exchanges started to launch blockchain-based platforms, while working closely with the regulators on how to ensure the proper oversight. In the following year, PricewaterhouseCoopers announced the launch of the first auditing service based on blockchain technology that will check the manner in which fintech

blockchain is being used by companies. When it comes to blockchain in fintech, cryptocurrencies occupy a big share in the fintech market. As Bitcoin was considered as the most successful blockchain application that gained consumers' trust, many fintech startups have built their businesses around this cryptocurrency.

According to a Harvard Business Review article on blockchain technology (Iansiti & Lakhani, 2019), much of the private blockchain-based development is undertaken in the financial services sector. For example, Nasdaq worked with a blockchain infrastructure providers, Chain.com, in order to develop a technology for streamlining the processing and validation of financial transactions. Other big banks such as J.P. Morgan, Bank of America, Fidelity engaged in testing of blockchain applications for replacing paperwork and manual transaction processing in areas like foreign exchange, trade finance, securities settlement.

The world of cryptocurrencies

The world of cryptocurrencies has grabbed the attention of many investors as well as regulators. As the first application of the blockchain technology, cryptocurrencies introduced a paradigm shift into the world of payments. Besides Bitcoin, which was the first cryptocurrency and currently the most traded one, we can currently find around 1600 cryptocurrencies that are exchangeable on the market (Deloitte, 2018).

The common element shared by all these cryptocurrencies is their underlying technology, namely the public ledger that is shared among network participants as well as the use of native tokens to motivate participants to run the network in the absence of a central authority (Hileman & Rauchs, 2017).

As of October 2020, the most expensive cryptocurrencies worldwide were Yearn.Finance, Bitcoin, Wrapped Bitcoin, DFI.Money, Maker and Ethereum (Table 1). While Yearn.Finance was the most expensive virtual currency, with one coin valued at USD 24345.98, the second most expensive virtual currency, Bitcoin, could be purchased for USD 10917.02.

Despite the rising interest in other cryptocurrencies, Bitcoin remains the leader both in usage and market capitalization. Bitcoin (BTC) is described as a virtual and decentralized cryptocurrency that is not backed by any sovereign obligation and it cannot be exchanged into any commodity, not even gold (Grinberg, 2011).

Table 1: The most expensive Crypto globally

GLOBAL CRYPTOCURRENCIES	U.S. DOLLARS
Yearn. Finance	24345.98
Bitcoin	10917.02
Wrapped Bitcoin	10891.36
DFI. Money	3237.77
Maker	593.12
Ethereum	368.38

Source: Statista (2020)

The underlying technology for Bitcoin is an open and permission less blockchain. This implies that any user is allowed to join and leave the Bitcoin network, without being (pre-)authorized by any entity. All that participants in the Bitcoin network need is the relevant software installed on their computer. (Lewis.R, 2017)

One advantage associated with Bitcoin is the fact that this cryptocurrency is supported and used by the majority of wallets, exchanges and payment service providers, hence benefitting from this network effects (Hileman & Rauchs, 2017). Bitcoin is considered to be the easiest cryptocurrency to be directly converted into fiat currency on a wide range of cryptocurrency exchanges such as Coinbase or Kraken. At the same time, Bitcoin is a medium of exchange, being accepted by many large companies including Microsoft, Expedia or LOT Polish Airlines (Houben & Snyers, 2018). Moreover, given that the blockchain technology underlying Bitcoin offers a self-contained alternative to the traditional payment systems, this functions as if all bitcoin users are engaging in trasanctions with the same bank (Fatás & Weder di Mauro, 2019). Another benefit provided by Bitcoin is the ease of transferring funds between two participants in a transaction which is facilitated through the use of public and private keys for security purposes (Bunjaku et al., 2017).

Besides the previously mentioned benefits, there is a variety of vulnerabilities associated with cryptocurrencies: Bitcoin has proved the security of its proof-of-work system, but its scalability is limited and it uses a lot of energy when mining pools. Also, Bitcoin experienced strong volatility and almost all of the ups and downs in its value were a direct result of government's statements in different countries. This volatility creates a problem in the short term. However, there are also medium and long-term risks associated to Bitcoin, such as the absence of a central issuer to provide a backup in case of bankruptcy as well as the risk of money laundry, terrorist and illegal activity financing (Bunjaku et al., 2017). Lastly, the customers' association of Bitcoin with a venue for malicious activity, based on previous massive theft of cryptocurrencies and fraud by promoters of initial coin offerings represents a serious challenge to its widespread adoption (Wharton, 2018).

Discussion. The Future State of Blockchain Technology

Blockchain technology provides individuals and organizations with the opportunity to self-custody and exchange digital assets without the need for traditional intermediaries. However, significant work is needed before organizations can reap the full benefits of this technological innovation.

Looking ahead, the integration with law, regulation and governance will be critical. Even though the blockchain technology implies a new form of trust itself, the only way to secure its successful adoption is by ensuring it is sufficiently trustworthy, and this goes beyond the security of distributed ledgers (Wharton, 2018).

Decision makers in business are increasingly looking into blockchain applications in order to improve efficiency, reduce costs as well as risks. The blockchain technology has the great potential of creating synergies among multiple, permissioned organizations, which enables the creating of new business models to capture strategic value.

The application in financial services and the impact of blockchain and it's application in financial accounting was conducted by Trautman (2016), Omar et all (2020), Chang, et all (2020). Yu et all (2018), Fanning and Centers (2016) and Trautman (2016). For that reason a vision for the global organizations investment plan it is resented in Figure 3 and the impact for blockchain technology.

Fig. 3: The global organizations' investment plan for blockchain technology as of 2020
Source: By authors

Blockchain it is simply behind the Bitcoin, also with potential to transform through cryptography for that reason it is in five top priority in different countries as we can see from Figure 4.

Conclusions

Despite being a relatively new technological innovation, blockchain already started to leave its mark on multiple industries. As a distributed ledger technology, blockchain promises to change the way companies are operating by reducing costs and allowing for the creation of ecosystems where value can be derived from network effects.

The blockchain technology will also stimulate people to up-skill themselves, while companies with traditional business models will have to completely reconsider their processes. Currently, there is a lot of excitement about the distributed ledger technology since it is expected to provide a better, more efficient and more resilient form of recordkeeping across multiple industries.

When it comes to the financial services industry, digitized assets and innovative financial channels are creating new paradigms for financial transactions and promoting alternative ways of capital raising. Blockchain-based payments can streamline the entire transaction process by removing bureaucracy and time-consuming paperwork, while also reducing the redundancy of information and improving performance. This disruptive technology is likely to become mainstream in the financial services sector within the next decade and it is expected to successfully reduce the massive duplication of information that creates confusion, error and delays in so many aspects of the financial services sector. Also, any operation that does not grant transparency and traceability is prone to be disrupted by the blockchain technology.

Although, there are some areas where cryptocurrencies and other blockhain application were effectively deployed effectively, the blockchain technology is still immature. In order to secure adoption, organizations need to build confidence in the new blockchain systems there needs to be transparency around how the processes work and what the benefits are, and in order to secure adoption, they need to be straightforward to use.

Besides the financial sector, blockchain will also revolutionize business processes in many other industries, but its adoption requires time, efforts and a global alignment in terms of legal, regulatory and governance frameworks. Nevertheless, the current Coronavirus pandemic facilitated the acceleration of the innovation process and some of the largest global companies will speed up the adoption of blockchain solutions to fill the informational gaps and delays.

Reconciling of Work and Family Life of Mother with Employee Status

Silvia TRELOVA

Faculty of Management Comenius University in Bratislava, Bratislava, Slovak Republic,
e-mail: silvia.trelova@fm.uniba.sk

Abstract

The issue of employing women with maternity, respectively parental responsibilities relating to childcare is still a frequently discussed topic today. Women, especially in the position of mothers, do not have a simple return to work, but they do not want to neglect their parental responsibilities at the expense of work. The paper summarizes the tools for reconciling work and family life that the mothers of children can use when choosing to return to work. We analyze and compare the various flexible forms of work performance that are admitted and regulated by national legislation (legislation of the Slovak republic) and we are considering the appropriate form of work depending on the age of the child.

Keywords: Reconciling of Work and Family Life, Maternity Leave Parental Leave, Parental Allowance, Flexible Forms of Work, Part-Time Job, Home Work, Telework.

Introduction

In the last period, one of the reasons for postponing motherhood is the fear of an unfavourable economic situation that occurs in a young household in connection with childbirth. There is no doubt that the costs of upbringing of children are rising and these costs are often perceived by parents as an unbearable financial burden. An important tool of the state supporting families with children is the system of social security, which represents an effective means of enforcing the family policy of the state through appropriate social benefits (maternity, compensation benefit) and especially state social support benefits (childbirth allowance, allowance for multiple concomitant children, child allowance, parental allowance, childcare allowance, childcare allowance for alternative care). (Treľová, 2015)

We point out the fact that there are reserves not only within the system of state social support (e.g. lower amount of parental allowance), but also other areas of support for families with children are not at a sufficient level, e.g. persistent low capacity in kindergartens. Even a few years ago, Hlásna et al. stated that in terms of support for families with children, there is a large lack of support for the compatibility of family and work life. (Hlásna, Horváth and Köksal, 2013). At present, however, we must point out that various positive measures are being taken, as well as to support the reconciliation of work and family life. An example of legislative measures is Directive (EU) 2019/1158 of the European Parliament and of the Council of 20 June 2019 on the work-life balance of parents and carers, repealing Council Directive 2010/18/EU, which aims to involve fathers to care for the child to a greater extent, which we evaluate positively.

At the time of expectation and birth of the offspring, as well as especially in the first months of his life, the family is often provided with only one income due to the care of the child, respectively. in some cases, the income is only state benefits provided in connection with the birth of a child and the period immediately following it (e.g. a single woman who has not fulfilled the condition of entitlement to maternity benefit). After maternity leave, mainly due to low financial security, many women in particular are considering returning to work and would like to harmonize work with their families (about whether family or work are also considered Freel and Ligasová, 2017). Various flexible forms of work performance, which are permitted and regulated by Slovak legislation, should help them to reconcile work with their families.

Tools to reconcile work and family life of the child's mother

Important tools for reconciling work and family life are maternity leave (maternity benefit), parental leave, parental allowance and childcare allowance, which have gradually changed their functions and meaning in the conditions of the Slovak Republic. (see also Hamuľák, Freel and Nevická, 2020) Parental leave on the one hand and parental allowance as well as childcare allowance on the other are two different instruments. While parental leave is an institute of labour law, parental allowance and childcare allowance are institutes of social security law and, namely state social support benefits. Unlike maternity leave, which in accordance with Act no. 311/2001 Coll. the Labour Code, as amended (hereinafter referred to as the "Labour Code"), is a justified working time off provided by the employer to an employee (a woman) in connection with childbirth and the care of a newborn child, parental leave is intended to encourage a parent to choose more freely between employment and childcare. (see also Hamuľák and Nevická, 2018) Relevant leave provisions can be organised into two categories whose features, at times, overlap: gender specific (maternity and paternity leave) and gender neutral (parental leave). (Torella and Masselot, 2010)

In connection with maternity leave, we note that the female employee temporarily suspends the performance of work duties during maternity leave and if she meets the legal conditions under § 48 -51 of Act no. 461/2003 Coll. on Social Insurance, as amended (hereinafter referred to as the "Social Insurance Act"), will receive maternity benefits from the Social Insurance Agency. The amount of the benefit provided to the entitled person may be different (the daily assessment basis of the entitled person is decisive). As part of the amendments to the Social Insurance Act, the maternity percentage was gradually increased from the original 55% to 60%, later to 65% and then to 70%, while currently (from May 2017) this benefit of sickness insurance is 75% of the daily assessment basis. The Social Insurance Agency pays maternity benefit in the maximum amount of EUR 1 498.70 per month (for a 30-day month) or in the amount of EUR 1 548.70 per month (for a 31-day month) - these amounts apply for this year 2020. It is a big shiftin the issue of material security for mothers, as the child's mother receives an income almost comparable to her salary she received in employment. We emphasize the very important fact that, however, entitlement to maternity benefit does not preclude a woman from having at the same time an income which is not considered to be the basis of assessment from which maternity allowance was calculated (§ 30 letter b) and § 138 par. 1 Act no. 461/2003 Coll. on Social Insurance, as amended; on the performance of work in addition to receiving maternity leave, although in relation to fathers also writes Freel, 2018). This means that a woman on maternity leave who receives a maternity benefit could conclude e.g. an agreement to perform the work, even with an employer with whom she has an obstacle to work due to maternity duties. The condition of caring for the child must be maintained. In this way, the mother can legally have another income.

During parental leave, the woman's previous income is to be compensated by a state social support benefit, namely parental allowance (Act no. 571/2009 Coll. on parental allowance and on the amendment of certain laws as amended) or childcare allowance (Ac no. 561/2008 Coll. on the childcare allowance and on the amendment of certain laws as amended). There has been no major change in recent years regarding the increase in the amount of parental allowance. Since 2014, the parental allowance has been provided in the amount of EUR 203.20 per month. The change occurred in May 2017, when as a result of its increase by 10 euros, the parent began to receive a parental allowance in the amount of EUR 213 per month. Another negligible increase has occurred since January 2018, when parental allowance of EUR 214.70 began to be paid, due to an increase in the amount of the subsistence minimum. The following year (2019), the parental allowance increased to EUR 220.70. These are the amounts of parental allowance per child. In the case of several children born at the same time, the amount of the parental allowance increases. It means if the beneficiary provides proper care for two or more children born at the same time, the parental allowance is increased by 25% for each additional child born at the same time. Very important is the fact that this parental allowance is always only one, regardless of the number of children under the age of three, respectively up to six years.

A more fundamental change in the use of parental allowance has occurred since January 2020, when the amount of parental allowance was adjusted differently: EUR 270 per month (twins EUR 337.50 and triples EUR 405) if the woman has not previously received maternity benefit and EUR 370 per month (twins EUR 462.50 and triples EUR 555) if the woman who applied for parental allowance was paid a maternity benefit before she became entitled to parental allowance.

The parental allowance differs from the maternity benefit in that the woman can receive it not only while taking parental leave, but also while not taking it. The mother can therefore return to work after maternity leave, where she will receive her full salary again and can also apply for parental allowance. Receiving a parental allowance enables active employment. The condition is that she must provide care for another person during her absence.

The childcare allowance is also a social benefit provided by the state to the mother (parents) to cover the costs of caring for a child under three years of age (up to six years of age in the case of a child with a long-term unfavourable health condition). The minimum amount of childcare allowance is EUR 41.10 per month if the mother does not prove the costs of childcare. Conversely, in the case of childcare expenses, a woman as a parent can receive an allowance of up to EUR 280 per month (maximum amount). The actual amount of the allowance provided depends on the proven childcare costs. If childcare is provided by a provider who is a kindergarten included in the network of schools and school facilities of the Slovak republic established by a municipality or local state administration body in education, the childcare allowance is a maximum of EUR 80 per month. Unlike parental allowance, childcare allowance is provided for each child separately. The positive effect of this benefit is clearly to support the employment of parents caring for a child. This means improving these parents' access to the labour market and, together with childcare providers, enabling them to reconcile their work and family life.

The relatively low level of these two benefits, zero dependence on the amount of previous income, problems resulting from many years of absence from work as well as loss of experience in the profession, led to gradual changes in the state social support system. The valid legal regulation for both benefits enables the performance of gainful activity, respectively in the case of childcare allowance, this gainful activity is a condition for its recognition. It follows from the above that while the mother may or may not be economically active in receiving parental allowance, gainful employment or study at a secondary school or university is required for entitlement to childcare allowance. With regard to the childcare allowance, Matlák points out that “the establishment of a condition of economic activity may in some cases be discriminatory, as for example a mother who takes care of a child with a long-term unfavourable health condition, respectively a child with a severe disability, has minimal preconditions for gainful employment. The same applies if the mother is a person with a disability or a person with a severe disability and has a child under three years of age”. (Matlák, 2014)

As parental allowance and childcare allowance are provided up to three years of age (up to six years of age in the case of a child with a long-term unfavourable health condition), it is the combination of benefits and income from dependent activity that allows a woman as a mother caring for a young child not only to combine work and family responsibilities, but even to improve financially. Although psychologists say parental care is very important for a child's further development and should not be disrupted by other responsibilities, often women do not take the full length of parental leave to return to work and rather return to work.

Just as children have the right to parental upbringing and care, Slovak legislation grants parents the right to care for and raise their children. (Gabrhelová and Čepelová, 2019). If a woman as a mother caring for a young child is considering returning to work, she also has several tools at her disposal that can help her reconcile family and work responsibilities. The female employee can agree with the employer on various flexible forms of work performance. The employer may propose individual working hours to the female employee, when, "the essence consists of different staggered hours". (Šipikal et al., 2007) The female employee individually chooses the work schedule, but must work the prescribed number of hours, which can be determined on a daily, weekly, monthly or yearly basis. In terms of working time arrangements, the employer can agree on flexible working hours with the female employee, where she will work full time, but can choose the beginning and end of the working day. Only certain hours are fixed when the female employee must be available to the employer at work. Such flexibility of working time gives the mother the opportunity to e.g. take your child to kindergarten or school in the morning.

Recently, also due to the constant development of information and communication technologies, the use of home work and telework has been expanding (§ 52 of the Labour Code), especially on a full-time basis. This way of performing work takes into account the family environment of the female employee and gives her the opportunity to work not only whenever she can in addition to fulfilling her parental responsibilities, but also in any place, it means not only from home. Russian study (survey, conducted in April-May 2019 in 69 settlements of the Russian Federation) has proved that „the format of teleworking appears to be attractive for women and effective in terms of balancing paid work and parental/family functions. Most often, women indicated that if they worked remotely, they would have more time to develop and educate children as well as attend cultural and entertainment events with them.“ (Tonkikh, Pesha and Markova, 2019)

We consider the use of the distance form of work (home work, telework) to be a suitable way of harmonizing family and work life, which also enables the mother to perform her work task in an efficient and effective way. Today, domestic work and teleworking form „an integral part of non-standard employment relationships and make a significant contribution to labour market flexibility". (Olšovská, Hodálová, Lacko and Valčuhová, 2008) The advantage (as opposed to shorter working hours) for an female employee is the same rules as for other employees (with a few exceptions). Even for employees working from home or elsewhere, as well as "classic" employees, the employer must provide equal pay, meals, equal career growth, access to training, provide leave, benefits, etc.

Although the advantage for the employee as a mother is the possibility of scheduling working hours, this precludes, for example, the right to compensation for wages and bonuses for overtime and holidays. Wage benefits for night work and wage compensation for difficult work performance are also not eligible, unless the employee and the employer agree otherwise. With the exception of the death of a family member, the Labour Code completely excludes the provision of compensation for the salary of an employee working from home due to important personal obstacles at work.

Female employees „who have a longer working week are more likely to find it more problematic to reconcile work and family life." (Križan, 2015) In addition to full-time employment, there is also a shorter employment period - employment for shorter working hours (§ 49 of the Labour Code). The possibility of adjusting working hours is enshrined in § 164 par. 2 of the Labour Code so that if a woman or a man permanently caring for a child under the age of 15 requests shorter working hours or other appropriate adjustment of the specified weekly working hours, the employer is obliged to comply with their requests, unless prevented by serious operational reasons. Working part-time may be a suitable choice for a woman in the position of a mother. The female employee can have the work distributed evenly or unevenly during the week, it all depends on the agreement between her and the employer. This type of employment is advantageous because the female employee enjoys the same employment and social benefits as full-time employees. The disadvantage is the amount of wages, which corresponds to shorter working hours. „Part-time work can be a chance, especially for women - mothers of young children, to maintain work habits and skills. After the end of the greatest burden of family responsibilities, it will allow them to move more smoothly among full-time employees." (Šipikal et al., 2007)

If the female employee voluntarily agrees with the employer on a shorter working time, she can use the institute of a divided job (49a of the Labour Code - job sharing). This form of work is based on work sharing, where one job is shared by several employees (usually two employees). The advantage is that the female employee agrees with her colleague who shares the job with her on the schedule of working hours and on the job description of this job.

Conclusion

Recently, there have been many positive changes in the use of women's human capital, which also has a positive impact on the sustainability of their jobs. (see also Szarková and Krásna, 2016) These changes occurred mainly as a result of legislative changes in the field of employment and the labour market in the form of new jobs, flexible forms of work performance (e.g. job sharing, home work, telework). "The offer of flexible working arrangements is a new contemporary solution to women's employment, designed to relieve the tension between women's dual work and family roles. While information technologies are developing and the range of positions in the remote employment segment is expanding, women are getting the opportunity to combine work and household responsibilities successfully." (Pesha, Tonkik and Markova,2019)

In the case of female employees with small children, a gradual return to work is suitable, so at the beginning, we recommend using a part-time job, job sharing. Telework is also not a bad choice, but the time allocated to work can exceed and reduce the time devoted to the family. The performance of telework requires great discipline of the employee. If the female employee already has older children, children in pre-school and school attendance, she can fully integrate into working life and work full-time. Due to parental responsibilities, it is advantageous to agree on flexible working hours or home work and telework.

There are still several shortcomings in reconciling work and family life, and this area has great potential, as it would certainly be much easier for many parents to combine their work and family life in the case of a more comprehensive and affordable system offering parents the opportunity to provide adequate childcare. life. Whereas „the taking of maternity and parental leave to a large extent affects the operation of employers" (Macková, 2015), in the conditions of the Slovak republic the part-time employment, home work and telework should be used to a much greater extent (Krásna, 2015), and employers should be motivated to employ parents of young children, to set up company kindergartens, etc. (Treľová, 2015) At a working mother considerable adjustments are necessary at the individual level and at the workplace, which help the mother to fulfill the dual responsibilities of career and motherhood. Private Health Insurance in Poland As A Response to Increasing Cancer Costs

Marta BORDA

Wroclaw University of Economics and Business, Wroclaw, Poland
marta.borda@ue.wroc.pl

Abstract

Demographic factors, epidemiological factors, and persistently low level of financing for oncological treatment in Poland create opportunities for further development of private health insurance providing services in the event of cancer. The purpose of this paper is to provide an overview of private health insurance products that are available in Poland for covering the various financial consequences associated with cancer risk. The study confirmed among others that most insurance is provided in lump sum benefits, pointing to a need for further development of current product offer, especially in the field of products that ensure compensation for incurred costs and income loss.

Keywords: Private Health Insurance, Oncological Treatment, Cancer Risk.

Introduction

The prevalence of cancer diseases is one of the most serious problems in the health care system in Poland. For many years, malignant neoplasms have been the second most common cause of death in Poland, right after cardiovascular diseases. As Statistics Poland (2020) reports, malignant neoplasms caused 26.4% of all deaths in 2018. It is also important to emphasize that in the case of people over 60, the mortality rate caused by malignant neoplasms is higher than in other age groups. As regards the European region, the European Commission 2020 estimates reveal that 62% of new cancer diagnoses and 76% of deaths that resulted from malignant neoplasms occur in people over 65 years old (European Commission 2020). For men aged 60 and older in Poland, the death rate from neoplastic diseases is almost 6 times higher than for those aged 45-59. For women, the rate is 4.5 times higher.

Data from the Organisation for Economic Co-operation and Development (OECD) shows that although the rate of cancer incidence in Poland is still lower than in most European countries, the mortality rate from cancer is much higher. As Table 1 presents, there was a decreasing trend in death rates from neoplasms recorded in European countries in the years 2000-2017. However, Poland (along with Hungary, Slovenia, Latvia, and Denmark) ranks among the top five European Union countries with the highest mortality from malignant neoplasms.

Due to the global aging trend, it can be expected that the number of patients with neoplastic diseases will increase since the risk of these diseases usually increases with age. Recent forecasts predict an increase in the incidence of malignant neoplasms for Poland in coming years, with a simultaneous decrease to mortality rates (see, e.g. Didkowska et al 2009; Węgrzyn 2020). As a result, an increasing number of people living with cancer can be expected, and it will be necessary to provide most with financial support to cover the costs of treatment and other expenses related to oncological diseases. Considering the problems faced by the public health care system (including the low level of oncological treatment financing and difficult access to innovative drug therapies), the increase in health awareness across society, and the growing level of household incomes, one can expect an increasing interest in private health insurance (PHI) that provides benefits in the event of oncological diseases.

The aim of this paper is to provide an overview of PHI products that are available in Poland to cover the risks from cancer and to examine the possibilities for financing various consequences of oncological diseases within the insurance coverage provided. In the study, the following research hypothesis is adopted: despite the recent dynamic growth of interest in insurance related to cancer risk, there is still a need for innovative insurance products that provide comprehensive coverage for the various consequences of this risk, and thus, are better suited to growing customer expectations.

The structure of the paper is organized as follows. First, the financial consequences of cancer risk are identified, and from these, the broadest possible catalogue of insurance products that cover the costs and/or income losses related to oncological diseases is indicated. Next, the analysis of PHI products available in Poland with respect to the possibilities of covering various consequences of cancer risk is conducted. To conclude, potential directions for further development of cancer insurance in Poland are formulated.

Effects of cancer risk in the context of insurance coverage

Sickness risk (also called the risk of poor health) belongs to the category of personal risks, defined as risks that directly affect an individual and can cause financial consequences such as reduction or loss of earned income, extra

expenses, and the depletion of financial assets (Black and Skipper 2020; Rejda 2003). In the field of insurance, this risk is considered in a negative sense, i.e. as a threat, the possibility of not achieving the expected effect (in the considered case as the possibility of worsening human health status as a result of cancer). Regardless of the adopted dimension of the analysis, the consequences of sickness risk, including cancer risk, always have direct effects on a given person and other members of his/ her household and have indirect influence on the activity of enterprises and the entire economy in a given country. In this study, cancer risk is examined as one of the risks associated with an individual or a household, regardless of its broader macroeconomic and social consequences.

The loss for a household resulting from the realization of the risk of poor health may apply both to resources already owned (e.g. the necessity to incur health expenses) and to expected ones (e.g. loss of income). Cancer risk includes both types of consequences: the payment of medical expenses and the loss of earned income from a person being unable to work. Under the first case, the risk is related to the necessity to cover various health expenses. In European countries, including Poland, the provision and financing of health services for the treatment of oncological diseases, in particular services provided in hospitals, is the domain of public health care systems. Treatment of oncological diseases requires a comprehensive approach and therefore generates huge costs, often spread over a long time horizon. As Hofmarcher et al (2020) indicate, over the last two decades in Europe, health spending on cancer has increased faster than the increase in cancer incidence. Costs incurred in the furtherance of cancer diagnosis include not only the costs directly related to the treatment process (e.g., oncological diagnostics using modern equipment, consultations with medical specialists, surgical procedures, hospital stays, costs of modern drugs, chemotherapy, or radiotherapy), but also indirect costs for patients and their families (including, e.g., access to medical facilities, appropriate diet, rehabilitation services, prostheses, psychological care, or home care for patients after hospitalization) (also see: Holecki et al 2020; Węgrzyn 2020).

The increasing costs of oncological treatment are accompanied by significant funding shortages in this area of medicine in Poland. The financial resources allocated to oncology in Poland are relatively small compared to other European countries. According to the report of the Supreme Audit Office (NIK 2018), the average expenditure on oncology in Poland is only EUR 42 *per capita*, compared to EUR 85 in the Czech Republic, EUR 156 in France, and EUR 171 in the United Kingdom. The low level of financing results in limited availability of many services, including specialist diagnostic tests and rehabilitation services. In Poland, patients suspected of having cancer wait too long for diagnostic tests (often several weeks or months) or the results of histopathological examinations, losing valuable time in the treatment of the disease. The geographic dispersion of cancer treatment facilities and the lack of centers specializing in the treatment of specific types of cancer mean that insufficient human resources also hinder the improvement of the effectiveness of cancer treatment.

Another important problem is the lack of availability of modern medical procedures and drug therapies, and it is made worse by the lack of reimbursement services for when they are available. The costs of many innovative medical procedures used in cancer treatment are not reimbursed by the National Health Fund, which makes it necessary to look for other sources of financing (e.g., charity campaigns). In Poland, patients with oncological diseases have access to a much smaller number of modern anti-cancer drugs compared to those in other European countries. Thanks to the progress in precision medicine, it is possible to use the so-called targeted therapy that includes the selection of molecular drugs tailored to a specific patient, which can enable faster, more effective, and more comfortable treatment. An example of such innovative therapy still not available in Poland is immunotherapy with the use of chimeric cells to treat lymphoma patients (Witkowska 2019). Unfortunately, more than half of modern oncological drugs registered in Europe are not covered for reimbursement by the National Health Fund. Patients in Poland have either limited or no access to approximately 70% of anti-cancer drugs used in European standards (NIK 2018).

In the scientific literature, increasing attention has been paid to the costs of informal care provided by family members or friends for patients suffering from cancer. It is important to emphasize that this cost category is especially difficult to estimate due to the frequent lack of reliable and comparable data in this area. Based on the results of a study conducted by Hofmarcher et al (2020), the costs of informal care related to cancer in 2018 in Poland were only EUR 15 *per capita*, compared to EUR 132 in Denmark, EUR 85 in Italy, and EUR 48 in the United Kingdom (European average was EUR 50 *per capita*).

Another important category of financial consequences of cancer risk is the loss of all or part of household income resulting from a patient's inability to work. The need to undergo treatment and rehabilitation causes a break in the professional activity of a sick person, and recovery does not always entail regaining full ability to perform the current job, which may result in the loss of the current position and the need to take a lower paying job. Particularly threatening to households is the situation in which the sole breadwinner falls ill. The productivity loss due to sickness incapacity includes the income lost during sick leave or the permanent loss of the ability to work. Cancer may also result in a complete loss of productivity due to the patient's death. In this case, the indirect cost of cancer

includes the lost future income that the person would have received until retirement. In 2018, the costs related to the loss of productivity due to cancer in Poland were estimated at EUR 21 *per capita*, and in the case of death resulting from cancer, it was EUR 47 *per capita* (Hofmarcher et al 2020). Temporary or permanent loss of an employee as a result of cancer is also a heavy burden for the employer (e.g., costs of remuneration payment for the period of inability to work or costs related to the retraining or recruitment of another employee).

Taking into consideration the variety of the financial consequences associated with cancer risk occurrence, adequate insurance coverage can be provided under a number of health insurance products, including:

- critical illness insurance and its specific type for oncological disease (so-called "cancer coverage health insurance");
- hospital stay insurance – providing a flat-rate daily benefit related to hospitalization, regardless of incurred treatment costs;
- drug insurance – covering the costs of purchasing medicines and auxiliary materials;
- medical expenses insurance, including the costs of treatment abroad;
- disability income insurance;
- premium insurance – available as an option to the life insurance contract in the event of a diagnosis of cancer (no premiums are required and the insurance coverage remains in force);
- medical assistance insurance, including oncological assistance – usually supplementing the critical illness insurance or comprehensive medical expenses insurance.

Analysis of health insurance offers related to cancer risk in Poland

The PHI products offered in Poland can be classified into:

- life insurance – if it is applied as a health or accident insurance option supplemental to the main life insurance coverage;
- non-life insurance – in the form of separate health and accident insurance products designed mostly to cover medical expenses.

In Table 2, the share of health and accident insurance in life and non-life segments in 2010–2019 is presented. As the trend in Table 2 shows, the Polish health insurance market is still developing. Health and accident insurance options that supplement life insurance products are more popular than similar insurance products offered by non-life insurance companies. During the examined period, dynamic growth has been recorded in the share of health insurance purchased in the life sector (an increase of 16.1%). This has resulted mainly from easier access to the customer (while purchasing life insurance policy or/and using bancassurance) and greater activity of life insurers in this segment of the market. Accident and sickness insurance belonging to the non-life insurance segment accounted for only 5.8–7.8% of the property and casualty insurance portfolio in 2010–2019. In Poland, the role of PHI is to supplement the public health care system, which at the time of consumption should provide almost all health care services to patients without additional cost. In practice, there are many difficulties with quick access to specialized health care.

Table 2: The share of health and accident insurance in gross written premiums in Poland in 2010–2019 (in %)

Type of insurance	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
Health and accident insurance supplemental to life insurance	13.6	14.0	12.9	15.4	18.1	19.7	22.8	22.4	27.2	29.7
Accident and sickness insurance (non-life segment)	7.1	6.6	6.8	7.2	7.6	7.8	6.3	5.8	6.1	6.4

Source: Polish Insurance Association (2019).

By purchasing PHI, it is possible both to have quick access to health services (the public system has long queues for specialists) and to use high-quality private services (e.g., a private hospital). Health insurance products cover medical expenses resulting from ambulatory care, hospitalization, medical assistance, and the costs of medicines. Typical insurance coverage usually lasts one calendar year and can be renewed for the next one-year period (Borda 2016).

In the Polish insurance sector, cancer risk coverage is provided mainly by the life insurers as an option to the primary life insurance contract in the form of critical illness insurance. These contracts are of growing interest because they guarantee the payment of certain cash benefits in the event of a diagnosis of a serious disease (e.g., cancer, heart attack, stroke, or renal failure) and subsequent treatment. Moreover, they are usually supplemented with coverage for medical assistance (in particular oncological assistance), including: organization and coverage of the costs of medical transport, drug delivery, the rehabilitation process, rehabilitation equipment rental or purchase and its delivery, home care after hospitalization, childcare, food delivery, reimbursement of wigs or prostheses, and more. A comprehensive analysis of the origin, product design, and market development of critical illness insurance is presented by Gatzert and Maegebier (2015). It should be added that the lump sum benefits paid in the event of cancer diagnosis (or other critical illness) do not directly relate to the actual costs of treatment, which are often very high. Comparative analyses of critical illness insurance products offered in Poland have been conducted lately by Michalak (2017), Osak (2018), and Węgrzyn (2020).

Insurance products that are aimed at covering the real costs of oncological treatment and recovery have been offered, but only recently and to a much smaller extent. From the insured's perspective, insurance that allows quick and easy access to oncological services and covers the actual expenses related to treatment may constitute an effective instrument for financing cancer risk in households. However, from the insurer's point of view, offering this type of insurance is more difficult. The product design must consider not only the level of risk which is insured, but also the current costs of medical services available under the insurance coverage. The existence of a wide catalogue of costly services that can be used by a person with cancer may lead to excessive consumption of services (moral hazard) from this perspective.

Table 3 presents a comparison of insurance coverages for cancer costs from selected insurance companies in Poland (compensation type products). The analysis intentionally includes examples of insurance products differentiated by the scope of services available in the event of a cancer.

Table 3: Comparison of the selected health insurance products against cancer costs offered in Poland

Criterion	Insurance Company		
	PZU Życie S.A.	**PKO Życie T.U.S.A.**	**Towarzystwo Ubezpieczeń Allianz Życie Polska S.A.**
Name of insurance product	Additional individual critical illness insurance	OnkoPlan	Allianz Best Doctors
Age of the insured	18-60 years, protection until reaching age of 65	18-60 years, protection until reaching age of 65	18-65 years, protection until reaching age of 85
Insurance period	5 years with possibility of renewal	1 year with possibility of renewal	1 year with possibility of renewal
Grace period	the same as in the main life insurance contract	90 days	180 days
Sum insured	no specified sum insured, benefits provided within quantitative limits	maximum limit of sum insured is EUR 500,000 for the policy year; EUR 1 million for the whole duration of the policy	EUR 1 million for the policy year, in the case of the contract renewal – EUR 2 million in relation to all the events of a lifetime
Services provided under the contract	medical consultations, diagnostic tests, rehabilitation services, psychological care, caregiver support	coverage of medically necessary costs of treatment outside Poland and the United States, costs of travel or medical	organisation and coverage of medically necessary costs of treatment abroad, including: costs of hospital stay, diagnostic tests,

		transport of the insured together with an accompanying person or donor, accommodation costs of the insured together with an accompanying person or donor, reimbursement of drugs after treatment abroad in Poland and the United States, daily hospital benefits (max. 60 days)	surgery, anaesthesia, radiotherapy, chemotherapy, drugs during hospitalisation, medical transport, reimbursement of the costs of purchasing drugs after returning to Poland (not reimbursed by the National Health Fund), daily hospital benefits
Limits of services	quantitative limits of benefits, not longer than 3 years from the diagnosis of the disease; for only one detected severe disease	amount limits for individual types of benefits, e.g. reimbursement of drugs up to PLN 100,000, but the insurance does not cover the costs of drugs reimbursed in part or in full under the National Health Fund relating to the reimbursed part, other costs are covered by insurance	upper amount limits for particular types of benefits, e.g. reimbursement of the cost of purchasing drugs after returning to Poland to EUR 50,000
Health care providers	medical providers in Poland designated by the insurer	foreign medical providers designated by the insurer, with the exception of the United States	selection from three foreign medical centres designated by the insurer
Additional services	preventive laboratory examinations every two years - from the second and fourth anniversary of the contract, psychological support for relatives in the event of the insured's death	second medical opinion (foreign)	second medical opinion (foreign) and *medical concierge* services

Source: own study based on: Allianz Życie (2018), PKO (2018a), PZU Życie (2019).

In the design of insurance products covering cancer costs, specific solutions are used in order to reduce moral hazard on the part of the insured. These include:

- precise definitions of covered risk – e.g., types of malignant neoplasms covered by an insurance;
- duration of the contract – typically for a specified period (1 or 5 years), with the possibility of continuing the insurance coverage after this period (a new premium amount is calculated based on the level of risk, which usually increases with the age of the insured person. For example, for a person aged 18-39, the premium in the fullest variant of the "OnkoPlan" insurance is PLN 89 per month, while for a 55-60-year-old insured it is PLN 262, respectively (PKO 2018b);
- age limits of the insured – typically the insured must be aged 18-60 to begin coverage, and standard insurance coverage lasts until age 65, with the exception of the "Best Doctors" insurance, which guarantees protection until age 85 (considering demographic trends, it can be expected that the percentage of older people with cancer, including those who have been using innovative anti-cancer therapies for many years, will increase);
- obtaining the right to benefits – usually the insurers require diagnosis to be supported by a histopathological examination, but in practice, a surgical operation is usually necessary to obtain this type of examination;
- grace periods – typically up to 180 days;
- limits on the amount, quantity, and time of provided medical and rehabilitation services;

- territorial scope of medical providers – usually limited to health care providers in the country and/or abroad, indicated by the insurer.

Conclusions

Malignant neoplasms constitute a complex medical problem, and to diagnose and treat them requires the cooperation of specialists from many fields. Considering the expected increase in cancer incidence, as well as the emergence of innovative treatment options offering the potential for many years of life after cancer diagnosis, it can be expected that the interest in PHI products providing comprehensive coverage of cancer costs should increase. However, it should be noted that the demand for cancer insurance products largely depends on households' incomes and the level of health awareness in the society. The analysis conducted regarding health insurance products offered on the Polish insurance market covering cancer risk showed that most critical illness insurance provides lump sum benefits that are not likely to match the real costs of treatment. There is an increasing need to develop insurance products that compensate all of the incurred costs and lost income resulting from cancer. Some of the most important challenges facing insurers in designing new cancer insurance products include: extending insurance coverage for people older than 65, including preventive examinations, and financing the use of drug therapies not reimbursed by the National Health Fund. Finally, information and mobile technologies represent valuable tools within the cancer insurance sector which can be used to monitor health status and to promote a healthy lifestyle among insured persons.

Abstract

The relevance of improving quality management methods at enterprises is explained by the fact that in recent years, modern progressive enterprises are aimed at improving the quality of products and services by introducing quality tools and methods into the organization. Quality management is a lever for the economic development of the organization, the improvement of quality management methods directly affects the increase in the productivity of the enterprise, leads to the optimization of production costs. Improving quality management methods increases one of the most important criteria for assessing an organization - its competitiveness.

Keywords: Quality, Quality Management, Competitiveness, Costs, Costs, Statistical Process Control, Systems Approach, Quality Management.

Introduction

The relevance of improving quality management methods at enterprises is explained by the fact that in recent years, modern progressive enterprises are aimed at improving the quality of products and services by introducing quality tools and methods into the organization. Quality management is a lever for the economic development of the organization, the improvement of quality management methods directly affects the increase in the productivity of the enterprise, leads to the optimization of production costs. Improving quality management methods increases one of the most important criteria for assessing an organization - its competitiveness.

Quality management is one of the main activities of the enterprise, since it allows not only to produce high-quality products that meet the requirements of the consumer, but also to quickly respond to new market requirements. Consequently, the improvement of quality management methods will allow the production of relevant, high-demand products with the latest manufacturing technologies and high product quality. With the improvement of quality management methods, the work of all departments is integrated, which increases the level of quality knowledge among employees, leads to overall involvement and improvement of the work of all departments of the organization. Thus, the improvement of quality management methods directly affects the socio-economic indicators of the enterprise and its niche in the industry.

In general issues related to quality management methods, the works of famous foreign scientists became famous - Albert Feigenbaum, Joseph Juran, Genichi Taguti, Edwards Deming, Kaoru Ishikawa, Yoshio Kondo, Philip Crosby.

One of the most famous scientists in the field of quality is Edwards Deming, in his teachings he proposed 14 principles of quality management. His approach to quality management is divided into 4 critical components:

statistical process control;

scientific foundations of management;

psychology of management;

a systematic approach.

Based on Edwards Deming postulates, any work is a process during which people transform the raw materials received from suppliers, materials, information into the results offered to the consumer (Deming, 1993).

Cite this Article as: Anastasia Kurilova and Dmitry Savenkov " Modern Methods of Quality Management " Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The system of total quality control TQC (Total Quality Control) is described in the works of Feigenbaum, 1945. This system represents quality as a method of business vision - a solution to the problem of quality and its price in relation to the benefit of the consumer. This system assumes quality not only on the result of the production of a product, but also on the result of quality at each stage of its creation:

design control;

incoming control;

control of technological processes;

control of the manufactured product and its delivery to the consumer.

Summarizing the above, Albert Feigenbaum defined quality control as an effective system for coordinating quality work across all departments of an organization, continually improving these works, minimizing investment and cost to meet customer requirements (Feigenbaum, 1945).

Philip Crosby has proven in his writings that it is possible to optimize costs in quality management. The main point that Philip Crosby put into his teachings is that products should be produced immediately of high quality without modifications and alterations, since any revision and alteration are additional useless costs (Crosby, 1999).

Considering the economic interpretation of the concept of quality, the American professor H. James Harrington understands by quality the satisfaction of the consumer's expectations for the price he can afford when he needs it, and high quality is the excess of the consumer's expectations for a lower price than he assumes.

Consequently, exceeding consumer expectations is a tool for increasing demand for a manufactured product and increasing the share occupied in the industry, which leads to an increase in profits. And this, in turn, is the main goal of any acting organization.

In the Russian economy, the emphasis is on more highly specialized issues: planning, control, accounting and analysis of quality costs, issues of the direct impact of quality indicators on the technical and economic indicators of the enterprise.

Among the Russian scientists who have made a great contribution to the development of the theory of quality management practice, we should highlight Vasily Boytsov, Yuri Adler, Svetlana Shchepetova.

Formulation of the problem

With the existing economic feasibility of the direct influence of the quality of the manufactured product on the economic indicators of the organization, some issues of improving the quality to optimize the economic indicators remain not fully disclosed. Currently, most organizations do not fully understand the importance of quality management, and it is it that allows organizations to survive in a certain area of the industry in the current conditions of a market economy. Consequently, quality management should be viewed as a lever for the global improvement of the organization's system, for its modernization to meet the latest technologies and constantly changing demand for the product.

But even with the understanding of the importance of the quality management system at the enterprise, it must be continuously improved and optimized for quality costs, focusing on the most effective costs.

The main idea of modern quality management is that quality management brings the maximum effect during the production process of manufacturing a product, that is, quality management is not effective after the production of a product. But it is also necessary to carry out quality assurance activities prior to the product manufacturing process.

Results

Quality management techniques are the ways in which controls affect the manufacturing process of making a product. This provides a process for achieving and maintaining the planned degree of product quality. These methods fall into 4 categories:

organizational;

organizational and technological;

economic;

socio psychological.

Quality management is carried out using special means, which include:

office equipment, communication facilities used by management bodies and persons who control the performance of certain functions in quality management systems;

normative documentation that regulates the quality indicators of the manufactured product and organizes the implementation of special quality management functions;

metrology means, which include measuring instruments and state reference samples;

GSI (documents that regulate ensuring the uniformity of measuring instruments);

GSSD (base of the state service of standard reference data on the properties of substances and materials).

The functions that an organization performs in relation to quality as an object of management include:

rationing (includes standardization, certification and attestation);

raising personnel qualifications, stimulating personnel;

information and metrological support for monitoring the progress of the production process;

technological supply of the production process (enough material and technical support).

The quality of the manufactured product as a control object is also characterized by possible deviations from the quality indicators required by the consumer. In this regard, it is necessary to identify, evaluate and measure these deviations and be able to influence the manufactured products to eliminate possible deviations from the quality indicators determined by the consumer.

Decrease in quality indicators can occur due to physical wear of components, transformation of the internal structure or properties of the manufactured product, its physical obsolescence. Quality parameters can vary within certain tolerances for several reasons during the manufacturing process. They directly depend on the production technology of the product, the quality of the supplied components, the technological state of machine tools and production equipment, measuring instruments and tools, personnel motivation and many other factors of both internal and external organizational environment (Petrichenko, 2015).

In general, the principles of quality management are related both directly to the quality of the manufactured product and to the methods of managing this quality.

The quality indicators of the manufactured product are reflected in the terms of reference (TOR), plans and contracts.

Quality requirements are fixed in the existing standards, certain technological conditions and technical specifications for modernization and design, in the descriptions of the nature of the service and technological standards.

The quality management sequence plan contains:

setting a plan (task) for quality;

implementation of the plan and its support;

continuous comparison of the reproduced quality with the established plan;

implementation of corrective measures in the event of deviations to eliminate them.

The quality of the product produced also depends on numerous random factors that occur at all stages of the product's production. The introduction of a quality management system is necessary to prevent the occurrence of these factors through the coordinated activities of all departments in the organization. The quality management system in this case provides for corrective measures with a constant impact on the production process and the implementation of the manufactured product with an appropriate level of quality that satisfies the end user.

In quality management, concepts such as system, environment, goal, program, etc. are constantly used.

There is a command and control system. Numerous levels of enterprise management appear to be a managed system.

The quality management system is created and maintained by the management system.

Quality management concepts are divided into:

Quality System (QS) - quality system;

Quality Driven Management System (QDMS) - a management system based on quality management;

Total Quality Management (TQM) - total quality management;

Quality Assurance (QA) - quality assurance;

Quality Control (QC) - quality control;

Statistical Quality Control (SQC) - statistical quality control;

Quality Assurance System (QAS) - quality assurance system;

Product Assurance (PA) - product guarantee;

Total Manufacturing Management (TMM) - total production management;

Good Manufacturing Practices (GMP) - best manufacturing practices;

Environmental Management System (EMS) - production resource management system;

“We Care” - the system “we are concerned”;

“Responsible Care” - system of “concern of responsible persons”;

Environmental Total Quality Management (ETQM) - overall environmental protection quality management;

Total Manufacturing Assurance (TMA) - total production assurance;

Integrated Process Management (IPM) - integrated process management;

Management for Quality Improvement (MQI) - quality improvement management;

Total Quality and Productivity Management (TQPM) - total quality and performance management;

Integrated Quality Management (IQM) - integrated quality management;

Continues Improvement Implementation System (CIIS) - a system for implementing continuous improvement;

Total Quality Transformation (TQT) - total quality transformation;

Quality System Management (QSM) - quality system management.

These quality management concepts contain different quality management methods that are used in the Total Quality Management methodology to solve quality problems.

Total quality management plays a critical role in the management of a modern organization. The management system originates from senior managers. They are the ones who build the organization's strategy aimed at improving the technical and economic indicators of the current year in relation to the previous period. In the structure of the organization there are special departments that coordinate the work on quality management and its improvement.

For quality, considered as an object of management, all sections of modern management, such as planning, analysis and control, are characteristic.

Actual quality management is based on research on quality management carried out by renowned foreign companies such as Hewlett-Packard, etc. Quality policy in these organizations in the 1980s was influenced by the works of foreign scientists Albert Feigenbaum, Joseph Juran, Genichi Taguti, Edwards Deming, Kaoru Ishikawa, Yoshio Kondo, Philip Crosby.

The activities of the largest foreign corporations began to be determined based on the following factors:

involvement of top-level managers in quality management activities;

the interest of all employees in the continuous improvement of the organization's processes;

the creation of groups to improve quality at all stages of the product life cycle;

guaranteeing both collective and individual participation in quality management activities in the organization;

involvement of suppliers in improving the quality management system, both in the organization and on the territory of the suppliers;

creation of plans for quality improvement on a short- and long-term basis, implementation of these strategies, according to the plan;

quality assurance of functioning management systems;

introduction of incentives for the work done.

It should be noted that it is important to ensure the quality of the functioning of control systems, since Many quality management teams make the mistake of focusing specifically on identifying and correcting errors, ignoring preventive measures and working only with the production process and the departments directly involved in it. Thus, a deviation management system is organized that does not consider preventive measures to eradicate these deviations. When analyzing this error, experts in the field of quality concluded that quality management is dependent on the control systems that regulate the production and economic activities of the organization.

The activities of each organization should be aimed at involving all employees of the enterprise in improving the quality of the manufactured product, i.e. each employee must be individually and collectively responsible for ensuring that their operations meet quality standards. Any production activity should be aimed at full satisfaction of the consumer and the fulfillment of all his requirements in the production of a product or the provision of services.

In total quality management, internal and external aspects are distinguished. In any production activity, a large profit directly depends on the level of satisfaction of the requirements of the end user. The competitiveness of an organization in a area of product production depends on the level of customer satisfaction. Total quality management proves that the effectiveness of the organization and the quality of the product produced depends on the quality of the activities of each department in the organization. Each department consists of a network of interaction with other departments of the organization, as a result of this interaction, the internal flow of materials, processing and assembly operations are provided from the moment of production start until the moment the finished product is received and sold to the end consumer (Gudkova & Shazamova, 2016).

Total quality management establishes common interests and ensures the involvement of all departments in the work related to the compliance of their activities with the established standards in force at each level of the organizational structure. The main direction of total quality management is to minimize the costs (both money and time) incurred to control the quality of the manufactured product, that is, it is necessary to continuously optimize the costs to prevent the occurrence of defects in both components and the finished product.

Improving employee motivation for quality management can be achieved using quality circles and employee participation programs.

Quality circles are bodies that are made up of employees of the organization who meet regularly under the leadership of a senior manager. Quality circle meetings discuss possible ways to improve quality and organizational processes during the production of a product or the provision of a service.

Employee participation programs are increasing employee motivation by dividing organizational shares among employees. Nowadays, in industrial production, an important factor in improving the relationship of senior management and workers is the membership of employees in the share capital of the organization; introduction of a lower-level representative into the current board of directors to ensure the involvement of employees of all levels in the management of the organization. Total quality assurance requires coordination of actions of all functional departments to improve the performance of the organization (Smolyaninova & Trapeznikova, 2020).

Philip Crosby noted the employee reward system as an integral part of the quality management system - rewarding achievements leads to incentives for the employee to ensure high performance in all departments of the organization.

The Deming Prize, established in 1951, forms the basis of the Total Quality Control system. It is based on the analysis of information flow from a wide range of specialists and offers a new way to consider quality. It is widely applicable

in Japanese quality. This was followed in 1987 by the Baldrige Prize. The European quality award model became its development, its essence was to assess the results of business and the impact on society.

Conclusions

Now, the quality policy in organizations in the field of market economy is formed so that it covers not only the quality of the product produced and the services offered, but also the production activities of each employee of the organization. It clearly fixes the components of the quality management system and quality standards for an organization, considering that the manufactured product will be delivered to the end consumer within a certain time frame, in certain volumes and at a certain price.

Having a certified quality management system in a modern organization is essential for the successful development of this organization. The certified quality management system guarantees high stability and sustainability of the quality of the manufactured product. The quality management system certificate ensures maintaining competitiveness in area of production.

Abstract

Macroeconomic stability, which is represented by an appropriate combination and levels of macroeconomic indicators, lays the foundations for attaining sustainable economic development over a long time horizon. Maintaining macroeconomic stability is particularly important in the EU countries, which compose a heterogenous structure in terms of both national economies and the development of financial markets. The EU member states are at different stages of their integration with the union. Most (19) are in the eurozone, having adopted the common currency, thereby abandoning autonomous monetary policy and transferring it to the European Central Bank. Critics of the common currency point to the risk of integrated monetary policy implementing the tools that might not be adequate for sustaining the stability of all national economies. Surveillance of the current economic situation is therefore crucial for the economic growth of these countries. The research subject raised in this paper is important for the present and future situation of the countries in the euro area and ones considering the date of access thereof. Monitoring macroeconomic stability is also significant in view of the current global situation, including the struggle with the COVID-19 pandemic.

The purpose of this study has been to evaluate the macroeconomic stability of the EU countries based on data published under the framework of the Macroeconomic Imbalance Procedure (MIP) in 2011-2018. The research results suggested an overall improvement in the macroeconomic stability of the countries submitted to the analysis, which was implicated by the decreasing number of cases when the thresholds set for particular indicators were exceeded. Moreover, regardless of whether given countries belong to the eurozone or not, most cases of exceeding the thresholds were observed in the areas of public and private sector debt and in the international investment position as well as export market share. These findings point to the areas that require improvement in the analyzed countries.

Keywords: macroeconomic stability, European Union countries, Macroeconomic Imbalance Procedure

Introduction

Macroeconomic stability, testifying to the effectiveness of the implemented economic policy, is an essential prerequisite for the achievement of sustainable economic development. Maintaining macroeconomic stability is particularly difficult in the EU countries, which are distinguished by diversity in many areas, including the historical or geographical background, as well as the financial and economic situation. Regarding these countries, it is especially important to consider the diversity in terms of the economic policy, including monetary policy, that they pursue, which is due to the different stages of integration at which they operate. Most EU countries (19) have already accessed the euro area, thereby adopting the common currency, which meant abandoning autonomous monetary policy in favour of the policy conducted by the European Central Bank. Critics of the common currency claim that integrated monetary policy gives rise to a risk that the tools implemented under its umbrella may not correspond adequately to the stability needs of every national economy. Moreover, it is believed that the effectiveness of traditional monetary policy instruments is becoming exhausted. On the other hand, the eurozone states adhere to different fiscal policies, which – despite the implemented policy mix tools - may contradict the solutions envisaged in monetary policy. The other EU countries (8) that have not accessed the eurozone conduct autonomous monetary and fiscal policies, although they respond to the general EU regulations (Kotliński 2012, p. 130).

Due to differences among the EU countries, especially in the economic sphere, and because of the recent deterioration of the macroeconomic situation caused by the latest financial crisis, with its earliest symptoms identified back in 2007

Cite this Article as: Bogdan WLODARCZYK and Aleksandra OSTROWSKA " Macroeconomic Stability of The European Union Member States in The Light of The Macroeconomic Imbalance Procedure" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

and the consequences felt in the following years, several reforms of economic governance have been introduced in order to improve the situation. An example is the MIP, an instrument which enables surveillance of the macroeconomic stability of all EU member states, with instruments to take immediate measures to improve thereof. Surveillance of macroeconomic stability is significant for both the authorities and citizens. For the latter, macroeconomic stability is a determinant of wealth.

The variety of definitions of macroeconomic stability in the literature results in the absence of a uniform method applied to measure it. In view of the greater attention paid to the stability of economy by both researchers and economic authorities as well as the consequences of the latest economic crisis, which brought to light some irregularities in the functioning of the EU, the objective of this article has been defined as follows: to evaluate the macroeconomic stability of the EU states based on the indicators published in compliance with the MIP in 2011-2018.

Macroeconomic stability as a major objective of economic policy

Economic policy is a premeditated strategy of state authorities, institutions and international organizations to influence economy – its dynamics, structure, functioning and economic relations (Winiarski 2006, p. 18). Macroeconomic stability and the attainment of a positive economic growth rate are major goals of economic policy (Włodarczyk, Heller, Ostrowska, 2018, p. 130). Despite having the objectives defined as above, we are still lacking an unambiguous definition of macroeconomic stability. Moreover, rather than trying to define what macroeconomic stability means, the focus is on the conditions that must be fulfilled to be able to speak of macroeconomic stability (Ionita 2015). Macroeconomic stability can be defined as an appropriate set of macroeconomic indicators which best corresponds to the conditions of sustainable economic growth (Gorynia, Łaźniewska, 2009, p. 145). Likewise, macroeconomic stability has been defined as a combination of factors derived from the macro-environment the aim of which is to accelerate the dynamics of economic growth in a country, or at least not to hinder such growth (Kupiec, Wierzbicka, 2017, p. 53). These two definitions suggest that macroeconomic stability is a broad concept, which is modelled under the influence of many macroeconomic factors. The subjects interested in the level of macroeconomic stability include: fiscal authorities, monetary authorities, national institutions, credit rating agencies, investors, and any entities that make business decisions (Janecki 2017, p. 124-125), including companies and households.

The concept of macroeconomic stability is also associated with the idea of economic balance. Macroeconomic stability is equated with the occurrence of balance, both internal and external, over a long time period. Internal balance is a situation where actual production obtained in an economy is generated with the full use of production factors, the unemployment rate is equal to a natural unemployment rate, inflation is low and stable, and public finances are in the state of balance, as verified by acceptable values of the deficit and public debt. External deficit refers to economic exchange with other countries and signifies balanced payments and stable exchange rates (Puszer 2014, p. 42). Maintaining internal and external balances, both strongly interconnected, ensures that the economy in question is resilient to external shocks (Sameti, Isfahani 2012, p. 38), that is sudden, undesirable changes in the environment, which can undermine the country's macroeconomic condition. Macroeconomic stability is one of the fundamental elements of the economy's competitiveness (Kirikkaleli, Ozun, 2019, p. 351, Luylov, Chygryn, Pimonenko, 2018, p. 143). Any fluctuations in macroeconomic indicators may therefore weaken the resilience of the economy of external shocks or affect its attractiveness on the international arena, e.g. due to a lowered level of investments. Any case of economic imbalance is an impulse activating various adaptation mechanisms, the effectiveness of which depends on the extent to which economic balance has been affected, the degree of flexibility of markets, type of economic policy instruments applied, and the external circumstances in which the given economy functions. The interdependence between internal and external balance strengthens as the share of a given economy in the international labour division is higher while the liberalization of its economic system and economic relations with foreign countries are stronger (Puszer 2014, p. 46).

Noteworthy is the fact that the lack of an unambiguous definition of macroeconomic stability is compounded by the absence of a uniform method to measure thereof (Melnyk, et. al., 2018, p. 106). Among the methods applied to explore macroeconomic stability, the ones used most often are: evaluation through the prism of convergence criteria (Pietryka 2009), Macroeconomic Stability Pentagon (Lyeonov, Lyulov 2018) and Macroeconomic Imbalance Procedure (Kämpfe, Knedlik 2017). An authorial comparison of these three methods is presented in table 1.

Table 1: Methods for evaluation of macroeconomic stability – a comparison

Question/method	Macroeconomic Stability Pentagon	Convergence criteria	Macroeconomic Imbalance Procedure
When was the method developed?	1990	1992	2011
How many partial indicators does the method include?	5 indicators	5 indicators	11 basic indicators, auxiliary indicators and 3 labour market indicators
Does an application of the method generate a synthetic indicator?	Yes	No	No
Are there thresholds for evaluation of macroeconomic stability?	No	Yes, for 4 of the 5 conditions	Yes, for the basic indicators but not for the auxiliary ones
Are data for evaluation of macroeconomic stability available for broad public?	Yes	Yes	No
Does the method take into account macro-finance data?	Only regarding public debt relative to GDP	Only regarding public debt and deficit relative to GDP	No

Source: elaborated by the authors

The method chosen in this research for making further assessment of macroeconomic stability is the Macroeconomic Imbalance Procedure, as it provides a wide range of indicators, which are easily available and interpretable (owing to the inclusion of threshold values).

The Macroeconomic Imbalance Procedure as a method for the measurement of macroeconomic stability

The research interest in macroeconomic stability has been stimulated by the consequences of the latest financial crisis, which revealed the imperfections in how the EU structures operated (Graj 2015, p. 22). The expansive fiscal and monetary policies, errors in economic governance and disruptions in financial markets resulted in a rapid increase in deficit and public debt, which was most severe in peripheral EU states, such as Spain, Portugal and Ireland (Widerski 2016, p. 236-237). One of the shortcomings identified then was the lack of an early alert mechanism for the eurozone countries, which were worst stricken by the crisis. In response to the emergence of certain undesirable phenomena and the need to supervise the current economic situation of the EU member states, MIP was implemented in 2010, as part of the so-called six-pack of economic governance reforms (Erhart, Becker, Saisana, 2018, p. 3).

The main instrument for measuring the level of macroeconomic stability with the use of the mentioned method is the scoreboard published by the European Commission in annual Alert Mechanism Reports. Based on the MIP scoreboard, the presence or absence of harmful economic imbalances is confirmed. When a case of imbalance is verified, the Commission issues recommendations to the EU member state in question. If these recommendations are not implemented, the European Commission can impose penalty fees on this EU country (Rymarczyk 2017, p. 300). Table 2 shows the MIP scoreboard. Beside 11 headline indicators that define the level of internal balance, external balance and competitiveness in the EU states, the European Commission employs several auxiliary indicators. However, no threshold values have ben set for these indicators. In 2015 three labour market indicators have been added to the MIP Scoreboard.

Table 2: The MIP Scoreboard

Indicator	Unit	Thresholds
External imbalances and competitiveness		
Current Account Balance (CA)	% of GDP (3 year average)	-4% / +6%
Net International Investment Position (NIIP)	% of GDP	> -35%
Real Effective Exchange Rate (REER)	42 trading partners, HICP deflator; 3 year % change	+/- 5% (EA)
		+/- 11% (Non-EA)
Export Market Shares (EMS)	% of world exports; 5 year % change	> -6%
Unit Labour Costs (ULC)	(2010=100); 3 year % change	< 9% (EA)
		< 12% (Non-EA)
Internal imbalances		
House Prices Index (HPI)	(2015=100), deflated (1 year % change)	< 6%
Private Sector Credit Flow (PSCF)	Consolidated; % of GDP	< 14%
PSD – Private Sector Debt (PSD)	% of GDP	< 133%
Gross Government Sector Debt (GGSD)	% of GDP	< 60%
UR – Unemployment Rate (UR)	3 year average	< 10%
Total Financial Sector Liabilities (TFSL)	Non-consolidated; 1 year % change	< 16,5%
Employment indicators		
Activity rate	% of total population aged 15-64 (3 year change in pp)	> -0,2%
Long-term unemployment rate	% of active population aged 15-74 (3 year change in pp)	< 0,5%
Youth unemployment rate	% of active population aged 15-24 (3 year change in pp)	< 2,0%

Source: developed by the authors, based on the Report from the Commission to the European Parliament, the Council, the European Central Bank and the European Economic and Social Committee, Alert Mechanism Report 2020.

The European Commission justifies the selection of indicators included in the MIP as follows (European Commission 2012, p. 4):

- first, the set of indicators takes into account a broad approach to potential disturbances in economic balance, including macroeconomic stability and competitive position of economies, based on both economic literature and the experience gained thus far. The MIP takes into consideration indicators that identify internal balance, external balance and competitive position.
- secondly, the indicators and their permissible thresholds were determined in such a way as to create an efficient early alert mechanism indicating a potential threat to macroeconomic balance and therefore to economic competitiveness. The thresholds were established with the help of statistical methods, according to the lower or upper quartile of the historical data distribution.
- thirdly, the scoreboard plays a very important communication role. To this end, it displays a limited, clearly presented set of indicators so that the information is understandable to third parties. Another significant contributor to the communicative function is the open access to collected data, which are available online.

- finally, the indicators must be of high quality, reliability and comparability between the states, which is ensured by the European Statistics Code of Practice. EUROSTAT is indicated to be a reliable source of statistical data, and if some data are unavailable there, it is recommended to use other reliable sources, such as the European Central Bank database.

MIP, same as the Excessive deficit procedure, is composed of the preventive and the corrective part (Kotliński 2013, p. 171). The former applies to all EU member states, and the latter is valid for the eurozone countries only. The preventive part consists of an analysis of indicators and detection of imbalances in macroeconomic stability. Next, an in-depth analysis is performed and if any of the detected imbalances is deemed to be excessive, the corrective part if activated. In this part, an EU member state in question is obligated to publish a corrective plan, the implementation of which is then surveilled by the Commission. Once completed, the procedure is terminated.

Table 3: Advantages and disadvantages of the MIP as a method for evaluation macroeconomic stability

Advantages	Disadvantages
Takes into account a wide range of indicators (microeconomic, macroeconomic, real estate market data, financial data)	Lack of a synthetic indicator of macroeconomic stability
Contains cautionary thresholds for each headline indicator	Cases of exceeding cautionary thresholds may indicate macroeconomic instability, hence it is necessary to apply also a qualitative analysis and descriptive analysis, and to establish a broader context
Apart from economic indicators, it takes into account financial indicators, which is significant from the point of view of financialization of economy	Short time of the application as the MIP was created only a few years ago, in 2011
Contains a qualitative analysis of the results	The method is applied exclusively to evaluate macroeconomic stability in EU countries
Provides a uniform measurement of macroeconomic stability in the EU countries; when modified, it is applicable to measuring stability in countries outside Europe	Despite pointing to imbalances in some EU countries, the European Commission has never imposed sanctions
Provides a possibility of rapid response to disturbances in macroeconomic balance	Discretion of the Commission assessment of the imbalances; a member state which not respect more thresholds of the indicators may not be included in the category of the countries with imbalances if Commission consider this. There are also cases when Commission include a member state in the category of countries with imbalance if the member state fails to respect only one threshold of the scoreboard
The possibility of imposing sanctions on the euro area countries, which do not follow the recommendations of the European Commission as part of the macroeconomic balance	Some recommendations of the Commission are supporting objectives that contradict each other

Advantages and disadvantages of the MIP according to the authors of this article are contained in table 3.

Measurement and evaluation of macroeconomic stability through the prism of the MIP scoreboard

The level of macroeconomic stability in the EU countries has been measured with the help of 11 headline indicators, published by the European Commission in annual Alert Mechanism Reports, and compared with the threshold values. The employment indicators introduced in 2015 are not included in the analysis due to the adopted research period. It has been agreed that more cases of exceeding the set thresholds implicate a lower level of macroeconomic stability. Because of the high number of the EU member states and the limited length of this article, only general trends were analyzed, without exploring specific causes underlying the macroeconomic stability in every country. It should be emphasized that in depth-reviews (IDR) are published in relation to the countries that the European Commission finds that there is an imbalance, which allows to show the long-term trends leading to it.

In 2011-2018, there were fluctuations in the macroeconomic stability levels in the EU member states, which was manifested by the number of cases where the threshold values of the indicators published in the MIP scoreboard were exceed. There were 87 such cases in 2011, increasing to 97 in the following year, then declining to 90 in 2013. Since 2014, the number of cases surpassing the permissible thresholds for the MIP published indicators decreased, down to 67 in 2017, which was the lowest number over the analyzed time period. The highest number of excessive indicator values occurred in 2012 (97). During the analyzed period of time, some improvement in the general level of macroeconomic stability of the EU member states was achieved, which is confirmed by the decreasing number of excessive values of the MIP indicators (from 87 in 2011 down to 67 in 2017). In the last year submitted to our analysis, that is in 2017, the number of such cases increased again, up to 71, which should alert one to make detailed analyses of the macroeconomic situation in these countries.

Fig. 1: Number of cases where the threshold values of the MIP indicators were exceeded in the EU member states in 2011-2018

Source: developed by the authors, based on the Report from the Commission to the European Parliament, the Council, the European Central Bank and the European Economic and Social Committee, Alert Mechanism Report 2020.

Despite positive overall tendencies leading to some improvement in the level of macroeconomic stability, the EU countries in 2011-2018 were distinguished by certain variation in this regard. Most cases of surpassing the indicator threshold values were observed in Cyprus (47), while the smallest number was noted in the Czech Republic (11). Other countries with a high number of such cases, apart from Cyprus, were Ireland (46), Portugal (39), Greece (37) and Spain (37), that is the eurozone peripheral countries, which are considered to be less developed. The European Commission has identified the existence of imbalances or excessive imbalances in these countries in recent years but without imposing any sanctions. In turn, the countries with the smallest number of cases where indicators exceeded their threshold values included Romania (12) and Poland (12). The analysis justifies the conclusion that the eurozone countries in that time period were characterized by a lower level of macroeconomic stability than the countries outside the common currency area.

Fig. 2: Number of cases where the threshold values of the MIP indicators were exceeded in each EU member states in 2011-2018

Source: developed by the authors, based on the Report from the Commission to the European Parliament, the Council, the European Central Bank and the European Economic and Social Committee, Alert Mechanism Report 2020.

Cases of exceeding the allowable values were observed for all the indicators in the analyzed countries, although their number was not higher than 20 in any of these states. The threshold value was exceeded most often for the indicators NIIP, EMS, PSD, GGSD and UR. However, the number of excessive values for most indicators tended to decrease, from 16 to 12 for the NIIP, from 16 to 1 for the EMS (the highest decrease), from 13 to 12 for the PSD and from 10 to 7 for the UR. An increase was only recorded for the GGSD indicator, from 14 to 15 cases. The thresholds were least often exceeded for the following indicators: TFSL, REER, ULC, HPI, and PSCF. There was a slight increase for the TFSL, from 1 to 2 cases of values above the threshold, and for the ULC, from 3 to 4 such cases. The highest increase was detected for the HPI, from 0 to 6. For the other indicators, the number of cases above the thresholds decreased, namely from 3 to 0 for the PSCF and from 3 to 2 for the RRER.

Fig. 3: Number of cases where threshold values of indicators were exceeded, in 2011-2018

Source: developed by the authors, based on the Report from the Commission to the European Parliament, the Council, the European Central Bank and the European Economic and Social Committee, Alert Mechanism Report 2020.

Among the eurozone states, the indicator pertaining to external balance that most often scored above its threshold value was the NIIP (68), followed by the EMS (64), while the CA (28), REER (22) and ULC (19) were least often above the threshold values. As for internal balance and competitiveness, the GGSD (89), PSD (67) and the UR (59) most often exceeded their thresholds, while the HPI (16), PSCF (9) and the TFSL (4) least often reached values above their thresholds. Thus, there were disturbances in both external and internal balance among these countries. The most serious problem in terms of external balance was identified to appear in the net international investment position and in the export market share. Regarding internal balance, most troublesome was the debt of both state institutions and the private sector, although certain problems also occurred in the social sphere, e.g. unemployment.

Fig. 4. Number of cases where thresholds of the MIP indicators were exceeded in the eurozone states, in 2011-2018

Source: developed by the authors, based on the Report from the Commission to the European Parliament, the Council, the European Central Bank and the European Economic and Social Committee, Alert Mechanism Report 2020.

The situation in the countries outside the eurozone was similar to the one observed above. Most cases of exceeding the threshold values of indicators measuring external balance concerned the NIIP (38), EMS (23) and CA (15), while the least cases were noted for the ULC (6) and REER (1). As for internal balance and competitiveness, most such cases were connected with the PSD (21), GGSD (18) and the UR (15), whereas values of the HPI (12) and TFSL (2) least often surpassed the relevant thresholds. Values of the PSCF were never higher than its permitted threshold over the entire analyzed period of time.

Fig. 5. Number of cases where threshold values of the MIP indicators were exceeded in countries outside the eurozone in 2011-2018

Source: developed by the authors, based on the Report from the Commission to the European Parliament, the Council, the European Central Bank and the European Economic and Social Committee, Alert Mechanism Report 2020.

The above analysis of macroeconomic stability in the EU countries has implicated an overall improvement in the level of this parameter. A small and decreasing number of cases where the thresholds set for the MIP indicators were exceeded is a positive finding. Both in countries using the common currency and the ones outside the eurozone, the net international investment position and export market shares need some improvement, as they could enhance the investment attractiveness of the EU countries while helping them to better the current account balance. Attention should be drawn to the problem that is already broadly discussed in the literature and in public debate, namely to excessive debt, which appears in both public and private sectors (Włodarczyk 2018, p. 97). It is also crucial to take measures for the sake of improving the situation of the social sector, for instance to combat unemployment. This is also important for the current situation in global economy because unemployment certainly entails poorer macroeconomic stability in both the EU countries and outside the union.

Conclusions

The macroeconomic Imbalance Procedure, implemented in 2011, can serve as a useful instrument to evaluate economic situation. Advantages of this method certainly include a broad range of proposed indicators, which take into account economic indices (both internal and external balance) as well as financial ones, in addition to a series of auxiliary indicators, with employment indicators. This is important from the standpoint of the growing importance of financial factors as well as fiscal ones, and their impact on the economic position of every country (Wichowska, Ostrowska, 2018, p. 339-340). Another advantage lies in the publication of threshold values of the MIP indicators, which enables rapid detection of any disturbances in the macroeconomic stability within particular areas. The method, however, is not free from shortcomings, such as the lack of a possibility to react instantly to cases where thresholds are exceeded, or the fact that published data are averaged values. The other disadvantage of MIP is discretion of the Commission assessment of the imbalances and no sanctions against countries with imbalances.

The analysis of macroeconomic stability presented in this paper suggests some improvement in this parameter during the analyzed time span which occurred in most EU countries, and this is confirmed by the decreasing number of cases where the MIP indicator threshold values were exceeded. However, the countries outside the eurozone proved to possess higher macroeconomic stability. Possible reason could be sought in the lack of adequate tools for application in common monetary policy in the eurozone, or in an autonomous fiscal policy of the countries outside this group of EU states. Another possible reason might be the different degree of development of financial markets, which national economy in each country is to some extent dependent on.

A further challenge in research dedicated to macroeconomic stability should be to continue surveillance of levels of macroeconomic indicators in the analyzed countries, and to seek for solutions which could strengthen the

macroeconomic stability of these countries. It is also worth bearing in mind that global economy in most countries across the world, not only in Europe, is facing new challenges connected with the COVID-19 pandemic.

The Impact of EU Regional Policy on Economic Growth, Promoting Access to Employment and Social Inclusion

Małgorzata GORZAŁCZYŃSKA-KOCZKODAJ

Institute of Spatial Management and Socio-Economic Geography; University of Szczecin; Szczecin, Poland
malgorzata.gorzalczynska-koczkodaj@usz.edu.pl

Abstract

Regional development is largely an economic process, involving the transformation of regional factors and resources (internal and external) into goods and services. Its main feature is the growth of the region, i.e. the increase in the production of goods and services as a result of a quantitative increase in used factors of production (material and personal) and improvement of their efficiency.
The aim of the article is to analyse the EU funds and determine the impact of EU funds received by Poland under the financial perspective 2007-2013 and 2014-2020 for reducing unemployment and for economic growth. The article shows the important role that the European Union plays in supporting employment through the implementation of the main objective of cohesion policy supporting employment, business competitiveness and economic growth and sustainable development, as well as improving the quality of life of citizens. The objectives of this policy are addressed to all regions and cities in the European Union.
Detailed data cover different periods in the analysed range, due to their availability. The presented results form the basis for further, extensive research, in order to fully specify factors affecting the described phenomena and their role. Due to a limited space, many details as well as factors directly affecting the analysed phenomenon, such as changes in social policies in the country, are not taken into account.

Keywords: EU funds, GDP, Registered Unemployment, Relative Poverty

Introduction

Regional development can be understood as harmonized and systematic activities of the local community, local government and other entities operating in the region aimed at creating new and improving the existing conditions of the region's economy and ensuring spatial and ecological order [17,21,19]. The most synthetic categories of regional development explain the definitions Szlachta, Kudłacz i Klasik. According to Szlachta [25], "regional development is a systematic improvement in the competitiveness of business entities and the standard of living of the inhabitants, as well as an increase in the economic potential of regions, contributing to the socio-economic development of the country". Kudłacz defines regional development as "a permanent increase in the standard of living of the inhabitants and economic potential in the scale of a given territorial unit". In contrast, Klasik defines regional development as "the sustainable growth of three elements: the economic potential of regions, their competitive strength and the level and quality of life of residents [18,15,14]. Increasing the quantity and improving the quality of manufactured goods and services is the basis for changes in the way, level and quality of life of the region's inhabitants. Economic growth affects social development, which is the second aspect of regional development [16]. The development of local government units is associated with planning and management efforts, using appropriately designed methods and instruments of impact [20,22].

A process of integration with the European Union has contributed also to significant changes in the policy of rural development in Poland [31]. Despite the increased availability of jobs also in rural areas, there is still high international emigration (temporary and permanent). This phenomenon mainly concerns young people who may no longer return to their places of residence, which reduces the potential of the regional labour market and the possibilities of increasing the region's economic potential [30,3].

Essential is Article 9 of the Regulation (EU) No 1303/2013 [7] of the, in which they are written thematic objectives for the ESI Funds. In order to contribute to the Union strategy for smart, sustainable and inclusive growth as well as the Fund-specific missions pursuant to their Treaty-based objectives, including economic, social and territorial cohesion, each ESI Fund shall support the following thematic objectives:

1. strengthening research, technological development and innovation,

Cite this Article as: Małgorzata GORZAŁCZYŃSKA-KOCZKODAJ "The Impact of EU Regional Policy on Economic Growth, Promoting Access to Employment and Social Inclusion" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

enhancing access to, and use and quality of, ICT,

2. enhancing the competitiveness of SMEs, of the agricultural sector (for the EAFRD) and of the fishery and aquaculture sector (for the EMFF),
3. supporting the shift towards a low-carbon economy in all sectors,
4. promoting climate change adaptation, risk prevention and management,
5. preserving and protecting the environment and promoting resource efficiency,
6. promoting sustainable transport and removing bottlenecks in key network infrastructures,
7. promoting sustainable and quality employment and supporting labour mobility,
8. promoting social inclusion, combating poverty and any discrimination,
9. investing in education, training and vocational training for skills and lifelong learning,
10. enhancing institutional capacity of public authorities and stakeholders and efficient public administration.

Thematic objectives shall be translated into priorities that are specific to each of the ESI Funds and are set out in the Fund-specific rules.

The main objective of cohesion policy is to reduce economic disparities between regions and inhabitants of the European Union. The adequate use of funds should aid those regions which are socially and economically disadvantaged. The funds are distributed on the basis of a measure of Gross Domestic Product. Nevertheless, the level of affluence of the inhabitants is one of the criteria for providing a given region with funds [10].

Regional statistics are employed when allocating funds. The NUTS classification is used to define regional boundaries and determine geographic eligibility for structural and investment funds. Regional eligibility for the European Regional Development Fund (ERDF) and the European Social Fund (ESF) during the programming period 2014–20 was calculated on the basis of regional GDP per inhabitant (in PPS and averaged over the period 2007–09). NUTS 2 regions were ranked and split into three groups:

- less developed regions (where GDP per inhabitant was less than 75% of the EU average);
- transition regions (where GDP per inhabitant was between 75% and 90% of the EU average); and
- more developed regions (where GDP per inhabitant was more than 90% of the EU average).

For the programming period 2021-2027, the Commission envisages the continued use of the NUTS classification for determining the regional eligibility for support from the ERDF and the ESF.

In accordance with the provisions of the Treaty on the Functioning of the European Union (Articles 174 to 178)[26], the aim of regional policy is to reduce economic, social and territorial disparities between EU regions by supporting job creation, competitiveness, economic growth, improved quality of life and sustainable development. These assumptions are specified in the provisions of "Europe 2020" document, which sets out detailed guidelines for achieving the objectives to be met by the end of 2020 at the latest. The issues raised in the article include, inter alia[1]:

- achievement of at least 75% of the employment rate for people aged 20 to 64;
- reduction of the percentage of school leavers to less than 10% and increasing the number of university graduates by at least 40%;
- reduction by 20 million of the number of people at risk of poverty or social exclusion.

In addition, the importance and gravity of the problem was recognised by the Permanent Representatives Committee of the Council of the European Union, which in December 2019 adopted a conclusion entitled "Inclusive labour markets: Improving the employment of people in a vulnerable position in the labour market". According to this document, the European Union's recognised objective is to increase employment opportunities for all. The European pillar of social rights also emphasises the right of all people to receive support in improving employment prospects or self-employment and access to the labour market. Moreover, workers in the Union are protected against discrimination on grounds of religion or belief, age, sex, sexual orientation, disability, racial or ethnic origin [11].

[1] Its aim is also to reduce greenhouse gas emissions by at least 20%, increase the share of renewable energy to 20% and increase energy efficiency by 20%, investing 3% of gross domestic product in research and development.

Labour and, in particular, skills shortages have an adverse impact on economic growth, labour productivity and European competitiveness [4]. For this reason, it is crucial to promote the employment of young people who are outside the labour market or unable to realise their potential due to their disadvantages or obstacles in the working environment, such as lack of accessibility. Disadvantaged people in the labour market are often an untapped resource and their integration into the labour market is an important means of achieving overall higher employment rates, social cohesion and inclusion. This is especially crucial for people with disabilities. Without this access and participation, they may experience greater social isolation, stigma and financial burden than people without disabilities or in a better position on the labour market. Moreover, the accumulation of disadvantages further increases the risk of long-term unemployment, inactivity or withdrawal from the labour market. It should be noted that Article 27 of the Convention on the Rights of Persons with Disabilities [2], signed by the EU and all Member States, commits the parties to "protect and promote the right to work" by, inter alia, creating and providing employment opportunities in all forms, including self-employment. However, according to Principle 17 of the European pillar of social rights2, "Persons with disabilities have the right to receive income support which ensures a decent living; services which enable them to participate in the labour market and in society and to be provided with a working environment appropriate to their needs".

Public authorities may increase employment among different groups of disadvantaged people in the labour market by taking into account social aspects, and in particular employment criteria, in public procurement procedures [1]. EU funding, in particular the European Social Fund, is crucial to reach out to and aid disadvantaged people to integrate them into both the labour market and society, for example by supporting social innovation and implementing multi-sectoral initiatives [13].

Regional policy is implemented through three main funds: European Regional Development Fund (ERDF), Cohesion Fund (CF) and the European Social Fund (ESF) [5]. Most cohesion policy funding focuses on the less developed European countries and regions to help them bridge the gap and redress the economic, social and territorial disparities that still exist in the EU.

Materials and Methods

The analysis focuses in particular on economic growth per capita, the broadly understood labour market and the socially excluded. The analysis concerned primarily the Zachodniopomorskie province which has significantly improved its socio-economic situation on account of EU funds. The article concentrates on the cohesion policy and excludes other funds received by Poland, e.g. under agricultural policy. In the study, a detailed determination was made of the impact of the EU budget only on the Zachodniopomorskie Voivodship, due to the first stage of research, which will then be extended to all Polish regions to compare Polish regions with neighboring regions in the last stage. To explore the research problem, the key macro-economic figures which have improved on account of the EU funding, as well as the main areas of their allocation will be identified. The methods adopted to examine and evaluate the discussed issues include the review of literature and Internet sources. Empirical data available on the websites of individual ministries, Statistics Poland and portals dedicated to European funds were additionally used.

The role and importance of the EU in promoting employment - Results and Discussion

Upon Poland's accession to the European Union, the period of implementation of the Community's cohesion policy has commenced. It is aimed at promoting harmonious development through measures leading to the reduction of disparities in the levels of development of its regions, and thus enhancing the economic, social and territorial cohesion of the Community. EU regional policy is considered by some researchers to be the policy implementing the largest number of programmes aimed at supporting development, if not the largest integrated development policy of the modern world.[24]

The impact of the cohesion policy on the social and economic development of Poland to date should be assessed as clearly positive. European funds had a significant impact on economic growth, investment activity and the labour market in Poland, as well as on the internal and external economic equilibrium. Figure 1 illustrates the amount of funds received by Poland from the European Union budget under the individual financial perspectives.

[2] A European Union document signed jointly by the European Parliament, the Council of Europe and the European Commission on 17 November 2017 at the Social Summit for Fair Employment and Economic Growth held in Gothenburg, Sweden.

Fig. 1: The amount of the European Union funds for Poland in the years 2007-2020, including funds allocated to the cohesion policy in billion euro.

Source: Own work based on www.funduszeeuropejskie.2007-2013.gov.pl, www.funduszeeuropejskie.gov.pl [28,29]

Although the European Union's budget has been reduced (in 2007-2013 it was 1,035 billion euros to 997 billion euros in 2014-2020), Poland has received more funds. This encouraged greater investments, which resulted in an increase in employment, and this contributed to economic growth and improvement of the economic situation of the population in Poland. EU support provides a great opportunity for the Polish economy and human capital. The provision of EU funds led to numerous investments in Poland, even during the economic crisis [24].

Fig. 2: Amount of European Social Fund resources under the cohesion policy for Poland in the years 2007-2020.

To achieve the objectives related to the reduction of the unemployment rate, improving professional qualifications, acquiring education and skills in the years 2007-2013 the Human Capital Operational Programme was primarily used, which in the 2014-2020 perspective, in response to the needs for reforms in the areas of employment, social inclusion, education, higher education, health and good governance, was transformed into the Operational Programme Knowledge Education Development (OP KED) and approved by the European Commission.

The programme is intended to support social innovation and transnational cooperation in these areas. More than €4.4 billion is available from the European Social Fund and €252.4 million from the dedicated budget line of the Youth Employment Initiative.

Fig 3. Share of funds under OP KED.

Source: Own work based on https://www.power.gov.pl/ [8]

The following priorities have been determined under the Operational Programme Knowledge Education Development, within which support is to be provided:

1. Young people on the labour market. This priority involves measures to be taken towards unemployed young people aged 15-29 (in particular those who do not participate in education and training, the so-called Youth NEET), which will contribute to their professional activation and improvement of the situation on the labour market (EUR 1,757 billion).

2. Effective public policies for the labour market, economy and education – implementation of reforms of systems and structures in selected areas of key public policies from the point of view of the Europe 2020 strategy and the National Reform Programmes (EUR 739 billion).

3. Higher education for economy and development – supporting quality, effectiveness and openness of higher education as an instrument for building a knowledge-based economy (EUR 301 billion).

4. Social innovations and transnational cooperation – implementation of atypical, innovative, transnational measures, leading to development of solutions which may be tested before the implementation, which in most cases will take place on a regional level, and additionally implementation of programmes in terms of transnational mobility (EUR 1,056 billion).

5. Support for the health care – adoption of measures concerning, inter alia, implementation and development of preventive programmes with regard to diseases that have a negative impact on labour resources, dedicated to persons at the age of professional activity and implementation of pro-quality measures and organisational solutions in the health care system facilitating access to inexpensive, permanent and high quality health services (EUR 670 billion).

6. Technical assistance (EUR 164 billion).

Impact of EU funds on unemployment, GDP and poverty rate

According to the source literature, the term "unemployment" was introduced by the English economist J.A. Hobson in the mid-1890s. He defined unemployment as "involuntary inactivity of workers", emphasising its adverse consequences both for individuals and society as a whole. As this definition implies, the negative impact of unemployment on two main levels, individual and general, was recognised already at that time. Due to a difficult situation prevailing on the labour market in Poland at the beginning of the 21st century, it was necessary to implement a social and economic policy which was conducive to creating new jobs and eliminating unemployment. The aim of this policy was, on the one hand, to counteract unemployment through active labour market programmes and mitigate its effects through protective measures, and, on the other hand, to promote productive employment and undertake measures to maintain existing jobs. The former of the above mentioned objectives of the labour market policy was implemented by means of active programmes (involving trainings, intervention works, public works, loans for the unemployed and employers), special programmes addressed to specific categories of the unemployed (e.g. women, youth, etc.) and passive programmes (involving unemployment benefits, pre-retirement benefits, early retirement financed by ZUS [Social Insurance Institution]) [6]. Active programmes could be implemented on a large scale though the provision of funds from the European Union dedicated to combating unemployment. Figures 4 and 5 depict the figures related to the unemployment rate and the number of unemployed.

Fig.4: The rate of registered unemployment in Poland and in Zachodniopomorskie province in the years 2000-2020.

Source: Own work based on: https://bdl.stat.gov.pl/BDL/dane/podgrup/ [9]

Fig. 5: Number of unemployed in Zachodniopomorskie Voivodship in 2010 and 2019 by age.

Source: Own work based on: https://bdl.stat.gov.pl/BDL/dane/podgrup/ [9]

The data presented in the figures (figures 4 and 5) relate to the registered unemployment rate in Poland and in the Zachodniopomorskie province in the years 2000-2020. The years 2000 and 2005 were presented as a visual reference to illustrate the situation that occurred before the two financial perspectives in which Poland fully participated. It is clearly evident that the registered unemployment rate has significantly decreased [27]3 both in Poland and in the Zachodniopomorskie province. The analysis of the age of the unemployed in the examined province clearly indicates that the greatest decrease in the number of the unemployed occurred in the 25-34 and 45-54 age range. This is a very positive phenomenon, which proves that people of working age are active on the labour market, contributing to the economic growth of their region and the increase of their wealth. It should be noted that unemployment among people over 60 has slightly increased.

The change in GDP per capita over the period of EU funds utilisation is presented in Figure 6.

Fig 6. Gross domestic product per capita in Poland in 2010 and 2016.

Source: Own work based on: https://bdl.stat.gov.pl/BDL/dane/podgrup/ [9]

When comparing data from 2010 and 2016 (figure 6), it is clear that the level of affluence in the majority of provinces has clearly improved. Six provinces achieved in 2016 GDP per capita in the same range as in 2010, and five of them still reach the lowest values from the range
of PLN 25,875 to PLN 38,000 (this concerns the Warmińsko-Mazurskie, Podlaskie, Lubuskie, Podkarpackie, Świętokrzyskie provinces).
In the case of the Zachodniopomorskie province, an increase in GDP per capita may be observed from the lowest level to a level between PLN 38 001 and PLN 51 000 per capita.

[3] The positive impact of EU funds is also visible in the reduced unemployment rate. The unemployment rate of people aged 15+ in the Zachodniopomorskie province in the year of accession to the EU (2004) was as high as 23.8%, and in 2018 only 3.8%.

Fig. 7: Rate of relative poverty4 in Poland in 2010.

Source: Own work based on: https://bdl.stat.gov.pl/BDL/dane/podgrup/ [9]

Fig 8. Ratio of relative poverty in Poland in 2018.

Source: Own work based on: https://bdl.stat.gov.pl/BDL/dane/podgrup/ [9]

[4] relative poverty has a variable value and refers to the average standard of living in a country, generally measured by the amount of average income (expenditure). In this respect (relative), as opposed to the concept of absolute poverty, the emphasis is not so much on absolute income but on the level of disparity, i.e. the gap between the standard of living of certain population groups which results from income levels. The supporters of the relative approach believe that the poverty primarily stems from the functioning of the socio-economic system. Unemployment is the main cause of poverty, as it is beyond the control of the poor. It is followed by low wages in certain occupations, regions or for certain discriminated groups. Insufficient income resulting from circumstances beyond the awareness and will of the poor is the primary cause of poverty.

The reduction in the unemployment rate and the increase in GDP per capita resulted in a decrease in the number of people eligible for various forms of social welfare benefits (figures 7 and 8). Undoubtedly, this is also the effect of the "500 +" programme, however, the mere implementation of the programme, which was introduced in April 2016, without providing new jobs as a result of, inter alia, projects financed by EU funds, various forms of support for the unemployed and those professionally excluded, would certainly not have led to such an improvement.

Fig 9. Registered unemployment rate and the number of people receiving social welfare benefits in Poland in 2010 and 2017.

Source: Own work based on: https://bdl.stat.gov.pl/BDL/dane/podgrup/ [9]

The presented data (figure 9) clearly demonstrate that the number of beneficiaries has decreased significantly. Only one province, Śląskie, in 2017 remained at the 2010 level, however with a clear reduction in the number of unemployed, especially those under 34 years of age.

The number of persons receiving from social welfare benefits in Zachodniopomorskie province dropped from the range of 570.1 – 735.0 persons per 10,000 inhabitants to the range of 242.3 – 405.0 persons per 10,000 inhabitants, which is a very positive trend.This section may be divided by subheadings. It should provide a concise and precise description of the experimental results, their interpretation as well as the experimental conclusions that can be drawn.

Conclusions

Despite the improvement of the social and economic situation, combating unemployment and persistently high poverty rates remains a priority for the entire EU. Social and employment issues are crucial for European citizens,

who expect the Union to become more involved in this area. The additional challenges which the Union is still facing are related to [26]:

- a deficiency of specific skills by certain professional groups;
- insufficient achievement of objectives by active labour market policies and education systems;
- challenges posed by new technologies, such as automation and, consequently, new forms of work;
- the social exclusion of marginalised groups;
- low mobility of workers.

The above requirements must be imposed and fulfilled on an ongoing basis in order to fully achieve their objectives as soon as possible.

Zachodniopomorskie province is one of many provinces in Poland, which has significantly improved its socio-economic situation as a result of EU funds. This is evidenced by the data and information presented in the article, as well as information from various analyses and studies. An important indicator reflecting the qualitative changes is, inter alia, the employment rate, which in the year of Poland's accession to the EU (2004) for the Zachodniopomorskie province amounted to 54.1%, (employment of persons aged 20-64), while in 2018 the value of this indicator was 70.4% [12]. The presented research results clearly indicate that the EU funds constitute an important support for the Polish economy and are the basis for its stable development.

The analysis of data presented in the article proves that although the years 2007-2013 saw an increase in unemployment in Poland by more than 2 percentage points, i.e. from 11.2% to 13.4%, it may be concluded that without funds from the European Union the unemployment rate would be much higher, especially in the context of the economic crisis. The European funds have contributed to the mitigation of the effects of the crisis on the Polish economy.

Potential Application of Land Art in Marketing

Denis VASILIEV
Turiba University, 68 Graudu Street, Riga, LV-1058, Latvia
*denisksil@gmail.com

Abstract

Modern companies intend to implement and communicate sustainable business practices. Moreover, marketing communications aim to attract attention of target audiences through differentiation. At the same time, philosophy of Land Art movement and high visibility of its artworks have a great potential to be appealing to environmentally conscious customers and to allow the company to "stand out from the crowd". Surprisingly, application of Land Art in marketing is not discussed in scientific literature and the opportunity to use this synergy is largely overlooked by companies. Thus, using conceptual research approach – theory adaptation, I demonstrate how Land Art can be used by modern companies to enhance their branding, place marketing and PR activities, as well as achieve high level of customer engagement. I also discuss potential use of Land art as a part of integrated marketing communications, with particular emphasis on enhancement of digital communications effectiveness. Exploration of all these areas of Marketing leads to a conclusion that there is an urgent need for research and practical application of Land Art in marketing.

Keywords: Earth art, environmental art, advertising, branding, PR

Introduction

Land Art movement emerged in the middle of the last century in the USA and in Western Europe as an expression of the protest against limiting culture to art galleries (Hogue, 2004). Also known as environmental art or Earth art, the movement is based on the principles of placing artworks within the landscape using natural materials and sculpting the land (TATE, 2020). Pioneer land artists, such as Robert Smithson, Richard Long and Andy Goldsworthy were inspired by ancient indigenous art pieces, such as Nazca lines, Carnac Stones and Stonehenge (Tilley et al., 2000). Later on, the movement has evolved from being limited to purely natural materials to use of textile, metal and other substances, including for example famous fiber art works of French artist Edith Meusnier (Meusnier, 2020). Moreover, Land Art greatly ranges from monumental art works, such as famous Robert Smithson's Spiral Jetty made of stones (TATE, 2020), to increasingly fragile temporary installations that exist just several days or even hours, such as works of Andy Goldsworthy made of autumn leaves, twigs or snow (Artnet, 2020). Nevertheless, core philosophy of the movement has remained remarkably consistent, intending to demonstrate the link between human culture and nature. This core idea of Land Art movement actually is consistent with the philosophy of sustainability and sustainable development (UN, 2020). Given the fact, that modern business in general and marketing in particular are intended to become truly sustainable, finding opportunity of synergy between Land Art and marketing becomes increasingly relevant task.

However, to my best knowledge, Land Art is neither discussed in the literature nor used in Marketing practice. In fact, outdoor media has been used for advertising purposes historically, with billboard advertising being between the most common forms of marketing communications in Europe and in the USA for centuries (Norris, 1980). Sculpture and installations are also used by companies to attract attention of their target audiences to products, services, or brands (e.g. Amifor, 2016). These advertising methods, however, are usually not linked to green thinking. Furthermore outdoor marketing communications are often seen as causing visual pollution (Chmielewski et al., 2016). Given the philosophy of Land Art and the synergy between the art works and the environment I believe that integration of the movement with modern marketing that focuses on sustainability has a great promise. Thus, the objective of this work is to demonstrate potential opportunities of application of land art in modern marketing. For this purpose, possible role of Land Art in branding, place marketing and PR are discussed. Application of Land art as a part of integrated marketing communications mix, including digital strategies is considered, too. Particular emphasis is placed on sustainability, engagement with the audiences and achievement of strong differentiation.

Cite this Article as: Denis VASILIEV "Potential Application of Land Art in Marketing" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Methodology

Conceptual research becomes an increasingly important method that allows bridging several disciplines, and it is considered to be particularly important in the field of marketing (Jaakkola, 2020). According to Jaakkola (2020) there are four main approaches to conceptual research, including theory synthesis, theory adaptation, typology, and modeling. Given the fact that discussion of Land Art applications in marketing currently is virtually absent from scientific literature (e.g. search string "Land AND art AND marketing" at Scopus resulted only in 38 hits all of which were not relevant to the topic discussed in present article), methods based on existing literature were considered not to be suitable. Thus, theory adaptation approach was chosen (Jaakkola, 2020). The approach allows exploring concepts that are not yet discussed in existing scientific literature and is focused on proposal of the novel insights (Jaakkola, 2020). Theory adaptation seeks to amend existing theories and practice using evidence and theories from several disciplines (Malclnnis, 2011). Present paper brings together marketing theories and examines how Land Art can be applied in modern marketing practice, this way bridging the two disciplines. First, potential adaptation of Land Art in branding is discussed, considering theoretical aspects of effective brand building. Second, possible applications of Land Art in Place marketing are explored, based on theories of place branding, as well as more general considerations of 'place' element of marketing mix. Then, possible uses of Land Art in PR are considered, with particular emphasis on achievement of customer engagement. Finally, application of Land Art as a part of integrated marketing mix is discussed.

Major Arguments

Branding

Strong brands are based on solid value system, which reflects the values that are relevant to the customer (Urde, 2003). Today with increasing environmental consciousness, customers want to associate themselves with sustainable brands (Lin and Niu, 2018). Philosophy of the Land Art movement and the fact that artworks are organically integrated into the environment, perfectly match the value system of environmentally conscious consumers. One could see the tendency of Land artworks to be placed outside the city as an obstacle for effective application of the tool for branding. However, large Land Art objects that are well integrated into natural environments may be placed as an effective outdoor advertising tools along motorways. Moreover, works of famous Land artists, such as Edith Meusnier (Meusnier, 2020) are often integrated into urban parks, while many works of a prominent representative of the movement – Dennis Oppenheim were installed directly in urban environments (Ketcham, 2010). So, potential use of Land Art works are not limited to certain environments and may be used as widely as traditional outdoor advertising for purposes of brand building.

Along with communication of sustainability and green values, Land Art has a great advantage for branding over traditional marketing communications. According to Chris Fill (2016) one of the most important strategic dimensions of brand include brand differentiation. Indeed, in line with the salience framework advertising works by standing out, by being different from competitor communications (O`Malley, 1991). At the same time, works of Land artists have proven to attract attention of viewers, by being remarkably unusual, large and aesthetically perfect, often utilizing natural phenomena, such as changes in light, movements of water and wind etc. For instance, famous ''Lightning Field'' created by Walter de Maria in Mexico, consists of metal posts that magnet lightning, attracts attention of visitors and of media. Less radical works include famous Spiral Jetty, which appears from the water during undertow. Indeed potential of Land Art is unlimited and use of it by a company in collaboration with good artists has a great potential to differentiate marketing communications from the ones of competitors and maximize corporate brand visibility.

Finally, brands are often based on signs and symbols that intend to be memorable and convey corporate values (Berthon, 2007). Land Art is also based on symbology and underlying meanings (Najafi and Abbas, 2014). For instance famous Vietnam Veterans Memorial in Washington created by famous Land artist Maya Ying Lin is full of symbology, inducing thinking in visitors. This characteristic of Land Art indicates potential to convey brand values and other important communications messages through use of symbology. Overall, capability of Land Art to enhance modern corporate branding is immense and is currently underutilized.

Place Marketing

Place marketing, also known as place branding, is primarily focused on promotion of a geographical location in order to attract tourists, entrepreneurs, visitors or investors (van Ham, 2008). Famous works of Land artists, such as aforementioned "Spiral Jetty" (the USA), as well as "Green Cathedral" by Marinum Boezem (the Netherlands), "Storm King Wavefield" by Maya Lin (the USA), "Synergy" by Martin Hill and Philippa Jones (Australia), "Strading Arches" by Andy Goldsworthy (Scotland) and many others, naturally attract interest of tourists. However, such works

are usually created with an intention to become a 'brand' of a certain place, that could attract relevant stakeholders. At the same time, artworks and in particular Land Art have great potential to create place identity, making a geographical location unique and distinguishing it from other places (Hull et al., 1994). Thus, deliberate use of Land Art as one of the key tools in place branding could potentially provide a powerful tool for this area of marketing.

Another less noticeable prospective use of Land Art may be attracting attention of consumers to the point of sale. Remarkably, artworks that could be used for attracting customers to a location, may be inexpensive, using either natural materials, colored materials, or textile (Hahner and Varda, 2014). A good example of such urban artwork is a recently emerged (2005) separate movement within Land Art – "yarn bombing", also known as urban knitting, that due to their colorfulness have high visibility (Hahner and Varda, 2014). In addition to attractiveness and contrast that may be achieved through use of the art works within urban environment, Land Art can provide great flexibility. Temporary installations, that can be created for a short time period – from several hours to several weeks, can be regularly applied at different locations, thereby avoiding target audiences getting used to the artwork and getting blind on it. Such approach could potentially make marketing communications cost effective, flexible, and consistently delivering results by attracting attention to company locations.

PR

Key goal of PR is to engage with broader society, which is mainly achieved through attracting attention of media (Lasson, 2009). In this respect Land Art has a lot to offer. First of all, the art pieces are often very unusual and have high visibility, potentially attracting interest of media. For instance, famous "Bus Home" sculpture by Dennis Oppenheim, installed in California, has attracted huge attention from media and was able to provoke a serious public debate (Artcritical, 2011). Another important function of PR is to convey companies' stance on controversial issues of public concern (Frankental, 2001). Land Art is a conceptual art and therefore is particularly strong at conveying opinion (McFadden, 2014). A great example of the artists opinion expression on an environmental problem of forest loss in Western Europe is "Disappearing Forest of Germany", by Alan Sonfist.

Not only the art works themselves can attract attention of media, but the events, such as "Land Art" workshops, if organized or sponsored by a company can create a great PR and ensure engagement with customers and border public (Hulubei and Avasilkai, 2020). Such workshops due to their interactivity can be particularly effective in case not only artists participate, but also general public is involved. The events may be in a form of masterclasses that can include participation of local community, schoolchildren or students, potentially achieving high level of engagement and attracting attention of local media. Creating temporary installations may be a part of such event program and may also support place marketing. In fact, there is a great potential to integrate Land Art PR strategy with other elements of companies marketing communications mix, this way achieving high visibility, customer engagement and increasing cost-effectiveness of marketing operations (Kitchen et al., 2008).

Integrated marketing communications

One of the key principles of integrated marketing communications is that cumulative effect of marketing activities is greater than if each activity is implemented separately (Keller, 2016). Inclusion of Land Art could potentially enhance other elements of marketing communications mix, especially on-line activities. Indeed, "standing out from the crowd" becomes increasingly problematic in the digital media landscape (Miah et al., 2008). Inclusion of Land Art works and/or events into marketing communications mix, may substantially increase visibility of the digital content, increase engagement with the target audiences (Harmeling et al., 2017). Additionally, similarly as with off-line PR, Land Art may provoke interest of influential bloggers, thereby enhancing online PR (Xifa and Huertas, 2008). Moreover, given the uniqueness and unusual nature of the art pieces, Land Art could form a core of viral campaigns, where the content is actively shared on social media by viewers themselves (Ewing et al., 2014). Creative approaches may further enhance engagement with target audiences by, for example, announcing contests and sourcing ideas for Land Art based advertising or PR activities from public. Overall, applications of Land Art in integrated marketing communications may be diverse and may greatly enhance communications effectiveness.

Conclusions

The aim of this paper was to demonstrate potential opportunities of application of Land Art in modern Marketing. Expiration of particular characteristics of Land Art allowed to reveal its great potential for enhancing branding, place marketing and PR activities in the modern enterprise. Sustainability based Land Art philosophy, visibility and unusual nature of the art works makes it particularly suitable for effective marketing communications. Allocation of Land Art also has great perspectives for generating high levels of engagement with the audiences, and thereby could enhance integrated marketing communications strategies, including digital marketing. Lack of the literature and practical

application of Land Art in marketing suggest an urgent need for research in this area and adaptation of the approach by modern businesses.

Regulation of Segregation of Agri-Food Flows in The EAEU Countries

Svetlana V. IVANOVA

Plekhanov Russian University of Economics (PRUE), Moscow, Russian Federation
Ivanova.SV@rea.ru

Abstract

The article is devoted to identifying global and regional trends in the segregation of agricultural flows. We are talking about the production and turnover of agricultural goods produced a) by traditional industrial intensive technology; b) using genetic modification; c) based on organic farming technologies.
A conclusion is made about the world tendency of outstripping the growth of areas for sowing GM crops relative to areas of organic farming. The state, possibilities and problems of the introduction of organic farming technologies in the EAEU (Eurasian Economic Union) are investigated.
The analysis of the current institutional environment for the formation of organic farming in the EAEU countries and the main regulatory acts concerning the turnover of GM products on the territory of the Union, taking into account the concepts of food security of the Russian Federation and the EAEU. According to the author, biotechnologies are a priori dual-use technologies, that is, they can be used both to the detriment and benefit of humans and the environment. The lack of evidence of the safety of GMOs (taking into account long-term effects) means the validity of maintaining the ban on the cultivation of GM crops in the territory of the EAEU countries. When importing a GM product, the precautionary principle must be followed.
It is concluded that there are discrepancies in interpretations in a number of legal documents with a general trend towards convergence of the positions of the five countries.

Keywords: EAEU, institutional environment, food security

Introduction

In the format of the Eurasian Economic Union (EAEU), agriculture is recognized as a priority area of cooperation. The relevance of the study is due to the growing importance of Russia (as the nucleus of the Eurasian Union) in the world markets of agricultural products, especially cereals. According to forecasts of the Ministry of Agriculture of Russia, in the 2019-2020 agricultural year at least 132 million tons of cereals and legumes will be harvested, a significant part of which will be exported [Ministry of Agriculture of the Russian Federation, 2020]. Currently, these products are produced on the basis of traditional for the end of the 20th century technologies: using means of chemical protection of plants from pests and diseases, chemical fertilizers, means of mechanization and automation. Meanwhile, in the practice of different countries, other technologies and methods of organizing production, circulation, and processing of agricultural products are increasingly being used. The EAEU countries are improving the institutional environment for the development of two alternative flows of agricultural products: genetically modified and organic. It is of scientific interest to analyze this process in the context of the problem of preserving national and regional food security.

In Russia, within the framework of the priority project "Export of agricultural products" in 2017, a program was launched to develop the export of niche products with high margins, which included the branch program "Organic agriculture" [Union of organic farming, 2017]. From the point of view of the legal environment, a number of standards and programs aimed at legitimizing organic agriculture have been adopted and are in force in Russia. In particular, GOST 33980-2016 “Organic products. Rules for production, processing, labeling and sale "(recognized by the standardization bodies of Belarus, Kyrgyzstan, Tajikistan); GOST R 57022-2016 “Organic products. The procedure for conducting voluntary certification of organic production "; GOST R 56104-2014 "Organic food products". However, in the EAEU format, the task is to create a single agricultural market, which implies coordination of actions in the field of organic farming development.

Along with the technology of creating an organic product, there is a very active development of the agricultural business based on the production of genetically modified organisms. The new stage of scientific and technological progress - the "gene revolution" - continues to be the subject of heated discussions. The problem is that the widespread use of GMOs certainly creates new business opportunities in terms of increasing the productivity of plants and

Cite this Article as: Svetlana V. IVANOVA“ Regulation of Segregation of Agri-Food Flows in The EAEU Countries” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

animals, their resistance to diseases while reducing the use of pesticides, increasing the duration of the marketable appearance and, ultimately, increasing the profitability of the agricultural business. Proponents of promoting GMOs emphasize the unprecedented possibilities of combating hunger and malnutrition in the world, expanding the economic accessibility of food for the most disadvantaged groups of the population due to the reduction in the cost of a unit of the product obtained. In particular, the President of the Russian Grain Union A. Zlochevsky believes that Russia can maintain its position as a major exporter of wheat only by using the capabilities of GM wheat [Zlochevsky A., 2020]. Opponents of GMO promotion emphasize the excessive risks of widespread commercialization of this technology [Engdahl W. F., 2009]. Let's mark the most significant ones. Poor knowledge of the impact of consumption of a GM product on human health, including future generations. A possible decline in reproductive function among consumers essentially means managing the population's fertility through food. Other extremely negative consequences are possible, including those associated with a decrease in immunity and metabolic disorders. The second danger is the extreme degree of monopolization of this business by global companies such as Monsanto, which makes farmers and consumers heavily dependent on the business decisions of a global company, that is, destroys national food security. The third danger is the lack of knowledge of the long-term effects of GMOs on the environment, in particular the destruction of biodiversity and natural ecosystems, the emergence of mutant organisms with unpredictable properties, and a number of other risks [GMOs: real and potential risks, 2014]. The conflict of interests in the field of expanding GMO practices is certainly reflected in the institutional environment of the EAEU countries.

Methodology

The research methodology is based on a generalization of the practices of regulating the production and turnover of GM products in the EAEU countries and an analysis of the legal framework for the formation of the organic products market in the Union countries.

Methods used: abstract-logical, historical, statistical, comparative analysis and content analysis.

The scientific novelty of the study consists in identifying trends, factors, problems and possible prospects for the segregation of agricultural products in the EAEU countries.

Results

Legal regulation of the turnover of GM products

The high marginality of the implementation of advances in the field of biotechnology led to a rapid increase in the global area under crops of GM crops, which in 2019 amounted to 191.7 million hectares [ISAAA, 2020]. This trend is set, first of all, by the companies of the USA, Brazil and Argentina. The EAEU member states belong to the group of countries in which cultivation is prohibited, but the import and use of GMOs as food, animal feed or for research purposes is allowed. In accordance with the Customs Code of the EAEU, a unified customs regulation is carried out in the Union, which includes the establishment of the procedure and conditions for the movement of goods across the customs border of the Union, their location and use in the customs territory of the Union or outside of it, the procedure for performing customs operations related to arrival / departure goods to the customs territory of the Union [Customs code of the Eurasian Economic Union, 2017].

Scientific experiments with GMOs are taking place in all EAEU countries, especially in Russia, Belarus and Kazakhstan. One of the main goals of such research is the development of methods for the qualified tracking of the import of imported products containing GMOs. This is especially important in an environment where products created using the latest genomic editing technologies are increasingly difficult to identify and account for. In Kyrgyzstan, GMO products are prohibited in principle.

Russia, Kazakhstan, Belarus and Armenia signed the Cartagena Protocol to the Convention on Biological Diversity. The member states of the Protocol are obliged to ensure that safety measures are observed during the processing, packaging and transportation of GMOs. The importing country decides on the admission of products based on scientifically reliable risk assessment. To this end, the Protocol establishes principles and methods for conducting risk assessment. If there is not sufficient scientific information on the issue under consideration, then the importing country, when deciding to import GMOs, can apply the “precautionary principle” and refuse to import or postpone the decision. National legislation in this area is just being formed. It is based on the Model Law on the Safety of Activities Related to Genetically Modified Organisms, which was adopted at the 27th plenary session of the Interparliamentary Assembly of the CIS Member States (Resolution No. 27-9 of November 16, 2006).

In accordance with the new version of the Food Safety Doctrine of the Russian Federation (clause 21), in order to ensure the quality and safety of food products, it is necessary to: “a) control its compliance with the mandatory requirements of the technical regulations of the Eurasian Economic Union; b) ensure control over food products obtained from genetically engineered plants and using genetically engineered microorganisms ”[Decree, 2020].

In Russia, such control is exercised by a number of bodies: the Ministry of Health of the Russian Federation and the Federal Service for Surveillance in Healthcare (regarding the use of GMOs in the manufacture of medicines and medicines); the Federal Service for Veterinary and Phytosanitary Surveillance (regarding GMOs used in agriculture); The Russian Federal Service for Surveillance on Consumer Rights Protection and Human Wellbeing (Rospotrebnadzor) (in relation to GMOs used for the production of food and raw materials).

In the first half of 2019, Rospotrebnadzor examined more than 16 thousand samples of food products for the presence of GMOs, of which more than 0.9% of GMO content was detected in 11 samples - 0.06% of the samples examined (flour and cereals, fruits and vegetables) without information for the consumer on the presence of GMOs in the product. From July 1, 2019, the import of fresh papaya production from China to the territory of the Russian Federation has been suspended, all products have been withdrawn from circulation. [Rospotrebnadzor, 2019].

The beginning of the formation of the legal field in the field of GMOs was laid by the Federal Law "On state regulation in the field of genetic engineering" [Federal law, 1996]. Resolution of the Government of the Russian Federation of September 23, 2013 N 839 "On state registration of genetically modified organisms intended for release into the environment, as well as products obtained using such organisms or containing such organisms, including the specified products imported into the territory of the Russian Federation" [Decree, 2013] a number of clarifications. In particular, a new requirement was introduced for importers of GMOs. If previously only GMOs themselves were registered, now it is the duty of importers to register products that contain GMOs. The country provides for the maintenance of a register of modified organisms. On September 1, 2017, a new technical regulation came into force in Russia, which toughens the requirements for the production, storage and sale of fish food products, which "should not contain hormonal preparations, natural and synthetic substances, as well as GMOs." [Rospotrebnadzor, 2017].

In 2017, an interdepartmental group was created to control the import of GM products into the country and their processing for the purpose of export without release into circulation on the territory of the Customs Union [GARANT.RU, 2017].

The main document in force on the territory of the EAEU governing the circulation of GM products is the Union technical regulation "Food products in terms of their labeling", which concerns the labeling of food products obtained using genetically modified organisms. Starting from June 26, 2020, the labeling of food products obtained with the use of GMOs must have, next to a single product circulation mark on the market of the Eurasian Economic Union (EAC), the same shape and size mark of the “GMO” marking [Eurasian Economic Commission , 2020]. If the manufacturer did not use GMOs in the production of food products, that is, their content in it does not exceed 0.9 percent, is considered an accidental or technically irreparable impurity. Such goods are not classified as containing GMOs, and they do not need to be labeled with appropriate information. In Russia, 18 GMO lines are officially allowed to be used for food production, including three varieties of soybeans, six varieties of corn and four varieties of potatoes.

The merger of the two largest GMO companies, Bayer and Monsanto, has also impacted Russia. The Federal Antimonopoly Service of Russia, where Bayer AG operates, has approved the international corporate merger. According to the agreement, the German side will organize the transfer of molecular breeding funds for corn, rapeseed, wheat, soybeans, and a number of vegetable crops and will provide Russia with non-discriminatory access to digital farming technologies (digital applications and platforms). It should be noted that counterparties from the Russian side (for example, the Pavlovskaya Niva agricultural company) fear excessive control by the Bayer company over the production process of new selection products in Russia. Legal regulation of the transfer of intellectual property in the field of agriculture is just being formed. The use of Bayer's genetic material, in particular germplasm, with unclear identification of new Russian varieties and vague conditions of licensing agreements, may lead to the imposition of royalties on all seed production in Russia and the destruction of this (still weak) segment of the Russian agro-industrial complex.

In June 2020, the Federation Council of the Federal Assembly of the Russian Federation held a meeting dedicated to "Improving state regulation in the field of production and circulation of genetically modified organisms and products obtained using such organisms or containing such organisms." The question was raised about the clarification of the used conceptual apparatus and the consistency of different legal acts. Thus, Russia is in the process of finalizing the legal environment for businesses related to GM products.

Perhaps the most liberal (“soft”) approach to the GMO issue has developed in Kazakhstan. Here, the emphasis is placed on the creation of domestic GM plants, in particular drought-resistant wheat, on the monitoring of crops and strict control over imported seed and planting material.

Since all the EAEU countries, except Belarus, have joined the WTO, we note that none of the provisions of this international organization obliges any country to allow the cultivation of GM crops on its territory. But the practice of regulating the import of GM products must comply with the spirit of the most favored nation and national WTO regime. According to the author, the main conflict is possible around the question of "a similar product". It is legally

controversial whether GM seeds and conventional seeds (eg wheat) are similar commodities. Simultaneously with the debatable issues in the legal field of the WTO, there are agreements, in fact, allowing to impose a ban on the import or cultivation of GMOs. Thus, the Agreement on Sanitary and Phytosanitary Measures allows nation states to protect themselves from goods that are harmful to human and animal health. Although there is no clear, generally accepted evidence of the harm of GMOs, due to their manifestation in the long term. The agreement on technical barriers to trade allows national states to resolve the issue of labeling imported goods. The legal framework of the WTO requires revision in connection with the introduction of new technologies, goods and methods of trade. This refinement should be based on the precautionary principle or “do no harm”. The author is close to the position of a number of European countries (Switzerland, Austria, Luxembourg, Scotland and a number of others), where the moratorium on the cultivation of GM products is constantly extended, and local residents prefer to consume the products of organic farming.

Institutional environment, trends and problems of organic farming technologies implementation

According to FiBL & IFOAM - Organic Agriculture, the global area of organic agriculture is 71.5 million hectares. (2018) and has a moderate upward trend. [Willer, Helga, Bernhard Schlatter, Jan Travnicek ..., 2020].

Analysis of data from the latest FiBL & IFOAM research showed that several business models for the production and circulation of organic products are being formed in the world. Let's note two opposite options. Specialization in organic farming with the aim of producing an organic product: a) mainly to meet domestic demand (Liechtenstein); b) exclusively for export to other countries (Samoa).

An important milestone in the development of Russian organic farming is the adoption of the Federal Law "On organic products and on amendments to certain legislative acts of the Russian Federation" [Federal law, 2018]. The law came into force on January 1, 2020. This legal document regulates relations related to the production, storage, transportation, labeling and sale of organic products. The concepts, requirements for the production of organic products, requirements for the confirmation of the conformity of the production of organic products, the unified state register of producers of organic products, labeling, the transition to organic agriculture, state support for the manufacturer, information and methodological support in the field of production of organic products. The criteria to be met by the production of organic products that receive the Russian ORGANIK mark are determined by the interstate standard GOST 33980-2016 Organic products. Rules for production, processing, labeling and sale ". In accordance with GOST R 57022-2016, the procedure for conducting voluntary certification of organic production has been determined. Changes have been made to the Federal Law "On the Development of Agriculture" dated December 29, 2006 N 264.

An important limiting factor in the development of the organic direction is the incompleteness of harmonization of the standards of Russia, the EAEU countries and the main international standards EU 834/2007 and USDA organic; underdevelopment of the national certification system for organic producers. In this regard, the accreditation of certification companies in the importing countries has begun. It is necessary to carry out the allocation of organic products by a separate code of the commodity nomenclature of foreign economic activity. The support system for organic producers is relevant. Small and medium agricultural enterprises do not have the financial resources to pay for the certification procedure, as well as to restructure the entire business to meet the requirements of organic farming.

In Russia, the area of agricultural land was 656.9 thousand hectares, or 0.3% of the area of all agricultural land in the country. According to the Union of Organic Agriculture, there are only 70 certified organic agricultural producers in Russia. As of August 2020, 46 agricultural enterprises in Russia are certified according to international organic standards of the EU, USA and Japan. The largest number of producers is concentrated in the field of plant growing and wild plants. The most successful organic exporters are B2B exporters. The volume of organic products certified according to the international standards of the EU and the USA amounted to more than 11 million euros in 2019. The leader in the export of organic products is the Tomsk region, where economic measures have been taken to support producers of organic products (per hectare support). In Russia, there are still no federal government support measures for organic producers. Meanwhile, according to the Union of Organic Agriculture in European countries, there is a high demand and readiness to purchase organic products certified according to international standards in Russia, especially wheat, soybeans, sunflower and grass seeds (clover, alfalfa). Market prices for organic products are significantly higher than prices for products grown in a traditional way.

The original document regulating organic agriculture in the post-Soviet space was the Model Law, adopted in 2014. [National organic Union, 2014]. The EAEU countries are characterized by a different-speed formation of the legal environment for the functioning of organic agriculture. Thus, in Armenia, the law "On organic agriculture" was adopted in 2008, in the Republic of Kazakhstan - in 2015, in the Republic of Belarus - in 2018, in the Kyrgyz Republic in 2019.

At the moment, the issue of harmonizing the approaches of the EAEU member states to the legal regulation of the production and circulation of organic products within the Union is of the greatest relevance. Apparently the most productive is the idea of recognition by the EAEU countries of international standards harmonized with the Codex Alimentarius standard for the production, processing, labeling and marketing of organic food products CAC / GL 32-1999. However, not all participating countries agree with this position. In addition, it makes sense to take into account the experience of the International Federation of Organic Agriculture Movement (IFOAM) and intensify cooperation of the EAEU countries with the regional branch of this organization - "IFOAM - Eurasia".

Conclusion

In the world, the area under GM crops is more than twice the area of organic farming. This is due to the high margins in the production of GM goods. According to the author, biotechnologies are a priori dual-use technologies, that is, they can be used both to the detriment and benefit of humans and the environment. The lack of evidence of the safety of GMOs (taking into account long-term effects) means the validity of maintaining the ban on the cultivation of GM crops in the territory of the EAEU countries. When importing a GM product, the precautionary principle must be followed. The central issue is the availability of independent laboratories, effective methods / procedures for the detection and control of GMOs (goods containing GMOs), which implies the active implementation of scientific research in the field of biotechnology by scientists from the EAEU countries. In general, this approach is typical for all EAEU countries.

The foundations of the national and union institutional environment for the development of organic farming have been laid. The prospects of this technology are due to the availability of basic natural resources and compliance with the spirit of achieving food security in the Eurasian space. According to the EEC forecasts, organic products of the EAEU countries could occupy a fifth of its world market. It is this form of greening agriculture that has widespread support in society. The main limiting factors of the process remain: underdevelopment of a unified all-Union system of organic product certification and high certification costs; incomplete harmonization of the relevant standards for the circulation of organic products in the internal and external markets of the EAEU countries; the fragmentation of the financial and economic mechanism of the complex transition to the system of organic farming; lack of systematic state support for the production of organic products at the federal level.

On the side of market demand, the segregation of agri-food flows reflects the intensified stratification of the population into rich and poor in recent years. Expansion of production and sale of GM products and organic products requires further improvement of the regulation of their turnover at the international, regional and national levels in the interests of wide layers of society.

Abstract

This paper identifies the potential risks to which consumers are exposed when trading via e-commerce. In order to increase consumer confidence in e-commerce and get them to choose this method for future purchases, we must first understand where this lack of trust comes from, what are the potential risks, but also the dangers to which consumers are exposed, and only then to combat the risk in the E-C, by proposing concrete measures and developing such a necessary tool, through the HAZOP method.

Keywords: E-Commerce Risks, HAZOP, Risk Matrix, E-Commerce Risk Mitigation;

Introduction

According to Wikipedia, HAZOP - (Hazard and operability) technique was originally developed in the 1960s and is believed to be based on the Heavy Organic Chemicals Division of the Imperial Chemical Industries (ICI). The main reason why this technique was created involves the analysis of major chemical process systems, but over time the use of this technique has expanded to other areas. Gupa J. (2014) mentioned that this technique, being qualitative, aims to stimulate the imagination to identify potential hazards and operability problems. Hazard and operability study is a method used to identify the operational hazards and concerns of a system in order to analyze them. This study provides the possibility to perform a step-by-step analysis regarding the security of a system. HAZOP analysis can be performed both at the level of specifications and at the level of code, in the first case it can help to identify any specifications that are missing or incorrect and thus lead to unwanted behavior or in terms of code level, it can help to finding errors, introducing results from implementation. The HAZOP method was introduced to define and delineate the principles needed to perform interoperability studies and risk analysis due to the increasing complexity of processes, which can no longer be examined using conventional approaches according to Lawley (1974). HAZOP is a qualitative technique based on „guide words", which generates ideas about how to deviate from the expected operating conditions, which can lead to dangerous situations and operability problems. Risk analysis refers to the recognition and assessment of threats and is the process of identifying and measuring risk. The HAZOP technique is not 100% certain for risk identification mentioned Prostean et al (2014). Starting from the risk management analysis, which can be defined as a systematic application of management policies, procedures and practices, which include the identification, analysis, evaluation, monitoring and review of risk, is identified by HAZOP, the way in which the online trading process line may deviate from its original design conditions. The HAZOP study is extremely effective in identifying deviations of a process in relation to its prescribed mode of operation, involving the application of a formal systematic review and analysis of processes. A HAZOP report can improve all possible deviations, as well as their causes and consequences. It is noted that HAZOP is the ideal methodology for identifying unwanted events in a system. Also, according to Schuller, the soundness of the methodology is a function that extends the known interactions evaluated, as well as the level of detail of the analysis and the consequences identified, in the depth of the study. Schuller also argues that the success of a

Cite this Article as: Patricia Simona LUP, Gabriela Ioana PROȘTEAN and Denisa PAP GHERASIM "Risk Analysis in E-Commerce (E-C) Through the Method HAZOP (Hazard and Operability)" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

HAZOP study depends on knowledge of the process and its technical deviations metioned Galante et al (2014). In a research study by Rossing et al (2009), the Hazop study can be based either on a simple process flow diagram or on a P&ID diagram, pipeline and tool diagram used in the process industry. The present paper used a simple process flow diagram in risk assessment to investigate deviations from operating rules or design intent, such as the purpose of an E-C site.

Methodology

The main objective of the traditional HAZOP study is to identify the operability problems of potential hazards and to propose risk prevention actions. HAZOP, qualitatively is able to estimate the risks following the research of consumer behavior, the study of several factors of trust in e-commerce, as well as the protection offered by the company providing E-C. This technique uses the systematic approach to identify possible deviations from normal operations and to ensure that appropriate safeguards are in place to help prevent risks by testing consumer confidence in E-C, thus observing which deviations from the conditions of safety. HAZOP quantitatively develops scenarios and finds deviations of the causes, in order to identify safety functions and estimate the final effects. At the same time, it completes the assessment of severity and probability, thus allowing the selection of several important preventive recommendations in implementation. Although the basis of the HAZOP method came from the need to identify the hazards of handling hazardous substances in the chemical industry, it has expanded into various fields of research. The purpose of using this method in this paper is to identify the risks to which consumers who use e-commerce are exposed and to minimize or completely eliminate potential sources of risk by proposing concrete measures. HAZOP is a systematic safety study, based on the systemic approach, to an assessment of the safety and operability of complex process equipment or the production process. The objective of the present study overlaps with the main one of the traditional HAZOP method, which consists in identifying the potential problems of operability of the encountered dangers; thus, consumers face certain dangers in the online trading process, and as a consequence, risk prevention actions are proposed mentioned Kotek et al (2012).

It is considered that, in testing consumers' confidence in E-C, if the analysis and identification effort will be performed by experienced specialists, using the HAZOP technique, it is possible to identify at least 80% of the potential deviation that may occur during normal of an online transaction accordin to Prostean et al (2014). The framework of this study was conducted in order to test consumer confidence in E-C in 2020. The first step was to identify all the risk factors integrated in the two aspects associated with the risk: economic, technological and psychological. In the second step, the research team identified and analyzed on an individual basis, each risk factor that may occur in the EC, following the correlation of confidence factors with reliable sources, as well as with the dimensions of confidence in the testing models. consumer confidence (21 risk factors were identified in Table No. 1) and the probability of occurrence of each risk factor in percentages was estimated.Four models of testing consumer confidence in EC were examined to highlight confidence factors and to identify risks: Model I B2C of perceived confidence (Brian J. Corbitt et al, 2003), Model II testing of factors affecting the confidence in e-commerce (Musfiq Mannan, Choudhury, 2008), Model III for testing the dimensions of consumer confidence in e-commerce (Tiago Oliveira et al 2017), Model IV for testing the confidence of Romanian consumers in e-commerce (Lup et al 2019).

***Model I**:* Trust is a critical factor that governs consumer behavior. According to Corbitt, both market orientation and trust in web technology are extremely important. On the one hand, the perception of trust can be seen as a combination of benevolence and credibility; on the other hand, on the other hand, there is the decision of consumers to engage in technologically risky purchasing decisions. Corbitt points out that the web browsing experience is also important, so the higher it is, the more consumers are more likely to proceed with online purchases. The capacity of the website also contributes to gaining an advantage over the competition, while also attracting consumer confidence. A complex site has a better reputation and uses high quality consumer protection technologies. In this first model, trust as a critical factor in e-commerce is predominantly influenced by 3 sources: the reputation of e-commerce in general, consumers and the specificity of the website.

Model II: A first test hypothesis of this model verifies whether consumer confidence in E-C is negatively correlated with the risks involved in this type of trade. Perceived technological trust and security - are based on two major components: user security / privacy and technical capabilities to complete the transaction. Market orientation - the activity through which constantly, the needs and desires of buyers must be met. Social presence is positively correlated with buyers' trust in online commerce sites. The quality of the user interface (navigation and comfort) - takes into account the appearance of the system, the navigation part and the convenience of searching for a product or information. Quality of perceived information about products and services - updating information about products and services, to help the buyer make a decision.The importance of the reputation of websites - safe signals and clues, through which the buyer decides to buy online or not. Experience on user's websites - the experience, ideas,

knowledge and all the clues gathered and developed by a user regarding online transactions mentioned Musfiq Mannan, Choudhury (2008).

Model III: In the model of Tiago Oliveira et al (2017), tests of e-commerce trust were performed in order to conceptualize the sources of consumer trust in e-commerce (consumer characteristics, company characteristics, website infrastructure and interactions), verifying as well as how the sources influence the dimensions of consumer confidence in e-commerce: competence, integrity and benevolence and verify the significance of total consumer confidence in e-commerce. The hierarchy of the model components are of reflective-reflective type with the secondary constructs: the characteristics of the consumers, the characteristics of the company and the interactions, being essential in explaining the three dimensions of the consumer confidence. Also, following the testing of the effect of total trust in e-commerce, it was concluded that it is a partial mediator of competence in purchasing intention, integrity and benevolence.

Model IV: It has five sources of consumer confidence in e-commerce, which are grouped as follows: 1) The psychological profile of the consumer; 2) The company providing E-C - composed of the following factors: brand recognition, reputation, site accessibility, variety of products, online payment security; 3) Delivery infrastructure with three factors: traceability, promptness and easy return of products; 4) The guarantees offered by the supplier company being quality data that affects the consumer's satisfaction; 5) The dimensions of consumer confidence in e-commerce, which are: agility, integrity rate and adaptability of the e-commerce provider, influence all other sources of trust; they affect the final purchasing decision according to Lup et al (2019).

Following the detailed study and the analysis performed on the four models, 21 risks and 6 scales were configured, respectively, identified in Table no. 1, showing a classification of the probability of occurrence in percentages, for each risk factor separately. The difference between these tables stems from the fact that each risk factor affects the consumer (CONS) or the E-C company (COMP), having a certain high, moderate or low impact depending on the stage of the purchase trading. E-C has become the engine of the modern economy, replacing all the more in the current context of the Covid 19 pandemic, the traditional stores with a lot of companies, which are specialized in online transactions. Opening an online business involves certain risks, both for the company and for consumers. In Table no. 1 a classification of risks has been made, the probability of their occurrence indicates their severity, so it is necessary to take strong measures to counteract them; while other risks are insignificant and do not affect E-C companies or consumers according to an on-line study Running a Risk Assessment of Your e-Commerce Business (2020).

Table 1: Risks identified in E-C confidence testing

No.	Risk (B2C)	Category E (economic) P (psychological) T (technological)	Probability	What is affected?	Impact	The trust phase I - information U- understanding P - purchase
1.	Fraud	E, T, P	50%	COMP/CONS	SEVERE	I, U, P
2.	Previous experiences	E, T, P	73%	COMP/CONS	SEVERE	I, U, P
3.	Manipulation of decisions	P	80%	CONS	MODERATE	I, P
4.	Infrastructure defective site	E, T	38%	COMP/CONS	MAJOR	I, U, P
5.	Lack of logistics	E, T	77%	COMP/CONS	MODERATE	P
6.	Quality failure	E, T	70%	CONS	MAJOR	P
7.	Warranty failure	E, T	48%	CONS	MAJOR	P
8.	Low accessibility	E, T	65%	CONS	MAJOR	I
9.	Behavior changing	E, P	30%	COMP/CONS	MODERATE	I, U, P
10.	Misleading advertisements	E, P	65%	COMP/CONS	MODERATE	I, P
11.	Misperception of information	E, P	9%	COMP/CONS	INSIGNIFICANT	I
12.	Low reputation	E	81%	COMP	SEVERE	I, U
13.	Cyber security of the transaction	E, T	70%	COMP/CONS	SEVERE	P
14.	After-sales irresponsibility	E, T	80%	COMP/CONS	MAJOR	P
15.	Short description of the product	E	56%	COMP	MAJOR	I, U
16.	Changing preferences	E, P	70%	COMP/CONS	MODERATE	I, U
17.	Negative reviews	E, P	69%	COMP	SEVERE	I, U
18.	Data Privacy Infringement (G.D.P.R.)	E, T	85%	CONS	MAJOR	P
19.	Excessive costs	E	77%	CONS	SEVERE	P
20.	Wrong market orientation	E, P	54%	COMP/CONS	MODERATE	I, U, P
21.	Lack of customer support	E, T	20%	CONS	MODERATE	P

(Source: Lup Patricia Simona et al, 2020)

FRAUD: According to Soviany (2007), E-C fraud is based on three factors, namely: motivated criminals (who carry out cyber attacks), fraudulent consumers as a reasonable target audience, and the lack of relevant security measures, which should be taken by the company, E-C providers. Given that E-C fraud is distributed as follows: 70% of fraudulent websites that promote cheap electronic products but never deliver, followed by sales of used cars, 45% of consumers were deceived. At the same time, over 41% of consumers face counterfeit products, and 30% reported a large number of complaints about free trials of products mentioned Prostean et al (2014). Realizing the most common types of fraud at European level, it turned out to be an average of 50%, with an almost certain probability of E-C fraud occurring.

PREVIOUS EXPERIENCES: According to Dunne (2020), 73% of consumers mentioned that previous experiences influence their choices online. About 42% prefer to pay more for a friendly and welcoming experience, so improving E-C has increased buyers expectations. Customers are increasingly emancipated and with extensive online experience, anticipating access to customer service: fast, polite and useful orders through a wide range of channels, from social media to e-mail.

MANIPULATION DECISIONS: (The case of consumers manipulated by other competing companies): According to online checks of consumer behavior mentioned Hagai (2018), that over 80% of site visitors will buy elsewhere following clicks on ads, which appear on retailer sites that offer the same or much lower price for the product you are looking for.

INFRASTRUCTURE: (E-C provider's website) According to an online survey by Allen R. (2016), almost 38% of consumers will abandon an E-C web-site if its interface and design are unattractive and inaccessible, while 39% of site visitors will not purchase anything if the loading time of the site takes extremely long.

COSTS AND LOGISTICS: Consumers were asked to mention the main reasons for purchasing online, they indicated four specific reasons: price, shipping, selection and delivery time. 77% of respondents also pointed out that transport and other additional excessive costs would cause them to give up the online basket mentioned Hagai (2018).

QUALITY and PREFERENCES: ADI Consumer Electronics Report (2020) mentioned that Google Analytics measures over 80% of the transactions of the largest web retailers in the world, making anonymous reports on consumer behavior. The analysis of the products is performed following the daily study of millions of orders. From the analysis of purchases of electronic products, it emerged that they are most often followed by consumers, and in making the purchase decision 70% of the priority is the quality of the products.

WARRANTY: The conformity guarantee is mandatory according to the law in force, unlike the technical guarantee, which refers to the repair of the product, consumers following sites, which offer a guarantee as long as possible; according to the study of Allen (2016) where 7 risks identified in launching an online business, 48% of shoppers consider guarantees to be extremely important.

ACCESSIBILITY: For consumers, the online shopping experience is extremely important, requiring detailed information that is accessible and includes clear descriptions. According to online consumer behavior checks, the importance of simplicity and ease of navigation on the e-commerce website, easy search and simple navigation prevails for 65% of consumers, otherwise they will go to another retailer mentioned Hagai (2018).

BEHAVIOR REMODELING: In the analysis of consumer behavior, Adlum (2020), highlighted that over 30% of desktop transactions are followed by a mobile click. Thus, if a consumer views a product on their mobile device while on the way to work, they can later view the same product in the shopping cart on their laptop or tablet desktop. In recent years, consumer behavior has been reshaped and there has been a growing shift towards m-commerce (mobile commerce).

ADVERTISEMENTS: In most online shopping sessions, shoppers are diverted from visiting the online store by being exposed to unauthorized advertising. About 65% of the ads analyzed introduce unauthorized ads, which causes a decrease in visitors mentioned Etzioni (2020).

MISPERCEPTION OF INFORMATION: An informed consumer is determined to know all the relevant details before buying online. An E-C company must clearly and concisely show the value of the products by providing a comprehensive description. Otherwise, inaccurate and vague descriptions lead them to turn their attention to another retailer, in 9% of consumers can differentiate the exact information about the correct description of product quality according to Foot (2019).

REPUTATION: Many consumers resort to researching a product before purchasing it, about 81% check from other sources. If the website is reliable and offers complex services, the purchase decision is made quickly according to Hagai (2018).

SECURITY: According to Etzioni (2020), in a consumer survey, he found out that they consider that over 69% of E-C companies are exposed to cyber attack and their personal data is negligently managed.

AFTER-SALES IRRESPONSIBILITY: Awkward return policies discourage 80% of consumers from turning to the online store, which provides poor return services to customers, in a study By Expert commentator (2018).

SUMMARY DESCRIPTION OF THE PRODUCT: There are consumers who currently spend a lot of time researching product descriptions and posting various reviews online, following their documentation from several sources. They are the discerning rational consumers who can make a clear line between the useful content of a product description and advertising mentioned Stradling, (2019).

NEGATIVE REVIEWS and G.D.P.R.: In survey no. 20 global CEO of PwC, 69% of CEOs of many digital companies, said it is becoming increasingly difficult to gain consumer trust, which varies by industry. E-C companies must implement clear privacy policies, ensure transparency and responsiveness to consumer needs. In an increasingly technology-dependent world, consumers fear an overwhelming proportion of personal data breaches by 85% of consumers who will no longer approach a company if they have doubts about data protection. „Unlike the European Union's approach to regulating the confidentiality of personal data - the General Data Protection Regulation (GDPR), in most US data privacy laws vary by sector, type of data or state to State".

MARKET ORIENTATION: Zoovu Blog (2018) mentioned that the Waitrose's report on consumer trends, showed that 64% of consumers occasionally feel overwhelmed by the choice they make when they experience shopping online. Another recent consumer report found that about 54% of consumers are so frustrated that they abandon E-C sites if they can't choose what they want. In more than ten years of research, several psychologists have investigated the psychological effects of „choice overload". It turned out that the wide range of options discourages consumers from making purchasing decisions. A famous example is the experiment carried out by Iyengar and Lepper (2000), in which a table with „free samples" was installed at a grocery store and customers were presented with either: 6 or 24 jam flavors. The experiment showed that when only 6 options were presented, 30% of people made a purchase; unlike only 3% of consumers, who made a decision when faced with 24 options. In another similar experiment, Procter & Gamble found that: „decreasing the choice available for any given product leads to a 10% increase in revenue, so fewer choices, eliminates the cognitive burden and helps us act faster" mentioned Popova (2017).

LACK OF CUSTOMER SUPPORT: Recent surveys made by Dunne (2020), show that over 80% of consumers assume that E-C customer support teams will respond to an e-mail within 24 hours. So the lack of customer support is against policy and has a negative impact on the costs of e-commerce. In conclusion, there is a risk that 20% of companies will not have a call center for customer support, because over 80% of buyers said they expect to be answered and interact with them in real time mentioned the Salesforce research report.

For example, in Table no. 2 shows the probability of classification of the occurrence of the risk in Table No. 1. As described above, according to consumers, these factors represent a high risk of impact in online transactions, with an almost certain probability of occurrence.

Table 2: Probability of occurrence of risk factors in B2C

Scale	Probability of occurrence	Explication	Probability of occurrence refers to risk factors
6	Almost certain	>=50%(1 in 2)	1, 2, 3, 5, 6, 8, 10, 12, 13, 14, 15, 16, 17, 18, 19, 20.
5	Likely	>=25%(1 in 4)	4, 7, 9.
4	Possible	>=20%(1 in 5)	21
3	Unlikely	>=10%(1 in 10)	-
2	Rare	>=5%(1 in 20)	11
1	Almost never	>=2%(1 in 50)	-

(Source: Lup Patricia Simona, 2020)

In the third step, the research team, individually analyzed each risk factor, listed in Table no. 1 and established, through estimates based on brainstorming and experience, the risk severity classification table. The severity classification estimates the worst potential consequences, affecting online transactions. For example, it is also considered that factor no. 1 - The risk of fraud, which is an operational risk, investigates both the possibility of losing personal data of consumers and financial losses associated with fraud suffered by the company. According to some studies, fraud involves other losses in addition to financial costs, for example the negative impact on the reputation of the company providing E-C. The estimated impact for this risk is expressed in Table no. 3 and it can be observed that it has a high impact, related to the losses that both the consumer and the E-C company can suffer, it is translated into: „Severe impact", being assigned the value 6 on the value scale, according to Table no. 3.Following the study of the specialized literature, a classification of the severity of the risk was made according to table no. 3. The risks with severe impact in E-C are the following: fraud, previous experiences, logistics, company reputation, cyber security of the transaction, negative reviews and excessive costs.

Table 3: Aspect of severity classification for risk factors

Scale	Severity of classification	Classification of risk factors
6	Severe impact	1, 2, 5, 12, 13, 17, 19
5	Major impact	4, 6, 7, 8, 14, 15, 18, 20
4	Moderate impact	3, 9, 10, 16, 21
3	Minor impact	-
2	Insignificant impact	11
1	No impact	-

(Source: Lup Patricia Simona, 2020)

In the fourth step of the risk analysis in e-commerce is identified, the position of each risk factor in the risk matrix (Figure no 1) according to the individual scale established for the probability of occurrence and severity.

Significance		Severity (Consequence)					
		1 - No impact	2 - Insignificant impact	3 - Minor impact	4 - Moderate impact	5 - Major impact	6 - Severe impact
Probability of occurrence	1 - Almost never	Very low	Very low	Very low	Low	Moderate	High
	2 - Rare	Very low	Low	Low	Moderate	Moderate	Very high
	3 - Unlikely	Very low	Low	Moderate	Moderate	High	Very high
	4 - Possible	Low	Low	Moderate	High	Very high	Sever
	5 - Likely	Low	Moderate	High	High	Very high	Sever
	6 - Almost certain	Low	Moderate	High	Very high	Sever	Sever

Figure 1: Risk Matrix (Source: adapted by a standard matrix of risks)

The risk matrix is a visual diagram of risk analysis based on the probability and significance of the risks. From left to right, a risk classification is made starting with the lowest, moderate risks and gradually ascending to the most severe risks. Risks that have a high probability of occurrence also have a severe impact, which is why they require a thorough risk assessment, efficient management and countermeasures. The color codes in the risk matrix contribute to risk mitigation in the sense that they increase the visibility of risk classification, thus making it easier for companies to take risk mitigation measures according to an online article Running a Risk Assessment of Your eCommerce Business (2020). Based on the risk theory in management and integrating the HAZOP method, the risks of e-commerce were detailed as comprehensively as possible. To date, no particular attention has been paid to their assessment, according to Daijang Hao (2011), who adds a new concept aimed at ensuring management risks in e-commerce.

Significance		Severity (Consequence)					
		1	2	3	4	5	6
Probability of occurrence	1						
	2		11				
	3						
	4				21		
	5				9	4, 7	
	6				3, 10, 16	6, 8, 14, 15, 18, 20	1, 2, 5, 12, 13, 17, 19

Figure 2: Integration of risks in the risk matrix (Source: Lup Patricia Simona, 2020)

The HAZOP study is a process analysis technique that aims to systematically identify risks, malfunctions and operational problems that may compromise the personal safety of consumers or the operation of the E-C system. Hazop has the capacity to estimate the outcome of the risk deviation, having the ability to come up with measures to rectify the system. Hazop has proven to be extremely effective in recognizing the disadvantages of systems, but also in creating or developing new systems contributing to risk management mentioned Baradits (2007).

Conclusions and Recommendations

HAZOP analysis involves identifying hazards and assessing risks, which lead to undesirable consequences. Based on a structured and systematic approach, it is an important part of the risk management process, because no action can be taken to avoid or reduce unidentified hazards. In the risk matrix, a systematic review of the E-C process is performed and the severity of the risks, their causes and consequences are identified. The HAZOP study examines the consequences of failure and is a systematic and comprehensive technique mentioned Glossop (2000). Through E-C, buyers have access to a practical method of shopping and at the same time, easy for sellers, but that comes bundled with certain risks. The risks that may arise are, among others, of a financial nature, caused by fraud, improper use of access to various sources by buyers, lack of trust, lack of security, etc. These risks can be combated through a system in which buyers have a chance to become members. Consumers can become active participants in the trading process, can thus view the products offered, can make purchases and can follow the transaction process, as well as prove the payment according to Sahara et al (2019). Consumers also have the ability to assess the risks of online transactions as follows: the likelihood that the E-C provider will deliver on its promises and the assessment of potential damages in the event that the order is not honored. The first could be assessed from reviews or various indications found on the seller's profile, which indicate the seller's confidence, and the second is most directly reflected in the purchase price mentioned Nancy et al (2018).

The present study showed that some consumers, who used E-C, perceived an increased risk in terms of: technology, costs, performance, time, privacy, financial insecurity and in some cases even psychological risks. Thus, the following solutions were proposed:

- Effective ways to leave opinions / reviews - consumers' perception of risks, which may arise in relation to a supplier, will be improved, if there is such a mechanism by which consumers are allowed to share positive experiences and negative from online.
- Awareness of the brand's reputation - achieving this awareness among buyers, by promoting it through various electronic means: TV, Radio, posters, physical campaigns abroad, as well as on social media, targeting different market segments. A proper information campaign can reduce the risks / concerns of potential consumers.
- The option to pay on delivery - in Romania, there is still a fear of payment and not receiving the product after it has been paid. This fear is found among shoppers who make occasional online purchases. That is why it is useful to be able to pay when the product is delivered, thus reducing the risk of fraud in the provision of bank details.
- Commitment from the seller of E-C - transparency regarding delivery time, prompt shipping, warranties must be maintained.
- Providing details about the product, order, invoice helps buyers. If changes / problems occur, they must be communicated to the buyer.
- Return and warranty policy, efficient return policy / compensation / repair - product quality is always the one that creates uncertainty among buyers, in terms of E-C. The possibility of returning the product will increase confidence in „online shopping”. The existence of guarantees will determine consumers to „buy back”, to become loyal customers. The possibility of return, if the buyer is not satisfied, increases confidence and encourages online shopping.Collecting as little personal data as possible - collecting only the data that is necessary and important, so as not to create doubt among customers.
- Providing seals and security certification from trusted suppliers - certification of the website with services that ensure customer safety in terms of purchases, will increase trust and provide impartial approval of the sale, it becomes an assurance that what is delivered to the buyer, is reliable.
- Effective methods for complaints / support for buyers - the existence of such a method, the resolution of complaints by the E-C company, in the shortest possible time, the existence of a unique number of emergencies and a call center 24/7 for registration of complaints, clarifying misunderstandings / doubts and solving problems. Call center for providing information, finding out the degree of satisfaction / dissatisfaction among buyers, in terms of previous shopping experiences.

- Combining „kiosk" models with the virtual store - setting up a center where orders can be placed, but be in a public space, on the model of bank ATMs mentioned Jitendra et al (2017).
- In a study made by Bluestone Team, it is mentioned that providing the most accurate, complete and compact product information leads to the comparison of the consumer's interaction with the website compared to the seller in the physical store. The best possible view of the ideal product page must coincide with consumers' expectations in accordance with the latest trends: „particular descriptive titles, unique, extensive and complex descriptions; detailed specifications and attributes to answer all customer questions; the buttons should be prominent and colored: „Add to cart" and „Checkout"; mandatory high-resolution product image on white background (with zoom option); appropriate metadata for images; high quality videos showing how the product can be used; clearly presented shipping information and return conditions; related products and accessories; customer reviews".

According to Wylder (2004): „there are several risk mitigation strategies, including access control policies, physical and perimeter security policies, remote access policies and methodologies". According to Miyazaki and Fernandez (2001), the best way to increase consumer confidence in E-C is to display privacy and security seals on E-C websites. As many technical security measures as possible, in terms of security and confidentiality, need to be set up in order to protect the sensitive information of consumers and companies regarding: „the security system on connection, third party verification and seals on the Internet". Companies providing E-C services should develop mechanisms to ensure the confidentiality of consumerspersonal data and the secure transfer of electronic funds through cooperation with third-party systems for purchasing and implementing internet seals according to Vos et al (2014).

Abstract

Domestic consumption is one of the cornerstones of any national economy. Particularly in the retail trade, the corporate social responsibility is a guarantee for the company's sustainable development and its competitiveness. To identify the impact factors of the corporate social responsibility, the authors have set out to investigate the customer satisfaction from three aspects - customer service quality, marketing activities, as well as product placement and shopping convenience. The authors examine the theoretical background of customer relationship formation and corporate social responsibility. Then they describe retail trade development tendencies in the Baltic countries and, by conducting a customer survey (1446 respondents) determine the main factors underlying the socially responsible relations with customers. This study gives retailers an understanding of the need for a socially responsible relationship with customers and points to specific aspects of this process in retailing that ensure the customer loyalty. The authors conclude that by understanding the main principles of customer relationship formation, the retail enterprise can manage these processes in the socially responsible way and that responsibility can be one of the tools for enhancing business competitiveness.

Keywords: Customer Satisfaction, Corporate Social Responsibility, Retailing, Customer Loyalty.

Introduction

Domestic consumption is one of the cornerstones of any national economy. Particularly in the retail trade, the corporate social responsibility is a guarantee for the company's sustainable development and its competitiveness. The ground factors of the consumers' choice are the ones of the product assortment and quality, price, point of sales, service according to expectations and necessary information. In the current market situation customer can obtain information about the best offer quite easy, therefore the retailers have search for new ways to attract and retain customers and create a long-term relationship. Retailers need certain mechanisms to ensure their competitiveness, customer satisfaction and loyalty. In the era of the new technologies the retail trade also exhibits new developmental tendencies:

- Growing number of enterprises;
- Expansion of mega-retailers;
- Rapid development of new types of retailing (e.g. internet selling);
- Use of new technologies in retailing;
- Increase of competitiveness in retailing. (Berman & Evans, 2013)

Therefore, it is very important to find new ways and methods for successful development within the dense competitive environment. Unfortunately, many enterprises to ensure their competitiveness chose unethical and/or illegal course of actions. To avoid such threat and to function in the sustainable mode, the social orientation of the enterprise plays more and more important role. To identify the impact factors of the corporate social responsibility, the authors have set out to investigate the customer satisfaction from three aspects - customer service quality, marketing activities, as well as product placement and shopping convenience. The authors examine the theoretical background of customer relationship formation and corporate social responsibility. Then they describe retail trade development tendencies in the Baltic countries and, by conducting a customer survey (1446 respondents) determine

the main factors underlying the socially responsible relations with customers related to the customer satisfaction and loyalty. Accordingly, the research question of the current investigation is: What are the main impact factors of the corporate social responsibility upon customer satisfaction and loyalty?
